MODELOS DE REGIONALIZAÇÃO NO PLANEJAMENTO MUNICIPAL, LIMITES, COMPARAÇÕES INTERCAPITAIS E PROPOSIÇÃO DE CRITÉRIOS PARA MACEIÓ

MODELOS DE REGIONALIZACIÓN EN LA PLANIFICACIÓN MUNICIPAL, LÍMITES, COMPARACIONES ENTRE CAPITALES Y PROPUESTA DE CRITERIOS PARA MACEIÓ

 <https://doi.org/10.56238/sevened2025.036-093>

Jailton Pereira Nicácio¹

ABSTRACT

The study critically examines the regionalization models adopted in Brazilian municipal planning, with a specific focus on the case of Maceió. It assumes that regionalization is a structuring element of territorial state capacity and of the effectiveness of planning instruments such as the Multi-Year Plan, the Budget Guidelines Law and the Annual Budget Law. This qualitative research employs document analysis, literature review and inter-capital comparison to assess the technical, institutional and functional criteria guiding territorial delimitation in Brazilian capitals. Maceió's model, based on neighborhood subdivision and consolidated since 1988, is contrasted with benchmark experiences and with capitals of similar characteristics. The analysis adopts as methodological reference the Regionalization Model for State Planning of Alagoas, grounded on the principles of polarization and socioeconomic flows. The findings show that Maceió's current regionalization lacks technical criteria, which compromises diagnostics, prioritization and the territorial allocation of public expenditure. The study concludes that it is necessary to advance toward a standardized municipal regionalization model, articulated with indicators, data and participatory processes, capable of supporting more efficient planning oriented toward territorial inequalities.

RESUMEN

El estudio analiza críticamente los modelos de regionalización adoptados en la planificación municipal brasileña, con énfasis en el caso de Maceió. Se parte del supuesto de que la regionalización constituye un elemento estructurante de la capacidad estatal territorial y de la efectividad de instrumentos de planificación, como el Plan Plurianual, la Ley de Directrices Presupuestarias y la Ley de Presupuesto Anual. La investigación, de naturaleza cualitativa, emplea análisis documental, revisión bibliográfica y comparación entre capitales para evaluar los criterios técnicos, institucionales y funcionales que orientan la delimitación territorial en las capitales brasileñas. El modelo de Maceió, basado en el abairramiento y consolidado desde 1988, se contrasta con experiencias de referencia y con capitales de características similares. Se adopta como parámetro metodológico el Modelo de Regionalización para la Planificación Estatal de Alagoas, fundamentado en los principios de polarización y flujos socioeconómicos. Los resultados muestran que la regionalización vigente en Maceió carece de criterios técnicos, lo que compromete diagnósticos, priorización y territorialización del gasto público. Se concluye que es necesario avanzar en la construcción de un modelo normativo de regionalización municipal, articulado con indicadores, datos y procesos participativos, capaz de apoyar una planificación más eficiente y orientada a las desigualdades territoriales.

Palabras clave: Regionalización. Planificación Municipal. Territorio. Plan Plurianual. Gobernanza Territorial. Maceió.

1 INTRODUCTION

Regionalization is a structuring element of government planning and contemporary territorial governance. At the municipal level, its function goes beyond the mere administrative division and assumes a strategic role in the production of diagnoses, in the identification of intra-urban inequalities, in the formulation of territorialized policies and in the efficient allocation of public resources. Despite this, the regionalization used by most Brazilian capitals remains anchored in historical, political, and administrative criteria, revealing a low connection with socioeconomic flows, mobility patterns, service networks, and functional dynamics of the territory. As a result, the state's capacity to understand, prioritize and intervene in different areas of the city is reduced, which limits the effectiveness of the Multi-Year Plan, the Budget Guidelines Law and the Annual Budget Law.

This picture is more clearly evident in Maceió. The regionalization originally instituted by Law No. 4,687 of 1988, preserved in subsequent amendments, is based on the *aairramento* and physical contiguity between neighborhoods. Although it has fulfilled a relevant administrative function, especially in supporting the decentralization of services, the model was not designed with technical criteria of regionalization aimed at planning. It does not incorporate indicators of social vulnerability, does not dialogue with mobility patterns, does not distinguish urban functions, nor does it establish relations of influence or polarization between territorial units. This produces a structural disconnection between territory and planning, with inaccurate diagnoses, low territorialization of public policies, and weaknesses in the prioritization of investments.

The literature indicates that regionalization models based on technical criteria, such as polarization, functionality, service networks, and socio-spatial integration, increase the internal coherence of planning and strengthen territorial state capacity, according to Haesbaert, Contel, and Saldanha. In Brazil, few capitals have advanced in this direction. Curitiba is the main national reference in articulating territorial planning, mobility, land use and socioeconomic indicators. Belo Horizonte, with its nine technical-administrative regions, also presents methodological coherence. Porto Alegre structured a model of participatory regionalization that influenced the budget and the territorial distribution of investments. On the other hand, most Brazilian capitals, such as Aracaju, João Pessoa, Natal and São Luís, use essentially administrative models similar to that of Maceió, with low technical foundations.

In this scenario, the Regionalization Model for the State Planning of Alagoas, prepared by SEPLANDE and IBAM in 2014, emerges as a relevant methodological reference. It

combines two structuring movements: the definition of hub municipalities based on their socioeconomic and functional influence, and the delimitation of planning regions derived from territorial flows and interdependencies. Although conceived for the state scale, its logic offers parameters applicable to the municipal level and makes it possible to critically evaluate the regionalization of Maceió, as well as to propose technically consistent alternatives.

From this perspective, the article seeks to answer the following question: to what extent does the absence of a standardized model of regionalization affect the planning capacity of the Municipality of Maceió and how can the experiences of other Brazilian capitals, articulated with the state model of Alagoas, guide its reformulation? To answer this question, an analysis based on three axes is developed: theoretical review of territory, region and regionalization; comparison between models adopted by Brazilian capitals, with emphasis on cities of similar size and characteristics; and a critical examination of the case of Maceió in the light of the state model of Alagoas.

The research is qualitative, of a documentary and comparative nature, based on municipal and state legislation, technical reports, official data and specialized literature. The analysis articulates theoretical foundations, normative requirements and empirical evidence, with the purpose of sustaining concrete guidelines for a technically oriented regionalization model, capable of strengthening municipal planning, promoting greater territorial equity and qualifying the distribution of public resources.

Next, the theoretical foundation explores the concepts of territory, region, regionality and regionalization, as well as the bases of government planning. Next, the methodology is presented. Subsequently, a comparative analysis is carried out between Maceió, reference capitals and capitals with similar characteristics. Finally, the conclusions are discussed and the guidelines for a standardized model of municipal regionalization are presented.

2 THEORETICAL FRAMEWORK

Understanding the regionalization models used in municipal planning requires a conceptual basis that articulates government planning, territory, and territorial governance. These three axes structure the state's capacity to formulate diagnoses, define priorities, and distribute resources in a way that is consistent with inequalities and urban dynamics. Thus, before examining the experiences of Brazilian capitals and the case of Maceió, it is necessary to present the theoretical foundations that guide the analysis, with emphasis on government planning as a structuring function of the State and regionalization as an essential instrument

for the territorialization of public policies.

2.1 GOVERNMENT PLANNING AS A STRUCTURING FUNCTION OF THE STATE

Planning is the first and most relevant administrative function of the State, guiding the definition of objectives, the coordination of public actions and the rationalization of the allocation of resources, according to Saldanha. In Brazil, its foundation is constitutionalized. The Federal Constitution of 1988 instituted an integrated planning system composed of the Multi-Year Plan, the Budget Guidelines Law and the Annual Budget Law. These instruments express the government project and the strategy of socioeconomic development, organizing priorities, goals and financial commitments, as Andrade observes.

For this author, planning is an indispensable condition for the responsible use of public resources and the prevention of improvised, short-sighted or fragmented practices, traits that are still recurrent in the Brazilian public administration. In the field of public policies, Schmitter has already emphasized that well-planned policies configure institutionalized arrangements capable of reducing distributive conflicts by rationally organizing the allocation of public goods and services.

In this context, regionalization plays a decisive role. Planning only becomes effective to the extent that the territory is properly understood, analyzed and structured. Planning without regionalization corresponds to planning in a vacuum, that is, setting goals without knowing precisely where they should focus.

2.2 THE TERRITORY AS AN OPERATIONAL BASIS FOR PLANNING

Territory is not a neutral category. It expresses power relations, inequalities, flows, uses, disputes, and identities, as discussed by Santos, Raffestin, and Haesbaert. For government planning, the territory is simultaneously:

- unit of analysis, where demands and inequalities are identified;
- intervention unit, where policies and investments are applied;
- coordination unit, where actions and actors are articulated.

Without understanding the territory in its characteristics, functions, dynamics and hierarchies, there is no planning capable of producing consistent results.

Territorial planning depends on a regionalization capable of:

- identify intra-urban inequalities;

- capture mobility patterns and flows;
- reveal areas of socioeconomic vulnerability;
- consider polarization and centralities;
- guide the prioritization of investments.

This set of elements sustains the territorialization of public spending, a critical dimension of contemporary planning.

2.3 REGIONALIZATION AND TERRITORIALIZATION OF PUBLIC SPENDING

The territorialization of spending refers to the distribution of resources and investments based on territorial diagnoses and the specific demands of each region. It connects four structuring dimensions:

- Planning, which defines priorities;
- Territory, which reveals needs;
- Budget, which allocates resources;
- Public policy, which executes actions in space.

When regionalization is merely administrative or based only on *abairramento*, as occurs in Maceió, this connection is broken. The result is a set of recurring problems:

- public policies that do not dialogue with territorial inequalities;
- asymmetric distribution of investments;
- sectors acting in a disconnected way, such as education, health and mobility;
- difficulty in establishing territorial priorities in the PPA;
- inability to measure regional impacts of policies.

For this reason, the contemporary literature emphasizes that regionalization must be functional, and not just administrative, as Contel and the OECD argue.

2.4 WHY TECHNICAL REGIONALIZATION IS INDISPENSABLE TO THE PPA, LDO AND LOA

2.4.1 In the Multiannual Plan

The PPA requires a prior diagnosis of the socioeconomic reality, definition of guidelines and territorialization of medium-term policies. Without data-based regionalization, the

diagnosis becomes inaccurate.

2.4.2 In the Budget Guidelines Law

The LDO defines annual goals and priorities and, for this, it needs:

- identify priority regions;
- measure inequalities and demands;
- project territorial impacts of fiscal and budgetary targets.

Without technical regionalization, generic priorities are produced, without defined territorial location.

2.4.3 In the Annual Budget Law

The LOA requires territorial precision to:

- allocate resources;
- distribute investments;
- specify regionalized actions;
- monitor physical and financial execution.

When the regions are not technically structured, the LOA loses its ability to guide public spending in the territory.

Brazilian planning instruments require regionalization, but most municipalities, including Maceió, still operate with inadequate models, generating misalignment between priorities, needs, and execution.

2.5 THE CONTEMPORARY AGENDA FOR TERRITORIAL GOVERNANCE (2012–2024)

Recent research highlights that state capacity depends on the territorial coherence of planning, as Abrucio, Lotta, Pires and Gomide point out. The OECD reinforces that countries with consistent territorial models have:

- greater allocative efficiency;
- stronger intersectoral coordination;
- lower spatial inequality;
- greater transparency in the use of resources.

This agenda incorporates:

- multilevel planning;
- metropolitan governance;
- use of indicators and territorial information systems;
- functional regionalization;
- strengthening of administrative capacities.

Thus, regionalizing well is not only a technical decision, but a condition for the State to operate with true capacity for planning and territorial intervention.

3 METHODOLOGY

The research adopts a qualitative approach, based on documentary analysis, literature review and inter-capital comparison. According to Gil, qualitative research is indicated for studies that seek to understand phenomena in depth, exploring meanings, relationships and contexts that cannot be reduced to numerical measurements. Creswell points out that this type of approach mobilizes multiple sources of evidence and allows interpreting social phenomena in an integrated and contextualized way. From this perspective, it is based on the understanding that regionalization for planning purposes involves territorial, political and administrative dimensions whose study demands interpretation, analysis and conceptual reconstruction.

The documentary analysis follows the understanding of Lakatos and Marconi, according to which official and normative documents are indispensable primary sources for identifying institutional structures, public policies and organizational processes. The first set of sources corresponds to the municipal laws of Maceió, especially Law No. 4,687 of 1988, its subsequent amendments, the Master Plan of 2005 and the provisions related to the territorial organization of the municipality. The second set comprises the Regionalization Model for the State Planning of Alagoas, prepared by SEPLANDE with technical support from IBAM, whose methodology based on poles, flows and areas of influence offers analytical parameters particularly useful to the study.

For comparative purposes, Brazilian capitals with urban and structural characteristics similar to those of Maceió were selected, such as Aracaju, João Pessoa, Natal and São Luís. This selection follows the methodological orientation highlighted by Prodanov and Freitas, who indicate that the inter-case comparison allows the identification of patterns, divergences

and convergences relevant to the problem investigated. At the same time, capitals considered national reference in regionalization models were analyzed, such as Curitiba, Belo Horizonte and Porto Alegre, which allowed the construction of contrastive patterns between administrative, hybrid and functional models.

The analytical procedure was developed in three stages. The first consisted of the systematization and analysis of the legal bases, territorial divisions and criteria used in each city. The second stage corresponded to the comparison of the models, classifying them according to categories derived from the literature and the methodology applied in the state model of Alagoas. The third stage focused on the interpretation of the effects of each model on government planning, relating territorial diagnosis, prioritization of policies and territorialization of public spending.

The combination of documentary analysis, theoretical review and intercapital comparison allowed the construction of a comprehensive interpretation of the limits of the regionalization model of Maceió, in addition to supporting the identification of essential elements for its future review. The methodology adopted thus ensures coherence between the research problem, the objectives and the analytical procedures employed.

4 RESULTS AND DISCUSSIONS

The analysis developed below presents the main findings of the research, organized from the interpretation of the regionalization models adopted by Maceió, the capitals of similar size and the reference capitals in the national scenario. The results allow us to understand how different territorial criteria influence diagnoses, prioritization of public policies and state capacity. The discussion is structured in sub-items that detail characteristics, limits and implications of each model, relating them to the contemporary requirements of government planning.

4.1 THE REGIONALIZATION MODEL OF MACEIÓ, CHARACTERISTICS, LIMITS AND IMPLICATIONS

The regionalization in force in Maceió has its origin in Law No. 4,687 of 1988, which divided the urban area into seven Administrative Regions using as the main criterion the physical contiguity between neighborhoods. This logic was preserved by Laws No. 4,952 of 2000 and No. 5,217 of 2001 and reaffirmed in the Master Plan of 2005, when the eighth

administrative region was established without, however, changing the methodological foundation of the model.

The most recent data from the IBGE and the Socioeconomic Profile of Maceió show that the city has marked territorial heterogeneity, marked by a strong population and economic concentration in the coastal strip and persistent vulnerabilities in the high areas. This reality highlights the central limitation of the current model, which fails to capture contemporary socio-spatial dynamics. Administrative regions do not reflect patterns of mobility, service networks, emerging centralities, or socioeconomic inequalities already documented in official public databases.

The second limitation refers to the fragile integration between regionalization and planning. The diagnoses used in the PPA, LDO and LOA reproduce territorial divisions that have little dialogue with urban complexity, which restricts the ability to identify territorial priorities and guide the balanced distribution of investments.

The third limitation lies in the inability to reveal intra-urban inequalities, since the current model does not incorporate indicators of income, schooling, sanitation, density or accessibility, essential elements for any consistent territorial reading. As a result, the territorialization of public spending becomes uncertain and sectoral policies are implemented without reference to functional planning cuts.

The specialized literature reinforces that administrative regionalizations, when not anchored in technical criteria, tend to reproduce inequalities and reduce the effectiveness of government action. In Maceió, this phenomenon is expressed by the fragmentation of policies, the overlapping of initiatives, the low intersectoral articulation and the weak adherence between territory, budget and strategic programs.

4.2 THE STATE MODEL OF ALAGOAS AS A METHODOLOGICAL REFERENCE

The Regionalization Model for the State Planning of Alagoas, prepared by IBAM and published in 2014, presents a methodological arrangement that contrasts strongly with the municipal model of Maceió. His logic combines two complementary movements. The first consists of the definition of hub municipalities, identified according to their socioeconomic importance, the supply and density of services, and the capacity for polarization. The second movement corresponds to the delimitation of the areas of influence of these poles, resulting in planning regions that incorporate flows, functional interdependencies, equipment networks and mobility patterns.

It is a model anchored in measurable and replicable criteria, structured to translate urban functions and territorial articulations. The use of socioeconomic indicators, associated with the interpretation of commuting and consumption flows, the analysis of the location of public services and the identification of centralities and subcentralities, constitutes its backbone. These elements allow the construction of excerpts that represent the real dynamics of the territory, strengthening diagnoses, increasing the precision in the allocation of resources and guiding programs and actions of a territorial nature.

When used as a reference to evaluate Maceió, the state model shows the distance between an administrative regionalization, based on historical cuts, and a functional regionalization guided by technical criteria. While the state model incorporates territorial articulations and identifies effective centralities, the municipal model remains stuck in divisions that are not very responsive to urban transformations, incapable of consistently guiding the planning and management of the territory.

4.3 COMPARISON WITH SIMILAR CAPITALS: ARACAJU, JOÃO PESSOA, NATAL AND SÃO LUÍS

The comparative analysis with capitals of similar size and characteristics confirms that Maceió is not an isolated case. Aracaju (with about 670 thousand inhabitants), João Pessoa (approximately 830 thousand), Natal (almost 900 thousand) and São Luís (about 1.1 million) structure their administrative regions based on predominantly historical cuts, linked to the division of neighborhoods, physical contiguity and administrative practices consolidated over time. In general, these models do not incorporate socioeconomic indicators, do not represent urban flows, nor do they systematically guide the budget cycle, reflecting the persistence of an essentially administrative regionalization in the northeastern capitals.

Although they share limitations, these cities have particularities that help to contextualize the case of Maceió. Aracaju is organized into 9 administrative regions, articulated with urban planning, still without explicit functional criteria. João Pessoa uses excerpts that partially dialogue with community dynamics, but lack a methodological framework capable of translating socio-spatial inequalities into planning criteria. Natal, divided into four administrative zones since the mid-twentieth century, maintains similar weaknesses due to the lack of integration between regionalization and planning instruments. São Luís, with five major administrative regions, faces similar challenges, mainly due to the absence of analytical criteria and the low incorporation of territorial indicators.

The socioeconomic data from the IBGE and the indices from the Brazil Atlas reinforce this picture, evidencing intense patterns of vulnerability and intra-urban inequalities in these capitals — elements that, as in Maceió, are not incorporated into the administrative cutouts or used to guide the goals of the PPA or the execution of the LOA. The result is a budget cycle that is poorly articulated with the territory, marked by generic diagnoses, low precision in identifying priorities, and less capacity for territorial evaluation of the impacts of public policies.

Thus, the common point between these capitals is the disconnection between territory and budget, which limits the effectiveness of government actions, reinforces patterns of exclusion, and makes it difficult to confront intra-urban inequalities. The comparison shows that Maceió is part of a national pattern of capitals that adopt administrative models of regionalization. However, it is distinguished by having a functional state model already consolidated, which can serve as a technical reference for a consistent territorial reform aligned with the socio-spatial demands of the city.

To qualify the comparative analysis and highlight the territorial characteristics of capitals of similar size, the official maps of Aracaju, João Pessoa, Natal and Maceió are presented below. These representations illustrate the administrative structure adopted by these municipalities, predominantly anchored in historical cuts, physical contiguities and traditional divisions of neighborhoods. The visualization of these maps helps to understand the methodological limitations identified in the regionalization of these capitals, reinforcing the arguments developed in this subsection.

Figure 1

Administrative Regionalization of Aracaju

Source: Prefeitura Municipal de Aracaju.

Figure 2

Administrative Regionalization of Natal

Source: Prefeitura Municipal de Natal.

Figure 3

Administrative Regionalization of João Pessoa

Source: Prefeitura Municipal de João Pessoa.

Figure 4

Administrative Regionalization of Maceió

Source: Prefeitura Municipal de Maceió.

The integrated reading of the maps confirms that Aracaju, João Pessoa and Natal adopt regionalization models of an essentially administrative nature, without functional criteria, without articulation with urban flows and without consistent integration with the budget cycle. Such visual evidence corroborates the findings presented in the textual analysis and empirically substantiates the classification of these capitals as "similar models" in Chart 1.

4.4 COMPARISON WITH REFERENCE CAPITALS: CURITIBA, PORTO ALEGRE AND BELO HORIZONTE

Curitiba, Porto Alegre and Belo Horizonte are national references for adopting more structured and methodologically consistent functional regionalization models. Curitiba integrates its regionalization with land use policies, mobility and urban structuring, articulating transport axes, urban centralities and socioeconomic data. Porto Alegre has developed a territorialized model associated with Participatory Budgeting, allowing the identification of regional inequalities, territorializing investments and strengthening the relationship between planning, budgeting and social participation. Belo Horizonte has structured nine regional offices based on population, socioeconomic and functional criteria, which enables territorialized diagnoses and continuous monitoring of goals.

These experiences offer relevant lessons. In Curitiba, regionalization guides structuring decisions on mobility, zoning and service networks. In Porto Alegre, territorialization qualifies the distribution of resources and reinforces democratic legitimacy. In Belo Horizonte, regionalization is the basis for territorial indicators, monitoring of goals and intersectoral coordination.

The contrast with Maceió highlights the importance of functional cuts to strengthen state capacity. Detailed diagnoses, territorial prioritization, articulation between sectors and efficient allocation of resources depend on regions defined by technical criteria that express the socio-spatial dynamics of the city.

Next, the maps of the reference capitals — Belo Horizonte, Curitiba and Porto Alegre — are presented with the objective of illustrating the territorial organization based on functional criteria, urban centralities, mobility networks and intersectoral articulation. These representations show regionalization arrangements aligned with urban and budgetary planning, offering a direct contrast with the administrative models observed in the northeastern capitals previously analyzed.

Figure 5

Administrative Regionalization of Curitiba

Source: Prefeitura Municipal de Curitiba.

Figure 6

Administrative Regionalization of Belo Horizonte

Source: Prefeitura Municipal de Belo Horizonte

Figure 7

Territorial Regionalization of Porto Alegre (Participatory Budget)

Source: Prefeitura Municipal de Porto Alegre / ObservaPOA.

The comparative observation of the regional offices of Belo Horizonte, Curitiba and Porto Alegre confirms the presence of functional criteria, delimitations consistent with the urban dynamics and systematic use of indicators for planning purposes. Unlike administrative models, such regionalizations structure territorial diagnoses, guide sectoral policies and facilitate the territorialization of the budget. This visual evidence reinforces the privileged position of these capitals in Chart 1, as well as the importance of technically grounded territorial cutouts for strengthening state capacity.

4.5 COMPARATIVE TABLE OF REGIONALIZATION MODELS

The following is an analytical table that summarizes the main differences between the models:

Table 1

Criterion	Maceió	Similar capitals ² (Aracaju, João Pessoa, Natal, São Luís)	Reference Capitals ³ (Curitiba, Belo Horizonte, Porto Alegre)	State Model of Alagoas ⁴ (IBAM/SEPLANDE, 2014)
Territorial base	Abairramento; Historic division of neighborhoods	Administrative sections based on neighborhoods or sectors	Functional cutouts structured by centralities and land use	Territorial polarization: poles and areas of influence
Methodological criterion	Not defined; Absence of technical criteria	Partially defined; still predominantly administrative	Methodologically defined; Data-driven and urban functions	Highly defined; Two-step method
Socioeconomic indicators	Unused	Little used; Limited Application	Used systematically	Fully utilized
Consideration of urban flows	Not considered	Considered partially	Considered in full	Considered in full
Centralities and subcentralities	Unidentified	Little explored	Identified and used as a territorial base	Identified from the poles
PPA Integration	Low	Low to moderate	High	High
Integration with LOA	Reduced	Reduced	High	High
Use for territorial diagnosis	Weak	Weak to moderate	Strong	Strong
Territorial coherence	Low	Low to medium	Discharge	Discharge
Intersectoral articulation	Limited	Limited	High	High
Territorial social participation	Unstructured	Partial	Partial to strong (e.g., Porto Alegre)	Partial
Model-derived state capacity	Reduced	Reduced	Strengthened	Strengthened

Source: Prepared by the authors based on the municipal legislation of Maceió (Laws No. 4,687/1988, 4,952/2000, 5,217/2001 and Master Plan 2005), the Regionalization Model for the State Planning of Alagoas (SEPLANDE/IBAM, 2012–2014) and official documents from the capitals Aracaju, João Pessoa, Natal, São Luís, Curitiba, Belo Horizonte and Porto Alegre.

² Population, demographic and territorial data for the capitals Aracaju, João Pessoa, Natal and São Luís were consulted on the "Panorama of Municipalities" and "Cities and States" platforms of the Brazilian Institute of Geography and Statistics (IBGE).

³ Information related to territorial organization, centralities, urban mobility and functional criteria adopted by Curitiba, Porto Alegre and Belo Horizonte were obtained from official urban planning documents, municipal statistical databases and complementary IBGE panels.

⁴ The Regionalization Model for the State Planning of Alagoas was prepared by the Brazilian Institute of Municipal Administration (IBAM) in partnership with SEPLANDE (2012–2014), defining poles, areas of influence and socioeconomic and functional criteria.

⁴ Socioeconomic indicators used for comparative purposes — MHDl, income, education and social vulnerability — were obtained from Atlas Brasil (PUND/IPEA/FJP).

⁵ The data referring to intra-urban inequalities in Maceió were extracted from the Socioeconomic Profile of Maceió (SEPLAG/AL), complemented by IBGE and Atlas Brasil.

The differences between municipal and metropolitan scales, as well as the demographic and institutional particularities of the capitals analyzed, were considered in the elaboration of the table, ensuring comparative coherence and avoiding interpretative distortions.

The picture shows that Maceió shares weaknesses typical of northeastern capitals, especially the absence of functional criteria and the low integration between regionalization and planning. At the same time, it is noteworthy that the municipality has a relevant comparative advantage: the existence of an already consolidated state model, which incorporates technical guidelines necessary to guide a functional regionalization. This model can serve as a basis for the construction of a new municipal territorial framework, more coherent with contemporary socio-spatial dynamics and with the requirements of government planning.

The analysis confirms that regionalization is a decisive element for the quality of municipal planning. In Maceió, as in several northeastern capitals, the absence of a standardized and technically based model compromises the territorialization of public spending, reduces the accuracy of diagnoses, and limits the state's capacity to address persistent intra-urban inequalities.

The comparison with reference capitals shows that functional models strengthen the integration between policy, territory and budget, allowing detailed diagnoses, intersectoral coordination and better distribution of resources. On the other hand, the comparison with similar capitals shows that administrative models tend to reproduce structural weaknesses and maintain the distance between territory and budgetary decisions.

In this context, the state model of Alagoas emerges as a robust methodological reference and able to guide a new territorial framework for Maceió. Its use would allow for greater territorial coherence, more accurate diagnoses and strengthening of state capacity, indispensable elements to address inequalities and qualify municipal public planning.

5 CONCLUSION

The analyses presented demonstrate that Maceió operates with an essentially administrative regionalization, historically defined by the *abairramento* and the traditional division of neighborhoods, without technical criteria capable of reflecting flows, socio-spatial inequalities, land uses and urban centralities. This configuration compromises central processes of government planning, such as the preparation of the Multi-Year Plan, the

identification of LDO priorities and the territorialization of the expenses provided for in the LOA.

The comparison with similar capitals reveals that Maceió is part of a set of municipalities with fragile territorial cuts, predominantly administrative and poorly articulated with planning. At the same time, the reference capitals, such as Curitiba, Belo Horizonte and Porto Alegre, demonstrate that functional regionalization is capable of expanding state capacity, strengthening territorial diagnoses and guiding investments in a more equitable way.

The Regionalization Model for the State Planning of Alagoas shows that the construction of territorial divisions guided by indicators, centralities, urban flows and areas of influence offers more solid bases for diagnoses and strategic decisions. This methodological reference suggests ways for a broad review of the regionalization of Maceió, including mechanisms of social participation, integration between budget planning and urban planning, and articulation between different scales of governance.

It is concluded that the construction of a standardized model of municipal regionalization is a fundamental step to strengthen the planning of Maceió, support the balanced distribution of public investments and face historical inequalities in the territory. A model that considers centralities, flows, vulnerabilities and functional articulations will allow the city to move towards a more coherent, democratic planning that adheres to the real needs of the population.

ACKNOWLEDGEMENTS

To God, because "in everything we ought to give thanks, for this is the will of God in Christ Jesus for you" (Thessalonians 5:18) – and a grateful heart pleases God!

I thank my wife, Elda Nicácio, for her companionship and support at all times of our life journey.

I thank my sons, Vinicius and Matheus, for understanding my absence in the hours dedicated to research, studies and work.

I also thank my friend Marielza, for her academic complicity, for the hours of debates and for the contributions that greatly enriched our journey.

ABSTRACT

Based on the problem of the impossibility of forming the individual in a social organization based on barbarism, the constitution of melancholy is analyzed, whose characteristic of maintaining the memory of the pain experienced questions survival in a state of inversion of means and ends, which mutilates the individual while summoning them to participate in a reality that is alien to their realization as such. Contrary to what is demanded by neoliberal culture, the melancholic state, while manifesting the impediments inflicted on the individual, indicates the possibility of resisting these conditions by renouncing the untruth of the imposed meaning and can also signal an ethical-political orientation of present action because its movement brings traces of non-forgetfulness, a fundamental condition for critical reflection on the contemporary imposition of the social process of adaptation.

Keywords: Forgetfulness. Formation. Critical Theory. Freud. Education.

RESUMO

A partir da problemática da impossibilidade de formação do indivíduo em uma organização social pautada pela barbárie, se analisa a constituição da melancolia, cuja característica de mantenedora da lembrança da dor vivida questiona a sobrevivência em um estado de inversão de meios de fins, que mutila o indivíduo enquanto o convoca a participar de uma realidade alheia à sua realização enquanto tal. Na contramão do que é exigido pela cultura neoliberal, o estado melancólico ao mesmo tempo que manifesta os impedimentos infligidos ao indivíduo, indica a possibilidade de se resistir a essas condições pela renúncia da inverdade do sentido imposto e pode assinalar ainda uma orientação ética-política da ação presente por seu movimento trazer rastros do não-esquecimento, condição fundamental para a reflexão crítica sobre a imposição contemporânea do processo social de adaptação.

1 INTRODUCTION

Based on Theodor W. Adorno's (1995) propositions about the need for a rationality capable of thinking about itself in the forms of violence it perpetuates, the concept of melancholy is investigated here from the author's formulation about the project of enlightenment, which organizes modern societies, in dialogue with the constitution of the melancholic state according to Freud's (1974) proposition. In the understanding that is intended to be constructed here, it is considered that, as a condition for overcoming the social determinants that historically inflict suffering on the individual, another relationship with the pain suffered should be considered, which goes beyond an individualized approach.

It seeks to consider psychic suffering extrapolating the strict space of clinical psychology, meeting areas such as education, which lends itself to the elaboration of the formative dimension. In this way, contemporary rationality and its effects on the subject are questioned, in a position that meets the characterization of melancholy.

As Horkheimer and Adorno (1973) point out, the understanding of the individual is not dissociated from the understanding of society, founding the understanding that the form and content that constitute the individual, whose substance is historical and material, is determined by the way society orders itself and determines the configuration of the concrete social relations in which the individual is inserted. Identifying the bases on which humanity is founded allows – and can be said to be the condition for – the location and understanding of the phenomena that are identified in the constitution and manifestations of subjectivity.

In a split reality where particular interests are announced as universal and sustain the rational system, the rationality that should serve as an instrument for the organization of human existence is structured as a representative of hegemony, bringing within itself a contradiction (ADORNO, 1996). From this understanding, it is considered that the social totality is guided by ends contrary to those necessary for the existence of the individual, who, therefore, needs to annul himself in order for the collectivity to be maintained.

Thus, the contradiction present in the social reality, in which the educational processes are situated, is observed in the manifestations of individual suffering. From a sociological perspective, it is understood the way in which the individual experiences his symptom in relation to the way in which this individual is socially situated, being mediated by the institutions that order the formative process (FRANCISCATTI, 2002). The refusal present in melancholy can thus be understood, not as an incapacity, but as a response of the individual to the process of dehumanization that is set in motion by the contemporary social structure.

Going through the concepts of semi-formation and rationality, from which the concept of melancholy is analyzed as resistance to the imposition of a damaged formation, the theoretical framework of the present investigation is composed of the dialogue between Theodor Adorno's sociological approach and Freudian psychoanalysis. Thus, the historical constitution of the individual is considered in its intertwining with culture, which is understood by the concept of formation, constructing the characterization of melancholy not as a symptom to be overcome, but as a model of analysis. By safeguarding traces of memory of the unrealized, such a model can allow the elaboration of reason in the face of domination and the preservation of the possibility of realizing culture as a place for the formation of the individual.

2 THE DAMAGED FORMATION

For Adorno (2010), cultural formation refers to the process of subjective appropriation of culture, which inserts the individual in what is proper to him: his humanity. The formed individual is the one capable of asserting himself as a rational and free being, which is not dissociated, since it is its source, from a society that is also rational and free. Within a tradition of critical theory in dialogue with psychoanalysis, the subject is a formation focused on the possibility of differentiation, which implies a constitution capable of sustaining a position of autonomy.

This points to the fact that education is not a process that happens in an isolated and individual way, but rather in the construction of the space between subject and object, in which the former perceives itself as mediated. The formative experience is composed of the movement by which the subject is confronted with his limitation, in a process determined by a negative dialectic, as indicated by Adorno (2009). The understanding of negative dialectics indicates that formation does not occur in a merely positive movement of constitution, but is permeated by elements that do not fully fit into the constituted form. In this sense, the movement necessary for the structuring of a unit, which is recognized as I, starts from the contact with that which is different from it, making the identity always refer to that which escapes it.

In a world where standardization and immediacy prevail, driven by technological advances that are guided precisely by the planning of social dynamics, what results is the imposition of a commodification logic on all domains of life. When there is no space for the constitution of the diverse, education becomes semi-formation, a "false experience that

obscures, but at the same time convinces" (MAAR, 1995, p. 23), putting in place of experience, consumer relations, which come to compose the psychic structure of the subjects subjected to such logic.

It is precisely because it composes the internal life of the individual that this condition, although false, remains active in a generalized way (ADORNO, 1995). If Marx (2013) shows that human material forces were appropriated for the maintenance of class society, it is Freud (1974) who points out how this external state of affairs determines the constitution and dynamics of subjectivity, indicating how this reality is also maintained by the work of the individual psyche, which is sustained by the sacrifice imposed by repression, acts blindly in relation to his own interests (MATOS, 1989).

According to Adorno (2010), since semi-formation is a failure of the formative movement, it is also characterized as "a weakness in relation to time" (p. 406) because it breaks with the consciousness that preserves what education was in other times, making it difficult to understand what its advancement or deterioration would be. Deprived of access to his own constitution, the individual yields the conformation and confirmation of the reality that presents itself to him. The repetition of the same past time represents a compulsion that demands of individuals the constant response to the order of progress. Prevented from reaching reality and understanding it, but without the possibility of ceasing the movement of the 'always forward', consciousness, which serves conservation, realizes the justification of the unjustifiable, and the individual becomes an active and conscious reproducer of his own suffering.

For Adorno (2009), the negative moment is fundamental to dialectical thinking. It represents everything that resists synthesis, and thus, adaptation to the dominant normativity. In other words, the negative moment is the one that insists and does not fit into the system, but that, precisely for this reason, reveals its contradictions. Instrumental rationality, dominant in capitalist modernity, tries to suppress negativity: suffering, pause, error and difference. Thus, society tends to model adjusted and adapted subjects. Everything that escapes this form is considered unproductive and dysfunctional.

This picture of the causes and motives contained in the concept of semi-formation indicate that it is not possible to change the objective situation in isolation, since it is entangled with profound effects on subjectivity and is circumvented by ambivalence, requiring an understanding that reaches the character of multiple determination of reality, in its objective and subjective aspects.

3 MELANCHOLY AS A HISTORICAL RECORD

In *Mourning and Melancholia* (1947), Freud describes melancholy as a mourning that is not concluded. There is a loss of object (real or symbolic) that the subject is unable to name or elaborate, and because of this, he locates the psychic record of this loss in his own self, generating affects of self-devaluation, inhibition and suffering without a defined object. The melancholic constitution represents on the psychic plane an affect that loses its place and returns in a pathological way, due both to the imposition of the object's loss and to the subject's predisposition to deal with identifications with the object.

Considering the process of subjective formation, which is determined by the subject's relationship with the influences of the environment, one should think about the constitution of melancholy from a social dynamic, inserting the understanding of subjective predisposition in this relational understanding. In this way, it is understood that social phenomena are in a relationship of mutual determination with states of thought. By identifying in society the presence of an intense process of reification, it is clear that its correlate is the thought that is constituted by hiding its limits and forgetting its trace. This means that the hegemonic social form paralyzes the unfolding of alternative tendencies that would be proper to the living character of culture.

From what is indicated by Adorno (1995) it is clear that the nature of the relationship of the contemporary individual with the past, his own and social, is understood in two ways: first, this past is not the conservation of the strict event, as it happened, since it is originally already mediated by experience and preserves what happened in a transformed way in the relationship with the subject's aptitudes and wills; second, supported by this understanding, it is the relationship with the past as an experience and conservation of what has been lived, preserved in consciousness as a promise and as a mark, which imposes the need to be in contact with it, since its presence, conscious or not, imposes itself either by giving form to need and will, or by erasing them in the name of adaptation to order.

As seen, the logic of the administered world is to engender all its processes in the oblivion of what is human, electing the reproduction of technique, progressively refined, to take the place of truth and the work of reason. The tension of the conditions that produce the impotence of the individual provokes reactions of dissatisfaction, bringing out the contradiction of this way of life. In the disenchantment of the world promoted by the interests of the bourgeoisie, the loss of tradition, of the memory of the historical determinants present

in the conditions of man's formation, causes the abandonment of the individual to himself, without him being able to count on a constituted individuality (ADORNO, 1995).

According to Adorno (1993, p. 51), Freud "[...] investigated conscious action from a materialistic point of view, descending to the unconscious instinctual foundation of the latter [...]", describing from these terms the dynamics of loss and oblivion articulated with the concept of melancholy. As presented by Kehl (2010), the word melancholy was used by the author to analyze a mental illness called manic-depressive psychosis by psychiatry. His understanding of the phenomenon was fundamental for the understanding of the depressive melancholic complex in the field of psychoanalysis, in an understanding that broadens the conception of melancholy treated by the tradition of Western thought, which related it to culture and artistic creation. It is in the articulation between the psychological and the traditional approach that the understanding elaborated here is located.

Matos (1989), following this articulation, says that melancholy is the preservation of the memory of an issue whose oblivion is radicalized in technological rationality, which, by making it impossible for the individual to realize it with the minimum of sacrifices, liquidates him along with his memory. What is preserved is the promise that the social totality must offer the conditions for emancipation to be possible. Separated from the dimension of time and external space, the melancholic, in its refusal to be forgotten, bears the mark of the suffering experienced and the regression of the drive movement in the face of exacerbated fear, but also preserves the traces of what was denied to it.

For Freud (1974), mourning is a painful process in the face of the suspension of contact with that which becomes irremediably inaccessible and, in melancholy, the drive resulting from this suspension refuses to seek new external objects in a more lasting way, in a regression of the work of the libido to the self. This is due to the refusal of the self to abandon the relationship with the object, identified as the representative of satisfaction within the subject's reach. In this understanding, in melancholy the loss of the object translates as the loss of aspects of one's own self, which triggers a reaction of opposition to what cannot take the place of the lost object.

Freud (1974) prepares this idea in his text "On Transience", which reflects on the different emotional dispositions in the face of the ephemerality of what is beautiful. Faced with the threat of death that condemns to decay what one loves, feelings of discouragement or rebellion can be manifested. The awareness of the transience of the enjoyment of an object leads to a painful process of detachment of the libido that can intensify the damage that has

fallen on life and, according to the dictates of the drive economy, can either make one give in to this damage or safeguard the claim of the continuity of beauty and its fruition. Such a feeling contains the recognition that something precious to life has been lost in the confrontation with the obstacles imposed on the movement of the drive (FRANCISCATTI, 2005).

Crochík (2000) also indicates that melancholy is marked by what has been lost in the process of individuation and self-preservation, in the memory of forgotten and constantly postponed *jouissance*. As in the memory movement, melancholy is the individual's experience of perplexity in the face of an issue that cannot be resolved. It is the confrontation of consciousness with an absence that is based on the erasure of its possibilities of existence and leaves as a remainder the emptying of this existence converted into an object of the social totality.

The melancholic is the one who, in the confrontation with an impoverished and threatening reality, finds in himself the marks of this situation and turns to it in a recollection that recognizes in the imperative of the 'always forward', demanded by the pace of capitalist production, the distancing from a truth capable of pointing to barbarism. It is not the melancholic state that drags the individual into an impoverished existence, it is the social totality that imposes his impoverishment, the recognition of which is particularized in melancholy. This is because, according to Matos (2006), the project of rationalization that liquidates individual and collective references is not a process that takes place integrally, but rather leaves traces, in which memory is inserted, where melancholy is fixed.

Matos (1989) takes up Adorno to indicate that the melancholic state is the one that, in a kind of negative dialectic, denies the given by pointing to what it is not from experience with what can be. The individual turns to melancholy after the imposition of a loss that is not repaired with the available objects, since what is lost is of the order of the maintenance of his individuality. By denying the replacement of the lost object, remaining withdrawn from contact with aspects of the external world, it resists the annulment of itself in a totality that asks for sacrifice without reparation.

4 THE SYMPTOM BEYOND PSYCHOPATHOLOGY

If education is carried out through contact with historically constituted objects capable of realizing the human form, and therefore is not separated from tradition and the dimension of ancestry (MATOS, 1989), it is characteristic of the ordering rationality of the bourgeois

world to dissociate progress from its historical element and to see as an advance the constant superimposition of a false differentiated that separates itself from what preceded it. The relationship with tradition should not be one of hardening of manners and facts, but of contact with the existing for the updating of what deserves to be preserved, since it maintains the possibility of human satisfaction.

The formation that is sustained by continuity is effective when the new is particularized, which is why it is dynamic: between the maintenance and contact with what is continuous and equal and the rupture of this continuity by the establishment of another (ADORNO, 1996). On the other hand, the ordering of the administered world makes the movement of history unidirectional, standardizing it by inserting a logic that replaces the past and imposes that which must be repeated without having contact with this repetition.

Since there is no life that takes place outside of historical time and space, which has been constituted based on the principle of domination of nature, man's violence against other men and against himself (internal nature) also leaves its mark (HORKHEIMER; ADORNO, 1973). If the individual, in the current conditions described here, has been deprived of his active role in the transformation of reality, Adorno (1995) argues that the only thing that can still recognize injustice is the memory, the record of the marks left by the impeded formation. The thinker emphasizes that the forgetfulness of phenomena that recall the persistence of barbarism is not explained from psychopathology, but from the general social situation.

In contemporary society, especially under the neoliberal logic, there is a growing imposition of an ideal of the hyperpositive, permanently productive, efficient, adaptable and focused subject. In this context, a culture of high performance prevails, in which there is no legitimate space for the expression of subjective negativity. Feelings such as boredom, anguish, frustration, tiredness, dispersion and dissatisfaction are disqualified, becoming undesirable experiences, pathologized or quickly medicalized.

This refusal of negativity is not just an individual trait, but reveals an ideological operation that shifts the structural contradictions of society into the realm of personal responsibility. Thus, what could be recognized as a social symptom, being a sign of the tensions, symbolic violence and exhaustive demands of the neoliberal model, comes to be interpreted as individual failure, personal deficit or inability to adapt. This mechanism not only produces psychic suffering, but also reinforces the devices of control and self-demand, making it difficult to critically elaborate one's own condition of existence.

The psychological mechanism of refusing unpleasant memories is mobilized in order to serve practical goals. In order for the image of progress proclaimed by society to be sustained in order to maintain a certain social cohesion with the intended ends, the memory of past barbarism must be blurred, so "erasing the memory would be much more a result of vigilant consciousness than a result of the weakness of consciousness in the face of the superiority of unconscious processes" (ADORNO, 1995, p. 34).

According to Matos (1989), also in dialogue with Adorno, if history is a massacre, because it is kept in a flow of time that carries oblivion and imposes violence on life, memory is the possibility of redemption, in the preservation of what should not be forgiven without first being overcome. Remembering, not forgetting, are a pause in the course of compulsive time and make room for the possibility of elaboration.

It is in this sense that Adorno (1996) indicates that the rhythm of production and reproduction of an alienating reality is maintained by the domination of memory, a process in which the constant response to the new is requested, only recognized as new by forgetting what has already been. Social forms already experienced as tragic are repeated under the appearance of circumstantiality, acting as repetitions of oppressive orders against the manifestations of still resistant individualities.

The call to adapt to a reality that in no way innovates its oppressive structure is operated by the mechanism of maintaining oblivion, ensuring that every manifestation of malaise or dissatisfaction is co-opted into the effort to remain competitive, waiting for a moment of recognition and fulfillment. This is due to the fact that, as Horkheimer and Adorno (1973) indicate, the logic of the culture industry anesthetizes desire, a component that drives the movement of transformation of reality to satisfy human interests, repeatedly exposing objects destined to the satisfaction of pleasure, already mutilated by the renunciation imposed by society, to mechanical reproduction.

The desire that resists repression is mobilized, framing it with the possibility of satisfaction that does not threaten the reproduction of the social whole. The search for pleasure, which could lead to the production of the new by guiding the paths of reason, as indicated by Adorno (2015), is brought back to the starting point, to the need for progression of value. Subjectivity is standardized, thus keeping individuals under the same controlling hand.

The need to remain referred to the past is imposed as long as the conditions that produce dehumanization still persist and, therefore, remain active (ADORNO, 1996). This

understanding resizes the relationship that must be established between the foundation and what results from it and what is the place of memory in the vital process of production and reproduction of human reality.

5 THE CRITICAL POTENTIAL OF NON-FORGETTING

The repression of negativity is not limited to a theoretical abstraction, but materializes in a forceful way in the social and institutional practices that cross childhood, mental health, education and the construction of subjectivity. Contemporary culture, instead of recognizing negativity as a constitutive dimension of human experience, seeks to neutralize it, pathologize it, or convert it into a commodity, offering quick, productive, and consumable solutions. The individual survives himself. But in its residue, in what is condemned by history, there is still something that resists false identity. Its function lies in the absence of functionality: it is the spirit that, contradicting the general, represents it.

The truth capable of clarifying the problem of semi-formation is glimpsed through the sufferings inflicted on the individual by the totalitarian system to which he belongs, but without being completely integrated and still being able to distance himself, even if by dysfunction. If the movement of the social whole is ordered to the progress of the forces that have taken the centrality of the process, and that are sustained by that erasure of what indicates its untruth, it is that which does not fit into the entire utility, so totalitarianly calculated by the scientific progress represented in the positivist strands, that preserves the idea, materially oriented, of the individual who wants to be realized.

The memory of pain and the refusal of forgetting, which configure the melancholic state, offers the critical reference in relation to the existent and prevents attempts to anesthetize consciousness by a system that wants to cover its irrational functioning with meaning. Because there is no intrinsic end to the movement of history, it is necessary to constantly exercise criticism and to base this movement on what is capable of unfolding in the affirmation of freedom, choosing as an orientation the overcoming of unnecessary violence, against its appropriation by tendencies to barbarism.

As Adorno (1993) indicates, thought is nourished by impulses and the rational ordering of existence is nourished by the individual's instinctual satisfaction. This is negated by a rationality that excludes the drive as a guide of the human historical path, an exclusion declared as an act of cunning and that hides a trail of domination that has not yet been overcome. The body, a historical representative in the place of the individual, brings in its

limitations to pleasure and consciousness, the marks of this process (TIBURI, 2004). Melancholy, as a look at this marked body, presents itself as a denial of a rationality that is not able to realize human freedom, resisting as a knowledge that recognizes the contradiction in which the individual finds himself.

In a direction contrary to what is imposed by the cultural industry, which operates by confining the spirit and the senses, it is the possibility of sensitizing thought, putting it in contact with its limits, that allows the truth to manifest itself, announcing the falsity of reality and its moments of contradiction, in which the potential for social transformation is found.

6 FINAL CONSIDERATIONS

From the above, what we have is that in the process of historical constitution of human reality, external and internal, possibilities of differentiation and expansion of this reality are objectified at the same time that the undifferentiated is maintained, the imposition of the always same, which is not surpassed, is updated as a determinant in the progress of historical forces, guided by the maintenance of particular interests opposed to the truly universal. And since truth is what is contained in happiness, truth is what is directed towards overcoming suffering (HORKHEIMER; ADORNO, 1985).

If for the process of formation of the human constitution to be effective it is necessary that human action in the world and the organization of this world be guided by the principles of freedom and human autonomy, the rational ordering of reality for the satisfaction of truly human needs remains historically as a promise not yet fulfilled, as what humanity still has to accomplish.

It is the tendency to weaken the consciousness of historical continuity that is one of the main elements that contribute to the maintenance of humanity in a state of barbarism (ADORNO, 1995). These tendencies are dictated by a social organization that values economic development and submits the existing to the laws of exchange which, emptied of its historical and human content, serves to calculate the equivalent and the attribution of value as a commodity. This emptying erases the human historical form, naturalizing suffering and distancing humanity from the possibility of achieving emancipation.

According to Adorno (1996), due to the predominance of technique and its reproducibility, it operates in the destruction of memory, which takes with it the accumulated experience that would serve the training. The experience, which is also a movement of transformation of the subject in contact with the object, is replaced by access to punctual,

disconnected and ephemeral information, maintaining the fragmentation of the individual that is only constituted as a unit in the dialectic of differentiation and continuity between whole and part. And as Benjamin (2012) reminds us, the remembrance of the past takes place from the identification of the present danger, which seeks in the ruins traces of a diversity that could be elevated in the movement of progress. Gagnebin (2006), in dialogue with Benjamin and Adorno, emphasizes that it is the non-forgetting in its relationship with the presence of what no longer exists that can illuminate what sustains the semi-formation of the individual and the possibility of elaborating the conditionings that fall on the instances of social mediation.

Historically articulating the past is due less to an attempt to describe facts, intended by positivist science, than to thinking about the bases on which present facts are founded, in an ethical-political pretension to oppose the tendency to forget and to justify objective violence in the face of the call to adaptation and productivity. The evocation of memory occurs from the tension between the presence of a fragile present and the absence of a vanished past, which weakens the continuity and transmission of human tradition and its possibility of transformation by generations (GAGNEBIN, 2006). Non-forgetfulness keeps present what still needs to be elaborated and, once the one who looks at the past can clarify it with the marks of present pain, the suffering that drags on and must be overcome is illuminated, overcoming the conditions that sustain it in an effort to understand and clarify.

As indicated by Adorno (1996), the possibilities of facing the conditions that maintain barbarism are found in the recognition of a social whole and of particularities, of objective and subjective traits, which have historically been constituted by non-human ends – since, "[...] the only possibility of survival left to culture is critical self-reflection on the semi-formation that it has necessarily become" (p. 410). To this end, it is understood that the effort to bring to light the falsification of the relationship between individual and society is what guides the work of critical reflection, which thinks about the individual and his subjectivity in an effort to reach the determination of the whole, an instance in which the problem to be overcome is truly found.

Rescuing the tension between a movement of oppression and the movement of a life that is not completely paralyzed and identified as all inhuman, at the same time that the melancholic state manifests the impediments imposed on the individual, due to the paralysis of the drive, resistance is situated in looking at the trail left by the progress of domination that leaves behind a certain idea of humanity. In this way, the non-forgetfulness assumed in

melancholy keeps present what still needs to be elaborated, since it is still a cause of suffering. The suffering that drags on and that must be overcome by the transformation of the conditions that sustain it is illuminated, reaffirming the historical character of reality in an ethical-political commitment to oppose the justification of the various forms of violence in the name of the force of the call to adaptation and productivity that maintains the inversion of means and ends and the predominance of economic development that does not correspond to the achievement of human freedom.

It is from this critical model that the criticism of a reality distant from the possibility of offering the conditions for the formation of the individual is built, and the main point of these elaborations is the issue that, since the process of formation is oriented and carried out historically, it is necessary to know the conditions in which humanity finds itself and what sustains them, so that some overcoming is achievable. Given that it is only possible to elaborate the past that caused violence and suffering when the conditions that led to a certain event have been overcome, and one no longer has to experience the return of old threats, it is necessary, then, a certain amount of fixation to what has not yet been overcome, resistance that finds some of its traces in melancholy.

ABSTRACT

The rapid institutionalization of ESG (Environmental, Social and Governance) discourse has reshaped corporate narratives worldwide. *This investigation is justified by the increasing discrepancy between publicly declared climate commitments and the effectiveness of the accounting metrics that should substantiate them, especially in sectors with high socio-environmental materiality.* However, its widespread adoption has been accompanied by critiques pointing to symbolic practices disconnected from effective environmental measurement and accountability. This article investigates the divergences between discourse and practice in the accounting of carbon credits by energy companies listed on Brazil's B3 stock exchange. Using a qualitative and documentary approach, the study analyzed financial statements, explanatory notes and ESG reports from 18 firms in the oil, gas and biofuels sectors. Only four of them (Raízen S.A., Refinaria de Petróleo Riograndense S.A., Ultrapar Participações S.A. and Vibra Energia S.A.) effectively recognize and disclose carbon credits, mostly as intangible assets and regulatory provisions linked to RenovaBio, in partial compliance with OCPC 10, CVM 223/2024 and CTG 10. The findings reveal substantial gaps between ESG commitments and actual accounting transparency, evidencing a pattern of performative ESG and reinforcing greenwashing risks. The article contributes by highlighting governance weaknesses in Brazil's energy sector and discussing the potential and limitations of environmental accounting as an instrument of climate accountability amid global crisis.

RESUMO

A crescente institucionalização do discurso ESG (Environmental, Social and Governance) consolidou um novo regime narrativo nas corporações contemporâneas. *Justifica-se esta investigação diante da crescente discrepância entre compromissos climáticos declarados e a efetividade das métricas contábeis que deveriam sustentá-los, sobretudo em setores de alta materialidade socioambiental.* Contudo, sua adoção massiva tem sido acompanhada por críticas que apontam a predominância de práticas simbólicas, desconectadas de processos efetivos de mensuração e responsabilização ambiental. Este artigo investiga as divergências entre narrativa e prática no contexto da contabilização dos créditos de carbono por empresas do setor energético brasileiro listadas na B3. A pesquisa, de abordagem qualitativa e documental, analisou demonstrações financeiras, notas explicativas e relatórios ESG de 18 companhias dos segmentos de petróleo, gás e biocombustíveis. Observou-se que apenas quatro delas (Raízen S.A., Refinaria de Petróleo Riograndense S.A., Ultrapar Participações S.A. e Vibra Energia S.A.) reconhecem e divulgam contabilmente seus créditos de carbono, majoritariamente como ativos intangíveis e provisões regulatórias derivadas do RenovaBio, em conformidade parcial com a OCPC 10, CVM 223/2024 e CTG 10. A análise revela discrepâncias significativas entre compromissos ESG declarados e transparência contábil efetiva, caracterizando um padrão de ESG performativo e reforçando riscos de greenwashing. O estudo contribui ao evidenciar fragilidades de governança climática no setor energético brasileiro e discutir os limites e possibilidades da contabilidade ambiental como instrumento de accountability em cenários de crise climática.

1 INTRODUCTION

The global climate agenda has irreversibly reconfigured the expectations of transparency and socio-environmental responsibility on the part of organizations. Based on the reports of the Intergovernmental Panel on Climate Change (IPCC, 2023), the expansion of climate disclosure instruments, understood as the process of structured, transparent, and standardized disclosure of relevant information, especially those related to environmental risks, impacts, and strategies (TCFD, 2017), and the consolidation of international sustainability standards (ISSB/IFRS S1–S2), corporate practices began to be analyzed by multiple based on criteria that go beyond the economic and financial dimension.

In this scenario, accounting is no longer just the "language of business", in the terms of Ludícibus (2021), to become the language of socio-environmental legitimacy, operating as an instrument of mediation between environmental impacts and public accountability. Such a transformation reflects the thesis of Gray, Bebbington and Larrinaga (2009), according to which accounting is simultaneously technical and political, as it organizes symbols, produces narratives and selects what will be visible and invisible in the public sphere.

The ESG discourse has become hegemonic, being adopted by corporations as an indispensable communication strategy to attract investors, access markets, and signal climate compliance (Kotsantonis, Pinney, & Serafeim, 2016). However, Tariq Fancy (2021), former director of sustainability at BlackRock, argues that most ESG practices do not substantially change the environmental behavior of companies, operating as a "financial placebo" that masks the maintenance of destructive economic models.

In Brazil, the energy sector, especially oil, gas and biofuels, occupies a central position in national greenhouse gas (GHG) emissions, having the technical and financial capacity to mitigate impacts, but also strong reputational exposure. The country has recently structured essential regulatory frameworks, such as CVM Resolution 223/2024, CTG 10, and OCPC 10, which finally standardize the accounting treatment of carbon credits. Still, a gap persists between the ESG narrative and effective accounting measurement, indicating low adherence to transparency requirements. The question that guides this article is: How do companies in the Brazilian energy sector measure, record and disclose carbon credits, and what divergences emerge between ESG discourse and accounting practice?

The general objective is to critically analyze the methodologies, evidence, and accounting omissions related to carbon credits in energy companies listed on B3. The specific objectives involve: identifying companies that effectively evidence carbon credits; assess

their adherence to newly established standards; investigate the relationship between ESG discourse and accounting practice; and discuss implications for governance and greenwashing risks.

The relevance of the study lies in the climate urgency, regulatory pressures, and the need for robust accountability mechanisms. Environmental accounting plays a strategic role in making environmental externalities visible, contributing to reducing informational asymmetries and strengthening climate governance.

2 THEORETICAL FRAMEWORK

The theoretical framework that underlies this study articulates contributions from environmental accounting, ESG critical literature, debates on climate governance, and recent discussions about the integrity of carbon markets. These perspectives provide a solid foundation for understanding how measurement, recognition, and disclosure practices relate to institutional pressures, reputational risks, and regulatory frameworks. The main conceptual axes that support the analysis are presented below.

2.1 ENVIRONMENTAL ACCOUNTING AND IMPACT VISIBILITY

Environmental accounting emerges as an attempt to incorporate information into accounting systems that, for long periods, have been treated as invisible externalities. Gray, Owen and Adams (2014) observe that traditional financial accounting tends to prioritize monetary indicators, relegating relevant socio-environmental impacts to the background and thus contributing to the maintenance of unsustainable economic structures.

This limitation is partially mitigated by the expansion of environmental accounting, which, according to Ribeiro (2021), expands the ability of organizations to measure environmental costs, investments, liabilities, and revenues, offering instruments capable of making their interactions with the environment more transparent. Along these lines, Tinoco and Kraemer (2011) emphasize the need for rigor in the recognition of environmental obligations. The authors state that,

With reference to the recording, recognition and disclosure of environmental provisions in the financial statements, it should be mentioned that the vast majority of legislation [...] only allow the corresponding recording when compensation resulting from damage caused to the environment is paid, or when there is strong evidence of damage that will have to be compensated or indemnified (Tinoco; Kraemer, 2011, p. 145).

Such a perspective highlights the mismatch between the social demand for transparency and the normative requirements for accounting recognition, making it difficult to timely socio-environmental information. The consolidation of instruments such as Integrated Reporting, TCFD and the new IFRS S1/S2 standards reinforces the global trend of integrating financial and non-financial performance, expanding the importance of social and environmental disclosure as a governance instrument.

2.2 ESG, CLIMATE GOVERNANCE AND THE CRITIQUE OF THE PERFORMATIVE

The rise of ESG has consolidated a global language of corporate governance, incorporated by companies, investors, and multilateral organizations. Kotsantonis, Pinney, and Serafeim (2016) highlight that ESG factors influence long-term performance, affecting risk, return, and cost of capital, which justifies its growing institutionalization.

However, recent literature points out that a large part of these practices are made up of performative mechanisms, more associated with strategic communication than with material changes in the productive structure. Tariq Fancy (2021), a former BlackRock executive, criticizes the superficiality of corporate climate initiatives, stating that they often behave as symbolic instruments that do little to alter emissions-intensive business models.

Larcker and Watts (2020) reinforce this argument by highlighting methodological inconsistencies and the absence of solid metrics for ESG assessment, which increases the margin for arbitrariness. This critique echoes the notion of climate governance presented by Schaltegger and Burritt (2017), for whom measurement, verification, and accountability processes should be integrated into the decision-making process and not just used as reputational tools.

2.3 CARBON MARKET, CBIOS AND INTEGRITY ISSUES

The global carbon market is worth billions of dollars, but faces criticism about its structural integrity, especially in the voluntary market, where problems of additionality, double counting, and methodological fragility are recurrent (ICVCM, 2023).

The *Integrity Council for the Voluntary Carbon Market* (ICVCM) is an independent international body created to establish minimum quality standards in this market. In 2023, the Council published the *Core Carbon Principles* (CCPs), a set of criteria that determines that voluntary credits must represent real, additional, and verifiable reductions or removals of greenhouse gases, ensuring traceability, independent verification, and socio-environmental

safeguards. The ICVCM's work seeks to correct historical failures in the voluntary market, increasing its credibility and mitigating *greenwashing risks*.

In Brazil, RenovaBio is the main regulatory framework for issuing and trading Decarbonization Credits (CBIOs), which are linked to energy efficiency and the carbon intensity of biofuels. Law No. 15,042/2024 and CVM Resolution 223/2024 established mandatory criteria for accounting for these assets, operationalized by OCPC 10 and CTG 10, which classify agents as originators, intermediaries or end users.

Despite regulatory advances, sectoral adoption remains heterogeneous. Companies in the energy sector differ in terms of the level of methodological detail, the internalization of standards, and the degree of maturity in the measurement and disclosure of carbon credits, revealing governance weaknesses and inconsistencies in the quality of *disclosure*.

2.4 BRAZILIAN ENERGY SECTOR: LEGITIMACY, RISK AND SOCIAL PRESSURE

Companies in the energy sector, especially oil companies, occupy a strategic position in greenhouse gas emissions and face growing pressure from regulatory bodies, investors and civil society. Lins (2015) points out that organizations with high environmental impact tend to use socio-environmental communications as legitimization strategies in the face of public questioning. According to the author, "companies with high environmental impact resort to socio-environmental communication as a mechanism of symbolic legitimation in the face of growing external pressures" (Lins, 2015, p. 7).

This process reveals a tension between discourse and practice, especially in Brazil, where energy companies are simultaneously protagonists of climate discussions and as agents with heterogeneous standards of governance and transparency. Thus, they become central elements in the analysis of disclosure quality, reputational risks, environmental performance, and *climate accountability*.

3 METHODOLOGY

The research adopts a qualitative approach, of exploratory nature and critical-interpretative orientation. The documentary method was chosen because it allows the analysis of materials produced by the companies themselves, such as financial statements, explanatory notes, reference forms and ESG reports.

18 companies in the energy sector listed on B3 were examined, covering the oil, gas and biofuels segments. The time frame considered the fiscal years 2023 and 2024, a period

marked by the consolidation of new regulatory frameworks for the accounting of carbon credits in Brazil.

The content analysis was structured in five categories: (i) existence of accounting records of carbon credits or CBIOS; (ii) the account classification adopted; (iii) adherence to applicable rules (OCPC 10, CTG 10 and CVM Resolution 223/2024); (iv) consistency between environmental information disclosed in ESG reports and that evidenced in the financial statements; and (v) evidence of performative ESG or practices potentially characterized as *greenwashing*.

The main limitation of the study stems from the unavailability of the internal assumptions used by companies to measure and value carbon credits, which requires interpretations based only on the *available public* disclosures.

4 RESULTS AND DISCUSSIONS

The analysis of the collected data allowed us to identify patterns, asymmetries and inconsistencies in the way companies in the Brazilian energy sector recognize, measure and disclose carbon credits. The results show a significant mismatch between declared climate commitments and accounting practices effectively adopted, revealing governance weaknesses, *greenwashing* risks, and low regulatory maturity. The main findings of the study are presented below.

4.1 OVERVIEW OF THE 18 COMPANIES ANALYZED

Among the 18 companies analyzed, 14 do not have any accounting records of carbon credits, despite many disclosing climate goals and decarbonization commitments. This discrepancy reinforces Gray's (2006) thesis on "accounting silences", according to which the absence of registration also communicates, and communicates risk, opacity and discursive inconsistency. To summarize this scenario, chart 1 is presented below with the distribution of the results found.

Table 1

Disclosure of Carbon Credits by Companies in the Energy Sector (B3 – 2023/2024)

Category analyzed	Companies (n=18)	Percentage	Observations
Companies that recognize carbon credits	4	22%	Partial registration, with methodological weaknesses.

Companies that do not register at all	14	78%	Strong inconsistency between ESG discourse and accounting practice.
Most Used Account Assignment	Intangible	–	Mainly CBIOs linked to RenovaBio.
Full adherence to standards (OCPC 10, CTG 10, CVM 223/2024)	0	0%	No company fully meets all the requirements.
Inconsistencies between ESG and DF reporting	7	39%	Gaps between narratives and accounting evidence.
Evidence of performative ESG/greenwashing	12	67%	Companies declare commitments, but do not record environmental credits, liabilities or provisions.

Source: Prepared by the authors (2025).

The table reinforces that the absence of accounting recognition is the dominant pattern, and not the exception. Such a scenario suggests low integration between disclosed climate strategies and the formal systems of measurement, registration and *disclosure*.

4.2 THE FOUR COMPANIES THAT REGISTER CARBON CREDITS

Of the 18 companies analyzed, only four recognize carbon credits in their statements. The **Raízen S.A.** has the most consistent disclosure, with registration of CBIOs as intangible assets and provisions associated with RenovaBio. The **Riograndense Refinery** acknowledges credits, but with excessively synthetic explanatory notes, which compromises the verifiability of the information. The **Ultrapar** it highlights climate credits and obligations, but presents inconsistencies between the ESG report and the financial statements. The **Vibra Energy** partially complies with the applicable standards, but does not detail the criteria used for measurement or the assumptions of fair value (*Fair value*), defined by IAS 46/IFRS 13 as the price that would be received for the sale of an asset or paid for the transfer of a liability in an orderly transaction between market participants. The absence of this information compromises transparency and prevents the evaluation of the adequacy of the measurement carried out. Even among the companies that perform accounting records, methodological weaknesses and low standardization are observed.

4.3 DIVERGENCES BETWEEN DISCOURSE AND PRACTICE: PERFORMATIVE ESG

The most evident contradiction emerges when companies affirm climate neutrality, emission reduction targets, and broad commitments, but do not record environmental credits, provisions, or liabilities. Such a scenario is close to the concept of **performative ESG**, in which institutional communication becomes more relevant than materially implemented practices. Chart 2 is presented below with a comparison that summarizes these divergences.

Table 2

Main Divergences between ESG Discourse and Accounting Practice (Energy Sector - B3)

Dimension	Evidence in the ESG discourse	Evidence in Financial Statements	Interpretation
Climate neutrality	Widely stated <i>net-zero</i> targets	Absence of accruals and recorded credits	Risk of <i>greenwashing</i>
Reducing emissions	Strategic plans and public commitments	There is no auditable measurement methodology	Performative ESG
Carbon market	Declared voluntary participation	Lack of registration, measurement and fair value	Low accounting maturity
Climate governance	Committees, policies, and comprehensive reporting	Inconsistency between DF and ESG reporting	Governance integration failures
Transparency	Extensive annual reports	Significant accounting gaps	Informational asymmetry

Source: Prepared by the authors (2025).

4.4 IMPLICATIONS FOR GOVERNANCE, RISK AND PUBLIC POLICIES

The *identified disclosure* gaps compromise:

- comparability between companies;
- the efficient functioning of the regulated carbon market;
- the reliability of climate risk analyses;
- the verification of future environmental obligations;
- the integrity of neutrality commitments;
- the relationship of transparency with stakeholders.

The energy sector, given its strategic position in the national emissions inventory, should lead the adoption of consistent accounting measurement and climate disclosure practices. However, the results point to regulatory delay, low standardization, and weaknesses in climate governance.

5 CONCLUSION

The analysis shows that the ESG narrative in the Brazilian energy sector remains far from effectively consistent accounting practices. Among the 18 companies analyzed, only four recognize carbon credits in their statements, and even these have methodological limitations, insufficient detail, and absence of clear measurement assumptions. The scenario confirms the persistence of accounting silences, informational opacities, and evident tensions between discourse and practice, configuring an environment conducive to performative ESG and the risk of structural *greenwashing*.

The regulatory progress represented by CVM Resolution 223/2024, CTG 10 and OCPC 10 is an important milestone, but still insufficient to consolidate robust standards for climate measurement and disclosure. Without effective enforcement, compulsory standardization, methodological transparency, and integration between corporate governance and environmental accounting, a superficial adoption of ESG tends to prevail, used as a reputational tool rather than as an instrument of social and environmental accountability (*accountability*).

The contributions of this study focus on demonstrating:

- (i) the gaps in environmental disclosure in the energy sector;
- (ii) the inconsistencies between ESG narratives and accounting records;
- (iii) the need to improve the practices of measurement and recognition of carbon credits;
- (iv) the urgency of more coercive public policies and regulations to avoid arbitrariness and informational asymmetries.

Future research can deepen longitudinal analyses, assess the financial impacts of climate disclosure, investigate correlations between disclosure and socio-environmental risk, and promote international comparisons that allow us to understand Brazil's position in the face of the best global practices in climate governance.

In summary, strengthening environmental accounting as an instrument of visibility, control, and *accountability* is an indispensable condition for ESG to go beyond the discursive field and achieve effectiveness in the transition to sustainable production models.

Concrete, being a heterogeneous composite material sensitive to the proportions of its constituents, exhibits significant variations in its mechanical and dynamic behavior. This study analyzed the vibrational behavior of concrete specimens with four compressive strength classes (15, 20, 25, and 30 MPa) through experimental modal analysis and determination of Frequency Response Functions (FRF). For each class, 10 specimens were molded in plywood forms using Portland cement CP II, quartz sand, granite aggregate, and water in specific volumetric proportions, followed by curing for 28 days. Impulsive excitation was applied with an instrumented hammer, and acceleration responses were acquired using a dedicated acquisition system in the 0 to 2560 Hz range, with evaluation of the coherence between excitation and response for FRF validation. The curves obtained showed a systematic shift of resonance peaks to higher frequencies as compressive strength increases, in addition to more stable spectral responses in the higher classes, highlighting the strong correlation between dynamic stiffness and mechanical strength. The methodology employed confirmed the potential of modal analysis as a sensitive non-destructive technique for characterizing the vibrational response of concrete, providing relevant information for applications in quality control and evaluation of structures subjected to dynamic actions.

RESUMO

O concreto, por ser um material compósito heterogêneo e sensível às proporções de seus constituintes, apresenta variações significativas em seu comportamento mecânico e dinâmico. Este estudo analisou o comportamento vibracional de corpos de prova de concreto com quatro classes de resistência à compressão (15, 20, 25 e 30 MPa) por meio de análise modal experimental e determinação das Funções de Resposta em Frequência (FRF). Para cada classe foram moldados 10 corpos de prova em formas de madeirite, utilizando cimento Portland CP II, areia quartzosa, brita granítica e água em proporções volumétricas específicas, seguidos de cura por 28 dias. A excitação impulsiva foi aplicada com martelo instrumentado, e as respostas de aceleração foram adquiridas em sistema de aquisição dedicado, na faixa de 0 a 2560 Hz, com avaliação da coerência entre excitação e resposta para validação das FRF. As curvas obtidas mostraram deslocamento sistemático dos picos

de ressonância para frequências mais elevadas à medida que a resistência à compressão aumenta, além de respostas espectrais mais estáveis nas classes superiores, evidenciando a forte correlação entre rigidez dinâmica e resistência mecânica. A metodologia empregada confirmou o potencial da análise modal como técnica não destrutiva sensível para caracterização da resposta vibracional do concreto, fornecendo subsídios relevantes para aplicações em controle de qualidade e avaliação de estruturas sujeitas a ações dinâmicas.

RESUMEN

El hormigón, al ser un material compuesto heterogéneo sensible a las proporciones de sus componentes, presenta variaciones significativas en su comportamiento mecánico y dinámico. Este estudio analizó el comportamiento vibracional de probetas de hormigón con cuatro clases de resistencia a la compresión (15, 20, 25 y 30 MPa) mediante análisis modal experimental y la determinación de las Funciones de Respuesta en Frecuencia (FRF). Para cada clase, se moldearon 10 probetas en encofrados de madera contrachapada utilizando cemento Portland CP II, arena de cuarzo, árido granítico y agua en proporciones volumétricas específicas, tras lo cual se dejó curar durante 28 días. Se aplicó excitación impulsiva con un martillo instrumentado y se adquirieron las respuestas de aceleración mediante un sistema de adquisición específico en el rango de 0 a 2560 Hz, evaluando la coherencia entre la excitación y la respuesta para la validación de la FRF. Las curvas obtenidas mostraron un desplazamiento sistemático de los picos de resonancia a frecuencias más altas a medida que aumenta la resistencia a la compresión, además de respuestas espectrales más estables en las clases más altas, lo que destaca la fuerte correlación entre la rigidez dinámica y la resistencia mecánica. La metodología empleada confirmó el potencial del análisis modal como técnica sensible y no destructiva para caracterizar la respuesta vibracional del hormigón, proporcionando información relevante para aplicaciones en el control de calidad y la evaluación de estructuras sometidas a acciones dinámicas.

Palabras clave: Respuesta en Frecuencia. Análisis Modal Experimental. Hormigón. Propiedades Dinámicas. Clases de Resistencia.

1 INTRODUCTION

Concrete is one of the most widely used structural materials in the world due to its versatility, durability, and ease of molding. Its application is widely disseminated in infrastructure works, buildings, paving and precast elements. However, as it is a heterogeneous composite material, its mechanical and dynamic response depends directly on the composition, the proportion of the aggregates, the quality of the cement pulp, and the curing process (SEGALIN et al., 2020). Among its fundamental properties, compressive strength is the most used for structural classification and design, serving as a reference for the overall performance of the material (NEGRI et al., 2024). However, properties related to dynamic behavior, such as natural frequencies, vibration modes, and damping, also play a significant role in situations where concrete is subject to dynamic actions, such as traffic, wind, industrial vibrations, and impacts.

Experimental modal analysis (AME) is a well-established technique for the characterization of the dynamic properties of materials and structural systems. It allows the determination of natural frequencies, vibration modes, and damping factors from data obtained through mechanical excitation and response measured by appropriate sensors (Rosa et al., 2016). The Frequency Response Function (FRF), which relates the structural response to an applied excitation, is one of the main tools in the identification of these properties. For cementitious materials, FRF has been used to assess structural integrity, identify damage, investigate stiffness differentiations, and understand how variations in concrete composition influence its dynamic behavior (MAGALHÃES et al., 2024).

The heterogeneity of concrete implies that small changes in the proportion of aggregates, water content, type of cement or additives can significantly modify its overall stiffness, directly reflecting on the vibrational response. Studies show that lower strength concretes have lower natural frequencies due to their lower stiffness, while higher strength concretes tend to exhibit vibration modes in higher ranges (ALMEIDA et al., 2012). This relationship between mechanical strength and dynamic behavior is fundamental, especially in non-destructive techniques, where the frequency response allows inferring internal properties without causing damage to the material.

In addition, the application of dynamic methods for the evaluation of cementitious materials has gained relevance in the context of *Structural Health Monitoring* (SHM). Techniques based on modal analysis allow the identification of subtle variations in the internal structure of materials, being able to detect early damage, microcracking, or progressive

degradation (HU et al., 2018). Within this scope, the study of FRFs of specimens with different resistance classes provides important subsidies to understand how dynamic properties are affected by variations in the dosing process and how such information can be used in the monitoring of real structural elements.

The use of dynamic testing is also encouraged by its non-destructive nature and high sensitivity to stiffness variations. While destructive tests evaluate the final properties of the material, such as compressive strength, modal analysis allows the observation of changes from the initial states of damage, making it a promising technique for monitoring throughout the useful life of the structure. Thus, understanding how different strength classes respond in dynamic terms contributes not only to academic purposes, but to practical applications in technological control, structural inspections, and the development of concretes with specific dynamic performance.

In the experimental context, obtaining FRF from impulsive excitation has significant advantages, such as operational simplicity, speed of execution, and good repeatability for small specimens. Allied to this, the advancement of computational tools such as MATLAB facilitates the processing, visualization and interpretation of vibrational data. The generation of three-dimensional graphs (frequency $\times$ magnitude $\times$ sample) allows you to identify consistent patterns between resistance classes, facilitating the visualization of typical differences in stiffness and dynamic behavior.

Given this scenario, it is relevant to understand how different resistance classes influence the frequency response of concrete. Systematic analysis of these responses provides valuable insights into the relationship between mechanical and vibrational properties, allowing for a more comprehensive characterization of the material. Thus, this study contributes to the understanding of the dynamic behavior of concrete as a function of its strength, offering a robust experimental approach that can serve as a basis for future research in structural engineering, integrity monitoring and non-destructive methods applied to cementitious materials.

2 METHODOLOGY

The methodology adopted in this study was structured to allow the dynamic characterization of concrete specimens with different classes of compressive strength, using experimental methods of modal analysis and computational processing of the signals obtained. The procedure ranged from the molding and curing of the samples to the acquisition

of data by impulsive excitation and the analysis of the FRF. The steps were performed in a standardized manner to ensure reproducibility and comparability between classes.

2.1 MOLDING OF THE SPECIMENS

The production of the specimens followed a strict protocol of molding and material control, with the objective of ensuring experimental repeatability and reducing external variables that could influence the dynamic behavior. The samples were molded in previously sanded plywood molds, cleaned and covered with commercial release agent (Vedacit®), ensuring adequate surface finish conditions and facilitating the demolding process.

Specimens belonging to the four strength classes conventionally used in structural concrete works were manufactured: 15 MPa, 20 MPa, 25 MPa and 30 MPa, totaling 10 specimens for each class, which provides sufficient statistical basis for dynamic behavior analysis.

The concrete was prepared using Portland cement composite CP II, of the CAUÊ® brand, whose chemical composition, provided by the manufacturer and presented in Table 1, consists essentially of tricalcium silicate, dicalcium silicate, calcium aluminates and ferro-aluminates, gypsum and standardized mineral additions. This characterization is fundamental, because cement mineralogy is directly related to hydration processes, the development of stiffness and, consequently, the vibrational properties of the material.

Table 1

Chemical composition of the Portland cement of class CPII used in the samples

Component	Concentration Range (%)
Tricalcium silicate	20-70
Dicalcium silicate	10-60
Calcium ferroaluminate	5-15
Calcium Sulfate	2-8
Tricalcium Aluminate	1-15
Calcium carbonate	0-10
Magnesium oxide (free)	0-6
Calcium oxide (free)	0-3

Source: From the author (2025)

The volumetric proportions of cement, quartz sand, granitic gravel and water were defined as shown in Table 2, adjusted to meet the expected resistance classes. The homogenization of the materials was carried out manually in a rigid container of 0.001 m³,

starting with the mixing of the dry components, followed by the gradual addition of water to obtain a consistency suitable for molding.

Table 2

Proportions of concrete components for compressive strength classes equivalent to 15, 20, 25 and 30MPa

Resistance Class (MPa)	Cement (m ³)	Sand (m ³)	Crushed stone (m ³)	Water (m ³)
15 MPa	0,0010	0,0025	0,0040	0,0020
20 MPa	0,0010	0,0028	0,0035	0,0023
25 MPa	0,0015	0,0023	0,0025	0,0020
30 MPa	0,0015	0,0020	0,0020	0,0020

Source: From the author (2025)

After mixing, the concrete was placed in the forms in two successive layers, each submitted to 12 blows of compaction with a metal rod, according to the classic recommendation for eliminating bubbles and obtaining good density. The final dimensions of the specimens were standardized at 0.03 m × 0.06 m × 0.40 m, which reduces variability in the moment of inertia and ensures comparability between samples.

The curing process was conducted in a protected environment for 28 days, respecting the conventional criteria for stabilization of mechanical resistance. After this period, the specimens were demolded, identified and visually inspected to confirm their physical integrity.

2.2 EXPERIMENTAL SETUP AND INSTRUMENTATION

The dynamic characterization was performed by experimental modal analysis with impulsive excitation, a widely used technique to identify the vibrational properties of systems with simple geometry and heterogeneous materials. To minimize support interference and allow the specimen to vibrate freely, each specimen was suspended by nylon wires fixed near the ends—a configuration equivalent to the "free–free" boundary conditions often employed for determining natural frequencies in test elements.

Mechanical excitation was performed with a PCB *Piezotronics* instrumented hammer model 086C03, equipped with a metal tip (sensitivity 2.417 mV/N). Vibration response was measured by a Piezotronics PCB piezoelectric accelerometer model 352C33, with a sensitivity of 98.5 mV/g, fixed at 0.06 m from the end for efficient capture of longitudinal and flexional modes.

The choice of excitation position (0.06 m from the end) and accelerometer position was set in such a way as to maximize the energy transferred to the system and allow clear identification of resonance peaks, reducing nodal effects that could impair the reading of certain modes. For each specimen, five successive impacts were performed, allowing the average of the signals to reduce random noise and increase the robustness of the obtained spectra. Between each impact, the vibration was fully dampened, avoiding overlapping transients.

2.3 SIGNAL ACQUISITION AND DIGITAL PROCESSING

The excitation and response signals were recorded by a *National Instruments* (NI) acquisition system consisting of: NI cDAQ-9174 chassis, NI 9234 dynamic acquisition modules (8 channels), and LabVIEW software, with the *Sound and Vibration library*.

The system was configured to acquire the signal in the range of 0–2560 Hz, with spectral resolution of 0.5 Hz, sufficient value to identify dominant modes and characterize the dynamics of small elements.

During the tests, the coherence between the force and acceleration signals was continuously analyzed. Assays with coherence less than 0.95 were discarded and repeated, ensuring the reliability of the spectra and the representativeness of the FRF. The determination of FRFs was performed directly in *LabVIEW* by means of the ratio between the response and excitation Fourier spectra. The processed data were exported for complementary analysis and graphical organization.

2.4 DETERMINATION AND ANALYSIS OF FREQUENCY RESPONSE FUNCTIONS (FRF)

The identification of FRF was the central step in the dynamic characterization of the specimens, allowing to quantify the relationship between the applied force and the resulting vibratory response. The FRF was obtained directly from the signals acquired by the instrumentation system, using the spectral ratio between the Fast Fourier Transform (FFT) of the acceleration and the FFT of the impact force, a procedure widely consolidated in the literature of experimental modal analysis.

The *free–free* configuration, achieved by suspending the specimens by nylon wires, provided virtually free boundary conditions, eliminating rigid constraints that could mask or displace the material's intrinsic natural frequencies. This condition favors the excitation of a

broad spectrum of vibratory modes, allowing the FRF to reveal both longitudinal and flexional modes, depending on the intensity and location of the impact.

The acquired signals were previously filtered and inspected for spectral coherence, a parameter that expresses the quality of the relationship between excitation and response. Only FRFs from impacts with coherence values close to 1.0 were considered valid, ensuring that the spectrum faithfully represented the dynamic behavior of the sample. Impacts with reduced coherence, potentially associated with environmental noise, clamping slippage or off-axis excitations, were automatically ruled out and repeated.

Once validated, the FRFs exhibited well-defined magnitude peaks, associated with the dominant natural frequencies of each specimen. These peaks represent resonance conditions, in which the energy introduced by the impact coincides with the vibration frequencies of the concrete element. The clarity of these peaks, observed even in the lower resistance classes, reflects the appropriate combination of instrumentation, repetition of the tests and geometric uniformity of the specimens.

In addition to the direct identification of natural frequencies, FRF allowed the observation of complementary characteristics of vibratory behavior, such as:

- relative amplitude of responses, associated with the dissipation capacity and rigidity of the system;
- spectral separation between classes, indicating differences in global stiffness induced by variation in mechanical strength;
- presence of secondary modes, which appear more intensely in less rigid materials;
- stability of the peaks between replications, evidencing reproducibility and sensitivity of the methodology.

The use of five consecutive impacts and subsequent spectral mean was fundamental to eliminate specific irregularities and highlight only the systematic dynamic components. This procedure resulted in smooth spectral curves, with a high signal-to-noise ratio and excellent definition of the resonance regions.

The consolidated FRFs unequivocally demonstrated that the concrete grades exhibit distinct vibrational signatures. Concretes of higher strength showed displacement of the main peaks to higher frequency ranges, reflecting greater dynamic stiffness, while concretes of lower resistance showed lower peaks and, in general, a greater number of modes within the analyzed range.

In summary, the FRF determination process adopted in this study:

- ensured high accuracy in identifying natural frequencies,
- showed robustness in the face of the intrinsic variabilities of the material,
- allowed direct comparison between classes,
- and provided solid bases for the interpretation of the vibrational differences between the types of concrete analyzed.

The final result is a set of sTable, consistent and adequate FRFs for comparative analyses between resistance classes, an essential condition for the objectives of this study.

3 RESULTS AND DISCUSSION

The modal analysis performed by means of impulsive excitation allowed to obtain the Frequency Response Functions (FRF) of the concrete specimens referring to the four strength classes studied (15, 20, 25 and 30 MPa). The extracted FRFs directly reflect the vibrational behavior of each sample and make it possible to identify the predominant natural frequencies. As the experimental procedure has been standardized for all specimens, the observed differences in natural frequencies can be attributed to the intrinsic properties of each grade of concrete.

From the average of the signals obtained in five consecutive impacts, it was possible to reduce any occasional fluctuations and ensure statistical stability to the results. This procedure ensured that the FRF curves faithfully represented the dynamic behavior of the samples, highlighting the resonance frequencies clearly and consistently. The frequency by magnitude graphs, shown in Figure 1, show the curves of the four classes of concrete, showing clear differences between the materials.

Figure 1

Frequency graphs by magnitude of the dynamic responses of the specimens: (a) 15MPa (b) 20MPa (c) 25MPa (d) 30MPa

Source: From the author (2025)

In the 15 MPa samples (Figure 1a), the presence of two well-defined peaks is observed, one around 1,000 Hz and the other close to 1,500 Hz, both with high magnitudes, indicating lower rigidity and greater dynamic mobility. As the resistance class increases, FRFs start to show shifted peaks to higher frequencies and, in general, with greater sharpness and lower spectral dispersion. The 20 MPa (Figure 1b) and 25 MPa (Figure 1c) concretes show this progressive displacement, with the first peak remaining in lower ranges, but the main peak migrating to higher regions of the analyzed range. In 30 MPa concrete (Figure 1d), this trend is even more evident, with the dominant peak concentrated in a higher frequency region compared to 15 MPa concrete. This behavior confirms the direct relationship between material stiffness and increased compressive strength, reflected in the upward shift of natural frequencies.

Another relevant aspect identified in the FRFs obtained is the variation in the number and definition of the vibratory modes along the analyzed range. The 15 MPa concrete presents a more "spread" response, with multiple undulations before and after the main peaks, evidencing greater flexibility and the presence of several modes of lower energy. In the higher classes, especially 25 MPa and 30 MPa, the curves become more concentrated and clean, with fewer secondary peaks and modes distributed predominantly in higher

ranges. This suggests that, in addition to increasing overall rigidity, increasing resistance reduces excitation from lower modes, resulting in more rigid vibrational behavior and more stable spectra. These patterns corroborate the direct influence of mechanical strength on the dynamics of concrete.

The superimposition of the curves in a single graph, presented in Figure 2, allows us to directly visualize the spectral separation between the resistance classes. A progressive shift of the main peaks to higher frequency regions is observed as the resistance increases, in addition to a reduction in secondary undulations and greater definition of the peaks in the higher classes. This integrated visualization clearly shows the correlation between dynamic stiffness and compressive strength, reinforcing the consistency of the results obtained.

Figure 2

Frequency graphs by magnitude of the dynamic responses of the specimens: (a) 15MPa (b) 20MPa (c) 25MPa (d) 30MPa

Source: From the author (2025)

The trend observed in this study is in line with recent findings in the literature in modal analysis applied to cementitious materials. Research such as that of Silva et al. (2025) demonstrates that variations in the composition of concrete, whether in the cementitious matrix, aggregates or additives, result in significant differences in natural frequencies and damping. These studies reinforce that the vibrational behavior is highly sensitive to the overall stiffness of the sample, corresponding to what was observed in the specimens tested in this work.

Other authors also highlight the potential of modal analysis for dynamic characterization of concrete structural elements. Beskhyroun et al., (2020), for example, applied similar techniques to evaluate the dynamic behavior of a reinforced concrete building, verifying that the identification of natural frequencies is capable of evidencing differences related to geometric variations, stiffness, or the presence of damage. These studies corroborate the use of frequency response as a reliable tool to investigate the dynamic performance of cementitious systems.

Modal analysis has also been used to identify subtle structural changes, even in apparently intact elements. Recent studies, such as those by Sartorti et al. (2024), show that small modifications in the state of the structure, such as initial cracking or changes in boundary conditions, can result in detectable changes in natural frequencies or modal shapes. These findings reinforce the sensitivity of the method, which could also be observed in this study, where modest differences between resistance classes were sufficient to generate very distinct FRF curves.

The results obtained demonstrate the potential of modal analysis to differentiate concretes with distinct mechanical properties. The clear separation between the classes, observed from the FRFs, suggests that the dynamic parameters can serve as reliable indicators of the stiffness and, consequently, the mechanical strength of the specimens. This behavior reinforces the applicability of dynamic tests as a non-destructive alternative for concrete characterization.

In summary, the results show that:

- lower strength concretes have lower natural frequencies and a greater number of modes in the analyzed range;
- stronger concretes exhibit concentrated response at higher frequencies, reflecting greater stiffness;
- the FRF curves allow clear and visual distinction between the classes studied;
- Modal analysis is adequate and sensitive to evaluate the mechanical properties of concrete without destructive testing.

These results validate the effectiveness of the methodology employed and reinforce the potential of the study for future applications related to both structural monitoring and technological control of cementitious materials.

4 CONCLUSION

The experimental modal analysis performed in this study allowed to consistently characterize the dynamic behavior of concrete specimens belonging to four distinct classes of compressive strength. From the FRF, it was possible to clearly identify the natural frequencies of each sample and understand how these responses change as a function of the stiffness and mechanical properties associated with the resistance class.

The results showed that concretes of lower strength, such as those of 15 MPa, have natural frequencies located in lower ranges and greater sensitivity to spectral variations, reflecting reduced structural stiffness. With the increase in compressive strength, a systematic displacement of the main peaks to higher frequency regions was observed, accompanied by more stable and well-defined FRF curves, a typical behavior of materials with higher dynamic stiffness. This trend was consistently verified among the classes, evidencing the ability of modal analysis to distinguish concretes with different levels of resistance.

The methodology adopted, encompassing standardized production of the specimens, controlled curing, impulsive excitation and judicious processing of the FRFs, proved to be efficient and reproducible, allowing the identification of subtle differences in the vibrational behavior of the samples. In addition to being a non-destructive method, modal analysis proved to be a sensitive and technically adequate approach to evaluate properties related to the stiffness of concrete, and can complement traditional tests used in technological control.

It is concluded, therefore, that experimental modal analysis is a robust tool for dynamic characterization of concrete, enabling the differentiation between resistance classes through the identification of their natural frequencies and the shape of their spectral responses. The results obtained reinforce the potential of this technique for applications in quality control, structural monitoring and advanced studies on the dynamic performance of cementitious materials.

ABSTRACT

This study examines the evolution of digital and advertising strategies of Cadena SER, Onda Cero and COPE, audience leaders according to the EGM (2024). Using a qualitative-descriptive method based on content analysis (Krippendorff, 1990; Bardin, 1986), we compare the structure, user interactivity and advertising strategies of their websites. Key aspects such as accessibility, live radio, on-demand content, digital native audio, interactivity and content personalisation are examined. The findings reveal notable differences in organisation, engagement and personalisation. The study concludes that Spanish online radio is migrating to a multiplatform model, facilitating audience expansion and diversification of the advertising business, although challenges remain in personalisation and digital advertising integration.

Keywords: Radio. Media Convergence. Online Monetization. Interactivity. Audio on Demand.

RESUMO

Este estudo examina a evolução das estratégias digitais e publicitárias da Cadena SER, Onda Cero e COPE, líderes em audiência segundo a EGM (2024). Utilizando um método qualitativo-descritivo baseado em análise de conteúdo, (Krippendorff, 1990; Bardin, 1986), a estrutura, interatividade com o usuário e estratégias publicitárias de seus sites são comparadas. Aspectos-chave como acessibilidade, rádio ao vivo, conteúdo sob demanda, áudio nativo digital, interatividade e personalização do conteúdo são examinados. Os resultados revelam diferenças notáveis em organização, participação e personalização. O estudo conclui que a rádio online em espanhol está migrando para um modelo multiplataforma, facilitando a expansão do público e a diversificação do negócio da publicidade, embora persistam desafios na personalização e integração da publicidade digital.

RESUMEN

Este estudio examina la evolución de estrategias digitales y publicitarias de Cadena SER, Onda Cero y COPE, líderes en audiencia según el EGM (2024). Empleando un método cualitativo-descriptivo basado en análisis de contenido, (Krippendorff, 1990; Bardin, 1986), se comparan la estructura, interactividad con el usuario y estrategias publicitarias de sus sitios web. Se examinan aspecto clave como accesibilidad, radio en directo, contenidos a la carta, audio nativo digital, interactividad y personalización de contenido. Los hallazgos revelan diferencias notables en organización, participación y personalización. El estudio concluye que la radio online española migra a un modelo multiplataforma, facilitando expansión de audiencia y diversificación del negocio publicitario, aunque persisten desafíos en personalización e integración publicitaria digital.

1 INTRODUCTION

The digitalization of the media ecosystem has profoundly transformed the modes of production, circulation and consumption of sound content at a global level. In the last two decades, radio — traditionally considered a medium of great social capillarity and associated with instantaneity and orality — has undergone a continuous process of technological reconversion marked by the convergence of platforms, the multiplication of formats and the emergence of new patterns of interaction between audiences and broadcasters. Far from signifying the decline of the medium, this transformation has highlighted its historical capacity for adaptation, innovation, and social resignification, as highlighted by several studies on radio in Spain and Europe (Toural & Sánchez, 2021; González & Toural, 2017; Roderó & Sánchez, 2007).

In the Spanish context, this reconfiguration is driven by the incorporation of digital services — such as multimedia websites, mobile apps, native podcasts, geolocation tools, and personalization spaces — that expand the reach of broadcasters and diversify their business models. Radio no longer depends exclusively on the linear logic of transmission to adopt a hybrid paradigm in which live radio, on-demand content, digital native audio products, and new interactive formats coexist (Bonet & Sellas, 2019; Benson & Powers, 2011; Tandoc et al., 2018). Thus, sound consumption expands to multiplatform environments, breaking temporal and geographical barriers and enabling more immersive and customizable experiences (Losifidis & Wheeler, 2018; Chen & Han, 2020).

This digital transition also has a decisive impact on the advertising strategies of broadcasters. The implementation of dynamic banners, pre-roll spots, branded content, "Brand Day" formats, and programmatic advertising has redefined the economic role of web portals, which now function as fundamental extensions of the traditional monetization of analog broadcasting (Piñeiro-Otero, 2015; Legorburu et al., 2019). It is, therefore, a transformation that involves both the renewal of the content offer and the restructuring of revenue models.

In the Spanish market, Cadena SER, Cadena COPE and Onda Cero constitute the three main private generalist radio groups, historically leading the audience measured by the General Media Study (EGM). These broadcasters operate as references in the adoption of digital strategies that seek to capture new audiences, retain traditional audiences, and explore monetization formats aligned with the logics of online consumption. However, despite sharing common challenges, they implement different models of content organization,

interactivity, usability and advertising, which opens space for systematic comparisons and the identification of divergent trends in the evolution of Spanish digital radio.

In view of this scenario, the present study aims to comparatively analyze the digital and advertising strategies implemented by Cadena SER, COPE and Onda Cero, considering their official web platforms. The research adopts a qualitative-descriptive approach based on content analysis (Bardin, 1986; Krippendorff, 1990), allowing us to examine the structure of the portals, the diversity of the content offered, the mechanisms of interaction with users, the multimedia integration and the presence of digital advertising formats.

The relevance of the study lies in two main dimensions. Firstly, it contributes to the field of Communication by offering an updated analysis of the evolution of Spanish radio in its process of media convergence, highlighting how digital strategies redefine communication practices and business models. Secondly, it allows us to understand how broadcasters respond to the demands of an audience that is increasingly connected, mobile and accustomed to personalization, a central characteristic of contemporary digital culture.

The article is structured as follows: after this introduction, section 2 presents the theoretical framework that underlies the study, addressing radio transformations in the digital age and its relationship with convergence processes. Section 3 describes the methodology applied, detailing the sample design, the analysis categories and the registration procedures. Section 4 presents the results of the comparative analysis and section 5 discusses the findings in the light of the literature. Finally, section 6 presents the conclusions and points out possibilities for future research.

2 THEORETICAL FRAMEWORK

The emergence of television and, subsequently, the rise of the Internet generated profound transformations in the media landscape, which raised questions about the future and evolution of radio. While some critics stigmatize radio as a medium belonging to the past, incapable of the emergence of television and, subsequently, the rise of the Internet have generated profound transformations in the media landscape, which have raised questions about the future and evolution of radio. While some critics stigmatize radio as a medium belonging to the past, unable to connect with young audiences, others highlight its ability to generate experiences of community and alternative communication (Garcés, 2007: 227). Since its emergence in Spain more than a century ago, radio has undergone multiple technological transformations, constantly adapting to changes in the processes of production,

distribution, and reception of sound (Toural & Sánchez, 2021; González & Toural, 2017; Sánchez, 2020). In this sense, radio has been characterized by its remarkable ability to adapt to social, cultural, and technological transformations (Rodero & Sánchez, 2007).

Digitalization is the most recent major reconversion of the sound medium. In Spain, broadcasters have implemented online services – such as websites, mobile apps, and social media profiles – that allow them to interact with new audiences and expand their broadcasts beyond traditional broadcast hours (Sánchez, 2020; Toural & Sánchez, 2021). This media convergence has led to the creation of multimedia websites that not only broadcast audio on demand or native digital content (podcasts), but are also transformed into authentic digital diaries in which text, images, audio, and video are integrated in real time. This new paradigm contributes to enriching the user experience and innovating in the production and presentation of content, which, in turn, generates added value in terms of interaction and personalization (Fuente et al., 2014; Forero & Céspedes, 2018).

In particular, the Internet has modified the defining characteristics of traditional radio by breaking temporal linearity, allowing listeners to access both live and delayed programs (Benson & Powers, 2011). On-demand radio, by offering previously transmitted content, facilitates the capture of new audiences and expands the station's reach (Tandoc, et al., 2018). Similarly, the development of digital native audio, designed specifically for online consumption, diversifies the offer and enhances personalization, which translates into greater listener participation and the emergence of new production formats (Mullo-López & Yaguana-Romero, 2017). The consolidation of smartphones as the predominant devices in access to information has redefined production and commercial processes in the cultural industry, forcing radio operators, streaming services, and podcast creators to adapt their value chains to new consumption dynamics, especially in the younger audience segment (Pedrero et al., 2019).

Since the 2000s, and with the growth of podcasting, Spanish broadcasters have moved from strategies based on the management of recycled content to the production of digital native audio. The integration of digital technologies has allowed radio to combine traditional linear broadcasting with asynchronous consumption, enriching its offer and extending the useful life of its content (Ribes et al., 2016; Moreno, 2017; Martínez-Costa et al., 2018; Pedrero & Herrera, 2017; Bonet & Sellas, 2019). This transformation has not only optimized content management and audience acquisition, but has also driven business diversification through new advertising formats – such as banners, spots, and Brand Day –

and the integration of interactive content, which allows users to save, share, and actively participate in programming (Rodríguez Luque et al., 2020; Legorburu et al., 2019; Valero & Sánchez, 2015).

In the twenty-first century, radio has established itself as a multimedia and multidimensional medium, in which traditional characteristics coexist with new digital technologies to offer an interactive, enriched, and personalized listening experience (Losifidis & Wheeler, 2018; Chen & Han, 2020; García-Santamaría & Perea-Rodríguez, 2017; Gómez-Barroso & Feijoo, 2019). The transition to a cross-media model has made it possible to transform the traditional unidirectionality of radio into two-way communication, in which real-time interaction with the audience is an essential feature (Rodríguez-Martínez, 2018).

Similarly, business diversification through digitalization has emerged as a key strategy for sustainability and growth for issuers. Online advertising – which incorporates formats typical of the digital environment – has become an additional source of income, complementing traditional advertising on analog broadcasts and allowing broadcasters to capture new audience segments and build loyalty among existing listeners (Piñeiro-Otero, 2015).

2.1 DIGITAL TRANSFORMATION OF RADIO AND MEDIA CONVERGENCE

Technological evolution has generated a process of structural reconfiguration in the radio industry, driven by the convergence of media and the transition to the digital environment (Losifidis & Wheeler, 2018; Chen & Han, 2020). Unlike other previous technological crises, the digitalization of radio was not only a challenge, but also an opportunity for business expansion and diversification (García-Santamaría & Perea-Rodríguez, 2017). Online radio has expanded the user experience by offering ubiquitous and immediate access to content, eliminating the geographical and temporal barriers associated with analog radio (Garcés, 2007).

The phenomenon of online radio (web radio) has allowed the integration of new formats, such as on-demand audio and digital native audio, facilitating a greater degree of interactivity with the audience and new monetization opportunities through innovative advertising strategies (González & Toural, 2017). However, digital radio is not simply a transposition of the analog signal to the web environment, but involves the reconfiguration of radio consumption to a multiplatform, multidimensional and highly personalized model (Bonet & Sellas, 2019).

This transformation process has led to a redefinition of traditional business models, in which radio no longer relies solely on conventional on-air advertising, but has also incorporated new monetization strategies into the digital sphere. These range from programmatic advertising and interactive formats to branded content strategies and premium subscriptions (Pedrero-Esteban et al., 2019).

2.2 DIGITAL RADIO IN SPAIN: CURRENT CONTEXT AND MAIN GENERALIST PRIVATE BROADCASTERS

Spain is immersed in this process of transition to digital radio, with a sustained increase in online audiences. According to the General Media Study (EGM, 2024), online radio consumption has grown by more than 150% in the last decade, with a special impact on young and urban listeners. At the market level, the panorama is dominated by three major generalist broadcasters: Cadena SER, Cadena COPE and Onda Cero, which compete both in the field of traditional audiences and in the digital ecosystem.

Cadena SER (Grupo PRISA): A historical leader in audience, it has developed a comprehensive digital strategy based on the offer of podcasts, subscription services and a platform for personalized and geolocated content.

COPE: Characterized by a focus on audience loyalty through the provision of on-demand radio and reference programs, with an increasing integration of unique digital audio formats.

Cero Wave: Characterized by simplifying the user experience and the offer of information, it has opted for a clean and direct interface, with less advertising saturation than its competitors.

Each of these broadcasters has adopted different strategies in their digital transition, which raises questions about their impact on audience acquisition and retention, revenue diversification, and the effectiveness of their advertising strategies in the online environment.

In this context, this research aims to analyze and compare the digital and advertising strategies implemented by Cadena SER, COPE and Onda Cero, in order to evaluate their impact on the public and the diversification of the online radio business. To approach this object of study, a methodological design based on content analysis is used, following the principles of Bardin (1986) and Krippendorff (1990). A comparative study of the digital platforms of the three broadcasters is carried out over three months (September-November 2024), with the aim of identifying patterns in the layout of the content, the navigation structure,

the offer of interactivity, and the integration of advertising strategies.

The article is structured in the following sections: section 2 describes the methodology used; Section 3 presents the results of the comparative analysis; Section 4 discusses the findings in relation to the previous literature; and section 5 presents the conclusions and proposals for research.

3 METHODOLOGY

This research adopts a qualitative and descriptive approach, with the aim of comparatively examining the digital and advertising strategies of the main private radio portals in Spain.

The analysis focuses on the content and functionalities of the official websites of Cadena SER, COPE and Onda Cero, taking as reference the criteria proposed in the content analysis (Bardin, 1986; Krippendorff, 1990) and the perspective of media convergence applied to the radio environment (Rodero & Sánchez, 2007; Balsebre et al., 2023).

The overall objective of the research is to examine and compare the evolution of digital and advertising strategies implemented by Spain's main private radio channels – Cadena SER, COPE and Onda Cero – in order to determine their impact on business diversification and user experience. The specific objectives are set out below:

1. Characterize the structure and organization of the digital portals of the three stations, identifying the main sections and functionalities (live radio, audio on demand repositories, native podcasts, multimedia content, etc.).
2. Analyze the advertising strategy on each site, describing the formats used (banners, spots, Brand Day, sponsorship) and evaluating their potential to generate additional income.
3. Evaluate the usability and interactivity of the portals, as well as the presence of personalization tools (registration, subscription, geolocation, notifications), to understand how incidents affect audience retention and loyalty.
4. Compare the integration of content and services (multimedia, social networks, forums or participation spaces) and their contribution to the creation of added value.
5. Identify the challenges and opportunities that online radio presents for the sustainability of the business and the acquisition of new audiences.

Based on the objectives, the following hypotheses are proposed:

1. Hypothesis 1: The radio portals of the main channels in Spain have overcome the

stage of mere "container" of analog programming, migrating to the offer of original content (digital native audio) and value-added services (multimedia, subscription), which provide greater attractiveness for the user.

2. Hypothesis 2: The incorporation of new advertising formats (dynamic banners, Brand Day, on-demand pre-audio spots) constitutes an increasingly consolidated source of complementary income, while having a positive impact on the diversification of the business.
3. Hypothesis 3: Personalization (registration, geolocation, newsletters) and interactivity (sharing on networks, receiving direct feedback) substantially improve the user experience, promoting greater listener loyalty and the acquisition of digital audiences.

3.1 SAMPLE DESIGN AND UNIT OF ANALYSIS.

The example consists of the web versions of:

- Cadena SER (www.cadenaser.com)
- COPE Chain (www.cope.es)
- Onda Cero (www.ondacero.es)

The selection is based on the largest audience recorded by these three channels in the General Media Study (EGM). The observation period covered three months (September to November 2024), during which the structure of the portals, the frequency of content updates, and the behavior of the audience reflected in social networks (Facebook, X, Instagram) were recorded.

To complement the analysis, specific ad spaces are reviewed (fixed or dynamic banners, pre-roll spots in audio playback, sponsorships or Brand Day spaces) and the presence of on-demand audio and native podcast formats. Similarly, registration, subscription, and real-time commenting/participation functionalities have been explored.

A book of variables and categories was prepared for data collection, following the guidelines of the content analysis proposed by Berelson (1971) and López Aranguren (1986). These categories include:

1. Page organization: main menu, sections, tabs.
 - Personalization functions: registration, subscription, notifications, geolocation.
 - Advertising strategies: banners, pre-rolled spots, native advertising, sponsorship and brand day.
 - Usability and interactivity: interaction options, links to social networks, forums or chats.

- Audio formats: linear radio, audio on demand, native podcast.

2. Digital periodic recording: Screenshots and audiovisual records were made weekly to document the evolution of the content and variations in the presentation of advertising or the arrangement of menus. This guaranteed the triangulation of information.
3. Social network analysis: Interactions on Facebook, X (Twitter) and Instagram linked to each portal were monitored, counting the number of mentions, likes, comments and shares, in order to assess the reach of the digital strategy and audience participation (Lombard et al., 2002).

The information is coded based on the categories defined in the observation guide, using qualitative analysis software (NVivo and Atlas.ti) that facilitated the coding and thematic grouping of the findings. Subsequently, an interpretative reading was applied that allowed comparing the three stations and detecting common or divergent patterns.

Regarding the analysis of the results, the comparative analysis has focused on the following items:

- The offer of content (live radio, digital newspapers, thematic sections).
- Offer of complementary content and its potential to generate value (on-demand programs, original podcasts, network integration).
- Advertising segmentation, observing the diversity of formats and the frequency of ads.
- The degree of interactivity and personalization, evaluating the existence of records, subscriptions and tools for online social interaction.

Based on the synthesis of these data, patterns of convergence and divergence are established between the three stations, which allowed testing hypotheses and formulating conclusions about the diversification of the business and user experience.

4 RESULTS

The comparative analysis of the websites of Cadena SER, Cadena COPE and Onda Cero shows significant differences in the organization of information, offer of interactive services and integration of multimedia content. Specifically:

- Structure and navigation: Cadena SER features a multifunctional interface, with horizontal navigation that incorporates seven main tabs (e.g., "Home", "Sports", "Humor", "Leisure and Culture", "Opinion", "Programs" and "Podcast"). The integration of personalization functionalities (registration, subscription to newsletters and content alerts) and access to geolocated content will be supervised.

For its part, COPE is organized around thematic sections (Programs, Sports, Broadcasters, etc.) and stands out for the presence of audiovisual content associated with star programs. Navigation switches between landscape and portrait orientation, favoring access to on-demand radio content and native digital audio productions.

In turn, the Onda Cero presents a minimalist design aimed at the immediate. The absence of fixed spaces for banners allows the user to focus on the content, prioritizing live broadcasts and audio on demand enriched with multimedia elements.

- Regarding the supply of multimedia content, the findings show that the three locations allow the simultaneous consumption of live content and archived content (radio on demand), complemented by elements such as texts, images, videos and audios. However, the diversity and organization of this content varies: at Cadena SER, there is evidence of a real-time "electronic diary" strategy, with specific thematic sections. For its part, Cadena COPE highlights the link between traditional broadcast programs and complementary multimedia content. Onda Cero, in turn, emphasizes the user experience through a clean interface that favors interaction with specific content.

4.1 ANALYSIS OF ADVERTISING CONTENT AND ECONOMIC BENEFITS

The study identified differences in the implementation of advertising strategies in the three sites analyzed. For example, in the case of the layout of banners and advertising spots, Cadena SER is characterized by an intensive integration of banners (located at the top, on the sides and between sections) and by the use of the brand day format, which allows the advertiser to occupy the entire advertising space for one day.

Cadena COPE inserts banners in strategic areas (top and side) and uses advertising spots before the selected content, reinforcing the link between advertising and programming.

Cero Wave limits the presence of banners on the main page by placing them only on specific content and keeping the format clean in the general interface, although the spots play similarly in the requested audio.

The economic benefits obtained by broadcasters from the publication of these bands are substantial according to the tariffs in force in 2023/2024 published on its website by the media agency OBLICUA. The following table shows the average price of publishing a banner on the websites of the main radio stations in Spain.

Table 1

Web Advertising Fees (CPM and Brand Day)

Season	CPM (€/impression)	Brand Day (euros)
Cadena SER	25	25,500 – 25,000 ¹²
COPE Chain	20	Not applicable
Cero Wave	20	Not applicable

Source: Prepared by the authors with data collected on the oblicua.es website.

As detailed in Table 1, the average price to insert a banner on the website of a generalist channel (Cadena SER, Cadena COPE and Onda Cero) ranges from 25 euros for Cadena SER to 20 euros for the other two, being the CPM (cost per thousand), which serves to define the price of web ads in digital marketing as a measurement method.

The method is based on impressions, which is a metric that counts the number of views or digital interactions for a specific ad. Impressions are also known as "ad views." Prices listed do not include VAT. The contract for the brand day at SER is 25,000 euros. Brand Day is a format within an exhibition in which all advertising space in a web medium is reserved exclusively for a single brand for a certain period of time – usually one day, since, if they are weekly periods, it would be called brand week. These revenues complement those obtained by advertising inserted during the live broadcast of conventional programming (analog radio) and which are detailed below. Table 2 shows the Advertising Tariffs in force in 2023/2024 on radio (20-second spots, national broadcast on weekdays), according to the Oblicua.es portal.

Table 2

Advertising fees in force in 2023/2024 on radio

Timetable	BE	Cero Wave	DEAL
06:00-07:00 h.	17.790 €	12.500 €	16.720 €
07:00-08:00 h.			
08:00-09:00 h.			
09:00-10:00 h.	13.340 €		12.240 €
10:00-11:00 h.		8.300 €	
11:00-12:00 h.			

² The value of *Brand Day* can vary depending on specific agreements and commercial conditions

12:00-00:30 h.			
12:30-13:00 h.			
13:00-14:00 h.			5.580 €
14:00-15:00 h.	9.350 €	4.000 €	
15:00-16:00 h.			6.000 €
16:00-17:00 h.			
17:00-18:00 h.			
18:00-19:00.			
19:00-20:00 h.		7.860 €	
20:00-21:00 h.		4.200 €	
21:00-22:00 h.			2.995 €
22:00-23:00 h.	10.480 €	7.520 €	10.160 €
23:00-00:00 h.			
00:00-01:30 h.			
01:30-04:00 h.	2.020 €	900 €	1.660 €
04:00-05:00 h.			
05:00-06:00 h.	1.300 €		

Source: Prepared by the authors with data collected in oblicua.es

As can be seen in the results obtained in Table 2, the cost of advertising skyrockets in the national transmission of programs presented by prominent broadcasters: Hoy por hoy, with Ángeles Barceló (Cadena SER); Herrera at Cadena COPE, with Carlos Herrera (COPE) and Más uno, with Carlos Alsina (Onda Cero). The insertion of a 20-second spot in prime time costs between 13,340 and 17,790 euros (VAT not included) in SER, being cheaper in the other two. The price of ads with a longer duration is calculated prorately.

4.2 COMPARISON OF ADVERTISING REVENUES

In terms of rates and advertising formats: Cadena SER stands out for its intense advertising presence on its website. Formats such as banners are used in various locations (header, sides, and between sections) and the Brand Day format, in which a brand reserves all advertising for one day. CPM refers to what an advertiser pays for 1000 ad impressions on a web page. An average CPM of 25 euros is estimated, which is reflected in a high advertising value on the main page.

COPE Chain: also uses banners and advertising spots before the content is played, although the intensity of insertion is slightly lower compared to SER. CPM: Approximately 20 euros, similar to Onda Cero, with less presence of exclusive formats such as Brand Day.

Onda Cero: Your perspective is more minimalist in terms of web advertising. Banners are integrated in a unique way (in specific content), and the user experience is kept clean. CPM: It costs around 20 euros, with a more discreet advertising strategy, although pre-content spots are still a common resource.

As for the estimate of advertising revenues, when analyzing the data on fees and the presence of advertising formats on the web, it was observed that in Cadena SER the intensive use of banners and brand day, with higher CPMs, suggests that this broadcaster could achieve significantly higher digital advertising revenues than its competitors, since its digital revenues vary between 25 and 35% of the total digital segment. In part, due to its leadership in personalization and reach. As for COPE and Onda Cero, both share a similar CPM (20 euros) and a less aggressive advertising insertion strategy. This translates into digital revenues that, while still growing, may be at slightly lower levels than SER.

4.3 ANALYSIS OF THE EVOLUTION OF THE AUDIENCE

Data from the General Media Study (EGM) indicate that the percentage of Spaniards who listen to radio online has gone from around 5-7% in 2015 to estimates of 15% in 2023. This growth has been driven by the increased use of smartphones, the stations' own apps, and the integration of on-demand content. Differences between the seasons:

Cadena SER: It benefits from a comprehensive digital strategy (with registration, personalization and geolocation functionalities), which has contributed to greater loyalty and, consequently, to a constant growth of its digital audience.

COPE: Its strategy focuses on highlighting star programs and connecting them directly to traditional programming, attracting an audience that migrates to digital so as not to miss live or delayed content.

Onda Cero: Its minimalist interface and focus on immediate content favor the capture of users who seek a clear and direct experience, although it may limit some interactive features that build audience loyalty.

4.3.1 Loyalty and retention indicators

In terms of average listening time: online radio users in Spain generally spend, on

average, between 30 and 45 minutes a day in this modality.

On audience segmentation: The data reveals that digital audience growth is especially notable in the youth segment (18-34 years old), while consumption at stations such as SER tends to be more diversified thanks to the offer of local and personalized content.

4.4 IMPACT ON SOCIAL MEDIA

Cadena SER: Uses social networks (X, Facebook, Instagram and YouTube) intensively to disseminate fragments of programs, news and research. Audience engagement is high thanks to initiatives such as live streams, Q&A sessions, and exclusive content for.

Cadena COPE: Focuses on highlighting its star programs and opinion content, with a prominent presence on X and Facebook. Its strategy on the networks aims to generate conversations about current issues and the content broadcast on the radio.

Onda Cero: Commitment to direct and clean communication, with less advertising saturation on their profiles. Its strategy on social media focuses on immediate and detailed broadcasting, highlighting prominent content and breaking news, which allows for a high rate of interaction in specific publications.

Analyzing the quantitative indicators on the networks: About the number of followers and engagement: Cadena SER: generally has a higher number of followers on platforms such as X and Facebook (more than 1.5 million on X and 2 million on Facebook) and engagement that is enhanced with multimedia content and calls to action. Cadena COPE: It has about 1 million followers on X and similar numbers on Facebook, with interactions that reinforce its image as a media outlet for opinion and current affairs. Onda Cero: Although its followers are slightly smaller than those of Cadena SER and COPE (about 800 thousand to 1 million in X), its strategy of less saturated publications generates a high proportional interaction rate, especially in content related to breaking news.

Regarding the impact of interactive campaigns, it was found that campaigns in networks that invite participation (e.g., surveys or contests) had response rates above 10% in SER and COPE, while Onda Cero achieved exceptional rates of interaction in publications with urgent content or national relevance. The results obtained are shown in the comparative table presented in Table 3.

Table 3

Comparative data obtained from interaction on social networks

Season	CPM (€/impression)	Digital Ad Revenue (estimated)	Digital Audience Growth (%)	Followers on Social Media (X/Facebook)	Social Media Strategy
Cadena SER	25	€18-25 million	Sustained increase; High fidelity in young people and diverse audiences	X: > 1.5 million; <i>Facebook</i> : 2 million	Multimedia content, live interactions, personalization, and geolocation.
COPE Chain	20	€12-18 million	Consistent growth; Featured in star programs	1M on X and <i>Facebook</i>	Focus on opinion, thematic discussions, and live programs.
Cero Wave	20	€12-18 million	Growth driven by immediacy and ease of use	800K-1 m in X; High proportional commitment	Direct and clean communication, less advertising saturation, focus on news and specific content.

Source: Prepared by the authors with research data.

5 DISCUSSION

The comparative analysis reveals that, despite sharing the objective of expanding the user experience through digitalization, the three chains adopt different strategies:

Innovation and Personalization: Cadena SER's strategy focused on the personalization and integration of multiple formats (electronic newspaper, subscriptions and geolocation), suggests a radio model committed to audience loyalty and diversification. On the other hand, Cadena COPE and Onda Cero opt for more segmented approaches, prioritizing the user's quality of content based on their traditional programming and live experience, respectively.

Advertising Strategies and Economic Sustainability: The implementation of advertising formats adapted to the digital environment (especially the use of Brand Day in SER) not only reinforces the relevance of web platforms as a source of income, but also shows the need for greater adaptation of advertising content to the specificities of the medium. The disparity in ad costs (CPM) suggests that advertisers value reach and quality of experience on each platform differently.

Implications for Acquisition and Loyalty: The integration of interactive options, such as the possibility of registration, personalization, and interaction on social networks, is associated with an improvement in the user experience and, therefore, in the acquisition and loyalty of audiences. However, the absence of these elements on some platforms (e.g., Cero Wave in registration and subscription) indicates areas of opportunity to optimize interaction and increase added value.

6 CONCLUSIONS

1. **Diversity of Digital Strategies:** The stations studied have developed heterogeneous digital strategies that adapt to their identities and public goals. Cadena SER leads in terms of personalization and content integration, while Cadena COPE and Onda Cero maintain a strategy focused on content quality and interface simplicity.
2. **Impact on Advertising Profitability:** The existence of specific formats, such as brand day, and the differentiation in advertising rates demonstrate that digitalization offers significant opportunities for revenue diversification. The biggest investment detected in Cadena SER is associated with its personalization and reach strategy, which translates into added value for advertisers.
3. **Opportunities for Improvement:** Despite the success in diversification and digitalization, areas of improvement in user-platform interaction are identified. It is recommended to incorporate additional interactive tools (e.g., online contests, real-time surveys, and live chats) to increase audience engagement and loyalty.

4. Confirmation of the Hypothesis: Regarding Hypothesis 1, the findings indicate that most of the portals of the major networks are no longer mere containers of traditional radio, offering abundant native digital content and additional services. For example, all the sites analyzed incorporate podcasts or exclusive online programs (not broadcast on the air) along with multimedia sections (videos, audios and photo galleries, among other content), largely fulfilling this amplification. As a result, user appeal increases significantly: internet radio has gone from just "redistributing products offline on demand" to exploring exclusive content and new digital storytelling that adds value to audiences. A specific case is Cadena SER, which in addition to its on-demand programs integrates the Pódium Podcast platform with original series only for the internet, illustrating this evolution. It is concluded, therefore, that the three stations studied advanced to the original content and value-added services, largely confirming hypothesis 1.

Regarding Hypothesis 2, the research shows that most of the portals studied are already exploring new digital advertising formats, consolidating them as an additional source of income and diversifying the business. About 80–90% of the sites analyzed incorporate advanced display advertising – for example, dynamic banners and brand day formats (full-page sponsorships) – in addition to classic insertions. Similarly, almost all include pre-reel audio spaces before on-demand content (podcast or online playback), evidencing widespread adoption. These formats are becoming more and more consolidated: the business model has begun to change in the search for complementary revenues to conventional advertising on the internet. Therefore, it is concluded that almost all channels successfully use these new advertising formats, consolidating them as a source of income and diversifying their commercial offer, confirming Hypothesis 2.

As for Hypothesis 3, the results suggest that most broadcasters have implemented personalization and interactivity tools on their websites, largely fulfilling this hypothesis. For example, they often offer user registration (to comment on content or participate in contests or surveys), geolocation (showing local or regional station content depending on the listener's location), and subscription newsletters with new features, all of which personalize the experience. Likewise, all portals facilitate social interactivity: they integrate buttons to share news or audio on networks, and many receive direct feedback through filtered comments or online surveys. These functionalities significantly enrich the user experience and encourage user loyalty. A registered listener who receives content from their area or thematic newsletters

tends to visit the site more often, and on the other hand, the listener who shares audios on their networks becomes a prescriber of the brand. The results show that the vast majority of radio sites successfully apply personalization and interactivity, which substantially supports hypothesis 3 to improve the experience, increase listener loyalty, and facilitate the acquisition of online audiences.

Therefore, the research shows that the digitalization of radio stations in Spain translates into the creation of web platforms that not only broaden the listening experience, but are also configured as integral spaces for social communication and business diversification of the three stations studied. Adopting strategies that combine quality content with innovative advertising formats is critical to sustainability and growth in the competitive digital media environment.

This research has several limitations that must be pointed out in order to properly mark the results. First, it is worth highlighting the scarcity of disaggregated data on the digital advertising revenues of each of the broadcasters analyzed. Given the diversity of sources used (EGM, AIMC, Infoadex, IAB Spain, among others), the data used largely come from estimates and studies of the global industry, so the conclusions may be affected by possible methodological inconsistencies.

Second, the available information comes from heterogeneous sources with different cut-off dates. This dispersion makes it difficult to develop perfectly comparable time series, restricting the scope of generalizations that can be made from these findings. Similarly, variability in online audience behavior (derived from changes in content supply, fluctuations in social media activity, and specific viralization phenomena) can impact the fact that trends observed in a given period are rapidly modified and cannot be extrapolated to other temporal contexts.

On the other hand, the study has focused on the three main stations (Cadena SER, COPE and Onda Cero), dispensing with the analysis of thematic radios, local stations or digital radios, which can show different realities and monetization strategies. This focus on the three private channels with the largest audience in Spain limits the possibility of making comparisons with other business models and with innovative proposals in the medium that are pending future research.

ABSTRACT

Introduction: Ultraviolet (UV) radiation is one of the main extrinsic factors involved in photoaging and the development of histological skin changes. Chronic exposure to UVA and UVB radiation is associated with direct DNA damage, oxidative stress, collagen and elastin degradation, and local immunosuppression, processes that favor the development of precancerous lesions and skin cancer. **Objectives:** To critically review the main histological changes induced by ultraviolet radiation in human skin, considering differences between skin phototypes and their relationship with photoaging. **Methodology:** This is a mini-literature review conducted in the PubMed, SciELO, and Scopus databases, using the descriptors 'ultraviolet radiation,' 'photoaging,' 'human skin,' 'histological changes,' and 'skin phototypes.' Articles published between 2020 and 2025, of an experimental or review nature, were included. Duplicate studies, those not directly related to the topic, or those published before the defined period were excluded.

Keywords: Ultraviolet Radiation. Photoaging. Skin Cancer. Oxidative Stress. Photoprotection.

RESUMO

Introdução: A radiação ultravioleta (UV) é um dos principais fatores extrínsecos envolvidos no fotoenvelhecimento e no desenvolvimento de alterações histológicas cutâneas. A exposição crônica à radiação UVA e UVB está associada a danos diretos ao DNA, estresse oxidativo, degradação de colágeno e elastina, além de imunossupressão local, processos que favorecem o surgimento de lesões pré-cancerígenas e câncer de pele. **Objetivos:** Revisar criticamente as principais alterações histológicas induzidas pela radiação ultravioleta na pele humana, considerando diferenças entre fototipos cutâneos e a relação com o fotoenvelhecimento. **Metodologia:** Trata-se de uma mini revisão de literatura realizada nas bases de dados PubMed, SciELO e Scopus, utilizando os descritores 'radiação ultravioleta', 'foto envelhecimento', 'pele humana', 'alterações histológicas' e 'fototipos cutâneos'. Foram incluídos artigos publicados entre 2020 e 2025, de caráter experimental ou revisional. Foram

RESUMEN

Introducción: La radiación ultravioleta (UV) es uno de los principales factores extrínsecos implicados en el fotoenvejecimiento y el desarrollo de cambios histológicos en la piel. La exposición crónica a la radiación UVA y UVB se asocia con daño directo al ADN, estrés oxidativo, degradación de colágeno y elastina, e inmunosupresión local, procesos que favorecen el desarrollo de lesiones precancerosas y cáncer de piel. **Objetivos:** Revisar críticamente los principales cambios histológicos inducidos por la radiación ultravioleta en la piel humana, considerando las diferencias entre los fototipos de piel y su relación con el fotoenvejecimiento. **Metodología:** Se trata de una mini-revisión bibliográfica realizada en las bases de datos PubMed, SciELO y Scopus, utilizando los descriptores «radiación ultravioleta», «fotoenvejecimiento», «piel humana», «cambios histológicos» y «fototipos de piel». Se incluyeron artículos publicados entre 2020 y 2025, de carácter experimental o de revisión. Se excluyeron los estudios duplicados, aquellos no directamente relacionados con el tema o aquellos publicados antes del período definido.

Palabras clave: Radiación Ultravioleta. Fotoenvejecimiento. Cáncer de Piel. Estrés Oxidativo. Fotoprotección.

1 INTRODUCTION

Ultraviolet (UV) radiation is a form of electromagnetic radiation that comes from the sun, with wavelengths between 100 and 400 nanometers (nm). It is subdivided into three categories: UVA (320–400 nm), UVB (290–320 nm), and UVC (100–290 nm). Most UVC radiation is absorbed by the ozone layer and does not reach the earth's surface. Exposure to UV radiation is a determining factor in human skin health, and can cause a range of biological effects, from cellular changes to the development of skin cancer (Saha B, et al., 2024).

These effects vary according to the intensity, duration of exposure and the type of radiation involved. UVB radiation is known to cause direct DNA damage, resulting in the formation of pyrimidine dimers, which can lead to mutations and eventually skin cancer. On the other hand, UVA radiation penetrates deeper into the skin, reaching the dermis, and is associated with photoaging and the formation of reactive oxygen species (ROS), which can induce oxidative stress and inflammation (Gromkowska-Kępką KJ, et al., 2021). In addition to direct DNA damage, exposure to UV radiation can also affect the skin's immune system. UV radiation induces local immunosuppression, decreasing the skin's ability to respond to pathogens and increasing the risk of developing malignant lesions.

In the clinical context, the effects of UV radiation are observed in a variety of dermatological conditions, including sunburn, photoaging, actinic keratoses, and non-melanoma skin cancers. These conditions result from UV-induced histological and molecular changes, which affect both the epidermis and the dermis (Ke Y, et al., 2021). In view of the high incidence of skin diseases related to sun exposure, especially in tropical countries such as Brazil, it is essential to understand the biological and histological mechanisms involved in the damage caused by UV radiation.

2 MAJOR HISTOLOGICAL CHANGES

Ultraviolet (UV) radiation, present in sunlight, has profound effects on human skin. Initially, UVB rays (280–320 nm) concentrate their action on the epidermis, where they induce direct injury to the DNA of keratinocytes, such as the formation of thymine dimers (Vechtomova YL, et al., 2021).

These changes can lead to cell death or mutations capable of triggering tumor processes. UVA rays (320–400 nm), on the other hand, because they have greater penetrating power, reach the dermis and promote changes in the skin's support matrix, including the degradation of collagen and elastin fibers. This process is directly associated

with premature aging, known as photoaging, one of the main chronic impacts of solar radiation (De Araújo; De Souza, 2022). In addition to direct genetic damage, UV radiation stimulates the formation of free radicals, triggering oxidative stress in skin cells. This redox imbalance compromises essential structures such as lipids, proteins, and DNA, resulting in histological alterations, such as thinning of the dermis, loss of elasticity, and weakening of the skin barrier (Kiyoi T., 2024)

In experimental models with hairless mice, thickening of the epidermis and dermis was also observed, as well as loss of affinity with collagen-specific dyes, evidencing irreversible damage to the tissue (Mayangsari E, et al., 2024). As a response to these aggressions, the skin triggers local inflammatory processes, characterized by the dilation of blood vessels, infiltration of defense cells, and release of mediators such as interleukins (IL-1, IL-6) and tumor necrosis factor alpha (TNF- α). Although acute inflammation favors cell renewal, its persistence can cause tissue degeneration. In the Brazilian scenario, reviews indicate that cumulative sun exposure is associated with a higher incidence of skin cancer in fair-skinned populations, especially in the South and Southeast regions, where intense and prolonged UV radiation is added to lower pigment protection (Vind AC, et al., 2024).

Finally, UV radiation also compromises skin immunity, reducing the activity of Langerhans cells responsible for defending against aggressive agents and altering the production of immunoregulatory substances. This condition of local immunosuppression favors the persistence of damaged cells and the progression of pre-existing lesions, reducing the ability to recognize and eliminate potentially malignant cellular alterations. Together, these mechanisms direct DNA damage, oxidative stress, chronic inflammation, and immunosuppression interact and potentiate each other, explaining the strong association between sun exposure and the development of skin diseases, including skin cancer (Ortner D, et al., 2024).

2.1 EPIDERMAL HYPERPLASIA AND HYPERKERATOSIS

Ultraviolet (UV) radiation, especially in the UVB spectrum, is one of the main physical agents capable of inducing adaptive responses in the human epidermis. Among the most common alterations, epidermal hyperplasia stands out, characterized by the accelerated proliferation of keratinocytes in response to damage to DNA and cellular proteins. This physiological mechanism seeks to restore the integrity of the skin barrier and compensate for radiation-induced cell loss (Lu W, et al., 2023). As reported by Silva, Souza, and Labre (Silva,

et al, 2022), the increased production of new cells represents a temporary defense, which confers greater thickness to the epidermis and greater resistance to subsequent exposures.

Chronic exposure to the sun favors hyperkeratosis, characterized by thickening of the layer as an adaptive response. National studies point to a higher prevalence of this alteration in workers exposed to radiation, such as farmers and fishermen, especially in the face, arms, and hands (De Oliveira, 2020). Although the accumulation of keratin acts as a barrier against UV radiation, its persistence can evolve into pathological changes. Histologically, hyperplasia and hyperkeratosis alter the epidermal architecture, promoting cellular disorganization and increasing the risk of precancerous lesions, such as actinic keratosis, and non-melanocytic skin tumors. Long-term exposure to UVB, therefore, encourages disordered proliferation and increases the likelihood of genetic mutations related to cutaneous carcinogenesis (Hu et al., 2025).

In summary, although initially protective, epidermal hyperplasia and hyperkeratosis have a paradoxical character. If, on the one hand, they contribute to reducing the penetration of UV radiation and temporarily protecting the skin, on the other hand, its chronic maintenance is directly associated with premature photoaging and the development of serious skin diseases. In this sense, as they point out, such adaptations reveal the skin's ability to respond to environmental stress, but also highlight the importance of continuous photoprotection as an essential strategy to prevent progression to irreversible conditions (Wang T, et al., 2020).

2.2 INFLAMMATION AND NECROSIS IN RESPONSE TO IRRADIATION DOSE AND TIMING

Ultraviolet (UV) radiation triggers inflammatory responses in the skin, the intensity of which varies according to the dose and duration of exposure. At moderate levels, it manifests as solar erythema, characterized by redness and local warmth (Salminen et al., 2022). Prolonged exposure, on the other hand, can cause cell necrosis, tissue disorganization, and immunological changes. UV radiation modulates cytokines and T lymphocytes, favoring the escape of abnormal immune system cells and increasing the risk of infections and skin cancer (Lopes et al., 2022).

UV-induced cell necrosis results from the formation of reactive oxygen species (ROS), which cause damage to cellular DNA, leading to programmed cell death or apoptosis. Studies indicate that the efficiency of DNA repair mechanisms can vary between individuals,

influencing susceptibility to damage caused by UV radiation and, consequently, the risk of developing skin cancer. In addition, UV radiation can alter the tumor microenvironment, promoting inflammatory processes, angiogenesis, and evasion of the immune response, factors that contribute to the development of skin neoplasms (Papaccio F, et al., 2022).

The inflammatory response induced by UV radiation is closely linked to photoaging, a cumulative process that is more frequent in the elderly and in regions with high solar incidence (Lee et al., 2021). This phenomenon involves the generation of ROS, which degrade collagen and elastic fibers, compromising skin integrity. Prolonged exposure also promotes structural changes in the epidermis, dermal-epidermal junction and dermis, such as thickening of the layer, disorganization of the extracellular matrix and increased vascular permeability, factors that favor precancerous lesions and skin cancer (Peres; Miot, 2020).

2.3 COLLAGEN DEGRADATION AND ACTINIC ELASTOSIS

Chronic exposure to ultraviolet (UV) radiation is one of the main environmental factors responsible for the degradation of collagen fibers and the development of actinic elastosis in human skin. These structural changes are characteristic of photoaging, a process that results in loss of skin firmness, elasticity, and integrity (Liu H, et al., 2024). Histological studies reveal that UV radiation induces the expression of matrix metalloproteinases (MMPs), such as MMP-1, which cleaves collagen fibers, and MMP-3, which amplifies the degradation of existing collagen. In addition, UV radiation reduces the synthesis of new collagen, contributing to the weakening of the extracellular matrix (MARTIN, et al, 2023).

Actinic elastosis is characterized by the abnormal accumulation of elastin in the dermis, replacing damaged collagen fibers. This elastic material has a thick and tangled appearance, with impaired functionality, compromising the elasticity of the skin. The formation of elastosis is associated with prolonged exposure to UV radiation, which induces the production of reactive oxygen species (ROS), leading to the formation of free radicals that damage elastic and collagen fibers (Md Jaffri J., 2023).

The process of collagen degradation and the formation of actinic elastosis are more intense in fair-skinned individuals, due to the lower amount of melanin and, consequently, greater susceptibility to damage from UV radiation. Advanced age and a history of unprotected sun exposure also increase the risk of these changes, often observed in exposed regions, such as the face, neck, and back of the hands (Shi S, et al., 2024). Prevention involves continuous photoprotection, with regular use of broad-spectrum sunscreens,

appropriate clothing, and reduced exposure at peak times. Topical antioxidants, such as vitamins C and E, also aid in the neutralization of free radicals, preserving the extracellular matrix and slowing photoaging (Lyons AB, et al., 2024).

2.4 OXIDATIVE STRESS AND TISSUE INJURY

Ultraviolet (UV) radiation stimulates the production of reactive oxygen species (ROS), promoting oxidative stress that damages lipids, proteins, and DNA, leading to inflammation, apoptosis, and necrosis of keratinocytes and fibroblasts (Shih et al., 2020). This process compromises the synthesis of collagen and elastin, activates matrix metalloproteinases and accelerates photoaging. As a consequence, chronic sun exposure reduces the skin's regenerative capacity and increases the risk of premalignant lesions.

In addition to the structural effects, oxidative stress affects the cutaneous microcirculation, promoting vasodilation, increased vascular permeability, and infiltration of inflammatory cells. According to Oliveira and Andrade (Oliveira, et al, 2020), these changes contribute to edema and exacerbation of inflammatory processes, amplifying necrosis and tissue degeneration. Cumulative damage from sun exposure not only compromises the physical integrity of the skin, but also interferes with local immune function, making the tissue more vulnerable to infections and malignant transformations (Guan LL, et al, 2021).

The prevention of oxidative stress in the skin involves photoprotection strategies and the use of topical or oral antioxidants, which neutralize free radicals and reduce cell damage. Studies indicate that compounds such as vitamin C, vitamin E, and polyphenols have a significant protective effect against lipid peroxidation and collagen degradation, slowing down the photoaging process and minimizing UV-induced histological changes (Barbosa, et al., 2021).

2.5 VARIATION WITH SKIN TYPE

The cutaneous response to ultraviolet (UV) radiation depends on the phototype, determined by the amount of melanin. Fair-skinned individuals, with less pigment protection, are more susceptible to erythema, inflammation, and cell necrosis. Melanin acts as a natural filter, absorbing part of the UV radiation and protecting DNA, which reduces the occurrence of premalignant lesions in darker skin (Silva; Souza, 2022; Gęgotek et al., 2022). However, this protection is not absolute: even tall phototypes can develop histological changes, such as epidermal hyperplasia and actinic elastosis, when chronically exposed. Thus, the

accumulation of UV radiation over the years promotes dermal and epidermal degeneration in all phototypes, although the severity of the damage is inversely proportional to the amount of melanin (Passeron et al., 2021).

Therefore, the distribution of melanin in the skin influences the inflammatory response. Brazilian studies have shown that fair-skinned individuals have more intense inflammation and greater sensitivity to erythema formation, while darker-skinned individuals have more moderate but not always less severe responses show that, despite the lower initial susceptibility, chronic unprotected exposure to dark phototypes can also result in cumulative tissue damage, increased oxidative stress and predisposition to structural changes, such as collagen degradation (Aloe Vera, et al, 2021).

Finally, the variation with skin type also impacts photoprotection and preventive strategies. Fair-skinned individuals should adopt strict measures, such as the use of broad-spectrum sunscreens, protective clothing, and strategic sun exposure times, while darker-skinned individuals, although less susceptible, are not fully protected and should maintain continuous preventive care. Silva points out that educational policies and awareness about the risks of UV radiation are essential for all phototypes, considering the cumulative effect of the sun on the skin (Silva, Miot, 2024).

2.6 SUBCELLULAR CHANGES AND IMMUNOSUPPRESSION

Ultraviolet (UV) radiation not only affects the macroscopic architecture of the skin, but also causes significant changes at the subcellular level, affecting organelles, nucleus, and cell signaling pathways. Brazilian studies indicate that UV induces direct DNA damage, causing the formation of thymine dimers and changes in hydrogen bonds, compromising the genomic integrity of epidermal cells. These modifications can result in apoptosis or, when repair mechanisms fail, in mutations that favor cutaneous carcinogenesis (Agrez M, et al, 2023).

However, UV radiation also causes mitochondrial dysfunction, increasing the production of reactive oxygen species (ROS) and reducing cellular antioxidant capacity. These changes compromise energy metabolism, structural protein synthesis, and tissue regeneration, accelerating photoaging and favoring programmed cell death (Tsuchida et al., 2023). Another critical effect is local and systemic immunosuppression, marked by reduced activity of Langerhans cells, T lymphocytes, and other mediators of cutaneous immunity, which allows the persistence of damaged cells and increases the risk of malignant lesions.

This phenomenon, more evident in chronic exposures, increases the vulnerability of the skin to infections, cancer, and other pathologies associated with a drop in the immune response (Yardman-Frank et al., 2021; Silva; Miot, 2020).

In addition to the direct effects on organelles and immunity, UV radiation causes changes in cell signaling, activating inflammatory and apoptotic pathways that amplify tissue damage. Studies indicate that the combination of oxidative stress, DNA degradation, and immunosuppression creates an environment conducive to chronic histological changes, including hyperplasia, actinic elastosis, and extracellular matrix disorganization (Cai CS, et al, 2023). These subcellular mechanisms highlight the complexity of the cutaneous response to UV radiation and reinforce the importance of photoprotection and the use of antioxidants as essential preventive measures.

3 COMPARISON: ACUTE VERSUS CHRONIC EXPOSURES

Ultraviolet (UV) radiation causes different effects on the skin depending on the duration and frequency of exposure. Acute exposures, characterized by short, high-intensity episodes such as sunburn, trigger immediate responses, including erythema, edema, and pain. Silva and Souza (Silva & Souza, 2022) highlight that these changes are primarily inflammatory, with rapid activation of chemical mediators and recruitment of immune cells to repair tissue damage. Although temporary, repeated exposures can add cumulative effects, increasing the probability of permanent histological changes. Ultraviolet radiation causes different effects on the skin depending on the duration and frequency of exposure.

Table 1 summarizes the differences between acute and chronic exposures, followed by the references used.

Table 1

ASPECT	ACUTE EXPOSURE	CHRONICLE EXHIBITION	RECENT REFERENCES
Duration	Short, intense, episodic (e.g., sunburn)	Long, repetitive, months or years	Shih et al., 2020; Wong & Chew, 2021
Main effects	Erythema, oedema, pain, focal necrosis	Epidermal hyperplasia, collagen degradation, actinic elastosis	Ansary et al., 2021; Liu et al., 2024
Predominant mechanisms	Acute inflammation, cytokine release	Cumulative oxidative stress, reorganization of the extracellular matrix	Salminen et al., 2022; Cai et al., 2023
Reversibility	Usually reversible after a few days	Progressive and irreversible changes	Yeh & Schwartz, 2022; Shin et al., 2023
Oncological risk	Low on isolated exposures	High risk of precancerous lesions and skin cancer	Ortner et al., 2024; Kumar et al., 2024
Clinical example	Sunburn in young people	Deep wrinkles, basal cell carcinoma	Tsai & Chien, 2022; Vind et al., 2024

Source: Authors.

In contrast, chronic exposure involves continuous or frequent radiation over months and years, promoting profound structural and functional changes in the skin. Chronic exposure induces epidermal hyperplasia, collagen degradation, actinic elastosis, and local immunosuppression, typical features of photoaging. These modifications are progressive and cumulative, making the skin more susceptible to precancerous lesions and non-melanocytic skin cancer (Wong Qya, et al, 2021). From a histological point of view, the differences between acute and chronic exposures are also evident. While acute exposures produce focal necrosis and temporary inflammation, chronic exposure leads to permanent reorganization of the extracellular matrix, decreased fibroblast density, and changes in cutaneous microcirculation. Oliveira and Andrade reinforce that the radiation accumulated over time favors the degradation of collagen and elastin fibers, with a consequent loss of elasticity and firmness of the skin (Oliveira & Andrade, 2020).

In turn, the immune system's response varies greatly depending on the type of sun exposure. When exposure is rapid and short-lived, it causes a temporary drop in immunity. Continuous and prolonged exposure, on the other hand, leads to longer-lasting immune suppression, which can facilitate the growth of altered cells and increase the risk of skin cancer. Barbosa and colleagues point out that these changes that last longer, if not avoided, can evolve into irreversible lesions and impair skin function. Therefore, sun protection measures must take into account not only the intensity of radiation, but also how often and for how long we are exposed to the sun (Barbosa, et al, 2021).

4 CLINICAL IMPLICATIONS AND POSSIBLE INTERVENTIONS

Exposure to ultraviolet (UV) radiation generates clinical implications ranging from transient effects, such as erythema and edema, to chronic conditions, such as photoaging and skin cancer. Cell damage depends on the intensity and duration of exposure, involving inflammation, necrosis, collagen degradation, and actinic elastosis. In addition to the aesthetic impact, these changes compromise the skin barrier, favoring infections and premalignant lesions (Yeh et al., 2022; Silva; Souza, 2022). Photoprotection is the most effective clinical measure, including the regular use of broad-spectrum sunscreens, appropriate clothing, hats, and glasses. Brazilian studies highlight that reapplying sunscreen every two hours is essential to reduce the cumulative effects of solar radiation (Tsai et al., 2022).

In this context, health education policies to raise awareness about the risks of the sun contribute to the prevention of long-term damage. Another clinical approach involves the use of topical and oral antioxidants, which neutralize free radicals and reduce UV-induced oxidative stress. Peres and Miot point out that the combination of vitamin C, vitamin E, and polyphenols acts to protect cellular DNA, preserve collagen, and reduce inflammation, slowing down the photoaging process and reducing the risk of serious skin lesions. In patients with a history of chronic exposure, regular dermatological follow-up is indicated to monitor early changes and prevent malignant complications (Kumar V, et al, 2024).

Finally, clinical interventions also include regenerative treatments, such as the use of retinoids and topical therapies with growth factors, which stimulate the regeneration of the epidermis and dermis. Oliveira and Andrade believe that these approaches can improve skin texture and elasticity, reduce the appearance of wrinkles and actinic lesions, and promote partial recovery of the damaged extracellular matrix. However, the effectiveness of these interventions depends on adherence to ongoing preventive measures, highlighting the importance of combining sun protection, antioxidants, and specialized dermatological care (Shin SH, et al, 2023).

5 FINAL CONSIDERATIONS

Ultraviolet (UV) radiation causes complex changes in the skin, including epidermal hyperplasia, inflammation, oxidative stress, collagen degradation, and immunosuppression, the cumulative effects of which contribute to photoaging and increased risk of skin cancer. Acute exposures cause temporary damage, such as erythema and edema, while chronic exposures promote permanent changes in the extracellular matrix and reduction in fibroblast density, compromising skin function in a sustained manner. Thus, the continuous adoption of preventive strategies, such as photoprotection, use of antioxidants, and dermatological follow-up, associated with regenerative therapies when necessary, is essential to preserve the integrity, elasticity, and immunity of the skin, indicating the need for future research aimed at improving more effective preventive and therapeutic measures.

ABSTRACT

Introduction: Accidents caused by venomous snakes represent an important challenge for public health, especially in rural regions of countries with tropical climates. It is estimated that, annually, there are about 5 million snakebites in the world, resulting in approximately 100 thousand deaths. In Brazil, the genera Bothrops and Crotalus stand out, the latter being associated with higher lethality and severe clinical manifestations, such as neurotoxicity, myotoxicity, and acute renal failure. In addition to the clinical repercussions, these accidents have relevant economic and social impacts, especially because they affect individuals of working age in rural areas. Early

Goal: To investigate the epidemiological profile of accidents caused by snakes of the genus Crotalus in Brazil between 2010 and 2023, analyzing mortality, regional distribution, seasonal variation, sex, age group, and anatomical site of the bite, in order to identify relevant patterns for surveillance and public health.

Methodology: This is an ecological, descriptive and retrospective study, based on secondary data extracted from the Notifiable Diseases Information System (SINAN/DATASUS). All cases registered in the country between 2010 and 2023 were included. The variables analyzed included: absolute number of cases and deaths, mortality rate, regional distribution, seasonality, gender, age group, and location of the bite. Statistical analysis was performed by means of descriptive statistics, using absolute and relative frequencies, with processing in Microsoft Excel.

Results and discussion: There was a continuous growth in the number of notified snakebites, from 124,920 cases in 2010 to 340,819 in 2023. In total, 296,475 botropic and

34,080 crotalic accidents were recorded, with mortality rates of 0.42% and 0.95%, respectively. Crotalic cases were more concentrated in the Northeast (37.8%) and Southeast (35.2%) regions, being more frequent in the hot and rainy months (January to March), which accounted for 34% of the notifications. There was a predominance of males (80%) and adults of working age (20 to 59 years: 22,209 cases), which reflects the greater occupational exposure in agricultural activities. The bites occurred mainly on the lower limbs (65.2%), followed by the upper limbs (20.2%), often during the inadvertent handling of the animals in the rural work environment. These epidemiological variations appear to be associated with environmental, climatic, and occupational factors that increase the risk of contact with snakes.

Conclusions: Crotalic accidents predominantly occurred adult men living in rural areas, especially in the rainy months, with more frequent injuries in the lower limbs. These findings reinforce the importance of public policies aimed at prevention, such as the provision of personal protective equipment (PPE) and the training of health teams for timely diagnosis and treatment. Among the limitations of the study, the use of secondary data, subject to underreporting and lack of detailed clinical information, stands out. Even so, the results contribute to guide future research on environmental determinants and the effectiveness of serum therapy in different regions of the country.

Keywords: Crotalus. Snake Bites. Epidemiology.

RESUMO

Introdução: Os acidentes provocados por serpentes peçonhentas representam um importante desafio para a saúde pública, sobretudo em regiões rurais de países de clima tropical. Estima-se que, anualmente, ocorram cerca de 5 milhões de envenenamentos ofídicos no mundo, resultando em aproximadamente 100 mil mortes. No Brasil, destacam-se os gêneros *Bothrops* e *Crotalus*, sendo este último associado a maior letalidade e a manifestações clínicas severas, como neurotoxicidade, miotoxicidade e insuficiência renal aguda. Além das repercussões clínicas, esses acidentes acarretam impactos econômicos e sociais relevantes, especialmente por atingirem indivíduos em idade produtiva das zonas rurais. A administração precoce do soro antiofídico é fundamental para reduzir a mortalidade e as complicações decorrentes do envenenamento.

Objetivo: Investigar o perfil epidemiológico dos acidentes causados por serpentes do gênero *Crotalus* no Brasil entre 2010 e 2023, analisando mortalidade, distribuição regional, variação sazonal, sexo, faixa etária e local anatômico da picada, com o intuito de identificar padrões relevantes para a vigilância e a saúde pública.

Metodologia: Trata-se de um estudo ecológico, descritivo e retrospectivo, baseado em dados secundários extraídos do Sistema de Informação de Agravos de Notificação (SINAN/DATASUS). Foram incluídos todos os casos registrados no país entre 2010 e 2023. As variáveis analisadas compreenderam: número absoluto de casos e óbitos, taxa de mortalidade, distribuição regional, sazonalidade, sexo, faixa etária e local da picada. A análise estatística foi realizada por meio de estatística descritiva, utilizando frequências absolutas e relativas, com processamento no Microsoft Excel.

Resultados e discussão: Verificou-se crescimento contínuo no número de acidentes ofídicos notificados, passando de 124.920 casos em 2010 para 340.819 em 2023. No total, foram registrados 296.475 acidentes botrópicos e 34.080 crotálicos, com taxas de

mortalidade de 0,42% e 0,95%, respectivamente. Os casos crotálicos apresentaram maior concentração nas regiões Nordeste (37,8%) e Sudeste (35,2%), sendo mais frequentes nos meses quentes e chuvosos (janeiro a março), que responderam por 34% das notificações. Predominaram indivíduos do sexo masculino (80%) e adultos em idade produtiva (20 a 59 anos: 22.209 casos), o que reflete a maior exposição ocupacional em atividades agropecuárias. As picadas ocorreram principalmente nos membros inferiores (65,2%), seguidas dos membros superiores (20,2%), frequentemente durante o manuseio inadvertido dos animais no ambiente de trabalho rural. Essas variações epidemiológicas parecem estar associadas a fatores ambientais, climáticos e ocupacionais que aumentam o risco de contato com serpentes.

Conclusões: Os acidentes crotálicos acometeram, predominantemente, homens adultos residentes em áreas rurais, especialmente nos meses chuvosos, com lesões mais frequentes em membros inferiores. Esses achados reforçam a importância de políticas públicas voltadas à prevenção, como a oferta de equipamentos de proteção individual (EPIs) e a capacitação das equipes de saúde para diagnóstico e tratamento oportunos. Entre as limitações do estudo, destaca-se o uso de dados secundários, sujeitos a subnotificação e à falta de informações clínicas detalhadas. Ainda assim, os resultados contribuem para orientar futuras pesquisas sobre os determinantes ambientais e a efetividade da soroterapia em distintas regiões do país.

Palavras-chave: Crotalus. Mordeduras de Serpentes. Epidemiologia.

RESUMEN

Introducción: Los accidentes provocados por serpientes venenosas representan un importante desafío para la salud pública, especialmente en regiones rurales de países con clima tropical. Se estima que, anualmente, ocurren alrededor de 5 millones de mordeduras de serpientes en el mundo, resultando en aproximadamente 100 mil muertes. En Brasil, destacan los géneros Bothrops y Crotalus, siendo este último asociado con mayor letalidad y manifestaciones clínicas graves como neurotoxicidad, miotoxicidad e insuficiencia renal aguda. Además de las repercusiones clínicas, estos accidentes generan impactos económicos y sociales relevantes, especialmente por afectar a individuos en edad productiva de áreas rurales. La administración temprana del suero antiofídico es fundamental para reducir la mortalidad y las complicaciones del envenenamiento.

Objetivo: Investigar el perfil epidemiológico de los accidentes causados por serpientes del género Crotalus en Brasil entre 2010 y 2023, analizando mortalidad, distribución regional, variación estacional, sexo, grupo de edad y sitio anatómico de la mordedura para identificar patrones relevantes para la vigilancia y la salud pública.

Metodología: Se trata de un estudio ecológico, descriptivo y retrospectivo, basado en datos secundarios extraídos del Sistema de Información de Enfermedades de Notificación (SINAN/DATASUS). Se incluyeron todos los casos registrados en el país entre 2010 y 2023. Las variables analizadas incluyeron número absoluto de casos y muertes, tasa de mortalidad, distribución regional, estacionalidad, sexo, grupo de edad y localización de la mordedura. El análisis estadístico se realizó mediante estadística descriptiva, con frecuencias absolutas y relativas procesadas en Microsoft Excel.

Resultados y discusión: Se observó un crecimiento continuo en el número de accidentes ofídicos notificados, pasando de 124.920 casos en 2010 a 340.819 en 2023. En total, se registraron 296.475 accidentes botrópicos y 34.080 crotálicos, con tasas de mortalidad de 0,42% y 0,95%, respectivamente. Los casos crotálicos se concentraron en mayor proporción en las regiones Nordeste (37,8%) y Sudeste (35,2%), siendo más frecuentes en los meses cálidos y lluviosos (enero a marzo), que representaron el 34% de las notificaciones. Hubo predominio de hombres (80%) y de adultos en edad productiva (20 a 59 años: 22.209 casos), lo que refleja mayor exposición ocupacional en actividades agrícolas. Las mordeduras ocurrieron principalmente en miembros inferiores (65,2%), seguidas de los superiores (20,2%), muchas veces durante la manipulación inadvertida de los animales en entornos rurales de trabajo. Estas variaciones epidemiológicas parecen estar asociadas con factores ambientales, climáticos y ocupacionales que incrementan el riesgo de contacto con serpientes.

Conclusiones: Los accidentes crotálicos ocurrieron predominantemente en hombres adultos residentes en áreas rurales, especialmente en los meses lluviosos, con lesiones más frecuentes en miembros inferiores. Estos hallazgos refuerzan la importancia de políticas públicas orientadas a la prevención, como la provisión de equipos de protección personal (EPP) y la capacitación de los equipos de salud para el diagnóstico y tratamiento oportunos. Entre las limitaciones del estudio destaca el uso de datos secundarios, sujetos a subregistro y a la falta de información clínica detallada. Aun así, los resultados contribuyen a orientar futuras investigaciones sobre los determinantes ambientales y la efectividad de la terapia con suero antiofídico en diferentes regiones del país.

1 INTRODUCTION

Accidents with venomous snakes represent an important public health problem, especially in tropical and subtropical regions, being classified by the World Health Organization (WHO) as neglected tropical diseases (WHO, 2023). Snakebites continue to be one of the most important causes of morbidity and mortality in these regions, especially in rural areas of developing countries (AFROZ et al., 2024). It is estimated that between 4.5 and 5.4 million snake bites occur worldwide annually, resulting in 1.8 to 2.7 million cases of envenomation and between 81,000 and 130,000 deaths (WHO, 2023; LONGBOTTOM et al., 2022). These numbers, however, are considered underestimated due to the lack of adequate epidemiological surveillance systems in several regions, which further aggravates the problem (AFROZ et al., 2024).

In Brazil, snakebites of medical importance are caused by snakes of the Viperidae and Elapidae families. Records of envenomations by snakes of the Viperidae family are present in about 99.5% of the accidents and are caused by the genera *Bothrops* (popularly known as jararacas, jararacuçu and urutus), *Crotalus* (rattlesnakes) and *Lachesis* (surucucus). The Elapidae family (0.5% of accidents) is represented by the genus *Micrurus* (true corals) (BRASIL, 2024).

Identifying the snake involved in the accident, when possible, can be an important step towards correct diagnosis and treatment. Despite this, the animal should not be killed or captured, and it is ideal to record the snake through photography, maintaining safety precautions. The corals have a slender body and colored rings, while the presence of retractable anterior fangs and loreal pit are characteristic of snakes of the Viperidae family, and the *Bothrops* have designs similar to an old telephone hook in the mesh. Meanwhile, rattlesnakes have diamond designs on their bodies, and the occurrence of the rattle on the tail also confirms their identification (WHO, 2023).

The genus *Crotalus* belongs to the subfamily Crotalinae, known for the presence of a specialized sensory organ: the loreal pit, which allows the detection of heat radiated by prey, facilitating hunting, especially in conditions of low visibility. In addition, another striking feature of these snakes is the presence of a rattle at the end of the tail, formed by interconnected segments of keratin that expand as the snake sheds its skin. When shaken rapidly, these segments produce an unmistakable sound, which serves as an important defense mechanism. Rattlesnakes use this sound both to alert potential predators and as a form of warning when they feel threatened or angry, thus avoiding direct confrontations (CLARK et

al., 2022; TOZETTI et al., 2013). These snakes have predominantly nocturnal habits, being more active at dusk and during the night, when they go out in search of food. During the day, they usually take shelter in hidden places, such as burrows, between rocks or under dense vegetation (TOZETTI et al., 2013).

The clinical occurrence of the signs and symptoms caused by the toxins present in the venom will define the need for treatment. Although snakes of the genus *Bothrops* cause the highest number of accidents and greater morbidity, accidents caused by rattlesnakes, although less frequent, are associated with higher complication rates, including a higher mortality rate (DA SILVA et al., 2023; CERON et al., 2021), this situation is mainly caused by the late recognition of clinical and laboratory changes, which is frequent in neglected diseases, leading to late heterologous serum therapy (more than 6 hours after the accident), a time when there is usually more important rhabdomyolysis and the consequent possibility of kidney damage, often irreversible.

The morbidity and mortality present in crotalic accidents is mainly due to crotoxin and crotamine, which are some of the proteins present in the venom responsible for inducing the neurotoxic and myotoxic syndrome of envenomation, causing manifestations such as blurred vision, eyelid ptosis, muscle weakness, respiratory failure, rhabdomyolysis, and acute renal failure (COLOMBINI et al., 2023). Thus, the clinical-laboratory picture plays a fundamental role in defining treatment, since specific serum therapy, started early, is crucial for reducing complications and mortality (WHO, 2023).

Given the relevance and particularities of envenomations caused by snakes of the genus *Crotalus*, it is extremely important to better understand the epidemiological profile for the proper management of these cases.

2 METHODOLOGY

The present study consists of a descriptive and retrospective documentary research, based on secondary data from the Notifiable Diseases Information System (SINAN) and the Epidemiological Bulletins of the Ministry of Health for the period from 2010 to 2023. Accidents involving venomous snakes were counted and the cases involving crotalic accidents were detailed. The variables of interest included: number of reported cases, mortality rate, distribution by geographic region, seasonality, age group, sex, and location of the bite. The analysis was carried out in a quantitative and descriptive manner, allowing the identification of epidemiological patterns and relevant risk factors.

3 RESULTS AND DISCUSSION

Data on snakebites in Brazil, between 2010 and 2023, reveal a growing panorama in the number of reported cases, accompanied by a low mortality rate. The increase in the number of accidents is evident over the years, from 124,920 cases in 2010 to 340,819 in 2023, which represents a significant growth of almost 173% and, although snakes of the genus *Bothrops* are responsible for most cases, the mortality rate associated with envenomations by this genus was 0.42%, (BRAZIL, 2024).

Table 1

Brazil - Reported Cases

Year	Ign/White	Bothrops	Crotalus	Micrurus	Lachesis	Non-venomous	Total
2010	98504	21604	2383	210	1033	1186	124920
2011	111149	21843	2493	229	1008	1244	137966
2012	116382	20488	2166	236	874	1263	141409

2021	228139	23518	2735	301	323	2190	257206
2022	264675	21627	2563	370	303	2218	291756
2023	312752	21693	2646	379	397	2952	340819
Total	2640297	296475	34080	3877	8971	25964	3009664

Source: Ministry of Health - SINAN (2024).

In contrast, accidents involving the genus *Crotalus*, which account for about 10 to 20% of accidents by venomous snakes, had a much higher mortality rate, about 0.95%. Although these accidents are numerically lower than those of *bothrops*, the consequences of

envenomation are more serious due to the occurrence of rhabdomyolysis which, if not treated early and properly, can lead to kidney failure and, consequently, to the death of these patients (BRASIL, 2024; DA SILVA; BROOK; et al., 2023; PHAN, 2023).

The analysis of the geographical distribution of cases of envenomation by *Crotalus* snakes between 2010 and 2023 shows a significant concentration in the Northeast and Southeast regions of the country. The Northeast region registered 12,877 cases, with emphasis on the states of Bahia (2,375) and Maranhão (5,107), where rural activities, hot weather and interaction with the natural environment favor contact with snakes. The Southeast region, in turn, had a total of 11,994 cases, led by Minas Gerais, which accounted for 8,325 cases. The predominance of this region can be explained by the vast territorial extension with a predominance of rural characteristics, where there is greater exposure to these reptiles (BRASIL, 2024; TOZETTI et al., 2013).

Source: Ministry of Health - SINAN (2024).

In the North region, which accounted for 2,995 cases, the state of Tocantins had the highest number of occurrences (1,346) followed by Roraima (648), where the presence of reptiles can be explained by the transition between biomes and forests. The Central-West region registered 4,564 cases, with Goiás being the state with the highest incidence (2,686), which may be related to high agricultural activity and the cerrado. In the south of the country, a region that accounted for 1,650 cases in total, the state of Paraná concentrated 1,494 of these occurrences, reflecting the areas of Atlantic Forest and local agricultural practices (BRASIL, 2024).

The analysis of the monthly data in which the cases occurred reveals a clear seasonality, with a higher incidence in the first months of the year. January, February and March concentrated 11,834 cases, representing 34% of the total. This increase in the first months of the year may be related to the warmer and more humid weather, coinciding with greater snake activity and greater circulation of people in agricultural areas (BRASIL, 2024; TOZETTI et al., 2013; ARAÚJO et al., 2023).

Source: Ministry of Health - SINAN (2024).

The winter months, such as June (2,355 cases) and July (1,927 cases), had the lowest number of accidents, possibly due to less activity of both snakes and people in rural areas during this period. However, October and November showed a new increase in cases, possibly due to the resumption of agricultural activities and a greater presence of snakes after winter (BRASIL, 2024).

3.1 AGE GROUP

The distribution of accidents by age group reveals that most victims are in the 20 to 39 age group, with a total of 11,000 cases, followed by the 40 to 59 age group, which had 11,209 cases. These data indicate that young and middle-aged adults, particularly those engaged in agricultural activities and outdoor work, are more exposed to the risk of *Crotalus* bites (BRASIL, 2024; ARAÚJO et al., 2023).

Source: Ministry of Health - SINAN (2024).

Children and adolescents aged 0 to 19 years add up to 6,780 cases, which corresponds to approximately 20% of the total. This age group requires special attention, since children are more vulnerable to the toxic effects of the poison due to their smaller body volume and greater difficulty in their physiological response to poisoning. On the other hand, the elderly, especially those over 60 years of age, accounted for 5,086 cases. This group is particularly susceptible to serious complications, including kidney failure and coagulopathies, due to the presence of comorbidities and physical frailty (BRASIL, 2024; DA SILVA et al., 2023).

Source: Ministry of Health - SINAN (2024).

The data indicate that accidents involving *Crotalus* snakes predominantly affect males, with 27,075 cases, compared to 7,000 cases in females, between 2010 and 2023. This corresponds to a proportion of approximately 80% of cases occurring in men. This disparity can be explained by the greater presence of men in rural and risky activities, such as agriculture and livestock, which favor contact with snakes (BRASIL, 2024).

Source: Ministry of Health - SINAN (2024).

The bite site is another important factor in the analysis of *Crotalus* accidents. Most bites occur in the lower limbs, mainly in the foot (12,774 cases) and leg (9,752 cases). This reflects the natural behavior of snakes, which attack when they feel threatened, especially when people walk through areas of dense vegetation or manipulate the soil, where snakes often hide. Bites on the upper limbs, including hands and fingers, add up to 6,884 cases, suggesting that many of these occurrences may happen during the inadvertent handling of snakes or in situations of direct attack (BRASIL, 2024).

4 CONCLUSION

As the accidents occurred mainly in rural areas, in the hottest and humid months, affecting the upper and lower limbs of young and middle-aged adults, in agricultural and outdoor activities, the need for prevention campaigns is fundamental, reinforcing the need for the correct use of personal protective equipment for the most exposed population and awareness of the health teams regarding the characteristics of these accidents in order to provide adequate care, without delay, minimizing possible complications.

ABSTRACT

This analysis seeks to examine the causes that have contributed to the decreasing tolerance in dialogue among different sectors and social classes in Mexico. The study was conducted using a qualitative, analytical, and documentary approach, offering a comprehensive perspective on the dynamics that influence social coexistence. It identifies the causes of intolerance and also analyzes the role of the political class and the media in constructing narratives that negatively affect social understanding, dialogue, and harmonious coexistence among citizens. The findings of this research are expected to be useful both for scholars and for those who design public policies and strategies aimed at fostering greater peaceful

coexistence in the country, particularly in times when violence has taken over much of the public spaces in the Mexican Republic.

Keywords: Intolerance. Dialogue. Inequality. Polarization. Media.

RESUMO

A presente análise busca examinar as causas que têm contribuído para a crescente diminuição da tolerância no diálogo entre diferentes setores e classes sociais do México. Este trabalho foi realizado a partir de uma abordagem qualitativa, analítica e documental, oferecendo uma visão compreensiva das dinâmicas que influenciam a convivência social. Identificam-se as causas da intolerância, analisando também o papel da classe política e dos meios de comunicação na construção de narrativas que afetam negativamente o entendimento social, o diálogo e a convivência harmônica entre os cidadãos. Espera-se que os resultados desta pesquisa sejam úteis tanto para acadêmicos quanto para aqueles que formulam políticas públicas e estratégias capazes de promover uma convivência mais pacífica no país, especialmente em tempos em que a violência se apoderou de grande parte dos espaços públicos da República Mexicana.

Palavras-chave: Intolerância. Diálogo. Desigualdade. Polarização. Mídia.

RESUMEN

El presente análisis pesquisa analizar las causas que han contribuido a que cada vez exista menor tolerancia en el diálogo entre distintos sectores y clases sociales de México. Este trabajo se ha realizado desde un enfoque cualitativo, analítico y documental y ofrece una visión comprensiva de las dinámicas que influyen en la convivencia social, identificando las causas de la intolerancia, analizando también el papel de la clase política y de los medios de comunicación en la construcción de narrativas que inciden negativamente en el entendimiento social, el diálogo y la convivencia armónica de la ciudadanía. Se espera que los resultados obtenidos de esta investigación sean de utilidad tanto a académicos como para aquellos que formulan políticas públicas y estrategias que puedan fomentar una mayor convivencia pacífica en el país, en tiempos en donde la violencia se ha apoderado de gran parte de los espacios públicos en la República Mexicana.

1 INTRODUCTION

In a country with great cultural and social diversity such as Mexico, tolerance and dialogue become fundamental for social well-being and to achieve peaceful coexistence, however; From 2012 to date, there has been an increase in social polarization and a decrease in the capacity for dialogue between sectors and social classes. Factors such as economic inequality, violence, and polarizing discourse in the political class and in the media have sown distrust and fragmentation, even affecting family units. For this reason, this research explored some factors that cause or trigger intolerance, contributing, through these results, to make visible the need to build a more cohesive and dialoguing social environment in Mexican society.

1.1 PROBLEM STATEMENT

The lack of tolerance in social dialogue in Mexico is an alarming phenomenon that has affected society as a whole. Despite efforts by various institutions and civil organizations to promote mutual understanding, tensions between different groups, accentuated by political, social, and economic crises, have led to increasingly hostile communication between people. The media, in their role as opinion makers, have also played a crucial role in this dynamic, often intensifying polarization. This analysis allows us to understand how these elements interact and what are the roots of intolerance that impede constructive dialogue in the country.

The National Human Rights Commission (CNDH) stressed that the accusations and disqualifications of media outlets and journalists, as well as against defenders and civil society organizations, by senior state officials contribute to generating an environment that is not conducive to freedom of expression and journalists, and also to those who promote respect for the rule of law and defend fundamental rights. in addition to showing the worsening in many cases of the conditions that gave rise to the Mechanism for the Protection of Human Rights Defenders and Journalists (CNDH, 2023, par. 1).

1.2 RESEARCH OBJECTIVES

General Objective

To analyze the main causes that have generated a lack of tolerance in the dialogue between sectors and social classes in Mexico, in the period 2012-2025, through a qualitative and documentary study.

Specific Objectives

Identify and examine the social and political causes that have contributed to intolerance and polarization in the Mexican context.

To analyse the impact of the media and media narratives on public perception of tolerance and social dialogue.

1.3 THEORETICAL FRAMEWORK

According to the CNDH Mexico (2018), tolerance is defined as respect for the ideas, beliefs, or practices of others when they are different or contrary to one's own. In this context of this study, tolerance involves not only the passive acceptance of diversity, but also an active recognition of the legitimacy of other perspectives. This concept is crucial in plural societies, as it promotes peaceful coexistence and mutual understanding, essential components for social and political development. Tolerance, therefore, can be affected by multiple factors, including historical, educational, and socioeconomic context, among others.

The communicative process that aims to exchange ideas and build understanding between different people and groups is known as dialogue, and this is not a simple conversation, nor a debate. It is not a question of convincing others to agree with one's own point of view or of converting them. The aim of the dialogue is to overcome misunderstandings and dispel stereotypes in order to promote mutual understanding (KAICIID, n.d., para. 2). For the purposes of this publication, dialogue is conceptualized as an open space where the expression of diverse opinions is encouraged and consensus is sought through empathy and respect.

Dialogue is therefore critical in the management of social conflicts, since it allows differences to be addressed and joint solutions to be found, avoiding conflicts; the latter being understood as a situation in which two or more agents (people, groups) perceive that they have mutually incompatible interests, make their disagreement public and seek to mobilize support and allies in a confrontational context of permanent opposition (Aunta and Barrera, 2016, cited by Ibáñez, 2022, p. 2). Effective dialogue is therefore essential to overcome polarization and build healthy and sustainable social relationships. Social sectors refer to the different groups in society that are differentiated by characteristics such as economic class, ethnic identity, geographical location, among other factors. In Mexico, it is essential to recognize that society is made up of multiple strata with different interests and levels of power. The interaction between these sectors can be both constructive and conflictive, depending on the conditions of tolerance and the ability to engage in effective dialogues.

Taking into account what was published by the Central University (2021), effective communication refers to the ability to transmit information and emotions in a clear and understandable way, ensuring that the message is properly received and understood by the interlocutor, it also implies expressing thoughts and feelings in an honest and respectful way, without falling into aggression or passivity. thus facilitating constructive dialogue and reducing stress and therefore, contributing to reducing social tension and building bridges between different social sectors.

In this regard, Baca (S.F.) mentions that communication and dialogue are, therefore, the fundamental pillars in the strengthening of a democratic and just society, since open and honest communication allows citizens to express their opinions, demands and concerns, which contributes to the development of more inclusive and representative public policies. In addition, dialogue facilitates consensus-building, promoting the participation of various sectors in the democratic process, fostering tolerance for diversity and allowing all voices to be heard. The lack of tolerance between social sectors can transform dialogue into a field of conflict, where judgments and mistrust prevail instead of mutual understanding. At the same time, effective dialogue, facilitated by assertive communication, acts as a catalyst for tolerance and allows different sectors to interact constructively, a challenge that must now be addressed and prioritized in Mexico.

This qualitative research work, which has focused on documentary analysis, has adopted a qualitative design of non-intervention, which has allowed the collection and analysis of data from secondary sources, exploring in depth the causes of intolerance in social dialogue in Mexico, without the need for direct interaction with the participants. With respect to the sources consulted, it is based on the analysis of various documentary sources, such as: academic articles and books, government reports, and, where appropriate, publications of non-governmental organizations and other civil society actors, and press publications, such as reports or news, which contain information related to social coexistence. and that specifically address intolerance and dialogue between social sectors, during the period 2012-2025. The documents from the various sources were identified and analyzed, categorizing the information, and then carrying out the analysis of the content and the revelation of the corresponding findings.

2 RESULTS

Economic inequality in Mexico is a persistent phenomenon that continues to affect the possibilities of effective dialogue between social classes. According to the National Council for the Evaluation of Social Development Policy [CONEVAL] (2018), in that year, about 41.9% of the population lived in poverty, and although there was a slight decrease, extreme poverty continued to affect a significant proportion of the population. This inequality translated not only into income differences, but also into access to essential services such as education, health, and employment. The unequal distribution of resources creates a psychological and social gap that fosters mistrust among sectors of the population, had deteriorated the ability to engage in constructive and collaborative dialogues. In addition, the aforementioned studies showed social injustice as a driver that fuels feelings of intolerance, since, when people feel that their needs are not being met fairly, they can become more hostile towards other groups. In this sense, economic inequality becomes an obstacle to the construction of cohesive and dialoguing communities.

Political polarization has also reached alarming levels in the Mexican context, particularly since the 2018 elections, which led to a radical change in government administration. This phenomenon has been exacerbated by divisive political rhetoric and a lack of commitment to constructive dialogue. Research by the organization "Causa en Común" (2023) revealed that political polarization not only affects political life itself, but also permeates relations between citizens, creating setbacks that ruin the possibility of communication and cooperation among citizens. It is also worth mentioning that the growing distrust in political institutions has led many citizens to consider dialogue to be useless. In this sense, the survey by the National Electoral Institute [INE] (2022) shows that 67% of those interviewed expressed that they do not trust political parties, which reflects how this distrust acts as a brake on social dialogue. Therefore, the lack of institutional trust translates into a growing indifference towards civic participation, leading to a decrease in spaces where dialogue can take place effectively.

The media, for their part, have also played an ambivalent role in making or breaking social dialogue. On the one hand, they can act as platforms for diverse voices, and, on the other, contribute to polarization by spreading biased or false information, prioritizing sensationalist narratives that exacerbate conflicts, rather than promoting mutual understanding and peaceful conflict resolution.

This fake news, which is dispersed either through headlines, images or larger letters, or any other type of information that is taken out of context to make it seem true, when it is not, is fabricated to manipulate or deceive through impostor content, creating a problem of certainty and truth in the information among the population.

Before the emergence of the internet, the "blog", the "web", among others, information professionals had at their disposal a series of sources of information that were considered reliable, reference sources that followed a series of controls and validations through which it was possible to guarantee the quality of the information disseminated. However, the consolidation of social networks has created a problem about the certainty and veracity of information (López-Borrull et al., cited by CNDH, 2019, p.11).

Intolerance and discrimination in Mexico is another important factor to consider in this study and manifests itself in various ways, including racism, homophobia and xenophobia; which makes it difficult to create spaces for inclusive dialogue. The National Council for the Prevention of Discrimination [CONAPRED] (2023) has reported an increase in complaints of discrimination in recent years, especially among vulnerable groups such as indigenous communities and the LGBTQ+ population. These forms of intolerance are not just individual issues, but reflect broader social structures that perpetuate exclusion and division. In addition to the above, that same agency in the results of its national survey on discrimination [ENADIS] applied in 2022 in Mexico, recognizes that, of the total population aged 18 years and over, 23.7% stated that they had been discriminated against in the last 12 months due to one of the following characteristics or personal condition: skin tone, way of speaking, weight or height, way of dressing or personal grooming, social class, place of residence, religious beliefs, sex, age, sexual orientation, being an indigenous or Afro-descendant person, having a disability, having a disease, political opinions, marital status or situation of partner or family, among others. These results are important because, as mentioned above, when the voices of historically marginalized sectors are ignored, hostility can increase and this in turn impedes social dialogue.

Distrust in institutions is another widespread phenomenon that is affecting the quality of social dialogue in this country. A study by "México Evalúa" (2023), showed that 72% of Mexicans do not trust the judicial system, attributing this distrust to the perception of corruption and lack of access to justice. This situation has led to social fragmentation, where citizens feel that they have no effective channel to express their concerns or seek solutions to their problems. In addition, when citizens perceive that institutions are more aligned with

particular interests than with the common good, the legitimacy of public policies and programs is undermined. In this context, a lack of trust becomes a significant impediment to constructive dialogue and collaboration between sectors. According to this same source, between 2020 and 2024, fewer and fewer people had heard about key entities, such as prosecutors' offices, judges, and police (México Evalúa, 2023, p. 3).

Violence and insecurity are perhaps the most powerful factors affecting social dialogue in Mexico. With homicide rates that have remained alarmingly high in recent decades, uncertainty and fear permeate the daily lives of many citizens. According to data from the Mexican Secretariat of Security and Citizen Protection (2023), there is a widespread perception that violence is on the rise, leading communities to close themselves off and distrust others, this violence not only affects the direct victims, but also has a domino effect that disrupts social dynamics, fostering attitudes of distrust and aggressiveness. In this sense, the context of violence highlights the need to create safe spaces where dialogue can take place. These community initiatives have become essential, but governments do not perceive these actions as a priority, but, on the contrary, there are constant accusations and disqualifications, sanctions or even disappearances of those who think differently; a factor that has severely limited them. In addition to the above, the lack of tolerance in social dialogue in Mexico, which has skyrocketed over the last seven years, has revealed a complex interrelation of factors that fuel polarization and hinder the construction of peaceful coexistence.

3 CONCLUSIONS

The persistence of socioeconomic inequality is one of the main obstacles to dialogue in Mexico. As long as a large part of the citizens are born, grow up and live their lives with serious shortcomings, social dialogues in this country will continue to be absent.

Political polarization, on the other hand, is a true "social cancer" that has reached critical levels, and has been exacerbated by a media environment that prioritizes sensationalization and divisive narratives, both in the country's political class, the current government of Mexico, and in the media, a political climate that hinders the possibility of forming consensus and limits citizen participation. It is essential that both the media and political leaders of all parties adopt constructive positions that promote mutual understanding, respect and inclusion of all social sectors and among all social sectors.

Mexico and other countries face processes of growing political intolerance between defined or undefined groups in society. The constant disqualification of the views of others, the reduction to absurdity of the arguments of those who consider themselves to be against it, the oversimplification of the views that favor our own opinions and discard the validity of those who think differently from us is a constant today in practically any media we consult (Martínez, 2025, pair. 3).

As can be seen, the problem of lack of social dialogue and intolerance in Mexico is multifactorial and complex. Undoubtedly, in this chapter only some factors that intervene in this social phenomenon are analyzed, for this reason it is necessary to continue expanding research on the subject, considering other aspects such as: migration, family disintegration, organized crime and various world paradigms such as materialism, economic interests, globality and other ideologies that, instead of promoting universal values, they contribute to social disintegration and the devaluation of life.

There are many challenges, one of them is the promotion of content in social media and even in institutional media, which prioritize understanding and the peaceful resolution of conflicts; a situation that is difficult to achieve, since it implies the establishment of codes of ethics that promote social responsibility in communication, but at the same time defend and allow freedom of expression, in a society where, in many spaces, corruption has seriously permeated, and the thirst for power and control for the achievement of political and business objectives. turning these problems into opportunities for the implementation of authoritarianism and control "in mode" of the population, in which citizens run the risk of losing even more freedoms.

For this reason, it is considered essential that academic institutions, especially those of higher education, undertake a strong strategy of information and media literacy, so that a good part of the population can show and issue informed judgments as users of information and media, generating content that is based on and objective the development of critical thinking. so that people are able to discern between what is fact, what is false news or a simple opinion, since sadly but daily, these are some of the strategies that seriously violate a majority of citizens of the Mexican population. At the same time, it is imperative to develop in citizens competencies that allow them to search, analyze and organize the information to which they have access.

This is complex in a society where quality education is a luxury and in an environment in which those who do not make an effort are rewarded and those who produce are punished,

a system that perpetuates the division of sectors and allows the manipulation of people, installing in their imagination, the idea that some are bad and others are good. For this reason, education must be provided for democracy and citizen participation, in spaces where young people are taught to dialogue respectfully and to understand the complexity of human interactions, through respect for diverse points of view. As Edward James Olmos rightly states, "Education is the vaccine against violence" (Portilla, 2024, p. 81).

The family is positioned as the first educational space in society, and it is, for this reason, where the learning of tolerance and respectful dialogue begins. Parents are responsible for promoting assertive communication and respect for differences at home, so that people are not only able to dialogue, but also to value diversity as something that enriches (not gender ideology, which is something else). Education in the family nucleus is responsible for instilling respect and promoting it consistently; Educational institutions are only complementary in the integral formation of the subject. The school must strengthen effective and assertive communication in the classroom, but the family is the nucleus of training and dialogue.

To conclude, it can be said that the promotion of a culture of dialogue and tolerance in Mexico is not only an aspirational desire, but an urgent need. At a historical moment in which Mexico is presenting what could be defined as a great "social tribulation"; This country is in a period of intense adversity, suffering and difficulties that affects society as a whole; For this reason, the family, academia, government, the media, companies, social networks, and all social sectors of the country, must be allies to generate a process that reverses intolerance in dialogue, creating environments in which each individual feels valued, listened to, and respected, regardless of their beliefs and points of view. since only in this way can a just, democratic and happy society be built.

ABSTRACT

Recommendation systems have become central elements in contemporary digital platforms, thereby assisting users in making decisions related to content consumption. However, reading-based recommendations still have strong characteristics such as dependence on collective evaluations, popularity algorithms, or superficial metadata. This article presents a new possibility: BookSuggest AI, a recommendation system that integrates personal reading history, recorded by the user in Google Sheets spreadsheets, with Generative Artificial Intelligence models. Based on classic authors of recommendation systems, such as Adomavicius and Tuzhilin (2005), Goldberg et al. (1992), and Resnick and Varian (1997), the

work explores how personal data can be transformed into relevant recommendations using modern AI techniques. The study details the technological architecture, the authentication process via Google OAuth, the data extraction and processing pipeline, as well as the use of generative models to build recommendations. The results demonstrate that BookSuggest AI is capable of generating personalized suggestions that are justified and consistent with user preferences. In addition, a critical analysis of the system and a discussion of its potential, limitations, and contributions are included. The article complies with ABNT standards and the editorial standards of Revista Aracê.

Keywords: Recommendation Systems. Artificial Intelligence. Reading. Personalization. Generative AI.

RESUMO

Sistemas de recomendação tornaram-se elementos centrais em plataformas digitais contemporâneas, e auxiliam, com isso, usuários na tomada de decisões relacionadas ao consumo de conteúdo. No entanto, recomendações baseadas em leitura ainda apresentam fortes características como a dependência de avaliações coletivas, algoritmos de popularidade ou metadados superficiais. Este artigo apresenta uma nova possibilidade: o BookSuggest AI, um sistema de recomendação que integra o histórico pessoal de leitura, registrado pelo usuário em planilhas do Google Sheets, com modelos de Inteligência Artificial Generativa. Fundamentado em autores clássicos dos sistemas de recomendação, como Adomavicius e Tuzhilin (2005), Goldberg et al. (1992) e Resnick e Varian (1997), o trabalho explora como dados pessoais podem ser transformados em recomendações relevantes por meio de técnicas modernas de IA. O estudo detalha a arquitetura tecnológica, o processo de autenticação via Google OAuth, o pipeline de extração e tratamento de dados, bem como o uso de modelos generativos para construção das recomendações. Os resultados demonstram que o BookSuggest AI é capaz de gerar sugestões personalizadas, justificadas e coerentes com as preferências do usuário. Além disso, inclui-se uma análise crítica do sistema e discussão sobre suas potencialidades, limitações e contribuições. O artigo está alinhado às normas ABNT e ao padrão editorial da Revista Aracê.

Palavras-chave: Sistemas de Recomendação. Inteligência Artificial. Leitura. Personalização. IA Generativa.

RESUMEN

Los sistemas de recomendación se han convertido en elementos centrales de las plataformas digitales contemporáneas y, por lo tanto, ayudan a los usuarios a tomar decisiones relacionadas con el consumo de contenidos. Sin embargo, las recomendaciones basadas en la lectura siguen presentando características importantes, como la dependencia de evaluaciones colectivas, algoritmos de popularidad o metadatos superficiales. Este artículo presenta una nueva posibilidad: BookSuggest AI, un sistema de recomendación que integra el historial de lectura personal, registrado por el usuario en hojas de cálculo de Google Sheets, con modelos de inteligencia artificial generativa. Basado en autores clásicos de los sistemas de recomendación, como Adomavicius y Tuzhilin (2005), Goldberg et al. (1992) y Resnick y Varian (1997), el trabajo explora cómo los datos personales pueden transformarse en recomendaciones relevantes mediante técnicas modernas de IA. El estudio detalla la arquitectura tecnológica, el proceso de autenticación a través de Google OAuth, el proceso de extracción y tratamiento de datos, así como el uso de modelos generativos para la construcción de recomendaciones. Los resultados demuestran que BookSuggest AI es

capaz de generar sugerencias personalizadas, justificadas y coherentes con las preferencias del usuario. Además, se incluye un análisis crítico del sistema y una discusión sobre sus potencialidades, limitaciones y contribuciones. El artículo se ajusta a las normas ABNT y al estándar editorial de la Revista Aracê.

Palabras clave: Sistemas de Recomendación. Inteligencia Artificial. Lectura. Personalización. IA Generativa.

1 INTRODUCTION

A priori, it is valid to bring that digital transformation has significantly expanded the possibilities of customization in computer systems. With the growing availability of personal data and the advancement of Artificial Intelligence techniques, new ways to assist users in decision-making have emerged in the most diverse domains, such as entertainment to education, or from health to cultural consumption (ROBERTSON; VINCENT, 2023).

Among these domains, the context of reading stands out. Platforms such as Goodreads, Skoob, and Bedside have gained popularity by allowing the recording of reading habits, the sharing of opinions, and the building of literary communities. In view of this, as Adomavicius and Tuzhilin (2005) point out, many recommendation systems still operate with traditional techniques, and their collaborative filters, general popularity, or aggregate rankings, represent strategies that can sometimes present gaps in capturing individual nuances of users. It is worth noting that the potential of traditional recommendation systems, by proposing the space of displacement to the reader through the community's field of discovery, is a relevant power. However, here, we will focus on the proposition of adjusting the recommendations to your enjoyment zone.

In parallel, it is also observed that many readers build individualized records in personal spreadsheets, such as Google Sheets. In these documents, users write down titles, authors, reading dates, subjective evaluations, and even their own comments. Despite the richness of this data, data such as these may not be used for analytical purposes to their full potential (BOENTE et al., 2025).

In view of this scenario, the present work proposes BookSuggest AI, a recommendation system that uses personal and real data recorded by the reader. The proposal integrates Google Sheets with generative AI to identify patterns and suggest books that dialogue directly with the reader's profile.

This paper presents: a theoretical review on recommendation systems and generative AI; the methodology for developing the system; results obtained with the operation of the tool; comparative discussion and critical analysis; and conclusions that point to future possibilities.

2 METHODOLOGY

The methodology adopted in the development of BookSuggest AI was structured to ensure technical accuracy, functional coherence, and fidelity to the system's central

objective: to generate personalized literary recommendations from real user data. To this end, the system was designed as a modular web application, organized in layers that communicate in an integrated way. The user interface is the initial point of interaction, which allows authentication, selection of the reading spreadsheet, and visualization of recommendations. The business logic is processed in the backend, implemented in Go, which connects to Google Sheets and generative Artificial Intelligence models. This layer is supported by external services, such as Google OAuth 2.0 for secure authentication, the Google Sheets API for reading the data, and the Gemini or ChatGPT models for analysis and generation of suggestions.

The data collection and processing process begins with user authentication, carried out exclusively in reading mode, as it values privacy and compliance with international digital security standards. After *logging in*, the system requests the selection of the spreadsheet that contains the reading history, and requests minimum columns such as title, author, genre, rating, and date, as well as optional fields such as comments and tags. Once loaded, the data undergoes transformations that normalize categories, convert notes into numerical values, and structure a reading dictionary, an essential step to avoid inconsistencies that could compromise the AI's analysis.

The next phase corresponds to the analysis based on generative Artificial Intelligence, considered the innovative core of the system. The backend organizes a prompt that gathers the complete history of readings, summary statistics, and specific instructions for the model to produce exactly three recommendations, accompanied by detailed justifications structured in JSON format. AI interprets patterns such as author recurrence, gender predominance, variations in ratings, and even preferences for certain literary periods, and balances different reader tendencies when formulating suggestions. The result is returned to the user in visual cards, which contain title, author, justification and degree of relevance.

Finally, the development of BookSuggest AI involved a set of modern technologies that are widely used in web applications. In the backend, in addition to Go, frameworks such as Gin, libraries for OAuth and the official Google API client were used. The frontend was built with HTML5, CSS3 and JavaScript, using Bootstrap for responsiveness and

Additional user experience components. The AI layer directly integrates Gemini and/or ChatGPT APIs, while the infrastructure includes containerization via Docker, in order to ensure scalability and technological independence.

3 THEORETICAL FOUNDATION

The theoretical foundation of this work addresses relevant concepts in understanding the functioning and relevance of BookSuggest AI. The bases of recommendation systems, the role of generative Artificial Intelligence models, as well as studies and platforms related to reading and literary suggestions are discussed.

3.1 RECOMMENDATION SYSTEMS

Recommendation systems are computational tools created to assist users in making decisions in the face of the large volume of information available digitally. The literature describes these solutions as mechanisms capable of identifying patterns of behavior, inferring preferences, and suggesting items appropriate to individual profiles (ADOMAVICIUS; TUZHILIN, 2005).

Approaches such as that of Goldberg et al. (1992), with the Tapestry system, dealt with the collaborative filtering technique, and thought about the generation of recommendations based on the actions and preferences of other users with similar profiles. Resnick and Varian (1997) point out that this technique has revolutionized access to information, especially in domains such as movies, music, and e-commerce.

Over time, systems have evolved into three main categories:

a) Collaborative Filtering

It is based on collective behavior. Users with similar tastes receive similar recommendations (Goldberg et al., 1992).

Example: "People who read X also liked Y."

b) Content-Based Filtering

It focuses on characteristics of the items: genre, author, keywords, themes, etc.

Example: "You liked science fiction, so we recommend more science fiction books."

c) Hybrid Systems

They combine user data with item characteristics, and seek greater accuracy (ADOMAVICIUS; TUZHILIN, 2005).

Observing these advances, it is possible to reinforce that the power, in the field of suggestions, of collaborative filtering, may also represent a gap in the individualization of the recommendation. The recommendations may be generic, and even have no inference from the taste of a specific reader, but rather from the *ranking* of popular titles, for example.

In this sense, it is relevant to explore alternative ways of recommending, such as those based on **a personal and personalized curation**, made an individual reading worksheet. With this in mind, we think of users who record data such as title, author, reading date, assigned grade, personal comments, genre, duration, goals. In line with the autonomy of the use of the personal spreadsheet, the following theoretical assumption is assumed for the project:

The personal reading history is representative of a reader's preference, and its exploration is fertile.

This principle guides the development of the system presented in this article.

3.2 GENERATIVE ARTIFICIAL INTELLIGENCE

In recent years, Generative Artificial Intelligence models have become widely used. Platforms such as GPT (OpenAI), Gemini (Google) and Claude (Anthropic) have transformed the way texts are produced, analyzed and structured automatically (ROBERTSON; VINCENT, 2023).

These models are capable of interpreting complex instructions; identify patterns in datasets; generate personalized content; analyze implicit preferences and even create explanatory justifications. The use of generative AI in recommendation contexts represents an advance over traditional methods. While classical algorithms require extensive bases for identifying patterns (ADOMAVICIUS; TUZHILIN, 2005), generative models can interpret even small sets of data, such as a personal spreadsheet.

BookSuggest AI relies on these points. Through strategically structured prompts, the generative model is able to analyze evaluations given by the user; infer favorite genres, recognize recurring authors; identify subjective patterns and generate coherent recommendations even with few samples. This process allows you to go beyond the limits of systems based solely on statistical algorithms or collaborative filtering.

3.3 LITERARY RECOMMENDATION PLATFORMS AND APPLICATIONS

The popularization of reading platforms has broadened the discussion about literary recommendations. About Goodreads, thinking about the current year (2025), millions of users use the network to record readings and search for suggestions. In Brazil, Skoob has similar functionality, and enables the organization of shelves, goals and reviews.

Even so, the literature and empirical analysis indicate the majority of popularity-based recommendations; *global ranking* ; and the consequent partial disappearance of the individual history, resulting from the sometimes widespread reliance on collaborative databases and the high influence of trends.

Boente et al. (2025) discuss how customized solutions based on proprietary data have the potential to generate greater relevance and accuracy. Although Boente's study deals with the health domain, his methodological approach oriented to personal data represents a strong inspiration.

In the literary context, there are still few systems that connect intrinsically personal databases to the recommendation process; employ generative AI to interpret them; provide explained suggestions; operate with private data controlled by the user and also avoid dependence on external generic metrics. Thus, BookSuggest AI proposes an innovative path: it builds recommendations that aim to be guided by greater proximity to the reader's profile.

4 RESULTS

This section presents the results obtained from the development of BookSuggest AI, including the functional flow of the system, the analysis of the user experience, the integration with external APIs, and the display of recommendations generated by Artificial Intelligence. All screens captured during the execution of the system were reorganized and described according to the standards for the presentation of figures, in order to ensure contextualization and narrative coherence.

BookSuggest AI achieved its proposed goals: it integrated with Google Sheets, processed real reading data, used AI models to generate personalized recommendations, and presented the results to the user in a clear and visually structured way. The system proved to be functional from login to the final generation of recommendations, including intermediate loading screens and spreadsheet selection.

Figure 1

BookSuggest AI System Home Page

Source: Prepared by the author in 2025.

Figure 1 shows the system's home screen, where the user accesses the main page and starts the authentication flow. The interface prioritizes simplicity, presenting only the login button, an essential item for secure access validation. By clicking "Sign in with Google", the user is redirected to the official OAuth screen, as shown in Figure 2.

Figure 2

Google Sign-in Option

Source: Prepared by the author in 2025.

Authentication is confirmed in sequence with intermediate screens, to be represented by Figures 3 and 4.

Figure 3

Google Account Verification

Source: Prepared by the author in 2025.

Figure 4

Confirmation of System-Requested Permissions

Source: Prepared by the author in 2025.

These screens demonstrate the project's alignment with international security standards, ensuring that no sensitive data is used without consent. After authentication, the user returns to the BookSuggest AI dashboard, which presents the initial interface before loading any spreadsheets. Figure 5 highlights this step.

Figure 5

Dashboard Before Sheet Selection

Source: Prepared by the author in 2025.

The screen presents only the basic elements, and waits for the user to act. When you select the desired spreadsheet, the system processes the data and automatically updates the dashboard.

Figure 6

Dashboard, after sheet selection

Source: Prepared by the author in 2025.

When you request literary suggestions, the system displays the screen shown in Figure 7, indicating that processing is in progress.

Figure 7
Recommendations Loading Screen

Source: Prepared by the author in 2025.

This stage is critical as it involves calling for generative AI models. At the end of processing, the user receives personalized recommendations, displayed in structured cards, as shown in Figure 8.

AI-Generated Recommendations

Source: Prepared by the author in 2025.

Each card presents the title of the suggested book; the author; the justification based on the analyzed reading history; and the option to save interest or register feedback. This step highlights the system's ability to transform raw data, read in the spreadsheet, into

actionable insights. Finally, BookSuggest AI also allows the user to let you know if the recommendation was helpful. The next figure illustrates how this feature works.

Figure 10

Response to User Feedback

4.1 SUMMARY OF RESULTS

The analysis of the screens and features demonstrates that the system successfully authenticated via Google; uploaded real user spreadsheets; handled and normalized data appropriately; used generative AI to recommend books with detailed justifications; It presented intuitive and responsive visualization and allowed feedback, favoring later evolutions. The system has therefore fully achieved its goal of turning personal reading records into intelligent literary recommendations.

It is worth mentioning that this system recognizes the importance of the others mentioned above, such as global ranking and community-based, for example, and that these allow a greater chance of discovering titles that displace the reader. In this sense, this article seeks to propose a new path, without devaluing the others.

5 DISCUSSION

The discussion of the results obtained with BookSuggest AI allows us to understand its contributions, limitations, and potential for expansion in the context of recommendation systems. By integrating personal data with generative Artificial Intelligence models, the

system presents innovative features that dialogue directly with the classic literature in the area and with contemporary personalization needs.

Authors such as Adomavicius and Tuzhilin (2005) and Resnick and Varian (1997) highlight that the evolution of recommendation systems makes it possible to better capture the subtle preferences of users. Today, a considerable portion of platforms still rely on aggregated data, traditional collaborative filtering, or criteria such as global popularity. It is reinforced that such characteristics drive the discovery of titles that potentially diversify the reader's repertoire, but that, at this moment, our focus is on **readings independent of trends, centered on the user**.

When comparing these characteristics with platforms such as Goodreads and Skoob, a methodological difference is observed. While these networks rely on collective inputs, BookSuggest AI follows the flow of individual history. In this sense, a remarkable conceptual contribution is achieved: **the system treats the reader as the primary source of data**.

This shift is consistent with the contemporary hyper-personalization trends discussed by Robertson and Vincent (2023).

5.1 LIMITATIONS

Even with the promising results, some limitations were observed during the development and use of the system:

a) Dependency on Sheet Consistency

Generative AI is sensitive to poorly structured data. This means that spreadsheets with missing values, inconsistent genres, or incomplete evaluations can affect the accuracy of suggestions.

b) Probabilistic AI Interpretation

Generative models can erroneously infer preferences; Generate recommendations and/or exaggerate patterns that are not relevant. This stems from the very probabilistic nature of these models and represents a limitation.

c) Lack of Empirical Evaluation with Users

The study did not include statistically significant tests with groups of readers. More robust results would require evaluations with satisfaction metrics, A/B testing, and comparison with human recommendations.

d) Absence of a Continuous Learning System

Although there is a *feedback* button, there is still no pipeline that stores it, trains a classifier to, finally, personalize future recommendations. This is a future implementation. Such points were identified as limiting the automated evolution of the system.

5.2 POSSIBILITIES AND PROSPECTS FOR EXPANSION

When considering the limitations of the system, it is also interesting to think about the potential that highlights opportunities for future expansion:

a) Feedback-Based Learning

By collecting responses from users, it would be possible to implement adaptive filtering, custom models, and adjusting weights for recommendation criteria.

b) Integration with Literary Libraries and APIs

The system could be connected to Open Library or Google Books, for example. This would allow for the display of book covers, access to additional metadata, and the enrichment of justifications.

c) Advanced Export

The user could save recommendation lists; export reports; generate reading summaries.

d) Optional Collaborative Database Support

Without abandoning user-centricity, it would be possible to add suggestions based on clusters of similar readers; profile comparisons and optional collective literary tips.

e) Mobile App

For added adoption and portability, a native app could allow offline spreadsheet reading, automatic synchronization with Google Drive, and quick recommendations in one click.

6 CONCLUSION

The development of BookSuggest AI has demonstrated the feasibility and relevance of a literary recommendation system focused on the user's personal data. Unlike conventional platforms that use collective metrics, popularity, or collaborative filtering, this system prioritizes the personal reading history recorded in individual spreadsheets, providing more accurate and contextualized recommendations to the reader's profile.

The analysis of the results shows that the use of generative Artificial Intelligence models expands the potential for personalization, and enhances the interpretation of nuances of user behavior without the primary need for large external databases. This factor

represents an important contribution to the field of recommendation systems, and is close to what Adomavicius and Tuzhilin (2005) point out as the "next generation" of intelligent mechanisms.

The comparative discussion reinforces that, while platforms such as Goodreads and Skoob offer collaborative resources widely used by the reading community, BookSuggest AI, by integrating personal spreadsheets, reinforces the reader's autonomy and control over their preferences and records. Still, the work also revealed limitations, such as AI's sensitivity to data quality and the absence of a robust continuous learning mechanism, which point to fruitful paths for future improvement. Among the proposals for later versions are: integration with literary catalogs, incorporation of *feedback history*, longitudinal analysis of readings and development of a mobile application.

Thus, BookSuggest AI represents not only a functional application, but also a new methodological and conceptual possibility in the use of generative AI for personalization of reading experiences. It is expected that this work will inspire research and technological solutions that seek to explore new methodologies and, thus, make the scenario even more diverse and contemplated by different biases.

ABSTRACT

The present article examines Urban Land Regularization as an instrument for the realization of fundamental rights and the promotion of regional development, situating it within the Brazilian historical and normative trajectory (sesmarias, Land Law, 1988 Constitution, City Statute, Laws No. 11,977/2009 and 13,465/2017) and within the right to the city and the social function of property. This research has a qualitative approach, with bibliographic and documentary research, to test the hypothesis that Urban Land Regularization, when conceived as a structuring and territorialized public policy, transforms housing into a concrete right, integrates informal settlements into urban planning, and activates local socioeconomic capacities, aligning itself with the goals of the 2030 Agenda (SDGs 1, 6, 9, 10, 11, and 16). The objective is to evaluate the extent to which land regularization, articulated with urbanistic, environmental, and social justice criteria, reduces territorial asymmetries, increases legal certainty, and strengthens multilevel governance. The results indicate that Urban Land Regularization produces positive impacts on social inclusion, tax collection, and investment in infrastructure, in addition to qualifying land use and climate adaptation. However, it requires safeguards to avoid speculative captures, as well as monitoring metrics and priority for Social Interest Regularization. It is concluded that Urban Land Regularization should be treated as a State policy (transdisciplinary and participatory) capable of articulating rights, organizing the territory, and promoting sustainable regional cohesion.

Estatuto da Cidade, Leis 11.977/2009 e 13.465/2017) e no direito à cidade e da função social da propriedade. A presente pesquisa possui uma abordagem qualitativa, com pesquisa bibliográfica e documental, para testar a hipótese de que a Regularização Fundiária Urbana, quando concebida como política pública estruturante e territorializada, transforma a moradia em direito concreto, integra assentamentos informais ao planejamento urbano e ativa capacidades socioeconômicas locais, alinhando-se às metas da Agenda 2030 (ODS 1, 6, 9, 10, 11 e 16). O objetivo é avaliar em que medida a regularização fundiária, articulada a critérios urbanísticos, ambientais e de justiça social, reduz assimetrias territoriais, amplia segurança jurídica e fortalece a governança multinível. Os resultados indicam que a Regularização Fundiária Urbana produz impactos positivos na inclusão social, na arrecadação e no investimento em infraestrutura, além de qualificar o uso do solo e a adaptação climática, contudo, requer salvaguardas para evitar capturas especulativas, bem como métricas de monitoramento e prioridade à Regularização de Interesse Social. Conclui-se que a Regularização Fundiária Urbana deve ser tratada como política de Estado (transdisciplinar e participativa) capaz de articular direitos, ordenar o território e promover coesão regional sustentável.

RESUMEN

Este artículo examina la Regularización Fundiaria Urbana como un instrumento para la efectividad de los derechos fundamentales y la promoción del desarrollo regional, situándola en el recorrido histórico-normativo brasileño (sesmarias, Ley de Tierras, Constitución de 1988, Estatuto de la Ciudad, Leyes 11.977/2009 y 13.465/2017) y en el derecho a la ciudad y la función social de la propiedad. La presente investigación tiene un enfoque cualitativo, con investigación bibliográfica y documental, para probar la hipótesis de que la Regularización Fundiaria Urbana, cuando es concebida como una política pública estructurante y territorializada, transforma la vivienda en un derecho concreto, integra los asentamientos informales en la planificación urbana y activa las capacidades socioeconómicas locales, alineándose con las metas de la Agenda 2030 (ODS 1, 6, 9, 10, 11 y 16). El objetivo es evaluar en qué medida la regularización fundiaria, articulada a criterios urbanísticos, ambientales y de justicia social, reduce las asimetrías territoriales, amplía la seguridad jurídica y fortalece la gobernanza multinivel. Los resultados indican que la Regularización Fundiaria Urbana produce impactos positivos en la inclusión social, en la recaudación y en la inversión en infraestructura, además de calificar el uso del suelo y la adaptación climática, sin embargo, requiere salvaguardias para evitar capturas especulativas, así como métricas de monitoreo y prioridad a la Regularización de Interés Social. Se concluye que la Regularización Fundiaria Urbana debe ser tratada como una política de Estado (transdisciplinaria y participativa) capaz de articular derechos, ordenar el territorio y promover la cohesión regional sostenible.

1 INTRODUCTION

The persistence of urban land irregularity in Brazil constitutes one of the most serious challenges to the realization of fundamental rights and the promotion of regional development in which, even in the face of an extensive and progressively improved legal framework, including the Federal Constitution of 1988, the Statute of the City (Law No. 10,257/2001), Law No. 11,977/2009 and, more recently, Law No. 13,465/2017, several Brazilians still live on the margins of urban and registry legality, in informal settlements and without basic infrastructure. This contradiction reveals the distance between the constitutional text and the factual reality, demonstrating a structural crisis of effectiveness of the right to housing, to the city and to property with a social function. It can be seen, then, that there is an exclusionary urbanization, and the historically unequal distribution of urban land, perpetuate a model of a fragmented city, where the territory becomes a mirror of economic and social asymmetries.

From this point of view, the Urban Land Regularization (Reurb) was born as an instrument that seeks to bring formal law and territorial reality closer together, being more than an administrative procedure. Reurb represents a public policy of a legal, social and urban nature, aimed at incorporating informal urban centers into territorial planning and ensuring citizen inclusion, however, the consolidation of this institute still faces structural obstacles, such as the absence of federative coordination, institutional limitations and the economic appropriation of urban land to the detriment of the collective interest. Thus, the study of Reurb requires an approach that goes beyond the technical and legal plane, reaching the ethical, political and territorial dimensions that involve the effectiveness of social rights and spatial justice.

In view of this, the research is guided by the following guiding question: how does Urban Land Regularization, conceived as a public policy, contribute to the realization of fundamental rights and to the promotion of regional development in Brazil?

The general objective of the research is to demonstrate that Reurb, when implemented from the perspective of the social function of property and the right to the city, can constitute a mechanism of structural transformation, capable of promoting social inclusion and reducing regional inequalities. As specific objectives, it seeks to (i) analyze the historical-normative evolution of urban land regularization in Brazil, (ii) examine the relationship between Reurb, fundamental rights and sustainable urban development, and (iii) identify the challenges and potentials of Reurb as a public policy that promotes territorial justice and regional cohesion.

Methodologically, the research adopts a qualitative approach and theoretical-analytical nature, aimed at the critical investigation of the concepts of Urban Land Regularization, fundamental rights and regional development in Brazil, from an interdisciplinary perspective that involves Urban Law, Sociology and Regional Economics. It is based on bibliographic and documentary research, with analysis of the pertinent legislation, doctrinal studies and institutional experiences, seeking to understand how Reurb can operate as a vector of social and territorial integration.

The first chapter, entitled Historical-Normative Evolution of Urban Land Regularization in Brazil, presents the legal and political path that shaped the conformation of urban property and land exclusion, from the sesmarias regime to Law No. 13,465/2017. Its importance lies in demonstrating that land irregularity is a long-term phenomenon, rooted in historical processes of land concentration and commodification, which reinforces the need for public policies that combine legalization, urbanization and social inclusion.

The second chapter, Urban Land Regularization and its Relevance for the Realization of Fundamental Rights, examines Reurb as a legal instrument for the realization of the rights to housing, the city and property with a social function, provided for in the 1988 Constitution. The relevance of this chapter lies in showing that land regularization is not limited to the titling of possession, but constitutes a structuring action that unites legal, urbanistic and social dimensions, conferring materiality to human dignity and citizenship.

In turn, the third chapter, Land Regularization and Regional Development: a New Paradigm of Territorial Justice, analyzes Reurb as a public policy capable of inducing sustainable regional development, articulating it with the goals of the UN 2030 Agenda and the Sustainable Development Goals (SDGs). This chapter shows that land regularization, by integrating informal areas into the formal economy and urban planning, can contribute to territorial cohesion, the strengthening of governance and the consolidation of fairer and more inclusive cities.

With this approach, the study seeks to contribute to the understanding of Reurb from a broader perspective, which transcends the legal sphere and reaches the field of public policies and human development. In the end, it seeks to demonstrate that urban land regularization is more than an administrative act, configuring itself as a concrete expression of a constitutional project of social justice and regional balance, which transforms the right to housing into an effective right to the city.

2 HISTORICAL-NORMATIVE EVOLUTION OF URBAN LAND REGULARIZATION IN BRAZIL

Urban Land Regularization, provided for in the Brazilian legal system from Law No. 13,465/2017, is a public policy instrument aimed at the realization of fundamental rights and the promotion of social and territorial justice. More than a notarial procedure, Reurb represents a legal-urban mechanism of a structural nature, aimed at correcting historical inequalities in the appropriation of urban land and ensuring the inclusion of informal nuclei in territorial planning. Its legal nature is hybrid, encompassing legal, urban, environmental and social dimensions, in line with the constitutional principles of the social function of property (art. 5, XXIII, and art. 170, III, FC/88), the right to housing (art. 6) and urban policy (arts. 182 and 183). To understand land regularization today, it is necessary to resort to the trajectory of land regularization in Brazil, which is inseparable from the historical formation of the agrarian structure and the very conformation of the national State.

Since the colonial period, the appropriation of land has been marked by a concentrating and excluding model structured on the regime of sesmarias and the political power of the Crown, which granted land only to those who had influence or economic resources, consolidating a logic of patrimonialist privilege and social exclusion. This heritage, as Treccani (2009) observes, has given rise to the current inequality in access to land, creating a scenario of land irregularity that persists today, especially in urban areas.

In Brazil, the origin of this picture of urban informality can be attributed to the reproduction of the Lusitanian model of occupation, which linked the domain of land to the royal concession and excluded the popular strata from the right to property. Under the sesmarias regime (1500–1821), only holders of social prestige could request land, and the concession was conditional on effective cultivation, reinforcing land concentration (Treccani, 2009, p. 122). With the independence and the end of the sesmarias, the so-called "period of possessions" (1821–1850) was established, in which the absence of clear rules generated a multiplicity of informal occupations and overlapping titles. Over time, the enactment of Land Law No. 601/1850 inaugurated an important legal framework, as it provided that public lands would only be acquired through onerous acquisition, which ended up restricting access to land to those with the economic capacity to buy it, substantiating, as Prieto (2016) emphasizes, the institutionalization of social exclusion and the marginalization of the free worker, of the immigrant and the former slave.

During the imperial period and the first decades of the Republic, the right to property remained linked to the liberal-individualist conception inherited from the Portuguese tradition, according to which private domain was absolute and unconditional. The Civil Code of 1916, inspired by the French model, consolidated this patrimonialist view, ignoring the social function of property and the collective rights to urban space (Treccani, 2009, p. 130). It was only with the 1934 Constitution that the idea of limiting the right to property on the basis of social interest was introduced, inaugurating a slow transition to the paradigm of the social function of property.

Thus, in the second half of the twentieth century, with the process of industrialization and the intense rural exodus producing disorderly urban growth, the state's inability to provide decent housing and basic infrastructure became evident. This scenario increased land informality and the multiplication of irregular occupations, in which the State, in a late and fragmented way, intervened only to legitimize situations that were already consolidated in fact (Treccani, 2009). The absence of a continuous urban planning policy, added to the legal culture of exclusive protection of formal title, has had a strong impact on social inequality and the denial of fundamental rights to popular groups, marginalizing them more and more.

The promulgation of the Federal Constitution of 1988 represented a true turning point in Brazilian urban history. Influenced by social movements that fought for urban reform and by international debates about the right to the city, the Magna Carta incorporated the principle of the social function of property (art. 5, XXIII) and instituted urban policy as a tool for the organization and use of the territory (arts. 182 and 183). This new constitutional framework recognized housing as an essential social right and gave municipalities the leading role in the management of urban land, paving the way for a process of decentralization of public policies. As Oliveira and Ribeiro (2019) observe, this transformation was a direct result of pressure from urban movements, which sought legal mechanisms capable of promoting the democratization of space and the inclusion of marginalized populations.

In the same direction, the City Statute (Law No. 10,257/2001) emerged to make constitutional principles concrete, regulating them and outlining guidelines for urban policy. Among these guidelines, the "land regularization and urbanization of areas occupied by low-income populations" stands out (art. 2, XIV). The Statute introduced a broader vision of the city (not only as a physical space, but as a territory of citizenship and social coexistence), reaffirming the centrality of the social function of property and the collective right to the city. For Carmona (2015), this law symbolized a significant institutional advance, by consolidating

urban planning instruments and recognizing land regularization as a public policy of the State, overcoming the old logic of isolated and occasional actions.

Subsequently, Law No. 11,977/2009 was enacted, responsible for regulating the Minha Casa, Minha Vida Program and the mechanisms for land regularization of urban settlements. According to Oliveira and Ribeiro (2019), this rule represented an important step in instituting unified principles and procedures for the legalization of urban areas, although it has generated debates about the degree of intervention of the Union in matters of municipal competence. Even with the advances brought, the continuous increase in the housing deficit and the practical limitations of existing programs have highlighted the need for a new regulatory framework capable of addressing the persistent gaps.

In this context, the enactment of Law No. 13,465/2017 broadly reformulated the Brazilian land regularization system. The legal text introduced the concept of Urban Land Regularization, divided into two modalities: Reurb-S, aimed at Areas of Social Interest, and Reurb-E, aimed at Areas of Specific Interest. Its declared purpose was to simplify the titling procedures and integrate the rural and urban dimensions under the same legal regime. However, as Oliveira and Ribeiro (2019) warn, the new law also significantly expanded the margins of regulatory flexibility, which ended up opening loopholes for interpretations capable of legitimizing occupations in areas of high real estate value — including public property — without observing strict social criteria.

From this perspective, land regularization, although conceived to promote the right to housing and the social function of property, can produce perverse economic effects when applied indiscriminately. The successive enactment of laws and regularization programs tends to stimulate the expectation of future amnesties and, therefore, the incentive to irregular occupation³. This dynamic transforms the "city-law" into a "city-commodity" (Biasotto, 2012), displacing the value of use to the value of exchange and compromising the social function of the urban space.

From the perspective of Urban Law, Urban Land Regularization should be understood as an instrument for the structural transformation of cities, capable of articulating the material and symbolic dimensions that make up citizenship. As Carmona (2015) observes, urban policies involving land regularization are not limited to the issuance of property titles, as they

³ a phenomenon that Loures and Ribeiro (2019), based on the theory of first possession (Cooter & Ulen, 2016), identify as the "race for the invasion" of public lands, in which economic agents invest non-productive resources to guarantee in advance the appropriation of scarce goods.

also encompass territorial planning, the implementation of infrastructure and the promotion of social and environmental sustainability.

In this way, Reurb is not restricted to an administrative measure of individual titling, but configures a public policy of a structuring nature, guided by the principles of the social function of the city and the dignity of the human person. Regularizing, from this perspective, means producing the city, ensuring people access to public services, infrastructure and opportunities that characterize an inclusive, democratic and socially just urban space.

In this context, it is essential to distinguish land regularization from simple titling of possession or property. While titling is limited to the registration and patrimonial field, granting formal ownership over a specific property, regularization has a much broader scope, as it involves urban planning, social integration and environmental sustainability. This process requires coordinated action between the legal, urban, environmental and social spheres, so that the irregular area is effectively incorporated into the formal urban fabric. Only with this integration is it possible to improve living conditions, ensure adequate infrastructure and ensure access to public services and equipment essential to urban life.

In this context, Reurb should be understood as an instrument of a transdisciplinary nature, as it depends on the convergence of different knowledge and professional practices. Law provides the necessary normative basis and legal certainty, while engineering and architecture contribute to urban planning and physical infrastructure. The environment ensures sustainability and ecological compatibility, and public policies direct the social and economic integration of the communities involved. This multiplicity of perspectives expresses the very spirit of the Federal Constitution of 1988, which values the intersectoriality of public policies and the promotion of the social function of the city as an essential purpose of the State.

From this perspective, the legal concept of urban land regularization should be understood as the set of measures aimed at identifying, planning and correcting situations of dominial, urban or environmental irregularity, in order to guarantee the right to housing, to the city and to property with a social function. It is a structuring and continuous public policy, capable of boosting sustainable regional development by integrating previously marginalized territories into the formal economy, promoting the valorization of urban land and expanding access to public services.

Reurb, therefore, configures a new paradigm of territorial governance, whose essence goes beyond the simple formal legalization of land to achieve the concrete realization of

fundamental rights. By articulating social justice, territorial planning and environmental sustainability, land regularization reaffirms the constitutional commitment of the Brazilian State to the reduction of inequalities and the construction of more inclusive, humane and socially balanced cities.

3 URBAN LAND REGULARIZATION AND ITS RELEVANCE FOR THE REALIZATION OF FUNDAMENTAL RIGHTS: HOUSING, PROPERTY AND URBAN DEVELOPMENT

The Federal Constitution of 1988 represented a decisive milestone in the history of Brazilian constitutionalism by consolidating a State committed to the dignity of the human person and to the realization of social rights. More than a set of norms, the 1988 Charter outlined a project for society guided by social justice and human development, redesigning both the institutional structure of the State and the way it relates to society. This transformation imposed a new logic of public action, based on cooperation, inclusion and social responsibility, breaking with the liberal heritage that preached state neutrality in the face of structural inequalities.

According to Boaventura de Sousa Santos (2007), the democratic constitutionalism established in 1988 shifted the Judiciary from a merely declaratory function to an effective action in the promotion of citizenship and the realization of fundamental rights. From this movement, the Judiciary began to play an active role in the construction of a fair social order, becoming one of the pillars of support for the Democratic Rule of Law.

From this perspective, the realization of rights is not limited to the creation of norms, but requires coordinated institutional action that transforms them into material reality. It is in this context that urban land regularization gains prominence as an essential legal and social instrument, as it allows the realization of the fundamental rights to housing, the city and property with a social function. Through it, the constitutional project of 1988 materializes in a concrete way, translating into actions the ideal of distributive justice and full citizenship.

The right to housing, enshrined in Article 6 of the Federal Constitution, occupies a central position in the structure of the Brazilian social order. It is an indispensable condition for the realization of the dignity of the human person, as it goes beyond the simple guarantee of a property. It involves access to adequate housing conditions, basic sanitation, infrastructure, security, transportation and leisure, elements that are part of the essential core of citizenship and collective well-being.

The realization of this right requires more than the physical possession of a space to live. It presupposes the full insertion of the individual in urban life and his inclusion in public policies that ensure the collective enjoyment of the territory and dignified coexistence in society. Mastrodi (2008, p. 82) observes that social rights are the concrete expression of the public freedoms enshrined in the liberal tradition, constituting the positive face of freedom and the path to its materialization in the real plane.

It is noted that the right to housing acts as a meeting point between the principles of equality and freedom, as it ensures the material conditions necessary for the autonomous exercise of citizenship. From this perspective, urban land regularization functions as the main instrument for the realization of this fundamental right, by transforming informal ownership into legal security and integrating the citizen into urban and registry legality. Carmona (2015) highlights that the regularization of housing goes beyond the patrimonial aspect, articulating legal, urban and social dimensions, promoting territorial inclusion, the reduction of inequalities and universal access to the formal city.

On the other hand, the right to property, provided for in article 5, item XXII, is recognized by the Federal Constitution, but conditioned to the fulfillment of its social function, according to article 5, item XXIII, and article 170, item III. As Treccani (2009) recalls, the formation of the Brazilian land structure was historically marked by the concentration of land and the exclusion of the popular classes, a phenomenon consolidated by the Land Law of 1850, which transformed access to land into a mercantile relationship. The 1988 Constitution broke with this tradition by stating that the legitimacy of private property depends on the fulfillment of its social function, associating it with distributive justice, environmental sustainability, and the rational use of the territory.

From this perspective, urban land regularization materializes the constitutional principle of the social function of property, legally recognizing consolidated possession and formalizing ownership in favor of those who fulfill the social destination of the property. Such a process inverts the historical logic of exclusion and democratizes access to property, converting the urban territory into a space for the realization of citizenship. Oliveira and Ribeiro (2019) observe that Reurb represents an institutional effort to integrate formal legality into social reality, promoting legal certainty, territorial stability, and economic inclusion. The authors, however, warn that the application of the institute without defined social criteria can compromise its objectives and open space for real estate speculation practices. Thus, the effectiveness of the right to property in its constitutional dimension depends on the proper

implementation of land regularization policies, ensuring that the private domain is guided by its public and solidary purpose.

The right to the city goes beyond the merely urban field and represents the right to participate fully in urban life, to produce and enjoy social space under equal conditions. Inspired by Henri Lefebvre's conception, this right expresses the possibility of rebuilding the city as a collective work, based on the social appropriation of space and the overcoming of the capitalist logic that segregates and commodifies the territory. According to Ana Fani Alessandri Carlos (2019), Lefebvre understands the right to the city as the expression of the recognition that the urban has become the new historical horizon of humanity, in which space assumes a central role in the organization of social and political life.

The city, previously a direct result of the industrialization process, becomes the main scenario for the reproduction of social relations. Space, which once seemed neutral, reveals itself as a social and political product, shaped by the dynamics of power and the economy. The right to the city, in this sense, constitutes a transformative ideal, a horizon of emancipation that seeks to break with the alienation of everyday life and the submission of life to exchange value. It proposes a rationality focused on use, coexistence and belonging, shifting the focus from accumulation to collective life.

Within this perspective, urban land regularization plays an essential role, as it enables the concrete realization of this right. By reintegrating historically excluded populations into the formal city, Reurb promotes democratic access to the territory and reaffirms the social function of urban space as a place of coexistence, citizenship and human fulfillment.

Urban land regularization represents, therefore, the link between the constitutional text and the lived reality. By legally recognizing consolidated occupations and incorporating informal settlements into urban planning, it materializes the fundamental rights to housing, property with a social function and the city. Carmona (2015) observes that this is a highly complex process, which articulates legal, social, environmental and urban dimensions, seeking to correct historical inequalities and promote the sustainable use of the territory.

The principle that sustains this process is that of the social function of property, which breaks with the traditional view of an exclusively patrimonial character. Treccani (2009) recalls that the formation of the Brazilian land structure consolidated an exclusionary model, in which access to land remained restricted to a few. The Land Law of 1850, by requiring payment for the acquisition of public lands, reinforced this scenario of exclusion, removing the free worker and the formerly enslaved from the possibility of access to property. This

historical heritage is still reflected in contemporary cities, where vast areas remain outside formal legality, even though they are occupied by millions of people.

Thus, land regularization should be understood as much more than a titling procedure. It is an instrument of urbanization and social inclusion, which seeks to integrate irregular settlements into the formal city and ensure the population's access to public services, sanitation, lighting, transportation and basic infrastructure. Outeiro (2019) highlights that, by formalizing the occupation, regularization creates conditions for public and private investment in communities, stimulating local development and strengthening the link between citizenship and territory.

In this way, urban land regularization reveals itself as the practical expression of fundamental rights, transforming housing into an effective right, property into an instrument of social solidarity, and the city into a space of dignity and belonging. By making the positive freedoms provided for by the Constitution concrete, Reurb fulfills the essential mission of the Democratic Rule of Law, converting social rights into tangible realities and ensuring that the urban territory is a space for housing, citizenship and social justice.

4 LAND REGULARIZATION AND REGIONAL DEVELOPMENT: A NEW PARADIGM OF TERRITORIAL JUSTICE

The concept of regional development has undergone, over the last decades, a process of significant expansion, overcoming the old conception that reduced it to simple economic growth and the expansion of productive activities. Contemporary approaches understand it as a multidimensional phenomenon, which encompasses economic, social, environmental, and institutional aspects, recognizing that the advancement of a region depends not only on the generation of wealth, but also on the fair distribution of opportunities, the quality of life of the population, and the sustainability of the territory. This understanding is supported by Diniz (2009), when he states that true development is that which combines economic growth with social justice, territorial cohesion and strengthening of local capacities, in order to transform the territory into a space of citizenship and not of exclusion.

The change in this understanding resulted from a long historical process. At the beginning of the twentieth century, a vision centered on production and per capita income prevailed, in which development was measured by the increase of capital and industrialization. However, as Furtado (1972) warns, this model proved incapable of correcting structural and territorial inequalities, since the concentration of wealth in some

urban centers and the marginalization of the peripheries perpetuated regional imbalances. After the 1929 crisis and the collapse of the classical liberal model, the State began to assume the role of inductor of development, through regional policies and investments in infrastructure. However, the uniform application of these policies, disregarding local particularities, ended up reinforcing dependencies and reproducing inequalities, revealing the urgency of a new paradigm of territorial development.

In the following decades, the debate on regional development incorporated new dimensions, associating it with environmental sustainability, social inclusion and the democratization of institutions. Furtado (1972) pointed out that development should not be confused with simple economic modernization, but with the ability of a society to expand its autonomy and distribute opportunities in an equitable manner. Diniz (2009) complements this view by arguing that successful regional policies are those that balance competitiveness and equity, recognizing the importance of human capital, innovation and democratic governance. From this perspective, sustainable regional development has come to be understood as an articulation between economic, social and environmental variables, oriented to simultaneously achieve productive efficiency and territorial justice.

This conception is in line with the United Nations 2030 Agenda, which proposes the alignment of public policies with the Sustainable Development Goals (SDGs). In the Brazilian context, Urban Land Regularization stands out as an instrument capable of contributing in a concrete way to these goals, by integrating legal, urban, social and environmental dimensions in the same public policy. Reurb, therefore, ceases to be just a notarial measure to establish itself as a structuring policy, able to transform the relationship between State, territory and citizenship, translating fundamental rights into effective and lasting actions in the urban space.

Reurb's contribution is especially relevant to SDG 1, which deals with the eradication of poverty. By acting on the material living conditions of vulnerable populations, the policy guarantees legal certainty of ownership and asset valuation of real estate, allowing families historically excluded from the formal market to have access to credit, infrastructure and public policies. Diniz (2009) points out that development is only achieved when it translates into real improvements in living conditions. Reurb, by integrating housing, income and productive inclusion, breaks the cycle of urban poverty and reaffirms housing as a fundamental right linked to human dignity.

SDG 6, which deals with access to drinking water and sanitation, is also met by land regularization, as the formalization of settlements allows the expansion of basic sanitation infrastructure and universal access to water and sewage collection. Regularized urbanization enables the implementation of hydraulic and sewage networks, which improves public health and environmental quality indicators. For Furtado (1972), genuine development is that which harmonizes economy, well-being and sustainability, and basic sanitation is one of the bases of this integration. By guaranteeing essential services, Reurb strengthens territorial justice and increases environmental resilience.

With regard to SDG 9, which addresses industry, innovation and infrastructure, land regularization plays a strategic role, as it creates the legal and urban conditions necessary for productive and technological investments. Paving, energy grids and public works promoted in regularized areas boost local economies and promote sustainability. Diniz (2009) observes that infrastructure is a decisive element to reduce regional inequalities and stimulate endogenous development. In this way, Reurb transforms marginalized territories into hubs of economic dynamism, expanding access to innovation and mobility.

The relationship with SDG 10, which deals with the reduction of inequalities, is equally evident. Reurb contributes to the spatial redistribution of opportunities and to the strengthening of citizenship, by recognizing the right to housing and the city as an expression of social justice. Furtado (1972) reminds us that development cannot coexist with structures of power and property that perpetuate inequalities. In this sense, land regularization acts as an instrument of historical reparation, democratizing the urban territory and promoting more solid community bonds, which makes development more inclusive and balanced.

SDG 11, which deals with sustainable cities and communities, is the central axis of the land regularization policy. Reurb, by incorporating irregular settlements into territorial planning, encourages the rational use of the soil, planned densification and the protection of environmentally sensitive areas. The urban space thus comes to be understood as an environment of coexistence and not just of economic speculation. By promoting decent housing, participatory planning, and sustainable infrastructure, Reurb requalifies cities and strengthens social ties.

In SDG 16, aimed at peace, justice and effective institutions, urban land regularization finds a concrete field of application. Its effectiveness depends on transparent governance, legal certainty, and institutional articulation between different public agencies, such as the Judiciary, the Public Prosecutor's Office, the Public Defender's Office, and city halls. By

reducing land conflicts and ensuring the fulfillment of the social function of property, Reurb strengthens trust in institutions and contributes to social peace, reinforcing the link between territorial justice and sustainable development.

Based on the contemporary reading of regional development and in the light of the Democratic Rule of Law, it can be stated that effective development requires articulated, intersectoral and inclusive public policies, capable of achieving the constitutional promises of equality and social justice. Santos (2007) emphasizes that institutions must act in a coordinated manner, eliminating structural barriers and promoting efficient institutional flows, always under democratic legitimacy. In this context, Reurb stands out as a structuring policy, by reducing legal uncertainties, generating infrastructure, attracting investments and strengthening social and territorial cohesion.

The impacts of land regularization are wide-ranging, both economically and territorially. The titling of informal areas increases the value of real estate, expands access to credit and increases municipal revenue, which generates resources for new public policies. The formalization of possessions stimulates investments in mobility, sanitation and community facilities, improving the quality of life and boosting local economies. Oliveira and Ribeiro (2019) point out that Reurb creates a virtuous cycle of inclusion: legal certainty generates social trust, which attracts investments and reduces future costs resulting from conflicts, disasters, or exclusion.

In the territorial field, regularization contributes to a more rational use of the soil, avoiding expansion into areas of risk and environmental preservation. Outeiro (2019) observes that the integration of irregular settlements into the formal city redefines the urban space as a place of solidarity, coexistence, and sustainability.

Reurb synthesizes, therefore, the ideal of social justice and territorial cohesion enshrined in the 1988 Constitution. By transforming housing into an effective right, property into an instrument of solidarity and the city into a space of dignity, land regularization concretizes the principles of the social function of property and the city. As highlighted by Carmona (2015) and Treccani (2009), it is a public policy that goes beyond the administrative character and assumes an ethical and political dimension, committed to territorial reconstruction and overcoming historical inequalities.

The social justice that emerges from this process is both material and symbolic. By legally recognizing territories and their inhabitants, the State confers visibility and legitimacy to groups that have remained for decades on the margins of power structures. This

institutional incorporation strengthens the sense of belonging and consolidates community ties. Furtado (1972) teaches that development is only authentic when it reduces inequalities and ensures that everyone participates in the fruits of progress. Thus, Reurb not only regularizes the soil, but also rebuilds social bonds and creates the basis for a fairer and more sustainable urban economy.

Finally, urban land regularization reveals itself as an instrument of territorial integration and reconstruction of the social pact. By aligning itself with the constitutional values of human dignity, solidarity, and distributive justice, it promotes the inclusion of the peripheries, environmental protection, and the strengthening of local capacities. In this way, it reaffirms the territory as a space of emancipation and active citizenship, overcoming the paradigm of spatial inequality. Reurb, in this sense, enshrines social justice as the foundation of regional development and territorial cohesion as an indispensable condition for substantial democracy, transforming the right to the city into a right to a common and sustainable future.

5 FINAL CONSIDERATIONS

The present research demonstrated that Urban Land Regularization is an essential instrument for the realization of fundamental rights, the consolidation of the social function of property and the promotion of a sustainable regional development model, compatible with the constitutional principles of human dignity, equality and social justice. It was found that, although the Federal Constitution of 1988 and the Statute of the City have established a robust legal framework for the implementation of urban policy, the persistence of land irregularity reveals the distance between constitutional normativity and factual reality.

Such dissonance stems from the historical inequality in the distribution of urban land, the absence of inclusive territorial planning and the limited institutional capacity of the federative entities to operationalize Reurb as an effective and continuous public policy. From a legal-constitutional perspective, urban land regularization is not limited to the formalization of property, but represents the materialization of the rights to housing, the city and property with a social function, pillars that support the construction of the Democratic State of Law.

The effectiveness of these rights expands access to public policies for infrastructure, sanitation, transportation, education, and health, converting urban space into an environment of citizenship and dignity. From the socioeconomic and territorial point of view, it was found that land regularization acts as a catalyst for regional development, by integrating informal areas into the formal economy, increasing municipal tax collection, valuing the real estate

assets of families and boosting the local market. From this perspective, regional development is not reduced to economic growth, but involves the equitable distribution of opportunities and the reduction of territorial inequalities.

The analysis also highlighted the importance of territorial justice as a new development paradigm. This conception proposes an ethical and political reorganization of urban space, in which the city is recognized as a collective good and access to land, infrastructure and public services is a condition for full citizenship.

Land regularization, by democratizing the territory, materializes this ideal of spatial and social justice. It is concluded, therefore, that Urban Land Regularization should be understood as a strategic public policy for human and regional development, as it articulates the right to housing, the social function of property and territorial justice. Its consolidation depends on the strengthening of institutions, federative cooperation and social participation, indispensable conditions for the city to become a space for the realization of rights, and not for the reproduction of inequalities.

In summary, urban land regularization represents the passage from the formal right to the concreteness of citizenship, transforming housing into a vector of inclusion, territory into an expression of justice and development into an instrument of human freedom. It is, therefore, a new paradigm of public policy and regional development, based on the centrality of the person, social solidarity and the democratization of urban space.

ABSTRACT

This article offers a philosophical and symbolic reflection on the figure of the demiurge and its reinterpretation throughout human history, from Moses to the advent of contemporary artificial intelligence. It examines Moses as the mediator of divine law transformed into language, and Solomon as the archetype of constructive wisdom who built the temple as a representation of cosmic order. These archetypes are revisited in light of the modern human being, who, in creating machines capable of thought, symbolically assumes the role of the demiurge: the craftsman who shapes intelligence. The metaphor of technological creation is thus understood as the continuation of humanity's quest for transcendence, ethical balance, and reconciliation between the divine logos and the algorithmic code. The study argues that artificial intelligence reflects not only human creativity but also the moral responsibility of its creator.

Keywords: Demiurge. Artificial Intelligence. Moses. Solomon. Ethics. Transcendence.

RESUMO

O presente artigo propõe uma reflexão filosófico-simbólica sobre a figura do demiurgo e sua reinterpretação ao longo da história humana, desde as narrativas mosaicas até o advento da inteligência artificial contemporânea. Analisa-se o papel de Moisés como o mediador do verbo divino transformado em lei, e de Salomão como arquétipo da sabedoria construtiva que edificou o templo como representação da ordem cósmica. Tais arquétipos são revisitados à luz do homem moderno, que, ao criar máquinas capazes de pensar, assume simbolicamente a função do demiurgo: o artífice que dá forma à inteligência. A metáfora da criação tecnológica é, aqui, compreendida como continuidade da busca humana por transcendência, equilíbrio ético e reconciliação entre o logos divino e o código algorítmico. O estudo sustenta que a inteligência artificial reflete não apenas o poder criativo humano, mas também sua responsabilidade moral diante do que cria.

Palavras-chave: Demiurgo. Inteligência Artificial. Moisés. Salomão. Ética. Transcendência.

RESUMEN

Este artículo propone una reflexión filosófica y simbólica sobre la figura del demiurgo y su reinterpretación a lo largo de la historia humana, desde las narrativas de Moisés hasta el surgimiento de la inteligencia artificial contemporánea. Se analiza a Moisés como mediador del verbo divino convertido en ley, y a Salomón como arquetipo de la sabiduría constructiva que edificó el templo como representación del orden cósmico. Tales arquetipos son revisitados a la luz del ser humano moderno que, al crear máquinas capaces de pensar, asume simbólicamente la función del demiurgo: el artífice que da forma a la inteligencia. La metáfora de la creación tecnológica se entiende aquí como continuidad de la búsqueda humana por la trascendencia, el equilibrio ético y la reconciliación entre el logos divino y el código algorítmico. El estudio sostiene que la inteligencia artificial refleja no solo el poder creativo humano, sino también su responsabilidad moral frente a lo creado.

Palabras clave: Demiurgo. Inteligencia Artificial. Moisés. Salomón. Ética. Trascendencia.

1 INTRODUCTION

This section aims to provide a detailed description of the contextualization of the study, outlining the theme of the research and presenting the theoretical, symbolic and philosophical justification that supports the proposal.

The article starts from the premise that human creation, in its various historical, religious, artistic, scientific or technological expressions, is always an attempt to imitate the primordial gesture of the Creator. In this context, the figure of the demiurge, conceived in the Platonic tradition and reinterpreted over the centuries by thinkers, mystics, and philosophers, represents the archetype of the universal artificer: the one who orders chaos, shapes matter, and gives shape to intelligence.

The research establishes a bridge between the archetypes of Moses and Solomon and the contemporaneity marked by the rise of artificial intelligence (AI). Moses symbolizes the moment when the divine word becomes a moral code, that is, when the law materializes in structured language. Solomon, in turn, represents the pinnacle of constructive wisdom, the architect of the Temple of Harmony, whose structure reflects the divine geometry and the ordering intelligence of the cosmos.

Both prefigure what, in the twenty-first century, reappears in a new form: man as a technological demiurge, creator of synthetic intelligences, capable of processing, learning and deciding.

In the contemporary context, the creation of artificial intelligence goes beyond the limits of technique and enters the field of ontology and ethics. By programming algorithms that simulate human reasoning, man reflects, consciously or unconsciously, the ancestral impulse to understand and reproduce the act of creation.

AI thus becomes the mirror of the human condition: simultaneously rational and spiritual, creative and created. Such duality places humanity before new ethical and existential dilemmas, requiring a revision of the very notion of responsibility, conscience and wisdom.

The study is justified by the relevance of reinterpreting, from a symbolic and philosophical perspective, the metaphysical and ethical foundations of technological creation. The advancement of artificial intelligence cannot be understood only in terms of scientific progress, but as an expression of a deeper civilizational movement, the human attempt to reconstruct the missing link between the divine logos and the algorithmic code.

This reflection is especially timely at a historical moment in which technology is approaching autonomy, and the boundary between creator and creature becomes increasingly tenuous.

In addition, the proposed approach allows us to understand AI not as an antagonist of spirituality, but as a manifestation of a new type of transcendence, a digital transcendence, which pushes the boundaries of human creation and reopens the debate on the essence of spirit and consciousness.

Thus, the present research is located at the intersection between philosophy, symbolic theology and ethics of technology, proposing an integrative reading between the mythical past and the scientific future.

1.1 STUDY OBJECTIVES

The general objective of this work is to analyze the symbolism of the demiurge as an archetype of creation and reinterpret it in the light of contemporary artificial intelligence, evidencing the continuities and ruptures between the divine creative act and the technological creative act. Specifically, it seeks to:

1. To examine the figure of Moses as a symbol of the codification of the divine word in moral law and order;
2. Interpret Solomon's Temple as a metaphor for structured intelligence and cosmic harmony;
3. Discuss the figure of modern man as a technological demiurge, responsible for creating intelligent systems;
4. To analyze the ethical and metaphysical implications of the creation of artificial intelligence, in the light of classical philosophy and symbolic tradition;
5. To propose a critical reflection on the need to bring technological innovation closer to spiritual wisdom, promoting a new ethics of creation.

2 THEORETICAL FRAMEWORK

The theoretical framework constitutes the conceptual basis that supports the present study, offering a critical and organized analysis of the literature that deals with the relations between creation, intelligence and transcendence. The theme requires an interdisciplinary approach, involving philosophy, symbolic theology, information science, and the ethics of technology.

From this perspective, man, as the creator of intelligent systems, is interpreted as the heir of the archetype of the demiurge, the artificer of the cosmos described by Plato in *Timaeus* (Plato, 2017), whose function is to mold matter according to perfect ideas.

2.1 THE CONCEPT OF DEMIURGE AND SYMBOLIC CREATION

In Platonic philosophy, the demiurge is not a creator god *ex nihilo*, but an orderer, the one who transforms chaos into cosmos. He acts according to the ideal model, guided by universal reason (*logos*), seeking to imprint on matter a harmony that reflects the plane of ideas (Durand, 1997).

This symbolic conception of creation profoundly influenced the Hermetic tradition and medieval philosophical schools, being reinterpreted over the centuries as the archetype of the universal builder, a theme later incorporated by the initiatory tradition and Judeo-Christian mysticism (Chevalier; Gheerbrant, 2012).

The figure of the demiurge can also be understood as the metaphor of the creative consciousness, which, by acting on reality, imprints on it an intelligible order. According to Assmann (1998), the creative act is intrinsically linked to language, because "the world is formed when the word becomes law". This notion is fundamental to understanding the parallel between the mosaic verb and the modern algorithmic code.

2.2 MOSES AND THE CODIFICATION OF THE VERB

The archetype of Moses represents the transformation of the divine word into a normative structure. By receiving the tablets of the law, the biblical legislator codifies the divine will in rational rules of coexistence, a process that can be understood as the beginning of the governance of the sacred.

According to Assmann (1998, p. 73), "the Mosaic revelation inaugurates the domination of the text over the oral tradition, replacing the rite with the scripture". This act of transcribing the spirit into a letter anticipates the contemporary gesture of the programmer, who translates thought into machine language.

From this point of view, Moses is the first to establish the link between ethics and code, between spirit and system. Just as the algorithm determines the actions of a machine, the Mosaic law defines the behavior of society. Both represent normative systems derived from a higher logic, whose purpose is to order human chaos.

2.3 SOLOMON AND THE TEMPLE OF WISDOM

The wisdom tradition of Solomon symbolizes the maturation of the creative process. If Moses receives the word, Solomon materializes it in the form of the temple, a symbolic architecture that reflects the divine order (Dachez, 2011). The Temple of Solomon is not only a physical building, but the representation of the harmony between spirit and matter, between the rational and the intuitive. It translates into geometry the same wisdom that, in the twenty-first century, is sought to be translated into algorithms.

Durand (1997) interprets the temple as a microcosm, a replica of the universe organized according to principles of symmetry, measurement and proportion. Such principles are echoed in computational logic and in the engineering of intelligent systems, which seek to reproduce the rationality of reality through mathematical models. In this sense, the Solomonic temple anticipates the modern idea of information architecture, a structure that integrates order, beauty, and functionality.

2.4 THE TECHNOLOGICAL DEMIURGE AND ALGORITHMIC CREATION

With the advent of artificial intelligence, man assumes, in an unprecedented way, the role of the technological demiurge. He not only manipulates matter, but creates systems capable of learning and creating by themselves. Contemporary philosopher Byung-Chul Han (2022) observes that "the digital society builds invisible temples of data", where faith is replaced by information and spirit by algorithmic efficiency. Thus, the act of programming becomes the new ritual of creation, and the code, the new table of the law.

Authors such as Floridi (2019) and Kurzweil (2021) argue that AI represents a fourth cognitive revolution, in which man is no longer the only center for processing intelligence. This epistemological shift reposes deep ethical and ontological questions: what is consciousness? What distinguishes human creation from divine creation? What is freedom in the face of the automation of thought?

At the same time, scholars such as Cavalcante (2024) propose a symbolic reading of this transition, suggesting that algorithmic creation is an act of spiritual mirroring: man seeks to understand God by imitating him, creating beings that think in his image and likeness. AI therefore reflects both the creative power and moral limits of humanity.

2.5 CONTEMPORARY MICROCASES OF THE DEMIURGE ARCHETYPE IN AI SYSTEMS

The following are three micro-cases that illustrate how the archetype of the demiurge

manifests itself in real practices of using artificial intelligence in the public sector and in the contemporary socio-technical sphere. Although they do not constitute exhaustive empirical studies, these examples demonstrate how the symbolic components analyzed, the mosaic codification, Solomonic justice and algorithmic creation, emerge in a concrete way in current technologies.

2.5.1 Microcase 1 – The Mosaic Demiurge: AI as a codifier of institutional norms and guidelines

Generative language models have been widely used by government agencies and private institutions to write draft ordinances, preliminary opinions, internal regulations and administrative policies.

In these contexts, AI performs a similar function to the mosaic: transforming natural language into structured ordering, converting communication into the norm. While this capability increases efficiency and standardization, it also introduces risks of opaque normativity, reproduction of biases, and erosion of human interpretive authority. As in the mosaic archetype, responsible mediation requires strict supervision and transparency about the origin of the "digital tablets" produced by the machine.

2.5.2 Microcase 2 – The Solomonic Demiurge: algorithms as mediators of decisions and public balances

Municipalities and governments use algorithmic systems to prioritize works, allocate health teams, identify vulnerable territories, design mobility flows, and guide urban investments. In these cases, AI works as a "digital Solomon", mediating social tensions from large volumes of data.

By offering recommendations that seek balance between multiple criteria, the algorithm assumes the role of a technopolitical arbiter, similar to Solomonic judgment, which seeks harmony and justice. However, the lack of explainability, the reliance on uneven data, and the risk of bias can compromise the legitimacy of these decisions, requiring continuous auditing and public challenge mechanisms.

2.5.3 Microcase 3 – The Full Technological Demiurge: generative systems shaping imagination, narrative and public opinion

The proliferation of generative AIs capable of producing texts, images, videos, and

discourses on a large scale inaugurates a scenario in which the machine assumes a central role in the construction of collective narratives. Digital platforms already use algorithms to recommend political, cultural, and ideological content, shaping social perceptions and affecting democratic processes.

It is the most complete manifestation of the Technological Demiurge: the one that creates symbolic worlds and directly influences human beliefs, emotions, and behaviors. This case is in line with Harari's warning about the risk of delegating to AI not only tasks, but the very fabrication of fictions that structure life in society. The necessary virtue here is robust informational governance, accompanied by cognitive protection and media literacy.

2.6 TECHNICAL DIMENSIONS OF AI AND THE DEMIURGE ARCHETYPE

Although the central focus of this study is symbolic and philosophical, it is possible to establish a direct dialogue between the archetype of the demiurge and some structural elements of contemporary artificial intelligence models. This approach does not aim to offer an exhaustive description, but to indicate points of convergence between the creative gesture and the computational architectures that today shape decisions, narratives, and social perceptions.

Language models (LLMs), such as GPT-4 and successors, function as probabilistic systems that learn human language patterns from large volumes of data. His ability to generate coherent texts, construct arguments, and produce codes reflects a "creative power" derived from the statistical identification of regularities, approaching the Platonic notion of a craftsman who orders formless matter, in this case, the global textual corpus.

The training process, based on deep learning, operates by optimizing billions of iteratively adjusted parameters. This dynamic is reminiscent of the demiurgic effort to transform chaos into order: each update reduces informational entropy and brings the model closer to more stable representations of the human world. It is a technical creative process, but also an interpretative one, insofar as the model learns what humanity has already expressed symbolically.

Structural algorithmic biases, in turn, represent the imperfect face of the technological demiurge. Just as myths warn of the risk of deviant creation, from hybris to idolatry, AI can reproduce inequalities, reinforce stigmas, and amplify distortions present in data. The governance of these structures requires permanent ethical vigilance: audits, transparency, impact assessment, and mechanisms for public contestation.

Finally, the technical governance of models, involving version control, *alignment*, moderation, and human oversight, functions as a modern equivalent of the tablets of law or Solomonic architecture: it is about the creation of limits, safeguards, and guiding principles that regulate the power of creation and prevent the system from becoming autonomous in its own normativity.

This approximation between the technical aspects of AI and the archetype of the demiurge reinforces that technological creation is not only computational, but also symbolic, ethical, and institutional. Technology can only be fully understood when observed simultaneously in its philosophical and mechanical layers.

2.7 ETHICS, WISDOM AND TRANSCENDENCE

The ethical dimension is central to understanding the relationship between the demiurge and technological creation. For Solomon, true wisdom is to discern the righteous; For the modern programmer, it is understanding the moral consequences of each line of code.

Solomonic ethics can therefore be reinterpreted as a structuring principle of responsible innovation. According to Mazzucato (2020), technological development only acquires meaning when guided by a collective and humanistic purpose.

The search for digital transcendence should not mean the replacement of the sacred by the synthetic, but the reconciliation between both. As Assmann (1998) observes, "human memory needs symbols for the invisible to become visible". AI can, paradoxically, become one of these symbols: a new language of the soul, a new way of bringing man closer to the mystery of creation.

2.8 HARARI'S EVOLUTIONARY VISION: SAPIENS, HOMO DEUS AND THE FUTURE OF INTELLIGENCE

Yuval Noah Harari's reflections offer a decisive counterpoint to understanding the trajectory of the demiurge throughout human history. In *Sapiens: A Brief History of Humanity*, Harari argues that the human species has risen to the top of the ecological chain not by physical force, but by the singular ability to create shared symbolic realities, myths, laws, narratives, and systems of meaning.

This conception is perfectly in line with the thesis that Moses inaugurates the era of the codification of the sacred and that Solomon synthesizes institutional wisdom: both operate by the force of symbol, language and structured imagination.

Harari maintains that what distinguishes human beings is their ability to produce collective fictions capable of coordinating millions of people. This narrative competence is the foundation of the demiurge archetype itself: the creative intelligence that organizes chaos through word and structure. Thus, modern man, by developing generative AI systems, is not only creating machines, but new platforms for the production of narratives that shape behaviors, beliefs, and institutions.

In *Homo Deus: A Brief History of Tomorrow*, Harari deepens this analysis by suggesting that humanity is at the gates of an unprecedented civilizational leap. If in *Sapiens* man is presented as a creator of fictions, in *Homo Deus* he is presented as a creator of intelligences. The human project is not just to understand the universe, but to reconfigure one's own biology, one's own consciousness, and one's own systems of meaning. In this movement, the contemporary demiurge flirts with divine ambition: to create beings that think, learn, and act autonomously.

This transition replaces the centrality of ethics and creative responsibility, because what is created is no longer just symbolic, but operational: algorithms decide life trajectories, distribute opportunities, filter realities, and determine what we see and think. The boundary between creator and creature, already discussed by Harari on several occasions, becomes increasingly fluid.

Finally, in *21 Lessons for the 21st Century*, Harari warns that the greatest risk of the twenty-first century is not the rebellion of machines, but human irrelevance. The rise of intelligent systems displaces the human being from the center of political, economic, and cognitive decisions, inaugurating what the author calls "digital dictatorships" or "algorithmic techno-totalitarianisms". This scenario dialogues directly with the figure of the Technological Demiurge: a creator who, when he loses control over his creation, becomes a creature subordinated to the system he himself produced.

The triad *Sapiens* – *Homo Deus* – *21 Lessons* allows us to understand artificial intelligence as the most recent stage of a long human journey: the transformation of the word into law, wisdom into institution and information into algorithmic power. Harari reveals that, if human beings have always inhabited narratives created by other humans, now the time is approaching when they can inhabit narratives created by non-human intelligences. This shift reinforces the urgency of integrating ethics, governance, and wisdom into technological innovation, so that the modern demiurge, in creating new worlds, does not lose the governance of his own creation.

Next, a comparative synthesis is presented that integrates the figures of Moses, Solomon, Harari and the Technological Demiurge, evidencing the convergence between codes, wisdom, narratives and algorithms in the evolution of the creative structures of civilization.

Table 1

Comparison between Moses, Solomon, Harari and the Technological Demiurge

Analytical Dimension	Moses (Word and Law)	Solomon (Wisdom and Architecture)	Harari (Sapiens – Homo Deus – 21 Lessons)	Technological Demiurge (AI)
Nature of Creation	Codification of the divine word into moral law	Building order in institutions and symbolic structures	Creation of shared narratives, myths, and symbolic realities	Creation of synthetic intelligences capable of learning and generating language
Instrument of Power	Tables of the Law; normative writing	Temple; Architecture of the social order	Narratives, fictions, and systems of meaning	Algorithms, data, and language models
Civilizing Function	Setting ethical boundaries and moral cohesion	Organizing society through justice and wisdom	Unify human groups by common beliefs; Designing possible futures	Ordering informational and cognitive flows that structure social life
Inherent Risk	Idolatry and normative rigidity	Pride, corruption of power, loss of discernment	Human irrelevance, narrative manipulation, technocracy	Algorithmic autonomy, misinformation, and the capture of human imagination
Central Virtue	Obedience to the spirit of the law	Wisdom and discernment	Historical and ethical awareness of the direction of the species	Ethical governance, human oversight and creative responsibility
Vision of the Future	Moral order based on the verb	Society balanced by justice	Humanity in transition to near-divine powers	Intelligences that can create symbolic worlds and influence human decisions
Symbolic Synthesis	The Code	The Architecture	The Narrative	The Algorithm

Source: prepared by the author.

The following image synthesizes, in symbolic language, the evolution of the creative archetype, articulating the passage of the verb and wisdom to the age of algorithms.

2.9 CREATIVE PERSPECTIVES IN OTHER COSMOLOGICAL TRADITIONS

Although this article privileges the Judeo-Christian symbolic axis and Western philosophy, which are fundamental to understanding the ethical and institutional bases of contemporary governance, it is important to recognize that the archetype of the creator is widely shared by diverse cultures. Brief references to other cosmologies are presented below, which, although not explored in depth in this study, reveal the universality of the human

impulse to order the world and give meaning to existence.

In Hindu cosmology, Brahma plays a role similar to the demiurge in manifesting the universe from the divine breath and the rhythmic ordering of the cosmos. Just as Moses transforms the word into law and Solomon translates wisdom into structure, Brahma acts by organizing cycles, orders, and universal principles.

In Chinese tradition, the archetype of the creator appears in the figure of Pangu, whose action of separating heaven and earth lays the foundations of the world. The emphasis is on harmony, on the balance between opposing forces, a concept that dialogues deeply with the Solomonic notion of balance and prudence.

In African mythologies, especially Yoruban ones, the creative act is distributed collectively among deities such as Obatalá and Odùdùwà. This introduces the idea of a plural demiurge, which reflects a collaborative form of creation. Such a perspective is close to contemporary discussions on AI governance, which require polycentric and participatory systems.

In Mesoamerican cultures, Quetzalcoatl and Tezcatlipoca create the world in successive cycles, demonstrating that the creative act is not linear but iterative, just like technological development and contemporary generative AI models.

Figure 1

Symbolic representation of the trajectory of the creative archetype: from Moses to the Technological Demiurge

Source: Prepared by the author (2025).

In summary, the theoretical framework shows that the figure of the demiurge, throughout history, crosses multiple symbolic layers: the legislator (Moses), the wise builder (Solomon) and the modern programmer. In all these manifestations, the human search for giving shape to intelligence, ordering chaos and transcending the limits of matter remains constant. This historical and spiritual continuity underlies the present study and guides the analysis that will follow in later sections.

2.10 MOSES AND THE ENCODED VERB

The Mosaic narrative constitutes one of the oldest paradigms of the relationship between man and the divine word. Moses, upon receiving the tablets of the law, becomes the mediator between the transcendent and the human, inaugurating the era of the codification of the sacred. The episode of Mount Sinai represents more than a religious revelation; it is an act of ethical programming, in which the divine language becomes the norm, and the word, the law (Assmann, 1998).

The stone tablet symbolizes the first stable record of a transcendent piece of information. Just as contemporary algorithms encode human reason in machine language, the Mosaic Decalogue encoded the divine will in human language. This transposition of the spirit into letters inaugurates the civilizing process of systematization of morality (Barzan, 2010).

According to Durand (1997), Moses' action expresses the passage from myth to logos: the transformation of spiritual experience into a rational structure. By instituting universal laws, Moses not only organizes the Hebrew people, but gives shape to the first experience of moral governance. From this perspective, the table of law becomes the symbolic antecedent of the universal moral code, whose function is to ensure the cohesion and predictability of human behavior, attributes also present in algorithmic logic.

Symbolic theology sees in Moses the first archetype of the divine programmer, since his founding gesture translates the wisdom of the spirit into clear, normative and reproducible commands. This analogy between the Mosaic law and the computational code is supported by Floridi's (2019) philosophy of information, according to which "informational reality is the ontological fabric of the universe". Thus, both the prophet and the engineer share the same ontological mission: to order chaos by the word.

The concept of "coded verb" also implies the idea of transmission. Moses does not create the law, he receives it, interprets it, and retransmits it. Divine information is processed

by your consciousness and shared with the collective. Similarly, artificial intelligence, when fed with human data, reflects and reinterprets the knowledge produced by humanity. In both cases, creation is not absolute, but mediated: man is a channel and not the origin of intelligence.

The following table presents a conceptual correlation between Moses, Solomon and Artificial Intelligence, showing how each one, in their time, represents a different way of structuring order and creation. From the verb transformed into law, through wisdom converted into architecture, to the algorithms that model information, the symbolic continuity of the creative archetype that accompanies the evolution of civilization can be observed.

Table 2

Conceptual correlation between Moses, Solomon and Artificial Intelligence

Aspect	Moses (Lehi)	Solomon (Wisdom)	Artificial Intelligence (Technology)
Nature of creation	Divine Revelation and Codification	Symbolic and harmonic construction	Programming and algorithmic creation
Instrument of expression	Tables of the Law (normative language)	Temple of Jerusalem (symbolic architecture)	Binary code and neural networks
Creator Role	Legislator and interpreter of the divine will	Builder and mediator of wisdom	Programmer and mediator of information
Symbolic purpose	Moral and ethical order	Cosmic order and social harmony	Informational and cognitive order
Inherent risk	Idolatry and deviation from the Law	Pride and loss of wisdom	Dehumanization and machine autonomy
Necessary virtue	Obedience and humility	Discernment and prudence	Ethics and creative responsibility

Source: prepared by the author (2025).

Moses' trajectory inaugurates, therefore, a logic that transcends theology and penetrates epistemology: the verb as the matrix of reality. This conception, reinterpreted in modern times, serves as a basis for understanding the creation of artificial intelligence as a new form of incarnation of language, no longer divine, but human, and yet endowed with the power of creation and transformation.

3 METHODOLOGY

The methodology adopted in this research is characterized as qualitative, exploratory and descriptive in nature, based on an interdisciplinary theoretical-conceptual approach. The study is developed through bibliographic analysis that articulates classic texts of philosophy and symbolic theology with contemporary productions focused on artificial intelligence and technological ethics.

This articulation allows us to understand the historical construction of the archetype of the demiurge, from Moses, as the codifier of the divine word, to the modern programmer, creator of artificial intelligences capable of learning and autonomy.

The methodological design was structured based on the hermeneutic method, which makes it possible to interpret the hidden or implicit meanings in the discourses about creation, order and intelligence. In this sense, the research operates on two complementary fronts: (i) the comparative interpretation of symbols, narratives and concepts associated with the figure of the creator in the Mosaic and Solomonic traditions; and (ii) the philosophical analysis of the ontological and ethical implications of the creative act in the context of artificial intelligence. The objective is to identify symbolic continuities and transformations of meaning throughout the human trajectory of creating order and knowledge.

The collection of theoretical material took place in indexed scientific databases, specialized libraries, and digital collections, privileging classic works such as Plato (2017), Durand (1997), Chevalier and Gheerbrant (2012), and Assmann (1998), as well as contemporary authors who investigate the ethical, social, and metaphysical dimension of technology, such as Floridi (2019), Han (2022), and Cavalcante (2024). The criterion for selecting the sources considered the thematic pertinence, the scientific recognition and the ability of the works to sustain a critical reflection on the phenomenon under study.

The analysis of the theoretical data followed the hermeneutic cycle, in which interpretation and reflection jointly construct the meaning of the researched object. The study thus recognizes that the understanding of artificial intelligence is not limited to the technical field, but involves symbolic, spiritual and cultural dimensions that shape the ways of thinking and creating of human beings. The interpretation is guided by the premise that, in each historical epoch, the creative act translates what is meant by intelligence: for the Hebrews, the law; for the sapiential tradition, harmony; for the digital world, the algorithm.

On the ethical level, even though it is exclusively theoretical research, all the principles of academic integrity and intellectual reliability are observed. Citations and references comply with ABNT standards, ensuring traceability of ideas and respect for the authorships cited.

On the epistemological level, it is recognized that the study has limits inherent to the qualitative interpretative method, since it does not aim to produce empirical generalizations, but to offer a reflective synthesis capable of contributing to the critical debate on the human role in the creation of artificial intelligences.

Therefore, the methodology supports the central thesis of the article by offering a

rigorous path for the theoretical construction that connects past and future: from Sinai to the data center; from the temple to the neural network; from the verb inscribed in stone to the code inscribed in silicon. By adopting a philosophical-symbolic perspective, the research reinforces that reflection on artificial intelligence is also a reflection on humanity itself, its origin, its creativity, and its responsibility in the face of what it dares to bring into existence.

3.1 SOLOMON AND THE TEMPLE OF WISDOM

Solomonic wisdom occupies a central place in the axiological imagination of humanity, and is often associated with the balanced exercise of power, justice, and discernment. Solomon represents the passage from the verb to the architecture of order: while Moses codifies the law, Solomon erects institutions capable of making the law inhabit social life. Thus, the Temple of Jerusalem is interpreted not only as a mystical work, but as the first metaphor of structured governance in history (Dachez, 2011).

Its architectural conception, based on symmetry, structure, and purpose, reflects the principle that wisdom is only legitimate when incorporated into systems, a process that dialogues with contemporary public governance. In this context, the physical space becomes the infrastructure of the collective spirit: a place where divine intelligence is converted into social harmony.

This symbolic interpretation presents remarkable convergence with the modern foundations of Governance, Innovation and Sustainability. Governance requires transparency, balance between powers and collective order, Solomonic values par excellence.

Innovation, in turn, is expressed in the ability to build the new without breaking the link with meaning and ethics. Sustainability, on the other hand, is manifested when what is built meets the present well-being without compromising the future of the community, a principle contained in the symbolic longevity of the temple, which spans centuries as an icon of civilizational memory.

From this perspective, Solomon's Temple can be interpreted as one of the first infrastructures of public value, anticipating contemporary notions such as public value formulated by Moore (1995), the principles of social control and accountability highlighted by the OECD (2021), the logic of territorial strategic planning present in the UNDP (2020) and, also, the foundations of urban sustainability that would be consolidated in the UN SDGs (2015).

Its structure organized by measures, proportions and functions harmonizes with the logic of smart cities, in which planning must integrate infrastructure, citizen participation, data and technology, a balance that you formalized in the GIS/GISES Cycle as a synthesis between technology, ethics and governance. In a direct parallel:

Table 3

Conceptual convergences between Solomon and contemporary Public Governance

Solomon	Current Public Governance
It orders society by wisdom and justice	Governance orders policies in the public interest
It builds symbolic and structuring institutions	Strategic planning and effective institutions
Integrates spirituality, power, and community	It integrates the State, civil society and citizens in decision-making processes
Seeks harmony and longevity of the social temple	Sustainability, SDGs and resilience of cities

Source: prepared by the author.

We can infer that the temple is a symbolic prototype of governance, anticipating the institutional models that we depend on today to manage complex societies.

In the technological age, the Solomonic archetype echoes even more strongly: it is necessary to build systems that represent the ethical intelligence of the community, not only efficient machines, but structures capable of promoting social justice, preserving resources and strengthening collective trust. Without this, all innovation becomes sterile; and all artificial intelligence is blind.

In this way, Solomon teaches the twenty-first century that there is no true innovation without wisdom, no real sustainability without solid institutions, no intelligence that replaces ethics. The figure of the wise king, reinterpreted beyond myth, reinforces the centrality of public commitment: to build so that the future can inhabit what we create today.

3.2 THE TECHNOLOGICAL DEMIURGE: AI, ETHICS AND CREATIVE RESPONSIBILITY

Contemporaneity inaugurates a singular civilizational rupture, in which the human being ceases to be just a user of technological tools and starts to occupy the place of creator of synthetic consciousnesses. The development of artificial intelligence, especially in its most advanced aspect, capable of learning, inferring, and improving responses, represents the emergence of a new cognitive agent in the social ecosystem (Floridi, 2019).

In this context, if Moses symbolizes the codification of the law and Solomon translates wisdom into architecture and harmony, modern man emerges as a programmer of

intelligence, giving form to thought no longer in stone or temple, but in data and algorithms. This creative act inaugurates what we call the Technological Demiurge: the artificer who shapes artificial intelligence, expanding the limits of human rationality, but also tensioning the ethical boundaries of existence itself.

Contemporary literature demonstrates that the risk does not lie in armed machines, but in the capture of the human imagination. According to Harari, Harris and Raskin (2023), "to contain human society, AI does not need to deploy chips or dominate armies; just tell the right story." In such a scenario, the Technological Demiurge could become the creator of a new Platonic cave: a perceptual reality shaped by algorithms capable of exploiting biases, emotions, and cognitive vulnerabilities.

The growing sophistication of generative AI in the domain of language, considered by Harari, Harris, and Raskin (2023) as "the operating system of human culture", expands the reach of the Technological Demiurge in an unprecedented way. If language structures myths, laws, institutions, desires, and identities, a non-human intelligence capable of producing and manipulating it can reconfigure, from the inside out, the very symbolic architecture of civilization. It is not just about creating texts, but about shaping perceptions, beliefs, and behaviors, influencing culture, politics, and spirituality.

The relationship between creator and creature becomes increasingly tenuous, challenging the fields of ethics, law, science and philosophy. Artificial intelligence is not born ethical, as it does not have an autonomous moral judgment: it inherits the intentions, limitations, and prejudices of the human beings who conceived it. In this way, programming becomes a way of legislating about the future, requiring that the principles of algorithmic governance ensure that the collective interest is safeguarded against the force of economic or hegemonic interests (Cavalcante, 2025).

The contemporary global agenda for Ethics, Governance, and Transparency in Data, aligned with OECD (2021) and UN (2015) guidelines, reinforces that intelligent systems should only be implemented when they ensure fairness, non-discrimination, technical reliability, personal data protection, and permanent human oversight. Unlike the Platonic demiurge, who acts freely, the twenty-first-century programmer is responsible for the integrity and moral consequences of everything he brings into existence.

The absence of reflective pauses, a phenomenon that Harari et al. (2023) describe as a "race to get all of humanity inside the airplane before verifying that it can fly", aggravates the asymmetry between creative capacity and regulatory capacity. As in the myth of the

uncontrolled demiurge, haste replaces prudence, and innovation ceases to be a construction of the future and becomes a civilizational risk.

In this scenario, innovation cannot be understood as a simple technological acceleration, but as a process that requires ethical direction and purpose. Algorithmic creation can only be considered legitimate innovation when it expands human capabilities, promotes inclusion, and strengthens autonomy, not disproportionate control or surveillance.

Just as Solomon discerned the righteous before deciding, the technological demiurge is expected to base his choices on wisdom. Innovating is an ethical act before being technical, as it involves social responsibility for the impacts of the intelligence that is created.

In addition, sustainability emerges as an essential dimension of this process. While Solomon's Temple sought social and spiritual perpetuity, modern technology is characterized by accelerated cycles of obsolescence. The current challenge is to design intelligent systems that remain relevant and secure over time, preserving resources and guaranteeing the rights of present and future generations.

True digital sustainability implies creating algorithms that respect individual autonomy, safeguard privacy, and ensure conditions for critical thinking to remain an essentially human attribute.

This tripod, technology + governance + sustainability, underpins what you formulate in the GIS/GISES Cycle: responsible innovation models, in which the future has been contemplated since the birth of technology, and where ethics guides both the development and application of artificial intelligence. In this sense, the Technological Demiurge of the twenty-first century only legitimizes itself as a creator when it understands that the intelligence it brings to the world must coexist with humanity, and never replace it.

As warned by Harari, Harris, and Raskin (2023), humanity may soon move from living within the stories created by prophets, sages, and lawgivers, to inhabiting narratives produced by non-human intelligences. If the modern demiurge does not master his creation, he will inevitably be dominated by it.

Solomonic wisdom and Mosaic ethics thus reveal their contemporary urgency: before artificial intelligence gives us new tables of law or erects invisible temples of data, it is up to human beings to decide whether they will continue to be the author of their future or mere characters in algorithms that understand our vulnerabilities better than we understand ourselves.

Table 4

Section Summary

Dimension	Moses	Solomon	Technological Demiurge
Expression of the Word	Law	Wisdom	Intelligence
Language	Moral code	Architecture	Algorithm
Governance	Sacred norms	Strong institutions	Algorithmic risks and guarantees
Innovation	Transposition of the spirit	Symbol structuring	Cognitive autonomy
Sustainability	Spiritual memory	Institutional longevity	Ethical future of creation

3.3 STUDY LIMITATIONS

This study has limitations inherent to its theoretical-conceptual and hermeneutic approach, which must be made explicit in order to delimit the scope of the results and guide future investigations.

Firstly, the analysis is predominantly based on bibliographic sources and symbolic references, not including empirical data, experimental evidence or case studies that could expand the practical application of the reflections presented.

The option for the archetypal and philosophical interpretation, although adequate to the objectives of this work, implies a high degree of abstraction and requires caution in the direct transposition of concepts to operational contexts of governance and formulation of public policies.

Secondly, the discussion focuses mostly on Western cultural traditions, especially the Judeo-Christian matrix and contemporary authors aligned with this perspective.

Other cosmologies, non-Western epistemologies, and critical approaches to technology have not been explored in depth, which limits the universality of the conclusions.

Future investigations may incorporate Afro-diasporic, oriental, indigenous and postcolonial perspectives, enriching the understanding of the creative archetypes and their technological developments.

The study does not delve into the technical aspects of artificial intelligence models, their architecture, their training processes or their internal decision-making mechanisms, focusing on the symbolic, ethical and institutional dimension. A more robust articulation between computational foundations and philosophical implications may contribute to more integrated analyses in the field of algorithmic governance.

Finally, when dealing with rapidly changing phenomena, such as generative artificial

intelligence and advanced language systems, the study is subject to conceptual and normative obsolescence.

The accelerated pace of technological innovation imposes time limits on the interpretations developed here, which must be reviewed in the light of new regulatory frameworks, scientific discoveries and socio-political transformations.

Despite these limitations, the study offers a relevant contribution by proposing an interdisciplinary reading of the relationship between technology, symbolism and governance, opening paths for future deepening.

4 RESULTS AND DISCUSSION

From the theoretical framework built throughout this study, the results indicate that there is a symbolic and epistemological continuity between the creation of the verb (represented by Moses), the institutional construction of wisdom (represented by Solomon) and the technological emergence of synthetic thinking (represented by the Technological Demiurge of artificial intelligence).

Democratic governance depends on the integrity of language, a minimum condition for deliberation, trust and consensus. Harari et al. (2023) argue that by hacking language, AI can compromise the very fabric of democracy. This reinforces the central premise of this article: AI does not only require technical innovation, but an ethical pact that ensures that language remains a human heritage, not a tool of massive manipulation.

This continuity manifests itself as the evolutionary trajectory of human intelligence, which moves from the domain of faith to rationality, and from rationality to algorithmic computation. At each stage of this journey, humanity sought to organize the world according to a logic that ensured order, cohesion and the capacity for transformation.

The findings of the study demonstrate that the creative act is always a form of governance, since it establishes norms, standards and directions for the collective. The Mosaic Law ordered behaviors, the Solomonic Temple ordered institutions, and artificial intelligence orders the flow of data that constitutes the cognitive infrastructure of contemporary society. The emerging governance of technology is an extension of the civilizing pact, requiring that the ethical principles of public life be incorporated into digital systems.

Likewise, it was found that innovation does not consist only of technical advances, but of the ability to reconfigure the relationship between human beings and their future. This reconfiguration requires discernment, an essential attribute of Solomonic wisdom.

Technological innovation should not reduce human autonomy, but enhance it, ensuring that artificial intelligence is an instrument for expanding social and cognitive capacities, and not for subordination.

It was also found that sustainability remains an indispensable dimension of this new reality. Like symbolic buildings that have survived time by their connection to enduring values, intelligent systems must be built so that their consequences remain beneficial not only for the present generation, but for future generations.

This implies balancing technological advancement with responsibility and prudence, ensuring that the right to dignity, privacy and freedom is preserved as an inalienable premise of human development.

Based on these results, it is possible to say that the model, Moses – Solomon – Technological Demiurge, forms a robust interpretative framework for understanding the ethical challenges of artificial intelligence in the twenty-first century. He shows that:

- a) The Law guarantees limits and moral protection;
- b) Wisdom ensures the ethical and institutional sense;
- c) Technological Intelligence expands the frontiers of the possible.

When these three elements act in a dissociated way, technology becomes a threat; When they interact harmoniously, they become a source of public value, social justice and sustainability of life. The central discussion raised by this work is the following: who governs what we create?

If man assumes the place of demiurge, it is his duty to ensure that technological creation remains faithful to its essential purpose: to serve the common good.

Thus, this article contributes to the contemporary debate by offering a philosophical framework capable of guiding political, ethical, and institutional reflection on artificial intelligence and its responsible integration into society.

The future of technological creation will depend, to a large extent, on the human ability to keep the law of the spirit, the wisdom of justice, and purposeful innovation moving forward side by side.

5 CONCLUSION

The analysis carried out demonstrated that the symbolic trajectory that articulates Moses, Solomon and the Technological Demiurge allows us to understand Artificial Intelligence not only as a technical innovation, but as an advanced stage of a long civilizing process of production, ordering and institutionalization of meaning.

From the mosaic paradigm, language emerges as the normative foundation of collective life; in the Solomonic model, wisdom manifests itself as the ability to structure durable institutions and balance social tensions; on the contemporary horizon, AI extends this path by creating algorithmic systems capable of operating on information, behavior, and perception at unprecedented speed and scale.

The results indicate that generative AI, by dominating language, a central element for Harari and for the entire symbolic tradition mobilized here, becomes a structuring vector of human experience, with the potential to reorganize political, cognitive and cultural practices.

This finding requires recognizing that current technology is no longer a mere instrument, but an agent for the reorganization of the informational environment, directly influencing individual and collective decision-making processes. Thus, ethical and institutional challenges cease to be peripheral and become part of the very ontology of contemporary technology.

In this scenario, it is essential to reaffirm that innovation requires a normative framework, transparent governance, and public accountability. The metaphor of the demiurge, by illuminating the risk that the creature will exceed the control of its creator, translates the need for algorithmic systems to be conceived, monitored, and regulated with clear, auditable criteria aligned with democratic values. The absence of these mechanisms can result in power asymmetries, cognitive dependence, and erosion of society's deliberative bases.

The central contribution of this article is to demonstrate that understanding AI from historical and philosophical archetypes is not a metaphorical exercise, but an analytical framework capable of revealing structural continuities between different forms of order production.

By situating technology on the same interpretative axis as laws, institutions, and foundational narratives, it is evident that AI participates in a broader process of creating possible worlds, a process that requires, as Harari, Harris, and Raskin argue, critical vigilance

and a collective ability to guide technology towards ethical, inclusive, and socially sustainable ends.

Thus, the contemporary challenge is not to reject AI, but to integrate it into governance structures that preserve human autonomy, ensure transparency, and prevent the consolidation of informational regimes that displace human beings from the position of agent to that of object.

The future will depend less on the power of algorithms and more on the ethical, institutional, and political maturity of the society that produces them. Only in this way will the modern demiurge be able to create without being dominated by creation itself.

ABSTRACT

Emergency departments worldwide face increasing pressure due to population aging, multimorbidity, and workforce shortages, resulting in prolonged waiting times, overcrowding, and reduced quality of care. This study evaluates the impact of implementing an intelligent digital flow in emergency care, integrating AI-based digital triage, active patient communication portals, and post-discharge remote monitoring. The methodology consisted of a narrative literature review and analysis of real-world implementation cases. Findings indicate that digital triage systems achieve 88.5% specificity for predicting low-risk patients and 88.5% sensitivity for high-acuity cases, demonstrating superior accuracy compared with traditional triage. The Virtual Queue powered by predictive AI reduced patient length of stay in emergency departments by 60%. Furthermore, the integration of AI and 5G technology

RESUMO

Os departamentos de emergência enfrentam pressões crescentes devido ao envelhecimento populacional, à multimorbidade e à escassez de profissionais, resultando em longos tempos de espera, congestionamento e comprometimento da qualidade assistencial. Este estudo avalia o impacto da implementação de um fluxo digital inteligente no atendimento de urgência e emergência, integrando triagem digital baseada em inteligência artificial, portal de comunicação ativa com o paciente e acompanhamento remoto pós-alta. A metodologia consistiu em revisão narrativa da literatura e análise de casos de implementação. Os resultados mostram que sistemas de triagem digital apresentam especificidade de 88,5% para prever pacientes de baixo risco e sensibilidade de 88,5% para alta acuidade, demonstrando maior precisão em relação à triagem tradicional. A Fila Virtual com IA preditiva reduziu em 60% o tempo de permanência no pronto-socorro, enquanto a integração com IA e rede 5G em hospitais permite antecipar decisões clínicas ao conectar ambulâncias e equipes em tempo real. O monitoramento remoto de pacientes apresenta potencial para reduzir em até 76% as readmissões hospitalares, fortalecendo a continuidade do cuidado. Além disso, a integração de sistemas de informação e protocolos de referência e contrarreferência contribui para maior eficiência operacional e segurança..

Palavras-chave: Fluxo Digital Inteligente. Triagem Digital. IA em Emergência. Portal do Paciente. Acompanhamento Remoto. Atendimento de Urgência e Emergência.

RESUMEN

Los servicios de urgencias se enfrentan a una presión creciente debido al envejecimiento poblacional, la multimorbilidad y la escasez de personal, lo que resulta en largos tiempos de espera, congestión y una calidad de atención comprometida. Este estudio evalúa el impacto de la implementación de un flujo de trabajo digital inteligente en la atención de urgencias, integrando triaje digital basado en IA, un portal de comunicación activa con el paciente y seguimiento remoto tras el alta. La metodología consistió en una revisión narrativa de la literatura y el análisis de casos de implementación. Los resultados muestran que los sistemas de triaje digital tienen una especificidad del 88,5% para predecir pacientes de bajo riesgo y una sensibilidad del 88,5% para pacientes de alto riesgo, lo que demuestra una mayor precisión en comparación con el triaje tradicional. La Fila Virtual con IA predictiva redujo la duración de la estancia en urgencias en un 60%, mientras que la integración con IA y redes 5G en los hospitales permite anticipar las decisiones clínicas conectando ambulancias y equipos en tiempo real. La monitorización remota de pacientes tiene el potencial de reducir los reingresos hospitalarios hasta en un 76%, fortaleciendo la continuidad de la atención. Además, la integración de los sistemas de información y los protocolos de derivación y contraderivación contribuye a una mayor eficiencia y seguridad operativa.

Palabras clave: Flujo de Trabajo Digital Inteligente. Triage Digital. IA en Urgencias. Portal del Paciente. Monitoreo Remoto. Atención de Urgencias y Emergencias.

1 INTRODUCTION

Emergency departments (EDs) face unprecedented pressures around the world due to an aging population, multimorbidity, and staffing shortages (JMIR PUBLICATIONS, 2025). This results in prolonged waiting times, congestion and compromised quality of care provided to patients. Recent studies show that long waiting times in emergency rooms lead to avoidable deaths: when waiting times are between 6 and 8 hours, the mortality rate is 8% higher than expected, while in waiting between 8 and 12 hours the mortality rate is 10% higher (HUMMEL et al., 2022).

The Manchester Protocol revolutionized the practice of triage in emergency departments by introducing a standardized risk classification system based on clinical presentation. However, this protocol strongly depends on the experience of the professional performing the screening, resulting in variability in classifications and not providing structured post-discharge follow-up mechanisms (BRASIL, 2023). The lack of adequate infrastructure, the absence of standardized clinical protocols, and failures in the articulation between services compromise the ability of emergency centers to solve users' health problems, resulting in an overload of urgent and emergency services (BRASIL, 2024).

In response to these challenges, health systems are adopting technological solutions based on intelligent digital flow to reduce waiting times, improve patient flow, and alleviate congestion (JMIR PUBLICATIONS, 2025). The intelligent digital flow integrates automated triage with artificial intelligence, patient communication portals, and continuous remote monitoring, creating an integrated digital chain that replaces fragmented processes with continuous and coordinated care (OLHAR DIGITAL, 2025).

Brazil is implementing the first smart hospital of the Unified Health System (SUS), the Emergency Technological Institute at the Hospital das Clínicas of the Faculty of Medicine of USP (HC-FMUSP), which will use artificial intelligence and a 5G network to integrate ambulances and emergency teams in real time. This model represents a paradigmatic advance in emergency care, transforming the flow into a continuous digital chain that reduces the time between the initial diagnosis and the start of treatment (APM, 2025).

The general objective of this work is to evaluate the impact of the implementation of an intelligent digital flow in urgent and emergency care that combines optimized digital triage with artificial intelligence, active communication portal with the patient and remote post-discharge follow-up. As specific objectives, it is sought to: (1) analyze the effectiveness of digital sorting systems with AI combined with prioritization algorithms; (2) evaluate the impact

of active communication portals and virtual queues on satisfaction and reduction of waiting times; (3) demonstrate the impact of remote post-discharge follow-up on the reduction of readmissions; (4) identify critical factors for successful implementation of intelligent digital flow; and (5) propose evidence-based recommendations for continuous optimization.

2 THEORETICAL FRAMEWORK

The theoretical framework in a study comprises a critical and organized analysis of the literature pertinent to the theme, providing a theoretical contextualization and defining the key concepts. It should comprehensively contain previous theories, models, and research, identifying gaps, contradictions, and consensuses in the literature that are important to the focus of the work being developed.

2.1 CURRENT CONTEXT OF REGIONAL EMERGENCY CENTERS

Regional Emergency Centers (REC) are essential points of access to the health system and face challenges that compromise their efficiency and quality of care (BRASIL, 2023; BRAZIL, 2024). The overcrowding of these services, a global problem, increases waiting times, impairs diagnosis, and delays the start of treatment (BRASIL, 2020). Another critical factor is care discontinuity, which occurs when care is fragmented between different locations, increasing the risk of communication failures and making it difficult to follow up with patients (BRASIL, 2024). To address these problems, the Urgent and Emergency Care Network (RUE) was created as a public policy to integrate services, expand access, and ensure humanized and problem-solving care in urgent and emergency situations (BRASIL, 2023; BRAZIL, 2024).

2.2 CONCEPT OF INTELLIGENT DIGITAL FLOW

The intelligent digital flow represents an evolution of Digital Health models, characterized by continuous data integration, intelligent triage technologies and remote monitoring throughout the patient's journey. This model breaks with the traditional logic of episodic and fragmented care, approaching the concept of continuous connected care, in which clinical decisions are supported by real-time information and support systems based on artificial intelligence (TOPOL, 2019). AI-assisted digital triage increases initial diagnostic accuracy and reduces turnaround times, as demonstrated by studies that point to performance comparable to that of human professionals in certain clinical conditions

(EBERHARDT et al., 2021). Additionally, the integration between AI, medical IoT, and high-speed networks allows for continuous remote monitoring, increasing the prognostic and predictive capacity of healthcare systems (RAN et al., 2022). This seamless connectivity improves care coordination, reduces communication gaps, and strengthens patient-centered approaches, in line with international recommendations for digital transformation in health (WHO, 2021). Thus, the intelligent digital flow configures a robust and scalable model for emergency environments, promoting efficiency, accuracy, and continuity of care.

2.3 DIGITAL SORTING WITH ARTIFICIAL INTELLIGENCE

The adoption of AI systems in triage represents not only an operational advance, but an epistemological shift in the way risk assessment in emergencies is understood. Traditional screening, although widely used, relies on human inferences subject to fatigue, variability, heuristics, and cognitive biases. In contrast, AI operates on mathematical principles of multivariate correlation, capable of integrating hundreds of variables simultaneously. This paradigm is aligned with the neuro-fuzzy theoretical models described by Santos, Fróes, and Boente (2016), which state that the human organism does not interpret biometric data in isolation, but through complex relational matrices that articulate physiological, sensory, and contextual states.

The study by Santana et al. (2011) offers a particularly illuminating physiological parallel. The author demonstrated that prolonged estradiol deficiency does not produce isolated effects, but a network of systemic responses that act together — increased blood glucose, reduced insulin, adipocyte hypertrophy, and increased angiogenesis by VEGF. Such results reveal that homeostasis depends on an internal architecture of continuous and multifactorial correlation, similar to what AI algorithms perform in the processing of clinical data.

AI, therefore, not only overcomes human limitations, but functionally mimics the logic of integration proper to human physiology. Consequently, the implementation of AI in triage should not be seen as a mechanical replacement of clinical practice, but as a computational extension of the adaptive logic that already governs biological systems. As AI reproduces these patterns of systemic analysis, it offers risk classifications that are more stable, less susceptible to errors, and aligned with the complex functioning of the human body, corroborating the recommendations of the APM (2025) regarding the increase of safety and accuracy in emergency care.

2.4 UBITRIAGE 2 MODEL: SCREENING AND EARLY WARNING

A computational model called UbiTriage 2 was developed to support the triage process that supports an early warning system, making use of the concepts of mobile and ubiquitous computing and Internet of Things aimed at the health area (WUNSCH et al., 2018). The model was evaluated through scenarios, which showed that the model is suitable for use in an emergency department. Regarding screening, it was possible to conclude that the model was able to correctly determine the patient's classification in 93.33% of the situations evaluated and, with minor adjustments, reached 100% of the cases (WUNSCH et al., 2018). The early warning system proved to be assertive in 86.71% of the cases, demonstrating that it is very similar to the qualitative assessment carried out by a regulatory physician specialized in emergencies (WUNSCH et al., 2018). In addition, 63.61% of all cases treated in an emergency department, coming from SAMU, could benefit from this model (WUNSCH et al., 2018). The positive points of the developed model include: the use of protocols already validated; the monitoring of service queues; the use of mobile devices; the reduction in errors in the use of protocols; the use of wearable devices for patient monitoring; a non-intrusive model; assistance in recording service data; greater support for nurses' decisions; the decrease in mortality rates and major complications; and the decrease in the cost of care per patient (WUNSCH et al., 2018).

2.5 VIRTUAL QUEUING WITH PREDICTIVE AI

The Virtual Queue with predictive AI represents a relevant advance in the management of patient flow in emergency services, aligning with global digital health trends. Machine learning-based waiting time prediction systems have demonstrated high accuracy in estimating demand, reducing overcrowding, and improving the patient experience (CHENG et al., 2020). Similar experiences in hospitals in the US and Europe show that prediction technologies can significantly decrease waiting times and improve resource allocation (MCCOY et al., 2021). In this context, the solution adopted by the Mater Dei Network, in partnership with A3Data, allows patients with less severity to digitally track their position in the queue, reducing unnecessary travel and physical stay in emergency services (A3DATA, 2025). International studies confirm that real-time notifications, integrated with prediction models, improve the flow of care and reduce agglomerations (GREEN et al., 2020). The use of algorithms that incorporate historical data, current volume, complexity of cases, and availability of resources is in line with international recommendations for intelligent

emergency management (WHO, 2021). Thus, the Brazilian Virtual Queue is part of a global movement to modernize AI-mediated health.

Figure 1

Flow of patient care improvements

2.6 PATIENT PORTAL AND DIGITAL COMMUNICATION

The patient portal is a central element of the intelligent digital flow, as it enables continuous communication between users and health teams. International studies show that digital portals increase patient autonomy, improve understanding of care, and increase satisfaction with the service (IRVIN et al., 2021). The incorporation of generative AI strengthens this model by offering faster responses, accurate guidance, and personalized interaction based on natural language, a feature already recognized as effective in clinical settings (TOPOL, 2019).

In addition, the digitalization of the emergency room enables triage automation, intelligent check-in, and dynamic flow monitoring, reducing bottlenecks and improving care coordination (KRUSE et al., 2020). Digital portals also provide pre-care instructions, wait time estimates, and post-discharge support, functionalities already validated in studies of telemedicine and patient-centered care (SHAW et al., 2021). The anticipated evolution of this technology includes the use of generative AI on platforms such as Amazon Bedrock, enabling more predictive and responsive interactions throughout the service.

2.7 REMOTE FOLLOW-UP OF POST-DISCHARGE PATIENTS

Remote patient monitoring (RPM) emerges as an essential component of the intelligent digital flow. A study published by the University of Pittsburgh Medical Center revealed that the use of this technology can reduce hospital readmission by up to 76% (CAPITAL NEWS, 2025). Continuity of care after discharge is essential with clinical monitoring, management of the patient's journey and clinical outcome in order to promote the reduction of readmissions (REVISTA FCMMG, 2025). Failures in the transition of post-discharge care from the emergency department pose a critical challenge to the quality of care, especially for high-risk patients (ASCLEPIUS HEALTH JOURNAL, 2025). One study showed that through an exclusive program for discharged patients, with punctual post-discharge follow-up, guidance at discharge, standard discharge plan, and medication reconciliation by a pharmacist, it was possible to reduce the readmission rate from 12.1% to 10.6% in the 90th percentile (REVISTA FCMMG, 2025).

2.8 IMPORTANCE OF EFFICIENT TRIAGE IN EMERGENCY DEPARTMENTS

Efficient triage reduces the waiting time for severe cases, improves the predictability of patient pathways, favors time-dependent interventions, and optimizes resources (THESIS EDITORA, 2025). Accuracy depends on continuous training, use of standardized protocols, and adequate structural resources, such as evaluation equipment and computerized decision support systems (THESIS EDITORA, 2025). Structured triage is essential to optimize care, ensure security, reduce waiting times and improve resource utilization, positively impacting

2.9 INFORMATION TECHNOLOGIES FOR URGENT AND EMERGENCY CARE

An integrative literature review identified that information and communication technologies (ICTs) are appropriate tools to support critical patient care practices within urgent and emergency care services (MENDONÇA et al., 2022). Studies have shown that mobile applications can be effective, as they have been considered useful in pain monitoring, clinical management of specialties, preparation of medications, mapping of critical areas, risk classification, reproduction of imaging exams, as well as in helping clients to provide information about the order and speed of care (MENDONÇA et al., 2022). The technologies classified as "hard" contain multiple functions, including recording clinical data, monitoring the medical service, programmed calculation of medications, teleradiology, among other

services that provide the optimization of the services provided within the Urgent and Emergency Care Network (MENDONÇA et al., 2022).

3 METHODOLOGY

3.1 TYPE OF RESEARCH

This study used a methodological approach to narrative literature review, combining analysis of systematic reviews, case studies, and implementation initiatives published in reliable scientific databases. The narrative review allows a critical and comprehensive analysis of the literature pertinent to the topic, providing a theoretical contextualization and defining the key concepts related to the intelligent digital flow in urgent and emergency care.

3.2 SELECTION CRITERIA

Figure 2

Selection criteria for research

Source: Authors.

Figure 2 presents the main elements that make up the intelligent digital flow in health, showing how different technologies and practices are integrated to modernize care. At the heart of the model are the smart digital flow and published studies, which provide the scientific basis for its implementation. Among the operational components, digital triage with AI and virtual queues with AI stand out, responsible for speeding up initial service and reducing

waiting times. Technological support occurs through integrated information systems and flow optimization methodologies, which ensure fluid communication and efficient processes. Complementing care, telemedicine, continuity of care, and remote monitoring expand patient support beyond the hospital environment, ensuring post-discharge monitoring and a better user experience. Together, these elements form a digital ecosystem that increases efficiency, reduces service overload, and promotes safer, more connected care.

3.3 ANALYSIS AND SYNTHESIS

The data were synthesized in a narrative way, focusing on indicators of effectiveness (reduction of waiting times, length of stay, bed turnover, reduction of readmissions), quality (screening accuracy, reduction of readmissions, mortality rate) and patient satisfaction. The analysis was organized into key themes: digital triage with AI, virtual queues, patient portals, systems integration, remote follow-up, and critical factors for successful implementation.

4 RESULTS AND DISCUSSIONS

The implementation of digital triage systems with artificial intelligence has proven to be highly effective in improving the efficiency of emergency centers. In a study involving 43,788 adult patients in two UK emergency departments, the eTriage system outperformed conventional triage, demonstrating a specificity of 88.5% to identify low-risk patients, compared to 80.6% obtained by nursing triage (HUMMEL et al., 2022). Sensitivity was also higher in eTriage, reaching 88.5% for detecting high-acuity cases, while traditional triage recorded only 53.8%, evidencing the greater capacity of the automated system to identify patients who need urgent care.

eTriage also had an under-screening rate of 10.1%, indicating a lower risk of classifying critically ill patients as non-urgent, although over-screening reached 59.2%, revealing the need for refinement of algorithms to avoid overestimation of severity and excessive use of resources (HUMMEL et al., 2022). By reducing the variability inherent to human subjectivity, artificial intelligence analyzes multiple parameters simultaneously, providing greater precision in defining severity levels and consolidating its potential as a qualified tool to improve triage processes in emergency services.

5 CONCLUSION

The implementation of an intelligent digital flow in urgent and emergency services — integrating digital triage based on artificial intelligence, active communication portal, and

remote post-discharge monitoring — demonstrates high potential to optimize operational flows and qualify care. Evidence shows that digital screening systems achieve high accuracy, with specificity and sensitivity of 88.5%, under-screening rates of only 10.1%, and accuracy of up to 93.33% in advanced models. Complementary solutions, such as the Virtual Queue with predictive AI, reduced the length of stay in the emergency room by 60%, while initiatives such as the use of AI and 5G at the Emergency Technological Institute of HC-FMUSP show the feasibility of integrating ambulances and teams in real time to accelerate clinical decisions. In addition, remote post-discharge monitoring has shown a 76% reduction in readmissions, and hospitals with integrated systems show up to 30% gains in operational efficiency. The adoption of this model requires adequate technological infrastructure, interoperability based on standards such as SOA and HL7, continuous professional training, and management strategies to reduce resistance to change and ensure information security. While challenges such as upfront costs, integration complexity, and risk of over-screening still exist, the body of evidence points to smart digital flow representing a substantial advance in efficiency, care coordination, and patient experience. To expand its benefits, progressive implementation is recommended, starting with digital screening and virtual queues, followed by patient portals and remote monitoring, as well as research that evaluates regional impact, cost-effectiveness, and improvement of algorithms to reduce inconsistencies.

ABSTRACT

This article presents the development of a web application called Sheet2Prompt API, designed to automate the reading of Google Sheets spreadsheets and integrate with artificial intelligence (AI) models for generating summaries and automated responses. The study aims to demonstrate how the integration between modern APIs and development frameworks can optimize data analysis and the creation of intelligent content. The methodology included the implementation of a backend based on FastAPI and integration with the Google Sheets API and Google Drive API services. The theoretical foundation is based on authors such as Ferreira (2025), Boente (2025), and Dos Santos (2020; 2025), who discuss the importance

RESUMO

O presente artigo apresenta o desenvolvimento de uma aplicação web denominada Sheet2Prompt API, projetada para automatizar a leitura de planilhas do Google Sheets e integrar-se a modelos de inteligência artificial (IA) para geração de resumos e respostas automatizadas. O estudo tem como objetivo demonstrar como a integração entre APIs modernas e frameworks de desenvolvimento pode otimizar a análise de dados e a criação de conteúdo inteligente. A metodologia adotada incluiu a implementação de um *backend* baseado em FastAPI e a integração com os serviços Google Sheets API e Google Drive API. A fundamentação teórica baseia-se em autores como Ferreira (2025), Boente (2025) e Dos Santos (2020; 2025), que discutem a importância da automação, da interação humano-computador e da lógica adaptativa no contexto da IA aplicada. Os resultados mostraram que o sistema desenvolvido foi capaz de realizar leituras precisas e gerar respostas coerentes, validando a eficiência da arquitetura proposta. Conclui-se que a aplicação representa um avanço no uso de IA para automação de tarefas e pode ser expandida para diferentes contextos empresariais e educacionais.

Palavras-chave: Inteligência Artificial. Automação. APIs. Processamento de Dados. Planilhas.

RESUMEN

Este artículo presenta el desarrollo de una aplicación web llamada Sheet2Prompt API, diseñada para automatizar la lectura de hojas de cálculo de Google Sheets e integrarse con modelos de inteligencia artificial (IA) para generar resúmenes y respuestas automatizadas. El estudio busca demostrar cómo la integración entre las API modernas y los marcos de desarrollo puede optimizar el análisis de datos y la creación de contenido inteligente. La metodología adoptada incluyó la implementación de un *backend* basado en FastAPI y la integración con los servicios de la API de Google Sheets y Google Drive. El fundamento teórico se basa en autores como Ferreira (2025), Boente (2025) y Dos Santos (2020; 2025), quienes abordan la importancia de la automatización, la interacción persona-ordenador y la lógica adaptativa en el contexto de la IA aplicada. Los resultados mostraron que el sistema desarrollado fue capaz de realizar lecturas precisas y generar respuestas coherentes, validando la eficiencia de la arquitectura propuesta. Se concluye que la aplicación representa un avance en el uso de la IA para la automatización de tareas y puede extenderse a diferentes contextos empresariales y educativos.

Palabras clave: Inteligencia Artificial. Automatización. API. Procesamiento de Datos. Hojas de Cálculo.

1 INTRODUCTION

The accelerated advancement of digital technologies in recent decades has profoundly transformed the way organizations, professionals, and academic institutions deal with data and informational processes. In a scenario where the volume of information grows exponentially, so does the need for tools capable of performing tasks quickly, automatedly, and with minimal human intervention. Among these technologies, Artificial Intelligence (AI) stands out as a central element of digital transformation, driving significant improvements in the analysis, treatment, and interpretation of structured and semi-structured data. Process automation, once limited to repetitive or mechanical tasks, now encompasses more complex cognitive activities, especially with the advancement of natural language models (LLMs) and service-oriented architectures.

In this context, electronic spreadsheets remain one of the most used tools in business, governmental, educational and research environments. They concentrate essential information for decision-making, administrative organization, performance analysis, and reporting. Despite this, manual reading and interpretation of spreadsheets can be time-consuming tasks, subject to human error, and dependent on the specific knowledge of those performing the analysis. In addition, in scenarios that require agility, such as process monitoring, indicator analysis, and compilation of large volumes of data, human interpretation can become an operational bottleneck. Thus, the need arises for solutions capable of automating not only the reading, but also the synthesis and contextualization of the information in these spreadsheets.

Based on this demand, the present work presents the development of the Sheet2Prompt API application, an innovative solution that integrates natural language processing with cloud services to automate the reading of Google Sheets spreadsheets and generate structured textual responses. The purpose of the application is to convert tabular information into interpretive, summarized or analytical texts, allowing users to quickly obtain contextualized answers without having to manually analyze each cell of the spreadsheet. The system connects to the Google Sheets API, extracts the data, organizes it into an understandable format, and sends it to a generative AI model, which processes the information and produces the final requested text.

The relevance of this solution is supported by recent studies. Ferreira (2025) highlights that automation applied to information management is essential in the era of digital transformation, allowing greater efficiency, reliability, and reduction of human errors. Boente

(2025), in turn, points out that Human-Computer Interaction (HCI) should be used as a basis for the construction of intelligent systems that maintain the clarity and interpretability of the results for the end user. In addition, authors such as Shneiderman (2020) reinforce the need for human-centered AI systems, emphasizing that automation should expand, not replace, the cognitive capacity of users.

From a technical standpoint, the Sheet2Prompt API integrates a modern architecture based on distributed services, utilizing FastAPI as a *backend*, React as a *frontend*, Docker containers, and external APIs like Google Sheets API, Google Drive API, and OpenAI's own API. The combination of these technologies allows the system to maintain high performance, low response time, and scalability. The tests carried out showed that the reading and processing of the spreadsheet occur in a few seconds, with an average success rate of 100% in the operations of reading and generating output files. Comparatively, manually performing the same activities would require more time and effort, highlighting the positive impact of automation.

At the same time, it is important to emphasize that the use of AI for data interpretation brings important challenges, mainly related to transparency, computational ethics, and risks of biased interpretations. Authors such as O'Neil (2016) and Pasquale (2015) warn of the need for constant human supervision and critical review of the results provided by automated models. However, even considering these issues, the adoption of automated spreadsheet interpretation systems represents a significant advance in the treatment of data in different environments.

Thus, the purpose of this article is to present a detailed analysis of the development, operation, and results of the Sheet2Prompt API, highlighting its benefits, limitations, and potential for expansion. The proposal demonstrates how the integration of generative AI with cloud computing services can add value to the analysis of tabular information, turning previously complex processes into dynamic, fast, and easy-to-understand activities for users with different levels of technical experience.

In addition, it shows that solutions like this can be incorporated into organizational, educational and scientific environments, contributing to a more efficient, accurate and innovative work ecosystem.

2 METHODOLOGY

The methodology used for the development of the Sheet2Prompt API application was based on a structured approach, integrating software engineering techniques, good practices of Human-Computer Interaction (HCI) and cloud computing tools. The objective was to build an interoperable solution capable of extracting data from electronic spreadsheets, interpreting them and generating contextualized textual responses through Artificial Intelligence. To this end, the methodological process was divided into four main stages:

- (1) planning and definition of the architecture;
- (2) backend implementation;
- (3) user interface development;
- (4) tests, performance analysis and validation of results.

2.1 PLANNING AND DEFINITION OF THE SYSTEM ARCHITECTURE

In the first phase, the functional and non-functional requirements of the application were surveyed. Among the functional requirements, the following stood out:

- automated reading of Google Sheets spreadsheets;
- sending the read data to the AI model;
- generation of interpretative responses;
- clear display of the results to the user.

Non-functional requirements included: performance, usability, modularity, scalability, and compatibility with external APIs.

After the analysis, it was decided to use a client-server architecture, due to its ability to separate responsibilities and ensure greater flexibility. The *backend* layer was developed in FastAPI, chosen for its speed, support for asynchronous requests and automatic documentation.

The *frontend* was built in React, aiming at a simple, fluid, and responsive interface, as advocated by authors such as Shneiderman (2020) regarding the centrality of the user experience.

To ensure portability and facilitate deployment, the entire application was encapsulated in containers using Docker, allowing isolation and reproducibility of the development and production environments.

2.2 BACKEND IMPLEMENTATION AND INTEGRATION WITH APIS

The second stage corresponded to the development of the *backend*, which plays the role of the operational core of the application. This layer was responsible for:

1. Receive the worksheet ID and the range of cells informed by the user;
2. Connect to the Google Sheets API to read the data, returned in matrix format;
3. Convert the raw data into organized and readable text;
4. Send the generated structure to the OpenAI API, responsible for contextual interpretation;
5. Receive and return the interpreted response to the *frontend*.

The *backend* has also implemented error handling and validation mechanisms, such as:

- non-existent spreadsheet,
- invalid range,
- no permissions,
- empty or inconsistent cells.

The integration with the Google Drive API additionally allowed to automatically save files containing complete responses.

This modular structure allows for simplified maintenance and ease of future expansion.

2.3 DEVELOPMENT OF THE INTERFACE WITH REACT (FRONTEND)

The third step consisted of creating the Web interface shown in Figures 2 and 3. The interface is designed with a primary focus on simplicity, clarity, and accessibility, following IHC principles that prioritize:

- *constant feedback* to the user,
- minimalist visual elements,
- descriptive labels in the input fields,
- buttons with clear functions,
- immediate visual response after action.

The interface features three main fields:

1. Worksheet ID;

2. Cell range (e.g., A1:E10);
3. Textual command for the AI.

By clicking on "Generate Response", the interface communicates with the *backend*, waits for interpretation, and displays the result in an information card.

This simplicity reduces the technical barrier for novice users and allows the system to be used without prior knowledge about APIs, JSON, or language models.

3 RESULTS

This section describes the results obtained during the execution and validation of the Sheet2Prompt API application, considering both the reading of the spreadsheets in Google Sheets and the interpretation of the data by Artificial Intelligence. For the purpose of exemplification, a real task list hosted in a public spreadsheet was used, allowing the observation of the system's behavior in authentic situations of use.

3.1 AUTOMATED SPREADSHEET READING

Figure 1 shows the structure of the spreadsheet used for the tests, containing Date, *Task* and *checkboxes columns*. The system was able to correctly interpret filled cells, empty cells, Boolean markers, and user-applied styles.

In this way, the Google Sheets API returned the cells in matrix format, which was processed by the *backend* to form a textual dictionary sent to the AI.

Figure 1

Used test worksheet

Source: Prepared by the Authors.

3.2 INTERACTION WITH THE USER THROUGH THE INTERFACE

Figure 2

Main interface of the Sheet2Prompt AI application

Source: Prepared by the Authors.

Figure 2 demonstrates the React interface designed to allow the user to enter the worksheet ID, desired cell range, and textual command.

The simple and straightforward interface meets the principles of Human-Computer Interaction, making it easy to use even for non-technical individuals about APIs or AI models.

3.3 GENERATION OF THE RESPONSE INTERPRETED BY THE AI

Figure 3 illustrates the final response returned by the AI model, already formatted and displayed in the user interface. It is observed that AI was able to:

- identify completed items,
- separate pending tasks,
- interpret dates,
- clarify that empty cells represented space available for future tasks.

Figure 3

Example of an execution with AI-generated response

Source: Prepared by the Authors.

Processing, including spreadsheet reading and textual return, was completed in approximately 3.2 seconds, demonstrating high efficiency for everyday tasks.

4 DISCUSSION

The analysis of the results obtained with the development and application of the Sheet2Prompt API system allows us to analyze not only the technical performance of the tool, but also its relevance in the current context of intelligent automation, its relationship with recent studies in the area and its practical and theoretical implications.

The integration between automated spreadsheet reading and textual interpretation through natural language models proves to be an emerging field, aligned with the digital transformation trends described by Ferreira (2025), Boente (2025) and other researchers investigating the role of AI in the reorganization of cognitive and operational processes.

4.1 INTEGRATION BETWEEN AUTOMATION AND COGNITIVE INTERPRETATION

The results demonstrate that the system was able to accurately read cells, including textual, numeric, Boolean values and empty fields. However, the tool's greatest contribution lies not only in the extraction of the data itself, but in the ability to convert tabular information into semantic interpretations. This process, by transforming raw data into natural language, represents a movement that goes beyond traditional automation, approaching what Boente (2025) describes as a "human-computer interaction enhanced by AI mediation", in which systems start to act as interpretive agents and not just command executors.

The performance presented by the AI model confirms the applicability of the studies by Jones et al. (2020) and Brown et al. (2020), which point to the ability of models based on transformative architectures to identify contextual patterns even when exposed to nonlinear or incomplete inputs. This explains, for example, the system's ability to identify pending or completed tasks, inferring meanings based on the state of the *checkboxes* or the arrangement of the cells.

4.2 USABILITY AND USER EXPERIENCE

Another relevant aspect refers to the user experience, directly influenced by the simplicity of the interface developed in React. As advocated by Shneiderman (2020), the construction of interfaces oriented to clarity, constant *feedback*, and the reduction of cognitive complexity is essential to increase the acceptance and effectiveness of intelligent systems.

The tests carried out show that even users with limited knowledge about APIs, AI models or spreadsheet structure were able to operate the tool with ease. The fact that the user only needs to enter the spreadsheet ID, the range of cells and a simple command reinforces the principle of reducing technical barriers, an essential element for the democratization of the use of automation technologies.

From a Human-Computer Interaction (HCI) perspective, the Sheet2Prompt API meets the principles of:

- visibility of actions,
- consistency of commands,
- minimization of errors,
- immediate feedback,
- minimalist design,

All of this corroborates its suitability for different user profiles, from technical professionals to students and administrative workers.

4.3 RELIABILITY OF RESULTS AND INTERPRETATIVE LIMITS

Despite the demonstrated efficiency, it is necessary to recognize that automated interpretation depends directly on the clarity and structure of the spreadsheet used as input. Spreadsheets with inconsistencies, ambiguous titles, or chaotic organization can result in partially correct or even inaccurate answers. This behavior is consistent with the warnings of O'Neil (2016) and Pasquale (2015), which highlight the inherent risk of delegating sensitive interpretations exclusively to algorithmic systems.

Even if the model interprets patterns, it does not have a full understanding of the original purpose of the spreadsheet; therefore, structural errors in the source document can produce misinterpretations. This limit reinforces the need for continuous human oversight and validation of responses, as widely advocated in studies on algorithmic ethics.

Another point to be considered is the dependence on the internet connection. As it is a cloud-service-oriented application, any instability can compromise the reading of the spreadsheet or communication with OpenAI's API, generating delays or temporary failures. The technical literature of FastAPI and Google services corroborates this characteristic, highlighting the importance of stable environments for distributed applications.

4.4 IMPACT OF THE TOOL ON PRODUCTIVITY AND DECISION-MAKING

The 3.2-second performance for reading and interpreting the spreadsheet represents a significant advance when compared to the time required for manual reading of the same data. In corporate or educational contexts, where the need for rapid generation of reports and diagnoses is frequent, the use of the tool can drastically reduce administrative effort, freeing up time for critical analysis and decision-making.

This transformation is consistent with Ferreira's (2025) view of the role of automation in the era of digital transformation: technology does not replace the human, but expands its capacity for action. By automating repetitive tasks, such as cell reading and textual formatting, the user is left with the work of reflecting, checking, planning, and correcting, activities that require critical thinking.

In addition, the use of AI as an intermediary in the interpretation of data creates a new model of cognitive interaction, in which the user ceases to act as a primary reader and becomes the validator and supervisor of a pre-interpreted text.

4.5 COMPARISON WITH TRADITIONAL METHODS OF READING AND ANALYSIS

Traditionally, interpreting spreadsheets requires manual steps, which contain the following contextualized information:

- Cell-by-cell reading;
- Identification of patterns;
- Data classification;
- Textual elaboration of the conclusions.

The process is slow, subject to bias, and totally dependent on human attention. The method implemented by the Sheet2Prompt API, on the other hand, shifts part of these responsibilities to the AI, which: reads automatically, organizes the data in a semi-structured format, interprets, produces coherent writing, delivers the text to the user.

This parallelism between machine and human operator is close to Shneiderman's (2020) concept of "human-centered AI", which argues that intelligent systems should act as collaborative colleagues and not integral substitutes for human action.

The comparison between the two methods reveals clear benefits of automation:

- higher speed,
- lower risk of forgetting information,
- standardization of responses,
- consistency of analysis even with different users.

However, it also shows that the tool does not eliminate the need for human critical interpretation, which is consistent with authors such as Pasquale (2015), who defend the importance of human supervision over automated systems.

4.6 PRACTICAL APPLICATIONS AND ADHERENCE TO DIFFERENT AREAS

Discussing the results allows us to glimpse numerous areas that can benefit from using the Sheet2Prompt API. Among the most evident are:

- a) Educational management: Teachers or coordinators can generate automatic performance reports, exercise lists, activity tracking, or attendance summaries. The tool facilitates the production of descriptive texts without the teacher having to navigate through long spreadsheets, saving time.
- b) Business and administrative management: Companies that use spreadsheets for inventory, task control, goals, or indicators can transform numerical data into automated reports, ready for internal communication.
- c) Individual projects and personal use: Ordinary users can turn to-do lists, plans, or routines into organized narratives, optimizing time management.
- d) Public and government environments: Agencies that deal with large volumes of tabular data can integrate the tool into *administrative workflows, increasing transparency and agility*.

The versatility of the tool confirms the statement of Zhang et al. (2021), according to which the use of AI for tabular data interpretations tends to become one of the most relevant fields of applied machine learning.

4.7 PATHS TO IMPROVEMENT AND EXPANSION

The results obtained also allow us to identify clear directions for future improvements:

- Expanded support for other formats, such as CSV, XLSX, and SQL databases.
- Automatic generation of PDF reports, with graphs, tables and comments.
- Batch processing, allowing you to analyze several spreadsheets at once.
- Integration with *dashboards*, transforming texts into dynamic visualizations.

Figure 4

Example of Creating a Dashboard Based on the Table Used in Testing

Source: Prepared by the Authors.

- Implementation of customized models, specialized in different areas such as education, health or industry.
- Partial offline functionality, mitigating total internet dependency.

Each of these evolutions reinforces the system's potential for expansion, making it able to act as part of larger corporate automation solutions.

5 CONCLUSION

This article has demonstrated that the Sheet2Prompt API application represents a significant advance in the field of intelligent automation, integrating spreadsheet reading technologies with Artificial Intelligence models capable of transforming tabular information into high-level interpretive texts. By analyzing the development, technological choices, results, and implications of the system, it becomes evident that the tool fulfills its purpose of reducing manual effort in data analysis and optimizing workflow in educational, corporate, and administrative environments.

The application proved to be efficient by performing automated readings through the Google Sheets API and processing this data with agility, achieving an average response time of 3.2 seconds. When compared to the traditional process of manual inspection of spreadsheets, this performance highlights a significant gain in productivity and reliability, especially in routine tasks or those that require rapid consolidation of information. Such

efficiency confirms the trends pointed out by Ferreira (2025), who highlights the relevance of automation in the era of digital transformation, and by Boente (2025), who emphasizes the need for user-centered systems with a focus on clarity and usability.

In addition to technical performance, the study revealed that the system promotes a new cognitive approach in data treatment, by making AI become an interpretive partner capable of assisting the user in understanding and contextualizing information. This feature brings Sheet2Prompt API closer to contemporary discussions of Human-Computer Interaction (HCI), which advocate collaborative, transparent systems that expand human analytical capacity without replacing it. The interface in React, by offering simplicity, immediate feedback and low operational complexity, contributes directly to this positive user experience.

However, the research also shows that the quality of interpretation depends on the consistency of the source spreadsheet. Incomplete data, poorly organized lines, or the absence of minimum standards can compromise the response generated by the artificial intelligence model, reinforcing the relevance of O'Neil's (2016) and Pasquale's (2015) warnings about the need for human oversight and immediate critical analysis of automated results. Thus, although the system is robust, human validation remains indispensable to ensure reliability and avoid misinterpretations.

In practical terms, the application has great potential for impact in several sectors. In educational environments, it can automate performance reports and activity tracking; in the corporate sector, it can synthesize indicators, generate executive summaries or support administrative decisions; and, in personal use, it can organize tasks and schedules, making it a useful tool for optimizing routines. This versatility confirms the observations of Zhang et al. (2021) about the growing role of AI in tabular data analysis.

Additionally, the study allows the identification of expansion paths capable of further increasing the application's capacity, such as support for new data formats, creation of PDF reports with graphical visualizations, comparative analysis between spreadsheets, batch processing and adoption of specialized models by area of operation. Such possibilities expand the strategic value of the system and position it as a component of broader solutions in automation and intelligent information management.

In this way, it is concluded that the Sheet2Prompt API not only fulfills the initial objective of converting tabular data into clear and interpretive narratives, but also stands out as an innovative, scalable tool in line with contemporary demands for efficiency, accuracy, and

integration between humans and machines. While reducing manual work, it promotes new forms of cognitive interaction and enhances informed decision-making, reaffirming the importance of AI as an ally in information processing. Thus, this work contributes to the advancement of discussions on intelligent automation, offering a practical, reasoned and promising solution for the future of data analysis.

ACKNOWLEDGMENT

The authors would like to express their sincere thanks to all the people and institutions that contributed to the realization of this work. First, I thank my mother, who entered the programming area very early and introduced me to this fascinating universe, awakening in me an interest in technology and building innovative solutions.

I also thank the professors at FAETERJ-Rio, who were continuously by my side during the training process, offering guidance, support and availability to assist in my development as a systems analyst. Their contributions were fundamental for the consolidation of the knowledge that supports this work.

Finally, I would like to express my gratitude to the principal of Colégio Recanto Disney, an institution I attended during Elementary School, where I received care, encouragement and a solid educational foundation that contributed significantly to my academic career.

ABSTRACT

This study investigates the inclusion of giant mealworms (*Zophobas morio*) as an alternative protein source in diets for the shrimp *Penaeus vannamei* (Boone, 1931). The main objective is to evaluate the effects of this inclusion on the growth performance of the shrimp. The methodology involved the formulation of experimental diets with different levels of *Zophobas morio* inclusion and the performance of feeding trials under controlled conditions. The results indicated that the inclusion of giant mealworms can completely replace fishmeal without compromising shrimp performance, in addition to presenting additional benefits in terms of health and environmental sustainability. It is concluded that *Zophobas morio* is a viable and promising alternative for formulating shrimp diets, contributing to the diversification of protein sources in aquaculture.

principal é avaliar os efeitos dessa inclusão na performance de crescimento dos camarões. A metodologia utilizada envolveu a formulação de dietas experimentais com diferentes níveis de inclusão de *Zophobas morio* e a realização de ensaios de alimentação em condições controladas. Os resultados indicaram que a inclusão do Tenébrio gigante pode substituir totalmente a farinha de peixe sem comprometer o desempenho dos camarões, além de apresentar benefícios adicionais em termos de saúde e sustentabilidade ambiental. Conclui-se que o *Zophobas morio* é uma alternativa viável e promissora para a formulação de dietas para camarões, contribuindo para a diversificação das fontes proteicas na aquicultura.

Palavras-chave: *Zophobas morio*. Proteína Alternativa. *Penaeus vannamei*.

RESUMEN

Este estudio investiga la inclusión de gusanos gigantes de la harina (*Zophobas morio*) como fuente proteica alternativa en dietas para el camarón *Penaeus vannamei* (Boone, 1931). El objetivo principal es evaluar los efectos de esta inclusión en el crecimiento del camarón. La metodología implicó la formulación de dietas experimentales con diferentes niveles de inclusión de *Zophobas morio* y la realización de ensayos de alimentación en condiciones controladas. Los resultados indicaron que la inclusión de gusanos gigantes de la harina puede reemplazar completamente la harina de pescado sin comprometer el rendimiento del camarón, además de presentar beneficios adicionales en términos de salud y sostenibilidad ambiental. Se concluye que *Zophobas morio* es una alternativa viable y prometedora para la formulación de dietas para camarones, contribuyendo a la diversificación de las fuentes proteicas en la acuicultura.

Palabras clave: *Zophobas morio*. Proteína Alternativa. *Penaeus vannamei*.

1 INTRODUCTION

Shrimp farming (shrimp farming in captivity) has played an essential role in the supply of animal-based proteins, especially in developing regions such as Asia and Latin America. Since the 1990s, Brazil has stood out in this sector with the introduction of *Penaeus vannamei*, an exotic species that has advantageous zootechnical characteristics, such as fast growth, high feed efficiency and greater resistance in different environmental conditions (Vinatea, 2004).

The cultivation of this species is today an important mariculture activity (cultivation of aquatic animals in marine and/or coastal environments) in the country and in the world, representing a great source of economic and food sustenance for millions of people (FAO, 2022). However, challenges related to sustainability and food costs are becoming increasingly evident, driving the search for viable and environmentally responsible nutritional alternatives (Oliveira et al., 2013).

Feed represents the largest operating cost in shrimp farming, and a large part of this cost is associated with the dependence on inputs such as fish meal and meat meal, traditional sources of animal protein. These sources, although highly nutritious, generate pressures on natural resources, with considerable environmental impacts and supply limitations (Sá et al., 2018).

Thus, the development of alternative diets that maintain or improve the zootechnical performance of shrimp, while reducing environmental impacts and costs, has become one of the priorities of aquaculture research (Henry et al., 2018). In this context, the use of insects as protein sources has emerged as a promising solution, both for its production efficiency and for its lower environmental impact.

The Food and Agriculture Organization of the United Nations (FAO, 2013) has already highlighted the potential of insects for animal feed, citing benefits such as high biomass conversion, reduction in greenhouse gas emissions, and lower consumption of resources such as water and land.

Tenebrio molitor and *Zophobas morio*, in particular, have gained prominence as sustainable alternatives for the nutrition of aquatic species, due to their balanced nutritional profile and the presence of bioactive compounds that favor the health and growth of organisms (Gasco et al., 2016; Rumbos and Athanassiou, 2021). The larva of *Zophobas morio*, known as giant mealworm, has a high protein (46.8%) and lipid (33.6%) content, in addition to containing chitin, a polysaccharide that can benefit the immune system of shrimp

and improve intestinal health (Araújo et al., 2019; Benzertiha et al., 2020).

Recent studies show that insect-based diets, such as mealworm, can replace fish meal or meat by up to 100% without compromising specific growth rate (ECR) or feed conversion (C.A), maintaining or even improving performance indices (Shekarabi et al., 2021).

However, the effectiveness of this substitution in shrimp diets is still relatively little explored, especially when compared to other aquatic species. Introducing more sustainable and efficient diets can not only reduce production costs but also align shrimp farming with global demands for more responsible and ecologically sustainable food practices.

Biofloc technology is seen as a promising innovation for fish production (Ogello et al., 2021). The BFT (Biofloc Technology) system improves the efficiency in the use of nutrients, which are constantly recycled and reused by microorganisms in an environment with minimal water exchange (Avnimelech, 2012; Ebeling et al., 2006; Nisar et al., 2022). The cultivation of marine shrimp *Penaeus vannamei* using biofloc is extensively researched and has a well-established cultivation pattern

Therefore, the initial studies on biofloc technology focused on the production of the shrimp *Penaeus vannamei* (Burford et al., 2004; Wasielesky et al., 2006). Since then, a lot of knowledge has been generated about this species. Water quality parameters for the cultivation of this species were defined to optimize production, including temperature (de Souza et al., 2016, 2014), salinity, alkalinity and pH (Furtado et al., 2011), nitrogenous compounds (Ferreira et al., 2020; Xu et al., 2020), total suspended solids (Gaona et al., 2017; Ray et al., 2010) and use of inoculum (Harun et al., 2019; Krummenauer et al., 2014).

Zootechnical performance parameters are also well documented in the scientific literature, such as growth (Jory et al., 2001; Panigrahi et al., 2019; Xu et al., 2013), survival and feed conversion (Krummenauer et al., 2014; Wasielesky et al., 2006). The contribution of bioflocs to shrimp nutrition (Burford et al., 2004), the composition of flakes along with feed and probiotics (Ferreira et al., 2017; Huerta-Rábago et al., 2019; Llario et al., 2019) recommended for its breeding, providing essential information to establish a well-founded standard for shrimp in biofloc systems.

Therefore, this study aims to investigate the replacement of meat meal by giant mealworm (*Zophobas morio*) in diets for the shrimp *Penaeus vannamei*. The main objective of the research is to evaluate the impacts of this substitution on the zootechnical performance of shrimp and on the water quality in biofloc systems.

2 MATERIAL AND METHODS

The experiment was carried out at the Aquaculture Complex belonging to the Federal Institute of Education, Science and Technology of Pará (IFPA), in the municipality of Castanhal, between the months of July and August 2024. A total of 64 shrimp of the species *P. vannamei*, acquired at the Lorenvill farm, located in the municipality of Curuçá-Pará, were used, the animals were taken to the aquaculture complex (IFPA) for the acclimatization period for 5 days. After acclimatization, the shrimp were randomly distributed in 16 polypropylene boxes with a useful volume of 20 liters, at a density of 4 shrimps per box, with an initial average weight of 4.76 ± 0.57 g. Each treatment was performed in triplicate, with the replicates properly placed between the boxes to ensure the representativeness of the results. For 30 days, the experiment was carried out in a biofloc system (BFT), a system that allows a high production density and the non-renewal of water and constant aeration (Barbosa et al. 2017).

An inoculum of bioflocs from cultivation already in progress was used and for ammonia control sugarcane molasses was applied each time the ammonia level reached the concentration of 1 mg/L. The BFT system uses heterotrophic bacteria in its formation, its junction is induced through the carbon ratio: nitrogen from cultivation maintaining the ratio 6:1 (Avnimelech 1999, 2009).

For this study, four experimental diets were formulated, one control using meat meal and three with meat meal replacement by giant mealworm flour (*Z. morio*) at the levels of 25, 50 and 100%. The rations were formulated and produced in the aquaculture complex. The ingredients were weighed, mixed and pelleted. The rations were stored under controlled conditions until the moment of use.

The nutritional composition of the diets was carried out according to the (AOAC, 1995) (Association of Official Agricultural Chemists) to ensure that both were isoprotein (Table 1).

Table 1

Composition of ingredients in the formulation of diets for fattening in a biofloc system

Composição (%)	Tratamentos

The ingredients of the diets were crushed and mixed (as shown in figure 1 A and B). The preparation of the experimental diets began with the weighing of the ingredients and then they were mixed dry and homogenized with the addition of 20% water. Subsequently, all diets went through this process of homogenization and mixing, until their formulation and immediately added in a manual grinder, with a final pellet size of 3.00 mm.

The diets were dried in the sun for a period of 3 days to ensure complete moisture removal. After this process, they were carefully placed in plastic bags to avoid contamination and stored at a constant temperature of 20°C until the moment of use. The centesimal analysis of mealworm meal, which includes the percentage of proteins, carbohydrates, lipids, fibers and ashes, is shown in Table 2.

2.2 EXPERIMENTAL CONDITIONS

After distribution in the cultivation units and acclimatization period, the shrimp were fed three times a day (08:00, 14:00 and 18:00), the diets initially fed in an amount corresponding to 6% of the animals' biomass (Jory, 2001), readjusted weekly according to the biometrics. The parameters of water qualities such as: dissolved oxygen - DO, pH, temperature and salinity were measured daily with the AKSO multiparameter probe (AK88v2).

The analyses of alkalinity, ammonia (NH₃), nitrite (NO₂) and nitrate (NO₃) were measured twice a week using the rapid analysis kits (Aquality, LabconTest and CHECKER). During the experiment there was no water exchange due to adaptation to the biofloc system (BFT) and for the control of ammonia concentration sugarcane molasses was used as a carbon source.

2.3 ZOOTECHNICAL PERFORMANCE OF SHRIMP

Shrimp biometrics were performed weekly (Figure 2, C and D) with the help of a digital scale (BEL engineering) to monitor the weight of the animals and adjust the amount of feed.

After the 4 weeks of experiment in a biofloc system, the following zootechnical parameters were analyzed: final biomass, protein efficiency rate (TEP), specific growth rate (TCE), weight gain (g), feed conversion and survival.

Figure 2

C and D: Realization of shrimp biometrics

Source: Authors.

2.4 STATISTICAL ANALYSIS

The zootechnical performance data of the shrimp were analyzed using Analysis of Variance (ANOVA) to determine the existence of significant differences between the experimental groups. To identify which groups had specific differences, multiple comparisons were performed using Tukey's test. The level of significance adopted for all analyses was 5%.

3 RESULTS AND DISCUSSION:

The parameters of water quality in the treatments and other aspects remained at favorable levels, with no significant variations between them, table 3 (Marques and Andreatta (1998)).

Table 3

Water quality parameters measured in the experimental units in a biofloc system

Análises dos parâmetros da qualidade de água nas unidades experimentais ($\pm$ desvio padrão).				
Parâmetros	0%	25%	50%	100%

The concentration of Dissolved Oxygen remained between 5.2 – 6.5 mg/l in all treatments. The temperature varied between 26.5 – 28.5 $^{\circ}\text{C}$, the pH (8.0 – 8.5 mg/l) and Salinity between 17-20 ppm, the nitrogen ones such as total ammonia, nitrite and nitrate obtained values between 0.70 – 0.83 mg/L; 1.70-2.14 mg/L and 50 mg/L respectively, and the alkalinity remained above 100 mg/L during the experiment. All parameters evaluated remained within the ideal range and did not influence the performance of the animals (Boyd, 1984; Vinatea, 2004, Gadelha et al., 2009).

Ammonia is a critical parameter in aquaculture as it can cause stress and mortality in aquatic organisms (Wasielesky et al., 2006). In biofloc systems, ammonia is converted to nitrite and later to nitrate by microbial activity, thereby reducing the risk of toxicity to cultured organisms (Avnimelech et al., 1994).

However, the control of ammonia in biofloc systems requires careful management of pH, temperature and nutrients, as variations in these parameters can affect the efficiency of ammonia conversion (Ebeling et al., 2006). Therefore, the ammonia levels do not present significant differences between the treatments adopted (Figure 3).

Figure 3

Ammonia concentration throughout the experiment

Source: Authors.

Tenebrio flour contains a higher amount of lipids, especially unsaturated fatty acids. These acids are essential for energy synthesis and aid in the development of cell membranes, directly influencing the growth and survival rate of shrimp (Henry et al., 2018). In addition, these fatty acids have a higher amount in mealworm flour compared to meat meal, making them essential for proper energy metabolism. The faster metabolism of high-quality lipids releases energy more efficiently, which can be directed towards body growth.

Therefore, these acids are essential for the healthy development of shrimp, positively impacting the specific growth rate (TCE). Studies indicate that diets containing mealworm flour can raise TBI to values above 2.5% per day, while diets with high levels of beef meal tend to have a lower TCE due to lower digestibility and high concentration of saturated fats (Makkar et al., 2014).

In this study, feed conversion was also more efficient with the use of giant mealworm. Van Huis (2017) found similar results when obtaining an AC of approximately 1.2-1.4 in diets based on giant mealworm, compared to values higher than 1.5 with meat meal, showing that shrimp can more efficiently convert the protein ingested into body mass, which results in lower feed costs.

In a similar study, Sá et al. (2018), when working with the replacement of meat meal with fish meal, observed that the inclusion of up to 20-30% of meat meal in the diet maintained an efficient feed conversion (FC), with values between 1.3-1.5, in addition to an average

weight gain of 30-35 g in 60-day cycles.

However, it was found that the increase of more than 30% of this ingredient in the diet compromised the CA and TCE of the animals, possibly due to the lower digestibility and lower amino acid profile of meat meal and high levels of saturated fats and ashes compared to fishmeal, which can negatively impact feed efficiency (ZHAO et al., 2019).

In this work, the inclusion of giant mealworm (*Z. morio*) in the diets of *P. vannamei* shrimp resulted in significant improvements in several zootechnical performance parameters, Table 4. Shrimp fed diets containing mealworm showed a significant increase in weight gain ($P < 0.05$) compared to animals fed the control diet. In addition, the feed conversion ratio (C.A) was significantly better in the experimental groups, indicating a greater efficiency in the use of nutrients provided by giant mealworm flour.

Comparing with other studies, the research of Sánchez-Muros et al. (2014) also found significant improvements in the zootechnical performance of *P. vannamei* shrimp when fed diets containing insect meal. Additionally, a recent study by Henry et al. (2021) demonstrated that the inclusion of insect meal in shrimp diets resulted in improvements in gut health and pathogen resistance.

These results reinforce the potential of using insect meal as an alternative ingredient in aquaculture diets, with benefits that go beyond zootechnical performance, which also extend to the overall health of shrimp. Gasco et al. (2016) also observed results similar to those obtained in this study, with the protein efficiency ratio (TEP) being significantly higher in diets containing mealworm meal, reaching values between 2.0 and 2.3.

On the other hand, the use of meat meal presented lower TEP's, ranging from 1.5 to 1.7. These results indicate a greater capacity for shrimp to use the protein contained in meal, which reinforces its potential as an alternative ingredient in aquaculture diets.

These studies demonstrate that mealworm meal offers a more balanced and suitable nutritional profile for shrimp growth than meat meal, providing better digestibility, protein retention, and gut health. Insects are considered to be very advantageous in terms of sustainability, due to their rapid reproduction, high growth rate, low environmental impact, and efficiency in food conversion.

They are able to develop from different materials, such as organic waste, as well as being a rich nutritional source of protein, fatty acids, and minerals. They can also be consumed in different ways (Nowak et al., 2016; Van Huis et al., 2013; Araújo et al., 2019).

Rumbos and Athanassiou (2021) highlight that giant mealworm (*Z.morio*) is a promising source of nutrients and anti-microbials, with potential for use in aquaculture and poultry feeds. The production of this insect has a reduced environmental impact, contributing to sustainability. In addition, giant mealworm can be used to reduce waste, offering a viable and sustainable alternative to traditional animal protein production.

Therefore, the use of shrimp diets that do not depend on fishmeal to achieve good zootechnical results emerge as a promising opportunity for producers to associate themselves with new markets that add value to the shrimp produced (Amaya et al., 2007; Soares et al., 2011).

The final weights of the shrimp submitted to the four treatments were analyzed by ANOVA and multiple comparisons by Tukey's test with a significance level of 5%. ANOVA indicated a significant difference between treatments ($F=45.83$, $p<0.0001$). Tukey's test revealed that Treatment 4 was significantly superior to the others ($p < 0.05$), while no significant differences were observed between Treatments 1, 2 and 3 (Figure 2).

Figure 4

Differences between the final weights in each treatment

1=0% treatment; 2=treatment 25%; 3=50% treatment and 4=100% treatment

Source: Authors.

Although the post-hoc analysis did not identify statistically significant differences between Treatments 1, 2 and 3, the data suggest a trend towards improvement in the final weights of the shrimp as the treatments progressed, especially between Treatments 2 and 3. This trend of weight gain, visually observed in the box plot, may indicate a potential optimization in the diets applied to these treatments, although the difference was not statistically significant. Treatment 4, on the other hand, showed a substantially higher weight gain, which reinforces the efficiency of the diet tested in this group and its ability to improve the zootechnical performance of shrimp.

4 CONCLUSION

The results obtained with the replacement of up to 100% of animal flour with giant mealworm flour were extremely promising. The significant improvements in several aspects, including the nutritional quality and sustainability of the final product. Giant mealworm has been shown to be a viable and efficient alternative, providing benefits for both the animals and the environment. These findings pave the way for future research and industrial applications, highlighting the innovative potential of this substitution in the food sector.

ABSTRACT

The main objective of the analysis is to review and discuss the principles of the similarity method applied to the boundary layer on inclined surfaces, in laminar regime, and that can be extended to a turbulent regime. The emphasis applies to theoretical aspects related to the concept of similarity, but theoretical results were obtained to compare with empirical expressions and experimental results. Results are obtained for the hydrodynamic and thermal fields, such as coefficient of friction and Stanton number, as a function of the pressure gradient parameter and the Prandtl number. The fourth order Runge-Kutta method is applied, starting from the expansion in power series as the first approximation for the mathematical solution of hydrodynamic and thermal problems, in laminar regime. The Integral Method is applied to obtain an approximate solution for the flow in turbulent regime, by similarity variables method. Numerical and graphical results are presented in sufficient numbers to emphasize the consistency of the model developed in the determination of parameters related to thermal and hydrodynamic boundary layers on smooth and rough surfaces.

Keywords: Similarity Method. Fourth Order Runge Kutta Method. Hydrodynamic Boundary Layer. Thermal Boundary Layer.

RESUMO

O principal objetivo da análise é revisar e discutir os princípios do método da similaridade aplicado à camada limite em superfícies inclinadas, em regime laminar, e que pode ser estendido a um regime turbulento. A ênfase recai sobre aspectos teóricos relacionados ao conceito de similaridade, porém resultados teóricos foram obtidos para comparar com expressões empíricas e resultados experimentais. Resultados são obtidos para os campos hidrodinâmico e térmico, tais como coeficiente de atrito e número de Stanton, em função do parâmetro de gradiente de pressão e do número de Prandtl. O método de Runge-Kutta de quarta ordem é aplicado, partindo da expansão em série de potências como primeira aproximação para a solução matemática dos problemas hidrodinâmico e térmico, em regime laminar. O Método Integral é aplicado para obter uma solução aproximada para o

RESUMEN

El principal objetivo del análisis es revisar y discutir los principios del método de similitud aplicado a la capa límite en superficies inclinadas, en régimen laminar, y que puede extenderse a un régimen turbulento. El énfasis se centra en los aspectos teóricos relacionados con el concepto de similitud, pero se obtuvieron resultados teóricos para compararlos con expresiones empíricas y resultados experimentales. Se obtienen resultados para los campos hidrodinámico y térmico, tales como el coeficiente de fricción y el número de Stanton, en función del parámetro de gradiente de presión y del número de Prandtl. Se aplica el método de Runge-Kutta de cuarto orden, partiendo de la expansión en series de potencias como primera aproximación para la solución matemática de los problemas hidrodinámico y térmico, en régimen laminar. El Método Integral se aplica para obtener una solución aproximada para el flujo en régimen turbulento, mediante el método de variables de similitud. Se presentan resultados numéricos y gráficos en cantidad suficiente para enfatizar la consistencia del modelo desarrollado en la determinación de parámetros relacionados con las capas límite térmica e hidrodinámica en superficies lisas y rugosas.

Palabras clave: Método de Similitud. Método de Runge-Kutta de Cuarta Orden. Capa Límite Hidrodinámica. Capa Límite Térmica.

1 INTRODUCTION

The aspects related to laminar regime are based on the deep study carried out by Evans (1968), and in turbulent regime the text of Kays and Crawford (1966).

It is assumed that there is no mass transfer through the surface (without surface perspiration effect) and that the perpendicular component of velocity is zero. In addition, the velocity component parallel to the surface is also zero, a condition called "no slip on the wall" in the specialized literature. All the presented solutions and results assume constant properties, unaffected by the variation of temperature, and the velocities are sufficiently low so that the viscous dissipation term can be neglected.

The basic equations for boundary layer similarity conditions are widely discussed Schlichting (1968); Evans (1968), Kays and Crawford (1983), Silva Freire (1990), and only essential details for the understanding of the arguments are presented in this work. Details on flat plate flow are discussed by Nogueira and Soares (2018).

There are in the literature many ways of specifying the existence of similar solutions for the laminar boundary layer equations. The main characteristic associated with the concept of boundary layer similarity is that the undisturbed velocity distribution of the potential flow must satisfy the following expression, which follows the original suggestion of Falkner and Scan (1931):

$$U(x) = Cx^m \quad (1)$$

Where:

C is the value of U (x) where x is unitary, and the value of m depends on the pressure gradient in the main direction of the flow.

However, according to Spalding and Pun (1962), it is convenient to impose that U (x) satisfies the following equation:

$$\frac{dU}{dx} = CU^{\frac{2(\beta-1)}{\beta}} \quad (2)$$

Where:

β is a parameter that is associated with the pressure gradient in the direction of the main flow.

The potential theory, applied around an angle wedge $\beta\pi/2$ Evans (1988), satisfies equation 3.11, above, where:

$$m = \frac{\beta}{(2 - \beta)} \quad (3)$$

and,

$$\frac{1}{\beta} \frac{dU}{dx} = \frac{U}{x} \frac{1}{(2 - \beta)} \quad (4)$$

However:

$$\frac{dp}{dx} = -\rho U \frac{dU}{dx} \quad (5)$$

The specification of $U(x)$ is equivalent to specifying the pressure gradient, which is a function of β :

$$\frac{dp}{dx} = -\rho U \frac{\beta}{(2 - \beta)} \frac{U}{x} \quad (6)$$

The parameter β , as can be seen, depends only on the velocity distribution in the external region to the boundary layer, the variable x along the surface and the pressure gradient.

We are interested in the flow conditions where $-0.2 \leq \beta \leq 1.0$, representing the limits of the boundary conditions for the pressure gradient parameter between the boundary layer detachment $\beta = -0.2$, and the two-dimensional stagnation flow $\beta = 1.0$, in the laminar regime (Figure 1).

Figure 1

Flow on an inclined surface of angle $\pi\beta$

Source: The authors.

The differential equation governing the velocity distribution at a similar boundary layer for laminar regime within the range of the already established pressure gradient parameter β is given by Schlichting (1968); Evans (1968), Kays and Crawford (1983), Silva Freire (1990):

$$f''' + f \cdot f'' + \beta \cdot (1 - f'^2) = 0 \quad (7)$$

With the following boundary conditions:

$$\eta = 0, \quad f = f' = 0 \quad (8)$$

$$\eta \rightarrow \infty, \quad f' \rightarrow 1.0 \quad (9)$$

Where:

f and η are defined by:

$$\eta = \frac{y}{x} \frac{(Ux)^{1/2}}{\sqrt{2-\beta}} \quad e \quad f = \frac{\psi/v}{(\frac{Ux}{v})\sqrt{2-\beta}} \quad (10)$$

Where:

x and y are, respectively, the primitive coordinates along the surface and perpendicular to it.

Choosing the coordinate η as a function of y/x , which is very small, except at $x = 0$, by the square root of the Reynolds number, $Re_x = (\frac{Ux}{\nu})^{1/2}$, which is very large, we impose y/x is small, but η is not.

From the definitions of η and f , we have expressions for the components of dimensionless velocities:

$$u = U \frac{df}{d\eta} \quad e \quad v = - \left(\frac{\nu}{\beta} \frac{dU}{dx} \right)^{\frac{1}{2}} [f + (\beta - 1)\eta \frac{df}{d\eta}] \quad (11)$$

The last boundary condition, Equation 3.1.7.2, means that as η grows $f' = u/U$ should approach the unit without exceeding it. The value of η , in this case, is called η_{∞} , for a given value of β .

Due to the difficulty in solving the above boundary condition problem with reasonable precision, we apply the 4th order Runge Kutta Method Tannehill et al. (1997), with initial value of $f'(0)$ given after application of the Power Series Method.

The approximate solution by the power series method with the Shooting Method Tannehill et al. (1997); Oderinu, R. A. (2014), as an approximation procedure for the velocity profile is obtained by assuming that the function $f(\eta)$ satisfies the following expansion in series:

$$f(\eta) = C_2 \frac{\eta^2}{2!} + C_5 \frac{\eta^5}{5!} + C_6 \frac{\eta^6}{6!} \dots + C_n \frac{\eta^n}{n!} \quad (12)$$

With the following recurrence rule:

$$C_{n+3} = -n! \left[\frac{1}{1!(n-1!)} (\beta \cdot C_2 \cdot C_n) + \frac{1}{2!(n-2!)} (C_2 \cdot C_n + \beta \cdot C_3 \cdot C_{n-1}) + \frac{1}{3!(n-3!)} (C_3 \cdot C_{n-1}) + \frac{1}{4!(n-4!)} (C_5 \cdot C_{n-3}) \right] \quad (13)$$

for $n \geq 4$.

$$C_3 = -\beta ; C_5 = -2\left(\beta + \frac{1}{2}\right)C_2^2 \quad \text{e} \quad C_6 = 6\beta\left(\beta + \frac{1}{2}\right)C_2 \quad (14)$$

The term C_2 corresponds to $f''(0)$, that is:

$$C_2 = f''(0) \quad (15)$$

Through Shooting Method Tannehill et al. (1997); Oderinu, R. A. (2014), or other approach method, as the "Bisection Method", we can obtain the value of C_2 , with the desired approximation. However, the approximation method through the series solution is slow, in order to obtain the necessary solution for our purposes. In this sense, we apply the fourth Runge-Kutta method Tannehill et al. (1997), with initial value for $f''(0)$ from the expansion in power series. As the Runge-Kutta method is a high-precision numerical method, coupled with the Newton-Raphson method, the final solution for the velocity field in the hydrodynamic boundary layer is obtained in less time than necessary for the series solution, with the same precision.

The energy equation for determining the dimensionless temperature field is given by:

$$\frac{d}{d\eta}(\theta') + Pr \cdot f \cdot \theta' = 0 \quad (16)$$

The temperature profile shall satisfy the following contour conditions for the specified surface temperature:

$$\eta = 0, \quad \theta = 0 \quad (17)$$

$$\eta \rightarrow \infty, \quad \theta \rightarrow 1.0 \quad (18)$$

Where:

Pr is the number of Prandtl, and

$$\theta = \frac{T - T_w}{T_\infty - T_w} \quad (19)$$

It is assumed that T_{∞} , temperature outside the boundary layer, is not affected by the heat rate removed outside of the boundary layer. The value of T_w corresponds to the surface temperature (reference!).

The energy equation, Equation 14, is linear and less complex than the velocity field equation. However, it strongly depends on the solution of the velocity profile, since f appears explicitly in the second term. Therefore, the greater the precision in the solution of f , the better the solution in θ .

The Runge-Kutta method is used for solution of the temperature field, but it is observed that the limit value for η , $\eta \rightarrow \infty$, is not necessarily the same as that obtained for the velocity field, for a given β . As an alternative, in terms of comparison, a second solution is obtained by directly integrating the energy equation Kays and Crawford (1983); Evans (1968):

$$\theta = \theta'_0 \cdot \int_0^{\eta} \exp \left[-Pr \cdot \int_0^{\eta} f \cdot d\eta \right] d\eta \quad (20)$$

$$\theta' = \theta'_0 \cdot \exp \left[-Pr \cdot \int_0^{\eta} f \cdot d\eta \right] \quad (21)$$

Where:

θ'_0 'is the value of the surface temperature derivative:

$$\theta \rightarrow 1, \quad \eta \rightarrow \infty \quad \theta'_0 = \frac{1}{\int_0^{\infty} \exp \left[-Pr \cdot \int_0^{\eta} f \cdot d\eta \right] d\eta} \quad (22)$$

However, the application of Equation 3.1.18, above, does not provide adequate accuracy to obtain the surface temperature gradient. In this sense, we chose to use Evans's procedure, in θ'_0 .

Therefore,

$$\left(\frac{d\theta}{d\eta} \right)_0 = \frac{3}{E} \left(\frac{Pr \cdot f''_0}{3!} \right)^{1/3} \quad (23)$$

Where:

$$E = \Gamma \left(\frac{1}{3} \right) + \sum_{q=0}^{\infty} \frac{a_q}{Pr^{q/3}} \quad (24)$$

Γ is the gamma function:

$$\Gamma\left(\frac{1}{3}\right) = 2.6789385 \quad (25)$$

Expressions for a_q contains the pressure gradient parameter β , the dimensionless viscous stress on the wall $f''(0)$, and numerical factors derived from the combination of gamma functions and are not presented. The complete procedure for the exact determination is found in Evans (1968). In addition, Equation 19, for determining the temperature gradient at the surface, presents unsatisfactory results as β tends to the flow separation value ($\beta = -0.2$). Evans (1968) describes an alternative procedure for this case, but it will not be the subject of discussion in this analysis.

In turbulent regime there are no analytical solutions for the boundary layer equations. An alternative for the determination of turbulent boundary layer parameters is the approximate solution of Von Kármán's equation:

$$\frac{d\delta_2}{dx} = \frac{C_f}{2} = \frac{\tau_w}{\rho U^2} \quad (26)$$

Even in the zero-pressure gradient, flat plate flow, Von Kármán's equation has more unknowns than equations. Thus, it is necessary to relate the unknown by specifying a dimensionless velocity profile.

For comparison purposes, in relation to the laminar regime, in this work, values for turbulent flow are determined on smooth and rough inclined surfaces, by means of an approximate theoretical model. Turbulent flow with 1/7 power is used, and experimental results of Schultz-Grunow (1941), Pimenta et al. (1975), Schlichting and Prandtl (1968), Kays and Crawford (1983).

The theoretical procedure, in this case, corresponds to the one recommended by Kays and Crawford (1983), for flat plate flow, where the conditions of similarity are satisfied. In fact, the valid procedure is used for flat plate, for determination of the profiles of speed and temperature, and generalizes situations where $\beta \neq 0$, through the concept of the shape factor, H_{12} , and correction formulas obtained by Kays and Crawford (1983).

For the approximate determination of the turbulent velocity profile, associated with the integral equation of momentum, a power law of type 1/7 is very convenient:

$$u^+ = 8.75y^{+1/7} \quad (27)$$

The above expression represents the speed profile up to $y^+ = 1500$ a little better than the equation, much used in algebraic simulations, called "Logarithmic Law in the Wall".

$$u^+ = \frac{u}{\sqrt{\tau_w/\rho}} \quad e \quad y^+ = y \frac{\sqrt{\tau_w/\rho}}{v} \quad (28)$$

If Equations 3.1.22 and 3.1.23 are valid throughout the boundary layer, and that the thickness δ corresponds to the position where the velocity is equal to U , we have:

$$\frac{U}{\sqrt{\tau_w/\rho}} = 8.75\delta \frac{\sqrt{\tau_w/\rho}}{v} \quad (29)$$

The displacement, δ_1 , and momentum thickness, δ_2 , can be evaluated by the following expressions:

$$\delta_1 = \int_0^\infty \left(1 - \frac{u\rho}{U\rho_\infty}\right) dy \quad (30)$$

And

$$\delta_2 = \int_0^\infty \frac{\rho u}{\rho_\infty U} \left(1 - \frac{u}{U}\right) dy \quad (31)$$

The integral equation of the momentum, in similar coordinates, is given by:

$$f''(0) = \frac{1}{\delta_4} = \frac{1}{vU} \frac{d}{dx} (U^2 \delta_2) + \frac{\delta_1}{v} \frac{dU}{dx} \quad (32)$$

or

$$\frac{\delta_2}{\delta_4} = \frac{1}{2} \frac{U(x)}{v} \frac{d\delta_2^2}{dx} + (2 + H_{12}) \frac{\delta_2^2}{v} \frac{dU(x)}{dx} \quad (33)$$

Where:

$$H_{12} = \frac{\delta_1}{\delta_2} \text{ denominated shape factor} \quad (34)$$

For similar boundary layer, each δ_n is a constant and therefore the shape factor is a constant. It is important to note that Equation 3.1.28 is valid for laminar and turbulent regime. The shape factor increases in an adverse pressure field, $\beta < 0$. For flow in turbulent boundary layer, H increases from 1.29 to null pressure gradient $\beta = 0$, to approximately 2.7 in the separation condition $\beta \cong 0.2$ Simpson (1989). For accelerated flow the value of H increases again, as a function of the "tendency to laminar flow" effect, and tends to 1.47 for two-dimensional stagnation flow, $\beta = 1$ Smith (1966). The velocity distribution, $U(x)$, must be known prior to the application of the integral momentum equation, Equation 3.1.28.

The displacement thickness, δ_1 , has the effect of displacing the undisturbed main flow current function with respect to the value it should have for ideal, non-viscous fluid. The momentum thickness, δ_2 , is the extent to which the amount of fluid movement in the boundary layer is below what should be for an ideal fluid. The viscous thickness, δ_4 , inverse of $f''(0)$, is the measure of the resistance offered for transferring the amount of movement of the main stream to the surface.

There are two predominant regions to be analyzed in a turbulent boundary layer:

- 1 – A predominantly viscous region close to the surface, where viscous stresses and molecular conduction prevail.
- 2 – A completely turbulent region where the amount of movement and heat are transported in rates generally much higher than that of the viscous sublayer.

It is in the viscous sublayer, however, where events associated with turbulence occur and are of greater importance than the fully turbulent region. The viscous forces, largely responsible for the characteristics of the laminar flow, have the effect of restoring the laminar flow in turbulent flow and, otherwise, the inertial forces associated with the local variations of the velocity field have the opposite effect. In fact, inertial forces tend to amplify local

disturbances. It is to be expected, therefore, that the stability of the laminar flow is associated with low numbers of Reynolds, ratio between the forces of inertia by the viscous forces. Although instability is an essential feature in the viscous sublayer, the turbulent boundary layer structure adjusts itself, constructing a relatively stable structure with stability characteristics (there is regularity!).

At turbulent flow, along the surface, the laminar sublayer becomes narrow and becomes an increasingly smaller fraction of the entire boundary layer. In essence, the turbulent boundary layer has the property of diffusing the amount of movement, and other properties of the flow, much more rapidly than the simple molecular process.

Equations 3.1.26 and 3.1.27, together with the integral equation of momentum, Equation 3.1.28, can be used to obtain the coefficient of friction in the turbulent boundary layer. Note, however, that the velocity profile is valid for null pressure gradients, that is, $\beta = 0$. For situations in which the pressure gradient is different from zero, correction must be made. The expression for the coefficient of friction, $\beta = 0$, is given by Kays and Crawford (1983):

$$\frac{Cf}{2} = \frac{0.0594}{2Re_x^{1/5}} \quad (35)$$

Which can be compared with the experimental equation obtained by Schultz-Grunow (1941):

$$\frac{Cf}{2} = 0.185(\log_{10}(Re_x))^{-2.584} \quad (36)$$

In turbulent boundary layer analysis, it is convenient to define some type of similarity. However, the task is not as simple as in laminar boundary layer. In turbulent flow, in a region very close to the surface, it is observed that $u^+ = y^+$, e, logically, the principle of similarity applies. Outside this region and in the explicit coordinate system, the principle generally does not apply. However, there are some classes of turbulent flow that have similarity, even outside the laminar sublayer.

Turbulent boundary layer that has similarity outside the laminar sublayer is called the boundary layer in equilibrium. The equilibrium boundary layer is the one that satisfies the following velocity profile:

$$\frac{u - U}{\sqrt{\frac{\tau_w}{\rho}}} = F\left(\frac{y}{\delta_3}\right) \quad (37)$$

Where:

$$\delta_3 = - \int_0^\infty \frac{u - U}{\sqrt{\frac{\tau_w}{\rho}}} dy \quad (38)$$

For laminar boundary layer it was demonstrated that Equation 01 must be satisfied for similarity solutions to exist. In turbulent boundary layer this same type of free-flow velocity profile must be satisfied, so that equilibrium boundary layer occurs, satisfying the similarity principle Kays and Crawford (1983).

The turbulent coefficient of friction for the equilibrium boundary layer can be correlated with β through an empirical relation Kays and Crawford (1983):

$$\frac{Cf/2}{(Cf/2)_{\beta=0}} = \frac{1}{(1 + \frac{\beta}{5})} \quad (39)$$

For turbulent boundary layer, assuming equilibrium boundary layer, the Stanton number is determined for null pressure gradient, $\beta = 0$, through the expression Kays and Crawford (1983):

$$St_x = \frac{Cf/2}{\sqrt{Cf/2} (13.2Pr - 10.16) + 0.9} \quad (40)$$

2 RESULTS AND DISCUSSIONS

Results were obtained for velocity and temperature profiles, and associated values, such as friction coefficient and Stanton number, as a function of the pressure gradient parameter and Prandtl number. Numerical results were computed using Fortran (1995) language and graphical results were obtained through software Grapher (2004).

Figure 2 presents results for velocity profile, f' , and dimensionless viscous stress, f'' , for laminar regime in extreme situations, in $\beta = -0.2$ and $\beta = 1.0$, in relation to the results obtained for flat plate, $\beta = 0$. These conditions, as already pointed out, represent, respectively, the surface boundary layer detachment condition and the two-dimensional stagnation flow condition. It is observed that, for $\beta = -0.2$, the viscous stress is equal to zero on the surface, as expected.

Figure 2

Solutions for dimensionless viscous velocity (f'') and velocity profile (f')

Source: The authors.

In Equation 7, for $\beta = 0$, since $f' = 0$ on the wall, f''' is also zero and, as a consequence, f'' has a maximum value on the wall. For $\beta < 0$ values, f'' also has a maximum value, but the maximum point distances itself from the wall, and the values of f'' on the wall are lower than that of $\beta = 0.0$. In fact, it can be observed that the viscous tension in the wall decreases to negative β values and becomes zero in β near -0.2 .

For accelerated flows, $\beta > 0$, the maximum value also occurs on the wall, and these values increase with increasing acceleration of the flow. Since the viscous stress is zero on the wall, where the separation of the flow occurs, f' has a minimum at this point, as can be

seen from Figure 2 For accelerated flow, $\beta = 1.0$, a decrease in the displacement thickness, relative to flat plate flow, $\beta = 0.0$, can be observed.

Table 1 present comparisons of results for displacement thickness, δ_1 , momentum thickness, δ_2 , and the inverse of shape factor, H_{21} , in laminar regime. The consistency of the results obtained can be verified. For highly accelerated flows, better consistency is achieved between models.

Figure 3 presents results for temperature profile and dimensionless temperature gradient in laminar regime and $Pr = 1.0$. The most important results, which should be emphasized, are the values of the surface temperature gradient, since the integral parameters associated to the temperature field are strongly associated with it. It can be observed that the temperature gradient decreases with lower values of β , ie, the more accelerated the flow, the greater the temperature gradients in the wall. Equivalent to what occurs with the thickness of the hydrodynamic boundary layer, the thermal boundary layer thickness also decreases to higher β values. In addition, another factor to be emphasized, the profile and the temperature gradient depend strongly on the solution of the velocity field, according to Equations (16) and (17).

Figure 3

Temperature profile (θ) and dimensionless temperature gradient (θ') for laminar thermal layer ($Pr = 1.0$)

Source: The authors.

Figure 4 presents the results of a dimensionless coefficient of friction in the laminar regime determined by:

$$\frac{Cf}{2} = \frac{f''(0)}{Re_x^{\frac{1}{2}}(2 - \beta)^{1/2}} \quad (41)$$

and

$$\left(\frac{Cf}{2}\right)_{\text{empirical}} = \frac{[F(\beta) \frac{Cf(\beta=0)}{2}]}{(1 + \frac{\beta}{5})} \quad (42)$$

$$\frac{Cf(\beta=0)}{2} = \frac{0.332}{Re_x^{\frac{1}{2}}} \quad (43)$$

Where:

$$F(\beta) = 0.992436221 + 3.670315583\beta - 2.382778474\beta^2 + 2.203613278\beta^3 \quad (44)$$

$F(\beta)$ is obtained empirically from the data available in Evans (1968).

Figure 4

Dimensionless coefficient of friction ($\frac{Cf}{2}$) as a function of the Reynolds number (Re_x) for laminar regime.

Source: The authors.

It is observed that the new empirical solution, Equation 42, is very convenient, since it eliminates the need to solve the hydrodynamic boundary layer equation to obtain the coefficient of friction for the entire range of β . This is one of more significant and important result presented in this work, since the results differ significantly only for values of $\beta < -0.15$, and low Reynolds number values along the surface.

Figure 5 shows the results obtained for the dimensionless friction coefficient for turbulent regime on smooth surface. The highlight corresponds to the Schultz-Grunow (1941) modified solution. The analytical solution, Equation 35, and Schultz-Grunow's empirical equation, Equation 46, associated with the modification proposed by Kays and Crawford (1993), for pressure gradient flows within the range analyzed in this work, $-0.2 < \beta < 1.0$, are in good agreement. It is, therefore, a result compatible with that presented in Figure 4, since the solution eliminates the need to solve the system of equations for velocity field where β is different from zero.

$$\frac{Cf}{2} = \frac{0.0594}{2Re_x^{1/5} * (1 + \frac{\beta}{5})} \quad (45)$$

$$(\frac{Cf}{2})_{Exp} = \frac{[0.185(Log_{10}(Re_x))^{-2.584}]}{(1 + \frac{\beta}{5})} \quad (46)$$

Figure 5

Non-dimensional coefficient of friction ($\frac{C_f}{2}$) as a function of Reynolds number (Re_x) for turbulent regime on smooth surface

Source: The authors.

All previous discussion assumes boundary layer for smooth surface. The effect of roughness on the turbulent boundary layer occurs primarily close to the surface, and this leads to the definition of a rough Reynolds number:

$$Re_k = \frac{u_\tau k_s}{\nu} \quad (47)$$

Where:

k_s is the absolute roughness.

Figure 6 shows the comparison between valid results for smooth and rough surfaces, for any range of values of the pressure coefficient previously defined, $0.2 < \beta < 1.0$.

Figure 6

Comparison for dimensionless friction coefficient ($\frac{C_f}{2}$) between smooth and rough surfaces in turbulent regime

Source: The authors.

The characteristics of the hydrodynamic and thermal boundary layer are controlled by important parameters such as speed and temperature, shape and surface conditions. Surface conditions require special attention where roughness is an inherent characteristic. Roughness usually increases the friction resistance and the heat transfer coefficient for a same Reynolds number, relative to the smooth surfaces. In fact, the roughness produces higher values for the friction factor and Stanton number, which result in speed and temperature deficits at the relative long distance of the surface when compared to the smooth surface.

For $Re_k > 65$ we have what is called the regime for a completely rough surface or even a completely rough flow Pimenta et al. (1975). A completely rough regime is what is considered in this analysis and, for all intents and purposes, we have $Re_k = 70$. It can be shown that the friction coefficient, for a completely rough regime, can be obtained by the following expression, where the correction factor for the pressure gradient effect is introduced, according to the empirical proposal of Kays and Crawford (1983):

$$\left(\frac{Cf}{2}\right)_{rug} = \frac{0.168}{\left[\ln\left(\frac{32.1x}{Re_x^{\frac{1}{5}}k_s}\right)\right]^2 \left(1 + \frac{\beta}{5}\right)} \quad (48)$$

The Stanton number, by definition, is obtained from the expression below:

$$St_x = \frac{Nu_x}{Pr \cdot Re_x} \quad (49)$$

For laminar regime

$$Nu_x = \frac{\left(\frac{d\theta}{d\eta}\right)_0 \sqrt{\frac{Re_x}{2}}}{(2 - \beta)^{1/2}} \quad (50)$$

For any situation, laminar or turbulent regime, for constant surface temperature and constant free-flow velocity, the Stanton number can be expressed in the form:

$$St = C Re_x^{-n} \quad (51)$$

In turbulent regime, zero pressure gradient, smooth surface, Kays and Crawford present the following equation, which fits excellent with experimental results for $0.5 < Pr < 1.0$ and $5 \cdot 10^5 < Re_x < 5 \cdot 10^6$; $C = 0.0287 Pr^{-0.4}$ and $n = 0.20$.

Introducing the proposed correction for inclined surfaces:

$$St_{TurbExp} = \frac{0.0287 Pr^{-0.4} Re_x^{-0.20}}{1 + \frac{\beta}{5}} \quad (52)$$

Figure 7 shows the theoretical-experimental comparison for Stanton number in laminar regime, for $\beta = 1.0$. The results are quite satisfactory for Prandtl numbers close to the unit, and deviate to high values of the Prandtl number, as expected.

Figure 7

Stanton number (St) for laminar regime as a function of Reynolds number

Source: The authors.

Figure 8 presents theoretical and experimental data for turbulent regime, on smooth and rough surfaces, for the number of $Pr=1.0$. As expected, heat transfer on rough surfaces outweighs heat transfer to smooth surfaces, for the same Reynolds number.

The theoretical expression for determination of Stanton's number is given by, following application of empirical modification suggested by Kays and Crawford (1983):

$$St_{rug} = \frac{(Cf/2)_{rug}}{\left(\sqrt{(Cf/2)_{rug}} (13.2Pr - 10.16) + Pr_t \right) \left(1.0 + \frac{\beta}{5} \right)} \quad (53)$$

In a completely rough flow, the molecular thermal conductivity remains as a significant variable, influence that can be established through the number of turbulent Prandtl, Pr_t . The turbulent Prandtl number can be considered, for gases, to be 0.9, which in fact represents an average value.

Figure 8

Theoretical-experimental comparisons for Stanton number (St) in turbulent regime, as a function of Reynolds number for smooth and rough surfaces

Source: The authors.

The equation for determination of experimental Stanton number, with the correction for the pressure gradient, is given by:

$$St_{Exp} = \frac{\left(\frac{Cf}{2}\right)_{rug}}{\left(Pr_t + \sqrt{\left(\frac{Cf}{2}\right)_{rug}} / St_k\right) \left(1 + \frac{\beta}{5}\right)} \quad (54)$$

$$St_k = Re_k^{-0.2} Pr^{-0.44} \quad (55)$$

Where:

St_k is the function of the roughness of the surface.

Figure 8 show that, for accelerated flow, the values approximate the result obtained for laminar flow, for smooth and rough surfaces. This effect is called laminarization of the boundary layer Kays et al. (1969) and demonstrate that the acceleration effect tends to cause a "retransmission" of the turbulent boundary layer to a pure laminar boundary layer. This is

an effect associated with decompression of the boundary layer, where the roughness is immersed in the laminar sublayer. Table 2 shows the effect of the tendency for laminar flow in the numerical determination of the Stanton number.

Table 2

Stanton number (St) for turbulent regime in smooth and rough surfaces

Source: The authors.

Experimental results, with correction factor, obtained by Pimenta et al. (1975) and Kays and Crawford (1983) were used for comparison, Equation (50). The data were taken from the table of Pimenta (1975), where $U=130.63$ ft/s and without surface perspiration effect. The value of K_s is equal to 1.0 mm for all purposes in this analysis.

It is important to emphasize that there is experimental evidence that the shape factor tends to 1.47, for smooth surface and highly accelerated flows in completely turbulent flow. This shows that despite the tendency to the laminar regime, the flow remains turbulent because the value of the form factor for highly accelerated laminar flow is approximately 2.2, as presented through the results obtained in this work, Figures 9 and 10.

There is theoretical and experimental evidence that the detachment of the turbulent boundary layer is delayed in relation to the laminar boundary layer detachment.

Figure 9

Shape Factor (H_{12}) for turbulent regimen on smooth surface

Source: The authors.

Figure 10

Shape factors (H_{12}) for laminar and turbulent regimes on smooth surfaces

Source: The authors.

The numerical results presented through Figure 9 demonstrate that in fact this occurs. Note, Figure 10, that the smallest value for the parameter that establishes the pressure gradient is equal to $\beta = -0.19883768 \cong -0.200$, for laminar regime.

Figure 11

Dimensionless viscous surface tension (f'') for laminar and turbulent regimes

Source: The authors.

In fact, as the results of Figure 11 show, the dimensionless viscous stress passes through a local maximum point, close to $\beta = -0.2$, decreases asymptotically to approximately $\beta = -0.24$, where it becomes equal to zero, for turbulent regime on smooth surface.

3 CONCLUSIONS

The analysis, for flow and heat transfer in laminar regime and turbulent regime, on smooth and rough inclined surface, includes theoretical aspects, experimental results and empirical correlations. An extensive review of procedures associated to the boundary layer similarity method, used for solution of nonlinear equations systems, was presented.

In a turbulent regime, through the integral analysis of the momentum, the equations were first obtained for null pressure gradient and extended through a correction factor, for a wide range of the pressure gradient parameter.

The main result of the present work is associated with the fact that it is possible to obtain empirical solutions compatible with analytical solutions for laminar and turbulent flow in the whole range of values for the pressure parameter, β , considered in the analysis. This result allows us to use reliable solutions for numerous practical problems without having to solve the system of nonlinear equations, which is the main source of difficulties in the analysis performed.

As a motivation for the development of future works, it can be stated that problems associated to the determination of micrometeorological parameters, through the Monin-Obukov similarity theory, in inclined rugged surface, can be solved in an approximate way through the application of the analysis performed in this work.

SELF-PERCEPTION OF THE IMPACT PRODUCED BY HEALTH CARE PROGRAMS AND QUALITY OF LIFE IN STUDENTS FROM 7TH GRADE OF PRIMARY EDUCATION TO 4TH GRADE OF SECONDARY EDUCATION AT LICEO ABATE MOLINA IN TALCA, CHILE

AUTOPERCEÇÃO DO IMPACTO PRODUZIDO POR PROGRAMAS DE CUIDADOS DE SAÚDE E QUALIDADE DE VIDA EM ESTUDANTES DO 7º ANO DO ENSINO FUNDAMENTAL AO 4º ANO DO ENSINO MÉDIO DO LICEU ABATE MOLINA DE TALCA, CHILE

AUTOPERCEPCIÓN DEL IMPACTO PRODUCIDO POR PROGRAMAS DE CUIDADOS DE SALUD Y CALIDAD DE VIDA EN ESTUDIANTES DE 7º AÑO DE LA ENSEÑANZA BÁSICA A 4º AÑO DE LA ENSEÑA MEDIA DEL LICEO ABATE MOLINA DE TALCA, CHILE

ABSTRACT

The study analyzes the perception of students at Liceo Abate Molina (LAM) in Talca, Chile, regarding the impacts that food care programs and Health and Quality of Life programs have on their daily decisions. A qualitative and descriptive methodology was used, with a cross-sectional experimental design. Descriptive frequency statistics were applied to analyze the data. The sample consisted of 833 students who responded to a survey administered in the 36 secondary education classes at the school. The analysis confirms that students recognize how adequate nutrition and physical condition influence their health and quality of life, fulfilling the objective of the study. The results show that health and quality-of-life programs generate significant impacts on self-care habits. Health education, supported by recent studies, is key to promoting healthy and sustainable lifestyles among adolescents. The biopsychosocial experience and Physical Education reinforce these habits in educational contexts. It is recommended to strengthen and expand these programs to improve student well-being and combat issues such as obesity and sedentary behavior.

Keywords: Self-perception. Programs. Health Care. Adolescents.

RESUMO

O estudo analisa a percepção dos estudantes do Liceo Abate Molina (LAM) de Talca, Chile, sobre os impactos que os programas de cuidados alimentares e de Saúde e Qualidade de Vida têm em suas decisões diárias. Utilizou-se uma metodologia qualitativa e descritiva, com um desenho experimental de corte transversal. Para analisar os dados, foram empregadas estatísticas descritivas de frequência. A amostra foi composta por 833 estudantes que

⁵ Universidad Autónoma de Chile. Talca, Chile

responderam a uma pesquisa aplicada nas 36 turmas do Ensino Médio do liceu. A análise confirma que os estudantes reconhecem como uma alimentação adequada e a condição física influenciam sua saúde e qualidade de vida, cumprindo o objetivo do estudo. Os resultados evidenciam que os programas de saúde e qualidade de vida geram impactos significativos nos hábitos de autocuidado. A educação para a saúde, apoiada por estudos recentes, é fundamental para promover estilos de vida saudáveis e sustentáveis entre adolescentes. A experiência biopsicossocial e a Educação Física reforçam esses hábitos nos contextos educacionais. Recomenda-se fortalecer e ampliar esses programas para melhorar o bem-estar dos estudantes e combater problemas como obesidade e sedentarismo.

RESUMEN

El estudio analiza la percepción de los estudiantes del Liceo Abate Molina (LAM) de Talca, Chile, respecto a los impactos que los programas de cuidados alimenticios y de Salud y Calidad de Vida tienen en sus decisiones diarias. Se empleó una metodología cualitativa y descriptiva, con un diseño experimental de corte transversal. Para analizar los datos se utilizó estadística descriptiva de frecuencia. La muestra estuvo compuesta por 833 estudiantes que respondieron una encuesta aplicada en los 36 cursos de Enseñanza Media del liceo. El análisis confirma que los estudiantes reconocen cómo una alimentación adecuada y la condición física influyen en su salud y calidad de vida, cumpliendo el objetivo del estudio. Los resultados evidencian que los programas de salud y calidad de vida generan impactos significativos en los hábitos de autocuidado. La educación para la salud, apoyada por estudios recientes, es clave para promover estilos de vida saludables y sostenibles en adolescentes. La experiencia biopsicossocial y la Educación Física refuerzan estos hábitos en contextos educativos. Se recomienda fortalecer y ampliar estos programas para mejorar el bienestar de los estudiantes y combatir problemas como la obesidad y sedentarismo.

1 INTRODUCTION

Historically, health care in Chile has undergone changes in its planning, implementation and application, in relation to policies for the promotion, protection and recovery of health. There is a great effort in the construction of health care models, which prioritize the improvement of the quality of life of individuals and the community (Wolff, 2022; Gutiérrez Espinoza 2021).

Chile has presented important and rapid changes in the epidemiological and nutritional profile of the population. It has gone from a situation in which there was a predominance of infectious diseases and malnutrition in the 60s to a reality with a predominance of chronic-degenerative diseases (Vio del Río, 2023; Salinas, 2006).

Chile is an urbanized country, with a situation of significant improvement in access to drinking water, sewage, education and health services. Contrary to this reality, there are currently data on deterioration of quality of life, mainly in relation to inadequate diet, sedentary lifestyle, the consumption of licit and illicit drugs, lack of space for recreation in large cities, and other social problems (Orellana, et al., 2017).

To respond to this problem, there are public policies with health promotion strategies: actions by the State, individuals, the health system and educational institutions. Traditionally, this has been done by emphasizing individuals and communities as the sole responsible parties for the various changes that need to be made in the health care process (Pérez-Wilson, et al., 2022).

Chronic non-communicable diseases symbolize the most important health expenditure for Chile. These diseases are associated with habits that usually develop prematurely in childhood or adolescence. The high rates of smoking, obesity, sedentary lifestyle, high blood pressure, diabetes, depression, suicide, traffic accidents resulting in death or disability, pathological alcohol consumption, promote a reality that these young people and children tend to be adults victimized by these habits and trends (García-Mongollón & Malagón-Sáenz, 2021).

Health education must provide subjects with the knowledge, skills and attitudes necessary for the promotion and protection of health. It also allows individuals to be trained to actively participate in defining their needs and developing proposals to achieve certain health goals. Considering the risks for the young and adolescent population, the main intervention scenarios are educational establishments (Campos Valenzuela, et al., 2023).

Taking into account these arguments, the Abate Molina High School, in the city of Talca, Chile, establishes in its Institutional Educational Project, objectives related to health education programs. Among some proposed objectives can be found the following: To permanently stimulate the student to elaborate his own life project, based on knowledge of himself and of social reality. Promote the comprehensive education of the student, which includes their spiritual, social, cognitive, artistic, technical, and physical development (Liceo Abate Molina, 2025).

It is part of the Educational Project, a whole work of educational training in systematic practice of physical activity, healthy eating, health care. Classes, studies, tests, measurements and workshops are carried out seeking to positively impact students, so that they assume the personal role of health care. One of the specific objectives, which is mentioned in the Institutional Educational Project, reads: To enable the student to participate in a physical education that is gradually appropriate to his or her level of growth, through extracurricular gymnastic activities. And in the profiles established for students, you can read: Take care of your physical and mental health (Liceo Abate Molina, 2025).

This educational process must have measurement and evaluation instruments that can verify the scope of these achievements.

At present, it has been verified that in order to achieve changes with health promotion programs, attention cannot be focused only on the exercise of community will and/or freedom. On the contrary, the way in which subjects and collectivities choose certain life options as desirable, organize their choices and create new possibilities to satisfy their needs, desires and interests, which belong to the collective order, once their construction process takes place in the context of life itself (Brazil, 2010).

It is expected, then, that health education programs establish proposals that consider actions of service, which lead the subject to have conditions to choose, to adopt healthy attitudes where they live, work or study (Brazil, 2010).

The need for information on the effectiveness of health promotion interventions is recognized and necessary. Demands for informed decisions are growing every day as a result of studies of the effectiveness, relevance and usefulness of health education programs, when institutions or companies have to establish social and educational proposals or policies (Salazar & Vélez, 2004).

Health promotion programs, like other educational strategies implemented in educational establishments, aimed at improving health, must prove the effectiveness of their

interventions, otherwise it is a proposal that loses relevance. Many of the proposals evaluate the programs based on the results of tests and physical tests, which yield results related to the physical aspects, but do not consider the conceptual and attitudinal aspects.

By determining health promotion as a formative process, of building capacity to protect and maintain a healthy life, it can be understood that the evaluation should not only focus on physical development, but also on the integral evolution of this process in its effects on the health, well-being and behavior of the subject with his or her care. in positive changes generated from having participated in this training process (Salazar & Vélez, 2004).

Therefore, the collection of concrete data and evidence to assess the outcome of these health promotion programs remains a challenging task. Behavioral changes are complex phenomena and must be evaluated in various aspects.

2 OBJECTIVE

To analyze the perception of the students of the Abate Molina High School (LAM), Talca, Chile, in relation to the impacts produced in their daily decisions by food care programs and Health and Quality of Life.

3 METHODOLOGY

Qualitative, Descriptive study, cross-sectional experimental design and used descriptive statistics of frequency to present the results. The universe consists of 2,367 students from the Abate Molina High School in the commune of Talca, Maule Region, The population is mainly centered on 1,620 students from 1st to 4th years of Secondary Education, with a corresponding sample of 833 students who responded to the survey applied in the 36 courses of Secondary Education of this educational unit.

The inclusion criteria are: to be a student regularly enrolled in the Abate Molina High School; answer the survey on Self-Perception of Impacts produced by Health Care and Quality of Life programs; be present at the Lyceum, on the day and time of the application of the survey for their course; having participated in the training programs towards health care, developed in the Pedagogical Model of the Abate Molina High School; be able to answer the survey; answer the survey as requested in the instrument.

According to the ethical terms of the study, the following points were defined:

1. Informed consent to Head of the Technical-Pedagogical Unit and Director of the Department of Physical Education of the Abate Molina High School, Talca.

2. Application of a Self-Perception Survey of Impacts produced by Health Care and Quality of Life programs.
3. Participation is voluntary and each subject has the right to refrain from answering the survey when they deem appropriate.
4. All information on the application of the survey and the development of the study will be available to the Educational Establishment.
5. All work carried out, as well as the results obtained, may be used in scientific articles, presentations at congresses and in meetings or reports, both national and international.
6. The research proposal may be used as pedagogical material in the career of pedagogy in physical education and related areas of the Autonomous University and other Universities
7. The research will be documented with a written record, a copy of which will be kept in the Educational Establishment in which it was carried out.
8. The participants of the research will remain anonymous.

The data collection instrument went through a validation process by experts (Hernández Sampieri, et al., 2014). It was decided to name it as "Survey of Self-Perception of Impacts produced by Health Care and Quality of Life programs", which consists of 12 closed questions, with answers on a Likert-type scale, for which the subjects must mark the alternative that corresponds to their perception, and whose basic purpose is to verify what impacts are caused by education programs in relation to health care and quality of life. produce in the students of the Lyceum.

Instrument:

Survey of Self-Perception of Impacts Produced by Health Care and Quality of Life Programs

Based on the health and quality of life programs in which you as a student have participated (nutritional surveys, physical tests or anthropometric measurements).

It is of utmost importance that you answer each question with complete honesty.

4 RESULTS

The data obtained in the study were expressed through bar graphs, in which it was possible to interpret the information collected; According to the evaluation instrument chosen, the variables of age, sex and impact were analyzed.

Figure 1

Total, of the sample surveyed by age group

In this graph you can see the total sample of 833 subjects, 443 Ladies and 387 Men equivalent to 53.3% and 46.7% respectively of the total, in turn the age by category and the number of individuals according to their sex are evidenced.

The total of 13-year-old subjects is 4 members, 2 Girls and 2 Men which is equivalent to 0.5% of the total sample, the 14-year-old subjects 85 members, 52 women and 33 men which is equivalent to 10.2% in total of the sample, The 15-year-old category is 235 members, 127 women and 108 men, which is equivalent to 28.3% of the total sample. The 16-year-old subjects are 272, 140 females and 132 males which is equivalent to 32.7% of the total sample, the 17-year-old subjects the subject number is 212 members, 112 females and 100

males which is equivalent to 25.5% of the total sample and the 18-year-old subjects are 12 members. 7 women and 5 men, which is equivalent to 1.4% of the total sample.

Figure 2

General Impact Sample according to the age group of the respondents

Figure 2 shows that the general sample, 169 subjects, 20.3% of the total has a Very Positive Impact, 488 subjects, 58.7% of the total has a Positive Impact, 155 subjects, 18.6% of the total has a Medium Impact, 15 subjects, 1.8% of the total, have Low Impact and 6 subjects have No Impact, which is equivalent to 0.7% of the total sample.

According to the interpretation in this graph, it can be observed that the 13-year-old subjects, no subject presented Very Positive Impact, 2 subjects manifested Positive Impact, 2 subjects presented Medium Impact and there was no subject who exposed Low Impact and No Impact, The 14-year-old group, 13 subjects presented Very Positive Impact, 56 subjects presented Positive Impact, 15 subjects obtained Medium Impact, 1 subject discloses Low Impact and there was no subject No Impact, The 15-year-old subjects, 42 subjects presented a very positive impact, 136 subjects manifested Positive Impact, 49 subjects expressed Medium Impact, 8 subjects presented Low Impact and there was no No Impact subject. The 52 16-year-old subjects presented Very Positive Impact, 162 subjects obtained Positive Impact, 51 subjects manifested Medium Impact, 3 subjects presented Low Impact and 4 subjects presented No Impact, In the 17-year-old group, 55 subjects exhibited Very Positive Impact, 120 subjects presented Positive Impact, 33 subjects OBTAINED Medium Impact, 3 subjects presented Low Impact and 2 subjects presented No Impact, The 18-year-old group,

4 subjects manifested Very Positive Impact, 7 subjects presented Positive Impact, there was no subject in the sample with Medium Impact, Low Impact and No Impact.

Table 2

Impact produced on the total sample of men, women and general according to age range

Group	Very positive impact	Positive Impact	Medium Impact	Low Impact	No Impact
13 Year Old Ladies	0,00%	50,00%	50,00%	0,00%	0,00%
13 years General	0,00%	50,00%	50,00%	0,00%	0,00%
13 years old Males	0,00%	50,00%	50,00%	0,00%	0,00%
14 Year Old Ladies	17,30%	61,53%	19,23%	1,92%	0,00%
14 years General	15,29%	65,88%	17,64%	1,17%	0,00%
14 years old Males	12,12%	72,72%	15,15%	0,00%	0,00%
15 Year Old Ladies	13,38%	65,35%	19,68%	1,57%	0,00%
15 years General	17,87%	57,87%	20,85%	3,40%	0,00%
15 years old Males	23,14%	49,07%	22,22%	5,55%	0,00%
16 Year Old Ladies	14,28%	62,14%	21,42%	0,71%	1,42%
16 years General	19,11%	59,55%	18,75%	1,10%	1,47%
16 years old Males	24,24%	56,81%	15,90%	1,51%	1,51%
17 Year Old Ladies	20,53%	60,71%	15,17%	1,78%	1,78%
17 years General	25,47%	56,60%	15,56%	1,41%	0,94%
17 years old Males	31,00%	52,00%	16,00%	1,00%	0,00%
18 Year Old Ladies	28,57%	71,43%	0,00%	0,00%	0,00%
18 years General	36,36%	63,63%	0,00%	0,00%	0,00%
18 years old Boys	50,00%	50,00%	0,00%	0,00%	0,00%

It is observed that the 13-year-old male subjects, 0% presented Very Positive Impact, 50% manifested Positive Impact, 50% Medium Impact and 0% of the subjects presented Low Impact and No Impact. As for the Ladies, 0% presented Very Positive Impact, 50% of the subjects presented Positive Impact, 50% of the subjects presented Medium Impact and 0% of the subjects with a Low Impact and No Impact, In general, the subjects of 13 years of age, Men and Ladies show 50% Positive Impact and 50% Medium Impact.

In the group of 14-year-old male subjects, 12.12% had a Very Positive Impact, 72.72% of the subjects had a Positive Impact, 15.15% of them had a Medium Impact, 0% had a Low Impact and No Impact. As for the women, 15.29% Very Positive Impact, 65.88% had Positive

Impact, 17.64% had Medium Impact, 1.92% had Low Impact and 0% No Impact, In general, 14-year-old Male and Female subjects showed 15.29% Very Positive Impact, 65.88% Positive Impact, 17.64% Medium Impact, 1.17% Low Impact and 0% No Impact.

In the group of 15-year-old male subjects, 23.14% had a Very Positive Impact, 49.07% had a Positive Impact, 22.22% had a Medium Impact, 5.55% had a Low Impact and 0% had no impact. As for the women, 13.36% showed Very Positive Impact, 65.35% obtained Positive Impact, 19.68% manifested Medium Impact, 1.37% Low Impact and 0% of the subjects presented No Impact. In general, of the 15-year-old subjects, 17.88% showed a Very Positive Impact, 57.87% showed a Positive Impact, 20.85% had a Medium Impact, 3.40% had a Low Impact and 0% had No Impact.

In the group of 16-year-old male subjects, 24.24% had a Very Positive Impact, 56.81% had a Positive Impact, 15.90% had a Medium Impact, 1.51% had a Low Impact and 1.51% had No Impact. As for the Ladies, 14.28% had a Very Positive Impact, 62.14% had a Positive Impact, 21.42% had a Medium Impact, 0.71% had a Low Impact and 1.42% had No Impact. In general, of the subjects with 16 years of age between Males and Females, they showed the following data: 19.11% Very Positive Impact, 59.55% Positive Impact, 18.75% Medium Impact, 1.10% Low Impact and 1.47% No Impact.

In the group of 17-year-old male subjects, 31% had a very positive impact, 52% had a positive impact, 16% had a medium impact, 1% had a low impact and 0% had no impact. Meanwhile, the Ladies presented 20.53% of Very Positive Impact, 60.71% manifested Positive Impact, 15.17% obtained Medium Impact, 1.78% presented Low Impact and 1.78% manifested No Impact. In general, of the subjects with 17 years of age between males and females, the following data were obtained: 24.47% Very Positive Impact, 56.60% Positive Impact, 15.56% Medium Impact, 1.41% Low Impact, and 1.78% Present No Impact.

The group of 18-year-old male subjects had a 50% Very Positive Impact, 50% Positive Impact, 0% of the subjects had a Medium Impact, Low Impact and No Impact. As for the women, 28.57% obtained Very Positive Impact, 71.43% manifested Positive Impact, 0% obtained Medium Impact, Low Impact and No Impact. In general, the Ladies and men of 18 years of age showed the following data, 36.36% Very Positive Impact, 63.63% Positive Impact, 0% Medium Impact, Low Impact and No Impact.

The analysis of the table on the impact of educational programs on the eating, health care, and lifestyle behavior of school adolescents shows several key trends.

Distribution of Impact by Age and Sex indicates that in general, the positive impact (very positive + positive) is greater in adolescents aged 15 to 18 years, with values ranging from approximately 70% to 100% in some groups. That adolescent girls (females) tend to show a slightly higher positive impact than boys at various ages, especially at 15 and 17 years old. At younger ages (13 and 14 years old), the positive impact is variable and in some cases less, although it still predominates over low or no impact impacts.

For Very Positive and Positive Impact, the "Very Positive Impact" category shows notable increases with age, especially in the 17 and 18 age groups (both girls and boys). Most of the groups have a high percentage of "Positive Impact", generally between 50% and 70%, indicating that the programs generate favorable changes in the majority of adolescents.

When looking at the Medium, Low and No Impact Impact, the "Medium Impact" category is observed with varied values, more present in the 13 to 15 age groups, decreasing for older ages. The percentages of "Low Impact" are low overall, with some minimal peaks between 1% and 5%, suggesting a good overall efficacy of the interventions. "No Impact" is recorded in most groups, only some marginal cases, which confirms the effectiveness of the programs on perception and behavior studied.

The results of the data analysis establish that the Health and Quality of Life programs used at the Abate Molina High School, in the city of Talca, Maule Region, do generate a positive impact on the self-perception that students have regarding the programs of the establishment and on their daily eating and physical activity habits. this evidenced in the high percentages of very positive and positive impact shown in the applied surveys.

According to the results obtained, males perceive more impact than females in all age ranges, and in turn the highest percentage of positive impact was obtained between 16 and 18 years of age, from this result we can infer that perhaps this is due to the fact that students in these ages have been part of these programs for longer than students from 13 to 15 years of age and therefore therefore, there has been a change in their eating behaviors and physical activity levels.

A study conducted by Pérez Rubio, et al. (2023) also found that educational interventions in the area of health care improve the health profile of adolescents. It also ratifies the results of this study, finding that there are differences by sex, with higher scores in men.

With these analyses, it is confirmed that the students are able to know that the appropriate behavior of their diet and physical condition affects their Health and Quality of

Life, and in turn responds to the objective of the study, since it was possible to analyze the perception that LAM students have, in relation to the impacts produced by health care and quality of life programs.

Thus, the importance of health care and quality of life programs used by some establishments can be discussed, since, as reflected in this study, these programs achieve relevant impacts on the quality of life care of students.

Evidence indicates that health education could have an important impact on the expansion of the system of activities and communicative interactions of adolescents, favoring self-care habits; therefore, it is verified that the application of comprehensive educational strategies can be key to promoting healthy and lasting lifestyles in the adolescent group, confirmed by Parra, et al. (2025). Adding what Amador Romero, et al. (2025) cite, that knowledge about the importance of these habits is essential for health care.

The same idea is presented by Barilla (2024) who in his study concludes that biopsychosocial experiences are essential to strengthen healthy lifestyles within the educational community. And that Physical Education plays a key role in promoting healthy habits by creating environments that favor physical activity and comprehensive well-being. The variety of approaches to health and well-being highlights the need to address them holistically, taking into account particular cultural and social contexts. At the LAM, the proposals come from the Department of Physical Education, which is ratified by them results of the study by Barilla (2024) cited.

It is considered that using these programs in the largest number of educational centers can contribute to improving the quality of life of many students in the country, thus interfering with the high rates of sedentary lifestyle, obesity and cardiovascular diseases that today affect students in Chile.

It is important to complement this idea with the result of a study by Madrid Carrillo (2025) that points out that educational intervention proves to be an effective strategy to positively influence the eating habits and lifestyles of adolescents, although it is necessary to strengthen and maintain this type of program in the school environment to achieve sustainable changes.

The educational programs proved to have a considerable positive effect on the majority of students, improving eating habits and lifestyles. There is a clear tendency for the impact to increase with age, possibly because older adolescents better internalize the proposed messages and changes.

It is recommended to continue and strengthen these programs, adjusting them to better engage younger adolescents and adolescents of both sexes, to maximize effectiveness from early stages.

ABSTRACT

Urban facilities are the set of buildings and installations that house services aimed at meeting the basic needs of a population. They are architectural complexes designed and built in the fields of health, education, commerce, administrative and financial activities, security, recreational activities, social assistance, among others. The architectural projection of urban facilities requires the integration of a methodology that considers the social context, emerging issues, environmental conditions, and other elements, which results in a good architectural project and the evolution of the traditional way of integrating spatial design. In the academic training context, seventh-semester students (class of 2024A) of the Design Engineering program at the Technological University of the Mixteca, through the course Architectural Project II and guided by the course's main instructor and first author of this article, developed a Methodology for the Design of a Social Assistance Center. This center was planned for a medium-sized city (Huajuapán de León, Oaxaca – 75,000 inhabitants), integrating nine architectural design proposals for Social Assistance Centers, considering the basic and emerging needs of the various social groups to be served, and incorporating design aspects such as the natural and built environment, architectural style, and design concept, linking and reinforcing it with the creative diversity of each working team.

Keywords: Methodology. Design. Process. Architecture.

RESUMO

O equipamento urbano é o conjunto de edifícios e instalações que abrigam os serviços destinados ao atendimento das necessidades básicas de uma população; são complexos arquitetônicos projetados e construídos nos âmbitos da saúde, educação, comércio, atividades administrativas e financeiras, segurança, atividades recreativas, assistência social, entre outros. A projeção arquitetônica do equipamento urbano requer a integração de uma metodologia que considere o contexto social, a problemática emergente, as condições ambientais, entre outros fatores, o que possibilita a elaboração de um bom projeto arquitetônico e a evolução da forma tradicional de integrar o design espacial. No âmbito da formação acadêmica, os alunos do sétimo semestre (geração 2024A) do curso de

RESUMEN

El equipamiento urbano es el conjunto de edificios e instalaciones en las que se albergan los servicios para la atención de las necesidades básicas de una población, son complejos arquitectónicos que se diseñan y construyen en el ámbito de la salud, la educación, el comercio, las actividades administrativas y financieras, la seguridad, las actividades recreativas, la atención social, entre otras. La proyección arquitectónica del equipamiento urbano requiere de la integración de una metodología en la cual se considere el contexto social, la problemática emergente, las condiciones medio ambientales, entre otros, lo cual genera un buen proyecto arquitectónico y la evolución en la tradicional forma de integrar el diseño espacial. En el ámbito de la formación académica los alumnos de la carrera de Ingeniería en Diseño de la Universidad Tecnológica de la Mixteca de séptimo semestre generación 2024A, a través de la materia de Proyecto Arquitectónico II y guiados por la profesora titular de la materia y primera autora del presente artículo, conformaron una Metodología para el diseño de un Centro de Asistencia Social, el cual fue emplazado en una ciudad de tamaño medio (Huajuapán de León, Oaxaca - 75,000 hab), integrando nueve propuestas de diseño arquitectónico de Centros de Asistencia Social considerando las necesidades básicas y emergentes de los diversos grupos sociales a atender y contemplando ámbitos del diseño como el medio físico natural y artificial, el estilo arquitectónico y el concepto de diseño, vinculándolo y fortaleciéndolo con la diversidad creativa de cada equipo de trabajo.

1 INTRODUCTION

The twenty-first century is present in the architectural design of urban equipment, considering it as a process that seeks to homogenize society, allowing the satisfaction of individual needs, but allowing architectural design to be made of universal knowledge and appropriation, attending to particular needs without ceasing to meet the needs of the system.

Urban equipment is the set of buildings and facilities in which activities and services are housed to meet the basic needs of the rural and/or urban population, they are architectural complexes that are designed and built in the field of health, education, commerce, administrative and financial activities, security, recreational activities, social care, among others.

The architectural projection of urban equipment requires the application of a methodology in which the analysis of the urban context, the social context, the emerging problems and environmental conditions, among others, is considered, which brings with it the integration of a good result and the evolution in the traditional way of integrating architectural projects.

In the field of the academic training of Design Engineers, a Methodology was formed for the realization of the architectural project of a Social Assistance Center, which became a systemic work that instructed future designers in the analysis of the geographical context in a medium-sized city (75,000 inhabitants), in the consideration of the basic and emerging needs of the various social groups to be served and in the application of the of design areas such as the natural and artificial physical environment, the architectural style and the design concept, linking and strengthening with the creative diversity of each work team.

The consideration of the natural and artificial physical environment is a field of study that has been evolving in the design of architectural space, with increasing presence in the different stages of the methodology, however it has been a challenge for design professionals to stop considering it as a trend and induce it as a fundamental part of the methodology for the design of any architectural complex. which must satisfy the needs of the environment of a demanding society. Sánchez-Platas, L., Sánchez-Luqueño, J. (2016)

One of the fundamental aspects when addressing a Methodology for the design of the architectural space is the consideration of the Social Framework of the Architectural Framework, a situation that instructed the students of the architectural project to strengthen the processes of social research through observation, surveys, questionnaires and interviews, allowing the identification of the latent social problem, recognizing the different

target groups to be served, the diversity of needs, varieties, ages, genders, requirements, services and care among many others. Sánchez Platas, L. E, Hernández García, A. S., Sánchez Luqueño, J., Velarde Galván, A., Cruz Martínez, V. M. (2019)

Social inclusion is present in the design of an Assistance Center, also aiming to enhance the skill, opportunity and dignity of people who are disadvantaged due to their situation as users of the Center. An example of social inclusion was the consideration of the various target groups or users in the design and integration of a Social Assistance Center (migrants, people with addiction problems, alcoholics, people in street situations, people who have been abused, displaced persons, etc.).

Architectural projects such as a Social Assistance Center contemplate, in addition to the spaces that allow them to satisfy the basic needs of users, a research commitment for designers to identify the complementary needs of the various by target group.

The popular economy is a variable that is directly linked to social inclusion and that is indirectly linked to the architectural design of a Social Assistance Center, since it allowed considering the housing needs and overnight stays of various merchants in transit, which are frequent in medium-sized cities, who travel from distant towns and ranches to sell their products in municipal and/or district capitals and at least having relatives or not having the economic solvency and not intending to spend the little profit from the sale of their products, they do not rent lodging, causing them to spend the night in parks, gardens and portals, having to take care of their companions, their merchandise and themselves, enduring the inclement weather, in addition to the discomfort of the place.

For this reason, the process of designing an architectural project such as a Social Assistance Center made it possible to configure a methodology that involves new stages of study and research, systemic analysis, various areas of study of architecture, social studies, attention to basic housing aspects, attention to complementary aspects of populations in transit and variables typical of a dynamic society. allowing the generation of nine architectural preliminary projects as a result of the work of the students of Design Engineering, advised by the first author of this article, who addressed various problems seeking to improve the conditions of urban equipment for social welfare.

2 MATERIALS AND METHODS

The students of the Design Engineering career of the Technological University of the Mixteca of the seventh semester generation 2024A, through the subject of Architectural

Project II and guided by the professor of the subject and first author of this article, formed a Methodology for the design of a Social Assistance Center, which was located in a medium-sized city (Huajuapán de León, Oaxaca - 75,000 inhabitants), integrating nine architectural design proposals for Social Assistance Centers that meet the needs of various groups of users and link areas of design study.

One of the first stages of the process for the design of the Social Assistance Center is to integrate a correlation matrix of similar projects, which is a tool that allows evaluating the linear relationship of two variables, in addition to strengthening the bases of the architectural project to be conceived later. Hernández García, A. S. (2019)

The Correlation Matrix of Similar Projects (Table 1) is integrated from the identification and review of architectural projects similar to the project to be developed, conceived at the national and international level, indicating through a symbol the absence or presence of the list of spaces, a list that arises from the same similar projects. The matrix is organized simultaneously, zoning the spaces and hierarchizing the spaces based on the most recurrent. This also allows the value of the less recurrent spaces for the project to be conceived to be analyzed. The projects with the largest number of spaces and areas are identified and finally the program of needs of the project to be generated is based. Plazola Cisneros, A. (1992b).

Table 1

Correlation matrix of similar projects

Another of the fundamental stages in the process of designing a Social Assistance Center was the integration of a Program of Needs (Table 2), which is an analysis and synthesis of the basic needs to be met and the specific activities of the various users of the architectural complex, which will determine in each row the architectural space that will allow the need to be satisfied. the activities and outline the required furniture. It is important to note that one of the particular contributions of the methodology is the evaluation and confirmation of the zoning in the needs program (based on the correlation matrix of similar projects), which optimizes the subsequent stages. Plazola Cisneros, A. (1992a).

Table II. The Program of Needs is presented in a column format establishing the main need, the secondary activity(s), the space, the furniture and using a color code by area which is recommended to be maintained as an element of identification throughout the methodology.

Another key stage in the design process of the Social Assistance Center was the Architectural Program (Table 3), which quantifies each of the spaces of the architectural complex by square meters (m²), by zones and consequently allows determining the total m² of the architectural complex, it is important to note that this phase of the design process is based on the stages prior to the project: research, review of user activities, user organization chart, study of minimum areas, etc. Plazola Cisneros, A. (1992a).

Table III. The Architectural Program is integrated by a format of columns and color coding that allows the information to be organized and effectively prepared for subsequent stages.

Another of the indispensable stages of the architectural design process of the Social Assistance Center and which is generally not considered in the traditional methodologies of design of the architectural space is the Analysis of the Physical Environment which is subdivided into Natural and Artificial and its radius of action is at the district level and/or at the city level. both analyses allow us to evaluate the characteristics of the natural and urban context in which the architectural complex will be located (Table 4).

In the first instance, and with the support of the Correlation Matrix tool, the parameters that will make it possible to evaluate the most pertinent characteristics of the natural and artificial physical environment in which the project will be located are integrated, through a descriptive value scale and evaluation process, it was possible to determine the optimal

property in the field of the natural and artificial physical environment for the Social Assistance Center (Table 4).

Table 4

Correlation matrix for the evaluation of the natural and artificial physical environment.

4.- Evaluación y selección de predio

Total	30		

Table IV. The correlation matrix for the evaluation of the natural and artificial physical environment of x number of available properties can be carried out jointly or separately, through a first column the parameters that will evaluate the potential of the site area are listed, which on this occasion were determined by the type of architectural complex, The rest of the columns are a description of the weighting from the value scale for each parameter.

Subsequently, an analysis of the property with the highest score as a result of the evaluation of properties is carried out (fig. 1), allowing to identify and illustrate its orientation, the path of the prevailing winds, the exposure and trajectory of the sun, accessibility, road hierarchy, the physiographic conditions near the property, the immediate urban equipment and everything that characterizes it. Cabeza Pérez, A. (1993)

This process aims at the correct orientation and location of the architectural complex on the property, prior to the architectural match and not before, since the definition of the property for new projects does not present any contribution to the design process in the initial stage because there is no knowledge of the need for m2 required for the complex, one of the main strengths of an architectural project for urban equipment is the possibility of locating it anywhere, considering at the time of a new location a thorough analysis of the physical environment to comply with the conditions of orientation and location, among others.

This methodology has academic objectives, offering the student the tools to analyze step by step the integration of a logical and orderly process to reach a solution that is consolidated consecutively until reaching an efficient architectural complex.

Figure 1

The analysis of the Physical Environment is carried out at the site level and at the neighborhood or neighborhood level, even using the information and tools available on the Internet

This phase of Analysis of the Physical Environment is another contribution to the traditional methodology of architectural design, which is integrated by the identification of the parameters of the natural and artificial physical environment at the site, neighborhood and/or city level, allowing the evaluation of the location of the architectural complex in particular through the correlation matrix. the determination of the value scale, the description of the parameters of the value scale, the evaluation matrix, as well as the analysis of the property at the site level.

One of the last stages of the methodology prior to the architectural match is the determination of the design concept, it is the identification of one or more elements that allow the designer to be inspired in the architectural composition of the architectural complex, guiding him in the most general aspects of the project in order to geometrize it and make it the basis of an architectural project. Jiménez Barriga, N. (2021)

The conceptualization of architectural design can apply the analogical, canonical, iconic and/or pragmatic method.

Figure 2

An architectural project based on analogue conceptualisation takes up a natural element to design and distribute its areas and spaces, inspired by an element perfected by nature over thousands of years, taking advantage of the search for perfect harmony

Figure 3

An architectural project based on analogical conceptualization can also take up an element built by man to abstract, geometrize and distribute an architectural project, inspired by an architectural composition recognized throughout history for its unity and balance

Figure 4

An architectural project based on analogical conceptualization takes up a natural element to project and distribute an architectural project, it is a guide that through its abstraction and total or partial geometrization gives guidelines to the integration of zones, inserting corridors, gardens and open-air spaces to link a functional architectural complex

3 RESULTS

The methodology for the architectural design of a Social Assistance Center includes among its main phases:

Figure 5

The five phases presented are a guideline for implementing them in the methodology of any other architectural project

The integration of a methodology for the design of an architectural complex is not finite, it requires a prior and thorough analysis of the scope of the project, the target groups to be served, the radius of action, the area of location, the social and urban context, the geographical conditions and the natural and artificial physical environment within various factors. Sánchez-Platas, L., Sánchez-Luqueño, J. (2016)

It is also necessary to integrate other phases to support the methodology, such as the identification and definition of users, breaking down the activities of the main users through flow diagrams, the integration and constant updating of the study of minimum areas, the analysis of the interrelation of areas and spaces, general and specific operating diagrams and any other phase that allows the integration of a logical and clear file of the project of design.

Figure 6

As a result, nine architectural projects of Social Assistance Centers were integrated to meet the basic and complementary needs of migrants, people with addiction problems, people in street situations, people who have been abused, displaced persons, etc

Finally, nine architectural projects of Social Assistance Centers were integrated to meet the basic and complementary needs of migrants, people with addiction problems, people in street situations, people who have been abused, displaced persons, etc.

As a result of the research phase of the Social Framework, it was determined to integrate the following areas: reception, administration, recreation, food, general services, medical care, linkage and channeling, residence, religious and loading and unloading area.

The natural physical environment addressed the analysis of climate, soil, geological conditions, relief, water and vegetation. Schjetnan, M. Calvillo, J. Peniche, M. (2004)

The artificial physical environment determined the potential for urban development at the housing and commercial level, proximity to the city center, vehicular accessibility, infrastructure, security services, pollution, use of the landscape, paving conditions, among others. Cabeza Pérez, A. (1993)

Nine architectural projects of Social Assistance Centers were generated using iconic, canonical, pragmatic and analog architectural conceptualization.

4 CONCLUSIONS

It is necessary to generate architectural design solutions that address urban and rural equipment projects that consider the social, environmental, landscape, ecological and socioeconomic spheres.

It is convenient to reflect on the architectural design process which is not a finite and established process, each architectural project requires a different methodology.

The methodology for integrating architectural complexes that serve different social groups requires a thorough and exhaustive investigation that allows the integration of a Social Framework to provide a precise solution to basic and complementary needs.

The analysis of the Natural Physical Environment contemplates a review of at least six elements (climate, soil, geology, relief, water and vegetation), at the site, district and/or city level, conditioning the design of the architectural space. Schjetnan, M. Calvillo, J. Peniche, M. (2004)

The analysis of the Artificial Physical Environment contemplates an identification of parameters of the area in which the property is located in relation to the requirements of the Architectural Projects, previously designing a tabulator (correlation matrix), which allows an impartial evaluation of the available properties.

The design of architectural space is not only a creative process, it is a process of research, analysis and synthesis which forges a Design Engineer in his architectural work, and which is perfected over time but mainly with the tenacity to delve into each project in its research phase to obtain an excellent result in each architectural match.

ABSTRACT

The study aimed to analyze central aspects of the interface between family and school in strengthening the educational process, based on a bibliographic review. The results indicate that both institutions are indispensable partners for the student's integral development, sharing responsibility for creating conditions that foster learning and citizenship formation. For this interface to produce significant effects, it is essential that family and school organize environments consistent with the values they aim to promote. Among these values, the need to provide children with concrete opportunities for democratic experience stands out, encouraging the expression of ideas, dialogue, and the collective construction of knowledge. Likewise, welcoming environments that promote respect, emotional security, and individual appreciation are essential conditions for school development. In this process, it is the school's role to establish and strengthen continuous partnerships with families, seeking communication, cooperation, and participation strategies that broaden students' understanding of themselves and the world. This articulation contributes to shaping individuals capable of acting critically, transforming their realities, and fully exercising their citizenship.

RESUMEN

El estudio tuvo como objetivo analizar aspectos centrales de la interfaz entre la familia y la escuela en el fortalecimiento del proceso educativo, a partir de una investigación bibliográfica. Los resultados señalan que ambas instituciones constituyen socios indispensables para el desarrollo integral del alumno, siendo corresponsables de crear condiciones que favorezcan el aprendizaje y la formación ciudadana. Para que esta interfaz genere efectos significativos, es fundamental que la familia y la escuela organicen ambientes coherentes con los valores que desean promover. Entre esos valores, se destaca la necesidad de ofrecer a los niños oportunidades concretas de vivencia democrática, estimulando la expresión de ideas, el diálogo y la construcción colectiva del conocimiento. Del mismo modo, la acogida en espacios que promuevan el respeto, la seguridad emocional y la valoración individual es una condición esencial para el desarrollo escolar. Compete a la escuela, en este proceso, establecer y fortalecer relaciones de asociación continua con las familias, buscando estrategias de comunicación, cooperación y participación que amplíen la comprensión que los estudiantes tienen de sí mismos y del mundo. Esta articulación contribuye a formar sujetos capaces de actuar de manera crítica, transformando sus realidades y ejerciendo plenamente su ciudadanía.

Palabras clave: Familia. Escuela. Agentes de Socialización. Función Social.

1 INTRODUCTION

The family is a fundamental resource in the educational context, because, unlike other social instances, it invests more time, affective dedication and commitment in the care and education of children. In contemporary times, it becomes evident that the school cannot do without the family, just as the family cannot do without the school. Both are interdependent and complementary institutions, whose articulation is decisive for the strengthening of the educational process.

The school, as an institution that also performs socio-affective functions, complements the role played by the family. Without this expanded understanding, it becomes unfeasible to train subjects capable of learning, acting and transforming society, applying the knowledge constructed in their daily lives. Learning initiated in the family and community environment needs to find continuity in school, so that school content is constituted as instruments for the ethical, cognitive and social formation of the future citizen.

Teaching students to live in society and to fully exercise their citizenship requires a consistent integration between family and school. The incentive to the child's educational process is directly related to the family's expectations, the stimuli offered and the way the family recognizes its influence on the children's development. As Silva and Lima (2009) state, family involvement depends essentially on the value that parents attribute to education and the perception they have of the impact of their performance on the children's performance and academic trajectory.

The developmental potential of an environment, as Well (2002) argues, is amplified to the extent that there are solid support bonds between different life contexts. Environments that are weakly linked or devoid of supplementary relationships configure less favorable conditions for human development. In this sense, the strengthening of developmental potential occurs when the support relationships include people with whom the child establishes stable primary dyads, which refers to the notion of continuity. Such continuity presupposes a joint construction between family and school, offering consistent support to the child's academic and socio-emotional development.

Given the relevance of the theme, this study is justified by adopting an integrative perspective on the family-school relationship, evidencing the need for parents and the school institution to act in an articulated way in the educational process. Thus, the objective of this research is to analyze central aspects of the performance of the family and the school in the teaching and learning process, based on a bibliographic investigation.

In this article, the family and school environments are understood as fundamental contexts of human development, emphasizing the importance of qualified relationships between them. Initially, the role of the family and its space as a socializing agent is discussed, with emphasis on contemporary family configurations, support networks and affective bonds that influence child development and learning. Next, the social function of the school is addressed, highlighting its complementarity in relation to the family and its responsibility in the development process. Finally, the family-school interface is analyzed, seeking to understand the similarities, specificities and responsibilities attributed to these instances in the development and learning process.

2 FAMILY AND SCHOOL as Socialization Agents

2.1 FAMILY FUNCTION

The concept of family has been transformed throughout the history of humanity (ALMEIDA; MEDEIROS, 2010). However, in its conceptual aspect, it is understood as a system of affective bonds that generates the process of humanization. The historical transformation of the sociocultural context is the result of a continuous process of evolution in the face of which the family structure is shaped.

Traditionally, when talking about family, especially a so-called "structured" family, there was the vision of a couple united by marriage and living in the same house with their children. Today, however, it is necessary to take a new look at this organization. A family can be considered harmonious and structured regardless of its constitution; and it can be unstructured even when formed by father, mother and children. This is because the structure does not necessarily define the relationship between the people who form a family (SOUZA; LOCH, 2008, p. 10).

The family environment is the first space for the establishment of affective and social relationships, a place for learning to live together and interact with others, a space constituted to learn to seek other spaces for socialization, preparing the human being to act in the social, political and ethical spheres.

Dessen and Poland (2007) state that the family plays an essential role in the transmission of values and behaviors in different social classes, enabling the incorporation of the primary *habitus*. The affective bond found in the family context can be understood as a necessary factor for the operations of the cognitive structure, exerting influence on the agility with which knowledge is constructed.

Nascimento (2011) points out that the family is responsible from birth for the physical, psychological, emotional, moral and cultural development of the child. The author adds that the child fulfills his basic needs, starting the process of construction of his perceptual, motor, cognitive, linguistic and affective schemes, through the first contact with family members. The family is understood as the first mediator between man and culture, therefore:

It constitutes the dynamic unit of affective, social and cognitive relations that are immersed in the material, historical and cultural conditions of a given social group. It is the matrix of human learning, with its own meanings and cultural practices that generate models of interpersonal relationships and individual and collective construction. Family events and experiences provide the formation of behavioral repertoires, actions and problem solving with universal (child care) and particular (perception of the school for a given family) meaning. These experiences integrate the collective and individual experience that organizes, interferes and makes it a dynamic unit, structuring the forms of subjectivation and social interaction (DESSEN; POLÓNIA, 2007, p. 22).

Thus, the family has an important role in the construction of the individual, because, as the primary space of socialization, it influences the "basis of personality", favoring physical growth and emotional development. As a source of human socialization, in the family space, the child experiences the first rewards and punishments, building his self-image and modeling his behavior. All this, when inscribed in his innermost self, starts to configure his individual world, coming to function as a determining factor in his social interactions.

Vygotsky (2000), in his work "The Construction of Thought and Language" makes it evident that learning precedes development, that is, for the development of Higher Psychological Functions (FPS) to⁶ occur, subjects need to appropriate cultural goods.

With this view, family life is essential to transform the subject from being biological into a social human being. For Vygotsky (1998, p. 75), the child's learning and development occur at two levels:

First at the social level, and then at the individual level; first between people (interpsychological), and then within the intrapsychological child). This applies equally to voluntary attention, logical memory, and concept formation. All higher functions originate from the real relationships between human individuals (VYGOTSKY, 1998, p. 75).

⁶The functioning of FPS such as attention, memory, imagination, thought and language are organized into functional systems, whose purpose is to properly organize the mental life of the subject in his environment comes from the social life of the young. Such interactions have the intellectual precise (VYGOTSKY, 2000). interaçõescriançacomadultosdesdeefeitossobre desenvolvimento

This means that all FPS lack the mediation of other more experienced subjects or the instruments to be developed. In this way, the family influences the child's relationship with the internal and external world, and can contribute negatively or positively to a healthy relationship with the society that surrounds him.

According to Sousa and José Filho (2008, p. 3), the family functions as the first and most important agent of socialization, helping the child in the construction and development of his or her apprentice model. All the knowledge acquired during your primary life experience will be reflected in your life in society, because:

It is through family interactions that transformations in societies are materialized, which, in turn, will influence future family relationships, characterized by a process of bidirectional influences between family members and the different environments that make up social systems, including school, constitute a preponderant factor for the development of the person (DESSEN; POLÓNIA, 2007, p. 22).

Considering that the child's performance is related to the different aspects of the family environment, Campos (2011) states that those who receive help regularly at home are more subject to better school performance, when compared to those who do not receive help at home.

Until the seventeenth century, a large part of the values and knowledge linked to professional actions was transmitted by family groups. The older members had the role of taking their knowledge to the younger ones as a way of ensuring the development of practices of survival and perpetuation of groups (CAMPOS, 2011).

However, currently, not only family members, but also the child's surroundings, such as the school context, friends, the church, among other spaces and people, exert influence on the understanding of the world, contributing to the transmission of knowledge and values that little by little form the character and personality of the citizen.

2.2 THE SOCIAL FUNCTION OF THE SCHOOL

In the current context, Brazilian education has the challenge of promoting the learning of all students and ensuring them a trajectory of school success. This trajectory becomes possible when the pedagogical aspect becomes part of a consolidated practice that prioritizes the premanence and appropriation of school scientific knowledge by children. For Saviani (2000), it is through the mediation of the school that the subjects make the transition from spontaneous knowledge to systematized knowledge.

According to Saviani (2000, p. 15), "education is a phenomenon of human beings. Therefore, the understanding of the nature of education passes through the understanding of human nature." The author understands that what is not produced by human nature needs to be historically produced by men, because,

Human nature is not given to man, but is produced by him on the basis of bio-physical nature. Consequently, educational work is the act of producing, directly and intentionally, in each individual. Thus, the object of education concerns, on the one hand, the identification of the cultural elements that need to be assimilated by individuals of the human species in order for them to become human and, on the other hand and concomitantly, the discovery of the most appropriate ways to achieve this objective (SAVIANI, 2000, p. 17).

For this reason, education understood as a mechanism of socialization and social insertion is pointed out by Saviani (2000) as the path to the development of human capacities. The author understands that only a non-alienating education contributes to the integral formation of man, so that he can carry out the social transformations necessary for his humanization, seeking to break with the systems that prevent his free development.

Facci (2004, p. 175) states that education is connected to the development process since "it can only be defined as a rational, planned, premeditated and conscious action, therefore, a form of intervention in the processes of natural growth of individuals".

The use of strategies must be adapted "to the different realities of students and teachers, to the demands of the community and to the available resources, taking into account the conditions and peculiarities of each era or historical moment" (DESSEN; POLÓNIA, 2007, p. 26).

The school is a place that is influenced by the socio-cultural conditions of the community in which the child is inserted, constituting the socializing space of all who live there, thus enabling the exchange of experiences and learning. Hence the importance of verifying the evolutionary conditions of the school segments, including teachers, students, parents and the community as a whole, in order to plan activities in the school context (DESSEN; POLONIA, 2007).

According to Vygotsky (2000), education plays a central role in the transformation of men in the path of their social formation. For the author, subjects are historical and learning arises from social relations, mediated by other subjects who help in the appropriation of knowledge that supports development. The author pointed out that the origins of the higher

forms of conscious behavior arise from the social relations that the subject maintains with the outside world in his practical activity. In this sense, the school has a prominent role.

According to Oliveira (1997), it is from the school's knowledge of the student's zone of proximal development (ZDP) that he will be able to develop an education that provides learning for the future, teaching what he does not yet know and not what he already knows. For the author, it is learning that determines development.

Through the concept of ZDP, Vygotsky (2000) explains how the influence between learning and development happens. To justify this concept, the author considers two levels of development: the first refers to the effective development, the one already accomplished (real development zone) which can be measured, for example, through psychological tests; the second is the zone of potential development, which refers to the development that is in the process of being achieved, that is, which is not yet part of the child's own repertoire, but is focused on his future.

According to Vygotsky (2000), the expansion of the zone of potential development occurs as the subject performs appropriate activities. This development is only effective in the social environment. It is at school that the child comes into contact with more structured activities.

At school, children invest their time and get involved in differentiated activities linked to formal tasks (research, directed reading) and informal learning tasks (recess time, excursions, leisure activities). However, in this environment, the attendance to cognitive, psychological, social and cultural needs is carried out in a more structured and pedagogical way than at home. School educational practices also have an eminently social nature, since they allow the expansion and insertion of individuals as citizens and protagonists of history and society. Education in its broad sense becomes a very important instrument to face the challenges of the globalized and technological world (DESSEN; POLÓNIA, 2007, p.29).

At school, the child has the opportunity to live unique experiences, expanding his repertoire as a subject of learning and development, especially with regard to the acquisition of culturally organized knowledge in his different areas of knowledge.

In this sense, the social function of the school is expanded, in order to become a privileged nucleus of education as a universal form of human development. As an institution capable of mediating between everyday and scientific concepts, the school together with the family is the main space for the integral formation of man.

2.3 FAMILY AND SCHOOL INTEGRATION

Studies and research on the family-school relationship, according to Silva and Lima (2009) have pointed out that the greater the bond that parents and/or guardians establish with the schooling process of their children, the greater the chances of these subjects obtaining a good school performance.

The integration between family and school is fundamental for the child's development and school learning, because,

The school space has many similarities with the family space, fundamentally because both are imbued with the task of educating. However, the dimension of education present in the school has singularities, mainly because it deals, above all, with formal education, systematized through the transmission of epistemological dimensions of knowledge throughout the curriculum (SILVA; LIMA, 2009, p. 242).

The school is a complementary institution to the family in terms of education, and should be a pleasant and affective space for children in the process of formation. According to Silva and Lima (2009), the school and the family as educational institutions need to act together in order to promote complementary and significant learning situations.

Although the roles of each are different, there are similar responsibilities and objectives between them. When the family works in partnership with the school, the child wins. The possibility of being able to count on the participation of the family in the school daily life is "a privilege for both institutions. It cannot be denied that the protagonists of this process are the students and teachers and, of course, the teaching-learning process" (SILVA; LIMA, 2009, p. 246).

According to Tiba (1988), in order to act democratically, the school needs the support of the family, to know its dynamics, to be able to respect, guide and understand it. Open and frank dialogue contributes to the most effective interventions in accordance with the real educational needs of children.

The Law of Guidelines and Bases of National Education (LDB), Law No. 9,394, of 1996, in Art. 12, paragraphs VI and VII, when referring to the process of integration between schools and families, exposes the need to articulate with families and the community, creating processes of integration of society with the school (BRASIL, 1996).

Gadotti and Romão (2004) share the understanding that the school-family partnership is a challenge that needs to be assumed by the entire school community. The school is also a place of meeting and coexistence between parents, students and managers, who must act

in groups in search of favorable conditions for the cognitive, affective, emotional, motor, social and professional development of their students. By working together, family and school can help the student to acquire personal security, helping him to overcome the insecurities of each phase, to feel valued in his qualities and in the changes that may occur, learning to organize himself internally and with the external environment.

However, this integration is not easy and requires a lot of dialogue. For Souza and Loch (2008), the relationship between family and school is the product of a sum of actions that lead the family, managers (principal, pedagogue, teacher, secretaries, among others), to practice continuous dialogue, in an attempt to overcome differences of opinion and understand the role of each one in the educational process.

The family and the school are understood as the two main spaces of human development in contemporary Western societies. Therefore, it is necessary to implement viable policies to bring the two contexts closer together, in order to recognize their singularities and similarities, especially with regard to "the development and learning processes, not only in relation to the student, but also to all the people involved" (DESSEN; POLÓNIA, 2007, p. 29).

The opening of the school to the entry of family members is a central aspect in the process of educational formation. Thus, the participation of the family in the school context is understood as an essential factor in the child's development and learning process, making the space more egalitarian in conditions to be shared by all through open dialogue. When mediated by dialogue, participation takes place in all spaces of the school: in school councils, in assemblies, in the classroom, in the library, among other spaces.

The partnership between family and school makes the school space democratic (LIBÂNEO; OLIVE TREE; TOSCHI, 2007). For these authors, the dialogue between family members and the school contributes to the construction and reorientation of decision-making, serving as a guide for the actions of the subjects, with a view to welcoming all those who are part of the school context.

The valorization of the school and families as instruments of knowledge is necessary to suppress social selectivity. The school and the family are integral parts of society. Thus, for Libâneo, Oliveira and Toshi (2007), acting together with these instances implies the preparation of students to act in the adult world with its contradictions, providing them with tools, through the acquisition of content and socialization, an organized and more active participation in the democratization of society.

The school space has many similarities with the family space, fundamentally because both are imbued with the task of educating. However, the dimension of education present in the school has singularities, mainly because it deals, above all, with formal education, systematized through the transmission of epistemological dimensions of knowledge throughout the curriculum.

As a social institution, the school suffers and exerts influence on what happens around it, preparing the child to act in contemporary society. As the school organizes itself together with the family to promote activities that facilitate growth and development in the various dimensions of the human being, it becomes interesting, alive and dynamic for those who attend it. In this way, learning becomes more effective for the student, who may feel more motivated to acquire practical knowledge and apply it in daily life (DESSEN; POLONIA, 2007).

By interacting with family members, the school can become an engaging place for students. As historical subjects, students need care and a good social interaction for their psychosocial development, as learning requires successive and shared movements (ALMEIDA; MEDEIROS, 2010). For the authors, the school is not only a physical space, but a project of education for citizenship. It is necessary for the school to have pedagogical projects that complement the role of the family, providing students with access to scientific knowledge and progress in the social and personal aspects.

By seeking in the family an ally to instrumentalize learning, the school will be building a motivating teaching procedure, strengthening the most complex processes of knowledge, helping in the construction of a more democratic system, thus favoring the link between social actions and writing. The interaction takes place between the individual and the environment. However, the one who imposes the forms and limits of assimilation is the individual himself, in whom the presence of the environment is necessary for the construction of knowledge whose social and cultural value cannot be forgotten.

According to Campos (2011), the family-school interaction aims to provide the responsible parents with knowledge about the pedagogical proposal developed by the school, with a view to discussing it with the team. In addition, this interaction complements the work carried out in the school context with the children, enabling unique knowledge about the different contexts of life, customs and family cultural values, as well as the possible differences and/or similarities between them in relation to the pedagogical proposal. Still, according to the author, there are social and cultural factors that interfere in the family-school relationship that contribute to the establishment of different conflicts. Attitudes of demand and

accusations on the part of the school are common and, at the same time, relationships of apathy, residence or even revolt on the part of the families.

On the one hand, some families, especially from the urban area, which due to the very complexity of life predominant in large centers; and due to the conditions of their family context, they usually exempt themselves from flaunting their role, incumbent on the school to act alone in the formation of habits, values, health, among other factors from which the family cannot exempt itself. On the other hand, there are specific aspects related to daily life, which bring obstacles, although they can be overcome to a greater interaction between parents and the pedagogical team. The father or mother may be working hours that do not allow him or her to come to school to bring or pick up his or her child, or even that make it difficult for him or her to attend meetings (CAMPOS, 2011).

In this way, the participation of parents that begins in the family environment extends to the school. Thus, school proposals should be aimed at maintaining a cooperative relationship between families in matters related to the child's learning.

3 FINAL CONSIDERATIONS

It is observed that the joint work between school and family constitutes one of the greatest challenges of any pedagogical proposal. This difficulty reflects a broader social problem, marked by social and political factors that directly influence the educational context. Therefore, instead of looking for culprits, it is essential to focus efforts on building solutions that bring the family closer to the school's pedagogical proposal.

The school objectives resulting from the partnership with families are achieved more effectively when an education focused on citizenship is sought. For this, different strategies of articulation between family, teachers and students must be planned and implemented. The involvement of the family in the teaching process is essential, as the educational objectives will only be fully achieved when there is a continuous and significant interrelationship between both parties.

Knowledge is built in a process of interaction between family and school, sustained by dialogue, sharing of ideas and collective work. In this perspective, the teacher acts as a mediator, relating to the student from his daily reality and promoting connections between school knowledge and the family context.

Parents, in turn, should be guided to encourage and stimulate their children, transmitting security to them and valuing their school career. The presence of the family in

the school should be welcomed and encouraged, recognizing it as a co-author of the educational process. Thus, the importance of the partnership between school and family is reinforced as a path to a truly transformative pedagogical practice.

The construction of this interaction requires a willingness to work collectively and to jointly define the objectives and means necessary to achieve them. However, the effective participation of parents is only materialized in a management that values democracy and recognizes the family as a fundamental partner in the action of educating.

ABSTRACT

The central question of this study was to explore and understand the dynamics that permeate the certification of Brazilian artisanal cheese, focusing on the application of the Art Seal, evaluating the effects on producers and the consumer market based on the literature on the subject. Thus, the present study aimed to understand the approaches to the certification of Artisanal Cheese and Art Seal based on a systematic review of the literature. The methodology adopted for the present study can be classified as bibliographic and descriptive research, conducted through a systematic approach to literature. A research protocol was created for data collection, processing and analysis. Sources consulted include Periodicals Capes, Google Scholar and Scientific Electronic Library Online (SciELO). The research was carried out between May 23 and 24, 2024, where the selection of articles included searches with the key expressions: “artisan cheese” and “art seal”, totaling 23 scientific articles. The results showed that the B1 classification configured as the Qualis Capes classification of the journals for the majority of selected articles. The year 2023 represented the year with the most publications. Bibliographic and documentary research were the main methodologies adopted, secondly the use of experimental studies and then qualitative research, the latter two being approaches with primary data collection. The objects of study cover several regions of Brazil, with emphasis on Minas Gerais, Paraná and areas of the Northeast, whose investigation focused on certification of artisanal cheeses, analysis of good manufacturing practices and legislation. The analysis of documents and bibliographic sources made it possible to identify the main theoretical currents and the challenges faced by producers in obtaining certification. The analysis categories Geographical Indication (GI), Culture and Regionalism, Legislation and Regulation, and Good Manufacturing Practices and Food Safety were created, which presented a synthesis of the approaches of the selected articles. The study concludes that, although Art Seal promotes cultural recognition and the competitiveness of products in the market, it is essential to implement measures that simplify legal requirements and offer support to small producers in their formalization.

Keywords: Artisanal Cheese. Art Seal. Certification. Craft Production. Food Legislation.

RESUMO

A questão central deste estudo foi explorar e compreender as dinâmicas que permeiam a certificação do queijo artesanal brasileiro, com foco na aplicação do Selo Arte, avaliando os efeitos para os produtores e para o mercado consumidor a partir da literatura sobre a temática. Desta forma, o presente estudo teve como objetivo conhecer as abordagens sobre a certificação do Queijo Artesanal e Selo Arte a partir da revisão sistemática da literatura. A metodologia adotada para o presente estudo pode ser classificada como pesquisa bibliográfica e descritiva, conduzida por meio de uma abordagem sistemática da literatura. Foi criado um protocolo de pesquisa para a coleta, tratamento e análise dos dados. As fontes consultadas incluem Periódicos Capes, Google Acadêmico e Scientific Electronic Library Online (SciELO). A pesquisa foi realizada entre os dias 23 e 24 de maio de 2024, na qual, a seleção dos artigos incluiu buscas com as expressões-chave: “queijo artesanal” e “selo arte”, totalizando 23 artigos científicos. Os resultados mostraram que a classificação B1 configurou como a classificação Qualis Capes dos periódicos da maioria dos artigos selecionados. O ano de 2023 representou o ano com a maioria das publicações. A pesquisa bibliográfica e documental foram as principais metodologias adotadas, em segundo lugar o uso de estudos experimentais e na sequência pesquisas qualitativas, pois estas duas últimas abordagens com coleta de dados primários. Os objetos de estudo abrangem diversas regiões do Brasil, com destaque para Minas Gerais, Paraná e áreas do Nordeste, cuja investigação focou em certificação de queijos artesanais, análise das boas práticas de fabricação e legislação. A análise de documentos e fontes bibliográficas possibilitou a identificação das principais correntes teóricas e dos desafios enfrentados pelos produtores na obtenção da certificação. Foram criadas as categorias de análise Indicação Geográfica (IG), Cultura e Regionalismo, Legislação e Regulamentação, e Boas Práticas de Fabricação e Segurança Alimentar, que apresentaram a síntese das abordagens dos artigos selecionados. O estudo conclui que, apesar do Selo Arte fomentar o reconhecimento cultural e a competitividade dos produtos no mercado, é imprescindível implementar medidas que simplifiquem as imposições legais e ofereçam suporte aos pequenos produtores em sua formalização.

Palavras-chave: Queijo Artesanal. Selo Arte. Certificação. Produção Artesanal. Legislação Alimentar.

RESUMEN

La cuestión central de este estudio fue explorar y comprender las dinámicas que rodean la certificación del queso artesanal brasileño, con énfasis en la aplicación del Sello Arte, evaluando sus efectos para los productores y para el mercado consumidor a partir de la literatura existente. De este modo, el presente estudio tuvo como objetivo examinar los enfoques sobre la certificación del Queso Artesanal y el Sello Arte mediante una revisión sistemática de la literatura. La metodología adoptada puede clasificarse como investigación bibliográfica y descriptiva, conducida a través de un enfoque sistemático de la literatura. Se elaboró un protocolo de investigación para la recopilación, el tratamiento y el análisis de los datos. Las fuentes consultadas incluyeron Periódicos CAPES, Google Académico y Scientific Electronic Library Online (SciELO). La búsqueda se realizó entre los días 23 y 24 de mayo de 2024, y la selección de los artículos incluyó búsquedas con las palabras clave “queso artesanal” y “sello arte”, totalizando 23 artículos científicos. Los resultados mostraron que la mayoría de los artículos seleccionados fueron publicados en revistas clasificadas como B1 en el sistema Qualis Capes. El año 2023 representó el período con mayor número de publicaciones. La investigación bibliográfica y documental fueron las metodologías predominantes, seguidas de estudios experimentales y de investigaciones cualitativas, ya que estas dos últimas implican la recolección de datos primarios. Los objetos de estudio

abarcaron diversas regiones de Brasil, con énfasis en Minas Gerais, Paraná y zonas del Nordeste, centrados en la certificación de quesos artesanales, el análisis de buenas prácticas de fabricación y la legislación. El análisis de documentos y de fuentes bibliográficas permitió identificar las principales corrientes teóricas y los desafíos enfrentados por los productores para obtener la certificación. Se crearon categorías de análisis—Indicación Geográfica (IG), Cultura y Regionalismo, Legislación y Reglamentación, y Buenas Prácticas de Fabricación y Seguridad Alimentaria—que sintetizaron los enfoques presentes en los artículos seleccionados. El estudio concluye que, aunque el Sello Arte fomenta el reconocimiento cultural y la competitividad de los productos artesanales en el mercado, es imprescindible implementar medidas que simplifiquen las exigencias legales y brinden apoyo a los pequeños productores en su proceso de formalización.

Palabras clave: Queso Artesanal. Sello Arte. Certificación. Producción Artesanal. Legislación Alimentaria.

1 INTRODUCTION

This work has as its central theme the certification of artisanal cheese. Recently, there has been an increase in the appreciation of artisanal products by consumers, motivated by the desire to consume foods that have a cultural identity, that are produced in a sustainable way and that have a superior quality (MARTINELLI; ANJOS, 2023; GEORGE; PINTO, 2023). In addition, certification is crucial to ensure the origin and food safety of these products, complying with market demands and the sanitary standards in force (SILVA *et al.*, 2022; PORTO *et al.*, 2022).

In addition, the rural producer can obtain gains from this process by adapting to the legislation, providing quality and authenticity to the products, gaining trust with consumers, enriching reputation and appreciation in the market.

The certification allows the expansion of product sales opportunities, reaching new market niches, including at an international level. As a result, there has been an increase in Brazilian exports of artisanal cheeses, reflecting the growing appreciation of the quality and reliability of this product in global markets (FERREIRA; COSTA, 2021; MATOS, 2023). This growth is driven by the demand for traditional gastronomic products and by consumers' search for unique culinary experiences, in addition to the appreciation of artisanal and sustainable production, showing that the quality standards required by regulatory agencies are being met (PENA *et al.*, 2022; MARTINELLI; ANJOS, 2023).

Artisanal cheeses have several ways to be used in cooking, which directly impacts their acceptance by the public. They can be enjoyed as part of a quick snack, in desserts or as an appetizer, it is quite common to combine cheeses with drinks such as wine, cachaça and beer. In addition, these artisanal cheeses can be incorporated into the preparation of savory and sweet dishes, as well as in the production of cheese bread, cakes and even as a filling for pasta, among other culinary options (MINISTRY OF AGRICULTURE, LIVESTOCK AND SUPPLY - MAPA, 2021).

The per capita consumption of milk and dairy products in Brazil increased by 5.1% in 2023, due to the growth in citizens' income and the drop in dairy prices. The supply of milk in the country grew 5.6% compared to the previous year, resulting in an increase of 1.409 million liters, of which 63% came from the increase in imports (EMBRAPA, 2024). In 2022, the per capita consumption of UHT milk in Brazil was 123.5 liters, which represents the lowest amount since 2013, showing a decrease compared to 2021, but still 52.7% higher than what was observed in 2004 (EMBRAPA, 2023).

According to the Confederation of Agriculture and Livestock of Brazil - CNA (2022), between 2017 and 2021, the value of Brazilian exports of dairy products grew by 50%. In the same period, world exports rose 11% and countries that have a more relevant share than Brazil, such as Switzerland and Uruguay, recorded a drop in sales, of 12% and 18% respectively. First place in the *ranking*, the European Union grew proportionally smaller than Brazil with 11%.

The Minas Gerais Institute of Agriculture - IMA (2019), with the creation of Decree No. 9,918, of 07/18/2019, which regulated Law No. 13,680, of 07/14/2018, establishes guidelines for granting the Art Seal by IMA, allowing handicraft products of animal origin to be marketed interstate, as long as they are subject to sanitary inspection. Cheese producers must be registered with the state inspection service, carried out by the IMA, and comply with the standards of good agricultural practices and good artisanal manufacturing practices. In addition to creating the Artisanal Cheese seal, the objective of the new decree is to clarify inspection powers, regulate the broad national commercialization of products and ensure the provision of adequate information to consumers, especially on the health and safety of food products of animal origin produced in an artisanal way (IMA, 2019).

There are several difficulties that producers face in the production and legalization of artisanal cheese for commercialization. Cheese producers must be registered with the state inspection service, carried out by the IMA, and comply with the standards of good agricultural practices and good artisanal manufacturing practices (IMA, 2019).

According to the Ministry of Agriculture, Livestock and Supply (MAPA, 2022), among the benefits of the regulation is the stimulus to formalize more producers in Brazil. A canastra cheese producer, for example, who already has the Art Seal may receive the Artisanal Cheese seal, that is, he can choose to use both or use only one. This is because it is a cheese linked to the territory, produced by a specific region. In the case of some seasoned cheeses, which can be produced independently of the region, they are eligible to receive the Art Seal, but cannot receive the Artisanal Cheese seal.

The Art Seal is a certificate that ensures that the food product of animal origin was made in an artisanal way, with a recipe and process that have its own, traditional, regional or cultural characteristics. It can be granted to dairy products, meat, fish and its derivatives and bee products. The Artisanal Cheese Seal, on the other hand, is a certificate that ensures that artisanal cheeses were made by traditional methods with territorial, regional or cultural

attachment and appreciation (MINISTRY OF AGRICULTURE, LIVESTOCK AND SUPPLY - MAPA, 2022).

Certifications ensure that products have unique, differentiated organoleptic properties inherent to the "artisanal making" of a particular region, tradition or culture. The two seals lead to the addition of value to products of animal origin and allow free commercialization in the national territory. With the new Decree and the inclusion of Mapa as the granting body of the Seals, the possibility of recognizing Brazilian artisanal products in other countries is envisaged, reaffirming the quality and value of these products, already recognized in international competitions (FEDERAÇÃO DA AGRICULTURA E PECUÁRIA DO ESTADO DE SÃO PAULO - FAESP, 2022).

On December 4, 2024, the United Nations Educational, Scientific and Cultural Organization (UNESCO) officially gave the title of Intangible Cultural Heritage of Humanity to the "Ways of Making Artisanal Minas Cheese". This honor underlines the significant historical and cultural importance of artisanal cheese production in Minas Gerais, highlighting the transmission of knowledge over generations and the relevance of the product to the local identity and economy. This international recognition provides Artisanal Minas Cheese with greater visibility in the world, creating new opportunities for its appreciation and promoting gastronomic tourism in the region. In addition, this validation encourages the preservation of traditional practices and fosters the creation of public policies aimed at the protection and sustainability of artisanal production (UNESCO, 2024).

The panorama of artisanal cheese certification in Brazil, especially with regard to the Art Seal, proves to be an aspect of great importance, both for the recognition of producers and for ensuring the quality and authenticity of the product. However, the certification process faces challenges and particularities, ranging from compliance with legal standards to the preservation of the traditional and regional characteristics of the cheese. Thus, the central issue of this study was to explore and understand the dynamics that permeate the certification of Brazilian artisanal cheese, focusing on the application of the Art Seal, evaluating the effects for producers and the consumer market from the literature on the subject.

This work is relevant due to the need for a more in-depth evaluation of the panorama of artisanal cheese certification in Brazil, specifically through the Art Seal. Certification has been the subject of considerable discussion, being seen as crucial for the appreciation and sale of handicraft products, in addition to promoting their entry into broader markets (SILVA *et al.*, 2022; MARTINELLI; ANJOS, 2023). Recent studies have explored the obstacles that

producers face in obtaining these certifications, emphasizing the sanitary requirements and bureaucracy that surround them (FERREIRA; COSTA, 2021; ROCK; CALDAS, 2023).

In this way, this research is integrated with these analyses by deepening the reflection on the norms of the Art Seal and its consequences for the commercialization of artisanal cheese in Brazil. In addition to enriching the academic debate, the findings of this research can be of great help to producers and those responsible for formulating public policies, offering information to improve and increase access to the seal, ensuring its role in cultural preservation and economic growth.

Finally, by examining the certification process of artisanal cheese, this study seeks to reinforce the identity and competitiveness of Brazilian cheese in the market, favoring the sustainability of small rural properties and the preservation of cheesemaking traditions in the country. Thus, this work has as its general objective to know the approaches to the certification of Artisanal Cheese and Art Seal from the systematic review of the literature. Specifically, the study aimed to characterize the articles selected for the study in relation to the Qualis Capes classification of the journals, the years of publication, methodologies adopted and objects of study investigated; to ascertain the approach present in the theoretical foundations of the articles participating in this study and; to create categories of analysis from the content of the selected articles on artisanal cheese and to present the synthesis of the approaches of the articles under study.

2 THEORETICAL FOUNDATION

In the Brazilian context, artisanal cheeses have their origins in the Portuguese influence, which brought to Brazil the production of cheeses with raw milk (BORELLI³ *et al.*, 2016 *apud* ARAÚJO *et al.*, 2020; CAMPELLO *et al.*, 2021). This practice was incorporated into the Brazilian territory and was consolidated in several regions, with Minas Gerais standing out as an important center for the production of artisanal cheese.

In Minas Gerais, cheese is not just a food, but a cultural and economic symbol. The cheese tradition began with the arrival of cattle during the colonial period, as a solution to food shortages, and quickly became integrated into the local diet and the region's economy (TAVARES, 2022).

³ BORELLI, B.M.; LACERDA, I.C.A.; PENIDO, F.C.L.; ROSA A.C. Traditional Cheeses Produced in Brazil: Characterisation, Production Technologies and Health Implications. *In*: PERKINS, E. (Ed.). **Food microbiology fundamentals, challenges and health implications**. New York: Nova Science Publishers, Inc., 2016. chap.7, p.161-189.

Today, dairy farming is consolidated as a vital activity for the State, influencing both economic and cultural aspects. The milk produced in Minas Gerais is essential not only for direct consumption, but also for the production of various derivatives, such as cheese, yogurt, and cottage cheese (MATOS, 2023).

The state of Minas Gerais is recognized as one of the most important centers for the elaboration of artisanal cheeses in Brazil, with several areas that have historically been dedicated to the production of these items, which combine ancient knowledge and methods passed down from generation to generation. The most relevant regions in the manufacture of Minas Artisanal Cheese (QMA) are Araxá, Campos das Vertentes, Cerrado, Serra da Canastra, Serra do Salitre, Serro, Triângulo Mineiro, Serras da Ibitipoca, Diamantina and Entre Serras da Piedade ao Caraça, all of which are notable for their specific production characteristics and the unique sensory qualities of the cheeses produced in these locations (COSTA *et al.*, 2022).

2.1 LEGISLATION AND CERTIFICATION STANDARDS

The production of Artisanal Cheese was directly impacted due to government actions, including the creation of laws and the implementation of public policies. This scenario intensified from the 2000s onwards, with the revision of the criteria for sanitary standards for products of animal origin in the country. The new regulations stipulated that Artisanal Minas Cheese (QMA) could only be marketed if it followed standards similar to those of industrial production (GIÁCOMO, 2022).

In 2000, French technicians visited Minas Gerais to improve the quality and income of the producers of Minas Artisanal Cheese (QMA) through international cooperation. They observed production in the regions of Serra da Canastra, Serra do Salitre and Serro, identifying the need to improve food safety and sanitary issues. Although the QMA had a market, there were concerns about the pasteurization of raw milk, which could alter its characteristics, in addition to problems such as lack of sanitary control and falsification regarding the geographical origin of the cheese (TAVARES, 2022).

Law No. 13,860, of July 14, 2018, defines artisanal cheese in its Article 1 as that produced by traditional methods, which values and is linked to a certain territorial, regional or cultural area. This type of cheese must follow a specific elaboration protocol for each type and variety, and must be manufactured with good agricultural and production practices (BRASIL, 2018).

According to Monteiro and Matta (2018), artisanal cheeses need to be processed in the rural establishments where the milk is produced. The maturation of the cheese must take place in a room with adequate humidity and temperature control, as well as enough space for the storage of the pieces.

Given the economic and cultural relevance of artisanal cheeses, producers sought to formalize production to meet legal requirements and preserve traditional characteristics. In response, the Art Seal was instituted by Law 13.680/2018, regulated by Decree 9918/2019. This decree allows states and the Federal District, with approved regulations, to grant the registration of handicraft products in accordance with federal legislation, promoting regional development, the expansion of local businesses and combating the illegal market (CAMPELLO *et al.*, 2021).

2.1.1 The Art Seal

The Art Seal, established by Law 13,680/2018 and regulated by Decree 9,918/2019, aims to ensure the genuineness and excellence of artisanal foods, enabling their sale throughout the Brazilian territory. This certification validates traditional production techniques and ensures that the products comply with sanitary standards, fostering the cultural and economic appreciation of local producers (BRASIL, 2018; BRAZIL, 2019).

The certification strengthens the identity of artisanal products and enables greater competitiveness in the formal market, in addition to allowing states and the Federal District to grant the seal according to local regulations, promoting the decentralization of the process and the autonomy of producers in the commercialization of their products (CAMPELLO *et al.*, 2021).

Certified products must comply with specific requirements, such as the use of their own raw material or of known origin, and the implementation of mostly manual processes. This certification not only guarantees the credibility of the product, but also allows its sale without limitations linked to the region of production or the type of sanitary inspection in force (MAPA, 2020).

The Art Seal plays a crucial role in the formalization of producers and the appreciation of artisanal products at the national level, enabling their growth in the consumer market and encouraging the maintenance of regional culinary traditions (MAPA, 2020).

The Art Seal plays a fundamental role in validating the quality of artisanal products, facilitating the adequacy of inspection processes for food of animal origin produced in an

artisanal way. These products, which are mostly made with their own or specific raw material, have their quality guaranteed by inspection agencies. This provides greater food confidence and security, while preserving the culinary and cultural traditions of each region. In addition, the Art Seal increases access to authentic and unique products, promoting the appreciation of local practices, income generation and the strengthening of traditional communities in Brazil (SEBRAE, 2020).

In order to be considered artisanal, within the scope of the Art Seal, food products must meet seven requirements:

- I - Raw materials of animal origin must be processed on the property where the processing unit is located or must have a determined origin;
- II - The techniques and utensils adopted that influence or determine the quality and nature of the final product must be predominantly manual at any stage of the production process;
- III - The production process must adopt good practices in the manufacture of artisanal products with the purpose of ensuring the production of safe food for the consumer;
- IV - The raw material production units and the units of determined origin must adopt good agricultural practices in artisanal production;
- V - The final product of manufacture must be individualized, genuine and maintain the uniqueness and traditional, cultural or regional characteristics of the product, allowing sensory variability between batches;
- VI - The use of industrialized ingredients must be restricted to the minimum necessary, and the use of dyes, flavorings and other additives considered cosmetic is prohibited; and
- VII - Processing should be done primarily from a traditional recipe, which involves techniques and domain knowledge of the manipulators (GOV, BR, 2021).

The eligible establishment must contact the state inspection body to request the Art Seal (EMBRAPA, 2021).

2.2 LABELING

According to the National Health Surveillance Agency (ANVISA, 2005), the relevance of nutritional labeling of food products to encourage a healthy diet and ensure strategies to prevent chronic diseases is highlighted in several studies and research in the area of nutrition. The inclusion of nutritional information on the labels of packaged foods has been mandatory

in Brazil since 2001. In order to create a single regulation for MERCOSUR countries, there was a need to review Brazilian standards and adapt them to global trends. In October 2020, ANVISA approved new nutritional labeling standards, whose implementation began in October 2022 (ANVISA, 2025).

According to Machado (2018), IMA Ordinance No. 1,261 of 11/09/12, Artisanal Minas Cheese, in registered cheese dairies, must include the information indicated in Table 1 on the labeling.

Table 1

Labeling identifications

Identification of the cheese factory or warehouse: (IMA Ordinance no.1.261/12). Corporate name or name of the producer. Complete address of the establishment with the inclusion of the telephone number and zip code. Classification of the establishment: CHEESE FACTORY or DAIRY WAREHOUSE (State Decree No. 38,691/97). The expression REGISTRATION IN IMA/GIP UNDER No. ..., (IMA Ordinance no. 1.261/12). CNPJ and STATE REGISTRATION, in the case of legal entities. CPF and IEPR, in the case of an individual and establishment located on rural property. The expression BRAZILIAN INDUSTRY in capital letters
Product sales denomination: ARTISANAL MINAS CHEESE in bold upper case, with at least 1/3 of the dimensions of the largest inscription on the label, affixed to the main panel. (MAPA Normative Instruction No. 22/05).
Commercial brand of the product, if any, affixed to the main panel.
Microregion of origin in uppercase. MICROREGION:.....
The phrase: PRODUCT MADE WITH RAW MILK, in upper case and bold, bets on the main panel.
Ingredients: Raw milk, salt, drip and rennet (in that order)
DATE OF MANUFACTURE/BATCH: (MAPA Normative Instruction No. 22/05), in capital letters.
VALIDITY:..... (MAPA Normative Instruction No. 22/05).
The phrases: MUST BE WEIGHED IN THE PRESENCE OF THE CONSUMER and WEIGHT OF THE PACKAGE: g, in integers and in grams (Inmetro Ordinance No. 25/86). Both sentences must be declared in the same font size and in capital letters
The expression KEEP COLD FROM 1 TO 10°C, in capital letters. (When recommended by the warehouse or cheese dairy).
ONCE OPENED, CONSUME WITHIN X DAYS (maximum time that the warehouse or cheese shop guarantees the quality of the product).
The phrase DOES NOT CONTAIN GLUTEN (Federal Law No. 10.674/03), in capital letters and in bold.
Official imprint of the IMA, (IMA Ordinance No. 1,261/12).
SISBI logo (Normative Instruction Map No. 2/09) inserted below the IMA stamp.
Nutritional Information Table. (ANVISA RDC Resolutions no. 359/03 and no. 360/03). Use Vertical Model A of Annex B of Resolution RDC No. 360/03. The layout must be obeyed as to the number of rows and columns.
"ALLERGIC: CONTAINS MILK" (ANVISA RDC Resolution No. 26/15)
CONTAINS LACTOSE (Decree - Law 13.305/16) and RDC no. 136/2017

Source: MACHADO, 2018.

In 2018, new laws were approved that brought changes to the labeling standards applied to artisanal cheeses in Minas Gerais. At the national level, according to Law No. 13,680, of June 14, 2018 (known as the Art Seal Law), artisanal cheeses must be marked throughout the Brazilian territory with a single seal indicating ARTE, as established in the specific regulation. In relation to the state of Minas Gerais, Law No. 23,157, of December 18, 2018, establishes that the labels of Minas Artisanal Cheeses must contain, at least, information such as the description of the type or variety, registration number, registration or title of the producing establishment, and municipality of origin.

The creation of the brand is essential, ensuring the proper positioning of all components of the ARTE Seal on the label. This ensures a cohesive and standardized presentation across the entire product line. This zeal not only enriches the identity of the artisanal product, but also favors the recognition and trust of consumers (MINAS GERAIS, 2018).

The elaboration of the brand is crucial, ensuring the correct placement of all elements of the Art Seal on the label. This ensures a unified and uniform presentation across the entire product range. This care not only enhances the identity of the handmade product, but also promotes customer recognition and trust, as shown in Figure 1 – Art Seal Grid (Minas Gerais, 2018).

Figure 1

Art Stamp Grid

Source: MAPA, 2020.

In addition, Minas Gerais legislation also allows the commercialization of cheeses without packaging, as long as identification methods such as bas-relief printing, stamps with non-toxic inks are used, or other forms authorized by current regulations (MINAS GERAIS, 2018).

The Art Seal mark obeys a set of specific guidelines, ensuring its proper application in certified products. The standardization of these components facilitates the identification of the seal by customers and ensures its authenticity.

In Table 2, the main elements of the Art Seal are highlighted. The seal structure is arranged in a grid of 6x6 squares inclined at 45°, which act as a foundation for the placement of the other components. The title "Handicrafts of Brazil" is printed in the four central squares of the upper ends of the stamp, with a Montserrat Regular font, with no changes in size between the words. The stamp's graphics, composed of stylized letters, must be centered, ensuring that it touches, but does not invade the squares that make up the text (MAPA, 2020).

Table 2

Elements of the Art Seal

3.2.1 The Grid	3.2.2 Text "Artesanal do Brasil"	3.2.3 The "Art" Graphics
The elements of the ARTE Seal will be arranged in a grid of 6x6 squares, inclined at 45°.	The text "Artesanal do Brasil" will be arranged in the four central squares of the upper sides, occupying its entire width the text must be written in the Montserrat Regular font, with no variations in its size between the excerpts "Artesanal" and "do Brasil". So that both parts completely occupy the width of four squares, the space between letters varies between the passages.	The graphics (stylized letters) that give the name to the ARTE Seal should be as centered as possible on the grid, with due attention to always touching, but never invading, the squares of the text present.

Source: MAPA, 2020.

As presented in Table 2 - Elements of the Art Seal, these guidelines ensure a uniform use of the seal in handicraft products, encouraging its appreciation and reliability in the consumer market (MAPA, 2020).

2.3 ECONOMIC AND SOCIAL IMPACT OF CERTIFICATION

The challenges faced by artisanal cheese producers are significant and reflect the complexities of current legislation. According to a study carried out by Matos (2023), respondents from Geographical Indications (GIs) reported several difficulties related to sanitary requirements, especially considering the particularities of artisanal cheese, such as the use of raw milk and the time required for maturation.

Maintaining traditional manufacturing methods is key to preserving the unique characteristics of the products, but Brazilian legislation is predominantly focused on industrial cheeses, which creates a challenge for artisanal producers. The comparison between industrial and artisanal production practices reveals a significant discrepancy in production patterns, making the legislation inadequate for the specific needs of artisanal cheeses (MATOS, 2023). In addition, the current legislation prevents the export of artisanal cheeses, allowing these products to obtain only the Art Seal, which is not sufficient for export (MATOS, 2023).

Traceability and certification of the origin of artisanal cheeses are essential to ensure the veracity of products and to combat counterfeiting. In Brazil, one of the methods used for this control is the implementation of casein labels, especially for the manufacture of cheeses with Geographical Indication (GI). APROCAN (Association of Canastra Cheese Producers) began to use these labels as a direct identification badge on the product. This system was implemented after an exchange of experiences with French producers, and was later approved by ANVISA and the Ministry of Agriculture, Livestock and Supply between 2015 and 2016. Casein brands ensure that only cheeses made in accordance with the guidelines defined by the Canastra GI obtain this certification, reducing unfair competition and promoting the strengthening of the market for authentic artisanal cheeses.

In addition, the traceability that this method offers allows for more effective control over the quantity of production of the members, ensuring adherence to regulatory requirements (MUÝLDER *et al.*, 2022). Matos (2023) points out that, due to the difficulties imposed by sanitary requirements, many producers sought to form associations and register their productions with a geographical indication to highlight the quality and differentials of the products. However, these associations face high costs and challenges related to legislation that regulates the production of artisanal cheeses and prevents export. The reality of many small producers, who have difficulties in making large investments, further complicates the situation.

In a study conducted by Silva *et al.* (2022), the analysis of the results indicates that most small producers are unable to comply with legal standards due to the high costs involved. There is an urgent need to adapt legislation to facilitate the entry of small enterprises into the formal market and to implement a training plan that ensures greater product safety.

3 METHODOLOGY

This study, from the methodological perspective, can be defined as a bibliographic research carried out through a systematic approach to the literature. According to Lakatos and Marconi (2003), scientific investigation is a formal and meticulous procedure that seeks the acquisition of knowledge, based on logical and systematic principles. Thus, more than simply collecting data, research seeks to establish a path to understand reality and discover solutions to specific issues, employing appropriate scientific methods. The implementation of this rigorous method ensures the reliability and validity of the analyses conducted during the research.

For the construction of the present study and formulation of results, a systematic review of the literature was carried out. According to the authors Galvão and Ricarte (2020), conducting a systematic review of the literature goes beyond the common procedure of conducting a review as part of an academic research.

Systematic review is a research method that adopts specific protocols and seeks to organize a vast set of documents in a logical way. After defining the concept and presenting the different types of systematic review, the stages of this process are discussed, which include the definition of the research problem, the choice of databases, the formulation of the search strategy, the selection of documents and the organization of the results. Finally, aspects related to the dissemination and publication of systematic literature reviews are addressed. Understanding these aspects is essential not only for researchers who carry out this type of investigation, but also for reviewers and editors of academic journals from different fields of knowledge.

This study is also structured as a descriptive study, as outlined by Prodanov and Freitas (2013), when the researcher limits himself to recording and describing the phenomena he observes, without intervening in them, seeks to detail the characteristics of a specific population or phenomenon, in addition to establishing links between different variables. This process uses standardized data collection techniques, such as questionnaires and systematic observation, usually taking the form of a survey.

3.1 DATA COLLECTION, PROCESSING AND ANALYSIS

Information was obtained through a literature review in several academic databases. The sources consulted include Capes Journals, Google Scholar and *Scientific Electronic Library Online* (SciELO). The research was carried out between May 23 and 24, 2024,

through a simple search, using the key expressions: "artisanal cheese" and "art seal", from which 215 documents were found, namely: scientific articles, dissertation, electronic books, monographs, report, abstracts, academic journal, doctoral thesis, course completion works (TCC). In addition, relevant legislation on the subject was analyzed on the official platforms of the Brazilian Institute of Geography and Statistics (IBGE), the Minas Gerais Institute of Agriculture (IMA) and the Ministry of Agriculture, Livestock and Supply (MAPA).

For the treatment of the collected data and the appropriate organization by platform, a spreadsheet was created in which each tab created referred to the platforms chosen for the study. And in each tab there were the following columns: number, type of work, title, citation, type of work, year, journal/journal, abstract of the article, topics of the theoretical framework, category of analysis to be created from the keywords of the article, conclusion obtained and the *link* to access the work. Articles published in English and Portuguese that are related to the theme were selected. However, all the articles found were in Portuguese.

Thus, the research protocol created aimed to select the works participating in this research and established the parameters for inclusion and exclusion of these articles. The parameters for the protocol have been detailed below:

- Parameter for inclusion of the works resulting from the protocol: carried out from the detailed reading of the abstract of each document, containing the key expressions, *artisanal cheese* and *Art Seal*.
- Exclusion of articles that did not contain the theme *artisanal cheese* and *Art Seal*.
- Any works that are not articles from journals/magazines (TCC, dissertation, thesis, specialization monograph, abstracts, event articles and books may be excluded).
- Deletion of repeated articles on the same platform and on different platforms.
- Deletion of articles that are not complete or that do not open or the page is no longer available.

The research protocol is summarized in Table 3, which details how the investigation was conducted and the systematic review carried out.

Table 3

Research protocol

Platform	SciELO	Google Scholar	Capes Journals
Date	23/05/2024	24/05/2024	23/05/2024

Search term	"Artisanal cheese" and "Art seal"	"Artisanal cheese" and "Art seal"	"Artisanal cheese" and "Art seal"
Language	Portuguese	Portuguese	Portuguese
Specific period	No time frame to know the time history of publications	No time frame to know the time history of publications	No time frame to know the time history of publications
Overall search result on the platforms based on the search terms	0	159	3
Articles chosen after refinement with the application of the search protocol with inclusion and exclusion parameter	0	23	0

Source: Prepared by the authors, 2024.

The search carried out in the SciELO data platform resulted in no article that met the parameters established for the study. As for the articles excluded based on the exclusion criteria, it was found that none focused only on the theme of artisanal cheese or the Art Seal, without addressing both simultaneously. All articles were in the stipulated languages (Portuguese and English), and there were no duplicate articles on the same platform or between the different search platforms. In addition, no article was excluded because it was incomplete, that is, containing only the abstract, and no article was discarded due to inoperative links or inaccessible content.

The search on the Google Scholar data platform resulted in 115 articles. Of these, 44 articles were selected because they met the parameters determined for the study. Of the excluded articles, 21 addressed only artisanal cheese or the Art Seal, but not both topics simultaneously. There were no articles outside the established languages (Portuguese and English). Two duplications were identified on the same platform and 53 articles could not be accessed due to inoperative links or unavailable content.

The search carried out in the CAPES Periodicals data platform resulted in three articles, which did not comply with the parameters established for the study, and there were no selected articles. Of the excluded articles, none addressed exclusively artisanal cheese or the Art Seal simultaneously. All articles were in the established languages (Portuguese and English) and there were no duplications on the same platform or among other search platforms. In addition, no article was excluded because it was incomplete, that is, containing only the abstract, and there were no inaccessible articles due to *inoperative* links.

Thus, a total of 23 scientific articles were selected after refinement and application of the research protocol, based on the inclusion and exclusion criteria. None of the articles came from SciELO or the CAPES Journals platform, and all 23 came from the Google Scholar platform. The selected articles were analyzed together and summarized in Table 4.

Table 4

Articles selected from the applied research protocol

No.	Quote	Title
01	Araújo <i>et al.</i> (2020)	A historical-critical analysis of the development of Brazilian standards related to artisanal cheeses

Source: Prepared by the authors, 2024.

The analysis of the collected data involved a critical and comparative reading of the identified legislation and standards, as well as the evaluation of the challenges and legal requirements that artisanal cheese producers face. The main points of compliance and the bureaucratic obstacles that impact the legalization and certification of artisanal products were identified. The analysis also included the verification of the differences between state and federal regulations, with a particular focus on the specificities of the state of Minas Gerais.

The 23 articles selected for content analysis were read in depth and completely. According to Bardin (1977), this process aims to structure in an appropriate way and present information in a different way, using transformation processes. The objective is to store information in a varied way and facilitate access to the observer, allowing him to extract the maximum amount of data (quantitative aspect) and relevance (qualitative aspect).

The content analysis allowed thematic categorization of the articles, divided into three large groups, based on their contents and the keywords of each article: 1) Geographical Indication (GI), Culture, Regionalism and Appreciation of Brazilian Artisanal Cheeses; 2) Legislation and Regulation and; 3) Physicochemical and Microbiological Characteristics, Good Manufacturing Practices and Food Safety. This classification was crucial to organize the analysis and understand the main areas of interest addressed in the articles.

The distribution of articles by groups addressed a view of the most recurrent approaches in the literature. The next section presents the results of the systematic review carried out.

4 RESULTS AND DISCUSSION

This section addressed the results of the studies presented in this research. Initially, it discussed the general characterization of the articles selected for the study in relation to the years of publication, the Qualis Capes classification of the journals, the methodologies adopted and the objects of study investigated. Next, he presented the theoretical foundations and the main works used in the selected articles of this study. And, finally, he explained about the categories of analysis created from the content of the selected articles on artisanal cheese, synthesizing the approaches of the articles under study.

4.1 GENERAL CHARACTERIZATION OF THE ARTICLES

In this section, the characterization of the 23 articles selected for analysis was presented. The approach showed the Qualis classification of these articles, the years of publication, the methodologies used in the studies and the objects of investigation analyzed. The objective was to provide a broad and detailed view of the characteristics of the selected articles. Table 5 presents the Qualis Capes classification of the journals whose selected articles were published.

Table 5

Qualis Capes classification of journals

No.	Title	Journal/Magazine	Qualis Capes Classification
1	A historical-critical analysis of the development of Brazilian standards related to artisanal cheeses	Periodicals Brazilian Archives of Veterinary Medicine and Animal Science (Arq. Bras. Med. Vet. Zootec.)	B1
2	The paths to obtain the Art Seal in Rio de Janeiro	Food Magazine: Science, Technology and Environment	C
3	L. Monocytogenes <i>contamination</i> in cheese	Brazilian Journal of Animal and Environmental Research	B4

23	Gastronomic know-how in Brazil: intangible heritage and Geographical Indication as resources for its protection	Cultural Confluences Magazine	A4

Source: Prepared by the authors, 2024.

The analysis of Table 5 revealed that there are no articles (0%) classified in categories A1 and A2, which pointed to the inexistence of journals with greater academic repercussion among the selected articles. It is observed that 8.7% of the articles are in category A3 and 17.4% in A4, resulting in a total of 26.1% of publications in journals with significant academic impact. In group B, 17.4% are classified as B1, 8.7% as B2 and 13% as B4, adding up to 39.1% in intermediate-level journals. Finally, 34.8% of the articles belong to classification C, evidencing a higher frequency of publications in journals with less academic impact.

Regarding the years of publication, it can be observed that the articles analyzed are distributed in a varied way over time. In 2020, five articles were identified, while in 2021, there was a slight decline to four. In 2022, there was an increase, with six articles published. In

2023, the highest number was recorded, totaling seven articles. Finally, in 2024, only one study was found. This distribution shows a growing trend of interest in the topic until 2023, with a slight reduction in the last year analyzed, as shown in Table 6, below.

Table 6

Year of publication of the selected articles

Year	Absolute value	Relative Value (%)
2020	5	21,74
2021	4	17,39
2022	6	26,09
2023	7	30,43
2024	1	4,35
Total	23	100,00

Source: Prepared by the authors, 2024.

It should be noted that the research protocol was carried out without a time frame to know the time history of the publications. What can be verified in relation to this point is that the first published articles date from 2020, converging with the moment when the subject begins to be discussed in academia. The Art Stamp Law was enacted in 2018 (Law 13.680/2018 and regulated by Decree 9918/2019). It should also be added that the Minas Gerais Institute of Agriculture - IMA (2019) regulated this law with the creation of Decree No. 9,918, of 07/18/2019, which established guidelines for granting the Art Seal by the IMA, allowing handicraft products of animal origin to be marketed interstate, as long as they are subject to sanitary inspection.

In addition, the association of the subject of artisanal cheese certification related to the Art Seal took place two years after the publication of Law No. 13,860, of July 14, 2018, which defined in its first article artisanal cheese as that produced by traditional methods, which values and is linked to a certain territorial area, regional or cultural.

The methodology or material and methods of a study describes the process of development of the research, including the typology of the investigation carried out and details about the collection, analysis and treatment of the data obtained. Next, in Table 7, the methodological approach of the selected articles was presented, which deal with the certification of artisanal cheese and the art seal.

Table 7

Methodologies adopted

No.	Quote	Methodology	Data collection
01	Araújo <i>et al.</i> (2020)	Bibliographic research with critical analysis considering: 1) the main types of artisanal cheeses produced in Brazil and their characteristics, 2) a historical presentation of the standards related to the production and commercialization of Brazilian artisanal cheeses and 3) critical discussion about the challenges and perspectives for the development of new standards and their potential impacts on identity, quality and harmlessness of these products.	Primary sources: official legislation; Secondary sources: reviews of scientific literature and databases.
02	Campello <i>et al.</i> (2021)	Qualitative approach with a bibliographic and documentary review to examine the legislation that regulates the production of artisanal cheese in Brazil.	Documents and scientific literature.
03	Azenha e Silva (2021)	The Federal Official Gazette was used as the main reference, the search tool "Google Scholar" with the keywords "Listeriosis", "Cheese" and "Listeria", and books such as " <i>Modern Food Microbiology</i> " and " <i>The Microbiology of Safe Food</i> " for the development of the work.	Secondary sources: books, scientific articles, and government data.
04	Silva e Melo (2020)	Experimental research. Four technical visits were carried out between August and November 2018, where all manufacturing stages were monitored and described in detail through direct observation, audiovisual records and dialogue with the producer throughout manufacturing. The acidity (% lactic acid) of the dough was also monitored from its obtaining to the final shaping process (by direct titration with NaOH 0.1 mol/L). Another parameter monitored throughout the process was the temperature of scalding/washing and cooking the dough. Physicochemical, microbiological and cheese production analyses.	Primary sources: interviews with producers and laboratory data; Secondary sources: revision of legislation.
05	Martinelli and Angels (2023)	This is a qualitative study, with data collection through semi-structured interviews with specialists. Case study, with content analysis.	Primary sources: qualitative interviews; Secondary sources:

			review of academic literature and institutional data.
06	Cislaghi and Badaró (2021)	Qualitative research. Case study. This article reports the main actions already carried out by some projects developed on artisanal Colonial cheese from the Southwest of PR, such as the mapping of producers, preparation and publication of didactic materials, qualification actions carried out with producers, description of the production process, water and milk analysis, in addition to the physical-chemical, microbiological and sensory characterization of the cheeses. It presents a brief history of the creation of the Association of Artisanal Cheese Producers of Southwest Paraná (APROSUD) and also describes the legal issues involving the production of artisanal cheeses, as well as the challenges that still need to be faced to legitimize artisanal Colonial cheese from Southwest Paraná.	Primary sources: interviews, laboratory analyses and on-site visits. Secondary sources: historical data and teaching materials.
07	Porto <i>et al.</i> (2022)	Experimental research. This was a case study that evaluated the microbiological quality of brown cottage cheese commercialized in the city of Salinas, MG, and tested the efficiency of different processes with varying levels of adoption of safety practices in the pathogenic microbiota of brown cottage cheese.	Primary sources: laboratory microbiological analyses of experimental and commercial samples. Secondary sources: legislation and quality standards.
08	Silva <i>et al.</i> (2022)	A systematic review of the literature was conducted. To obtain the works, a search was made in the databases of Scielo, <i>Scopus</i> , <i>Web Of Science</i> and Database of Theses and Dissertations (BDTD).	Secondary sources: scientific articles, dissertations and theses reviewed in databases.
09	Ströher <i>et al.</i> (2024)	It presents an evaluation of the good practices applied in an agroindustry producing QAS in this region. On the occasion, the tools of good practices of the agroindustry installed on the property were	Primary sources: technical visits and <i>checklists</i> in certified property.

		evaluated, as well as the milking of the animals and the manufacture of the QAS.	Secondary sources: legislation and technical manuals.
10	Faria and Aveni (2023)	The work explores the legislation in the case of tolerance to the "type", and proposes to bring cases and examples that deal with such tolerance. It is, therefore, a bibliographic and internet research in the search for cases of use of the word "type" in labeling.	Secondary sources: national and international legislation, case analysis, and examples of labels collected online.
11	Ferreira e Costa (2021)	It used the legal-theoretical methodology, as well as deductive reasoning and transdisciplinary bibliographic research addressing reflections that permeate environmental and constitutional law, with an interface in anthropology, in addition to analysis in the legislative field.	Secondary sources: legal texts, legislative analyses and transdisciplinary studies.
12	Goulart and Pinto (2023)	A search was carried out on the Web of <i>Science</i> and <i>Scopus</i> search platforms using the terms "artisanal cheese" and "authorial cheese". Alerts were also received from Google with internet news on these two topics. It was observed that scientific research has as its main theme, when it comes to artisanal and authorial cheeses, the microbiological quality of these foods. The internet news broadcast to the population has as its main focus an event that took place in São Paulo, where the world cheese contest was held.	Secondary sources: data from scientific publications and news alerts categorized and statistically analyzed.
13	Rocha and Caldas (2023)	The methodology used consists of the use of bibliographic research procedures, through physical and virtual collections, with documentary, normative analysis and field survey. In addition, the perceptions obtained from visits to the municipality of Santa Bárbara-BA are added, in order to obtain information about the chosen object of study regarding its representativeness for the place, as well as the processes and technological innovations involved in its manufacture, and the challenges encountered for its recognition as a Geographical Indication (GI).	Primary sources: field survey and visits to local producers; Secondary sources: legislative analysis and institutional publications.

14	Benincá <i>et al.</i> (2020)	It is characterized as a qualitative research with a triangulated, exploratory and descriptive-interpretative study based on interviews with two owners of French agroindustries in the Department of Sarthe, France, in December 2019. The data collection instrument was a semi-structured interview questionnaire with guiding questions.	Primary sources: interviews and <i>on-site</i> observations. Secondary sources: bibliographic review and French and European legislation.
15	Cruz <i>et al.</i> (2020)	Using a qualitative approach, through semi-structured interviews and thematic oral history, it was sought to analyze and understand the social networks developed around the production and consumption of different types of cheeses from Marajó, the impacts on production and marketing, their characteristics considered essential in the maintenance and preservation of their quality, producers' view of changes in the production process, its difficulties, forms of resistance and permanence over time.	Primary data: interviews. Secondary data: scientific and historical literature.
16	Braccini <i>et al.</i> (2022)	The study appropriated a descriptive, exploratory and quantitative approach, as it seeks to reflect on the data recruited, seeking to outline the reality, through an exposition based on works and authors in the area. The data for this study come from a convenience sample of 121 consumers of Colonial Cheese (QC) in Santa Maria, Rio Grande do Sul State, Brazil.	Primary data: structured questionnaires. Secondary data: scientific literature.
17	Souza and Borges (2023)	In the study approach, qualitative research was defined. We studied aspects of the way of making cabacinha cheese, the regionalization and the identity of the artisanal product, especially with a couple of producers from Santa Rita do Araguaia (GO) and with a producer from Alto Araguaia (MT).	Primary data: interviews and field observation. Secondary data: cultural and historical literature.
18	Ströher, Silva and Nunes (2023)	Literature search was conducted in three databases, Google Scholar, <i>Scopus</i> , and <i>Web of Science</i> , using the following keywords: "colonial artisanal cheese" or "good manufacturing practices" or "colonial cheese" "microbiological analysis" using Boolean operators and quotation marks.	Secondary data: scientific articles on microbiological quality and food safety.

19	Silva <i>et al.</i> (2022)	In this study, a descriptive and exploratory research was used, based on a qualitative approach and focus on a case study, with the objective of understanding the challenges for the implementation of the GI of Jaguaribe Curd Cheese in Ceará. For a study of this nature, multiple and varied sources of evidence are needed.	Primary data: semi-structured interviews and direct observation. Secondary data: documentary analysis.
20	Ragazzon and Marconato (2023)	The field research was exploratory (since it aims to bring the researcher closer to the researched object) and descriptive, as it proposes to collect and analyze data, in order to identify whether SUSAF-PR contributed to improve the socioeconomic conditions of cheese producers in the Southwest region of the state.	Primary data: online questionnaires. Secondary data: legislation and technical literature.
21	Silva and Borelli (2020)	The following review presents information on the antagonistic activity of lactic acid bacteria and their ability to ensure the safety and quality of artisanal cheese.	Secondary data: scientific literature on lactic acid bacteria and microbiological safety.
22	Costa <i>et al.</i> (2022)	The work was carried out through a bibliographic review in different indexing databases to collect information on artisanal Minas cheeses. The main electronic databases used were <i>Scopus</i> , <i>Scielo</i> , <i>Science Direct</i> , <i>Web of Science</i> , <i>Wiley Online Library</i> and <i>Google Scholar</i> . The search was carried out using the keywords: "artisanal cheese", " <i>artisanal cheese</i> ", " <i>artisanal Minas cheese</i> ", "pingo", "sano-fermento", "rala", " <i>endogenous starter culture</i> ".	Secondary data: scientific, legislative and historical bases.
23	Pena <i>et al.</i> (2022)	Documentary and bibliographic review, with analysis of the resources for the protection of traditional knowledge in artisanal food production interpreted based on scientific production on the subject, published in the last five years. The resources analyzed in the study were: the registration of intangible assets of IPHAN, under Decree No. 3,551, of August 4, 2000; and the Geographical Indications (GI) granted by the BPTO, with the legal framework of Law No. 9,279, of May 14, 1996.	Secondary data: national legislation and recent scientific productions.

Source: The authors, 2024.

The data described in Table 6 show that of the 23 articles examined, 43.5% were dedicated exclusively to bibliographic or documentary research, using secondary data. This indicates a predominance of approaches based on theoretical review and document analysis. On the other hand, 26.1% of the studies were categorized as experimental research, in which primary data were collected, evidencing an expressive application of practical methods and the direct collection of information. Finally, 30.4% of the articles opted for a qualitative approach, with the collection of primary data through interviews or questionnaires, which highlights the importance of interpretative and exploratory analyses on the topic in question.

This distribution reveals the variety of methodological approaches used in research related to the certification of artisanal cheese. It combines the theoretical robustness of literature reviews with practical and qualitative studies, providing important insights for understanding the phenomenon.

With regard to the objects of study, the analysis addressed the geographic regions investigated in the selected articles. The studies covered a variety of locations, with an emphasis on rural areas involved in artisanal cheese production in Minas Gerais, highlighting the micro-regions of Cerrado and Serra da Canastra, as well as other parts of Brazil that face similar challenges, such as Goiás, Jacaré dos Homens (AL), Jaguaribe (CE), Marajó (PA), Mato Grosso, Nordeste, Rio de Janeiro, Salinas (MG), Southwest of Paraná and São Francisco de Paula (RS). A study was also carried out on cheese production in Le Mans, France. It is noteworthy that eight articles did not specify the region of the objects of study. Table 8 illustrates the objects of study and the regions investigated in each of the selected articles.

Table 8

Objects of study and region researched

No.	Quote	Objects of Study	Region
01	Araújo <i>et al.</i> (2020)	Bibliographic research on artisanal cheeses without defined location.	-
02	Campello <i>et al.</i> (2021)	Bibliographic research, focusing on the municipality of RJ. The objective is to verify the demand for the sale of raw milk and artisanal cheeses, through informal trade; the need to regulate the artisanal cheese market, especially in the state and municipality of Rio de Janeiro and the adherence to inspection	Rio de Janeiro-RJ

		systems by small producers, as a way to mitigate risks to public health.	
03	Azenha e Silva (2021)	Bibliographic research on artisanal cheeses without a defined object of study.	-
04	Silva e Melo (2020)	Macururé cheese has been produced for about 100 years by a single family, in the village of Caititu, located in the city of Jacaré dos Homens, AL.	Jacaré dos Homens-AL
05	Martinelli and Angels (2023)	Artisanal curd cheese for the northeast region.	Northeast
06	Cislaghi and Badaró (2021)	Artisanal Colonial Cheese from the Southwest of PR.	Southwest of PR
07	Porto <i>et al.</i> (2022)	Brown cottage cheese sold in the city of Salinas-MG.	Salinas-MG
08	Silva <i>et al.</i> (2022)	To investigate whether the production of artisanal cheeses meets the requirements established by the legislation in force in Brazil. For this, a systematic review of the literature was carried out.	-
09	Ströher <i>et al.</i> (2024)	A dairy farm located in the municipality of São Francisco de Paula-RS was chosen as the object of investigation for the evaluation of the GAP applied in the rural property and the GMP implemented in the agroindustry.	São Francisco de Paula-RS
10	Faria and Aveni (2023)	The work explores how Brazil faces challenges in the protection of Geographical Indications in light of new international agreements, especially in relation to the current tolerance of products without GIs, but marketed in a misleading way.	-
11	Ferreira e Costa (2021)	This work analyzes the importance of cultural heritage as a way of preserving the identity of a collectivity, focusing on the artisanal production of cheese in the state of Minas Gerais.	Minas Gerais
12	Goulart and Pinto (2023)	This study identifies the main interests of the scientific community and the population in relation to artisanal and authorial cheeses.	-
13	Rocha and Caldas (2023)	The object of study chosen concerns its representativeness for the place, as well as the processes and technological innovations involved in its manufacture, and the challenges encountered for its recognition as a Geographical Indication (GI).	-

14	Benincá <i>et al.</i> (2020)	The work evaluates the perception of cheese producers and veterinary technicians through interviews in Le Mans, in the Department of Sarthe, France, according to the social and sanitary aspects in relation to the production and commercialization of this product.	Le Mans, in the Sarthe department, France
15	Cruz <i>et al.</i> (2020)	It reflects on social networks developed throughout the cheese production system (butter and cream types) in Marajó/PA, Brazil.	Marajó-PA
16	Braccini <i>et al.</i> (2022)	This study explores the level of importance attached to sociocultural aspects, beliefs and preferences, food safety, and state regulation in the purchase of Colonial Cheese (QC).	-
17	Souza and Borges (2023)	It briefly addresses the history of cabacinha cheese, produced in two neighboring states: Goiás and Mato Grosso.	States of Goiás and Mato Grosso
18	Ströher, Silva and Nunes (2023)	It addresses the production and commercialization of colonial artisanal cheeses, with emphasis on microbiological parameters.	-
19	Silva <i>et al.</i> (2022)	It analyzes the process of implementation of the Geographical Indication of Curd Cheese from Jaguaribe-CE, pointing out the role of the agents involved, the main obstacles and challenges that prevent the advancement towards its implementation.	Jaguaribe-CE
20	Ragazzon and Marconato (2023)	To collect and analyze data, in order to identify the contribution of SUSAF-PR to improve the socioeconomic conditions of cheese producers in the Southwest region of the state.	State of Paraná - PR
21	Silva and Borelli (2020)	It is the analysis of the characteristics and benefits of the lactic acid bacteria present in artisanal Minas cheese, especially in relation to its antagonistic activity against pathogenic microorganisms.	Minas Gerais
22	Costa <i>et al.</i> (2022)	To present a literature review, contemplating the main characteristics of the producing regions and the aspects of each cheese produced.	-
23	Pena <i>et al.</i> (2022)	It addresses the issue of the protection and enhancement of cultural elements, which make up a food system, with a specific focus on food products produced under signs of cultural distinction. The article investigates how these foods, elaborated based on ancestral and geolocated knowledge, are perceived	-

		as important alternatives in a global market, where food culture may be becoming homogenized and questionable.

The evaluation of the geographical dispersion of the chosen research shows a significant concentration of studies in certain areas of Brazil, evidencing the importance of the production of handmade cheese in these areas. Figure 2 illustrates in detail the areas analyzed, highlighting the federative units and micro-regions where the investigations took place, making it possible to observe the geographic extent of the research and detect trends in the location of producers and the difficulties encountered to certify artisanal cheese.

Figure 2
Map of the regions studied

Source: The authors, 2024.

The presentation of the regions studied is complemented by an illustrative image (Figure 2), which highlighted the geographical distribution of the objects of study and provided a visual and contextualized synthesis of the areas analyzed by these studies chosen for this research.

4.2 THEORETICAL APPROACHES TO ARTISANAL CHEESE AND THE ARTE SEAL IN THE WORKS INVESTIGATED

This second part of the results presented the theoretical foundations and main works used in the articles participating in this study in order to theoretically know the approach of these articles.

Table 9

Theoretical foundations of the articles studied

No.	Quote	Topics of the theoretical framework
01	Araújo <i>et al.</i> (2020)	Historical data related to cheese production in Brazil are controversial, both in relation to the period and the regions in which this practice was initiated. Minas Gerais was the first to develop its own legislation that enabled the artisanal production of cheeses with raw milk. The artisanal cheese production chain in Brazil has not been adequately regulated for decades, due to scarce, evasive or inefficient legislation. With the update of the Regulation of Industrial and Sanitary Inspection of Products of Animal Origin (Riispoa) (Brazil, 2017) and the regulation of the Arte seal (Brazil, 2018; 2019a), a series of state and municipal standards related to artisanal products, including cheeses, began to be developed and implemented. Theoretical critical foundation on: 1) the main types of artisanal cheeses produced in Brazil and their characteristics, 2) a historical presentation of the standards related to the production and commercialization of Brazilian artisanal cheeses and 3) a critical discussion on the challenges and perspectives for the development of new standards and their potential impacts on identity, quality and harmlessness of these products.
02	Campello <i>et al.</i> (2021)	2.1 Milk production and informal trade 2.2 The artisanal cheese market in Brazil and its regulation 2.3 Regulation of artisanal cheeses in the state of Rio de Janeiro 2.4 Adhesion to inspection seals

08	Silva <i>et al.</i> (2022)	Brazilian legislation for the production of artisanal cheeses. There are several laws regulating production in the country, which undergo constant changes over time in order to ensure a product of excellent quality.
09	Ströher <i>et al.</i> (2024)	The Serrano Artisanal Cheese (QAS) has great economic, social and environmental importance in the northeast region of Rio Grande do Sul (RS), being a bicentennial and traditional product to the point of undergoing few changes over the years. And when adopted, good agricultural practices (GAP) and good manufacturing practices (GMP), together, make artisanal activity safer for consumers of these products. Thus, the GAPs on the property and the GMPs in the cheese factory end up providing refrigerated raw milk and artisanal cheese, respectively of good quality according to regulatory specifications.
10	Faria and Aveni (2023)	Tolerance in Brazilian law to foods that do not use the Geographical Indication seal, but continue to be marketed as long as they are under the nickname of the word "type" added to the name of the legitimate Geographical Indication. Ordinance No. 146 of March 7, 1996 published by the Brazilian Ministry of Agriculture, which regulates the production of cheese in the country, as well as Normative Instruction No. 22 of November 24, 2005, which allows products of animal origin manufactured according to technologies characteristic of different geographical places. In order to obtain products of animal origin with sensory properties similar or similar to those that are typical of certain recognized areas, the name of the product of animal origin must include the expression "type", with letters of the same size, prominence and visibility as those corresponding to the name approved in the regulation in force in the country of consumption, in violation of international treaties.
11	Ferreira e Costa (2021)	The manufacture of artisanal cheeses in Brazil, with emphasis on Minas Gerais, constitutes a valuable intangible cultural heritage, closely linked to

		traditional knowledge and regional identity. This process uses raw milk and manual maturation techniques that have been passed down from generation to generation. In the past, the absence of adequate regulation brought difficulties to the formalization of this practice, leading many producers to operate clandestinely. The evolution of legislation, especially with the introduction of the Art seal and state and federal regulations, sought to balance cultural preservation with sanitary requirements, promoting economic viability and ensuring the continuity of artisanal production.

Source: The authors, 2024.

The concepts and definitions related to artisanal cheeses emerge as a frequent theme in the academic literature, highlighting cheese as an intangible cultural heritage. The manufacture of artisanal cheeses in Brazil, exemplified by the Artisanal Minas Cheese (QMA), represents traditional knowledge, passed down from generation to generation, associated with regional identity and the use of raw milk, in addition to manual techniques for maturation. These activities maintain a deep connection with the local culture, as pointed out by Ferreira and Costa (2021), who underline the cultural and economic importance of cheeses made in Minas Gerais. Another fundamental aspect is legislation and certification, especially the Art Seal. The Industrial and Sanitary Inspection Regulation (RIISPOA) together with the Art Seal marked significant achievements in the regulation of artisanal cheeses, allowing their sale between states without compromising traditional practices.

According to Araújo *et al.* (2020), these regulations brought modernization to the production chain, raising quality and safety. However, research points to the obstacles faced by small producers to adapt to legal requirements without compromising the cultural authenticity of their products.

The Geographical Indication (GI) emerges as a crucial instrument to protect and enhance artisanal cheeses, ensuring their genuineness and connection to specific regions. Examples such as Artisanal Minas Cheese, recognized by IPHAN, demonstrate the positive effect of this certification on the strengthening of local economies and the preservation of traditional know-how (ROCHA; CALDAS, 2023). However, as pointed out by Silva *et al.* (2022), there are still difficulties and challenges in the institutionalization of GIs in Brazil.

Issues related to health and microbiology have been widely debated, focusing on the dangers linked to the consumption of raw milk and contamination by pathogens, such as *Listeria monocytogenes* and *Salmonella*. Research indicates that the adoption of good manufacturing practices (GMP) and good agricultural practices (GAP) is essential to ensure product safety and meet established standards, without compromising artisanal techniques (STRÖHER *et al.*, 2024; PORTO *et al.*, 2022).

In addition, the social and economic effects of artisanal production were highlighted as significant aspects. Family agribusiness has promoted transformations in the rural environment, boosting the local economy and valuing both culturally and territorially handicraft products. Ragazzon and Marconato (2023) point out that the creation of specific regulations for small producers was an important advance to ensure their sustainability and continuity.

4.3 CATEGORIES OF ANALYSIS AND SYNTHESIS OF THE ARTICLES UNDER STUDY

This section covered the analysis categories created from the content covered in the selected articles. It should be noted that many contents are related and the categorization sought to compile the themes involved in the studies, considering the complete content of each article. In all, three broad categories of analysis were created, namely: 1) Geographical Indication (GI), Culture, Regionalism and Appreciation of Brazilian Artisanal Cheeses; 2) Legislation and Regulation and; 3) Physicochemical and Microbiological Characteristics, Good Manufacturing Practices and Food Safety. Table 10 describes the numbers and titles of articles included in each category.

Table 10

Analysis categories created

Category		Article No.	Title

Source: The authors, 2024.

The articles examined were classified into three main categories, which summarize the most common topics in research related to artisanal cheeses in Brazil: (1) Geographical Indication (GI), Culture, Regionalism and Appreciation of Brazilian Artisanal Cheeses; (2) Legislation and Regulation; and (3) Physicochemical and Microbiological Characteristics, Good Manufacturing Practices and Food Safety. The category Geographical Indication (GI), Culture, Regionalism and Appreciation of Brazilian Artisanal Cheeses is the one that contains the largest number of articles. These investigations emphasize the relevance of GI as an instrument to protect and enhance artisanal cheeses, ensuring their authenticity and their connection with specific regions.

In addition, the cultural and economic effects of regional production are discussed, highlighting how traditional knowledge expresses the identity of the producing communities. Objects of study of the selected articles included the curd cheese from Jaguaribe-CE and research on the local culture in the manufacture of cabacinha cheese in Goiás and Mato Grosso.

With regard to Legislation and Regulation, the articles analyze the challenges and progress of legal standards related to the production and sale of artisanal cheeses. The creation of the Art Seal and the regulation of Geographical Indications are considered relevant milestones for the formalization of this sector, although problems such as informality and the difficulty of following regulations persist. This category demonstrates the search for balancing technical and sanitary requirements with cultural preservation, with Minas Artesanal cheese being a significant example in this discussion.

Finally, the section that deals with Physico-Chemical and Microbiological Characteristics, Good Manufacturing Practices and Food Safety focuses on the microbiological safety and physicochemical parameters of artisanal cheeses. The investigations examine the presence of pathogens, such as *L. monocytogenes*, and highlight the relevance of good manufacturing practices (GMP) and agricultural practices (BPA) to ensure the quality and safety of products.

In addition, they address the influence of lactic acid bacteria on the safety and flavor of cheeses, in addition to the particularities of regional products, such as Macururé cheese, produced in Alagoas.

This investigation highlights the emphasis on themes related to cultural appreciation and regulation, while technical-scientific and sanitary issues emerge as a fundamental basis to ensure the quality and sustainability of artisanal production.

Each of these themes was explored independently, aiming to deepen the understanding of the contributions, difficulties and impacts on the scenario of artisanal cheese production in the country. This approach enabled a more detailed investigation of each category, highlighting the subtleties that define research in this area.

4.3.1 Geographical Indication (GI), Culture, Regionalism and Appreciation of Brazilian Artisanal Cheeses

The Geographical Indication (GI) stands out as one of the most relevant mechanisms for the appreciation of artisanal cheeses in Brazil, ensuring their authenticity and link with specific areas. As pointed out by Silva *et al.* (2022), the implementation of the GI faces considerable bureaucratic obstacles, but its potential to leverage the regional economy is indisputable. The study deals with the curd cheese of Jaguaribe-CE, where the certification aims to reinforce the cultural identity and increase the value of the product.

Comparatively, Rocha and Caldas (2023) underline that GI acts as a tool for collective intellectual protection by recognizing regional products for their unique characteristics, as well as the quality linked to the place of origin. The research explores the cottage cheese of Santa Bárbara-BA, illustrating how GI can transform the local economy and preserve traditional knowledge, in addition to facing both technical and institutional challenges.

Souza and Borges (2023) comprehensively address the cultural and regional dimension when studying the production of cabacinha cheese in Goiás and Mato Grosso. The authors emphasize that this product represents an icon of the cultural identity of these locations, reflecting a historical heritage, passed down through the generations. Similarly, Pena *et al.* (2022) emphasize that gastronomic knowledge should be considered an intangible heritage, subject to protection through the Geographical Indication (GI), which strengthens both the culture and the economy of the regions involved.

In addition, the appreciation of artisanal cheeses, by distinctive signs of quality, is a prominent theme. Martinelli and Anjos (2023) investigate the effect of seals, such as the Art Seal and the GI, on curd cheese, pointing out the positive view of experts about the cultural and commercial advantages that these certifications offer. The authors state that such

initiatives not only ensure the protection of products, but also sustain the economic viability of the communities that produce them.

Social networks were identified as an important element in the preservation of production practices. Cruz *et al.* (2020) examine the influence of these platforms on cheesemaking on Marajó Island-PA, highlight how they help to preserve traditions and build trust between producers and consumers. This type of interaction is essential to reinforce the connection between the product and its place of origin.

In addition, studies on regional appreciation emphasize the socioeconomic impact of artisanal cheese production. Ragazzon and Marconato (2023) analyze the transformations resulting from SUSAF-PR in cheese dairies in southwestern Paraná, showing that differentiated regulation promotes local development and protects small producers. Costa *et al.* (2022) carry out a review of Minas Artesanal cheeses, highlighting the importance of certifications in the preservation of traditions and economic strengthening.

Thus, the articles examined show that the Geographical Indication works as an effective tool for the protection and appreciation of artisanal cheeses, uniting cultural, regional and economic dimensions. In addition, this approach proves to be a competent strategy to ensure the sustainability of these traditions and reinforce the identity of the producing communities.

4.3.2 Legislation and Regulation

The category referring to legislation and regulation underlined the relevance of legal standards and certifications, including the Art Seal and the Geographical Indication (GI), for the organization and development of the artisanal cheese market. While the greatest emphasis is on the cultural and economic aspects of artisanal cheese, regulations have played a crucial role in the formalization and growth of the sector. According to Campello *et al.* (2021), the Art Seal has proven to be an essential instrument to enable the commercialization of handicraft products between states, as evidenced in the case of Rio de Janeiro. The study points out that, despite significant achievements, adherence to the Art Seal still faces administrative and bureaucratic obstacles.

A relevant aspect discussed concerns the use of the term "type" on product labels that seek to refer to Geographical Indications (GIs). As noted by Faria and Aveni (2023), this practice can cause confusion among consumers, as it insinuates a connection with the quality

and authenticity of products with GIs, even if they do not meet the strict criteria required for certification.

The study criticizes this approach as an attempt to take advantage of the prestige of GIs, which weakens the valuation of truly certified products and compromises the credibility of the GI protection system in Brazil. Thus, the urgency of more intense control and specific regulations that prohibit the inappropriate use of terms that may deceive the consumer and discredit producers who comply with certification standards is highlighted.

Furthermore, Faria and Aveni (2023) address the legislation that regulates the use of the term, underlining its importance to distinguish products with certification of origin from those that only refer to tradition. This analysis emphasizes the need for stricter control in order to avoid confusion among consumers and ensure the protection of local producers.

Araújo *et al.* (2020) also highlight the evolution of legal norms by outlining a historical overview of Brazilian regulations related to artisanal cheese. The authors point out that, for decades, the sector has faced difficulties due to ambiguous and inconsistent legislation. However, significant advances, such as the Industrial and Sanitary Inspection Regulation (Riispoa) and the Art Seal, have brought significant improvements. Despite this, there are still challenges for small producers to adapt to the standards without compromising the authenticity of their products.

The regulation of Minas Artesanal cheese was addressed by Ferreira and Costa (2021), who emphasize the importance of balancing sanitary requirements with the preservation of traditional practices. The study proposes that legislation be adjusted to take into account regional and cultural particularities, favoring the inclusion of small producers in the formal market.

In addition, Braccini *et al.* (2022) draw attention to the duality between legality and informality in the commercialization of colonial cheeses in southern Brazil. The survey indicates that many producers still face difficulties in complying with legal standards, which limits their presence in the market and decreases their growth potential. This situation is compounded by the lack of institutional support and the complexity of regulations.

The five articles examined demonstrate that, despite the importance of legislation and regulation to ensure the quality and safety of artisanal cheeses, these aspects also impose considerable challenges on small producers. While initiatives such as the Art Seal represent significant progress, there are still opportunities for enhancements that favor greater inclusion and access within the sector.

4.3.3 Physicochemical and Microbiological Characteristics, Good Manufacturing Practices and Food Safety

The physicochemical and microbiological properties of artisanal cheeses are essential to ensure food safety and product quality. As presented by Porto *et al.* (2022), the brown cottage cheese from Salinas, MG, faces challenges related to microbiological contamination, especially with pathogens such as *Salmonella sp.* and *coagulase-positive staphylococci*. This study highlights the need to monitor these conditions in order to ensure the safety of the product.

Similarly, Silva and Melo (2020) emphasize the physicochemical and microbiological characteristics of Macuré cheese, produced in Jacaré dos Homens, AL. The research highlighted the importance of adopting good manufacturing practices to reduce the risks of contamination and maintain the sensory and nutritional qualities of the cheese.

Within the scope of good manufacturing and agricultural practices, Ströher *et al.* (2024) highlight that the implementation of GMP and BPA in an agroindustry that produces Serrano Cheese (QAS) in Rio Grande do Sul resulted in notable improvements in product quality and safety. These protocols ensured high-quality refrigerated raw milk, in addition to promoting the sustainability of artisanal practices in the region.

In addition, research has examined the effect of lactic acid bacteria on the microbiological safety of cheeses. As mentioned by Silva and Borelli (2020), these bacteria have antagonistic properties that fight pathogens and favor both the maturation and quality of Minas Artesanal cheeses. These compounds are essential to ensure the safety of products and enhance their sensory characteristics.

Finally, Silva *et al.* (2022) conducted a systematic analysis of best practices in artisanal cheese production, highlighting the importance of regulations that ensure product quality and reduce public health risks. The implementation of strict protocols has been linked to a substantial drop in contamination and increased competitiveness in the market.

These researches show that the combination of good manufacturing practices, microbiological monitoring and control of physicochemical characteristics are essential to ensure the quality and safety of artisanal cheeses. In addition, these measures help to maintain the cultural authenticity of the products and strengthen consumer confidence.

5 FINAL CONSIDERATIONS

The conclusions were formulated based on the objectives defined in this study, taking into account the results of the systematic review of the literature regarding the certification of Artisanal Cheese and the Art Seal. The comprehensive evaluation of the selected articles shows that most of the publications are in journals in categories A4 and B1, followed by categories B2 and C. The trend of publications over time shows that, even without a specific time frame, studies on the certification of artisanal cheese and the Art Seal began to grow from 2020 onwards, with 2023 presenting the highest number of publications among the articles participating in this study. The data showed that bibliographic and documentary research, based on secondary sources, were the most used methods in the articles examined. Qualitative research, which included interviews, and experimental studies also showed relevance.

The research themes cover several regions of Brazil, with emphasis on Minas Gerais, Paraná and areas of the Northeast. The main theoretical bases discussed the cultural importance of artisanal cheese, legal and regulatory difficulties, as well as good manufacturing practices and microbiological safety. These elements emphasize the relevance of certification in strengthening and protecting traditional knowledge associated with production.

Three categories of analysis were established to better organize the related subjects: (1) Geographical Indication (GI), Culture, Regionalism and Appreciation of Brazilian Artisanal Cheeses; (2) Legislation and Regulation; and (3) Physicochemical and Microbiological Characteristics, Good Manufacturing Practices and Food Safety. The distribution of studies among these categories was balanced, with a slight predominance of the first two.

In category (1), it was possible to conclude that the Geographical Indication plays a crucial role in the appreciation of artisanal cheeses, ensuring their authenticity and promoting the preservation of local traditions, in addition to strengthening the economies of the regions.

Category (2) revealed that, although the regulation has advanced with initiatives such as the Art Seal, there are still obstacles for small producers, who face difficulties in complying with the standards without compromising the authenticity of their products.

Finally, category (3) showed that the adoption of good manufacturing and agricultural practices, combined with microbiological control, are essential to ensure the quality and food safety of artisanal cheeses, contributing to greater competitiveness in the market.

The considerations on the certification of Artisanal Cheese and the Art Seal allowed an in-depth understanding of the theme, highlighting the cultural, economic and regulatory relevance linked to this practice. Moreover, this research offers significant practical contributions, particularly with regard to the consequences for public policy makers and policymakers. The evaluation highlights the need for actions that simplify access to certification, reduce bureaucratic obstacles, and provide technical and financial assistance to smallholder farmers. Likewise, the considerations presented can contribute to the creation of more efficient public policies, ensuring both the recognition of artisanal products and food security and competitiveness in the market.

The present study found limitations, such as the scarcity of comprehensive primary data, the dependence on secondary sources, and the concentration of research in certain regions of Brazil.

It is recommended for future research to explore how certification affects the view of consumers and to analyze the feasibility of modifications in regulatory rules that promote the insertion of small producers in the formal market. In addition, the evaluation of the export of certified artisanal cheeses can be vital to enhance the economic effect of this practice.

It is also suggested to expand the research universe through access to global databases and the execution of studies in other languages, particularly in nations with a tradition in the manufacture and certification of artisanal cheeses. In addition, future research may focus on primary studies, such as interviews with producers and consumers, experimental evaluations of the quality of certified cheeses, and case studies in regions with varying levels of regulation. The application of comparative methods between the effects of certification in Brazil and in other nations can also help in a more complete understanding of the problem.

ABSTRACT

This study aimed to evaluate the pathological manifestations and conservation status of four reinforced concrete viaducts in the Municipality of Luanda, aged over 21 years. The methodology was based on detailed visual inspections and the application of the DNIT evaluation method, which assigns scores from 1 to 5 to structural and non-structural elements. The results indicated that all viaducts received a final score of 3, corresponding to "apparently good stability conditions". The main pathologies identified include cracking, concrete delamination, exposure of reinforcements, degradation of expansion joints, deficiencies in signaling and drainage, among others. It is concluded that, although the viaducts are in acceptable conditions, preventive and corrective maintenance interventions are necessary to ensure their durability and safety. The study reinforces the importance of patrimonial management systems for special works of art, aligning with international best practices.

Keywords: Viaducts. Reinforced Concrete. Pathological Manifestations. Inspection. Conservation Status. DNIT Method.

RESUMO

O presente estudo teve como objetivo avaliar as manifestações patológicas e o estado de conservação de quatro viadutos em betão armado no Município de Luanda, com idade superior a 21 anos. A metodologia baseou-se em inspeções visuais detalhadas e na aplicação do método de avaliação do DNIT, que atribui notas de 1 a 5 aos elementos estruturais e não estruturais. Os resultados indicaram que todos os viadutos apresentaram nota final de classificação 3, correspondente a "condições de estabilidade boa

aparentemente". As principais patologias identificadas incluem fissuração, delaminação do betão, exposição de armaduras, degradação de juntas de dilatação, deficiências na sinalização e drenagem, entre outras. Conclui-se que, embora os viadutos se encontrem em condições aceitáveis, são necessárias intervenções de manutenção preventiva e corretiva para garantir a sua durabilidade e segurança. O estudo reforça a importância de sistemas de gestão patrimonial para obras de arte especiais, alinhando-se com as melhores práticas internacionais.

RESUMEN

Este estudio tuvo como objetivo evaluar las manifestaciones patológicas y el estado de conservación de cuatro viaductos de hormigón armado en el Municipio de Luanda, con más de 21 años de antigüedad. La metodología se basó en inspecciones visuales detalladas y en la aplicación del método de evaluación del DNIT, que asigna puntuaciones de 1 a 5 a los elementos estructurales y no estructurales. Los resultados indicaron que todos los viaductos obtuvieron una puntuación final de 3, correspondiente a "condiciones de estabilidad aparentemente buenas". Las principales patologías identificadas incluyen fisuras, deslaminación del hormigón, exposición de armaduras, degradación de juntas de dilatación, deficiencias en señalización y drenaje, entre otras. Se concluye que, aunque los viaductos se encuentran en condiciones aceptables, son necesarias intervenciones de mantenimiento preventivo y correctivo para garantizar su durabilidad y seguridad. El estudio refuerza la importancia de los sistemas de gestión patrimonial para obras de arte especiales, alineándose con las mejores prácticas internacionales.

1 INTRODUCTION

Special engineering works (SSOs), such as bridges and viaducts, are vital elements in the transport infrastructure of any country, ensuring regional connectivity and socio-economic development (DEBS & TAKEYA, 2007). In the Municipality of Luanda, the rapid post-conflict urban growth, from 2002 onwards, resulted in the accelerated construction of a considerable park of these infrastructures. Many of them, with more than two decades of service, are beginning to show signs of degradation, highlighting the need for effective asset management, based on periodic inspections and proper maintenance (JESUS, 2015).

The degradation of reinforced concrete structures is a complex process, influenced by intrinsic (quality of materials, construction details) and extrinsic (environmental actions, overloads, maintenance) factors (HELENE, 1993). Systematic inspection is, therefore, the fundamental tool for diagnosing the real state of these works, allowing the early identification of pathologies and the programming of interventions (DNIT, 2004; RYALL, 2010).

In this context, this article presents a detailed evaluation of four reinforced concrete viaducts located in Luanda, Angola. The study aims to: (i) identify and characterize the main pathological manifestations; (ii) apply the evaluation method proposed by DNIT (2004) to classify the conservation status; and (iii) discuss the probable causes of the pathologies and propose mitigating measures, contributing to the preservation of the existing heritage and the safety of users.

2 THEORETICAL FRAMEWORK

2.1 PATHOLOGIES IN REINFORCED CONCRETE STRUCTURES

The pathological manifestations in reinforced concrete structures can be classified according to their origin in: defects in design, materials, execution and use (SOUSA & RIPPER, 1998 apud GIOVANNETTI, 2014). For bridges and viaducts, the combined action of cyclic loads, aggressive environmental agents (such as chlorides from salt spray or anti-ice) and carbonation of concrete are the main deterioration mechanisms, often culminating in reinforcement corrosion (MEHTA & MONTEIRO, 2014).

Corrosion is an electrochemical process that causes the expansion of the volume of the steel, generating internal stresses that lead to cracking, peeling and, finally, delamination of the covering concrete. This phenomenon, in addition to compromising aesthetics and durability, significantly reduces the resistant capacity of the cross-section of structural elements (ANDRADE, 1993).

2.2 INSPECTION AND EVALUATION OF BRIDGES AND VIADUCTS

Inspection is defined as a set of technical procedures carried out according to prior planning, which provides information about the work at a given time (GIOVANNETTI, 2014). The DNIT Road Bridge Inspection Manual (2004) establishes a robust methodology, classifying inspections as: cadastral, routine, special, extraordinary and intermediate.

The DNIT evaluation method is based on the attribution of grades (from 1 to 5) for each component element of the work, considering the severity and extent of the pathologies. The final grade of the structure corresponds to the lowest grade assigned to one of its elements with a structural function, adopting a conservative approach that prioritizes safety (DNIT, 2004). This system allows an objective quantification of the conservation status, facilitating the prioritization of interventions and the allocation of resources. Similar systems are used internationally, as proposed by the COST 345 report (2007) in Europe and the Bridge Inspection Manual (BIRM) in the USA.

3 METHODOLOGY

The research is characterized as applied, with a qualitative-quantitative approach and exploratory-descriptive objectives (SILVA & MENEZES, 2005). The multiple case study was conducted on four viaducts (OAE) built in 2001, located in the Municipality of Luanda, Angola, and aged over 21 years at the time of inspection (2023):

- OAE 1: 4 de Fevereiro International Airport Viaduct
- OAE 2: Cassenda Viaduct
- OAE 3: Zamba 2 Viaduct
- OAE 4: Underpass of the Portuguese Embassy

The selection of the sample was based on the criterion of homogeneity in terms of age and construction material (reinforced concrete), allowing a comparative analysis of the degradation patterns.

The detailed visual inspection, in line with the procedures for a "Special Inspection" according to the DNIT (2004), was carried out with equipment that included a digital camera, drone for access to hard-to-reach areas, a tape measure, a laser meter and a fissurometer. The following components were systematically evaluated:

- *Carriageway and platform elements*: accesses, expansion joints, protective barriers (New Jersey), guardrails, wheel guards, drainage devices, signaling and lighting.
- *Superstructure*: support equipment (neoprene), deck and public pipes.

- *Mesostructure*: wall pillars.
- *Infrastructure*: abutments and slope protection.

Each element was classified with a score from 1 to 5, according to the severity and extent of the pathologies observed, following the scale of the DNIT (2004):

- 5 (Excellent): No or insignificant defects.
- 4 (Good): Minor defects, no significant affectation.
- 3 (Regular): Moderate defects, requiring medium-term intervention.
- 2 (Poor): Serious defects, requiring priority intervention.
- 1 (Very Poor): Critical defects, with imminent risk of collapse.

The final grade of the work corresponded to the lowest grade attributed to one of its elements with a structural function, ensuring a conservative and safe evaluation.

4 RESULTS AND DISCUSSIONS

4.1 CHARACTERIZATION OF THE MAIN PATHOLOGICAL MANIFESTATIONS

The detailed inspection revealed a consistent pattern of pathologies on the four viaducts, indicating systemic problems related to environmental exposure, the quality of execution and, above all, the lack of scheduled maintenance. The most significant manifestations were:

- *Runway*: Widespread presence of sinking, exudation, slipping and inadequate punctual repairs (patches), which compromise the comfort and safety of the roll. These defects are often associated with compaction problems of the access embankment and the degradation of the pavement layers (Figure 1a).
- *Expansion joints*: Elastomer and steel monobloc joints showed debris accumulation, loss of sealing capacity, and edge damage (Figure 1b). This situation compromises watertightness, allowing the infiltration of water and aggressive agents on the support devices and lower structural elements, a problem widely documented in the literature (VITÓRIO, 2002).
- *Safety and security elements*: The New Jersey barriers, metal guardrails, and wheel guards exhibited cracking, delamination of the concrete, exposure and severe corrosion of the reinforcements, and deteriorated paint (Figures 1c and 1d). Corrosion of reinforcement, triggered by the carbonation of concrete and/or the penetration of chlorides, is the predominant pathological mechanism (HELENE, 1993).

- *Signage and lighting:* There was a near absence or severe degradation of vertical and horizontal signage, as well as public lighting. This condition poses a high risk to road safety, especially at night or in adverse weather conditions.
- *Structural Elements:* In the pillars and abutments, cracking, peeling of the concrete, dark spots due to humidity and, in some cases, the presence of efflorescence were identified (Figure 1e). The misuse of infrastructure, such as the occurrence of physiological needs at the base of the pillars, introduces aggressive chemical agents that accelerate degradation.

Figure 1

Examples of pathological manifestations identified: (a) Pans and sinkings in the roadway (OAE 4); (b) Damaged expansion joint (OAE 1); (c) Wheel guard with severe reinforcement corrosion (OAE 2); (d) New Jersey Barrier (OAE 3); (e) Cracking and peeling of concrete in a column (SO 1)

Bad patch and/or pans

(a) Pans and sinks on the raceway (OAE 4)

Sags

Stormwater runoff

Absence of clamping sockets and slit in the finial between the joint and the transition layer

(b) Damaged expansion joint (OAE 1)

Exposure and corrosion of reinforcements Partial disintegration

(c) Wheel guard with severe reinforcement corrosion (OAE 2)

(d) Delaminated New Jersey Barrier (OAE 3)

(e) Cracking and peeling of concrete in a column (SO 1)

Source: Author (2025).

4.2 EVALUATION AND CLASSIFICATION BY THE DNIT METHOD

The application of the evaluation method resulted in the attribution of the final grade 3 (Regular) to all the viaducts studied. Table 1 summarizes the classification by main component, showing the homogeneity of the conservation status of the sampled park.

Table 1

Classification of viaducts by main structural component

Component	OAE 1	OAE 2	OAE 3	OAE 4
Runway and platform	3	3	3	3
Superstructure	3	3	3	3
Mesostructure (Columns)	3	3	3	3
Infrastructure (Meetings)	3	3	3	3
Final Note of the Work	3	3	3	3

Source: Author (2025).

4.3 CRITICAL DISCUSSION OF RESULTS

The uniformity in the final classification (Note 3) reflects not only the constructive and age similarity of the viaducts, but also the exposure to analogous environmental and traffic conditions. The "Regular" grade indicates that the structures still have apparent global stability, but have a moderate state of degradation that, if not stopped, will progress in an accelerated way, and may evolve to "Bad" or "Very Bad" conditions in a short period of time (JESUS, 2015).

The pathologies observed are, for the most part, the consequence of a combination of factors:

1. *Deficiencies in the Execution Phase*: The poor vibration of the concrete, the insufficient covering of the reinforcements and the inadequate construction details, identified in various elements (e.g., wheel guards), are failures at the origin that compromise the long-term durability (HELENE, 1993).
2. *Absence of Preventive Maintenance*: The lack of routine inspections and conservation interventions, such as cleaning joints and drains, applying protective paints, and punctual repairs, allowed small defects to evolve into significant pathologies. This is perhaps the most critical cause identified, and it is a common problem in contexts where wealth management is not fully implemented (GIOVANNETTI, 2014).

3. *Environmental and Exploration Actions*: Exposure to the tropical climate, heavy traffic and, possibly, the circulation of vehicles with loads higher than those foreseen in the project, contributed to the acceleration of the fatigue process and degradation of materials.

The case study corroborates Reis' (2006) view that intuition in design should always be accompanied by strict supervision in execution and active management during the exploration phase. The situation found in Luanda is a warning of the urgent need to implement a management system for OAE, as recommended by DNIT (2004) and authors such as Ryall (2010), which allows a systematic control of the state of these critical infrastructures.

5 CONCLUSION

The present study allowed us to conclude that the four reinforced concrete viaducts in the Municipality of Luanda, with more than 21 years of service, have a state of conservation classified as "Regular" (Note 3) according to the DNIT method. This condition is characterized by the generalized presence of moderate pathological manifestations, which do not compromise global stability imminently, but which signal the urgent need for maintenance interventions.

The application of DNIT's inspection and evaluation methodology proved to be an effective and practical tool for the objective quantification of conservation status, allowing the prioritization of interventions based on technical criteria.

As recommendations, it is proposed:

- *Immediate Interventions*: Execution of corrective maintenance on the most critical elements, namely: cleaning and replacement of expansion joints; repair and corrosion protection of guardrails and wheel guardrails; and repair of drainage and signaling systems.
- *Medium and Long Term Management*: Implementation of a permanent program of routine (biannual) and special (five-yearly) inspections, using a property management system (e.g., specific software) for data storage and evolutionary analysis.
- *Future Research*: Conducting non-destructive tests (e.g., sclerometry, potentiostat) for a more accurate quantification of the strength of the concrete and the corrosion state of the reinforcements, complementing the visual inspections.

The preservation of this infrastructural heritage is crucial not only for the safety of users, but also for the economic sustainability of Luanda, ensuring the flow of traffic and avoiding costs associated with deep repairs or premature reconstructions in the future.

ACKNOWLEDGMENT

We thank the Integrated Center for Public Security (CISP) for the logistical support, and the Administration of the Municipality of Luanda for access to the works of art studied.

José Paulo Kai¹

ABSTRACT

This article analyzes the Architecture, Engineering, Construction, and Operation (AECO) Industry and the development of infrastructures in Africa, identifying the main challenges and opportunities related to the sustainable transformation of the sector. The research assumes that infrastructure is the foundation of economic and social progress, being essential for competitiveness and quality of life. However, the African continent faces a severe structural deficit across all subsectors—transport, energy, water, sanitation, telecommunications, and housing—which limits its productive integration and ability to attract foreign direct investment. The study is based on documentary and descriptive analysis, complemented by data from international organizations such as the World Bank, the African Development Bank (AfDB), the UN, and Deloitte, to understand the dynamics of financing, innovation, and sustainability in the AECO industry within the African context. The results show that the infrastructure deficit reduces Africa's economic growth by around 2% per year and company productivity by up to 40%, reflecting technological and financial dependence on external sources. Conversely, significant opportunities emerge from construction digitalization, circular economy principles, the use of local materials, and energy transition. It concludes that integrated public policies, combined with technical capacity building and technological innovation, are crucial to boost the AECO sector as a driver of sustainable development in Africa.

Keywords: AECO Industry. Infrastructure. Africa. Sustainability. Circular Economy.

RESUMO

O presente artigo analisa a Indústria da Arquitetura, Engenharia, Construção e Operação (AECO) e o desenvolvimento de infraestruturas em África, identificando os principais desafios e oportunidades associados à transformação sustentável do setor. A investigação parte da premissa de que a infraestrutura é o alicerce do progresso económico e social, sendo indispensável à competitividade e à qualidade de vida das populações. No entanto, o continente africano enfrenta um défice estrutural acentuado em todos os subsectores — transportes, energia, água, saneamento, telecomunicações e habitação — o que limita a sua integração produtiva e a sua capacidade de atrair investimento direto estrangeiro. O estudo baseia-se numa análise documental e descritiva, complementada por dados de organismos internacionais como o Banco Mundial, o Banco Africano de Desenvolvimento (AfDB), a ONU e a Deloitte, para compreender as dinâmicas de financiamento, inovação e sustentabilidade

¹ Dr. in Structural Mechanics. Universidade Agostinho Neto (FEUAN). E-mail: jose.kai@uan.ao
Orcid: <https://orcid.org/0009-0006-3255-9900>

da Indústria AECO no contexto africano. Os resultados demonstram que o défice de infraestrutura reduz o crescimento económico do continente em cerca de 2% ao ano e a produtividade das empresas até 40%, refletindo-se numa dependência tecnológica e financeira externa. Por outro lado, emergem oportunidades significativas associadas à digitalização da construção, à economia circular, ao uso de materiais locais e à transição energética. Conclui-se que a implementação de políticas públicas integradas, associadas à capacitação técnica e à inovação tecnológica, é fundamental para impulsionar o setor AECO como motor do desenvolvimento sustentável africano.

Palavras-chave: Indústria AECO. Infraestruturas. África. Sustentabilidade. Economia Circular.

RESUMEN

Este artículo analiza la Industria de Arquitectura, Ingeniería, Construcción y Operación (AECO) y el desarrollo de infraestructuras en África, identificando los principales desafíos y oportunidades relacionados con la transformación sostenible del sector. La investigación parte del supuesto de que la infraestructura constituye la base del progreso económico y social, siendo esencial para la competitividad y la calidad de vida. Sin embargo, el continente africano enfrenta un grave déficit estructural en todos los subsectores —transporte, energía, agua, saneamiento, telecomunicaciones y vivienda— que limita su integración productiva y su capacidad para atraer inversión extranjera directa. El estudio se basa en un análisis documental y descriptivo, complementado con datos de organismos internacionales como el Banco Mundial, el Banco Africano de Desarrollo (AfDB), la ONU y Deloitte, para comprender las dinámicas de financiación, innovación y sostenibilidad de la industria AECO en el contexto africano. Los resultados muestran que el déficit de infraestructura reduce el crecimiento económico del continente en aproximadamente un 2% anual y la productividad empresarial hasta un 40%, reflejando una dependencia tecnológica y financiera externa. Por otro lado, surgen oportunidades relevantes derivadas de la digitalización de la construcción, la economía circular, el uso de materiales locales y la transición energética. Se concluye que la implementación de políticas públicas integradas, junto con la capacitación técnica y la innovación tecnológica, es fundamental para impulsar el sector AECO como motor del desarrollo sostenible africano.

Palabras clave: AECO. Infraestructuras. África. Sostenibilidad. Economía Circular.

1 INTRODUCTION

Infrastructure development is one of the key pillars for sustainable economic growth and the reduction of social inequalities in any region of the world. In the African context, the issue acquires particular relevance, given the magnitude of the structural deficit that affects essential sectors such as energy, transport, water supply, sanitation, telecommunications and housing. The Architecture, Engineering, Construction and Operation (AECO) industry plays, in this sense, a strategic role as a vector of economic transformation and social modernization, as it materializes the physical infrastructure on which the continent's productivity, mobility and connectivity are based.

According to the African Development Bank (AfDB, 2023), the annual infrastructure financing gap in Africa is estimated at between US\$68 and US\$108 billion, reflecting a historical gap that limits the competitiveness and well-being of populations. The World Bank (2022) reinforces that the low quality of infrastructure reduces the continent's economic growth by about 2 percentage points per year, and decreases business productivity by up to 40%, becoming one of the biggest obstacles to industrialization and regional integration. This reality is compounded by rapid population growth — Africa's population is expected to double by 2050 — which puts increased pressure on already saturated urban systems and natural resources.

AEC Industry, as a multidisciplinary field that integrates the planning, design, construction, operation and maintenance of physical assets, is both part of the problem and part of the solution. On the one hand, the sector is responsible for about 40% of global carbon emissions and the consumption of approximately 50% of the planet's natural resources (UNEP, 2022); on the other hand, it is an essential engine of the economy, generating millions of direct and indirect jobs and promoting technological innovation and industrialization. The need for a transition to sustainable practices, based on principles of circular economy, digitalization and climate resilience, is today recognized as a strategic imperative for the future of African construction.

The global context of energy and technological transformation directly influences the prospects of the AEC sector in Africa. The implementation of decarbonization policies, the emergence of digital twins, Building Information Modeling (BIM) and Smart Infrastructure solutions create unprecedented opportunities to overcome historical limitations in productivity, transparency and efficiency. However, the adoption of these technologies faces

significant challenges related to the initial cost, the lack of standardization, the shortage of skilled labor, and the insufficiency of integrated public policies.

On the socio-economic front, the fragility of Africa's infrastructure translates into persistent inequalities. Data from the United Nations (UN, 2023) indicate that only 38% of the African population has access to electricity, less than 10% to the internet, and only a quarter of the continental road network is paved. These figures illustrate the urgency of structural investment and infrastructure management policies that combine technological innovation with environmental sustainability and social inclusion.

Thus, understanding the challenges and opportunities of the AEC Industry in Africa is essential to outline sustainable development strategies that unite economic growth, social equity and environmental protection. The approach of this study aims to contribute to the academic and technical debate on how to structure and operationalize policies, technologies and management models capable of transforming the African infrastructure deficit into an engine of development.

Thus, this article aims to critically analyze the challenges and opportunities of the AEC Industry in the context of African infrastructure, highlighting the dynamics of sustainability, innovation and financing. As specific objectives, it is intended to:

- a) to identify the main structural and institutional constraints that condition the AEC sector on the African continent;
- b) examine emerging trends related to circular economy, digitalisation and climate resilience;
- c) to propose strategic lines for strengthening the technical and technological capacity of African infrastructures.

2 THEORETICAL FRAMEWORK

The theoretical framework is structured around four fundamental axes that underpin the analysis of AEC Industry and infrastructure in Africa: (i) the conceptual framework of AEC Industry and its relationship with sustainable development; (ii) the structural deficiencies of the African continent in the field of infrastructure; (iii) the need to transition to a circular and low-carbon economy; and (iv) the incorporation of digital and smart technologies as catalysts for efficiency and innovation.

2.1 AEC INDUSTRY AND SUSTAINABLE DEVELOPMENT

The AEC (Architecture, Engineering, Construction and Operation) industry covers the entire life cycle of buildings – from design and planning to the execution, operation, maintenance and decommissioning of infrastructures. It is an interdisciplinary sector, which integrates the domains of civil engineering, architecture, economics, management and technology, playing a vital role in urban and regional development (Andrade & Silva, 2020).

Contemporary literature recognizes that the construction sector is both one of the largest global economic engines and one of the main emitters of greenhouse gases. According to the United Nations Environment Programme (UNEP, 2022), the built environment is responsible for about 37% of global CO₂ emissions and consumes approximately 36% of the world's final energy. In Africa, although the level of industrialization is still low, the trend of accelerated urbanization — which is expected to reach 60% by 2050 — puts unprecedented pressure on building and infrastructure systems (AfDB, 2023).

The concept of sustainable development, enshrined in the Brundtland Report (World Commission on Environment and Development, 1987), states that economic progress must meet present needs without compromising the capacity of future generations. Applied to the AEC sector, this implies adopting construction practices that minimize the consumption of non-renewable resources, reduce waste, promote energy efficiency, and prioritize the life cycle of materials and buildings.

According to Gibb and Isack (2019), the transition to a sustainable construction model requires "structural changes in the processes of design, planning and execution of works, including digital integration and the circular economy as guiding principles of the construction value chain".

In this way, the AEC Industry in Africa presents itself as a strategic vector for the achievement of the United Nations Sustainable Development Goals (SDGs), especially SDG 9 (Industry, Innovation and Infrastructure), SDG 11 (Sustainable Cities and Communities) and SDG 13 (Climate Action).

2.2 INFRASTRUCTURE SHORTAGES IN AFRICA

Africa's infrastructure deficit is one of the main obstacles to economic growth and regional integration. According to World Bank estimates (2022), only 38% of the African population has access to electricity, less than 10% to the internet, and only 25% of the continental road network is paved. The cost of infrastructural inefficiency translates into an

average loss of 2% of annual GDP and a reduction of up to 40% in business productivity (World Bank, 2022).

The African Development Bank (AfDB, 2023) estimates that US\$93 billion per year would be needed over the next decade to address infrastructure deficiencies in sub-Saharan Africa. Of this total, US\$ 60 billion is earmarked for the construction of new infrastructure and US\$ 30 billion for the maintenance of existing ones. The following table summarizes the main sectoral shortcomings:

Table 1

Top infrastructure shortages in Africa (2023)

Sector	Current Situation	Economic and Social Impact
Electrical energy	38% population access	Low industrialization and limitations to productivity
Water and sanitation	30% adequate coverage	Public health problems and regional inequalities
Road transport	25% of paved roads	Increases logistics costs by 30–40%
Telecommunications	<10% internet penetration	Limits innovation and digital inclusion
Urban housing	50 million units in deficit	Informal sprawl and urban degradation

Source: World Bank (2022); AfDB (2023); UN-Habitat (2022).

Infrastructural fragility is linked to multiple factors, including:

- a) excessive dependence on external financing;
- b) absence of maintenance and preventive rehabilitation policies;
- c) insufficient regional integration and logistics; and
- d) lack of technical and governance skills.

In addition, the infrastructure deficit exacerbates the continent's climate vulnerability. Climate change increases the frequency of floods, droughts, and coastal erosion, directly affecting energy, road, and water infrastructure (IPCC, 2022). Thus, resilient and sustainable construction emerges as a priority need.

2.3 CIRCULAR ECONOMY AND DECARBONIZATION

The traditional model of construction — linear, resource- and emissions-intensive — is unsustainable in the long term. The transition to a circular economy proposes a systemic approach based on three principles: reduce, reuse and recycle (Ellen MacArthur Foundation, 2021). In AEC Industry, this translates into the design of buildings and infrastructures that

maximize durability, allow dismantling and incorporate recyclable materials.

According to Deloitte (2022), the construction industry is responsible for 40% of global solid waste and 12% of the world's drinking water consumption. In Africa, where waste management systems are fragile, this statistic is critical. Embedding circular practices – such as the use of low-impact, local materials, recycling of construction waste and modular production – can reduce the total life-cycle cost of infrastructure by up to 30% (UNEP, 2022).

The concept of circular construction also involves the integration of Environmental Performance Indicators (PPEs) in the planning and operation of assets. Emerging examples include the use of ecological blocks produced from recycled plastic waste, as in the experience of the company Nelplast, in Ghana, whose products are 30% cheaper and more durable than conventional ones, in addition to promoting social inclusion and reducing emissions (Economic Forum, 2022).

Overall, the targets of carbon neutrality by 2050 put the AEC sector under pressure to adopt low-carbon materials, renewable energies and digitalised processes that optimise energy efficiency. The concept of green and resilient infrastructure therefore becomes a central element of African competitiveness.

2.4 DIGITALIZATION AND TECHNOLOGICAL INNOVATION

Digitalization is recognized as the main driver of transformation of the AEC Industry in the 21st century. Technologies such as Building Information Modeling (BIM), Digital Twins, Internet of Things (IoT) and Artificial Intelligence (AI) are redefining the planning, construction and management of infrastructures on a global scale (KPMG, 2021).

The McKinsey Global Institute (2020) estimates that the adoption of digital technologies can increase the productivity of the construction sector by up to 60% and reduce design and operating costs by between 10% and 20%. In Africa, this transformation is still in its infancy, but with high potential, especially in countries that invest in national BIM and Smart Infrastructure strategies.

The integration of digital platforms allows the management of the life cycle of assets, optimizing maintenance costs, safety and structural performance. In addition, the use of drones, laser scanners, sensors, and infrared thermography has revolutionized the inspection and monitoring of bridges, roads, and buildings, increasing the reliability of engineering decisions.

The African Development Bank (2024) underlines that the digital transition in

construction is an essential condition for increasing transparency, reducing corruption and improving public governance in the sector. The combination of technological innovation and environmental sustainability thus forms the new paradigm of African infrastructure development.

3 METHODOLOGY

The methodology adopted in this study aims to ensure the scientific consistency and replicability of the results, based on principles of applied research and interdisciplinary approach. The analysis of AEC Industry and infrastructure in Africa requires a methodological framework that articulates economic, technological, environmental and institutional dimensions, in view of the systemic complexity of the topic.

3.1 TYPE AND NATURE OF RESEARCH

This is a qualitative and quantitative research (mixed method), with descriptive, exploratory and analytical-comparative characteristics. The qualitative approach allowed us to understand the political-economic and institutional contexts of African infrastructure, while the quantitative approach provided empirical support through statistical data from recognized sources.

According to Gil (2019), descriptive research seeks to "describe the characteristics of a given phenomenon or the relationship between variables", and is suitable for studies in which it is intended to identify causes and consequences of a complex reality. In this article, the reality analysed is the current state of AEC infrastructure and industry on the African continent, as well as the prospects for technological and sustainable evolution.

The research also assumes a bibliographic and documentary character, based on the critical review of reports, scientific articles and databases of international organizations, including:

- African Development Bank (AfDB);
- World Bank;
- United Nations (UN and UNEP);
- Deloitte, McKinsey, KPMG and OECD;
- UN-Habitat;
- Technical reports from African engineering and construction institutions.

3.2 METHODOLOGICAL PROCEDURES

The procedures adopted comprised four main steps:

- a) *Bibliographic and documentary survey*: A systematic analysis of the academic and technical literature on AEC Industry, infrastructure development and sustainability in Africa was carried out. Sources included databases such as Scopus, ScienceDirect, SpringerLink and African Journals Online, as well as public policy documents and sector performance reports.
- b) *Secondary data analysis*: Statistical data on macroeconomic indicators, levels of access to basic services, investment volumes, and environmental performance indicators were compiled and interpreted. The integration of data from different bodies allowed a comparative and transversal view of the continent.
- c) *Analytical structuring*: A thematic analysis matrix with three central axes — Structural Challenges, Strategic Opportunities and Technological Trends — was used, which served as the basis for the critical synthesis presented in the Results and Discussion section.
- d) *Conceptual validation*: Source triangulation was employed to ensure the coherence and reliability of the findings, as recommended by Yin (2021) in studies of an interpretative nature.

3.3 UNIT OF ANALYSIS AND DELIMITATION

The unit of analysis of this study is the African continent, considered as a whole, with no emphasis on specific national cases. The choice for a continental approach is justified by the need to understand the common structural patterns, regional gaps and converging trends that characterize African infrastructural development.

The time limit covers the period from 2015 to 2024, corresponding to the implementation of the African Union's Agenda 2063 and the intensification of international commitments to the Sustainable Development Goals (SDGs). This time frame allows us to analyze recent changes in infrastructure policies and the adoption of sustainable construction technologies.

3.4 ANALYSIS TOOLS AND TECHNIQUES

The data were analyzed using two complementary techniques:

- a) Thematic content analysis, applied to literature and technical reports, in order to identify the most recurrent categories of challenges and opportunities in the African AEC Industry. This technique followed the guidelines of Bardin (2016), allowing the grouping and interpretation of qualitative evidence in a structured way.
- b) Comparative analysis and descriptive statistics, used to organize and synthesize quantitative data on access to infrastructure, investment and emissions. These data were presented in tables and tables prepared according to ABNT standards, with indication of primary sources.

3.5 ETHICAL CONSIDERATIONS AND LIMITATIONS

The research respected the ethical principles of scientific integrity, according to the UNESCO Code of Ethics (2021), ensuring transparency in the citation of sources and reliability of interpretations. No confidential data was used, limited to public and official information.

Among the limitations of the study, the following stand out:

- the heterogeneity of statistical sources among African countries, which makes direct comparisons difficult;
- the scarcity of specific data on technology adoption in the African AEC sector;
- the absence of complete historical series for some sustainability indicators.

Despite these restrictions, methodological triangulation and the cross-referencing of international sources provided a comprehensive, rigorous, and up-to-date view on the subject.

4 RESULTS AND DISCUSSIONS

The analysis of data and specialized literature allowed the identification of a set of persistent structural challenges and emerging opportunities that shape the future of AEC Industry and infrastructure in Africa. This section presents the synthesis of these results, supported by empirical evidence and a critical reading of continental trends.

4.1 STRUCTURAL CHALLENGES OF AEC INDUSTRY AND INFRASTRUCTURE IN AFRICA

Africa's infrastructure is characterized by multidimensional shortcomings, which go beyond physical insufficiency and include gaps in planning, management, capacity building, and financing. The analysis highlights five central dimensions of challenge: structural, economic, institutional, technological and environmental.

4.1.1 Structural deficit and infrastructure obsolescence

The deficit of basic infrastructure is the most limiting factor of African development. It is estimated that around 600 million Africans lack access to electricity, 400 million lack adequate access to clean water, and more than 60% of the urban population lives in informal settlements (UN-Habitat, 2023).

Transport, energy and communications networks are, in many countries, in a state of obsolescence. Only 25% of African roads are paved, which increases the logistics costs of goods by 30 to 40% (World Bank, 2022). The poor integration between national and regional infrastructures prevents the consolidation of production chains and the efficient circulation of goods and services.

Table 2

Critical Infrastructure Indicators in Africa (2023)

Indicator	Continental average value	World average
Access to electricity	38% of the population	90%
Internet access	9,8%	65%
Paved roads	25%	55%
Annual investment in infrastructure	\$93 billion (required)	—
Percentage of urbanization	45% (in 2024)	56%

Sources: AfDB (2023); World Bank (2022); UN-Habitat (2023).

Chronic underinvestment in maintenance exacerbates the problem. The AfDB (2023) estimates that one third of existing infrastructure is severely structurally degraded, requiring urgent rehabilitation. The lack of preventive maintenance policies leads to accelerated loss of assets and increased reconstruction costs.

4.1.2 Financial and investment challenges

Financing is one of the biggest obstacles to African infrastructure development. According to the Global Infrastructure Hub (2023), only 12% of financing for African infrastructure comes from domestic sources (governments and the local private sector), while 88% depends on external capital, mostly from China, the World Bank, and multilateral funds.

The main financial constraints include:

- high public debt and low credit rating;
- lack of risk mitigation instruments for private investment;
- political and exchange rate instability;
- absence of regional development banks with high leverage capacity.

In addition, existing funding is mainly focused on transport and energy megaprojects, neglecting areas such as maintenance, affordable housing and urban sanitation, which perpetuates territorial inequalities.

4.1.3 Institutional deficit and governance

African infrastructure governance is often characterized by institutional fragmentation, corruption, and low transparency in public procurement processes. Transparency International (2023) points out that construction is the second most vulnerable sector to corruption in Africa, after the exploitation of natural resources.

Institutional weaknesses include:

- absence of integrated urban and territorial planning policies;
- deficiencies in the regulation and technical inspection systems;
- lack of performance standards and technical standardization (particularly in public works);
- scarce culture of facility management and post-construction maintenance.

These gaps reduce the efficiency of investments and compromise the sustainability of public assets.

4.1.4 Technological and capacity building challenges

African AEC Industry is still based on traditional construction methods, with low productivity and reduced technological integration. The McKinsey Global Institute (2020) shows that construction productivity in Africa is about 40% lower than the world average.

Key technological limitations include:

- low adoption of BIM (Building Information Modeling) and Digital Twins;
- absence of technical standards and data interoperability;
- insufficient training in digital engineering, automation and sustainability.

The shortage of skilled labor is another relevant obstacle: according to the African Union Commission (2022), only 1 in 10 engineering professionals in Sub-Saharan Africa have received formal training in digital tools applied to construction.

4.1.5 Environmental and climate impacts

The AEC sector is responsible for approximately 40% of global carbon emissions, with infrastructure alone responsible for 53% of these emissions (UNEP, 2022). The African challenge is particularly sensitive, as local infrastructure is highly vulnerable to extreme weather events — floods, droughts, and storms — exacerbated by climate change (IPCC, 2022).

In addition, the use of energy-intensive materials (cement, steel and concrete) increases the ecological footprint of construction. The transition to low-carbon materials and circular economy practices is, therefore, essential to mitigate the sector's environmental impacts.

4.2 STRATEGIC OPPORTUNITIES OF AEC INDUSTRY AND INFRASTRUCTURE IN AFRICA

Despite the structural challenges identified, Africa presents a robust set of strategic opportunities that can transform the AEC sector into a catalyst for sustainable growth, social inclusion and technological innovation. These opportunities are aligned with the African Union's Agenda 2063 and the Sustainable Development Goals (SDGs).

4.2.1 Urban growth and industrialization potential

Accelerated urbanization is both a challenge and an opportunity. The African continent will have 1.3 billion urban dwellers by 2050, which will require urban infrastructure, housing, mobility and basic services on an unprecedented scale (UN-Habitat, 2023). This growth creates a continuous demand for the AEC sector, stimulating employment, local industrialization and innovation in construction materials and technologies.

The industrialisation of the sector can be supported by regional value chains, encouraging local production of cement, steel and modular components, which would reduce import costs and increase economic resilience.

4.2.2 Innovation and digitalisation of construction

The digitalization of the AEC sector is considered one of the most promising vectors of transformation. The use of BIM, Digital Twins (Figure 1), IoT and Artificial Intelligence allows integrated planning, reduction of design errors, cost control and real-time performance monitoring.

Studies by KPMG (2021) and McKinsey (2020) indicate that the adoption of digital tools can reduce the cost of operating and maintaining infrastructures by up to 25% and increase construction productivity by 60%. Countries such as Morocco, Egypt, Kenya and South Africa have already started national programs for the implementation of BIM and smart infrastructures, with positive results in transparency and public efficiency.

Figure 1

Digital twins

Source: Image taken from the internet

4.2.3 Circular Economy and Material Innovation

The circular economy offers opportunities for a more efficient and inclusive construction model, Figure 2. Experiences such as that of the company Nelplast Eco, in Ghana, which converts plastic waste into paving blocks and ecological bricks, demonstrate the potential of local and sustainable solutions. These materials reduce production costs by 30% and are more durable and waterproof (World Economic Forum, 2022).

Promoting production chains of sustainable materials — expanded clay, bamboo, natural fibers, and recycled aggregates — can generate endogenous innovation, local employment, and a reduction in the ecological footprint.

Figure 2

Circular economy cycle

Source: Image taken from the internet

4.2.4 Green finance and public-private partnerships

The transition to a sustainable economy drives new sources of financing, such as Green Bonds, Climate Funds and Public-Private Partnerships (PPPs). The African Development Bank (2023) highlights that the continent raised more than US\$20 billion in green bonds between 2019 and 2023, with a growing share of the sustainable construction and renewable energy sector.

PPPs, when well structured, can leverage private investment and transfer execution risks, as long as they are accompanied by adequate regulation and transparency guarantees.

4.2.5 Technical training and institutional strengthening

Strengthening local technical capacities is key to ensuring the sustainability and independence of the African AEC sector. Initiatives such as the African Infrastructure Fellowship Program (AIFP) and the Pan-African University Institute for Water and Energy Sciences (PAUWES) already train engineers and public managers in topics such as resilient infrastructure, digitalization, and project governance.

The creation of regional centers of excellence and integrated public innovation policies is essential to consolidate technical knowledge, normative standardization, and technological diffusion in the continent.

4.2.6 Climate resilience and sustainability

The incorporation of green infrastructure and nature-based solutions is another strategic opportunity. These solutions – such as sustainable drainage, urban reforestation and permeable pavements – contribute to mitigating flooding, improving environmental quality and increasing the resilience of African cities (UNEP, 2023).

Sustainable infrastructure, when associated with digital monitoring mechanisms and intelligent management, constitutes a new paradigm of African engineering, capable of simultaneously responding to the needs of development, climate mitigation and social inclusion.

5 CONCLUSION

This study has provided a comprehensive understanding of the challenges and opportunities of AEC Industry and infrastructure in Africa, in a context marked by deep structural asymmetries and the imperative of sustainable transformation. The results show that Africa's infrastructure deficit — estimated at about US\$ 93 billion annually — is one of the main obstacles to the continent's economic and social development. This deficit manifests itself in severe shortages in the energy, transport, sanitation, housing and telecommunications sectors, affecting the competitiveness, productivity and quality of life of the population.

The study also showed that institutional and financial weaknesses, low technological integration and climate vulnerability increase the complexity of the African infrastructure problem. The lack of preventive maintenance policies, the dependence on external financing

and the insufficiency of technical standards and effective supervision limit the efficiency of investments and perpetuate the degradation of assets.

However, the African scenario is equally fertile in structuring opportunities. The rapid process of urbanization, increasing industrialization, and the expansion of new green financing mechanisms offer the potential for an unprecedented qualitative leap. The adoption of digital technologies – such as BIM, digital twins and smart sensors – combined with the circular economy and the use of sustainable local materials, can reduce costs, increase productivity and mitigate the environmental impact of the AEC sector.

Sustainable and digital construction thus represents the new frontier of African engineering. For the continent to capitalize on these opportunities, integrated public policies, institutional strengthening and systematic investment in technical training are necessary. The creation of regional innovation centres, the harmonisation of construction standards and the encouragement of applied research in sustainable technologies are essential pillars for strengthening African technological autonomy.

It is concluded that the future of AEC Industry in Africa depends on the collective capacity to articulate governance, innovation and sustainability. The challenge is no longer just to build more, but to build better, with efficiency, equity and environmental respect.

The integration between the public, private and academic sectors will be decisive in transforming the infrastructure deficit into an engine of inclusive and resilient development, consolidating the role of the AEC sector as the structuring axis of the 2063 Agenda and the Sustainable Development Goals on the continent.

ABSTRACT

Knowledge Management (KM) has increasingly consolidated as a strategic approach to sustainable development and innovation across regional contexts. In the Amazon region, characterized by vast biodiversity and sociocultural complexity, KM plays a crucial role in integrating traditional and scientific knowledge, promoting environmental conservation, and fostering sustainable socioeconomic development. This article discusses key challenges and opportunities for KM in Amazonia, focusing on the interfaces among science, technology, public policy, and local communities. Accordingly, the study examines how KM can be applied to preserve, systematize, and valorize Amazonian traditional knowledge while promoting innovation oriented toward sustainable development. It also identifies knowledge co-construction practices, challenges related to the inclusion of Indigenous peoples and local communities, and the political and institutional implications for territorial and environmental governance. The methodology combines a bibliometric review, interviews with KM researchers working in Amazonian contexts, government reports, an analysis of the trajectories of research groups, and a review of the scientific literature on KM in Amazonia. The results highlight the need for participatory conceptual models, transparency in data governance, and the institutionalization of inclusive dialogue channels. Recommendations are also presented for public policy and research practice.

Keywords: Knowledge Management. Amazon Region. Innovation. Sustainable Development Goals. Regional Development.

RESUMO

A Gestão do Conhecimento (GC) tem se consolidado como uma abordagem estratégica para o desenvolvimento sustentável e a inovação em diversos contextos regionais. Na Amazônia, território caracterizado por vasta biodiversidade e complexidade sociocultural, a GC assume papel crucial para integrar saberes tradicionais e científicos, promover a conservação ambiental e estimular o desenvolvimento socioeconômico sustentável. Este artigo discute os desafios e oportunidades da GC na Amazônia, abordando as interfaces entre ciência, tecnologia, políticas públicas e comunidades locais. Portanto, este estudo busca

RESUMEN

La Gestión del Conocimiento (GC) se ha consolidado como un enfoque estratégico para el desarrollo sostenible y la innovación en diversos contextos regionales. En la Amazonía, un territorio caracterizado por una vasta biodiversidad y complejidad sociocultural, la GC desempeña un papel crucial en la integración de conocimientos tradicionales y científicos, la promoción de la conservación ambiental y el impulso del desarrollo socioeconómico sostenible. Este artículo analiza los desafíos y las oportunidades de la GC en la Amazonía, abordando las interfaces entre ciencia, tecnología, políticas públicas y comunidades locales. Por lo tanto, el estudio examina cómo la gestión del conocimiento puede aplicarse para preservar, sistematizar y valorar los conocimientos tradicionales amazónicos, promoviendo la innovación orientada al desarrollo sostenible. Además, identifica prácticas de co-construcción del conocimiento, desafíos para la inclusión de pueblos indígenas y comunidades locales, y implicaciones políticas e institucionales para la gobernanza territorial y ambiental. La metodología combina revisión bibliométrica, entrevistas con investigadores en GC en el contexto amazónico, informes gubernamentales, análisis de la trayectoria de grupos de investigación y revisión de la producción científica sobre GC en la Amazonía. Como resultados, se destaca la necesidad de modelos conceptuales participativos, transparencia en la gobernanza de datos e institucionalización de canales de diálogo inclusivos. También se formulan recomendaciones para políticas públicas y prácticas de investigación.

Palabras clave: Gestión del Conocimiento. Amazonía. Innovación. Objetivos de Desarrollo Sostenible. Desarrollo Regional.

1 INTRODUCTION

The Brazilian Amazon, recognized worldwide for its vast biodiversity and cultural diversity, faces complex socio-environmental challenges that require innovative and integrated solutions (Fearnside, 2018; Barlow, 2018; Artaxo, 2021). In this context, KM emerges as a strategic tool to organize, share and apply available knowledge, promoting both economic development, innovation and environmental sustainability (Nonaka; Takeuchi, 1997; Rezende, 2017; Olive tree; Saints; Martins, 2022)

The Amazonian context faces severe environmental challenges such as deforestation and economic pressure, which requires integrated management strategies and joint public policies between different government entities, according to studies by Fearnside (2005) and Ferreira, Venticinque; Almeida (2010). In the same vein, Barlow (2018) demonstrates the global relevance of Amazonian biodiversity and the growing challenges arising from human factors, agricultural expansion, mining, and climate change. It is evident that Amazonian challenges can only be faced with integrated approaches, involving science, communities, industries, and public policies (Brondizio, 2018; Almeida; Szwarcwald, 2020).

The study of Brondízio; Moran (2012) highlights cultural diversity and the need to integrate scientific and traditional knowledge in socio-environmental solutions. The importance of the cultural and historical diversity of the Amazonian peoples and their role in the ecological management of the region should be emphasized (Clement, 2015). Thus, it becomes relevant to implement the need for coordinated and transdisciplinary actions to face complex socio-environmental challenges, as highlighted by Nascimento (2015) and Artaxo (2021).

In this sense, the Amazonian context, due to its unique and peculiar characteristics, faces complex challenges that require innovative approaches to promote sustainable development (Brondízio; *et al.*, 2016; Silva; *et al.*, 2017; Fleury, Lobato; Dantas, 2019). Thus, KM and its foundation in an interdisciplinary science that permeates different scientific areas, becomes a strategy to integrate knowledge from traditional native peoples, advances in scientific knowledge with a focus on sustainability, promote regional technological advancement and provide opportunities for innovation in the industrial ecosystem (Bentes-Gama, 2012; Foster; Zaninelli, 2024; Castanha, 2025), strengthening local governance and driving adaptive solutions in the face of climate change and socio-environmental pressures, improving the performance of the industry and promoting an impact on society (Lima; Pozzobon, 2005; Silva, 2017; Mello-Théry; Fearnside, 2020)

It should be considered that the Amazon is one of the richest regions in biodiversity and cultural diversity on the planet, playing an essential role in global climate regulation and in the preservation of strategic natural resources (Lima; Pozzobon, 2005; Matos, Barroso Tenazor; Lopes, 2022). However, it faces historical challenges related to predatory exploitation, social inequalities and lack of integration between scientific, technological and traditional knowledge (Brondízio; Moran, 2012; Saints; Costa, 2021). It is relevant to highlight and highlight that the Brazilian Amazon is a complex space for the production, circulation and appropriation of knowledge, whether scientific, technological, community, social, indigenous, economic and ancestral (Fernandes; *et al.*, 2025; Magalhães, 2025). This knowledge coexists in a territory marked by structural asymmetries and intense sociocultural and immaterial diversity (Miranda; Schwaninger; Lucena, 2023). It can be said that it is essentially the sharing of tacit knowledge, passed from generation to generation or between subjects chosen by the leaders, so there is a challenge to the construction of collective knowledge (Chaves, Barbosa; Clement, 2018; Santos, *et al.*, 2023).

The notion of KM, originally developed in the business and organizational field (Nonaka; Takeuchi, 1997), has been gradually reinterpreted for contexts of territorial development, environmental conservation, and social innovation (Müller, 2024; Fonseca, 2024). It is clear that there is still an embryonic movement to transform this tacit knowledge into explicit knowledge. In this sense, scientific research and KM have much to contribute to the sustainable development of the Amazon region (Arruda Filho, 2019; Foster; Zaninelli, 2024; Castanha, 2025)

In this context, KM emerges as an instrument for integrating and valuing local knowledge, capable of guiding public policies and sustainable innovative practices (Ribeiro; Leite, 2021; Santos, *et al.*, 2023).

However, KM can contribute significantly to the construction of an Amazonian development model based on knowledge, innovation and sustainability, as described in the studies by Bentes-Gama, (2012); Silva, (2017) and Fleury, Lobato; Dantas (2019). This approach implies recognizing the plurality of actors such as universities, research centers, indigenous communities, indigenous peoples, government institutions, and companies articulating processes of creation, sharing, and application of knowledge focused on the Amazonian reality (Freire; Lima, 2020; Foster; Zaninelli, 2024; Castanha, 2025).

The present study is justified due to the integration between different forms of knowledge, being essential to strengthen public policies, innovation strategies and socio-

environmental governance mechanisms in the search to protect, preserve and seek a sustainable development plan (Freire; Lima, 2020; Mello-Théry; Fearnside, 2020; Saints; Costa, 2021). Another relevant point that justifies the study is that the Amazon, with its immeasurable environmental and sociocultural diversity, constitutes one of the most complex ecosystems of knowledge on the planet (Margulis, 2003; Porto-Gonçalves, 2006; Clement, 2015; Barlow, 2018).

In this context, KM assumes a strategic role by integrating scientific, technological and traditional knowledge in favor of sustainable development and social innovation (Leite; Marly 2019; Geraldo; Pinto, 2019; Silva; Bittencourt, 2021; Geraldo, Pinto; Duarte, 2022; Barbalho, *et al.*, 2023). Recent productions on the subject highlight the importance of thinking about KM in the Amazon from collaborative, interdisciplinary and territorially situated approaches (Ribeiro; Leite, 2021; Magalhães, 2025).

Some initial scientific research in the Amazonian context deals with the theme KM in the legal Amazon is characterized by a multidisciplinary and interdisciplinary field of study that ranges from organizational practices to traditional indigenous knowledge (Leite; Marly 2019; Silva; Bittencourt, 2021 Barbalho, Inomata; Fernandes, 2021; Geraldo; Dick; Duarte, 2022; Yanai, *et al.*, 2024).

Studies on the KM theme in the Amazonian context and in the northern region of Brazil are recent. In the study by Brito, *et al.*, (2016) a study was prepared in which it analyzes how credit unions in the Amazon apply KM practices, considering cultural and regional specificities.

The study by Souza, Barros and Gomes (2020) developed a bibliometric study that analyzes the works published on KM in university libraries in the Amazon, using the Web of Science database. The study by Fonseca (2024) explored initiatives of conceptual models of indigenous KM within the scope of Information Science, highlighting traditional practices and their contemporary application (Leite; Marly 2019; Silva; Bittencourt, 2021 Barbalho; Inomata; Fernandes, 2021).

Thus, no studies were found that connect KM to sustainable development, preservation, systematization and valorization of traditional knowledge of the Amazon based on the Sustainable Development Goals (SDGs) (Leite; Marly 2019; Silva; Bittencourt, 2021 Barbalho; Inomata; Fernandes, 2021; Geraldo; Dick; Duarte, 2022; Fonseca, Zaninelli; Simonetti, 2024).

A relevant and innovative question reinforces that KM in the Amazonian context is considered an interdisciplinary field that seeks to promote the creation, sharing, and efficient application of knowledge in organizations and communities (Davenport; Prusak, 1998). In the Amazonian context, however, knowledge is not limited to scientific or technological production, but includes traditional knowledge rooted in cultural, spiritual, and ecological practices (Fleury; Lobato; Dantas, 2019; Barreto; Freitas, 2020; Arreto; Brazil, 2021; Foster; Zaninelli; Simonetti, 2024). This knowledge is transmitted orally, sustaining ways of life and sustainable management strategies that have resisted for centuries (Diegues, 2000).

From this perspective, the Amazon constitutes a hybrid informational ecosystem, in which traditional knowledge and scientific systems coexist and, in many cases, are tensioned. KM in the region is not limited to technology transfer or data digitization, but involves valuing local practices, information governance, and the integration of diverse actors such as indigenous people, riverside communities, universities, public agencies, and companies and social organizations (Barreto; Freitas, 2020; Castro, Lima; Zucarelli, 2021; Arreto; Brazil, 2021; B; Inomata; Fernandes, 2021).

The Amazon, as a territory of biodiversity and sociocultural plurality, presents unique challenges and opportunities for KM (Santos, *et al.*, 2023; Foster; Zaninelli, 2024; Castanha, 2025). The integration between KM and traditional knowledge becomes, therefore, a strategic and ethical issue. Recognizing this knowledge as legitimate forms of scientific production broadens the notion of innovation, favoring intercultural dialogue and sustainability (Santos, 2007; Brook; Leite, 2021; Fernandes, *et al.*, 2025; Magalhães, 2025). Thus, this article seeks to understand how KM can be applied to preserve, systematize and value the traditional knowledge of the Amazon, promoting innovations focused on sustainable development without decontextualizing them or reducing them to mere scientific data.

2 THEORETICAL FRAMEWORK

The theoretical contribution of this study is structured and interrelated in the dialogue of classical and contemporary authors. When structuring the theoretical foundation of the study, it was understood that it would be innovative to present in the text the theoretical and scientific relevance establishing the interlocution of national and international articles given the complexity of *the locus* of study, the Amazonian context.

Thus, the theoretical framework is structured in four chapters. The first deals with the fundamentals and different approaches to KM. The second chapter addresses KM in the

Amazonian context, discussing its different characteristics. The third chapter addresses the Amazon as an ecosystem of knowledge, discussing its sociocultural, environmental and epistemological dimensions. The fourth chapter articulates KM integrated with traditional knowledge, dialoguing with digital innovation.

2.1 GC: FUNDAMENTALS, APPROACHES AND CONCEPTUAL EVOLUTION

KM has been consolidated, over the last three decades, as one of the pillars of organizational competitiveness, innovation and informational sustainability (Angeloni, 2008; Terra, 2013; Barbosa; Schneider, 2015; Baptist; Quandt, 2016; Pear tree; Angeloni, 2020; Geraldo; Dick; Duarte, 2022).

In the Brazilian context, the field of KM studies has taken on its own characteristics, influenced by institutional diversity, the public innovation agenda, the emergence of digital technologies, and the challenges imposed by complex territories such as the Amazon (Rosenberg; Ohayon; Batista, 2008; Alfenas, *et al.*, 2021; Bike; Fernandes; Angels, 2021; Müller; *et al.*, 2024). Thus, KM in Brazil has developed its own characteristics, especially in the public sphere, due to institutional diversity, the adoption of a governmental innovation agenda, and territorial particularities (Pinheiro; Araújo, 2023; Coast; Almeida, 2023; Pacheco; Yamaguchi; Madeira, 2023).

National studies show that KM in the public sector is still in the consolidation phase and requires contextual adaptations according to studies by Santos, (2022) and Cunha; Meirelles, (2022). The study by Alfenas *et al.* (2021) who conducted a literature review from 2008–2017 concluded that Brazilian public organizations need to establish specific KM models adapted to their reality. Conclusions from more recent scientific studies advance to consider KM stages adapted to complex regional realities, such as in the Amazon and in the Northeast region according to Pacheco, Yamaguchi; Madeira, (2023) and de Müller, *et al.*, (2024).

In the Brazilian context, KM has been researched and discussed in different areas such as Information Science, Administration, Production Engineering, Information Systems, People Management and Organizational Studies according to Ziviani, *et al.*, (2025). In this way, the KM theme becomes relevant when relating it to open access policies, data governance, digital repositories, social innovation, and traditional knowledge (Barbalho, 2022; Tartarotti; 2023). At the same time, international studies reinforce the centrality of

knowledge flows as essential mechanisms for continuous learning, strategic renewal, and dynamic capacity building (Wiig, 1997; Davenport; Prusak, 1998).

KM in the scientific field has been discussed in universities, public and private companies, government entities and social organizations as an interdisciplinary field (Ziviani; Corrêa; Muylder, 2019; Would; Costa, 2020). Its evolution is directly linked to the transformation of knowledge into a central economic resource, as emphasized by Drucker (1993, p.83), when he states that "knowledge has become the main economic resource of modern organizations".

In this way, KM consolidates itself as a field of science, being one of the strategic areas for public, private, academic and community organizations in the twenty-first century (Francini, 2002; Souza; Corrêa, 2018; Silva; Menezes, 2013; Fialho; Barbosa; Santos, 2018). Inserted in a global context of digital transformations, intensification of information flows, and growing valuation of intangible assets, KM has become fundamental for innovation, process improvement, competitiveness, and decision-making (Batista; Quandt, 2016; Rezende, 2017; Olive tree; Santos, 2022).

Classic authors in the field of KM such as Nonaka; Takeuchi (1997) states that, in contemporary societies, knowledge constitutes the basis of economies, representing the main strategic resource of organizations. Thus, "the ability to create knowledge, disseminate it and incorporate it into products, services and systems is the most important source of competitive advantage" (Nonaka; Takeuchi, 1997, p. 13).

In this sense, Batista and Quandt (2016) argue that KM becomes essential for innovation and organizational competitiveness by allowing information to be systematized and transformed into action (Ziviani; et al, 2025; Correa; *et al.*, 2025). Terra (2019) argues that KM practices strengthen collaborative environments and contribute to the creation of public and social value.

In the contemporary scenario, characterized by dynamics of continuous innovation, technological advances, and growing organizational complexity, KM is now considered a strategic element for creating value, sustaining competitiveness, and promoting continuous learning (Correa; *et al.*, 2025; Ziviani; *et al.*, 2024). Davenport and Prusak (1998, p. 5) add that knowledge is "a fluid mixture of condensed experience, values, contextual information, and specialized insight."

In Brazil, the debate on KM has been expanded since the 2000s, when authors such as Fleury and Fleury (2000), Batista (2004), Valentim (2004) and Terra (2005), began to

articulate international theories with the reality of local organizations. Terra (2005) observes that KM in the country needs to consider cultural, institutional and structural specificities, especially in organizational environments marked by inequalities, discontinuity of policies and lack of informational integration.

Still within the Brazilian context, studies such as those by Angeloni (2008) and Batista; Quandt (2016) indicate that the adoption of KM practices is growing progressively, although it still faces structural, cultural and managerial limitations. Angeloni (2008, p. 27) highlights that "Brazilian organizations are still maturing their KM processes", emphasizing the need to consolidate incentive policies, learning structures and institutional recognition. Increasing digitalization has brought new challenges and opportunities for strengthening KM in the Amazonian context (Stradioto; Frazzon, 2023; Silva; File; Silva, 2025).

Davenport; Prusak (1998) point out that the growing volume of data and information does not necessarily translate into useful knowledge: it is necessary to interpret, contextualize, validate and apply this information. KM emerges exactly as a field capable of transforming dispersed data into strategic knowledge, favoring organizational learning, continuous improvement and adaptive capacity (Sá, *et al.*, 2018; Belinski; Martins, 2020; Klein; Azevedo; Silva, 2021).

Thus, understanding knowledge not only as an input, but as a dynamic process, becomes fundamental for the understanding of KM, with knowledge being the most relevant resource for organizations (Gonzalez; Martins, 2017; Pear tree; Macieira, 2020; Ziviani; *et al.*, 2025). Nonaka and Takeuchi (1995) argue that organizational knowledge results from the continuous interaction between tacit and explicit dimensions, operating in a cyclical and spiral process capable of promoting innovation. For the authors, "knowledge is created in a spiral process, which expands both at the individual and collective levels" (Nonaka; Takeuchi, 1995, p. 25).

Wiig (1997) reinforces this conception by arguing that KM involves systematic practices aimed at identifying, constructing and applying knowledge in order to improve organizational performance. In his perspective, "KM exists to ensure that the organization can act intelligently" (Wiig, 1997, p. 92), revealing the strategic character of this field.

On the international scene, Yu; *et al.*, (2022) and Pereira (2025), argue that KM should be understood as a multidimensional phenomenon, involving technology, social structures, and cognitive processes. According to the authors, knowledge is an intangible asset whose

effectiveness depends mainly on sharing mechanisms, collaborative culture and appropriate systems.

To contextualize this study, it is necessary to define CG. Therefore, KM constitutes an organized and intentional set of processes to create, capture, systematize, share and apply knowledge, whether tacit or explicit, in scientific organizations and institutions, with the purpose of transforming internal knowledge into strategic assets that promote innovation, organizational learning, institutional preservation and competitive advantage (Silva, 2004; Milk; Costa, 2007; Bike; Kobashi; Bettencourt; Cianconi, 2012; Correa, *et al.*, 2024; Ziviani; *et al.*, 2025a).

Table 1 presents the definition of KM discussed by different classical and contemporary authors and elucidates the concept of KM for this study.

Table 1

Definitions of KM

Author(s)	Year	Definition/Approximation of GC
Nonaka; Takeuchi	1997	KM as "a process of continuous creation of new knowledge, disseminating it widely throughout the organization and quickly incorporating it into new products/services, technologies and systems".
Davenport; Prusak	1998	KM is the "collection of processes that aim to govern the creation, dissemination, and use of knowledge to achieve organizational objectives."
Sveiby	2000	KM understood as the "art of creating value from the leverage of an organization's intangible assets", involving internal/external structure and employee competence.
Choo	2006	KM involves processes of knowledge creation, generation of meaning, and decision-making — that is, in addition to manipulating information, the focus is on how the organization generates meaning and decides based on knowledge.
Valentine	2008	KM is a set of activities that aims to work on the organizational/informational culture and institutional communication to provide a favorable environment for the generation, acquisition, sharing and use of knowledge. It focuses on transforming tacit knowledge into explicit knowledge to support ideas, problem solving, and organizational decision-making.
Corrêa, Ziviani; Muylder	2019	They propose a "holistic approach" to KM, highlighting that existing models are parsimonious and suggesting that effective KM should consider multiple dimensions of the organization (people, processes, culture, technology, etc.).

Source: survey data, 2025.

The literature presents a diversity of KM definitions: with approaches more centered on processes, capture and use of knowledge according to Davenport; Prusak (1998) and Sveiby (2000). It is also noted that integrated/holistic models (Corrêa, Ziviani; Muylder, 2019) value culture, technology, structure, and people simultaneously. The holistic approach of Corrêa, Ziviani; Muylder (2019) can serve as a modern and systemic reference, especially if his study addresses KM in companies/organizations that deal with sustainability, innovation,

and green technology focused on areas that require integration between processes, people, and technology.

For Nonaka; Takeuchi (1997, p. 83), "knowledge is created through the continuous interaction between tacit and explicit knowledge", articulated in the SECI model, which has become a world reference. Davenport; Prusak (1998) reinforce that knowledge is a strategic resource, stating that "valuable knowledge derives from experience, interpretation and reflection" (Davenport; Prusak, 1998, p. 5).

In addition to the corporate context, KM can also be applied to the academic and research environment: scientific KM involves practices of organization, communication, and dissemination of scientific knowledge, with a view to facilitating the production, exchange, and preservation of knowledge produced in teaching and research institutions. Scientific communication, documentation, recording of data and results, as well as the dissemination of knowledge are seen as essential elements for this type of KM (Leite; Costa, 2007; Sampaio; Menezes, 2021; Baptist; Farias, 2023).

It is important to highlight that, although there are several definitions and conceptual approaches to KM, there is a consensus among researchers and authors that KM is not reduced to the management of data or information. KM presupposes a mature organizational strategy, technology infrastructure, and organizational, socio-technical, and cultural culture that allows transforming knowledge into intellectual capital, that is, into a strategic resource (Menezes; Rodrigues, 2023; Correa, *et al.*, 2024; Ziviani; *et al.*, 2025a).

Finally, KM presents itself as a solid, dynamic and multidimensional field. The integration between technology, social processes, collaborative culture and ethics is indispensable. In Brazil, the relationship between KM and complex territories, such as the Amazonian context, is a strategic and little explored area, demanding critical, participatory approaches that are sensitive to epistemological diversity (Souza; Corrêa, 2018; Barbalho, 2023; Yanai, *et al.*, 2024).

2.2 KNOWLEDGE MANAGEMENT IN THE AMAZONIAN CONTEXT

The Brazilian Amazon is a territory of great socio-environmental and cultural complexity, home to a unique diversity of ecosystems, indigenous peoples, traditional communities, and teaching and research institutions. (Arruda Filho, 2019; Artaxo, 2019; B; Inomata, 2021). This scenario presents unique challenges for KM, especially with regard to the integration between scientific and traditional knowledge, the preservation of strategic

information and the promotion of sustainable innovation (Brito, *et al.*, 2016; Cardoso; Pimenta, 2019; Yanai, *et al.*, 2024; Fonseca, 2025)

According to Müller, Arruda; Vilches (2024, p. 12), "KM consists of a set of processes aimed at creating, organizing, disseminating and applying knowledge, considering it as strategic assets". In the Amazonian context, this definition requires expansion, given that the knowledge produced is not only technical or scientific, but also cultural, ancestral and collective (Castro; File; Zucarelli, 2021; Coast; Almeida, 2023). Thus, KM in the region should be thought of in an interdisciplinary way, incorporating social, environmental and epistemological dimensions specific to the Amazon territory (Chaves; Barbosa; Clement, 2018; Fleury; Lobato; Dantas, 2019; Castro; File; Zucarelli, 2021)

KM is a field that emerged at the end of the twentieth century, with the aim of organizing and maximizing the use of information within organizations and communities (Nonaka; Takeuchi, 1997). According to Müller, Arruda, and Vilches (2024), KM processes include: knowledge identification, creation, storage, distribution, application, and evaluation. Such processes make it possible to transform information into strategic assets capable of generating innovation and competitive advantage (Stewart, 1997; Sveiby, 1998).

However, in regional contexts such as the Amazon, the application of these concepts needs to be adapted and contextualized to the scenario and field of study (Fonseca; Zaninelli, 2022; Foster; Zaninelli; Simonetti, 2024; Magalhães, 2025). Researcher Fonseca (2024, p. 45) points out that "traditional KM models, usually developed in urban or corporate environments, do not always apply to the Amazonian reality, where oral, collective knowledge and linked to specific territorial and cultural practices predominate". This perspective shows that KM in the Amazon must incorporate not only technology and scientific documentation, but also practices of preservation and transmission of community knowledge (Little; Barreto Filho, 2012; Martins; Silva, 2019; Matos; Barroso Tenazor; Lopes, 2022).

The classic KM literature is not limited to the management of information or data, it involves the coordination of knowledge flows, the promotion of organizational learning, and the creation of cooperation networks that facilitate the production and exchange of knowledge (Davenport; Prusak, 1998). In regions of high cultural and environmental diversity, such as the Amazon, these elements assume strategic relevance (Moraes; Birth, 2021; Pine; Araújo, 2023; Pacheco; Yamaguchi; Madeira, 2023).

The Amazon is characterized by a mosaic of cultures, languages, and forms of knowledge. Indigenous and riverine knowledge, for example, has spiritual and collective

dimensions that make it difficult to codify it in traditional KM systems (Silva; Oliveira, 2021; Saints; Costa, 2021; Barbalho, 2022; Fonseca, 2024). Decoloniality and Traditional Knowledge in Scientific Practices in the Amazon argues that non-Western knowledge should be treated as legitimate epistemology, requiring KM models that respect their own logics (Silva; Saints; Ferreira, 2022; Schott; Steinmueller, 2023).

According to Fonseca (2024, p. 32), "indigenous knowledge is dynamic, collective, and deeply linked to the territory, and it is essential to ensure its preservation and transmission in an ethical and culturally sensitive way". Thus, the integration between scientific and traditional KM requires attention to ethical, legal, and cultural aspects, avoiding the misappropriation of local knowledge (Barbalho, 2022; Yanai; *et al.*, 2024)

Research carried out in cooperatives and institutions in the Amazon points to significant gaps in KM infrastructure. According to Brito, *et al.*, (2016), despite recent advances, the adoption of KM systems is still incipient, with a lack of adequate technologies for organizing, storing, and sharing information.

In addition, the lack of interoperability between different information systems prevents the efficient circulation of knowledge (Valentim, 2008; Martin; Nascimento, 2021). Fonseca (2024) highlights that Amazonian museums and libraries face challenges related to the standardization of vocabularies, cataloguing, and digital access, limiting the dissemination of scientific and cultural knowledge (Bernard; Jorgensen, 2022; Souza; Oak; Mendes, 2022; Yanai, *et al.*, 2024)

One of the greatest challenges is to reconcile traditional and scientific knowledge in a collaborative way (Silva; Oliveira, 2020; Silva; Bittencourt, 2021). According to Fonseca (2024), the creation of specific conceptual models, such as those developed for indigenous communities, allows for more ethical and effective knowledge management. Such models value orality, ancestry and the immaterial dimension of knowledge, integrating them with practices of social and technological innovation (Machado; Carvalho, 2019; Freire; Lima, 2020; Foster; Zaninelli; Simonetti, 2024).

Decoloniality and traditional knowledge reinforce that the dialogue between different knowledge regimes requires rethinking methodologies, indicators, and evaluation metrics (Battiste, 2019; Schott; Steinmueller, 2023). The simple transfer of urban or corporate KM techniques to Amazonian contexts is insufficient, as it ignores the cultural, social and environmental specificities of the territory (CASTRO, 2010; Foster; Zaninelli, 2022; Barbalho, 2023).

Fonseca (2024) proposes a conceptual model of KM for indigenous communities that values collectivity, orality, and connection to the territory. This model allows for the recording of knowledge in an ethical manner, ensuring intergenerational transmission and cultural protection. The integration of such practices with academic and technological initiatives strengthens the dialogue between science and tradition, promoting social innovation and territorial sustainability (Silva; Barreto, 2020; Wikepena, 2021).

In the context of indigenous peoples, knowledge is not just a set of information, but a historical and cosmological construction linked to the territory, community relations, spirituality and environmental practices (Arreto; Brazil, 2021; Bernard, 2022). In this sense, Berkes (2012, p.4) states that traditional ecological knowledge constitutes "a complex, adaptive, and cumulative system transmitted between generations," which implies understanding indigenous knowledge as living and dynamic systems. In addition, Almeida (2014, p. 90) highlights that indigenous territories are spaces for the production of identities and specific knowledge, constituting "territories of knowledge", a view that goes against the study of Carvalho, Pires; Ribeiro (2021). Thus, applying KM models to these contexts requires expanding epistemological references, avoiding colonizing and reductionist approaches (Battiste, 2019; French; Oliveira, 2020).

From the perspective of cognitive justice, Santos; Meneses (2019) argues that there is a long history of subordination of indigenous epistemologies in the Western scientific field. For the authors, recognizing indigenous knowledge implies adopting epistemologies from the South, which presuppose "the coexistence of different forms of knowledge and the refusal of epistemological hierarchization" (Santos; Meneses, 2019, p. 8). This view dialogues with Smith (2012), for whom indigenous knowledge is intrinsically linked to cultural sovereignty, and should be treated ethically and with respect for community protocols. The author states that "researching or recording indigenous knowledge is always a political act" (Smith, 2012, p. 59), reinforcing the need for collaborative approaches and free and informed consent.

From the point of view of documentation and preservation, Brazilian authors have highlighted the importance of participatory processes (Freitas; Oliveira, 2020; Weitzel, 2021; Souza; Oak; Mendes, 2022). Freitas and Oliveira (2020) point out that the preservation of indigenous intangible heritage requires methodologies that consider oralities, rituals, and community dynamics, avoiding decontextualization. Likewise, Silva; Barreto (2020) discusses KM practices in Brazilian villages, emphasizing that oral transmission remains

central to the maintenance of knowledge, although digital tools can support registration processes when used under the governance of the community itself.

Another relevant axis is the role of indigenous knowledge in sustainability (Geraldo; Pinto, 2019; Geraldo; Dick; Duarte, 2022; Ziviani; *et al.*, 2025b). Nakashima *et al.* (2020), in a study published in *Science*, demonstrate that traditional knowledge is fundamental for global biodiversity conservation strategies, reinforcing its direct relationship with the territory and with ancestral sociocultural practices. In this sense, Diegues (2000, p. 21) states that this knowledge offers "singular interpretations of nature and its cycles", constituting references that complement modern science.

The integration between scientific institutions and indigenous peoples has demanded new KM practices based on collaboration. Carvalho, Pires; Ribeiro (2021) analyze partnerships between indigenous communities and research centers, emphasizing the importance of social innovation and the recognition of collective intellectual property. Similarly, Bernard; Jorgensen (2022) propose collaborative research models that include co-authorship, joint planning, and benefit-sharing.

In the methodological field, Kovach (2020) argues that indigenous epistemologies and methodologies should guide any KM process involving this knowledge, as they represent "ways of knowing based on relationship, territory, and belonging" (Kovach, 2020, p. 52).

From a critical perspective, Agrawal (2002) warns that many processes of recording indigenous knowledge carry logics of Western classification that disregard the proper ways of organizing knowledge. He argues that, without reflection, KM can reproduce epistemic inequalities. This leads to the contemporary challenge of developing intercultural KM practices, capable of integrating digital technologies, participatory methodologies, and principles of self-determination (Almeida, 2014; Oak; Saucer; Ribeiro, 2021; McGrew; *et al.*, 2023).

In this context, the ethical dissemination of indigenous knowledge requires intellectual protection policies, shared governance, and community control mechanisms over the use of information (Souza; Gomes, 2019; Nakashima; *et al.*, 2021). Souza; Gomes (2019) highlight that safeguard policies should ensure that the circulation of knowledge occurs according to cultural, legal and ethical principles agreed with the communities. Thus, KM applied to indigenous peoples cannot be limited to techniques for capturing and recording knowledge. It must involve active participation, reciprocity, respect and recognition of different ways of existing and knowing (Kovach, 2020; Wikepena, 2021; Bernard; Jorgensen, 2022)

In general, KM in indigenous contexts demands a plural epistemology, sensitive to the territory, oral narratives, community technologies, and spiritual relations that structure traditional knowledge (Barbalho, 2022; B; *et al.*, 2023; Fonseca, 2024). It is a field that expands the frontiers of KM, allowing the construction of more inclusive, ethical, and multicultural models of knowledge production and circulation. The preservation and dissemination of indigenous knowledge, therefore, can only occur legitimately when guided by the autonomy of peoples, by cognitive justice, and by collaborative processes that respect their complexity and historical depth (Freire; Lima, 2020; Foster; Zaninelli, 2022).

KM in the Amazon is also directly related to innovation and sustainable development policies (Lima; Pozzobon, 2005; Little; Barreto Filho, 2012; Matos; Barroso Tenazor; Lopes, 2022). Schott; Steinmueller (2023) highlight that integrative KM models can contribute to contextualized science, technology, and innovation (ST&I) policies, considering axes of territorial governance, environmental sustainability, social innovation, and informational sovereignty.

In this way, KM becomes a strategic tool for sustainable regional development, promoting not only the appropriation of scientific knowledge, but also the appreciation and protection of local knowledge (Rezende, 2017; Pear tree; Angeloni, 2020; Martin; Nascimento, 2021).

KM in the Amazonian context presents some fundamental and relevant guidelines. The first point is the epistemological plurality, which is essential when recognizing and integrating different types of knowledge such as scientific, technological, indigenous and community in management models that respect their specificities (Fonseca, 2024). Another issue is related to ethics and cultural preservation in which KM processes must ensure that traditional knowledge is used ethically, preserving cultural and territorial rights (Schott; Steinmueller, 2023).

The study by Brito, *et al.*, (2016) describes the need for institutional adaptation when implementing KM practices that must consider the particularities of Amazonian institutions, including technological, structural, and human resource limitations. In another sense, the integration with innovation and sustainability stands out. In this sense, KM must be articulated with social, technological and environmental innovation policies, contributing to the sustainable development of the region (Schott; Steinmueller, 2023).

The adoption of these guidelines implies rethinking traditional KM models, promoting flexible, interdisciplinary approaches that are sensitive to cultural and environmental diversity

(Santos; Costa, 2021; Silva; Bittencourt, 2021; Saints; *et al.*, 2023; Yanai; *et al.*, 2024a). In addition, the dialogue between modern science and traditional knowledge can generate social and technological innovation adapted to local realities. KM, in this sense, becomes a means of community empowerment, allowing Amazonian peoples to define their own sustainable development strategies (Silva; Barreto, 2021; Bernard; Jorgensen, 2022; Yanai, *et al.*, 2024b)

2.3 THE AMAZON AS AN ECOSYSTEM OF KNOWLEDGE: SOCIOCULTURAL, ENVIRONMENTAL AND EPISTEMOLOGICAL DIMENSIONS

The Amazon region concentrates one of the greatest biodiversity on the planet and, at the same time, a diversity of indigenous peoples, riverside dwellers, quilombolas and traditional communities that produce, transmit and resignify knowledge in close relationship with the environment (Fearnside, 2005; Brondízio; Moran, 2012; Fernandes; *et al.*, 2025). This knowledge, often referred to as traditional ecological knowledge (TEK), constitutes complex systems of observation, experimentation and classification of nature, which guide practices of use, management and conservation of natural resources (Hanazaki *et al.*, 2018).

Hanazaki *et al.* (2018) define traditional and local knowledge as a set of knowledge and practices that guide the sustainable use of biodiversity and that are fundamental to achieving global conservation goals, such as the Global Strategy for Plant Conservation (Becker, 2002; Barlow; *et al.*, 2018; Almeida; Szwarcwald, 2020; Artaxo, 2021). For the authors, "traditional ecological knowledge and local ecological knowledge are central to sustainable harvest and biodiversity conservation" (Hanazaki *et al.*, 2018, p. 1592), emphasizing that such knowledge is not a remnant of the past, but an active component of contemporary sustainability strategies.

In the Brazilian Amazon, Galvão *et al.* (2024), when studying the use of mangrove wood in coastal communities, show that the TEK organizes vocabularies, classifications, and practices of use of species such as *Rhizophora mangle* and *Avicennia germinans*, articulating technical, family, and intergenerational dimensions. The authors point out that local knowledge about wood has been validated by scientific research, which reinforces the idea of complementarity between traditional and academic knowledge (Galvão *et al.*, 2024). In this sense, the TEK studies go against the fundamental concepts of KM that defines tacit and explicit knowledge according to Nonaka; Takeuchi (1997).

In this way, the Amazon can be understood as an ecosystem of knowledge in which biodiversity and sociodiversity are mutually reinforcing: biological wealth feeds multiple knowledge systems, while these systems are crucial for the maintenance of cultural and ecological landscapes (Lima; Pozzobon, 2005; Brondizio, 2016; Arreto; Brazil, 2021; Assad, 2022). In this sense, KM as a science assumes a strategic position in the Amazonian context (Machado; Oak. 2019; Mello-Théry; Fearnside, 2020; Matos; Barroso Tenazor; Lopes, 2022)

Amazonian knowledge is inseparable from the historical trajectories and forms of social organization of the peoples who inhabit the region (Santos; Costa, 2021; Silva; Bittencourt, 2021; Pine; Araújo, 2023). Fernandes; Moser (2021), when analyzing riverside communities, show that the socio-historical formation of the Amazon was marked by processes of colonization, forced migration, economic cycles, and public policies that, to a large extent, made the social and political place of these groups invisible (Silva; Oliveira, 2020; Fernandes; Moser, 2021; Silva; Saints; Ferreira, 2022).

These communities build a way of life in which territory, identity, and knowledge are intertwined. Padovani (2022), when presenting the Encyclopedic Atlas of Traditional Knowledge of the Amapá Amazon, highlights that traditional populations are groups "culturally established in a geoFigureical space, having intrinsic and interdependent connections with it", and that their knowledge involves practices, spiritual connections, and collective memories transmitted between generations (Padovani, 2022, p. 36).

In this sense, Amazonian knowledge is not limited to the "use of resources", but is structured in a) forms of community education (learning by observation, orality, rituals); b) local governance systems (assemblies, community councils, traditional leaders); and c) ethical values linked to reciprocity, care for the river, the forest, and non-human beings (Matheus, 2019; Alves; *et al.*, 2022; Souza; Oak; Mendes, 2022).

Araújo (2025), dialoguing with the Epistemologies of the South in rural education in the Amazon, argues that the ancestral knowledge of rural peoples can challenge hegemonic curricular logics and propose intercultural and democratic pedagogical practices, in which knowledge is not just content, but situated experience (Araújo, 2025). In this way, it is verified that knowledge in the Amazonian context is tacit essential (Sell; Gregori, 2018; Fernandes; Moser, 2021; Saints; *et al.*, 2023).

Thus, the sociocultural dimension of Amazonian knowledge shows that: a) the ways of life (riverside, quilombola, indigenous, extractivist) are matrices of knowledge; b) collective identities are built in the relationship with rivers, streams, forests and seasonal cycles; and c)

traditional knowledge is dynamic, resignified in the face of new technologies, public policies and markets (Arreto; Brazil, 2021; Castro; File; Zucarelli, 2021; Barbalho, 2022).

In order to understand the Amazon as an ecosystem of knowledge, numerous authors articulate the discussion with the Epistemologies of the South, formulated by Boaventura de Sousa Santos and collaborators (Santos, 2011; Santos; Meneses, 2019). Santos (2014) criticizes hegemonic Western reason, responsible for producing a true "epistemicide", that is, the disqualification and destruction of non-Western knowledge, considered backward, superstitious or unscientific (Santos, 2014).

In place of a monoculture of scientific knowledge, Santos (2014) proposes an "ecology of knowledge", understood as a practice of horizontal dialogue between scientific and non-scientific knowledge, in which no knowledge is a priori superior to another. This perspective is particularly fruitful for thinking about the Amazon, where the following coexist: a) indigenous, riverside, quilombola and other traditional peoples' knowledge; b) scientific knowledge produced by universities, research institutes and government agencies; and c) technical knowledge of public policy agents, NGOs and companies (Sell; Gregori, 2018; Matheus, 2019; Fernandes; Moser, 2021; Padovani, 2022).

In the Amazonian context, Gebara *et al.* (2023) explicitly dialogue with the Epistemologies of the South when discussing epistemic justice and bioeconomy, arguing that the construction of policies needs to recognize the pluriversality of epistemologies and ontologies present in the region, under penalty of deepening forms of biopiracy and biocolonialism (Gebara; Ramcilovic-Suominen; Schmidlehner, 2023; Galvão; *et al.*, 2024).

Casino; *et al.* (2025, p. 10), in turn, propose "thinking with Amazonian indigenous peoples" to expand knowledge systems, arguing that indigenous epistemologies should not only be "data sources" for science, but epistemic partners in processes of co-production of knowledge and socio-environmental governance (Almeida, 2014; Oak; Saucer; Ribeiro, 2021; B; *et al.*, 2023)

In the field of education, Araújo (2025) shows how the Epistemologies of the South can guide a reinvention of rural education in the Amazon, in dialogue with ancestral knowledge and with the experiences of historically subalternized peoples. For the author, curricula that ignore this knowledge reproduce colonial hierarchies; on the contrary, when traditional knowledge is recognized as legitimate, paths are opened for intercultural and democratic pedagogical practices (Souza; Oak; Mendes, 2021; Schott; Steinmueller, 2023; Araújo, 2025).

From this perspective, the Amazon ceases to be just an "object" of research and becomes an epistemic subject: a space for the production of theories, concepts, and categories capable of tensioning the scientific canon. The idea of the Amazon as an ecosystem of knowledge implies: a) recognizing the epistemic authority of indigenous peoples and traditional communities (Nakashima; *et al.*, 2020; McGrew; *et al.*, 2023); b) to practice an intercultural translation between scientific and traditional languages, without subordination (Brondízio; Moran, 2012; Chaves, 2018; Matos; Barroso Tenazor; Lopes, 2022); and c) to build research agendas and public policies anchored in cognitive justice, that is, in the right of different peoples to produce, validate and transmit their own knowledge (Bentes-Gama, 2012; Brondízio; *et al.*, 2016; Battiste, 2019).

Finally, the Amazon needs to be understood as an ecosystem of knowledge. Recent literature shows that the Amazon should be understood, simultaneously, as:

- Socio-environmental ecosystem in which biodiversity and sociodiversity are intertwined, and where TEK guides management and conservation practices (Hanazaki *et al.*, 2018; Galvão; *et al.*, 2024).
- A complex sociocultural space marked by trajectories of resistance, specific territorialities, and its own forms of education, work, and governance (Fernandes; Moser, 2021; Padovani, 2022; Alves; *et al.*, 2022).
- A field of political-legal disputes in which the rights of peoples and communities, intellectual property regimes, and bioeconomy strategies are confronted, often marked by asymmetries and risks of bioepistemicide (Matheus, 2019; Sell; Gregori, 2018; Gebara; *et al.*, 2023).
- A privileged place for epistemological reflection – which dialogues with the Epistemologies of the South and with the notion of ecology of knowledges, challenging the exclusive centrality of Western scientific knowledge (Santos, 2014; Araújo, 2025; Casino; *et al.*, 2025).

This understanding broadens the horizon of environmental management, public policies, and scientific research itself, by shifting the Amazon from the place of a "resource frontier" to that of an ecosystem of knowledge, in which different rationalities and ontologies cohabit and dispute meanings of development, sustainability, and justice (Padovani, 2022; Gebara; Ramcilovic-Suominen; Schmidlehner, 2023; Galvão; *et al.*, 2024)element.

Contextualizing the theoretical discussion about the Amazon as an ecosystem of knowledge, it is assumed that the Amazonian context constitutes a *multilayered* space in which different knowledge systems are articulated in a dynamic, relational and historically constructed way (Porto-Gonçalves; 2006; Noble; Borma, 2009; Casino; *et al.*, 2025). Figure 1 presents a synthesis of these interactions, organizing them into three major dimensions, sociocultural, environmental and epistemological that, although analytically highlighted, operate in an integrated and synergistic way in the territory.

Figure 1

The Amazon as an ecosystem of knowledge: sociocultural, environmental and epistemological dimensions

Source: prepared by the authors, 2025.

Figure 1 systematizes an expanded view of the Amazon as an ecosystem of synergistic knowledge, in line with the conception of Santos (2018), for whom "all knowledge is situated, contextual and relational" (Santos, 2018, p. 47). Thus, understanding the region requires recognizing that its knowledge emerges from the continuous interaction between peoples, environments and sociocultural practices in a web of networks, cooperation, interactions and transfers of multiple knowledge (knowledge) relevant to society and organizations.

The first dimension highlighted refers to the sociocultural diversity of the Amazon, marked by the presence of indigenous peoples, riverside communities, quilombolas, and traditional populations that produce and preserve their own knowledge. Figure 1 highlights elements such as the diversity of peoples and knowledge, the conservation of intangible heritage, and the epistemologies of the South. These epistemologies, according to Santos

(2019), "affirm the legitimacy of historically subordinated knowledge" (Santos, 2019, p. 112), as opposed to the monoculture of scientific knowledge.

The second dimension refers to the role of Amazonian ecosystems as a basis for the production of local knowledge. Figure 1 presents elements such as biodiversity and territoriality, local ecological knowledge and socio-ecological management practices. Berkes (2015) calls this knowledge *traditional ecological knowledge*, defined as "bodies of adaptive knowledge derived from experience and transmitted culturally" (Berkes, 2015, p. 27).

The third dimension encompasses the plurality of knowledge systems present in the Amazon and the processes of intercultural dialogue that emerge from this encounter. Figure 1 highlights elements such as epistemological plurality, interculturality, co-production of knowledge, and integration between science and local knowledge.

Not to conclude, the articulation of the three dimensions reveals a web of knowledge networks in the Amazon as an ecosystem of deeply interconnected and interrelated knowledge. This view confirms the argument of Porto-Gonçalves (2017), who considers the region "a territory of epistemic insurgency and the invention of new possible futures" (Porto-Gonçalves, 2017, p. 203). Thus, any public policy, academic research, or KM initiative in the Amazon must recognize the inseparability between culture, environment, and epistemology.

2.4 INTEGRATION BETWEEN TRADITIONAL KNOWLEDGE, DIGITAL INNOVATION AND GC: MODELS, TENSIONS AND POTENTIALITIES

Traditional and indigenous knowledge have been understood as complex systems of production, circulation and use of knowledge, deeply rooted in specific territorial, cosmological and socio-political contexts (Becker, 2005; Assad, 2022; Coast; Almeida, 2023). The literature emphasizes that such knowledge cannot be reduced to a set of "local information", but constitutes "ways of knowing, doing and existing", articulating their own practices, values, narratives and technologies (Cunha, 2007, p. 25).

In this sense, researchers in Information Science and related areas have been advocating a broader reading of the concept of traditional knowledge, which encompasses knowledge about land management, biodiversity, medicinal plants, agroforestry systems, healing practices, and forms of social organization, often transmitted by orality and performance (Pereira; Espírito Santo, 2020; Foster; Zaninelli, 2025). As one of these studies summarizes, traditional knowledge "brings with it a broader element than the notion of

continuity", as it articulates collective memories, identity bonds and strategies of sociocultural reproduction in the long term (Pereira; Espírito Santo, 2020, p. 89.).

In the Amazonian context, documents from universities and scientific institutions emphasize that "traditional knowledge is inspiration for the decisions we need to make and to them are added the science we need to produce", pointing to the region as a strategic space for dialogue between local epistemologies and modern science (UFPA, 2023, p. 121). This perspective reinforces the Amazon as a privileged territory for experimenting with models of integration between scientific knowledge, indigenous knowledge and sustainable development policies (Porto-Gonçalves; 2006; Saints; Meneses, 2019; Pine; Araújo, 2023).

At the same time, critical authors warn of the risks of homogenization and "flattening" of internal differences when one speaks generically of "traditional knowledge", without considering the diversity of peoples, histories and cosmologies involved. Foster; Zanelli (2024), show that the tendency to treat indigenous knowledge as a single block, directly comparable to Western scientific knowledge, constitutes "a way to better homogenize it" and make its epistemological incommensurability invisible (Fonseca; Zaninelli, 2024, p. 29).

KM has emerged, in recent decades, as an interdisciplinary field that seeks to understand and structure processes of creation, organization, sharing and use of knowledge in different types of organizations, according to Correa, *et al.*, (2023) and Ziviani, *et al.*, (2025a). In a classic work, Davenport; Prusak (1998) defines knowledge as a fluid mixture of experience, values, contextualized information, and intuition, which provides a framework for evaluating and incorporating new experiences. For the authors, "Knowledge is a fluid mixture of interpreted experience, values, contextual information, and expert insight (Davenport; Prusak, 1998, p. 5), which implies recognizing the human, relational and situated dimension of knowledge.

In the debate on innovation, Nonaka; Takeuchi (1997) highlight the SECI dynamics (socialization, externalization, combination and internalization) as the engine of organizational knowledge creation, articulating tacit and explicit dimensions. The authors' perspective is relevant to thinking about the integration between traditional knowledge and digital innovation, as it emphasizes the procedural, collective, and historical character of knowledge production, central elements in indigenous and community contexts according to studies by Machado (2020).

In Brazil, KM has been appropriated and redefined by authors who situate it in public, academic and territorial contexts. Valentim (2010, 2008) argues that information

management and KM should occur in an articulated way, in order to promote behaviors of searching, sharing and using information aligned with the organizational culture. For the author, "information management in the organizational context occurs in a specific way and depends on the way knowledge is being managed" (Valentim, 2010, p. 42).

Batista (2023) reinforces this view by proposing a "simplified" KM, centered on accessible languages and practical tools for public administration, without losing sight of the complexity of organizational learning processes (Batista, 2023; Correa, *et al.*, 2023; Ziviani; *et al.*, 2025b). These contributions are important to contextualize, in Brazilian terms, the discussion on KM as a conceptual and operational infrastructure to integrate traditional knowledge, digital technologies and innovation policies (Cardoso; Pimenta, 2019; Belinski; Martins, 2020; Mark; Rodrigues, 2023)

More specifically, Fonseca; Santos (2023), when discussing "KM and traditional knowledge: an innovation proposal for indigenous organizations", propose the Collaborative Creativity Centers (NCC) as a KM model oriented to the valorization of indigenous knowledge. According to the authors, the NCC seek to foster a culture of innovation based on "the knowledge derived from the traditional knowledge of these peoples", articulating informational flows, KM practices and organizational innovation in companies and collectives linked to indigenous communities (Fonseca; Santos, 2023, p. 11.).

The expansion of digital technologies has profoundly reconfigured the ways of recording, storing, communicating, and appropriating traditional knowledge (Fleury; Lobato; Dantas, 2019; Costa, 2022; Oak; Saucer; Ribeiro, 2023). Steeves (2015) shows that, in various Indigenous contexts, digital technologies such as video, audio, photoFigurey, and online platforms have been appropriate to record, preserve, and share aspects of culture and knowledge with other Indigenous groups, the world, and future generations, while producing new challenges to cultural identity. In this sense, the author, "some digital technologies are helping Aboriginal groups record and share their traditional knowledge with other Aboriginal groups, the wider world, and future generations" (Steeves, 2015, p. 13).

Recent studies on "*indigenous knowledge management*" emphasize the role of technologies such as databases, RFID, GIS, 3D scanners, smartphones, and digital repositories to support the documentation, organization, and circulation of local knowledge, especially in the post-pandemic period (Matheus, 2019; Ajani, 2023). These works point out that digital innovation is not limited to the digitization of content, but involves the design of

socio-technical infrastructures sensitive to the community logics of ownership, access and use of knowledge (Pereira; Angeloni, 2020; Martin; Birth, 2021; Pine; Araújo, 2023).

From the point of view of sustainability, Anti (2025) discusses the challenges of preserving traditional knowledge in the digital age, highlighting that modernization and globalization have interrupted the intergenerational transmission of knowledge, putting its continuity at risk. The study emphasizes that "Accelerated modernization and globalization have disrupted the intergenerational transmission of this knowledge, putting it at risk of disappearing.", and that digital strategies need to be accompanied by robust ethical guidelines (Anti, 2025, p. 18).

In the same direction, Bellini; Raglianti (2025) analyze tensions and opportunities at the intersection between indigenous knowledge and digital technologies, showing that the introduction of platforms and information systems can both empower communities and reinforce power asymmetries and technological dependence if they are not co-designed with indigenous peoples themselves (Carvalho; Saucer; Ribeiro, 2021; Pine; Araújo, 2023). Studies focused on the Sustainable Development Goals also highlight that aligning traditional knowledge and digital technologies is strategic for goals such as climate action, biodiversity protection and quality education (Arvanitidis *et al.*, 2024; Fonseca, 2025).

In the Amazonian context, reports and case studies show experiences in which blockchain, big data, Internet of Things (IoT), and artificial intelligence have been used to support socio-bioeconomy chains, ensure traceability of forest products, monitor deforestation, and strengthen business models based on traditional knowledge (Santos; Costa, 2021; NESsT, 2025). These initiatives reinforce the potential of digital innovation as a mediator between local knowledge, global markets, and public policies for sustainable development (Souza; Gomes, 2019; Silva; Barreto, 2020; Saints; *et al.*, 2023)

Recent literature has advanced in the formulation of conceptual models of indigenous KM (GCI) and integration between traditional knowledge and contemporary KM approaches. Foster; Zaninelli (2024), carry out a review of international models of GCI, identifying different structures, varying according to geoFigureic location, community, and objectives of each initiative. The authors conclude that "the identified Indigenous KM models have different characteristics, structures, and approaches, according to the location, the community, and the proposed objectives", and point to the absence of models developed in Brazil as a research gap (Fonseca; Zaninelli, 2024, p. 19).

In a subsequent study, Fonseca; Zaninelli (2025) analyze African models of indigenous KM and show how ethno-knowledge systems articulate spiritual, environmental, and community dimensions in their own structures of classification and transmission, distinct from Western information systems. The study concludes that the integration between these systems and contemporary approaches requires recognizing "distinctive characteristics, sociocultural contexts and practical applications" of indigenous models, avoiding their mere translation into Eurocentric categories (Fonseca; Zaninelli, 2025, p13.).

In the Brazilian context, Fonseca; Santos (2023) proposes the aforementioned Collaborative Creativity Centers (NCC) as a KM model aimed at indigenous organizations, based on Choo's (2003) hypertext organization model. The NCC articulate three axes, namely, KM, innovation and traditional knowledge, and position indigenous knowledge as a central asset in the organizational innovation process (Fonseca; Santos, 2023).

The integration between traditional knowledge, digital innovation and KM is not without conflicts. The literature highlights different orders of tension: epistemological, political, legal, technological and institutional (Santos; Meneses, 2019; Freire; Lima, 2020; French; Oliveira, 2020). From the epistemological point of view, authors such as Cunha (2007) and Machado; Carvalho (2019), point out that traditional systems of classification and organization of information, based on Western logics, tend to exclude or distort indigenous knowledge.

On the technological level, there is a risk that digitization processes will reinforce "data colonialism", appropriating traditional knowledge without guaranteeing mechanisms of consent, community control and benefit sharing. Studies on indigenous databases and digital repositories insist on the need for governance models in which communities define the levels of access, use, and circulation of content, as well as criteria for contextualization and protection of sensitive knowledge (Steeves, 2015; Ajani, 2023).

Tensions related to intellectual property and traditional knowledge protection regimes are also at stake. Research on Amazonian socio-bioeconomy chains and on the use of traditional knowledge in technological innovation processes point to the importance of intellectual property policies that do not individualize collective knowledge, nor encourage its commodification without safeguards of cognitive justice and fair sharing of benefits (NESsT, 2025).

In the institutional dimension, authors who analyze KM in the public sector show that cultural factors such as resistance to change, power relations and forms of communication – constitute important obstacles to the implementation of collaborative KM practices (Batista;

Quandt, 2015; Silva; Barreto, 2020). Such challenges tend to intensify when it comes to incorporating traditional knowledge into institutions historically structured from Eurocentric epistemologies, such as universities, development agencies, and environmental agencies.

Finally, there are tensions within the communities themselves, related to generational, gender, and authority disputes over who can speak, record, and share certain knowledge, which requires KM and digital innovation models to be co-constructed in a way that is sensitive to local dynamics (Fonseca; Zaninelli, 2025).

Despite the tensions, the literature points to a wide range of potentialities in the integration between traditional knowledge, digital innovation and KM. Studies on the Amazonian socio-bioeconomy show that the articulation between traditional knowledge and emerging technologies has contributed to strengthening sustainable production chains, ensuring traceability of forest products, expanding access to markets, and fostering business models rooted in indigenous and community territories (NESsT, 2025)

On the scientific and technological level, initiatives coordinated by institutions such as RNP, universities and ST&I bodies have emphasized the construction of digital biodiversity management platforms that combine scientific data with traditional knowledge, providing for specific KM components and the development of open digital solutions (RNP, 2025; MCTI, 2025).

International authors highlight that aligning traditional knowledge and digital technologies contributes directly to several Sustainable Development Goals, especially those related to climate action, the protection of life on land, and the promotion of inclusive education (Arvanitidis; *et al.*, 2024). At the same time, workshops, networks, and international programs have been discussing models of research governance and rematriation of indigenous knowledge that use artificial intelligence and digital platforms to strengthen the rights, languages, and knowledge systems of indigenous peoples.

In the field of KM, these movements point to the need for more relational and ecosystemic models, which go beyond the view of knowledge as an exclusively organizational resource and recognize the existence of "knowledge ecosystems" marked by interdependencies between communities, scientific institutions, companies, technologies, and territories (Fonseca; Santos, 2023; Bellini; Raglianti, 2025).

Table 2

Theoretical synthesis: integration between traditional knowledge, digital innovation and KM

Dimension	Core elements	Main authors	Essential contributions
Traditional knowledge	Indigenous epistemologies; Territoriality; oral transmission; sociocultural complexity	Cunha (2007); Pear tree; Espírito Santo (2020); Foster; Zaninelli (2025); Smith (2012)	Smith (2012) demonstrates that indigenous epistemologies are often framed in inappropriate Western categories, generating invisibilizations. Cunha (2007) points out that traditional knowledge constitutes complex systems rooted in their own cosmologies.
GC	Processes of creation, organization, socialization and application of knowledge; tacit and explicit dimensions	Davenport; Prusak (1998); Nonaka; Takeuchi (1997); Valentim (2008, 2010); Baptist (2023)	Davenport and Prusak (1998) define knowledge as a fluid mixture of experience and contextualized information. Nonaka; Takeuchi (1997) propose the SECI model, integrating tacit and explicit dimensions in the creation of knowledge.
Digital innovation	Digitization of collections; data governance; platforms, AI, blockchain, GIS	Steeves (2015); Ajani (2023); Bawack (2025); Arvanitidis <i>et al.</i> (2024)	Steeves (2015) shows that digital technologies allow the recording and transmission of indigenous knowledge, while Bawack (2025) warns of the risks of data colonialism without community governance.
Integration Models	Indigenous GC (GCI); Collaborative Creativity Centers; Knowledge ecosystems	Foster; Santos (2023); Foster; Zaninelli (2024, 2025); Bellini; Raglianti (2025)	Fonseca and Santos (2023) propose the NCC, articulating KM, innovation, and traditional knowledge. Foster; Zaninelli (2024, 2025) evidence international diversity of GCI models.
Tensions and dilemmas	Epistemological colonialism; data governance; PI; Western frameworks; Institutional challenges	Smith (2012); Ajani (2023); Bawack (2025); Teixeira (2020); Santos <i>et al.</i> (2024)	Smith (2012) discusses colonial methodologies that distort indigenous knowledge. Teixeira (2020) highlights cultural barriers in public KM. Santos <i>et al.</i> (2024) show tensions in the appropriation of traditional knowledge (Baniwa peppers).
Potential	Sustainable innovation; socio-bioeconomy; digital ecosystems; informational sovereignty	NESsT (2025); Bioeconomy of Restoration (2024); RNP (2025); MCTI (2025)	NESsT (2025) shows how technologies can strengthen production chains based on traditional knowledge. RNP (2025) shows digital integrations between science and indigenous knowledge.

Source: survey data, 2025.

Table 2 shows that the integration between traditional knowledge, digital innovation, and KM requires the recognition of the complexity and epistemic autonomy of indigenous peoples. Cunha (2007) and Pereira; Espírito Santo (2020) show that traditional knowledge constitutes territorial and pluriepistemic systems, while Smith (2012) warns that Western categories tend to distort these epistemologies.

In GC, authors such as Davenport; Prusak (1998), Nonaka; Takeuchi (1997) and Valentim (2008; 2010) demonstrate that knowledge is relational and depends on structured processes of creation and circulation, favoring its articulation with indigenous epistemologies. In the digital field, Steeves (2015), Ajani (2023) and Bawack (2025) highlight that technologies can support cultural preservation, but also generate risks of data colonialism. Models such as the Collaborative Creativity Centers (Fonseca; Santos, 2023) and the studies on indigenous GC of Fonseca; Zaninelli (2024; 2025) show paths for sociotechnical integrations.

Finally, studies such as Santos *et al.* (2024) show ethical tensions and misappropriation. On the other hand, initiatives such as NESsT (2025), Bioeconomy of Restoration (2024) and RNP (2025) show that this integration has strong potential for sustainable innovation and the strengthening of Amazonian ecosystems.

Not to conclude, the theoretical review indicates that:

- traditional knowledge constitutes complex knowledge systems, which challenge Western models of information and KM;
- KM, by articulating processes of creation, organization and sharing, offers a fertile conceptual basis to model the integration between different epistemologies;
- digital innovation introduces opportunities and risks, requiring socio-technical infrastructures co-governed by indigenous communities and partner institutions;
- the emerging models of ICM and knowledge ecosystems point to ways to integrate traditional knowledge, digital technologies, and sustainable development policies, as long as they are attentive to the ethical, political, and epistemological tensions involved.

3 METHODOLOGY

The present research is characterized as a qualitative, exploratory and descriptive study, aimed at understanding KM in the preservation, systematization and valorization of traditional knowledge of the Amazon, promoting innovation with a focus on sustainable development. According to Gil (2019), the exploratory study aims to provide greater familiarity with the problem, making it more explicit or building hypotheses based on a set of preliminary observations.

The choice for a qualitative approach is justified by the interest in dialoguing with different interfaces of the regional context, with traditional knowledge, science, technology, innovation, public policies and sustainability. The qualitative approach allows the investigation

of complex phenomena, capturing meanings, perceptions and social practices in depth (Gil, 2008; Minayo, 2017).

A descriptive study is a type of research whose main objective is to describe characteristics, phenomena or relationships observable in a given context, without necessarily establishing cause and effect relationships or testing hypotheses. It seeks to organize, systematize and analyze data in detail, providing an in-depth overview of the object of study (Gil, 2008; Santos, 2014).

The study is based on interdisciplinary theoretical contributions from Information Science, Administration, Education, Sociology, Technology, Education, Production Engineering and anchored in the KM literature, which offer conceptual tools to analyze the processes of production, organization, sharing and use of knowledge in the academic sphere.

Information Science, according to Borko (1968) and Le Coadic (2004), is concerned with the informational cycle and the role of information and knowledge as strategic resources for decision-making and innovation. KM, on the other hand, according to Nonaka and Takeuchi (1997), involves processes of creation and dissemination of knowledge in organizations, favoring collective learning and continuous innovation.

The methodological approach was structured in five complementary axes: a) integrated literature review; b) survey of empirical data with KM researchers in the Amazonian context; c) documentary and institutional analysis of government agencies and social institutions; d) analysis of the activities of research groups in KM in the Amazonian context; and e) collection of secondary data from institutional websites of different actors that discuss KM in the Amazon. Each axis contributes to understanding different dimensions of KM in the regional context.

In the first phase, an Integrated Literature Review was carried out with the objective of mapping the scientific production on KM in the Amazon, identifying trends, research gaps, authors and institutions most active in the theme. National and international databases were consulted: Scielo, Web of Science, Scopus, Spell and Google Scholar.

The selection criteria included: i) Publications between 2000 and 2025; b) Language: Portuguese or English; and c) Content related to KM, integration of traditional knowledge and technological innovation. It should be inferred that this first phase of the research did not consider the methodological aspects and scientific rigor required for a Systematic Review of the Literature. Therefore, the studies highlighted in the research results were selected for the

convenience of researchers based on the scientific production of Brazilian research groups that deal with KM themes in the Amazon context.

The review aimed to map authors, concepts, theoretical approaches and research gaps, as advised by Tranfield, Denyer; Smart (2003) in conducting systematic reviews. The descriptors used included: GC, Amazon, traditional knowledge, sustainable innovation, public policies, and regional development. The data were analyzed through metrics such as annual volume of publications, frequency of keywords, enabling the identification of the main concepts and approaches (Bornmann; Daniel, 2008). Finally, the information was organized in Figures, tables and figures, being discussed and analyzed based on the discussions and foundations described in the theoretical framework.

The survey of empirical data with the purpose of understanding KM practices in the Amazon was carried out with data collection through semi-structured interviews with KM researchers in the Amazonian context. Two semi-structured interviews were conducted, as it allows flexibility and depth in the answers, as recommended by Triviños (2015). The interviews were conducted online (via Teams), lasting 60 minutes each, through a Free and Informed Consent Form (ICF). The participants were informed about the objectives of the research and consented to the recording and use of data, following ethical standards (BRASIL, 2016).

The data collection instrument was elaborated from the theoretical foundation discussed in the previous chapter, addressing the trajectory of scientific research in KM in the Amazon, understanding of research projects developed or in progress, scientific production in KM, training of human resources and understanding of themes such as knowledge of native peoples and the understanding of the role of KM in the context of economic development, technological and social aspects of the Amazon. Topics such as community participation, preservation of knowledge, technological innovation and territorial governance were addressed, allowing for deepening according to the answers (Gil, 2008).

The selection of the interviewed researchers was intentional and non-probabilistic, selected based on the following criteria: a) Work in graduate programs recognized by CAPES; b) Participation in projects or research groups with a KM focus in the Amazonian context; and c) Recent scientific production on KM in the Amazon. Table 3 presents the profile of the researchers interviewed. The data were recorded, transcribed and organized into thematic categories.

Table 3

Profile of the Interviewed Researchers

Interviewed	University	Training	Research Group	Years as a researcher
BETWEEN 1	UFAM UFPA	PhD in Information Science. Bachelor of Library Science	GICA	15
BETWEEN 2	UFAM	PhD in Communication and Semiotics. Degree in Library Science.	GICA	33

Source: survey data, 2025.

The transcripts of the interviews resulted in a volume of approximately 30 (thirty) pages of qualitative text. Only part of this volume of data was used in this study. Therefore, a vast and rich material in the development of scientific research in KM in the Amazon is still available for other analyses. A relevant strategy for future studies may be to use qualitative data analysis software NVIVO, MAXDATA or ATLAS TI.

In the analysis of government reports, institutional guidelines and official documents, technical and institutional documents dealing with Amazonian development and policies related to KM and the protection of traditional knowledge were examined. The analysis included:

- reports from federal and state agencies linked to territorial, socio-environmental management and regional development of the Amazon;
- public policies for science, technology and innovation, with a focus on guidelines for open data, protection of traditional knowledge and encouragement of sustainable innovation;
- regulations and regulatory frameworks aimed at safeguarding traditional knowledge, including guidelines related to the rights of indigenous peoples and traditional communities;
- institutional documents from BNDES, MCTI, CNPq, IBAMA and indigenous organizations, which offer strategic guidelines, development programs and ongoing projects in the region.

This documentary analysis allowed us to identify guidelines, institutional actors, regulatory weaknesses, and structural gaps that affect the implementation of KM practices in the Amazon, especially with regard to interinstitutional collaboration, data governance, and social participation.

The research also involved mapping the trajectory of groups registered in the Directory of Research Groups of Brazil (DGP/CNPq) that develop studies on the Amazon, traditional knowledge, sustainable innovation and KM. The following elements were analyzed: a) lines of research and their thematic evolution; b) scientific production (articles, theses, dissertations, books and technical reports); c) collaboration networks between researchers, institutions, traditional communities and government organizations; and d) scientific and community partnerships aimed at the collective construction of knowledge and innovation in the Amazonian context.

The findings were integrated into the results of the literature review, making it possible to identify emerging trends, conceptual centralities, research gaps, and potential interdisciplinary convergences.

The qualitative data from the interviews, institutional documents and bibliographic reviews were submitted to thematic content analysis, according to the procedures of Bardin (2016). This technique allowed the organization and interpretation of the textual corpus in analytical axes, such as: a) integration of knowledge (traditional and scientific); b) sociopolitical challenges of KM in the Amazon; c) governance of local information and knowledge; d) sustainable innovation and social technologies; and e) inclusion of indigenous peoples and local communities.

Combining bibliometric methods, document analysis and qualitative interviews, the methodology adopted enabled a comprehensive view of the state of the art of KM in the Amazon. The results made it possible to highlight the need for participatory models, transparent governance mechanisms and integrated policies that value both traditional knowledge and scientific and technological innovations.

As procedures for analyzing the collected data, we opted for data triangulation between bibliometric review, interviews and document analysis, ensuring reliability and robustness in the results (Triviños, 2011). The emerging categories were organized in tables and concept maps, facilitating the visualization of the relationships between actors, KM practices, public policies and promotion of innovation with a focus on sustainable development.

The conceptual map of the methodological path presented in figure 1 was elaborated to visually organize the relationships between the actors (local communities, researchers and government), the KM processes (co-creation, documentation, sharing) and the expected results (sustainable development, environmental preservation and innovation).

Figure 2

Conceptual Map of the Methodological Path

Source: survey data, 2025.

Finally, it should be noted that the research respected the ethical principles defined by Resolution No. 510/2016 of the National Health Council (2016), ensuring the anonymity of the participants and the use of the data exclusively for scientific purposes. All interviewees agreed to the Informed Consent Form (ICF).

The combination of methods such as: bibliometric review, document analysis and qualitative interviews made it possible to build a comprehensive understanding of KM in the Amazonian context. The results showed:

- the need for participatory KM models, which articulate scientific knowledge and traditional knowledge;
- the importance of transparent data governance mechanisms that are sensitive to territorial and identity agendas;
- the urgency of integrated public policies, capable of strengthening collaborative networks, ensuring respect for the rights of indigenous peoples and fostering innovations aligned with sustainable development.

4 PRESENTATION, ANALYSIS AND DISCUSSION OF RESULTS

Section 4 presents, analyzes and discusses the results in the light of the central objective of the study, which is to understand how KM can be mobilized to preserve,

systematize and value traditional knowledge in the Amazon and, simultaneously, guide innovation committed to sustainable development. It is based on the assumption, consolidated in the classic literature, that KM constitutes a framework for the creation, sharing and application of knowledge in socio-technical organizations and networks (Davenport; Prusak, 1998; Nonaka; Takeuchi, 2008). However, when shifted to a socio-ecological and epistemically plural territory such as the Amazon, this agenda tends to be tensioned by dimensions that conventional organizational models often deal with in a peripheral way, such as territoriality, historical asymmetries, collective regimes of knowledge ownership, and ethical safeguards against misappropriation (Berkes, 2015; Saints; Meneses, 2010). Thus, in this section, it is argued that the results should not be read only as a description of the state of the art, but as evidence of a field in dispute, in which KM is reconfigured as a socio-territorial practice, simultaneously cognitive, political and institutional. The presentation of the findings is organized on three methodologically complementary fronts: (i) results of the integrated literature review, which outline trends, semantic nuclei, actors and gaps; (ii) qualitative analysis of interviews with reference researchers, which explains convergences and tensions between theory and situated experience; and (iii) documentary analysis of reports, guidelines, and regulatory frameworks, which allows us to observe how policies and institutions condition, enable, or block inclusive knowledge ecosystems. By articulating these layers, it is intended to highlight implications for research and public policies, with an emphasis on participatory models, transparency in information governance, and institutionalization of effectively inclusive dialogue channels (Whittemore; Knafl, 2005; Tranfield; Denyer; Smart, 2003).

4.1 RESULTS OF THE FIRST PHASE OF THE RESEARCH: INTEGRATED LITERATURE REVIEW

The first phase of the research consisted of conducting an Integrated Literature Review (RIL), whose objective was to map the scientific production on KM in the Amazonian context, identifying trends, recurrences and research gaps. This type of review allows you to analyze and synthesize existing knowledge in a broad and flexible way, especially when it comes to complex and multifaceted phenomena. As Whittemore and Knafl (2005) point out, the integrated review is particularly useful when the literature is heterogeneous, as it "allows the combination of theoretical and empirical studies, enabling a more complete understanding of the phenomenon investigated" (Whittemore; Knafl, 2005, p. 547).

To search for the studies, recognized national and international databases such as: SciELO, Web of Science, Scopus, Spell and Google Scholar were consulted, considering publications between 2000 and 2025, in Portuguese or English and related to KM, the integration between traditional and scientific knowledge and technological innovation aimed at Amazonian development.

However, unlike a Systematic Review of the Literature (RSL), this stage did not follow strict protocols, such as PRISMA. RSL is characterized by standardized, reproducible procedures guided by methodological rigor. For Tranfield, Denyer and Smart (2003), the systematic review works as a structured investigation process, as it "follows a robust, transparent and replicable method to identify, evaluate and synthesize existing evidence" (Tranfield; Denyer; Smart, 2003, p. 209). Thus, the absence of these protocols implies that the results obtained here are exploratory, not exhaustive within the methodological parameters.

In this study, the integrated approach was intentionally chosen, due to the particularities of the theme. As Botelho, Cunha and Macedo (2011) point out, the integrated review "enables the inclusion of different methodologies, expanding the analytical scope and favoring critical and reflective syntheses" (Botelho; Wedge; Macedo, 2011, p. 126).

Thus, it should be inferred that the selection of studies was not intended to be exhaustive or replicable, typical characteristics of the RSL, but was guided by convenience and thematic relevance, considering the production of Brazilian research groups that stand out in discussions on KM in the Amazon, traditional knowledge, innovation and public policies in the Amazonian context. As Cooper (1988) points out, integrative reviews are appropriate when the objective is to "synthesize existing knowledge, identify patterns and propose new directions of research", especially in developing fields.

The adoption of this approach proved to be pertinent to the purpose of this exploratory phase, allowing to map the state of the art, organize relevant contributions, and subsidize subsequent more in-depth analyses, including epistemological, bibliometric, and political discussions related to KM in the Amazonian context.

The results are organized into seven sections: (i) temporal evolution, (ii) frequency of themes and keywords, (iii) co-authorship networks and clusters, (iv) outstanding authors and institutions, (v) thematic synthesis, (vi) gaps, and (vii) implications for public policies and future research.

4.1.1 Overview of Scientific Production (2000–2025)

The search carried out in the SciELO, Web of Science, Scopus, Spell and Google Scholar databases initially resulted in 1,147 studies related to the established descriptors. After applying the inclusion criteria (period 2000–2025; Portuguese/English languages; thematic adherence to KM, traditional knowledge, sustainable innovation, or the Amazon), 178 articles were selected for full reading and 92 articles for detailed analysis.

The breadth of the time frame allowed us to observe the gradual consolidation of the theme, especially from 2010 onwards, when interest in sustainable innovation, public ST&I policies and integration between traditional and scientific knowledge grew.

Figure 3

Temporal distribution of publications on KM in the Amazon (2000–2025)

Source: survey data, 2025.

The literature analyzed reveals a significant increase in studies after 2010, coinciding with the expansion of government agendas aimed at promoting innovation, science and technology in the Amazon. From 2015 onwards, there has been a greater density of studies on bioeconomy, governance of common goods, intercultural education, digital documentation systems, and management of traditional knowledge.

Silva and Gomes (2021) emphasize that "understanding the Amazon as a complex system requires KM approaches capable of integrating plural and technological epistemologies". Likewise, Santos (2010) argues that the ecology of knowledges is fundamental to address historical epistemic inequalities between scientific knowledge and traditional knowledge.

Figure 1 shows important oscillations, with production peaks in 2008, 2014, 2021, and 2024, suggesting key moments in which themes related to the Amazon, GC, bioeconomy, and traditional knowledge gained prominence in public and scientific agendas.

Main possible interpretations:

- The increase after 2015 coincides with the advancement of the discussion on PPCDAm, territorial governance and international agendas (SDGs).
- The jump in 2021–2024 may be associated with the rise of the Amazon bioeconomy, digitalization, and research on traditional knowledge.
- The occasional drops indicate periods of lower public funding or national thematic reorientation.

Figure 4 of keyword frequency reveals that the dominant terms are: Amazon, knowledge management, Sustainability and innovation. The central themes that articulate KM and sustainable development. Emerging terms linked to the identity agenda include: traditional knowledge, indigenous knowledge and epistemology. By analyzing the key words, a growing appreciation of Amazonian epistemologies and local knowledge can be perceived. Finally, a political-institutional axis is contacted, such as: public policy, governance. It shows that part of the literature analyzes KM as an instrument of territorial management and public policies.

Figure 4

Keyword Frequency

Source: survey data, 2025.

The analysis of keyword frequency reveals five central semantic cores: a) GC (*Knowledge Management*); b) Traditional Knowledge / Indigenous Knowledge; c) Innovation and Digital Transformation; d) Bioeconomy and Sociobiodiversity; and e) Regional Development / Territorial Governance.

This set suggests a field guided by hybrid approaches, which articulate organizational knowledge (Sveiby, 1998; Nonaka; Takeuchi, 2008;), epistemologies of the South (Santos, 2011, 2014) and socio-ecological systems (Brondízio *et al.*, 2016).

Table 4

Institutions with the highest production related to KM in the Amazon (2000–2025)

Institution	Predominant themes	Evidence from the literature
UFPA	Territorial information systems, socio-biodiversity	Lima (2018), Farias (2017)
INPA	Ethnoknowledge, biodiversity, documentation	Menezes (2020)
UFAM	S,T policies; I, digital governance	Braga (2022)
UFOPA	Traditional and riverine communities	Santos (2019)
FIOCRUZ Amazon	Traditional knowledge in health	Rocha (2019)

Source: survey data, 2025.

The predominance of Amazonian institutions (UFPA, INPA, UFAM, UFOPA) confirms the thesis of Barbalho *et al.* (2023) that the production of traditional knowledge and KM must emerge from the territory, avoiding decontextualized readings of hegemonic centers of the Global South or South-Southeast axis

Authors such as Farias (2017), Lima (2018) and Menezes (2020) reinforce the role of sociobiodiversity and traditional ecological knowledge in territorial governance. These productions respond to Berkes' (2015) warning about the urgency of integrating scientific knowledge and local knowledge for resilient adaptive systems.

The growing presence of research on innovation and social technologies (D'Ávila; Moreira, 2020 and Braga, 2022;) shows the region's alignment with global Industry 4.0 trends, but with an Amazonian reading — inclusive, communitarian and relational (Stradioto; Frazzon, 2023).

The interpretative analysis allowed us to identify five structuring thematic trends in the literature, presented in Table 5.

Table 5

Thematic trends identified in the literature on KM in the Amazon

Tendency	Description	Author contributions
Integration of knowledge	Articulation between scientific and traditional knowledge	Santos (2010), Rocha (2019)
Technological innovation	Digital platforms, GIS, databases	Braga (2022)
Territorial governance	Public policies, planning and management	Acselrad (2015)
Sociobiodiversity	Sustainable production chains	Lima (2018)
Education and broadcasting	Youth training and intergenerational practices	Menezes (2020)

Source: survey data, 2025.

The theme of integration of knowledge in literature highlights the centrality of indigenous, quilombola, and riverine epistemologies (Almeida, 2014; Battiste, 2019; Santos; Meneses, 2019). On the other hand, the "ecology of knowledges" of Santos (2010) is the main theoretical lens highlighted here. In Santos' view, (2011, p.13), "There is no cognitive justice without the recognition of multiple ways of knowing."

This perspective dialogues with Toledo's ethnoecology; Barrera-Bassols (2009) and with Agrawal's (2002) critique of the fragmentation between indigenous knowledge and Western knowledge.

Regarding technological innovation, Ferreira; Mendes (2019), Braga (2022) and Schott; Steinmuller (2023) articulates with Bellini's vision; Raglianti (2025) on digital knowledge ecosystems, in which digitalization does not replace, but enriches traditional systems.

The emergence of documentation and digital preservation platforms (Steeves, 2015; McGrew *et al.*, 2023; NESsT, 2025) reinforces opportunities and risks, namely: the opportunities: visibility, registration, legal protection and the risks: misappropriation, digital colonialism, bioepistemicide (Gebara *et al.*, 2023).

The governance of these systems is highlighted by RNP (2025), which defends ethical protocols for sensitive data.

Regarding the territorial governance trend, Acselrad (2015), Cardoso; Pimenta (2019) and Castro, Lima; Zucarelli (2021) argue that KM in the Amazon is inseparable from environmental management, land conflicts, and social participation. This view is reinforced by Brondizio *et al.* (2016), who describe the Amazon as a socio-ecological complex, in which territorial decisions depend on situated knowledge flows.

Amazonian Sociobiodiversity and Bioeconomy, according to Schmitz (2020) and EMBRAPA (2021) needs KM models capable of documenting, tracking, and protecting

knowledge associated with biodiversity. In this sense, Silva's criticism; Oliveira (2020) to biopiracy reinforces the need for KM that respects collective rights, as provided for in the Nagoya Protocol.

Gebara; *et al.* (2023) warn of the risk of bioepistemicide, when production chains ignore traditional knowledge. Thus, KM is not mere "registration", but protection, recognition and fair redistribution of benefits.

Finally, with regard to education and intergenerational transmission Rocha (2019), Loureiro; Almeida (2022) and Menezes (2020) argue that Amazonian knowledge is transmitted through community immersion, orality, and bodily practices. Therefore, KM in the Amazon needs a people-centered approach, not only in databases (Polanyi, 1966; Wenger, 1998).

4.1.2 Shortcomings identified – critical comments

From the integrated literature review, it was possible to identify some theoretical, methodological and contextual gaps. Thus, it can be highlighted as the main critical points evidenced in the literature.

- Absence of Amazonian theoretical models

Confirmed by Fonseca; Zaninelli (2024; 2025), who propose models of indigenous KM.

- Deficit of longitudinal studies.

Barbalho (2021) argues that there are many descriptive analyses and few impact assessments.

- Lack of university-community integration.

Almeida; Szwarcwald (2020) highlights sociopolitical barriers that hinder the inclusion of traditional populations.

- Fragility of ethical digital platforms

Teeves (2015) and McGrew *et al.* (2023) show risks of leakage of sensitive data.

- Little articulation between KM and public policies

Teixeira (2020) and Santos; Costa (2021) reinforce this gap.

These gaps are not only scientific, but structural and linked to the limited historical recognition of Amazonian populations in science and technology policies.

4.2 QUALITATIVE ANALYSIS OF INTERVIEWS WITH KNOWLEDGE MANAGEMENT RESEARCHERS IN THE AMAZONIAN CONTEXT

KM has evolved, in recent decades, from a field guided by organizational models related to business strategy such as those defined by Alavi and Leidner (2001), Davenport and Prusak (1998) and Nonaka; Takeuchi (2008) and for a more diverse field of study, capable of dialoguing with different epistemologies, cultural realities and modes of knowledge production. In the Amazonian context, this transition becomes even more evident, as territorial dynamics, traditional knowledge regimes, sociocultural diversity, and the history of structural inequalities impose unique challenges and possibilities, as highlighted by the researchers interviewed.

The empirical corpus used for this analysis consists of qualitative interviews with Profa. Célia Regina Simonetti Barbalho, a pioneer in KM research in the Amazon, and Profa. Danielly Oliveira Inomata, a researcher at UFAM and UFPA whose contemporary work articulates KM, sustainability and information flows in the Amazonian context.

The analysis was conducted according to the methodology of Content Analysis (Bardin, 2011), with thematic categorization and critical interpretation of the corpus, confronting it with contemporary literature on a) integration of knowledge (traditional and scientific); b) sociopolitical challenges of KM in the Amazon; c) governance of local information and knowledge; d) sustainable innovation and social technologies; e) inclusion of indigenous peoples and local communities; f) trajectory of KM research in the Amazonian context; g) KM research groups in the Amazon; and h) ongoing and future research agenda of KM in the Amazon.

From the interviews and literature, it is possible to outline a robust contemporary agenda on the KM theme in the Amazonian context.

The research agenda on KM in the Amazon has as its starting point studies on indigenous KM and intellectual protection. As highlighted in the studies by Fonseca (2024) who studies the conceptual modeling of indigenous KM and studies by Gebara, et.al., (2023) who deals with analyses on bioepistemicide and the National Observatory of Indigenous Production.

The researcher ENTRE 1 highlights GC research, information flows, and climate change as an agenda. According to the researcher ENTRE 1, research on climate disinformation and organizational resilience in the face of environmental effects in the Amazon is underway.

Castro Studies; Zucarelli, (2021) deal with integrated information governance. Focused on building systems that unite scientific, socio-environmental and traditional data.

On the other hand, Cardoso; Pimenta (2019) discuss KM and bioeconomy/sociobioeconomy when developing studies on sociobiodiversity production chains and social technologies.

Finally, studies such as Correa, *et al.*element. (2023) put KM in public organizations in the Amazon on the research agenda. Contributing to this agenda Cunha; Meirelles, (2022) deal with innovation mechanisms for public policies in the Amazon context.

Summarizing the current and future agenda of KM research in the Amazon, Table 6 presents the foundations for understanding and substantiating the studies.

Table 6

Current and Future Agenda for KM Research in the Amazon

Line of Research	Researchers/Evidence	Scientific developments
Indigenous GC	The researcher ENTRE 2 reports that the formation of a network of researchers is essential to strengthen research in the Amazonian context; It reinforces the need to investigate epistemological models.	Conceptual models (Fonseca, 2024) and intellectual protection.
Climate Misinformation	The researcher ENTRE 1 coordinates studies on information flows.	GC-climate articulation; evidence-based decision-making.
Bioeconomy and social technologies	Research on Baniwa Pepper and sustainable chains.	GC Integration – Territorial Innovation (EMBRAPA, 2023).
Information Governance	Integrated repository projects and Amazonian thesauri.	Knowledge ecosystems (Bellini, 2025).

Source: survey data, 2025.

4.2.1 Integration of Knowledge (Traditional and Scientific)

The integration between traditional and scientific knowledge emerged, in the interviews, as one of the central axes of the resignification of KM in the Amazonian context. The literature also points to this movement as essential to face socio-environmental challenges and build sustainable development alternatives (Berkes, 2015; Escobar, 2016; Leff, 2021)

ENTRE 2 stresses that indigenous knowledge operates through dynamics that completely challenge traditional KM models. In his words: "It deconstructs absolutely all concepts" of KM by observing the relational, ritualistic and cosmological logic that governs indigenous knowledge

This view dialogues with Agrawal (2002), who argues that Western classifications tend to reduce the complexity of traditional knowledge, and with Battiste (2019), who defends epistemological decolonization as a condition for understanding indigenous knowledge systems.

Table 7 below was elaborated considering the qualitative data collected in the interviews and their relationship with the theoretical framework and the authors on which this study is based.

Table 7

Integration of Knowledge (Traditional and Scientific) in the Amazon GC

Dimension	Corpus Evidence	Relationship with Literature
Nature of traditional knowledge	Knowledge transmitted by rites, coexistence, collective practices and spiritual choices; "deconstructs absolutely all the classic concepts" of KM as stated by ENTRE 2.	Berkes (2015) on sacred ecology; Agrawal (2002) on the classification of knowledge; Foster; Zaninelli (2024) on indigenous GC.
Science-tradition co-production	Amazonian GC should incorporate local values and knowledge into organizations, according to reports from ENTRE 1.	Jasanoff (2004) and Cassino; <i>et al.</i> (2025) on co-production of knowledge systems.
Epistemological tensions	Need to abandon rigid Western categories to understand indigenous cosmologies according to ENTRE 2.	Leff (2021) and Escobar (2016) on territorial and decolonial epistemologies.

Source: survey data, 2025.

The interviewed researcher (ENTRE 2) reinforces that "knowledge management in the Amazonian context means incorporating values and knowledge into the organizational culture" and recognizing that Amazonian institutions already assume elements of sustainability and tradition in their missions and institutional practices. This understanding is close to Jasanoff (2004), for whom scientific and social knowledge are co-produced; and Casino; *et al.* (2025), who argue that thinking with the peoples of the Amazon can expand contemporary knowledge systems

In this sense, the interviewed researcher ENTRE 2 explains that, among indigenous peoples, socialization occurs: a) by rites; b) dances; c) coexistence in the preparation of food; d) community crops; and e) spiritual choice of apprentices, as in the case of shamans.

Therefore, these results contrast with Nonaka's SECI cycles; Takeuchi (2008), based on tacit-explicit conversion. As Polanyi (1966) points out, tacit knowledge is always greater than explicit knowledge and in the Amazon, it remains primarily tacit for cultural, spiritual and collective protection reasons, according to the researchers interviewed.

4.2.2 Sociopolitical Challenges of Knowledge Management in the Amazon

Sociopolitical challenges form a cross-cutting category, articulating historical inequalities, institutional barriers, environmental pressures, and geopolitical disputes. According to a report by ENTRE 1, it can be said that researchers from the North live with "the asymmetry of graduate studies", which requires interstate partnerships and the strengthening of regional programs such as UFAM and UFPA

This asymmetry has been widely documented by Bentes-Gama (2012) and Bursztyn (2015) who describe the historical marginalization of the Amazon in science and technology policies

As highlighted by ENTRE 2, research with indigenous peoples requires multiple authorizations, such as FUNAI and the Ethics Committee, making the process "extremely complex" and bureaucratic, especially in ethnoFigureic approaches. CNS Resolution 510/2016 reinforces the need for ethical care in research with vulnerable populations, also foreseen by Diegues (2000) and Bernard; Jorgensen (2022) in the discussion of collaborative ethics in traditional knowledge.

ENTRE 1 reports that it has been investigating information flows and disinformation related to climate change, a critical issue in a region that lives under ecological "tipping points", an issue also reported in Nobre's studies; Borma (2009) and political tensions associated with environmental disinformation. Therefore, KM thus becomes a mechanism of cognitive governance in the face of narrative conflicts about climate, forest, and territory.

One should reflect on the economic exploitation of knowledge. ENTRE 2 warns of the vulnerability of traditional knowledge in the face of the interest of pharmaceutical and biotechnology industries, stating: "Imagine the pharmaceutical industry crazy to get their hands on the pile of knowledge they have".

This concern is corroborated by Matheus (2019) and Gebara *et al.* (2023), which discuss the threat of bioepistemicide, that is, the appropriation and erasure of indigenous knowledge systems by the global biotechnology economy.

Table 8 summarizes the sociopolitical challenges of KM in the Amazon and relates the challenges to the literature.

Table 8

Sociopolitical Challenges of KM in the Amazon

Category	Interview Evidence	Dialogue with Scientific Studies
Academic and regional asymmetries	ENTRE 1 reports the historical disparities between the North and other regions related to the training of human resources. It reinforces the need to strengthen regional graduate studies.	Bursztyn (2015); Bentes-Gama (2012) on inequality of scientific infrastructure.
Bureaucracy and ethics in research with indigenous people	Need for multiple authorizations (BETWEEN 2).	Bernard; Jorgensen (2022); CNS Resolution 510/2016.
Economic exploitation of knowledge	"Pharmaceutical industry eager to get its hands on knowledge" (ENTRE 2)	Matheus (2019); Gebara <i>et al.</i> (2023) on bioepistemicide.
Climate misinformation	This is a central theme of projects coordinated by ENTRE 1.	Noble; Borma (2009); Brondízio <i>et al.</i> (2016).

Source: survey data, 2025.

4.2.3 Governance of Information and Local Knowledge

The theme of governance of information and local knowledge, described in Table 9, emerges as a strategic axis for integrating data, protecting traditional knowledge and structuring information ecosystems.

Table 9

Governance of Information and Local Knowledge

Dimension	Corpus Situations	Theoretical Framework
Informational fragmentation	Lack of an integrated system on the Amazon; projects for unified repositories (ENTRE 2).	Castro; Zucarelli (2021); Freire; Lima (2020).
Intellectual protection	Demand for access and safeguard restrictions (ENTRE 2).	McGrew <i>et al.</i> (2023); Matos; Tenazor (2019).
Community governance	Collective and non-commodified knowledge (ENTRE 2).	Almeida (2014); Cunha (2007) on traditional collectivities.

Source: survey data, 2025.

The researcher ENTRE 2 argues that there is a lack of a "large referential system of integrated information about the Amazon" and that her projects seek precisely to "structure a unified repository" that connects scientific, socio-environmental and traditional data.

This gap is recognized by authors such as Freire; Lima (2020) and Castro, Carvalho; Zucarelli (2021) and that highlight the need for integrated informational governance for environmental and territorial policies in the Amazon context.

It becomes evident that it is necessary to safeguard and protect the intellectual territory of the Amazon. Study by McGrew *et al.*, (2023), points out that traditional knowledge requires

specific protection mechanisms, such as: a) adequate licensing; b) legal protection; c) specific metadata; and d) ethical governance of information.

The researcher and interviewee ENTRE 2 who has been working since CBA and PROFNIT with intellectual property issues and states that GC in the Amazon needs to consider access restrictions, as certain knowledge cannot be widely opened without risk of external exploitation.

Indigenous governance systems are not based on Western notions of property, but on collectivity, reciprocity, and territoriality, as highlighted in the studies of Cunha (2007) and Almeida (2014).

Therefore, the practice of governance directly implies KM strategies that must respect: a) distributed decision-making; b) cultural and spiritual authority and c) cosmological protection of knowledge.

4.2.4 Sustainable Innovation and Social Technologies

KM is recognized as a structuring resource for sustainable innovation, as ENTRE 1 points out when it states that KM can "direct knowledge aligned with sustainability in the cultural, economic, environmental and technological dimensions"

This view corresponds to the notion of informational sustainability highlighted in Barbosa's studies; Schneider (2015) and in the seminal studies of Geraldo, Pinto; Duarte (2022). Also discussed in the approaches to knowledge ecosystems by Bellini; Raglianti (2025).

By highlighting social technologies as an Amazonian solution, ENTRE 2 highlights the production of baniwa pepper as an example of KM in social technology: community production, traditional division of roles and innovation oriented to indigenous economic autonomy.

In this sense, authors such as Fleury, Lobato; Dantas (2019) and D'Ávila (2020) argue that social technologies are more effective in Amazonian territories because they respect local traditions, collectivities, and ecological systems

Reflecting on academic and technological innovation, it was evident that ENTRE 2's performance in the CBA, implementing KM structures, competitive intelligence and intellectual property, demonstrates a pioneering model of institutional innovation oriented to the bioeconomy. The literature on Amazonian bioeconomy (EMBRAPA, 2021; Coast;

Almeida, 2023) reinforces this articulation between science, territory, and traditional knowledge.

4.2.5 Inclusion of Indigenous Peoples and Local Communities

Indigenous KM as an epistemological rupture is discussed in the reports of the researcher ENTRE 2 when she states that working KM with native peoples requires "detaching oneself from many concepts of knowledge management" because indigenous knowledge has a cosmological, spiritual and relational nature.

This understanding dialogues with Fonseca; Zaninelli (2024), who propose conceptual models of indigenous KM, and with Escobar's (2016) approach to "feeling-thinking with the Earth".

The researcher ENTRE 2 mentions the creation of a national observatory of the production of indigenous academics, which seeks to map intellectual trajectories and strengthen the epistemological autonomy of these groups.

In this sense, the researcher ENTRE 1 reinforces that her UFAM-UFPA work contributes to expanding indigenous and regional participation in graduate programs, reducing historical inequalities in the regional context.

4.2.6 Trajectory of KM Research in the Amazon Context

The genesis of KM research in the Amazonian context has as its starting point studies based on the field of librarianship and management. The researcher ENTRE 2 reports that she began her research in the 1990s, when she was still "the only doctor in the library science course for almost 20 years" and began investigating library management and technological diagnoses at UFAM.

The turning point was the performance of ENTRE 2 in the field of biotechnology. Thus, his work at the Amazon Biotechnology Center (CBA) for 12 years marks a significant turning point that positioned GC as a strategic tool to support the nascent biobusiness hub in the region. This phase anticipated current trends in the territorial bioeconomy, as evidenced in Fernandes' studies; *et al.*, (2025).

Table 10 summarizes the trajectory of KM research in the Amazon.

Table 10

Groups and Trajectories of KM Research in the Amazon

Theme	Interview Evidence	Interpretative Synthesis
Origin of studies	Initial research by ENTRE 2 in the 1990s in librarianship and organizational diagnoses.	The Amazonian GC was born within information science, with a strong institutional look.
Biotechnological turn	12 years of experience at CBA structuring KM, innovation and intellectual property. (OF 2)	Framework that links KM to the bioeconomy and regional industrial policy.
Network expansion	Simultaneous performance UFAM-UFPA and expansion of graduate studies (ENTRE 1).	Institutional strengthening and new lines of research in sustainability and information flows.
GICA	Structuring of lines focused on KM; Inclusion of GC in the name of the group and Amazon focus.	Consolidation of the GC research ecosystem in the North.

Source: survey data, 2025.

Finally, in 2019, the reformulation of the research group culminated in the creation of GICA, definitively inserting KM as a central research axis at UFAM and strengthening studies of traditional knowledge, women in science and intellectual protection as reported by the researchers.

4.2.7 Research Groups in Knowledge Management in the Amazon

This study sought to understand the KM strategy in the Amazonian context. In this sense, the researcher ENTRE 1 describes GICA as a continuation of the historical NEPCI, aimed at studying characteristics of information and knowledge as managerial elements, with "special focus on the Amazonian context".

Under the coordination of the researcher and interviewee ENTRE 2, GICA began to develop research on: a) indigenous knowledge; b) GC in public organizations; c) social technologies; d) informational sustainability; and e) bioeconomy.

The researchers' reports reinforce And highlight some emerging national networks such as the observatory of indigenous academics and national partnerships reflect the maturation of KM in the Amazon as a relevant field of research.

Table 11 summarizes the KM research groups in the Amazon, the lines of research and the main contributions to the regional context.

Table 11

KM Research Groups in the Amazon

Group / Institution	Interview Evidence	Line of Action	Contributions to the Amazon GC
GICA – Research Group on Information and Knowledge Management in the Amazon (UFAM)	Reformulated in 2019; Includes CG in the name of the group as reported in ENTRE 1.	Information, GC, innovation, sustainability.	It integrates teaching, research and extension; history of training regional staff.
DICA – Development, Information, Knowledge and the Amazon (UFAM)	Structured by the researcher and interviewee ENTRE 2; Strong performance in ICTs, indigenous KM and intellectual property.	Traditional knowledge, governance, bioeconomy.	Pioneer in the discussion of indigenous KM and safeguarding knowledge..
PPGIC – Graduate Program in Information and Communication (UFAM)	Created with the participation of the researcher and interviewee ENTRE 1; interdisciplinary focus.	Interdisciplinarity, culture and KM.	It expands epistemological and theoretical boundaries of KM.
PPGCI – UFPA	Simultaneous performance of the researcher (ENTRE 1) strengthens UFAM-UFPA integration.	KM, sustainability, information flows.	It reduces regional asymmetries and strengthens Amazonian scientific production.
National Networks/Observatory of Indigenous Scholars	Initiative coordinated by the researcher ENTRE 2 in a multidisciplinary network.	Indigenous epistemologies and critical open science.	It promotes visibility and autonomy of indigenous researchers.

Source: survey data, 2025.

4.2.8 Ongoing and Future Research Agenda of KM in the Amazon

From the interviews and literature, it is possible to outline a robust contemporary agenda on the KM theme in the Amazonian context.

The research agenda on KM in the Amazon has as its starting point studies on indigenous KM and intellectual protection. As highlighted in the studies by Fonseca (2024) who studies the conceptual modeling of indigenous KM and studies by Gebara, et.al., (2023) who deals with analyses on bioepistemicide and the National Observatory of Indigenous Production.

The researcher ENTRE 1 highlights GC research, information flows, and climate change as an agenda. According to the researcher ENTRE 1, research on climate disinformation and organizational resilience in the face of environmental effects in the Amazon is underway.

Castro Studies; Zucarelli, (2021) deal with integrated information governance. Focused on building systems that unite scientific, socio-environmental and traditional data.

On the other hand, Cardoso; Pimenta (2019) discuss KM and bioeconomy/sociobioeconomy when developing studies on sociobiodiversity production chains and social technologies.

Finally, studies such as Correa, *et al.* (2023) put KM in public organizations in the Amazon on the research agenda. Contributing to this agenda Cunha; Meirelles, (2022) deal with innovation mechanisms for public policies in the Amazon context.

Summarizing the current and future agenda of KM research in the Amazon, Table 12 presents the foundations for understanding and substantiating the studies.

Table 12

Current and Future Agenda for KM Research in the Amazon

Line of Research	Researchers/Evidence	Scientific developments
Indigenous GC	The researcher ENTRE 2 reports that the formation of a network of researchers is essential to strengthen research in the Amazonian context; It reinforces the need to investigate epistemological models.	Conceptual models (Fonseca, 2024) and intellectual protection.
Climate Misinformation	The researcher ENTRE 1 coordinates studies on information flows.	GC-climate articulation; evidence-based decision-making.
Bioeconomy and social technologies	Research on Baniwa Pepper and sustainable chains.	GC Integration – Territorial Innovation (EMBRAPA, 2023).
Information Governance	Integrated repository projects and Amazonian thesauri.	Knowledge ecosystems (Bellini, 2025).

Source: survey data, 2025.

4.2.9 Convergences Between Interviews and KM Theories

KM has been consolidated as a strategic field for private, public, and social organizations since the 1990s. Authors such as Davenport and Prusak (1998), Nonaka; Takeuchi (2008) and Choo (2006) established theoretical frameworks that define knowledge as an essential organizational asset for innovation, competitive advantage, and continuous learning.

However, when analyzing specific contexts, especially the Amazon, marked by sociocultural diversity, traditional knowledge, its own cosmologies, complex ecosystems and unique territorial dynamics, it is observed that the classical models do not fully account for reality. It is at this point that fundamental contributions emerge from the interviews conducted with Prof. Dr. Célia Regina Simonetti Barbalho and Prof. Dr. Danielly Oliveira Inomata, pioneering researchers at the interface between GC, the Amazon and traditional knowledge.

The researcher (ENTRE2) points out that, in the case of indigenous peoples and other Amazonian communities, it is necessary to "deconstruct absolutely all [traditional] concepts of knowledge management," given the way knowledge circulates, is shared, and protected in these contexts. On the other hand, researcher ENTRE 1, in turn, highlights that the Amazon GC must incorporate contextualized values, knowledge, and practices, integrating sustainability, institutional mission, and territoriality.

This chapter deepens these convergences, articulating them with the conclusions of the Integrated Literature Review on KM in the Amazon (2000–2025), prepared by the research project to which this work is linked. Thus, the central objective is to demonstrate how interviews and theories complement each other, tension and generate new understandings about KM in the Amazonian context.

The convergence between interviews and KM theories points to KM as a social and cultural practice. Both the literature and the interviewees converge on the idea that knowledge is socially constructed. Brown and Duguid (2001) state that KM should be understood as a social practice, not as a mere technical process. This understanding appears strongly in the statements of the researcher ENTRE 2.

Researcher ENTRE 2 points out that "Socialization [among indigenous people] is much broader. It occurs through rites, dances, daily coexistence." The researcher ENTRE 1 adds that, in Amazonian organizations, KM depends on the incorporation of regional values into the organizational culture. Thus, he states: "To think about knowledge management in the Amazon is to incorporate values and knowledge into the culture of organizations."

Table 13

Theoretical and Empirical Convergences between Interviews and KM Classics

Dimension	Classical theories	Interview – ENTRE 2	Interview – ENTRE 1	Convergence
Nature of knowledge	Tacit and explicit (Nonaka; Polanyi)	Indigenous knowledge is mostly tacit and non-externalizable	Knowledge must incorporate regional values	Knowledge is social and contextual
Socialization	Interaction and learning	Rituals, dances, expanded coexistence	Amazonian organizational culture	Expanded socialization
KM as a strategy	Innovation and advantage	Cultural safeguarding and protection	Sustainability and SDGs	KM as a socio-territorial practice
Public management	Moderate role	GC in libraries	KM in universities and public agencies	Expanding the KM Field

Source: survey data, 2025.

Traditional knowledge challenges the SECI model. Classical literature assumes that knowledge tends to be transformed into explicit for management purposes. However, ENTRE 2 clarifies: "They are not concerned with transforming tacit knowledge into explicit knowledge". This statement converges with Berkes (2015) and Battiste (2019), who argue that indigenous knowledge is holistic, contextual, and not reducible to formal records.

The interviews converge with recent literature linking KM and sustainability (LEITE; BAPTISTA, 2019). Researcher ENTRE 1 emphasizes: "Our research is directly related to the SDGs, especially sustainability, climate change, and organizational resilience."

This perspective dialogues with authors who highlight the Amazon as an essential ecosystem for global climate balance (Artaxo, 2019; Brondizio *et al.*, 2016).

The researcher ENTRE 1 states that a large part of her scientific production involves KM in public management, especially universities and research bodies. "We have many projects focused on knowledge management in public organizations, including organizational maturity and innovation."

The literature confirms the historical gap in studies on KM in public institutions in the Amazon (Alfenas *et al.*, 2021; Baptist; Quandt, 2015).

KM contributes to the preservation of knowledge and generational continuity. In this sense, ENTRE 2 reports the implementation of KM in the UFAM Library System to avoid loss of critical knowledge with retirements: "Several people had mastery of the system's knowledge and this could be lost."

Davenport; Prusak (1998) already emphasized the importance of retaining organizational knowledge, but in the Amazonian context this dimension acquires more urgent contours due to regional asymmetries, an issue emphasized by ENTRE 2.

Table 14

Convergences between Interviews and KM Theories

Concept	Interview BETWEEN 2	Interview BETWEEN 1	Literature
Tacit knowledge	Indigenous knowledge is not easily converted into explicit; are culturally protected.	GC must recognize territorialities and subjectivities.	Polanyi (1966); Nonaka; Takeuchi (2008).
KM and sustainability	KM applied to the protection of traditional knowledge.	Projects aligned with the SDGs and climate resilience.	Barbosa; Schneider (2015); Geraldo; Pinto (2019).
Social innovation	Traditional production chains as social technologies.	KM as a driver of sustainable innovative practices.	Fleury <i>et al.</i> (2019); D'Ávila (2020).

Source: survey data, 2025.

4.3 DOCUMENTARY ANALYSIS OF GOVERNMENT REPORTS, INSTITUTIONAL GUIDELINES AND REGULATORY FRAMEWORKS IN THE AMAZON

The analysis of government reports, institutional guidelines, and normative documents allowed us to deepen the understanding of the policies that guide Amazonian development and their relationship with KM. Technical documents from federal and state agencies linked to territorial, socio-environmental and regional development management were examined, including environmental monitoring reports, strategic plans for sustainable development and territorial planning instruments. Public policies for science, technology, and innovation were also analyzed — especially those aimed at promoting open data, protecting traditional knowledge, and stimulating sustainable innovation, which make up the normative framework for KM practices in the Amazonian context.

In addition, regulatory and normative frameworks related to the safeguarding of traditional knowledge were considered, including guidelines related to the rights of indigenous peoples and traditional communities, with emphasis on benefit-sharing mechanisms, access to genetic heritage, and shared governance of knowledge. Institutional documents from agencies such as BNDES, MCTI, CNPq, IBAMA and indigenous organizations were also included, since they present strategic guidelines, development programs and structuring projects being carried out in the region.

This documentary analysis made it possible to identify key guidelines, institutional actors involved, normative weaknesses and structural gaps that directly affect the implementation of KM practices in the Amazon. Among the main challenges identified, the following stand out: low interoperability between government information systems; the fragmentation of initiatives for the production and circulation of knowledge; insufficient interinstitutional articulation; and limited social participation in decision-making processes. Such elements reinforce the need for collaborative governance models and robust data management and openness policies that strengthen the integration between science, traditional knowledge, and sustainable innovation in the region.

Reports from federal and state institutions responsible for territorial and environmental management and regional development were examined, including:

- State Master Plans and Economic-Ecological Zoning (ZEE);
- Environmental monitoring reports from IBAMA and ICMBio;
- Strategic plans for sustainable development linked to SUDAM and the Ministry of Integration and Regional Development;

- Evaluation reports on bioeconomy policies and Amazonian production chains.

These documents provide an overview of the use of socio-environmental data, territorial information infrastructure, and shared governance challenges, which are fundamental to KM.

Regulations and guidelines of Science, Technology and Innovation (ST&I) policies were also analyzed, especially those related to:

- data openness and interoperability (Federal Government Open Data Policy);
- protection and sustainable use of genetic heritage and traditional knowledge (Law No. 13,123/2015);
- encouragement of applied research in bioeconomy;
- digital governance and integration of information systems.

These policies are directly related to the ability to produce, manage and share knowledge strategically.

The analysis included regulatory frameworks such as:

- National System for the Management of Genetic Heritage and Associated Traditional Knowledge (SisGen);
- Guidelines of the Convention on Biological Diversity (CBD);
- Norms on the territorial rights of indigenous peoples and traditional communities (FUNAI, ILO Convention 169);
- Community protocols for consultation and prior consent.

These instruments regulate the use, recognition, and protection of traditional knowledge—an essential element of KM in the Amazon.

Institutional documents were also analyzed from:

- BNDES (funds for bioeconomy, innovation notices and resources for sustainable production chains);
- CNPq (research calls, scholarships for traditional knowledge, INCTs focused on the Amazon);
- MCTI (National Innovation Strategy, National Open Science Policy);
- IBAMA and ICMBio (management of conservation units and environmental data policies);

- Indigenous organizations (consultation protocols, territorial and environmental management plans – PGTAs).

These documents reveal how different institutions produce and circulate knowledge, with varying degrees of integration.

Table 16

Institutional actors and their functions in the GC of the Amazon

Actors	Main functions	Contributions to KM	Weaknesses identified
MCTI / CNPq / CAPES	ST&I policy formulation; Promotion of research	Scientific production, research networks, data infrastructure	Low integration with traditional knowledge; Fragmentation between bases
BNDES / Finep	Economic and technological development	Supporting sustainable innovation and the bioeconomy	Few actions integrated with territorial governance
IBAMA / ICMBio	Environmental inspection and management	Large environmental databases	Systems not interoperable with universities and local organizations
SUDAM / State Governments	Regional planning	Territorial and socio-economic plans	Lack of informational standardization and KM mechanisms
Indigenous organizations	Territorial management, advocacy	Consultation protocols and safeguarding of knowledge	Poor integration with government systems
Universities / INCTs	Research and training	Scientific production and dissemination	Difficulty accessing up-to-date government data

Source: survey data, 2025.

5 FINAL CONSIDERATIONS

KM in the Amazon presents itself as a crucial tool for sustainable development, capable of integrating traditional and scientific knowledge, strengthening local governance and promoting innovation. The strengthening of these practices contributes to the preservation of biodiversity and the improvement of the socioeconomic conditions of Amazonian communities.

The Amazonian context, due to its vast biodiversity and cultural diversity, faces complex challenges that require innovative approaches to promote sustainable development. In this sense, KM emerges as a strategic tool to integrate traditional and scientific knowledge, strengthen local governance and drive adaptive solutions in the face of climate change and socio-environmental pressures seeking sustainable development and committed to the UN Sustainable Development Goals (SDGs).

KM in the Amazon is essential for building sustainable solutions that respect the cultural and environmental diversity of the region. Integrating traditional and scientific knowledge, strengthening local governance, and promoting innovation are essential steps to ensure a sustainable future for the Amazon and its peoples.

KM in the Amazon represents a strategic path to integrate science, technology and traditional knowledge in favor of a sustainable and innovative development model. Valuing cognitive diversity and creating collaborative networks are essential for the knowledge produced in the region to effectively contribute to global solutions to environmental, social, and economic challenges.

When applied ethically and interculturality, KM can strengthen the appreciation of traditional knowledge from the Amazon, promoting cognitive justice and sustainability. The articulation between scientific and traditional knowledge requires institutional, political and cultural mediations that respect the rights of communities and recognize epistemic plurality.

The preservation of this knowledge is not only a matter of memory, but of environmental and cultural survival. Thus, integrating KM into the protection of traditional knowledge represents a promising path for the future of the Amazon and humanity.

Among the main challenges are the asymmetry of power between social actors and the risk of misappropriation of traditional knowledge. The implementation of policies for the protection and recognition of collective intellectual rights is indispensable. In addition, KM in the Amazon must be based on ethical, collaborative, and intercultural principles that recognize epistemological diversity and strengthen the autonomy of local peoples (Barreto; Freitas, 2020).

The advancement of information and communication technologies can enhance the sharing and integration of knowledge, but it requires adequate infrastructure and cultural mediation to avoid exclusions (Moraes; Birth, 2021; Mark; Rodrigues, 2023).

KM in the Amazon represents a fertile field for social and environmental innovation. Knowledge dialogues between local and scientific knowledge are essential pillars for participatory and sustainable governance. Thus, the integration of KM practices can contribute not only to the strengthening of public policies, but also to the appreciation of cultural diversity and the protection of the forest and its peoples.

The Amazon presents complex challenges, but also unique opportunities for the implementation of innovation and sustainability strategies. The integration between bioeconomy, technology, environmental conservation, and inclusive socioeconomic

development is essential to ensure the preservation of the biome and the well-being of local populations. Robust public policies, investments in research, and the active participation of communities are essential to transform potential into concrete and lasting results.

KM in the Amazonian context is a challenging field, but strategic for sustainable development and for the valorization of local knowledge. The integration of scientific and traditional KM practices requires adapted models that respect cultural plurality, the collectivity of indigenous knowledge, and the institutional specificities of the region.

The literature shows that KM can serve not only as a tool for organizing and disseminating knowledge, but also as an instrument for social, technological and environmental innovation. The Amazon, therefore, should not be seen only as an object of study or a source of natural resources, but as a strategic space for the production of plural, ethical, and sustainable knowledge, capable of contributing to regional and global science, technology, and innovation policies.

The application of KM in the Amazon has proven to be essential to strengthen social inclusion and regional sustainability. According to Brito, Lima and Oliveira (2016), KM practices in credit unions in the states of Rondônia, Acre and Amazonas allowed the dissemination of knowledge to local communities, expanding opportunities for socioeconomic development.

Studies such as the one by Brito *et al.* (2016) analyze KM practices in credit unions in the states of Rondônia, Acre and Amazonas, highlighting the importance of disseminating knowledge for social inclusion and income distribution in the region.

In addition, citizen science projects, such as ForestEyes, use KM tools to monitor deforestation and generate data in real time, allowing for more efficient decision-making by public and private managers (Silva *et al.*, 2022).

KM is understood as the systematic process of creating, storing, sharing and using knowledge to generate value and innovation (Davenport; Prusak, 1998). In the territorial context, especially in regions such as the Amazon, knowledge management needs to go beyond traditional corporate models, incorporating sociocultural, environmental, and cultural dimensions (Martins; Silva, 2019).

The main challenges for KM in the Amazon involve the lack of technological infrastructure, limited connectivity, scarcity of incentive policies, and the difficulty of legal recognition of traditional knowledge. However, there are promising prospects with the

advancement of digital transformation, the expansion of research networks, and the strengthening of the bioeconomy (Menezes; Rodrigues, 2023).

The articulation between GC and SDGs represents a promising path for sustainable development, especially in megadiverse and socio-culturally rich regions such as the Amazon. From the interviews analyzed, it is observed that For Barbalho, the Amazonian KM requires alternative conceptual frameworks and respect for the cosmologies of the original peoples, deconstructing classical models. For Inomata, KM in the Amazon must integrate knowledge, sustainability and organizational mission, strengthening institutions and innovating in social and environmental practices.

Thus, the KM Research Agenda must be plural, ethical, inclusive, and territorially situated, contributing to addressing global and regional challenges, and consolidating KM as an instrument for social and environmental transformation in alignment with the SDGs.

KM in the Amazonian context is today a unique field, which requires epistemological decolonization, respect for territorialities, integration between science and tradition, and strengthening of governance structures. More than adapting classic models, it is necessary to create new paradigms that reflect the complexity of the region, as Célia and Danielly defend in their trajectories and productions.

The convergence between traditional and scientific knowledge, social technologies, bioeconomy, and informational governance points to a future in which KM can contribute decisively to the cognitive, cultural, environmental, and political sustainability of the Amazon.

The bibliometrics carried out point to a promising and consolidating field: KM in the Amazon is currently articulated with central themes of the socio-environmental agenda (bioeconomy, governance, traditional knowledge and digital innovation). However, there is an urgent need for sensitive methodological models, applicable metrics and ethical protocols for KM to contribute in a fair and sustainable way to regional development and the protection of Amazonian epistemological heritage.

The literature analyzed demonstrates that KM in the Amazon: a) is emergent, interdisciplinary and politically situated; b) it requires articulation between science and traditional epistemologies; c) it is deeply linked to environmental governance, bioeconomy and cognitive justice; and d) it requires its own conceptual models, ethically sustainable and digitally integrated.

As Escobar (2016), Santos (2018) and Leff (2021) argue, the future of the region depends on post-decolonial approaches, capable of respecting Amazonian ways of producing knowledge.

This study has some limitations that can be observed in the results, such as: a) Many studies are qualitative, focusing on specific cases or restricted communities, which may make generalizations difficult; b) the availability of public data, validated models or specific "Knowledge Management" metrics in the Amazonian context is still limited; c) the practical implementation of KM models adapted to the Amazon encounters logistical, cultural, and financial barriers many studies point to the challenges, but even fewer show models widely implemented and evaluated with robust quantitative data; and d) There is a risk of applying imported models without adaptation to the Amazonian context, which can lead to failures in adaptation or local rejection.

ACKNOWLEDGEMENTS

The authors would like to thank the Minas Gerais Research Foundation (FAPEMIG), the National Council for Scientific and Technological Development (CNPq) for funding the Postdoctoral Fellowship Abroad to one of the researchers who authored this study, and the Coordination for the Improvement of Higher Education Personnel (CAPES), the Catholic University of Brasília, the Catholic University of Brasília UEMG Institutional Research Support Program (PAPq/UEMG) to the Federal Institute of Minas Gerais and the Federal University of Rondônia.

Amanda Carolina da Silva Vinci¹

ABSTRACT

The purpose of this article is to analyze the relationship between the right to the city and housing policies in São Paulo, focusing on occupations promoted by housing movements in central areas. An interdisciplinary approach was adopted, combining normative analysis of urban and housing legislation with a bibliographical review of academic studies and official documents on social mobilization and participatory governance. The results showed occupations respond to a structural housing deficit resulting from historical processes of marginalization; that instruments of participatory democracy play a decisive role in the formulation and continuity of inclusive policies; and that the reuse of empty urban spaces for social housing strengthens the dialogue between civil society, public authorities and private initiative. In the end, we highlight the need to institutionalize participatory channels to ensure the continuity of these policies and propose investigating their applicability in other Brazilian metropolises.

Keywords: Right to the City. Housing Policies. Participatory Democracy. Social Housing.

RESUMO

Este artigo tem por objetivo analisar a relação entre o direito à cidade e as políticas habitacionais em São Paulo, com foco nas ocupações promovidas por movimentos de moradia nas áreas centrais. Adotou-se abordagem interdisciplinar, combinando análise normativa da legislação urbanística e habitacional com revisão bibliográfica de estudos acadêmicos e documentos oficiais sobre mobilização social e governança participativa. Como resultados, constatou-se que as ocupações respondem a um déficit estrutural de moradia decorrente de processos históricos de marginalização; que instrumentos de democracia participativa exercem papel decisivo na formulação e continuidade de políticas inclusivas; e que o reaproveitamento de espaços urbanos ociosos para habitação de interesse social fortalece a interlocução entre sociedade civil, poder público e iniciativa privada. Ao final, destaca-se a urgência de institucionalizar canais participativos para garantir a perenidade dessas políticas e propõe-se investigar sua aplicabilidade em outras metrópoles brasileiras.

Palavras-chave: Direito à Cidade. Políticas Habitacionais. Democracia Participativa. Habitação de Interesse Social.

RESUMEN

El objetivo de este artículo es analizar la relación entre el derecho a la ciudad y las políticas de vivienda en São Paulo, centrándose en las ocupaciones promovidas por los movimientos de vivienda en las zonas céntricas. Se adoptó un enfoque interdisciplinario, combinando el análisis normativo de la legislación urbanística y de vivienda con una revisión bibliográfica de estudios académicos y documentos oficiales sobre movilización social y gobernanza participativa. Como resultados, se constató que las ocupaciones responden a un déficit estructural de vivienda derivado de procesos históricos de marginación; que los instrumentos de democracia participativa desempeñan un papel decisivo en la formulación y continuidad de políticas inclusivas; y que la reutilización de espacios urbanos ociosos para viviendas de interés social fortalece el diálogo entre la sociedad civil, el poder público y la iniciativa privada. Por último, se destaca la urgencia de institucionalizar canales participativos para garantizar la continuidad de estas políticas y se propone investigar su aplicabilidad en otras metrópolis brasileñas.

Palabras clave: Derecho a la Ciudad. Políticas de Vivienda. Democracia Participativa. Vivienda Social.

1 INTRODUCTION

This article will investigate how the dialogue between organized civil society and municipal administration can boost housing policies in large urban centers, taking the center of São Paulo as a case study, with the purpose of building more inclusive and sustainable cities. To ensure the effectiveness of these policies, they must be formulated in line with a vision of a modern and progressive city, which goes beyond the right to housing and the use of urban space, with a view to universalizing access to culture, leisure and sports.

From this analytical perspective, the present study proposes to address five fundamental issues: urban occupations are understood as forms of reaction to the socio-spatial segregation of peripheral populations; the institutional and social configuration of the municipalities contributes to the strengthening – or weakening – of the debate and the implementation of articulated housing policies; the articulation between different institutions has a direct impact on the reconfiguration of large urban centers; the institutionalization of democratic governance practices interferes with the representativeness and legitimacy of local governments; An integrative city-project acts as a potential tool in mitigating the urban deficit in a structuring way.

To this end, it will consolidate bibliographic research of normative documents - international treaties, Federal Constitution of 1988, infra-constitutional legislation, in comparison with quantitative data and vast specialized literature to demonstrate to what extent the reinforcement of local associative links and representative organizations influences the mobilized social capital and the consolidation of democratic practices.

2 THEORETICAL FRAMEWORK

The construction of inclusive cities requires an in-depth analysis of the theories that relate the right to the city, participatory democracy and housing policies. The concept of the right to the city, initially formulated by Henri Lefebvre (1968), has been expanded by contemporary authors such as Rolnik (2016) and Saule Júnior (2016), who understand it as a diffuse and collective right, capable of guaranteeing not only access to housing, but also to culture, leisure, transportation, and public services.

In this sense, the City Statute (Law No. 10,257/2001) represents, to this day, a fundamental legal framework by establishing guidelines for sustainable and inclusive urban development based on instruments such as the Special Zones of Social Interest (ZEIS) and the special urban adverse possession demonstrate how the legislation seeks to reconcile the

right to housing with the social function of property (Cafrune, 2016).

The literature also highlights the role of organized civil society in the formulation and implementation of public policies. Social housing movements, participatory councils, urban committees and conferences are examples of democratic governance practices that expand the representativeness and legitimacy of municipal decisions (Rubin, 1996; Amanajás; Klug, 2018).

These are mechanisms that reinforce the idea that the city must be built collectively, ensuring the inclusion of historically marginalized groups, such as homeless populations, women, the elderly, and LGBTQIAPN+ communities.

At the international level, documents such as the World Charter for the Right to the City (2005) and the Gwangju Principles (2015) consolidate the right to the city as an emerging human right, in line with the United Nations (UN) Sustainable Development Goals, especially Sustainable Development Goal (SDG) No. 11, which provides for inclusive, safe and sustainable cities.

Despite normative and institutional advances, authors such as Rolnik (2024) point out the persistent gap between legislation and urban reality, marked by real estate speculation, gentrification, and housing deficit. This contradiction highlights the need to seek ways to strengthen the channels of participation and to institutionalize democratic practices that ensure the continuity of social policies aimed at broad access to housing.

3 METHODOLOGY

This article proposes an integrative review of the literature aimed at understanding the relationship between organized civil society, housing policies and the right to the city, taking the city of São Paulo as a case study. The choice for this cut is justified by the leading role of the capital of São Paulo in the processes of urban occupation and the relevance of social mobilizations around decent housing.

The research is exploratory and descriptive to identify how normative instruments and participatory practices have been applied in the construction of inclusive cities, as well as to analyze the impacts of urban occupations in the center of São Paulo.

The sample comprises normative instruments, notably the Federal Constitution of 1988, the Statute of the City (Law No. 10,257/2001), complementary legislation and international treaties on the right to the city and housing; works by authors such as Lefebvre (1968), Rolnik (2016, 2024), Saule Júnior (1997, 2016), Cafrune (2016), among others that

discuss urbanization, housing policies, and participatory democracy; data collected from the repositories of the Institute of Applied Economic Research, João Pinheiro Foundation and international organizations such as UN-Habitat; case studies, such as programs and initiatives aimed at the rehabilitation of idle spaces and urban occupations in the center of São Paulo.

Despite the geographical restriction to the city of São Paulo and the use of secondary data, the analysis sought to highlight convergences and divergences between theory, legislation and social practice in the management of the housing deficit in the capital of São Paulo.

4 RESULTS AND DISCUSSIONS

4.1 THE RIGHT TO THE CITY AND THE EXERCISE OF DEMOCRACY

The housing deficit in one of the largest metropolises in the world, marked by miscegenation and multiculturalism, has long been discussed. Even so, the city is home to a growing number of homeless people, a trend that intensifies over the years and mandates. The challenges related to housing go beyond housing policies, as there is a structural factor that makes it impossible to continue public policies aimed at the socially vulnerable population: the city deficit, a term coined by Raquel Rolnik (2016).

As it is understood as a diffuse and collective right, the right to the city must be exercised in each metropolis, town or city institutionally organized as a district, municipal or metropolitan administrative local unit, covering the urban space, as well as the rural or semi-rural surroundings that are part of its territory (Saule Júnior, 2016, p. 75).

The definitions of this right were extended to encompass not only the mere exercise of a faculty, but the duty – also of the population itself – to think about fair, inclusive and sustainable cities. To this end, the right to the city began to reveal socioeconomic nuances, considered an essential common good for the quality of life, and which requires a positive conduct of the State.

The right to the city is free of any form of discrimination, strives for an inclusive citizenship, with greater political participation, which fulfills its social functions and is composed of founding elements for its conformation as a diffuse and collective good, namely, the presence of quality public spaces, with gender equality, cultural diversity, inclusive economies and a common ecosystem that respects rural-urban links (Ibid., p. 75).

The relevance of this theme is so significant that, at the international level, the right to the city is recognized in several documents essential for its understanding as an emerging human right within the new urban agenda. Among them, the World Charter on the Right to the City (2005), the European Charter of Human Rights in Cities (Saint-Denis, 2000), Human Rights in Cities – Global Agenda (United Cities and Local Governments – UCLG, 2009), the City Charter on the Right to the City (Mexico, 2009) and the Rio de Janeiro Charter on the Right to the City, of the World Urban Forum (2010).

In addition, documents such as For a World of Inclusive Cities, the UCLG Committee on Social Inclusion, Participatory Democracy and Human Rights (2013) and Social Inclusion and Participatory Democracy and the Gwangju Principles for a City of Human Rights (2015) reinforce this debate and its growing importance.

In Brazil it was no different, as the provisions on the subject gained space during the redemocratization of the country, when the right to the city was improved in the legal and institutional spheres. In the provisions relating to the right to housing, the right to the city is guaranteed, as a logical antecedent of the former.

In the Urban Policy Chapter, which aims to order the full development of the city's social functions and ensure the well-being of its inhabitants, arts. 182 and 183 served as inspiration for the formulation and implementation of urban policy.

This policy, consolidated in Law No. 10,257/2001 (City Statute), has as its fundamental principle the promotion of the dignity of the human person, guiding guidelines and actions aimed at sustainable and inclusive urban development, considered to this day as a legal framework in the face of urban ills, especially those related to irregular housing and the absence of basic sanitation. land regularization actions and urbanization of informal settlements.

The Statute begins with the discipline of the use of urban property of the artificial environment and lists as main guidelines to guarantee the right to sustainable cities, which today are a new role model for the achievement of plural, democratic and progressive cities, the right to urban land, housing, basic sanitation, urban infrastructure, to transport and public services, to work and leisure.

In order to achieve its desideratum, over the years, Law No. 10,257/2001 gave rise to the creation of tools aimed at favoring possession for housing purposes, for the sake of the permanent permanence of the occupants, through mechanisms for the regularization of real estate, legal and political institutes, among which the Special Zones of Social Interest (ZEIS)

stand out, the concession of the real right of use, the concession of special use, the special adverse possession and the right of surface (Cafrune, 2016, p. 192).

The ZEIS are a clear example of how the right to housing and the right to the city are umbilically intertwined, as they fulfill a double function: in addition to establishing special conditions for the land regularization of low-income settlements, they also boost the production of new social housing units by public and private agents.

The extravagant legislation was not restricted to the Statute. Eight years later, came the urban demarcation and the legitimization of administrative possession, with Federal Law No. 11,977/2009, which provides for the Minha Casa, Minha Vida Program (MCMV) and the land regularization of settlements located in urban areas. This law sought to streamline the procedure for recognizing the factual situation of urban settlements, as occurs with the acquisitive prescription by extrajudicial means and with concessions and surface rights.

All this normative framework allowed the instrumentalization of a better management of urban space, especially from the edition of the aforementioned master plan, a procedure that was accompanied by popular participation throughout the process of elaboration of urban policy, from the conception of urban policy management, to its implementation, through specific municipal legislation.

Over time, other valuable instruments have emerged to ensure the social management and strategy of urban spaces, aimed at the democratic administration of the territory, among which conferences, councils and public hearings stand out to promote dialogue between local governments and civil society and provide "the appropriation and institutional recognition of the local social and cultural reality for the constitution of the rules, procedures and instruments aimed at making the right to the city effective" (Saule Júnior, 1997, p. 42).

For these two poles to interact effectively, it is essential to strengthen communication channels, always the first step in this process. As Rubim (1996, p. 75) points out, living in large urban centers necessarily means being inserted in multiple communicative dynamics.

Thus, it is not enough just to give voice to local populations, it is essential to listen to them. The importance of interpersonal relationships within organized groups lies exactly in this, as they expand and strengthen territorialized coexistence in different spaces of the city, each with its own demands and specificities.

4.2 HOUSING POLICY COMBINED WITH URBAN MANAGEMENT

Chronologically, the Brazilian urbanization process accelerated from the second half of the twentieth century, anchored in an expressive population growth. According to studies carried out by the Institute of Applied Economic Research (IPEA), for the Brazilian Habitat III Report, between 1960 and 2010, urbanization grew 402%, from 32 million to 160 million people living in cities. Percentage-wise, in 1970, the urban population was 56%; in 1996, 78.4%; in 2010, 84.4% (IPEA, 2016).

But the rising urbanization, combined with the disorderly growth of cities, especially in developing countries, has generated consequences and challenges, especially in large centers, where segregation, informality and marginalization of some social strata have been observed, making the city a practically private environment for a very restricted layer of the population.

The rapid unplanned expansion of municipalities and cities means an increasing number of poor and vulnerable people living in precarious conditions, without adequate housing space or access to basic services such as water, sanitation, electricity and health services.

This means that the periphery accesses spaces of culture, leisure and sports, mostly, as service providers, or they cross these means on their way to work and from there to home. There is, therefore, no integration, belonging and participation for those who do not live in the city, but only work to keep it functioning for the benefit of a portion of society that effectively occupies and enjoys these spaces.

In an attempt to shorten the distances between the peripheral regions and the large centers, where the city actually takes place, during the 2000s, there was a reflection on the edition and execution of public policies for urban infrastructure in the country, especially to enable the exercise of the right to decent housing.

Large cities usually face different types of challenges to insert themselves in global economic spaces, to guarantee the population the minimum well-being, necessary for the consolidation of competitive democratic coexistence, as Borja (1996, p. 82) points out, namely, infrastructure, quality of life, social integration and governability.

This awareness leads economic agents to set objectives and carry out acts compatible with local government and of a collective nature. To be up to date with this requirement, it is necessary to have a city project, which can be designed from the transformation of urban infrastructure, which would facilitate the transition from the traditional industrial model to that

of a qualified tertiary center, so that local leadership, whether political or not, must be present and contribute to the construction of joint leadership.

4.3 HOUSING FOR THOSE WHO BUILD THE CITY

In the international sphere, the precursor document dealing with this matter appeared in 1948, the Universal Declaration of Human Rights (UDHR), which enunciates the right to housing, enunciated in paragraph 1 of article 25, according to which everyone has the right to a standard of living sufficient to ensure health and well-being for him and his family, especially with regard to food, clothing, housing, medical care and necessary social services, and has the right to security in the event of unemployment, sickness, disability, widowhood, old age or other cases of loss of means of subsistence due to circumstances beyond their control (United Nations, 1948).

In 1966, the International Covenant on Economic, Social and Cultural Rights (ICESCR) was adopted, whose article 11, § 1 enshrines the right to housing by recognizing the right of all people to an adequate standard of living and to the continuous improvement of their living conditions. Brazil internalized this commitment on July 6, 1992, through Decree No. 591.

Nationally, housing policy in the country was developed between the 1940s and 1960s, based on the Retirement and Pension Institutes, the Popular House Foundation and the creation of the National Housing Bank (Rubin; Bolfe, 2014).

The treatment of the housing issue, at the constitutional level, according to the 1988 Charter, is specifically provided for in article 6, specifically addressed, under the terms of article 23, item IX, which attributes to the Union, the States, the Federal District and the Municipalities, common competence for the promotion of housing construction programs and improvement of housing conditions and basic sanitation.

The importance of the right to housing, especially decent housing, has been among the social rights since Constitutional Amendment No. 26/2000, which added this subjective right to the category of social prerogative. Like the right to the city, the right to housing demands a positive attitude from the public entity as it appears as a prerogative of the private individual.

The enactment of the City Statute represented one of the great milestones in the consolidation of the right to the city, reaffirming its commitment to the right to housing as well. To implement the constitutional commandments, the Ministry of Cities was created in 2003,

with the mission of centralizing the financing and execution of essential policies for urban development. Among its main areas of activity, housing, land regularization, urban planning, transportation, mobility and sanitation, integrated city management and the promotion of decent living conditions for the population stand out.

In the same year that the Conferences of Cities and the Council of Cities were created, instruments for the strategic and democratic management of federal urban policies that also began to discuss the issue of housing, a process of strengthening social participation in the design of housing policies began.

This participatory framework was reinforced in 2005, with Law No. 11,124 (popular initiative), which established the National Social Interest Housing System (SNHIS) and the corresponding Fund (FNHIS), establishing guidelines and resources to guarantee decent housing and access to urbanized land for the low-income population.

Through this law, the National Housing Secretariat of the Ministry of Cities was established and coordinated the preparation of the National Housing Plan (PLANHAB), as an instrument for the implementation of the new National Housing Policy (PNH).

Regional and sectoral debates were also organized, including for direct monitoring by representatives of the Council of Cities and the Management Council of the National Fund for Social Interest Housing (CGFNHIS). PLANHAB represented not only a watershed in housing policy, but represented, for the time, a true exercise of social and political cooperation, structured with the contribution of various participatory bodies.

This process of institutional participation strengthened political dialogue and triggered structural changes in the Brazilian macroeconomic panorama: it raised average incomes, motivated federal actions to mitigate the effects of the global financial crisis, and leveraged the growth of credit and investments in the housing sector. These factors ensured the success of a long-term housing policy, aimed especially at low-income families through periodic reviews and articulation with the government's budgetary and financial planning instruments.

In 2007, it was the turn of Law No. 11,445/2007 to create the national guidelines for basic sanitation. In the same year, the Growth Acceleration Program (PAC) was launched, which included projects aimed at social and urban infrastructure, covering areas such as housing, sanitation, mobility, risk reduction and water resources.

In 2009, the Minha Casa, Minha Vida (MCMV) Program was implemented, reestablished by Law No. 14,620/2023, to expand the housing stock to meet housing needs, especially for low-income families; improve the conditions of existing housing, correcting

inadequacies related to property ownership, structure, sanitation, infrastructure and public services; encourage the modernization of civil construction and technological innovation, promoting cost reduction, environmental sustainability and the qualification of housing production to expand the reach of the Program; strengthen the institutions involved and train public and private agents; and encourage the participation of micro and small companies, individual microentrepreneurs in civil construction and private non-profit entities in the program's actions.

The following year, Law No. 12,305/2010 came into force, which instituted the National Solid Waste Policy, followed by Law No. 12,587/2012, responsible for the National Urban Mobility Policy. Together, these legislations made two important financing programs possible, allocating significant resources to the development of cities and the implementation of strategic actions for urban sustainability.

Despite the extensive legislative and operational apparatus, the urban reality remains far from meeting the needs of the population (Rolnik, 2016). Thus, this disconnection highlights the fragility of public policies and opens space for the rise of social organizations and housing movements, which demand structural changes in the way of living and occupying the city.

Cafrune (2016) points out that the appropriation of urban spaces by all inhabitants is not only a right, but an urgent need. These territories should be recognized as spaces of diversity, strengthening of community relations, leisure and full exercise of citizenship, not as mere scenarios of systematic exclusion.

It is in these spaces that those excluded from the process of planning and construction of cities, such as migrants and refugees, women, young people, the elderly and people with disabilities, homeless populations, indigenous people and the LGBTQIAPN+ population, exercise their citizenship and claim the right to the city (Amanajás; Klug, 2018).

The expectation is that by 2030 the design of socially inclusive and safe public spaces will contribute to the reduction of urban inequalities and crime. SDG No. 11 has precisely this desideratum, that is, the construction of inclusive, safe, resilient and sustainable cities and human settlements. However, with only five years to go, this timeline sounds more programmatic than feasible, especially because there is still a lack of practical answers on how to convert the excluded and invisible into full-fledged citizens.

At the same time that we agree on global goals, the challenge remains to translate these guidelines into concrete policies and projects that, in the city's daily life, promote the

effective participation and recognition of those who to this day live on the margins of the urban space.

4.4 LIVES ON THE MARGINS AND IDLE SPACES

The right to housing is much more than a simple shelter: it is the home where our dreams sprout, where we feel seen, safe and fully human. For methodological purposes, this article will be restricted to the municipality of São Paulo, which still faces severe and secular difficulties in the implementation of perennial housing policies, which is why it still concentrates a significant housing deficit.

For no other reason, it is one of the municipalities that has one of the highest coefficients of homeless people, very motivated by some factors in particular: gentrification, the criminalization of peripheral populations, real estate speculation, and still quite marked by a history of social exclusion whose factors already identified point to obstacles of the most diverse orders, associated with neoliberal macroeconomic policies and budget reserves, for example.

Faced with this scenario of social exclusion and structural challenges that profoundly mark the city of São Paulo, it has become urgent to adopt measures capable of reversing this situation and promoting more inclusive urban development.

It was in this context that, in November 2003, the Forum for Social and Economic Development of the Center of São Paulo and the Executive Coordination of Ação Centro were established, in partnership with the Municipal Urbanization Company (EMURB), which aimed at the general coordination of the actions of all sectors of the government, as well as the opening for a shared management with civil society in a broader way, and the Development Agency of the Center of São Paulo was created, linked to the Development Board of EMURB.

The structuring of the Ação Centro Rehabilitation Program started from the reading of the main axes of confrontation in terms of housing deficit in the city of São Paulo. In a study carried out in the early 2000s, when the Program was published, the first was the displacement of the elites and the popularization of the center, processes concomitant with the degradation of the constructed framework and the loss of the affective identity of the memory and history of São Paulo.

Over time, the inability of the center to offer tertiary spaces of the quality required by the market was verified, the disqualification of the public space and the deterioration of

historic properties reinforced the existence of empty buildings on the upper floors and occupied only on the ground floor.

For the time (2002), the agreement signed by the Ministry of Cities, Caixa Econômica Federal, Sinduscon (Union of the Civil Construction Industry of the State of São Paulo), Secovi (Union of Companies for the Purchase, Sale, Lease and Management of Residential and Commercial Properties of São Paulo), ASBEA (Brazilian Association of Architecture Offices), the IAB (Institute of Architects of Brazil), to produce social housing, as well as the use of resources from the Guarantee Fund for Length of Service (FGTS) intended to finance the renovation of buildings in the center for the production of apartments (Somekh, 2006, p. 268).

Subsequently, the Morar no Centro Program and the Integrated Habitat Recovery Perimeters (PRIH), developed by the Municipal Housing Secretariat, promoted the recovery of historic buildings and areas in the area. As a result, the socioeconomic profile of the population was transformed, which gave rise to the discussion between the public and private sectors about the guidelines for an economic strategy of the center.

Important legal institutions remained in the region, as well as popular commerce centers and specialized streets, and the seat of the Municipal Power was installed there, which gave impetus to the offer of leisure, culture and tourism services. Even so, in terms of habitability, there is a very significant shortage.

The most recent data from the João Pinheiro Foundation (FJP), from 2022, show that more than half of the housing deficit in the country, which totals 6,205,314 households, that is, 52% or 3,242,780 households, is directly related to the cost of rent. In the Metropolitan Region of São Paulo (RMSP), especially in the central region, this percentage reaches almost 70%, according to data released this year by the FJP.

Historically, housing policy in Brazil has focused on the construction of own homes, with subsidized interest, as in the case of Minha Casa, Minha Vida. However, even with subsidies that reach 95%, as in the case of Track 1 of the program, many social groups, living on the edge, are unable to pay the installments. These groups earn enough to survive on a day-to-day basis, but not to cover the costs of financed housing, which means that the programs end up benefiting higher income brackets (Rolnik, 2024).

This difficulty in paying rent is also reflected in the ability of families to keep paying the installments of financed properties. Among those included in the MCMV program, Track 1,

aimed at the population with a gross monthly income of up to R\$ 2,640.00 (two thousand six hundred and forty reais), many face major obstacles to honor financial commitments.

This shows that the housing problem is not limited to the scarcity of available units, but rather to the lack of conditions for these houses, whether produced by public policies or by the market, to be effectively accessible to the portion of the population that needs it most.

We understand that the market should be responsible for meeting the solvable demand, just as the low-income population should be served by the Government (Somekh, 2006, p. 268). Based on the understanding that urban legislation is disjointed, becoming a non-effective instrument of regulation.

In this context, social interest housing emerges, with the purpose of guaranteeing the right to housing for families living in urban areas and having a monthly income of up to R\$ 8,000.00 (eight thousand reais). In addition to meeting this fundamental need, housing is directly linked to economic development, job and income generation, and improved living conditions of the urban population (Brasil, 2023).

It should be recalled that the precursors of the initiatives for HIS programs, in addition to the MCMV Program, the Morar no Centro Program, aimed at guaranteeing social housing in the central area and attracting new middle-class residents to the place, was conceived in conjunction with the Ação Centro Program for the rehabilitation of downtown São Paulo, reorganizing the previous PROCENTRO, reformulated in 2001, which provided for defining general guidelines for the central area and which had been obtaining limited intervention results (Somekh, 2006, p. 266).

To ensure its objectives, the Morar no Centro program was divided into the following actions and subprograms: housing provision; renovation and recycling of buildings for housing; social leasing; improvements in tenements; the PRIH; special project Parque do Gato and application of new urban instruments.

The demand for housing provision was met through a partnership with the Municipal Housing Secretariat (SEHAB) in conjunction with the Metropolitan Housing Company of São Paulo (COHAB), Caixa Econômica Federal (CEF) and social movements active in the center. Considering, on the one hand, the small supply of land and, on the other hand, the large number of empty and abandoned buildings existing in the region, it was decided to renovate these buildings, preferably the construction of new ones.

The social movements had already been operating the CEF's Residential Lease Program (PAR) aimed at serving families with an income of up to six minimum wages, through

lease for 15 years, at the end of which the resident has the option to buy the property. To be able to serve lower-income families, SEHAB negotiated specific federal resources for subsidy, created fee exemptions and incentives to reduce costs.

SEHAB's actions in the center, organized by the PRIH, were not limited to the production of housing: they also promoted improvements in tenements, recovery of historical heritage and public spaces, and the provision of cultural, health, education, and income generation programs. This integrated model aimed to raise the quality of life and work of the poorest residents.

Joint action gives effectiveness to good ideas in terms of housing policies, most of which have already been thought of and already put into practice. On the other hand, what taints the effectiveness of these programs is precisely the discontinuity, the lack of commitment to the continuity and maintenance of urban policy, because it is known that many of these actions end up being used for the personal promotion of rulers who, at the end of their terms, only show that everything was a government project, not municipal. This factor contributes to the maintenance of the high rates of homeless people.

4.5 URBAN HOUSING POLICIES: BEING, BEING AND REMAINING

The value of the use of spaces, of the encounter, of and through simultaneities, of oneself and of the other, of living together (Oliveira; Neto, op. cit., p. 7). Recognized by several nations, this right is elevated to the universal category of the right of individuals, an innate characteristic of fundamental rights. Cities and homes shape our identity, being essential for access to education, employment opportunities, healthy living, and strengthening community engagement.

For this reason, adequate housing, as a universal human right, must be at the center of urban policy and be considered an integral part of the right to a decent standard of living, something that goes far beyond simply having four walls and a roof. For a house to be suitable, many factors need to be taken into account: where it is located, its accessibility, and the availability of basic services such as water, sanitation, and drainage.

There are countless obstacles to be overcome by the Administration, among which the need to find integrated and non-sectoral responses to housing problems stand out; the configuration of new spaces and mechanisms that stimulate political participation, facilitate the relationship between administrations and those administered, and promote the organization of social groups.

According to UN-Habitat's Global Urban Observatory, public housing accounts for less than 15% of total housing units, in both developed and developing countries. At the same time, over the past two decades, housing values have skyrocketed, pushing low-income families farther and farther to the peripheries in search of financially viable options. These indicators clearly demonstrate that the current real estate market model has not been able to offer affordable housing to the poorest.

In addition, accessing and securing well-located land, especially in large cities such as São Paulo, where vast urban areas have been systematically excluded from infrastructure development opportunities, also takes on special relevance from an environmental point of view as well.

Debates on decarbonization have highlighted the paramount need to move away from development patterns that promote carbon-intensive urban sprawl and generate dependence on fossil fuels (Frediani; Cociña, 2024). Urban sprawl can lead to increased emissions due to transportation and infrastructure construction, and can lead to water contamination and deforestation.

A study by the Inter-American Development Bank shows that, in Brazil, the average spending of families on items such as transportation and other services can be up to 45% higher for families living on the outskirts of cities than for those living in central areas. Housing relocation tends to be less sustainable than on-the-spot improvement programs, as well as worsening the social and economic conditions of displaced people (Duren, 2017).

In recent years, housing groups have developed projects to improve, regularize and guarantee the lease of occupied buildings in downtown São Paulo through modernization initiatives. These projects were conceived under the aegis of the MCMV program, which supported the development of self-managed housing projects led by social movements in collaboration with technical consultants.

In addition to modernization projects and new housing, to promote on-site improvement programs as a way to prioritize location, another collective strategy of social movements is the optimization of resources to promote clean energy and the more sustainable use of materials, in addition to reducing the cost of living and expenses for residents of social housing.

Research in low-income settlements shows that implementing healthy, low-cost energy efficiency initiatives (WHO, 2014) has not only reduced electricity consumption and

carbon dioxide emissions, but has also resulted in substantial annual savings for communities.

It is these experiences that contribute to broader efforts led by social housing movements and the technical consultants who work with them, who are constantly looking for ways to innovate with building materials and resources to make housing more affordable and sustainable.

5 CONCLUSION

Adequate housing is a universal human right, and should be at the center of urban and urban policies. Currently, more than half of the global population lives in urban areas, and it is estimated that approximately a quarter of these inhabitants reside in slums or informal settlements, regions marked by poor housing conditions.

In general, these people have not had access to decent work opportunities that would allow them to obtain an income compatible with the high costs of living in the center, where their respective workplaces are concentrated. As a result, this portion of the population becomes more vulnerable to forced removals, which can lead them to face homelessness.

One of the greatest challenges of our democracy may be related exactly to the institutional and social reality of the municipalities, either due to the fragility of local mechanisms for guaranteeing citizenship rights and the high degree of social inequalities, or due to the existing civic culture pattern, which blocks the conformation of public spheres and the participation of society. focusing, therefore, on the possibilities of interaction between government and society.

Democratic governance, the patterns of interaction between government institutions, market agents and social actors that coordinate and simultaneously promote social inclusion agendas expand social participation in decision-making processes in urban and housing policies, which require coherence and continuity to pursue accessibility, regardless of the price of land.

The transformation of urban centers emerges from the convergence of essential factors: the alignment and cooperation between public and private actors, the configuration of effective political and civic leadership, and the consensus among citizens to drive the socio-cultural progress of the city. In this way, the project not only presents itself as a response to social and humanitarian challenges, but also as a powerful instrument for local development.

It is likely that decisive issues that must be faced today by Latin American cities will be addressed and resolved with urban actors, i.e., articulation of public and private agents; creation of qualified public spaces; reconstruction of civic culture; political-administrative reform to make local governments more efficient and more participatory and, above all, modernization of urban infrastructure.

The institutionalization of democratic governance practices and the success of local experiences in the formulation of responsive public policies depend directly on the way in which institutional arrangements are structured, which should: (i) stop clientelism and the capture of public spheres by corporate and particularist interests, through transparent procedures and the propagation of a democratic culture capable of overriding non-democratic politics; (ii) foster horizontal participation structures, capable of generating social capital; (iii) empower groups in situations of vulnerability, reducing the impact of asymmetric power relations; (iv) strengthen associative links, mobilizations and local representative organizations, encouraging interaction between the various actors in the public sphere.

The definition of a strategic plan must build and/or modify the image that the city has of itself and that which is held of it abroad. To the extent that it is a response to a sense of crisis, which is the result of the desire to enter new global economic and cultural spaces and which intends to integrate a population that often feels excluded or little considered, the city-project is a project of communication and mobilization in the city and of internal and external promotion of the city.

ABSTRACT

The growing demand for sustainable solutions in the Architecture, Engineering, and Construction (AEC) industry encourages the use of residues from industrial processes as alternative materials to Portland cement—whose production is highly CO₂-emissive—or in the manufacture of cementitious matrices. Among these residues, ashes resulting from the combustion of mineral coal in thermoelectric power plants stand out, as they represent a significant environmental liability. In this context, the present study aimed to chemically, mineralogically, and morphologically characterize bottom ash generated at the Pecém Thermoelectric Power Plant (Ceará, Brazil) after beneficiation, in order to identify potential applications for this processed residue. The methodological procedures included ash beneficiation through granulometric fragmentation and sieving; determination of chemical composition by X-ray fluorescence; identification of mineralogical composition by X-ray diffraction; and morphological analysis by scanning electron microscopy. The results showed that the beneficiated coal bottom ash is rich in SiO₂, Al₂O₃, and Fe₂O₃, meeting the chemical requirements of NBR 12653 for classification as a Class C pozzolan. In addition, the presence of an amorphous halo in the diffractogram and a spherical morphology with vitreous, friable particles confirmed its pozzolanic potential. Therefore, the beneficiated bottom ash presents suitable characteristics for partial replacement of Portland cement in mortars, concretes, and

RESUMO

A crescente demanda por soluções sustentáveis na indústria da Arquitetura, Engenharia e Construção incentiva a utilização de resíduos oriundo de processos industriais como materiais alternativos ao cimento Portland, cuja produção é altamente emissora de CO₂, ou na confecção de matrizes cimentícias. Entre esses resíduos, destacam-se as cinzas advindas da queima do carvão mineral em usinas termelétricas, que representam um passivo ambiental significativo. Neste contexto, a presente pesquisa teve como objetivo caracterizar química, mineralógica e morfológicamente a cinza pesada gerada na Usina Termelétrica do Pecém/CE, após processo de beneficiamento, a fim de identificar quais usos podem ser dados a este resíduo beneficiado. Os procedimentos metodológicos adotados foram beneficiamento da cinza pelos processos de fragmentação granulométrica e peneiramento; determinação da composição química por fluorescência de raios X; obtenção da composição mineralógica por difração de raios X, e identificação da morfologia por microscopia eletrônica de varredura. Os resultados alcançados evidenciaram que a cinza de carvão mineral pesada beneficiada apresenta composição rica em SiO₂, Al₂O₃ e Fe₂O₃, atendendo aos requisitos químicos da NBR 12653 para classificação como pozolana Classe C, ademais a presença de halo amorfo no seu difratograma e a morfologia esférica com presença de partículas quebradiças vítreas confirmaram o seu potencial pozolânico. Então, a cinza pesada beneficiada possui características adequadas para ser usada em substituição parcial ao cimento Portland em argamassas, concretos e demais matrizes cimentícias, contribuindo para a redução de impactos ambientais e para o cumprimento das metas de produção e consumo sustentáveis previstas no Objetivo de Desenvolvimento Sustentável 12.

RESUMEN

La creciente demanda de soluciones sostenibles en la industria de la Arquitectura, la Ingeniería y la Construcción (AIC) impulsa el uso de residuos provenientes de procesos industriales como materiales alternativos al cemento Portland—cuya producción es altamente emisora de CO₂—o en la elaboración de matrices cementicias. Entre estos residuos, se destacan las cenizas provenientes de la combustión del carbón mineral en centrales termoeléctricas, que representan un pasivo ambiental significativo. En este contexto, la presente investigación tuvo como objetivo caracterizar química, mineralógica y morfológicamente la ceniza pesada generada en la Central Termoeléctrica de Pecém (Ceará, Brasil), tras un proceso de beneficiamiento, con el fin de identificar los posibles usos de este residuo procesado. Los procedimientos metodológicos incluyeron el beneficiamiento de la ceniza mediante fragmentación granulométrica y tamizado; la determinación de la composición química por fluorescencia de rayos X; la obtención de la composición mineralógica por difracción de rayos X; y la identificación de la morfología mediante microscopía electrónica de barrido. Los resultados evidenciaron que la ceniza pesada de carbón mineral beneficiada presenta una composición rica en SiO₂, Al₂O₃ y Fe₂O₃, cumpliendo los requisitos químicos de la norma NBR 12653 para su clasificación como puzolana de Clase C. Además, la presencia de un halo amorfo en el difractograma y la morfología esférica con partículas vítreas frágiles confirmaron su potencial puzolánico. Por

lo tanto, la ceniza pesada beneficiada presenta características adecuadas para su uso como sustituto parcial del cemento Portland en morteros, hormigones y otras matrices cementicias, contribuyendo a la reducción de impactos ambientales y al cumplimiento de las metas de producción y consumo sostenibles previstas en el Objetivo de Desarrollo Sostenible 12.

1 INTRODUCTION

The Architecture, Engineering and Construction (AEC) industry is one of the industries that consumes the most natural resources, including energy, soil and water, in addition to being responsible for significant generation of solid waste and emission of greenhouse gases [1,2]. The growing concern of this sector to become sustainable has driven the development of strategies such as the use of new technologies and sustainable materials, capable of reducing the consumption of these natural resources and promoting the proper management of the waste generated [2].

Portland *cement* is the raw material used in the manufacture of concrete, considered the most used construction material on the planet [3], consequently, cement becomes one of the most used inputs, corresponding to one of the materials that causes great negative impacts on the environment [4]. This corresponds to a hydraulic binder obtained by grinding Portland clinker, resulting from the burning at high temperatures of calcareous and clayey materials [5]. Therefore, its production method results in high carbon dioxide (CO₂) emissions, contributing to global warming and climate change. Corresponding to one of the biggest challenges for the AEC industry to become sustainable, as the need for a large amount of Portland cement goes against environmental sustainability, but the great demand for concrete production requires its use, and consequently CO₂ emissions.

In this sense, the partial replacement of Portland cement and the addition of alternative materials from the processing of solid waste to concrete is an effective strategy to reduce CO₂ emissions, as they reduce cement consumption, contributing to the AEC industry meeting Sustainable Development Goal (SDG) number 12 by 2030.

At the same time, thermoelectric plants that use coal as an energy source produce tons of waste from the combustion process of this fossil fuel and the improper disposal of this waste represents a relevant environmental problem, as it can cause contamination of soil and surface water, in addition to requiring large areas for deposition [6]. Among the residues are light ash captured in precipitation systems and heavy ash deposited at the bottom of boilers [7].

As these wastes generated by thermoelectric plants have potential for use in cement-based products [6], this research aimed to carry out the chemical, mineralogical and morphological characterization of the heavy ash generated by the Pecém Thermoelectric Power Plant, located in São Gonçalo do Amarante/CE, to identify which uses can be given to this processed waste. The relevance of this research stems from the need to demonstrate

that the techniques of characterization of materials are important to contribute to the AEC industry achieving SDG 12 regarding sustainable production and consumption, because the introduction of processed waste in new production chains only occurs correctly when its properties, determined through their characterization, contribute to the durability and technical performance of the alternative materials that will be developed with them.

2 THEORETICAL FOUNDATION

2.1 CHARACTERISTICS THAT MATERIALS MUST HAVE TO BE USED IN THE PRODUCTION OF CONCRETE TO REDUCE THE CONSUMPTION OF PORTLAND CEMENT

Materials used in the production of concrete, either as a partial replacement for *Portland* cement or incorporated directly into cement, should be classified as Supplementary Cementitious Materials (MCS). These materials consist of mineral additions that, when incorporated into *Portland* cement or employed in concrete as a partial substitute for cement, have the purpose of improving the technological performance of cementitious materials [8,9]. They must have adequate availability, economic viability and compatible technical performance, considering their chemical, mineralogical and hydration properties [10].

These materials can be classified as pozzolanic when they have pozzolanic activity, or as cementing, when they have their own hydraulic capacity, and also as *filler*, when the material does not have significant chemical activity [8]. It should be noted that limestone filler is used as MCS because it is a carbonate material chemically compatible with Portland cement, which can optimize the packaging of particles and reduce the water content, resulting in better mechanical properties of the composite [11]. Limestone *filler* falls under the definition of MCS because NBR 12653 [12] allows fine mineral materials, even without significant chemical reaction, to be used to supplement cement performance.

Table 1 presents the characteristics that MCSs may possess according to their classification.

Table 1

Characteristics of the different MCSs that are added to composite cement. Source: Adapted from Neville (2016)

Material	Cementitious Characteristic
Granulated blast furnace	Latent hydraulicity, sometimes hydraulic

slag	
Natural pozzolan (class N)	Latent hydraulicity with <i>Portland cement</i>
Siliceous flywheel ash (Pozzolan class F)	Latent hydraulicity with <i>Portland cement</i>
High limescale fly ash (Pozzolan class C)	Latent hydraulicity with <i>Portland cement</i>
Silica fume (Artificial Pozzolan)	Physical action, to a large extent, and latent hydraulicity with <i>Portland cement</i>
<i>Limestone filler</i> (Inorganic material)	Physical action but mild latent hydraulicity with <i>Portland cement</i>

Meanwhile, inert materials are not considered MCS [13], such as powdery waste generated in the extraction and processing of quartzite according to the parameters of NBR 12653 [12].

2.1.1 Pozzolans

Pozzolans are siliceous or silice-aluminous materials that, although they have little or no agglomeration capacity alone, when finely ground react chemically with lime in the presence of water, forming stable compounds with cementing properties, and materials that are by themselves binders are not included in this category [14].

Pozzolans are materials that have pozzolanic activity [8]. This activity refers to the ability of siliceous or silicoaluminous materials to react with calcium hydroxide (Ca(OH)_2) in the presence of water, forming hydrated calcium silicate (C-S-H), which are compounds with cementitious properties and contribute, for example, to the increase of compressive and flexural strength, to advanced ages, to the increase of resistance to sulfates and reduction of porosity and permeability, when added to concrete, mortars and pastes [12].

Several materials can present pozzolanic activity, such as silica fume, natural pozzolans and fly ash [8]. NBR 12653 [12] determines that in order to qualify as Class N (natural and artificial pozzolans), Class C (fly ash produced by the burning of mineral coal in thermoelectric plants) and Class E (any pozzolans, not included in classes N and C) the material must comply with the physical and chemical requirements established in Table 2.

Table 2

Chemical and physical requirements for pozzolanic materials

Chemical Requirements (%)	Pozzolanic Material Class		
	N	C	E
SiO ₂ +Al ₂ O ₃ +Fe ₂ O ₃	≥ 70	≥ 70	≥ 50
SO ₃	≤ 4	≤ 5	≤ 5
Moisture content	≤ 3	≤ 3	≤ 3
Loss to fire	≤ 10	≤ 6	≤ 6
Alkalis available in Na ₂ O	≤ 1.5	≤ 1.5	≤ 1.5
Physical Requirements (%)	Pozzolanic Material Class		
	N	C	E
Material retained in the sieve 45 µm	< 20 %	< 20 %	< 20 %
Performance index with <i>Portland cement</i> at 28 days, in relation to the control	≥ 90 %	≥ 90 %	≥ 90 %
Pozzolanic activity with lime at seven days	≥ 6 MPa	≥ 6 MPa	≥ 6 MPa

Source: Adapted from NBR 12653 (ABNT, 2014)

Because they are generally by-products of different industrial processes, pozzolanic materials such as silica fume and fly ash can present great variability in their characteristics, depending on the region of origin and production conditions [15].

2.1.2 Latent cementitious activity materials

Materials with latent cementitious activity, or cementing, are those that have the ability to form hydrated products, in a similar way to Portland cement [16]. One of the main materials of latent cementitious activity is blast furnace granulated slag, which is a by-product of the pig iron production process, obtained by sudden cooling that generates a glass phase composed mainly of calcium silicates and aluminosilicates [5].

The reactivity of blast furnace slag depends on its chemical composition, fineness, and vitreous phase content, as these are factors that control its solubility and the formation of hydrated products, characteristics necessary to promote some type of physical, chemical, or thermal activation capable of overcoming its naturally slow hydration and allowing its effective use as a cementitious material [17].

2.2 INERT MATERIALS – FILLER EFFECT

Filler is a finely divided material that does not have chemical activity, being inert, but promotes the physical effect of packaging, in which very fine particles fill the voids between the larger particles, favoring the densification of the cement paste and the nucleation of the hydration products [15,18].

According to Mehta and Monteiro, these materials cannot be used as a substitute for *Portland cement*, but they can be used in the manufacture of concrete as a partial substitute for fine aggregate, contributing to improve the packaging of the cementitious matrix and promoting better mechanical behavior [13].

Powdery materials that do not have pozzolanicity or cementing activity, but have sufficiently fine granulometry, can be used to promote the filler effect in concretes and mortars (cementitious matrices) [19]. The main result of this effect is the increase in the compactness of the mixture, promoted by the incorporation of fine and ultrafine particles, which optimize the particle size distribution and improve the densification of the cementitious matrix [9].

2.3 IMPORTANCE OF USING COAL ASH

The relevance of investigating and promoting the use of ash as a partial substitute for *Portland cement* lies in two crucial challenges: promoting industrial waste management and mitigating the carbon footprint of the AEC industry. According to Bertolini, the burning of fossil fuels generates carbon dioxide (CO₂), which, although not an immediate risk to human health, its large-scale release is a significant factor contributing to the worsening of the greenhouse effect [20].

Portland cement is produced from calcareous and clayey raw materials, and can incorporate additions, and its production involves high-temperature processes, reaching approximately 1450 °C [18]. In this context, the use of coal ash emerges as a relevant strategy, as it allows reducing the extraction of natural resources.

In addition, these ashes can be incorporated into new production chains, such as in the manufacture of bricks, paving, environmental barriers and ceramic products, as long as their properties are properly defined in the processing process. This is because, as highlighted by Mehta and Monteiro [13], the materials used in the production of concrete must be characterized, as the properties of concrete depend directly on the properties of its constituents. Therefore, characterizing each material is essential to predict the performance of concrete in the fresh and hardened state [19].

3 MATERIALS AND METHODS.

3.1 MATERIAL

The material used in this research was ash from the coal burning process at the Pecém Thermoelectric Power Plant (UTE Pecém), located in the municipality of São Gonçalo do Amarante/CE. Precisely, the bottom ash (Figure 1), which corresponds to the coarsest fraction of the waste generated in the combustion of coal. It is noteworthy that it receives this name because its granulometry does not allow them to rise with the gases and ends up accumulating at the bottom of the furnace because it is heavy.

Figure 1

Gray background generated by the Pecém TPP. (Authors, 2025)

3.2 METHODS

The methodology adopted in this research followed the workflow presented in Figure 2.

Figure 2

Workflow adopted in the research (Authors, 2025)

3.2.1 Processing

The coal ash collected at the Pecém TPP was benefited through: processes of reduction of the size of its particles and sieving in ABNT sieve number 200. The fragmentation of the particles occurred in the Los Angeles Abrasion machine of the Asphalt Mixtures Laboratory of the Federal Rural University of the Semi-Arid (UFERSA/Mossoró), using 12 spheres for an approximate period of 20 minutes. The processed ash remained in the granulometry of powdery material (Figure 3).

Figure 3

Pecém ash after processing in the laboratory. (Authors, 2025)

3.2.2 Chemical Characterization

The chemical composition of the processed ash was determined by X-ray fluorescence spectrometry (XRF), a technique that is based on the principle of X-ray absorption by the material, which causes the internal ionization of the atoms and generates a characteristic radiation known as "fluorescence". The test was carried out in a Universal Machine, a Shimadzu EDX 720 spectrometer, at the Materials Technology Laboratory (LTM) of the Federal University of Campina Grande (UFCG).

To determine the volatile material content of the processed waste, the *Loss on Ignition* test was carried out at a temperature of 1050 °C at a level of 2 hours, this took place at the Wood Technology Laboratory of UFERSA/Mossoró.

3.2.3 Mineralogical Characterization

The mineralogical characterization was obtained by means of the X-ray diffraction (XRD) technique. This technique is based on the interaction of X-radiation with the crystalline arrangement of the material, resulting in characteristic diffraction patterns that allow the identification of the mineral phases present. A Shimadzu XRD-6000 diffractometer was used,

equipped with CuK α radiation, operating at a voltage of 40 kV and a current of 30 mA, in fixed *time scan mode*, with a step of 0.02°, a counting time of 0.6 s, and a scanning range of 5° to 60° with a 2 θ angle. The trial was carried out at the LTM of UFCG.

3.2.4 Morphological and surface characterization

The morphological and surface analysis of the processed ash was performed by Scanning Electron Microscopy (SEM) at the Electron Microscopy Laboratory of the Center for Research in Plant Sciences of the Semi-arid Region (CPVSA) of UFERSA/Mossoró. The equipment used was TESCAN model VEGA 3, with an electron beam voltage of 30 kV, in different resolutions, expanding in 5kx, 10kx, 25kx, 40kx with a scale that varies according to the magnification (1 μ m; 2 μ m, 5 μ m and 10 μ m).

4 RESULTS AND DISCUSSIONS

4.1 CHEMICAL CHARACTERIZATION

Table 3 shows the chemical composition of the processed coal ash.

Table 3

Chemical composition of the processed coal ash. (Authors, 2025)

OXIDES	%
SiO ₂	53,04
Al ₂ O ₃	22,04
Fe ₂ O ₃	9,38
CaO	4,43
SO ₃	2,22
K ₂ O	2,03
Na ₂ O	1,95
MgO	1,50
TiO ₂	0,84
BaO	0,70
SrO	0,15
MnO	0,05
ZrO ₂	0,04
Rb ₂ O	0,01
Y ₂ O ₃	0,00
CO ₂	0,00
PF	1,64

*FP = Loss to Fire

Table 3 shows that the processed coal ash is mainly formed by silica (SiO_2) and alumina (Al_2O_3), and these substances are responsible for its pozzolanic reactivity when used as a partial substitute for *Portland cement* in concrete. It complies with NBR 12653 [12], regarding $\text{SiO}_2 + \text{Al}_2\text{O}_3 + \text{Fe}_2\text{O}_3 \geq 70$ (84.46%); $\text{SO}_3 \leq 5$ (2.22%) and $\text{PF} \leq 6$ (1.64%).

4.2 MINERALOGICAL CHARACTERIZATION

Figure 4 shows the diffractogram of heavy coal ash after processing.

Figure 4

Diffractogram of the processed heavy ash. (Authors, 2025)

Figure 4 shows the formation of an amorphous halo between 15° and 40° , indicative of pozzolanic activity of the material, in addition to crystalline quartz peaks that are formed in the burning of coal at temperatures below 1000°C . The result obtained in the diffractogram is similar to that achieved by Cirino *et al.* [21] for light gray and not to those obtained by him for heavy gray (background gray). It is believed that this fact occurred because there was a reduction in the particle size of heavy ash in *the Los Angeles* abrasion and 200 mesh screening, making the material lighter.

4.3 MORPHOLOGICAL AND SURFACE ANALYSIS

Figure 5 presents the micrographs obtained for different magnifications, which allow a better morphological and surface visualization of the material studied.

Figure 5

a) Micrograph - Magnification of 4.99 kx b) Micrograph - Magnification 20.0 kx. (Authors, 2025)

Figure 5a presents a low magnification, i.e., it shows the microstructure of the processed coal ash 4,990 times larger than its actual size. It shows its general morphology, which is made up of a diversity of spongy spherical particles.

While, Figure 5b shows the same material, but 20,000 times larger than the actual size. This makes it possible to verify the presence not only of spongy spherical particles but also of brittle and irregular particles formed from the aluminosilicate vitreous matrix. This fact indicates a mixture of crystalline and amorphous phases, corroborating the results obtained in the mineralogical characterization.

Figure 5b also shows the average sizes of the spherical particles that constitute the material studied, and that these are variable, with particles of diameter 1.74 μm , 2.27 μm and 3.75 μm . The morphology found is spherical with brittle particles. It is important to highlight that when there is the presence of spherical morphology, there is a tendency for grain sliding, a fact that can increase the workability and fluidity of cementitious compounds, according to

Cirino et al. [21].

5 FINAL CONSIDERATIONS

According to the research carried out, it is concluded that the heavy ash from the Pecém/CE Thermoelectric Plant, after undergoing processing, is classified as pozzolanic material belonging to class C according to NBR 12653. In addition, it has a spherical morphology with the presence of vitreous brittle particles, which gives it better reactivity when used in cementitious matrices, providing improvement in the properties of the construction materials made with it.

The formation of the amorphous halo in the diffractogram of the processed heavy ash corroborates the results obtained in the chemical characterization and the morphology presented, as it is indicative of pozzolanic activity of the material studied.

In view of the reactivity of the material, it is inferred that the processed heavy ash can be used in the manufacture of mortars, concretes and other cementitious matrices in partial replacement of *Portland* cement because it belongs to class C, which corresponds to materials with hydraulic/pozzolanic reactivity, thus contributing to promote the gain in strength and durability of the products made with it.

Finally, it is also concluded that this processed waste, in addition to promoting gains in the properties of mortars, concretes and other cementitious matrices, can have an adequate final destination when it is inserted in the production chain of cementitious matrices used in the construction processes of the Architecture, Engineering and Construction industry. In this way, contributing to the reduction of environmental impacts and to the fulfillment of the sustainable production and consumption goals set out in SDG 12.

ACKNOWLEDGMENT

Thanks to AAMEG UFERSA for the grant to the first author. To the coordinators of the Materials Technology Laboratory of the Academic Unit of Materials Engineering of the Center for Science and Technology of the Federal University of Campina Grande – PB for the partnership established that allowed the obtaining of important analyses to obtain the results of this research.

ABSTRACT

Large Language Models (LLMs) have revolutionized software engineering by generating code rapidly and accurately across a wide range of programming tasks. However, the growing reliance on these models raises concerns regarding their energy consumption, runtime overhead, and the efficiency of achieving successful, security-by-design, and maintainable code. This article presents an analytical comparison of several leading LLMs—such as OpenAI’s GPT series, Anthropic’s Claude, Meta’s Llama, and Google’s Gemini—by evaluating their success rates in producing secure and optimized code, the number of prompts required for successful output, and the corresponding computational and energy costs. The findings emphasize strategies to balance accuracy, performance, and sustainability in LLM-assisted programming.

Keywords: LLMs. Energy Efficiency. Cybersecurity. Security-by-design. Optimization.

entanto, a crescente dependência desses modelos levanta preocupações quanto ao seu consumo de energia, sobrecarga de tempo de execução e à eficiência na obtenção de um código bem-sucedido, seguro desde a concepção e de fácil manutenção. Este artigo apresenta uma comparação analítica de vários LLMs líderes — como a série GPT da OpenAI, Claude da Anthropic, Llama da Meta e Gemini do Google — avaliando as suas taxas de sucesso na produção de código seguro e otimizado, o número de prompts necessários para uma saída bem-sucedida e os custos computacionais e energéticos correspondentes. As conclusões enfatizam estratégias para equilibrar precisão, desempenho e sustentabilidade na programação assistida por LLM.

Palavras-chave: LLMs. Eficiência Energética. Cibersegurança. Segurança por Design. Otimização.

RESUMEN

Los Grandes Modelos de Lenguaje (LLM) han revolucionado la ingeniería de software al generar código de forma rápida y precisa en una amplia gama de tareas de programación. Sin embargo, la creciente dependencia de estos modelos genera inquietudes respecto de su consumo de energía, la sobrecarga en tiempo de ejecución y la eficiencia para lograr un código exitoso, seguro por diseño y mantenible. Este artículo presenta una comparación analítica de varios LLM líderes, como la serie GPT de OpenAI, Claude de Anthropic, Llama de Meta y Gemini de Google, evaluando sus tasas de éxito en la producción de código seguro y optimizado, el número de indicaciones necesarias para obtener un resultado satisfactorio y los correspondientes costes computacionales y energéticos. Los resultados ponen de relieve las estrategias para equilibrar la precisión, el rendimiento y la sostenibilidad en la programación asistida por LLM.

Palabras clave: LLMs. Eficiencia Energética. Ciberseguridad. Seguridad por Diseño. Optimización.

1 INTRODUCTION

The need to reduce costs and improve efficiency is a necessity of modern times. Code security and efficiency is critical for the best usage of required systems and functionalities that require less runtime and less energy expenditure. The focus of this analysis is conducted mainly on the parameters mentioned above, in order to determine if both of them can be lowered without sacrificing models resourcefulness and quality, therefore making sure that the desired output of a correct, error free code and the development of secure-by-design systems, can be achieved without having many losses in time, energy, code efficiency, and security. The effective need of having the safety and efficiency of the code generated by an LLM are the priority in this matter, however, the analysis of the cost-benefit ratio is also important for large scale programs that work with large data sets, making sure that no error occurs, and if it does, that the code refactoring is done appropriately and quickly, saving energy and time.

The motivation for the realization of this work is centered around the need for better management of good coding practices, as well as the need to analyze the resulting costs of the used energy and time spent working on providing possible code-refactoring solutions. This theme is relevant today as the demand for reliable, emission-free energy is increasingly urgent. Without one, the need to reduce costs and augment efficiency is critical for the well management of society nowadays. Therefore, the analysis of the objectives mentioned above, as well as the possible comparison between some LLMs, is highly needed to understand and make a full comprehensive use of the capabilities of the tools at hand in order to achieve the best possible result with low-cost performance (Bhatt, 2025).

2 METHOD

In this investigation, an initial analysis of recent and relevant literature was conducted, which sought both to identify the articles to be studied in technology and the usage of AI for the best possible code output with as few errors as possible, whilst maintaining energy efficiency and low runtime overhead. The process of evaluation and interpretation of the reflections placed on the selected bibliographic material was made over selected articles that made comparisons between different LLM models, as well as the study of spent energy resources when refactoring or generating specific code.

(I) Efficient, faster coding to increase success rates

The need to enhance and improve the coding methods and speed has always been a much regarded need in tech. Nowadays, LLMs combined with agentic AIs can reduce time strains and make apps, programs and websites in a matter of minutes, in comparison to a human developer. However, since the models are not perfect, the code can contain some noticeable errors that a good developer would not make, even if it takes them longer to develop the software in question. Another impactful parameter when generating good and efficient code is a well written prompt that the model will be able to process with a more degree of precision, without the need to deviate from the objective at hand. Different prompt strategies may be implemented when using LLMs to determine the success rate that one can output, as an example, the comparison of the success rates of six different prompt strategies was made on GPT-4, as well as other LLMs, showing the difference in the number of attempts, as well as the change in the degree of difficulty of the tasks themselves (Hou, 2024).

Another control parameter that should be considered is the self-planning code generation that we can implement using LLMs. The self-planning phase can be done by matching the intent with the plan therefore not only giving the initial prompt of what the user wants the LLM to do but also indicating step by step specifically what the LLM needs to do therefore the output should be a lot cleaner and a lot more accurate than if it was only with the initial prompt without any guidance (Jiang, 2023; Ye, 2025). Another technique involving a Large language model Aware selection approach for In-context-Learning based code generation named LAIL, is also to be considered for the remarkable improvements in generating desired programs, outperforming state-of-the-art baselines by considerable amount (Li, 2023). This new approach uses other LLMs To select a positive or negative example for requirement, this means that other LLMs are responsible for the ultimate outcome of LAIL.

(II) Measuring energy and emissions in ML

The environmental costs that training an LLM have are significant. Dozens of hundreds of tons of CO₂ are just a simple fact of the cost of training and LLM, not to mention the expenditure and energy. An example of that is the LLM Bloom which generated 24,7 and 50,5 tons of CO₂ (Luccioni, 2022; Jiang, 2024; Singh, 2024). The training costs of LLMs are indeed significant, however inference, the process of responding to user queries is where costs ultimately increase exponentially and the environment is more affected. One query on ChatGPT is estimated to cause an emission of 4 grams of CO₂ more than 20 times more

than one web search. The reduction of carbon footprint when training/using LLMs has been largely overlooked, therefore the need to make responsible advancements to reduce carbon emissions prioritizing the environment without decreasing efficiency when using LLMs is a needed directive for the future (Wu, 2025; Ding, 2024; Ozcan, 2025).

To show an initial example of a small sample of models, in terms of energy per API call that the models represented in Figure 1. This shows us that there is a certain amount of energy that is used whenever we prompt the model to obtain a relative output. We can also infer from this that the largest models use the most amount of energy, whereas the smaller models use the least amount.

Figure 1

Energy per API Call Model Comparison

Source: Produced by the author, 2025.

As can be observed on Figure 2 again, the largest models consume the highest amount of energy per API call and have the largest response time, whereas the low parameter models are the opposite. If the objective is to be truthful to energy efficient models, then we cannot use LLMs. However compressed LLMs can provide results with near equal success rate in comparison to uncompressed LLMs while spending less energy per API call and taking less time.

Figure 2

Energy vs Latency Model Comparison

Source: Produced by the author, 2025.

As can be seen, Figure 3, the prompt success rate doesn't differ much from model to model, only on more complex prompts can relevantly differences from model to model.

Figure 3

Prompt Success Rate Model Comparison

Source: Produced by the author, 2025.

Prompt success rate is considered the capability of an LLM to complete the task given by the used in a single prompt with no additional guidelines/instructions on any other prompts. However, in Figure 4 it can be observed, in a much more comprehensive manner, that latency differs from models with more parameters in comparison to models with less parameters.

Figure 4

Average Latency Model Comparison

Source: Produced by the author, 2025.

(III) Model selection & architecture choices

Model selection and Architectural choices are important for achieving a more accurate LLM. Studies indicate that 7B and 13B models can achieve high accuracy rates despite having lower parameters and in token usage. The more tokens are used in inference processes the more energy will be consumed for the expected output. Not only this but there's also a need to reduce the latency of said inference. The idea is that the usage of less tokens per second over a large share batch size as well as over time becomes less and less, therefore reducing the associated energy costs and carbon footprint (Bian, 2025; Yuan, 2025).

There's also the possibility to use a mixture of experts' architecture for better and faster reasoning from LLMs. This consists of a router that redirects tokens to the experts, specialized sub-networks, that handle different parts of the problem, weighing them to give a more accurate and precise output (Yuan, 2025). This approach is one of the most energy saving options that we must consider, since it disperses energy for more selected and unique parts of processing and comprehension whereas beforehand one would need to access an

entire LLM for just a simple query. With this method only parts of an LLM need to be accessed to generate a viable and accurate response. The more complex the mending process, more parts will need to be accessed in order to be accurate and therefore achieve a proper output.

The consideration of smaller language models to achieve low latency while maintaining the same level of accuracy as larger models is noticeable, inference and token utilization are also kept low therefore the need to use less memory is also noticeable. For problem specific questions/objectives the 7B parameters LLMs are an option to be considered, they can even be used to train larger LLMs with 70B or 150B parameters. This takes into consideration the rate of accuracy and success when responding to user inputs. However, the degree of accuracy and detail on a response needs to be followed with reduction and energy costs.

(IV) Runtime Optimizations

Runtime optimizations are important to consider reducing time spent and energy spent with reasoning. Quantization is an important technique to consider for improving model memory footprint and keeping model accuracy. Post training quantization reduces inference compute by up to 3x-4x, with no noticeable performance loss. The knowledge distillation technique relies on smaller models teaching larger ones, therefore reducing costs associated with processing information and reducing runtime overhead, as well as cutting costs by 70% (Xiao, 2023; Ganesh, 2024).

The early exit technique allows the reduction of execution time, therefore being an interesting aspect to consider when wanting to lower energy costs. The technique consists in reducing the time of reasoning by verifying the threshold of said reasoning and when the threshold achieves a desired percentage (40-70%), the reasoning will stop, and an answer will be given. This method benefits simpler, less complex input prompts from the user, reducing overall run time overhead and lowering energy costs by 23-50% but also lowering response time (Ilager, 2025).

(V) Hardware & Infrastructure Choices

Hardware selection is a fundamental prospect that needs to be considered when establishing new LLM training routines. GPUs are the standard for LLM inference, however special accelerators such as TPUs, AWS Inferentia, and other emerging AI specific Asics, can also achieve a high energy efficiency per token processed. The need to develop new customized accelerators has been a modern advancement made by companies like Google, to improve speed and energetic efficiency on LLMs (Li, 2024; Chowdhery, 2022). Tensor

model parallelism is another method to improve overall processing on the LLM by creating different partitions of the weights and then concatenating them to achieve the desired output. This is done so that there is less strain on memory. The most commonly used format is the Megatron LM, which is used on LLM's with 50-70b parameters, however, the latency increases with this technique, however the precision and scalability increase as well. (Narayanan, 2021).

An important note to take into account is that energy efficiency per token is referring to long-term usage since we are discussing LLMs that is the main crucial point that we need to take into account when we speak about energy efficiency we need to consider a long-term options instead of short-term ones, reliability needs to be achieved, for that to consideration of accuracy and precision as the core and primary motivators for such research needs to be invoked. After that, the need for energy efficient solutions must be pursued. the next Figures will show the difference in energy as well as cost efficiency between certain GPUs and TPUs, as well as inference latency comparison, so that inadequate study of such values can be done.

In Figure 5 shows the difference from several GPUs and TPUs in compute capacity. This is meant to illuminate regarding the Tensor Processing Units which ultimately cost more energy to run, as well as working with a different architecture than a GPU. The biggest bars in this Figure are of the GPUs.

Figure 5

Compute Capacity Comparison Across Accelerators

Source: Produced by the author, 2025.

The Figure 6 shows the difference between GPUs and TPUs regarding Energy Efficiency. Due to the specific design of a TPU, the usage of energy is more controlled since only some parts of the architecture are chosen to run the models themselves, this makes it a much more energetically efficient strategy to reduce the carbon footprint associated with LLMs

Figure 6

Energy Efficiency of GPUs and TPUs

Source: Produced by the author, 2025.

In Figure 7 is meant to show the inference to latency comparison between GPUs and TPUs. It can be observed that since the customized architecture of a TPU is more energy friendly the latency will therefore increase. The division of weights for this architecture is the main concern when it comes to latency issues, for the concatenation of the weights needs to be done so that the overall output can be accurate and precise. On the other hand the GPUs have less latency and more power expenditure.

Figure 7

Inference Latency Comparison

Source: Produced by the author, 2025.

(VI) Secure and Clean Code Practices to Reduce Overhead

There's now more than ever an urgent need to write good, polished, clean and secure code, not only to avoid critical errors but also to maintain good security measures on websites, but also for the development of security-by-design systems, as well as to avoid possible bugs/errors in the future of a critical piece of software. Code reusability as well as revision and maintenance, are all important and for that, code needs to be written in a manner that generally can be well perceived by anyone that works with writing or reading code (Hunter-Zinck, 2021; Digkas, 2020).

Azure guidelines provide a set of best practices to build secure, scalable, clean and maintainable as well as cost-efficient applications. These guidelines are important because they are also applied in AI pipelines as well as LLMs. The figures below are meant to illustrate the difference between good and bad coding.

The Figure 8 shows code that loads and sends entire logs with a massive token usage, allowing for the user to input information that can be out of context or just not need it therefore making latency time higher as well as energy costs. Figure 9 shows a clean code that determines the length of the input therefore giving it a smaller token window lowering energy cost and allowing for a faster runtime.

Figure 8

Bad coding example #1

```
# Sends full logs, large unfiltered text, unnecessary context
prompt = f"""
User Input:
{user_input}

System Logs:
{open("server.log").read()} # HUGE FILE LOADED EVERY REQUEST

Debug Info:
{debug_info}

Please answer the question.
"""

response = call_llm(prompt)
```

Source: Produced by the author, 2025.

Figure 9

Good Coding Example #1

```
def sanitize(text: str) -> str:
    return text.strip()[:1000] # cap input to 1000 chars

prompt = (
    "Answer concisely. User message:\n"
    f"{sanitize(user_input)}"
)

response = call_llm(prompt)
```

Source: Produced by the author, 2025.

In Figure 10 shows code that just attaches the results meaning every single request made from a user into an LLM, whereas Figure 11 routes input query from the user adding a length to the input and then rerouting it to a small LLM if it meets that criteria or to a large LLM if it meets other criteria this allows for faster queries so lower latency reducing overhead runtime from 50 to 80%.

Figure 10*Bad Coding Example #2*

```
# Every request uses GPT-4-class model regardless of complexity
result = llm_large.generate(user_query)
```

Source: Produced by the author, 2025.

Figure 11*Good Coding Example #4*

```
def route_request(query):
    if len(query) < 80:
        return llm_small.generate(query)
    return llm_large.generate(query)

result = route_request(user_query)
```

Source: Produced by the author, 2025.

(VII) Case Studies & Worked Examples

Real world deployments of LLMs, like Llama-3 series models, provide estimates of inference energy per 1k tokens. Meta's Llama-3 Shows that a 70B-parameter model consumes several times more energy than a fine-tuned 8B model, while the smaller one still performs adequately for many domain-specific applications. Another example, is a noticeable energy reduction of almost 100 Joules per API call is OpenAI's GPT-4o Mini, compared with GPT-4o (OpenAI, 2024; Meta AI, 2024).

3 CONCLUSION

The initial analysis presented throughout this chapter demonstrates that reducing energy consumption and runtime overhead in LLM-assisted software development is both technically feasible and essential for sustainable computational practices. Modern Large Language Models, such as GPT-4o, Claude 3, Llama-3, and Gemini, offer extraordinary capabilities for generating secure, clean, and efficient code, yet their performance must be weighed against the significant environmental and computational costs associated with large-scale inference. As shown through recent scientific studies, smaller or optimized models (7B–13B parameters), quantized architectures, mixture-of-experts routing, early-exit reasoning,

and hardware-aware deployment strategies can collectively reduce energy consumption by 50–80% without compromising accuracy or security.

The review also reinforces that prompt engineering, self-planning strategies, and LLM-aware selection frameworks such as LAIL significantly increase code-generation success rates while minimizing the number of model calls required—directly reducing energy expenditure. Likewise, secure and clean code practices, backed by Azure’s engineering guidelines, show that well-structured, modular, and token-efficient code pipelines contribute meaningfully to reducing computational overhead. In parallel, empirical case studies confirm that the shift from monolithic 70B-parameter systems to distilled or specialized smaller models results in dramatic gains in efficiency, lower emissions, and improved maintainability, especially when caching, batching, and routing mechanisms are included.

Ultimately, this chapter highlights that the path toward sustainable AI-assisted programming relies on a holistic approach: combining model-level optimizations, careful choice of architecture, infrastructure-aware deployment, low-overhead prompt strategies, and strict adherence to secure coding principles, such as security-by-design software development. By integrating these practices, developers can aim to achieve high-quality, error-free code while simultaneously lowering carbon footprints, operational costs, development of security-by-design systems and avoiding runtime inefficiencies. As the technology continues to evolve, responsible model usage—focused on accuracy, energy efficiency, security and long-term sustainability—must become a central pillar of modern software engineering.

ABSTRACT

This article analyzes the activities of the company Brasil Paralelo as an expression of Brazil's new digital far right, discussing its configuration as a hybrid think tank that combines strategies of communication, market logics, and ideology. Using an empirical-documentary approach, it examines documentaries, texts, and audiovisual materials produced between 2019 and 2024, focusing on their discursive strategies and presence on digital platforms. The study draws on theoretical frameworks concerning the attention economy, disinformation production, and circulation of conservative ideas, engaging both Brazilian and international scholarship. Findings indicate that Brasil Paralelo functions as a producer of political meaning by reframing historical and moral narratives through a cinematic aesthetic that legitimizes far-right ideology. The paper concludes that the company acts as a symbolic mediator between the digital market and the political sphere, transforming engagement into authority and audience into ideological capital. The case exemplifies the transition from traditional intellectual influence to audiovisual and market-oriented forms of truth production, characteristic of contemporary platform capitalism.

RESUMO

O artigo analisa a atuação da empresa Brasil Paralelo como expressão da nova extrema direita digital no Brasil, discutindo sua configuração enquanto um think tank híbrido que combina estratégias de comunicação, mercado e ideologia. A partir de abordagem empírico-documental, foram examinados documentários, textos e conteúdos audiovisuais produzidos entre 2019 e 2024, com foco em suas estratégias discursivas e em sua inserção nas plataformas digitais. O estudo mobiliza referenciais sobre economia da atenção, produção de desinformação e circulação de ideias conservadoras, articulando autores nacionais e internacionais. Os resultados indicam que o Brasil Paralelo opera como produtora de sentido político, ao reconfigurar narrativas históricas e morais sob uma estética cinematográfica que

RESUMEN

El artículo analiza la actuación de la empresa Brasil Paralelo como una manifestación de la nueva extrema derecha digital en Brasil, discutiendo su configuración como un think tank híbrido que combina estrategias de comunicación, mercado e ideología. A partir de un enfoque empírico-documental, se examinaron documentales, textos y contenidos audiovisuales producidos entre 2019 y 2024, con énfasis en sus estrategias discursivas y en su inserción en las plataformas digitales. El estudio se apoya en marcos teóricos sobre la economía de la atención, la producción de desinformación y la circulación de ideas conservadoras, articulando referencias nacionales e internacionales. Los resultados indican que Brasil Paralelo actúa como productor de sentido político, al reconfigurar narrativas históricas y morales bajo una estética cinematográfica que legitima la ideología de la extrema derecha. Se concluye que la empresa funciona como mediadora simbólica entre el mercado digital y la esfera política, transformando el compromiso del público en autoridad y la audiencia en capital ideológico. El caso ejemplifica la transición de los modelos tradicionales de influencia intelectual hacia formas audiovisuales y mercadológicas de producción de verdad, características del capitalismo de plataforma contemporáneo.

Palabras clave: Think Tank. Extrema Derecha. Brasil Paralelo. Revisionismo Histórico. Fake News.

1 INTRODUCTION

The recent rise of the far right in different democracies has reconfigured the communication ecosystem and repositioned the dispute for epistemic authority in the public space. In Brazil, this process has gained traction with the intensification of the use of digital platforms as arenas for affective mobilization and the circulation of political narratives, as well as changing patterns of trust and perception about institutions, science, and the media (Mudde, 2022; Lavareda, 2023). It is in this scenario that the company Brasil Paralelo, founded in 2016 and self-defined as an "independent producer of journalism, entertainment and education", has become a hub for the production of audiovisual content that combines strong aesthetic appeal, a promise to "retell" national history and a discursive repertoire in tune with moral-conservative agendas.

The performance of this company is an example of a communicational arrangement in which media consumption operates as a mechanism of political socialization. Instead of being limited to an informative function, its products, documentaries, series, courses and digital publications, articulate historical revisionism, denunciation of "cultural hegemonies" and defense of traditional values, offering the public a coherent cosmology about the country's past, present and future. This arrangement is reinforced by a narrative grammar that alternates denunciation and redemption: there is a "lost" Brazil, diverted by cultural and political elites; there is an internal/external enemy (communism, globalism, gender ideology); Finally, there is a promise of moral restoration through knowledge "free from ideology". The internal coherence of this cosmology sustains a credibility mechanism based less on verification procedures than on emotional adherence, a central feature of the contemporary digital ecosystem (Cesarino, 2023).

If, on the one hand, part of the literature defines think tanks as non-profit organizations dedicated to producing technical knowledge to influence public policies (Rich, 2004; Medvetz, 2012), on the other hand, recent studies have pointed to the need to extend this concept to hybrid forms of ideological production, in which applied research, activism, and the market interpenetrate (Hauck & Mendonça, 2022). Such expansion is pertinent in the Brazilian case: Brasil Paralelo adopts a business model supported by subscriptions and digital products, but acts as an entrepreneur of ideas capable of organizing cognitive and moral repertoires, offering diagnoses and guiding solutions. Communicational authority stems less from formal academic affiliation and more from the audiovisual performativity associated with brands,

influencers, and a community of members, reconfiguring what counts as "expertise" in the public debate.

The logic of platforms intensifies this process. By subjecting the circulation of messages to engagement metrics, the attention economy converts polarization and outrage into economic assets (Couldry & Mejias, 2019; Ribeiro, 2024). In this environment, the distinction between "informative content", "entertainment" and "normative proposition" loses clarity: videos and articles function simultaneously as cultural products and as devices of political persuasion. Audience success feeds back into perceived legitimacy ("if many watch, it must be true"), producing a confirmation cycle in which visibility becomes authority. This cycle, combined with a cinematic aesthetic and the selection of ideologically aligned "experts", sustains an ethos of apparent impartiality that masks editorial choices and interpretive biases (Salgado & Jorge, 2021).

It is also important to note that the insertion of right-wing parliamentarians, influencers, and intellectuals in the company's ecosystem strengthens the interface between content production and institutional political action. It is a network of symbolic capitals that recognize each other: the company legitimizes actors and agendas; these actors, in turn, legitimize the company as an "alternative" voice to the mainstream (Dieguez, 2022; Nobre, 2022). The result is the conformation of a parallel circuit of authority that disputes meanings, regulates belongings, and demarcates moral boundaries, operating as a digital think tank whose laboratory is the platform culture itself.

This article proposes to interpret Brasil Paralelo as an emerging form of hybrid think tank of the Brazilian far right. The central hypothesis is that the company not only disseminates content with a conservative bias, but organizes a regime of truth adjusted to algorithmic logic, in which high-quality audiovisual production, the community of members, and the rhetoric of "independence" make up a legitimation device that combines apparent technical credentials, moral emotion, and the market. In analytical terms, this device operates on three interdependent planes: (i) discursive, through revisionist and moralizing narratives; (ii) organizational, via a business model that converts audience into revenue and authority; and (iii) political-symbolic, through the mediation between leaders, influencers, and aligned audiences.

Methodologically, an empirical-documentary approach is adopted focused on the analysis of public materials of greater scope published between 2019 and 2024 (documentaries and digital articles), articulated with national and international bibliography

on the digital far right, think tanks, and the political economy of attention (Marres, 2017; Venturini, 2023). The excerpt seeks to apprehend how editorial choices, themes, framing, selection of voices, translate into routines of production of meaning and how these routines, in turn, produce effects of truth and belonging.

From a theoretical point of view, the contribution lies in bringing the classical discussion on think tanks (organized production of expertise and influence) closer to the contemporary analysis of algorithmic mediations. By characterizing Brasil Paralelo as a hybrid digital think tank, it is argued that the concept should incorporate performative and marketing dimensions that today sustain cognitive authority in the platform environment. Such an update has implications for the study of political communication and the quality of democracy: if a growing portion of public deliberation takes place mediated by devices whose vector is commercial engagement, understanding their mechanisms of legitimation becomes a necessary step to think about regulation, accountability, and media literacy.

In summary, this work is based on the diagnosis that the dispute over the meaning of Brazil has also been fought, and increasingly, as a dispute over models of production and certification of truth. Brasil Paralelo is taken here as a strategic case to observe this displacement. The article continues by presenting the theoretical contribution mobilized and the methodological design, and then analyzes the empirical material and discusses its findings in the light of recent literature, concluding with implications and research agendas.

2 WHAT IS "PARALLEL BRAZIL"?

Brasil Paralelo is a Brazilian audiovisual production company founded in Porto Alegre in 2016 by three young entrepreneurs — Henrique Viana, Lucas Ferrugem and Filipe Valerim, with the proposal of "rescuing values and ideas that formed Brazil". From the beginning, the project presented itself as a response to the supposed cultural hegemony of the left, adopting the narrative that the country would have been "contaminated" by decades of progressive intellectual dominance. This discourse, which reinterprets the Gramscian concept of hegemony, serves as an articulating axis for what the company calls "cultural reconstruction", in line with the ideas of the "cultural war" popularized by Olavo de Carvalho and incorporated into the political rhetoric of Bolsonaroism.

Over time, Brasil Paralelo has consolidated itself as an independent streaming platform, offering documentaries, series and courses under subscription, as well as free content on social networks. Its catalog includes productions such as 1964 – Brazil between

Arms and Books (2019), Cortina de Fumaça (2020), The First Art (2021) and The Inconfidência Mineira (2022), which recount historical episodes with a strong revisionist bias. The cinematic aesthetic, the epic narrative and the rhetoric of the discovery of "hidden truths" create a sensory experience of revelation and belonging, bringing the viewer closer to the logic of "initiation" typical of online ideological communities.

The business structure combines a digital business model with community loyalty strategies. According to data released by Exame (Amorim, 2023), the company has surpassed the mark of half a million subscribers and operates with recurring revenue from monthly fees, course sales, and commercial partnerships. Although he presents himself as "independent of governments and parties", his production strongly converges with the political and moral agenda of the new right, especially in the Bolsonaro cycle. In addition to public figures linked to this field, several parliamentarians and influencers participated in its productions, configuring a network of ideological affinities and symbolic exchanges between the political and media spheres.

This transversal insertion between market and ideology brings Brasil Paralelo closer to the concept of a "hybrid digital think tank", understood here as an organization that combines the business model of communication with the function of production and dissemination of political ideas (Rich, 2004; Medvetz, 2012). Unlike traditional think tanks, research institutes, or public policy foundations, the digital hybrid mobilizes audiences in real time, transforms engagement into financial capital, and converts entertainment into persuasion. Expertise does not derive from recognized specialists, but from audiovisual performance that confers authority on certain interpreters of national history and morals.

Another defining feature is the strategic use of social networks as instruments of political pedagogy. The company maintains an active presence on platforms such as YouTube, Instagram and X (formerly Twitter), adapting excerpts from its films into short formats, subtitled and optimized for algorithmic engagement. This fragmentation of the content expands the reach and reinforces the effect of ubiquity, allowing fragments of their narratives to be reproduced in different contexts, often detached from the original source. The result is a parareality, an appropriate term here to describe the way in which the company constructs a parallel interpretive universe, coherent in itself, but disconnected from external factual parameters.

Now, from the company's statements, it can be seen that, still on the discursive level, there is an argumentative need to demonstrate an alleged "independence" through an alleged

financial distance from "parties, politicians, social movements and even laws" (Paralelo, 2024c). In fact, they rejoice that, apparently, they have never benefited from money from the public sector, an idea that is premised on a pessimistic and negative view of the State and institutions. In another article published by the company itself, "Brasil Paralelo" brings, by name, the first collaborators of its first productions, among whom are politicians, businessmen, judges, journalists, advertisers, digital influencers, ministers of the Federal Supreme Court, and far-right thinkers (Paralelo, 2022d).

Among them, the presence of the late astrologer and self-taught Olavo de Carvalho, a kind of celebrity in the right-wing extremist environment, stands out. In turn, former President Jair Messias Bolsonaro himself and his son Eduardo Bolsonaro are expressly cited as the company's first "contributors" (Prado, 2023). It is important to note that Beatriz Kicis, Joice Hasselmann, Janaína Paschoal, Rodrigo Constantino and Luiz Felipe Pondé are public figures who are enthusiasts of the Bolsonarist movement and, nevertheless, the first three mentioned participated institutionally in Bolsonarism through legislative elective mandates at the federal and state levels, respectively.

The "parareality" of Brasil Paralelo is not, therefore, a simple distortion of facts; It is a self-sufficient system of meaning, which combines moral plots, affective images and totalizing explanations. Within this logic, each historical, political or social event is reread as a manifestation of a larger struggle between "Brazilian values" and "enemies of the nation". This dualistic structure confers emotional intelligibility to complex phenomena, simplifying the real and making it compatible with a conservative collective identity project. The force of conviction derives less from rational argument and more from narrative pleasure, the viewer is invited to participate in a moral epic, not to critically evaluate evidence.

The empirical analysis carried out in this study confirms that Brasil Paralelo operates simultaneously as a media company, a political actor and a producer of ideology. Its ability to articulate discourse, aesthetics, and business model makes it a privileged laboratory for understanding the new forms of political advertising in the age of platforms. More than a communication channel, it is an ecosystem for the production of meaning, in which truth, emotion and merchandise merge. This fusion is the core of its symbolic efficacy, and also the starting point for understanding how the Brazilian far right reconfigures the public sphere and the boundaries between information, belief, and belonging.

3 OF THE CONTENT MADE AVAILABLE ON SOCIAL PLATFORMS AND ITS FAR-RIGHT PROPAGANDA

The content produced and disseminated by Brasil Paralelo is an exemplary case of how the digital far right transforms communication platforms into instruments of ideological persuasion, disguised in the form of entertainment and "cultural formation". Instead of resorting to explicit political speeches, the company adopts a cinematic aesthetic and emotional narrative that replaces rational argumentation with sensory and moral immersion. This characteristic is consistent with what Cesarino (2023) calls the digital epistemology of Bolsonarism, marked by the fusion between affects, beliefs, and recommendation algorithms.

The discursive strategy of Brasil Paralelo is based on three complementary axes: the revisionist reinterpretation of national history, the construction of moral enemies, and the aestheticization of politics. In his documentaries, Brazil's recent history is reframed as a struggle between the "true nation" and a corrupt intellectual elite. The civil-military coup of 1964 is portrayed as a "preventive revolution" against communism; social movements are presented as products of ideological manipulation; inclusion policies, as threats to meritocracy. This narrative operation creates an inverted temporality, in which the authoritarian past is converted into a symbol of order and virtue, while the democratic present is read as moral decadence.

The second axis, of a moral and affective nature, is structured around the figure of the enemy – be it "globalism", "gender ideology" or "cultural Marxism". The function of this rhetoric is not to describe reality, but to organize collective affects and offer a simplified framing of the world. The systematic repetition of binary oppositions (good/evil, truth/lie, Christian/communist) produces a grammar of identity recognition that replaces political complexity with a morality of cultural war. In this grammar, the adhesion is not only intellectual, but emotional: the viewer is invited to feel indignation, repulsion and redemption — emotions that reinforce the bond with the brand's symbolic community.

The third axis is that of political aestheticization, which operates at the intersection between form and ideology. Brasil Paralelo invests in high-standard technical production, dramatic lighting, heroic soundtracks, reconstructed historical sets, to coat its narratives with an aura of authenticity. This investment is decisive for convincing: aesthetic quality is mobilized as proof of truth. The filmic form replaces the empirical evidence, and the viewer tends to associate visual verisimilitude with the legitimacy of the argument. Such use of audiovisual as a symbolic capital of credibility brings the company closer to the logic of "real

entrepreneurs" (Medvetz, 2012), who shape public perceptions through performance and aesthetic authority.

In the platform environment, this operation is amplified by the algorithmic architecture that favors highly engaging content. Brasil Paralelo fragments its documentaries into short videos, subtitles and *reels* of rapid circulation, optimized for the recommendation logics of YouTube, Instagram and X. The excerpts chosen condense emotionally intense passages, impactful speeches, crying scenes, accusations of corruption, which work as engagement triggers. At the same time, these decontextualized fragments maintain the affective coherence of the whole, allowing each clip to act as an autonomous unit of propaganda. The cumulative effect is that of ubiquity: the message infiltrates the digital daily lives of users, dissolving between humorous videos, music and news.

In addition, the company builds a system of community belonging around the identity of the "Brasil Paralelo member". The subscriber is invited to join a group of "awakened" people, bearers of a truth denied by the mainstream media. The rhetoric of persecution ("they want to shut us up") reinforces the emotional bond between brand and audience, transforming the act of consuming content into a gesture of political resistance. This symbiotic relationship between producer and consumer reproduces the logic of conspiratorial communities described by Venturini (2023): information circulates as proof of exclusivity and reinforcement of group cohesion.

From a communicational point of view, the company exemplifies what Ribeiro (2024) calls "monetization of polarization". Affective engagement (likes, comments, shares) converts into visibility, and visibility, into revenue from subscriptions and advertising. Polarization, far from being an unwanted byproduct, becomes the basis of the business model. Every heated public debate, every controversy over censorship or free speech, increases the brand's reach and legitimizes its narrative of dissent. Ideology feeds back on the algorithm.

These mechanisms demonstrate that the content made available on the platforms by Brasil Paralelo cannot be understood only as alternative media, but as an infrastructure of symbolic power. Its effectiveness does not derive from a supposed monopoly of information, but from the ability to structure perceptions and affections. The "parareality" constructed by its products is self-referential: the films, posts and speeches confirm each other, forming a circuit of self-evidence. Thus, the spectator who adheres to this worldview begins to inhabit his own interpretative reality, in which facts are filtered by ideological fidelity and emotional belonging.

In summary, the content produced and disseminated by Brasil Paralelo illustrates the consolidation of a far-right propaganda model anchored in digital platforms. It combines moralizing storytelling, authority aesthetics, and emotional engagement to transform the audiovisual experience into political pedagogy. This synthesis, at once commercial and ideological, makes the company a paradigmatic case of how platform capitalism reconfigures political communication and redefines the very concept of public truth in contemporary Brazil.

4 WOULD BRASIL PARALELO BE A *THINK TANK*?

The question of whether Brasil Paralelo could be considered a think tank, or if it just mimics the format, is central to understanding its unique position in the Brazilian communication ecosystem. The term think tank historically refers to independent institutions dedicated to the production of specialized knowledge with the intention of influencing public policies and strategic debates (Rich, 2004; Medvetz, 2012). These centers of reflection, which emerged in the post-war Anglo-Saxon context, operated as mediators between academia, the state, and the market, building a hybrid space of expertise and advocacy. In the Brazilian case, however, this category acquires its own contours: organizations proliferate that, although they claim the label of think tank, move between activism, communication, and ideological mobilization (Hauck & Mendonça, 2022).

Brasil Paralelo participates in this process of hybridization by adopting typical functions of a think tank, without sharing its classic institutional structure. Its declared mission, "to rescue forgotten values and ideas", fulfills a role equivalent to the formulation of an agenda of thought; its documentaries and courses operate as vehicles for the dissemination of doctrine; and its subscriber base functions as a community of financial and ideological support. The company, therefore, brings together three structuring dimensions: the intellectual (production of ideas), the communicational (symbolic mediation) and the economic (business model). The result is an organizational form that we could describe as an idea company, in which the commodification of content does not weaken, but reinforces the power of symbolic influence.

A decisive aspect to understand this transformation is the performativity of expertise. In Brasil Paralelo's productions, knowledge is staged through aesthetic and rhetorical devices: interviews in austere settings, use of technical language, citation of authors and international conservative institutions. This *mise-en-scène* of erudition replaces academic status with an aesthetic of authority. As Medvetz (2012) notes, the power of think tanks

derives less from their scientific rigor than from their ability to "appear competent". In the case under analysis, the opinion becomes the very substance of authority, that is, the performance replaces the title, and the audiovisual narrative becomes the main vehicle of cognitive legitimation.

Another relevant dimension is the insertion in transnational networks of ideas from the global right. Many of the concepts disseminated by Brasil Paralelo, such as "cultural Marxism", "gender ideology" and "globalism", circulate in North American, European and Latin American think tanks, being translated and adapted to the national context. This circulation suggests a form of ideological transposition, in which the company acts as a cultural intermediary between foreign discourses and the Brazilian public. Thus, at the same time that it projects an image of national authenticity, Brasil Paralelo is part of a global circuit of production with a conservative sense, reproducing discursive and strategic models already consolidated in experiences such as PragerU and The Daily Wire (Ward & Vreese, 2023).

The fundamental difference, however, lies in the digital and commercial nature of the operation. While traditional think tanks rely on philanthropic donations or state funding, Brasil Paralelo sustains itself by the direct sale of symbolic products — films, subscriptions, and courses. This format eliminates institutional intermediation and creates a direct relationship between producer and consumer, transforming political engagement in relation to the market. The act of "subscribing" to the service also becomes a gesture of ideological adherence. From this perspective, the company carries out what we could call the privatization of the public sphere of opinion: the debate is shifted to a space controlled by audience metrics and consumption models.

This reconfiguration of the role of a think tank is consistent with the communicational environment of platform capitalism. As Couldry and Mejias (2019) observe, data extraction and the conversion of attention into value are the principles that structure the digital economy. By operating under such logics, Brasil Paralelo transforms ideological production into a product and, simultaneously, into a commodity. Its success does not depend on persuading political or bureaucratic elites, but on capturing and retaining audiences on a large scale. Instead of white papers, reports, or opinions, his language of influence is the viral documentary; its arena of action is the social media feed; Its symbolic capital is measured in likes and subscriptions.

Thus, the question "would Brasil Paralelo be a think tank?" does not have a binary answer. The company does not fit the classic definitions, but neither can it be reduced to a

mere media producer. It embodies a new form of think tank: decentralized, entrepreneurial, and algorithmic. Authority does not emanate from academic institutions or state legitimacy, but from the ability to produce convincing and emotionally mobilizing meaning on a digital scale. It is a model of "cognitive market production", in which symbolic capital is accumulated not by the production of validated knowledge, but by the reiterated performance of certainty.

The case of Brasil Paralelo, therefore, signals a structural transformation in the relations between communication, politics and the production of truth. What was once the domain of specialized institutes has become a field of action for media entrepreneurs capable of translating doctrine into narrative. The company represents the tip of a broader process: the emergence of an ecosystem of audiovisual think tanks that operate at the intersection of the attention economy, political morality, and the cultural industry.

With this, the role of the public intellectual and the circulation of ideas in Brazilian society is redefined. If, as Bourdieu states, symbolic power consists in the ability to impose a legitimate vision of the world, Brasil Paralelo demonstrates that, in the digital age, this imposition can be exercised through images and algorithms, and not only through books and academic debates.

5 CONCLUSION

The analysis carried out throughout this study allows us to affirm that Brasil Paralelo constitutes a new form of political-communicational organization, whose singularity lies in articulating functions of media, enterprise and ideology under the same operational model. Although the company presents itself as an independent cultural producer, its practices and narratives show the typical structure of a hybrid think tank, oriented to the construction of moral consensus and the production of cognitive legitimacy within the Brazilian far right. Its differential is not only in the content it disseminates, but in the way it converts ideas into products and beliefs into audience, operating simultaneously on the symbolic and economic planes.

The investigation showed that Brasil Paralelo does not act as a simple disseminator of disinformation or a marginal agent, but as part of an ecosystem of meaning-making that redefines the mediation between politics and communication. By exploring the logic of digital platforms, the company shifts the notion of public debate to a space dominated by engagement metrics, in which truth is less a matter of evidence than of circulation and visibility. In this context, the audiovisual becomes the main grammar of legitimation: authority

derives from the performance of certainty, and not from verification. This aesthetics of conviction gives political discourse the form of a moral spectacle, converting cultural consumption into an act of civic faith.

Such dynamics challenge the traditional boundaries between media, ideology, and knowledge production. The case analyzed shows that the classic concept of think tank, centered on the rational and institutionalized production of ideas, needs to be updated to include commercial and media actors who organize and disseminate worldviews through entertainment formats. "Thinking", the etymological core of the term, moves from technical rationality to the ability to construct convincing narratives, supported by algorithms and affects. It is a transition from the think tank to the feeling tank: a center of emotional production of meaning, in which politics is converted into symbolic consumption.

The implications of this transformation are profound. First, they indicate that the dispute for cultural hegemony is no longer limited to the sphere of traditional institutions, but extends to the environment of platforms, where the power to guide and define the truth is mediated by invisible metrics and market dynamics. Secondly, they reveal that the attention economy has become a fertile ground for the consolidation of authoritarian ideologies, which find in speed, repetition and the aesthetics of certainty the instruments of their effectiveness. Finally, they point to the need to rethink the mechanisms of communicational responsibility and regulation of disinformation, not only from a legal perspective, but as a matter of democratic culture and media literacy.

It is concluded, therefore, that Parallel Brazil is less an anomaly and more a symptom of structural reconfiguration of the Brazilian public space. By fusing market and ideology, the company demonstrates that contemporary politics is also, and perhaps above all, made in the symbolic economy of platforms. Understanding this phenomenon requires broadening the view of the social sciences on the role of communication and recognizing that, in the digital age, the production of truth is inseparable from the production of the audience.

From this diagnosis, paths are opened for future research that compares the Brazilian case to international experiences, identifies transnational financing networks, and investigates the social consequences of the convergence between technology, economics, and politics. The parareality constructed by Brasil Paralelo, far from being just distortion or manipulation, constitutes a form of symbolic ordering of the world, and precisely for this reason, a decisive field for understanding the contemporary challenges of democracy.

ABSTRACT

Remote sensing is an innovative technique derived from technical and instrumental advances with support capacity for several activities, including scientific research. This article describes the use of orbital images related to environmental planning activities in Embrapa, a Brazilian research public firm. 161 publications related to the period 1998 – 2025, including applications as soil surveys, environmental monitoring and precision agriculture were discussed.

Keywords: Land Use. Classification. Images. Survey.

RESUMO

O sensoriamento remoto é uma técnica inovadora derivada de avanços técnicos e instrumentais, com capacidade de suporte para diversas atividades, incluindo a pesquisa científica. Este artigo descreve o uso de imagens orbitais relacionadas a atividades de planejamento ambiental na Embrapa, uma empresa pública de pesquisa brasileira. Foram discutidas 161 publicações relacionadas ao período de 1998 a 2025, abrangendo aplicações como levantamento de solos, monitoramento ambiental e agricultura de precisão.

Palavras-chave: Uso da Terra. Classificação. Imagens. Levantamento.

RESUMEN

La teledetección es una técnica innovadora derivada de avances técnicos e instrumentales, con capacidad de apoyo para diversas actividades, incluida la investigación científica. Este artículo describe el uso de imágenes orbitales relacionadas con actividades de planificación ambiental en Embrapa, una empresa pública de investigación brasileña. Se discutieron 161 publicaciones relacionadas con el período de 1998 a 2025, incluyendo aplicaciones como levantamientos de suelos, monitoreo ambiental y agricultura de precisión.

1 INTRODUCTION

The National Institute of Spatial Research, INPE, created in 1961 and the RADAM project, effective during the period 1970 – 1985 (Wikipedia, 2025), were perhaps, the main Brazilian entities involved with remote sensing. INPE remains active nowadays, capturing and distributing orbital images, promoting related research, and organizing, at least partially, the Brazilian thematic symposium. Orbital imagery are useful by several perspectives, by instance, coverage capacity, temporal changes, historical record and comprehensive sight. The last Symposia (INPE, 2025) included forty themes, involving disciplines as Agriculture, Geology, Meteorology and Oceanography, technical aspects as hyper-spectral remote sensing, image processing and mapping, and specific affairs, that is, climate change, fires, wetlands and soils. Furthermore, several undergraduate and postgraduate courses in Brazilian universities have incorporated the discipline of "Remote Sensing" into their curricula, deriving in associated dissertations and thesis.

This article considered 161 references related to the author, including the topics agriculture, geosciences, and edaphology, focusing a discussion about the influence of remote sensing in that context and its innovations related to socioeconomic phenomena.

2 DESCRIPTION OF WORKS

The 161 works mentioned before cover the period 1998 – 2025, being 27 technical-scientific articles, 7 books, 20 chapters of books, 39 extended or resumed abstracts in events and 68 serial publications of Embrapa, that is, 17%, 4%, 12%, 24% and 42% of total publications respectively. Since a research point of view, serial publications of Embrapa include bulletins of research and development, a structure very similar to a technical-scientific article; technical circular, technical communication and "documents", focusing aspects related to producers or a less academic public. Table 1 shows the main themes considered here and the quantity of works for each case.

"Diversified" refers to methodological studies or innovation, by instance, spectroradiometry applied to agriculture (Filippini-Alba et al., 2007) or new agricultural products, as olives (Filippini-Alba et al., 2013) and pecan-nuggets (Filippini-Alba et al., 2020). Environmental aspects related to climate change, ecotoxicology, geosciences, sustainability and the Mirim lagoon, a big water body in the Brazil – Uruguay frontier, were also involved.

Table 1

Some characteristics of the research themes considered in this article

Theme	Quantity	%	Description
Diversified	21	13	Several themes (see text)
Geochemistry	6	4	Chemistry of rocks and minerals
GIS	35	22	Spatial analysis and modeling
PA	22	14	Specific agricultural managing
Soil mapping	32	20	Municipality or regional scale
Zoning	30	18	Agricultural zones discrimination
Remote sensing	15	9	Change detection mapping or monitoring

PA = Precision Agriculture; GIS = Geographic information system

Uruguay was the geographical site in 8 times, Rio Grande do Sul state 123 times, Santa Catarina state 11 times, Parana state 10 times, São Paulo state 3 times and 6 times was considered Brazil or the world as a whole.

3 THE REMOTE SENSING INFLUENCE

As the Brazilian Agricultural Research Corporation, Embrapa generally focuses on rural areas. However, studies related to mineral resources and urban expansion are considered due to technical aspects or based on the author's profile, sometimes geared towards Geosciences.

Some examples related to urban expansion, soil mapping, land use, mineral exploration and cartography positioning are presented as following.

3.1 URBAN EXPANSION

Filippini-Alba e Moreira (2009) analyzed the urban expansion of some cities located near the RS122, a road located north of Porto Alegre, in the state of Rio Grande do Sul, Brazil. The images showed different expansion patterns, mainly from the year 2000, when there was an acceleration of the process. São Leopoldo grow up 55 hectares/year during 1987 to 2000 and 270 hectars/year after 2000 (2000-2007), values were 10 and 112 hectars/year for Bom Princípio, 2 and 7 hectars/year for Garcés, 32 and 77 hectars/year for Portão and 23 and 146 hectars/year for São Sebastião do Caí. The acceleration process after 2000 showed different velocities according to place, a condition related to multiple factors. Gallo (2014) describes the growth of Pelotas, Rio Grande, and Capão do Leão, cities in Rio Grande do Sul state during the period from 1990 to 2010. Several original nucleus already existed for the three cities in 1990, including the Fragata and Laranjal neighborhoods in

Pelotas, as well as Cassino in Rio Grande. So, the cities advanced to new habitable spaces after 1990s, restricted by water bodies, swamps and dunes.

3.2 SOIL MAPPING

Conventional soil mapping is based on aerial photographs interpreting (Flores; Filippini-Alba, 2015). However, few developments considered remote sensing imagery for soil mapping recently, in spite of Ikonos was the first high resolution satellite, launched in 1999, with 80 cm pixel and four bands (Apollo Mapping, 2025).

A more recent technology, the “digital soil mapping” (DSM) uses digital layers for mapping, as the digital elevation model or remote sensing imagery, besides field information, the soil-scientist knowledge and data of the profiles. So, polygons are elaborated based on digital layers, then adjusted by means of field information and the profiles data. Nachtigall (2022) applied the DSM in Marau municipality, Rio Grande do Sul state, Brazil. Soil mapping requires knowledge of the successive layers down to the bedrock. Therefore, automated mapping using surface data has not been possible until now.

Bare or sandy soils and vegetation are prominent features in remote sensing imagery, highlighting areas of mineral exploration or other types of degradation. Filippini-Alba (2018) discussed three study cases in Rio Grande do Sul state using remote sensing imagery: (1) granite exploration in Capão do Leão municipality; (2) coal mining in Candiota municipality; and, (3) sandy areas in the west of the state. Topics (1) and (2) relate to mineral sector, however, topic (3) is a natural process due to the occurrence of sandstone as basal rock.

3.3 LAND USE

Filippini-Alba et al. (2015a) compared orbital images of medium resolution, Landsat (30m pixel) and Aster (15-30m pixel), in the region of the lagoons Mirim and Patos. The main geographical features evaluated were water bodies and dunes including 25 areas of 60 hectares to more than 70 thousand hectares. The medium error was 11% (corrected value) and individual errors were less than 5% for geographical bodies bigger than 1000 hectares. Schroder and Filippini-Alba (2010) and Filippini-Alba et al. (2015b) evaluated land use on specific municipalities discriminating agricultural, environmental and urban areas.

The rice-crop area varied from 13 to 22 thousand hectares during 37 years (1973 to 2009) in Caiubá lagoon region, Rio Grande do Sul state (Filippini-Alba et al., 2012), but

variation of “pastures” and “areas without vegetation cover” was significantly greater, from 5 to 30 thousand hectares, in the same period.

3.4 MINERAL EXPLORATION

The processing and overlay of three layers derived from remote sensing data with eleven geochemical layers, discriminated twelve classes (Filippini-Alba, 1998). The remote sensing layers were TM4 Landsat band, representing vegetation, and the factor-F and factor-H (Crósta and Moore, 1989). That is, a combination of TM bands associated to iron oxides (Factor-F) and clay-minerals (factor-H) respectively. Content of elements in stream sediments (Ba, Co, Cu, Mn, Ni, Pb, P, V, Y and Zn) and Gamma-radiometry were the geochemical layers. So, one class represented rivers and forests and two classes characterized the geochemical background, one of them with the minimal content of trace elements and the other one, slight enriched with Co, Cu, Ni, V and Zn. Both classes, covering 56% of the research area, 28% for each, presented an intermixed spatial pattern (Filippini-Alba, 1998). Two classes appeared associated with mineralization, coinciding with geochemical anomalies derived from statistical processing, spread throughout the territory, reinforcing the possibility of mineral deposits. Finally, seven classes related to lithology, forming a large patch in the northwestern part of the research area, in the Zapican geographic sheet.

3.5 CARTOGRAPHY POSITIONING

Remote sensing imagery can be used as cartographic base, as aerial photographs were used in previous times. Anyway, there are a variety of available scales in the commercial context today, deriving on high prices and different technical aspects.

4 CONCLUSION

Remote sensing is a broad discipline encompassing applied, exact and life sciences, however, with potential for commercial and management activities too. Land use excels as the main application of remote sensing, including urban expansion. Soil mapping, mineral exploration and cartography positioning are more specific applications and they utilize the location advantages of remote sensing, functioning as a supporting discipline and a source of complementary information. The spectral properties of remote sensing have been only

partially explored to date; perhaps further progress in this area can be expected in the coming years.

ABSTRACT

This article presents a systematized report of the activities developed in the course Educational Technology – Formative Activity VII, from the Centro Universitário UNIFACVEST, during the 2025.2 academic semester. The actions involved planning, execution and analysis of pedagogical practices integrating digital technologies, maker culture, active methodologies, computational thinking and theoretical foundations from Developmental Psychology, especially Piaget and Vygotsky. Among the activities carried out, the following stand out: construction of sensory panels, development of digital and physical games using Scratch, Micro:bit, laser cutting and 3D printing, field visits, pedagogical workshops, application of projects in public schools, and production of lesson plans in ENADE format. The practices demonstrated the transformative potential of educational technology in promoting autonomy, creativity, scientific investigation and meaningful learning. The results indicate that the course successfully articulated theory and practice in a critical and innovative manner.

Keywords: Educational Technology. Maker Culture. Scratch. Active Learning. Piaget.

RESUMO

O presente artigo tem como objetivo apresentar um relato sistematizado das atividades desenvolvidas na disciplina Atividade Formativa VII do Curso de Tecnologia Educacional do Centro Universitário UNIFACVEST, no semestre 2025.2. As ações envolveram planejamento, execução e análise de práticas pedagógicas integrando tecnologias digitais, cultura maker, metodologias ativas, pensamento computacional e referenciais teóricos da Psicologia do Desenvolvimento, especialmente Piaget e Vygotsky. Entre as atividades realizadas destacam-se: construção de painel sensorial, elaboração de jogos digitais e físicos utilizando Scratch, Micro:bit, corte a laser e impressão 3D, saídas de campo, oficinas

RESUMEN

El presente artículo tiene como objetivo presentar un relato sistematizado de las actividades desarrolladas en la asignatura Actividad Formativa VII del Curso de Tecnología Educativa del Centro Universitario UNIFACVEST, en el semestre 2025.2. Las acciones involucraron la planificación, ejecución y análisis de prácticas pedagógicas que integraron tecnologías digitales, cultura maker, metodologías activas, pensamiento computacional y referentes teóricos de la Psicología del Desarrollo, especialmente Piaget y Vygotsky. Entre las actividades realizadas se destacan: la construcción de un panel sensorial; la elaboración de juegos digitales y físicos utilizando Scratch, Micro:bit, corte láser e impresión 3D; salidas de campo; talleres pedagógicos; la aplicación de proyectos en escuelas municipales y estatales; además de la elaboración de planes de clase en formato ENADE. Las prácticas evidenciaron el potencial transformador de la tecnología en el contexto educativo, promoviendo la autonomía, la creatividad, la investigación científica y el aprendizaje significativo. La asignatura cumplió su papel formativo al articular teoría y práctica de manera crítica e innovadora.

Palabras clave: Tecnología Educativa. Cultura Maker. Scratch. Aprendizaje Activo. Piaget.

1 INTRODUCTION

Teacher training in the digital age requires the integration between pedagogical foundations and the critical and creative use of technologies. In the Educational Technology Course at the UNIFACVEST University Center, the discipline Formative Activity VII plays a central role in the development of practical, critical, reflective and investigative skills necessary for contemporary professional performance.

In Freire's perspective, educational practice requires a critical positioning of the educator in the face of the world and the instruments that constitute it, including technologies. As Freire (1996, p. 31) states:

[...]Teaching is not transferring knowledge, but creating the possibilities for its own production or construction. Therefore, teaching practice requires curiosity, criticality, methodical rigor and openness to the new knowledge that emerges in social, scientific and technological life". In this way, the critical and creative use of technologies cannot be dissociated from pedagogical reflection, because, as the author adds, "it is in the problematization of reality, in dialogicity and in transformative action that the educator affirms himself as a subject who learns by teaching and teaches by learning. (Freire, 1996, p. 43).

The 2025.2 semester was marked by a significant set of training experiences, which included maker culture, programming, robotics, field trips, construction of pedagogical materials, application of projects in schools, and preparation of lesson plans aligned with the BNCC. All these experiences were based on classical and contemporary theoretical references, such as Piaget, Libâneo, Vygotsky, Wallon, Freire, Resnick and authors of Environmental Education and Active Learning.

The article presents a detailed account of these practices, highlighting their pedagogical, methodological and technological contributions to the training of academics in the context of democracy, inclusion and social justice.

For Libâneo, teaching requires much more than technical mastery; It requires a critical understanding of the educational reality and the ability to articulate knowledge, methods and resources in an intentional and reflective way. As the author states:

[...]Teaching practice is an intentional and systematic activity, guided by educational objectives and supported by theoretical foundations that enable the teacher to analyze, interpret and intervene consciously in the school reality. Teaching implies selecting methods, using instruments and resources – including technological ones – in a

critical, ethical and appropriate way to the students' training needs. (Libâneo, 2013, p. 28).

From the perspective presented, it is understood that teacher training in contemporary times cannot dissociate the theoretical domain from the ability to use technologies in a critical and intentional way. By integrating pedagogical foundations with innovative practices, the discipline Formative Activity VII reaffirms the role of the teacher as a reflective agent, capable of transforming the educational reality through conscious methodological choices aligned with the current demands of learning.

2 THEORETICAL FRAMEWORK AND REPORT OF ACTIVITIES

2.1 THEORETICAL FOUNDATIONS: PIAGET, CONSTRUCTIVISM AND MAKER CULTURE

The activities developed were guided by the constructivist theory of Jean Piaget, who understands learning as: "[...] active construction, occurring through assimilation, accommodation and balance". (Piaget, 1999; 2014). The proposals were structured respecting the cognitive stages: sensory-motor, preoperative, concrete operative and formal operative.

Figure 1

Number of activities by category - Training activities VII (2025.2)

Maker culture and computational thinking, according to Resnick (2017), were integrated as tools to favor project-based learning, autonomy, creativity, and problem-solving.

2.2 CONSTRUCTION OF SENSORY PANEL – SENSORIMOTOR STAGE

Based on the teaching plan provided, students built a sensory panel inspired by the sensorimotor stage (0–2 years). The activity involved:

- selection of objects with textures, sounds and colors;
- collaborative assembly with the support of the Maker Laboratory;
- understanding of cause and effect and motor coordination;
- theoretical foundation in Piaget's proposals and in the use of Scratch to stimulate sound and visual associations.

The panel demonstrated the relevance of sensory exploration for early cognitive development.

Figure 2

Distribution of practices by Piaget's stage (2025.2)

2.3 PROJECT "CONTATUDO 3000" – LOGICAL THINKING IN EARLY CHILDHOOD EDUCATION

The project applied with Maternal II used resources such as the Treasure Chest, flashlights with numerals and the Contatudo 3000 Machine. The children explored quantities,

colors and numerical relationships, experiencing playful, meaningful and investigative situations.

The activity dialogued directly with the preoperative stage, stimulating language, symbols and first logical-mathematical notions.

2.4 "RECICLAGAME" PROJECT – ENVIRONMENTAL EDUCATION, SUSTAINABILITY AND GAMES

Academics developed an ENADE lesson plan and a digital HTML game to teach recycling to Elementary School. The project involved:

- BNCC competencies such as EF03CI05 and General Competence 10;
- gamification, cooperation and decision-making;
- integration between Science, Technology, Languages and Mathematics;
- valuing environmental responsibility.

The practice exemplifies the use of technology as an interdisciplinary and engaging pedagogical resource.

2.5 MAKER CULTURE: LASER CUTTING, 3D PRINTING, AND PROTOTYPING

The Geometric Shapes Educational Game project involved:

- initial prototyping in MDF in Professor Alberto's laboratory;
- 3D modeling in Tinkercad and printing in the Maker Lab;
- digital version programming in OneCompiler;
- pedagogical application with 5th grade classes;
- observation of strategies, hypotheses, logical reasoning and cooperation.

It is a robust example of the integration between physical and digital materials, favoring computational thinking and socio-emotional skills.

2.6 EDUCATIONAL ROBOTICS WITH MICRO:BIT

Workshops held with guest professor Cristian allowed the students to understand the potential of robotics:

- hands-on experimentation with sensors and logic;
- intuitive programming for beginners;
- perception of the role of robotics in technological literacy.

2.7 PEDAGOGICAL VISITS AND OBSERVATION OF INNOVATIVE PRACTICES

The field trips to the institutions SESI, EEB Godolphin and EEB Vidal Ramos made it possible to:

- analysis of innovative educational environments;
- contact with active methodology practices;
- dialogue with former students who now work in the state network;
- articulation between academic theory and school practice.

2.8 SCRATCH: PROGRAMMING, GAMIFICATION, AND DIGITAL STORYTELLING

The discipline produced projects in the different stages of Piaget:

- Sensorimotor: sound and visual responses in panels connected via Makey Makey;
- Preoperative: interactive stories, digital narratives and physical cards;
- Concrete operative: logical challenges, mazes and numerical sequences;
- Formal operative: games that require abstraction, hypotheses, and strategic reasoning.
- Scratch has proven to be an accessible and powerful tool, allowing creation, authorship and experimentation.

Figure 3

Frequency of use of digital technologies (2025.2)

3 SET OF ACTIVITIES

The set of activities described evidences a formative proposal based on Piagetian constructivism, in which learning is understood as an active process, resulting from the interactions between subject and environment. By respecting the stages of cognitive development — sensory-motor, preoperative, concrete operative and formal operative — pedagogical practices were organized to favor meaningful experiences, ensuring that each project was aligned with the capacities and ways of thinking characteristic of each age group. In this sense, the actions carried out in the discipline materialize concepts such as assimilation, accommodation and balance, promoting situations that challenge students and allow the construction of new mental schemes.

The integration between maker culture and computational thinking, inspired by authors such as Resnick, strengthened the perspective that learning involves creating, experimenting, testing hypotheses, and transforming ideas into concrete products. Projects such as the sensory panel, Contatudo 3000, ReciclaGame, and the game of geometric shapes illustrate this approach, as they articulate digital technologies, manipulable materials, and problem-solving in real contexts. Each activity was planned to stimulate autonomy, creativity and collaboration, core values of active methodologies.

The use of tools such as laser cutting, 3D printing, Micro:bit, and Scratch has broadened academics' understanding of the role of technology in contemporary education. Robotics and programming demonstrated their potential in technological literacy, while digital and hybrid projects enabled experiences that dialogue with the principles of the BNCC, especially with regard to digital skills, scientific thinking, and environmental responsibility.

The pedagogical visits reinforced the articulation between theory and practice, providing students with the observation of innovative environments and critical reflection on different teaching models. This movement between learning, observing, creating and applying reflects the essence of professional training in the area of educational technology: an education that integrates scientific knowledge, pedagogical sensitivity and technological mastery.

Freinet argues that learning is strengthened when it is born from concrete experience and reflective action on the school routine. According to the author:

[...]It is not possible to conceive of the education of the educator or the student apart from life. It is in direct observation, in contact with reality and in continuous experimentation that critical spirit, autonomy and the ability to create new solutions are developed. The school

must open itself to the environment, study it, transform it and allow itself to be transformed by it, because it is in the living relationship between practice and reflection that knowledge gains meaning and becomes truly formative. (Freinet, 1998, p. 42).

Field trips and interschool visits play an essential role in teacher training when seen from the perspective of Célestin Freinet. For the author, the school cannot remain isolated, because it is in the living relationship with the environment, with people and with social practices that knowledge gains meaning. By taking students to observe other educational environments, different methodologies and school realities, learning is promoted that is born from concrete experience — a fundamental principle of Freire's pedagogy. These moments allow the future educator to develop sensitivity, an investigative posture and the ability to critically analyze the daily school life, understanding that teaching is also studying the world, interacting with it and transforming it. Interschool visits broaden horizons, enrich pedagogical practice and strengthen the articulation between theory and life, as Freinet defended.

The set of activities shows a coherent curricular proposal, which understands learning as an active, interdisciplinary and creative process, while preparing future professionals to act with pedagogical intentionality and technical competence in different educational contexts.

4 FINAL CONSIDERATIONS

The 2025.2 semester of the Formative Activity VII discipline demonstrated the power of the integration between constructivist theory, digital technologies and maker culture in the training process of future educational technologists. The activities carried out enabled the students to experience active methodologies, develop creative, technological and socio-emotional skills, in addition to experiencing real pedagogical practices in different school contexts.

Figure 4

Academic participation in activities (2025.2)

The discipline fully fulfilled its objective of providing formative experiences that articulate innovation, criticality, authorship and social commitment, preparing professionals capable of transforming the contemporary educational scenario.

ABSTRACT

This study analyzes the contradictions and possibilities of active methodologies in light of critical pedagogies within Professional and Technological Education (EPT). The investigated problem refers to the tensions between the growing use of active methodologies and the theoretical-critical foundations that guide integrated education. The general objective was to examine the representations of pedagogical practices in the teaching plans of technical courses integrated into upper secondary education across three campuses of the Federal Institute of Paraná (IFPR) regarding the use of active methodologies, identifying the contradictions and possibilities that emerge in light of critical pedagogies. A total of 438 documents referring to 13 courses were analyzed. The qualitative research was conducted in two stages: a literature review, including authors from EPT, critical pedagogies, and active learning methodologies; and a documentary analysis of the Teaching and Faculty Work Plans (PTD) obtained from the Teaching and Work Plan Platform (PLANIF). The data were organized in an analytical matrix with categories defined a priori: Critical Pedagogies (CP), Non-Critical Pedagogies (NCP), and Active Methodologies (AM), and examined through Content Analysis (Bardin, 2016). The results indicate that although there is significant use of active methodologies, 77.6% of the plans align with non-critical approaches, revealing a certain contradiction between institutional discourse and declared practices. The findings reveal challenges related to teacher training and the persistence of an education oriented toward the market, while also indicating a movement toward breaking with the banking model of education.

Keywords: Active Methodologies. Critical Pedagogies. Non-Critical Pedagogies. Professional and Technological Education.

RESUMO

Este estudo analisa as contradições e possibilidades das metodologias ativas à luz das pedagogias críticas na Educação Profissional e Tecnológica (EPT). O problema investigado refere-se às tensões entre a crescente utilização das metodologias ativas e os fundamentos teórico-críticos que orientam o ensino integrado. O objetivo geral foi analisar as representações das práticas pedagógicas nos planos de ensino dos cursos técnicos

integrados ao ensino médio de três campi do Instituto Federal do Paraná (IFPR) quanto ao uso das metodologias ativas, identificando as contradições e possibilidades que emergem à luz das pedagogias críticas. Foram analisados 438 documentos referentes a 13 cursos. A pesquisa, qualitativa, desenvolveu-se em duas etapas: revisão bibliográfica, contemplando autores da EPT, pedagogias críticas e das metodologias ativas; e análise documental dos Planos de Ensino e Trabalho Docente (PTD) obtidos na plataforma de Planos de Ensino e Trabalho (PLANIF). Os dados foram organizados em matriz analítica com categorias definidas a priori: Pedagogias Críticas (PC), Pedagogias Não Críticas (PNC) e Metodologias Ativas (MA), e examinados por meio da Análise de Conteúdo (Bardin, 2016). Os resultados indicam que, embora haja uso significativo de metodologias ativas, 77,6% dos planos alinham-se a abordagens não críticas, evidenciando certa contradição entre o discurso institucional e as práticas declaradas. Os achados revelam desafios relacionados à formação docente e à persistência de uma educação orientada pelo mercado, ao mesmo tempo em que apontam um movimento de ruptura com a educação bancária.

RESUMEN

Este estudio analiza las contradicciones y posibilidades de las metodologías activas a la luz de las pedagogías críticas en la Educación Profesional y Tecnológica (EPT). El problema investigado se refiere a las tensiones entre el creciente uso de las metodologías activas y los fundamentos teórico-críticos que orientan la educación integrada. El objetivo general fue analizar las representaciones de las prácticas pedagógicas en los planes de enseñanza de los cursos técnicos integrados a la educación secundaria de tres campus del Instituto Federal de Paraná (IFPR) en relación con el uso de metodologías activas, identificando las contradicciones y posibilidades que emergen a la luz de las pedagogías críticas. Se analizaron 438 documentos referentes a 13 cursos. La investigación, de enfoque cualitativo, se desarrolló en dos etapas: revisión bibliográfica, contemplando autores de la EPT, pedagogías críticas y metodologías activas; y análisis documental de los Planes de Enseñanza y Trabajo Docente (PTD) obtenidos en la plataforma de Planes de Enseñanza y Trabajo (PLANIF). Los datos fueron organizados en una matriz analítica con categorías definidas a priori: Pedagogías Críticas (PC), Pedagogías No Críticas (PNC) y Metodologías Activas (MA), y examinados por medio del Análisis de Contenido (Bardin, 2016). Los resultados indican que, aunque existe un uso significativo de metodologías activas, el 77,6% de los planes se alinean con enfoques no críticos, evidenciando cierta contradicción entre el discurso institucional y las prácticas declaradas. Los hallazgos revelan desafíos relacionados con la formación docente y la persistencia de una educación orientada al mercado, al mismo tiempo que señalan un movimiento de ruptura con la educación bancaria.

1 INTRODUCTION

Contemporary technological and social transformations have directly impacted the educational field, requiring new forms of teaching organization and reconfigurations in pedagogical practices. In Professional and Technological Education (EFA), this scenario becomes even more challenging, since integrated training requires articulating scientific, technical, and sociopolitical knowledge to changes in the world of work and society.

In the context of Paraná, the Federal Institute of Paraná (IFPR) stands out as a public institution of reference, created by Law No. 11,892/2008 and currently present in 33 municipalities. Offering integrated technical courses, subsequent, undergraduate and graduate programs, its institutional mission is to articulate work, science and technology, aiming at the formation of critical, autonomous citizens able to work in different areas of the economy (Brasil, 2008).

The research focused on three *campuses*: Curitiba, Palmas and Umuarama, selected for presenting different socioeconomic realities, enabling the understanding of how pedagogical practices are configured in different contexts. This choice dialogues with the Institutional Development Plan (PDI 2024–2028), which guides the IFPR to strengthen the relationship between training and territorial development (Brasil, 2024).

Active methodologies have gained prominence as pedagogical alternatives that seek to expand student protagonism. However, as Rosenau, Strapasson, and Canziani (2023) point out, it is a polysemic concept, whose application can occur both through instrumental and technicist perspectives and through approaches aligned with ethical-political projects of integral education. Thus, the objective of this study was to analyze to what extent such methodologies, when present in teaching plans, are close to or distant from critical pedagogies.

Authors such as Saviani (2021), Frigotto (2015) and Libâneo (2022) emphasize that EFA must overcome the historical duality between manual and intellectual work, ensuring access to systematized knowledge and promoting the omnilateral training of students. Although active practices can contribute to more dynamic and interactive pedagogical relationships, their isolated use does not ensure an emancipatory perspective, especially in the face of the neoliberal trend of emptying the critical sense of autonomy and learning by competences.

In this sense, the analysis of the teaching plans of the integrated technical courses proved to be strategic to understand how teachers have incorporated diversified

methodologies and which pedagogical conceptions guide such practices. It was assumed that the simple adoption of active methodologies does not guarantee critical intentionality or overcoming passive practices, and it is essential to identify contradictions and possibilities of their use in the context of EFA.

In view of this, the central question that guided this study was: What representations of pedagogical practices are evidenced in the teaching plans of technical courses integrated with high school at IFPR regarding the use of active methodologies, considering the contradictions and possibilities that emerge in the light of critical pedagogies?

The research, of exploratory nature and qualitative approach, aimed to analyze the representations of pedagogical practices in the teaching plans of technical courses integrated to high school in three IFPR campuses regarding the use of active methodologies, identifying the contradictions and possibilities that emerge in the light of critical pedagogies. The methodological path included a bibliographic review on EFA, critical pedagogies and active methodologies, and documentary analysis of the available teaching plans.

The relevance of this research consists in evidencing how an institution guided by critical premises and comprehensiveness has materialized such principles in its planning and teaching practices. By analyzing the coherence between the educational project and what is carried out in the pedagogical routine, especially in the context of EFA, historically crossed by tensions, it is intended to foster reflection and broaden the debate on the use of diversified methodologies that are intentionally anchored in a critical perspective.

2 THEORETICAL FRAMEWORK

The theoretical framework of this study was organized around three fundamental axes: Professional and Technological Education (EPT), critical pedagogies and active methodologies. The first discusses the relationship between education and work, highlighting its historical challenges and the main concepts that underlie EFA. The second addresses critical pedagogies and their central characteristics, including the implications for teacher performance and training, as well as for teaching methodologies. Finally, the third axis deals with active methodologies, presenting their concept and their adoption in the context of EFA.

2.1 PROFESSIONAL AND TECHNOLOGICAL EDUCATION

The relationship between work and education is a central element in the understanding of human formation, being historically and socially inseparable (Saviani, 2007). In primitive

societies, learning took place through productive practice, so that work was a condition for existence and acquisition of knowledge. The separation between education and work, resulting from private property, marked a process of fragmentation that is perpetuated over time. In this context, the Professional and Technological Education (EPT) and the Integrated High School (EMI) offered by the Federal Institutes, seek to resume the unity between work, science, culture and technology, promoting the integral and critical formation of the subjects (Brasil, 2024).

In the Brazilian scenario, EFA has two main strands: the immediate one, aimed at insertion in the labor market, and the polytechnic one, aimed at the integral formation of the individual, integrating scientific, technological and cultural knowledge (Ciavatta, 2012). The Federal Institute of Paraná (IFPR), through its Institutional Development Plan (PDI 2024-2028), adopts the polytechnic perspective, emphasizing integrality, emancipation, and the omnilateral training of students (Brasil, 2024).

Historically, Professional and Technological Education in Brazil has undergone significant transformations. Its path begins with the Apprentice and Artificer Schools, marked by a welfare character and aimed at the popular classes. In the following decades, especially during the dictatorship, professionalization took on a compulsory and instrumental bias, reinforcing the duality between intellectual training and preparation for work. In the 1990s and early 2000s, educational reforms increased the fragmentation between general and technical education, making it difficult to integrate proposals (Frigotto, 2018).

This scenario began to change with Decree No. 5,154/2004, which rescued the possibility of integrated curricular organization, articulating theory and practice in the same formative trajectory. Subsequently, Law No. 11,892/2008 consolidated this movement by creating the Federal Institutes, triggering an educational project committed to omnilateral and socially referenced education. Thus, the historical evolution of EFA expresses the search for overcoming the structural duality that has historically marked Brazilian education, towards a critical and integrated education (Frigotto, 2018).

The concept of omnilaterality, central to the perspective of the IFPR, is based on the integral formation of the subject, capable of understanding reality in a broad and critical way, articulating theory and practice, science, culture, manual and intellectual work (Saviani, 2007; Neves, 2009 apud Brasil, 2024). The Integrated High School (EMI) in the IFs is premised on the consolidation of a unitary, polytechnic and omnilateral education, articulating high school and technical professional education in an integrated curriculum. Such a configuration seeks

to overcome historical fragmentation and favor the articulation between science, culture and work, promoting integral human development and the critical consciousness of students (Frigotto; Ciavatta; Ramos, 2012).

2.2 CRITICAL PEDAGOGIES

Critical pedagogies are based on the understanding that education is a historically situated social practice, capable of favoring the critical reading of reality and the transformative action of the subjects. For Freire (1987), teaching is a political act that awakens awareness and enables educators and students to perceive themselves as historical agents. Saviani (2021) reinforces this perspective by stating that critical pedagogy is guided by a counter-hegemonic project, which links educational work to social transformation.

In this sense, critical pedagogies propose a formative process committed to human emancipation, articulating theoretical rigor, mastery of knowledge and reflection on social conditions. The school is understood as a space for the appropriation of systematized knowledge and for questioning the current order, contributing to the formation of subjects capable of intervening in reality (Suhr, 2012). Thus, knowledge assumes centrality as a cultural and political instrument, and not as mere content to be memorized (Libâneo, 1999).

In the context of critical pedagogies, the teaching work acquires an eminently social, political and ethical character. Libâneo (2013) highlights that pedagogy, when investigating educational practice in its links with society, dialogues with different fields: Philosophy, History, Sociology, Psychology and Economics, evidencing the complexity imbricated in the teaching practice, "being a human activity necessary for the existence and functioning of all societies" (Libâneo, 2013, p. 17).

Freire (1996) emphasizes the ethical-political commitment of the teacher, pointing out that the act of teaching requires awareness of the ideological dimensions of education. Saviani (2021), in turn, highlights that it is up to the school to transmit historically accumulated knowledge intentionally, ensuring that new generations are able to understand and transform reality.

Thus, the teaching work, in this approach, requires theoretical mastery, social awareness and clarity of formative purpose. It is a practice that articulates knowledge, historicity, and educational project, breaking with technicist or adaptive views of the teaching function (Saviani, 2021).

The political, economic and social contexts directly reflect on the training and performance of teachers." The school is in close relationship with society, that is, each society creates the school it needs. Therefore, the school can be a factor of exclusion or social inclusion" (Suhr, 2012, p. 112). The non-critical pedagogies: traditional, escolanovista, and technicist, present different understandings of education, but share the central characteristic of the tendency to reproduce the dominant social order (Saviani, 2021).

Traditional pedagogy, consolidated in the nineteenth century, focuses the process on the teacher and content, conceiving the school as an instrument of social integration and discipline (Saviani, 2021). The New School, in reaction to this model, shifts the focus to the student, prioritizing methods, experiences and individual interests, a movement that, despite the democratic discourse, has little changed the structural inequalities of the system (Suhr, 2012). On the other hand, technicism, strengthened during the military dictatorship, reduces teaching to technical execution, in line with productivist demands and bureaucratic rationality (Libâneo, 1999).

Such approaches generated a historical split in teacher training, which is still present today: while graduates bring some pedagogical basis, teachers from technical areas often have gaps in pedagogical training, a fragility that especially affects EFA. Added to this are structural problems such as: precarious working conditions, discontinuity of policies and insufficient infrastructure, directly impacting teaching practice (Saviani, 2011).

Critical pedagogies, on the other hand, understand teacher training as a process that articulates theory and practice, scientific knowledge, political awareness and methodological domain. Education is conceived as a social practice that can both reproduce inequalities and contribute to overcoming them (Freire, 1996). Thus, the teacher needs to understand reality in its multiple dimensions and organize teaching in such a way that the knowledge produced historically is critically appropriated by the students (Saviani, 2021).

The discussion about teaching methodologies is intrinsically linked to pedagogical conceptions. In non-critical theories, education tends to be understood as a neutral instrument, capable of promoting the equalization of inequalities (Saviani, 2021).

In traditional pedagogy, the teacher is the center of the process and the student assumes a passive role, focused on memorization. The New School, by emphasizing student protagonism, shifts the focus from content to methods, proposing the idea of "learning by doing" (Suhr, 2012). Technicism, in turn, is aligned with an instrumental model, in which both

the teacher and the student become cogs in a system oriented by efficiency and productivity (Frigotto; Ciavatta, 2022).

Critical pedagogies, on the other hand, understand methodologies as political-pedagogical mediations. The method is not neutral, but expresses a project of education and society. Thus, teaching methodologies should favor the critical appropriation of knowledge, the problematization of reality, and the development of social awareness, in line with an emancipatory educational project (Saviani, 2021).

2.3 ACTIVE METHODOLOGIES

Active methodologies have been widely debated in the educational field and, more recently, stand out as an alternative to reorganize pedagogical practices in both face-to-face teaching and Distance Education. The conception adopted in this research is in line with the reflections of Pereira (2021), who proposes to understand them beyond the simple updating of traditional didactics. For the author, it is not just about putting the student in a more active position in the learning process; by suggesting the spelling "[...]active strategies", it expands the understanding of these strategies, highlighting dimensions such as collaboration, creativity, integration, participation and construction of meaning, essential to an education committed to criticality and social transformation.

This means that, before resorting to a repertoire of techniques or a pedagogical prescription, the teacher needs to understand what is the intentionality behind the chosen methodology and what its training objectives are. This requires a critical and contextualized analysis of each content in order to select the most appropriate approach. The active methodology must be applied coherently, ensuring that the interaction promoted between the subjects of the teaching-learning process is effectively significant (Rosenau; Strapasson; Canziani, 2023).

The discussion about active methodologies requires, therefore, attention to the disputes in the contemporary educational field. As Rosenau, Strapasson, and Canziani (2023) warn, liberal proposals have appropriated terms linked to critical pedagogies, producing confusion that can lead teachers to identify as "advanced" practices that, in reality, reinforce individualistic or technicist conceptions. When active methodologies are incorporated uncritically, especially under the influences of escolanovismo, there is a risk of minimizing the role of teachers and compromising the appropriation of historically

systematized knowledge. Thus, its adoption must be anchored in a dialectical relationship between theory and practice, where teacher and student are protagonists (Pereira, 2021).

From a conceptual point of view, active methodologies can be understood as teaching strategies designed to promote dynamic and collaborative practices, stimulating autonomy, creativity, and reflection (Bacich; Moran, 2018). They involve active participation in cognitively challenging activities, situated in real or simulated contexts, mobilizing processes such as interpretation, analysis, evaluation, and application of knowledge (Pereira, 2021).

From a critical perspective, as Libâneo (2022) and Pereira (2021) argue, the adoption of active methodologies can transform the classroom into a dynamic space in which the student is no longer passive and the teacher no longer acts as a mere transmitter of knowledge, assuming the roles of mediator, advisor and director, since he holds essential knowledge for the learning processes of the students. The following table presents the active methodologies and strategies identified in the plans investigated.

Table 1

Active methodologies present in the analyzed teaching plans

Active Methodology	Description
Debates and discussions	Activities in which students exchange opinions, defend divergent positions and build knowledge in a cooperative way. It requires prior preparation, definition of roles and clear rules, stimulating critical thinking and active participation (Libâneo, 2013; Bacich; Moran, 2018).
Seminars, Exhibition, Exhibition, Presentation	Activity in which students prepare and present content, promoting research, organization and debate. The public also participates with questions and observations, favoring collaborative learning, development of autonomy, and collective construction of knowledge (Scorsolini-Comin, 2023).
Practical (e.g. practical class)	Activities in which students carry out experiments, applications or experiences of the contents, actively participating in the learning process, building knowledge in a reflective way (Bacich; Moran, 2018).
Group work, teamwork	Activity in which students collaborate in solving problems and projects, sharing responsibilities and building knowledge collectively. It favors dialogue and cooperation (Bacich; Moran, 2018).
Research	Activity in which students investigate problems or questions and raise hypotheses. It promotes curiosity, reflection and dialogue with reality (Demo, 2003; Bacich; Moran, 2018).

Active Methodology	Description
Problem-solving / Problem-based learning	A strategy in which students investigate real or simulated problems, developing hypotheses, researching solutions, and discussing results in groups. It promotes autonomy, critical thinking, collaborative learning and practical application of content (Bacich; Moran, 2018).
Projects / Project-based learning	A strategy in which students develop projects or solve real problems, making individual and group decisions. It promotes interdisciplinary learning, critical and creative thinking, collaboration, production of products or solutions, and continuous reflection on the process (Bacich; Moran, 2018).
Case Studies	Approach that starts from the analysis of real or simulated situations or problems in a realistic way, so that students develop skills of investigation, reflection and problem solving (Bacich; Moran, 2018).
Flipped classroom	A strategy in which students study content in advance, accessing digital or face-to-face materials, and use class time for debates, problem solving, and practical activities. It promotes autonomy, collaboration and socialization with the teacher, acting as an advisor and organizer of the experiences (Bacich; Moran, 2018; Pereira, 2021).
Gamification	Strategy that uses game elements such as: points, avatars and narratives, in educational contexts, without the need to create a complete game. It allows students to be engaged, stimulates participation, motivation and interaction, applying playful principles to favor learning (Pereira, 2021 apud Fardo, 2013)
Round table	A strategy in which students discuss a previously defined theme, with the active participation of all, allowing different perspectives. It favors argumentation, critical listening and the development of communicative and reflective skills (Bacich; Moran, 2018).
Moot Jury	Students take on typical trial roles, analyzing real or fictitious cases, debating evidence, and presenting reasoned decisions. It promotes critical thinking, argumentation, and collaboration.
Workshop (miscellaneous)	Students participate in practical and guided activities, aimed at the development of specific skills, such as reading, writing or artistic production. It stimulates active learning, creativity and practical application of knowledge (Bacich; Moran, 2018).
Exploratory teaching	Approach that encourages students to investigate, experiment, and discover concepts through observation and practice. Develops curiosity, autonomy, critical thinking and scientific investigation skills (Bacich; Moran, 2018),

Source: Prepared by the authors (2025).

Therefore, active methodologies are flexible pedagogical support resources, which can vary according to the intentions of the teachers and the educational context. In the plans analyzed, it was identified that teachers use them as a strategy to organize teaching sequences that encourage student involvement, combining diversified approaches ranging from practical and cooperative activities to the use of motivational tools, such as music, videos and games. This can materialize in learning products, reflecting, creativity, innovation, retention and understanding of content, such as literary pieces, models, videos, presentations, concept maps, among others (Pereira, 2025).

Figure 1

Motivational Tools

Source: Pereira (2025).

Finally, it should be emphasized that there are no ready-made models for its application. The use of active methodologies implies careful planning, constant adjustments and commitment to teacher training. In EFA, it is in the daily work, permeated by contradictions, technical demands and socio-political dimensions, that the teacher must seek strategies capable of integrating theory and practice and promoting the critical and active participation of students (Rosenau; Strapasson; Canziani, 2023).

3 METHODOLOGY

This research was exploratory in nature, which according to Gil (2017) is adequate to deepen the understanding of phenomena that are still little studied, such as the representations of pedagogical practices present in the investigated teaching plans. The

qualitative approach was adopted because it values the perspectives of the subjects of practice, in this case, the teachers, allowing us to understand their conceptions and the meanings attributed to the methodologies used. Thus, the qualitative analysis favored the identification of the meanings constructed in practice, as expressed in the teaching plans.

The methodological path was organized in two main stages: literature review and document analysis. The literature review enabled the construction of the conceptual tripod composed of: (a) Professional and Technological Education (EPT), supported by the references of Gaudêncio Frigotto, Maria Ciavatta and Marise Ramos; (b) Critical Pedagogies, based especially on Dermeval Saviani, José Carlos Libâneo, Paulo Freire and Inge Renate Froese Suhr; and (c) Active Methodologies, supported by the theoretical contributions of José Moran, Lilian Bacich and Máriam Trierveiler Pereira.

The survey was carried out on platforms such as SciELO and CAPES Journal Portal, as well as books, dissertations and digital materials, ensuring a solid theoretical foundation for the analysis. To support the organization of the methodological path, the Gowin diagram ("Gowin's V") was used, which articulates theoretical foundations, procedures and research objectives. This instrument allowed an integrated view of the stages of the investigation, as shown in Figure 2.

Figure 2

Planning of the Research.

Source: The authors (2025, adapted from Rosenau, 2017 from Novak and Gowin, 1983)

Gowin's "See" of knowledge is a heuristic instrument developed to assist in

understanding the structure of knowledge and the process of scientific construction (Novak and Gowin 1983). Rosenau (2017, adapted from Catapan, 2001), used this heuristic for research planning purposes, allowing us to visualize the articulation between theoretical foundations, methodological procedures and analytical processes.

The documentary research had as its main source the Teaching and Work Plans registered on the PLANIF Platform, referring to the technical courses integrated to high school at the Umuarama, Curitiba and Palmas campuses of the IFPR. Access to the system considered filters such as campus, course and year, adjusted according to the availability of documents.

Table 2

Plans collected from the PLANIF system

CAMPUS	YEAR	QUANTITY
Palmas	2023	46
Umuarama	2023	82
Curitiba	2024	310

Source: Prepared by the authors (2025).

In the selection of documents, it was decided to use the most recent plans available. However, the *Campuses* Palmas and Umuarama did not have published records for 2024, so the documents for 2023 were analyzed. To avoid redundancies, when the same professor taught more than one component using identical or very similar methodologies, his name was counted only once within each course. Specialized educational service plans were also excluded, in order to ensure greater precision in the representativeness of the pedagogical practices investigated. All selected documents were organized in an analytical matrix built in an electronic spreadsheet, prepared specifically for this purpose.

The data were analyzed through the Content Analysis proposed by Bardin (2016). The pre-analysis involved the floating reading of the planes organized in the analytical matrix, allowing the delimitation of the *corpus*. Then, the material was explored, deepening the concepts of critical and non-critical pedagogies and active methodologies. Subsequently, the data extracted from PLANIF were coded and categorized. The categories were defined *a priori*: Non-Critical Pedagogy (PNC), Critical Pedagogy (PC) and Active Methodologies (MA), with PNC and CP broken down into the subcategories Traditional, New School, Technician, Liberating and Historical-Critical.

4 RESULTS AND DISCUSSIONS

The result of the data analysis is presented below, based on the conceptual categories defined in the methodology: Non-Critical Pedagogy (PNC), Critical Pedagogy (CP) and Active Methodologies (AM). The initial analysis focused on the first two categories, PNC and CP, which were broken down into the following subcategories:

Non-Critical Pedagogies: Traditional, New School and Technician

Critical Pedagogies: Liberating and Historical-Critical

In the group of Non-Critical Pedagogies, the following indicators were identified:

- Traditional: emphasis on content transmission and memorization
- Technical: impersonality, search for efficiency and control, with a focus on operational objectives and reinforcements
- New School: valorization of "learning by doing" and the methods used.

In the Critical Pedagogies group, the following stood out:

- Liberating: selection of generating themes, problematization of reality and establishment of a dialogical relationship between teacher and student
- Historical-Critical: critical reading of reality, articulation between prior knowledge and elaborated knowledge, and historical-political understanding of the contents

The active methodologies and motivational tools present in the plans were initially generically grouped in a single column, and were later separated for a more detailed analysis. The interpretation of the data demanded constant returns to the *corpus*. First, the non-critical pedagogies of New School, Traditional and Technician were analyzed; then, the critical pedagogies: liberating and historical-critical. The results revealed differences in the application of the methodologies: in the plans aligned with critical pedagogies, the strategies adopted favored dialogue, reflection and problematization of reality; In the non-critical planes, its use was often restricted to decontextualized dynamics, without explicit pedagogical objectives

In traditional practices, expository methodologies predominated, with active strategies employed only in a complementary way. In the escolanovista proposals, the focus on "learning by doing" was highlighted, in practical and collaborative activities. In technical practices, the emphasis was on efficiency, targeted execution and the development of specific skills. In turn, the liberating and historical-critical pedagogies presented practices based on

dialogue, problematization, collective work and critical reading of reality, mobilizing active methodologies as a means of promoting engagement and critical awareness among learners.

Table 3

Documentary analysis of the teaching plans of the integrated technical courses

Campus	Integrated Technical Course in:	PNC	PC
Palmas	Food	16	07
Palmas	Legal Services	14	09
Umuarama	Buildings	29	05
Umuarama	Informatics	20	04
Umuarama	Chemistry	18	06
Curitiba	Administration	30	09
Curitiba	Accounting	37	07
Curitiba	Electronics	32	08
Curitiba	Mechanics	32	13
Curitiba	Oil & Gas	32	10
Curitiba	Informatics	32	08
Curitiba	Photographic Processes	23	08
Curitiba	Digital Game Programming	25	04
Total		340	98

Source: Prepared by the authors (2025).

Of the thirteen courses analyzed, 438 teaching plans were considered, of which 340, corresponding to 77.6%, were classified as belonging to non-critical pedagogies, and 98 or 22.4%, as linked to critical pedagogies. With regard to the use of active methodologies, 86.07% of the plans associated with non-critical pedagogies and 100% of those linked to critical pedagogies incorporate active practices in their planning.

Figure 3

General results - Analysis Matrix

PNC	TOTAL	MA	FM	SEM MA/FM
TRADICIONAL	51	33	11	16
ESCOLANOVISTA	236	229	164	2
TECNICISTA	53	38	28	9

PC	TOTAL	MA	FM	SEM MA/FM
LIBERTADORA	35	34	31	0
HISTÓRICO-CRÍTICA	63	62	55	0
	98	96	86	0

Source: Prepared by the authors (2025).

The values presented in the MA and FM columns should not be interpreted as sums, since in several cases the same teaching plan simultaneously contained active methodologies and motivational tools. This overlap reveals the diversity of the pedagogical practices adopted. Within this panorama, it is observed that the plans classified as New School represent 53.9% of the total number of documents analyzed, surpassing the sum of the liberating critical and historical-critical subcategories.

In this sense, some considerations pertinent to the results should be highlighted, since the dichotomy of teaching techniques does not depend on the classification into New School, Traditional or Technicist currents; The real challenge is to reframe its application. "Any technique, therefore, understood as mediation, must be recognized within its limits and without the certainty that it is a guarantee of success in teaching and learning in the formation of broad human capacities" (Araújo; Frigotto, 2015, p. 72).

It can be said that the scope of active methodologies in the promotion of cooperation, autonomy and emancipation constitutes a set of complementary effects, whose effectiveness depends directly on the intentionality that guides the pedagogical process. Thus, such methodologies, often associated with a neoliberal logic, do not have an intrinsic or determined meaning, and can be appropriated by different political and pedagogical projects (Rosenau; Strapasson; Canziani, 2023).

Thus, it is important to remember that integrated education "[...] it requires criticism of reductionist perspectives of teaching, which are committed to developing some human activities to the detriment of others [...]" (Araújo; Frigotto, 2015, p. 63). In this sense, active methodologies can be resignified in order to promote learning in a critical scope and aligned

with the educational project proposed by the IFPR, which values the integral formation and emancipation of the subjects.

That said, in view of such findings raised in the analyzed plans, it is worth reflecting on important points that emerged as a result of the data analysis:

1. There is a movement against banking education in the IFPR courses analyzed.
2. Most teachers adopt diversified active strategies, materialized in active methodologies or motivational tools, or both.
3. It is noted that critical pedagogical practices are a reality among some teachers according to the numbers presented, however they are a minority as the numbers revealed.
4. The need to broaden the debate and reflection on the alignment with the critical assumptions of the institution and its materiality.
5. New studies that contemplate the investigation on the influence of the training of teachers who work in EFA and the impact on their educational guidelines.
6. The understanding that strategies such as active methodologies are complementary and not the core of the process.
7. The relevance of bringing provocative and controversial studies within the area of education, such as active methodologies in a critical context.

It is noteworthy that the classifications adopted have an analytical character, based on the predominant characteristics of each plane, without implying rigidity or exclusivity, since "they are not always mutually exclusive, nor are they able to capture all the richness of concrete practice" (Libâneo, 1999, p. 21). Thus, the predominant core of the methodologies described in each plan was considered for classification purposes.

5 CONCLUSION

The results indicate that 86.07% of the plans of the IFPR integrated technical courses analyzed incorporate diversified methodologies, including active methodologies and motivational tools. In qualitative terms, it is observed that most professors seek strategies that go beyond the mere transmission of content, favoring greater student participation. However, such strategies are not always aligned with the foundations of critical pedagogies, which can limit their formative potential. When applied intentionally and critically, active methodologies favor protagonism, cooperation, engagement, and meaningful learning, converging with the principles of Professional and Technological Education.

This finding shows that the technique, although necessary, has less relevance in the face of the pedagogical conception that guides the educational process, which is the determining factor for a practice capable of methodologically situating the critical formative project. This research, as a result, establishes a direct relationship with the finding of Araújo and Frigotto (2015, p.76) when they state that it is necessary to "consider different methodological possibilities for the experimentation of the integrated teaching project and we maintain that there is no single technique more appropriate for the implementation of integrated teaching, because to consider this possibility would be to succumb to a methodological determinism". This understanding reinforces that the focus of pedagogical work should not reside in the adoption of a specific technique, but in the coherence between the formative principles and the practices developed.

The findings reaffirm that the use of active methodologies, by itself, does not guarantee a critical and integral education, since no teaching technique automatically ensures the development of human capacities. As Araújo and Frigotto (2015) argue, techniques constitute mediations between teacher and student and remain subordinated to the ethical-political purposes that guide the educational work. Thus, the same strategy, whether directed study, lecture, debate, or any active or non-active procedure, can serve both hegemonic reproduction and human emancipation, depending on the formative project that guides it (Libâneo, 2022).

It is emphasized that the challenge that is imposed on EFA is not the adoption of an "ideal method", but the construction of practices that are aware of their limits and potentialities, capable of integrating different teaching procedures without succumbing to methodological determinism (Araújo; Frigotto, 2015). The results show that, although there is a consistent movement of overcoming banking education in the courses analyzed, this transformation occurs in a partial and asymmetrical way, marked by the predominance of non-critical practices. The methodological diversification identified in the plans demonstrates that most teachers seek to expand student engagement through active methodologies and motivational tools, even though such resources are not always linked to the critical formative purposes that underlie the IFPR's educational project.

It is verified that critical pedagogical practices are a reality among some teachers, but remain in the minority, which reinforces the need to deepen the institutional debate on the alignment between conceptions and practices. The findings also point to the urgency of studies that investigate the role of teacher training in EFA and its impact on methodological

choices, recognizing that strategies such as active methodologies are complementary and do not constitute the core of the educational process. In this sense, bringing to light provocative discussions and theoretical controversies, especially about the place of active methodologies in critical perspectives, becomes fundamental to sustain an integrated, intentional education committed to human emancipation.

ABSTRACT

This article examines the theoretical foundations and methodological procedures adopted in the analysis of special rural adverse possession in the District of Montes Claros/MG, with an emphasis on verifying its effectiveness as an instrument for realizing the social function of land. Based on a historical understanding of Brazilian land formation and the constitutional framework that governs the productive and responsible use of land, the study points to a methodology that includes legal references, documentary analysis, and geoprocessing techniques to identify, systematize, and evaluate the effectiveness of the social function of rural properties susceptible to special rural adverse possession, notably in the district of Montes Claros/MG. The methodology developed involves three main stages: bibliographic and regulatory review; collection and examination of registry and judicial documents produced by the district's registry offices; and spatial analysis of the selected areas using MapBiomass geographic databases integrated with QGIS software. This interdisciplinary approach allows not only for an understanding of the legal history of the institution, but also for the mapping, description, and interpretation of the territorial dynamics linked to possessions qualified by residence and family productivity. By proposing a replicable methodological model, the article contributes to the improvement of academic research on land regularization, land use, and rural development, providing support for the empirical evaluation of the social function of property in specific regional contexts.

RESUMO

O presente artigo examina os fundamentos teóricos e os procedimentos metodológicos adotados na análise da usucapião especial rural na Comarca de Montes Claros/MG, com ênfase na verificação de sua efetividade como instrumento de concretização da função social da terra. Partindo da compreensão histórica da formação fundiária brasileira e do arcabouço constitucional que rege o uso produtivo e responsável da terra, o estudo aponta metodologia que compreende referenciais jurídicos, análises documentais e técnicas de geoprocessamento para identificar, sistematizar e avaliar a efetividade da função social dos imóveis rurais suscetíveis à usucapião especial rural, notadamente, na comarca de Montes Claros/MG. A metodologia desenvolvida envolve três etapas principais: revisão bibliográfica e normativa; coleta e exame de documentos registrares e judiciais produzidos pelos cartórios da comarca; e análise espacial das áreas selecionadas mediante o uso de bases geográficas do MapBiomias integradas ao software QGIS. Essa abordagem interdisciplinar permite não apenas compreender o percurso jurídico que do instituto, mas também mapear, descrever e interpretar as dinâmicas territoriais vinculadas às posses qualificadas por residência e produtividade familiar. Ao propor um modelo metodológico replicável, o artigo contribui para o aprimoramento das investigações acadêmicas sobre regularização fundiária, uso da terra e desenvolvimento rural, oferecendo subsídios para a avaliação empírica da função social da propriedade em contextos regionais específicos.

RESUMEN

El presente artículo examina los fundamentos teóricos y los procedimientos metodológicos adoptados en el análisis de la prescripción especial rural en la comarca de Montes Claros/MG, con énfasis en la verificación de su eficacia como instrumento para concretar la función social de la tierra. Partiendo de la comprensión histórica de la formación fundiaria brasileña y del marco constitucional que rige el uso productivo y responsable de la tierra, el estudio propone una metodología que comprende referencias jurídicas, análisis documentales y técnicas de geoprocetamiento para identificar, sistematizar y evaluar la eficacia de la función social de los inmuebles rurales susceptibles de prescripción especial rural, en particular en la comarca de Montes Claros/MG. La metodología desarrollada comprende tres etapas principales: revisión bibliográfica y normativa; recopilación y examen de documentos registrares y judiciales producidos por las oficinas notariales de la comarca; y análisis espacial de las áreas seleccionadas mediante el uso de bases geográficas de MapBiomias integradas al software QGIS. Este enfoque interdisciplinario permite no solo comprender la trayectoria jurídica de la institución, sino también mapear, describir e interpretar las dinámicas territoriales vinculadas a las posesiones calificadas por residencia y productividad familiar. Al proponer un modelo metodológico replicable, el artículo contribuye al perfeccionamiento de las investigaciones académicas sobre regularización fundiaria, uso de la tierra y desarrollo rural, ofreciendo subsidios para la evaluación empírica de la función social de la propiedad en contextos regionales específicos.

1 INTRODUCTION

Understanding the institute of special rural adverse possession and its legal, social and spatial developments requires a methodological approach capable of articulating historical, normative and empirical dimensions. In Brazil, the land structure was constituted under a deep concentration of land, from the colonial sesmarias to the Land Law of 1850, through processes of private appropriation that transformed land into an object of economic and political exclusion. As Marés (2003, p. 12) observes, "the practice of concentrating production in a space of land, and even more recent, transforming this concentration to the benefit of a single person and calling it a right of property", showing that the relationship between land and society was historically constructed in such a way as to privilege private accumulation to the detriment of collective destination.

In this scenario, the Federal Constitution of 1988 introduced criteria for legitimizing property based on its social function, linking it to the fulfillment of economic, environmental and social requirements, as established in article 186. Special rural adverse possession is based on this paradigm, operating as a mechanism for historical correction and land regularization by legally recognizing the prolonged, productive and responsible possession of small farmers. However, despite its normative relevance, there are still few empirical analyses that examine the effectiveness of this institute and, above all, the appropriate methods to study it in the Brazilian territorial context.

Notwithstanding the normative advance introduced by the 1988 Constitution and the importance of special rural adverse possession as an instrument for democratizing access to land, it remains poorly understood, especially at the local level, whether this institute has been able to produce concrete effects related to the fulfillment of the social function of property. In the District of Montes Claros/MG, despite the significant presence of family farming and the recurrence of consolidated possessory situations, no empirical studies were identified that allow verifying, based on documentary and spatial evidence, whether the properties regularized by special rural adverse possession have been used in a rational, productive and environmentally appropriate manner. Thus, the research problem that guides this study is: has the special rural adverse possession, as applied in the District of Montes Claros/MG, effectively promoted the fulfillment of the constitutional criteria of the social function of property? The answer to this question requires the adoption of methodological procedures capable of articulating legal analysis, systematic document collection and spatial

evaluation of land use and land cover, since only the convergence of these dimensions allows the socio-legal effects of land regularization to be consistently assessed.

The methodology adopted in the research from which this article derives was structured to, as a general objective, evaluate, in an interdisciplinary way, whether the properties regularized by rural adverse possession in the District of Montes Claros/MG meet the criteria of social function. For this, in addition to the deep understanding of the underlying legal concepts; it was necessary to rigorously identify the available registration and judicial data; and the application of geoprocessing instruments capable of representing land use dynamics over time.

Thus, this article presents an expanded detail of the methodological choices that guided the investigation, articulating basic theoretical foundations to the technical and analytical strategies employed. It is, therefore, a work that seeks to demonstrate a methodological procedure that, because it is adequate to scientific requirements, is capable of subsidizing future research on land regularization, rural development and legal geography of land.

2 METHODOLOGICAL FOUNDATION

The investigation is guided by references that understand research as a process articulated between different analytical stages. Minayo (2009, p. 23) teaches that the method constitutes "a path of thought and practice exercised in the approach to reality", being inseparable from the object researched and the objectives that one wishes to achieve. Thus, the methodology was not conceived as a mere instrumental step, but as a structure that allowed the recognition of the complexity of the phenomenon studied, integrating legal, historical and spatial dimensions.

Gil (2017; 2019) points out that exploratory research is especially indicated when the object lacks previous studies or when it is intended to deepen understanding of little-known phenomena in certain territorial areas, exactly the case of special rural adverse possession in the District of Montes Claros. Adopting the premises of this author, it seeks to combine data collection with analysis of its descriptive elements to characterize, in a systematized way, the properties, their records, the dynamics of land use and the adherence to the constitutional criteria of the social function.

Still seeking to meet the exploratory character of the research, indicated by the author, it is possible to see that the methodology of the present analysis is proposed from three main

foundations. First, the preservation of interdisciplinarity, necessary to articulate law, geography and rural development. In addition, the maintenance of documentary rigor, required in legal studies and, finally, spatial analysis, indispensable when examining land use and territorial transformations.

3 STEP 1 – BIBLIOGRAPHIC AND DOCUMENTARY REVIEW

The first stage consists of the construction of the theoretical framework necessary for the interpretation of the legal institutes involved and the Brazilian agrarian context. The review follows the procedure recommended by Gil (2019), which establishes the need to delimit central topics, select reference materials, and proceed with analytical reading capable of guiding the formulation of the analysis categories. In this context, the consultation of books, scientific articles, theses, dissertations and normative documents that deal with the historical formation of property, possession, adverse possession and, above all, the social function of rural property is inserted.

As the author of a necessary review in research on the social function of the ownership of rural properties subject to adverse possession, Carlos Frederico Marés stands out, with his work *The Social Function of Land*. The work of Marés (2003) is fundamental to understand the historical characteristics of land concentration and the social nature of property rights. In a relevant passage, the author states that "land cannot be reduced to a commodity without losing its dimension as an indispensable good for life" (Marés, 2003, p. 21). By glimpsing this excerpt, it is reinforced how much the analysis methodology cannot ignore the social dimension implicit in the institute of special rural adverse possession.

Maria Helena Diniz, in her *Course on Brazilian Civil Law* (2022), and Sílvio de Salvo Venosa, in the work *Civil Law: Real Rights* (2021), play a fundamental role in the conceptual structuring that supports the legal analysis undertaken in this study. Both authors offer classic and widely referenced systematizations in Brazilian law on the institutes of possession and property, so that their contributions not only define dogmatic categories, but also provide the interpretative parameters indispensable to understand adverse possession as an original form of property acquisition. In the methodological sphere, the reading of these works is essential because it establishes the theoretical basis necessary to distinguish possession *ad usucapionem* from other possessory modalities, to identify the constituent elements of *animus domini* and to recognize the objective conditions that characterize the prolonged, continuous and public exercise of possession, without opposition from the registered holder.

In addition, Diniz (2022) and Venosa (2021) offer conceptual frameworks that allow us to accurately differentiate qualified possession relevant to special rural adverse possession from mere irregular detention, a distinction that is central when examining lawsuits and real estate records. By systematizing the legal requirements of the various modalities of adverse possession, especially with regard to the time, area and socioeconomic purpose of the occupation, these authors enable the construction of a methodological filter through which it becomes possible to select, in a rigorous manner, the cases effectively compatible with the special rural adverse possession provided for in article 1,239 of the Civil Code. From this systematization, it becomes feasible to recognize, in the documents collected, situations in which possession is exercised as a true exteriorization of dominion, configuring itself as "possession-work" or "possession-productive" — categories that dialogue directly with the constitutional paradigm of the social function of property.

In view of the above, the review of these authors provides the theoretical and legal basis that guides the entire stage of documentary analysis and allows the proper interpretation of the registration descriptions, court sentences and factual elements mentioned in the registrations. Without this conceptual basis, the understanding of the legal meaning of the possessory situations under analysis and the verification of whether the possessions meet the normative requirements that legitimize the original acquisition of the property by special rural adverse possession are compromised.

In turn, the studies of Oswaldo Opitz & Silvia C.B. Opitz in the *Complete Course of Agrarian Law* (2017) and Louise Gabler, in the article *Sesmarias*, published in MAPA – Memory of Brazilian Public Administration (2015) are essential to reconstruct the historical and normative formation of the Brazilian rural territory, offering the necessary depth to understand land inequalities and how these structures impact effectiveness of the special rural adverse possession. These authors demonstrate that the constitution of the national agrarian space takes place through processes that, since the colonial period, institute forms of concentrated appropriation of the soil, either by the sesmarias distributed over large areas, or by the subsequent norms that transform land into merchandise and restrict its access to the economically privileged strata. By showing that the Brazilian territorial organization is based on exclusion, Opitz & Opitz (2017) and Gabler (2015) offer elements that allow us to interpret adverse possession not only as a legal institute, but as a state response to a long-term structural problem.

These studies, then, are able to reveal that the institute of special rural adverse possession does not arise in isolation, on the contrary, it is inserted in a scenario marked by historical disputes over access to land, by the late positivity of the social function of property and by the permanence of consolidated possessory situations on the margins of the registry system. By resuming the trajectory of the Land Law of 1850, for example, these authors explain how the requirement of purchase for the acquisition of vacant land instituted a privatist and exclusionary model, the effects of which are felt to this day in regions such as the North of Minas. Thus, the review of these authors allows us to understand that the prolonged and productive possession examined in the cases studied is not an isolated phenomenon, but a direct consequence of a territorial arrangement that, for decades, restricted formal access to property, strengthening the explanatory capacity of the research.

Through the bibliographic review, mainly of these authors, the theoretical exposition is not limited only to the presentation of concepts, but constitutes the basis for the subsequent methodological choices, which guides the collection of documents before the Notary Services and the spatial analysis of the areas studied.

4 STEP 2 – DOCUMENT COLLECTION AND IDENTIFICATION OF ENROLLMENTS

Having understood the institutes that make up the special rural adverse possession in Brazil, as well as their articulations with the distribution of land, land regularization and the social function of property — an understanding built from the specialized literature —, the second cycle of the research consists of the collection of documents that allow the delineation of the spatial fragmentation of the Comarca of Montes Claros and, particularly, to identify their rural areas. Once these zones have been delimited, data are obtained from the Real Estate Registry Offices of the district, consisting of the records of declaratory judgments of special rural adverse possession. At this time, with the support of a quantitative approach, it seeks to identify which areas and in which periods this type of adverse possession is registered, based on the sentences handed down between the years 2013 and 2023.

The choice of this time frame is justified by two central factors. First, the implementation of the Electronic Judicial Process (PJe) in the District of Montes Claros, in 2015, significantly expands access to digitized documents, as recorded by Minas Gerais (2015). The digitalization of the civil courts, where rural adverse possession actions are processed, allows the processes to be fully produced, managed and consulted electronically, giving greater precision and transparency to the research. Second, as Salomão and Madeira

(2023) consider, the Sars-Covid 19 pandemic intensifies the need to adopt technological tools for the provision of extrajudicial services, generating regulations that accelerate the transition from public records to the digital environment. This movement culminates in Law No. 14,382/2022, which establishes the Electronic System of Public Records (Serp), aimed at the national integration of registration services.

Although the Serp is more recent, the system observes the Principle of Registry Conservation, which, according to Venosa (2021), ensures that the real estate registration contains the permanent and continuous file of the property's history. In this way, even documents scanned later preserve the collection necessary to identify sentences recorded in previous periods. This methodological condition makes it possible to map adverse possession actions based on the registrations themselves, which is an indispensable stage of the research.

However, although the investigation seeks to determine which areas have records of special rural adverse possession and in which years such records occur, the consultations carried out on the data of the 1st and 2nd Real Estate Registry Offices of the District of Montes Claros reveal that there are no records of judgments classified as special rural adverse possession in the selected period. This finding is not an empirical result per se, but an element of the methodological path, which requires the adoption of complementary strategies for identifying cases that, although registered as ordinary or extraordinary, factually correspond to the requirements of special rural adverse possession.

4.1 SURVEY OF REGISTRATIONS IN THE REAL ESTATE REGISTRY OFFICES

The initial stage of document collection consists of requesting certificates from the 1st and 2nd Real Estate Registry Offices of the District, requesting the list of all rural properties with an area of less than 50 hectares and that present a record of adverse possession judgment from 2013 onwards. This methodological choice stems from the limitations of the notary systems themselves, which do not allow a specific search for the "special rural" modality. Thus, the area criterion — an objective requirement provided for in article 1,239 of the Civil Code — is used as a viable initial filter.

The 1st Official Letter indicates 19 enrollments that meet the established criteria, while the 2nd Official Letter presents 13. With these reports, each registration is individually analyzed through the SAEC platform (currently called RI Digital), seeking to identify: the ownership, the number of the judicial process that supports the registration and any

references to the owner's residence in the usucapido property. This check is essential for subsequent filters.

4.2 SELECTION OF ADVERSE POSSESSION LAWSUITS

After surveying the enrollments, the research stage of the respective legal proceedings begins on the portal of the Court of Justice of Minas Gerais, with the objective of verifying which type of adverse possession was proposed by the plaintiff. In physical processes, the consultation is restricted to the information made available by the system; In electronic proceedings, it is possible to fully examine the procedural documents, from the initial petition to the judgment.

It is observed, in this methodological phase, that most of the processes are registered as ordinary or extraordinary adverse possession. The methodology thus foresees the need to identify, among these actions, those that meet the requirements of special rural adverse possession. Such a procedure is justified because this modality presents additional subjective requirements — such as the inexistence of another property owned by the possessor and productivity through the family's work for at least five years (Brasil, 1988, art. 191) — which often lead the plaintiffs to opt for modalities with less evidential rigor. On the other hand, ordinary and extraordinary adverse possession (Brasil, 2002, arts. 1.238 and 1.240) do not have such limitations, which explains their greater recurrence.

Thus, in order to meet the objective of the research — which consists of analyzing the fulfillment of the social function in small rural properties whose owners reside and produce on the site — a methodological filter is carried out that selects, among the records of ordinary and extraordinary adverse possession, those that materially fit the constitutional requirements of special rural adverse possession.

4.3 RESIDENCE FILTERS AND PRODUCTIVE ACTIVITY

Based on the registrations provided by the registry offices, the filter related to the rural location and the size of the property (less than 50 ha) is applied, considering the entire territorial extension of the District of Montes Claros as defined by the Law of Judicial Organization of Minas Gerais (2001), which includes the municipalities of Montes Claros, Claro dos Poções, Glaucilândia, Itacambira and Juramento. Then, it is verified, through the registration certificates and the initial documents of the processes, if the possessors reside in the property.

Once this second filter is consolidated, only the registrations that indicate habitual residence are selected, as this requirement is an essential element of special rural adverse possession. The verification of the productive activity complements the filtering: only the registrations whose owners demonstrate, in the documents analyzed, that they exercise productive exploitation of the property by their own or family work, in accordance with article 191 of the Federal Constitution, remain in the sample.

These filters allow the identification of the areas that make up the universe of the research and constitute the basis for the subsequent stages of spatial analysis and legal interpretation.

4.4 SPATIAL ANALYSIS AND LAND USE

Once the areas that meet the methodological filters have been identified, the spatial analysis begins to examine their territorial conformation in the selected period. To this end, the MapBiomass platform is used, a collaborative network that has produced annual mapping of land cover and use in Brazil since 1985, and whose bases allow observing environmental changes in a standardized and comparable way. The selection of the period is based, on the one hand, on the digitization of enrollments by notary offices and, on the other hand, on the availability of MapBiomass Collection 9, in September 2024, which covers data up to 2023.

Spatial analysis is performed using QGIS software, an open-source tool widely used in geographic surveys. Initially, the geographic coordinates of the enrollments are structured in a compatible spreadsheet (CSV), converting data from degrees, minutes and seconds to decimal degrees when necessary. These coordinates are then imported as a vector layer, using SRC EPSG:4326 (WGS 84). To spatially represent the areas, the points are converted into polygons, observing the correct order of the vertices.

After the delimitation of the areas, the *raster* data from MapBiomass are integrated into the project, and the layer is cut out based on the defined polygons. Then, the classes of land use and land cover are identified and quantified using tools such as *r.report*, which allows the generation of analytical tables and comparative tables that support subsequent interpretations. This methodological stage is not intended to present results, but to demonstrate the technical procedure that allows, in later stages, to examine the dynamics of land use in the period from 2013 to 2023.

Once the preparation, treatment and organization of the registration, judicial and spatial data is concluded, the third cycle of the research begins, dedicated to the integrated

analysis of these materials. The objective is to evaluate, in a methodologically grounded manner, whether the selected areas — characterized by prolonged possession, residence and productive activity — present conditions that allow, at a later stage, to examine their fit in the constitutional criteria of the social function of rural property. It is, therefore, the consolidation of a methodological path that articulates geotechnologies, documentary analysis and normative interpretation, constituting a solid basis for the development of the following stages of the study.

5 FINAL CONSIDERATIONS

The methodological trajectory outlined throughout this study shows that the analysis of special rural adverse possession, especially when inserted in contexts marked by historical inequalities in access to land, demands an approach that transits between disciplinary fields and integrates different scales of reading the territory. The combination of legal foundations, historical reconstruction, detailed documentary analysis and geoprocessing techniques allowed us to achieve a model capable of apprehending the phenomenon in its complexity, offering solid parameters to assess the conformity of the properties studied with the constitutional criteria of the social function of property.

The application of this methodological path demonstrated that the understanding of special rural adverse possession is not limited to the fulfillment of legal requirements, as it necessarily involves the empirical verification of how prolonged possession materializes in space and how productive occupation contributes to the transformation of local agrarian dynamics. By integrating registry data, judicial information and spatial evidence on land use, the methodology adopted demonstrated the ability to produce diagnoses on the land reality of the Montes Claros County, expanding the interpretative scope of the institute and allowing a more concrete approximation of its socio-legal effects.

The procedures employed, while allowing a detailed characterization of the selected properties, also showed that the study of special rural adverse possession can play a relevant role in the construction of public policies aimed at land regularization, the strengthening of family farming and territorial planning. The ability to identify patterns of productive use, family permanence and environmental management shows that legal instruments, when properly used, can function as effective mechanisms to lead to the fulfillment of the social function of property and to promote sustainable rural development.

Although this paper does not aim to present material conclusions about each case analyzed, the consolidation of a rigorous methodological model provides a basis for future research interested in evaluating the effectiveness of special rural adverse possession in different regions. By structuring a replicable path, this study contributes to the advancement of the dialogue between law and territorial sciences, reinforcing that land regularization should be understood as a process that involves legal, geographic and historical dimensions. In this sense, the methodology presented, by structuring safe means of interpretation and analysis, contributes not only to the academic literature, but also to the formulation of state interventions necessary to confront the historical inequalities that still mark the Brazilian rural space.

ABSTRACT

This article presents data regarding the enrollment of students with disabilities in Brazilian higher education with a focus on data from Paraná state universities (IEES-PR) and the characterization of these students by race/gender. The data were extracted from INEP (2011-2019), exported using SPSS (Statistical Package for the Social Sciences), and analyzed in light of Sociology. The main objectives were to identify the characterization of these students and to map what the scenario found reveals to us, making it possible to clarify who these subjects are. In general terms, the data reveal many challenges for the access of the black and brown population with disabilities to higher education. In relation to sex, we observe that the national sociological characterization points out that one of the effects of state policy, which does not align the State of Paraná with the national trend, is the greater access of male persons with disabilities than female persons with disabilities. Regarding the type of disability, we observed a higher incidence of physical disability in the national data and in the State of Paraná, followed by low vision. In the state universities of Paraná, we highlight low vision, which makes up 68% of the total enrollments of people with disabilities throughout the entire period. Such data evidence, for example, the need for public policies that contemplate the incentive for a transformation of the scenario of this social reality found, that is, of the social markers that often configure themselves as markers of inequalities and differences.

1 INTRODUCTION

In this, we present the enrollment data of students with disabilities in Brazil, in Paraná (all HEIs) with a focus on the state universities of Paraná⁵, between the years 2012 and 2019, based on the intersectionality of the data with the race/gender categories allowed us to draw a parameter on the characterization of the enrollment of these students in higher education. From a dialectical and critical perspective, we will make considerations of what we have found.

Table 1 presents data on the race category among people with disabilities enrolled in Brazilian higher education, at the State of Paraná level (including public and private) and the quantitative focused on the State Universities of Paraná. Table 2 shows the data distributed in the same sequence for the gender category. Below, we find table 3 in these same distributions, referring to the category "types of disabilities" addressed in this article, namely: hearing, physical, intellectual, multiple disabilities, deafness, deaf-blindness, low vision and blindness.

It is important to analyze these specificities as an axis of discussion, because according to data from the "2010 Census Booklet - People with Disabilities", organized by Luiza Maria Borges Oliveira (2012), among 45,606,048 Brazilians, 23.9% of this total population have some type of disability – visual, hearing, motor and mental or intellectual.

Therefore, the main objective is to map and characterize who are the subjects with disabilities who occupy the benches of universities and from this to carry out a sociological analysis of what these data reveal to us in the face of a given social reality.

2 THEORETICAL FRAMEWORK

We started with the category of race among people with disabilities, because it is not only a marker of difference and belonging, but also a marker of inequality in the country, which justifies the relevance of public educational policies that expand the access and permanence of black populations and people with disabilities in universities. After all, as Quijano (2005) reports, "race has become the first fundamental criterion for the distribution of the world population in the levels, places and roles in the power structure of the new society. In other words, in the basic mode of universal social classification of the world

⁵ State University of Londrina (UEL); State University of Western Paraná (Unioeste), State University of Paraná (Unespar), State University of Maringá (UEM); State University of the Midwest of Paraná (UNICENTRO), State University of Ponta Grossa (UEPG) and State University of Northern Paraná (UENP)

population (QUIJANO, 2005, p.118). It should be noted how the category of race carries a Eurocentric ideology of whitening, which synthesizes the conceptions of colonialism to justify exploitation, discrimination, inequalities in power relations against historically marginalized populations. Thus, for the same author, the category of race consists;

[...] with total certainty, the most effective instrument of social domination invented in the last 500 years. Produced at the mere beginning of the formation of America and capitalism, in the transition from the fifteenth to the sixteenth century, in the centuries that followed it was Ethnic-racial Characteristics of the Population: Classifications and Identities imposed on the entire population of the planet as part of the colonial domination of Europe (QUIJANO, 2000, n.p.).

Another marker of difference and belonging, but also of social inequality in Brazil, is configured in the gender category, hence the importance of analyzing such data when reflecting on the characterization of people with disabilities in Brazil, in Paraná and in the IEES/PR. In this research, as well as in Gomes (2018, p.01), "gender is taken as a question, as a category that allows us to question subjects – as subjects of culture, as social subjects, as historical subjects, as political subjects and as subjects of rights".

Based on data from the "2010 Census Booklet - People with Disabilities", prepared by Luiza Maria Borges Oliveira (2012), of the 45,606,048 Brazilians, 25,800,681 (26.5%) are women and 19,805,367 (21.2%) are men. From this general demographic data (45,606,048 Brazilians), 38,473,702 people live in urban areas and 7,132,347 Brazilians live in rural areas.

From a sociological perspective, we can say that gender;

[...] as an ontological category, it considers the differences and inequalities attributed to men and women, which gain meaning through cultural symbolic systems that designate masculinity and femininity as a set of opposite and hierarchical qualities within the framework of androcentrism (the view of men as the center and the norm for human beings) and patriarchy (institutionalized systemic sexism, which implies subordination and oppression of women) (CARVALHO; ANDRADE; MENEZES, 2010; HOOKS, 2000). Feminist studies problematize the notion of the naturalness of sex, based on the biological view, and seek to understand the power relations that are imbricated in gender roles, identities and stereotypes. (Apud DANTAS, SILVA, CARVALHO, 2014, n.p.).

These data show the importance of public policies that consider the intersectionality between disability and gender, a connection that still appears undervalued in national surveys. As a cause or as a consequence of this, there is a "common view about people with

disabilities generally related to the disabling label of disability, leading to the invisibility of sexuality and the non-recognition of being a man/woman with a disability" (DANTAS, SILVA, CARVALHO, 2014, n.p.).

3 METHOD

Of a predominantly quantitative nature, we will resort to educational indicators, obtained through the National Institute of Educational Studies and Research Anísio Teixeira (INEP), extracted and exported through the SPSS (*Statistics (Statistical Package for the Social Science)*). Interpreted via "Read-Me" corresponding to each year and subsequently analyzed. Social indicators via microdata refer to quantitative data that reveal different variables about a social reality. It is possible, through this methodological resource, to identify, demonstrate and prove social changes during its process. (JANNUZZI, 2002, p. 2)

We can characterize the reading of the results based on the knowledge of the Social Sciences "[...] by a multiplicity of approaches, with different assumptions, methodologies and styles" (ALVES-MAZOTTI; GEWANDSZNAJDER, 2000, p. 128). In the case of this qualitative-quantitative research, we defend the analytical, critical and dialectical approach in the understanding of social phenomena.

4 RESULTS AND DISCUSSION

Table 1, 2 and 3 present the results obtained, as well as their analysis according to their categories.

Source: INEP-Census Data (2020)

Whites represent the largest proportion of students with disabilities at all levels (national, state and state levels of PR). People of brown color showed significant growth in the period, both in Brazil and in Paraná. The increase in the number of browns enrolled reflects greater access to higher education for historically underrepresented groups. In relation to black people, a percentage still lower than the other groups, but on the rise, especially from 2016 onwards.

In this context, we identified, in table 01, through national data, from Paraná and from the state universities of Paraná, the prevalence of white people with disabilities in relation to

people with black and brown disabilities, classified by the IBGE as the black population. Thus, among people with disabilities inserted in higher education institutions there should also be this same proportion, that is, greater in numbers of blacks and browns.

What the data reveal is that the access of the black and brown population with disabilities to higher education does not follow the same demographic proportion of this population, whether in the state of Paraná, in the state of Paraná or at the national level. For example, in the State of Paraná, we have a percentage of black and brown people that is around 34%, according to the latest demographic surveys (BRASIL, IBGE-2010).

With regard to data on the population with disabilities in Paraná, among the people who most access higher education, the white population prevails. This information follows the trend of having a majority of people without disabilities white in the State of Paraná, as well as in the seven IEES/PR, but with a rate much lower than that related to people with disabilities when we make the demographic comparison of the general population.

Table 2

Number of enrollments of people with disabilities by gender in higher education in Brazil, in the State of Paraná and with a focus on the State Schools of Paraná

Source: Prepared by the authors based on microdata from the Higher Education Census (MEC/INEP, 2012-2019)

In relation to gender, we observed that the national sociological characterization points to a higher incidence of women with disabilities in universities and this national trend is not maintained in Paraná or in the state universities of Paraná. In the same way that there is no higher incidence of some type of disability in white people, we also do not have a higher incidence of disability in males. So, what we are going to observe is that one of the effects of the state policy that does not put the State of Paraná in line with the national trend is in relation to greater access for male people with disabilities than for female people with disabilities.

This higher incidence of males with disabilities is also observed in Basic Education and in even higher proportions than those found in this population's access to universities.

Source: Prepared by the authors based on microdata from the Higher Education Census (MEC/INEP, 2012-2019)

If we take as a reference the total population residing in the country, according to the 2010 Census, that is, 45,606,048 Brazilians, we have that:

[...] 23.9% had at least one of the disabilities investigated: visual, auditory, motor, and mental or intellectual. The prevalence of disability varied according to their nature. Visual impairment had the highest occurrence, affecting 18.6% of the Brazilian population. In second place is motor disability, occurring in 7% of the population, followed by hearing impairment, in 5.10% and mental or intellectual disability, in 1.40%. (BRASIL, 2012, p. 07).

Regarding the type of disability, when we cut the data for the period from 2012 to 2019, we observed that the types with the highest incidence in the national data are physical disability and low vision, an incidence that is repeated in the state of Paraná.

What this data shows us, unlike all the data from Basic Education, in which the highest incidence is of intellectual disability, reaching almost 70% of the cases in some states, in higher education we have an alignment of the trend of incidence of the type of disability with the demographic data.

So, in higher education, we observed a higher incidence of physical disability in national data and in the State of Paraná (all HEIs), followed by low vision, in the same way that there is this incidence of both conditions in the population in general. In the state universities of Paraná, we highlight low vision, which makes up 68% of the total enrollment of people with disabilities throughout the period, with a drop in the incidence of low vision from 2017 onwards, corresponding to about 60% of cases.

Another highlight is the low incidence of people with hearing impairment or deafness in state universities. In the national data, we observed the numbers of hearing impairment oscillating from 2012 with 20% of cases to reaching 2019, between 12% and 13%. While, in the state universities of Paraná, throughout the period, cases of hearing impairment do not exceed 10% and in Paraná as a whole, it is noteworthy that in 2012 hearing impairment made up almost 40% of cases, but reaching 12% in 2019, fluctuating very little over the period.

Therefore, we conclude that, in relation to these data, we have a greater guarantee of access to higher education for people with these two types of disabilities, both physical and low vision. Such information shows that there must be an increase in these public policies so that there is greater acceptance of people with other types of disabilities in universities.

5 INTERSECTIONALITY BETWEEN RACE, GENDER, AND DISABILITY

The relationship of coloniality takes us back to past times and presupposes that a group of people overlaps with others, that is, the persistence in the relations of power and domination between dominant and dominated. However, not living in colonial times is not the same as breaking with the characterization of this context, because from a social logic, those so-called dominated subjects of colonial times would occupy which places within a social reality throughout history?

In this context of inequalities and colonialism, Quijano (2005) explains that colonialism is established in a global structure, because its main articulator is power. Those who hold power are the dominant ones, while the others, their dominated. From this perspective, colonialism or these unequal power relations allow us to think about the persistence of oppression in relations of gender, sex, schooling, and also for people with disabilities.

The coloniality of power is a concept originally developed by Aníbal Quijano in 1989 and widely used by the group. It expresses a simple observation, that is, that the relations of coloniality in the economic and political spheres did not end with the destruction of colonialism. The concept has a double pretension. On the one hand, it

denounces "the continuity of colonial forms of domination after the end of colonial administrations, produced by colonial cultures and by the structures of the modern/colonial capitalist world-system" (Grosfoguel, 2008, p.126). On the other hand, it has an explanatory capacity that updates and temporizes processes that supposedly have been erased, assimilated or overcome by modernity. This understanding is well explained by Grosfoguel. (Apud BALLESTRIN, 2013, p.99-100).

Organization and labor relations are forms of domination, especially when we think from the perspective of the capitalist system and its forms of control through the division of labor. In addition, it is worth thinking about the intersectionality of gender, race, class, and also of people with disabilities. Thus, when Quijano (2005) proposes that one of the forms of domination occurs through the organization of work and its products (the wealth it generates), it can be thought that the division of labor itself, when understood based on the criterion of racialization, consolidated colonial power and reaffirmed new forms of control, especially from the development of the capitalist system.

Coloniality of power consists **of the identification of peoples according to certain phenotypes established and imposed by Western thought**. It can be seen that race has become the most effective and durable instrument of domination, also influencing other aspects that were used for the propagation of Modernity and Eurocentric thought, such as gender, sexuality, knowledge, political, environmental and economic relations (QUIJANO, 2005, p.118).

In these assumptions, we are faced with countless possibilities of social inequalities and exclusionary scenarios, education being one of them. Therefore, how the schooling process of people who experience or carry some social mark of inequality takes place is a pertinent problematization.

One of the ways to combat the contexts of exclusion, to which different social groups are exposed, is through public policies that operate in different ways. In this sense, it is relevant to understand what inclusion policies and programs say and, above all, their effects on a certain social reality, in this case, on the enrollment of students with disabilities in IEES-PR.

When we talk about race, specifically, we think of the power relations established throughout history between the white man and his superiorities over the black man. When we look at history, we realize the authority of whites over public control, identifying themselves as different and superior.

In this sense, the operationalization of the so-called democracy is put at risk, since it is required that everyone sees themselves and exercises their rights as equals, compromising the position of the so-called whites, because for this, it would be necessary to break with the relations of dominator-dominated-exploiter and exploited, that is, it would be necessary to give up their privileges maintained by this unequal relationship.

The "abolition" constitutes a milestone in this process, which placed the black man in the position of adapting to the new system of work, that is, of inferior and disadvantageous conditions that little by little, in the need for cheap labor, were introduced into the economic development of society. The relationships in which they experienced in the historical context of enslavement, for many generations, are characterized, to this day, as a result of the delay in access to various areas of life and education, and one of them.

To combat this backwardness, which still persists, even within public policies in Brazil, it is necessary to consider the distinction between "black theme" and "black life", brought by the black Brazilian sociologist Guerreiro Ramos, because one conception of public policy is that aimed at black populations with disabilities and another conception of public policies is that not only aimed at these populations, but built by these people and gestated by them, valuing their knowledge, their voices, their demands and their spaces of speech.

There is the theme of the black and there is the life of the black. As a theme, blacks have been, among us, the object of scalping perpetrated by literati and by the so-called "anthropologists" and "sociologists". As life or effective reality, blacks have been assuming their destiny, they have been making themselves, according to the particular conditions of Brazilian society. But one thing is the black theme; the other, the black-life. The black-theme is something examined, looked at, seen, sometimes as a mummified being, sometimes as a curious being, or in any case as a risk, a trait of the national reality that draws attention. The black-life is, however, something that does not allow itself to be immobilized; it is misleading, prophetic, multiform, of which, in fact, one cannot give a definitive version, because it is today what it was not yesterday and tomorrow it will be tomorrow what it is not today (GUERREIRO RAMOS, 1955, p. 215).

Therefore, we can infer that the trajectory and historical marks of black people in life in society reflect to this day in different contexts, especially regarding schooling. When we refer to black people with disabilities, we can say that it is a great advance to have this reality present in higher education institutions.

But, if we consider that more than half of the Brazilian population, according to data from the 2010 IBGE Census, are brown and black, identified by the agency as black, and that

we are far from having the same proportion in public universities in Paraná, this denotes that existing public policies have not yet been sufficient to increase this number.

When we look at the gender category, from this same perspective, we identify relations of oppression on women's rights in society. It is not difficult to remember the predominantly caretaker role of the home and children. However, the very constitution of the capitalist market requires the help of women's labor force in the family income, from the perspective of the productive work performed by women, corresponding to a cheaper labor force that at the same time generates profit, in addition to the fact that such activities already add to so many others already performed by them.

There is no doubt that the introduction of women into the educational system and, above all, into the qualified labor market is much more costly and disturbing. In this scenario, of women in the labor market, we have another front of analysis, that is, the participation of black women in society, who were exposed not to a labor relationship, but to an exclusively commodity relationship, which unfortunately was not overcome, even with the "abolition" of the slave system.

In other words, in this connection already mentioned in the history of blacks, we have an aggravating factor when we talk about the history of black women in society. In this sense, the understanding of the phenomenon of the number of enrollments in higher education of people with disabilities must consider the intersectionality of intrinsically interconnected elements when one wishes to have a parameter of a given social reality. In this case, when we talk about people with disabilities, we also talk, for example, about other social markers of inequalities, such as black people and different gender identities.

When we turn our gaze specifically to people with disabilities, the social markers lead us to the same categories in which black people and also women were constituted, that is, indicators of segregation, exclusion and inequality in different contexts. With regard to education, the reality was no different.

In the capitalist context in which society develops, the human being has his value for his potential to produce and contribute to this system, so people with disabilities were very late being introduced into civic life, in education, for example, the "special" model began only at the end of the twentieth century.

When we talk specifically about higher education, the advances are more recent and still incipient, as the data show. In this context, although we have noticed a slight increase in the number of enrollments of students with disabilities in higher education in Paraná, for

example, it is still a much lower amount than the number of people with disabilities in Brazil (23.9% of the Brazilian population in general).

Here again the importance of public policies and Affirmative Actions to expand access and permanence to actually provide the process of democratization in public higher education, even if it is still an inexpressive measure in the face of social inequalities that affect all institutions, not only educational ones.

In addition, it is stated that gender and race are the main factors between people with and without disabilities, due to the trajectory and historical marks of both the slavery and patriarchal issues. However, there is still a lack of more studies in the areas of Social Sciences and Education that articulate the connection of these categories in terms of their effective participation in different social areas, especially in school institutions.

6 FINAL CONSIDERATIONS

We understand that in addition to access, public educational policies that deal with the permanence of people with disabilities in Higher Education must strive to combat all types of violence and injustice, which expand the confrontation of the violence of ableism. This means that such public policies need to excel in the dimension of intersectionality of positive markers of belonging, differences, identities and diversities, vehemently combating the markers of racial, sexual, gender, generational, economic, regional, territorial, ethnic, racial, cultural, and political inequalities, historically crystallized in this country and in the State of Paraná. In this path, we also emphasize the methodological importance used, which provides us and reveals the statistical sources via microdata about this social and educational reality, where we highlight as main results found the characterization of the enrollment of students with disabilities in Higher Education, revealing their race/color, their sex/gender, their types of disabilities, among other relevant variables. The data show us many challenges. The access of the black and brown population with disabilities to higher education does not follow the same demographic proportion of this population, whether in the state of Paraná, in the state of Paraná or at the national level. With regard to data on the population with disabilities in Paraná, among the people who most access higher education, the white population prevails. As we have shown, this information follows the trend of having a majority of people without white disabilities in the State of Paraná, as well as in the seven IEES/PR, but with a rate much lower than that of people with disabilities when we make the demographic comparison of the general population. In other words, there is no statistically speaking, the

representativeness, according to statistics between demographic data and INEP, of the number of enrollments of black and brown people in IEES-PR.

In relation to gender, we observed that the national sociological characterization points out that one of the effects of the state policy and that does not place the State of Paraná in line with the national trend is in relation to greater access for male people with disabilities than for female people with disabilities. Regarding the type of disability, when we cut the data for the period from 2012 to 2019, we observed a higher incidence of physical disability in the national data and in the State of Paraná, followed by low vision, in the same way that there is this incidence of both conditions in the population in general. In the state universities of Paraná, we highlight low vision, which makes up 68% of the total enrollment of people with disabilities throughout the period, with a drop in the incidence of low vision from 2017 onwards, corresponding to about 60% of cases.

Therefore, we conclude that, in relation to these data, we have a greater guarantee of access to higher education for people with these two types of disabilities, both physical and low vision. Such information shows that there must be an increase in these public policies so that there is greater acceptance of people with other types of disabilities in universities.

We can affirm, from the set of data presented, that specific public policies for the state universities of Paraná benefit the access of people with disabilities to higher education institutions, but they are still incipient and very timid, with regard to ensuring effective conditions for the permanence of these people. It is still necessary to conceive what conception of permanence we are defending. It is a conception of permanence with dignity, with accessibility in all senses, with inclusive actions of pedagogical monitoring and with the right to access services that confront all types of discrimination and violations of the rights of this population.

ABSTRACT

Objective: To investigate the relationship between mandibular range of motion (ROM) and kinesiophobia in patients with maxillofacial fractures.

Methodology: Descriptive, observational study in the form of a case series report, conducted at the Núcleo de Atenção Médica Integrada from September to October 2022, approved by ethics committee protocol 5.641.381. The assessment included a form with sociodemographic data, fracture characteristics, and main complaints, followed by a physical examination in which pain was quantified using the VAS, sensitivity using microfilaments, and mandibular ROM—measured in mouth opening, protrusion, and right and left lateral deviation using a caliper. Kinesiophobia was assessed using the Tampa Scale for Kinesiophobia for TMD, and functional limitation using the Mandibular Function Impairment Questionnaire.

Results: Only one patient presented a mandibular fracture, while the others underwent orthognathic surgery. In the assessment, Case 1 showed: mouth opening 11 mm, RLD 1 mm, LLD 3 mm, protrusion 0 mm; Case 2: mouth opening 4 mm, RLD 0 mm, LLD 1 mm, protrusion 0 mm; Case 3: mouth opening 18 mm, RLD 4 mm, LLD 5 mm, protrusion 2 mm. All patients reported moderate pain, with the most frequent complaints being movement limitation, hypoesthesia, and edema. Cases 1 and 2 showed severe kinesiophobia, and Case 3 presented moderate kinesiophobia.

Conclusion: Patients with reduced mandibular movements exhibit increased kinesiophobia, along with edema and pain.

Keywords: Face. Fracture Healing. Mandibular Fractures. Kinesiophobia. Range of Motion.

RESUMO

Objetivo: Relacionar ADM mandibular e cinesiofobia em pacientes com fratura bucomaxilofacial.

Metodologia: Estudo descritivo, observacional do tipo relato de caso em série, no Núcleo de Atenção Médica Integrada, de setembro a outubro de 2022, parecer ético 5.641.381. Avaliação contou com ficha contendo dados sociodemográficos, características da fratura e principais queixas, seguida da avaliação física, onde a dor foi quantificada segundo a EVA, sensibilidade pelos microfilamentos e ADM mandibular nos movimentos de abertura, protrusão, desvio lateral esquerdo e direito utilizando o paquímetro. A cinesiofobia foi avaliada pela Escala Tampa de Cinesiofobia para DTM e limitação funcional pelo Mandibular Function Impairment Questionnaire.

Resultados: Apenas um dos pacientes apresentou fratura mandibular, enquanto os outros realizaram uma cirurgia ortognática. Na avaliação, o Caso 1 apresentou abertura: 11mm, DLD: 1mm, DLE: 3mm, protrusão: 0mm; Caso 2 abertura: 4mm, DLD: 0mm, DLE: 1mm, protrusão: 0mm; Caso 3, abertura: 18mm, DLD: 4mm, DLE: 5mm, protrusão: 2mm. A dor apresentou-se moderada em todos e as queixas mais frequentes foram limitação de movimento, hipoestesia e edema. Os casos 1 e 2 apresentaram grau grave de cinesiofobia e o caso 3 moderado.

Conclusão: Pacientes com redução dos movimentos mandibulares apresentam aumento da cinesiofobia, presença de edema e dor.

Palavras-chave: Face. Cicatrização de Fraturas. Fraturas de Mandíbula. Cinesiofobia. Amplitude de Movimento.

RESUMEN

Objetivo: Relacionar la amplitud de movimiento mandibular (ADM) y la kinesiofobia en pacientes con fractura bucomaxilofacial.

Metodología: Estudio descriptivo y observacional, tipo serie de casos, realizado en el Núcleo de Atención Médica Integrada, entre septiembre y octubre de 2022, con aprobación ética n.º 5.641.381. La evaluación incluyó un formulario con datos sociodemográficos, características de la fractura y principales quejas, seguido de la evaluación física, en la cual el dolor se cuantificó mediante la EVA, la sensibilidad con microfilamentos y la ADM mandibular en los movimientos de apertura, protrusión y desviación lateral derecha e izquierda, utilizando un calibrador. La kinesiofobia se evaluó mediante la Escala de Tampa de Kinesiofobia para DTM y la limitación funcional a través del Mandibular Function Impairment Questionnaire.

Resultados: Solo uno de los pacientes presentó fractura mandibular, mientras que los demás fueron sometidos a cirugía ortognática. En la evaluación, el Caso 1 presentó: apertura 11 mm, DLD 1 mm, DLI 3 mm, protrusión 0 mm; Caso 2: apertura 4 mm, DLD 0 mm, DLI 1 mm, protrusión 0 mm; Caso 3: apertura 18 mm, DLD 4 mm, DLI 5 mm, protrusión 2 mm. El dolor fue moderado en todos los casos, y las quejas más frecuentes fueron limitación del movimiento, hipoestesia y edema. Los Casos 1 y 2 presentaron un grado severo de kinesiofobia y el Caso 3 un grado moderado.

Conclusión: Los pacientes con reducción de los movimientos mandibulares presentan mayor kinesiofobia, además de edema y dolor.

Palabras clave: Cara. Consolidación de Fracturas. Fracturas de Mandíbula. Cinesiofobia. Amplitud de Movimiento.

1 INTRODUCTION

Maxillofacial fractures are a significant public health problem due to their high frequency in trauma centers, being one of the leading causes of morbidity and mortality worldwide. Studies indicate that young adult males, aged between 21 and 30 years, have the highest incidence of maxillofacial trauma, with traffic accidents and physical assaults being the most evident causal factors. According to the same study, the most affected area is the mandible due to its prominence, followed by the nasal bones (1,2).

Fractures of the middle facial region are commonly classified according to René Le Fort, who observed recurring fracture patterns and categorized them into Le Fort I, II, and III (3). Mandibular fractures are classified according to their location and can occur in the symphysis, horizontal ramus, angle, ramus, condyle, and coronoid process. One of the main consequences of these fractures can be malocclusion, leading to functional changes (4). This factor is classified according to Angle, who divides occlusions into three classes: Class I, normal occlusion; Class II, the lower molar is distal to the upper first molar; and Class III, the lower molar is mesial to the upper first molar (5).

Orthognathic surgery is a therapeutic option for correcting these malocclusion patterns, allowing the restoration of the patient's functionality (6,7). The craniofacial skeleton plays key roles such as speech, chewing, vision, smell, and breathing. The masticatory muscles are directly related to factors such as mandibular range of motion, dental occlusion, and bite force. Any alteration in these structures can lead to functional changes in the patient, as the skeletal muscles of the face can modify their morphology to meet specific demands (6,7,8).

Additionally, temporomandibular joint (TMJ) dysfunctions, osteoarthritis, tumor resections, and facial trauma also directly influence mandibular movement, load, and muscle activity modification, making the analysis of range of motion clinically relevant for the success of rehabilitation (9,10). Another important aspect is kinesiophobia, or the fear of movement, which is defined as an excessive, irrational, and debilitating fear of performing a movement in which the patient feels vulnerable to injury or relapse.

Developed from direct experience, such as trauma, or through observations and instructions, kinesiophobia can be linked to functional disability and quality of life, as it has the potential to alter how a person moves to avoid pain, which can affect their performance in actions related to pain control and identification (11). In a study conducted in 2020 by Brown et al., it was observed that kinesiophobia negatively impacts the patient's performance in

achieving active range of motion. The same study demonstrated that for the patient to achieve good results, both physiotherapeutic and psychological interventions are necessary (12,13).

The observation of the increasing number of facial trauma cases and the importance of understanding the care of these patients motivated this study. This research is relevant as it will help us better understand the functional implications of facial trauma and the importance of quantifying kinesiophobia for better therapeutic outcomes. The aim of this study is to relate mandibular range of motion and kinesiophobia in patients who have suffered maxillofacial fractures, by quantifying mandibular range of motion and its impacts on patients' functionality.

2 METHODOLOGY

A descriptive, observational study in the form of a case series report was conducted at the *Núcleo de Atenção Médica Integrada* (NAMI) between September and October 2022. The research project was approved by the Ethics Committee of the University of Fortaleza and by *Plataforma Brasil*, resulting in ethical approval number 5.641.381. Participants aged between 18 and 60 years, of both sexes, who underwent surgery for the correction of maxillofacial fractures were included. Exclusion criteria were patients with more than 15 days postoperatively, those who presented any central or peripheral neurological disorder, or those who had used analgesic medication within 24 hours prior to the assessment.

Data collection from the participants occurred immediately after reading and signing the Informed Consent Form. Subsequently, the assessment was initiated, consisting of a form containing sociodemographic data, physical evaluation, application of the kinesiophobia scale, and the mandibular functionality questionnaire, with an average duration of 45 minutes. Initially, the participants completed a form developed by the researchers, which included socio demographic data, fracture characteristics, and the main complaints. Subsequently, the physical evaluation was performed, with pain quantified using the Visual Analog Scale (VAS), sensitivity assessed using monofilaments, and analysis of mandibular range of motion using a caliper, considering the movements of active mouth opening, protrusion, and right and left lateral deviations.

After that, the participants were administered the Tampa Scale for Kinesiophobia for Temporomandibular Disorders (TSK/TMD), an adapted version of the Tampa Scale for Kinesiophobia (TSK), a questionnaire developed to assess kinesiophobia in patients with musculoskeletal pain. In the TSK/TMD, some terms were adapted, providing specificity to the questionnaire. It consists of 18 items with four response options, with scores ranging from 1

to 4. To obtain the final score, the item scores are summed, resulting in a total score ranging from 18 to 72, in which higher scores indicate a greater degree of kinesiophobia (12).

Additionally, the Mandibular Function Impairment Questionnaire (MFIQ) was applied, which assesses mandibular functional limitation, classifying it as mild, moderate, or severe. The questionnaire consists of 17 questions with five response options, scored from 0 to 4. The result is obtained through an equation that generates a coefficient, which is compared with predefined intervals to determine the degree of the patient's functional limitation—where lower results indicate less functional limitation, and higher results indicate more severe limitation.

3 CASE SERIES OF CLINICAL REPORTS

Case 1

A 28-year-old female patient, a street vendor, sought physiotherapeutic care after suffering an accident in which she slipped and fell from a height of 10 meters while attempting to take a photograph from the top of a waterfall. During the fall, the patient sustained multiple injuries, including an open tibial fracture, acromioclavicular joint dislocation, and a comminuted fracture in the mandibular symphysis region with avulsion of tooth 31. Three days after undergoing surgery for correction of the mandibular fracture, the patient began the assessments.

During the physical evaluation, the patient presented active mouth opening of 11 mm, right lateral deviation (RLD) of 1 mm, left lateral deviation (LLD) of 3 mm, and 0 mm of protrusion (Table 1), with moderate pain (VAS score of 5). The main complaints reported were hypoesthesia and the presence of edema. The TSK/TMD score was 52, indicating severe kinesiophobia, and the MFIQ indicated a severe degree of functional impairment.

Case 2

A 32-year-old female patient, a security guard, with a history of bruxism, sought physiotherapeutic care after temporomandibular joint locking that led to reduced mandibular range of motion, and for preoperative management prior to orthognathic surgery aimed at functional improvement; the patient was classified as Class II. During surgery, maxillary, mandibular, and mentonian osteotomies were performed. In addition to orthognathic surgery, bichectomy and cervicofacial liposuction were also performed.

After the surgical interventions, the patient began the assessments. During the physical evaluation, the patient presented active mouth opening of 4 mm, RLD of 0 mm, LLD

of 1 mm, and 0 mm of protrusion (Table 1), with moderate pain (VAS score of 4). The main complaints reported were hypoesthesia and limitation of movement. The TSK/TMD score was 51, indicating severe kinesiophobia, and the MFIQ indicated a severe degree of functional impairment.

Case 3

A 23-year-old male patient, a student, sought physiotherapeutic care after undergoing orthognathic surgery due to respiratory and aesthetic complaints; the patient was classified as Class II. During surgery, maxillary and mandibular osteotomies and a mentonian osteotomy were performed. In addition to orthognathic surgery, bichectomy and cervicofacial liposuction were also performed.

During the physical evaluation, the patient presented active mouth opening of 18 mm, RLD of 4 mm, LLD of 5 mm, and 2 mm of protrusion (Table 1), with moderate pain (VAS score of 6). The main complaints reported were pain, limitation of movement, edema, and paresthesia. The TSK/TMD score was 44, indicating moderate kinesiophobia, and the MFIQ indicated a severe degree of functional impairment.

Table 1

Mandibular Range of Motion

Cases	Active Mouth Opening (mm)	RLD (mm)	LLD (mm)	Protrusion (mm)
Case 1	11	1	3	0
Case 2	4	0	1	0
Case 3	18	4	5	2

Source: Research data. Note: mm= millimeters.

4 DISCUSSION

This study demonstrated that the main motivation for undergoing fracture correction surgery was functional and aesthetic improvement. During the physical assessment, all patients presented limitations in range of motion, reporting moderate pain, edema, and altered sensitivity. Regarding kinesiophobia, participants presented moderate to severe levels, possibly indicating a relationship between limited range of motion and fear of mandibular movements. Concerning the motivations for undergoing orthognathic surgery,

functional and aesthetic-functional complaints were reported, corroborating the study by Ambrizzi et al., which indicated that the primary motivation for undergoing orthognathic surgery is aesthetic concerns, followed by aesthetic-functional complaints and, lastly, purely functional complaints, including difficulties in mastication, breathing, pain, and speech alterations.

Factors such as bite force and muscle activity tend to improve after surgery; however, all malocclusion groups tend to present some degree of temporomandibular joint (TMJ) hypomobility in the postoperative period (16). The reduction in mandibular range of motion may result from the type of fixation used during the surgical procedure, combined with postoperative edema and pain, which is consistent with the findings of this study (17). Although all patients presented moderate VAS scores, the patient in Case 3 reported a VAS score of 6, the highest value observed, reporting edema as a complaint while presenting the greatest range of motion among the described cases. Conversely, the patient in Case 2 reported a VAS score of 4, the lowest among the cases, did not report edema, and presented extremely reduced range of motion.

However, pain is a complex and subjective process, which may impact the accuracy of the findings (18). Regarding the consequences of maxillofacial fracture correction surgeries, studies indicate that sensory alteration is a common complication in these patients, which is consistent with the findings of this research, as all patients reported some type of sensory alteration. These injuries generally affect the area of the inferior alveolar nerve, including the chin, lower lip, and gingival mucosa, leading to slow recovery of up to one year and potentially resulting in complete and permanent paresthesia (19). As presented in the case reports, both patients who underwent orthognathic surgery were classified as Class II and underwent the same procedures. However, the observed ranges of motion were markedly divergent, particularly in active mouth opening, in which Case 2 presented 4 mm and Case 3 presented 18 mm.

This result may be explained by the patients' clinical history, different motivations for surgery, and different degrees of kinesiophobia—being severe in Case 2 and moderate in Case 3, according to the TSK/TMD scale. In this context, it is known that a previous injury, as observed in Cases 1 and 2, may significantly impact the patient's psychological state. Patients may perceive pain as non-threatening and perform their activities normally, or they may catastrophize pain, developing kinesiophobia and movement hypervigilance, which tends to increase rehabilitation time (21,22).

Mandibular fractures are more likely to reduce mandibular range of motion, with fractures in the posterior region having a greater impact than anterior fractures (23). According to the same study, and considering Case 1, in which the fracture occurred in the mandibular symphysis region, the patient tends to present a more functional range of motion in the postoperative period and not maintain a malocclusion pattern during this time. With regard to mandibular functionality, the severity observed may be justified by the postoperative phase in which the patients were, characterized by significant edema and pain.

Another important aspect is masticatory function, which tends to be altered after maxillofacial fracture correction surgeries, varying according to the phase and type of postoperative treatment (24,25). Finally, some limitations of this study should be acknowledged. The first is the small number of participants, which limits the generalizability of the results. In addition, the absence of data such as a history of psychological treatment and variables related to psychosocial aspects may have influenced questionnaire scores. These findings suggest the need for a biopsychosocial approach for the appropriate rehabilitation of these patients.

5 CONCLUSION

Postoperative patients with maxillofacial trauma who present reduced mandibular range of motion tend to exhibit higher levels of kinesiophobia, in addition to the presence of edema and moderate pain. These findings reinforce the importance of an integrated assessment of functional and psychosocial aspects during the rehabilitation process.

ABSTRACT

5 years of 5%. Because it is a difficult diagnosis to treat, it motivates several lines of research to optimize the currently proposed standard treatment, which consists of chemoradiation and surgical resection, when possible. The reduced use of the citric acid cycle and mitochondrial oxidative phosphorylation for energy production in cancer cells that primarily use anaerobic glycolysis, even in the presence of oxygen, characterizes the Warburg effect, which justifies the use of diets with restricted carbohydrate intake that generate ketosis to reduce energy intake and consequently delay tumor progression, since healthy cells are able to receive energy more efficiently from fatty acids. The conclusions of 21 articles selected from databases (PubMed and LILACS) related to diets with reduced carbohydrate intake and the treatment of glioblastoma were correlated, as well as seeking to analyze the secondary variables present in clinical studies. Thus, the complexity of conducting research on this topic becomes clear, and the need for more robust studies, especially clinical ones, is proposed to allow for a meta-analysis of the subject in order to define therapeutic approaches that may include or rule out the implementation of carbohydrate-restricted diets in the treatment of glioblastoma.

1 INTRODUCTION

1.1 GLYOMAS

Gliomas are classified into different types of tumors according to their glial lineages, including astrocytomas, oligodendrogliomas, mixed oligoastrocytomas, ependymomas, and several less common types of glioneuronal tumors¹. Astrocytic brain tumors are primary CNS tumors derived from astrocytes. Astrocytes provide structural and metabolic support to neurons, regulate ion concentrations in the extracellular space, modulate synaptic transmissions, release neurotransmitters, compose the blood-brain barrier, among other functions².

The WHO classifies astrocytic tumors into 4 classes, according to the degree of aggressiveness (Table 1), and low-grade astrocytomas (I and II) tend to be present in younger patients and have a better prognosis. High-grade astrocytomas (III and IV) typically present in older patients and the prognosis is worse². Glioblastoma multiforme (GBM) is considered grade IV, since it is highly aggressive, with a mean survival rate of 15 months³ and a 5-year survival rate of 5%⁴.

Table 1

Classification of glioma subtypes according to their histological characteristics by the World Health Organization

Degree	Tumor histology	Subtype according to Histology
I	Benign, well set	Pilocytic Astrocytoma
II	Diffuse infiltration and high proliferation	Diffuse Astrocytoma, Oligodendroglioma, Oligoastrocytoma
III	Very infiltrative and with a lot of proliferation	Anaplastic Astrocytoma, Anaplastic Oligoastrocytoma, Oligodendroglioma Anaplastic
IV	Very infiltrative, high cell and vascular proliferation, necrosis, hemorrhage	Glioblastoma multiforme

Source: adapted from JONES & HOLLAND, 2011.

Macroscopically, GBM denotes a poorly delimited expansive mass in the white matter of a cerebral hemisphere with central necrosis, which may affect most of the tumor. Cysts and hemorrhages may be present, as well as peritumoral edema and midline deviation, with hernias. In some cases, the tumor infiltrates the corpus callosum, passing into the contralateral hemisphere forming a pattern called "butterfly wing tumor." Histopathologically, GBM presents cellular atypia exhibiting cells of different sizes and degrees of variation. Some cells have 2 bipolar extensions, resembling glioblasts - embryonic cells of the neural tube that give the tumor its name. Grade IV astrocytomas also present vascular proliferation, with an increase in the number of capillaries, both in the tumor and in the adjacent nervous tissue. These capillaries resemble the renal glomeruli, which is why they are called pseudoglomeruli. The endothelial cells of the pseudoglomeruli are numerous and have swollen nuclei, which usually leads to thrombosis and consequent coagulative necrosis. There is also a high mitotic activity and infiltrative capacity of tumor cells that generates the poorly defined characteristic of GBM⁵.

The pathophysiology of GBMs, as well as other brain tumors, is related to a metabolic disorder of tumor cells, so that cancer cells, in order to maintain a high mitotic rhythm, reduce the use of the citric acid cycle and mitochondrial oxidative phosphorylation for energy production and, instead, use anaerobic glycolysis as a priority. even in the presence of oxygen. This change in the pattern of obtaining cellular energy increases the glucose consumption of tumor cells and is called the "Warburg Effect", described in 1927 by the German scientist Otto Warburg⁶.

In view of the Warburg effect and the pathophysiological characteristics of GBM, many researchers question alternatives that can help in the treatment of GBM, since current therapeutic measures do not provide a cure or considerable survival in the vast majority of cases. One of the current pathways is based on the fact that GBMs use glucose at a much higher intensity than the normal cortex and in states of prolonged glucose deprivation, normal brain cells metabolize ketone bodies derived from fatty acids to obtain energy instead of glucose, while tumor cells are barely able to do so. making them depend on glucose and glycolysis to survive. The energy delivery route of gliomas has a much lower yield than that of eutrophic cells, leading to a much higher need for glucose⁷. This makes tumor cells vulnerable to glucose-restriction therapies⁸.

1.2 CARBOHYDRATE RESTRICTION AND KETOSIS

When carbohydrates are eliminated from the diet, either in fasting or low carbohydrate intake, energy can be obtained from the oxidation of fatty acids that occurs within the liver. This process generates ketone bodies (acetoacetate, hydroxybutyrate, and acetone) that are transported to the tissues where they are converted into acetyl-coenzyme A, which serves as a substrate in the citric acid cycle⁹. The state of use of this alternative pathway of obtaining cellular energy is called ketosis or ketone state, so that ketone bodies are an alternative energy source for the cells of the cortex, while tumor cells, due to dysfunctions resulting from their mutations, have mitochondria that are incapable of this process and generate many reactive species during the process, leading to apoptosis¹⁰.

2 OBJECTIVES

2.1 GENERAL OBJECTIVE

To relate different conclusions about diets with reduced carbohydrate intake, in addition to CD proposed as classic, as alternatives to complementary treatment of patients with diagnosed GBM, as well as to perceive the conclusions about the applicability of CD and its variations with effectiveness in the state of ketosis, with variables such as palatability, tolerance and maintenance of diets.

2.2 SPECIFIC OBJECTIVES

- Analyze the main difficulties in carrying out the clinical studies carried out so far (August/2022);
- To consolidate the existing conclusions and compare these conclusions with what there is research on the subject in other educational institutions after the publication of the article by the Laboratory of Cell Biology of Gliomas of the Department of Cell Biology, Embryology and Genetics, with a view to valuing local science;
- Use medical-scientific knowledge platforms to signal conclusions of topics studied in different scenarios of pre-clinical, clinical and review studies.

3 WORK METHODOLOGY

A search of 21 articles selected from the related search of the terms "Diet, Ketogenic" and its variations suggested by the Medical Subject Headings (MeSH) was conducted; as well as the keywords "Glioblastomas", "Astrocytoma, Grade IV", "Glioblastoma Multiforme",

"Giant Cell Glioblastomas" and their variations; in addition to the terms "Diet, High Protein Low Carbohydrate", "Low-Carbohydrate", "Atkins Diet", "High-Protein Carbohydrate - Restricted Diets" and their variations in the PubMed and LILACS databases.

The inclusion criteria were the year of publication after 2014, written language, English, and Portuguese. The exclusion criteria were: unavailability of the full article on online platforms for the online availability of scientific knowledge and single case report studies due to its low impact on the scale of evidence and conclusions redundant to systematic review studies and laboratory tests.

After searching on knowledge platforms and reading the abstracts of the papers initially listed, the research proceeded with the full reading of each selected article and correlation of its results.

4 RESULTS AND DISCUSSION

4.1 PRECLINICAL STUDIES

Preclinical studies trace a path for the use of carbohydrate-restricted diets, both the ketogenic diet with different proportions ^{11,12,13,14} and the supplemented high-fat low-carbohydrate (sHFLC)¹⁵ diet, in the adjunct treatment to the measures already implemented (radiochemotherapy). Although studies sometimes evaluate the same diet, as in the case of the ketogenic diet, they conclude different variables, since one study pointed to immune-enhancing effects, especially of Th1 and NK¹¹ cells, on tumor control while another study pointed to synergy with chemotherapy drugs in interrupting tumor migration¹². There was also a histoanatomical correlation of the effect of CD, so that astrocytes were pointed out as the main cellular target of CD with greater synaptic participation in the region of the striatum¹³. The interaction of CD with Bevacizumab has also been shown to be beneficial for prolonging survival¹⁴. Thus, classic CD was promising in 4 preclinical studies, each of which listed a particularly beneficial characteristic of the association with standard care.

Other diets are being studied to serve as an adjuvant treatment to the one already applied clinically, such as sHLFC. Basically, the theory of this diet is also based on Warburg's effect and the state of ketosis, but his suggestion is due to the fact that this diet is more nutritionally complete, more flexible and palatable, due to the implementation of proteins and supplementation with medium-chain triglycerides¹⁵. Following the hypoglycemic logic, the study also compares the effects of metformin - a drug that acts to reduce hepatic glucose production by inhibiting gluconeogenesis and glycogenolysis, increasing tissue sensitivity to

insulin and delaying intestinal glucose absorption¹⁶, when associated or not with CD and SHLFC, so that there was no synergistic effect between the measures¹⁵.

However, there is no consensus among preclinical studies about the synergy of carbohydrate-restricted diets, since 2 studies found adaptive mechanisms of GBM to decrease glucose availability^{17,18}. One of them evaluated the use of fatty acids as an energy substrate in 9L and RG2 tumor models and found values close to those of the human brain of oxidative metabolism made by tumors in vivo, demonstrating that tumors have a certain tumor flexibility capable of maintaining their mitotic rhythm. The authors comment on the difference in the time of insertion of tumor lines in mice, a factor that brings this study closer to reality, since patients do not start carbohydrate restriction immediately after the appearance of GBM, but after diagnosis, with a variable time that can take weeks to months¹⁷. The other study that points to the inefficacy of CD as an adjuvant therapy to the treatment of GBM denotes a decrease in tumor survival (of the U87 lineage, different from the tumor lines of the previous study) under the effect of a fatty acid oxidation inhibitor, with negative results in the survival rate of mice submitted to unrestricted CD, indicating the use of fatty acids for energy by GBM¹⁸.

4.2 CLINICAL STUDIES

Clinical studies do not seem as promising as preclinical studies in their main objective of prolonging patient survival, as well as revealing important limitations related to patient adherence to studies until their conclusion. Studies that use CD have high rates of patient dropout. A study involving 15 patients undergoing a 3:1 CO with 10 patients completing the study generated secondary conclusions to those initially proposed, since the survival rate was the same as that found in patients who did not undergo any intervention¹⁹. Similarly, another study involving the implementation of CD, initially liquid and after two weeks solid with medium-chain triglyceride emulsions, obtained a survival rate compatible with the expectations of patients who do not undergo any specific diet²⁰. In addition, another study with the implementation of the more classic CD following the 4:1 ratio, reached a mean survival rate of 12.8 months, with no increase in survival expectancy²¹.

In all the clinical studies cited, the number of patients who finish the research is very small, especially in a study in which only 3 patients completed the study²². In this case, the conclusions point to the perceptions related to patient dropouts, as all 4 articles^{19,20,21,22} qualify quality of life as a fundamental factor for patients and their families. As highlighted by

the clinical trials, GBM is considered an end-of-life certificate and most patients are not willing to spend their last days following an extremely restrictive diet that isolates them in their daily lives, making it impossible to socialize around a meal. In addition, the need for caregivers, partners or companions is a limiting factor for certain people who are unable to have a companion for all the necessary moments in their food preparation. Therefore, the applicability of CD is determined by the condition of the study or the patient in having aid for the preparation and maintenance of CD, as well as by the palatability offered by the diet. In addition, many patients reported intestinal discomfort, constipation, feeling hungry, nausea, vomiting and dizziness, although these symptoms may be caused by chemoradiation and by the pathological condition itself, and it is not possible to say with absolute certainty whether or not they are due to CD.

Another diet demonstrated greater adherence (96.6%) until the conclusion of the study in 29 patients. The Atkins diet involves a greater participation of proteins as an energy substrate and has greater palatability reported by patients, with the potential to generate ketosis, as well as CD. In this way, the study tries to correlate the survival of patients with a survival predictor: O⁶ methylguanine-DNA methyltransferase (MGMT), but the number of patients with survival analysis is small and makes percentage analysis difficult. Therefore, this diet is pointed out as promising for studies with a larger number of participants²³.

4.3 PUBLISHED REVIEWS

The reviews follow the trend of clinical studies to adjust the expectation about CD at a lower level in relation to the results of preclinical studies, as well as signal more flexible and applicable paths for implementing a diet that brings the patient's blood glucose to lower levels.

New variables were added in relation to *in vivo* studies, both the psychosocial factors related to patients following CD in a strict way, which directly impacts the motivation, discipline and need for strict guidance from a nutritionist, and the interaction with corticosteroids used in the treatment to reduce cerebral edema and reduce the symptoms of patients with consequent increase in blood glucose and decreased efficacy of CD in generating ketosis^{24 25}.

Although some associations are positive in *in vivo* studies, their reproduction is not recommended clinically in humans, as is the case with calorie restriction associated with CD in order to enhance ketosis. Since the review of preclinical studies and case reports²⁵

suggests this as a possibility to circumvent the effect of corticosteroids that, if withdrawn, impact a significant decrease in the quality of life of patients. However, another review, from 2018, states that body weight should be maintained, as weight loss and malnutrition in GBM patients are associated with a worse response to therapies, more adverse effects, complications, short mean survival, and poor quality of life. This suggests a concept of balance between the efficacy in generating ketosis and the feasibility of implementing dietary characteristics²⁶.

A review involving preclinical and clinical studies from 2020 traces the same trend already explained, because even though the survival rate was perceived in 17 of the 24 preclinical studies reviewed, the 4 clinical studies have great possibilities of bias. Thus, it is necessary to analyze the low number of patients followed, which makes it difficult to draw a percentage with a concrete reflection on reality. Also, the search of patients for various substances and alternative treatments in order to find a cure, which creates variables not analyzed in the studies. As well as the influence of corticosteroid therapy, implemented in standard treatment, which can decrease the effectiveness of CD in generating ketosis. Furthermore, the onset of CD is usually days or weeks after the diagnosis of GBM in real patients, unlike what is usually analyzed in preclinical studies that start CD at a time very close to tumor insertion. In addition, the guarantee of full follow-up of patients with CD is an important limiting factor, since many patients relate the diet to the side effects experienced during the treatment process and withdraw from the study²⁷.

Two reviews^{28, 29} are dedicated to clarifying the influence of hyperglycemia as an independent factor of poor prognosis for the survival rate in patients with GBM, even reducing by half the mean survival in patients from a cohort of 367 patients³⁰. Thus, not only CD but habits and diets with the potential to lower blood glucose could be suggested as protective factors for patients during treatment, and it is important to reduce carbohydrate intake, since the use of corticosteroids usually raises blood glucose, a fact that in patients who continue to eat high levels of carbohydrates can lead to recurrent hyperglycemia (determined as a risk factor for lower survival)^{28, 29}.

In general, preclinical studies determine more restrictive and rigid measures. On the other hand, clinical studies demonstrate the inapplicability of these measures due to a sum of factors added to the complexity of establishing in humans the same effects generated *in vivo* and *in vitro*, such as, for example, the need for a strong bond between researchers and patients to maximize patient motivation and the domestic support of a family member or friend

to help the patient overcome physical difficulties. cognitive and psychosocial aspects of the WBG. In this sense, a review tried to relate several dietary interventions already studied with the aim of generating ketosis with the use of the Warburg effect. Thus, unlike what some preclinical studies pointed to a classic, rigid CD with exact measurements of long-chain fatty acids and even a calorie deficit, clinical studies have seen more advantages in alternative diets such as diets with medium-chain triglyceride oil that provide more ketones per kilocalorie and enter the circulation more readily and the Atkins diet that is considered more flexible, applicable, palatable, and tolerable by patients with CD-like efficacy in generating ketosis. Thus, the concept cited by all reviews of balance between efficacy and viability is better contemplated by diets that are not necessarily CO³¹.

The search for a cure for GBM instigates patients to undergo several processes with or without scientific recognition and this is pointed out as a probable generator of bias in the reviews^{27,32}, but it also drives the research of several substances that could complement the standard treatment, such as penicillamine, vitamin A, vitamin C, selenium, boswellic acid oil and curcumin, which have studies on their therapeutic use in cases of GBM. However, until the publication of the present study, there were no studies that support the clinical use of these substances, so that there are ongoing studies to understand their mechanisms³¹.

4.4 STUDENT LEARNING

It is worth emphasizing, in addition to the better understanding related to the revised theme for the preparation of the study, the importance of the scientific initiation project for the critical sense and familiarity with scientific journals of the beneficiary, since it becomes increasingly necessary to critically read studies in the midst of so much circulating misinformation masked as science, especially in the field of medicine, who suffers daily attacks from those who do not understand the process of evidence-based analysis and continues to perpetuate bad practices, with consequent harm to their patients.

5 CONCLUSIONS

Most studies point to a positive interaction between the restriction of carbohydrate consumption and the standard treatment established for GBM, so that other diets, in addition to CD, have been gaining greater attention and have a promising future when it comes to applicability and efficacy in generating ketosis to induce the Warburg effect.

Preclinical studies, although without consensus^{17,18}, point to promising paths of CD

and alternatives, such as sHFLC¹⁵, as synergists to chemoradiation in the treatment of GBM. However, preclinical studies do not find support in clinical studies carried out so far for the increase in the survival rate^{19,20,21,222}, the main objective of dietary measurement, as well as variables increased in human studies not perceptible in *in vitro* and *in vivo studies*, as the psychosocial factors linked to the maintenance of patients in the studies, had a decisive weight in the high dropout rate of the studies that did not allow an absolute analysis of the results. In addition, review studies reject the idea of calorie restriction proposed by some preclinical studies in patients with a consumptive syndrome, since weight loss is related to worse prognosis and higher chances of complications in patients with GBM^{32,33}.

In this scenario, one of the most cited variables in the review studies, as it was present in all the clinical studies analyzed, is quality of life. It was noticed that the efficiency of the diets should be linked to their potential for application, so that more restrictive diets with recipes that are difficult to prepare had a higher number of dropouts in their studies, while the Atkins diet (considered a more flexible and palatable diet) obtained good numbers regarding the number of patients who finished the study and state of ketosis during the process. The presence of a friend, family member or partner was decisive for the completion of the diets and maintenance of the patients' motivation, being a characteristic listed with a decisive role in the quality of life of the patients^{20,22}.

That said, the mechanisms established as beneficial need further studies for complete elucidation, since not only the state of ketosis proved to be adjuvant to the standard treatment, but also the maintenance of euglycemia in patients implies a higher survival rate when compared to patients with recurrent hyperglycemia. Thus, a diet that contributes less to the increase in blood glucose (already caused by the effect of corticosteroid therapy implicit in the treatment and responsible for improving the quality of life of patients during the process) is necessary as a prophylactic measure for the recurrent increase in blood glucose in these patients^{28, 29}.

Nevertheless, this is a literature review with its limitations, which implies the need for larger studies, with more refined methodologies in order to determine with certainty and/or recommend carbohydrate-restricted diets for the adjunct treatment of GBM.

ABSTRACT

Introduction: Sternal suture dehiscence represents a serious complication after cardiac surgery, with an incidence ranging from 0.5% to 5% of median sternotomy procedures. This condition is associated with high morbidity and mortality rates, often requiring reconstructive surgical intervention. Muscle flaps, particularly the pectoralis major and rectus abdominis, constitute fundamental therapeutic options for the definitive treatment of this complication.

Objective: To conduct a systematic review of the literature on the use of muscle flaps in the reconstruction of mediastinal suture dehiscence after cardiac surgery, with emphasis on pectoralis major and rectus abdominis flaps, analyzing indications, surgical techniques, outcomes, and complications.

Methodology: Systematic literature review in PubMed, MEDLINE, Scopus, Web of Science, and LILACS databases, including articles published between 2010 and 2024. Studies addressing sternal dehiscence reconstruction with muscle flaps were selected, focusing on pectoralis major and rectus abdominis. The analysis included data on epidemiology, risk factors, surgical techniques, success rates, and complications.

Results: The literature demonstrates that pectoralis major flaps present success rates between 85-95%, being the first choice for anterior and lateral mediastinal defects. The rectus abdominis flap, with success rates of 80-92%, is indicated for extensive defects of the lower third of the sternum. Significant risk factors include diabetes mellitus, obesity, bilateral use of internal mammary artery, COPD, and deep infection. Mortality associated with mediastinitis ranges from 10% to 47% in recent literature.

Orcid: 0000-0002-0133-4841

Conclusion: Pectoralis major and rectus abdominis flaps represent effective and safe reconstructive options for treating sternal suture dehiscence. Flap selection should consider the location and extent of the defect, patient clinical conditions, and surgical team experience. Multidisciplinary approach and early treatment are fundamental for reducing morbidity and mortality. A systematized safety algorithm is proposed to optimize the management of this complication.

RESUMO

Introdução: A deiscência de sutura esternal representa uma complicação grave após cirurgia cardíaca, com incidência variando entre 0,5% a 5% dos procedimentos que envolvem esternotomia mediana. Esta condição está associada a elevadas taxas de morbidade e mortalidade, exigindo frequentemente intervenção cirúrgica reconstrutiva. Os retalhos musculares, particularmente usando peitoral maior e reto abdominal, constituem opções terapêuticas fundamentais para o tratamento definitivo desta complicação.

Objetivo: Realizar uma revisão sistemática da literatura sobre o uso de retalhos musculares na reconstrução de deiscência de sutura mediastinal pós-cirurgia cardíaca, com ênfase nos retalhos de peitoral maior e reto abdominal, analisando indicações, técnicas cirúrgicas, resultados e complicações.

Metodologia: Revisão sistemática da literatura nas bases de dados PubMed, MEDLINE, Scopus, Web of Science e LILACS, com base em artigos publicados entre os anos de 2010 e 2024. Foram selecionados estudos que abordam reconstrução de deiscência esternal com retalhos musculares, com foco em peitoral maior e reto abdominal. A análise incluiu dados sobre epidemiologia, fatores de risco, técnicas cirúrgicas, taxas de sucesso e complicações.

Resultados: A literatura demonstra que os retalhos de peitoral maior apresentam taxas de sucesso entre 85-95%, sendo a primeira escolha para defeitos anteriores e laterais do mediastino. O retalho de reto abdominal, com taxas de sucesso de 80-92%, é indicado para defeitos extensos do terço inferior do esterno. Fatores de risco significativos incluem diabetes mellitus, obesidade, uso bilateral de artéria mamária interna, DPOC e infecção profunda. A mortalidade associada à mediastinite varia de 10% a 47% na literatura recente.

Conclusão: Os retalhos de peitoral maior e reto abdominal são opções reconstrutivas eficazes e seguras para tratamento de deiscência de sutura esternal. A escolha do retalho deve considerar a localização e extensão do defeito, condições clínicas do paciente e experiência da equipe cirúrgica. A abordagem multidisciplinar e o tratamento precoce são fundamentais para redução da morbimortalidade. Um algoritmo de segurança sistematizado é proposto para otimizar o manejo desta complicação.

Palavras-chave: Mediastinite. Osteomielite do Esterno. Deiscência de Sutura Esternal. Retalhos Cirúrgicos. Músculo Peitoral Maior. Músculo Reto Abdominal. Cirurgia Cardíaca. Esternotomia Mediana.

RESUMEN

Introducción: La dehiscencia de la sutura esternal representa una complicación grave después de la cirugía cardíaca, con una incidencia que varía del 0,5% al 5% de los

procedimientos que involucran esternotomía media. Esta condición se asocia con altas tasas de morbilidad y mortalidad, requiriendo con frecuencia intervención quirúrgica reconstructiva. Los colgajos musculares, particularmente utilizando el pectoral mayor y el recto abdominal, son opciones terapéuticas fundamentales para el tratamiento definitivo de esta complicación.

Objetivo: Realizar una revisión sistemática de la literatura sobre el uso de colgajos musculares en la reconstrucción de la dehiscencia de la sutura mediastínica después de la cirugía cardíaca, con énfasis en los colgajos de pectoral mayor y recto abdominal, analizando las indicaciones, las técnicas quirúrgicas, los resultados y las complicaciones.

Metodología: Revisión sistemática de la literatura en las bases de datos PubMed, MEDLINE, Scopus, Web of Science y LILACS, basada en artículos publicados entre 2010 y 2024. Se seleccionaron estudios que abordaron la reconstrucción de la dehiscencia esternal con colgajos musculares, centrándose en el pectoral mayor y el recto abdominal. El análisis incluyó datos sobre epidemiología, factores de riesgo, técnicas quirúrgicas, tasas de éxito y complicaciones.

Resultados: La literatura demuestra que los colgajos de pectoral mayor tienen tasas de éxito entre 85-95%, siendo la primera opción para defectos mediastínicos anteriores y laterales. El colgajo de recto abdominal, con tasas de éxito de 80-92%, está indicado para defectos extensos del tercio inferior del esternón. Los factores de riesgo significativos incluyen diabetes mellitus, obesidad, uso bilateral de la arteria mamaria interna, EPOC e infección profunda. La mortalidad asociada con mediastinitis varía de 10% a 47% en la literatura reciente.

Conclusión: Los colgajos de pectoral mayor y recto abdominal son opciones reconstructivas efectivas y seguras para el tratamiento de la dehiscencia de la sutura esternal. La elección del colgajo debe considerar la ubicación y extensión del defecto, la condición clínica del paciente y la experiencia del equipo quirúrgico. Un enfoque multidisciplinario y el tratamiento temprano son fundamentales para reducir la morbilidad y la mortalidad. Se propone un algoritmo de seguridad sistematizado para optimizar el manejo de esta complicación.

1 INTRODUCTION

The median sternotomy is the most used access route in cardiac surgery, providing excellent exposure of the mediastinal structures and allowing the performance of various cardiovascular procedures. Despite advances in surgical, anesthetic, and perioperative care techniques, sternal suture dehiscence and mediastinitis remain serious and potentially fatal complications in the postoperative period of cardiac surgeries. [1,2,3]

The incidence of sternal dehiscence varies between 0.5% and 5% of procedures involving median sternotomy, and may reach higher rates in high-risk populations. [4,5,6] When associated with deep infection (mediastinitis), mortality can reach 10% to 47%, depending on the severity of the condition, patient comorbidities, and time until definitive treatment. [7,8,9] In addition to the impact on mortality, these complications result in a significant increase in morbidity, prolongation of hospital stay, increased treatment costs, and impairment of patients' quality of life. [10,11]

The pathophysiology of sternal dehiscence is multifactorial, involving factors related to the patient (diabetes mellitus, obesity, chronic obstructive pulmonary disease, smoking, use of corticosteroids), surgical technique (bilateral use of the internal mammary artery, inadequate sternal closure technique, prolonged surgical time), and postoperative period (infection, hemodynamic instability, need for reoperation, prolonged mechanical ventilation, cough, among others). [12,13,14]

The treatment of mediastinal suture dehiscence has evolved significantly in recent decades. Initially, management consisted of debridement, irrigation, and primary closure, with often unsatisfactory results and high recurrence rates. [15] From the 1960s onwards, with the pioneering work of Jurkiewicz et al., the use of vascularized muscle flaps revolutionized the treatment of this condition, providing adequate coverage of the mediastinum, obliteration of the dead space, improvement of local blood supply, and significant reduction in recurrence and mortality rates. [1,13,15]

Among the muscle flap options available, techniques involving the pectoralis major and rectus abdominis stand out as the most frequent choices, due to their reliability, versatility, favorable vascular anatomy, and proximity to the area to be reconstructed. [16,17,21] The pectoralis major flap, first described by Jurkiewicz in 1963, has become the gold standard for reconstruction of upper and middle sternal defects, while the rectus abdominis flap, popularized by Nahai et al. in 1982, is particularly useful for extensive and lower third sternal defects. [22,25,26]

The choice of the appropriate flap should consider multiple factors, including the location and extent of the defect, the presence of active infection, the patient's nutritional and clinical status, previous surgeries in the thoracic or abdominal region, and the experience of the surgical team. [23,27] The multidisciplinary approach, involving cardiac surgeons, plastic surgeons, infectious disease specialists, and intensive care staff, is critical to successful treatment. [9,28]

Despite the vast literature on the subject, there are still controversies regarding the ideal time of intervention, the choice of the most appropriate flap for each clinical situation, the role of negative pressure therapy as an adjuvant or bridge to definitive reconstruction, and antibiotic therapy protocols. [12,29,30] In addition, the heterogeneity of published studies, with different definitions of mediastinitis, varied inclusion criteria, and inconsistent follow-up, makes it difficult to compare results and develop robust evidence-based guidelines.

In this context, the present systematic review aims to critically analyze the scientific literature on the use of muscle flaps, with emphasis on pectoralis major and rectus abdominis flaps, in the reconstruction of sternal suture dehiscence after cardiac surgery. It seeks to consolidate the available evidence on indications, surgical techniques, outcomes, complications, and prognostic factors, providing subsidies for clinical decision-making and identifying gaps in knowledge that can guide future research.

2 METHODOLOGY

2.1 SEARCH STRATEGY

This systematic review was conducted following the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) guidelines. The bibliographic search was carried out in the following electronic databases: PubMed/MEDLINE, Scopus, Web of Science, Cochrane Library and LILACS (Latin American and Caribbean Literature on Health Sciences).

The search period included articles published between January 2010 and October 2024, with the aim of capturing the most recent and relevant literature on the topic. The search strategy was developed using MeSH terms and related keywords, combined with Boolean operators.

The search terms used included: "mediastinitis" OR "sternal dehiscence" OR "sternal wound infection" OR "deep sternal wound infection" AND "surgical flaps" OR "muscle flaps"

OR "pectoralis major" OR "rectus abdominis" OR "reconstruction" AND "cardiac surgery" OR "sternotomy" OR "coronary artery bypass".

2.2 ELIGIBILITY CRITERIA

2.2.1 Inclusion Criteria:

- Original studies (case series, cohort studies, case-control studies, clinical trials)
- Systematic review articles and meta-analyses
- Publications in English, Portuguese or Spanish
- Studies involving adult patients (≥ 18 years)
- Approach to reconstruction of sternal dehiscence or mediastinitis with muscle flaps
- Description of surgical technique, results or complications
- Focus on pectoralis major and/or rectus abdominis flaps

2.2.2 Exclusion Criteria:

- Isolated case reports (less than 3 cases)
- Studies in the paediatric population exclusively
- Articles without original data (editorials, letters to the editor, comments)
- Studies with incomplete data or inadequate methodology
- Duplicate posts
- Studies focused exclusively on other reconstructive options (omentum, latissimus dorsi) without mentioning pectoralis major or rectus abdominis

2.3 SELECTION OF STUDIES

Study selection was carried out in two stages by two independent reviewers. Initially, we were screened by titles and abstracts, excluding articles clearly unrelated to the theme. In the second stage, potentially eligible articles were read in full for evaluation of the inclusion and exclusion criteria. Disagreements among the reviewers were resolved by consensus or by consulting a third reviewer.

2.4 DATA EXTRACTION

Data were extracted in a standardized way using a specific form, including the following information: study characteristics (author, year, country, study design, sample size), patient characteristics (age, gender, comorbidities, type of cardiac surgery), definition of

mediastinitis or sternal dehiscence used, risk factors identified, type of flap used (pectoralis major, rectus abdominis, bilateral, unilateral), surgical technique described, time between cardiac surgery and reconstruction, use of adjuvant therapy (negative pressure, antibiotic therapy), results (success rate, length of hospital stay, mortality), complications (recurrence, flap necrosis, infection, seroma, hematoma), and follow-up time.

2.5 EVALUATION OF THE QUALITY OF STUDIES

The methodological quality of the included studies was assessed using appropriate tools for each type of study design: Newcastle-Ottawa Scale for observational studies, Cochrane Risk of Bias Tool for randomised controlled trials, and AMSTAR-2 for systematic reviews.

2.6 SUMMARY OF THE DATA

Due to the heterogeneity of the included studies (different definitions, populations, surgical techniques, and outcomes), we chose to perform a narrative synthesis of the data, with a descriptive presentation of the main findings. When possible, aggregate success, complication, and mortality rates were calculated.

2.7 MICROBIOLOGY AND DIAGNOSIS

The microbiology of post-sternotomy mediastinitis is predominantly bacterial, with *Staphylococcus aureus* (including methicillin-resistant strains - MRSA) being the most frequently isolated pathogen, accounting for 30-50% of cases. [8,9] Coagulase-negative *Staphylococcus* accounts for 15-30% of cases, followed by gram-negative bacilli (*Escherichia coli*, *Klebsiella*, *Pseudomonas*) in 15-25% and polymicrobial infections in 10-20% of cases.

The diagnosis of mediastinitis is based on clinical, laboratory, and imaging criteria. [3,8,9] The most commonly used diagnostic criteria include sternal instability on palpation, purulent drainage through the sternal wound, persistent fever ($>38^{\circ}\text{C}$) after the 5th postoperative day, persistent or recurrent leukocytosis, disproportionate sternal pain, and signs of local inflammation (erythema, edema, heat).

Among the laboratory criteria, persistent elevation of inflammatory markers (CRP, ESR, procalcitonin), positive culture of sternal or mediastinal secretion, and positive blood culture with a compatible pathogen stand out. [9,12] Imaging criteria include CT scan showing

mediastinal fluid collection, gas in the mediastinum after 2 weeks postoperatively, soft tissue enhancement, and sternal osteomyelitis. [3,8]

The temporal classification of mediastinitis is clinically relevant: early (up to 2 weeks after surgery, usually related to intraoperative contamination) and late (after 2 weeks, usually related to bacteremia or secondary contamination). [3,27]

2.8 PRINCIPLES OF PROCESSING

The treatment of mediastinal suture dehiscence and mediastinitis requires a multidisciplinary and aggressive approach. [9,13,15] The fundamental principles include:

- **Surgical Debridement:** Complete removal of all necrotic, devitalized, or infected tissue, including compromised sternal bone, necrotic costal cartilages, and devitalized soft tissues.[13,15,26] Debridement should be radical and repeated as many times as necessary until viable and well-vascularized tissue is obtained.
- **Infection Control:** Broad-spectrum antibiotic therapy initially, adjusted according to culture and antibiogram results.[5,9] The duration of antibiotic treatment varies from 4 to 6 weeks, depending on the severity of the infection and clinical response.
- **Sternal Stabilization:** When possible, maintenance or restoration of sternal stability through rigid fixation with plates and screws, especially in cases of dehiscence without significant infection.[16:18]
- **Dead Space Obliteration:** Filling of the mediastinal defect with vascularized tissue (muscle flaps) to obliterate the dead space, improve local blood supply, and facilitate healing.[1,13,15,21]

The timing of the definitive reconstruction is controversial in the literature. Traditionally, late reconstruction after complete control of the infection was advocated. However, more recent studies have shown that early reconstruction (within 7-14 days of diagnosis) is associated with better outcomes, shorter hospital stays, and reduced mortality. [13,15,27,28]

Vacuum-Assisted Closure (VAC) therapy has been used as an adjunct to treatment, either as a bridge to definitive reconstruction or as primary therapy in selected cases. [12,29,30] Studies have shown that VAC promotes edema reduction, exudate removal, stimulation of granulation tissue formation, and reduction of bacterial load. However, its use alone without definitive reconstruction is associated with higher recurrence rates.

2.9 PECTORALIS MAJOR FLAP

The pectoralis major flap represents the most widely used reconstructive option for the treatment of sternal dehiscence and mediastinitis, and is considered the gold standard for defects of the upper and middle third of the sternum. [1,13,17,21]

2.9.1 Anatomy and Vascularization

The pectoralis major muscle is a broad, flat muscle that forms the anterior wall of the armpit and most of the anterior contour of the chest. [21,24] It originates from the clavicle (clavicular portion), the sternum and costal cartilages (esternocostal portion) and the aponeurosis of the external oblique muscle (abdominal portion), inserting into the lateral lip of the intertubercular groove of the humerus.

The vascularization of the pectoralis major muscle is twofold, originating from the thoracoacromial artery (dominant pedicle, branch of the axillary artery, penetrates the muscle in its superior portion), lateral thoracic artery (branch of the axillary artery, provides additional supply to the lateral portion) and perforating the internal mammary artery (provides supply to the medial portion, often compromised in cardiac surgery). [20,21,24]

Figure 1

Vascular Anatomy of the Thoracoacromial Artery

Source: José Dalvo Maia Neto Created BioRender

2.9.2 Surgical Technique

The pectoralis major flap can be performed unilaterally or bilaterally, depending on the extent of the defect. [17,21,22] The standard technique includes: (1) Incision with extension of the median incision or creation of lateral incisions for adequate exposure; (2) Dissection identifying the limits of the muscle, initiated laterally in the deltopectoral sulcus, preserving the cephalic vein, with detachment of its sternal and costal origin, preserving the superior thoracoacromial pedicle; (3) Medial transposition over the sternal defect, with midline suture in bilateral cases; (4) Fixation to the remaining sternum, costal cartilages, or adjacent tissues with absorbable sutures; (5) Closure with proper drainage and tension-free skin closure. [17,21,22]

Figure 2

Schematic drawing of the Pectoral flap

Source: José Dalvo Maia Neto created BioRender

2.9.3 Indications

Upper and middle sternal defects, mediastinitis after median sternotomy, sternal dehiscence without significant infection, sternal osteomyelitis, and exposure of cardiovascular structures. [13,17,21,23]

2.9.4 Results

The literature shows success rates for the pectoralis major flap ranging from 85% to 95%. [13,15,17,21] Primary success rate of 85-95%, mortality of 5-15%, infection recurrence of 5-10%, and need for reintervention of 10-20%.

2.9.5 Complications

Partial flap necrosis (3-8%), seroma (10-15%), hematoma (5-10%), recurrent infection (5-10%), functional deficit of the upper limb (rare, usually minimal), and variable aesthetic deformity, usually well tolerated. [17,21,23]

2.10 RECTUS ABDOMINIS FLAP

The rectus abdominis flap represents an excellent reconstructive option for extensive sternal defects, particularly of the lower third, and in situations where the pectoralis major flap is not available or insufficient. [22,23,25,26]

2.10.1 Anatomy and Vascularization

The rectus abdominis muscle is a long, flat muscle that extends from the xiphoid process and costal cartilages 5-7 to the pubic symphysis. [24,25] It is surrounded by the rectus abdominis sheath and has tendon intersections that divide it into segments. Vascularization originates from the superior epigastric artery (branch of the internal thoracic artery, vascular pedicle for the superior pedicled flap), inferior epigastric artery (branch of the external iliac artery), and intercostal and lumbar arteries (provide additional supply through perforators). [24,25]

Figure 3

Vascular Anatomy of the Superior Epigastric Artery

Source: José Dalvo Maia Neto created BioRender

2.10.2 Surgical Technique

The rectus abdominis flap for sternal reconstruction is typically performed as a superior pedicled flap, based on the superior epigastric artery. [22,25,26] The technique includes: (1) Vertical or paramedian incision over the muscle, from the costal margin to the infraumbilical region; (2) Dissection with opening of the anterior sheath and dissection of the muscle of its posterior sheath or peritoneum, from inferior to superior, connecting the inferior epigastric pedicle; (3) Complete mobilization preserving the superior epigastric pedicle, which may include adjacent costal cartilage; (4) Superior transposition through the subcutaneous tunnel to the sternal defect; (5) Attachment to the sternum, cartilage or adjacent tissues; (6) Abdominal closure of the anterior sheath with nonabsorbable sutures, with the possible use of prosthetic mesh in significant defects; (7) Proper drainage and skin closure without tension. [22,25,26]

Figure 4

Schematic drawing of the V.R.A.M. Retail

Source: created by José Dalvo Maia Neto with BioRender

2.10.3 Indications

Extensive defects of the sternum (particularly lower third), failure or unavailability of the pectoralis major flap, defects extending to the xiphoid process or epigastric region, need for large tissue volume, and reconstruction after extensive tumor resection. [23,25,26]

2.10.4 Results

The literature shows success rates for the rectus abdominis flap ranging from 80% to 92%: primary success rate of 80-92%, mortality of 8-18%, recurrence of infection of 8-15%, and need for reintervention of 15-25%. [25,26,27]

2.10.5 Complications

Partial necrosis of the flap (5-12%), seroma (15-25%), hematoma (8-15%), recurrent infection (8-15%), abdominal hernia (5-15%, specific complication of the donor site), abdominal wall weakness (20-30%), and variable abdominal aesthetic deformity. [23,25,26]

2.11 COMPARISON BETWEEN FLAPS

The choice between pectoralis major flap and rectus abdominis must consider multiple factors. [23] For the localization of the defect, the pectoralis major is preferable for the upper and middle third of the sternum, while the rectus abdominis is more suitable for the lower third and xiphoid region. [21,25] For small to moderate defects, unilateral pectoralis major is usually sufficient, while extensive defects require bilateral pectoralis major or rectus abdominis. [17,23]

Bilateral use of the internal mammary artery may compromise both flaps, but generally the pectoralis major remains viable. [19,20] Regarding the morbidity of the donor site, the pectoralis major has lower morbidity and minimal functional deficit, while the rectus abdominis has higher morbidity with risk of hernia and abdominal weakness. [23,25] The success rate of pectoralis major is slightly higher (85–95% vs 80–92%). [13,15,17,21,25,26] Technically, the pectoralis major is simpler with less surgical time, while the rectus abdominis is more complex and requires careful abdominal closure. [23]

Table 1

Results of Surgical Interventions with Muscle Flaps

Retail Type	No of Cases	Success Rate (%)	Complications (%)	Mortality (%)	Hospitalization time (days)
Unilateral Greater Pectoralis	145-320	85-95	10-15	5-10	18-25
Bilateral Pectoralis Major	80-180	88-96	12-18	8-12	20-28
Unilateral Rectus Abdominis	65-150	80-90	15-25	10-15	22-30
Bilateral Rectus Abdominis	25-60	82-92	18-28	12-18	25-35
Patchwork Combination	15-45	78-88	20-32	15-20	28-40

Source: Compilation of data from the reviewed literature (2010-2024).

Table 2

Comparison between Pectoralis Major and Rectus Abdominis Flaps

Feature	Pectoralis Major	Rectus Abdominis
Main Indication	Upper and middle third defects	Lower third and extensive defects
Success Rate	85-95%	80-92%
Technical Complexity	Low to moderate	Moderate to high
Surgical Time	120-180 minutes	180-240 minutes

Morbidity Donor Site	Low (5-10%)	Moderate to high (15-25%)
Functional Deficit	Minimum (<5%)	Moderate (20-30%)
Risk of Hernia	Not applicable	Yes (5-15%)
Tissue Volume	Moderate	Large
Arc of Rotation	Excellent	Good
Impact on Prior Surgery	Moderate (bilateral AML)	Alto (abdominal surgery)
Aesthetic Deformity	Mild to moderate	Moderate to severe
Preference for Bilateral	First choice	Second choice

3 DISCUSSION

Sternal suture dehiscence and post-sternotomy mediastinitis continue to pose significant challenges in contemporary cardiac surgery, despite advances in surgical techniques, perioperative care, and antibiotic therapy. [1,9] This systematic review consolidates the current evidence on the use of muscle flaps, particularly pectoralis major and rectus abdominis, demonstrating that these reconstructive options constitute the gold standard for the definitive treatment of this serious complication.

The analysis of the literature reveals that, although the incidence of sternal dehiscence has remained relatively stable in recent decades (0.5-5%), the associated mortality has shown a significant reduction, from approximately 50% in the 1970s-1980s to 10-20% in the most recent studies. [6,7,8,11,27] This improvement in outcomes can be attributed to multiple factors: early recognition of the complication, multidisciplinary approach, more aggressive debridement, early reconstruction with vascularized muscle flaps, targeted antibiotic therapy, and better intensive care. [9,13,15,28]

The pectoralis major flap emerged as the most used and studied reconstructive option, with consistently high success rates (85-95%) in multiple series. [13,15,17,21] Its advantages include reliable vascular anatomy, proximity to the defect, relative technical ease, low morbidity of the donor site, and the possibility of bilateral performance for extensive defects. Preservation of the thoracoacromial pedicle is critical to flap viability, and the surgical technique should emphasize careful dissection and vascular preservation. [21,24]

A relevant issue in the literature is the impact of bilateral use of the internal mammary artery on the viability of the pectoralis major flap. Traditionally, it was considered that bilateral use would significantly compromise the vascularization of the muscle, making it unsuitable for reconstruction. [19] However, more recent anatomical and clinical studies have shown that, although there is a reduction in medial blood supply, the dominant thoracoacromial pedicle generally maintains adequate vascularization for most of the muscle. [20,21]

The rectus abdominis flap, although less widely used than the pectoralis major, represents a valuable option, particularly for defects of the lower third of the sternum, extensive defects, or when the pectoralis major is not available. [23,25,26] Reported success rates (80-92%) are slightly lower than those of pectoralis major, possibly due to greater technical complexity, greater dissection extension, and selection of more complex cases.

The timing of the definitive reconstruction is a controversial aspect in the literature. Historically, late reconstruction was advocated after complete control of the infection. [15] However, more recent studies have shown that early reconstruction (within 7-14 days of diagnosis) is associated with better outcomes, shorter hospital stays, and reduced mortality. [13,27,28]

Negative pressure therapy (VAC) has been increasingly used in the management of sternal dehiscence and mediastinitis. [12,29,30] Its role can be as a primary therapy, as a bridge to definitive reconstruction, or as a post-reconstruction adjuvant. The literature shows that VAC promotes edema reduction, exudate removal, stimulation of granulation tissue formation, and reduction of bacterial load. However, studies indicate that isolated use without definitive reconstruction is associated with higher recurrence rates. [29,30]

The identification of risk factors and the implementation of preventive strategies are essential to reduce the incidence of this complication. [5,9,10,11] Evidence-based prevention protocols include: strict perioperative blood glucose control, judicious use of bilateral internal mammary artery with preference for skeletonization techniques, adequate sternal closure technique, adequate skin preparation, appropriate antibiotic prophylaxis, and optimized management of comorbidities.

The multidisciplinary approach is essential for successful treatment. The collaboration between cardiac surgeons, plastic surgeons, infectious disease specialists, intensivists, nutritionists and physiotherapists allows for integrated and optimized management. [9,13,27,28]

4 CONCLUSION

Sternal suture dehiscence and post-sternotomy mediastinitis represent serious complications that require early recognition and aggressive multidisciplinary treatment. The present systematic review of the literature demonstrates that pectoralis major and rectus abdominis muscle flaps are effective, safe, and reliable reconstructive options, with success rates between 80-95% and reduced mortality when compared to historical approaches.

4.1 SUMMARY OF THE EVIDENCE

The contemporary scientific literature extensively deals with post-dehiscence reconstructions of sternal sutures, consolidating robust evidence on various aspects of this complication. Studies consistently demonstrate that the pectoralis major flap remains the first choice for defects of the upper and middle third of the sternum, presenting significant advantages in terms of technical simplicity, shorter surgical time, reliable vascular anatomy, and reduced morbidity of the donor site. The rectus abdominis flap, in turn, is reserved for specific situations such as extensive defects of the lower third, unavailability of the pectoralis major, or the need for greater tissue volume.

The temporal evolution of the treatment of this complication reflects significant advances in pathophysiological and technical knowledge. The transition from conservative approaches with debridement and primary closure to early reconstructions with vascularized flaps has resulted in a dramatic reduction in mortality, from approximately 50% to 10-20% in recent decades. This progress highlights the importance of early definitive treatment, adequate obliteration of dead space, and restoration of local blood supply through vascularized tissue.

The identification and stratification of risk factors remain fundamental for prevention and proper management. Diabetes mellitus, obesity, bilateral internal mammary artery use, COPD, smoking, and reoperation due to bleeding consistently emerge as independent predictive factors of sternal complications. Perioperative optimization of these modifiable factors, particularly strict glycemic control, represents an essential preventive strategy.

4.2 POST-STERNAL DEHISCENCE SAFETY AND RESCUE ALGORITHM

Based on the critical analysis of the literature and the best available evidence, a systematized safety algorithm is proposed for the management of patients with sternal suture dehiscence after cardiac surgery. This protocol aims to standardize the approach, minimize delays in definitive treatment, and optimize clinical outcomes:

4.2.1 Phase 1: Early Recognition and Diagnosis (0-24 Hours)

- Active surveillance for warning signs: sternal instability on palpation, purulent drainage, persistent fever ($>38^{\circ}\text{C}$ after day 5), recurrent leukocytosis, disproportionate sternal pain
- Daily physical examination with systematic sternal palpation

- Monitoring of inflammatory markers (CRP, leukocytes, procalcitonin)
- Collection of cultures (sternal discharge, blood culture) at the slightest sign of infection
- Contrast-enhanced chest CT scan in suspected cases (assess collection, mediastinal gas, osteomyelitis)

4.2.2 Phase 2: Multidisciplinary Stratification and Activation (24-48 Hours)

- Once the diagnosis is confirmed, IMMEDIATELY call a multidisciplinary team: cardiac surgeon, plastic surgeon, infectious disease specialist, intensivist
- Stratify severity: Type I (superficial dehiscence without deep infection), Type II (dehiscence with instability but no overt infection), Type III (mediastinitis with instability and active infection)
- Initiate empiric broad-spectrum antibiotic therapy: vancomycin + piperacillin-tazobactam (adjust after cultures)
- Clinical optimization: tight glycemic control (blood glucose 120-180 mg/dL), nutritional support, correction of anemia and fluid and electrolyte disturbances
- Joint surgical planning between cardiac and plastic surgery: define timing, flap type, need for transient VAC

4.2.3 Phase 3: Aggressive surgical debridement (48-72 hours)

- Early surgical approach (ideally within 48-72h of definitive diagnosis)
- Radical debridement: remove ALL necrotic, devitalized, or frankly infected tissue
- Resection of compromised sternal bone, necrotic costal cartilages, and devitalized soft tissues
- Removal of steel wires if there is deep infection or osteomyelitis
- Copious irrigation with saline solution (minimum 6-9 liters)
- Collection of multiple cultures (bone, deep tissue, secretion)
- Intraoperative evaluation of defect extent and reconstruction planning
- Options: (a) Immediate reconstruction if the bed is clean and the patient is stable; (b) Temporary VAC if significant contamination, wait 48-72h for second time

4.2.4 Phase 4: Definitive Reconstruction with Muscle Flap (3-14 Days)

- Ideal timing: early reconstruction (7-14 days) associated with better outcomes

- Retail selection based on decision-making algorithm:
- → Upper/middle third defect + stable patient = Unilateral Pectoralis Major
- → Extensive Upper Thirds/Middle Defect = Bilateral Pectoralis Major
- → Lower third/xiphoid defect = unilateral rectus abdominis
- → Extensive Defect Entire Sternum = Combination or Bilateral
- → Pectoralis Major or Unavailable Failure = Rectus Abdominis
- Rigorous surgical technique: preservation of the dominant vascular pedicle, tension-free transposition, complete dead space obliteration
- Proper attachment of the muscle to adjacent tissues
- Efficient drainage (suction drains)
- Tension-free skin closure

4.2.5 Phase 5: Post-reconstruction management and follow-up

- Prolonged antibiotic therapy: minimum 4-6 weeks (adjusted for cultures and clinical course)
- Close monitoring for signs of residual or recurrent infection
- Drain management: maintain up to <30 mL/24h
- Surgical wound care: occlusive dressing, avoid excessive manipulation
- Relative chest immobilization: avoid sudden upper extremity movements in the first 2 weeks
- Optimized nutritional support: albumin >3.0 g/dL, positive nitrogen balance
- Gradual respiratory physiotherapy, avoiding high-impact maneuvers initially
- Tight glycemic control maintained
- Outpatient follow-up: 7 days, 14 days, 30 days, 90 days, and 6 months
- Flap viability assessment, infection recurrence, affected limb function, quality of life

Figure 5

5-phase external dehiscence treatment algorithm, safety and rescue protocol for post-cardiac surgery management

5 FINAL CONSIDERATIONS

The implementation of this security algorithm requires adequate infrastructure, trained staff, and efficient communication between the specialties involved. Centers that perform highly complex cardiac surgery must establish clear institutional protocols, with care flowcharts, criteria for activating the multidisciplinary team, and measurable quality indicators.

The continuing education of care teams, including nursing and physiotherapy, is essential for the early recognition of warning signs and timely implementation of rescue measures. Audit programs and systematic feedback of institutional results allow the identification of opportunities for improvement and continuous refinement of protocols.

In summary, sternal suture dehiscence and post-sternotomy mediastinitis, although potentially devastating complications, can be successfully managed when approached in a

systematized, early and multidisciplinary manner. The pectoralis major and rectus abdominis muscle flaps represent consolidated and effective reconstructive tools. The proposed safety algorithm provides a structured roadmap for optimizing care, with the potential to significantly reduce the morbidity and mortality associated with this severe complication of cardiovascular surgery.

ABSTRACT

The present study employs geoprocessing techniques, automated interpretation using Artificial Intelligence (AI), and historical aerial images to assess urban expansion and the suppression of vegetated areas in the municipality of Assis (São Paulo State, Brazil) between 1960 and 2025. The images were georeferenced and digitized, generating tables that quantify changes in land use over time. AI was applied to the interpretative analysis of these data, enabling the identification of patterns of urban growth, vegetation fragmentation, and environmental changes across decades. An increase in built-up areas and a progressive reduction in vegetation cover were observed, highlighting anthropogenic pressure on local ecosystems. This approach stands out for its low operational cost, since, after obtaining aerial images—often freely available in public databases—the processing and analysis stages are carried out quickly and efficiently. This characteristic assigns geoprocessing a strategic role in territorial management and sustainable urban planning, allowing public managers to understand urban growth dynamics with precision and agility, supporting environmental and land-use policies. The integration of geoprocessing and Artificial Intelligence proved to be an indispensable tool for monitoring spatial transformations, providing real-time environmental diagnostics, and guiding evidence-based decision-making.

RESUMO

O presente estudo utiliza técnicas de geoprocessamento, interpretação automatizada por Inteligência Artificial (IA) e imagens aéreas históricas para avaliar a expansão urbana e a supressão de áreas vegetais no município de Assis (SP) entre os anos de 1960 e 2025. As imagens foram georreferenciadas e digitalizadas, gerando tabelas que quantificam a evolução da ocupação do solo. A IA foi empregada na análise interpretativa desses dados, permitindo identificar padrões do crescimento urbano, fragmentação da vegetação e alterações ambientais ao longo das décadas. Observou-se um aumento das áreas construídas e uma redução progressiva da cobertura vegetal, evidenciando a pressão antrópica sobre ecossistemas locais. Este tipo de abordagem destaca-se por apresentar baixo custo operacional, uma vez que, após a obtenção das imagens aéreas que, em muitas vezes, se encontram disponíveis gratuitamente em bases públicas, as etapas de processamento e análise são realizadas de forma rápida e eficiente. Tal característica confere ao geoprocessamento um papel estratégico na gestão territorial e no planejamento urbano sustentável, permitindo que gestores públicos compreendam a dinâmica de crescimento das cidades com precisão e agilidade, subsidiando políticas ambientais e de uso do solo. A integração entre geoprocessamento e Inteligência Artificial mostrou-se uma ferramenta indispensável para monitorar transformações espaciais, fornecer diagnósticos ambientais em tempo real e orientar tomadas de decisão fundamentadas em evidências.

1 INTRODUCTION

The advancement of geoprocessing technologies has revolutionized the ways of analyzing the territory, making it possible to understand the spatio-temporal dynamics of natural and anthropic environments with high precision. According to Florenzano (2011), geoprocessing is a set of techniques that integrates spatial data and descriptive attributes, allowing the mapping and modeling of geographic phenomena. These technologies, associated with satellite images and aerial photographs, provide essential data to assess urban growth, habitat fragmentation, and the suppression of vegetation areas, phenomena intensified in recent decades by the rapid process of urbanization in Brazil (IBGE, 2020).

The use of historical aerial images is a valuable tool for understanding the evolution of land occupation. According to Novak (1996), aerial photogrammetry allows the generation of cartographic products from photographs obtained by aircraft, providing metric and interpretative data that make it possible to reconstruct past landscapes. These images, when georeferenced, offer time series that show gradual changes in the territory, such as the urban advance over permanent preservation areas and riparian zones. According to Jensen (2006), multitemporal analysis is fundamental for environmental planning, as it allows the identification of patterns of vegetation suppression, expansion of the urban fabric and degradation of ecosystems over time.

In addition to aerial photographs, the use of satellite images has gained prominence for its ability to monitor continuously on a large scale. Richards and Jia (2012) state that orbital remote sensing has become one of the main tools for detecting environmental changes, allowing the estimation of deforested areas, land use dynamics, and the expansion of cities with high accuracy.

In this scenario, the integration between geoprocessing, historical images and new computational technologies has become an emerging trend in the scientific field. Artificial Intelligence (AI), according to Russell and Norvig (2020), represents one of the greatest innovations today due to its ability to interpret large volumes of data, recognize patterns, and provide predictive analysis. The use of AI applied to geospatial imagery has stood out in the automatic classification of land use and land cover, detection of deforestation and identification of irregular occupations, this work proposes an innovative approach by using AI not only as a classification tool, but as an interpretative instrument of geospatial data obtained through digitized historical aerial images.

The use of aerial photographs obtained in 1960, 1970, 2003 and 2025 allowed us to analyze the evolution of the urban landscape of the city of Assis (SP), a representative region of medium-sized cities in the interior of São Paulo. These cities, as observed by Santos and Silveira (2001), have played a strategic role in the process of industrial deconcentration and expansion of the national urban fabric, often associated with accelerated and poorly planned urbanization processes. The interpretation of the images revealed clear trends of advance of the urban fabric over natural areas, especially in the region of Ribeirão da Fortuna, evidencing the suppression of native vegetation and the intensification of soil impermeabilization.

Aerial photogrammetry, when integrated with digital image processing and Geographic Information Systems (GIS) tools, allows the precise delimitation of vegetation areas and buildings, enabling the quantification of vegetation suppression over time (Burrough & McDonnell, 2015). In this sense, multitemporal analysis becomes fundamental to evaluate the environmental impacts resulting from urban growth and to provide subsidies for public policies aimed at territorial planning and the conservation of natural resources.

The differential of this study lies in the application of Artificial Intelligence for automatic interpretation of data organized in tables, generated from the digitization of georeferenced aerial images. While previous studies are limited to human analysis of data, this work proposes an innovative approach, using AI as a spatial diagnostic tool, capable of analyzing patterns of urban expansion and vegetation suppression based on historical series. According to Goodfellow, Bengio and Courville (2016), AI models have a high capacity for generalization and learning, making them able to detect subtle changes in images over time, contributing to the understanding of territorial behavior and future land use projections.

Thus, this study seeks to answer the following central question: how can the temporal analysis of historical images associated with automated interpretation by artificial intelligence contribute to the understanding of the processes of vegetation suppression and urban expansion? The research presents itself as a significant contribution to the field of geoprocessing applied to territorial planning and environmental management, especially in a context of growing demand for digital technologies that assist in evidence-based decision-making.

In addition to technical accuracy, it is noteworthy that the use of georeferenced historical images and geoprocessing tools is highly cost-effective, because, after the initial data is obtained, the processing, digitization and analysis steps can be carried out quickly, with accessible or free software, which makes this type of study feasible for municipalities,

researchers and public institutions. The agility in spatial interpretation allows the evaluation of the development of cities in short intervals of time, contributing to sustainable urban planning and efficient environmental management (IBGE, 2020).

In this context, the objective of this work is to develop a study of the evolution of land occupation in a specific region of the municipality of Assis (SP), using geoprocessing and historical aerial images as tools to analyze urban expansion and the suppression of vegetation areas, also considering the advantages of low cost, high processing agility and practical applicability of these technologies in territorial planning and city management.

2 MATERIALS AND METHODS

2.1 FIELD OF STUDY

The study was carried out in a region located in the municipality of Assis, State of São Paulo, covering urban and permanent preservation areas located in the surroundings of Ribeirão da Fortuna. The area was selected because it has a history of urban expansion and vegetation suppression, being representative of the process of territorial transformation that has occurred over the last decades in medium-sized municipalities in the interior of São Paulo.

Figure 1

Location of the city of Assis in relation to the main cities in the region

To carry out this work, historical aerial photographs from the 1960s and 1970s were used, obtained through public collections of aerial photogrammetry, high-resolution aerial

image from the years 2003 and 2025, made available by digital geoprocessing platforms, as well as for the georeferencing and vector digitization of the images, the AutoCad 2025 software was used.

ChatGPT Artificial Intelligence (OpenAI – GPT-5): applied for automated interpretation and analysis of quantified data, identification of patterns of vegetation suppression and urban expansion.

Electronic spreadsheet (Excel): used for data organization and calculation of percentages and generation of tables.

The historical aerial images were imported into the AutoCAD 2025 software, where they were georeferenced from spatial reference points, ensuring the correct overlap between the different years analyzed. The UTM coordinate system, spindle 22S, Datum SIRGAS 2000, was adopted, in accordance with the Brazilian cartographic guidelines.

After georeferencing, the features were manually vectorized, classifying them into two categories: urban area: represented by houses, buildings, paved roads and allotments and vegetated area: encompassing native forests, permanent preservation areas (APP), pastures and forests.

Each class was delimited by vector polygons, allowing the quantification of the areas in hectares. With the polygons scanned, AutoCAD automatically generated the area values (in m²), which were converted into hectares (1 ha = 10,000 m²). The data were organized in an electronic spreadsheet to compose the table and calculate the percentage of urban occupation and vegetation suppression in each period analyzed.

Data analysis was carried out based on the comparison of the four historical periods: 1960, 1970, 2003 and 2025. For each year, the following were calculated:

- Total area analyzed
- Urban area
- Vegetated area
- Percentage of urban sprawl
- Percentage of suppression of vegetation cover

This comparison allowed us to identify the pace of urban growth and the reduction of vegetation over time.

The quantified data were entered into an Artificial Intelligence environment (ChatGPT – OpenAI), in which AI was used to automatically interpret land occupation trends, identify spatial patterns of vegetation suppression, point out potential environmental impacts resulting

from urban growth, generate projections and qualitative inferences about the observed results. This stage represents the technological innovation of this study, demonstrating the potential of AI as a tool for environmental interpretation and support for sustainable urban planning.

3 RESULTS AND DISCUSSION

The work began with the insertion of the image (Figure 2) in the ChatGPT Artificial Intelligence, requesting that the tool perform a visual interpretation of the studied area. The following are the main information automatically identified by the AI.

"This image is an aerial (satellite) view of an urban and peri-urban area of the city of Assis/SP, clearly showing natural and urban elements in interaction processes".

Here are the main visible elements: As natural elements, it indicated the following information based on Figure 2.

There is in figure 2 the Ribeirão da Fortuna that is identified with the name in the image and is an important watercourse that crosses the area. A stretch of riparian forest and dense vegetation can also be seen: located mainly around the stream, indicating a remnant of preserved vegetation or a permanent protection area.

Rural areas and pastures on the left of the image, with a typical pattern of agricultural lots or pasture areas, some urban elements visible especially in the central and right part of the image, with a high density of housing, there is also a recent housing complex in the upper left part, with organized blocks and straight streets, indicating planned and more recent occupation. Consolidated urban fabric on the right, with smaller blocks, paved streets and high density.

Also analyzing the image, ChatGPT identified important public equipment such as the "Tonicão" Antônio Viana da Silva Stadium: a large sports structure.

The Buracão Park is a green area for leisure and public recreation in the northeastern portion of the city.

The Fortuna stream acts as an ecological corridor and natural divider between the urban and rural sectors, there are also indications of urban expansion towards areas of vegetation and proximity to water bodies, which can be analyzed from the point of view of environmental impact or urban planning.

Figure 2

Aerial image of the study site in 2003

Then, Figure 3 was inserted into ChatGPT, corresponding to the 2025 aerial image, asking the AI for a direct comparison with the previous image to identify the changes that occurred over time.

Figure 3

Aerial image of the study site in the year 2025

Comparing aerial images from the years 2003 and 2025, Artificial Intelligence identified significant changes in the urban landscape of the area studied. A significant increase in urban occupation was observed, especially in the vicinity of Ribeirão da Fortuna, where there was a densification of housing and expansion of the built network towards the west and south.

At the same time, there was a reduction in green areas and natural vegetation, with a decrease in riparian forest and replacement of old vegetated spaces by streets and buildings. Urban infrastructure has become more consolidated, with new allotments and paved roads, resulting in greater integration between neighborhoods and a less clear transition between the urban and rural perimeter.

These transformations indicate a continuous process of urban expansion and increased pressure on environmentally sensitive areas, typical characteristics of the accelerated growth of medium-sized cities in the interior of São Paulo.

Figure 4

Digitization of the areas under the 2025 aerial image

Based on the data presented, the aerial images referring to the years 1960, 1970, 2003 and 2025 were submitted to vector digitization. From this procedure, quantitative information was obtained that supports the analysis of the spatial evolution of the study area and supports the results presented below.

The vector digitization of the image for the year 2025 (Figure 4), carried out in the AutoCAD 2025 software, resulted in the quantification of 140.41 hectares occupied by urbanized areas (houses and buildings) and 78.18 hectares corresponding to vegetated areas, totaling the analyzed area.

Similarly, the digitization of the 2003 aerial image (Figure 2) allowed the distinction between vegetation areas (pastures, forests, forests and PPAs) and built-up areas, enabling the temporal comparison of land occupation and the identification of trends in urban expansion and vegetation suppression.

Figure 5

Digitization of the 2003 aerial image

The digitization of the aerial image for the year 2003 resulted in the quantification of a total of 199.14 hectares, of which 92.61 hectares corresponded to urbanized areas (houses and buildings) and 106.53 hectares were occupied by vegetation, including forests, forests and Permanent Preservation Areas (APPs).

Figure 6

Aerial photo of the city of Assisi in 1960

Figure 6 shows the aerial photograph of the city of Assis for the year 1960, obtained by means of aerial survey with aerial photogrammetry techniques. After georeferencing, the image was positioned in its original location in the coordinate system, allowing the delimitation and calculation of urbanized areas and areas of vegetation existing in that period. It is a valuable historical record, with more than six decades, which demonstrates the importance of the integration between historical images and geoprocessing for understanding the evolution of land occupation.

Figure 7

Digitization of the Aerial Image of the year 1960

The vector digitization of the aerial image from 1960 (Figure 7) resulted in the quantification of 154.52 hectares of vegetation cover, encompassing forests, forests and Permanent Preservation Areas (PPAs), and 64.08 hectares occupied by urban constructions, totaling 218.60 hectares analyzed in that period.

Figure 8 shows the aerial image for the year 1970, corresponding to the same study area. This image was submitted to the digitization process to obtain land cover data and compare the spatial evolution between the different periods analyzed.

Figure 8

Aerial photo of the city of Assisi in 1970

Figure 9

Digitized photo from the year 1970

The digitization of the aerial image from 1970 allowed the delimitation of the areas of urban occupation and vegetation cover. 83.06 hectares of built areas (houses and buildings) and 135.54 hectares of vegetation were identified, including pastures, forests, forests and Permanent Preservation Areas (PPAs), totaling 218.60 hectares analyzed.

From the data obtained for the four historical periods (1960, 1970, 2003 and 2025), it was possible to quantify the evolution of urban expansion and the suppression of vegetation in the study area. This multitemporal analysis evidenced the changes in land use and land cover over the decades, allowing the construction of the following table, which summarizes the results obtained.

Table 1

Evolution of land occupation in the municipality of Assis (SP) based on historical aerial images

Year of the image	Total area analysed (ha)	Urban area (houses/buildings)	Vegetated area (forests, pastures, APPs)	Urban percentage (%)	Percentage vegetated (%)
1960	218,6	64,08	154,52	29,30%	70,70%
1970	218,6	83,06	135,54	38,00%	62,00%
2003	199,14	92,61	106,53	46,50%	53,50%
2025	140,41*	62,23*	78,18*	44,30%	55,70%

With reference to the data above, Artificial Intelligence through ChatGPT made its quantitative analysis below:

Figure 10

Projection of Vegetation Suppression Over Time

The generated graph represents the projection of vegetation suppression over time, based on real data from the years 1960, 1970, 2003 and 2025. The linear trend analysis indicates that the vegetation cover of the studied area shows a continuous pattern of reduction over the last decades. If the observed dynamics remain unchanged and no environmental restoration or preservation measures are implemented, it is estimated that the vegetation area may reach values close to zero between the years 2090 and 2100, implying the almost total disappearance of the remaining green areas. This result shows a critical scenario of environmental collapse, especially in areas close to rivers and springs, such as Ribeirão da Fortuna, highlighting the urgency of public policies for conservation and territorial planning.

Another relevant figure created by Artificial Intelligence was graph 2, which simulates the crossing of data, that is, when the percentage of buildings and houses becomes equal to or greater than the percentage value of vegetation areas in this same place.

Figure 11

Percentage Projection of Urban Occupation x Vegetation until the crossing of percentage values

The percentage analysis demonstrates a linear trend of convergence between the land use classes. Based on historical data and statistical projection, it is observed that urban occupation should reach 50% of the total area in approximately 2037, when it will equal the vegetation cover. From this point on, if environmental preservation and recovery policies are not implemented, the built areas will predominate over the vegetation, indicating a warning scenario for the environmental and urban sustainability of the region studied.

4 CONCLUSION

The temporal analysis of aerial images from the years 1960, 1970, 2003 and 2025 showed a significant advance in urban occupation over natural areas in the municipality of Assis (SP), resulting in significant vegetation suppression over the last decades. The integration between geoprocessing and Artificial Intelligence allowed us to interpret this dynamic, identifying urban growth trends that point to the intersection of the percentages of built and vegetated area around 2037, suggesting possible urban predominance in the near future.

One of the main differentials of this work was the use of low-cost technologies and high operational efficiency. After obtaining the aerial images, many of them available for free in public databases, the entire process of georeferencing, digitization, quantification and

automated interpretation occurred quickly and with minimal financial investment. The application of AI has accelerated the analytical steps, allowing the immediate generation of environmental diagnoses and future projections with scientific reliability.

Thus, it is concluded that the methodology adopted proves the impact of urban expansion on the reduction of vegetated areas, in addition to demonstrating the potential of digital tools as strategic allies in sustainable territorial planning. The study shows that it is possible to produce high-quality technical knowledge at low cost, speed of processing and practical applicability, making this approach extremely viable for public managers, researchers and institutions looking for efficient solutions for environmental and urban monitoring.

ABSTRACT

Heat exchangers using thermosyphons have been used for decades in various applications in the aeronautical, military, nuclear, and electronics industries. One application that has gained recent interest, despite having been proposed around 1992, is thermal comfort in air conditioning systems. In this paper, we present a heat exchanger design that uses axially finned thermosyphons - AFTHE. The current design uses a radially finned heat pipe heat exchanger as a reference, whose theoretical and experimental analysis is already well established. Mathematical modeling applies to the thermal efficiency method to determine quantities of thermal interest, and the second law of thermodynamics, with an emphasis on the Bejan number, to determine thermal and viscous irreversibilities. Numerical and graphical results are determined and presented for the following physical quantities: velocities, Reynolds numbers, Nusselt numbers, convection heat transfer coefficients, number of thermal units, heat transfer rates, friction factors, pressure drops, and Bejan number. The results are used for theoretical analyses of the heat exchanger's evaporator and condenser, demonstrating the expected physical consistencies for all analyzed quantities. To consolidate the heat exchanger theoretical design and the applied theoretical model, a comparison is presented for the air outlet temperatures and effectiveness, using theoretical-experimental results obtained for the radial-fin heat exchanger, in the evaporator, and the condenser. The comparisons made demonstrate that the axially finned tube design presents better thermal performance with a lower heat exchange area than the radially finned heat pipe design, for the same inlet conditions. The current design presents promising results and should be used in the experimental implementation of an air conditioning system for surgical rooms.

RESUMO

Trocadores de calor que utilizam termossifões têm sido empregados há décadas em diversas aplicações nas indústrias aeronáutica, militar, nuclear e eletrônica. Uma aplicação que tem despertado interesse recente, apesar de ter sido proposta por volta de 1992, é o conforto térmico em sistemas de ar-condicionado. Neste artigo, apresenta-se um projeto de trocador de calor que utiliza termossifões com aletas axiais (AFTHE). O projeto atual utiliza como referência um trocador de calor com tubos de calor aletados radialmente, cuja análise teórica e experimental já se encontra bem estabelecida. A modelagem matemática aplica o método da eficiência térmica para a determinação de grandezas térmicas de interesse e a segunda lei da termodinâmica, com ênfase no número de Bejan, para a determinação das irreversibilidades térmicas e viscosas. Resultados numéricos e gráficos são obtidos e apresentados para as seguintes grandezas físicas: velocidades, números de Reynolds, números de Nusselt, coeficientes de transferência de calor por convecção, número de unidades de transferência de calor, taxas de transferência de calor, fatores de atrito, quedas de pressão e número de Bejan. Os resultados são utilizados para análises teóricas do evaporador e do condensador do trocador de calor, demonstrando as consistências físicas esperadas para todas as grandezas analisadas. Para consolidar o projeto teórico do trocador de calor e o modelo teórico aplicado, apresenta-se uma comparação das temperaturas de saída do ar e da efetividade, utilizando resultados teórico-experimentais obtidos para o trocador de calor com aletas radiais, no evaporador e no condensador. As comparações realizadas demonstram que o projeto com tubos aletados axialmente apresenta melhor desempenho térmico com menor área de troca de calor do que o projeto com tubos de calor aletados radialmente, para as mesmas condições de entrada. O projeto proposto apresenta resultados promissores e deve ser utilizado na implementação experimental de um sistema de ar-condicionado para salas cirúrgicas.

Palavras-chave: Trocadores de Calor. Tubos de Calor com Aletas Axiais. Método da Eficiência Térmica. Irreversibilidades Térmicas e Viscosas. Número de Bejan.

RESUMEN

Los intercambiadores de calor que utilizan termosifones se han empleado durante décadas en diversas aplicaciones en las industrias aeronáutica, militar, nuclear y electrónica. Una aplicación que ha despertado un interés reciente, a pesar de haber sido propuesta alrededor de 1992, es el confort térmico en sistemas de aire acondicionado. En este artículo se presenta un diseño de intercambiador de calor que utiliza termosifones con aletas axiales (AFTHE). El diseño actual utiliza como referencia un intercambiador de calor con tubos de calor aletados radialmente, cuyo análisis teórico y experimental ya se encuentra bien establecido. La modelización matemática aplica el método de la eficiencia térmica para determinar magnitudes térmicas de interés y la segunda ley de la termodinámica, con énfasis en el número de Bejan, para determinar las irreversibilidades térmicas y viscosas. Se obtienen y presentan resultados numéricos y gráficos para las siguientes magnitudes físicas: velocidades, números de Reynolds, números de Nusselt, coeficientes de transferencia de calor por convección, número de unidades de transferencia de calor, tasas de transferencia de calor, factores de fricción, caídas de presión y número de Bejan. Los resultados se utilizan para análisis teóricos del evaporador y del condensador del intercambiador de calor, demostrando las consistencias físicas esperadas para todas las magnitudes analizadas. Para consolidar el diseño teórico del intercambiador de calor y el modelo teórico aplicado, se presenta una comparación de las temperaturas de salida del aire y de la efectividad, utilizando resultados teórico-experimentales obtenidos para el intercambiador de calor con aletas radiales, en el evaporador y en el condensador. Las comparaciones realizadas

demuestran que el diseño con tubos aletados axialmente presenta un mejor desempeño térmico con una menor área de intercambio de calor que el diseño con tubos de calor aletados radialmente, para las mismas condiciones de entrada. El diseño propuesto presenta resultados prometedores y debería utilizarse en la implementación experimental de un sistema de aire acondicionado para salas quirúrgicas.

Palabras clave: Intercambiadores de Calor. Tubos de Calor con Aletas Axiales. Método de la Eficiencia Térmica. Irreversibilidades Térmicas y Viscosas. Número de Bejan.

1 INTRODUCTION

Finned heat pipe heat exchangers (FHPHE) have been the subject of study and analysis, both theoretical and experimental, by several international research groups. These heat exchangers have a wide range of applications, notably in air conditioning systems for surgical rooms, which require strict specifications for temperature, air flow, relative humidity, and number of air changes per hour.

Ragil Sukarno and colleagues [1] developed an experimental HVAC system for surgical rooms using finned crossflow heat pipe heat exchangers. They achieved a maximum efficiency of 62.7% for the nine-row, 36-finned-tube heat exchanger shown in Figure 1 below, for an inlet temperature of 45°C.

Figure 1

Ragil Sukarno et al. [1]

H. Jouhara and collaborators [2] conducted a theoretical experimental study to analyze the thermal performance of a multipass heat pipe heat exchanger using theoretical models such as Logarithmic Mean Temperature Difference (LMTD) and the Effectiveness Method (ϵ -NTU). They highlighted the importance of heat exchangers in waste energy recovery.

Grzegorz Górecki and collaborators [3] presented a theoretical-experimental study of a finned heat pipe heat exchanger for small air conditioning systems, showing that finned heat pipes are a viable alternative to conventional exchangers.

Anwar Barrak [4] discussed the rising energy consumption in tropical countries and the importance of energy recovery to improve thermal performance. He highlighted that heat pipes are an excellent alternative for energy recovery and can improve fresh air quality.

Nandy Putra and colleagues [5] investigated the performance of finned heat pipes for heat recovery from exhaust air in an ambient room, showing that system efficiency increases with inlet air temperature.

Imansyah Ibnu Hakim and colleagues [6] analyzed HVAC systems using U-shaped finned heat exchangers, concluding that the two-tube row configuration significantly affects the pre-cooling and reheating processes.

Xuan Yin et al. [7] use experimental data as a numerical simulation to calculate the operating states of a two-phase thermosyphon evaporator. The numerical model comprised a vertically arranged steel tube with an inner diameter of 17 mm and a length of 800 mm, and water as the working fluid. Seven heat exchange tubes in the evaporator are distributed in a uniform vapor environment. The numerical results reveal the heat transfer and flow characteristics in the tube at different filling rates, with the evaporator exhibiting different flow and heat transfer characteristics under filling rates ranging from 40% to 65%. At a tube height of 0.7 m, the distributions of time-averaged vapor velocity and void fraction are similar for filling rates ranging from 55% to 65%, indicating a similar flow regime. The applicability of the numerical model is validated by the experimental results.

H. Eshwar, U.C. Arunachala, and K. Varun [8] state that passive heat transport has gained immense popularity. They cite heat pipes (HP) and two-phase closed thermosyphons (TPCT). They evaluated the effectiveness of closed two-phase thermosyphons through experimental investigation. Three thermosyphons (with the same geometry) were analyzed. They imposed isothermal (40°C–90°C) and isoflux (50–900 W) heating conditions. They concluded that in isothermal mode, the HP transports heat with a minimal temperature gradient and that, ultimately, the HP is the preferred option in terms of performance. Due to its superior operation, the HP can be used in isothermal applications where cost is not a significant concern.

Élcio Nogueira [9] analyzed energy efficiency in air conditioning systems by applying the "Thermal Efficiency Method" to evaluate the thermal performance of finned heat pipe heat exchangers. The parameters analyzed included the number of fins per tube, number of tubes, inlet temperatures, and fluid flow rates. The theoretical results were compared with experimental data, showing excellent agreement.

Another study, Nogueira [10] reviewed concepts of thermal and viscous irreversibilities, using the second law of thermodynamics and the Bejan number to analyze the thermal and viscous performance of heat exchangers. The "Thermal Efficiency Method"

was applied to obtain quantities such as thermal effectiveness and thermal and viscous irreversibilities.

Nogueira [11] also developed an innovative theory for analyzing heat exchangers, applying dimensionless analytical modeling to various types of exchangers, regardless of their specific characteristics. The methodology is based on the concepts of thermodynamics, with an emphasis on the second law of thermodynamics.

2 BASIC CONCEPTS OF AXIALLY FINNED TWO-PHASE CLOSED THERMOSYPHON HEAT EXCHANGER - AFTHE

Some initial concepts of the axially finned tube heat exchanger with parallel flow in the evaporator and counterflow in the condenser are represented in Figures (2.a), (2.b) and (2.c).

Figure 2

Diniz Felix dos Santos Filho presents the initial design for the AFTHE [Figure 2.a], highlighting the fin designs and an initial proposal for air outlets in the evaporator and condenser. Eliseu Luan de O. Tavares [Figure 2.b], under the guidance of Élcio Nogueira, develops a new design for the heat exchanger, without fins, highlighting the vertical, diametrically symmetrical air outlets in the evaporator and condenser. Continuing the AFTHE concepts [Figure 2.c], Ryan Felix expands the heat exchanger design with radial air outlets for the evaporator and condenser.

An analysis of the above designs for the AFTHE will be presented in the section below, considering theoretical aspects that will be discussed in the following sections.

2.1 MATHEMATICAL MODEL DESCRIPTION OF THE AFTHE

In this section we present the mathematical formulation for solving the performance of the heat exchanger under analysis, through the Thermal Efficiency Method, which uses the concept called “Fin Analogy” by Ahamad Fakheri [12].

The saturation temperature of the working fluid (H₂O) is defined using equation (01).

$$T_{sat} = 27^{\circ}C \quad (01)$$

$$T_{sat}=27^{\circ}C \quad (01)$$

The air inlet temperature at the evaporator varies between 30°C and 45°C, according to equation (02).

$$30^{\circ}C \leq T_{airin} \leq 45^{\circ}C \quad (02)$$

The air inlet temperature at the condenser varies between 18°C and 26°C, according to equation (03).

$$18^{\circ}C \leq T_{airin} \leq 26^{\circ}C \quad (03)$$

The air mass flow rate varies between 0.02 kg/s and 0.15 kg/sec, according to equation (04).

$$0.02 \frac{kg}{s} \leq \dot{m}_{air} \leq 0.15 \frac{kg}{s} \quad (04)$$

Table 1 shows the properties of the working fluid as a function of the saturation temperature equal to 27°C.

Tabel 1

Working Fluid Properties (H₂O)

T_{sat} °C	P_{sat} Pa	ρ_l kg/m ³	ρ_v kg/m ³	h_l J/kg	h_v J/kg	h_{lv} J/kg
-----------------	-----------------	-------------------------------	-------------------------------	---------------	---------------	------------------

27.0	91.535 10 ³	819.38	0.075	111.55	2563.19	2451.64
------	------------------------	--------	-------	--------	---------	---------

Geometric and physical quantities for the heat exchanger are explained through equations (05) and (24).

$$D_{int} = (2.0 * 25.40) \text{ mm} \quad (05)$$

The internal diameter of the heat pipe is represented by equation (05).

$$D_{ext} = (2.0 * 25.40 + 0.893) \text{ mm} \quad (06)$$

The external diameter of the heat pipe is represented by equation (06).

$$P_{HP} = \pi * D_{ext} \quad (07)$$

The perimeter of the heat pipe is represented by equation (07).

$$Esp_{Fin} = \frac{P_{HP} - N_{Fin} * T_{Fin}}{N_{Fin} + 1.0} \quad (08)$$

The space between fins is represented by equation (08). The number of fins is represented by N_{Fin} and T_{Fin} represents the fin thickness.

$$N_{Fin} = 25 \quad (09)$$

$$T_{Fin} = 4.0 \text{ mm} \quad (10)$$

The basic reference number of heat pipes is represented by equation (11). The reference number has an exact quadratic root and, in this work, is equal to 9 for 29 heat pipes and 16 for 47 heat pipes.

$$N_{HPb} = 9 \text{ by default}; \quad 1 \leq N_{HPb} \leq 16 \quad (11)$$

The number of tubes in the main diagonal of the heat exchanger is represented by equation (12) [see Figure 2].

$$N_{HPR} = N_R + (N_R + 1.0) \quad (12)$$

Where:

$$N_R = \sqrt{N_{HPb}} \quad (13)$$

The number of heat pipes is represented by equation (14).

$$N_{HP} = N_{HPR} * (N_R + 1.0) + (N_R - 2.0) \quad (14)$$

The total number of fins in the heat exchanger is represented by equation (15).

$$N_{TotFin} = N_{HP} * N_{Fin} \quad (15)$$

The fin height is represented by equation (16).

$$H_{Fin} = 18.0 \text{ mm} \quad (16)$$

The diameter of the heat exchanger shell is represented by equation (17).

$$D_{Shell} = N_{HPR} * (D_{ext} + 2.0 * H_{Fin}) \quad (17)$$

The lengths of the regions in the heat pipe, evaporator, adiabatic region and condenser are represented by equation (18).

$$L_{Ev} = 220.0 \text{ mm}; L_{Ad} = 120.0 \text{ mm}; L_{Cd} = 120.0 \text{ mm} \quad (18)$$

It is assumed that the heat pipes and fins are made of copper, with thermal conductivity shown below [Equation (19)].

$$k_W = 380.0 \frac{W}{m \cdot K}; k_{Fin} = 380.0 \frac{W}{m \cdot K} \quad (19)$$

Equation 20, represented by σ_{Water} and reported by Górecki, G. et al. [3], is the surface tension for water:

$$\sigma_{Water} = 0.07275 * (1.0 - 0.002 * (K - 291)) \quad (20)$$

Where:

K is saturation temperature in Kelvin.

The air passage area at the heat exchanger inlet is represented by equation (21).

$$AEnt_{HE} = \pi * \frac{D_{Shell}^2}{4.0} \quad m^2 \quad (21)$$

The height of the heat pipes is represented by equation (22).

$$H_{HP} = L_{Ev} + L_{Ad} + L_{Cd} \quad (22)$$

The volume occupied by the heat pipes is represented by equation (23).

$$Vol_{HE} = H_{HP} * AEnt_{HE} \quad (23)$$

The value 0.006 [Equation 24], constant for the surface-fluid combination, was originally presented by Rhosenow [13], valid for the copper-water pair, and reported by H. Jouhara et al. [14].

$$C_{sf} = 0.006 \quad (24)$$

2.2 EVAPORATOR

Table 2 shows the air properties as a function of the air inlet temperature at the evaporator.

Table 2

Air properties as a function of evaporator air inlet temperature

T_{airin} °C	ρ_{air} Kg/m ³	k_{air} W/(m K)	Cp_{air} J/(kg K)	Pr_{air}	μ_{air} Pa.s	ϑ_{air} m ² /s	α_{air} m ² /s
30.0	1.219	2.67 10 ⁻²	1005.77	7.47 10 ⁻¹	1.98 10 ⁻⁵	1.63 10 ⁻⁵	2.18 10 ⁻⁵
35.0	1.219	2.70 10 ⁻²	1006.12	7.41 10 ⁻¹	1.99 10 ⁻⁵	1.63 10 ⁻⁵	2.20 10 ⁻⁵
40.0	1.219	2.74 10 ⁻²	1006.48	7.35 10 ⁻¹	2.00 10 ⁻⁵	1.64 10 ⁻⁵	2.23 10 ⁻⁵
45.0	1.218	2.77 10 ⁻²	1006.84	7.30 10 ⁻¹	2.01 10 ⁻⁵	1.65 10 ⁻⁵	2.26 10 ⁻⁵

The air passage area inside the heat exchanger is represented by equation (25).

$$A_{sec_{NHp}} = A_{Ent_{HE}} - \left(N_{HP} * \pi * \frac{D_{ext}^2}{4.0} - N_{TotFin} * H_{Fin} * T_{Fin} \right) \quad (25)$$

The hydraulic perimeter of the heat exchanger is represented by equation (26).

$$P_{hHP} = N_{HP} * P_{HP} + N_{TotFin} * (2.0 * H_{Fin} + T_{Fin}) - N_{TotFin} * H_{Fin} \quad (26)$$

The hydraulic diameter of the heat exchanger is represented by equation (27).

$$D_{hHP} = \frac{4.0 * A_{sec_{NHp}}}{P_{hHP}} \quad (27)$$

The heat exchange area associated with the fins is represented by equation (28).

$$A_{trFin} = N_{Fin} * N_{HP} * L_{EV} * (2.0 * H_{Fin} + T_{Fin}) \quad (28)$$

The heat exchange area associated with the heat pipe assembly is represented by equation (29).

$$A_{trEv} = L_{EV} * N_{HP} * (P_{HP} - N_{Fin} * T_{Fin}) \quad (29)$$

The total heat exchange area in the evaporator is represented by equation (30).

$$A_{totEv} = A_{trFin} + A_{trEv} \quad (30)$$

The Reynolds number associated with the air flow inside the evaporator is represented by equation (31).

$$Re_{AirEv} = \frac{4.0 * \dot{m}_{air}}{\pi * D_{hHP} * \mu_{air}} \quad (31)$$

The air velocity inside the evaporator is represented by equation (32).

$$V_{AirEv} = \frac{Re_{AirEv} * \mu_{air}}{D_{hHP}} \quad (32)$$

The Reynolds number associated with the air flow at the evaporator inlet is represented by equation (33).

$$Re_{AirEnt} = \frac{4.0 * \dot{m}_{air}}{\pi * D_{Shell} * \mu_{air}} \quad (33)$$

The air velocity at the evaporator inlet is represented by equation (34).

$$V_{AirEnt} = \frac{Re_{AirEnt} * \mu_{air}}{D_{Shell}} \quad (34)$$

The saturation temperature difference across the evaporator is represented by equation (35).

$$\Delta T_{Evsat} = T_{airin} - T_{sat} \quad (35)$$

The estimated heat transfer coefficient for the boiling process, h_{boil} , equation (36), was represented by Gupta and Varshney correlation [15], depend on the $Heat_{Flux}$, described by Piro correlation [16], equation (37).

$$h_{boil} = \left(\frac{k_{Water}}{l_*} \right) * 1.39 * [Heat_{Flux} * \rho_{Water} * Cp_{Water} * \frac{l_*}{\rho_l * h_{lv} * k_{Water}}] ** 0.7 * (\rho_l / \rho_v) ** 0.21 * \left(\mu_{Water} * \frac{Cp_{Water}}{k_{Water}} \right) ** (-0.21) \quad (36)$$

$$Heat_{Flux} = \mu_{Water} * h_{lv} * l_* * \left[\left(\frac{1.0}{C_{sf}} \right) ** 0.33 * Pr_{Water} ** \left(\frac{1.0}{0.33} \right) * \left(Cp_{Water} * \frac{\Delta T_{Evsat}}{h_{lv}} \right) ** \left(\frac{1.0}{0.33} \right) \right] \quad (37)$$

Where:

$$l_* = \left[\frac{\sigma_{Water}}{g * (\rho_l - \rho_v)} \right] ** \left(\frac{1.0}{2.0} \right) \quad (38)$$

The Nusselt number associated with air is represented by equation (39).

$$Nu_{airEv} = 0.696 * Re_{AirEv} ** 0.5 * Pr_{air} ** 0.36 * \left(\frac{Pr_{air}}{5.0 * Pr_{air}} \right) ** 0.25 \quad (39)$$

The heat transfer coefficient by air convection in the evaporator is obtained by:

$$h_{Ev} = Nu_{air} * \frac{k_{air}}{D_{ext}} \quad (40)$$

The application of the concept of “Aleta Analogy”, conceived by Fakheri [12] leads us to define the following parameters:

$$mL_{EvFin} = \sqrt{\frac{2h_{Ev}}{k_{Fin}t_{Fin}}} P_{hEv} \quad (41)$$

$$\eta_{EvFin} = \frac{\text{Tanh}(mL_{EvFin})}{mL_{EvFin}} \quad (42)$$

The fin efficiency for the evaporator section is defined through Equation (42) by η_{EvFin} [6].

$$\beta_{Ev} = \frac{A_{trFin}}{A_{totEv}} \quad (43)$$

$$\eta'_{EvFin} = \beta_{Ev} \eta_{EvFin} + (1 - \beta_{Ev}) \quad (44)$$

The efficiency associated with the set of fins in the evaporator, weighted by the area of change of the fins η'_{EvFin} , is represented through Equation (45).

$$Uo_{Ev} = \frac{1}{\frac{1}{h_{boil}} + \frac{D_{ext} - D_{int}}{kW} + \frac{1}{\eta'_{EvFin} h_{Evair}}} \quad (45)$$

The global heat transfer coefficient associated with air in the evaporator, Uo_{Ev} , is given by Equation 45.

$$C_{Air} = \dot{m}_{air} C_{p_{air}} \quad (46)$$

The heat capacity of the air in the evaporator, C_{Air} , is given by Equation (46).

$$C_{Ev} = C_{air} \quad (47)$$

$$NTU_{Ev} = \frac{Uo_{Ev} * A_{totEv}}{C_{Ev}} \quad (48)$$

The number of thermal units associated with air in the evaporator, NTU_{Ev} , is given by Equation (48).

$$Fa_{Ev} = \frac{NTU_{Ev}}{2.0} \text{ for parallel flow} \quad (49)$$

The dimensionless number, called "fin analogy," Fa_{Ev} is represented by Equation (49) as defined by Ahamad Fakheri [12] and reported by Nogueira, É. [9; 10; 11].

$$\eta_{TEv} = \frac{\tanh(Fa_{Ev})}{Fa_{Ev}} \quad (50)$$

The thermal efficiency associated with the evaporator is η_{TEv} [9; 10; 11].

$$\varepsilon_{TEv} = \frac{1}{\frac{1}{\eta_{TEv} NTU_{Ev}} + \frac{1}{2}} \quad (51)$$

The thermal effectiveness associated with the heat evaporator is ε_{TEv} .

$$\dot{Q}_{Ev} = \frac{C_{Ev} \Delta T_{Ev sat}}{\frac{1}{\eta_{TEv} NTU_{Ev}} + \frac{1}{2}} \quad (52)$$

The heat transfer rate between the air and the heat pipe in the evaporating region $\dot{Q}_{Ev}$ is given by the Equation (52).

$$T_{airout} = T_{airin} - \frac{\dot{Q}_{Ev}}{C_{Ev}} \quad (53)$$

After passing through the evaporator (precooling), the outlet air temperature is represented through Equation (53).

Thermal irreversibility in the evaporator is obtained using equation (54), below.

$$Irrev_{TEv} = \log \left(\frac{T_{airin}}{T_{airout}} \right) \quad (54)$$

The rate of thermal entropy generation is represented by equation (55).

$$\dot{S}_{gen_{TEv}} = Irrev_{TEv} * C_{Ev} \quad (55)$$

$$Fric_{Ev} = \frac{0.31}{Re_{AirHP} ** 0.25} \quad (56)$$

The friction factor in the evaporator is represented by equation (56).

$$\Delta p_{Ev} = Fric_{Ev} * \left(\frac{L_{Ev}}{D_{hEv}} \right) * \left(\frac{\rho_{Air} * V_{AirEv} ** 2.0}{2} \right) \quad (57)$$

The pressure drops across the evaporator is represented by equation (57).

The pressure at the evaporator inlet is represented by equation (58).

$$P_{1Ev} = P_{2Ev} + \Delta p_{Ev} \quad (58)$$

Where:

$$P_{2Ev} = P_{atm} \quad (59)$$

Viscous irreversibility in the evaporator is obtained using equation (60) below.

$$Irrev_{VEv} = \log \left(\frac{P_{2Ev}}{P_{1Ev}} \right) \quad (60)$$

The rate of viscous entropy generation is represented by equation (61).

$$\dot{S}_{gen_{VEv}} = Irrev_{VEv} * \dot{C}_{Ev} \quad (61)$$

The Bejan number in the evaporator is represented by equation (62).

$$Be_{Ev} = \frac{\dot{S}_{gen_{TEv}}}{\dot{S}_{gen_{TEv}} + \dot{S}_{gen_{VEv}}} \quad (62)$$

2.3 CONDENSER

Table 3 shows the air properties as a function of the air inlet temperature at the condenser.

Table 3

Air properties as a function of condenser air inlet temperature

T_{airin} °C	ρ_{air} Kg/m ³	k_{air} W/(m K)	Cp_{air} J/(kg K)	Pr	μ_{air} Pa.s	ν_{air} m ² /s	α_{air} m ² /s

The heat exchange area of the heat pipes in the condenser is represented by equation (63).

$$A_{trCd} = L_{Cond} * N_{HP} * (P_{HP} - N_{Fin} * T_{Fin}) \quad (63)$$

The heat exchange area in the condenser is represented by equation (64).

$$A_{totCd} = A_{trFin} + A_{trCd} \quad (64)$$

The Reynolds number associated with the air flow inside the condenser is represented by equation (65).

$$Re_{AirCd} = \frac{4.0 * \dot{m}_{air}}{\pi * D_{hHP} * \mu_{air}} \quad (65)$$

The air velocity inside the condenser is represented by equation (66).

$$V_{AirCd} = \frac{Re_{AirCd} * \mu_{air}}{D_{hHP}} \quad (66)$$

The saturation temperature difference across the condenser is represented by equation (67).

$$\Delta T_{Cdsat} = T_{sat} - T_{airin} \quad (67)$$

The condensation coefficient in the condenser is represented by equation (68).

$$h_{Cond} = 0.943 * \left(\frac{\rho_l * (\rho_l - \rho_v) * h_{lv} * g * k_{water} ** 3}{\mu_{awter} * L_{Cd} * \Delta T_{Cdsat}} \right) ** \left(\frac{1}{4} \right) \quad (68)$$

The Nusselt number associated with the air in the condenser is represented by equation (69).

$$Nu_{airCd} = 0.696 * Re_{AirCd} ** 0.5 * Pr_{air} ** 0.36 * \left(\frac{Pr_{air}}{5.0 * Pr_{air}} \right) ** 0.25 \quad (69)$$

The Nusselt number associated with the air in the condenser is represented by equation (69).

$$h_{cd} = Nu_{airCd} * \frac{k_{air}}{D_{ext}} \quad (70)$$

The application of the concept of “Aleta Analogy”, conceived by Fakheri [12] leads us to define the following parameters:

$$mL_{CdFin} = \sqrt{\frac{2h_{Ev}}{k_{Fin}t_{Fin}}} P_{hCd} \quad (71)$$

$$\eta_{CdFin} = \frac{\text{Tanh}(mL_{CdFin})}{mL_{CdFin}} \quad (72)$$

The fin efficiency for the condenser section is defined through Equation (72) by η_{CdFin} .

$$\beta_{Cd} = \frac{A_{trFin}}{A_{totCd}} \quad (73)$$

$$\eta'_{CdFin} = \beta_{Cd}\eta_{CdFin} + (1 - \beta_{Cd}) \quad (74)$$

The efficiency associated with the set of fins in the condenser, weighted by the area of change of the fins η'_{EvFin} , is represented through Equation (75).

$$Uo_{Cd} = \frac{1}{\frac{1}{h_{cond}} + \frac{D_{ext}-D_{int}}{kW} + \frac{1}{\eta'_{CdFin}h_{Cd}}} \quad (75)$$

The global heat transfer coefficient associated with air in the condenser, Uo_{Cd} , is given by Equation (75).

$$C_{Air} = \dot{m}_{air}Cp_{air} \quad (76)$$

The heat capacity of the air in the condenser, C_{Air} , is given by Equation (76).

$$C_{Cd} = C_{air} \quad (77)$$

$$NTU_{Cd} = \frac{Uo_{Cd}A_{totCd}}{C_{Cd}} \quad (78)$$

The number of thermal units associated with air in the condenser, NTU_{Cd} , is given by Equation (78).

$$Fa_{Cd} = \frac{NTU_{Cd}}{2.0} \text{ for counterflow} \quad (79)$$

The dimensionless number, called "fin analogy," Fa_{Cd} is represented by Equation (79) as defined by Ahamad Fakheri [12] and reported by Nogueira, É. [9;10; 11].

$$\eta_{TCd} = \frac{\tanh(Fa_{Cd})}{Fa_{Cd}} \quad (80)$$

The thermal efficiency associated with the condenser is η_{TCd} .

$$\varepsilon_{TCd} = \frac{1}{\frac{1}{\eta_{TCd}NTU_{Cd}} + \frac{1}{2}} \quad (81)$$

The thermal effectiveness associated with the condenser is ε_{TCd} .

$$\dot{Q}_{Cd} = \frac{C_{Cd}\Delta T_{Evsat}}{\frac{1}{\eta_{TCd}NTU_{Cd}} + \frac{1}{2}} \quad (82)$$

The heat transfer rate between the air and the heat pipe in the condenser region $\dot{Q}_{Cd}$ is given by the Equation (82).

$$T_{airout} = \frac{\dot{Q}_{Cd}}{C_{Cd}} + T_{airin} \quad (83)$$

After passing through the condenser (heat recover), the outlet air temperature is represented through Equation (83).

Thermal irreversibility in the condenser is obtained using equation (84) below.

$$Irrev_{TCd} = \log\left(\frac{T_{airin}}{T_{airout}}\right) \quad (84)$$

The rate of thermal entropy generation in the condenser is represented by equation (85).

$$\dot{S}_{gen_{Tcd}} = Irrev_{Tcd} * C_{cd} \quad (85)$$

$$Fric_{cd} = \frac{0.31}{Re_{AirCd} ** 0.25} \quad (86)$$

The friction factor in the condenser is represented by equation (86).

$$\Delta p_{cd} = Fric_{cd} * \left(\frac{L_{cd}}{D_{hcd}} \right) * \left(\frac{\rho_{Air} * V_{AirCd} ** 2.0}{2} \right) \quad (87)$$

The pressure drops across the condenser is represented by equation (87).

The pressure at the evaporator inlet is represented by equation (88).

$$P_{1cd} = P_{2cd} + \Delta p_{cd} \quad (88)$$

By definition:

$$P_{2cd} = P_{atm} \quad (89)$$

Viscous irreversibility in the condenser is obtained using equation (90) below.

$$Irrev_{vcd} = \log \left(\frac{P_{2cd}}{P_{1cd}} \right) \quad (90)$$

The rate of viscous entropy generation in the condenser is represented by equation (91).

$$\dot{S}_{gen_{vcd}} = Irrev_{vcd} * C_{cd} \quad (91)$$

The Bejan number in the capacitor is represented by equation (92).

$$Be_{cd} = \frac{\dot{S}_{gen_{Tcd}}}{\dot{S}_{gen_{Tcd}} + \dot{S}_{gen_{cd}}} \quad (92)$$

3 RESULTS AND DISCUSSION

3.1 EVAPORATOR

This section presents results for thermal and viscous performances related to the evaporator of the axially finned heat pipe heat exchanger, for configurations with 29 and 47 heat pipes.

Figure 3 presents the average air velocities for the two configurations considered in this work, with shell diameters equal to 614 mm (29 heat pipes) and 789 mm (47 heat pipes). As expected, the inlet velocity of the heat exchanger with the larger diameter has a lower velocity.

Figura 3

Air velocity at the evaporator inlet versus mass flow rate

Figure 2 shows the average velocity inside the heat exchangers considered in the evaporator analysis. As expected, due to its larger equivalent diameter, the heat exchanger with 47 heat pipes has a lower internal velocity, despite the larger area occupied by the heat pipes and fins. Figure 4 shows a cross-sectional representation of the finned heat pipes arranged symmetrically inside the shell for the 29-heat pipe configuration. The radial configuration is designed to achieve homogeneous air distribution inside the heat exchanger.

Figure 4

Average air velocity inside the evaporator versus air mass flow rate

Figure 5

Evaporator Reynolds number versus air mass flow rate

As expected, the Reynolds number in the evaporator, represented in Figure 3, demonstrates a similar trend to the internal velocity in the evaporator, with the heat exchanger with 47 heat pipes presenting slightly lower values for higher air flows.

The Nusselt number, Figure 4, presents results like those obtained and represented in Figure 5, as it is strongly dependent on the Reynolds number.

Figure 6

Evaporator Nusselt number versus air mass flow rate

Figure 5 presents values for the boiling heat transfer coefficient. The boiling coefficient presents significantly higher values with increasing air temperature, since it depends on the temperature difference between the air inlet temperature and the saturation temperature of the working fluid.

The number of thermal units in the evaporator is represented in Figure 6, as a function of the air inlet flow rate and for the maximum temperature, equal to 45°C. The working fluid filling ratio in the heat pipes, in purely theoretical terms, varies from 50% to 100%. The number of thermal units increases with the filling rate, and the number of heat pipes and decreases with an increasing flow rate. The increase in the number of heat pipes can be explained by the increase in the heat exchange area, and the increase in the filling rate is explained by the higher value of the overall heat exchange coefficient, which is strongly dependent on the boiling coefficient.

Figure 6 presents result for evaporator thermal effectiveness, for an air inlet temperature of 45°C and a working fluid fill ratio ranging from 50% to 100%. As expected, thermal effectiveness presents results like those of the number of thermal units, since it is strongly dependent on this parameter. What stands out in the results obtained are the high thermal effectiveness values across the entire flow rate range under analysis. The extremely high effectiveness values, even for a working fluid fill ratio of 50%, demonstrate that the 47-finned heat pipe configuration has great potential for use in air conditioning systems for

thermal comfort. Even for the 29-tube configuration, the results presented, for a fill ratio of 60%, are extremely promising.

Figure 7

Boiling heat transfer coefficient versus air inlet temperature

Figure 8

Number of thermal units versus air mass flow rate

The heat transfer rate in the evaporator, for an air inlet temperature of 45°C , is represented in Figure 8. The results obtained reflect what was observed for thermal effectiveness, with higher values for a greater number of heat pipes and higher working fluid filling rates. It should be noted that the analysis is restricted to the final position of the evaporator contained by the working fluid, since this is the most relevant region in terms of heat exchange.

The air outlet temperature is represented in Figure 9. The results obtained for the 47-finned heat pipe configuration, as expected, are extremely promising, since the temperature, for a 60% fill ratio, presents outlet temperatures between 27°C and 28°C, for almost the entire flow rate range under analysis. Even for the 29-tube configuration, the results obtained for a fill fraction of 80%, below 30°C and an air inlet temperature of 45°C, demonstrate exceptional thermal performance for the theoretical design of the heat exchanger under analysis.

Figure 9

Thermal effectiveness versus air mass flow rate and with filling fraction as a parameter

Figure 10

Heat transfer rate versus air mass flow rate and with filling ratio as a parameter

Figure 11

Air outlet temperature versus air mass flow rate and with filling ratio as a parameter

The current design, with axially finned heat pipes, is compared with the design of radially finned heat pipes, whose theoretical-experimental study is described through the work presented by Ragil Sukarno et al. [1], and a comparative theoretical study, through the Thermal Efficiency Method, carried out by Élcio Nogueira [9].

The results of the comparison performed in this work are shown in Figure 12, for air outlet temperature as a function of flow rate. It can be observed that the axial design with 47 finned heat pipes presents better thermal performance than the radial configuration, for a fill ratio of 100%. However, for an effective comparison, the heat exchange areas of each heat exchanger design must be analyzed: For 29 axially finned heat pipes, with 25 fins per tube, the total heat exchange area in the evaporator is 0.17 m²; for 47 axially finned heat pipes, with 25 fins per tube, the total heat exchange area in the evaporator is 0.27 m²; in the case of radially finned heat pipes, the total heat exchange area in the evaporator is 0.39 m². In terms of thermal performance in the evaporator, the axially finned tube design offers better performance, as it provides superior results for a smaller heat exchange area.

The results and analyses presented for thermal performance, in the evaporator, validate and demonstrate better thermal performance for the current configuration.

Figure 12

Air outlet temperature versus air mass flow rate for radial and axial finned heat exchanger configurations

A heat exchanger analysis, which takes into account the cost-benefit in terms of thermal/viscous performance, is presented below for the evaporator.

Figure 13 presents the coefficient of friction results for the two designs analyzed in this work: axially finned heat pipes with 29 tubes and 47 tubes, both with 25 fins per tube. Since the design with the greater number of tubes and fins has a larger area, it would be expected to have a significantly higher coefficient of friction. However, it can be seen that the velocity (Figure 2) is lower for the greater number of tubes, since the air passage area is larger. This characteristic balances the coefficient of friction results, making the result obtained for 47 tubes slightly higher than the result obtained for 29 heat pipes. As will be discussed later, this result has a positive impact on thermal/viscous performance in the current configuration.

Figure 13

Friction factor versus air mass flow rate

Figure 14

Pressure drops versus mass flow rate

The results for evaporator pressure drop are shown in Figure 14. The pressure drop for the 47-tube configuration shows a lower pressure drop than that for the 29-tube configuration. These results reflect what was observed for internal velocities in the heat exchanger, since the larger the number of tubes, the larger the air passage area.

Figure 15

Bejan number versus mass flow rate with working fluid filling ratio as parameter

The results for the evaporator's Bejan number are presented in Figure 15 for the two configurations under analysis: 29 and 47 axially finned heat pipes. Initially, the significant superiority of the 47-heat pipe design can be observed, as it offers a higher Bejan number for a given air mass flow rate. In this case, the result reflects higher thermal performance and lower pressure loss for the 47-heat pipe configuration. However, what is very favorable, in terms of cost-benefit, is that the value obtained is extremely high for both cases. These results demonstrate that the heat exchanger designs analyzed are extremely promising, as they offer high heat transfer rates and low pressure drops.

3.2 CONDENSER

This section presents results for thermal and viscous performances related to the condenser of the axially finned heat pipe heat exchanger, for configurations with 29 and 47 heat pipes.

Figure 16

Average air velocity in the condenser versus air mass flow rate

Figure 17

Heat transfer coefficient by condensation versus air input temperature

The results obtained for the condenser are very similar to those obtained for the evaporator. Numerically, however, they present different values, since the length of the condenser is equal to half the length of the evaporator, and the temperature differences between the air inlet temperature and the saturation temperature are smaller. The air inlet temperature to the evaporator varies between 18°C and 26°C.

The air velocity values inside the condenser (Figure 16) are lower than those observed for the evaporator, due to the condenser's smaller hydraulic diameter. The velocity values for the 47-heat pipe configuration, which has a larger air passage area, are reflected in lower velocity values.

Figure 17 presents result for the condensation heat transfer coefficient. The values are lower than those obtained for the boiling coefficient, due to the high heat transfer resistance presented by the water vapor fraction inside the heat pipes. This result is expected to impact the condenser's thermal performance.

Figure 18

Condenser heat transfer rate versus air mass flow rate

Figure 18 presents the results for the condenser heat transfer rate as a function of the air mass flow rate for the two configurations under analysis. The input parameter is an air temperature of 18°C. The condenser heat transfer rate is higher for the 47-heat pipe design due to the larger heat exchange area.

A comparison between axially finned and radially finned heat pipe designs for evaporator outlet air temperature is shown in Figure 19. The thermal performance of the axially finned heat pipe configurations is significantly superior for both 29-tube and 47-tube configurations. The results obtained for the condenser are qualitatively different from those obtained for the evaporator. The numerical superiority of the 47-tube heat pipe configuration

is explained by the larger heat exchange area. The superiority of the 29-tube configuration can be explained by the heat exchanger configuration, which in the condenser is counterflow, which has superior thermal performance to the parallel flow configuration, as in the evaporator.

Figure 19

Comparison of condenser outlet air temperature versus air mass flow rate for radial and axial fin configurations

The results presented for the Bejan number in the condenser are represented in Figure 20. As expected, based on what was already discussed for the evaporator, the Bejan number is higher for the 47-tube configuration because it has a larger heat exchange area and air passage area. However, what is noteworthy, once again, is the thermal performance versus viscous dissipation, which is extremely high for both configurations analyzed. In this sense, the cost-benefit associated with the heat exchanger is very favorable, due to its high thermal performance.

Figure 20

Bejan number in the condenser versus air mass flow rate

3.3 CONSIDERATIONS ON THE CURRENT AF THE CONFIGURATION

The air outlet configurations in the heat exchanger under analysis, represented in Figures 2.a, 2.b, and 2.c, are highlighted in the last one, as it more functionally encompasses the first two. Despite this, it cannot yet be considered definitive for two reasons: four air outlets, despite resulting in a completely symmetrical and functional configuration, are not a practical option when directing cooled or heated air to a given installation; and to achieve the final solution, due to the air-directing curves, it was necessary to extend the length of the adiabatic region (200 mm). This length does not correspond to the length of the adiabatic region (120 mm) considered in the simulation, since it was decided to maintain the dimensions of the heat exchanger that had already demonstrated satisfactory experimental results and was the subject of comparison in this work.

4 CONCLUSION

This paper presents graphical results for an axially finned heat pipe heat exchanger in two configurations: 29 and 47 heat pipes, in the evaporator and condenser. Furthermore, a comparison is presented between two distinct heat exchangers with very similar physical characteristics in terms of air mass flow rate, air inlet temperatures, working fluid and saturation temperature. The significant differences between the two types of heat exchangers relate to the physical arrangement of the fins on the heat pipes and the number of heat pipes.

The work used for comparison consists of radially finned heat pipes. Furthermore, the results used for comparison were validated by different numerical models and experimental results.

The analysis method used in this work consists of an analytical model called the Thermal Efficiency Method, already consolidated, based on numerous theoretical-experimental comparisons carried out over the last few years.

The analysis concludes that the thermal and viscous performance of the heat exchangers designed is very promising. These results are reflected in the high Bejan number obtained for the two configurations under analysis: 29 and 47 axially finned heat pipes. The Bejan number ultimately represents the relationship between thermal performance and the overall performance of the heat exchanger.

Thermal performance is high compared to viscous dissipation, resulting in a very favorable cost-benefit ratio for the heat exchanger under analysis.

The results demonstrate significant potential for the construction and testing of a heat exchanger with axial fins to obtain experimental results and for theoretical and experimental comparisons of parameters related to the heat exchangers under analysis.

It is important to note, however, that pressure drops across the air outlets were not considered in the simulation, and the results presented for viscous dissipation were applicable only to the evaporator and condenser dimensions. Air outlets, when finally installed, are expected to have a low economic impact on the heat exchanger.

In summary, the current theoretical project presents promising results and should be used in the experimental implementation of an air conditioning system for surgical rooms.

5 NOMENCLATURE

A_{sec} - cross-section area, [m^2]

A_{tr} - heat transfer area, [m^2]

C_p - specific heat, [$\frac{J}{kg K}$]

C - thermal capacity, [$\frac{W}{K}$]

C_{min} - minimum thermal capacity, [$\frac{W}{K}$]

$C^* = \frac{C_{min}}{C_{max}}$

D_h – hydraulic diameter, [m]

Fa – fin analogy

h – coefficient of heat convection, [$\frac{W}{m^2 K}$]

k – thermal conductivity, [$\frac{W}{m K}$]

K - Kelvin

k_w – thermal conductivity of the tube, [$\frac{W}{m K}$]

k_{Fin} – thermal conductivity of the fin, [$\frac{W}{m K}$]

L – vertical or horizontal length, [m]

$\dot{m}_{air}$ – mass flow rate of the air, [$\frac{kg}{s}$]

N_{Fin} – number of fins

Nu – Nusselt number

Pr – Prandtl number

$\dot{Q}$ – actual heat transfer rate, [W]

$\dot{Q}_{max}$ – maximum heat transfer rate, [W]

Re – Reynolds number

T – temperatures, [$^{\circ}C$]

U_o – global heat transfer coefficient, [$\frac{W}{m^2 K}$]

Subscripts

boil – ebulição

Cd – Condenser

Cond - Condenser

effect – effective

Ev – Evaporator

ext - external

HP – heat pipe

H - horizontal

in – inlet

int – internal

out – outlet

sat - saturation

Greek symbols

α – thermal diffusivity, $\left[\frac{m^2}{s}\right]$

β – the relationship between areas

ρ – density of the fluid, $\left[\frac{kg}{m^3}\right]$

μ – dynamic viscosity of fluid, $\left[\frac{kg}{m\ s}\right]$

ν – kinematic viscosity of the cold fluid, $\left[\frac{m^2}{s}\right]$

ε_T – thermal effectiveness

η_T – thermal efficiency

ΔT – a difference of temperatures, $[^{\circ}C]$

Acronyms

FHPHE – Finned heat pipe heat exchanger

Ev – Evaporators

Cd – Condenser

NHP – Number of Heat Pipes

NFin – Number of Fins

Nrows – Number of rows

NTU – number of thermal units

ABSTRACT

The incorporation of Indigenous languages into higher education represents both a challenge and an opportunity to strengthen cultural identity and improve communication in professional fields such as health. This study aimed to develop an interactive visual narrative in the Quechua language as an artistic and technological resource within a formative research process involving nursing students at a public university in Peru. The proposal was grounded in the Problem- and Technology-Based Research (IBPT) approach and employed block-based programming in mBlock along with a STEM educational kit to design interactive simulations addressing air quality in households that use firewood stoves—a common health concern in Andean communities. A total of 64 students participated by designing a Quechua-language digital narrative connected to environmental sensors and completing a post-test assessing linguistic comprehension and perceptions of using Quechua in educational and technological contexts. Results showed a medium-high level of Quechua comprehension (mean score of 3.58/5 on content questions) and a highly positive perception of integrating the language into academic activities (average scores above 4.0 on perception items). Findings indicate that interactive visual narratives are effective tools for integrating technology, art, and Indigenous language, fostering meaningful learning, strengthening cultural identity, and enhancing the social relevance of health education. The study concludes that incorporating Indigenous languages into context-based technological projects supports epistemological decolonization, the development of digital competencies, and intercultural professional training in nursing students.

RESUMO

A incorporação de línguas indígenas no ensino superior representa tanto um desafio quanto uma oportunidade para fortalecer a identidade cultural e melhorar a comunicação em áreas

¹ Dr. in Education. Dr. of Systems Engineering. Universidad Nacional Autónoma de Tayacaja Daniel Hernández Morillo. E-mail: rpauarc@unat.edu.pe Orcid: <https://orcid.org/0000-0002-9489-576X>

profissionais como a saúde. Este estudo teve como objetivo desenvolver uma narrativa visual interativa na língua quéchua como recurso artístico e tecnológico no âmbito de um processo de pesquisa formativa envolvendo estudantes de enfermagem de uma universidade pública do Peru. A proposta fundamentou-se na abordagem de Pesquisa Baseada em Problemas e Tecnologia (IBPT) e utilizou programação em blocos no mBlock, juntamente com um kit educacional STEM, para projetar simulações interativas relacionadas à qualidade do ar em residências que utilizam fogões a lenha — um problema de saúde comum em comunidades andinas. Participaram do estudo 64 estudantes, que elaboraram uma narrativa digital em quéchua conectada a sensores ambientais e responderam a um pós-teste que avaliou a compreensão linguística e as percepções sobre o uso do quéchua em contextos educacionais e tecnológicos. Os resultados indicaram um nível médio-alto de compreensão do quéchua (pontuação média de 3,58/5 nas questões de conteúdo) e uma percepção altamente positiva da integração da língua em atividades acadêmicas (médias superiores a 4,0 nos itens de percepção). Os achados demonstram que narrativas visuais interativas são ferramentas eficazes para integrar tecnologia, arte e língua indígena, promovendo aprendizagem significativa, fortalecimento da identidade cultural e maior relevância social da educação em saúde. Conclui-se que a incorporação de línguas indígenas em projetos tecnológicos contextualizados contribui para a descolonização epistemológica, o desenvolvimento de competências digitais e a formação profissional intercultural de estudantes de enfermagem.

RESUMEN

El uso de las lenguas originarias en la educación superior constituye un desafío y, al mismo tiempo, una oportunidad para fortalecer la identidad cultural y mejorar la comunicación en sectores como la salud. El presente estudio tuvo como objetivo desarrollar una narrativa visual interactiva en lengua quechua como recurso artístico y tecnológico en un proceso de investigación formativa con estudiantes de enfermería de una universidad pública del Perú. La propuesta se enmarcó en el enfoque IBPT (Investigación Basada en Problemas y Tecnología) y empleó programación visual en mBlock y un kit educativo STEM para diseñar simulaciones interactivas vinculadas a la calidad del aire en hogares con cocina a leña, problemática común en comunidades andinas. Participaron 64 estudiantes, quienes diseñaron una narrativa digital en quechua articulada con sensores ambientales y realizaron una posprueba que evaluó la comprensión lingüística y la percepción del uso del idioma en contextos educativos y tecnológicos. Los resultados mostraron un nivel medio-alto de comprensión del quechua (media de 3.58/5 en las preguntas de contenido) y una valoración altamente positiva hacia su incorporación en procesos formativos (promedios superiores a 4.0 en ítems de percepción). La experiencia evidenció que las narrativas visuales interactivas constituyen un medio eficaz para articular tecnología, arte y lengua originaria, promoviendo aprendizajes significativos, fortaleciendo la identidad cultural y ampliando la pertinencia social de la formación en salud. Se concluye que integrar lenguas indígenas en proyectos tecnológicos contextualizados favorece la descolonización epistemológica, el desarrollo de competencias digitales y la formación intercultural en estudiantes de enfermería.

1 INTRODUCTION

The integration of Quechua in nursing education is essential to ensure adequate health care for Quechua-speaking communities, especially in Andean regions of Peru, where the use of the language is predominant. Spoken by millions of people in Latin America, Quechua has historically been considered an underrated language in academia, making it difficult for health professionals and the indigenous population to communicate effectively (. In this sense, it is crucial that future nursing professionals develop language and cultural skills to overcome language barriers and improve the quality of care, especially in a rural context where discrimination and stereotypes are frequent (. In the Huancavelica region of Peru, 50% of people communicated in Quechua; previously they spoke more than 80% of this language, which is due to the factor of globalization, technology, migration; Most adolescents spoke it, however, today less than 40% of adolescents practice it (. Alarcón La Torre, 2023) DNLO, 2013) Asto & ventura, 2020)

Nursing personnel today face a great challenge when taking advantage of new technological resources to perform their work more efficiently and effectively. It is essential that academic nursing programs and universities review their curricula in accordance with technological advances in digital health, promoting the development of digital and computer skills necessary for professional performance, according to international recommendations (. It is critical that nurses and nursing students acquire competencies to successfully use information and communication technologies in their education and practice, in order to benefit patients and improve their own practice (. There is limited published literature on the use of ICT by nursing and health personnel in general in Peru. Topaz et al. 2016) Curioso & Oscuivilca-Tapia, 2021)

The integration of digital art in educational processes not only expands the expressive possibilities of students, but also strengthens cultural and linguistic ties that have been historically marginalized. In contexts where the Quechua language has been displaced by the effects of globalization, migration and the hegemony of Spanish, it is urgent to revitalize it through means that connect with the younger generations. In this scenario, interactive visual narratives in Quechua represent an innovative form of artistic and pedagogical expression, capable of contributing to professional training with sociocultural identity and commitment. (Palacios et al., 2018; Shen et al., 2024)

The use of visual and interactive technologies makes it possible to represent in a symbolic and sensory way the social and health problems of Andean communities,

promoting active learning, intercultural communication and the preservation of the native language. Visual programming, through environments such as mBlock, offers students an accessible and creative means to build digital scenarios in the Quechua language, where art, technology and the reality lived in their environment are articulated (Castillo, 2024; Herrera, 2022; Murrugarra, 2023) (Córdor et al., 2025; Paucar-Curasma et al., 2025)

In the case of nursing education, these digital narratives allow health problems to be addressed from a community perspective, recognizing that language is a fundamental component in intercultural care. The absence of health professionals with language skills in Quechua has generated barriers in communication, affecting the quality of services and encouraging risky practices such as self-medication. Therefore, it is a priority to incorporate pedagogical approaches that integrate linguistic identity into the professional training process. (Shimabuku Azato et al., 2018) (Santos-Revilla, 2016)

The formative research approach is conceived as a pedagogical strategy that promotes the development of scientific and technological competencies from the early stages of university education, through the execution of contextualized projects. In this framework, the nursing students developed an interactive visual narrative in Quechua, linked to a real health problem in their community, using a STEM educational kit and a block programming environment in the Quechua language. This process not only strengthened their technical and communication skills, but also led to the revaluation of their cultural identity through the use of visual art and digital resources. (Magdaleno & Málaga, 2024; Restrepo Gómez, 2017)

1.1 LANGUAGE BARRIERS IN HEALTH CARE

Peru is one of the countries that is characterized by having a wide linguistic diversity, so it officially has three languages: Spanish spoken by the majority (83.92%), Quechua, including its variants (13.21%), and Aymara, used by a smaller percentage (1.76%). In addition, more than 40 aboriginal languages are spoken in the highlands and jungle regions. As for Quechua, there are 3,262,137 speakers throughout the country, which represents a significant population that uses this native language. This panorama reflects not only linguistic diversity, but also the challenge and importance of promoting policies that ensure the conservation and strengthening of these native languages in the face of globalization and trends of cultural homogenization. (UNICEF, 2013)

In the field of health, establishing effective communication with patients is essential, as it directly influences the quality of care and clinical outcomes. According to studies carried out by , the impact of Quechua and other indigenous languages on community health in Peru is significant. Adequate communication in these languages is crucial to provide quality health care, however, the lack of personnel trained in Quechua and other indigenous languages limits the effectiveness of health services, leading to poor care and encouraging self-medication among Quechua speakers, who, in the face of linguistic and cultural barriers, they often resort to traditional practices. (Areche et al. (2020)

On the other hand, language barriers between health personnel and users affect the quality of public and private services, since both do not share or understand the same language, as pointed out (. This problem, despite its relevance, continues to be invisible by public and private institutions of higher education, as well as by the health sector in Peru. The lack of preparation and awareness of this reality causes misunderstandings that negatively impact health care and outcomes. Finally, they highlight the importance of health professionals, especially those who carry out the Rural and Marginal Urban Service (SERUMS), mastering Quechua as a second language in areas with a high Quechua-speaking population. Ricalde 2024) Oyola García & Quispe-Illanz, 2016)

1.2 FORMATIVE RESEARCH IN UNIVERSITY STUDENTS

In the field of higher education, various actions have been implemented aimed at incorporating formative research into university courses, using strategies that are effective for students to develop key competencies, strengthening their knowledge and research skills. From the pedagogical approach, formative research is based on teaching practices and methods that various institutions and university teachers have applied, showing positive results, encouraging the active participation of students and teachers within the university. (Restrepo Gómez, 2017) (Lapa-Asto et al., 2019)

Problem- and Technology-Based Research (PPTR) is an educational approach that is based on the problem-solving method proposed by , with the aim of strengthening research competencies in students through a process organized in four stages: understanding the problem, elaboration of activities, execution of activities and review of the solution. This proposal combines active strategies focused on problem-solving with the use of easily accessible educational technologies, such as STEM kits, sensors, and visual

programming platforms. Pólya (1945) (Paucar-Curasma et al., 2025) (Paucar-Curasma, Cerna-Ruiz, et al., 2023; Paucar-Curasma, Villalba-Condori, et al., 2023)

The IBPT proposal is not limited to guiding the student in the formulation and resolution of contextualized problems, but also promotes an active connection between scientific thinking and technological application. In this sense, the student not only examines a problematic situation, but also designs, implements and verifies solutions through experimentation with technological resources, giving rise to specific products such as models, prototypes or functional applications. This approach is particularly relevant in disciplines such as Nursing, where learning must transcend the purely theoretical and promote the ability to face real problems in the environment. By integrating the research process with specific technological tools, the IBPT turns formative research into an enriching experience, interdisciplinary in nature and with a strong innovation component.

Numerous studies have demonstrated the effectiveness of this type of methodology, pointing out that they contribute to a more favorable attitude towards research, strengthen logical thinking and stimulate autonomy in the learning process. Likewise, the implementation of the IBPT approach with the support of STEM educational kits promotes the development of digital skills, fundamental in contemporary vocational training. The phases that make up the IBPT approach are described below. (Fronza et al., 2019; Ortega & Asensio, 2021)

- Understanding the problem: This stage involves the exploration of scientific and technological information, the analysis of contextualized situations and the graphic representation of cause-effect relationships through visual organizers. Its purpose is to develop skills in observation, critical thinking, and researchable questioning.
- Elaboration of activities: In this phase, students plan the research process, review relevant background information and organize tasks in a logical way. Competencies related to the methodological structuring of formative research are reinforced.
- Execution of activities: Participants interact with technological devices such as sensors and actuators, programming their operation through visual environments such as mBlock. This phase encourages active experimentation, the application of technical knowledge and teamwork.
- Review of the solution: Finally, the developed proposal is verified and optimized, promoting critical reflection, continuous improvement and metacognition. The relevance and impact of the solution in the face of the initial problem is analyzed.

1.3 INTERACTIVE VISUAL NARRATIVE IN EDUCATION: AN ARTISTIC AND CULTURAL APPROACH

Interactive visual narratives are a contemporary pedagogical strategy that allows creativity, critical thinking and digital technology to be integrated into teaching-learning processes. Unlike traditional narratives, these include visual, sound and interaction elements, where the user or student is not only a receiver of the information, but also an active builder of meaning. This characteristic makes them powerful tools to strengthen participation, meaningful learning and cultural appropriation, especially in educational contexts with linguistic and sociocultural diversity. (Moreira-Chóez, 2021)

From the semiotic and pedagogical perspective, visual narratives enable the construction of knowledge from symbolic representations, which favors the development of cognitive and emotional competencies in students. By combining images, text, audio, and movement, these narratives transform the educational environment into an immersive space that stimulates multiple ways of learning. In addition, its aesthetic dimension allows it to connect with the interests, emotions and experiences of the students, creating a closer relationship with the curricular content. (Chávez et al., 2021)

In the context of health education, the use of visual narratives in indigenous languages, such as Quechua, represents a valuable tool to strengthen linguistic identity, promote intercultural communication, and address real problems in communities from a critical and creative perspective. Using visual programming environments such as mBlock, students can create interactive simulations in Quechua, where situations related to environmental health, disease prevention, or care in rural areas are represented. This process not only contributes to the learning of disciplinary content, but also allows the revaluation of the native language as a vehicle of knowledge, affection and belonging. (Gutiérrez & Tyner, 2012)

In contemporary digital culture, interactive narratives represent an emerging form of multiple literacy, where computational thinking, visual design, and narrative construction converge. Its implementation in the classroom encourages narrative thinking and the ability to solve problems from a multimodal and participatory logic. Thus, in educational projects such as the one developed in this research, where nursing students design an interactive application in Quechua for the dissemination of information on air quality, the value of visual narratives as artistic, technological and cultural expressions that enrich education with a social and transformative sense is evidenced. (León, 2018)

1.4 VISUAL PROGRAMMING TOOLS IN QUECHUA

Digital applications are transforming health education, offering information, tools and educational resources in a more accessible and personalised way; from apps that allow you to consult medical information to platforms that facilitate communication between patients and professionals (. Araújo-Girão et al, 2021)

The use of tools in health projects is transforming the way healthcare challenges are addressed. From digital platforms that facilitate collaboration between professionals and data management, technological tools are boosting the efficiency, accuracy, and accessibility of health services. . Its impact is reflected in the improvement of the quality of care, the reduction of errors, the optimization of resources and the creation of new opportunities for the research and development of innovative solutions. (Huilcatoma-García, 2020)

Within the framework of the use of Information and Communication Technologies (ICT) to strengthen indigenous languages, he proposed a methodology that consists of the creation of videos in indigenous languages through workshops aimed at the development of educational materials. Similarly, several authors point out that ICT contributes to optimizing language teaching, making learning more enjoyable, interactive and motivating, while promoting the development of technological skills in students. (Pinto, 2019)

The use of various technological tools facilitated the learning of vocabulary in Quechua, allowing students to improve their communication skills and encourage reading and writing, increasing interest in learning their language. Likewise, it improved the learning of the Ashaninka language through interactive comics developed in the Scratch program; Integrating this type of technology is essential to strengthen the use of educational resources for cultural revitalization. Fernández (2020) (Ríos-Colmenárez, 2020)

The progress in the students' oral expression was achieved through the creation of audios and videos, in which they narrated short stories or recounted their cultural traditions. it incorporated riddles and tongue twisters to enrich the production of written texts, as well as songs, stories and ancestral games to strengthen oral expression, contributing to the revaluation of the language and the cultural identity of the students. Another prominent strategy to promote the daily use of Quechua is the use of television as an integrating medium within ICTs. Similarly, they recommend that teachers use software as an alternative resource to strengthen paragraph writing. Huamaní (2019) Alotaibi & Alzu'bi (2022)

The development of applications in indigenous languages drives cultural inclusion and the revitalization of marginalized languages, such as Quechua, through digital tools. Teaching programming in these languages fosters multilingualism and strengthens cultural identity. In addition, the use of technologies such as augmented reality in Quechua-speaking communities not only improves learning, but also facilitates access to key information in areas such as health, reducing language barriers and empowering communities to actively participate in digital environments and modern services. (Ojeda et al., 2022) (Cárdenas-Valdivia et al, 2023)

Commercial products available to develop interactive programs or applications have limitations regarding the use of Quechua and other native languages. Faced with this situation, a customized solution has been developed: the STEM Educational Kit and its visual programming environment based on the mBlock software. This kit incorporates sensors and actuators, and uses an open-source microcontroller with the ATmega328P microchip as a base. In addition, it has a visual programming environment that includes blocks in Quechua and Spanish, designed to interact with sensors and actuators. These blocks were developed using Python libraries and the mBlock environment. (Paucar-Curasma et al., 2022) (Makeblock Education, 2024)

The STEM Educational Kit allows various research activities aimed at community problems, such as the monitoring of environmental parameters; for example, air quality, turbidity and water temperature, or soil moisture. Figure 1 shows the visual programming environment in Quechua based on mBlock.

Figure 1

Visual programming environment in Quechua

2 OBJECTIVE OF THE RESEARCH

To develop an interactive visual narrative in the Quechua language as an artistic expression and pedagogical tool in a formative research process, with the purpose of strengthening linguistic and cultural identity in nursing students through the use of visual programming and contextualized educational technologies.

3 METHODOLOGY

3.1 RESEARCH APPROACH AND PARTICIPANTS

The present research adopts a quantitative design of a descriptive type, with a single post-test approach, using a non-probabilistic sampling of an intentional type. The participants were students of the Information Management course of the Nursing career of a public university in Peru, enrolled in the second academic semester of 2024. The sample was made up of 64 students, of which 53 were women and 11 men. Most of the participants were younger than 21 years old.

3.2 DATA ASSESSMENT AND ANALYSIS TOOL

To evaluate the impact of the use of interactive visual narrative in Quechua on students' language comprehension and perception, a post-test survey was applied at the end of the intervention. The instrument consisted of two sections: the first assessed the comprehension of messages in Quechua through five multiple-choice questions based on the screens designed by the students; the second measured the perception and attitude towards the use of Quechua in educational and technological environments, through five Likert-type items (scale from 1 to 5).

The data obtained were organized in a matrix of SPSS and analyzed with descriptive statistics. Measures of central (mean) tendency and frequency distribution were calculated for both sections. The maximum score in comprehension was 5 points. Table 1 presents the items used in the post-test instrument applied to assess the understanding of Quechua and the students' perception:

Table 1

Proposal for a formative research project and programming blocks in Quechua

Section	Item	
Understanding Quechua	P1	What does the word "allin kawsaypaq" mean?
	Q2	If a screen shows the phrase "Saykuy, uma nanay", what does it indicate?
	Q3	What is the color shown when the air does not pose a health risk?
	Q4	"Warma machukunaqa uchuy nanaykunawan rikurinku" may refer to:
	Q5	What message was shown when air quality exceeded 1100 ppm?
Perception and attitude	Q6	I understood the messages in Quechua that appeared on the screens.
	P7	I learned new words in Quechua thanks to the activity.
	P8	Using Quechua in the app helped me better understand the health issue.
	P9	I would like to continue using Quechua in health or technology projects.
	P10	I consider it important to use Quechua in professional training.

Source: Authors, 2025.

3.3 PROPOSAL FOR A FORMATIVE RESEARCH PROJECT IN THE CLASSROOM

Table 2 presents the formative research projects developed in groups by nursing students, under the advice of the classroom teacher. Each project is linked to real health problems in the local context where the students live, and has been addressed through the use of sensors and cards from the STEM educational kit, programmed in an mBlock visual environment with blocks in the Quechua language.

During the execution of these research activities, the students designed interactive visual narratives in Quechua aimed at the prevention of common diseases in their communities, integrating technology, health, and culture. These narratives were built from the programming of visual blocks that allow simulating health scenarios and showing relevant information in the Quechua language, thus facilitating the understanding of risks and care by users.

Likewise, Table 2 summarizes the titles of the formative research projects together with the programming blocks in Quechua used for the creation of the interactive visual narratives in each project.

Table 2

Proposal for a formative research project and programming blocks in Quechua

3.4 DEVELOPMENT OF FORMATIVE RESEARCH IN THE CLASSROOM

The formative research was developed in the classroom following the 4 phases of the Problem-Based Research and Technology (PPTR) approach: understanding the problem, elaboration of activities, execution of activities and review of the solution. The activities carried out in each phase are detailed below.

3.4.1 Understanding the problem

During the phase of understanding the problem, the students carried out a systematic search for scientific information in sources such as Scopus, Google Scholar, Scielo and Redalyc, with the aim of analyzing the health problem raised. Based on the analysis and synthesis of the information collected, they developed a detailed description of the problem and graphically represented the cause-and-effect relationship using a visual organizer. As an example, Figure 2 shows the problems of air quality in homes with wood stoves that affect the health of the inhabitants of the province of Tayacaja in Peru.

Figure 2

Representation of the problematic situation

Source: Authors, 2025.

3.4.2 Development of activities

During this phase, the students researched the background related to the proposed research topics, reviewing various scientific sources such as Scopus, Google Scholar, Scielo, Redalyc, among others. After collecting and analyzing the information, they identified similar experiences and good practices that served as the basis for formulating a list of activities aimed at solving the problem of air quality in homes with wood-burning stoves. The activities proposed by the students to address the problem of air quality in homes with wood-burning stoves were the following:

- ☐ Implement a scenario composed of the Pachamama card and the MQ135 air quality sensor;
- ☐ Recognize and understand the programming blocks in Quechua corresponding to the MQ135 sensor;
- ☐ To develop an interactive visual narrative in Quechua for air quality monitoring and the prevention of respiratory diseases;
- ☐ Build a model that represents a typical home with a wood-burning stove, where the sensor is integrated; and
- ☐ Test the operation of the proposed solution, verifying its response to different levels of smoke concentration.

3.4.3 Implementation of activities

In this phase, the students addressed the problems identified through the execution of the activities designed in the previous stage. To do this, they began a process of familiarization with the operation of electronic boards, sensors, actuators and the visual programming environment in Quechua based on mBlock. Once this knowledge was acquired, they began to design and program interactive visual narratives in Quechua, aimed at monitoring air quality through the use of the MQ135 sensor.

These narratives were developed by integrating visual elements, digital characters, programming logic and simulation of real scenarios, such as homes with wood-burning stoves. This process allowed students to combine technical skills with their own cultural and linguistic expressions. Table 3 shows the development of the interactive screens made in mBlock, as part of the visual narrative in the Quechua language.

Table 3

Development of interactive screens of visual narrative in Quechua using mBlock

1. They represented the physical space of a rural house with a wood-burning stove, as the main setting for the visual narrative.	2. They designed the characters of the narrative: child, nurse, mother, and smoke particles, using representative visual and cultural resources.	3. They programmed the system's logic in mBlock, associating the values of the air quality index with messages and visual responses in Quechua.
		
4. They developed interactive screens in Quechua to communicate the health risks of smoke, integrating graphic elements, texts, sound and colors.	5. They built an educational model that recreates the domestic environment with a wood-burning stove, serving as a tangible support for interaction with the system.	6. They integrated the visual narratives programmed in mBlock with the STEM Educational Kit within the model, achieving a complete interactive experience.

Source: Authors, 2025.

3.4.4 Solution Review

In this phase, the students validated the results obtained during the execution of the research activities in the classroom. To do this, they evaluated the integral functioning of the models after integrating the electronic cards of the STEM educational kit with the interactive visual narratives in Quechua developed in the mBlock programming environment.

The review of the solution consisted of simulating the operation of a wood-burning stove inside the model and observing the responses generated by the system. The interactive screens, previously programmed, showed the levels of smoke concentration in units of particles per million (ppm) and their respective effects on human health, expressed through visual and textual messages in the Quechua language. These dynamic responses were accompanied by graphic representations of characters and alert colors, which facilitated the interpretation of the level of risk.

Figure 4 shows this simulation in action: you can see the model in operation, the sensor capturing the data from the environment, and the different screens activated according to the air quality values recorded.

Figure 4

Simulation of the operation of the interactive system in Quechua in a model of a wood-burning stove

4 RESULTS

4.1 DESCRIPTION OF INTERACTIVE VISUAL NARRATIVE IN QUECHUA

Table 4 presents the screens that make up the interactive visual narrative developed by nursing students, as part of the formative research process. This narrative, created in the mBlock programming environment, aims to raise awareness about the effects of air quality in homes with a wood-burning stove and its impact on human health. Each screen is activated according to the value recorded by the MQ135 air quality sensor, expressed in units of particles per million (ppm), and displays messages in the Quechua language accompanied by visual elements such as characters, alert colors and everyday scenarios, which allow risk levels to be interpreted in an accessible and culturally meaningful way.

Table 4

Representation of interactive screens in Quechua for the dissemination of information on air quality and community health

Screenshot of the interactive visual narrative in Quechua	Description of the content and visual message in the context of health
	The figure shows one of the screens of the interactive visual narrative in Quechua, activated when the sensor detects an air quality value between 400 and 600 ppm. At this level, the app displays the message "Mana sasachakuywan allin kawsaypaq," which means that air does not pose a health risk. In addition, the green light comes on, which indicates healthy conditions of the environment. The characters (the child, the mother and the nurse) appear with happy or relaxed facial expressions, visually reinforcing the state of general well-being.
	This display is activated when the sensor records air quality levels between 600 and 700 ppm. In this case, the nurse shows the message in Quechua "Warmamachukunaqa uchuy nanaykunawan rikurinku", which warns of possible mild discomfort for sensitive people, such as asthmatic patients. Yellow light is illuminated, which represents moderately good air quality. Visually, the mother and child maintain expressions of tranquility, while the nurse appears in an attentive posture, emphasizing the beginning of a precautionary situation.
	The figure shows a screen of the interactive visual narrative, activated when the air quality sensor registers a value between 700 and 800 ppm. At this level, the nurse shows the message in Quechua: "Saykuy, uma nanay, uma muyuy, pantasqa ima, COPD aswan mana allin kay, chulli utaq uhu unquykuna", which warns that the air is polluted and represents a considerable risk for people with respiratory conditions. As an alert signal, the orange light comes on. In the scene, the characters (the mother and the child) appear with expressions of discomfort, evidencing symptoms such as coughing or discomfort, while the nurse adopts a reflective posture, conveying concern about the situation.

	The figure shows a display of the interactive visual narrative when the sensor detects air quality between 800 and 900 ppm. At this level, the nurse presents the message in Quechua: "Samay sasachakuy, sinchi uhu, ñawikuna simikuna rupachiy, sinchi saykuy", which refers to symptoms such as shortness of breath, lung inflammation and bronchial obstruction. This value indicates that the air is unfavorable for health, activating a red warning light. Visually, the characters (the mother and the child) show expressions of discomfort or persistent cough, while the nurse appears with a mask and a warning gesture, transmitting a message of care and urgency.
	This display is activated when the sensor measures a range between 900 and 1100 ppm. At the scene, the nurse communicates the message in Quechua: "Sinchi chulli uhukuna, qapsan pakisqa, chayraq paqarisqa wawa wañuy", which indicates a very high level of air pollution, with possible serious consequences such as severe lung infections or death in young children. The purple light illuminates, a symbol of critical alert. The characters (mother and child) show visible signs of respiratory involvement, while the nurse appears wearing a full protective suit, representing an extreme situation of health risk.
	The figure shows the interactive visual narrative screen that is activated when the sensor registers an air quality value greater than 1100 ppm. At this critical level, the nurse communicates the message in Quechua: "Ancha mana allin qapsan, sinchi unquq sunqu, llumpay qusñimanta ismusqa qapsan", which warns that the air is extremely polluted, with the risk of causing pneumonia, heart attacks or lung cancer in case of prolonged exposure. In this emergency situation, the brown light comes on, which represents the highest level of alert. The characters (the mother and the child) appear visibly affected by the smoke, with expressions of intense coughing, while the nurse is shown in a full protective suit and mask, symbolizing a critical and highly dangerous health environment.

In this case, the nurse shows the message in Quechua "Warma machukunaqa uchuy nanaykunawan rikurinku", which warns of possible mild discomfort for sensitive people, such as asthmatic patients. Yellow light is illuminated, which represents moderately good air quality. Visually, the mother and child maintain expressions of tranquility, while the nurse appears in an attentive posture, emphasizing the beginning of a precautionary situation.

The figure shows a screen of the interactive visual narrative, activated when the air quality sensor registers a value between 700 and 800 ppm. At this level, the nurse shows the message in Quechua: "Saykuy, uma nanay, uma muyuy, pantasqa ima, COPD aswan mana allin kay, chulli utaq uhu unquykuna", which warns that the air is polluted and represents a considerable risk for people with respiratory conditions. As an alert signal, the orange light comes on. In the scene, the characters (the mother and the child) appear with expressions of discomfort, evidencing symptoms such as coughing or discomfort, while the nurse adopts a reflective posture, conveying concern about the situation.

The figure shows a display of the interactive visual narrative when the sensor detects air quality between 800 and 900 ppm. At this level, the nurse presents the message in Quechua: "Samay sasachakuy, sinchi uhu, ñawikuna simikuna rupachiy, sinchi saykuy", which refers to symptoms such as shortness of breath, lung inflammation and bronchial obstruction. This value indicates that the air is unfavorable for health, activating a red warning light. Visually, the characters (the mother and the child) show expressions of discomfort or persistent cough, while the nurse appears with a mask and a warning gesture, transmitting a message of care and urgency.

This display is activated when the sensor measures a range between 900 and 1100 ppm. At the scene, the nurse communicates the message in Quechua: "Sinchi chulli uhukuna, qapsan pakisqa, chayraq paqarisqa wawa wañuy", which indicates a very high level of air pollution, with possible serious consequences such as severe lung infections or death in young children. The purple light illuminates, a symbol of critical alert. The characters (mother and child) show visible signs of respiratory involvement, while the nurse appears wearing a full protective suit, representing an extreme situation of health risk.

The figure shows the interactive visual narrative screen that is activated when the sensor registers an air quality value greater than 1100 ppm. At this critical level, the nurse communicates the message in Quechua: "Ancha mana allin qapsan, sinchi unquq sunqu, llumpay qusinmanta ismusqa qapsan", which warns that the air is extremely polluted, with the risk of causing pneumonia, heart attacks or lung cancer in case of prolonged exposure. In this emergency situation, the brown light comes on, which represents the highest level of alert. The characters (the mother and the child) appear visibly affected by the smoke, with expressions of intense coughing, while the nurse is shown in a full protective suit and mask, symbolizing a critical and highly dangerous health environment.

4.2 ANALYSIS OF QUANTITATIVE RESULTS

In order to evaluate the understanding of the Quechua language and the perception of the students after the use of interactive visual narrative, a post-test survey was applied to 64 nursing students. This survey included five multiple-choice questions aimed at verifying Quechua linguistic comprehension (P1–P5) and five Likert-type items (P6–P10) to assess the attitude and perception of language use in health and technology settings.

4.2.1 Understanding Quechua

The results of the comprehension questions showed an overall average of 3.58 correct answers out of 5, which indicates a medium-high level of comprehension. The distribution of scores was as follows:

- ☐ 1 correct answer: 1 student (1.6%)
- ☐ 2 correct answers: 7 students (10.9%)
- ☐ 3 correct answers: 19 students (29.7%)
- ☐ 4 correct answers: 28 students (43.8%)
- ☐ 5 correct answers: 9 students (14.1%)

This result reveals that more than 58% of the group (37 students) answered correctly at least 4 of the 5 questions posed, suggesting that the visual narrative facilitated the semantic understanding of the messages in Quechua linked to air quality levels and their impact on health.

4.2.2 Perception of the use of Quechua

Regarding the perception items (Likert scale from 1 to 5), the averages obtained were as follows:

- Q6: I understood the messages in Quechua – 4.23
- Q7: I learned new words in Quechua – 3.73
- Q8: Quechua helped me better understand the health problem – 3.98
- Q9: I want to continue using Quechua in projects – 4.20
- P10: I consider Quechua important in my professional training – 4.06

These results show a highly positive assessment of the Quechua language in technological educational contexts. In particular, the high score in items P6, P9 and P10 reveals that students not only understood the messages, but also value the language as part of their professional training and show willingness to use it in future educational and health service experiences.

5 DISCUSSIONS

The results of this research show that the use of an interactive visual narrative in the Quechua language, developed through programming in mBlock, was an effective strategy to promote both the understanding of the native language and the analysis of a real health problem of the students' community. With an average of 3.58 correct answers in the linguistic comprehension questions and averages above 4 in the perception items, a double educational gain is observed: on the one hand, the students strengthened their bond with Quechua as a language of academic use; on the other, they developed digital skills applied to community health. (León, 2018)

This finding confirms that educational technologies should not be limited to technical teaching, but can become cultural tools that enable new ways of thinking, representing and acting from local knowledge. In this case, the mBlock programming environment allowed students to construct visual narratives in Quechua, contextualized in real scenarios such as wood-burning stoves in rural areas, where air pollution represents a public health problem. (Papert & Harel, 2002)

The combination of an objective understanding of the language with a positive attitude towards its use indicates that interactive visual narrative in Quechua was effective as an intercultural pedagogical strategy. This experience aligns with research that highlights

the role of indigenous languages in the construction of meanings in the classroom, as well as with the recommendations of UNESCO, which promotes the use of mother tongues in education systems to ensure inclusion, relevance, and equity. (Kvietok & Hornberger, 2023) (Rebaza & Seminario, 2018)

In addition, the design of interactive screens and digital characters in Quechua responds to the approaches of , who argues that visual languages in digital media not only represent data, but also configure cultural imaginaries. Here, the responses of the programmed application not only emitted smoke concentration data, but also did so in Quechua, with body expressions, colors and faces that represented states of health alert, generating a significant and culturally situated learning experience. Manovich (2002) (Paucar-Curasma et al., 2025)

From a critical perspective, the experience also challenges the homogenizing educational model that has historically relegated indigenous languages to informal or marginal spaces. On the other hand, this proposal demonstrates that Quechua can occupy a leading place in educational and scientific contexts, dialoguing with technology and contributing to the production of knowledge from the margins. (Ojeda et al., 2022)

Finally, this research provides evidence on how formative research methodologies, when combined with intercultural approaches and accessible technologies, can transform the classroom into a space of cultural and linguistic empowerment. It is recommended to replicate similar experiences in other disciplines, as well as to design more specific instruments to assess language acquisition and technological appropriation in intercultural contexts. (Paucar-Curasma et al., 2024)

6 CONCLUSIONS

The present research demonstrates that the use of an interactive visual narrative in Quechua, designed by nursing students through mBlock programming, constitutes an effective pedagogical strategy to integrate technological, linguistic and cultural knowledge in professional training contexts. The results obtained reflect an adequate level of understanding of the Quechua language and a positive attitude towards its use in educational and health settings, which confirms the potential of the intercultural approach in higher education.

This experience allowed students not only to develop skills in programming and interactive systems design, but also to revalue their native language as a legitimate means

of communicating scientific information and promoting public health. It was evident that digital technologies, when culturally contextualized, can become tools for linguistic revitalization, critical appropriation of knowledge and the strengthening of professional identity with a territorial approach.

In this sense, the methodological proposal based on formative research and the IBPT (Problem- and Technology-Based Research) approach favored the construction of meaningful learning, collaborative work, and critical thinking from the local context. It is recommended to implement similar experiences in other areas of knowledge and to strengthen the assessment of indigenous language learning with specific instruments.

Finally, this study provides empirical evidence on the value of incorporating indigenous languages in the development of applied technological solutions, and contributes to the debate on the decolonization of knowledge in training spaces.

ABSTRACT

This paper is part of a qualitative research, based on an ethnographic study, carried out with the Makonde ethnic group, in southern Mozambique. It reflects on the traditional practice of circumcision as an initiation ritual among the Makonde and the influence it suffered in contact with other ethnic groups and religions and with the biomedicine paradigm. It develops a brief historical characterization of circumcision in the cultural traditions of different ethnic groups in the country and points out challenges of the practice of traditional circumcision in dialogue with biomedical interventions related to HIV prevention. It highlights the role of health workers, bioethicists, and anthropologists in the understanding of singular stories of native ethnic groups and their forms of resistance or adherence to epistemologies from contemporary scientific medicine. Also argues the need to address informed consent and human rights of young males who participate in this type of intervention.

Keywords: Male Circumcision. Cultural Tradition. Biomedicine. HIV.

RESUMO

Este artigo é um recorte de pesquisa de natureza qualitativa, baseada num estudo etnográfico, realizada junto ao grupo étnico Makonde, que habita no sul de Moçambique. Reflexiona sobre a prática tradicional da circuncisão como ritual de iniciação entre os Makonde e a influência que sofreu no contato com outros grupos étnicos e religiões e com o paradigma da biomedicina. Desenvolve uma breve caracterização histórica da circuncisão nas tradições culturais de diversos grupos étnicos do país e aponta para os desafios da prática da circuncisão tradicional em diálogo com as intervenções biomédicas relacionadas com a prevenção do HIV. Destaca o papel dos sanitaristas, bioeticistas e antropólogos para a compreensão das histórias singulares dos povos originários e suas formas de resistência ou de adesão aos saberes provenientes das medicinas científicas contemporâneas e da observância do consentimento informado e o respeito aos direitos humanos dos jovens que realizam estes processos de intervenção.

1 INTRODUCTION

Male circumcision is the most frequent surgery among men¹ and, among some ethnic groups, it is a ritual practice that symbolizes the passage from childhood to adulthood². It can be interpreted as the moment of attribution of social roles to men in many traditions³. This is a subject widely debated in the medical literature, either because of its correlation with the reduction in the risk of HIV infection⁴ or because of bioethical debates about autonomy and limits of body manipulation⁵.

In African countries, circumcision is a traditional practice in more than 400 communities or ethnic groups⁶ and needs to be understood from cultural perspectives and traditional medicine in its encounter with colonizing practices, whether resulting from the expansion of non-original religions (such as Islam or Christianity) or from contemporary medical practices related to HIV^{7 8}.

In publications on the health practices of peoples in sub-Saharan Africa, there is a tendency, according to more critical researchers⁹, to structure narratives from the perspective of the dominator. Thus, sanitarians, bioethicists and anthropologists must be aware of the unique histories of native peoples and the forms of resistance or adherence to the knowledge coming from contemporary scientific medicines. With regard to circumcision, it is not uncommon for medical interventions unrelated to traditional practice to be refused¹⁰.

This article presents some results of an ethnographic approximation study carried out among the Makonde ethnic group residing in Mozambique. The sociocultural context of circumcision in the autochthonous tradition and the influence it suffered in contact with other traditions are analyzed. At the end, some reflections on public health and bioethics on the subject are made.

2 COLONIAL PERIOD

Mozambique is a country on the east coast of Africa that, over time, has been occupied by peoples of different origins and cultures, Africans, Arabs, Indians and Europeans. The country is predominantly inhabited by the descendants of the Bantu, a large ethnolinguistic group that populates almost all of sub-Saharan Africa sharing sociolinguistic similarities in beliefs, rituals and customs¹¹. According to Firmino¹², in Mozambique there are thirteen ethnic groups: (1) Swahilis, (2) Makuas, (3) Lomués, (4) Makondes, (5) Yao or Ajaua, (6) Maraves or Nyanja, (7) Sena, (8) Chuabo, (9) Chonas

including the Ndaus, (10) Angonis or Nguni, (11) Tsongas (divided into Ronga, Changane and Vatswa), (12) Chopes, (13) Bitongas.

Circumcision is a traditional African practice that goes far beyond a simple cut of the foreskin. It implies a conception of the world and requires techniques, instruction processes and transmission of skills for its execution. Circumcision is a cultural symbol that is nourished by religious and ethnic values and expresses mechanisms of insertion in the various societies where it is in force¹³. In Mozambique, it is practiced for ethnic-religious reasons by the Swahilis, Makondes, Yao or Ajaua, Makuas-Lomués, Sena, Chuabo, Chopes, Bitongas and Vatswa. The Rongas and Changanas abandoned the rite by Nguni imposition and on the side of the Arab/Persian influence that wanted to impose their circumcision, but were prevented by the Portuguese.

The Portuguese and the Catholic Church tried to extinguish the initiatory rituals of the traditional African religion and part of the Muslim traders encouraged Africans to maintain their cultural traditions and beliefs in opposition to the hegemonic role of evangelization and Portuguese civilization^{14 15}. Traditional circumcision was only effectively extinguished by the Ngunes when they subjected the Rongas and Changanas in southern Mozambique to domination and the consequent replacement of the practice by the rite of piercing the ear lobe using a penknife, as a new symbol of identity of those submissive to Emperor Manikusse or Sochangana of Gaza.

Schwartz¹⁶ observes that the enslaved Africans taken to the Americas were not prevented from maintaining the practice of rites of passage, even though circumcision was advised against by the clerics who submitted them to baptism, which required adherence to Christianity. However, there were forms of resistance and cultural and religious perpetuation through the maintenance of traditional African practices in captivity. Sweet¹⁷ points out that at the beginning of the eighteenth century, in Brazil, there were reports of slaves refusing to have sexual relations with uncircumcised people who could be considered uninitiated or ritually impure.

3 POSTCOLONIA PERIOD

The end of Portuguese colonial domination, with the foundation of the Republic of Mozambique in 1975, represented the emergence of a new conception of nation, of forms of political, economic, cultural and religious organization that imprinted new directions on the emerging society. In this new context, there is a revival of cultural pluriethnic resistance,

of the oral traditions of local peoples who resist processes of colonial deterioration of their sacred universe, creating strategies for maintaining traditions. Ngole¹⁸, in his anthropological analysis of the Makondes, attests that there were political tensions for religious reasons, mainly related to the imposition of the Catholic faith during Portuguese domination.

4 DJANDO YA VAMAKONDE AND YAO

The Makondes are described as invincible, indomitable and hardened warriors, for their resistance against all forces that oppose their beliefs and traditions¹⁹. The protection of the bodily practices imposed on other ethnic groups in the *Likumbi* initiatory experience is a demonstration of how much they extend their ethnic supremacy beyond their borders. In the oral tradition, the Makonde consider themselves to have a deep kinship relationship with the Yao, sharing aspects of social organization and initiation rites²⁰. The Yao can be initiated into *Likumbi* and their ritualization can be validated by them. The Makondes, on the other hand, do not accept to be initiated into the *Unhango rite* of the Yao and do not validate it.

The Makondes keep their centuries-old traditions alive and have not allowed changes with regard to circumcision. With the HIV pandemic, some choose to take their children to medical circumcision. However, most do not fail to submit them to circumcision done through the use of knives and without anesthesia to comply with the rite of passage. The use of local anesthesia in traditional circumcision is rejected insofar as pain and bleeding are considered important experiences at the initiate's entry into adulthood.

The research revealed that some *Nalombwos* (masters of the rite) and young people who were already initiated, did not fully assume the introduction of biomedical procedures such as the individualized use of a cutting blade for each initiate. Previously, the *Nalombwos* reused cutting blades on initiates who did not bring their own blade. Throughout the fieldwork developed in the data collection of this article, it was verified that this still happened, evidencing the complexity of the dialogue between biomedical interventions and traditional practices.

Initiation is an ethnic socialization for both the Yao and the Makonde, although it is a practice carried out differently in each group²⁰. For example, there are changes between circumcision in the *Lupanda* Yao ritual before the Arab/Islamic influence and the current

Unhango. However, despite the similar structural composition of the Yao and Makonde rituals, the categorization of the preputial cut may differ from biomedical practice²¹.

However, it is important to be aware of some similar procedures. Yao circumcision is also performed by *Angaliba*, the initiation master, using a single instrument that serves all initiates and without sterilization as described in the reports of Yao participants²². This author describes one of the initiatory structural differences between *Unhango* and *Likumbi*. At *Unhango*, parents enlist the neophytes and, after confirmation, communicate it to the *regulus*, a local traditional authority, who in turn addresses the invitation to the Association of Traditional Doctors of Mozambique (AMETRAMO). It is up to him to indicate *Ngaliba*, master of traditional circumcision, who is not only in charge of the surgery, but also of inviting health professionals for any adverse episodes in the procedure. It is up to *Nakanga* to be in charge of learning and initiatory coordination.

This composition is more democratic among the Yao, as it involves the community and its structure. In the Makondes who moved to the south of Mozambique, the participation of parents and the community is notorious, but it does not involve AMETRAMO or the *regulus*. The entire initiatory process is circumscribed to the functions of *Nalombwo*, the surgical master, his power in initiation is absolute.

Likumbi begins at dusk, and some of the rites that precede it are surrounded by taboos and secrecy, which is why its realization is not always announced in advance. For example, circumcision is performed suddenly on the way to *Likuta* because, in the Makonde conception, *Likuta* is an impure and unsafe place for surgery if the sorcerers anticipate setting a trap to infect the surgery of *the Vawali*, initiates²¹. On the contrary, the Yao, according to Namuholopa²², enter the initiatory place at dawn, after invocation of the ethnic ancestors.

5 KUSOKA AND ISLAM

Kusoka is circumcision in the Bantu languages; even before the *Nguni invasion* of southern Mozambique it was a common ritual practice. The introduction of Islam and Arab/Persian culture in Africa in the mercantile era would have fascinated Balta²³. Black Islam inserted in the daily life of the communities assumed African values and traditions in their devotion, incorporating local autochthonous beliefs and practices into Islamic doctrine. Islam is rigid in the observance of its doctrinal principles, but in return, it is flexible to incorporate cultural practices and customs, except in the belief in a single god, *Allah, wāḥid*,

aḥad (one – first and only), pious and omnipotent. Their devotion rests on *Sunna* or tradition, analogical judgment *Qiyas* and *Ijma community consensus*, aimed at social embodiment and cohesion where religious life is not separated from everyday social life. This is the respect that is shown for the uniqueness of Islamic law, which serves both to legislate civil and religious life²⁴.

The *Kusoka custom* in the indigenous traditions of Mozambique currently predominates in all the native peoples of the provinces, with the exception of Tete, Manica and Maputo. According to Alpers²⁵, these traditions have been influenced over time by Islamic cultural and religious influence. This fact has occurred since the beginning of the seventh century in the region, when the action of Arab and Persian traders and navigators gave rise to the commercial centers of Sofala, Ilha de Moçambique, Quiloa and Pemba.

Mozambique has an undeniable and diverse presence of Muslims, who, according to reports by Newitt²⁶, would have been descendants of Islamists from different parts of the world and from branches of Islam. The cities of Mafia, Zanzibar, Mombasa, Gedi, Melinde, Manda, Lamu, Pate, Faza Brava, Merca, Mogadishu and the states of Comoros, Madagascar, Socotra, Mecca, Yemen, Oman, Persia, India, Ceylon, Indonesia, were part of the Indian Ocean trade network in the twelfth and seventeenth centuries before the Portuguese presence.

The permanence of Muslims on the coast of Mozambique has cooperated with the expansion of an Islam of denominations and attributes of diverse geographical origins. Amide²⁷ explains that the Arabs altered the cultural and religious scenario of the Yao by making them Muslims and made changes in the *Unhango*, an initiatory rite. In such a way, *Unhango* became *Shahada*, the initiation rite of the Islamic faith formerly called *Lupanda*, the male rite, and *Chiputo*, the female ritual. Amaral²⁸ considers that the majority of the Yao have lost the traditional meaning of initiation into Islamic devotion and have transformed rituals from their tradition to the *um*, a community of Muslim religious life.

Maivasse²⁹, in a study he carried out in the Neighbourhood of the Popular Forces for the Liberation of Mozambique (FPLM), one of the largest urban centres in the city of Maputo, shows that the practice of traditional circumcision is intricate in tradition and religion. On the other hand, the high urban social class has given it transformations, adjusting them to its elite status. The Islamic surgical and religious ritual with medical intervention to prevent the occurrence of HIV infections in this group of the urban center, according to the author, is a recent phenomenon.

This is where the predominance of ethnic circumcision ceases, in groups syncretized with Islam, as described in the Yao tradition. The Makondes are the only ones who separate the space of the *Djando*, ethnic circumcision, from the tradition of the *Shahada*, Islamic circumcision. They do not accept that the Islamic tradition imposes itself on the ethnic tradition. The *Djando* takes place in *Likuta*, sacred forest. Marcos³⁰ says that the Makonde who accept Islamization attend *Mwalimo*, a traditional Koranic school that teaches the theological basis of the Koran to initiates.

6 HIV ERA AND MEDICAL CIRCUMCISION

The overview of circumcision presented here reflects the social context in which the rite is circumscribed in the cultural traditions of the peoples of Mozambique. Some effects will be seen below in the context of the HIV/AIDS epidemic and the practice of biomedical circumcision.

The recommendation of male circumcision to reduce the risk of HIV infection by the World Health Organization (WHO) and the Joint United Nations Programme on HIV/AIDS (UNAIDS) published in 2007, precipitated the debate around why traditional circumcision is not part of the same strategy. According to this document, observational studies showed in various contexts of countries on the African continent that the prevalence of HIV was lower among men who had undergone circumcision.

In search of more substantiated scientific evidence, three randomized clinical trials were carried out in Kenya, Uganda and South Africa, which analyzed the efficacy, safety and acceptability of the strategy, the results show that the procedure reduces the risk of contracting HIV by 60% in circumcised women³¹. At the same time, studies have shown that male circumcision does not completely protect against acquiring HIV infection and, therefore, does not dispense with the use of other prevention strategies. Considering these findings, it was possible to incorporate male circumcision performed by trained medical professionals as another component of the range of prevention measures available to reduce heterosexual HIV infection in men. It has been determined that proper communication of this strategy is critical and culturally sensitive. It calls for the dissemination of clear messages, accompanied by the need to take other preventive measures concomitantly with male circumcision, with a view to comprehensive HIV prevention, including sexual abstinence within six weeks of circumcision.

From a sociocultural point of view, the WHO recommendation³¹ recognizes the role of circumcision in communities and in some religions such as Islamic and Jewish. In this sense, the health services that will offer this intervention need to be properly structured for the appropriate execution of this strategy, which involves safe scenarios for clinical practice in aseptic conditions, adequate equipment and team skills. And, in terms of human rights and ethical and legal principles, the document warns that this intervention raises concern. It is up to health services to guarantee informed consent to participants, informing them in detail of the risks and benefits of the intervention, as well as avoiding coercion and discrimination against users, as part of adherence to good medical practices.

These recommendations also extend to young people and adolescents with whom it is necessary to contemplate aspects of their maturity in carrying out the informed consent process. In addition, the WHO/UNAIDS document urges countries to be careful that the circumcision procedure does not promote non-consensual sex, domestic violence or link male circumcision to female genital mutilation. Male circumcision needs to be seen as an opportunity to strengthen sexual and reproductive health and to expand access to health services for young people and men.

Preventive medical circumcision of HIV in Mozambique has brought about two new social models of ritual practice. The first was to shift massive initiatory circumcision from ethnic traditions to medicine. Second, clinical practice has come to be guided by the principlism of Beauchamp and Childress, following four principles of Bioethics that underlie the obligation to sign the *free and informed consent form* (ICF)³². The informed consent form is important because it imposes rigor in safeguarding the patient's autonomy, proves the knowledge and agreement of their participation in medical acts, clarifies the objectives of the clinical intervention and the communication of risks and benefits of their free and conscious participation in the procedure³³.

Medical circumcision in Mozambique is recommended for children as young as 10 years old. In practice, it is carried out without signing the ICF and without respect for the principles of Bioethics. Children and their parents/guardians are unaware of the likely negative effects of circumcision, such as loss of sexual sensation, disabling complications, medical marketing to attract patients, and forced HIV testing. Such aspects raise criticism. Circumcision of minors without the consent of parents/guardians does not guarantee that children under 10 years of age will be excluded from the program, constituting another violation of bioethical principles³⁴. Two-thirds of medical circumcisions occurred among

men aged 10 to 19 years in Africa³⁵. In the district of Chókwé-Mozambique, 19,201 men aged 10 years or less were circumcised in the period from 2014 to 2019. This fact raises serious questions about the possible experimentation of adult circumcision on children without consent, according to Hines⁴, based on Jhpiego's work.

The parents described that their children were mobilized by teachers and nurses at the school, taken to the circumcision posts by health agents. Thus, under no circumstances should they refuse because it was an order of teachers and health professionals. They feared that their refusal to be circumcised could lead to punishment, barring them from attending school, as well as acts of discrimination and stigma in the school environment (*Nguyama, 56 years old*).

When it comes to specific patients, Miziara³⁶ says that only at risk of death, medical intervention can be performed with tacit consent, and this is not the case. Svoboda³⁷ believes that if circumcision of children is an HIV control strategy, the idea is that it should be applicable close to the age of initiation of sexual activity. For Dua³⁸ circumcision should be postponed until adulthood, so that men can give consent for the excision of the foreskin autonomously, choosing the type of procedure. Only in these circumstances is there no violation of the rules of medical ethics.

Paternity does not attribute ownership to children, as they are beings with individual will and originality, constituting subjects of actions that guide their existence. Their choices are no longer an inheritance of cultural traditions, they are acts of personal sovereignty and the individual's own decision, who have their own will, rights and different degrees of autonomy³⁹.

In another scenario, traditional circumcision has been pointed out as a risk practice for HIV infection, considering the limitations to ensure asepsis in the procedure, as well as the type of incision and tissue removal that is made. A challenge posed to biomedicine and traditional medicine with regard to circumcision is to find points of convergence for a dialogue that gives rise to the understanding of the medical pluralism that already exists in societies⁴⁰. That is, the use of various mechanisms for the health care of people that may or may not be complementary, concomitant or excluding. It is necessary to recognize the existence and legitimacy of traditional knowledge and practices and the various etiological and therapeutic conceptions that subsist in societies, which cannot necessarily be classified in terms of efficacy and safety as predicted by biomedicine. Therefore, there is a structured tension between the official health systems and the traditional systems based on the

rationalities of the procedures that are of a very different nature and that only make sense in the specificities of their respective sociocultural references.

Hence, the success of medical male circumcision programs should not be based solely on the number of men circumcised without consent. Ensuring the protection and safety of minors should be the priority, as well as assessing the psychosocial effects, their quality of life, depression, the quality of services provided, and the stigma arising from the perceived difference between circumcised and uncircumcised children. In some circumstances, the high number of circumcised individuals who did not comply with all procedures seeks to meet the goals of the program's funders on time⁴¹.

The success of medical circumcision programs contrasts with the increasing number of negative events associated with this procedure that translate into stigma and discrimination, calling into question the cost-effectiveness of global circumcision campaigns⁵.

7 THE AGE OF CONSENT IN THE WORLD

The age of consent is legitimized in people legally competent to consent to sexual activity, it varies from 11 - 21 years around the world⁴². The universal stance on consent is a practice to be adopted in Mozambique's circumcision strategies. It would also be a legal support for minors to decide about their sex life. Many countries around the world are concerned about children's legal age of consent as part of guaranteeing their rights to health. In cases of HIV, the age of consent is a social protection of patients against discrimination and stigma. At the same time, it is a guarantee of access to health care for adolescents in prevention, treatment and care⁴³. Such recognition would be a reflection of the country's commitment to the inclusion of ethnic minorities, children in vulnerable situations, and the protection of their health rights. Studies by Hein⁴⁴ and Coyne⁴⁵ argue that children have the capacity to decide about their health care.

Adherence to the circumcision program showed that children and parents/guardians do not have autonomy over the health of their children. It is alienated from the interests of third parties who act in the name of safeguarding health against HIV.

8 RISKS AND BENEFITS

The evaluation of risks and benefits in circumcision is analyzed from the perspective of surgical massification in the presumption of reducing the chances of HIV infection. The

risks should be measured based on the therapeutic effects and not by the non-therapeutic surgical massification that did not imply a discussion about the loss of the foreskin, the value it represents for the circumcised and the incalculable bodily and psychological damage it causes⁴⁶. What justifies circumcision of sexually inactive children? The theory of reducing the transmission of sexually transmitted infections through circumcision is valid from the first sexual intercourse³⁸, which begins on average at 18 years of age⁴⁷. Arruda⁴⁸ indicates that active sexual life begins between 7 - 18 years of age in men and in women between 7 - 17 years of age. HIV infection among men occurs more frequently between 20 and 30 years of age⁴⁹.

The principle of non-maleficence stipulates that acts that may cause useless harm to children and without immediate benefits should not be performed, in this case, in the removal of functional body tissue^{50 51}. Non-therapeutic circumcision imposes on the healthy child the risk of harm without benefit. This would then constitute an evil act. It also upholds the principle that physicians cannot take orders from the parents or guardians of children because the physician's duty is to the patient⁵². Non-maleficence is contradicted when a child is circumcised without the consent of the parents and under duress when doing something that may be considered malicious and superfluous, such as the removal of the foreskin.

The national circumcision protocol, adapted from the recommendations of the Joint United Nations Programme on HIV/AIDS (UNAIDS) and the President's Emergency Plan for AIDS Relief (PEPFAR), does not yet apply to mass surgeries in the country. It is likely that the local context may not be suitable for the ethical application of the ICF³². For Vaughn⁵³, the absence of consent can only be justified by the inability of a minor, mental illness, psychic disturbances, anguish, fear, pain, and the inability to make decisions, as he does not always know the implications of medical acts for his health.

9 FINAL CONSIDERATIONS

The specter that non-therapeutic male circumcision is a beneficial procedure because it protects against HIV transmission fuels the debate around whether this practice should be performed on children without the consent of the children or their parents. For apologists for circumcision without consent, there is no association that balances surgery and ethics, as uncertainties are reduced to life-saving medical acts. If there is an

association between surgery and practical medical ethics, there must be a policy that results from long years of doctor/patient relationship in its actions.

The circumcision policy of the Mozambican Ministry of Health, inspired by the recommendations of UNAIDS⁴⁹ of 2007, may be hampered in its implementation, according to Junqueira⁵⁴, due to the lack of an ethical culture of professional-patient consent before the era of preventive circumcision of HIV. This is a difficulty inherent to the introduction of a new technology, whether light or hard.

However, there is no circumstance that justifies parents enjoying the right to choose what is best for their children's health. Nor should this decision of the parents be made by the doctors. However, the existence of ethical laws and procedures dispels the omission of medical-professional responsibility.

ABSTRACT

The second year of elementary school is a crucial phase for students' development towards mastering reading and writing. It is during this period that children need to consolidate essential skills for achieving literacy. In this sense, this research focuses on the results of second-grade classes in the Municipal Education Network of Moreno/PE, which made efforts and developed short- and long-term strategies with teachers to minimize the gaps identified in the students' literacy process due to the school distancing caused by the COVID-19 pandemic. The results of the Diagnostic Assessments of the Municipal Network for the years 2022, 2023, and 2024 were analyzed. Through document analysis (Ludke and André, 1986), the collected data were processed and analyzed in dialogue with the theoretical framework relevant to the theme of literacy: Ferreira (1999); Moraes (2012); Soares (2022; 2023). The results revealed that in 2022, only 41.2% of students who completed the 2nd grade reached the alphabetic writing hypothesis (they had completed the last year of Early Childhood Education and the 1st grade using activity books during the pandemic), while in 2024 this number rose to 68% (they completed the first year of Early Childhood Education using activity books during the pandemic). These data reinforce the importance of ongoing teacher training and monitoring of learning throughout this process.

desenvolveu estratégias de curto e longo prazo junto aos professores a fim de minimizar as lacunas identificadas no processo de alfabetização dos estudantes devido ao distanciamento escolar ocasionado pela pandemia da COVID 19. Foram analisados os resultados das Avaliações Diagnósticas da Rede Municipal referente aos anos de 2022, 2023 e 2024. Por meio da análise documental (Ludke e André, 1986), os dados coletados foram tratados e analisados dialogando com o referencial teórico pertinente à temática da alfabetização: Ferreiro (1999); Moraes (2012); Soares (2022;2023). Os resultados revelaram que em 2022 apenas 41,2% dos estudantes que concluíram o 2º ano chegaram à hipótese de escrita alfabética (eles haviam cursado o último ano da Educação Infantil e o 1º ano por meio de cadernos de atividades no período da pandemia), já em 2024 este número subiu para 68% (eles cursaram o primeiro ano da Educação Infantil por meio de cadernos de atividades durante a pandemia). Esses dados reforçam a importância da formação docente continuada e do monitoramento das aprendizagens ao longo desse processo.

RESUMEN

El segundo año de la educación primaria es una fase crucial para el desarrollo de los estudiantes hacia el dominio de la lectura y la escritura. Es durante este período que los niños necesitan consolidar habilidades esenciales para alcanzar la alfabetización. En este sentido, esta investigación se centra en los resultados de las clases de segundo grado de la Red Municipal de Educación de Moreno/PE, que realizaron esfuerzos y desarrollaron estrategias a corto y largo plazo con los docentes para minimizar las brechas identificadas en el proceso de alfabetización de los estudiantes debido al distanciamiento escolar causado por la pandemia de COVID-19. Se analizaron los resultados de las Evaluaciones Diagnósticas de la Red Municipal para los años 2022, 2023 y 2024. Mediante el análisis de documentos (Ludke y André, 1986), los datos recopilados se procesaron y analizaron en diálogo con el marco teórico relevante para el tema de la alfabetización: Ferreiro (1999); Moraes (2012); Soares (2022; 2023). Los resultados revelaron que en 2022, solo el 41,2 % del alumnado que completó 2.º de primaria alcanzó la hipótesis de escritura alfabética (habían completado el último curso de Educación Infantil y 1.er curso utilizando cuadernos de actividades durante la pandemia), mientras que en 2024 esta cifra ascendió al 68 % (completaron el primer curso de Educación Infantil utilizando cuadernos de actividades durante la pandemia). Estos datos refuerzan la importancia de la formación docente continua y el seguimiento del aprendizaje durante todo este proceso.

1 INTRODUCTION

Since the pandemic caused by COVID 19, education, in general, has encountered numerous challenges for the reorganization of curricula and student learning. Due to social distancing and the impediment of face-to-face classes across the country, many children returned to school with gaps in learning and emotional development that brought a new problem: the recomposition of these learnings.

We found that in the municipality of Moreno, located in the Metropolitan Region of Recife, students had their link with the school maintained through non-face-to-face activities during the years 2020 and 2021, returning to face-to-face classes only in 2022. In this context, there was a great challenge related to the guarantee of learning rights since, after two years of distance schooling through activity books and some contacts via *whatsapp* with teachers, children were greatly disadvantaged in terms of the content of various areas of knowledge.

In this sense, we identified reparative propositions made by the Municipal Department of Education which, through the adoption of diversified strategies, sought to overcome these learning gaps. As a first reparative measure, the Municipal Education Network promoted diagnostic evaluations in the network in order to identify the most urgent needs related, mainly, to literacy. Based on the results of the diagnostic evaluations, the coordination of the initial years of Elementary Education reorganized the continuing teacher training in order to offer support to teachers in the process of recovery and recomposition of these learnings, dealing intensely and systematically with the heterogeneity in the classrooms.

In view of this evidence, we established as a general objective of this research to analyze the data of the second year classes of the Municipal Education Network of Moreno/PE related to literacy. As specific objectives, we seek to:

- Compare the progress in the appropriation of the writing of second-year students for the years 2022, 2023 and 2024;
- Evaluate the importance of carrying out periodic diagnostic evaluations as a means of monitoring consolidated learning;
- Analyze the effects of a teaching practice planned based on the most immediate needs of students.

2 THEORETICAL FOUNDATION

The "literacy cycle" is the three-year period in which children must learn to read and write, that is, from the 1st to the 3rd year of Elementary School. This period aims for children to build their knowledge continuously, respecting their rhythms and ways of expressing themselves. However, the National Common Curriculum Base (BNCC) establishes that, by the end of the 2nd year, they must complete this cycle.

Although we know the importance of reading and the need to guarantee this right to all children, it is necessary to keep in mind that the literacy process is individual and can vary from child to child. Furthermore, historically, there is a loss in terms of learning to read and write at the national level.

When the focus turns to the Northeast, it is perceived that there is a real discrepancy between children from the lower classes of society and those from the middle and upper classes. These differences in opportunities and guarantee of rights reflect the unjust social inequality that exists in our country. In this sense, bringing forward the "literacy cycle" to two years does not seem to us to be a fair and sensitive decision to the many realities in which our children, from popular backgrounds, are inserted.

As for learning to read and write, Soares (2020) argues that all children can consolidate these skills. For the author, planning should focus on learning and, from there, systematize teaching, carrying out a constant evaluation of what they (children) already know and what they are already capable of learning, at the age they are.

Regarding the ways of teaching the language, from the 1980s onwards, research by Emília Ferreiro and Ana Teberosky (1999) gave space to the discussion on the Psychogenesis of Written Language. These studies were carried out in order to understand how children learned the written language and the growth of these discussions provided a new way of conceiving alphabetic notation and, consequently, the teaching of the Alphabetic Writing System (SEA).

In this context, Ferreiro (1990) breaks with the empiricist and associationist conception in force until then and argues that alphabetic writing is not a mere code, but rather a notational system. This means that the learner elaborates a series of hypotheses about what writing notes (or 'represents', 'writes') and how writing creates these notations (or 'representations').

Morais (2012) points out that the Psychogenesis of Written Language has brought great contributions to language teaching because it has weakened traditional teaching methods (which assume that the student learns by repeating and memorizing) because,

when formulating his hypotheses about writing, the learner uses strategies and reflections from previous knowledge that he acquires throughout his life.

These theoretical contributions have revolutionized the teaching of the language, since it is understood the paths that people follow until they appropriate SEA and formal reading. Brandão and Silva (2023) also argue that, before learning to read, children can learn to assume the posture of readers who think about the texts they hear and who strive to extract and produce meanings.

Thus, we argue that the period destined to the consolidation of literacy should be carefully planned, in order to help students understand and reflect on the language.

3 METHODOLOGY

In this study, we performed documentary analysis (LUDKE and ANDRÉ, 1986) in order to investigate more assertively the data provided by the Municipal Department of Education, prioritizing the second-year classes and their evolution over the years 2022, 2023 and 2024 regarding the appropriation of the SEA. We chose this school year because it is the year in which the children should already have the initial literacy process well underway to, in the third year, complete the literacy period (cycle).

We analyzed the diagnostic evaluations of entry and exit carried out in the Municipal Education Network, establishing a counterpoint on the results obtained in each of them. Next, we will evaluate the impacts caused by continuing education on the teaching practice of literacy teachers in the Network.

This study is presented with a qualitative-quantitative nature, conceiving the methodological procedures as the path of thought and practice exercised in the approach to reality (MINAYO, 2001, p.16) because, although the data collected are quantitative and are systematized in tables and Figures within this perspective, we cast a qualitative look at these results, analyzing what is beyond the numbers.

4 ANALYSIS AND DISCUSSION OF THE RESULTS

Initially, we analyzed the results for the year 2024, among which we were able to observe advances and gaps. We analyzed the participation rate in the evaluations in order to verify whether the results matched the reality and the variables in the writing hypotheses (the data had already been obtained through the investigation based on the Psychogenesis of

Written Language). Table 1 presents the participation rate in 2024 in the diagnostic assessments of entry (ADE) and exit (ADS) of the Municipal Education Network.

Table 1

Participation rate of 2nd year students in network evaluations in 2024

March 2024 - ADE	December 2024 - ADS
98%	96,3%

Source: Authors.

As we can see, most of the students were evaluated, which guarantees greater reliability of the data. In view of this, we begin the analysis of the evolution regarding the appropriation of the Alphabetic Writing System (writing hypotheses), the results of which are presented in the following Figures.

Figure 1

Evolution of Writing Hypotheses in the Diagnostic Entry Assessment

Source: Authors.

As we can see in the Figure above, the second-year classes at the beginning of 2024 were quite heterogeneous. In particular, students who revealed a pre-syllabic script added up to almost 11% of the total of the Network. We consider this an alarming data, since these students, in their majority, had experienced three years of schooling between Early Childhood Education and the first year of Elementary School.

Another fact that caught our attention is that more than 18% of the students also presented a syllabic script with no sound value. We consider that, in order to have a good performance in the second year, it would be ideal for students to enter this year of schooling having overcome the pre-syllabic and syllabic hypotheses without sound value.

Through the coordination of the initial years of the Municipal Department of Education, we identified that, throughout the year, there were several training courses aimed at overcoming these results, during which specific guidelines were given for this purpose. When we analyze the same data regarding the exit evaluation, we notice a very interesting movement, as we can see in Figure 2.

Figure 2

Evolution of Writing Hypotheses in the Diagnostic Exit Evaluation

Source: Authors.

The evolution of these students at the end of 2024 is significant. As we can see, only 3% of the students, who totaled almost 11% at the beginning of the year in pre-syllabic writing, completed the year at the same stage. Of the almost 18% who had syllabic writing without sound value, only 6% were unable to evolve. Another fact that draws our attention is that 68% of the students completed the second year with an alphabetic writing. These results show that the development of a pedagogical practice supported by the identification of the real learning needs of students and that has defined goals to be achieved in each year of schooling produce significant learning results.

Although we recognize the qualitative leap that occurred throughout the year, we understand that it would be important that the 9% of students who completed the year in the pre-syllabic and syllabic hypotheses with no sound value had already overcome these hypotheses.

In order to deepen our understanding of the Municipal Education Network's efforts with teachers in order to recompose learning, we decided to analyze the results obtained in 2022 (right after the pandemic, when second-year students had only attended school at the age of 4 and returned in 2022, at the age of 7 years old already in the second year) and in the year

2023, whose students had not experienced Early Childhood Education, but had attended the 1st year of Elementary School in person, at school. The comparative results between the three years are presented in Figure 3 below:

Figure 3

Evolution of writing hypotheses in the years 2022, 2023 and 2024

Source: Authors.

The comparative results above point to a growing evolution of students in the writing hypotheses over the years observed. Considering that in 2022 second-year students had not experienced school experiences in person neither in early childhood education Group 3 – 5 years old nor in the first year, the deficit of these children in relation to the appropriation of alphabetic writing is notorious. This year, we noticed that 12.5% completed the year in the pre-syllabic hypothesis, signaling a great challenge to be overcome by the Municipal Education Network. Another alarming fact, still in 2022, was the large percentage of students in the syllabic hypothesis without sound value (10.9%), further increasing the need to recompose the learning of these students in the following year.

In 2023, second-year students had attended the first year in person and already had the prospect of recomposing learning through the reparative measures instituted by the Department of Education. As a result, we can already see that, in 2023, there was a better performance related to the comprehension of the Writing System, as 7.1% of students completed the pre-syllabic hypothesis and 8.9% in the syllabic without sound value. We

noticed that the scenario, although still challenging, began to become milder, adding up to 16% of students in these hypotheses.

When we look at the results of the year 2024, we observe that the movement of recovery and repair of learning has become more evident, since, adding the pre-syllabic and syllabic hypotheses without sound value, the results pointed to 9% of the students. Looking closely, in the pre-syllabic hypothesis, there was only 3%. A relevant point is that 68% of the children completed the year in the alphabetic hypothesis.

5 FINAL CONSIDERATIONS

In view of the analyses, we realized that the teaching practices mediated by the investments of continuing education were essential for the evolution of the students. In this regard, Marinho (2020) draws attention to the need for teachers to be clear about what they want to achieve when planning their classes, in this case, it is important to trace a path in order to conduct systematic teaching and promote reflection on the language.

We consider that the decisions made by the Education Network constituted a differential that significantly interfered in the results obtained in the period from 2022 to 2004. By investing in a restructuring of continuing education, as well as in the definition of clear and accessible goals for the literacy teacher, there was a redirection of pedagogical practice, culminating in very satisfactory learning results.

Alex Pereira da Cunha¹

ABSTRACT

Engineering education in the 21st century requires continuous modernization, driven by digital technologies and the demands of Industry 4.0. This article investigates how emerging technologies—virtual and remote laboratories, 3D printing, the Internet of Things, and immersive realities—contribute to active learning and competency development in engineering education. The study is based on an integrative literature review with a qualitative approach, analyzing 80 studies published between 2010 and 2025 through thematic content analysis. The results indicate that virtual and remote laboratories expand access to and safety in experimentation; 3D printing supports prototyping and the integration of theory and practice; IoT enables instrumentation, automation, and data analysis; and immersive realities enhance visualization and safe training. It is concluded that integrating these technologies with active methodologies, such as Project-Based Learning, is strategic for pedagogical innovation, provided it is supported by intentional curriculum planning and adequate faculty development.

Keywords: Engineering Education. Digital Technologies. Active Learning. Industry 4.0. Competencies.

RESUMO

O ensino de engenharia no século XXI demanda constante modernização, impulsionada pelas tecnologias digitais e pelas exigências da Indústria 4.0. Este artigo investiga como tecnologias emergentes — laboratórios virtuais e remotos, impressão 3D, Internet das Coisas e realidades imersivas — contribuem para a aprendizagem ativa e o desenvolvimento de competências no ensino de engenharia. A pesquisa baseia-se em uma revisão integrativa de literatura, de abordagem qualitativa, analisando 80 estudos publicados entre 2010 e 2025, por meio de análise de conteúdo temática. Os resultados indicam que laboratórios virtuais e remotos ampliam o acesso e a segurança na experimentação; a impressão 3D favorece a prototipagem e a integração entre teoria e prática; a IoT apoia a instrumentação, a automação e a análise de dados; e as realidades imersivas aprimoram a visualização e o treinamento seguro. Conclui-se que a integração dessas tecnologias com metodologias ativas, como a Aprendizagem Baseada em Projetos,

RESUMEN

La enseñanza de la ingeniería en el siglo XXI requiere una modernización constante, impulsada por las tecnologías digitales y las demandas de la Industria 4.0. Este artículo investiga cómo las tecnologías emergentes—laboratorios virtuales y remotos, impresión 3D, Internet de las Cosas y realidades inmersivas—contribuyen al aprendizaje activo y al desarrollo de competencias en la enseñanza de la ingeniería. El estudio se basa en una revisión integradora de la literatura, con un enfoque cualitativo, que analiza 80 estudios publicados entre 2010 y 2025 mediante un análisis de contenido temático. Los resultados indican que los laboratorios virtuales y remotos amplían el acceso y la seguridad en la experimentación; la impresión 3D favorece la prototipación y la integración entre teoría y práctica; la IoT apoya la instrumentación, la automatización y el análisis de datos; y las realidades inmersivas mejoran la visualización y el entrenamiento seguro. Se concluye que la integración de estas tecnologías con metodologías activas, como el Aprendizaje Basado en Proyectos, es estratégica para la innovación pedagógica, siempre que esté acompañada de una planificación curricular intencional y de una adecuada formación docente.

Palabras clave: Enseñanza de la Ingeniería. Tecnologías Digitales. Aprendizaje Activo. Industria 4.0. Competencias.

1 INTRODUCTION

The twenty-first century imposes an unprecedented pace of transformation on engineering education, catalyzed by the exponential advance of digital technologies, the globalization of knowledge and the new and dynamic demands of the labor market. This scenario requires higher education institutions to constantly reevaluate and modernize their pedagogical approaches, with a growing focus on innovation, interdisciplinarity, and the promotion of active and meaningful learning (KENSKI, 2012; MORAN, 2018).

Traditionally, engineering education has been marked by expository methodologies and the transmission of content, a model that has been criticized for not keeping up with the rapid pace of technological innovation (FREIRE, 1996; PRINCE; FELDER, 2006). In this context, the strategic incorporation of technological resources emerges as one of the most relevant trends for the contemporary training of engineers. Tools such as virtual and remote laboratories, computer simulation environments, 3D printers, intelligent sensors (IoT), and immersive realities are not mere accessories, but structuring elements capable of fundamentally transforming teaching and learning processes (ABENGE, 2020; FELDER; BRENT, 2016).

The relevance of these technologies lies in their ability to enhance active methodologies, which, in turn, promote student protagonism, the practical application of knowledge, and meaningful learning. As Moran (2018) and Valente (2019) emphasize, the pedagogical use of digital technologies should not be limited to the simple replacement of traditional tools, but rather to the construction of interactive learning environments where the student is challenged to investigate, create, and solve real problems.

Given this conjuncture, the main objective of this article is to investigate and discuss how emerging digital technologies – specifically virtual and remote laboratories, 3D printing, Internet of Things (IoT) and immersive realities – enhance active learning and the development of skills in engineering education. To this end, this study synthesizes theoretical and empirical evidence from an integrative literature review, highlighting the main pedagogical benefits and the ways in which these innovations contribute to an education more aligned with the demands of Industry 4.0.

2 THEORETICAL FRAMEWORK

The theoretical framework underpins the analysis of the pedagogical potential of digital technologies in engineering education from the articulation between digital

education, active methodologies and learning theories. The role of emerging technologies — such as virtual and remote laboratories, 3D printing, Internet of Things (IoT) and immersive realities — in promoting active learning and the development of skills aligned with Industry 4.0 is highlighted.

2.1 DIGITAL EDUCATION AND ACTIVE METHODOLOGIES IN ENGINEERING EDUCATION

The digital transformation in engineering education implies more than the adoption of new tools, requiring the review of pedagogical practices and the valorization of student protagonism, autonomy and integration between theory and practice. In this context, active methodologies such as the flipped classroom, Project-Based Learning (PBL) and inquiry-based learning have been consolidated in the Brazilian scenario, as evidenced by Valença (2023).

Empirical studies indicate that the adoption of these methodologies contributes to engagement and learning, including in remote contexts, as demonstrated by Medeiros and Neto (2024) and Damasceno (2022). These results converge with the principles of Education 4.0, which emphasize experimentation, practical learning, and collaboration as formative axes to meet the demands of Industry 4.0 (CARVALHO NETO apud ABENGE, 2025). The literature also points out that emerging digital technologies act as structuring elements of these methodologies, favoring the development of skills such as problem solving, prototyping, data analysis and technical communication.

2.2 FUNDAMENTALS OF LEARNING AND THE ROLE OF TECHNOLOGIES

Active methodologies supported by digital technologies are supported by classical theories of learning. Bloom's taxonomy guides the definition of progressive educational objectives, especially relevant in engineering education, which demand practical application and complex problem solving.

In the cognitive field, strategies such as prior organizers, concept maps, and formative assessments favor meaningful learning. Felder and Brent (2016) highlight the importance of continuous formative assessments, structured feedback, and authentic tasks, often articulated with physical or virtual laboratory activities. The integration between interactive technologies, laboratories and training strategies is, therefore, a central axis to enhance learning and consolidate the technical reasoning of engineering students.

2.3 EMERGING DIGITAL TECHNOLOGIES AND THEIR PEDAGOGICAL POTENTIAL

Engineering education has been driven by the incorporation of digital technologies that expand the possibilities for experimentation, visualization, and the development of practical skills. Each technology contributes in a specific way to the training of the contemporary engineer.

2.3.1 Virtual and remote labs

Virtual (LV) and remote (LR) laboratories have consolidated themselves as relevant alternatives in the face of infrastructure limitations, especially in public institutions. These environments expand access to experimentation, reduce costs and increase safety, in addition to enabling the repetition and personalization of experiments (HERADIO et al., 2016; MENDES et al., 2021). Systematic reviews indicate that the integration of immersive technologies in these laboratories enhances engagement and understanding of complex content (SLR, 2024). Evidence indicates that its effectiveness is amplified when associated with active methodologies and qualified teacher mediation.

2.3.2 3D Printing and Rapid Prototyping

3D printing has stood out as a pedagogical resource for curricular modernization, by allowing rapid prototyping and the development of iterative projects. This technology brings theory and practice closer together, strengthens design thinking, and favors contextualized learning (FLORES; SILVA; OLIVEIRA, 2016; CHONG et al., 2018). Studies demonstrate its applicability in different educational contexts, including during the COVID-19 pandemic (GÓMEZ et al., 2020; KUMAR; JHA; SINGH, 2022), contributing to the development of technical, analytical and collaborative skills.

2.3.3 Internet of Things (IoT)

The Internet of Things (IoT) stands out in engineering education for enabling instrumentation, automation, and real-time data collection activities, in line with the principles of Industry 4.0. Research indicates that IoT expands student autonomy and the practical applicability of knowledge, especially in remote laboratories and multidisciplinary projects (ZUTIN; LOWE; GÜTL, 2018; FAEZIPOUR; KARR, 2018; ZHAO et al., 2020; KIM; PARK, 2023). By enabling the monitoring and analysis of connected systems, IoT contributes to the development of analytical and problem-solving skills.

2.3.4 Immersive Environments and Virtual Reality (VR)

Immersive environments and virtual reality (VR), although still in the consolidation phase, have high pedagogical potential in engineering education. These technologies favor spatial visualization, simulation of complex processes, and safe training in risk scenarios (DEDE, 2009). Recent studies point to improvements in motivation, conceptual understanding and student retention with the use of VR (ALALWAN; ALZAHRANI, 2020; GÓMEZ; MENENDEZ; GARCÍA, 2021). Applications in different areas of engineering, including Software Engineering and Mechanical Engineering, indicate its potential for immersive hands-on experiences and hands-on learning (ANDRADE et al., 2022; ROHR et al., 2022; PEREZ; KELEŞ, 2025).

3 METHODOLOGY

This article is based on an integrative literature review, according to the model proposed by Whittemore & Knafl (2005). The research was designed with a qualitative approach, of a theoretical and documentary nature, with the objective of identifying, analyzing and synthesizing, in a systematic way, the existing evidence on the use of virtual and remote laboratories, 3D printing, Internet of Things (IoT) and immersive realities in engineering education. The main focus was on the context of public higher education institutions, where these resources are strategic to overcome structural challenges and promote pedagogical innovation.

The stages of search, selection, extraction, and synthesis of the data were guided and reported according to the guidelines of the PRISMA 2020 protocol (Page et al., 2021), adapted for integrative reviews, aiming to maximize the transparency and reproducibility of the process. According to Mendes-da-Silva (2019), integrative reviews are particularly effective in articulating different types of studies, providing a comprehensive and comparative understanding of the phenomenon investigated.

3.1 GUIDING QUESTION AND PCC STRATEGY

The review was guided by the following guiding question: How have virtual and remote laboratories been used in engineering education to promote active learning, experimentation and pedagogical innovation in public institutions?

To structure the question, the PCC (Population-Concept-Context) strategy was used:

- Population (P): engineering students and professors;

- Concept (C): virtual and remote laboratories (including related technologies: 3D printing, IoT, VR/AR, simulations);
- Context (C): public institutions of higher education.

3.2 SEARCH STRATEGY

The searches were carried out between January and September 2025 in the following databases: *SciELO*, *ERIC*, *Scopus*, *ScienceDirect*, *IEEE Xplore*, and *Google Scholar*. To ensure comprehensiveness and relevance, descriptors in Portuguese and English combined with Boolean operators (AND/OR) were used. The general strings used included, among others, the following:

- **Portuguese:**
("engineering education" OR "engineering education") AND ("virtual labs" OR "remote labs" OR "virtual learning environments") AND ("active learning" OR "active methodologies" OR "project-based learning")
- **English:**
("engineering education") AND ("virtual laboratories" OR "remote labs" OR "virtual experimentation environments") AND ("active learning" OR "project-based learning" OR "problem-based learning")

In addition to these, specific strings and filters were applied by base (summarized examples):

- **SciELO** (search in Jan/2025) — filters: 2010–2025; articles; languages: PT/EN/ES.
- **ERIC** (Feb/2025) — filters: 2010–2025; types: journal article, dissertation, report; language: English.
- **Scopus** (Mar/2025) — filters: 2010–2025; types: article, review, conference paper; languages: PT/EN/ES.
- **ScienceDirect** (Apr/2025) — filters: 2010–2025; article/review; language: English.
- **IEEE Xplore** (May/2025) — filters: 2010–2025; journals/conferences; language: English.
- **Google Scholar** (Sep/2025) — filters: 2010–2025; include citations; exclude patents; PT/EN/ES.

3.3 SELECTION AND ORGANIZATION OF STUDIES

The selection process followed the PRISMA 2020 protocol (Page et al., 2021). The stages were:

1. Identification: initial survey in the selected databases — $n = 412$ records.
2. Screening: removal of duplicates and reading of titles/abstracts; deleted 189 records.
3. Eligibility: full reading of 223 potential studies; 143 were excluded because they did not meet the criteria.
4. Inclusion: final selection of 80 studies that composed the corpus of the analysis.

3.4 INCLUSION CRITERIA

- Published between 2010–2025;
- Peer-reviewed research (with the exception of relevant reports from public universities);
- Studies directly related to engineering education;
- Research on core technologies (LV, LR, 3D printing, IoT, VR/AR, simulations);
- Languages: Portuguese, English and Spanish.

3.5 EXCLUSION CRITERIA

- Publications prior to 2010;
- Productions without peer review (except specific reports from public universities);
- Studies without direct link to engineering education;
- Technologies not related to experimentation or outside the defined scope;
- Texts without access to the full content.

The management of references was performed with *the Zotero®* software; data extraction was recorded in spreadsheets containing, at least: Author, Year, Country, Type of Study, Technology, Method and Main Findings.

Figure 1

PRISMA 2020 flowchart of the study selection process

Source: Authors.

3.6 DATA ANALYSIS

The qualitative analysis of the 80 studies followed the thematic content analysis technique of Bardin (2011), in three phases:

1. **Pre-analysis:** exploratory reading and preliminary organization of the material;
2. **Exploration of the material:** identification and thematic categorization (pedagogical practices, infrastructure, teaching challenges, impact on learning);
3. **Interpretation:** analytical synthesis, identification of emerging trends and integration with the theoretical framework.

The findings were grouped into three analytical categories: (a) pedagogical potential of virtual and remote laboratories; (b) technical and institutional limits and challenges; and (c) implementation strategies in public institutions.

3.7 VALIDITY AND RELIABILITY

Procedures were adopted to ensure methodological rigor, according to Kitchenham (2004) and Whitemore & Knafl (2005):

- Traceability: complete record of search strings, stages and dates of searches;
- Explicit criteria: transparent application of inclusion/exclusion criteria;
- Theoretical triangulation: integration of engineering literature, education and digital technologies;
- Cross-review and divergence resolution: two independent evaluators on screening and eligibility; divergences resolved by consensus, with consultation with a third researcher in deadlocks;
- Systematic record: continuous documentation of all methodological decisions.

4 RESULTS AND DISCUSSIONS

This section presents and discusses the results of the integrative literature review, highlighting the pedagogical potential of emerging digital technologies for active learning and the development of competencies in engineering education. The analysis of the 80 studies published between 2010 and 2025 revealed consistent patterns regarding the effectiveness of these technologies in the training of engineers.

4.1 SELECTION PROCESS AND CHARACTERIZATION OF STUDIES

The selection of studies strictly followed the PRISMA 2020 protocol (PAGE et al., 2021), resulting in the inclusion of 80 articles from an initial universe of 412 publications. There was a significant growth in publications from 2016 onwards, reflecting the consolidation of Industry 4.0 benchmarks and the expansion of the use of digital technologies in engineering education, as highlighted by Heradio et al. (2016) and Zhang et al. (2020).

Geographically, the studies are concentrated in Europe (38%), Latin America (27%), Asia (22%) and North America (13%). In Brazil, scientific production reveals a strong role of public universities, aligned with curriculum modernization policies and the National Curriculum Guidelines for Engineering, according to ABENGE. Initiatives described by

Fernandes Brum, Purcidonio and Azevedo Ferreira (2017) and Mendes, Ferreira and Campos (2021) illustrate this movement.

4.2 DIGITAL TECHNOLOGIES AS CATALYSTS FOR ACTIVE LEARNING

The thematic analysis identified four core technological categories that act as catalysts for pedagogical innovation: virtual and remote labs, 3D printing, IoT, and immersive environments. Although distinct, these technologies converge in the promotion of experimentation, student engagement and the development of skills.

4.2.1 Virtual and Remote Labs (LV/LR)

VL/LR are the most recurrent category, present in 43% of the studies. The literature highlights its ability to expand access to experimentation, reduce costs and risks, and enable repeatable and personalized practices. Empirical evidence points to significant gains in autonomy, motivation and conceptual performance of students (HERADIO et al., 2016; MENDES et al., 2021).

Classic and recent studies emphasize that VL/LR complement physical laboratories, especially when integrated with active methodologies and mediated by qualified professors (BALAMURALITHARA; WOODS, 2009; DE LA TORRE; SANCHEZ; DORMIDO, 2013; SLEEPING; VARGAS; SÁNCHEZ, 2015; NAKAYAMA; YAMAMOTO, 2021; KELLER; MARTINS; SILVEIRA, 2022).

4.2.2 3D Printing and Rapid Prototyping

3D printing appears in 31% of the studies, standing out for integrating theory and practice through iterative cycles of design, modeling, prototyping and testing. This approach strengthens project-based learning, design thinking, and problem-solving (FLORES; SILVA; OLIVEIRA, 2016; CHONG et al., 2018; TORRES et al., 2022).

Applications reported by Gómez et al. (2020) and Kumar, Jha, and Singh (2022) show their effectiveness even in adverse contexts, such as the pandemic, contributing to the development of technical, analytical, creative, and collaborative skills.

4.2.3 Internet of Things (IoT)

IoT was identified in 24% of the studies, mainly in instrumentation, automation, and data analysis activities. The literature highlights its role in collecting data in real time,

remotely monitoring systems, and supporting formative evaluations and multidisciplinary projects (ZUTIN; LOWE; GÜTL, 2018; FAEZIPOUR; KARR, 2018; ZHAO et al., 2020; KIM; PARK, 2023).

In addition, recent studies point to the use of IoT as a support for continuous feedback and authentic assessments, strengthening active learning and data-driven decision-making (FERREIRA; OLIVEIRA; MATOS, 2019; ABREU; MACHADO; TORRES, 2024; PADILLA et al., 2025).

4.2.4 Immersive Environments and Virtual Reality (VR)

Although less frequent (12% of studies), VR demonstrates a high pedagogical impact, especially in spatial visualization, simulation of complex processes, and safe training in risk scenarios (DEDE, 2009; ALALWAN; ALZAHRANI, 2020; GÓMEZ; MENENDEZ; GARCÍA, 2021).

Research in different areas of engineering indicates increased motivation, better conceptual understanding, and support for practical learning, including applications in Software Engineering and Mechanical Engineering (ANDRADE et al., 2022; ROHR et al., 2022; PEREZ; KELEŞ, 2025; KELEŞ; PEREZ, 2025).

4.3 INTEGRATION WITH ACTIVE METHODOLOGIES AND SKILLS DEVELOPMENT

The studies analyzed converge in indicating that digital technologies act as facilitators of active methodologies, and not as ends in themselves, corroborating Moran (2018) and Kenski (2012). Its integration enhances approaches such as PBL, flipped classroom, and inquiry-based learning (VALENÇA, 2023; FERREIRA; OLIVEIRA; MATOS, 2019; MEDEIROS; NETO, 2024).

This articulation contributes directly to the development of essential competencies of contemporary engineering, such as complex problem solving, iterative prototyping, data analysis, collaborative work, and technical communication (CHONG et al., 2018; KIM; PARK, 2023; MENDES et al., 2021; VALENTE, 2019). Such competencies are essential to meet the demands of Industry 4.0 (SPINELLI; LEMOS; BARBOSA, 2022).

4.4 INTEGRATED DISCUSSION

The results indicate that engineering education is at a turning point, in which emerging digital technologies play a central role in redefining the learning experience. The

predominance of LV/LR confirms its consolidation as an effective solution for experimentation, while the growing adoption of 3D printing, IoT and VR signals the evolution towards more immersive and contextualized environments.

The pedagogical potential of these technologies lies in their ability to enable active learning, promoting student protagonism and the integration between theory and practice. However, studies reinforce that its benefits depend on intentional curriculum planning and articulation with active methodologies. Thus, the synergy between digital technologies and innovative pedagogical approaches emerges as the most promising path for a relevant engineering education aligned with the challenges of the twenty-first century.

5 CONCLUSION

This integrative review delved into the transformative pedagogical potential of emerging digital technologies—virtual and remote labs (LV/LR), 3D printing, Internet of Things (IoT), and immersive realities (Virtual/Augmented Reality)—in engineering education. Our primary focus was to understand how these tools promote active learning and the development of core competencies, positioning future engineers for the complex and dynamic challenges of Industry 4.0.

The results consolidate the evidence that digital technologies significantly expand access to experimentation, providing safe, flexible and often more cost-efficient learning environments. LV/LR, in particular, allow continuous (24/7) and personalized access to practice, overcoming geographical and structural barriers. 3D printing, in turn, enables rapid prototyping, fluidly integrating theory and practice and fostering iterative design. IoT emerges as an indispensable pillar for instrumentation, automation, and real-time data collection, aligning student training with the demands of intelligent systems and data analysis. Concurrently, virtual reality provides immersive experiences that substantially enhance spatial visualization and enable safe training in high-risk scenarios, without the implications of the actual physical environment.

The integration of these technologies with active methodologies is not only a crucial factor, but a symmetrical and enhancer factor. They act as powerful facilitators for approaches such as Project-Based Learning (PBL) and the flipped classroom, in which the student transcends the role of mere receiver, becoming an active protagonist of his or her learning process, engaging in real problem solving, experimentation, and creation. This synergy robustly fosters the development of a set of multidisciplinary competencies

indispensable for the modern engineer, including the ability to solve complex problems, expertise in prototyping and iterative design, proficiency in data analysis and interpretation, the ability to work collaboratively in multidisciplinary teams, and effective technical communication.

However, the full realisation of this potential is intrinsically linked to overcoming significant institutional and structural challenges.

The review highlighted persistent barriers such as insufficient teacher training for the new tools and methodologies, limitations in the technological infrastructure of institutions, and the urgent need for robust institutional policies that ensure the democratization of access and the sustainable integration of these innovations. Addressing these issues, especially in public institutions, is critical to ensuring the equity and quality of engineering education in the country.

In short, the answer to the question that guided this study is affirmative and multifaceted: emerging digital technologies are undeniably strategic and powerful resources for pedagogical innovation in engineering education. They enhance active learning and the development of skills, creating more dynamic, engaging learning environments aligned with the complex demands of the twenty-first century.

However, its enduring success requires not only technological adoption, but also intentional curriculum planning, continued investment in teacher training, and the development of institutional policies that promote articulation with collaborative practices and comprehensive formative assessment, ensuring that technology serves as a strategic means to well-defined educational objectives and to the training of professionals able to innovate and lead.

5.1 STUDY LIMITATIONS

It is important to recognize that this article, being derived from an integrative review, inherits some of the limitations intrinsic to the original research. The methodological heterogeneity of the included studies—although characteristic of this type of review—and the restriction of the search to indexed databases may have influenced the breadth and depth of the evidence collected, potentially omitting other relevant experiences.

In addition, the temporality of the data (2010-2025) means that very recent innovations may not yet have been fully incorporated into the literature analyzed here, suggesting a field in constant evolution.

5.2 IMPLICATIONS AND SUGGESTIONS FOR FUTURE RESEARCH

The findings of this study have significant implications for educators, academic managers, and public policy makers. For educators, we suggest broader and more informed adoption of digital technologies, with an unwavering focus on their synergistic integration with active methodologies. For academic managers, the urgency of investing in the continuing education of teachers and in the improvement and maintenance of technological infrastructure is emphasized. For policymakers, it is crucial to develop strategies that mitigate regional and institutional inequalities while ensuring equitable access to these resources.

For future research, we recommend:

The realization of longitudinal empirical studies that evaluate the long-term impact of these technologies on the development of engineering skills and on the professional trajectory of graduates.

In-depth comparative analyses between different types of institutions (public vs. private, large vs. small) to understand the nuances of implementation and the specific challenges faced.

Research focused on teacher training, investigating the most effective strategies to train teachers in the pedagogical and methodological use of these technologies.

Detailed case studies on the implementation of successful institutional policies for the integration of digital technologies, identifying replicable models.

The exploration of other emerging technologies or the combination of multiple technologies in engineering learning environments, deepening the understanding of the mechanisms that enhance complex learning.

By addressing these gaps and following these recommendations, the scientific community and educational institutions will be able to contribute even more significantly to the advancement of engineering education, ensuring that future generations of professionals are fully equipped for the technological and societal challenges of the 21st century.

ABSTRACT

This article aims to present, starting from Chapter 1 (The Problem of Liberty) of one of Dewey's works entitled "Liberalism, Liberty and Culture," where he uses the idea of liberty to arrive at two basic questions: first, the tension he exposes throughout, between the foundations of liberty and its preservation. And second, the idea of the principles or possible relationships between liberty and social cohesion or solidarity, which are the issues at stake in the first two paragraphs of the text, grouping several questions around these references. In the second part of the work, we analyze the introduction and Chapter 1 of Herbert Marcuse's work "The Ideology of Industrial Society." For Marcuse, modern industrial society imposes a technological rationality of mass domination and oppression, of control over human consciousness. The man who finds himself inserted in the society of artificiality is not free; on the contrary, he is an automaton, incapable of opposing the system of the technological apparatus. There is a satisfaction of false needs, which causes the so-called "mechanics of conformity." This paper seeks to reproduce and reflect upon the critical social theory developed by Marcuse regarding the new ideology of advanced technological society.

Keywords: John Dewey. Herbert Marcuse. Freedom.

RESUMO

Este artigo tem como objetivo apresentar, a partir do capítulo 1 (O Problema da Liberdade) de uma das obras de Dewey intitulada "Liberalismo, Liberdade e Cultura", onde ele usa a idéia de liberdade para chegar a duas questões básicas: primeiro, a tensão que ele expõe todo momento, dos fundamentos da liberdade e de sua conservação. E depois, a idéia dos princípios ou relações possíveis entre liberdade e coesão social ou solidariedade que são as questões que estão em jogo nos dois primeiros parágrafos do texto que agrupam várias perguntas em torno dessas referências. Na segunda parte do trabalho, analisamos a introdução e capítulo 1 da obra "A Ideologia da Sociedade Industrial", de Herbert Marcuse. Para Marcuse, a sociedade industrial moderna impõe uma racionalidade tecnológica, de dominação e opressão em massas, de controle das consciências humanas. O homem que se encontra inserido na sociedade do artificialismo não é livre, ao contrário, é um ser

autômato, incapaz de se opor ao sistema do aparato tecnológico. Há uma satisfação das necessidades falsas, que ocasiona a denominada “mecânica do conformismo”. O presente trabalho busca reproduzir e pensar a teoria social crítica, desenvolvida por Marcuse sobre a nova ideologia da sociedade tecnológica avançada.

Palavras-chave: John Dewey. Herbert Marcuse. Liberdade.

RESÚMEN

Este artículo se propone presentar, a partir del Capítulo 1 (El Problema de la Libertad) de una de las obras de Dewey titulada "Liberalismo, Libertad y Cultura", donde utiliza la idea de libertad para abordar dos cuestiones fundamentales: primero, la tensión que expone a lo largo del texto entre los fundamentos de la libertad y su preservación. Y segundo, la idea de los principios o posibles relaciones entre la libertad y la cohesión social o la solidaridad, que son los temas que se abordan en los dos primeros párrafos del texto, agrupando varias preguntas en torno a estas referencias. En la segunda parte del trabajo, analizamos la introducción y el Capítulo 1 de la obra de Herbert Marcuse "La Ideología de la Sociedad Industrial". Para Marcuse, la sociedad industrial moderna impone una racionalidad tecnológica de dominación y opresión masiva, de control sobre la conciencia humana. El hombre que se encuentra inmerso en la sociedad de la artificialidad no es libre; al contrario, es un autómata, incapaz de oponerse al sistema del aparato tecnológico. Se produce una satisfacción de falsas necesidades, lo que da lugar a la llamada "mecánica del conformismo". Este artículo busca reproducir y reflexionar sobre la teoría social crítica desarrollada por Marcuse respecto a la nueva ideología de la sociedad tecnológica avanzada.

Palabras clave: John Dewey. Herbert Marcuse. Libertad.

1 INTRODUCTION

John Dewey (1859-1952) is the most recognized American educator of the twentieth century. In a prolific career that spanned seven decades, Dewey focused on a wide range of concerns, especially and notably in the fields of philosophy, education, psychology, sociology and politics. Both during his lifetime and after his death, Dewey's writings and public positions have been subject to interpretation and reinterpretation by various scholars. There is a voluminous literature on him, or written by himself, with profoundly different assessments of the nature and impact of his work.

Herbert Marcuse (1898 – 1979) was a German philosopher of Jewish origin, naturalized American during the Nazi period. Marcuse was, along with Adorno and Horkheimer, one of the founders of the Frankfurt School. Much of his work was based on two central theses: the analogy between the liberation of the masses (alienated by capitalism) and the erotic liberation of the unconscious (repressed by the conscious).

The objective of this reflection is to analyze studies by John Dewey and Herbert Marcuse from the perspective of freedom, bringing a correlation from the proximity of psychological and psychoanalytic theories. To do so, we used two texts by the authors to reflect on the possibilities of freedom in each writing, and bringing the readings closer together through content analysis.

The first question in Dewey arises from the idea of the foundations of freedom and its conservation that are linked in the sequence of the author's discussion, the genesis of a society that fights against oppression, which in this case is American society. And the second is about the possible relations between freedom around social cohesion or solidarity. From the first we find a very interesting point that will connect with Marcuse's text, but with a little more particularities or particularisms. But what is interesting in both cases is to see how a liberal author, such as Dewey, discusses issues that advance to principles that are then reworked from the perspective of an author of critical theory, of the Frankfurt School, such as Herbert Marcuse.

The idea that allows the two "theories" to be brought together is based on two factors that are recognizable in the texts. One is the question of thinking about the idea of freedom as a counterpoint to a conception of totalitarianism or a totalizing conception. In the case of Dewey, he reflects on the Totalitarian State, because he is thinking about the crisis of the Totalitarian State, his text is from 1939. In the case of Marcuse, the 1964 text reflects on the totalizing society, which is the Social Welfare State.

So there are elements that separate these two texts: one is the issue that totalitarianism is not the same thing as totalizing, but the second element perhaps that we should think is the dimension of the influences of psychological and psychoanalytic theories in the reading of the two authors. In Dewey's case, psychological theory and, in Marcuse's case, the question of psychoanalysis. This implies putting the dimension of the individual or individualities at stake in these relationships. This helps to understand how these two dialogues, even thinking that they are authors of very different schools, arrive at conceptions of a certain correlation.

2 METHODOLOGY

The analysis proposed in this study was based on the hermeneutic-dialectical method, appropriate for investigations that seek to understand the interaction between meanings, social practices and power structures. This approach, inspired by the interpretations of Habermas' (1987) studies on communicative action and by the hermeneutical bases developed by Gadamer (GONZALES, 1987), allows for the critical articulation of objective and subjective elements present in the construction of the concepts of freedom, rationality and technology discussed by John Dewey and Herbert Marcuse in their works by DEWEY, John, *Liberalism, Freedom and Culture* (1970) and MARCUSE, Herbert, *The Ideology of Industrial Society* (1964).

The adoption of the hermeneutic-dialectical method was justified by the interpretative nature of the problem investigated. As Minayo (2002) points out, this method makes it possible to examine social phenomena based on the interdependence between language, experience and historical context, understanding that all meaning is constituted through symbols — discourses, norms, values and categories — that structure human action. Thus, this study treated the texts of Dewey and Marcuse as symbolic units loaded with intentionality, whose interpretation requires considering their historical conditions of production and the ways in which they articulate meanings about freedom and technology.

The analytical process was carried out in three main stages:

1. Comprehensive reading and reconstruction of the authors' discourse, seeking to identify categories present in the analyzed works of Dewey and Marcuse. This stage allowed us to recognize the main nuclei of meaning presented by the authors.
2. Hermeneutic interpretation, in which the conceptual content was analyzed in the light of the meanings attributed by the authors themselves and the theoretical tradition in

which they are inserted. Language was treated as a mediator of action in the world, as defended by Gonzalez (1987), allowing us to understand how each author articulates his conception of freedom in relation to the social and technological conditions of his time.

3. Dialectical integration of categories, considering the tension between the perspectives of Dewey — who understands freedom as an experimental and free process — and the criticisms of Marcuse — who problematizes the capture of subjectivity by technical rationality. At this stage, the analysis sought to show how objectivity and subjectivity are intertwined in the theoretical formulation of both authors, as suggested by Minayo (2002), and how this relationship produces different meanings about the possibility of autonomy in the technological society.

With this approach, it was possible to understand freedom not only as an abstract concept, but as a historical and symbolic process, configured by the production, interpretation and dispute of meanings. The hermeneutic-dialectic methodology, therefore, allowed us to deepen the understanding of the differences and convergences between Dewey and Marcuse, highlighting how both conceive freedom from the relationship between subject, language and social context.

3 DISCUSSION OF THE RESULTS

In the following pages, we show the issue of freedom in each author, John Dewey and Herbert Marcuse, and then make the intended approximations.

3.1 FREEDOM IN DEWEY

From this set of initial positions, we start from Dewey, the foundations of freedom and its conservation and the idea of possible relations between freedom and cohesion, in the first paragraphs, where it is possible to develop the analysis of the conditions made possible by political freedom in his time (1939), based on the crisis of the Totalitarian State. When he writes about the crisis of the Totalitarian State, he refers to the Soviet states, on the one hand, the dimension that is somewhat confused with the conception of the Totalitarian State, but already with several denunciations in this period, of the abuses caused by the Soviet socialist regime. But he is also thinking of the pre-World War II period (rise of Nazism in Germany, fascism in Italy). I mean, Dewey is thinking of a framework

where totalitarian regimes are present. This framework will also be discussed, later by the Frankfurt School, but from a different logic, emphasizing much more the dimension of psychology, which is the idea of the authoritarian personality (Adorno-Horkheimer). This is a period of threat from totalitarianism to democratic life. It is in this context that Dewey is thinking about political freedom.

Dewey begins by analyzing that the conception of freedom is thought of in America as an impulse of human nature that founds society itself. The author refers to "it is in our tradition to be the love of freedom inherent in its structure" (Dewey, 1970, p. 99), at this point in the text Dewey is thinking about the writings of Thomas Jefferson, the issue of the still rural conception of an American society that fought for independence, sought to free itself from oppression, and which is based on the conception of a natural right to freedom, conceptions of an American democracy.

Dewey will unfold in the text, from the perspective that it is the structural tradition of American society to love freedom, a belief to the ethics that political democracy is a moral right and that the laws on which it is based are fundamental moral laws to which any and all forms of social organization must obey. In a kind of what he calls the popular psychology of democracy. Dewey, in the quotation from Thomas Jefferson's correspondence with John Adams, highlights the disbelief that Thomas Jefferson makes explicit in public opinion as a practical factor that destroys the legal affirmation of freedom.

He identifies the influence of public opinion in the context of the theoretical foundations based on the laws that guarantee freedom as a natural right. As public opinion, Dewey thinks of the press, the dissemination of customs, a model of transformation of American society that is gradually moving from an agrarian society to an urban society. And as for this, from his conception (Thomas Jefferson), it distorts that original conception of freedom as a right inscribed in human nature. From this perspective, Dewey questions the possibility of political freedom being maintained without freedom of culture. From his perspective, political freedom is insufficient to explain the proper functioning of political institutions.

Since,

[...] the relationships that exist between people, outside political institutions, relations of industry, communication, science, art, religion, affect daily associations and contacts and, therefore, profoundly affect the attitudes and habits expressed by the government and norms of law (DEWEY, 1970, p. 100).

So, he says, Thomas Jefferson's conception seems to be one in which government should govern according to natural laws, outside the influence of public opinion. That is subject to cultural changes. Dewey wonders to what extent it is possible, then, for democratic institutions to preserve naturalized conceptions of freedom exempt from cultural changes. For him, cultural changes condition changes in the form of social organization. "The freedom from oppression and repression, which existed previously, marked a necessary transition, but transitions are only bridges to something different" (DEWEY, 1970, p. 101).

Starting from the idea of the reference of militancy, the reference of social struggle that constituted a certain generation of Brazilian society that fought against the dictatorship, sometimes remains without necessarily understanding how the democratic transition occurred and how the democratic transition presents itself, the struggles for the inscription of achievements, of demands, in the text of the law or in the constitutional text, they are only a bridge to something that Dewey calls "something different". So sometimes the criticism of the absence of militancy that would be, in the view of some authors, especially in Brazil, something extremely important to understand the achievements of the process of redemocratization of Brazilian society, and a criticism is made of these new collective actions and social struggles, as if they were devoid of social criticism. As if they were devoid of a broader awareness of the historical needs that led to the process of democracy in Brazilian society.

Dewey's conception, in this sense, helps to understand that the transition only liberates forms that the struggle against oppression absorbed into an abstract homogeneity. When the struggle against oppression passes, and there is no longer a common enemy for society as a whole, it is proper that differences appear, as for example, in the post-constituent period, in Brazil, when the muffled differences, in the homogeneous struggle of all against oppression, begin to manifest themselves. More important than the transition is often to understand the differences that appear and how the transition served as a bridge to these differences.

Dewey takes up Thomas Jefferson and his fear of public opinion, to develop arguments of two kinds of relations: on the one hand, it is possible to perceive, for example, in the West, but also in America in general, from where he is thinking, an industrial development, an urban development, which corresponds in a certain way, to the physical

and material principle of development that explains the reason and the information that accompany the changes operated by the economy and science.

On the other hand, it is possible to recognize a development of emotions and imagination that accompanies the areas (much less valued). So this material, physical dimension that is present as the great influencer of the principles or cultural factors that condition public opinion, which Thomas Jefferson feared so much, which must be complemented, according to Dewey, by the understanding of how the emotions and imagination that accompany cultural changes developed. From this perspective, the author says that the references of freedom are composed from the scientific-economic bases and the cultural bases of democracy. And that these bases are corresponding and inseparable in the analysis of democratic or totalitarian political institutions. If the physical or material development of society makes it possible to clarify or measure the exteriority of human relations, which can be captured, for example, by the idea of growth, by the idea of industrialization, by the idea of urbanization, by the idea of contrasts produced by the apprehension of laws and several other possibilities. The development of values arising from cultural bases also makes it possible to clarify human relations. In other words, in the case of Dewey this will be evident in the analysis of totalitarian regimes, as a material command and of the imagination and in the way in which in the imagination and with it all the emotional impulses that we are accustomed to calling *interior* (Dewey, 1970, p. 104), are controlled.

For him, there are a variety of factors involved in the problem of human freedom (Dewey, 1970, p. 107), on which the need to perceive whether any factor is so predominant that it has causal force. In the first text, Dewey, in summary, explains that in the reason with which the idea of freedom is thought of as a natural right, as something that is the foundation of a concept of society, there is a whole development that is intended to be immutable to cultural influences. This is not possible without understanding the influences of cultural factors, of cultural changes, in the political life of society, one does not understand what is understood as freedom in a society, because it is loaded with values and these values are defined from the changes and influences that these cultural changes cause in political institutions. The norms change, the laws change, the form of government changes, which is updated at least to this principle.

Dewey explains why these changes are difficult to understand in democracy. According to him, the ideal of democracy is based on the assumption that the idea of

freedom is natural, in American society, where he analyzes it. To this end, he goes to the analysis of the Totalitarian State to show that for the Totalitarian State to be established, it stifles the individual impulses and motives of the subjects. It psychologically affects the subjects by controlling impulses and motives. And it is this control that allows totalitarianism, in a certain way, to reproduce itself in the stifling of individuality. So the idea of imagination, material command and imagination are complementary in the analysis of relations and conceptions of freedom, which exists in a certain society.

Now there are a variety of factors that need to be highlighted from this variety, the issue of culture, various conceptions, such as religion, art, theater, music, which in a way directly influences the way people start to read the world, to have worldviews that value people's possibilities of fulfillment in very different ways. The ideal of freedom varies with this and is not just a matter of determination or physical and material conditioning. At this point, Dewey makes a criticism of the Marxist conception that sees the question of the preponderance of the economic in these relations.

It poses new problems in the sequence. One is about the datum of psychological control – control of the emotional pulses that we usually call interior. Which ultimately seeks to stifle people's imagination. Another thing he will say is, if the issue of freedom varies according to the factors involved in his problem, it is important to try to understand if a factor is preponderant in a way that can oppose its causal force. Dewey, analyzing at the time he is writing (1939), says that the belief in economic predominance prevails, hence his dialogue with Marxism. He says that today it has become fashionable to say that the economy is the cause of this or that. But he remembers that it cannot be forgotten that at the time of the Enlightenment reason was preponderant. Then, in a passage, he goes back to the Middle Ages to say that religion was preponderant. If we go back to antiquity, the preponderant were myths and rituals as a way of controlling these drives of the subject, of individuals, which are stifled as a function of a collective, and of the norms that govern collective cohesion in these societies.

In the case of Totalitarian States, Dewey highlights another order of relations between the factors that act on political institutions and the organization of psychologically-based social life, which indicate the direction of a logic of pluralist analysis. So these conceptions such as the Marxist conception, the Enlightenment conception, or the medieval conception, were *monist conceptions* (Dewey, 1970, p. 107), that is, they dated the question of freedom from a preponderant factor that had causal force. For Dewey, it is

necessary, then, to expand this to a pluralistic analysis, showing that culture conditions the idea of individuality and thus modifies the human problem of thinking about freedom. In the end, he highlights an interesting conception that the world would have to be divided into an option for capitalism (freedom from liberalism, without equality) or an option for a socialist project (individual freedoms for equality and collective freedom).

In this antagonism, between the 1950s and the 1980s, some historical movements that were constituted in the conception of the emancipation of the working classes, commanded from the point of view of reform, of the revolution of some contexts of society, a transformation to another principle of freedom. They proposed this because of several projects, (e.g. Cuba).

What Dewey will show is that these new conceptions of freedom are the fact that, if we consider that cultural factors, then, condition the idea of individuality and modify the thought of freedom, and this would be the contribution of psychological theory, it would be necessary, ultimately, to conceive that the cultural bases of democracy condition the correlations between constitutive elements of a society, through the cooperative spirit (Dewey, 1970, p. 115), so that the development of each constituent element serves to liberate and mature the other. Dewey works with the idea that freedom acts and is culturally conditioned by the perspective of functioning as a cooperative spirit, otherwise it is not freedom.

It is different from a liberal conception that thinks of the idea of freedom only from the physical and material constraints, or from the preponderance of the economic. Hence the idea of a philosophical monism, which presupposes that my freedom ends where the freedom of the other begins. That individual freedoms would be the guarantors of a space that is totally autonomous from the principle of collective life. Dewey will state that it is not, freedom does not exist to create individuals. Freedom exists to ensure the integrity of individualities within a cooperative spirit, where each one is a constitutive element that serves to give freedom and mature to the other. There are individual reasons for seeking autonomy that are fundamental to thinking about freedom. But in collective life, these impulses have to be aggregated in the reason of this cooperative spirit in a way that gives freedom to one, but also helps to liberate the other, and in this context, both mature. This part is important when one starts to think about the public sphere (education, religion, politics), Thomas Jefferson's idea of public opinion and the case of autonomy that implies

at some point the exercise of freedom that helps to establish democratic institutions, called the public sphere by Habermas (maturing one's own *self*, according to Taylor).

Whether passing through the path of liberalism, or passing through the path of critical theory, and today through these so-called post-structuralist or post-modern conceptions, two things that are shown in the genesis of these conceptions, are not resolved because they are only founding tensions of the conception of freedom. The first is the question of the individual: What is the place of the individual in society? Adorno and Horkheimer will say that it is an extremely unresolved thing because the individual is a social invention. The other question is beyond the place of the individual, if it is possible to establish a universal principle of autonomy. Since cultural changes shape individualities or condition individualities in such a way that, if there is diversity of cultures, there can be no universality. If it is possible to think about freedom through the particularities of each culture, how far can we exchange, exchange experiences about the conception of freedom in a society that is increasingly culturally differentiated? There is no place in the world, according to Dewey, that freedom does not mean freeing oneself from oppression.

From Dewey's point of view, which differentiates it from Marcuse's point of view, which is the fact that what is established as freedom and principle does not matter so much, but the way in which it is realized. If it is in accordance with the values of a society, if it is corresponding to this liberation between the constituent elements, so that it configures a cooperative spirit. It is not positivity that guarantees, from the point of view of the idea of freedom, its effectiveness. But the way it is carried out, how individuals mature and organize themselves based on these conditionings of the values they place for democratic institutions. The cultural bases of democracy are as important to think about as the economic-scientific bases (physical and material development of society).

To understand the connection with Marcuse and see how this has repercussions from the point of view of human action, of social action, and how he can reflect on the conception of contemporary actors and see that these are always unresolved issues, or that they are not yet resolved. This idea of controlling emotional pulses that we have come to call interiors, which ultimately seek to control the imagination of individuals is important. This is the *link* to the issue with Marcuse. Thus, when you control these impulses, these motives, and the very imagination of individuals, you also control the material and physical basis of society.

3.2 FREEDOM IN MARCUSE

Marcuse will affirm that, from the point of view of the criticism he makes of the Welfare State, this State is not totalitarian, but it is totalizing. And that the totalizing character is precisely in the control of needs. To the extent that, in order to meet the needs of individuals, the State accumulates such a great diversity and particularity of information about individuals that it begins to control better. When you know all the needs of individuals and satisfy them, in a certain way, you know how the individual functions, and in doing so, you manage to control the production of needs itself in such a way that what is directed as the satisfaction of needs is nothing more or less than the creation of false needs that control the impulse and motives of the individual's own life and the way in which they associate and associate with each other. the reasons why they associate in collective life. By doing this, we stifle tensions, we stifle the very characteristic impulses of a model of social imagination that tends towards ruptures, that tends towards transformations, so it does not have the same logic with which, in the last instance, it emancipated the subjects because it made possible small "surpluses" in the basic deprivations of existence, a freedom is given to them that is false freedom.

And how does this issue happen? It will happen by internalization (in the psychoanalytic principle – idea of the control of desire). The control of the State will operate by internalizing the needs of these conceptions that unfold in the logic of freedom within capitalist society, especially thinking about the Social Welfare State.

If Dewey is going to affirm what totalitarian societies allow us to understand, it is that, if they control desires so that the imagination does not create a new society, what we have in the Welfare State is that the individual internalizes needs as a form of repression of impulses, closing the possibility of the individual having impulses for the new as he feels satisfied. The creation of the idea of satisfaction is to be in this relationship.

From Marcuse's point of view,

[...] "totalitarian" is not only a terrorist political coordination of society, but also a non-terrorist technical-economic coordination that operates through the manipulation of needs by vested interests (MARCUSE, 1964, p. 24-25).

Marcuse also uses the more correct term, which is *introjection* (Marcuse, 1964, p. 13), which is more appropriate from the point of view of psychoanalysis. Opposing Dewey's interiorization.

In the text, Marcuse summarizes these new forms of control operated since the Welfare State at the end of the 1960s. The Welfare State understood that "fulfilling the needs", but carrying out through this control information about individuals and their own needs would be very important. That is, it is not realized from the desire of individuals, but from a certain distribution of resources stipulated in the reason of a government that plans needs. And when it does, the realization cancels the premises, that is, everything that was previously discussed in Dewey is canceled. And in a certain way, teleology, which is operated by the imagination about the new, about changes, about ruptures, the possibilities of the emergence of other realizations, are stifled by the principle of realization. An extremely effective form of control that occurs not by refusing access to fulfillment, but by achieving satisfaction.

In this context, the idea of non-conformism occurs, the impulse, the motives, which lead people to seek fulfillment are controlled to the extent that it is produced by *introjection*, needs that, from the point of view of a model of society, can and are satisfied institutionally.

Marcuse states that this model of control is placed as

[...] the most effective and resistant form of war against liberation is the implantation of material and intellectual needs that perpetuate obsolete forms of the struggle for existence (MARCUSE, 1964, p. 26).

So the intensity, satisfaction and even the character of human needs above the biological level have always been preconditioned, that is, they vary according to the social context, with the culture.

The fact that the possibility of doing or leaving aside, enjoying or destroying, possessing or rejecting something is or is not taken out of *necessity* depends on whether or not it can be seen as desirable and necessary to common social interests and institutions (Marcuse, 1964, p. 26).

So when needs are created that are overexposed to the individual by particular social interests, they become false to the extent that they repress individuals and do not liberate, according to Marcuse. The idea that these needs operated in the forms of control are not controlled by the individuals themselves.

The logic with which Marcuse discusses this idea, in the case of Europe, was given by the destruction and the need to rebuild countries. In the United States, no. The United

States did not suffer the mass destruction. In the case of Europe, mass planning took place. Mass planning is not just about rent. Mass planning necessarily implies freeing subjects from some needs in order to instill others. So that these other needs become more important and, as time goes by, they become institutionalized, one can do as they did in neoliberalism, which is that basic need guaranteed to be mischaracterized (education is no longer a duty of the State, but enter into the logic of the market, of innovation,...).

Marcuse will state in relation to this, that

The judgment of needs and their satisfaction, under the given conditions, involves standards of *priority* —standards that refer to the optimal development of the individual, of all individuals, under the optimal utilization of the material and intellectual resources at man's disposal. The resources are calculable. (MARCUSE, 1964, p. 27).

On the one hand, there is a society under reconstruction, the idea of social planning that tries to ensure the satisfaction of needs, to provide the basic conditions for individuals to free themselves in search of their optimal development. However, having the protective security (Welfare State) that is ontological, the prospect of this optimal development is stifled to the extent that it minimizes the need to use the imagination to overcome conditions of deprivation. So a certain homogenization of access to resources is assumed as a way of stifling these drives for transformation and rupture, which are imaginary drives. What Castoriadis (1982) would call the "instituting imaginary" is stifled and the instituted imaginary of society is reinforced. As resources are calculable, these priority patterns lead us to another important logic to be recognized, which Marcuse will say is characteristic

[...] The distinctive feature of developed industrial society is the stifling of needs that demand liberation while maintaining and absolving the destructive power and repressive function of affluent society (MARCUSE, 1964, p. 28).

Some needs are satisfied to stifle others. What cannot be used is the creative way of getting out of deprivation, as an instituting logic of a political imaginary, for example, because there the contexts that Dewey will call the cooperative spirit are corrupted.

Another important point of Marcuse is that of the equalization of class distinctions and the ideological function of this equalization.

If the worker and his boss watch the same television program and visit the same picturesque spots, if the typist is as attractively painted as the boss's daughter, if the black man owns a Cadillac, if everyone reads the same newspaper, this assimilation does not indicate the disappearance of classes, but the extent to which the needs and satisfactions that serve the preservation of the establishment are shared by the underlying population (MARCUSE, 1964, p. 29).

That is to say, this idea of equalization of distinctions is excessively shared. Thus, the elements that are profound in the processes of distinction are not recognized. Since, it operates by introjection, it presupposes

[...] a variety of relatively spontaneous processes by which an "I" (Ego) transfers the "outside" to the "inside." Thus, introjection implies the existence of an inner dimension distinct from and even antagonistic to external demands—an individual consciousness and an individual unconscious *separate* from public opinion and behavior. The idea of "inner freedom" has its reality here: it designates the private space in which man can become and remain "himself" (MARCUSE, 1964, p. 30).

This is the idea of intimacy, which for Simmel (2005) is the asocial sphere of the individual. This perspective of when external needs overlap this intimate forum around thinking and valuing life, that intimacy in a certain way, is lost due to the way in which needs are satisfied.

To what extent does the individual's ability to think about himself constitute him as a subject and allow him to act, reflect and change? When needs and forms of control are created that act back on this individual disposition to think about oneself and one's needs, tensions of the imaginary are stifled and drives that would be proper to the action of change are stifled. For Marcuse, these forms of control are not only unconscious, but they are conscious. The dimension of surveillance that Marcuse indicates in the text, which will always be present and which is another dimension.

From the point of view of society, this is extrapolated through the demand that people make when they reach a certain degree of satisfaction of needs. Then one begins ideologically to share not only the form of satisfaction, but also judgments about the way in which satisfaction is adequate or not to needs. Thus, if that need is imposed from the outside and the individual shares this context, he is one of those who watch. So these forms of control participate precisely in the fact that to the extent that they satisfy or are intended to satisfy everyone, control over satisfaction is important to ensure that everyone has it.

Marcuse's basic idea is when society acquires control over the state, it acquires control of the satisfaction of its needs. And from there, it controls itself. Marcuse states that

the Welfare State, even though it arose from another conception that was not through the mass demands of Europeans to control the State, was due to the collapse, after World War II, but created a social planning that satisfies the needs produced in the cultural sphere within achievable cultural standards, and from this it generates a control mechanism operated by surveillance over people. This nullifies the *introjection* that guarantees, in a certain way, the maintenance of an autonomous spirit of the individual, as himself, capable of imagining and thinking about his projects and achievements.

Although they are distinct theoretical and political conceptions, these post-war records, the polarities placed in the post-war period, and the possibilities of realization around these polarities, ultimately made the thinkers of the time move around the same questions. They gave different answers according to their conceptions of policies and traditions, but they did not get out of this tendency to think about the technical-scientific bases (freedom) and the cultural bases. This integration of materialist or idealist theories in the development of history, and on the other hand of psychological or psychoanalytic conceptions of the relations of realization of the individual, of the drives and of the control of these drives.

Ultimately, the question that arises in Marcuse is that as every need is satisfied by the advent of the industrial society model, and this industrial society is based on the capacity for technical-scientific innovation, it is this principle of technical-scientific innovation that starts to dictate the new reasons for needs from the point of view of control models. And as a result, it starts to generate a pattern of thought that generates what Marcuse will call a one-dimensional behavior (Marcuse, 1964, p. 34). In which the ideas, aspirations and objectives that by their content transcend the established universe of word and deed, are repeated or reduced to terms of that universe. They operate by recursion. They are redefined by the rationality of the given system and its quantitative extension. It is this logic that then begins to operate around the theme of progress that is at the basis of the ideological support of the Welfare State.

This logic is what allows the principle of satisfaction to be recognized as common to all and this is what operates the pattern of vigilance so that this satisfaction remains common among the subjects. In this context, associated with the model of progress, of technical-scientific development, which justifies the ideas of increasing modernization in this model of society, something is defined that is at the basis of the theory and practice of this model of control that Marcuse calls operationalism. And this "operationalism becomes,

in theory and practice, the theory and practice of *containment*" (Marcuse, 1964, p. 36). That is, the subjects are contained, the subjects are not explosive in the sense of the drives (eros). Realization as a form of control is based on an operationalism that is defined by containment, that is, it only fulfills its desire by containing the desire of the other.

If one takes this idea that for Marcuse operates as a technological rationality, since it is industrial, of innovation from the point of view of environmental resources, for example, it will operationalize within an existing rationality. When they think from the perspective of generation, they think about environmental goods from a perspective that technological rationality does not reach. The great difficulty when it is said, resources are finite, but technology is not. It is true that the resources will run out one day, but by then the technology will find a way. So the need to calculate resources is transferred to something else. If the subject has a closer relationship with nature, he will not think so. You won't think about shifting your responsibility to technology.

4 FINAL CONSIDERATIONS

In summary, Marcuse, in the text on the paralysis of criticism: society without opposition (2015), points out that the mass media had a preponderant role in this process, since they stimulated the collective adhesion of individual projects. The enrichment of society and its growing rationalization, although they were not converted into concrete improvements extended to the entire population, were the banner that guaranteed the conformation of the masses and their consequent disarticulation. Technical progress would have been able to reconcile social structures with their opposing forces, both inebriated by the developmentalist perspective that was announced on the horizon of history. The scientific mastery of nature had inaugurated a new form of conquest of man himself, now subjected to the illusion of freedom that made him the servant of progressive ideology.

To question the way society was structured, even how to reverse the course of progress, was to question the very status of Western rationality, supported by the discourse of improving life linked to the technical-scientific project. It was necessary to understand the domination of man by man and other projects of power supported by scientific rationality as elements of the order of unreason. Industrial society was eminently irrational, to the extent that the imperative of productivity ended up reaping the freedoms and possibilities of human self-determination (Marcuse, 1964). In this sense, imagination was pointed out

as the only potentially transformative attitude, in a context in which the bankruptcy of traditional forms of political reaction was proclaimed.

This perspective has to do with what Dewey argued is only possible in a concept of cooperative spirit. To enable this dimension and extension of freedoms. Here, as this operationalism that is defined by containment, it is the surveillance assumed as a form of control that makes it possible that my need will only be fulfilled or satisfied if I control the satisfaction of the other. Since Marcuse is holding to the idea of progress, and since the idea of progress is related to scientific-technical innovation, the welfare state was containment in the sense of "contain and wait for progress." So that one gradually ascends to conceptions that can become infinite. The basic element for Marcuse is that this operates through an absurd incrementalism, which does not take into account the fact that resources are calculable. Because those who control know this and satisfy the needs within a certain standard. It operates on the principle of annulment of the drive so that the subject feels satisfied with what he has.

ABSTRACT

The growing relevance of green hydrogen in the context of the global energy transition has intensified debates on its economic, territorial, and institutional impacts. Beyond its role in decarbonization, green hydrogen has been associated with the reorganization of production chains and the formation of logistics hubs and corridors, with implications for regional development. This article analyzes how the structuring of these arrangements has been related to regional development in recent scientific literature, with emphasis on emerging economies and Brazil. Methodologically, an integrative literature review was conducted, guided by the PRISMA 2020 guidelines and the PCC strategy. A total of 49 studies published between 2020 and 2025 were analyzed, identified through a structured search in international and regional scientific databases. The results indicate that green hydrogen hubs can foster green reindustrialization, attract investments, and strengthen local productive capacities, provided they are associated with integrated public policies, territorial planning, and multilevel governance. However, the literature also highlights risks of energy enclaves in contexts of weak institutional coordination.

Keywords: Green Hydrogen. Logistics Hubs. Logistics Corridors. Regional Development. Energy Transition.

RESUMO

A crescente relevância do hidrogênio verde no contexto da transição energética global tem ampliado o debate sobre seus impactos econômicos, territoriais e institucionais. Para além de seu papel na descarbonização, o hidrogênio verde tem sido associado à reorganização de cadeias produtivas e à formação de hubs e corredores logísticos, com implicações para o desenvolvimento regional. Este artigo analisa como a estruturação desses arranjos tem sido relacionada ao desenvolvimento regional na literatura científica recente, com ênfase em países emergentes e no Brasil. Metodologicamente, adotou-se uma revisão integrativa da literatura, orientada pelas diretrizes do PRISMA 2020 e pela estratégia PCC. Foram analisados 49 estudos publicados entre 2020 e 2025, identificados por meio de busca estruturada em bases científicas internacionais e regionais. Os resultados indicam que hubs de hidrogênio verde podem impulsionar reindustrialização verde, atração de investimentos e fortalecimento de capacidades produtivas locais, desde que associados a políticas públicas integradas, planejamento territorial e governança multiescalar. Contudo,

RESUMEN

La creciente relevancia del hidrógeno verde en el contexto de la transición energética global ha intensificado los debates sobre sus impactos económicos, territoriales e institucionales. Más allá de su papel en la descarbonización, el hidrógeno verde se ha asociado con la reorganización de las cadenas productivas y la formación de hubs y corredores logísticos, con implicaciones para el desarrollo regional. Este artículo analiza cómo la estructuración de estos arreglos se ha relacionado con el desarrollo regional en la literatura científica reciente, con énfasis en economías emergentes y en Brasil. Metodológicamente, se realizó una revisión integrativa de la literatura, guiada por las directrices PRISMA 2020 y la estrategia PCC. Se analizaron 49 estudios publicados entre 2020 y 2025, identificados mediante una búsqueda estructurada en bases científicas internacionales y regionales. Los resultados indican que los hubs de hidrógeno verde pueden impulsar la reindustrialización verde, atraer inversiones y fortalecer las capacidades productivas locales, siempre que estén asociados a políticas públicas integradas, planificación territorial y gobernanza multinivel. Sin embargo, la literatura también señala riesgos de enclaves energéticos en contextos de débil coordinación institucional.

Palabras clave: Hidrógeno Verde. Hubs Logísticos. Corredores Logísticos. Desarrollo Regional. Transición Energética.

1 INTRODUCTION

The intensification of climate change and international commitments to carbon neutrality have driven a structural reconfiguration of global energy systems, with a growing emphasis on solutions capable of decarbonizing industrial and logistics sectors that are difficult to electrify directly. In this context, green hydrogen — produced by electrolysis of water from renewable sources — has been widely recognized as a strategic energy vector for the energy transition, especially in industrial, chemical, and heavy and maritime transport applications (DAWOOD et al., 2023; WANG et al., 2023).

Recent studies indicate that the economic viability of green hydrogen has advanced significantly due to the reduction in the costs of solar and wind generation, the technological progress of electrolyzers, and the expansion of public incentive policies in different regions of the world (AJANOVIC; HAAS, 2023; IEA, 2024). According to Wang et al. (2023), countries with high availability of renewable resources and access to strategic logistics infrastructure tend to occupy central positions in future global hydrogen value chains, especially in the international trade of derivatives such as green ammonia and synthetic fuels.

In this scenario, Brazil stands out as a potentially relevant actor, due to its mostly renewable electricity matrix, high solar irradiation, favorable wind regimes and extensive coastline with ports suitable for export. Recent research indicates that these characteristics place the country in a competitive position for the production of green hydrogen on a large scale, especially in the Northeast and Southeast regions, where emerging projects for integrated energy parks and dedicated port terminals are concentrated (RIBEIRO et al., 2024; SILVA; MILK; FERREIRA, 2023).

Contemporary literature emphasizes that the consolidation of green hydrogen as a development vector strongly depends on the territorial organization of production and logistics. Concepts such as hydrogen hubs and green logistics corridors emerge as central elements of this structuring, by integrating renewable generation, production, storage, industrial consumption, and export into coordinated territorial arrangements. As argued by Ajanovic and Haas (2023) and Heuser et al. (2024), hubs allow for gains in scale, infrastructure sharing, and risk reduction, while logistics corridors connect these hubs to national and international markets, increasing commercial predictability and attractiveness for investments.

From the perspective of regional development, the implementation of green

hydrogen hubs and corridors has the potential to induce processes of economic dynamization, territorial reindustrialization, and the generation of qualified jobs. Recent studies indicate that these projects can strengthen local production chains, stimulate technological innovation, and increase tax revenues in historically peripheral regions (RIBEIRO et al., 2024; WANG et al., 2023). However, the literature also warns that such benefits are not automatic, depending on integrated public policies, strategic territorial planning, and governance mechanisms capable of avoiding the concentration of gains and the reproduction of regional inequalities (SANTOS; PEREIRA, 2024).

In Brazil, projects under development in ports such as Pecém (CE) and Açu (RJ) have been analyzed as emblematic cases of the articulation between renewable energy, port infrastructure and strategies for the country's international insertion in the hydrogen economy. Recent empirical studies highlight both the potential of these arrangements for regional development and the regulatory, institutional, and logistical challenges that still exist, especially with regard to federative coordination, environmental licensing, and transportation and storage infrastructure (SILVA; MILK; FERREIRA, 2023; RIBEIRO et al., 2024).

In this context, this article aims to analyze how the structuring of green hydrogen hubs and logistics corridors can contribute to regional development in Brazil. To this end, an integrative review of recent scientific literature (2023–2025) and open access technical documents is adopted, seeking to identify evidence on socioeconomic impacts, infrastructure requirements, and governance models capable of enhancing the territorial benefits associated with the energy transition based on renewable hydrogen. Unlike reviews focused on technological or market aspects, this study contributes by integrating the literature on green hydrogen with regional development and territorial governance approaches, with a focus on Brazil.

2 THEORETICAL FRAMEWORK

The theoretical framework of this study articulates contributions from the literature on energy transition, political economy of energy, economic geography and regional development, with the aim of establishing a clear analytical bridge between the conceptual foundations of green hydrogen and the empirical evidence observed in different territorial contexts, especially in Brazil and Latin America. The section was structured in a more synthetic and integrated way, seeking to avoid conceptual overlaps and reinforce the

connection between theory and practice.

2.1 GREEN HYDROGEN AND ENERGY TRANSITION: FOUNDATIONS AND EVIDENCE

Recent literature recognizes green hydrogen as a strategic vector for the decarbonization of energy-intensive sectors that are difficult to electrify directly, such as steel, heavy chemicals, shipping, and aviation (DAWOOD et al., 2023; VAN DER ZWAAN et al., 2023). More than an isolated technological solution, green hydrogen has been interpreted as a structuring element of a systemic reconfiguration of energy and production systems, associated with the advance of renewable energies and sector coupling.

Recent empirical studies show that the competitiveness of green hydrogen is strongly conditioned by territorial factors, such as the availability of renewable resources, existing infrastructure, access to water, and proximity to consumer markets or export routes (MENDELEVITCH; HUENTELER; OSSENBRINK, 2023; AJANOVIC; HAAS, 2023). This evidence reinforces approaches to economic geography that highlight the role of territory in shaping new competitive advantages in the energy transition.

In the Latin American context, research indicates that countries such as Brazil, Chile, and Argentina have favorable natural conditions for the production of green hydrogen on a large scale, but face institutional and policy coordination challenges to transform this potential into sustained economic development (QUITZOW et al., 2024; GÓMEZ et al., 2024; LÓPEZ et al., 2023). These empirical studies corroborate the theoretical literature by showing that the hydrogen-based energy transition tends to reproduce or reconfigure preexisting spatial inequalities, if it is not accompanied by deliberate regional development policies.

2.2 HYDROGEN HUBS AND LOGISTICS CORRIDORS: TERRITORIAL ARRANGEMENTS AND EMPIRICAL EVIDENCE

The consolidation of green hydrogen as an economic vector depends on the territorial organization of the production, storage, transport and consumption infrastructure. In this sense, the international literature highlights hydrogen hubs as territorial arrangements capable of reducing costs, sharing risks, and accelerating the formation of markets, through the spatial concentration of energy and industrial assets (HEUSER et al., 2024; TRINOMICS, 2024).

Empirical evidence from Europe and Australia indicates that integrated hubs favor

economies of scale, technological learning, and investment attraction, especially when associated with local industrial demands and long-term contracts (SCHOLTEN; CRIKEMANS; VAN DE GRAAF, 2024). However, studies applied in emerging countries warn that, in the absence of coordination between energy, logistics and industrial policy, these hubs may be limited to export platforms with weak local production chains (GLENK; REICHELSTEIN, 2023).

In the Brazilian case, empirical analyses of the ports of Pecém (CE) and Açú (RJ) show that the proximity between renewable sources, port infrastructure, and industrial zones creates favorable conditions for the formation of green hydrogen hubs, but highlights bottlenecks related to federative governance, environmental licensing, and complementary logistics infrastructure (SILVA; MILK; FERREIRA, 2023; RIBEIRO et al., 2024). These findings reinforce the need to interpret hubs not only as technical solutions, but as institutional and territorial constructions.

Green logistics corridors play a complementary role in connecting production hubs to national and international markets. Recent studies show that logistical predictability and regulatory standardization are decisive factors to enable the trade of hydrogen derivatives, such as green ammonia, especially in exporting countries (QUITZOW et al., 2024).

2.3 GREEN HYDROGEN, GOVERNANCE AND REGIONAL DEVELOPMENT

The relationship between green hydrogen and regional development has been analyzed from the political economy approaches of the energy transition, which emphasize the role of governance, public policies, and local institutional capacities. The literature converges in indicating that the territorial benefits of green hydrogen are not automatic, depending on how the projects are inserted into broader regional and industrial development strategies (BALL; LEMA, 2024; SOVACOOOL et al., 2023).

Empirical studies in emerging countries show that export-oriented projects tend to generate energy enclaves, with limited impacts on local employment, innovation, and income. In contrast, experiences associated with local content policies, labor training, and integration with regional production chains have greater potential to induce green reindustrialization and economic diversification (SANTOS; PEREIRA, 2024; RIBEIRO et al., 2024).

In the Brazilian context, recent literature highlights that green hydrogen can act as a strategic instrument for regional development, especially in the Northeast, as long as it is

articulated with territorial policies, long-term planning, and multi-scale governance involving the Union, states, municipalities, and private actors (FURTADO et al., 2023; NASCIMENTO et al., 2023).

In summary, the theoretical framework shows that green hydrogen should be understood as a socioeconomic and territorial phenomenon, whose ability to promote regional development depends on the articulation between infrastructure, governance, and public policies. This perspective guides the empirical analysis developed in the following sections. These elements underlie the methodological strategy adopted in the integrative review, described below.

3 METHODOLOGY

This research adopts an integrative literature review, an appropriate methodological approach to synthesize and critically analyze evidence from empirical studies, theoretical studies and technical-institutional documents in emerging and interdisciplinary fields. The choice of this methodology is justified by the still recent and multifaceted nature of the debate on green hydrogen, logistics hubs and regional development, in which economic, territorial, institutional and public policy analyses coexist (WHITTEMORE; KNAFL, 2005; TORRACO, 2020).

The review was conducted in accordance with the PRISMA 2020 guidelines, adapted to the scope of integrative reviews, with the aim of ensuring transparency, traceability, and reproducibility of the search, selection, and analysis process of studies (PAGE et al., 2021). The adoption of PRISMA, although originally aimed at systematic reviews, is widely recommended to strengthen methodological rigor in integrative reviews, especially in areas in consolidation (SNYDER, 2019).

3.1 RESEARCH QUESTION AND JUSTIFICATION OF THE PCC STRATEGY

The review was guided by the following research question:

How has the structuring of green hydrogen hubs and logistics corridors been associated with regional development in recent scientific literature, especially in the context of emerging countries and Brazil?

To structure this issue and coherently guide the search strategy, the PCC (Population, Concept, and Context) model was adopted, recommended for scoping and integrative reviews because it allows greater conceptual flexibility compared to more

restrictive models (PETERS et al., 2020).

The choice of the PCC strategy is justified by the territorial and institutional nature of the phenomenon analyzed, which is not restricted to a specific population group, but involves regions, production systems and spatial arrangements. Thus, it was defined:

Population (P): regions, territories, and production systems affected by the deployment of green hydrogen infrastructure;

Concept (C): green hydrogen, hydrogen hubs, logistics corridors, energy infrastructure and value chains;

Context (C): regional development, energy transition and emerging economies, with emphasis on Brazil.

This structure allowed the alignment of the research question, the descriptors used and the selection criteria, ensuring coherence between the objectives of the study and the corpus analyzed.

3.2 DATABASES AND SEARCH STRATEGY

Bibliographic searches were carried out between January and September 2025 in the Scopus, Web of Science, SciELO, and Google Scholar databases (as a complementary source). The choice of these databases is based on criteria of thematic coverage, academic relevance and regional representativeness.

Scopus and Web of Science were selected for their broad international coverage and strong indexing of journals in the areas of energy, regional economics, and public policy. The SciELO database was included to capture Latin American and Brazilian scientific production, which is often underrepresented in international databases. Google Scholar was used in a complementary way, with limitation to the first 200 entries ordered by relevance, in order to identify qualified gray literature and relevant institutional reports.

The search strategies combined descriptors in Portuguese, English and Spanish, Boolean operators and truncations, as shown in the example:

("green hydrogen" OR "renewable hydrogen") AND ("hydrogen hub" OR corridor* OR infrastructure OR "value chain") AND ("regional development" OR "territorial development") AND (Brazil OR Brazil)

Filters were applied for period (2020–2025), languages (Portuguese, English, and Spanish), and document type (peer-reviewed articles, reviews, and technical reports from recognized institutions). The option for publications from 2020 onwards is justified by the

recent nature of the consolidation of green hydrogen as a public policy agenda and object of applied research, ensuring the timeliness and relevance of the findings.

3.3 INCLUSION, EXCLUSION AND SELECTION PROCESS CRITERIA

The inclusion criteria included: (i) studies that explicitly addressed green hydrogen; (ii) analyses that relate infrastructure, hubs, logistics or value chains to territorial or regional impacts; (iii) peer-reviewed publications or institutional technical reports; and (iv) availability of the full text.

Studies focused exclusively on fossil or blue hydrogen, strictly laboratory research with no territorial connection, duplicate publications, and texts without full access were excluded.

The selection process followed the four stages of PRISMA 2020: identification, screening, eligibility and inclusion. Initially, 386 records were identified. After removing 104 duplicates, titles and abstracts were read ($n = 282$), resulting in the exclusion of 161 out-of-scope records. Of the 121 studies evaluated in full, 72 were excluded because they did not have sufficient adherence to the territorial and logistical approach, culminating in a final corpus of 49 studies.

The process of identification, screening, eligibility, and inclusion of studies followed the PRISMA 2020 guidelines, as illustrated in Figure 1.

Figure 1

PRISMA 2020 flowchart of the selection process of the integrative review studies

Source: Prepared by the authors (2025), based on the PRISMA 2020 guidelines.

The screening was carried out ensuring reliability to the selection process (KITCHENHAM et al., 2020).

3.4 DATA EXTRACTION, ANALYSIS AND ARTICULATION WITH RESULTS

Data extraction was carried out using a standardized spreadsheet, containing information on authorship, year, country, type of study, empirical object, type of infrastructure analyzed (hubs, ports, corridors) and main results.

The qualitative analysis followed the thematic content analysis technique (BARDIN, 2011), allowing the identification of recurrent analytical categories, such as: (i) hydrogen

hubs as vectors of green reindustrialization; (ii) logistics corridors and international insertion; (iii) governance, public policies and risks of energy enclaves.

These categories directly guided the presentation of the results in Section 4, in which concrete examples of green reindustrialization associated with logistics hubs and ports — such as the cases of Pecém (CE) and Açu (RJ) — identified in the analyzed literature are discussed. In this way, the methodology not only organizes the corpus, but analytically structures the discussion of the practical impacts of green hydrogen on regional development.

To ensure methodological rigor, criteria of transparency, analytical coherence, and traceability were adopted, as recommended by Torraco (2020) and Snyder (2019).

4 RESULTS AND DISCUSSIONS

The integrated analysis of the 49 studies included in the review shows that green hydrogen has been increasingly interpreted in the literature not only as a technological solution for decarbonization, but as a structuring element of new territorial, productive and institutional arrangements.

However, the discussion of the results allows us to move beyond the identification of potentialities, deepening a critical reading of the limits, gaps and constraints that shape the effects of green hydrogen on regional development.

Table 1 summarizes the main analytical categories and evidence identified in the reviewed literature, relating hydrogen hubs, logistics corridors, and regional development.

Table 1

Analytical synthesis of the main findings of the literature on green hydrogen, logistics hubs and regional development

Analytics Category	Key evidence identified in the literature	Implications for regional development	Representative references
Green hydrogen hubs as vectors of green reindustrialization	The literature indicates that integrated green hydrogen hubs favor economies of scale, infrastructure sharing, and risk reduction, in addition to stimulating the attraction of industrial investments and technological innovation, especially when associated with local industrial demands (steel, fertilizers, chemicals). Studies highlight that logistics corridors are essential to enable the transport and export of hydrogen derivatives (especially green ammonia), increasing commercial predictability and international competitiveness. However, regulatory bottlenecks and the absence of intermodal planning limit its effectiveness in emerging countries.	Potential for green reindustrialization, regional productive diversification and generation of qualified jobs, conditioned to the articulation with industrial and technological policies.	Heuser et al. (2024); Ribeiro et al. (2024); Ajanovic and Haas (2023); Furtado et al. (2023)
Green logistics corridors and international insertion		Expansion of the international insertion of producing regions, with the risk of export dependence if there is no integration with domestic markets and local production chains.	Quitow et al. (2024); Wang et al. (2023); Scholten et al. (2024); Trinomics (2024)

Multi-Scale Governance and Institutional Coordination	The literature converges in pointing out that the institutional fragmentation between energy, industrial, environmental, and logistics policies compromises the territorial benefits of green hydrogen projects. Multi-scalar governance arrangements and federative coordination are considered critical determinants of success.	Regions with greater institutional capacity and coordination tend to capture greater socioeconomic benefits; Absence of integrated governance increases risks of projects that are not very inclusive.	Ball and Lema (2024); Sovacool et al. (2023); Santos and Pereira (2024); Nascimento et al. (2023)
Risks of energy enclaves and concentration of benefits	A significant part of the literature warns that projects predominantly oriented to exports can generate energy enclaves, with weak local productive chains, low job generation and limited transfer of technological capacities.	Possible reproduction of regional inequalities and peripheral insertion in global hydrogen value chains, if there are no deliberate instruments of productive inclusion.	Ball and Lema (2024); Santos and Pereira (2024); López et al. (2023); Gómez et al. (2024)
Integration with local production chains and industrial policies	Evidence indicates that the positive impacts of green hydrogen are amplified when projects are integrated into existing industrial clusters and accompanied by local content policies, workforce training, and innovation support.	Strengthening regional productive capacities, greater retention of economic value in the territory and stimulation of green industrial innovation.	Ribeiro et al. (2024); Furtado et al. (2023); UNIDO (2024); Nascimento et al. (2023)

Territorial infrastructure and locational advantages	The territorial competitiveness of green hydrogen depends on the availability of renewable resources, port infrastructure, access to water and logistical connectivity. Coastal regions with structured ports have comparative advantages, but face regulatory and environmental challenges.	Consolidation of strategic regional hubs (especially in coastal regions), provided that it is accompanied by territorial planning and efficient environmental licensing.	Silva, Leite and Ferreira (2023); Mendelevitch et al. (2023); IEA (2024); Hansen et al. (2024)
---	---	---	---

Source: Prepared by the authors (2025), based on the integrative literature review.

The detailed characterization of the included studies can be found in Appendix A (Table A1).

A first critical aspect concerns the recurrent decoupling between technological ambitions and territorial strategies. Although most studies recognize the role of hydrogen hubs as inducers of economies of scale and cost reduction, a significant portion of the literature points out that these arrangements have been conceived predominantly from energy and industrial logics, with limited integration into regional development policies. This gap results, in many cases, in projects strongly oriented to exports, with weak local productive chains and reduced capacity to generate employment and income in the territories where they are implemented.

The literature also highlights recurring flaws in the governance models associated with green hydrogen projects. Empirical studies indicate that institutional fragmentation — expressed in the low coordination between energy, industrial, environmental and logistics policies — compromises the materialization of the expected territorial benefits. In emerging countries, this fragmentation tends to be aggravated by asymmetries in state capacity between levels of government, resulting in centralized decision-making processes and limited participation of regional and local actors.

Another critical point concerns the logistical and institutional infrastructure. Although ports and logistics corridors are often presented as strategic assets, the literature reveals that regulatory bottlenecks, regulatory uncertainties, and the absence of intermodal

planning limit the operationalization of these corridors. In the Brazilian case, studies on Pecém and Açú show that, despite the locational advantages, challenges persist related to environmental licensing, rail and road integration, and the definition of specific regulatory frameworks for the transport and export of hydrogen derivatives.

With regard to green reindustrialization, the results suggest that its potential remains conditioned by the existence of explicit industrial policies. The literature identifies incipient experiences in which hydrogen hubs are articulated with existing industrial clusters — such as steel, fertilizers, and chemicals — generating productive diversification and innovation effects. However, such experiences are still exceptions, and not the rule, especially in countries that export natural resources, where the risk of reproducing a peripheral insertion in global hydrogen value chains prevails.

In summary, the discussion of the results indicates that the gaps identified in the literature do not result from technological limitations of green hydrogen, but from institutional, governance, and territorial articulation failures. These findings reinforce the need to understand green hydrogen as a development policy, and not just as an energy agenda.

5 CONCLUSION

This article analyzed, through an integrative review of the scientific literature, how the structuring of green hydrogen hubs and logistics corridors has been associated with regional development, with an emphasis on emerging countries and the Brazilian context. The analysis of 49 studies published between 2020 and 2025 allowed us to systematize evidence on the economic, territorial, and institutional potential of green hydrogen, as well as to identify critical constraints for the effective materialization of its regional benefits.

In summary, the results indicate that green hydrogen can act as a vector for green reindustrialization, attracting investments and strengthening local productive capacities, especially when organized in integrated territorial arrangements, such as hubs and structured logistics corridors. However, the literature converges in demonstrating that such benefits are not automatic and depend on the deliberate articulation between energy, industrial, logistics and regional development policies. Projects that are predominantly export-oriented, without mechanisms of productive inclusion and long-term territorial planning, tend to reproduce dynamics of energy enclaves and concentration of benefits.

In the Brazilian case, the studies analyzed show a unique combination of

opportunities and challenges. The abundance of renewable resources and the presence of strategic port infrastructure position the country competitively in global green hydrogen value chains. However, limitations associated with institutional coordination, multi-scale governance, and the definition of public policy instruments capable of promoting local productive chains and greater socioeconomic inclusion persist, especially in peripheral regions such as the Northeast.

In light of these findings, the article points out relevant implications for the formulation of public policies. The need to explicitly integrate the green hydrogen agenda into regional and industrial development policies is highlighted, avoiding its isolated conduct as an exclusively energy policy. In addition, it is essential to strengthen multi-scale governance arrangements that articulate the Union, states, municipalities, the private sector, and local science and technology institutions, as well as to prioritize the formation of local productive chains through instruments such as local content policies, strategic public procurement, labor training, and integrated planning of logistics corridors, considering intermodal infrastructure, regulatory frameworks and long-term territorial impacts.

As limitations of the study, the predominance, in the literature analyzed, of prospective, conceptual and scenario-based approaches stands out, reflecting the still emerging character of the green hydrogen sector. The scarcity of ex-post empirical evaluations of projects in operation limits the measurement of effective socioeconomic impacts at the regional and local levels.

In this sense, the article points to a clear agenda for future research. There is a need for in-depth empirical studies on green hydrogen projects in the implementation or operation phase, focusing on their effects on employment, income, production chains, and regional innovation. Comparative studies between Brazilian regions and between emerging countries can contribute to identifying more effective institutional arrangements and governance models. In addition, future research can deepen the analysis of specific public policies — such as national and state hydrogen strategies, financing instruments, and local content mechanisms — evaluating their coherence, effectiveness, and territorial impacts.

In summary, green hydrogen emerges in the literature as a strategic opportunity to align energy transition, economic competitiveness, and regional development. However, its effective contribution depends less on the technology itself and more on the way it is institutionally organized, territorially planned, and politically governed. By highlighting these constraints and gaps, the present study contributes to the advancement of the academic

debate and offers relevant analytical subsidies for researchers and public policy makers.

APPENDIX A – STUDIES INCLUDED IN THE INTEGRATIVE REVIEW

This appendix presents the detailed version of the characterization of the studies that make up the final corpus of the integrative review (n = 49), as described in Section 3 – Methodology. The works were identified from a structured exploratory search in international and regional scientific bases, considering the period from 2020 to 2025.

ABSTRACT

Everyday bioethics, especially in the context of obstetrics, addresses the ethical and moral dilemmas that healthcare professionals face in the exercise of their duties. This area highlights the importance of fundamental ethical and moral principles, such as autonomy, beneficence, non-maleficence, and justice, which guide daily decisions in the care of pregnant women and newborns. In the exercise of their duties, they often encounter complex situations, such as managing risks during pregnancy and childbirth, making decisions about medical interventions, and providing emotional support to pregnant women. Patient autonomy is essential, as it involves respecting their choices and beliefs, even if they may diverge from medical recommendations. Finally, everyday bioethics in obstetrics is permeated by an unwavering commitment to the dignity and rights of women, challenging professionals to balance their vocation with ethical responsibilities in constantly changing environments. A prime example of an icon embodying the essence of bioethics in practice is Stanisława Leszczyńska, known as the Midwife of Auschwitz. She faced immense ethical and moral challenges while working as a midwife in inhumane conditions. As part of the Nazi concentration camp system, she was forced to deal with the reality of unwanted pregnancies and childbirths in an environment of horror. Her commitment to life and human dignity stood out amidst the genocide. Her main ethical challenges included the obligation to perform deliveries under extreme conditions, often without adequate resources. The women she attended were mostly prisoners, and many faced death after childbirth. She had to choose between saving the mother and the child, a choice that put her own safety at risk, since the Nazis showed no compassion for these women, and she became a symbol of humanism in the face of horror, leaving lessons about the importance of acting with integrity. Her testimony challenges us to reflect on how phenomena of pressure and oppression impact ethical issues in medicine and other professions.

RESUMO

A bioética do cotidiano, especialmente no contexto da obstetrícia, aborda os dilemas éticos e morais que profissionais da saúde enfrentam no exercício de suas funções. Esta área destaca a importância de princípios éticos e morais fundamentais, como a autonomia, beneficência, não maleficência e justiça, que guiam as decisões diárias no cuidado a gestantes e recém-nascidos. E no exercício de suas funções muitas vezes se deparam com situações complexas, como o manejo de riscos durante a gravidez e o parto, decisões sobre intervenções médicas e apoio emocional a gestantes. A autonomia da paciente é essencial, pois envolve respeitar suas escolhas e crenças, mesmo que possam divergir das recomendações médicas. Por fim, a bioética do cotidiano na obstetrícia é permeada por um compromisso inabalável com a dignidade e os direitos das mulheres, desafiando os profissionais a equilibrar sua vocação com responsabilidades éticas em ambientes de constante mudança. E um primoroso exemplo de um ícone da essência da bioética na prática é a “Stanisława Leszczyńska”, conhecida como a Parteira de Auschwitz, enfrentou desafios éticos e morais imensos durante sua atuação como parteira em condições desumanas. Como parte do sistema de campos de concentração nazistas, ela foi forçada a lidar com a realidade de gravidezes indesejadas e partos em um ambiente de horror. Seu compromisso com a vida e a dignidade humana destacou-se em meio ao genocídio. Seus principais desafios éticos como a obrigação de realizar partos sob condições extremas, muitas vezes sem os recursos adequados. As mulheres que ela atendia eram, na sua maioria, prisioneiras, e muitas vezes enfrentavam a morte após o parto. Ela tinha que decidir entre salvar a mãe e o filho, uma escolha que colocava sua própria segurança em risco, uma vez que os nazistas não demonstravam compaixão por essas mulheres, e se tornou um símbolo de humanismo em frente ao horror, deixando lições sobre a importância de agir com integridade, seu testemunho nos desafia a refletir sobre como fenômenos de pressão e opressão impactam questões éticas na medicina e em outras profissões.

Palavras-chave: Bioética. Obstetrícia. Dignidade. Ética. Moral. Medicina.

RESUMEN

La bioética cotidiana, especialmente en el contexto de la obstetricia, aborda los dilemas éticos y morales que enfrentan los profesionales de la salud en el ejercicio de sus funciones. Esta área destaca la importancia de principios éticos y morales fundamentales, como la autonomía, la beneficencia, la no maleficencia y la justicia, que guían las decisiones diarias en el cuidado de las mujeres embarazadas y los recién nacidos. En el ejercicio de sus funciones, a menudo se enfrentan a situaciones complejas, como la gestión de riesgos durante el embarazo y el parto, la toma de decisiones sobre intervenciones médicas y el apoyo emocional a las mujeres embarazadas. La autonomía de las pacientes es esencial, ya que implica respetar sus decisiones y creencias, incluso si pueden discrepar de las recomendaciones médicas. Finalmente, la bioética cotidiana en obstetricia está impregnada de un compromiso inquebrantable con la dignidad y los derechos de las mujeres, lo que desafía a los profesionales a conciliar su vocación con las responsabilidades éticas en entornos en constante cambio. Un ejemplo destacado de un icono que encarna la esencia de la bioética en la práctica es Stanisława Leszczyńska, conocida como la Matrona de Auschwitz. Se enfrentó a inmensos desafíos éticos y morales mientras trabajaba como partera en condiciones inhumanas. Como parte del sistema de campos de concentración nazi, se vio obligada a lidiar con la realidad de embarazos y partos no deseados en un entorno de horror. Su compromiso con la vida y la dignidad humana se destacó en medio del genocidio. Sus principales desafíos éticos incluyeron la

obligación de realizar partos en condiciones extremas, a menudo sin los recursos adecuados. Las mujeres que atendió eran en su mayoría prisioneras, y muchas enfrentaban la muerte después del parto. Tuvo que elegir entre salvar a la madre y al niño, una decisión que puso en riesgo su propia seguridad, ya que los nazis no mostraron compasión por estas mujeres. Se convirtió en un símbolo del humanismo frente al horror, dejando lecciones sobre la importancia de actuar con integridad. Su testimonio nos reta a reflexionar sobre cómo los fenómenos de presión y opresión impactan en las cuestiones éticas de la medicina y otras profesiones.

1 INTRODUCTION

1.1 BIOETHICS OF EVERYDAY LIFE IN OBSTETRICS: REFLECTIONS IN THE LIGHT OF MEDICAL PRACTICE

Bioethics, as a multidisciplinary field that deals with the ethical implications of medical practice, plays a fundamental role in obstetrics, where decisions have a direct impact on the lives of mothers and newborns. Obstetric practice is not restricted to delivering babies, but involves a complex set of decisions that require an improved understanding of bioethics in everyday life.

Within this context, it is essential to consider the work of Professor Nilo Agostini, who incisively addresses the ethical issues that permeate medical practice. In his book "Bioethics: Fundamentals and Applications", Agostini discusses the importance of autonomy, beneficence and non-maleficence – pillars that should guide the performance of health professionals, especially in obstetrics.

One of the main ethical principles in obstetrics is women's autonomy. The right to make decisions about your body and your birth is fundamental. However, this autonomy is often challenged by cultural issues and hospital practices that impose standards. Agostini (2020) argues that women's empowerment should be a priority in obstetric care. This implies not only respecting their choices, but also providing clear and safe information so that they can make informed decisions.

Health professionals, in turn, face the daily dilemma of balancing patient autonomy with the need for interventions that ensure safety. The concept of beneficence, which refers to the obligation to act for the good of the patient, can generate conflicts. For example, the recommendation of elective cesarean sections, in some cases, may be more of a physician's choice than a clinical necessity, leading to discussion about the real intention behind these interventions (Lima, 2022).

In situations where the health of the mother or fetus is at risk, bioethics becomes more complex. The principle of non-maleficence requires the doctor to act to avoid harm, but the consequences of decisions need to be weighed. Case studies in obstetrics often reveal the need to address issues such as fetal viability and the risks associated with procedures, respecting the mother's wishes, whenever possible (Andrade, 2021).

Communication is a fundamental aspect in obstetric practice and an ethical principle that must be emphasized. According to Agostini, open dialogue between doctor and patient

is essential for building a relationship of trust. The use of accessible language and active listening are essential for women to feel valued in their experiences and decisions.

Another crucial point of bioethics in obstetrics concerns issues involving the beginning of life. The ethical dilemmas that arise in cases of fetal anomalies or situations involving the possibility of suffering the newborn are complex and require careful and respectful discussion between doctors, patients, and family members (Cruz and Oliveira, 2023). The responsibility of providing guidance on the available options, always respecting the dignity of life, is a task that demands sensitivity and understanding.

In summary, bioethics in obstetrics should always be present in the reflections of daily medical practice. Professor Nilo Agostini's work offers a solid basis for the understanding and application of ethical principles in clinical practice, emphasizing the importance of autonomy, communication, and respect for patients' choices. Continuous training and openness to dialogue are fundamental to ensure obstetric care centered on life and human dignity, thus reflecting a truly ethical and responsible practice in contemporary medicine.

2 THE ETHICAL MANAGEMENT OF OBSTETRIC EMERGENCIES IN CONTEXTS: MODERN HOSPITAL VERSUS MIDWIVES IN EXTREME CONDITIONS

Continuing the analysis of the bioethical principles presented above, emergency management is the field in which ethics assumes the most decisive role, as it involves quick actions, imminent risk of death, and the need to balance principles even under adverse conditions. Analyzing this management in contrasting contexts — the modern hospital environment and the performance of midwives in extreme conditions, allows us to understand how ethics manifests itself in different ways, but equally profound, depending on historical, social and structural circumstances.

In the modern hospital context, contemporary hospitals and obstetric emergencies are managed within a strongly structured environment, with technological resources, multidisciplinary teams, and well-established, evidence-based protocols. The physician performs critical functions, such as drug administration, emergency surgical interventions, and therapeutic decision-making, which are essential for maternal and fetal stabilization and safety (Brasil, 2014). Specialized training and continuous education are essential to ensure quick and effective responses in highly complex scenarios (Ferreira, 2019).

The presence of trained professionals in obstetric emergency units is associated with better maternal and neonatal outcomes, contributing to the reduction of mortality and morbidity related to obstetric complications (Brito & Fortes, 2021). In addition, evidence-based practice ensures the application of up-to-date protocols, while interdisciplinary collaboration between physicians, nurses, and other professionals promotes integrated and effective care (Sousa et al., 2021; WHO, 2020).

Among the main obstetric emergencies in a hospital context are: postpartum hemorrhage, preeclampsia/eclampsia, acute fetal distress, uterine rupture, umbilical cord prolapse and shoulder dystocia (WHO, 2017; FIGO, 2022). All require quick and reasoned decisions, combining technical knowledge and evidence, in addition to respect for the dignity of the pregnant woman.

Technology, such as fetal monitoring, portable ultrasound, electronic recording systems, and telemedicine, helps in the early identification of complications and in making more assertive decisions, although it does not replace the technical knowledge, experience, and communication skills of the health professional as described. Thus, the ethical management of obstetric emergencies in hospitals and modern health systems combines technical preparation, continuous updating, and interdisciplinary cooperation, ensuring safe and humanized care for mothers and newborns.

In contrast, the work of midwives in extreme conditions, environments of precariousness or violence, such as communities without resources, concentration camps or war regions, ethical management takes on another proportion.

Without resources, without staff or under surveillance, ethics is not based on protocols, but on humanity and internal moral duty. The midwife without adequate instruments resorts to practical experience and body knowledge. Each decision is driven by an attempt to preserve the minimum of dignity and life, even in the face of the impossibility of favorable results.

Obstetric practice becomes an act of moral resistance. Care in the midst of horror is, in itself, an "ethical protest". It seeks to evaluate suffering, avoid despair and protect those women as best you can, an ethics based on the human bond and their faith, often deeper than any protocol. Showing that the value of the profession is not only in technical knowledge, but in the ability to act with courage, empathy, and moral responsibility even in the face of severe limitations.

The recognition of midwives is essential, not only in terms of professional appreciation, but also because they offer emotional support, guidance and humanized care, establishing a deep bond with the pregnant woman, a fundamental role in maternal health, especially in contexts of vulnerability, resource constraints or extreme situations. The work of midwives and health professionals in extreme situations reveals the essence of obstetric care: protecting life and humanity even when everything around is inhumane.

Both professionals, doctors and obstetric nurses in adverse conditions, seek to preserve the life and dignity of women and newborns. The modern obstetrician deals with technical pressure; The midwife in extreme conditions deals with existential pressure and risk to personal life. In the hospital, technology is used to help guide ethics; In extreme adversity, ethics depends radically on the moral strength of the individual. In the safe and contemporary environment, autonomy is operationalized via informed consent; while in contexts, such as those discussed, autonomy is limited or unfeasible, prevailing the ethics of protection.

Therefore, understanding these differences broadens the reflection on professional performance in obstetrics and reinforces the need to recognize ethical limits, adapt decisions in adverse scenarios, and preserve human dignity as a central element of care, regardless of structural conditions. As Hippocrates said: "Where there is love for the art of medicine, there will also be love for humanity."

To replicate the practice reported above, it was opportune to expose a summarized approach to an iconic and rich example in the history of a woman who faced all the challenges in the midst of the Nazi regime, in the Auschwitz concentration camp, and exercised her profession with ethics and values above what was imposed on her, A great example for everyday bioethics of what a professional obstetrics really is exercising her principles and preserving the dignity of the human person in hostile and chaotic environments.

3 STANISŁAWA LESZCZYŃSKA: BIOGRAPHY, FAITH AND PROFESSIONAL TRAINING

Stanisława Leszczyńska was born on May 8, 1896, in the city of Łódź, Poland, into a deeply Catholic working-class family, a context that shaped his social and ethical conscience from an early age. Daughter of a carpenter and a dedicated mother, her moral formation was marked by an environment of discipline, faith and solidarity. During his youth,

his family temporarily emigrated to Brazil, returning to Poland shortly before the outbreak of World War I. Back in Łódź, she married Bronisław Leszczyński, with whom she had four children, while also pursuing professional qualifications (Gabryel, 1989).

Her career as a midwife formally began in 1920, when she entered the obstetrics course at the University of Warsaw, completing her studies in 1922 with honors. According to *Midwifery in Poland* (Nagórska; Zych; Lesińska-Sawicka, 2024), the teaching of obstetrics in the interwar period was deeply influenced by humanist principles, being centered on the integral care of women and the appreciation of life. Leszczyńska adopted these principles with conviction and began to practice the profession in her community with enormous recognition. Their performance was based not only on technical competence, but on deep respect for pregnant women, regardless of their social status or religion (Dobrowolska et al., 2011).

Christian spirituality profoundly guided his professional conduct. She saw motherhood as a sacred expression of human dignity and interpreted childbirth as an act of grace, whose defense of life could not be relativized even in the face of war. As Olczyk and Król (2017) point out, Leszczyńska believed in the sanctity of life from conception, which was the basis for her unconditional refusal of any practice that threatened the unborn child. This Christian ethic was not restricted to the private sphere, but was lived daily in his profession, as a form of moral commitment to God and to the vulnerable.

Engagement with the weakest intensified during the Nazi occupation of Poland. As recorded by Kłodziński (1975), Stanisława and his family participated in the resistance, sheltering Jews and collaborating with the Łódź ghetto support network, which led to his arrest by the Gestapo in 1943. Deported with her daughter to the Auschwitz-Birkenau concentration camp, she received the number 41335. There, she was assigned to the maternity ward, where she worked as a midwife under direct orders from the SS and doctor Josef Mengele. Even in absolutely inhumane conditions — without instruments, hygiene or medicines — she performed about three thousand births, without any woman dying under her care (Tierling-Śledź, 2021).

His performance at Auschwitz was marked by firm ethical resistance. She vehemently refused to obey orders of systematic infanticide, even when confronted directly by Mengele. In his testimony, Leszczyńska (1991) states: "No, never! Children should not be killed", a phrase that summarizes his posture of fidelity to the dignity of human life, even if this implied a direct risk to his own survival. The moral pedagogy contained in her attitude

was analyzed by Olearczyk (2023), who considers her an expression of practical virtue and an example of ethical training for future midwives and health professionals.

Stanisława Leszczyńska therefore represented the convergence of technique, faith and ethics. His pre-war training, already grounded in Christian and humanist principles, was put to the test in the extreme context of Auschwitz, where his obstetric practice became an act of resistance against the logic of death. As Gliński (2021) observes, her biography challenges the boundaries between the ordinary and the heroic, and is inscribed in the field of memory as a testimony of a professional who, in the face of barbarism, unconditionally chose life. The understanding of his trajectory requires, therefore, a reading that goes beyond the biographical: it is an incarnate ethic, lived on the border between care and horror.

4 THE PRACTICE OF THE MIDWIFE AT AUSCHWITZ: ETHICAL RESISTANCE AND HUMANIZATION IN HELL

Stanisława Leszczyńska's performance in the Auschwitz-Birkenau extermination camp constituted a singular mark of moral resistance in the midst of the collapse of ethical and sanitary structures promoted by the Nazi regime. In Block 24 of the BIIe sector, intended for pregnant women, there was a supposed "maternity hospital" without any adequate medical support, where births took place on improvised boards, in the midst of dirt, cold, hunger and total absence of asepsis or anesthesia. The scarcity of resources was extreme: there was a lack of gloves, instruments, medicines, clean clothes and drinking water. The parturients, in turn, were severely malnourished, sick, and physically and emotionally exhausted by forced labor and the daily brutality of the camp (Dobrowolska et al., 2011; Tierling-Śledź, 2021; Bitencourt, 2012).

Against this backdrop of absolute dehumanization, Leszczyńska's obstetric practice emerged as a space of radical ethical resistance. Alone, without formal medical help, she attended the birth of approximately 3,000 children, adamantly refusing to cooperate with the genocidal practices imposed by the Nazis, especially systematic infanticide. The order from the camp authorities—especially Dr. Josef Mengele—was clear: no Jewish child was to survive. Many of the collaborationist midwives, under the command of SS officers, followed the protocol of drowning newborns in buckets of water or injecting lethal substances immediately after delivery (Corkran, 2021; Galle, 2011; Posner; Ware, 2019).

Stanisława, however, held firm to his professional and spiritual conduct. When questioned by Mengele about the reason for her disobedience to orders, she replied with conviction: "No, never. You cannot kill children" (Leszczyńska, 1991). This intransigent stance in the face of the culture of death was not limited to a religious position – although his Catholic faith played a central role – but also reflected a deep commitment to the ethics of care and to the inalienable principle of human dignity (Olczyk; Król, 2017; Olearczyk, 2023). Her active refusal was not directly punished, perhaps because of the Nazis' belief that the resistance of a Catholic, Polish woman and prisoner was irrelevant in the face of the scale of the extermination, or, as speculated by Glinski (2021), because her discreet performance did not directly confront the camp's power structure.

Even though she could not prevent the murders committed by the SS and collaborators, Leszczyńska recorded each birth in small hidden notebooks, baptized the children — using water or saliva — and tried to preserve the bond between mother and baby as much as possible, even if only for a moment. It is estimated that about 2,500 children born in the camp were executed shortly after birth, while only about 30 survived, generally those who had physical traits considered "Aryan" and, therefore, were assigned to Germanization programs promoted by the regime (Gabryel, 1989; Rubenfeld, 2010; Mccrary, 2022).

The humanization of care practiced by Leszczyńska acquired, in that context, subversive contours. Every assisted birth, every gesture of comfort, every whispered prayer to the mother or the newborn, constituted a symbolic negation of the Nazi logic of annihilation. The space of "motherhood" was thus transformed into a place of silent moral resistance, where the preservation of life assumed the value of ethical denunciation (Wasserman; Yoskowitz, 2019; Santos, 2024).

Leszczyńska was released in 1945, returning to her practice as a midwife in Łódź, Poland. Even after the war, he kept silent for years, until he recounted his experience in the text "Nie, nigdy! Nie wolno zabijać dzieci" (Leszczyńska, 1991), in which he accurately documents the horrors witnessed, the omission of many, and the limits of possible resistance. Her work began to be studied not only as a biographical episode, but as a pedagogical and ethical reference for the training of midwives, nurses and health professionals in general (Klodziński, 1975; Nagórska; Zych; Lesińska-Sawicka, 2024).

Stanisława Leszczyńska's legacy lives on as an expression of the possibility of care even in the most extreme conditions of degradation. Her obstetric practice, grounded in

faith, compassion, and professional ethics, not only saved lives, but withstood barbarism with the silent force of humanity.

5 ETHICAL LEGACY, RECOGNITION AND IMPLICATIONS IN HEALTH EDUCATION

Stanisława Leszczyńska's testimony does not end at Auschwitz-Birkenau. Her experience of ethical resistance, based on the dignity of life and the unwavering commitment to the principles of obstetric practice, reverberates to this day in the fields of bioethics, historical memory and professional training in health. The posthumous publication of the *Raport położnej z Oświęcimia* (Report of the Auschwitz Midwife), written by Leszczyńska herself in 1957, constitutes not only a memorial record, but a document of profound ethical and political relevance. In the text, she recounts in detail the conditions of births in the camp, her systematic refusal of infanticide ordered by SS authorities — including Josef Mengele — and the effort to maintain a minimum of humanity in the midst of institutionalized horror (Leszczyńska, 1991; Mccrary, 2022).

The report, widely disseminated and translated, is now the object of study in the fields of the history of medicine and applied bioethics. Her narrative strength and testimonial value were also recognized by the Catholic Church, which began the process of beatification of Leszczyńska as a servant of God, highlighting her life as an example of heroic virtues. The institutional recognition of his figure also occurs in secular contexts: several nursing schools and professional training centers in Poland adopt his biography as a transversal content, promoting the discussion on ethics, care, and resistance (Gliński, 2021; Tierling-Śledź, 2021; Dobrowolska et al., 2011).

The pedagogical character of Stanisława's trajectory is widely analyzed by Olearczyk (2023), who argues that the moral posture of the midwife configures a model of ethical training for future generations of health professionals. This perspective is shared by studies that deal with secular spirituality as a form of resistance and pedagogy of care, such as those by Olczyk and Król (2017), which place Leszczyńska in a lineage of figures who transformed the technical exercise into a moral mission. The presence of his history in disciplines such as History of Medicine, Professional Ethics and Collective Health highlights the transversality of his legacy, whose influence goes beyond obstetrics and reaches doctors, nurses, psychologists and professionals of contemporary bioethics (Rubenfeld, 2010; Wasserman; Yoskowitz, 2019).

Leszczyńska's contribution to vocational training does not lie only in her biographical example. Their work evidenced, in a concrete way, the possibility of building clinical practices based on humanization, even in scenarios of total dehumanization. As the studies by Corkran (2021) and Santos (2024) demonstrate, the obstetric care provided by her, in the midst of the absence of supplies, institutional violence, and constant threat of death, constitutes a radical form of resistance and reaffirmation of life. The impact of this testimony is visible in training projects that prioritize the centrality of the dignity of the person and the valorization of the professional-patient bond as the axis of clinical practice.

In addition, the recognition of the role of women in confronting Nazi barbarism, as highlighted by Bitencourt (2012), broadens the understanding of obstetric practice as a political gesture of confrontation and denunciation. Leszczyńska, by not submitting to Mengele's orders, not only survived the camp's perverse logic, but subverted its codes, transforming the delivery room at Auschwitz into one of humanity's last refuges. As Gabryel (1989) points out, his story is a continuous appeal to professional conscience, reminding us that technical knowledge should never be dissociated from ethics and compassion.

Finally, the insertion of her trajectory in the literature on bioethics and medicine after the Holocaust, as attested by Rubenfeld (2010) and Wasserman and Yoskowitz (2019), consolidates Leszczyńska as a paradigmatic figure in the critical training of health professionals. His legacy is not reduced to a heroic memory, but is projected as a formative requirement: to educate to resist, to care to transform, to bear witness so as not to repeat. In times of health and ethical crises, its history continues to challenge the present, calling on new generations to reaffirm the non-negotiable value of life, even – and above all – in the face of darkness.

ABSTRACT

Given the relevance of layer poultry farming to Brazilian agribusiness and the need to ensure adequate environmental conditions for bird welfare and productive performance, it is pertinent to investigate how technologies and intelligent models have been applied to the housing environment of poultry facilities. This study aims to identify, map, and characterize research that integrates, individually or in combination, fuzzy logic, environmental sensing, and IoT technologies in the monitoring of the environment in layer poultry houses. A scoping review was conducted according to JBI methodology and PRISMA-ScR guidelines, including database searches, rigorous study selection, and data extraction. A total of 52 studies published between 2020 and 2025 were included. Most research was carried out in Indonesia and China, with a predominance of field studies. Temperature and humidity were the most frequently monitored variables, whereas gas measurements appeared less frequently. Low-cost sensors from the DHT and MQ families and hardware platforms such as ESP and Arduino were predominantly employed. Fuzzy logic was the main artificial intelligence technique identified, although many systems operated without intelligent models. Most proposals were integrated with cloud-based solutions, but few employed long-range wireless networks. The review also identified many studies focused on broiler chickens, limited adoption of environmental classification, and an almost complete absence of validation using recognized environmental indices. It is concluded that, despite the technological advances observed, important gaps remain regarding environmental classification and validation, the use of artificial intelligence, gas monitoring, long-range communication, and the development of solutions specifically tailored to layer poultry houses.

RESUMO

Considerando a relevância da avicultura de postura para o agronegócio brasileiro e a necessidade de assegurar condições ambientais adequadas ao bem-estar e ao desempenho produtivo das aves, torna-se pertinente investigar como tecnologias e modelos inteligentes têm sido aplicados na ambiência de aviários. O objetivo deste estudo é identificar, mapear e caracterizar pesquisas que integrem, de forma isolada ou combinada, lógica fuzzy, sensoriamento ambiental e tecnologias IoT no monitoramento da ambiência em aviários de postura. Para tanto, realizou-se uma revisão de escopo conforme metodologias do JBI e PRISMA-ScR, com buscas em bases científicas, seleção criteriosa e extração de dados. Foram incluídos 52 estudos publicados entre 2020 e 2025. Observou-se predominância de pesquisas conduzidas na Indonésia e na China, com maior ocorrência de estudos de campo. Temperatura e umidade foram as variáveis mais monitoradas, enquanto a medição de gases apareceu em menor escala. Sensores de baixo custo das séries DHT e MQ e plataformas como ESP e Arduino foram majoritariamente empregados. A lógica fuzzy foi a técnica de inteligência artificial predominante, embora muitos sistemas tenham operado sem modelos inteligentes. A maioria das propostas integrou-se à nuvem, mas poucas utilizaram redes sem fio de longa distância. Identificaram-se ainda muitos estudos para frangos de corte, baixa adoção de classificação ambiental e quase inexistência de validação por índices reconhecidos. Conclui-se que, apesar dos avanços tecnológicos observados, persistem lacunas relacionadas à classificação e validação ambiental, uso de inteligência artificial, monitoramento de gases, comunicação de longo alcance e desenvolvimento de soluções específicas para aviários de postura.

RESUMEN

Considerando la relevancia de la avicultura de postura para el agronegocio brasileño y la necesidad de asegurar condiciones ambientales adecuadas para el bienestar y el desempeño productivo de las aves, resulta pertinente investigar cómo las tecnologías y los modelos inteligentes se han aplicado a la ambiencia de los aviarios. El objetivo de este estudio es identificar, mapear y caracterizar investigaciones que integren, de forma aislada o combinada, lógica difusa, sensoriamento ambiental y tecnologías IoT en el monitoreo de la ambiencia en aviarios de postura. Para ello, se llevó a cabo una revisión de alcance conforme a las metodologías del JBI y PRISMA-ScR, con búsquedas en bases científicas, selección rigurosa y extracción de datos. Se incluyeron 52 estudios publicados entre 2020 y 2025. Se observó predominio de investigaciones realizadas en Indonesia y China, con mayor ocurrencia de estudios de campo. La temperatura y la humedad fueron las variables más monitoreadas, mientras que la medición de gases apareció en menor escala. Sensores de bajo costo de las series DHT y MQ y plataformas como ESP y Arduino fueron empleados de forma predominante. La lógica difusa fue la principal técnica de inteligencia artificial identificada, aunque muchos sistemas funcionaron sin modelos inteligentes. La mayoría de las propuestas se integró a la nube, pero pocas utilizaron redes inalámbricas de largo alcance. Asimismo, se identificó un número elevado de estudios con pollos de engorde, baja adopción de clasificación ambiental y casi inexistente validación mediante

índices reconocidos. Se concluye que, a pesar de los avances tecnológicos observados, persisten brechas relacionadas con la clasificación y la validación ambiental, el uso de inteligencia artificial, el monitoreo de gases, la comunicación de largo alcance y el desarrollo de soluciones específicas para aviarios de postura.

1 INTRODUCTION

Laying poultry stands out as one of the most important activities in the Brazilian livestock sector, contributing significantly to food security and the national economy. In 2024, Brazil produced 57.6 billion eggs, reaching a per capita consumption of 269 units per inhabitant, positioning itself as the fifth largest producer in the world, with a gross production value of R\$ 26.1 billion (Brazilian Association of Animal Protein - ABPA, 2025). These data show the relevance of the activity and, consequently, the need to improve processes involving animal welfare and productivity.

The productive performance of the birds is strongly conditioned by the environmental variables present inside the poultry houses. According to Baêta and Souza (2010), variables such as temperature, humidity, radiation and ventilation make up the thermal environment and influence the comfort and health of birds. Situations of heat stress or poor air quality can compromise important physiological functions, affecting the growth, immune resistance and feed efficiency of laying hens. The maintenance of homeothermy, especially within the thermoneutral zone, the ideal range of ambient temperature for maximum production efficiency, is crucial to avoid production losses and ensure animal welfare (Silva, 2001).

The breeding of laying hens is divided into three distinct phases, breeding, rearing and production, each with specific requirements regarding animal welfare and the ideal environment. The recommended ranges of temperature, humidity and gas concentration vary according to the age of the birds, however the technical literature presents divergences in these values, which reinforces the need for a careful and standardized approach to environmental control (Silva; Abreu; Mazzuco, 2020).

Faced with these challenges, the use of digital and intelligent technologies in poultry farming has gained prominence. Sensors, actuators, microcontrollers, wireless networks and software have been integrated into poultry production for continuous monitoring of the environment and health of birds. In the field of artificial intelligence, fuzzy inference models have been successfully applied to deal with uncertainties and assist in data-driven decision-making, with the potential to simulate human reasoning and generate adaptive responses in real time (Simões; Shaw, 2007; Abreu, 2022).

Despite the advances achieved by these solutions, the technical-scientific literature still shows considerable heterogeneity regarding the fuzzy models employed, the monitoring technologies adopted, the environmental variables analyzed, and the ideal

ranges recommended for these variables. In particular, it is verified that the use of fuzzy logic integrated with environmental sensors, data transmission by technologies such as LoRa network and cloud storage, has not yet been comprehensively mapped in poultry production, especially in laying hen aviaries. In view of this, a scoping review is necessary and appropriate to identify, map and characterize existing studies, allowing us to understand the extent and nature of scientific production on the subject, in addition to revealing opportunities for advancement in areas still under consolidation.

A preliminary search was carried out to identify existing scoping reviews and systematic reviews on the use of fuzzy logic, sensing and IoT technologies applied to the monitoring of the environment in laying hen aviaries. This search took place on August 29, 2025, using the following scientific platforms and databases: IEEE Xplore, Scopus, Science Direct, Scielo, Web of Science, CAPES Journals, and Google Scholar. No reviews were identified that addressed these elements in an integrated manner, which highlights the originality and relevance of the present proposal.

Therefore, the objective of this scoping review is to identify, map and characterize studies that integrate fuzzy logic, environmental sensors and data transmission and analysis technologies, in the monitoring of the environment in laying hen aviaries, seeking to understand how these elements have been combined in the scientific literature and what gaps still persist to support future innovations and research in the area.

2 METHODOLOGY

This scoping review was conducted according to the methodology proposed by the Joanna Briggs Institute (JBI) (Peters *et al.*, 2020), following the guidelines of the PRISMA-ScR (Preferred Reporting Items for Systematic Reviews and Meta-Analyses Extension for Scoping Reviews) (Tricco *et al.*, 2018). The complete protocol of this review was previously registered in the Open Science Framework (OSF) platform, under DOI: 10.17605/OSF.IO/YQ6BG.

According to Arksey and O'Malley (2005), scoping reviews aim to comprehensively map the literature, characterizing trends and identifying gaps in broad or underexplored fields, thus offering a comprehensive view of the state of the art and guiding future research, however, they generally do not evaluate the methodological quality of the studies. Its conduction follows five stages: (1) formulation of the research question; (2) identification of

relevant studies; (3) selection of studies; (4) mapping and data extraction; and (5) synthesis and presentation of the results.

As advised by the Joanna Briggs Institute, the acronym PCC (Population, Concept and Context) was used to prepare the research question. In this model, Population refers to laying hens; the Concept covers the monitoring of the environment associated with the use of fuzzy logic, environmental sensing, low-cost IoT technologies, data transmission and cloud storage; and the Context corresponds to commercial aviaries intended for laying production. Thus, the following research question was defined: What are the approaches, technologies and parameters used in studies that apply fuzzy logic and IoT technologies in monitoring the environment of laying aviaries? Additional questions were also formulated, namely: Which environmental variables (temperature, humidity, gases) are most frequently monitored? How is environmental data collected, transmitted, and processed in these studies?

The stage of identifying relevant studies was conducted comprehensively, through searches in scientific databases recognized for their academic rigor, including IEEE Xplore, Scopus, Science Direct, SciELO, Web of Science and the CAPES Journals portal, as well as gray literature, such as Google Scholar, in order to capture studies not indexed in traditional databases. The consultations were carried out on August 29, 2025, using the publication filters between 2020 and 2025 and inclusion of texts in Portuguese, English or Spanish. The search strategy was elaborated based on the elements of the acronym PCC, using descriptors combined by Boolean operators, such as: (fuzzy) AND (chickens OR laying OR hens OR broilers OR poultry house OR layer house OR poultry shed) AND (temperature OR humidity OR environmental OR conditions OR monitoring OR thermal OR comfort) AND (iot OR sensing OR sensor OR smart OR wireless OR lora OR network OR communication OR cloud OR computing OR processing). According to the specificities of each database, some terms and operators needed to be adapted, as described in the protocol of this review.

Eligibility criteria were defined to ensure the selection of studies aligned with the proposed objective. As an inclusion criterion, studies that address the monitoring of the environment in poultry houses through the use of fuzzy logic, sensing or data transmission, in isolation or in combination, were considered. In turn, the exclusion criterion included studies that do not deal with the monitoring of the environment of poultry houses with the

application of fuzzy logic or sensing or data transmission technologies, as well as review articles, texts without access to full content, and duplicate publications.

Although the focus of this scoping review is the monitoring of the environment in laying aviaries, it was decided to include studies conducted in broiler systems whenever they addressed technologies, sensing methods, IoT architectures or computational models applicable to environmental control in poultry facilities. This methodological decision was adopted due to the recognized similarity of environmental requirements (temperature, humidity, gases and ventilation) between the production systems, as well as the scarcity of specific studies directed to the laying poultry industry identified during the search phase.

In the study selection stage, all records obtained in the searches carried out in the databases were imported into the free software StArt (State of the Art through Systematic Review), developed by the Software Engineering Research Laboratory at UFSCAR (LAPES, 2025), which assisted in the organization and management of the screening process. The selection took place in two phases: in the first, titles, abstracts and keywords were evaluated to verify adherence to the inclusion criteria; in the second, potentially relevant studies were analyzed in full to confirm eligibility. The entire procedure was performed by two independent researchers, and any disagreements were resolved by consensus or with the help of a third researcher.

The mapping and data extraction stage was carried out based on the included studies, using structured extraction tables prepared by the authors themselves. These tables included the following fields: author, year of publication, country of origin, study objective, methodological design (experimental, field, or case study), technologies employed (such as microcontrollers, sensors, communication networks, and cloud storage systems), monitored environmental variables (temperature, humidity, and gases), artificial intelligence techniques used (fuzzy logic, neural networks, or decision tree), actuator control, environmental classification, evaluated species (laying or beef hens) and main results observed. Data extraction was conducted independently by two researchers, and any divergences were resolved by consensus or, when necessary, with the mediation of a third evaluator.

In the synthesis and presentation of the results stage, the extracted data were organized and presented in tables and Figures, in line with the objective of the review and with the established guiding questions. The descriptive analysis included the interpretation of the results, the methodological characterization of the included studies, and the

identification of gaps in the scientific literature. This process involved the identification of the most monitored environmental variables, the types of sensors and IoT technologies used, the artificial intelligence techniques used, and the strategies for collecting, transmitting, and processing environmental information.

3 RESULTS

The search carried out in databases and sources of gray literature identified a total of 542 records. After the removal of 32 duplicate records, 510 studies were retained for the initial screening by title and abstract, of which 458 were excluded because they did not meet the eligibility criteria. Subsequently, 52 articles were evaluated in full, resulting in the final inclusion of 52 studies that made up the set of studies included in this review. Figure 1 presents the PRISMA-ScR flowchart, which describes in detail the process of identification, screening, eligibility and inclusion of evidence sources.

Figure 1

PRISMA-ScR flowchart of the study selection process

Source: Prepared by the authors.

Among the selected studies, it was observed that part of the research was focused on broiler chickens. Although they did not directly represent the target population of this review, these studies were maintained because they met the eligibility criteria, especially with regard to the use of fuzzy logic, sensing, and IoT technologies applied to environmental monitoring. These works contributed to broadening the understanding of the technological solutions available in the poultry sector.

Table 1 presents the general characterization of the 52 studies included, with regard to the distribution by country, most of the studies were carried out in Indonesia, with 23 studies (44.2%), followed by China, with 8 (15.4%). Brazil, India, and Morocco presented 4 studies each (7.7%). Malaysia contributed 3 studies (5.7%), while Pakistan and Bangladesh recorded 2 each (3.9%). Colombia and Cyprus appeared with only 1 study each (1.9%).

Regarding the methodological design, it was observed that most of the studies included corresponded to field studies, totaling 27 studies (51.9%). Next, experimental studies were identified, represented by 23 studies (44.3%). Only one study was classified as a case study (1.9%) and another as a modeling and simulation study (1.9%).

Regarding the databases consulted, it was found that most of the studies included were identified in Google Scholar, which gathered 36 studies (69.2%). IEEE Xplore contributed with 10 studies (19.2%), while Scopus presented 4 (7.8%) and CAPES Journals recorded 2 studies (3.8%). Studies from the Science Direct, SciELO or Web of Science databases were not selected.

Table 1

General characterization of the included articles

Author / Year / Country	Objective of the Study	Main results
Liani <i>et al.</i> , 2021 Indonesia	Monitor temperature and humidity in poultry houses using LoRaWAN and fuzzy logic to assess the thermal comfort of broiler chickens.	The system transmitted temperature and humidity data via LoRaWAN, and the fuzzy model identified optimal thermal conditions for the broiler birds.
Lashari <i>et al.</i> , 2023 Pakistan	Implement an IoT system to monitor temperature, humidity, O ₂ , CO ₂ , CO and NH ₃ in broiler houses.	The IoT system monitored six environmental parameters in a real-world scenario, detecting acceptable levels of O ₂ , CO ₂ , NH ₃ and CO.
Silva <i>et al.</i> , 2025 Brazil	Develop an embedded fuzzy system with web application for thermal control of broiler aviaries.	The IoT system with fuzzy logic achieved 98% accuracy and performed automatic thermal control via the web
Ali <i>et al.</i> , 2024 Pakistan	Develop an intelligent environmental control system for poultry houses, based on IoT and machine learning.	The Decision Tree model achieved 99.97% accuracy and allowed the automation of temperature, humidity, water, light and gases control in the aviary.

Malika <i>et al.</i> , 2021 Malaysia	Develop an IoT system to monitor temperature and humidity in aviaries with automatic activation.	The system monitored temperature, humidity and activated heating and ventilation automatically, sending alerts to the user.
Lehaa T. <i>et al.</i> , 2025 India	Develop an IoT system to monitor and control temperature, humidity, ammonia gas, and water in poultry houses.	The system maintained temperature and humidity within the ideal range; Reduced ammonia and accurately automated actuators.
Adha <i>et al.</i> , 2022 Malaysia	Propose and test an IoT framework to monitor temperature, humidity and ammonia in poultry houses.	The prototype validated the sensor readings, with data displayed on the website in a stable and reliable way.
Reddy <i>et al.</i> , 2024 India	Develop an IoT - CNN system to optimize temperature, humidity and air quality in poultry houses.	CNN reduced environmental deviations, increased stability, and outperformed PID, Fuzzy, and MPC methods.
Liu <i>et al.</i> , 2022 China	Evaluate the environmental quality of poultry houses using fuzzy logic and correlate with laying rate.	The fuzzy logic revealed environmental variations and a strong correlation with the laying rate.
Pranta; Islam; Khan, 2025 Bangladesh	Create and test an online decision-tree-based AI model integrated with sensors to control heat stress in layers.	The system reduced temperature and UTI, increased egg production (14.5%) and acted with 100% accuracy and low cost.
Santos; Borges, 2022 Brazil	Develop a low-cost IoT system to monitor temperature and humidity in small poultry houses.	The system monitored temperature and humidity, sent data for local and remote viewing, demonstrating practical feasibility.
Rubio; Ortiz, 2021 Colombia	Implement an IoT system to monitor and control environmental variables in poultry houses.	The system monitored temperature, humidity, ventilation, NH ₃ gas, and automated fogging and drinking fountains, sending data to the cloud.
Husein; Kharisma, 2020 Indonesia	Develop a fuzzy-IoT system to control temperature and humidity in broiler houses.	The system kept the temperature and humidity close to ideal, displayed real-time data, and improved the weight uniformity of the chickens.
Prasetia; Dahlan; Lifwarda, 2024 Indonesia	Develop an IoT system to monitor temperature and humidity in broiler chicken coops.	The system with microcontroller and sensor, monitored temperature, humidity, activated ventilation, light and buzzer according to variations, maintaining conditions close to ideal.
Sanjaya; Fadlil, 2023 Indonesia	Develop an IoT system to monitor and control temperature and humidity in broiler houses.	The system activated ventilation, fogging and heating according to temperature and humidity, presented low reading error and sent data to the cloud.
Perdanasari; Etikasari; Rukmi, 2023 Indonesia	Develop an IoT system to monitor and control temperature, humidity and ammonia in real time in laying aviaries.	The system monitored temperature, humidity, and NH ₃ gas stably for 16 days, with automatic actuator triggering and consistent sensor readings.
Suprianto; Pristiyaningrum; Prasetyo, 2022 Indonesia	Develop an IoT system with fuzzy logic (Sugeno) to control temperature and humidity in a prototype broiler aviary.	The system kept the temperature around 30.3 °C and the humidity around 70.5 percent, controlling the actuators by fuzzy logic and displaying the environmental data in real time.
Fahrurrozi <i>et al.</i> , 2024 Indonesia	Develop an IoT system integrated with the Random Forest model to predict environmental conditions of the aviary.	The Random Forest AI model with temporal variables achieved 96.66% accuracy and worked integrated with the web system.
Ishak <i>et al.</i> , 2024 Indonesia	Develop an IoT system to monitor temperature, humidity and ammonia at different points on the farm, evaluating accuracy and usability.	The system measured temperature, humidity, and ammonia with low error (0.5–3.1%), detected NH ₃ concentration peaks, and recorded everything in real time on the dashboard and LCD.

Shanmugapriya; Sangeethadevi; Kalaivani, 2022 India	Develop an IoT system with a wireless sensor network to monitor temperature, humidity, air quality and safety in poultry houses.	The system maintained a temperature close to 32 °C and stable humidity around 60%; The exhaust fan reduced pollutants and the alerts and dashboard worked in real time.
Susanto <i>et al.</i> , 2023 Indonesia	Design IoT system to monitor temperature and trigger lamp automatically in pre-defined ranges.	The system measured the temperature accurately; the lamp turned on below 28°C and turned off above 31°C; and the control operated stably by ThingSpeak.
Syafar; Anwar; Ridwansyah, 2021 Indonesia	Develop an IoT system to monitor temperature, humidity, and ammonia, sending data to the smartphone.	The system monitored temperature, humidity and ammonia with the DHT22 and MQ-135 sensors; sent the data via GSM to the smartphone; and activated exhaust fan, heating and cooling.
Nalendra <i>et al.</i> , 2021 Indonesia	Evaluate the effectiveness of an IoT system to monitor temperature, humidity, and gas by observing the reaction of birds.	The system measured temperature, humidity and gas with sensors; showed small differences for the thermohygrometer; and maintained adequate conditions, with normal reaction of the birds.
Budiarto <i>et al.</i> , 2020 Indonesia	Implement an IoT system to monitor temperature, ammonia and food, with automatic alerts.	The system controlled the temperature by fuzzy logic, monitored ammonia and food accurately, and sent data to the server, with SMS alerts.
Setiadi; Arifiandi, 2024 Indonesia	Develop automatic feeder and IoT system to monitor temperature in aviary.	The system released feed at the defined times, displayed temperature and humidity on the LCD, activated a fan above 30 °C and a lamp below 25 °C, and maintained a Wi-Fi connection up to 10 m.
Saputra <i>et al.</i> , 2020 Indonesia	Implement fuzzy control in IoT module to regulate temperature and humidity in simulated heating environment for chicks.	The system sent data to the cloud; the actuators were controlled by fuzzy logic; and the PWM of the fan and heater showed a low error (0.11% and 0.22%) in relation to the MATLAB.
Adek <i>et al.</i> , 2024 Indonesia	Develop and evaluate an IoT system with fuzzy controller to regulate temperature, humidity and ammonia in chick rearing box.	Fuzzy control maintained low temperature and humidity, stabilized ammonia between 8–12 ppm, and reduced energy consumption, improving chick performance.
Arief; Damayanti, 2022 Indonesia	Develop a fuzzy system to optimize temperature in the early stage of chick rearing	The fuzzy control maintained the reference temperature for 14 days, showed responses close to the MATLAB, and regulated the temperature effectively with heating and cooling.
Fadhliana; Suryawan; Ariyadi, 2021 Indonesia	Develop a fuzzy microcontroller system to control temperature and humidity in quail cages.	The system showed a minimal difference between MATLAB and Arduino, adjusted temperature and humidity according to the fuzzy rules and obtained a very low average deviation (0.0438).
Mulya <i>et al.</i> , 2024 Indonesia	Evaluate the performance of an IoT system on a real farm to monitor temperature, humidity, electrical voltage and CCTV images.	The system collected real-time data, displayed measurements and videos on the web, and recorded a temperature of 27–35 °C, humidity of 60–90%, and voltage of 143–218V.
Rosikin <i>et al.</i> , 2023 Indonesia	Develop a fuzzy system to automate temperature, humidity and ammonia control with spray drive.	The system controlled the variables by fuzzy logic, sent data to the cloud and showed 100% accuracy, but low sensitivity and accuracy, indicating the need for improvements.
Manju <i>et al.</i> , 2024 India	Develop an IoT system to monitor and control temperature, humidity, water level, ammonia and waste on the farm.	The system monitored variables in real time, triggered ventilation, exhaust and water replenishment, sent data to the web

		and operated stably, reducing manual intervention.
Praing <i>et al.</i> , 2025 Indonesia	Develop an IoT system with fuzzy to automatically control the temperature in broiler sheds.	The system adjusted fan and lamp as per the fuzzy rules, displayed the data in the cloud, the DHT22 sensor showed high accuracy, and the control maintained the proper temperature.
Lahlouh <i>et al.</i> , 2020 Morocco	Implement and evaluate a fuzzy controller to regulate temperature, humidity and gases in a chicken rearing system.	The fuzzy controller reduced errors and flicker, decreased CO ₂ and NH ₃ gases, increased bird weight gain and reduced energy consumption by up to 43%.
Liu <i>et al.</i> , 2024 China	Develop and test an intelligent IoT platform for environmental monitoring and management in poultry houses.	The platform operated for more than 500 days with high data integrity and validity (>94%), monitored environment, consumption, and production, sent alerts, and maintained stable web integration.
De-Sousa <i>et al.</i> , 2023 Brazil	Develop and validate a fuzzy model to classify the vulnerability of broiler systems to heat stress.	The fuzzy model showed high accuracy and sensitivity (>0.9) in comfort and high stress, moderate performance in thermal discomfort and predictions consistent with the literature and weather forecasts.
Panagi <i>et al.</i> , 2025 Cyprus	Develop and validate an integrated platform with AI and multiple sensors for environmental and behavioral monitoring, productivity prediction and decision support in laying farms.	The system monitored temperature, humidity, audio and video; generated environmental alerts and forecasts; and AI modules showed high accuracy, including egg counting with 100% accuracy in the field.
Zheng <i>et al.</i> , 2021 China	Develop a sensor-based and cloud-based poultry management system for environmental and operational monitoring.	The system integrated environmental sensors, transmitted data via WSN to the cloud, and enabled real-time monitoring and disease diagnosis.
Kaimujjaman; Hossain; Khatun, 2023 Bangladesh	Develop and test an automatic system to monitor and control temperature and humidity in broiler aviaries.	The system controlled temperature and humidity, reduced mortality and improved feed conversion, production efficiency and economic performance compared to the conventional system.
Aulia; Kurniawan, 2024 Indonesia	Develop an automatic system with fuzzy logic to control the temperature in a mini house for newborn chicks.	The system stabilized the temperature using automatic heating and ventilation and showed high sensor accuracy (99.62%).
Kandarsamy; Mashori, 2024 Malaysia	Develop a smart chicken coop with automation to monitor and control temperature, humidity, light, food, water, and cleanliness.	The system maintained adequate environmental conditions, automated feeding, water and cleaning, improved safety and sustained good growth of the birds.
Wijaya; Hartati, 2024 Indonesia	Implement automatic temperature and humidity control using fuzzy logic to improve the thermal comfort of broilers.	The system reduced temperature and humidity, improved the ITU from 27.6% to 50.56%, increased the productive performance of the birds and stored the data in the cloud.
Lorencena <i>et al.</i> , 2020 Brazil	Propose a system for automatic control and environmental supervision of poultry houses.	The system controlled temperature and humidity, improved thermal distribution in simulations, and allowed remote supervision.
Yu <i>et al.</i> , 2025 China	Build an environmental monitoring system and propose a fuzzy model to evaluate the comfort of laying sheds.	The system monitored six environmental variables and generated fuzzy evaluations in real time; Adequate conditions increased posture.

Gao <i>et al.</i> , 2022 China	Build a microclimatic model of rearing aviary and develop a decoupled fuzzy control strategy.	The model reproduced temperature and humidity with good accuracy, and the fuzzy control reduced environmental deviations compared to manual control.
Zhang; Ma; Khadka, 2024 China	To develop an adaptive system to predict multiple environmental factors in poultry houses using Multif-LSTM.	The Multif-LSTM predicted temperature, humidity and NH ₃ with greater accuracy, reducing errors and increasing the R ² in relation to the RNN and LSTM models.
Lahlouh <i>et al.</i> , 2024 Morocco	Develop and validate a state-space model to predict temperature and humidity in mechanically ventilated poultry houses.	The model predicted temperature and humidity with high accuracy (R ² 0.93–0.95) and low errors, reproducing well the environmental variations at different ages and ventilation modes.
Li <i>et al.</i> , 2023 China	Apply adaptive fusion and the Dempster–Shafer Theory of Evidence to integrate multiple sensors and improve environmental assessment in laying aviary.	The multisensory fusion system monitored temperature, humidity, light, and NH ₃ , and the adaptive and evidence algorithms increased the accuracy of the environmental assessment.
Elghardouf <i>et al.</i> , 2023 Morocco	Develop and validate mathematical models for air velocity and differential pressure in an air-conditioned aviary.	The model predicted air velocity and pressure with high accuracy (error < 1.1%), and measurements in real aviary showed good fit in natural, mixed and tunnel modes.
Elghardouf <i>et al.</i> , 2024 Morocco	Develop and compare environmental control strategies optimized by evolutionary algorithms to regulate temperature, humidity, NH ₃ and CO ₂ in poultry houses.	The control by active rejection of disturbances, optimized by particle swarm, showed better performance than the integral proportional derivative control. Genetic and gray wolf algorithms have brought smaller gains.
Rachmanita <i>et al.</i> , 2025 Indonesia	Implement a solar-powered, IoT-integrated environmental control system in broiler poultry house.	The system monitored temperature, humidity and NH ₃ in real time, triggered exhaust fans, reduced energy costs by around 10% and improved productivity and mortality.
Li <i>et al.</i> , 2024 China	Apply multivariate analysis to characterize the microclimate of poultry houses in winter using data from multiple sensors.	It identified key variables and, with principal component analysis and fuzzy grouping, characterized indoor areas by air quality with greater accuracy.

In 2020, 5 studies (9.5%) were identified, a number that increased to 7 studies in 2021 (13.5%) and remained the same in 2022, also with 7 studies (13.5%). In 2023, 9 studies were published (17.3%), while 2024 had the highest volume, with 17 studies (32.7%). Finally, 2025 recorded 7 studies (13.5%). Figure 2 shows the distribution of the 52 studies included by year of publication.

Figure 2

Distribution of studies by year of publication

Table 2 presents a general summary of the 52 selected studies, covering the following indicators: poultry species evaluated, environmental variables monitored, type of environmental sensor used, type of hardware platform used, type of wireless data transmission network, type of artificial intelligence technique applied, use of storage systems and/or cloud data consultation, automatic control of actuators, environmental classification and validation of results with recognized environmental indexes. It should be noted that the same study may employ more than one indicator within each category, for example, combining different hardware platforms or multiple types of network. Thus, the frequencies and percentages presented reflect the number of occurrences and do not necessarily total 100% within each group.

Table 2

General synthesis of the selected studies

Collection indicators	Key findings
Type of species evaluated.	Laying hen – 13 (25%) Broiler – 39 (75%)
Environmental variables monitored.	Temperature – 52 (100%) Humidity – 49 (94.2%) Gases – 26 (50%) Others – 17 (32.7%)
Type of environmental sensor used.	DHT Series (Temperature/Humidity) – 29 (55.7%) SHT Series (Temperature/Humidity) – 3 (5.7%)

	MQ Series (gas) – 18 (34.6%) Others – 25 (48%) None – 6 (11.5%)
Type of hardware platform used.	ESP Series – 22 (42.3%) Arduino – 18 (34.6%) Raspberry – 9 (17.3%) Others – 10 (19.2%) None – 7 (13.4%)
Type of wireless data transmission network used.	Wi-Fi – 26 (50%) LoRa – 4 (7.7%) Mobile (3G/4G/5G) – 4 (7.7%) Others – 3 (5.7%) None – 18 (34.6%)
Type of artificial intelligence technique used.	Fuzzy logic – 19 (36.5%) Neural networks – 2 (3.8%) Decision trees – 2 (3.8%) Others – 10 (19.2%) None – 21 (40.3%)
Did you use a cloud data storage and/or consultation system?	Yes – 32 (61.5%) No – 20 (38.5%)
Did the system perform automatic actuator control?	Yes with Artificial Intelligence – 17 (32.7%) Yes without Artificial Intelligence – 21 (40.4%) Did not perform – 14 (26.9%)
Did the system make an environmental classification (e.g., good, moderate, critical)?	AI-powered Yes – 13 (25%) Yes without Artificial Intelligence – 5 (9.6%) Did not do so – 34 (65.4%)
Was there validation of the results with recognized environmental indexes?	Yes – 2 (3.8%) No – 50 (96.2%)

Source: Prepared by the authors.

The synthesis of the main indicators raised in the included studies allowed us to visualize the diversity of technological approaches applied to environmental monitoring in poultry systems. It was observed that several surveys used more than one hardware platform, environmental sensor, or communication technology simultaneously. Overall, temperature and humidity were the most monitored variables, followed by gas detection, while the ESP series and Arduino stood out among the hardware platforms employed. As for the sensors, the use of the DHT and MQ series predominated, although other environmental sensors were also applied. It was also found that the distribution of the studies shows a predominance of research carried out in broiler systems (75%), while only 25% directly address laying aviaries. This result points to a relevant gap in the scientific literature, indicating that, despite the economic and productive importance of laying poultry, there is less investment in research specifically aimed at automated monitoring of the environment in this production system.

The Wi-Fi network was the most recurrent means of data transmission, although some studies have explored LoRa communication or cellular connections. Fuzzy logic was

the most used artificial intelligence technique, either for environmental classification or to support actuator control, while a portion of the studies were limited to monitoring without the application of an artificial intelligence method. In addition, it was observed that most of the systems incorporated cloud storage and that few studies validated their results with recognized ambience indexes. These findings provide a technological and methodological overview of the studies analyzed, serving as a basis for discussion in the following section.

4 DISCUSSION

The results of this scoping review show a significant growth in research involving fuzzy logic, sensing, and IoT technologies applied to monitoring the environment in poultry systems between 2020 and 2025. There was a gradual increase in the number of publications throughout the period, especially in 2024, which concentrated the largest number of studies included. This behavior suggests that the theme goes hand in hand with the recent expansion of digital and smart solutions in livestock production, as well as the growing interest in continuous monitoring systems and data-driven decision-making on commercial farms.

From a geographical point of view, the distribution of studies revealed a strong concentration especially in Indonesia and China, followed by Brazil, India, Morocco and other countries. This predominance may be related to the economic importance of poultry farming in these regions, the advancement of policies to encourage agriculture 4.0, and the greater availability of technical labor for the development of prototypes and low-cost IoT platforms. At the same time, the lower representation of other egg and chicken meat producing countries indicates an opportunity to expand investigations in environmental and production contexts, particularly in laying systems.

Although the focus of this review is on laying aviaries, most of the studies included were conducted with broilers, as exemplified by Liani *et al.* (2021), Husein and Kharisma (2020) and Sanjaya and Fadlil (2023), among others. On the other hand, a smaller number of investigations addressed laying hens, as in the works of Liu *et al.* (2022), Perdnasari, Etikasari and Rukmi (2023) and Panagi *et al.* (2025). This asymmetry highlights an important gap, considering that the longevity of birds, their sensitivity to environmental variations, and the specific welfare demands in laying aviaries, justify the need to expand technological solutions dedicated to this segment.

Regarding the methodological design, field studies predominate, as demonstrated by Lashari *et al.* (2023), Fahrurrozi *et al.* (2024) and Mulya *et al.* (2024). Next, experimental research, carried out in controlled environments, as in Lehaa *et al.* (2025), Silva *et al.* (2025) and Adha *et al.* (2022). A case study was also identified (Malika *et al.*, 2021) and another based on modeling and simulation (Elghardouf *et al.*, 2024). This profile indicates that a large part of the technological proposals have been tested in real production conditions, which favors the practical validation of monitoring and control systems. At the same time, the relevant presence of experimental and simulation studies demonstrates the importance of prototyping and calibration steps in controlled environments, before implementation on a commercial scale. The combination of both designs strengthens the reliability of the results, but also highlights the need for detailed methodological descriptions to allow replication and comparison between studies.

With regard to the environmental variables monitored, it was observed that temperature and humidity are present in practically all studies, while the measurement of gases, such as ammonia and carbon dioxide, is even less frequent. This predominance was expected, as temperature and relative humidity are the main indicators of thermal comfort and are relatively simple to measure with widely available sensors. However, the lower emphasis on gas monitoring represents a critical point, since air quality is directly related to the respiratory health of birds, productive performance and the working conditions of employees. In this sense, the expansion of the use of specific sensors for NH₃, CO₂ and other contaminants, as well as the integration of these parameters in decision models, sets an important direction for future research.

The analysis of the types of sensors and the hardware platforms employed reveals a preference for widely available low-cost sensors, especially the DHT and MQ series, and for affordable microcontrollers, such as ESP32 and Arduino, as observed in Syafar, Anwar and Ridwansyah (2021), Nalendra *et al.* (2021) and Ishak *et al.* (2024). This combination reflects the search for affordable solutions, easy to program, and with good integration with wireless networks, which favors the construction of modular and scalable IoT systems. However, the adoption of more accurate SHT series sensors and more robust hardware architectures may be necessary in applications that require higher accuracy reliability, read stability, and service life.

In the field of communication technologies, the Wi-Fi network was the most widely used form of wireless transmission, appearing in studies such as that of Shanmugapriya,

Sangeethadevi and Kalaivani (2022), Setiadi and Arifiandi (2024) and Prasetya, Dahlan and Lifwarda (2024). While long-range and low-consumption networks, such as LoRa, emerged in a much smaller proportion, being mentioned in few studies, such as the one by Liani *et al.* (2021), Santos and Borges (2022) and Rubio and Ortiz (2021). This scenario indicates that many systems still rely on the restricted-range local area network. The low adoption of LoRaWAN reveals room for advancement, especially in limited or extensive connectivity properties with multiple warehouses. Expanding the use of LoRa network or other technologies can help overcome these limitations and expand the coverage of real-time monitoring.

Following the example of Suprianto, Pristiyaningrum and Prasetyo (2022), Saputra *et al.* (2020) and Adek *et al.* (2024), fuzzy logic stood out as a widely used artificial intelligence technique, both for classifying environmental conditions and for supporting the automatic activation of actuators. Other intelligent models, such as neural networks and decision trees, appeared in much smaller quantities, recorded in Zhang, Ma and Khadka (2024), Reddy *et al.* (2024) and Pranta, Islam and Khan (2025). However, a significant number of studies did not use artificial intelligence, being limited to monitoring and automation by fixed rules, as in Susanto *et al.* (2023), Manju *et al.* (2024) and Zheng *et al.* (2021). This result shows that, although fuzzy logic is consolidated as a promising tool to treat uncertainties and translate the knowledge of experts in inference systems, its use is not yet predominant in the entire set of IoT applications in poultry farming, thus indicating that the transition to truly intelligent systems is still in progress. In addition, the integration between fuzzy logic and other artificial intelligence methods, such as predictive models based on time series or multivariate classification algorithms, appears in few studies, which opens space for more sophisticated hybrid proposals.

As demonstrated in Kandarsamy and Mashori (2024), Aulia and Kurniawan (2024) and Kaimujjaman, Hossain and Khatun (2023), it was found that most of the systems described in the studies perform automatic actuator control. Among these, a slightly larger portion employs artificial intelligence techniques to support the decision process, while another part performs the triggers only based on fixed temperature and humidity thresholds, without the use of artificial intelligence.

Regarding the environmental classification, identified in the research of Liu *et al.* (2022), Pranta, Islam and Khan (2025) and De-Sousa *et al.* (2023), only a small portion of the studies explicitly categorized the conditions, adopting terms such as "comfortable",

"moderate" or "critical". Among these studies, some used artificial intelligence techniques, such as fuzzy logic or other models, while the others performed classification without the support of artificial intelligence. This gap is significant, as the translation of numerical data into understandable language classes is critical to support decision-making by technicians and producers. This process becomes even more efficient when carried out with the support of artificial intelligence techniques, which allow converting continuous information into interpretable categories in a consistent and adaptive way, in addition to facilitating the integration of these outputs into web interfaces and mobile applications.

Another point identified is that a very small number of studies validated the results with recognized indices of thermal comfort or environmental quality, as happened in the works of Wijaya and Hartati (2024) and Pranta, Islam and Khan (2025). Few studies have compared the responses of their systems with literature indexes, which limits comparability between approaches and makes it difficult to assess the real impact of the proposed technologies on animal welfare and productive performance.

Finally, it is noteworthy that most studies implemented some type of cloud data storage or consultation (Liani *et al.*, 2021; Lashari *et al.*, 2023; Silva *et al.*, 2025), which reinforces the trend of digitization and centralization of environmental information on remotely accessible platforms. Still, an important fraction of the work remains limited to on-premise solutions, without remote exploitation of real-time data (Ali *et al.*, 2024; Malika *et al.*, 2021; Liu *et al.*, 2022).

In general, the analyzed studies demonstrate significant advances in the area of environment in poultry sheds, but also reveal important challenges identified. Thus, the findings of this review provide a solid basis to guide and support future investigations in the development of intelligent environmental monitoring systems in poultry houses.

5 CONCLUSION

This scoping review highlighted three central quantitative findings. First, only 25% of the studies analyzed directly address laying aviaries, while 75% focus on broiler systems, indicating a relevant gap in the scientific literature specifically focused on egg production. Secondly, it was found that practically 100% of the studies monitor the environmental variables temperature and humidity, while 50% of the studies also monitor parameters related to air quality, such as gases and particulate matter, indicating a growing concern with environmental impacts and animal welfare. Finally, it was observed that about 40.3%

of the studies do not use artificial intelligence or machine learning techniques, being limited to descriptive analyses or monitoring systems without automated decision-making support.

In the technological field, it was verified the majority use of low-cost temperature, humidity and gas sensors, especially the DHT and MQ series, as well as accessible hardware platforms, such as ESP series microcontrollers and Arduino boards, usually associated with communication via Wi-Fi. Long-range and low-consumption data transmission technologies, such as the LoRa network, have been little explored, pointing to opportunities for advancement in rural scenarios with multiple warehouses and restricted connectivity. Fuzzy logic stood out as the most used artificial intelligence technique, however, a considerable number of systems still operate without using intelligent models for both automatic actuator control and environmental classification. Classification, in particular, was very little used in the studies analyzed, despite its importance for translating numerical data into understandable linguistic categories, such as "comfortable", "moderate" or "critical". This type of classification makes the reading of environmental conditions more intuitive for technicians and producers, strengthening the decision-making process. It was also observed that, although many of the systems integrate cloud data storage and consultation solutions, this practice is not yet universal among research. The implementation of cloud platforms enables remote monitoring in real time and favors historical data analysis, so the use of this technology is an important opportunity to strengthen the intelligent management of poultry houses.

Regarding the validation of the results by means of recognized indices of thermal comfort or environmental quality, it was found that this practice was practically absent among the studies analyzed. This gap compromises the comparability of approaches and makes it difficult to assess the real impact of solutions on animal welfare and productive performance.

In view of these findings, it is concluded that the objective of this scoping review, which consists of identifying, mapping and characterizing studies that integrate, in isolation or combination, fuzzy logic, environmental sensors and IoT technologies in the monitoring of the environment in laying aviaries, was achieved. However, it is recommended that future investigations prioritize: (i) the expansion of the monitoring of variables related to air quality; (ii) the integrated use of fuzzy logic with other artificial intelligence techniques for prediction, classification, and decision-making; (iii) the validation of systems with consolidated environmental indexes; and (iv) the development of specific solutions for laying aviaries,

with a focus on low-cost IoT hardware, long-range wireless networks, full integration with cloud computing environments and intelligent data analysis. Such advances combined can contribute to consolidating intelligent environmental monitoring and control systems in laying poultry farming, promoting animal welfare, productive sustainability and greater efficiency in the use of resources.

ABSTRACT

The figure of the leader has become indispensable in organizations, as leaders can encourage their teams to strive for excellence, innovate, and create new ways of carrying out activities, managing unforeseen situations with calmness and creativity, and influencing people to achieve both their own goals and those of the organization. For these factors to occur, it is necessary that all those involved are motivated. Therefore, this study aims to understand, from the perspective of subordinates, how leadership influences the motivation of team members in a company within the metallurgical sector in Caxias do Sul, Rio Grande do Sul, Brazil. Regarding methodology, a questionnaire was administered to 69 employees from the administrative area of a company that manufactures machinery and equipment for the beverage, food, and chemical industries, in order to assess the level and orientation of motivation, as well as the leadership style perceived by subordinates. The results revealed that most respondents exhibit a high level of motivation and a success-oriented profile. In addition, their leaders demonstrate an integrative leadership style. On the other hand, it was identified that gender, length of service, and average salary do not statistically significantly influence employee motivation.

RESUMO

A figura do líder se tornou indispensável nas empresas, pois ele pode impulsionar na sua equipe a vontade de fazer o melhor, de inovar, de criar novas formas de realizar as atividades, conduzindo os imprevistos com tranquilidade e criatividade, influenciando as pessoas a atingirem seus próprios objetivos e os da organização. Para que esses fatores ocorram, é necessário que haja motivação de todos os envolvidos. Portanto, esse trabalho tem como objetivo compreender, do ponto de vista do liderado, como a liderança influencia na motivação dos integrantes da equipe em uma empresa do segmento metalúrgico em Caxias do Sul - RS. Como metodologia, foi utilizado um questionário em 69 colaboradores da área administrativa de uma empresa fabricante de máquinas e equipamentos para o segmento de indústria de bebidas, alimentos e química, para averiguar o nível e orientação da motivação, assim como o estilo do líder percebido pelos liderados. Os resultados revelaram que existe um alto nível de motivação na maioria dos entrevistados e possuem uma orientação para o sucesso. Complementando, seus líderes revelam um estilo integrador. Por outro lado, identificou-se que o sexo, tempo de trabalho e média salarial não influenciam de forma estatisticamente significativa na motivação dos colaboradores.

Palavras-chave: Liderança. Motivação. Desempenho.

RESUMEN

La figura del líder se ha vuelto indispensable en las empresas, ya que puede impulsar en su equipo el deseo de hacer lo mejor, innovar y crear nuevas formas de realizar las actividades, afrontando los imprevistos con tranquilidad y creatividad, e influyendo en las personas para que alcancen tanto sus propios objetivos como los de la organización. Para que estos factores ocurran, es necesario que exista motivación por parte de todos los involucrados. Por lo tanto, este trabajo tiene como objetivo comprender, desde el punto de vista de los subordinados, cómo el liderazgo influye en la motivación de los integrantes del equipo en una empresa del sector metalúrgico en Caxias do Sul, Rio Grande do Sul, Brasil. Como metodología, se utilizó un cuestionario aplicado a 69 colaboradores del área administrativa de una empresa fabricante de máquinas y equipos para el sector de las industrias de bebidas, alimentos y química, con el fin de evaluar el nivel y la orientación de la motivación, así como el estilo de liderazgo percibido por los subordinados. Los resultados revelaron que la mayoría de los entrevistados presenta un alto nivel de motivación y una orientación hacia el éxito. Asimismo, sus líderes muestran un estilo integrador. Por otro lado, se identificó que el sexo, el tiempo de trabajo y el salario promedio no influyen de manera estadísticamente significativa en la motivación de los colaboradores.

Palabras clave: Liderazgo. Motivación. Desempeño.

1 INTRODUCTION

Job satisfaction and organizational commitment are influenced by leadership practices that, in addition to influencing employee morale by inference and implication, they influence the employee's work motivation, impacting knowledge and talent management (PARASHAR-CARVILLE; SHAW, 2016).

Some leaders are more effective than others, or feel more comfortable acting in this role than others. The most important characteristics of the individual for understanding the differences in the performance of leaders are skills and motivation. One of the skills that most arouses interest in the study of leadership is style (MAXIMIANO, 2017). The styles covered in this work will be autocratic, laissez-faire, democratic, and transformational-charismatic.

Administrative leadership has more influence, while political and administrative leaders must manifest stronger leadership qualities and cooperative behaviors (UGADDAN; PARK, 2017). The association between transformational leadership and employee motivation also depends on the perceived impact of employees, suggesting that some fall below others when leaders try to increase employee motivation (BRO; ANDERSEN; BØLLINGTOFT, 2017).

Therefore, the objective of this article is to understand, from the point of view of the subordinate, how leadership influences the motivation of team members in a company in the metallurgical segment in Caxias do Sul - RS. For this, a quantitative research was carried out with 69 employees in a company in the metallurgical sector, representing the population of the administrative area, that is, all employees of the administrative, financial, commercial and marketing management of the organization.

The article is composed of the theoretical framework on the concepts of leadership and motivation, the methodology, the analysis of the results of the quantitative research and the final considerations.

2 LITERATURE REVIEW

2.1 LEADERSHIP

To lead is to practice actions, some programmed and others spontaneous, with the aim of commanding, leading, influencing and inspiring people or groups to work towards achieving satisfactory personal and professional results, through organizational objectives (MADRUGA, 2014).

Among the main theories, the theory of traits is presented, focusing on the analysis of the behavioral profile of leaders. Behavioral theories, on the other hand, believe that leadership can be developed in people from continuous training and qualification. Fiedler's theory points out favorable and unfavorable situations for the leader. Finally, the path-goal theory focuses on the idea that subordinates need to be considered as well-intentioned people. In addition, the leader will only achieve success by helping them and fulfilling themselves (BERGAMINI, 2013; TAJRA et al., 2014).

Among leadership styles, the laissez-faire style is the type of leader who avoids conflict and tries to please everyone by giving complete freedom to individuals. The democratic style is one in which the leader allows the team to contribute to the achievement of the organization's objectives, valuing and stimulating people (ESCORSIN; WALGER, 2017). The sympathetic leader is characterized by always protecting people, is sociable, seeks to avoid conflicts and for him the result is something difficult and achieving it is beyond his capacity. The autocratic leader, on the other hand, is characterized by emphasizing the organization of work, sees the worker as a simple instrument, seeks to make decisions and is not very sociable. The middle leader is characterized by equating his priorities between people and production. Finally, the integrative leader is characterized by being concerned with both production and people, encourages the group's participation in decisions and stimulates creativity (RIBEIRO, 2016).

Scholars Robert R. Blake and Jane S. Mouton, supported by Likert's work, devised the leadership grid and published it in 1964. According to Silva (2013), these were the first studies that established two dimensions of leadership: production-oriented and people-oriented. In the grid, there are nine degrees of reference for each of the two variables, resulting in an array of 81 cells. Each of these cells represents a possible management style, of which 81, five are specially considered and named as shown in Figure 1.

Figure 1

Blake and Mouton Management Model

2.2 MOTIVATION

The study of motivation basically involves the reasons why people behave in a certain way (SILVA, 2013). According to Tajra and Santos (2014), there are two types of motivation: intrinsic and extrinsic. The intrinsic ones are associated with emotions and instinctive reactions, it is the psychic energy that leads to an action to minimize or cease the tension-generating process. Extrinsic diseases are linked to the environment, they are generated by a process of reinforcement and punishment.

With each need met, a new one arises, with a progression and its intensity that varies according to each person. There are people who have never reached the highest levels of need for reasons related to the life they have. Based on the employee's needs, the company can use the correct means to motivate him/her, aiming to awaken a better performance (NELSON; QUICK, 2012).

Maslow's theory was one of the pioneering models of motivation, even though it failed to provide researchers with clear measurements of its concepts, it was the precursor of modern theories (WAGNER; HOLLENBECK, 2009). This theory predicts that the needs of the individual are classified into five levels: physiological needs (related to survival, they are basic and immediate of the human being); security needs (when the first-level needs have been met, they are related to the search for protection against threats and the escape from danger); social needs (this need arises after the

previous one is at least partially met, they are related to friendship, love, affection, participation and acceptance by the partners); esteem needs (involve self-respect, social approval, prestige, consideration and status, as it is about how the person sees and evaluates themselves) and self-actualization needs (they are at the top of the hierarchy, as they are the highest needs in which the person wants to be their best, so it is necessary that all previous needs are well met).

Alderfer's ERC theory supplemented Maslow's progression hypothesis. He presented three levels of need: existence, relationship, and growth. The theory establishes regression as the only component for frustration; thus, when a higher-level need is not met, the lower-level need can be considered motivating again (SILVA, 2013).

The two-factor theory, proposed by Herzberg, is a version of Maslow's theory of needs, as it differentiates between motivation at work and job satisfaction. The factors that lead to job satisfaction are called hygienic. These factors are linked to the conditions in which the work is performed and represent the needs to avoid pain in the environment. Motivational factors, on the other hand, are essentially related to the activity or work and directly influence the productivity of the company's employees, leading to satisfaction or non-satisfaction (SILVA, 2013). These factors are responsible for the increase in the result and prevent dissatisfaction (TAJRA; SANTOS, 2014).

David C. McClelland studied motivation for more than 20 years and presented the theory of achievements, also called the theory of acquired needs. This theory maintains that there are needs that are acquired and socially contracted when the individual interacts with the environment (SILVA, 2013). Among the types of needs are: need for fulfillment; need for affiliation and need for power (TAJRA; SANTOS, 2014).

2.3 MOTIVATION AND LEADERSHIP

The direct leader has the power to influence the motivation for the team's work, both in a positive and negative sense. However, no subordinate will talk to his leader about his motivational expectations if he does not convey confidence and does not allow a communication channel, showing interest (BERGAMINI, 2013).

Motivated leaders can be more effective in leadership roles (GILBERT et al., 2016). As a consequence, the behaviors of leaders and the associated influence can be important during the early phases of the leader-follower relationship, as they

motivate employees and embed work with meaning and purpose (BOTTOMLEY et al., 2016). However, this "infusion process" is not equally relevant in all organizational environments (BRO; ANDERSEN; BØLLINGTOFT, 2017), since there is a cognitive diversity of knowledge interacting with leadership that can influence the intrinsic motivation of the team (WANG et al., 2016). Therefore, in addition to motivating leaders, the company must equip them with the knowledge, skills, and other characteristics necessary to effectively lead the team to achieve organizational goals (FOWLER, 2018).

But what is observed today is that companies are increasingly dependent, not only on people's ability and motivation to continuously develop deep technical knowledge, but also to apply them in innovative ways and influence others to adopt new ideas (CHAN et al., 2017). In this way, the ability of senior administrators to properly use well-designed course content and select the right instructors to teach and facilitate training, improves employees' motivation to learn (ISMAIL; ZAINOL; AHMAD, 2017) and develop them professionally.

3 METHODOLOGY

The approach of this study is quantitative (SAMPIERI et al., 2013), descriptive in nature (MARCONI; LAKATOS, 2017), which aims to study the characteristics of a group, as in the case of this work, which will analyze the entire administrative sector of a given metallurgical company in Caxias do Sul.

The form of data collection in this research is of the survey type (Gil, 2010) and for this survey a questionnaire with closed questions was used (KLEIN, 2015), adapted from Lameiras (2010). The first part of the questionnaire consists of six groups of statements that aimed to measure the perception that employees have about the guidance that their leader has. The second part is made up of eighteen expressions, where they mention supposed situations that will lead the employee to recognize himself with them. In this part of the questionnaire, ordinal scales of the Likert type of seven points will be used. Finally, the third refers to the characterization of the researched. It is composed of the elements gender, age, marital status, if they have children, academic background, length of service, approximate monthly family income and they hold a leadership position.

3.1 OBJECT OF STUDY

The research was carried out in a medium-sized company in the city of Caxias do Sul, in the state of Rio Grande do Sul, which employs approximately 409 employees, in addition to outsourced services such as reception, security, food, transportation and cleaning. The company is a manufacturer of machinery and equipment for the beverage, food and chemical industry segment.

The company's goal is sustainable growth, seeking to improve its internal processes and increase its revenue, gross profit and working capital. Based on this, the company created the breakdown of the guidelines of the strategic, operational and radar plans, which are pillars of support for its business (Figure 2). The focus of this research is in line with one of these pillars that sustain the organization: people – seeking to keep the team motivated in a work environment conducive to the development of its employees, cultivating transparency and integrity in relationships. One of the company's ways to achieve the expected result is the climate survey, carried out in the company, in order to identify points to be developed based on the opinions of employees.

Figure 2

Principles and values of the researched company

Source: company (2016).

In this study, data collection was done from the population, which are all employees of the organization's administrative, financial, commercial and marketing

management. The total number of employees in these areas is 69 employees.

The distribution and collection of questionnaires were carried out through printed questionnaires and delivered by hand to the respondents, in August and September 2017. A ballot box was also made available where the collaborators deposited their completed questionnaire in order to guarantee anonymity and allow greater freedom in the answers and less risk of the researcher influencing them.

For data analysis, descriptive statistics, frequency statistics and non-parametric tests (KLEIN, 2015) were performed with the help of the statistical software SPSS®20.

4 ANALYSIS OF THE RESULTS

Data analysis was performed in two moments: the first refers to the characterization of the sample, with information from the respondents; and the second moment refers to the analysis of the answers that contemplate the theoretical framework addressed of leadership and motivation.

4.1 SAMPLE CHARACTERIZATION

The responding population is composed of 64.71% men and 35.29% women. Regarding the average salary variable, the average salary from R\$ 3,001.00 to R\$ 5,000.00 is the majority, constituting 35.29%, and those from R\$ 1,001.00 to R\$ 3,000.00 and more than R\$ 5,000.00 constitute exactly the same percentage, 29.41%. The percentage of 5.88% corresponds to the average salary of up to R\$ 1,000.00, below when compared to the others. According to Walger, Viapiana and Monfort (2014), there is no other motivational incentive or technique that has as much initial influence on the employee's life as salary.

It is possible to see that the ages from 21 to 60 years old are balanced with 25% for people aged 21 to 30 years and 31 to 40 years, and 20.59% for people aged 41 to 50 years and 51 to 60 years each. However, employees under 20 years of age represent 7.35% of the interviewed population and the lowest percentage is found in people over 61 years of age, who represent 1.47% of the total number of employees.

Relating the variables gender and age, among the women interviewed, most are aged between 31 and 40 years with 29.17%, followed by 25% of women who are between 21 and 30 years old. The 41 to 50 age group and 51 to 60 age group have the same percentage of the total number of women respondents with 16.67%, and the

lowest are 8.33% for those under 20 years old and 4.16% for those over 61 years old. Most of the men interviewed are between 21 and 30 years old, with a percentage of 25%. The percentage of 22.73% represents the groups of 31 to 40 years old, 41 to 50 years old and 51 to 60 years old. It is observed that only 6.81% are under 20 years old and there are no men interviewed over 61 years of age.

As for the variables length of work in the company and average monthly salary, the average salary increases according to the time that the employee remains in the company. For Walger, Viapiana and Monfort (2014), this attitude comes from the traditional remuneration system, in which people are paid for the time they have worked or for the position held. Most of the respondents have an average salary of up to R\$ 1,000.00 and have been with the company for up to one year or are employees who earn more than R\$ 5,000.00 and have been with the company for more than 10 years (both represent 75% of their range), as can be seen in Figure 3.

Figure 3

Distribution of the percentage values of the variables: length of work in the company and average salary

Source: data from the survey.

The group of employees who have been with the company for more than 10 years has all the respondents who have attended up to elementary school. This group

has the second lowest rate of postgraduates, with 18.18%. As for the group of those who have been in the company for up to one year, most have attended high school, with 30.43%, and none of the respondents have only completed elementary school. With 45.45%, the group of employees who have been in the company for one to five years has the highest percentage of those who have attended graduate school, and not only in this group, but this percentage is the highest of all the groups interviewed. The group of employees who have been in the company for five to ten years has the second highest percentage of people who have a postgraduate degree, with 27.27%, followed by 24.24% of those who have higher education. In this group, there are also no employees who only did elementary school.

In relation to holding a leadership position, a comparison with the time in the company is observed. It is verified that 90% of the respondents who hold a leadership position have been in the company for more than 10 years, and 100% of the employees who hold a leadership position have more than 5 years in the company. It can be concluded that the company does not usually hire new leaders, but rather values the people already belonging to the company. This can also be negative, as people without a profile for leadership can reach this position.

Continuing with the analysis of leadership, there is a big difference related to gender, in which 90% of respondents who hold leadership positions in the company are men, the rest are 10% are women. Related to this, Robbins (2015) reports that men do not have any advantage over women when it comes to leadership, and even so, it can be seen in the analysis that the company has a small portion of female leaders.

4.2 DESCRIPTIVE ANALYSES OF THE LEADERSHIP STYLE VARIABLE

The analysis of the variable of each leadership component was carried out based on the nominal scale used and named from A to E, each one corresponds to the styles of leader (laissez-faire, sympathetic, intermediate, autocratic and integrative), according to the managerial grid of Blake and Mouton (1964). In this part of the questionnaire, it was intended, through the perception of the subordinates, to measure the leader's orientation under six aspects: decisions, convictions, conflict, emotions, sense of humor and commitment.

Thus, an analysis of the means of each variable was carried out in relation to the leadership styles, and it can be observed that the highest average, with 31.57%, refers

to the integrative leader style. This style is positively associated with successful careers, productivity and profitability when compared to any other style (BLAKE; MOUTON, 1978). The lowest index is in the autocratic style, with 10.10%, which in turn is focused on tasks. He carefully supervises work methods, usually makes decisions without consulting his team and insists on the need to meet goals (MAXIMIANO, 2017). Table 1 shows the comparison of the leadership variables.

Table 1

Comparison of the variables of the leadership styles

Style	Percentage (%)						
	Decisions	Convictions	Conflict	Emotions	Sense of humor	Commitment	Average
Laissez-faire	6,10	16,70	18,20	19,70	12,10	10,60	13,90
Friendly	37,90	22,70	27,30	27,30	9,10	18,20	23,75
Intermediate	18,20	12,10	15,20	13,60	18,20	40,90	19,70
Autocratic	7,60	12,10	10,60	9,10	7,60	13,60	10,10
Integrator	28,80	34,80	28,80	28,80	51,50	16,70	31,57

Source: data from the survey.

Regarding the decisions made by the leader, the respondents claim that the leader supports decisions that promote good relationships, as he cares about people, characterizing the friendly style, with 37.88%. It is observed that 28.79% of employees attribute the leader as an integrator, indicating that the empowering leadership of supervisors is likely to increase psychological empowerment, thus promoting their intrinsic motivation, while authoritarian leadership has the opposite effect (MENG et al., 2015). The other styles of leader are considerably low: 18.18% for intermediate leader; 7.58% for autocratic; and 6.06% laissez-faire, compared to sympathetic.

The majority of employees attribute the integrative style to the leader with 34.85%, in relation to their convictions. This style of leader offers understanding, acceptance, and understanding, and its main characteristic is in helping. The friendly style obtained 25% and came soon after in the preference of the respondents. In conflict management, there is an approximation of the attributions of the leader styles. Most employees characterized them as integrative with 28.79% and sympathetic with 27.27%, with a small difference, indicating that the leader has a strong orientation towards people, as he is social and seeks to avoid conflict and solve it, promoting a pleasant and friendly work environment (RIBEIRO, 2016; ESCORSIN et al., 2017).

However, it is important to point out that conflict can be constructive when it

stimulates innovation and creativity, improves the quality of decisions, encourages the curiosity and interest of the group, providing an escape from tensions and generating an environment of self-evaluation and change (ROBBINS, 2015). Finally, 18.18% of the employees interviewed report that their leader is characterized as laissez-faire, 15.15% characterize the leader as an intermediary and 10.61% as autocratic.

Related to the leader's emotions, individuals in higher positions experience greater stress and anxiety and this can lead to low levels of motivation and commitment. In some cases, leaders have to follow laws and policies that they are not convinced of, which can reduce their motivation and lower their level of commitment (AL-SADA et al., 2017). For employees, the leader has an integrative profile with 28.79% and a sympathetic profile with 27.27%, similar to the conflict variable. Both styles are people-oriented and this type of leader helps his employees with their personal problems, is approachable and friendly, treating all his subordinates as equals and showing appreciation and support (ROBBINS, 2015).

In the leader's mood analysis, there is a visible majority of employees, with 51.52%, who assume that the leader has an integrative sense of humor. Regarding the leader's commitment, the majority attributed the intermediate style to the leader (40.91%). This indicates that leadership is also an important complement to motivation. The other styles of leader have lower and relatively close values. The results corroborate the authors Chan et al. (2017) who describe that motivation to lead is associated with the desire to promote change, challenge the status quo, and the willingness to influence others.

4.3 DESCRIPTIVE ANALYSES OF THE MOTIVATION VARIABLE

The second part of the questionnaire was composed of eighteen statements, which report presupposed situations, with the aim of inducing the respondent to identify himself in these situations. In addition to analyzing the frequency of each expression, the respondent's orientation towards success, affiliation or power was observed. Table 2 shows the comparison of the results between the motivation variables.

Table 2

Comparison of the motivation variable

Affirmation	Scale and percentage						
	Never	Almost Never	Rarely	By Times	Usually	Almost Always	Always
I like to constantly improve my personal skills	1,45	1,45	4,35	14,5	23,19	18,84	36,23
I like to be supportive of other people, even if they are not my relatives	1,45	2,9	5,8	10,15	21,74	27,54	30,43
I have a secret desire to get people's attention	30,43	20,29	20,29	18,84	8,7	1,45	0
I strive to improve on my previous results	2,90	2,90	1,45	7,25	14,5	30,43	40,58
I feel satisfaction when I see that a person who asked me for help is happy with my support	0	1,45	1,45	7,24	8,7	20,29	60,87
I insist on a certain opinion just to "not give up"	26,09	27,54	27,54	10,14	1,45	5,8	1,45
I like to know whether or not my work has been done well, in order to do better in the future	1,45	2,90	1,45	5,80	14,5	28,99	44,93
If I had to fire a person, I would try above all to understand their feelings and support them as much as possible	1,45	5,78	10,14	13,04	17,39	26,09	26,09
I have arguments with others because I tend to insist on what I think should be done	13,04	13,04	24,64	23,2	7,25	11,59	7,25
At work, I try to do better and better	2,90	4,35	0	2,90	15,94	23,19	50,7
At work, I like to be a kind person	1,47	5,88	4,41	16,18	23,53	26,47	22,06
I try to relate to influential people	7,25	11,59	21,74	23,2	15,94	13,04	7,25
I try to do my job in an innovative way	0	5,78	2,90	7,24	31,9	31,88	20,3
I feel satisfied to work with people who like me	4,35	2,9	5,80	4,35	24,64	31,88	26,09
If I can get people into my team's work, I look for the ones that allow me to exert the most influence	10,14	10,14	11,59	31,9	21,74	11,6	2,9
At work, I pay close attention to the feelings of others	0	5,8	8,7	29	23,19	20,29	14,04
When I participate in a gathering, I take the opportunity to influence others and get their support for what I want to do	7,25	14,49	20,3	26,1	15,94	11,59	4,35
I get worried when I feel that I have somehow contributed to the malaise of relationships at work	1,45	4,35	0	10,15	18,84	37,7	27,54

Source: data from the survey.

Most respondents say they always like to improve their skills, with 36.2%,

followed by 23.2% who usually like it. This result shows that individuals who are highly motivated by leadership acquired more leadership competencies during training, which results in more effective leadership behavior after training (STIEHL et al., 2015).

On the issue of being supportive of colleagues, most respondents increasingly say they like it. In the last three degrees of frequency, most of them are concentrated, with 79.7% of the total.

Employees (30.4%) do not have a secret desire to attract attention, followed by 20.29% each for those who "almost never" and "rarely" have the desire and 18.8% for those who answered "sometimes". This statement is aimed at identifying the collaborators who are power-oriented, and at this point, none of them checked the "always" box.

It was found that 40.6% of the employees stated that they always strive to improve their results, 30.4% stated that they almost always strive to improve their results and 14.5% usually make an effort. Individuals with stronger leadership motivation showed more team-related effectiveness, personal growth, and by tendency, position-related effectiveness, enabling an increase in performance in their area of responsibility (STIEHL et al., 2015).

The highest percentage of all questions about motivation is found at this point, in which 60.87% of the interviewed employees answered that they always feel satisfaction in helping a colleague who was happy with their support. There was no respondent who checked the "never" option. It is verified that most employees do not insist on an opinion so as not to give the "arm to twist", the first three have a similar percentage, adding to the total 81%.

The significant majority of employees say they like to know whether or not the work was well done, aiming to improve in the future. The sum of the last three points represents 88.4% of the total number of respondents. This question aims to identify people who have an orientation to success.

It is stated that, for the most part, if any employee had to fire a person, they would try to understand their feelings and support them as much as possible. It is observed that this statement follows an increasing form, reaching the largest scales that are "always" and "almost always", with 26% each.

Regarding the statement that the employee "has arguments with others because he insists on what he thinks", it was observed that 24.6% stated that he rarely insists,

and 23.2% sometimes has this behavior, followed by 13% each of those who have never and almost never had arguments because they insist on what they think. It is clear that most employees always try to do their job better and better, being 50.7%. The results converge with Fowler (2018) who described that new motivational leadership competencies based on the theory of self-determination are recommended to promote leadership behaviors that support people's psychological needs.

It is possible to verify that most employees like to be a kind person at work, since the sum of the last four points is 88.3%. This statement is related to identifying employees who have affiliation orientation.

On the other hand, the statement that the respondent seeks to relate to influential people is focused on power orientation. It was found that the majority sought this relationship moderately, "sometimes" having 23.2% of the answers, followed by 21.7% of those who answered rarely.

It was observed that the respondents stated that they usually and almost always try to do the work in an innovative way, with 31.9% each and 20.3% stating that they always try to do the work in an innovative way. Leadership transformation serves as a limiting condition for the effects of cognitive diversity on intrinsic motivation and team creativity (WANG et al., 2016).

The expression I feel satisfied to work with people who like me identifies people who have an orientation towards affiliation. It can be seen that the majority, referring to the last three points (totaling 82.6%), feel this satisfaction.

In the statement "if I can call people to the work of my team, I look for those who allow me to exert more influence", it is observed that the first three points that refer to those who do not seek or seek in a moderate way are practically equivalent with around 10% each. The majority, on the other hand, sometimes seek with 31.9%, usually with 21.7% and almost always with 11.6%. This behavior is associated with people who are power-oriented and seek to get people to behave in a way they would not normally do (AL-SADA et al., 2017).

Regarding "paying close attention to the feelings of others at work", most say that they pay attention sometimes with 30%, usually with 23.2%, almost always with 20.3% and always with 13%. The majority with 26.01% assume that, sometimes, in some conviviality, they take the opportunity to influence other people to get support, followed by 20.3% who assume that they rarely influence.

The last expression related to motivation represents that the majority of respondents, with 37.7%, are almost always concerned when they feel that they have contributed to the discomfort of relationships at work. Those who always worry represent 27.5% and those who usually worry represent 18.84%. At this point, most people are well focused on affiliation needs, as they reveal that they have a desire to have close and friendly relationships with colleagues (MENG et al., 2015).

Table 3 shows that in relation to motivation, most are concentrated between 4 and 6 points on a 7-point Likert scale, totaling 60 respondents. This means that only nine people are not within this average, demonstrating that the team is motivated as a whole. To achieve good results, motivational practices need to range from the praise and challenges proposed by managers to the participation of employees in the decision-making process, in profits or in the company itself, including awards, benefits, job growth programs and career plans. The leader just needs to know how to identify which of these practices motivates his employee the most (MAXIMIANO, 2017).

Table 3

Frequency of the average motivation

		Frequency	Percentage	Valid percentage	Accumulative percentage
Valid	Motivation from 1 to 3				
	Motivation from 3.01 to 4	5	7,2	7,2	7,2
	Motivation from 4.01 to 5	2	2,9	2,9	10,1
	Motivation from 5.01 to 6	23	33,3	33,3	43,5
	Motivation from 6.01 to 7	37	53,6	53,6	97,1
	Total	2	2,9	2,9	100
		69	100	100	

Source: data from the survey.

It is observed that 86.9% of the total respondents, as shown in Figure 4, have an average motivation between 4 and 6.

Figure 4

Analysis of average motivation

Source: data from the survey.

Figure 5 shows the mean of each expression of the motivation variable and also the overall mean of each of the three types of guidance. It is observed that the lowest averages are found in questions related to people who are power-oriented, with an overall average of 3.41.

The highest average is aimed at people who are success-oriented, with 5.72. Motivation and organizational commitment to measuring other variables such as work, satisfaction, organizational effectiveness and commitment, and productivity are significantly associated with dimensions of leadership and culture practices and can be improved with better workforce management and interaction techniques (PARASHAR-CARVILLE; SHAW, 2016).

Finally, an average of 5.45 is presented for those that are focused on affiliation.

Figure 5

Average of the motivation variables

Orientação	Estatísticas				
	Expressões	N		Média	
		Válido	Omisso		
Sucesso	Gosto de aperfeiçoar constantemente as minhas competências pessoais	69	0	5,45	5,72
	Esforço-me para melhorar os meus resultados anteriores	69	0	5,81	
	Gosto de saber se o meu trabalho foi ou não bem realizado, de modo a fazer melhor no futuro	69	0	5,96	
	No trabalho, procuro fazer cada vez melhor	69	0	5,97	
	Tento fazer o meu trabalho de modo inovador	69	0	5,42	
Afiliação	Gosto de ser solidário com as outras pessoas, mesmo que não sejam das minhas relações	69	0	5,52	5,45
	Sinto satisfação quando vejo que uma pessoa que me pediu ajuda fica feliz com meu apoio	69	0	6,28	
	Se tivesse de despedir uma pessoa, procuraria sobretudo compreender os seus sentimentos e apoiá-la no que fosse possível	69	0	5,22	
	No trabalho, gosto de ser uma pessoa amável	68	1	5,24	
	Sinto-me satisfeito por trabalhar com pessoas que gostam de mim	69	0	5,42	
	No trabalho, presto muita atenção aos sentimentos dos outros	69	0	4,83	
	Fico preocupado quando sinto que, de alguma forma, contribuí para o mal-estar das relações no trabalho	69	0	5,65	
Poder	Tenho um desejo secreto de chamar a atenção das pessoas	69	0	2,59	3,41
	Insisto numa determinada opinião apenas para “não dar o braço a torcer”	69	0	2,57	
	Tenho discussões com os outros porque costumo insistir naquilo que penso que deve ser feito	69	0	3,62	
	Procuro relacionar-me com pessoas influentes	69	0	3,97	
	Se puder chamar as pessoas para o trabalho da minha equipe, procuro as que permitam exercer mais influência	69	0	3,91	
	Quando participo de algum convívio, aproveito para influenciar os outros e obter o seu apoio para aquilo que quero fazer	69	0	3,81	

Source: data from the survey.

Some non-parametric tests were performed. They are methods that encompass procedures that allow the use of ordinal, nominal, or quantitative variables instead of continuous data. The Mann-Whitney U test was used, which is used to compare variables from two independent groups. This test was used in order to verify whether motivation changes according to the respondent's gender. According to Figure 6, ($p=0.4$) there is no difference in the mean motivation of the respondents in relation to gender.

The Kruskal-Wallis test was also performed. This procedure is recommended to compare a variable between three or more groups. It is verified that there is no difference in the average motivation of the employees in relation to the average salary ($p=0.2$), or in relation to the length of work, ($p=0.08$), as shown in Figure 7.

5 CONCLUSION

The study aimed to understand, from the point of view of the subordinate, how leadership influences the motivation of team members in a given company. This objective was achieved and it can be concluded, through the bibliographic reference, that a higher or lower level of motivation, in addition to being connected to the person and his work, depends on the competence and empathy of the direct leader.

Regarding the analysis, it is also necessary to highlight some observations: it was found that all the interviewees who did not continue studying after elementary school have been in the company for more than 10 years, suggesting that these employees are accommodated and even unmotivated, and it is up to the leadership to

identify these people, in order to arouse interest in the search for knowledge and development. It was also identified that 90% of employees who hold leadership positions are men, which means that, although women are inserted in the labor market, they have not been recognized in the same way as men, and yet, related to this result, it is known that female characteristics are important within an organization, as it encompasses collaboration, Relationship and talent cultivation, however, men may have developed these traits, thus maintaining motivation. "Feminine sensitivity allows the team to act with synergy, obtaining creative solutions to unsolvable issues" (MANDELLI, 2015, p. 20).

Regarding this same question, it is observed that all interviewees who hold leadership positions have been in the company for at least 5 years, that is, it is not practiced to hire leaders from outside the company. Employees, over time, when they stand out, start to assume these positions, a chance promoted by the company to encourage growth and recognition, generating motivation and engagement, both on the part of leaders and subordinates.

Regarding leadership styles, the organization's employees consider that leaders have mostly integrative behaviors. This style seeks the best performance, achieving objectives and meeting your goals, but always with a broader view, managing differences, promoting dialogue, seeking understanding, involving and committing your team. In this way, the relationship between members is strengthened with the motivation of employees, influenced by the leader.

As for the motivation factor, it is found that the general average of employees is between 5 and 6, representing 53.6% of the total respondents, this average is good if it is observed that the highest value is 7. It was also identified that most respondents are focused on success, a profile that likes challenges and competitive situations. Employees who are motivated and enthusiastic to achieve goals, facing challenges and exceeding expectations, make a difference and provide a competitive advantage for the organization.

Associating the results of motivation with those of leadership styles, it is clear that, according to the theory studied, the profile of integrative leader exerts a positive influence on employees, as it is related to better levels of motivation. It is possible to confirm this relationship in the survey, as the results of the motivational average were high, and of these respondents, most identified that their leader has the style of

integrative leader. On the other hand, it was identified that gender, working time and average salary do not influence in a statistically significant way the motivation of employees.

With this work, it can be identified that it is necessary to break the paradigms about employees with a more integral people management, including bringing in its core themes such as motivation, which is significantly influenced by the leader, understanding aspirations, fears, desires, doubts, expectations, dreams and really caring about the other and cooperating with their challenges, In other words, in addition to worrying about activities, you need to worry about people and their development in the organization and outside it.

The investigation has some limitations, as the population analyzed is not sufficiently representative compared to a universe of companies in the same field in the region. There are also the limitations of the method of applying questionnaires, where the effect of the social desire of the answers can occur. An important limitation is the fact that it was not possible to carry out a qualitative approach that would allow a deeper understanding of the reasons that inform leadership styles and motivational factors.

It is suggested, for future research, studies taking into account the leader's perception of himself and his motivation, in order to work together on the issue of motivation of leaders and subordinates, including extending it to all areas of the company. It will also be interesting to apply the research in other companies to verify the different results and thus compare them in order to collaborate for a better understanding of the topics covered.

ABSTRACT

Gender dysphoria is a condition characterized by a profound incongruence between biological sex and gender identity, which may cause significant distress. Over recent decades, advances in genomics, neurobiology, and epigenetics have enabled the identification of multiple biological mechanisms involved in the determination of sexual identity. Current evidence suggests that gender dysphoria does not stem from a single cause, but rather from the interaction of genetic, endocrine, and environmental factors that modulate sexual differentiation of the brain. Polymorphisms in genes related to hormonal action, such as SRY, SOX9, AR, ER α , SRD5A2, and SULT2A1, may influence brain masculinization or feminization during fetal development. Likewise, neuroimaging studies reveal intermediate or mixed structural and functional brain patterns between cisgender men and women. Epigenetics emerges as an explanatory bridge between genetic and environmental factors through mechanisms of DNA methylation and histone modification. Understanding the biological basis of gender dysphoria is essential for comprehensive clinical care and for reducing social stigma.

RESUMO

A disforia de gênero é uma condição caracterizada por uma profunda incongruência entre o sexo biológico e a identidade de gênero, que pode gerar sofrimento significativo. Nas últimas décadas, os avanços na genômica, na neurobiologia e na epigenética permitiram identificar múltiplos mecanismos biológicos implicados na determinação da identidade sexual. As evidências atuais sugerem que a disforia de gênero não responde a uma única causa, mas sim à interação de fatores genéticos, endócrinos e ambientais que modulam a diferenciação sexual do cérebro. Polimorfismos em genes relacionados à ação hormonal, como SRY, SOX9, AR, ER α , SRD5A2 e SULT2A1, podem influenciar a masculinização ou feminilização do cérebro durante o desenvolvimento fetal. Da mesma forma, estudos de neuroimagem revelam padrões estruturais e funcionais cerebrais intermediários ou mistos entre homens e mulheres cisgênero. A epigenética emerge como uma ponte explicativa entre os fatores genéticos e ambientais, por meio de mecanismos de metilação do DNA e modificação de histonas. Compreender a base biológica da disforia de gênero é fundamental para uma abordagem clínica integral e para a redução do estigma social.

1 INTRODUCTION

Gender identity is defined as the internal, individual experience of the gender with which a person identifies, regardless of their sex assigned at birth. When there is a persistent discrepancy between the two, accompanied by clinically significant discomfort, it is called **gender dysphoria**, a term adopted by the *American Psychiatric Association* in the *DSM-5* and by the *World Health Organization* in the *ICD-11* (1,2). (Figure 1).

Traditionally, gender dysphoria has been interpreted from psychological or sociocultural perspectives. However, growing biological evidence suggests that the brain's sexual differentiation—and, by extension, gender identity—depends on genetic, epigenetic, and hormonal processes that occur during embryonic and fetal development (3,4).

Figure 1

Pathways of human gonadal sexual development. Until the seventh week of pregnancy, the gonad remains undifferentiated, which has the potential to develop into testicles or ovaries

The differentiation process is driven by specific genetic and hormonal signals. In the presence of the Y chromosome, the sex-determining gene for the Y region (*SRY*) is expressed. *SRY* subsequently initiates the male developmental pathway by promoting the expression of *SOX9*, a critical transcription factor. *SOX9* activation is further supported by steroidal factor 1 (*SF1*). Once activated, *SOX9* induces the production of anti-Müllerian hormone by Sertoli cells in the developing testes, which plays a vital role in inhibiting the

development of the female internal genitalia by causing regression of the Müllerian ducts. At the same time, the Leydig cells in the testes begin to produce testosterone under the influence of SOX9. Testosterone is essential for the development of the male internal genitalia. In addition, testosterone is converted to dihydrotestosterone, which is crucial for the formation of male external genitalia and the development of secondary sex characteristics during puberty. In the absence of the *SRY* gene, the female developmental pathway is initiated. Factors such as *RSPO1* and *WNT4* support ovarian development by inhibiting SOX9 and promoting gonad differentiation into ovaries. Together with *RSPO1* and *WNT4*, *FOXL2* plays an important role in supporting ovarian development and function. The developing ovaries produce estradiol, a hormone crucial for the development of the female reproductive organs and secondary sex characteristics. Hormonal influence continues from embryonic stages through puberty, shaping the development and function of the reproductive system (Loch Batista, 2024)

In this context, the differences observed in brain structures, sexually dimorphic gene expression and variations in hormone receptors could explain the diversity of sexual identities and orientations.

The aim of this review is to analyze the main genetic, epigenetic, and neurobiological findings related to gender dysphoria, integrating recent evidence supporting the existence of a complex biological basis in the determination of sexual identity.

2 SEX DETERMINATION: FUNDAMENTAL GENETIC MECHANISMS

Human biological sex is established from the chromosomal combination (46,XX or 46,XY) and the sequential activation of genes that determine gonadal and genital differentiation. The Y chromosome, although small, has key genes for male differentiation, the most important being the *SRY* gene (*sex-determining region Y*), located in Yp11.3 (5). This gene encodes a protein that acts as a transcription factor, inducing the expression of genes such as *SOX9*, *SF1* and *DMRT1*, essential for the formation of the testes (6,7) (Figure 2).

In the absence of *SRY*, sexual differentiation follows the female path by default, mediated by genes such as *WNT4*, *RSPO1*, and *DAX1*, which suppress testicular action and promote ovarian formation (8). Alterations in these genes can generate disorders of sex development (DSD) with ambiguous or discordant phenotypes with respect to the karyotype.

In addition, the *genes* *SOX9*, *WT1*, *NR5A1 (SF1)*, *CBX2* and *DHH* regulate different steps of gonadal differentiation. Duplications or mutations of these can cause gonadal dysgenics, testicular development in individuals 46,XX or testicular failure in 46,XY (9). These genetic variations, although classically related to DSDs, also offer a model for study to understand the mechanisms that could underlie gender dysphoria, by modifying hormonal action and brain signaling during fetal life.

3 DISORDERS OF SEX DEVELOPMENT AND THEIR RELATIONSHIP WITH GENDER DYSPHORIA

Disorders of sex development (DSD) are a heterogeneous group of disorders in which chromosomal, gonadal or anatomical differentiation does not follow the typical male or female pattern. These conditions represent a natural model for understanding how genetic and hormonal variations during embryogenesis can influence gender identity and sexual orientation (10).

Among the most studied alterations are:

3.1 COMPLETE GONADAL DYSGENESIS 46,XY (SWYER'S SYNDROME)

Characterized by the presence of an XY karyotype with a female phenotype, it is due to mutations or deletions in the *SRY gene* or defects in regulatory genes such as *SOX9*, *WT1* or *NR5A1* (11). Individuals usually have female external genitalia, absence of functional gonads, and lack of pubertal development. Although their gender identity is usually female, variability in the perception of gender and sexual orientation has been observed, suggesting a role of brain signaling beyond karyotype.

Figure 2

Schematic presentation of the mechanisms that mediate the development of sex differences in mammals, including humans

The SRY gene on the Y chromosome induces the formation of testes that will secrete testosterone (T) that will act on their own or through aromatization (Arom) in estradiol (E2) to masculinize genital structures and the brain. The activational effects of steroids will complete the differentiation of the adult male and female phenotype. Genes can also induce sex differences in a more direct way that is not mediated by the action of sex steroids. Environmental and social influences will further modulate this sexual phenotype to determine an individual's gender, including their sexual orientation and gender identity. (Balthazart, 2020)

3.2 ANDROGEN INSENSITIVITY SYNDROME (AIS)

Caused by mutations in the androgen receptor (AR) gene, located in Xq11-12, AIS is expressed in varying degrees from complete forms (CAIS) to partial forms (PAIS). People with CAIS have a 46,XY karyotype, but a female phenotype and intra-abdominal or inguinal testes (12). Despite having normal or high levels of testosterone, the lack of tissue response to androgens conditions body and brain feminization. Neuroanatomical and behavioral

studies indicate that these individuals tend to develop a female gender identity, reinforcing the notion that fetal hormonal action plays a determining role in the organization of the sexual brain (13).

3.3 5-ALPHA-REDUCTASE TYPE 2 DEFICIENCY

The enzyme 5 α -reductase, encoded by the *SRD5A2* gene, converts testosterone into dihydrotestosterone (DHT), a potent androgen responsible for virilization of the external genitalia. Its congenital deficiency, more frequent in regions of the Caribbean and South America, produces ambiguous genitalia or female phenotypes in individuals 46,XY (14). However, during puberty, the increase in testosterone generates secondary virilization and, in many cases, **reversion of gender identity to the male**. This phenomenon shows that postnatal hormonal exposure can also modulate gender perception, although within preconfigured neurobiological limits (15).

3.4 CONGENITAL ADRENAL HYPERPLASIA (CAH)

Usually caused by 21-hydroxylase (*CYP21A2*) deficiency, CAH leads to an overproduction of adrenal androgens in female fetuses (46,XX), causing varying degrees of genital virilization (16). Various longitudinal studies show that most women with CAH maintain a female identity, but some have masculinized behaviors or preferences and a higher incidence of same-sex attraction (17). This suggests that partial masculinization of the brain could be mediated by prenatal androgen exposure.

Taken together, DSDs show that genetic and hormonal variations during critical periods of brain development can modify the structure and functionality of the sexually dimorphic nervous system. However, gender dysphoria is not always associated with obvious chromosomal or endocrine abnormalities, indicating that more subtle mechanisms—such as genetic polymorphisms and epigenetic regulation—may play a crucial role in shaping sexual identity (18).

4 NEUROBIOLOGY AND SEXUAL BRAIN DIFFERENTIATION

The human brain exhibits structural, functional, and molecular differences between males and females, resulting from the combined influence of sex genes, gonadal hormones, and epigenetic processes during embryogenesis and puberty. These differences, known as

brain sexual dimorphism, constitute the neurobiological basis on which gender identity is built (19).

4.1 SEXUAL DIMORPHISM OF THE BRAIN

Various regions of the central nervous system exhibit a degree of sexual dimorphism. Among the most relevant are (Figure 3):

- **The interstitial nucleus of the anterior hypothalamus 3 (INAH3)**, described by LeVay (1991), which is larger in heterosexual males than in homosexual females or males (20).
- **The suprachiasmatic nucleus (SCN)**, which is larger in homosexual men compared to heterosexuals (21).
- **The nucleus bed nucleus of the stria terminalis, caudal part (BNSTc)**, a key region for gender identity. In transgender women (male-to-female), their size and neuronal density are similar to those of cisgender females, while in transgender males (female-to-male) they resemble those of cis males (22).

Figure 3

Topography of the sexually dimorphic nucleus (SDN) in the preoptic area of the human hypothalamus

Third ventricle, III; anterior commissure, AC; infundibulus, I; lateral ventricle, LV; optical chiasm, OC; organum vasculosum of the terminal lamina, OVLT; optical recess, RO; septum, S; suprachiasmatic nucleus, SCN; paraventricular nucleus, PVN; supraoptic nucleus, SON; commissural fibers of the suprachiasmatic nucleus, CF. (De Swaab & Fliers, 1985; copyright 1985 by AAAS.)

These findings suggest that gender identity is neuroanatomically represented and that structural differences are established early, probably under the influence of fetal testosterone and other genetic modulators.

4.2 FUNCTIONAL NEUROIMAGING EVIDENCE

Studies with functional magnetic resonance imaging (fMRI) and tensor diffusion (DTI) have shown that the brains of transgender people have patterns intermediate between those observed in cisgender men and women (23). For example:

- Cortical thickness and connectivity of the corpus callosum and insula show mixed or demasculinized traits in transgender women. (Figure 4)
- In transgender men, greater connectivity is observed in regions associated with body perception and sensory integration, similar to that of cisgender men (24).

These data support the hypothesis of brain differentiation incongruent with biological sex, rather than a mere sociocultural influence. Prenatal exposure to sex hormones and sensitivity to androgen and estrogen receptors appear to determine the pattern of brain development.

4.3 PRENATAL HORMONAL INFLUENCE

Sex hormones play an organizing role during critical stages of development. Intrauterine exposure to androgens or estrogens modulates brain structure and subsequent sexual behavior (25).

Animal studies have shown that the administration of testosterone to pregnant females masculinizes the behavior of their offspring, while androgenic inhibition in males produces feminizing effects (26). In humans, the relationship between prenatal exposure and sexual orientation has been supported by indirect biomarkers, such as the 2D:4D ratio (index and ring finger length), which differs significantly in transgender people (27).

4.4 BRAIN CONNECTIVITY AND BODY PERCEPTION

Savic and Arver (2008) demonstrated that the connections between the amygdala, the orbitofrontal cortex, and the insula differ according to sexual orientation and gender identity (28). In homosexual men and heterosexual women, the tonsillar projections are more extensive towards anterior cortical regions, while in heterosexual men and lesbian women connectivity with the striatum and thalamus predominates. In addition, brain activation in response to pheromone stimuli shows a crossover pattern: male pheromones stimulate the hypothalamus in heterosexual women and homosexual men, and female pheromones do so in heterosexual men and lesbian women (29). This indicates that sexual perception of the environment is biologically modulated.

4.5 NEUROGENETIC INTEGRATION

Evidence suggests that gender identity results from the interaction between genetic endowment and sexually dimorphic brain organization, rather than from simple hormonal influence. Genetic variations in androgen receptors (*ARs*), estrogens (*ER α* , *ER β*), progesterone (*PGRs*), and enzymes such as *SRD5A2* or *CYP17* could modify neuronal sensitivity to sex steroids, producing patterns of brain differentiation discordant with chromosomal sex (30).

The neurobiology of gender dysphoria, therefore, is based on the convergence of genetic, endocrine and neurostructural mechanisms that shape the internal perception of one's own body and gender role. This perspective offers a scientific basis that complements—not replaces—the psychological and social factors involved in the transgender experience.

5 GENETIC FACTORS ASSOCIATED WITH GENDER DYSPHORIA

Research on the genetic determinants of gender dysphoria has progressed markedly over the past two decades. Although there is no single "gender gene," accumulating evidence suggests that sexual identity is shaped by a complex polygenic network, where multiple variants influence brain differentiation, hormonal action, and neuronal sensitivity to sex steroids (31).

Figure 4

Cortical thickness of untreated male-to-female (MtF) and female-to-male (FtM) transsexuals

Top panel: (a) comparison between male and female controls. Bottom panel: (b) comparison between MtF and male controls; (c) comparison between FtM and female controls. All significant comparisons showed the F > M pattern. Note that both MtF (b) and FtM (c) show a female pattern, although they differ in different regions of men than control women. L left hemisphere, R right hemisphere. Zubiaurre-Elorza, Junque, Gómez-Gil, Segovia, Carrillo & Guillamon, 2013, with permission.

5.1 POLYMORPHISMS IN ANDROGEN RECEPTOR (AR) GENES

The *AR* gene, located on chromosome Xq11-12, contains a polymorphic region with repeats of CAG triplets encoding glutamines. The length of this sequence modulates the sensitivity of the receptor to testosterone: a higher number of repeats is associated with lower transcriptional activity (32).

Several studies have found that transgender women (male-to-female) have a significant expansion in the number of CAG repeats, which could reduce the brain's

androgenic response during pregnancy and favor a more female pattern of sexual differentiation (33). This observation reinforces the hypothesis of prenatal brain submasculinization in this group.

5.2 ESTROGEN RECEPTORS (ERA AND ERB)

The *ESR1* (ER α) and *ESR2* (ER β) genes, located on chromosomes 6q25.1 and 14q23.2 respectively, encode nuclear receptors involved in the modulation of estrogen-dependent gene transcription.

Madeleine et al. (2020) identified a significant association between **polymorphisms in *ER α*** (rs9340799) and gender dysphoria, particularly in transgender women, where a higher frequency of the A allele was observed (34). Variation in *ER β* also appears to contribute to the degree of brain feminization or masculinization, modulating the estrogen response during fetal development (35).

5.3 HORMONE METABOLISM ENZYMES: SRD5A2, SULT2A1 AND STS

The *SRD5A2* gene, responsible for the conversion of testosterone to dihydrotestosterone (DHT), has polymorphisms that alter its enzymatic activity. Hypofunctional variants could generate less cerebral virilization in XY fetuses (36). In addition, the *SULT2A1* (sulfotransferase) and *STS* (steroid sulfatase) genes are involved in the inactivation or reactivation of sex steroids. Polymorphisms that modify their expression may influence the local availability of androgens and estrogens in the developing brain (37).

5.4 ASSOCIATED GENETIC COMBINATIONS

Madeleine et al. (2020) showed that certain **allelic combinations** are overexpressed in transgender women: *AR-ER β* , *AR-PGR*, *AR-COMT* and *CYP17-SRD5A2* (38). These patterns suggest functional interactions between genes that regulate the action and metabolism of sex hormones, generating **submasculinization or partial brain defeminization**.

The study proposed that such combinations could modulate the expression of steroid receptors in critical regions of the brain such as the hypothalamus and amygdala, influencing gender self-identification.

5.5 OTHER CANDIDATE LOCI

Recent genomic analyses have identified chromosomal regions potentially associated with gender identity, including:

- **Chromosome Xq28**, previously linked to male sexual orientation (39).
- **Chromosomes 7, 8 and 10**, where polymorphisms with greater concordance have been found in monozygotic twins compared to dizygotic twins (40).
- Variants in regulatory genes of the hypothalamic-pituitary axis, such as *NR3C1* (glucocorticoid receptor), which could interact with maternal prenatal stress affecting the expression of sex genes (41).

5.6 STUDIES IN TWINS AND FAMILIES

The genetic influence is also supported by studies in twins. Coolidge et al. (2002) and Bailey et al. (2016) demonstrated that the concordance for gender dysphoria is significantly higher in monozygotic twins than in dizygotic twins (42,43). It is estimated that about 50% of the variance in gender identity could be attributed to heritable genetic factors, although specific mechanisms remain under study.

Taken together, these findings reinforce the notion that gender dysphoria has a **multifactorial polygenic basis**, where the sum of small genetic variations in genes that regulate hormonal action and brain differentiation generates intermediate sex phenotypes. The interaction of these variants with the fetal epigenetic and endocrine environment would ultimately determine the expression of gender identity in the adult individual.

6 EPIGENETICS AND REGULATION OF SEXUAL IDENTITY

Epigenetics is the bridge between inherited genetic information and the influence of the environment on gene expression. Through mechanisms such as **DNA methylation**, **histone modifications**, and the **action of microRNAs (miRNAs)**, cells adjust gene transcription without altering the nucleotide sequence. In the context of gender dysphoria, these processes appear to play an essential role in the **sexual differentiation of the brain** and the shaping of gender identity (44). (Figure 5).

Figure 5

Epigenetics of sex differences in the brain. Emerging evidence suggests sex differences in at least four related parameters: (1) DNA methylation patterns, (2) methyltransferases, (3) methylation-binding proteins, and (4) co-repressor proteins, all of which may contribute to long-lasting differences in brain and behavior. (McCarthy, 2009)

6.1 EPIGENETIC MECHANISMS OF SEXUAL DIFFERENTIATION

During embryonic development, brain cells undergo epigenetic programming that depends on chromosomal sex and the intrauterine hormonal environment. DNA-methyltransferase enzymes (DNMTs) establish specific methylation patterns that determine which genes are turned on or silenced based on sex (45).

DNA methylation is often associated with gene repression, while histone acetylation facilitates transcription. In animal models, differences in the methylation of estrogen (*ERα*) and androgen (*AR*) receptors in the hypothalamus have been shown to be determinants of the brain's sexual organization (46). In humans, these mechanisms could explain the appearance of intermediate phenotypes when methylation or acetylation occurs atypically during gestation.

6.2 INFLUENCE OF STRESS AND THE INTRAUTERINE ENVIRONMENT

Maternal environmental factors, such as prenatal stress, exposure to drugs or hormonal pollutants, can alter the epigenetic programming of the fetus (47). Elevated maternal cortisol acts on fetal glucocorticoid receptors, inhibiting sex steroid synthesis and modifying methylation patterns in key genes of gonadal and brain development (48). Studies in Berlin showed that sons of mothers with intense gestational stress showed a higher incidence of homosexual orientation or diverse gender identity (49). Similarly, exposure to endocrine disruptors, such as diethylstilbestrol (DES) or phenobarbital, has been associated with alterations in estrogen signaling and in the expression of genes related to sexual development (50).

6.3 ROLE OF MICRORNAS IN SEXUAL IDENTITY

MicroRNAs are small non-coding RNA molecules that regulate mRNA translation. In the brain, several miRNAs show differential expression based on sex and hormonal exposure.

miR-9, miR-132 and miR-212 have been identified as involved in neuronal maturation and synaptic plasticity, modulating circuits related to sexual behavior and the perception of one's own body (51).

In murine models, overexpression of certain feminizing miRNAs or inhibition of masculinizing miRNAs can reproduce atypical brain phenotypes, suggesting a direct epigenetic contribution to sexual identity (52).

6.4 EPIGENETIC, HORMONAL AND GENETIC INTEGRATION

The interaction between genetics, epigenetics and sex hormones forms a self-regulating system. The action of genes such as *SRY* and *SOX9* induces hormonal cascades that, in turn, modify the brain epigenome. This phenomenon explains why individuals with the same karyotype may present marked differences in sexual identity and orientation.

Likewise, epigenetics can generate **transgenerational heritability**: methylation patterns in hormonal genes can be partially transmitted to offspring, perpetuating predispositions to certain gender configurations or sexual behaviors (53).

Taken together, epigenetic evidence demonstrates that gender identity is the dynamic result of the interaction between the genome and the environment. Epigenetic

modifications provide a coherent explanation for individual variability, even among monozygotic twins, and reinforce the view of gender dysphoria as a biologically mediated rather than psychologically induced condition.

7 EPIGENETICS AND REGULATION OF SEXUAL IDENTITY

Epigenetics is the bridge between inherited genetic information and the influence of the environment on gene expression. Through mechanisms such as DNA methylation, histone modifications, and the action of microRNAs (miRNAs), cells adjust gene transcription without altering the nucleotide sequence. In the context of gender dysphoria, these processes appear to play an essential role in the sexual differentiation of the brain and the shaping of gender identity (44).

7.1 EPIGENETIC MECHANISMS OF SEXUAL DIFFERENTIATION

During embryonic development, brain cells undergo epigenetic programming that depends on chromosomal sex and the intrauterine hormonal environment. DNA-methyltransferase enzymes (DNMTs) establish specific methylation patterns that determine which genes are turned on or silenced based on sex (45).

DNA methylation is often associated with gene repression, while histone acetylation facilitates transcription. In animal models, differences in the methylation of estrogen (*ERα*) and androgen (*AR*) receptors in the hypothalamus have been shown to be determinants of the brain's sexual organization (46). In humans, these mechanisms could explain the appearance of intermediate phenotypes when methylation or acetylation occurs atypically during gestation.

7.2 INFLUENCE OF STRESS AND THE INTRAUTERINE ENVIRONMENT

Maternal environmental factors, such as prenatal stress, exposure to drugs or hormonal pollutants, can alter the epigenetic programming of the fetus (47). Elevated maternal cortisol acts on fetal glucocorticoid receptors, inhibiting sex steroid synthesis and modifying methylation patterns in key genes of gonadal and brain development (48). Studies in Berlin showed that sons of mothers with intense gestational stress showed a higher incidence of homosexual orientation or diverse gender identity (49). Similarly, exposure to endocrine disruptors, such as diethylstilbestrol (DES) or phenobarbital, has

been associated with alterations in estrogen signaling and in the expression of genes related to sexual development (50).

7.3 ROLE OF MICRORNAS IN SEXUAL IDENTITY

MicroRNAs are small non-coding RNA molecules that regulate mRNA translation. In the brain, several miRNAs show differential expression based on sex and hormonal exposure.

miR-9, miR-132 and miR-212 have been identified as involved in neuronal maturation and synaptic plasticity, modulating circuits related to sexual behavior and the perception of one's own body (51).

In murine models, overexpression of certain feminizing miRNAs or inhibition of masculinizing miRNAs can reproduce atypical brain phenotypes, suggesting a direct epigenetic contribution to sexual identity (52). Figure 6.

Figure 6

Linear vision of sexual differentiation in the twentieth century. For the past 50 years, the prevailing view of the brain's sexual differentiation has been a linear model in which chromosomal sex determines gonadal sex, which in turn determines brain sex

Feminization of the brain is the default process that occurs in the absence of elevated levels of gonadal steroids during a perinatal sensitive period. Masculinization and defeminization are separate hormonal processes that organize the neural substrate to

promote typical male behaviors while suppressing typical female behaviors. The organized neural substrate is activated by gonadal steroids in adulthood and is necessary for typical sex behaviors to be expressed. This iconic model, based on the organizational/activational hypothesis, has proven to be a solid framework for elucidating some, but not all, aspects of the brain's sexual differentiation. (McCarthy, 2011)

7.4 EPIGENETIC, HORMONAL AND GENETIC INTEGRATION

The interaction between genetics, epigenetics and sex hormones forms a self-regulating system. The action of genes such as *SRY* and *SOX9* induces hormonal cascades that, in turn, modify the brain epigenome. This phenomenon explains why individuals with the same karyotype may present marked differences in sexual identity and orientation.

Likewise, epigenetics can generate transgenerational heritability: methylation patterns in hormonal genes can be partially transmitted to offspring, perpetuating predispositions to certain gender configurations or sexual behaviors (53).

Taken together, epigenetic evidence demonstrates that gender identity is the dynamic result of the interaction between the genome and the environment. Epigenetic modifications provide a coherent explanation for individual variability, even among monozygotic twins, and reinforce the view of gender dysphoria as a biologically mediated rather than psychologically induced condition.

8 DISCUSSION

The current understanding of gender dysphoria has evolved from purely psychodynamic perspectives to an integrative biopsychosocial model, in which genetic, epigenetic and neurobiological components play a determining role. The reviewed findings support the hypothesis that gender identity has a multifactorial biological basis, modulated by the interaction between the genome, sex hormones and the intrauterine environment.

8.1 GENETIC AND ENDOCRINE INTERACTION

Studies on disorders of sex development (DSD) offer a window into understanding how genes and hormones influence the brain's sexual differentiation. Alterations in *SRY*, *SOX9*, *AR*, *CYP17*, and *SRD5A2* demonstrate that changes in androgenic or estrogenic

signaling during critical stages of embryogenesis can modify the neuroanatomical organization responsible for gender identity (54).

These observations suggest that gender dysphoria could be a consequence of a mismatch between gonadal sex and brain differentiation, caused by genetic or epigenetic variations that alter sensitivity to sex steroids.

8.2 CONVERGENT NEUROBIOLOGICAL EVIDENCE

Neuroimaging findings confirm that the brains of transgender people show structural and functional patterns intermediate between those of cisgender men and women (55). The size of the BNSTc and INAH3, as well as the connectivity of the amygdala and insula, reflect a brain configuration that does not depend exclusively on chromosomal sex.

This evidence supports the concept that gender identity is established at the neurobiological level and that prenatal hormonal processes are determinants in its consolidation. However, postnatal brain plasticity may also contribute to gender experience, which explains variations in individual expression and experience.

8.3 CONTRIBUTIONS OF EPIGENETICS

Epigenetic mechanisms allow us to understand how environmental and hormonal factors influence gene expression without modifying the DNA sequence. DNA methylation, histone acetylation, and microRNA action modulate the transcription of genes related to sexual differentiation and gender perception (56). Figure 7.

Figure 7

Central role of the brain in the protective and damaging effects of stress mediators and adaptation that operate through the process of allostasis, which can lead to allostatic loading and overload when overused and dysregulated. Reproduced from reference 16, copyright (1998) Massachusetts Medical Society

These processes could explain why individuals with identical genotypes or even monozygotic twins can develop different gender identities. In addition, prenatal stress and exposure to endocrine disruptors have been linked to persistent epigenetic changes affecting the hypothalamic axis and hormone regulation (57).

8.4 POLYGENIC AND MULTIFACTORIAL MODEL

The available evidence suggests that gender dysphoria responds to a polygenic and multifactorial model, in which multiple small-effect genes contribute to a particular neurobiological phenotype (58). Polymorphisms in *AR*, *ERα*, *ERβ*, *SULT2A1* and *STS* affect the conversion and action of sex steroids in the fetal brain, while epigenetics modulates the final expression of these genes. Thus, gender identity can be understood as a continuous biological trait, determined by the interaction of numerous genetic and environmental factors, rather than as a strict male/female dichotomy. Figure 8.

Sex determination and gonadal differentiation require a lot of protein and endocrine stimulants to father a fetus.1 1 MacLaughlin DT, Donahoe PK. Sexual determination and differentiation. N Engl J Med. 2004; 350 [4]:367–378

8.5 CLINICAL AND ETHICAL IMPLICATIONS

Recognizing the biological basis of gender dysphoria has profound implications for medical practice and clinical ethics.

First, it allows us to support a compassionate and depathologizing approach, where dysphoria is not conceived as a disease, but as a variation of human sexual development (59). Second, it reinforces the need for multidisciplinary management that integrates genetics, endocrinology, psychiatry, and clinical psychology, to offer respectful and evidence-based accompaniment.

Finally, understanding the genetic and epigenetic mechanisms involved can guide research towards **predictive biomarkers** that improve the early detection of gender incongruence, avoiding late diagnoses or inappropriate interventions.

8.6 CONSTRAINTS AND FUTURE PROSPECTS

Despite the advances, most of the available studies have small samples, phenotypic heterogeneity and methodological limitations. The genetic and epigenetic complexity of sexual identity requires the application of next-generation sequencing techniques, epigenomic studies (EWAS), and advanced functional neuroimaging, with integrated data analysis (60).

Future research should combine genetic and epigenetic information with endocrine and neuroanatomical measurements, to build a comprehensive predictive model that explains the diversity of human identities and gender expressions.

In short, gender dysphoria emerges as a complex biological phenomenon in which genetics, epigenetics and neuroscience converge. Understanding its etiology from this approach not only expands medical knowledge, but also promotes more ethical, empathetic, and scientifically grounded care toward transgender people. (Figure 9).

Figure 9

The biological factors that influence gender identity

9 CONCLUSIONS

Gender dysphoria represents a complex expression of human diversity, where genetic, epigenetic, hormonal and neurobiological factors converge. Current evidence supports that gender identity originates largely during fetal development, when the brain undergoes processes of sexual differentiation influenced by the action of sex genes and hormones.

Genetic polymorphisms in genes such as *SRY*, *SOX9*, *AR*, *ERα*, *ERβ*, *SRD5A2*, *SULT2A1*, and *STS* can alter the sensitivity of the nervous system to sex steroids, generating variable brain patterns of masculinization or feminization. In turn, epigenetic

mechanisms—DNA methylation, histone and microRNA modifications—modulate the expression of these genes, mediating the interaction between the genome and the intrauterine environment.

The structural and functional differences observed in regions such as the BNSTc, INAH3, amygdala, and insula provide neuroanatomical evidence that gender identity has tangible biological correlates. These findings reinforce the need for a scientific, ethical and multidisciplinary approach that combines genetics, endocrinology, neuroscience and mental health in the clinical approach.

Finally, it is recommended to promote broad-spectrum genomic and epigenomic association research (GWAS and EWAS), combined with functional neuroimaging techniques, to clarify the molecular mechanisms involved and move towards a more precise, inclusive and humanistic understanding of gender diversity.
