Another point to be observed is how the signal will be amplified, as there are linear and logarithmic amplifiers. The form of amplification is much more linked to the practical sense of observing the signs. The log form is commonly used for fluorescence, as it expands weak signals and compresses strong ones by visually eliminating extreme values, as it is used for marking analysis for stem cells. The Linear form is used when you want to analyze the signals as a whole – this type of amplification is widely used for cycle analysis.

9.2 APPLICATIONS OF FLOW CYTOMETRY

There are several possible applications using flow cytometry. The parameters that can be measured are: cell volume and morphological complexity, cell pigments such as chlorophyll, in cancerology (detection of a pathological cell; measurement of an abnormal DNA content), DNA and cell cycle (distribution of cells in the different phases of the cycle, presence of cells with abnormal DNA content, cell type analysis, cell kinetics, proliferation, etc.), RNA, analysis and classification of chromosomes, proteins, cell surface antigens (markers for identification of immune cell subtypes, for example), intracellular antigens (various cytokines, secondary mediators, etc.), nuclear antigens, enzyme activity, pH, intracellular ionized calcium, magnesium, membrane potential, membrane fluidity, apoptosis (quantification, measurements of DNA degradation, mitochondrial membrane potential, changes in permeability, caspase activity), cell viability, monitoring of cell electropermeabilization, pharmacology (characterization of multidrug resistance in tumor cells), glutathione, hematology (diagnosis, detection or identification of cell subtypes), various combinations (DNA/surface antigens, etc.). This list is very long and constantly expanding.

9.3 FLUORESCENCE ACTIVATED CELL SORTER (FACS)

FACS is a technique based on flow cytometry with the objective of selecting one cell among thousands. A given cell that has an antigen of interest can be separated from others that do not have this antigen, if an Ab specific for this antigen is labeled with a fluorochrome. The FACS computer system associates the wavelength (color) of the fluorochrome as an event (in this case, a cell) that must be separated (**Figure 7**). In this way, a certain cell, with a specific marking, and that we want to separate, will receive an electric charge and, when passing through an electromagnetic field, this cell will be deflected towards one of the plates of the electromagnetic field, depending on the charge that this cell has received. The FACS technique is usually used to isolate different types of leukocytes. T cells, for example, have CD3 and Thy1.2 antigens; these molecules can be labeled with Ab conjugated with specific fluorochrome and associated electrical charge and the cells can be selected by this technique.

Figure 7

Fluorescence-activated cell separation (FACS). The cells are separated according to their marking and associated electrical charge. Thus, there are three possibilities: positive, negative or neutral charge

9.4 IMMUNOFLUORESCENCE PROTOCOL IN FLOW CYTOMETRY

For antigen labeling in flow cytometry, it is necessary that the procedure begins with the cells in suspension. We often work with cells that grow in suspension, but we also experiment with adhered cells. Regardless of the type of culture, after the experiment of interest, whether it is the addition of a substance, a drug, or the submission of the cell to some physical process such as irradiation, or simply reading the proliferative behavior or marking antigens for characterization, the cells must be resuspended and counted so that they can be read in the flow cytometer. The ideal number of cells for reading should be around 1×10^6 cells in total, but it is possible to read cells from 1×10^5 cells. The quantity is important because, during the cell antigen labeling procedure, the cells underwent several washes that include centrifugations and resuspensions in buffers to remove excess Ab and successive transfers to different tubes, procedures where a lot of cell loss occurs.

9.5 MARKING FOR SURFACE ANTIGEN DETECTION

The surface antigen labeling is performed with the live cells in suspension and at the end, if necessary, we fix it with 2% formaldehyde, in case the cytometer analysis cannot be performed immediately.

The procedure below is indicated for cell labeling in order to characterize the cells. Although the protocol below uses indirect labeling, in flow cytometry direct labeling is more attractive, as it avoids washing steps and incubation periods where more cell loss can occur.

Materials

Cells growing in culture with approximately 70 to 80% confluency.

Buffer Solution: PBS (*Phosphate Buffer Saline*), pH7.2, with 0.5% bovine albumin serum (BSA) and 2 mM Na₂EDTA.

This buffer solution with EDTA is useful to prevent cell aggregation.

Culture medium appropriate to the cell of interest.

Formaldehyde at 2%.

Trypsin.

Primary ab .

Secondary Ab (specific to the type of Ig of the species from which the primary Ab was obtained) bound to a fluorochrome.

Pipettes.

15 mL conical tubes.

1.5 mL conical tubes.

5 mL round-bottom tubes (for flow cytometry).

Procedure (direct and indirect dialing)

1. Disaggregate the cells in culture using trypsin.
2. Centrifuge the cells for 5 min at a speed of 300xg (approximately 1000 rpm) with the aid of the 15 mL conical tube.

It is interesting to calculate the speed in rpm of each centrifuge.

3. Resuspend the cells and count them. Subdivide them into 1.5 mL conical tubes in order to contain a quantity above 1x10⁵ cells in total.
4. Resuspend the cells at 50 to 100 µL and add 10 µL of the diluted primary Ab at the concentration indicated by the manufacturer or at the concentration found after titration of the Ab in the labeling standardization process. Gently mix and incubate the cells at 4°C for 10 to 20 min or at the time indicated by the manufacturer.

5. Wash the cells by adding 1 to 2 mL of buffer solution.

Washing includes a gentle cell resuspension and centrifugation at 300xg for 8 min.

6. (Optional) Wash one more time.

If the marking is indirect, the procedure for adding the secondary Ab should be the same as it was done with the primary. If there is a need for multicolored marking, each Ab should be added independently, following the sequences of steps 4 through 6. Another option is to make a mixture of primary Abs and apply them to the cells simultaneously (as long as there is no interference between antigens; this is a procedure widely used when you have primary Abs already conjugated with fluorochromes).

7. Resuspend the cells in 300 μ L, transfer them to a 5 mL round-bottomed tube, and keep them at 4°C if the reading is taken soon after. If you need to postpone the reading, you can fix the cells in 2% formaldehyde and keep them at 4°C – take the reading in less than a week.

When fixing the cells, first suspend in buffer solution and then add the formaldehyde so that the final concentration is 2%. This procedure prevents the cells from being aggregated if the cells were resuspended directly with the fixator.

9.6 LABELING FOR INTRACELLULAR ANTIGEN DETECTION – FIXATION AND PERMEABILIZATION

Many antigens of interest that we wish to label are inside the cell, in the cytoplasm, or in intracellular compartments such as endoplasmic vesicles and reticulum, even in the nucleus. In order for Ab to interact with the antigen that is inside the cell, it needs to enter the cell. To do this, the cell membrane must be permeabilized and the pores then formed must remain open. Therefore, initially, the cell must be fixed, which leads to cell death.

Materials

The materials required are the same as those used in the surface antigen labeling procedure described above, with the addition of the permeabilizer:

Permeabilization solution: 0.2% (v/v) Tween 20

Procedure (direct and indirect dialing)

1. Disaggregate the cells in culture using trypsin.
2. Centrifuge the cells for 5 min at a speed of 300xg (approximately 1000 rpm) with the aid of the 15 mL conical tube.

It is interesting to calculate the speed in rpm of each centrifuge.

3. Resuspend the cells and count them. Subdivide them into 1.5 mL conical tubes in a total of 1×10^6 cells.

In this experiment, it is advisable to use a total of 1×10^6 cells per tube, since the process of fixation, permeabilization and subsequent washing will result in much greater cell loss than the procedure of cell surface antigen labeling.

4. Centrifuge the cells and remove the supernatant. Add 875 μ L of iced buffer solution and mix gently. Add 125 μ L of the fixing solution and mix again. Incubate for 30 min at 4°C.
5. Centrifuge and remove the supernatant. Add 1 mL of permeabilization solution to the cells. Incubate for 15 min at 37°C.
6. Add 1 mL buffer solution, centrifuge and remove the supernatant.
7. Add the primary Ab diluted appropriately in 100 μ L of buffer solution to the cells. Mix gently and incubate for 30 min at 4°C.

A blockade step can be accomplished by incubating the cells for 1 min with 50 μ L of human AB serum inactivated by heating. Lock before adding the primary Ab. This procedure reduces non-specific markings. If a membrane immunoglobulin test is performed, this step should not be performed.

8. Add 1 mL buffer solution and centrifuge for 5 min at 300xg.
9. Wash the cells once more by adding 1 mL of buffer solution.
10. If it is necessary to mark the primary Ab with a secondary conjugated with a fluorochrome (**indirect marking**), repeat steps 7 through 9. If Ab is already conjugated (**direct dialing**) go to the next step.

The Ab indicated as secondary is the F(ab')₂ fragment format, because it is smaller, penetrates better into the cell, and eliminates the possibility of binding to Fc receptors.

11. Suppress the cells at 300 μ L, transfer to a 5 mL round-bottomed tube, and keep them at 4°C if the reading is taken soon after. If you need to postpone the reading, you can fix the cells in 2% formaldehyde and keep them at 4°C – take the reading in less than a week.

Reagents

Formaldehyde, 2%

As commercial formaldehyde comes in a 37% solution, its dilution is made considering this solution as 100%. Therefore, dilute 2 mL of the commercial formaldehyde solution in 98 mL of PBS pH 7.4.

If you wish to use paraformaldehyde, dissolve 4 g of paraformaldehyde powder in 10 mL of distilled water and heat to 60°C. Dilute in a 1:1 ratio with 2x concentrated PBS, pH 7.4.

Always prepare before use, it is not interesting to stockpile.

Permeabilization solution: 0.2% (v/v) Tween 20

Mix 200 µl of Tween 20 with 100 ml PBS.

Store in amber vial for less than 1 month at 4 °C. Use it at room temperature.

ABSTRACT

Microbial resistance to conventional therapy antibiotics (RAM) is one of the two biggest challenges of the 21st century. From different years, the beginning of the present series marks a definition of an important agenda for human development. Two 17 objectives, the one that deals with development brings together a series of goals that converge as the theme "microbial resistance". Goal 12.4 deals with technological development, strengthened by scientific promotion and partnership between nations. This text presents an analysis of the topic, pointing out the intimate relations between the technical-scientific development with the crisis of two antibiotics, proposing a discussion on how this scenario can contribute to the reduction of deaths due to microbial infections. The text was produced by Master and Doctorate students of two Post-Graduation programs, as part of the final exercise of the discipline that deals with this topic.

RESUMO

A resistência microbiana aos antibióticos da terapia convencional (RAM) é um dos maiores desafios do século XXI. A partir de diferentes ações, o início do presente século marcou uma definição de agenda importante para o desenvolvimento humano. Dos 17 objetivos, aquele que trata do desenvolvimento reúne uma série de metas que convergem com o tema “resistência microbiana”. A meta 12.4 trata do desenvolvimento tecnológico, fortalecido pelo fomento científico e parceria entre as nações. Este texto faz uma análise do tema, apontando as relações íntimas entre o desenvolvimento técnico-científico com a crise dos antibióticos, propondo uma discussão sobre como este cenário pode contribuir com a redução das mortes por infecções microbianas. O texto foi produzido por discentes de Mestrado e Doutorado de dois programas de Pós-Graduação, como parte do exercício final da disciplina que trata deste tema.

Palavras-chave: Objetivos de Desenvolvimento Sustentável. Resistência Microbiana. Indústria e Tecnologia.

RESUMEN

La resistencia antimicrobiana a la terapia antibiótica convencional (RAM) es uno de los mayores desafíos del siglo XXI. A través de diversas iniciativas, el inicio de este siglo marcó un hito importante en la agenda de desarrollo humano. De los 17 objetivos, el de desarrollo reúne una serie de metas que convergen en el tema de la "resistencia a los antimicrobianos". La Meta 12.4 aborda el desarrollo tecnológico, fortalecido por el desarrollo científico y las alianzas entre naciones. Este texto analiza el tema, destacando la estrecha relación entre el desarrollo técnico y científico y la crisis de los antibióticos, y propone un debate sobre cómo este escenario puede contribuir a la reducción de las muertes por infecciones microbianas. El texto fue elaborado por estudiantes de maestría y doctorado de dos programas de posgrado como parte del ejercicio final del curso sobre este tema.

Palabras clave: Objetivos de Desarrollo Sostenible. Resistencia a los Antimicrobianos. Industria y Tecnología.

1 INTRODUCTION

Microbial antibiotic resistance (AMR) represents one of the greatest threats to public health in the context of infection prevention and treatment. It occurs when microorganisms undergo changes when exposed to antimicrobials, becoming resistant and, as a result, the drugs lose their effectiveness, infections persist and spread. As a growing global public health problem, coordinated action by all government and society sectors is needed (PAHO, 2025). This health crisis is intrinsically linked to human activities and presents particular challenges for developing countries, where limited scientific and technological infrastructure increases population vulnerability. Sustainable Development Goal 12.a (SDG 12.a) aims to support developing countries in strengthening their scientific and technological capacities for more sustainable patterns of production and consumption (BRASIL, 2015; UN BRAZIL, 2015). The convergence between human activities, the emergence of resistant microorganisms and the need for sustainable technological innovation configures a field that needs multidisciplinary analysis and coordinated strategies to safeguard both therapeutic efficacy, in the context of human disorders, and environmental sustainability.

2 HUMAN ACTIVITIES AS DRIVERS OF ANTIMICROBIAL RESISTANCE

In 2021, AMR was listed as one of the top 10 threats to global public health (WHO, 2021), with human activities being identified as the main driver of the evolution and spread of AMR through multiple interconnected mechanisms, such as the irrational use of antibiotics (WHO, 2019). Projections for the future put the total number of deaths from drug-resistant diseases close to 10 million by 2050 if action is never taken to curb AMR (Tangcharoensathien *et al.*, 2021). This irrational use by the general public and health professionals emerges from a low level of knowledge and awareness about antibiotic use and microbial resistance (WHO, 2019). Thus, AMR arises as a result of mutations in pathogens and selection pressure from antibiotic use, which generates a competitive advantage for altered lineages (Esmaeili-khoshmardan *et al.*, 2024).

Allel *et al.* (2023) observed high rates of microbial resistance in several regions of the world, even in places where antimicrobial use is relatively low. This suggests that the incorrect use of antibiotics may represent only one of the risk elements, and not necessarily the most determinant, so effective strategies to cope with AMR must transcend the simple reduction of this misuse. Thus, integrated policies should be incorporated that involve the strengthening of sanitary and epidemiological surveillance, and basic sanitation.

Climate change alters the environment, facilitating the persistence and spread of resistant bacteria, especially due to increased temperature, changes in rainfall patterns, which impairs sanitation and increases the transmission of pathogens. Industrialization intensifies the problem by releasing pollutants such as pharmaceutical residues and heavy metals, contaminating ecosystems and creating selective pressures for bacterial resistance (Oyelayo *et al.*, 2025).

Heavy metals are important environmental contaminants that favor co-resistance between these compounds and antibiotics through shared genetic mechanisms, facilitating the spread of resistant genes in the environment and potentially in clinical settings. Polluted ecosystems act as reservoirs of resistance, increasing AMR and impacting global public health (Ezeonuegbu *et al.*, 2024). Inadequate hospitals, pharmaceutical industries, and wastewater treatment systems also release significant concentrations of antimicrobials into the environment, creating so-called "selection zones" where microorganisms develop resistance (Esmaeili-khoshmardan *et al.*, 2024).

2.1 TECHNOLOGICAL CAPACITY AND FOOD SAFETY

According to the Food and Agriculture Organization of the United Nations (FAO), the term food security designates a condition when everyone, at all times, has physical, social, and economic access to sufficient, safe, and nutritious food that meets their dietary needs and dietary preferences to enjoy an active and healthy life (FAO, 2024). Achieving this feat is a duty of each country and reinforced by international objectives, as evidenced by the 1996 World Food Conference (WCF). The CMA presents the agreement of the participating countries to reduce the number of people facing hunger by using integrative actions between the environment, politics, production and trade.

The boost in the agricultural sector is evidenced by the increase in its production scale over the years, however, problems related to access to food and its quality reveal inconsistencies in achieving the desired goals (EMBRAPA, 2018; Marchioni *et al.*, 2025). Countries in Latin America and the Caribbean are still one of the most affected by hunger in the world (FAO, 2024). In the national context, Brazil has public programs to combat hunger, in addition to programs that work on the redistribution of income that, as a consequence, improve access to safe food, but which, due to economic and sociopolitical changes, do not achieve their goal of eradicating hunger (Cabral *et al.*, 2014; Lins; Baptist; Espinoza, 2023).

Technological development can be a key to improving the quality of the food that reaches the population. Technologies such as whole-genome sequencing can be used to ensure the quality of the production chain and combat the spread of resistant microorganisms (FAO, 2018). However, developing countries face difficulties in ensuring technological development, as technological fragility for significant innovations is still one of the main obstacles to faster economic growth and better development indices (Leal; Figueiredo, 2021).

The indiscriminate use of antimicrobials in animal production, a common practice since the 1940s, has contributed significantly to the worsening of AMR worldwide, especially in developing countries. In these contexts, surveillance systems are fragile and regulation is deficient. In addition, the use of antibiotics as growth promoters or in subtherapeutic doses is a frequent practice, intensifying the selection of these microorganisms (Ansari *et al.*, 2020; EMBRAPA, 2021).

AMR poses a threat to global public health as different pathogens, such as *Escherichia coli* ESBL, *Salmonella* spp. and *Staphylococcus aureus* MRSA can be found in foods of animal origin, and can be transmitted to humans through meat, vegetables irrigated with contaminated water, and inadequate food hygiene practices (CFS, 2024; Founou *et al.*, 2016). The problem is even worse when sanitary inspection is insufficient. In addition, developing countries face challenges such as intensive production systems and scarce investments in biosafety, favoring the spread of AMR. FAO (2017) highlights that the food chain is an important vector of resistance, and that exposure to antimicrobials in livestock, agriculture and aquaculture contributes to the problem. Agricultural practice is also an aggravating factor, as the frequent and preventive use of antibiotics against phytopathogens, especially bacteriosis, has accelerated the selection of resistant strains (Machado; Luna, 2025).

The economic impact of AMR is significant: resistant infections, such as multidrug-resistant *Salmonella*, generate annual costs in excess of 365 million dollars in the US alone. If these numbers and the problem are extrapolated to countries with less health infrastructure, they can have even more serious consequences (Food Safety Brazil, 2024). In view of this, coordinated global actions are urgent, but especially in developing countries, it is essential to strengthen public policies, technical training, promotion of sustainable practices and the implementation of alternatives to the use of antimicrobials

2.2 SCIENTIFIC AND TECHNOLOGICAL STRENGTHENING IN THE CONTEXT OF SDG 12.A

Technical-scientific training has been shown to be a limitation and challenge faced by low- and middle-developed countries in coping with AMR (Kajumbula *et al.*, 2024). The lack of qualified professionals in areas such as microbiology, epidemiology, pharmacology, and health surveillance compromises everything from the collection and analysis of clinical samples to the interpretation of epidemiological and genomic data. This deficit is aggravated by inadequate laboratory infrastructure, absence of quality systems, shortage of reagents, and disarticulation between the technical and political levels (Okolie *et al.*, 2025).

Kajumbula *et al.* (2024) discussed in their study that only 1.3% of laboratories in 14 African countries perform basic microbiological tests, while the average compliance with quality standards is less than 50%. Additionally, in the Americas, it was observed that even in countries with active academic centers, such as Colombia and Jamaica, the dependence on external partnerships for specialized training is still high, evidencing the fragility of autonomous research networks (Kilmarx *et al.*, 2024).

In the Brazilian context, the development of public policies aimed at the prevention and control of antimicrobial resistance has played a central role in tackling this problem, structuring actions ranging from the promotion of the rational use of drugs to the implementation of microbiological surveillance systems (Aguiar *et al.*, 2023). Through historical programs such as the National Immunization Program and the control of hospital infections, to more recent strategies, such as the National Action Plan for the Prevention and Control of Antimicrobial Resistance (PAN-BR) (Brasil, 2022), the country has consolidated initiatives that aim to integrate efforts in the human, animal, and environmental sectors (Aguiar *et al.*, 2023).

With technological and scientific advances, many solutions for monitoring, prevention, diagnosis, and treatment have been proposed to combat bacterial resistance. Brown *et al.*, (2020) developed an automated, compact and low-cost system for microbial susceptibility testing, based on an optical system and machine learning. This system is particularly suitable for use in developing regions. From another perspective, the Oswaldo Cruz Foundation coordinates the structuring of a national network for genomic surveillance of multidrug-resistant bacteria. The institution trains professionals in genetic sequencing techniques for these bacteria. In addition, the use of nanoparticles, monoclonal antibodies, bacteriophages,

and vaccines is being studied as a promising therapeutic approach in the fight against AMR (Elbehiry *et al.*, 2022).

2.3 TECHNOLOGICAL INNOVATION FOR SUSTAINABLE PRODUCTION AND CONSUMPTION

The adoption of sustainable consumption and production patterns is crucial to mitigate environmental risks that compromise public health and environmental integrity. However, the implementation of these practices faces challenges, notably in developing countries. In these contexts, economic growth is often prioritized as the main vector for improving the population's living conditions, which can result in the adoption of measures with an adverse impact on sustainability. Urbanization and the expansion of urban centers is an example. By attracting large companies and the acceleration of industrialization, there is an increase in job search, *per capita* income and improvements in essential services such as health and education. In view of the above, the search for economic growth often overlaps with the adoption of a more sustainable development model.

On the other hand, developing nations have tools conducive to the implementation of an economic model capable of reconciling financial progress with sustainability. This is particularly relevant in the context of bacterial resistance, often aggravated by the improper disposal of industrial, hospital and agricultural waste into the environment. The adoption of the circular economy emerges as a promising solution to mitigate improper disposal. This concept, formalized in 1989 by British economists David W. Pearce and R. Kerry Turner, aims to extend the useful life of consumer goods and reduce the generation of waste from the conception of products. In the environmental context and the mitigation of AMR, this economic paradigm proves to be more advantageous than the current linear model (extraction, production, consumption and disposal), as it contributes to the reduction of waste that contaminates soils, rivers and lakes, favoring the regeneration of ecosystems. (Pearce, Turner, 1989).

Environmental management alternatives play a crucial role in mitigating bacterial resistance. Effluents from hospitals, slaughterhouses, and agricultural centers represent significant foci of Antibiotic Resistant Bacteria (ARB) and Antibiotic Resistance Genes (ARG) (Harth, 2025). This issue is particularly acute in least developed countries (LMICs), where the discharge of hospital effluents and other sources occurs directly into the environment, without adequate prior treatment. Given this scenario, it is imperative to implement accessible

technologies aimed at reducing this problem (Hounmanou, *et al.* 2025). Advanced technologies, such as Advanced Oxidation Processes (AOPs), have shown great potential in wastewater treatment. These processes are based on the generation of free radicals, especially hydroxyl ($\text{-OH}\cdot$), which have high oxidizing power and, consequently, high pollutant degrading properties (Divyapriya *et al.*, 2022).

3 STRENGTHENING COOPERATION AND TECHNOLOGY TRANSFER

As previously mentioned, AMR predominantly affects less developed countries, due to limited access to health services, inappropriate use of antimicrobials, and reduced focus on environmental issues, points related to the scarcity of resources. In view of this scenario, the collaboration of developed or high-income nations is imperative to control the spread of AMR, since it transcends the local scope, configuring itself as a global problem. Technology Transfer initiatives are fundamental for supporting poorer nations, establishing a model of cooperation between them and developed countries. This process enables access to high-cost and complex technologies, making them more accessible to countries with limited resources, as well as adapting their use to local specificities, independent of external support, but fostering self-sufficiency, as well as the development of scientific reasoning and the ability to overcome AMR (Harris; Tanner, 2000).

The diversity of technologies available to help combat bacterial resistance covers several sectors of research and development, including the design of rapid and more specific tests with molecular scope. Such tests can contribute to reducing the detection time of resistant bacterial species, thus speeding up the start of treatment (IDSA, 2011). The development of new antimicrobials with innovative mechanisms of action, such as metal-based compounds, is also crucial in this context, given that the speed of discovery of new antimicrobials is inversely proportional to the speed of emergence of new resistant strains. (Baker, *et al.* 2018) Low- and middle-income countries often have a vast biodiversity, and the support and cooperation of more developed countries in capacity building and technologies can be considered an incentive.

4 CONCLUSION

AMR represents a complex crisis, directly related to the unsustainable patterns of production and consumption addressed by SDG 12. The inadequate management of pharmaceutical waste and heavy metals highlights the need for environmentally safe

practices. In addition, in addition, the 12th proposes to strengthen scientific and technological capacities, especially in developing countries. These actions are essential to generate sustainable production systems. The "One Health" approach aligns with the systemic vision of SDG 12. Tackling AMR requires profound changes in global production and consumption patterns. Only with this transition can it be possible to avoid alarming projections of deaths from infections caused by resistant pathogens and meet the commitments of SDG 12. This perspective is essential to understand that antimicrobial resistance is not a phenomenon isolated to the clinical use of antibiotics, but the result of complex interactions between environmental, socioeconomic, and governance factors.

ABSTRACT

The United Nations supports 17 Sustainable Development Goals (SDGs), self-described as ambitious and interconnected, aimed at addressing a range of development challenges facing countries worldwide. SDG 12 aims to "ensure sustainable consumption and production patterns" through 11 targets. In this context, this paper proposes a link between the antibiotic crisis and item 4 of SDG 12 and presents anthropogenic factors related to the goal not being achieved by 2020. Although regulated, the paper addresses the contexts of the agricultural and food industries, as well as arbitrary waste management, which allow the spread of resistant microorganisms in the environment. This paper was produced by students from two postgraduate programs as a final project for their course and proposes to discuss antimicrobial resistance as a public health problem in light of SDG 12, focusing on target 12.4 as the guiding principle.

Keywords: Antibiotic Crisis. Sustainable Development Goals. Environmental Contamination.

objetivo de enfrentar uma agenda de desafios de desenvolvimento enfrentado pelos países em todo o mundo. O ODS 12, visa “assegurar padrões de produção e de consumo sustentáveis” por meio de 11 metas. Neste contexto, o presente trabalho propõe uma relação da crise dos antibióticos com o item 4 do ODS 12, e apresenta fatores antropogênicos relacionados à meta não ter sido alcançada até o ano de 2020. Embora sob regulação, são abordados contextos da indústria agropecuária, alimentícia e do manejo de resíduos de forma arbitrária que permitem a disseminação de microrganismos resistentes no ambiente. Este trabalho foi produzido por discentes de duas Pós-Graduações, como trabalho final de Disciplina e propõe discutir a resistência microbiana como um problema de saúde pública à luz do ODS 12, com foco na meta 12.4 como eixo condutor.

Palavras-chave: Crise dos Antibióticos. Objetivos do Desenvolvimento Sustentável. Contaminação Ambiental.

RESUMEN

Las Naciones Unidas apoyan 17 Objetivos de Desarrollo Sostenible (ODS), que se describen como ambiciosos e interconectados, y que buscan abordar diversos desafíos de desarrollo que enfrentan los países de todo el mundo. El ODS 12 busca "garantizar modalidades de consumo y producción sostenibles" a través de 11 metas. En este contexto, este documento propone un vínculo entre la crisis de los antibióticos y el punto 4 del ODS 12, y presenta los factores antropogénicos relacionados con la imposibilidad de alcanzar el objetivo para 2020. Si bien está regulado, el documento aborda los contextos de las industrias agrícola y alimentaria, así como la gestión ineficaz de residuos, que permiten la propagación de microorganismos resistentes en el medio ambiente. Este documento, elaborado por estudiantes de dos programas de posgrado como proyecto final de su carrera, propone debatir la resistencia a los antimicrobianos como un problema de salud pública a la luz del ODS 12, centrándose en la meta 12.4 como principio rector.

Palabras clave: Crisis de Antibióticos. Objetivos de Desarrollo Sostenible. Contaminación Ambiental.

1 INTRODUCTION

Microbial resistance (MR) can be defined as the ability of bacteria, fungi, viruses, and parasites to resist the action of antimicrobial drugs, making conventional treatments complex clinical challenges (Silva; Nogueira, 2021). This problem addresses one of the greatest threats to global public health in the twenty-first century, becoming increasingly responsible for deaths throughout the year (Ho *et al.*, 2025). It is estimated that about 9% of all deaths are caused by microbial resistance. In 2019 alone, about 5 million deaths were reported worldwide (Murray *et al.*, 2022). According to these data, these deaths were associated with 33 microbial pathogens, with emphasis on *Staphylococcus aureus*, *Escherichia coli*, *Streptococcus pneumoniae*, *Klebsiella pneumoniae*, and *Pseudomonas aeruginosa*, responsible for more than half of the deaths (GBD 2019 ARC, 2022).

According to the Ministry of Health, the situation in Brazil is similar to that observed in the rest of the world and has recorded serious infections caused by *E. coli*, *S. aureus* and *K. pneumoniae* in hospitals and large urban centers. Such infections make treatments difficult and increase costs by prolonging hospitalizations (Brasil, 2024). This problem is highly linked to the pattern of human behavior, such as indiscriminate use of antibiotics, improper disposal of medicines and disinfectants, contamination of soils and rivers, among others, contributing to the dissemination of resistance genes in the environmental microbiota (Carney *et al.*, 2019; Klein *et al.*, 2024).

Faced with this problem, it is essential to adopt an integrated approach, as proposed by the concept of "*One Health*". This perspective is key to understanding and addressing microbial resistance effectively and sustainably (Musicha *et al.*, 2024). In this sense, the UN Sustainable Development Goals (SDGs) offer an important framework for action. SDG 12, "Responsible Consumption and Production," highlights the need to reduce waste, improve waste management, and promote sustainable practices across sectors. Target 12.4, in particular, proposes to achieve environmentally sound management of chemicals and wastes, reducing their release into the air, water and soil (UN, 2025).

2 EXCESSIVE USE OF ANTIMICROBIALS IN AGRICULTURE AND ITS CONSEQUENCES

Modern agriculture, in the quest to maximize productivity and meet the growing demand for food security, has established itself as one of the main consumers of antimicrobials on a global scale (Van Boeckel *et al.*, 2015). This scenario is especially intensified in developing countries, where the increase in demand for animal protein

encourages intensive farming practices and the indiscriminate use of drugs that are often associated with the presence of antibiotic residues in animal products (Manyi-Loh *et al.*, 2018). It is estimated that more than 70% of the antibiotics consumed worldwide are destined for animal production, being used not only for therapeutic purposes, but predominantly as growth promoters and for infection prevention (Boeckel *et al.*, 2017). This widespread use has generated serious health and environmental implications, by favoring the selection and dissemination of resistant microorganisms in the environment (Tiseo *et al.*, 2020).

Different classes of antimicrobials widely used in agriculture, on a global scale, have aroused growing scientific concern due to their potential adverse effects and the complexity of risk management steps. Among these classes, tetracyclines, aminoglycosides, beta-lactams, lincosamides, macrolides, pleuromutilins and sulfonamides stand out (Baynes *et al.*, 2016; Finley *et al.*, 2013). These drugs share similar mechanisms of action or belong to the same therapeutic classes as antibiotics used in antibiotic therapy in humans, making their use, judicious in livestock, essential, given the possibility of transfer of resistant microorganisms between animals and humans (Gelband *et al.*, 2015).

The continuous use of antimicrobials in livestock, often in subtherapeutic doses, exerts constant selective pressure on the microbiota of these animals, favoring the selection and proliferation of resistant cells (Gelband *et al.*, 2015). These microorganisms can be transmitted to humans by different routes, either through the consumption of contaminated food or derivatives, or through direct contact with animals or by exposure to contaminated environments. In addition, antibiotic residues are commonly detected in animal waste, widely used as organic fertilizers, a practice that contributes to soil and water contamination (Manyi-Loh *et al.*, 2018).

From a broader perspective, the intensive and sometimes indiscriminate use of antimicrobials in animal production directly undermines the principles established by SDG 12, which seeks to promote sustainable production and consumption patterns. Item 12.4 proposed as a goal the significant reduction in the release of hazardous chemicals and waste into the environment by the year 2020. However, even after the deadline has passed, many countries still lack effective public policies to regulate the use of antimicrobials in livestock, as well as robust environmental surveillance systems aimed at monitoring microbial resistance (Van Boeckel *et al.*, 2015).

The inefficiency in the management of livestock waste containing antimicrobials constitutes a direct violation of the principles of environmentally safe management, as

recommended in item 12.4 of SDG 12. When disposed of without proper treatment, these residues contribute to the transformation of agricultural soils and water bodies into reservoirs of resistance genes, forming the so-called environmental resistomes. These genes can be transferred horizontally between different microorganisms, including human pathogens, through mechanisms such as conjugation, transduction, and transformation, significantly exacerbating the global antimicrobial resistance crisis (Pal *et al.*, 2016).

In addition, the global scenario of antimicrobial resistance is aggravated by the absence of standardized and uniform regulations among countries. While European Union nations have adopted, since the early 2000s, strict restrictions on the use of antibiotics as growth promoters in livestock (Schmerold *et al.*, 2023). On the other hand, many developing regions still make indiscriminate use of antimicrobials, as classes considered critical by the World Health Organization (WHO) in human therapeutics (Adebowale *et al.*, 2016; Moyane *et al.*, 2013). Consumption in these contexts is often driven by abusive practices, such as the acquisition of antimicrobials without a medical prescription, facilitated by unregulated supply chains and over-the-counter sales in commercial establishments (Ayukekbong *et al.*, 2017). This normative disparity favors the emergence of critical points of microbial resistance, whose impacts go beyond geographical boundaries through international food trade, the movement of live animals, and the global flow of travelers (Maron *et al.*, 2013).

Global projections reinforce the seriousness of this scenario: Van Boeckel *et al.* (2015) estimated that the consumption of antibiotics in the BRICS countries should practically double in the coming years. This increase is associated with the intensification of large-scale animal production systems, which require the routine use of antimicrobials to ensure productivity and prevent diseases, in response to growing consumer demand for animal products. Antimicrobial resistance, therefore, constitutes an inevitable and cumulative side effect of the excessive and abusive use of these drugs (Williams-Nguyen *et al.*, 2016).

The critical analysis of this scenario shows a worrying mismatch between scientific advances in the understanding of microbial resistance mechanisms and the effective implementation of public policies aimed at mitigating them. While antimicrobial resistance is essentially a natural phenomenon, its acceleration by unsustainable human practices poses a growing threat to global public health (You; Silbergeld, 2014). Industrial agriculture, when devoid of regulations based on sustainability, acts as a silent but persistent vector in the spread of resistance genes (Schmerold *et al.*, 2023).

In this context, it is urgent that countries adopt stricter control measures on the use of antimicrobials in animal production, promote investment in sustainable alternatives, such as vaccines, probiotics, and good sanitary management practices. Additionally, it strengthens environmental surveillance systems (Salam *et al.*, 2023). Incorporating these strategies into the SDG 12.4 agenda is essential to curb the advance of microbial resistance and ensure that antimicrobial efficacy is preserved for future generations.

3 HOSPITAL AND PHARMACEUTICAL WASTE: FROM CURE TO ENVIRONMENTAL CONTAMINATION

Investments in health on a global scale have reached unprecedented levels and continue to grow annually. In 2017, health spending was estimated at approximately US\$ 7.8 trillion, corresponding to about 10% of the world's GDP (Kenny; Priyadarshini, 2021). Health care, a rapidly expanding industry driven by therapeutic advances and the growth in cases of chronic diseases, is responsible for generating a significant amount of waste. This scenario has intensified the demand for efficient waste management (Abosse *et al.*, 2024).

Hospitals, laboratories, medical centers, veterinary clinics, research institutions, morgues, blood banks, and nursing homes are among the main culprits for the generation of healthcare waste (Janik-Karpinska *et al.*, 2023). This waste from health services can be classified into two distinct categories. The first fraction is similar to household waste, composed of materials such as paper, cardboard packaging, glass, food scraps and inert substances. The second fraction, of a hazardous nature, is made up of toxic, harmful, potentially carcinogenic elements and agents at risk of infection (Assemu *et al.*, 2020).

The technologies currently used in the treatment and final disposal of health service waste (HSW) can be grouped, in general, into three major classes: thermal processes, chemical processes and irradiation-based methods. In addition to these approaches, complementary methods are also used, such as disposal in landfills, safe reuse after reprocessing procedures, and recycling of materials (Kenny; Priyadarshini, 2021).

Incineration is widely adopted as the preferred technique for the disposal of waste from health services, since it enables a rapid and significant reduction in the residual volume, which can reach up to 90%. However, in the absence of appropriate technologies, this method can pose environmental and human health risks, especially due to the release of air pollutants and the formation of toxic byproducts (Chistholm *et al.*, 2021). Only modern incinerators, with emission control and operating at high temperatures (850-1100 °C), meet international

standards for dioxins and furans. Alternative methods, such as autoclaves, microwaves, and steam treatment with internal mixing, should be considered in places with adequate resources, as they reduce the release of pollutants (WHO, 2024).

The disposal of waste from health services in landfills is also widely used, and can cause relevant environmental impacts, especially the contamination of water resources as a result of leaching (Lee; Lee, 2022). Prior decontamination of chemical and pharmaceutical waste is essential before its final destination in landfills (Chi *et al.*, 2020).

The inadequate management of pharmaceutical waste represents a challenge, especially due to the lack of adequate guidance to the population on the correct ways of disposal. As a consequence, it is common for expired or unused medicines to be discarded in household garbage or flushed down toilets, which contributes to the presence of these compounds in landfills, water systems, and sewage networks, promoting environmental contamination (Endale; Mathewos; Abdeta, 2023). Residues in subinhibitory concentrations, from expired or degraded drugs, favor the adaptation of environmental microorganisms, stimulating the development of antimicrobial resistance mechanisms (Stanton *et al.*, 2020).

In this context, the continuous application of manure and organic waste as fertilizers can lead to the absorption of antibiotics by plants. This is due to soil contamination, the use of polluted water in irrigation, or the use of untreated manure. This practice represents a potential pathway of human exposure to subtherapeutic amounts of antimicrobials through the food chain (Zalewska *et al.*, 2021). This cycle, which results in environmental contamination, leads to an increase in microbial resistance, posing a serious risk to human health, in an era where antibiotics are less developed and infections become increasingly serious and pose a real threat.

According to WHO (1997), engineered landfills are the safest and most environmentally appropriate alternative, as long as the waste is previously subjected to immobilization processes, such as encapsulation or inerting, ensuring the containment of contaminants. Controlled landfills, in turn, are considered acceptable only on a transitional basis, and should also receive only immobilized waste. Uncontrolled landfills, on the other hand, because they pose significant risks to public health and the environment, are strongly discouraged. Its use is exceptional and restricted to emergency contexts, as long as the waste is properly encapsulated and there is a record of the site for future remediation.

Therefore, the reduction in the generation of waste from health services should be treated as a priority, as it considerably reduces the demand for treatment and final disposal.

Effective strategies include sustainable procurement of inputs, preference for products with eco-friendly packaging, use of reusable items whenever possible, rationalization of the purchase of medicines according to actual demand, and the adoption of recycling practices (WHO, 1997).

In summary, the management of waste from health services represents a growing challenge, especially in view of the increase in production and the complexity of discarded materials. The adoption of appropriate technologies, combined with the education of the population and the implementation of effective public policies, is essential to mitigate environmental impacts and protect public health. Sustainability in the health sector depends, therefore, on integrated actions based on scientific evidence.

4 INDUSTRIES AND ENVIRONMENTAL POLLUTION: WHEN PRODUCTION FUELS THE PROBLEM

One of the most notable threats to global public health is characterized by microbial resistance, causing a series of repercussions that are not limited to medicine, but include socio-environmental and economic aspects. Although there is recognition of the indiscriminate use of antibiotics as a determining factor, the responsibility of the industry in this process cannot be disregarded. Specifically considering the role of the agricultural and pharmaceutical industry in the dumping of antimicrobial residues into the environment, its role as an expressive vehicle in the dispersion of resistance can be seen (Larsson, 2014; Silva *et al.*, 2020). In light of target 12.4 of SDG 12, it is necessary to debate how the industry feeds this problem.

Manufacturing effluents, especially from pharmaceutical plants, have high concentrations of active ingredients that are not completely removed by conventional sewage treatment methods (Larsson, 2014; Rizzo *et al.*, 2013). This results in environmental contamination and may benefit the selection and dissemination of antimicrobial-resistant bacteria, which in turn can transfer their genes to other species through transformation and conjugation mechanisms (Rizzo *et al.*, 2013). Some antibiotics, such as ciprofloxacin, have been detected in high concentrations in industrial wastewater (Larsson, 2014). In addition, the improper disposal of industrial solid waste acts as reservoirs for microorganisms, which increases the risks of contamination of soils and groundwater (Souza *et al.*, 2018).

Therefore, resolutions to combat microbial resistance must consider its multifactoriality, considering the relationship of several stages of the production system,

application, and commercialization of antimicrobials, with consequences for the different industrial and economic sectors (Silva *et al.*, 2020). From production, distribution, and final consumption, each link in this web can cooperate to select and disperse resistant microorganisms. In this context, it is of paramount importance to use approaches encompassing competent public policies, thorough regulation, instruction of health professionals and other sectors such as agriculture. In addition, the need to encourage research, update therapeutic alternatives and sustainable conducts is highlighted (Anvisa, 2017).

The impacts generated by the industries are not limited to the production and disposal of drugs. With regard to the food industry, there are several ways to ensure greater safety and quality of products, despite this, outbreaks of foodborne diseases continue to affect populations worldwide, resulting in high health costs (Damião *et al.*, 2023). In this context, bacterial resistance to disinfectants used in the food industries stands out. Since the intensive and often inappropriate use of these compounds can select resistant microorganisms, able to resist hygiene processes (Langsrud *et al.*, 2003). Among the substances authorized to compose sanitizing products with antimicrobial functions, some belong to the class of phenolics, aldehydes, inorganic chlorine-releasing agents and quaternary ammonium. Subinhibitory concentrations of these biocides, in addition to contributing to the development of resistance, can also lead to cross-resistance to antibiotics (Santos; Goals, 2021).

In addition, cross-contamination stands out as a critical factor in food industries, since it is constantly related to the formation of biofilms by pathogenic microorganisms such as *Salmonella enteritidis*. These biofilms, which form easily on porous or hard-to-clean surfaces, such as wood and certain plastics, give high resistance to disinfectants commonly used in industrial routines. These microbial structures can resist, functioning as a reservoir of pathogens and favoring the transfer to ready-to-eat products (Carrascosa *et al.*, 2021).

From this perspective, resistance to disinfectants in the food industry is related to environmental pollution, since, if not properly treated before disposal, the waste generated during sanitization processes can reach soils, rivers, and sewage systems, affecting the natural microbiota of aquatic and terrestrial ecosystems, promoting the environmental dissemination of resistance genes. This context highlights the need for effective hygiene strategies, combined with the correct selection of materials in contact with food and the continuous training of handlers, as part of good manufacturing practices.

The agricultural industry also contributes significantly to this scenario. The use of antimicrobials as animal growth promoters generates waste that, when released into the environment without adequate treatment, exerts selective pressure on natural microbial communities (Silva *et al.*, 2020; Silva *et al.*, 2025). This aspect plays a relevant role in the emerging public health crisis, especially in antibiotic resistance. Although most of the use of antibiotics is carried out in agricultural systems, it is noteworthy that their use in livestock deserves significant attention as it contributes to the general issue of antibiotic resistance (Landers *et al.*, 2012).

Given this scenario, it is understandable that the absence of strict regulations in developing countries makes the situation even more aggravating. Many industries are installed in regions with poor environmental inspection, taking advantage of gaps in local legislation to operate with disposal standards below the recommended (Laxminarayan *et al.*, 2013; Silva *et al.*, 2020).

Therefore, it is of paramount importance to rethink industrial production models. It is necessary to search for alternative ways that minimize the impacts generated during these processes. In this context, clean technologies, such as bioremediation and advanced effluent treatment systems, should be encouraged through public policies and subsidies (Bengtsson-palme; Kristiansson; Larsson, 2018; Larsson, 2014). In addition, it is necessary to strengthen environmental surveillance and demand transparency from industries regarding the composition of their waste. International cooperation is also crucial, especially in the sharing of technologies and the agreement of regulatory standards (Larsson, 2014; Laxminarayan *et al.*, 2013).

5 SOCIAL AND ECONOMIC IMPACTS OF MICROBIAL RESISTANCE ASSOCIATED WITH HUMAN ACTIVITY

The accelerated urban growth has evidenced the absence of planning and infrastructure capable of keeping up with population expansion. Among the consequences, the increase in the generation of Urban Solid Waste (MSW) stands out, whose management is often neglected or treated as of minor importance. Despite representing a growing public health problem on a global scale, these difficulties are particularly pronounced in low- and middle-income countries, such as Latin America (Corrêa *et al.*, 2022).

In Brazil, the management of MSW is now regulated by Law No. 12,305/2010, which establishes the National Solid Waste Policy (PNRS), covering the political, economic,

environmental, cultural and social spheres. However, its effectiveness is still far from being achieved. (Brazil, 2010)

Capitalism, as the dominant economic model, encourages unbridled consumerism, generating mountains of MSW and impacting the ecosystem. The *International Solid Waste Association* (ISWA, 2022) estimates that waste generation will increase worldwide, reaching 3.4 billion tons in 2050. This expansion will be especially seen in low-income countries, where generation is expected to triple. The management of USW in small cities is also insufficient, since municipal leaders point out difficulties in keeping waste away from the urban area, which contributes to the emergence of environmental and public health problems (Silva; Zanchi; Lopes, 2023).

The negative impacts of MSW extend to many aspects in terms of environmental impact. Among the consequences are the advance of AMR, aggravated by the excessive or inappropriate use of antibiotics, as well as climate change and problems related to hygiene and basic sanitation (Brasil, 2025). In addition, AMR is one of the greatest public health challenges today, being considered one of the ten leading causes of death in the world. It is estimated that by 2030, global GDP could lose US\$ 3.4 trillion per year due to AMR, and 24 million people could be pushed into extreme poverty by 2050. With the growing increase in resistance, treatments become more expensive, with longer duration and less availability (Brasil, 2025).

With the increase in environmental imbalance caused by garbage, it becomes an environment conducive to the development of pathogenic microorganisms. Mphasa *et al.* (2024) evidenced the presence of pathogenic microorganisms in organic materials, fabrics, and plastics recovered from waste piles, increasing the risk of human exposure.

The systems for the treatment and disposal of MSW considered less harmful to the environment demonstrate positive results, both in the recovery of secondary matter for reuse and in the generation of economic return. In addition, they contribute to reducing the volume of garbage discarded in nature. Among the technologies used in the treatment and final disposal of MSW, landfills, systems for collecting and using or burning biogas, as well as drainage and leachate treatment, in addition to continuous environmental monitoring (Abrema, 2023), stand out.

Despite these advances, it is still common to use inappropriate places, such as dumps, controlled landfills, ditches, dumps and similar areas, unsuitable for the ecosystem and its resources. According to ISWA (2022), the precariousness in the proper disposal of waste is

largely due to the low coverage of collection, as well as the absence of appropriate disposal for all waste, pollution caused by irregular disposal, open fires, formation of dumps, and the presence of hazardous substances. In addition, the lack of funding and resources for the theme, as well as the low demand for secondary raw materials, also contribute significantly to the obstacles faced.

6 FINAL CONSIDERATIONS

Microbial resistance is a silent crisis that grows every year, driven by the inappropriate use of antimicrobials in medicine, agriculture, and industry. Incorrect waste disposal, environmental contamination, and lack of enforcement contribute to the spread of resistance genes in different ecosystems. This scenario compromises the effectiveness of treatments and threatens global health, requiring urgent and coordinated responses across sectors. The "One Health" approach is essential to understanding the connections between human, animal and environmental health. In addition, sustainable consumption and production must be prioritized as a way to contain this advance. Microbial resistance is not just a technical problem, but an ethical and structural challenge.

In this context, target 12.4 of SDG 12 highlights the fundamental axis to promote the environmentally safe management of chemicals and waste. For this to happen, it is necessary to strengthen health and environmental surveillance, regulate the use of antimicrobials, invest in clean technologies, and encourage sustainable practices in all sectors involved. Reducing microbial resistance depends on education, research, political commitment, and long-term integrated actions. Without these measures, there is a risk of significant setbacks in modern medicine. Therefore, preserving the efficacy of antimicrobials is a collective responsibility that must be addressed as a global priority.

ABSTRACT

This article aims to present a theoretical debate about the approach, from a historical point of view, to the peripheral spaces of a city that, throughout its four centuries, has been marked by a history of valuing its founding nucleus, the “Praia Grande” neighborhood. Throughout the 20th century, books, magazines, guides, albums and audiovisual productions sought to reproduce representations of the city through its historic center. In order to overcome this limitation, through the contributions of Certeau, Bresciani, Bodei and Reis, we sought to develop an itinerary in which we considered all the social actors involved in the construction of urban trajectory, through the convergence of relations between objects and the links between the public and the private are essential for reading everyday life in urban space.

Keywords: City. Territory. Periphery.

RESUMO

Esse artigo busca apresentar um debate teórico acerca da abordagem, sob o ponto de vista histórico, dos espaços periféricos de uma cidade que, ao longo de seus 4 séculos, é marcada por uma trajetória de valorização de seu núcleo fundacional, o bairro da “Praia Grande”. Ao longo do século XX, livros, revistas, guias, álbuns e produções audiovisuais buscaram reproduzir as representações da cidade por meio de seu centro histórico. A fim de superar essa limitação, por meio das contribuições de Certeau, Bresciani, Bodei e Reis, buscamos elaborar um itinerário no qual se considerou todos os atores sociais envolvidos na construção da trajetória urbana, por meio da convergência das relações entre objetos e os vínculos entre o público e o privado são essenciais para a leitura da vida cotidiana no espaço urbano.

Palavras-chave: Cidade. Território. Periferia.

RESUMEN

Este artículo propone un debate teórico sobre el enfoque histórico de los espacios periféricos de una ciudad que, a lo largo de sus cuatro siglos, se ha caracterizado por una trayectoria de valoración de su núcleo fundacional, el barrio de Praia Grande. Durante el siglo XX, libros, revistas, guías, álbumes y producciones audiovisuales buscaron reproducir representaciones de la ciudad a través de su centro histórico. Para superar esta limitación, y basándonos en las contribuciones de Certeau, Bresciani, Bodei y Reis, desarrollamos un itinerario que considera a todos los actores sociales involucrados en la construcción de la

trayectoria urbana, mediante la convergencia de relaciones entre objetos y los vínculos entre lo público y lo privado, esenciales para comprender la vida cotidiana en el espacio urbano.

Palabras clave: Ciudad. Territorio. Periferia.

1 INTRODUCTION

The urban history of the four-hundred-year-old São Luís (MA) is marked, from the seventeenth century to the twentieth century, by the valorization of its foundational nucleus, whose urban elaboration is attributed to the chief engineer Francisco Frias de Mesquita, at the beginning of the seventeenth century. including from the point of view of the urban organization of towns and cities (Macêdo, 2014). This legislation was in force in Brazil between the seventeenth and nineteenth centuries. The territory known as Praia Grande³, had its layout defined according to the interest of meeting the demands of export farming, through its port; in the background, to meet the need to create means of permanence of a nascent local elite – although, this group was closely linked to Lisbon, and, later, to Paris and the Court, in Rio de Janeiro.

Throughout the eighteenth and nineteenth centuries the city was characterized by being a trading post, a link between the large plantation of sugar cane and cotton (produced in the valleys of Itapecuru and Pindaré) and national and sometimes international trade. With the income from this trade, the city expanded and became a space for the experience of its elite, through the knowledge and practices of this group, and a supposed humanistic and civilizational vocation of this city – despite the non-humanistic slavery. According to Costa (2016), the local elite sought to create a tradition of distinction and uniqueness, based on the epithet of the Brazilian Athens – a stronghold of poets, intellectuals and figures of political expression. The focus of this text, however, is not to delve into the reasons for its creation, nor the uses and disuses of the concept of Athens. We are interested in the association of this concept with space, its streets, its stone and lime houses, seen as an archetype of a civilized and progressive city.

The arrival of the republican regime did not represent ruptures, since the interpretations of the city still revolved around the valorization of the icons of a supposed "civilization". The second half of the twentieth century, still tributary from this perspective, sought to value, in various aspects, the elitist tradition of the city. Books, magazines, guides, albums and audiovisual productions⁴, to a greater or lesser extent, reproduced this

³ Consisting of about 3.5 thousand buildings, it occupies an area of approximately 250 hectares. It was approved by the National Institute of Historical and Artistic Heritage, IPHAN, in 1974. Cf. SELBACH, 2009, p. 23.

⁴ From the second half of the twentieth century, the editorial production on the city of São Luís – and its 'historic' center was amplified, especially with the listing of the city by the Institute of National Historical and Artistic Heritage, IPHAN, in 1974. In view of this, events emerged that sought to value this space and several materials were produced for this purpose, such as tourist and sentimental guides, photo albums, postcards and newsreels, which met the interests of valuing these spaces with great success.

perspective, through metonyms that saw the totality of the city, being represented – according to a political project – by its old center, whose definition was "the most beautiful and complete architectural ensemble of colonial Brazil". And to the peripheries... what remained was silence and the unsaid!

In view of the many zones of opacities of the unsaid, it is therefore up to the historians of the city, according to the contributions of Maria Stella Bresciani (2002), to elaborate historical paths on the political and philosophical ideas that guided the construction and interventions in urban spaces, in order to understand the multiple dynamics of the city.

2 WHAT DEFINES A CITY?

What is a city? Until the moment when the question is asked of us, we usually define it in the most varied ways without, however, having greater precision in its meanings. Because it is an imprecise concept and used by almost all human beings, we tend not to problematize it and ignore the multiple nuances involved in its conceptualization. The Michaelis dictionary defines city in the following ways: a) an agglomeration of people in a geographical area, in which social, economic, industrial, commercial, cultural, administrative and political activities are developed; b) a group of inhabitants of the same geographical area; c) a shopping center; d) the oldest or most central location of a given urban agglomeration; e) municipal headquarters, where administrative activities are concentrated; f) hectic, dynamic life.

We are interested in scrutinizing items *a* and *d*, whose definitions converge with most definitions of the *latu sensu* type of city. From the economic and social point of view, the first definition is associated with a human agglomeration, in which social, economic, industrial, commercial, cultural and administrative activities are developed; Such a concept is tempting, due to its approximation with the image of European cities, originating from the urban and commercial revolution, at the beginning of the second millennium of the Christian era. However, the cities of the new world, which emerged from the sixteenth and seventeenth centuries onwards, followed a different trajectory and followed European aspects and indigenous elements, as well as enslaved groups, brought to America. Due to this trajectory of centuries, of our urban agglomerations, a definition that takes into account only aspects of their European ancestry is quite limited.

Item *d*) refers us to the historical dimension, which demarcates the spaces of political and social valorization. With the broad use of this concept, São Luís is transformed into a

"historic city", whose definition aimed, according to Rossini Corrêa (1993), to preserve the historical aspect and tradition, through the uses and disuses of the myth of Athens, by an intellectual elite and linked to agro-export and its architectural and urban complex, arising from this context.

Michel de Certeau (2003) points out that the city serves interests, sometimes unconfessable, that fulfill the role of conforming everyone, in an urban model, in which the clash of perspectives, looks and fragments, end up converging in the same physical space, marked by tensions and clashes, concealed in the traditional definitions of city. In the face of these not always peaceful convergences, what Certeau called "stubbornness and insistent traditions" are diluted in countless elements – always alive and present in the urban space, marked by intense transformations.

These "stubbornness", which certain groups make use of, here and there, clash with the modern norms of urbanism (new public environment) represent the synthesis of the various values that converge in the city. These questions were addressed by Pierre Nora (1993), who called them the "problematic of places", in which history, with its universalist perspective and at the same time, vocalizing the interests of those who write it – and govern it – confront the memory of those who live and make the city. Memory is always lived and woven by living groups; it is in permanent evolution and open to the dialectic of remembrance and oblivion; unaware of its successive deformations – or stubbornness – are unconscious. In view of this, the study of cities and their compartmentalizations (explicit and implicit) is marked by ambiguity, located at the crossroads, between the material, symbolic and functional dimensions, in which the most diverse relationships woven in space are anchored, condensed and expressed, especially in moments of transformation and imposition of new ways of living, live and move around the city.

This imposition of ways and ideas of the city is related to a certain "curiosity for the places where memory crystallizes" (Nora, 1993, p. 1) voiced by a group of interpreters of the city – journalists, writers, intellectuals, who recommended to their readers, through poetic, tourist and sentimental guides⁵, the correct ways to walk through the city. On the other hand, these same albums, guides and texts neglected the peripheries, which should be avoided

⁵ These editorial, artistic and imagery productions, whose target audience was the local elite, fulfilled the function of creating and fixing the traditional images of the historic city. Among them, we can mention the productions of Gaudêncio Cunha, the photos of the Teixeira Typography, through the albums of 1923 and the one produced by the journalist Miécio Jorge, in 1950 to the tourist guides of Astolfo Serra (1963), Domingos Vieira Filho (1975) and Jomar Moraes (1989). The newsreels produced by the National Agency, in addition to the Amaral Netto program, recorded on the streets of São Luís, in 1978.

and seen as the space of alterity, confrontation, the unsaid and the contestation – sometimes unpleasant – of the positions contained in the narratives of the official/traditional/sentimental urban space.

The narratives of the official/traditional urban space of São Luís, throughout the twentieth century, were widely defended by journalistic and literary texts, iconographic productions, in which the urban space and its houses of stone and lime were the central topic. Almost all of these editorial, artistic and imagery productions sought to recreate a very delimited urban space of São Luís, confirmed to a tiny portion of the city: the neighborhood of Praia Grande (also called the Historic Center, whose *historical name* suggests a possible "absence" of history from the other regions. To the other regions, neighborhoods and, more recently, to the invasions, there was invisibility – or insistent stubbornness.

In view of these, it is necessary that other historical truths, as observed by José Carlos Reis (2005) be laid bare, in addition to those related to the city of stone and lime and tradition. And what would be the "truths" from the urban point of view, which would be reproduced by the writing of the city's history? And what interests did this writing serve and serve? Our proposal is precisely to raise questions related to the city, its history and the political uses of its urban trajectory. This is our "principle of choice", according to Reis, in dealing with the issue of the city and its multiple territories. And, for this, it is necessary to make a new writing of the history of the periphery – and of its subjects and spaces made invisible by traditional narratives. It is up to this new writing to interpret the city having as one of its premises, which alerted Reis and his "understanding that historical knowledge is a "reflection", a "meditation" on human living in time" (2005, p. 336) – and in the city.

3 THE MEANINGS OF THE URBAN HISTORY OF SÃO LUÍS

The text by the Italian historian Remo Bodei (2002) presents us with a fundamental question for historiographical making: "what is the meaning of history?" And he goes on to question: "what are the assumptions that anchor the explanatory intention of history?" With regard to urban history – the focus of this text: what are the meanings, uses and interpretations that our writing confers to the city? It is up to the new approaches to urban history to explain the trajectory of the city, focusing on the peripheries – and, of course, their relations with the center, with the poles that induce the city's norms. The most appropriate itinerary for this purpose lies in accessing the memories contained in its spaces of sociability, since "it is in the city that history is exhibited, it is in it that history is built, in the space and in

the public building; in these spaces, possibilities of action are established by the collective presence of social actors" (Bresciani, 2003, p 30).

Urban history, since its advent in the nineteenth century, is an interdisciplinary field, where dialogue with various other types of knowledge contributed to its development. With regard to the craft of historians, it is up to us, according to the observation of Maria Stella Bresciani (2002), to elaborate historical paths on the political and philosophical ideas that guided the construction and interventions in urban spaces, in order to understand the multiple dynamics of the city, from a historiographical point of view. In this regard, Luís Octávio da Silva (2002) observes that "relevant contributions have emerged, in which the urban appears as an element of historical interpretation" (Silva, 2002, p. 76) on the role of cities in capitalist development, for example.

According to Bernardo Secchi (2009) "the history of the twentieth century is rich in pre-established bifurcations, abandoned paths and unforeseen ruptures. Urban studies go further, by considering that a street, an avenue, a square, a building are not able, by themselves, to induce profound changes in the urban space; Only the interaction of these spaces, with human dynamics, with their struggles and tensions, can promote more complex and instigating historical processes.

The city, in this way, fulfills the function of catalyst of the memories contained in its spaces of sociability, streets, monuments; in the relationships of its actors, in which ample possibilities are established. The city, according to Secchi (2009), is always the result of a process with multiple variants. And the product of this equation cannot be attributed to just one thing, be it state induction or the ways in which communities react to these phenomena.

Reflection on the fragments of the past is fundamental. Cultural and popular history – that is, with the popular strata as an object – has as its motto to abolish urban restrictions or ethnocentrisms and stigmas between the popular regions of the city, based on the analysis of the relations of power and domination and/or negotiation between popular culture and the dominant culture, from the prism of the occupation and uses of urban space. Popular history, a theme raised by Chartier (2007) has the potential to scrutinize elements submerged in the sea of official history. Without neglecting or abolishing traditional subjects and approaches – useful to the extent that it is necessary to establish relations, many comparative, between the center and the periphery – it is necessary to overcome possible ethnocentrist or reductionist approaches to the urban question, based on the treatment of the cultures of the periphery, as a coherent set of symbolic systems, which is ordered according to a logic implicitly

imposed by the centers of cultural and political power. This itinerary has the tools to address the relations of domination and the intense inequalities of the social world, through the intricate process of tensions, in respect to the dominate culture.

From these relationships, it is possible to unravel the thread of the urban history of São Luís and its popular neighborhoods - areas seen as "non-historical". The many transformations of the urban fabric, designed and applied in the late 1960s, intended to create an urban model, in which the elite, with their political projects, made use of a set of instruments to standardize a new space; Such norms had as their goal, the conformation of the subjects, victims of the displacements, of the removals that would form the new neighborhoods, giving them a certain degree of participation in the "progress", in this city in constant evolution, even if in a subordinate way.

The understanding that progress had the properties of solving social problems was prevalent throughout the 1960s and 1970s. At that time, Maranhão and its capital – which was the epicenter of this process – experienced what would come to be called the "Maranhão miracle", that is, the culmination of a set of actions to modernize the institutions – whose one of the focuses was the urban planning of São Luís. One of the strongest imagetic representations of this period was presented in the newsreel "The Miracle of Maranhão", directed by Romanian filmmaker Isaac Rosenberg⁶. The images, as they reinforced the epithet of historic city, sought to link São Luís to the signs of modernity – the bridge, the port, the dam, electricity – they could transform the urban space into a land of progress. Although the city is represented in an avant-garde way, the unspoken become evident, due to the silencing of a real city. In his first few seconds, the announcer says: "... and the miracle happened... machines have arrived to accelerate progress; a young team, led by young people, came to provide better days for the people of Maranhão" (O Milagre do Maranhão, 1970).

In this context of forced modernization, the city, in the process of recreation by the elite, represents the difficulty of "aging" and the preservation of its pasts. These new spaces, due to their iconoclastic nature, have a conflicting relationship with the past, in which the "old" has its space symbolically delimited. It is up to historical knowledge to scrutinize the interests at stake about the construction of the urban history of the city. The basic text "The invention

⁶ The newsreel "The Miracle of Maranhão" (1970) was directed by the Romanian filmmaker, based in Brazil since the 1930s, Isaac Rosenberg. The short film is part of the series "Coisas do Brasil", whose intention was to exalt the achievements of the military governments and the achievements of the José Sarney government (1966-1970).

of everyday life" by Michel de Certeau, indicates that historical knowledge has the complex task of summoning the past, through the study of urban practices and has as its starting point, two perspectives: a) one that privileges the analysis and observation of the physical elements of the city – its urban design, its architecture, its topography, flow of displacements – seen as material and administrative impositions in the territory, that is, in the periphery; b) the second perspective focuses on a socio-ethnographic analytical model of everyday life. These two perspectives, if worked in a watertight way and not associated, can cause confusion in the analysis of the urban process. On the one hand, there is the constant lamentation of the infrastructural limitations in the urban environment studied and, on the other hand, there is the disproportionate emphasis on the dimensions of everyday relationships, displaced from the larger structures that impose their existence.

In order to solve this dilemma, Certeau (2002) suggests that the method to be chosen should be the convergence between points of view, which contribute to the delimitation of the relations between objects and their links, between the private and public; "this is one of the conditions of possibility of daily life in the urban space, which decisively shapes the notion of neighborhood" (Certeau, 2002, p. 38).

The process of unfinished urbanization that Brazil has gone through – especially in its less dynamic regions – has been slower. "Without the possibility of contestation, this process is the engine of transformations in society" (Lefebvre, 2013, p. 54) where its effects, whether reduced or maximized, have led to a series of influences – economic, social, cultural – with which the most varied people have to live with these influences, adapt. Such adaptation to the urban and modern space, often mediated by violence, marked the experience of many subjects, especially São Luís in the 1960s and 70s. This process produced a series of memories, collective and/or individual, which, according to Roger Chartier (2007), confer a more powerful presence to the past than that established in history books.

An urban phenomenon – imposed from outside – is strongly influenced by the characteristics of the place in which it unfolds. The construction of a dam, for example, has limited influences on the transport and movement of people; But when it becomes a sign of progress and a link between the new and old city, the population configures this space, through political and symbolic purposes, whose meanings attributed by the population go beyond its merely utilitarian sense. For Milton Santos (1993), the intensification of this phenomenon occurred in the wake of the military coup of 1964, which created the conditions for a rapid integration of the country, into an internationalization movement that appeared to

be irresistible (Santos, 1993, p. 36).

During the 1970s, the capitalist system sought to constitute and expand "circuits of exchange, networks that allow transfers" (Lefebvre, 2013, p. 57) not only of money, but of equipment, people and knowledge and, above all, symbolic capital that would legitimize the urban transformations, planned in cities such as São Luís, which in the 1970s, with its 350 years, was already experiencing the effects of unequal and excluding urban growth. These actions sought to encourage economic development – even if exclusionary and aimed at serving a rapidly expanding consumer market. This technocratic and authoritarian growth model produced, even if in a limited and incomplete way, results, especially with the increase of a middle class, rocked by the maintenance of economic growth, between the 1960s and 1970s. On the other hand, this same model "maintained large population contingents, without access to basic social and civil rights, such as labor legislation, social security, housing, and sanitation" (Maricato, 2013, p. 21).

Avant-garde urban interventions, whose mission is to transform aspects of the city – such as the bridge, the highway, the port, the working-class neighborhood, contribute to the construction of what Michel de Certeau (2003) in the text "The Invention of Everyday Life: Arts of Making" called the "utopian city". This avant-garde space, of clashes between memory and the future, is crossed, from the urbanist point of view, by three elements, such as: the production of its own space; the establishment of a "no time" to replace and undermine the resistance and stubbornness arising from traditions; and finally, the attempt to create an anonymous "universal subject" integrated into the city, albeit in a peripheral way. Such elements marked, to a lesser or greater extent, the process of urban modernization, which São Luís went through, and especially the village of Anjo da Guarda, as a model "working-class neighborhood".

Disorganized urban expansion and the struggle for public services in peripheral areas marked this period. This was a time of changes in local governance, which influenced modern São Luís. In this way, the urban transformations of the city obey a history, organized by the political forces that control it and make the urban space meet their interests. On this point, the French sociologist Henri Lefebvre mentioned that "the city is the work of a history, that is, of well-defined people and groups that carry out this work in historical conditions" (Lefebvre, 2013, p. 13). According to Flávio Villaça (2001), a large part of the low-income strata began to occupy geographic regions stigmatized by the strata with higher purchasing power. The phenomenon of spontaneous occupation, generically called "invasions", provided the

formation of an infinity of communities in the interior of the island.

The path traced by the city – outlined by its leading forces – is part of a historical tradition, where the right to the city was neglected, in favor of a sanitized city that sought to make poverty invisible. During the nineteenth century, in the absence of a territorially extensive city, a large part of the population – especially enslaved individuals, was imposed a series of legal regulations, which hindered their citizenship status. With the decline of slavery (but not poverty) inflicted on the "brown" majority of the city, the curtailment of the right to the city became the rule, through codes of posture and police determinations, which considered the suburb as the habitat of these individuals, in a "tradition" originating in the nineteenth century.

4 FINAL CONSIDERATIONS

The urban history of São Luís is marked by the appreciation of the foundational nucleus, founded in the seventeenth century, whose neighborhood of Praia Grande was the greatest symbol of this space, which met the demands of export farming and housed the local elite. In the twentieth century, the reading of the city maintained its elitist tradition, without significant ruptures, in which the prevalence of historical interpretation and the identity of the city still linked it primarily to its foundational core – seen as the urban space that would represent the city as a whole.

From the 1960s and 1970s onwards, they were marked by the emergence of plans for the reformulation of the city, which had as a backdrop the integration of the city into national and international capitalist flows. It was up to the city leaders to lead this process of transformation and creation of various elements that are part of the city's structure, such as the Ring Road, the Embankment and the Bacanga Dam, in addition to the construction of popular houses via the BNH and the paving of the interior of the island. In the face of these impositions, the peripheral territories, inserted in a subordinate and limited way in the process of modernization of the city, produced a number of clashes, especially related to the right to the city and access to public services.

Urban history, from this point of view, is responsible for addressing more appropriately the meanings, uses and interpretations of societies – both those who control it and those who just live in it. However, as detailed above, it is up to the interpreters of urban history to focus on the broader dimensions of the city, especially the spatial, cultural and political relations, its disputes and tensions, especially the peripheries and their relations with the center. To

explain the trajectory of the city, it is essential to access the memories contained in its spaces of sociability, where history is exhibited and constructed, since the city, (Secchi, 2009), is the result of a process with multiple variants.

To this end, Michel de Certeau indicates that the task of summoning the urban past starts from two points; the first is related to the analysis and observation of the physical elements of the city – its urban design, its architecture, its topography, the flow of displacements – considered as material and administrative impositions on the territory, impossible to be neglected in the analysis of urban space; The second starting point focuses on the analysis of the daily life of communities. These points of view, if worked together, can contribute to the in-depth interpretation of the city.

Therefore, the city of the avant-garde, of the utopia of progress, of peripheral modernization and of urban transformation is a market for clashes between memory (tradition, stubbornness and insistence) and the future, seen as a space "not time" to replace and undermine traditions, whose ideal subject is seen as "universal" anonymous and integrated into the city, even if in a peripheral way – permeated by shocks and tensions. Such elements marked, to a lesser or greater extent, the process of urban modernization that São Luís went through, and especially the village of Anjo da Guarda, as a model "working-class neighborhood".

ABSTRACT

Accurate forecasting of active (P) and reactive (Q) power in electrical networks is fundamental to improving operational reliability and planning in modern power systems. This article proposes a forecasting model based on Long Short-Term Memory (LSTM) neural networks to estimate load demand in an IEEE 30-bus system. The model considers the active and reactive power supplied by the generators as input variables, while the power components of the loads are used as target variables for prediction. To improve performance, a Genetic Algorithm (GA) was used to optimize hyperparameters, which reduced the Mean Absolute Error (MAE) and increased the accuracy of the predictions. The results demonstrate that the proposed approach provides stable predictions of load behavior, highlighting its potential for application in smart grids and microgrid management systems.

RESUMO

A previsão precisa das potências ativas (P) e reativas (Q) em redes elétricas é fundamental para aprimorar a confiabilidade operacional e o planejamento nos sistemas de potência modernos. Este artigo propõe um modelo de previsão baseado em redes neurais do tipo Long Short-Term Memory (LSTM) para estimar a demanda de carga em um sistema IEEE de 30 barras. O modelo considera como variáveis de entrada as potências ativas e reativas fornecidas pelos geradores, enquanto os componentes de potência das cargas são utilizados como variáveis-alvo de previsão. Para aprimorar o desempenho, foi empregado um Algoritmo Genético (GA) na otimização de hiperparâmetros, o que reduziu o Erro Absoluto Médio (MAE) e aumentou a precisão das previsões. Os resultados demonstram que a abordagem proposta fornece previsões estáveis do comportamento das cargas, evidenciando seu potencial de aplicação em smart grids e em sistemas de gerenciamento de microrredes.

RESUMEN

La predicción precisa de la potencia activa (P) y reactiva (Q) en las redes eléctricas es fundamental para mejorar la confiabilidad operativa y la planificación en los sistemas de potencia modernos. Este artículo propone un modelo de predicción basado en redes neuronales LSTM (Long Short-Term Memory) para estimar la demanda de carga en un sistema IEEE de 30 barras. El modelo considera la potencia activa y reactiva suministrada por los generadores como variables de entrada, mientras que los componentes de potencia de las cargas se utilizan como variables objetivo para la predicción. Para mejorar el rendimiento, se empleó un algoritmo genético (AG) en la optimización de hiperparámetros, lo que redujo el error absoluto medio (MAE) y aumentó la precisión de las predicciones. Los resultados demuestran que el enfoque propuesto proporciona predicciones estables del comportamiento de la carga, lo que destaca su potencial aplicación en redes inteligentes y sistemas de gestión de microrredes.

Palabras clave: Predicción de Flujo de Potencia. LSTM. Algoritmo Genético. Potencia Activa. Potencia Reactiva. Redes Inteligentes.

Figure 2 illustrates the general architecture of the proposed LSTM network, highlighting the temporal sequence of the inputs (active and reactive powers of the generators) and the outputs corresponding to the predictions of the active (P) and reactive (Q) powers of the selected load.

In this scenario, the present article proposes the development of an algorithm based on recurrent neural networks (RNN) with LSTM units for the prediction of the behavior of loads in the IEEE 30-bar system, using historical data of power injections in the busbars. LSTM-based RNNs stand out for their ability to capture complex temporal patterns in sequential data, increasing the accuracy of predictions even under highly dynamic operating conditions. Previous work has shown that accurate load forecasts directly impact the efficiency of the operation of electrical systems, especially when integrated into distributed generation structures, allowing the optimization of energy costs and the increase of the penetration of renewable sources in the grid [3].

To understand the state of the art and contextualize the technical challenges involved, a review of previous studies on time series forecasting in electrical systems and their impacts on operational planning was carried out. In our analysis, different prediction scenarios were tested using real power flow data combined with machine learning approaches. The learning capacity of LSTM proved to be highly effective in capturing temporal dependencies, showing

promising results even when using a reduced set of input variables, such as the active and reactive powers of the generators, to predict the active and reactive demand of individual loads. The forecasts were updated every 10 moments of time, simulating a realistic operational horizon.

In the context of industrial and commercial applications, accurate load forecasting not only optimizes the operation of distributed resources, but also contributes to the stability of the power grid in regions with high penetration of renewable sources. Studies such as [4] highlight the potential of Artificial Neural Networks in predicting losses in distribution networks. Similarly, load forecasting with LSTM can act as a central element in reducing technical losses in distribution systems when integrated with advanced load management and energy storage strategies. This work advances over existing models by introducing innovative approaches to deal with the variability and complexity of load data. For this, a robust data set was built, contemplating various operating conditions of the IEEE 30-bar system. The data set used in this work was composed of the operating conditions of its generators and the 21 connected loads. Specifically, the input variables of the model corresponded to the active and reactive powers provided by the generators, while the output variables could, in principle, be the active and reactive powers of each of the 21 loads. However, for the experiments conducted in this study, only load 2 was selected as the prediction target. This choice aimed to reduce the initial complexity of the problem, allowing the methodology to be validated in a controlled scenario. Thus, even though the complete database includes all system loads, the forecast model was trained and evaluated considering exclusively the active and reactive demand of load 2. The data were pre-processed and normalized for training and validation of the prediction model.

Another novelty presented in this work was the use of a Genetic Algorithm (GA) to optimize the hyperparameters of the LSTM network, increasing the convergence speed and reducing the mean prediction error.

In conclusion, this study represents a significant contribution to the development of predictive techniques applied to the operation of electrical systems, with direct implications for the electricity sector and for sustainable energy planning. Future research may investigate the inclusion of additional operational variables, as well as the impact of extreme events and contingencies, with the aim of further improving the proposed predictive models.

2 MATERIAL AND METHOD

2.1 THEORETICAL FOUNDATION

2.1.1 Rnn

Recurrent Neural Networks (RNNs) are a class of artificial neural networks specifically designed to handle sequential data. Unlike traditional *feedforward* networks, RNNs incorporate feedback loops that allow information from previous instants to influence the current output. This characteristic makes them particularly suitable for forecasting tasks, in which temporal dependencies and correlations play a key role [5].

However, traditional RNNs often face limitations, such as *vanishing* and *exploding gradients* when trained on long sequences. These problems reduce the grid's ability to capture long-term dependencies, which are essential for accurate forecasting in electrical systems.

Figure 4

Recurrent Neural Networks (RNN)

Source: The author.

2.1.1.1 LSTM

Each cell in the hidden layer corresponds to a Long Short-Term Memory (LSTM) unit, illustrated in Figure 4. This is a variation of recurrent neural networks designed to handle long-term dependencies on data sequences. Its main objective is to avoid problems such as the disappearance or explosion of gradients, common in traditional RNNs. To do this, LSTM uses a structured mechanism of gates that control the flow of information over time, allowing the network to decide what information to keep, discard, or update.

Figure 5

Long Short Term Memory (LSTM)

Source: Researchgate

In general, the LSTM cell maintains two main states: the cell state (C_t) and the hidden state (h_t). The state of the cell is responsible for storing information over time, while the hidden state serves as the output at each instant. These states are dynamically updated through three main ports: oblivion port, inlet port, and outbound port.

2.1.1.1.1 Door of Oblivion (f):

Determines which previous state information (C_{t-1}) should be discarded. To do this, a sigmoid function is applied, which generates values between 0 (discard) and 1 (keep). These values are calculated from the combination of the previous hidden state (h_{t-1}) and the current input (x_t).

$$f_t = \sigma(W_f * [h_{t-1}, x_t] + b_f) \quad (1)$$

2.1.1.1.2 Gateway (i) and Candidate Information ($\tilde{C}_t$):

Defines what new information will be added to the cell state. First, a sigmoid function calculates the update coefficients. Next, candidate information ($\tilde{C}_t$) is generated through the hyperbolic tangent function ($\tanh$), which produces values between -1 and 1. These two steps ensure that only relevant information is incorporated.

$$i_t = \sigma(W_i * [h_{t-1}, x_t] + b_i) \quad (2)$$

$$\tilde{C}_t = \tanh(W_c * [h_{t-1}, x_t] + b_c) \quad (3)$$

2.1.1.1.3 Cell State Update (C_t):

The current state is updated by combining the previous state with the new candidate information. The oblivion port regulates how much of the previous state will be retained, while the gateway defines the proportion of candidate information that will be incorporated.

$$C_t = f_t \odot C_{t-1} + i_t \odot \tilde{C}_t \quad (4)$$

Here, $\odot$ represents element-by-element multiplication, ensuring a dynamic adjustment of the flow of information.

2.1.1.1.4 Exit Port (o):

Defines which current state information (C_t) will be used to generate the hidden state (h_t). The combination of the previous hidden state and the current input goes through a sigmoid function, which controls the fraction released. Then, the cell state is activated with the $\tanh$ function and multiplied by the output port values:

$$o_t = \sigma(W_o * [h_{t-1}, x_t] + b_o) \quad (5)$$

2.1.1.1.5 Calculation of the Hidden State (h_t):

Finally, the hidden state is calculated as the element-to-element product between the output of the output port (o_t) and the activated version of the cell state ($\tanh(C_t)$).

$$h_t = o_t \odot \tanh(C_t) \quad (6)$$

2.1.1.2 HeatMap

HeatMap is a widely used data visualization tool to represent the values of a matrix or table through color variations. This technique makes it easier to identify patterns, trends, or correlations between variables in complex data sets. In the context of time series and machine learning, HeatMaps are often employed to explore relationships between different variables or to analyze the behavior of data over time.

The operation of a HeatMap is based on assigning colors to numerical values, usually following a continuous scale, such as gradients ranging from blue (for low values) to red (for high values). Each cell of the map represents the intersection between two variables, allowing for an intuitive visualization of their interactions. For example, in a correlation matrix, the HeatMap is used to display the strength and direction of linear relationships between pairs of variables.

Additionally, HeatMaps are useful for identifying anomalies or seasonal patterns in the data. In practical applications, such as time series forecasting, they can be used to analyze the relevance of input variables, identify periods of greater concentration of extreme values, or understand the influence of external factors on the analyzed data. HeatMaps can be implemented in tools such as *Seaborn* or *Matplotlib*, which allow the customization of color scales, labels and annotations, expanding the ability to interpret the results.

In this way, the use of HeatMaps provides a powerful visual approach to understand and communicate complex information, being an essential tool in studies that require the analysis of large volumes of data and their interrelationships.

The choice of input data in the RNN architecture, illustrated in Figure 4, was based on the analysis of the correlations between the system variables. The HeatMap, presented in Figure 6, shows the correlation relationships between different variables, making it possible to identify those with the greatest impact on the behavior of the system and, therefore, more relevant to the model.

Thus, the power sources were chosen as the input variables for the training, and one of the loads (in this case, Load 2) was selected as the grid output variable.

2.1.1.3 TensorFlow and Keras

TensorFlow and Keras are essential tools for developing *deep learning* models, especially for time-series tasks such as predicting power flow variables in power grids.

TensorFlow, powered by Google, is a highly scalable and efficient open-source library designed to perform complex mathematical operations and support model training on high-performance hardware such as GPUs and TPUs. Keras, integrated as TensorFlow's high-level API, provides a modular, easy-to-use interface for building neural networks, allowing researchers to focus on the conceptual and experimental aspects of modeling.

In the model developed in this work, several features of TensorFlow and Keras were explored for their simplicity and efficiency in implementation. The architecture was built using the Sequential class, which organizes the layers in a linear fashion and is suitable for neural networks that process sequential data, such as the LSTMs employed in this study. The LSTM layers formed the backbone of the model, designed to capture temporal patterns and long-term dependencies on the input data. This capability is critical in time series analysis in power systems, as current load values are strongly influenced by past variations of active and reactive powers.

To enhance the learning process, a Bidirectional layer was added, which allows LSTM to analyze the data both in the direct and inverse direction of time. This approach is particularly advantageous in power flow forecasting, where future operating conditions can also be influenced by past interactions between generation and demand.

In addition to the LSTM layers, Dense layers were included, responsible for performing linear and nonlinear transformations in the internal representations, connecting the LSTM outputs to the final predictions. The output layer was configured with two neurons, corresponding to the active (P) and reactive (Q) powers of the selected load, ensuring that the model produced predictions aligned with the physical quantities of interest.

For the training, the model was compiled using the Adam optimizer, which is known for its efficiency in *deep learning tasks* due to adaptive adjustment of the learning rate. The loss function chosen was the Mean Absolute Error (MAE), which is suitable for regression problems and provides a direct interpretation of the mean of the differences between predicted and actual power values.

After training, the predictions were generated with the Keras predict function, integrated into the processing flow. Overall, TensorFlow and Keras stood out not only for their ease of use, but also for offering advanced solutions to complex problems, such as capturing temporal dependencies in the operation of electrical systems. These frameworks were instrumental in ensuring the efficiency, flexibility, and scientific rigor of the proposed forecasting model.

2.1.1.4 Genetic Algorithm for Hyperparameter Optimization

Genetic Algorithms (GAs) are a class of stochastic optimization techniques inspired by the principles of natural selection and genetics. Initially proposed by John Holland in the 1970s, AGs are widely used to solve optimization problems where the search space is complex, nonlinear, or difficult to approach by traditional gradient-based methods. Their robustness and adaptability make them suitable for a wide variety of engineering applications, including machine learning and power system analysis.

At their core, AGs operate on a population of candidate solutions, called individuals, that are represented by chromosomes (often encoded as binary chains, real value vectors, or more complex structures, depending on the problem). Each chromosome corresponds to a potential solution, the quality of which is evaluated through a fitness function that measures how well it meets the optimization objective.

The process of a GA follows the following key steps:

- Initialization: A population of candidate solutions is randomly generated within the defined search space. In the context of hyperparameter optimization in neural networks, these candidates can represent configurations such as number of LSTM cells, *dropout* rates, learning rate, and number of training epochs.
- Selection: Individuals are selected based on their fitness scores, favoring those who perform best. Strategies such as roulette, tournament, or ranked selection ensure that the strongest individuals are more likely to pass on their traits to the next generation.
- Crossover: Pairs of selected individuals exchange parts of their chromosomal representations to generate offspring. This process mimics biological reproduction, promoting the combination of advantageous characteristics of different solutions.
- Mutation: Random changes are introduced into the chromosomes of offspring with a small probability. The mutation ensures diversity in the population, avoiding premature convergence to suboptimal solutions.
- Replacement: A new population is formed, usually combining the best individuals from the previous generation with the newly generated offspring. The cycle of evaluation, selection, crossover, and mutation is repeated for a set number of generations or until the convergence criteria are met.
-

2.1.1.4.1 Application in this work

In the present study, the Genetic Algorithm was employed to optimize the hyperparameters of the LSTM-based prediction model developed for the IEEE 30-bar system. Instead of manually selecting parameters through trial and error, AG performed an automatic search for the best combination of hyperparameters that would minimize prediction error.

The following hyperparameters were encoded in the AG chromosomes:

- Number of LSTM units per layer: AG explored different configurations of hidden neurons, balancing the complexity of the model and its ability to generalize.
- Number of training seasons: By optimizing this parameter, AG ensured efficient convergence without causing *overfitting* or *underfitting*.
- Dropout rate: AG adjusted the level of regularization to avoid *overfitting*, which is particularly important in sequential models with high representation capacity.

- Learning rate: although it has been fixed in part of the experiments, this parameter can also be optimized by the AG to refine the speed of convergence and the stability of the training.

The fitness function was defined as the Mean Absolute Error (MAE) between the predicted and actual load values (active and reactive powers), after training the model with a certain set of hyperparameters. Lower MAE values indicated better performance, guiding the evolutionary search towards more suitable configurations.

With the integration of the AG into the modeling process, the model achieved a final MAE of 0.0507, a result higher than that of reference models with manually adjusted hyperparameters. This performance highlights the efficiency of AGs in exploring large search spaces and their ability to adaptively identify optimal solutions to complex problems, such as time series forecasting in electrical systems.

3 CASE STUDY AND RESULTS OBTAINED

Once the methodology for the implementation of power flow forecasting was established, its validation necessarily depended on the comparison of the model's performance in relation to a reference case derived from a real distribution feeder.

The code was implemented in Python to predict the active (P) and reactive (Q) powers of a selected load, using as inputs the generation data and auxiliary variables of the system. This approach allows the model to capture temporal and operational patterns inherent in the dynamics of power systems, ensuring accurate short-term forecasts. Such forecasts are crucial for the planning and operation of modern electrical systems, especially in scenarios with distributed generation and fluctuating demand. The procedure adopted and the considerations on the results obtained are presented below.

3.1 SPLITTING THE DATASET

Splitting the dataset is a critical step in ensuring that the model learns reliable patterns and is able to generalize to unseen data. In this study, a temporal division was adopted, allocating 80% of the samples for training and 20% for testing. This division preserves the chronological order of events, avoiding data leakage, a fundamental aspect in time series forecasting. Unlike random splits, which are often used in other machine learning tasks, time sequence maintenance better reflects the model's real-world applications in operational scenarios.

3.2 CONSTRUCTION OF THE SEQUENCES

Since LSTM networks are designed to process sequential data, the code employed a sliding window strategy to construct the temporal sequences. Specifically, each input sequence was composed of 20 consecutive instants of system operation, while the output corresponded to the active and reactive power values of the target load at the subsequent instant. This configuration provides the model with enough historical context to learn the temporal dependencies on the payload's behavior.

3.3 NEURAL NETWORK ARCHITECTURE

The neural network architecture is designed to capture both the temporal and nonlinear dependencies present in the power flow data. It is composed of stacked layers of Bidirectional LSTM, fully connected dense layers, and a linear output layer. Unlike fixed

architectures, the configuration of this model — such as the number of LSTM units per layer and the number of training epochs — was not chosen arbitrarily. Instead, a Genetic Algorithm (GA

Bidirectional LSTM layers: two bidirectional layers with different unit numbers (e.g., 64, 128) were tested, allowing the network to learn temporal dependencies in both forward and reverse. This is especially relevant in electrical systems, where current conditions may depend on both past and evolving states.

Dropout regularization: a *dropout rate* of between 1% and 5% was applied in order to mitigate *overfitting* and ensure that the model generalized well to unseen operating conditions.

Dense Layer: after LSTM, a dense layer of variable size (optimized by the AG) was included to refine the representations learned before the final output.

Output Layer: the final layer contained two neurons, corresponding to the active (P) and reactive (Q) power predictions of the selected load.

3.4 OPTIMIZATION OF HYPERPARAMETERS WITH GENETIC ALGORITHM

The Genetic Algorithm played a central role in choosing the optimal configuration of the model. The candidate solutions (chromosomes) encoded hyperparameters such as the number of LSTM cells per layer and the number of training times. AG evolved these solutions over the generations, through the processes of selection, *crossover*, and mutation, converging on architectures that minimized validation error. This evolutionary approach proved to be efficient in balancing the complexity of the model and its predictive accuracy.

It is important to highlight that the hyperparameters obtained represent the best configuration for the dataset and operational conditions of this study. However, different datasets or electrical system scenarios may require alternative configurations, reinforcing the flexibility of combining LSTM networks and evolutionary optimization techniques such as Genetic Algorithms.

3.5 MODEL COMPILATION AND CONFIGURATION

After defining the architecture, the model was compiled with the following elements:

- **Loss Function:** the Mean Absolute Error (MAE) was used. Unlike Mean Square Error (MSE), which penalizes large deviations more severely, MAE provides a more direct

interpretation metric in the context of power flow, representing the average magnitude of forecast errors in both active and reactive powers.

- Adam Optimizer: Adam (Adaptive Moment Estimation) was adopted, which combines advantages of RMSProp and Stochastic Gradient (SGD). Adam dynamically adjusts the learning rate of each parameter based on first- and second-order estimates (mean and variance), accelerating convergence and ensuring stability in the training of complex sequential data.

3.6 MODEL TRAINING

The training was carried out over 15 seasons, with a batch size of 32 samples. During the training, the following strategies were applied:

Adaptive Learning Rate: although the `ReduceLROnPlateau` *callback* was not explicitly used, the learning rate was adjusted empirically and also by the Genetic Algorithm, ensuring convergence without significant oscillations.

Loss Function Monitoring: training and validation losses were tracked at each time in order to detect signs of *overfitting* or *underfitting*. The evolution of these losses is shown in Figure 7 (Training and Validation Loss Graph), confirming the stable learning process of the model.

3.7 MODEL EVALUATION

After training, the model was evaluated in the test set to measure its generalizability. The evaluation involved the following steps:

Denormalization: Both the predicted and actual values have been rescaled to their original units using the adjusted *MinMaxScaler* objects. This ensured that the evaluation metrics were interpretable within the physical context of the power flow.

Mean Absolute Error (MAE): the final MAE obtained was 0.0507, reflecting a high degree of accuracy considering the active and reactive power scale in the IEEE 30-bar system. This low error demonstrates the robustness of the model and its ability to capture complex temporal and nonlinear relationships.

Visualization of Forecasts: comparative graphs were generated between actual and predicted values for the active and reactive powers of the target load. These graphs, presented in Figures 8 (Active Power – P2) and 9 (Reactive Power – Q2), highlight the

model's ability to follow trends and fluctuations, confirming its effectiveness in short-term prediction of load behavior.

4 STRENGTHS AND LIMITATIONS OF THE STUDY

Most studies that analyze predictions in electrical power systems do not combine recurrent neural network techniques with long-term memory units (LSTM) and Genetic Algorithms (AG) for hyperparameter optimization in load prediction problems. As a strong point of our study, we highlight precisely the use of this integrated approach, which allowed an automatic adaptation of the neural network and reduced subjectivity in the choice of training parameters. In addition, we emphasize that the analysis was performed using data derived from a standard system widely accepted in the literature (IEEE 30 bars), ensuring the reproducibility and comparability of the results. Another positive aspect is that the results achieved a relatively low mean absolute error (MAE), which reinforces the robustness of the proposed model and its practical usefulness for forecasting applications in the electricity sector. Thus, we believe that the results of this study are of great relevance, as they offer initial evidence on the applicability of deep learning techniques combined with evolutionary algorithms in power flow scenarios.

However, we recognize that our study also has limitations. First, it was conducted considering only the prediction of the active and reactive power of a specific load, which restricts the generalization of the results to the entire system. In addition, although the results were satisfactory, the use of simulated data limits the external validity, since noise, measurement failures or contingencies typical of real systems were not considered. Another limiting point is the computational cost associated with the Genetic Algorithm, which can become high in real-time applications or in larger systems. Other limiting factors include the reduced temporality of the analyzed database and the absence of testing under extreme event scenarios or anomalous operating conditions. Although the model has shown predictive capacity under normal conditions, it has not yet been validated in situations of greater variability or electrical disturbances, which are common in real networks.

Therefore, additional research is suggested, especially those involving larger systems and real operation data, to assess the robustness of the model under more challenging conditions. It is also recommended to investigate other optimization metaheuristics, as well as to expand the scope to multiple simultaneous loads, in order to increase the applicability and generalization of the proposed method.

5 CONCLUSIONS

The results obtained in this study demonstrate the effectiveness of Recurrent Neural Network (RNN) models, with Long Short-Term Memory (LSTM) units, for the prediction of load power (active and reactive components) in the IEEE 30-bar system. The proposed model, optimized by means of a Genetic Algorithm for the selection of hyperparameters, achieved a Mean Absolute Error (MAE) of 0.0507, which indicates a high level of accuracy in capturing temporal patterns from historical power flow data.

While the model is designed to predict the active and reactive power of a single load, the methodology can be easily extended to multiple loads and more complex grid configurations. The use of the active and reactive powers of the generators as input variables proved to be sufficient to model the dynamics of the selected load, reducing computational complexity and, at the same time, maintaining a robust predictive performance.

The integration of the Genetic Algorithm was particularly important, as it enabled an automatic search for optimal hyperparameters — such as the number of LSTM cells per layer and the number of training epochs — resulting in higher convergence speed and lower prediction error compared to manually tuned models.

This work represents a significant contribution to the development of intelligent forecasting techniques applied to power systems, offering a solid foundation to improve operational planning, reliability and efficiency in smart grids. Future research may explore the application of this approach to all loads of the IEEE 30-bar system, the inclusion of stochastic renewable sources, and the use of hybrid optimization techniques, with the aim of further refining the predictive capacity of neural network-based models in applications in the electricity sector.

ABSTRACT

In Brazil, freedom of belief is a guaranteed right, although there is still discrimination motivated by stereotypes and prejudices. This study addresses the concepts of religion and religious institutions, emphasizing the importance of pluralism and religious freedom for Brazil. The relationship between religion and the public sector is marked by the secular nature of the State and, at the same time, by interference in public policies. Brazil's religious diversity is characterized as broad and dynamic, expressing its history and culture. Education and public policies must foster respect, inclusion and appreciation of the plurality of plurality. The secular nature of the State is to guarantee religious freedom and the neutrality of public space, and to face permanent and constant challenges, to create and preserve impartiality. Religious and cultural pluralism is a wealth and needs to be celebrated and defended, requiring continuous actions to strengthen tolerance and social cohesion.

RESUMO

No Brasil, a liberdade de crença é um direito garantido, embora ainda haja discriminação motivada por estereótipos e preconceitos. Este estudo aborda os conceitos de religião e instituições religiosas, enfatizando para o Brasil a importância do pluralismo e da liberdade religiosa. A relação entre religião e setor público é marcada pela laicidade do Estado e, ao mesmo tempo, por interferências nas políticas públicas. A diversidade religiosa do Brasil caracteriza-se como ampla e dinâmica, expressando a história e sua cultura. A educação e as políticas públicas devem fomentar o respeito, a inclusão e a valorização da pluralidade

1 INTRODUCTION

After World War II, human beings had freedom of religion, as Bittencourt Filho points out⁵. The Government is prohibited from carrying out any religious political persecution, thus protecting the religious freedom of each one, even so it is not proven in a general way, the guarantee of elimination of forms of religious discrimination. The authorities, or the public, present a stereotype that a religion needs, for example: to behave, or to dress. They may not even meet the basic requirements, seeming not to fit into that category, according to religious tolerance, that is, they face accusations that they are acting under the law.

With the needs of changes in modern society, in the religious and spiritual sphere, it is surprising the consequences of the process of any social organization, prevailing social justice, personal fulfillment, self-knowledge and the application and strengthening of religion as an orientation for the positive side of life.

The objective of this article is to analyze the relationship between religion and the public sector in Brazil, highlighting the influence of modernity and the need for inclusive public policies that respect religious diversity. It is intended to understand how religion adapts to social and spiritual changes and how religious pluralism can be a powerful tool for building a more just and inclusive society. The specific objectives are: to investigate how the development of science and technology has impacted religious practices and beliefs in Brazil; to identify the challenges and opportunities generated by the coexistence of different religious traditions, and to discuss the importance of the secularity of the State, in guaranteeing religious freedom and the neutrality of public space.

This study adopts a qualitative approach, based on a literature review and critical analysis of secondary sources. The research is descriptive and exploratory, aiming to understand the complexity of the relationship between religion and the public sector in Brazil. Consult the works of authors such as Peter Berger and José Bittencourt Filho, among others, to support the theoretical analysis.

With these varieties developed by the new religions, which present scientific guidelines of today's society, they use science to achieve goals for spiritual purposes, reflecting on religious diversity, appearing as entrails or distorted, as it was in the past.

The relationship between religion and the public sector is a complex and multifaceted issue, which involves issues of religious freedom, secularity of the State, and the influence of

⁵BITTENCOURT FILHO. José. *Brazilian religious matrix: religiosity and social change*. 2. ed. Vitória: Unida, 2019, p. 30.

religious institutions on public policies. This chapter presents a series of broad quotations that explore these interactions, highlighting the importance of dialogue between the sacred and the profane in the context of public service.

2 RELIGION AND THE PUBLIC SECTOR

Religion for Berger encompasses two aspects: religion in the consciousness and behavior of individuals. The concept of religion compared to superstition, of "unleashing the world, while rationality swept away the old mysteries."⁶ Religion is influenced by modernity, since the development of modern social science there has been the prejudice of the Enlightenment regarding religion. Not being anti-religious in the philosophical version, but that "modernity and religion were empirically antagonistic – to put it simply: the more modernity, the less religion".⁷

The concept of religion according to Berger does not correspond to reality, "but that it is useful in that it allows us to reality, but that it is useful in that it allows us to classify real phenomena and to discover empirically where classifications fail."⁸

According to Berger "an institution is a program and behavior that, when properly internalized, makes the individual act spontaneously and without much or no reflection in the relevant sector of social life".⁹ This behavior depends on each individual, on his conduct, on his relations with society, that is, on social relations and the reality of each one, "[...] the behavior in religious practice until this behavior becomes habitual".¹⁰

Religious institutions struggle with religious freedom, especially "when they claim to possess divinely revealed truths, and even more so when they once had a monopoly position in a society," according to Berger¹¹. In the present day the Modern Catholic Church is extremely instructive, one can identify the fullness of truth.

Corroborating Bittencourt Filho, "From the perspective of the expansion of the religious field, what draws the most attention is the race of religious organizations to have a significant space in the media". For a long time with global development "the medium is the message"

⁶ BERGER, L. Peter. *The multiple altars of modernity: towards a paradigm of religion in a pluralistic era*. Petrópolis: Vozes, 2017, p. 48.

⁷ BERGER, 2017, p. 50.

⁸ BERGER, 2017, p. 47.

⁹ BERGER, 2017, p. 77.

¹⁰ BERGER, 2017, p. 78.

¹¹ BERGER, 2017, p. 84.

adapting to electronic media, in fact the tendencies of the very simple, utilitarianism and exceptional seclusion of religion, a phenomenon of post-modernity¹².

At the time when we are witnessing an unprecedented effervescence in the Brazilian religious field, it is necessary to expand the theoretical collection available if the proper interpretation of the phenomena is desired. More than ever, Brazilian religious pluralism is demanding a concerted effort to be understood. We intend to situate and incorporate not the *a priori* in the religious experience, but according to the sociological nature of the work, to point out the *a priori* dimension of the religiosity of the average Brazilian and to take this dimension as an additional theoretical tool in the hermeneutic effort of the religious panorama in our country, especially in the recent past. [...] to discuss the factors that make the religiosity of the majority of Brazilians unique and original, despite the fact that the Brazilian social formation was and is subordinated to economic, political and cultural determinants common to so many other peoples and nations¹³.

According to Berger, [...] the two effects of pluralism go together – faith as based more on individual choice than on fate or the chance of birth, and faith as institutionalized in form with voluntary modernity."¹⁴ There is a broad affinity with modernity, that is, an affinity that weakens what is taken for granted in institutions, not only religious ones.

For Bittencourt Filho "We live in an intellectual climate that shows a special sympathy for the denaturalization of traditional categories, for decentralization and for a certain view that prioritizes the boundaries of cultural institutions [...]"¹⁵element. Over the years, an internal plurality of Christianity is perceived, making them more complex, or even more problematic, can generate self-reflection.

When pluralism and religious freedom coincide, a specific type of market emerges, so that economic concepts can be applicable. Religious freedom deprives religious institutions of previous monopolistic privileges. Instead, they are forced to compete without resorting to coercion. There will be pressures to control competition, which makes a degree of cooperation practical¹⁶.

Corroborating it further, Bittencourt Filho highlights.

[...] because forms, religious conducts, styles of spirituality and uniform religious conducts, evidence the influential presence of a religious-cultural substrate that we call

¹² BITTENCOURT FILHO, 2019, p. 36.

¹³ BITTENCOURT FILHO, 2019, p. 38-40.

¹⁵ BITTENCOURT FILHO, 2019, p. 32.

¹⁶ BERGER, 2017, p. 102.

the Brazilian Religious Matrix. This expression must be understood in its broad sense, that is, as something that seeks to translate a complex interaction of religious ideas and symbols that have come together in a multi-secular course, therefore, it is not *stricto sensu* a category of definition, but an object of study. This multi-secular process had, as its main development, the gestation of an average religious mentality of Brazilians, a collective representation that goes beyond even the situation of a class in which it is found¹⁷.

With the official Roman Catholicism contributing, his papacy has diversified its strategies in relation to the guidelines, directly directing the Brazilian social space, in relation to the sacred. Roman Catholicism was a protagonist and has currently sought to achieve this position again, but it realized that the alliances of some social movements, in this case, Poles with ecclesiastics, caused confrontations with the old regime, in the cultural and political spheres¹⁸.

"The contemporary world, with few exceptions, is as intensely religious as any other in history."¹⁹

According to Bittencourt Filho "[...] the existence, in the midst of the cultural matrix, of a religious matrix, which provides a collection of characteristic religious and symbolic values, as well as providing a broad and diffuse religiosity among Brazilians".²⁰ However, this certainty reinforces the presence of cultural plurality, values and Brazilian religiosity that persist, despite the changes that occur in society, and that need to continue to be articulated and reproduced.

Thus, religious and cultural forms rejected as idolatrous and/or demonic are considered as a camouflaged religiosity, that is, adapted by itself as an instrument of resistance and preservation of identity in the face of aggression.²¹

Public services, such as health and education, must be provided in a way that respects the religious diversity of users. This includes ensuring that everyone has access to services that meet their specific needs, regardless of their religious beliefs²².

Religion and the public sector in their relationship are not unrelated to challenges and controversies. Issues such as religious education in public schools, the celebration of religious festivities in public spaces, and the participation of religious leaders in political

²² OLIVEIRA, Ana Paula. *Religious diversity and citizenship*. Brasília: University of Brasilia, 2019a, p. 104.

debates are topics that often generate controversy. It is essential that the State maintains a balance between the protection of religious freedom and the guarantee of the neutrality of public space, respecting the rights of all citizens²³.

Religious institutions are very significant and relevant in society, influencing the values and morals of the city and at the same time in the elaboration of public policies. The Catholic Church in Brazil, since colonial times, has always been involved in social issues, such as education, health and social assistance. This influence can be positive, that is, promote values of solidarity and justice, but it can also, in practice, harm, when religious interests hurt secular principles of the State²⁴.

3 RELIGIOUS DIVERSITY

Brazil is a country characterized by extensive cultural diversity, whose various traditions, religious beliefs, and ethnicities respect each other. Since this is one of the most important characteristics of what is part of our nation. Indigenous, African or European and Asian, all cultures have their influence in Brazil, which is a true melting pot of cuisine that reflects on: music, dance, cuisine and festivities. At the same time, this cultural richness not only enriches us in material possessions, but also compels us to make society a more inclusive and tolerant place, so that all voices can be heard and respected²⁵.

It is essential that Brazilian religious diversity be considered a complex phenomenon, reflecting the history and culture of the country. Whether through the religious mosaic of African-based terreiros and religious syncretism, or through influences from Catholicism, or rising evangelical churches, Brazilian religious diversity has been its contribution to religious myths and practices. The understanding of art itself is fundamental to foster inclusion for everyone, for everyone regarding their religious difference from society. The country, however, is religious diversity in Brazil does not remain, as it has its own trajectory and time permeates its development through social, economic and political considerations²⁶. As this approach needs to be not strict, but an all-encompassing display, to tumultuous it is clear that it is religious voices that must be followed.

²³ SOUZA, Carlos Alberto. *Religion and State: challenges and controversies*. São Paulo: Contexto, 2021, p. 90.

²⁴ PEREIRA, João Carlos. *Religion and politics in contemporary Brazil*. Rio de Janeiro: Civilização Brasileira, 2018, p. 78.

²⁵ SILVA, João. *Brazilian pluralisms*. São Paulo: Brasiliis, 2018, p. 23.

²⁶ COELHO JR., A. G.; MAHFOUD, M. *The spiritual and religious dimensions of human experience: distinctions and connections*. São Paulo: Casa Amarela, 2001, p. 45.

The public sector must promote religious diversity and guarantee all citizens the right to practice their own religion and/or faith without discrimination. This can be achieved through the formulation of public policies that respect and value religious diversity, in addition to the incorporation of educational programs that present the different religious traditions existing in the national territory. Religious diversity represents a cultural richness, which must be celebrated and safeguarded²⁷.

Education exerts an essential diversion in promoting understanding and respect for religious diversification, which is why it is essential that, in a country like Brazil, characterized by religious diversity, schools and educational institutions address this issue in an inclusive and respectful way, thus involving the training of educators who have the skills very well involved to work with religious plurality and the learning of religious that value the diversity of religious and practical curricula. Education for religious diversity is not restricted to formal education, it must permeate all spheres of school life in order to promote an environment of respect and inclusion. In addition, it should also be considered that educational policies need to consider and value the contribution of different religious traditions, and the ability to be recognized and valued for the cultural and moral constitution of students²⁸.

Public policies must consider religious diversity as an essential element for the construction of inclusive citizenship. Educational and social programs that promote respect and understanding between different religious traditions are crucial for social cohesion²⁹.

Interfaith dialogue in the public sector is a powerful tool for conflict resolution and the promotion of peace. Initiatives that encourage collaboration between different religious communities can contribute to the construction of a more harmonious and just society³⁰.

Religious diversity is a reflection of human plurality and the continuous search for meaning and transcendence. In Brazil, plurality is even richer, from indigenous and Afro-Brazilian traditions, to the various Christian denominations and different world beliefs. In this sense, the Brazilian social and cultural construction is enriched and created, enabling inter-religious dialogue and the capacity for tolerance among the race. Peaceful coexistence around the different religions is a challenge and an opportunity; however, it is perhaps the

³⁰ OLIVEIRA, 2019a, p. 128.

bedrock of a more tolerant, inclusive society. Brazil's religious diversity is not like its fetish in terms of tolerance, but of acceptance of differences, which enrich spiritual culture³¹.

4 RELIGIOUS FREEDOM AND SECULARITY OF THE STATE

Religious freedom is the fundamental basis of democracy. In Brazil, the Federal Constitution of 1988 ensures the inviolability of freedom of conscience and belief, as well as the free exercise of religious cults. However, the secularity of the State imposes limits on the direct intervention of religious institutions in public policies, ensuring that the public space is neutral and inclusive for all citizens, regardless of their beliefs³². However, the secularity of the State is a fundamental principle that guarantees religious freedom for all citizens. In a secular state, no religion is privileged, and all are respected and protected³³.

The secularity of the State is fundamental to guarantee equality and religious freedom in a plural society. The public sector must act neutrally, respecting the diversity of beliefs and not privileging any particular religion³⁴.

Religious freedom is an essential human right that must be protected by the state. Secularism ensures that all individuals can practice their faith without interference or discrimination³⁵.

Education in a secular state must promote respect for religious diversity and understanding between different faiths. Educational programs that encourage interreligious dialogue are important for the formation of conscious and tolerant citizens³⁶. However, while secularism is an essential principle for religious freedom, it faces constant challenges. A continuous effort is needed to ensure that the state remains neutral and impartial in religious matters³⁷.

Thus, the secularity of the State is the basis for a healthy religious pluralism, in a pluralistic society, the diversity of beliefs is seen as a richness, and secularism then ensures that all are respected³⁸.

Brazilian religious pluralism was generated by our history of syncretism and miscegenation. From indigenous religions to the nations of Candomblé and Umbanda,

³⁷ OLIVEIRA, 2019a, p. 80.

³⁸ OLIVEIRA, 2019a, p. 92.

including all Christian religions and doctrines, Brazil is a mosaic of religious beliefs and practices. Diversity, however, is a wealth to be celebrated and defended. So it generates challenges, even with the application of interreligious dialogue and free worship to the entire population, even for those who have no religion. The secularity of the State is essential to ensure that all religions are respected and that none of them is favored³⁹.

The political system in Brazil is characterized by the diversity of parties and ideologies, which are reflected by the opinions and interests of society. This political pluralism is necessary for democracy and to ensure that different voices are heard and represented. However, there are major challenges for governance, where party fragmentation can hinder the formation of consensus and the execution of effective public policies. Dialogue between the different political actors must be facilitated, as a permanent effort, so that pluralism serves to cooperate with the country's growth⁴⁰.

Several cultural aspects contribute to the national formation of Brazilian identity. Cultural pluralism serves as a threat and a force that helps enrich our intangible heritage, as a society challenges us to create a more tolerant and inclusive society. From popular celebrations such as carnival and June festivals, to artistic and literary manifestations, cultural diversity exists in almost all spheres, of Brazilian human action. However, it is necessary to know that this diversity is also accompanied by challenges, thus involving social inclusion and combating discrimination. Education is one of the methods that help to overcome these differences in respect and understanding of existing cultural groups⁴¹.

On the one hand, pluralism brings with it many challenges, despite being a richness. It is an undeniable fact that sharing with other cultural, religious and political groups requires a continuous effort to develop dialogue and mutual respect. In this scenario, it is necessary to take into account public policies that value diversity and combat approaches to discrimination. Education for global citizenship, which learns tolerance and respect successively in people, is important, to build a more just and inclusive society. Brazilian pluralism offers a great opportunity to learn about differences, where everyone can achieve the right to live in harmony and equality⁴².

5 FINAL CONSIDERATIONS

The interaction between religion and the public sector is a dynamic and constantly evolving field, that is, it presents multifaceted complexities that reflect social changes. Religious freedom and the secularity of the State are fundamental principles, which must be balanced, to guarantee a just and inclusive society. Religious institutions have an important role to play, but it is very important that the public sector promotes religious diversity, respects the rights of all citizens, creates an inclusive society and poses challenges to peaceful coexistence, regardless of their beliefs.

On the other hand, modernity meant adaptation of religious institutions to the way religions are structured, as a result of social and cultural changes. Science and technology have played an important role in religious beliefs, involving people to seek new approaches to spirituality, in accordance with contemporary values. Thus, this adaptation is a condition for the survival and expenditure of religions in their current context.

People form social, political and economic institutions, because they think and act according to their ideological convictions, consolidating the thought that predominates in the development of their cultural and socio-affective formation, as well as their religious construction. The legal precepts are always remembered through their rules, or doctrines used in the religious field. The view related to religious ideology, even with the relationship of referring to the process of achieving its result, that is, integrating oneself into a Christian religion, can be highlighted: Catholics, Protestants, Evangelicals, Spiritists and Afro-Brazilian religions, thus directing the construction of morals and ethics.

With contemporaneity, the changes that have occurred in the present day, the beliefs and practices in the religious field, have become deliberative, some perhaps identical, but the faith has not changed at all. Thus, religious institutions establish "behavior in religious practice until this behavior becomes habitual, that is, taken for granted" is what Berger describes⁴³.

Therefore, the religious field in Brazil guides us that being Brazilian automatically refuses to be Catholic, but that a large part is Christian. It means the existence of controlling and boosting mobility, ecumenisms and syncretisms/hybridisms, but also religious exclusivism, divergences, ideological or political intolerance and religious racism. There is deinstitutionalization and institutionalization and, simultaneously, the non-religious. Then, he

⁴³ BERGER, 2017, p. 78.

declares that the "Brazilian religious field" is superior to a complex issue, it is a mined percentage, in which the concept itself is at permanent risk.

Religious diversity in Brazil constitutes a broad and dynamic mosaic, composed of its diversity of beliefs and practices, which reflect our culture and history. Religious plurality is a characteristic feature of Brazilian society, involving indigenous and Afro-Brazilian traditions, the various Christian denominations and the various religions of the world. However, this diversity creates challenges, particularly with regard to coexistence and mutual respect between different religious traditions. However, this context brings challenges, with regard to peaceful coexistence and respect for diversity among practitioners of the religion.

The relationship between religion and the public sector is broad, and involves the influence of religious institutions, public policies and social life. The secularity of the State is fundamental to guarantee religious freedom and the neutrality of the public space, ensuring that all beliefs are respected and protected. This study highlighted the importance of inclusive public policies that promote respect and inclusion of religious diversity, contributing to social cohesion and the construction of a more just and harmonious society.

To achieve the proposed objectives, it is essential to engage in educational strategies and public policies that emphasize the appreciation of religious diversity and that stimulate interreligious dialogue. The educational process is a fundamental instrument for the formation of conscious and tolerant citizens in relation to cultural and religious differences. Educational programs that promote dialogue and understanding between different religious traditions are indispensable for building an inclusive society.

In this way, religious diversity in Brazil is a cultural wealth, which should be celebrated and safeguarded. The secularity of the State is important, in the sense of guaranteeing religious freedom and the neutrality of the public space, to establish an environment of coexistence and inclusion. Through inclusive public policies and educational strategies that value religious diversity, we can build a more egalitarian and harmful society, where all voices are respected and heard.

ABSTRACT

Objective: To analyze the main types of care provided to children living in vulnerable territories.

Methodology: This is an integrative, descriptive, and exploratory review with a qualitative approach, developed through the analysis of scientific articles published between 2019 and 2024. The search was conducted in the MEDLINE, BDENF, LILACS, and SciELO databases, accessed via the Virtual Health Library (VHL). Study selection followed the PRISMA protocol, and the data were examined using Thematic Analysis, based on Bardin's Content Analysis method.

Results: Three thematic categories emerged: (1) Care for vulnerable children exposed to situations of violence; (2) Interaction methods for providing care to children; and (3) Government strategies aimed at child care in contexts of vulnerability.

Conclusion: The study highlighted the multiple levels of vulnerability faced by children and the need to expand care strategies that promote welcoming, qualified listening, and protection. It also emphasized the importance of coordination among the State, health professionals, and the community to ensure effective and integrated actions in support of childhood.

Keywords: Child. Vulnerability. Care.

RESUMO

Objetivo: Analisar os principais cuidados prestados às crianças em territórios de vulnerabilidade.

Metodologia: Trata-se de uma revisão integrativa, descritiva e exploratória, com abordagem qualitativa, desenvolvida por meio da análise de artigos científicos publicados entre 2019 e 2024. A busca foi realizada nas bases MEDLINE, BDENF, LILACS e SCIELO, acessadas pela Biblioteca Virtual em Saúde (BVS). A seleção dos estudos seguiu o protocolo PRISMA, e os dados foram analisados por meio da Técnica de Análise Temática, conforme o método de Análise de Conteúdo proposto por Bardin.

Resultados: Emergiram três categorias temáticas: (1) O cuidado à criança vulnerável em situação de violência; (2) Métodos de interação para a prestação de cuidados à criança; e (3) Estratégias governamentais voltadas ao cuidado da criança em contextos de vulnerabilidade.

Conclusão: O estudo evidenciou os múltiplos níveis de vulnerabilidade enfrentados por crianças e a necessidade de ampliar estratégias de cuidado que promovam acolhimento, escuta qualificada e proteção. Ressalta-se, ainda, a importância da articulação entre Estado, profissionais da saúde e comunidade para garantir ações efetivas e integradas em prol da infância. Incluir o resumo.

Palavras-chave: Criança. Vulnerabilidade. Cuidado.

RESUMEN

Objetivo: Analizar los principales cuidados brindados a los niños en territorios de vulnerabilidad.

Metodología: Se trata de una revisión integradora, descriptiva y exploratoria, con enfoque cualitativo, desarrollada a través del análisis de artículos científicos publicados entre 2019 y 2024. La búsqueda se realizó en las bases de datos MEDLINE, BDENF, LILACS y SciELO, accesadas a través de la Biblioteca Virtual en Salud (BVS). La selección de los estudios siguió el protocolo PRISMA, y los datos fueron examinados mediante la Técnica de Análisis Temático, conforme al método de Análisis de Contenido propuesto por Bardin.

Resultados: Surgieron tres categorías temáticas: (1) El cuidado del niño vulnerable en situación de violencia; (2) Métodos de interacción para la prestación de cuidados al niño; y (3) Estrategias gubernamentales orientadas al cuidado del niño en contextos de vulnerabilidad.

Conclusión: El estudio evidenció los múltiples niveles de vulnerabilidad enfrentados por los niños y la necesidad de ampliar estrategias de cuidado que promuevan acogida, escucha calificada y protección. Asimismo, se resalta la importancia de la articulación entre el Estado, los profesionales de la salud y la comunidad para garantizar acciones efectivas e integradas en favor de la infancia.

Palabras clave: Niño. Vulnerabilidad. Cuidado.

1 INTRODUCTION

Thinking about the child's territory goes beyond simple geographical delimitation. It implies considering the space where they live and interact with their family and community, which is the concrete and symbolic scenario of health care. Reflecting on the territory requires understanding its multiple meanings in the social sciences and collective health, in addition to the practical implications for child care (Souza Prado & Caetano, 2024).

Territorialization in health initially involves revisiting the historicity of the concepts of "territory" and "territoriality", especially in their appropriation by the health sector. Etymologically linked to land possession and symbolic domination, territory has carried material and symbolic dimensions of power since its origin. In the current context, it is also understood as a space of existence, identity, and belonging (Fiocruz, 2023).

In the field of collective health, the territory is seen as a socially produced space, permeated by political, cultural, and economic relations that directly influence living and health conditions. This approach goes beyond a merely technical-administrative view and promotes a broader reading of social flows, structural determinants, and collective identities (Souza Prado & Caetano, 2024; Silva & Oliveira, 2021).

This broader conception also emphasizes that territory is both physical space and "territoryexistence": a place of identity, belonging, and everyday life (Fiocruz, 2023).

In this context, territorialization is configured as an analytical method and strategic practice in primary care. It allows us to know local realities, identify needs, plan interventions, and reveal critical inequalities among children in vulnerable contexts (Ferreira & Lima, 2022; Fiocruz, 2023). By mapping social determinants, such as housing, income, education, and access to services, it promotes more equitable and contextualized actions (Silva & Oliveira, 2021).

Children's social vulnerability reflects inequalities in the social determinants of health (SDH) and a lack of effective policies. Programmatic vulnerability, on the other hand, points to the limitations of the health system and other public policies in ensuring full protection. Children in vulnerable situations face structural and symbolic barriers that compromise their development, citizenship, and well-being (Souza Prado & Caetano, 2024; Ferreira & Lima, 2022).

In this scenario, the strategic role of primary care is strengthened, with qualified teams, capable of working in vulnerable territories in dialogue with communities. The Family Health Strategy, in line with the guidelines of the National Policy for Comprehensive Child Health

Care (PNAISC), defines responsibilities by territory, adjusting the population load according to local vulnerability (Brasil, 2021).

The training of professionals, with teaching-service integration, is fundamental: it requires data systematization, territorial analysis, and permanent education to strengthen a critical approach to health work processes (Silva & Oliveira, 2021; Fiocruz, 2023).

Despite the relevance of the theme, there are still few studies that discuss the organization of comprehensive child health care from the perspective of territorialization and care networks, with a focus on situations of vulnerability. There is, therefore, a scientific and political gap to be addressed.

In this context, the present study is justified by its timeliness and novelty, by proposing a reflective analysis of child care in territories marked by vulnerability. This is a relevant contribution to collective health and nursing, evidencing the strategic role of professional performance in promoting the health of child populations in contexts of risk and inequality.

Therefore, the objective of this study is: To analyze the main care provided to children in vulnerable territories.

2 METHODOLOGY

Study Type

A literature review was carried out of a quantitative nature in relation to the number of selected articles and qualitative in relation to the discussion of the articles (Pereira et al., 2018; Gil, 2017).

This is a bibliographic research of the integrative, descriptive and exploratory review type, with a qualitative approach, which aims at a deep understanding of the phenomenon studied through the analysis of previously published articles (Souza; Silva; Carvalho, 2010).

The integrative review followed six stages: identification of the theme and formulation of the research question by the acronym PICo; establishment of inclusion and exclusion criteria; categorization of studies; evaluation of the selected articles; interpretation of results and synthesis of knowledge (Mendes; Scott; Galvão, 2008).

Search Strategy

To elaborate the research question, the PICo strategy was used, defined as population (children), intervention (care) and context (territories of vulnerability).

Health Sciences descriptors (DeCS) were selected: child, vulnerability, and care, in addition to the MeSH terms: child, care, and vulnerability, combined by the Boolean operator "AND" to optimize the search in Portuguese, English, and Spanish.

Data Collection

Data collection took place electronically between March and April 2024, in the Latin American and Caribbean Literature on Health Sciences (LILACS), Nursing Databases (BDENF), MEDLINE, and Online Scientific Electronic Library (SCIELO) databases, accessed electronically through the Virtual Health Library (VHL). This study used the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) instrument, which consists of a flowchart for the selection of articles, promoting a systematization of the data in order to obtain greater clarity in the research.

Articles available in full and free of charge, which adhered to the theme/objective of the study, scientific articles in Portuguese, English, and Spanish, and in the time frame of the last five years, between 2019 and 2024, were considered.

Duplicate studies, identified by the Rayyan software, studies outside the child age group, and those that did not describe a context of vulnerability were excluded.

Data Analysis

For data analysis, the Thematic Analysis Technique based on the Bardin (2011) method was applied, involving three phases: pre-analysis, exploration and inference. Initially, the collected material was read and organized; then, the recurring themes were identified; and, finally, there was the selection and categorization of the themes, culminating in the critical interpretation of the results (Santos, 2012). The categories were elaborated 'a priori', and the analysis allowed us to evaluate the production of knowledge and discuss the findings.

Ethical Aspects

As this is an integrative review, without direct contact with human beings, submission to the Ethics Committee is waived, according to Resolution No. 466/2012 of the National Health Council. It should be noted that copyright was respected in accordance with Law No. 12,853/2013.

3 RESULTS

Initially, 2,737 articles were identified in the databases, after filtering, 960 remained. Among these, after the elimination of duplicates, through the Rayyan application, 50 were selected to be read in full and of these 10 were selected to compose the study. The screening

process and the number of publications obtained in each stage are exposed in the demonstrative flowchart, shown in Figure 1.

Figure 1

Flowchart demonstrating the search strategies in the databases

Source: Prepared by the authors.

A synoptic table was prepared in order to synthesize the main information of the selected articles. Thus, it became possible to view the title, author, year, objective, method, and journal of publication of the articles included in the review, as described in Chart 1. The articles, when cited in the tables, are represented by the alphanumeric symbology A1, A2... A10.

Table 1

Characterization of the articles analyzed in the integrative review on the care of children in vulnerable territories. Salvador – Bahia, Brazil, 2024, (n=10).

No.	Title	Author	Year	Journals	Goal
A1	Brazilian and Portuguese guidelines for the protection of children vulnerable to violence in the COVID-19 pandemic.	Cabral, L.E. et al	2021	Anna Nery School	Identify and analyze measures to protect children/adolescents vulnerable to violence in the COVID-19 epidemic in Brazil and Portugal.

A5	Medical student in action: promoting protective factors against sexual violence in vulnerable children	Touso, M.F.S. et al.	2021	Rev. Medicine	To analyze the repercussions of health education activities on sexual violence against children in situations of social vulnerability, enabling a reflection on the exercise of child protection in medical education.
A6	Representations of oral health care for vulnerable children in a city in northeastern Brazil	Cavalcante, P.S.; Gonzalez, R.H.	2022	Health and Society	To analyze the social representations of oral health care for vulnerable children

A7	RISC Units: a strategy for assessing health risks in children in contaminated communities	León-Arce, M. et al.	2023	Rev Panamericana de Salud Pública	Assess and mitigate health risks in children living in areas with environmental contamination.
A8	Full-time education: from deprivation to protection	Rodrigues, M.R.; Santiago, E.J.F.; Rota Júnior, C.	2021	Educational Psychology	To investigate how school education professionals, directly involved with this proposal and who have experienced the daily work in the context of full-time education, have apprehended such changes and, above all, how they perceive the public with which they are dealing: children and adolescents.
A9	Developmental Health in the context of an early childhood program in Brazil: the experience of better early childhood	Gonçalves, T.R.; Duku, E.; Janus, M.	2019	Public Health Notebook	The objective of this study was to identify family and child characteristics associated with developmental health outcomes in children aged 4 to 6 years who participated in Primeira Infância Melhor (PIM), a home visiting program in the state of Rio Grande do Sul, Brazil.
A10	Children and adolescents in situations of social vulnerability in Brazil	Rezende, K.; Cappellari, H.C.L.; Pagani, L.A.G.	2022	Research, Society and Development	To analyze the situation of social vulnerability in our country, through the study of the concepts of social vulnerability, life in society and the meaning of dignity of the human person, in order to understand what the situation of social vulnerability is, as well as the ways to detect it, the pictures as it presents itself in our daily lives.

Source: Prepared by the authors.

Finally, a descriptive analysis was carried out, adopted for the organization and discussion of the evidenced results, in which a synthesis of each study included in the review was presented, organized into thematic categories.

Thematic Categories

Categorization, according to Bardin (2011), aims to simplify raw data through condensation, organizing them into a system of categories. This process can be carried out in two ways: by "boxes" (a priori categories), in which the categories are defined before the analysis based on theoretical foundations, or by "miles" (a posteriori categories), in which the

categories emerge after the analysis of the content. Also, according to the author, good categories should be mutually exclusive, homogeneous, pertinent, objective, faithful and productive.

In view of this, the deductive method (a priori) was chosen. Based on the theoretical foundations, the information was carefully analyzed in line with the specific objectives of this review. Thus, three categories emerged, presented in Chart 2.

Table 2

Analytical categories that emerged from the integrative review on the care of children in vulnerable territories. Salvador – Bahia, Brazil 2024 – Dates

Categories	Title
Category 1	Care for vulnerable children in situations of violence
Category 2	Methods of interaction for child care
Category 3	Government strategies for the care of children in vulnerable situations

4 DISCUSSION

Care for vulnerable children in situations of violence

Violence against children — physical, psychological, sexual and neglect — constitutes a serious violation of human rights and a challenge to public health. According to Cabral et al. (2021), these forms of aggression affect different age groups and can occur both in the domestic environment and outside it. The situation of social isolation, as experienced during the Covid-19 pandemic, intensified the exposure of children to intrafamily violence, demanding more incisive responses from health and assistance services.

During the pandemic, the protection measures recommended in Brazil included actively listening to victims, removing aggressors, monitoring by health and social assistance professionals, and encouraging reporting through social networks and institutional channels. These strategies were essential, especially in contexts of social vulnerability, in which children already had a history of rights violations (Cabral et al., 2021).

Among the various types of violence, sexual violence is considered the most impactful in childhood. To address it, public policies such as the Specialized Reference Center for Social Assistance (CREAS) and the Specialized Protection and Care for Families and

Individuals (PAEFI) play a fundamental role in the care of victims and their families, with a focus on qualified listening and the construction of protective bonds (Martins & Santos, 2022).

Methods of interaction for child care

Health care for children in vulnerable situations requires the adoption of diverse care technologies, which go beyond equipment (hard technologies), incorporating knowledge (light-hard) and, mainly, interpersonal relationships (soft technologies), such as bonding and welcoming (Alaion & Machado, 2021).

In this sense, strategies such as playful games, conversation circles and the use of drawing as a symbolic expression were pointed out as effective instruments to establish communication with children and collect relevant data about their health. For example, Puygserver et al. (2020) used playful activities to assess children's oral language before and after the speech-language pathology intervention, promoting early diagnosis and appropriate follow-up.

Conversation circles, held in Family Health Support Centers (NASF), also proved effective in addressing topics such as child mental health, enabling a collective space for reflection and listening (Alaion & Machado, 2021). Touse et al. (2021) highlight the importance of health education through playful dynamics, especially in coping with sexual violence, allowing children to recognize risk situations and express their experiences safely.

Another relevant example is the use of the drawing-story technique, reported by Cavalcante and Gonzales (2022), as a tool for understanding children's perceptions of oral care, promoting a space for subjective expression about everyday health practices.

Government strategies for the care of children in vulnerable situations

Given the complexity of the factors involving child vulnerability, intersectoral government strategies become fundamental. León-Arce et al. (2023) propose, for example, the creation of Child Risk Units in Contaminated Areas (RISC), aimed at caring for children exposed to contexts of syndemic vulnerability, which involve overlapping environmental, social, and health risks.

Another essential factor for the child's care is nutritional status. According to Baptista (2019), childhood anemia, associated with poverty, impairs physical, cognitive, and emotional development. In this context, programs such as the National Iron Supplementation Program (PNSF) and Bolsa Família have contributed to improving the nutritional status of children served by the Family Health Strategy.

At the interface between education and health, the More Education Program seeks to extend the school day and strengthen the curriculum in schools with low development indexes, located in vulnerable territories (Rodrigues, Santiago & Rota Junior, 2021). These actions aim not only at school performance, but also at the social protection of children at risk.

In this sense, Primeira Infância Melhor (PIM), a state program of home visits, focuses on the integral development of the child from pregnancy to six years of age. Studies such as the one by Gonçalves, Duku and Janus (2019) reveal positive impacts of PIM on children's development, especially at the time of transition to schooling, reflecting the importance of early care in vulnerable territories.

Finally, despite all the state apparatus aimed at protecting the rights of children and adolescents, the study by Rezende, Cappellari and Pagani (2022) concludes that it is essential that society is sensitized to this reality and acts in accordance with current legal norms. The collaboration of all is essential to promote the integration and protection of this group, respecting their rights and particularities. In this way, in addition to ensuring the healthy development of these — who represent the future — it contributes to the continuity of life in society and to the strengthening of the future of the nation.

5 FINAL CONSIDERATIONS

The analysis of the literature shows that child care in vulnerable territories demands interdisciplinary, intersectoral and territorialized approaches, capable of articulating public policies in the areas of health, education and social assistance.

It is essential to have continuous and qualified training of primary care professionals, so that they can act sensitively and effectively in the face of the multiple expressions of child vulnerability.

The reviewed studies reinforce the importance of strategies that not only guarantee physical care, but also promote the welcoming and active listening of children, respecting their singularities and considering the social contexts in which they are inserted. It is also emphasized the need for accessible and integrated interventions in the territory, which recognize and enhance local resources.

The articulation between the State, health professionals and the community is essential for the implementation of sustainable and transformative actions, capable of promoting equity in child care.

Although this study has limitations regarding the time frame of the publications analyzed, it contributes with relevant subsidies for the understanding of the complexity involved in the care of children in contexts of vulnerability and points out ways to build more integrated and humanized practices.

ABSTRACT

Technological progress has expanded the capacity for observing geographic space. Drone technology, or Remotely Piloted Aircraft Systems (RPAS), has been widely disseminated. With the increasing use of RPAS, there is a growing application of this technology for monitoring, inspection, and planning purposes, as well as for obtaining aerial imagery for terrain studies, with special attention to environmental impacts. The use of this aircraft can significantly contribute to reducing environmental damage. The objective of this study is to take advantage of RPAS technology and its generated products to plan safety measures for combating fires in massive urban solid waste deposits. The study addressed the challenge of managing fire control in solid waste landfills, presenting RPAS as a valuable tool for surveying and monitoring these areas, especially during large-scale fire events. It is considered that this work and the proposed methodology were both appropriate and innovative, as they provided a tool-oriented approach for data collection to support fire prevention planning. The results showed that the use of RPAS for area mapping can be useful for fire-fighting planning, particularly in the context of the ARS-Aurá and Guamá sites.

RESUMO

O progresso tecnológico tem proporcionado uma ampliação da capacidade de observação do espaço geográfico. A tecnologia dos drones ou Sistema de Aeronaves Remotamente Pilotadas (SARP) está sendo amplamente difundida. Com o aumento do uso das SARP, há uma crescente utilização desta tecnologia para monitoramento, fiscalização e planejamento, além da obtenção de imagens aéreas para estudos do relevo, com especial atenção aos impactos ambientais. A utilização dessa aeronave pode contribuir significativamente para a redução dos danos ambientais. O objetivo deste trabalho é aproveitar o SARP aproveitando os recursos dessa aeronave e os produtos que podem ser gerados, visando planejar medidas de segurança para o combate a incêndios em massa de resíduos sólidos urbanos. O trabalho apresentou o desafio de gerenciar o combate ao fogo em aterros de resíduos sólidos, sendo uma ferramenta valiosa para o levantamento e monitoramento dessas áreas, especialmente durante a ocorrência de incêndios em massa. Considera-se que este trabalho e a metodologia proposta foram adequados e inovadores, pois forneceu uma orientação de ferramenta para coleta de dados para o planejamento contra incêndios. Os resultados mostraram que o uso de SARP, para mapeamento de área pode ser útil para o planejamento de combate a incêndios, neste contexto, dos ARS-Aurá e Guamá.

RESUMEN

El progreso tecnológico ha ampliado la capacidad de observación del espacio geográfico. La tecnología de drones, o Sistemas de Aeronaves Pilotadas a Distancia (RPAS), se ha difundido ampliamente. Con el creciente uso de RPAS, se observa una aplicación cada vez mayor de esta tecnología para fines de monitoreo, inspección y planificación, así como para la obtención de imágenes aéreas para estudios del terreno, con especial atención a los impactos ambientales. El uso de estas aeronaves puede contribuir significativamente a la reducción del daño ambiental. El objetivo de este estudio es aprovechar la tecnología RPAS y sus productos generados para planificar medidas de seguridad para combatir incendios en grandes depósitos de residuos sólidos urbanos. El estudio abordó el desafío de la gestión del control de incendios en vertederos de residuos sólidos, presentando a los RPAS como una valiosa herramienta para el estudio y monitoreo de estas áreas, especialmente durante incendios de gran magnitud. Se considera que este trabajo y la metodología propuesta fueron apropiados e innovadores, ya que proporcionaron un enfoque orientado a herramientas para la recopilación de datos que apoya la planificación de la prevención de incendios. Los resultados mostraron que el uso de RPAS para el mapeo de áreas puede ser útil para la planificación de la lucha contra incendios, particularmente en el contexto de los sitios de ARS-Aurá y Guamá.

1 INTRODUCTION

The technological advancement of the last decades has transformed the way human beings observe and understand geographical space. Among the most relevant innovations are Remotely Piloted Aircraft Systems (SARP), known as drones. The term "drone", of North American origin, designates remotely controlled aircraft (DE QUEIROZ et al., 2022). SARP is the translation of the term Unmanned Aircraft System (UAS), adopted by the International Civil Aviation Organization (ICAO) (SANTOS, 2019).

Initially aimed at military purposes, SARPs have become widely used in civilian activities, such as environmental monitoring, infrastructure, mining, civil construction, and agriculture (CHOMSKY; VLTCHEK, 2022). This technology makes it possible to obtain accurate information on the earth's surface, at low cost and with high quality, especially revolutionizing geographic mapping (SANTOS, 2021). There are different types of SARPs depending on the purpose: rotary-wing, more popular, and fixed-wing SARPs, with greater autonomy and range.

According to Santos et al. (2020), SARPs provide quick and detailed data, being useful in mapping landfills and dumps, areas frequently affected by fires and fires that cause explosions and environmental and public health damage. Quintas (2005) highlights that the intensity of fires and inadequate landfill infrastructure can cause serious environmental impacts and risks to human health, requiring effective preventive measures.

The National Solid Waste Policy (PNRS), instituted by Law No. 12,305/2010 and regulated by Decree No. 7,404/2010, defines solid waste as materials discarded from human activities that must be managed in a technical, economically feasible and environmentally sustainable manner (BRASIL, 2010). This concern has its roots in the Industrial Revolution, a period in which production and disposal patterns intensified (SEARA et al., 2013), but the issue dates back to the Middle Ages, with the first urban sanitary problems (CÂNDIDO et al., 2009).

Currently, there is a crisis in the management of Urban Solid Waste (MSW), aggravated by accelerated urbanization and the lack of infrastructure. Marques (2011) points out that the inadequate disposal of USW is one of the greatest municipal challenges, due to the lack of resources and technical knowledge. This mismanagement generates impacts such as soil degradation, water contamination, air pollution, and vector proliferation (JACOBI et al., 2021).

In the Metropolitan Region of Belém (RMB), the situation is critical. Belém, Ananindeua and Marituba collect about 40 thousand tons of garbage per day, resulting in bad smells, contamination and inconvenience to the population. Household waste alone corresponds to about 1,620 tons per day (VALE et al., 2015). The inadequate disposal and the risk of reactivation of the old Aurá dump aggravate the local "garbage crisis", intensifying fires in waste masses (PORTELLA, 2014).

Urban Solid Waste Landfills (ARSU) are areas of permanent risk due to the possibility of fires caused by the accumulation of flammable materials, operational failures and climatic factors. Therefore, it is essential to use effective monitoring, control, and prevention methods. In Belém, ARSU have a high risk of combustion, even without receiving hazardous waste, which can cause atmospheric pollution and soil and water contamination.

The use of drones equipped with optical, thermal, and multispectral sensors allows for agile and safe aerial monitoring, identifying hot spots and accurately assessing fire behavior. Thus, the use of SARPs in landfills represents a significant technological innovation, contributing to fire planning, inspection, and prevention, in addition to supporting environmental monitoring (SANTOS, 2021).

Thus, this dissertation aims to analyze the use of SARPs in Urban Solid Waste Landfills (ARSU), highlighting their technical resources and products for the planning of fire prevention and fighting measures. It is intended to demonstrate how this technology can contribute to a safer, more efficient and sustainable management of urban solid waste, integrating technological innovation and environmental responsibility.

2 METHODOLOGY

The research is of a bibliographic, qualitative and descriptive nature, based on the analysis of references on the use of Remotely Piloted Aircraft Systems (SARP) in the management and monitoring of Urban Solid Waste Landfills (ARSU). Books, articles, dissertations and theses on waste management, remote sensing, photogrammetry, geoprocessing and fire prevention were consulted (BRASIL, 2010; GOUVEIA, 2011; FLORENZANO, 2016; SANTOS, 2021). The methodology comprised three stages: data collection, data analysis and fieldwork, integrating remote sensing information and on-site observations.

2.1 DATA COLLECTION

The collection was carried out in the ARSU of the Metropolitan Region of Belém (RMB) using the SARP DJI Mavic 2 Enterprise Advanced, equipped with GNSS L1, IMU, 20 MP RGB and thermal camera, autonomy of 25 minutes and range of 4 km. The experimental flyby took place at 1 pm, under favorable weather conditions measured by the UAV Forecast application (FLORENZANO, 2016). The planning and execution of the flights were done in DroneDeploy® (DD), which allows configuring routes, altitude, and image overlay (DA SILVA et al., 2021). At ARS–Aurá, the flight was carried out at 100 m altitude, with a frontal overlap of 75% and a lateral overlap of 65%, covering 0.217 km² in 13 minutes and generating 252 images. All flights followed the rules of ANAC, DCEA, ANATEL, ANTAQ and ANEEL, according to Santos (2021). The products obtained subsidized the elaboration of high-resolution digital maps for the planning of firefighting actions.

2.2 DATA ANALYSIS

The captured data was processed in DroneDeploy®, with checkpoint verification to improve the accuracy of the orthomosaic and 3D models. Products such as 2D orthomosaic, NDVI, MDE, MDT, thermal model (MIT) and 3D model (M3D) were generated, later integrated into QGIS. This integration allowed spatial manipulation and analysis, resulting in thematic maps at the scale of 1:5,000, used in the planning of firefighting actions (IBAM, 2015). The maps identified buildings, structures and risk areas, providing technical support for operational monitoring.

2.3 FIELDWORK

The fieldwork was essential to validate the data obtained by remote sensing and refine the planning of the flights. The Avenza Maps app was used to mark ground control points and risk areas. Direct observations and photographic records were also carried out to characterize the areas of waste deposition, evaluating variables such as soil type, slope, drainage and occupied area.

In addition, a fire drill and evacuation was conducted at the Urban Waste Processing and Treatment Center (CPTR-Marituba), with the support of the 25th Military Firefighter Group (GBM). The activity made it possible to recognize the operational conditions of the landfill and to prepare a safety plan for preventing and fighting fires and landslides, in accordance with current regulations (SANTOS, 2021). During the exercise, an operational

checklist was applied for flying with SARP, essential for mission planning and support for CBMPA actions.

4 RESULTS AND DISCUSSIONS

The aerial survey carried out with the DJI Mavic 2 Enterprise Advanced model generated products that provided detailed information about the Urban Solid Waste Landfills of the Metropolitan Region of Belém (ARSU-RMB). The first product generated by the remotely piloted aircraft was the digital model, or orthomosaic, which results from the union of several scenes (orthophotos) captured in the ARS-Aurá. The ARS-Aurá orthomosaic consists of a georeferenced aerial image, produced using the DroneDeploy (DD) image processing platform. This means that the spatial elements in the orthophotos — such as the embankment, the massifs, the trees and the buildings — have positions corresponding to their actual geographic location.

The orthomosaic of landfills can be used to collect information, mainly visual and updated, about these areas. It is an essential product for daily use in the activities of ARSU-RMB, and can be used by various sectors, such as engineering, topography, energy, mining, agriculture and, especially, by the Military Fire Department of Pará (CBMPA).

This product is widely used in the construction of image maps and maps, for carrying out inspections, georeferencing, area measurements, map comparison and monitoring of the evolution of projects. In addition, it has direct application in the planning of firefighting actions in the massifs. Figure 1 shows the ARS-Aurá orthomosaic, which enables the pre-mapping and identification of strategic points for firefighting planning, as well as the analysis of other relevant data for understanding the risks and threats in the ARSU-RMB.

Figure 1

Orthomosaic or georeferenced orthophoto of the ARS of Aurá

Source: Author, 2024

The ARS-Aurá orthomosaic provides a complete vertical view of the area, favoring the performance of forensic examinations and facilitating the collection of information with less intervention and exposure of surveyors or experts. Thus, the use of Remotely Piloted Aircraft Systems (SARP) for the collection of preliminary data in these locations is highly recommended, as it is a tool capable of obtaining, quickly and accurately, a large volume of high-quality data, in addition to allowing the collection of spatial coordinates.

In general, the orthomosaic is the main product generated by SARP, since, through software that joins orthophotos based on common points identified in two or more images — such as DroneDeploy and the Geographic Information System (GIS) QGIS® —, it is possible to carry out direct measurements of distances, areas and angles, in addition to preparing thematic maps or situation plans. with precision, agility and low cost.

With the insertion of the ARS-Aurá orthomosaic in the GIS (Figure 2), measurements, demarcations and analyses become feasible for the tactical and operational use of firefighting and for the establishment of the command post by the Military Fire Department of the State of Pará. The orthomosaic can also serve as a basis for fire and explosion forensics. In the context of planning actions against fires in solid waste landfills, the implementation of QGIS facilitates the manipulation of images captured by SARP, such as the orthomosaic, for the purposes of topographic survey, analysis of the volume of waste in the massif, evaluation of water bodies, positioning of vehicles and implementation of the Incident Command System (SCI). among others. Figure 2 illustrates the application of GIS tools used to measure segments and areas of the ARS-Aurá in the orthomosaic image, as well as in other products automatically obtained by SARP via DroneDeploy (DD).

Figure 21

QGIS interface with ARS-Aurá orthomosaic image

Source: Author, 2023

In the QGIS® SIG, it is also possible to prepare an Image Chart (IC) of the solid waste landfills of the RMB, with the objective of defining strategic points of fire fighting. In addition, this tool enables the detailed identification of structural characteristics, which are fundamental for the composition of technical reports on fire prevention in ARSU-RMB. The ARS-Aurá orthomosaic, with a spatial resolution of 2.04 cm, is a high-precision raster image, which allows the complete visualization of the landfill area and the production of Image Maps (IC) or Digital Maps (DM). These products are used both for surveying spatial information and for the updated visualization of regions of interest, especially in areas subject to fire occurrences in the solid waste massif.

Through the ASRS-Aurá maps (Figure 14), it is possible to carry out inspections, georeferencing, measurements of burned areas and monitor the evolution of firefighting actions carried out by CBMPA. Thus, Figure 3 illustrates the application of the Geographic Information System (GIS) QGIS, with the image of the solid waste landfill of Aurá, used to define strategic firefighting points, in addition to enabling the identification of structural characteristics relevant to the preparation of technical reports on fires.

Figure 32

Image Letter (CI) of ARS-Aurá for the Survey of information of interest

Source: Author, 2024.

Consequently, an Image Chart (IC) generated from the orthomosaic produced by SARP (drone) constitutes a cartographic representation that allows the full and detailed visualization of the mapped area. Among its main benefits, the time savings, the richness of details and the precision in the identification of real points and obstacles on the terrain stand out, which can interfere with the movement of vehicles to the fire outbreaks, contributing significantly to the efficient planning of firefighting.

The cartographic resource can also be viewed through mobile applications, such as Avenza Maps, which has tools for spatial location in an agile and intuitive way, in addition to allowing the exchange of information in real time between the garrisons involved in the occurrences. This resource also helps in the structuring of the Incident Command System (SCI). Figure 4 shows the ARS-Guamá Image Chart viewed in the Avenza Maps application. Thus, the CI, generated in the GIS and exported to the application, assists in decision-making as to the type and amount of resources to be sent to the occurrence, in addition to subsidizing the operational planning of the CBMPA based on updated images, which can be transmitted in real time to the SCI.

Figure 43

CPTR-Marituba (ASRS-Guamá) situation plan on the Avenza Maps App

Source: Author, 2024

The Soil and Plant Interaction Image (NDVIT), also generated by SARP, results in the differentiation between occupied and vegetated areas, in a practical and effective way. Figure 16 shows the area of the ARS-Aurá, in which the red color indicates regions without vegetation cover or occupied by structures. The image presented in Figure 5 is an example of the application of Remote Sensing with SARP. In the case of the ARS-Aurá NDVIT, the product represents an essential resource for the characterization and spatialization of the physical environment, serving as a basis for the planning of firefighting actions in landfills. The NDVIT assists in the identification and characterization of soils, vegetation and access roads, which is essential for the planning of CBMPA vehicle positions, since it allows differentiating roads, streets and areas devoid of vegetation.

Figure 5

Georeferenced Soil and Plant Interaction (NDVIT) of the ARS of Aurá

Source: Author, 2024.

The ARS-Aurá Digital Elevation Model (MDE) and Digital Terrain Model (DTM) are SARP-generated products that represent the surface and terrain in three dimensions, including information on elevation and ground height, vegetation, and man-made structures.

The DEM, also known as the Digital Surface Model (SDM), represents all above-ground objects, such as buildings, trees, vehicles, and people. Although the MDE is not suitable for high-precision altimetry projects, it provides CBMPA with an overview of the ARS-Aurá elevation plan, constituting a valuable resource for firefighting planning. Based on this model, it is possible to build altimetric plans of specific areas, considering elements such as vegetation and buildings, which contributes to safer and more efficient tactical analysis.

In addition, the joint use of the MOU and the MDT of the ASRS-Aurá makes it possible to identify more efficient access routes for CBMPA combat vehicles, taking into account the topography of the terrain. From this information, containment barriers can be planned to prevent the spread of fire in the massif. Figure 6 shows that the MDE and MDT products of the SARP in the ARS-Aurá can be widely used in the planning of firefighting actions. These models must be analyzed in conjunction with other tactical and strategic information defined by the Commander of the Socorro (CMD of SOS). It can be seen in the images that it is possible to identify lower and higher regions of the terrain, as well as areas with the presence of watercourses, which can be used to refuel CBMPA tanker vehicles.

Figure 6

Georeferenced Digital Elevation Model (MDE) and Terrain Model (DTM) of the ARS of Aurá

Source: Author, 2024

The SARP thermal camera is a device that uses infrared technology to capture images containing temperature information. Unlike conventional RGB cameras, which record visible light, thermal cameras detect the infrared radiation emitted by objects based on their temperatures (Figure 18). In this way, this resource generates the thermal imaging product,

which has several applications in firefighting planning in solid waste landfills, enabling the mapping and monitoring of areas.

This type of image makes it possible to identify temperature variations and, consequently, thermal patterns, in addition to recognizing hot and cold spots and places that are difficult to access due to thermal intensity. In addition to supporting firefighting planning, the SARP thermal camera can be used in different contexts, such as search and rescue operations, inspections of massif infrastructures (points 2 and 4) and buildings (points 1, 5 and 6), as well as environmental and safety monitoring (point 3) of ARSU-RMB facilities.

The thermal camera applied in the ARS-Aurá captured thermal information that offers valuable perspective in low-visibility situations where conventional optical cameras may not be sufficient, such as at night or in densely vegetated environments. In the context of the ARSU of the RMB, thermal cameras play a fundamental role in the preventive monitoring of hot spots and fires, through the analysis of temperature variations in buildings, roads and homes. Regions in redder tones indicate the presence of high heat or flames, allowing quick and effective responses to prevent the spread of fire.

Figure 8 shows the three-dimensional image of the Solid Waste Landfills of Aurá (ARS-Aurá), with identification of points of interest for firefighting, such as existing buildings, streets, roads and massifs. This representation also helps in locating natural drainage points, which can be used to direct water to the burned areas. The Three-Dimensional Terrain Model (M3D) generated by SARP constitutes a detailed visual representation of the terrain, allowing fire crews to plan more effective combat strategies during and after the event.

Figure 74

Georeferenced Thermal Image of the ARS of Aurá

Source: Author, 2024

The 3D model is particularly useful for identifying efficient access routes for combat vehicles, taking into account the topography of the terrain of the ARS-Aurá. With the 3D image of the ARS-Aurá, together with the MDE and the MDT, firefighters can define appropriate combat techniques, such as the application of misty jets of water in rapid and controlled pulses, optimizing the cooling of the massif. M3D stands out, therefore, by allowing the visualization of access points, buildings, roads and natural barriers, which can both hinder the fight against fire and prevent its propagation, as shown in Figure 8.

Figure 8

Three-dimensional Terrain Model (M3D) of ARS-Aurá

Source: Author, 2024

In Figure 9, it is possible to identify several characteristics and structural elements of the landfill, including buildings susceptible to risk during fires, with the possibility of gauging their heights. The streets and internal paths are clearly visible in the M3D, which is useful for the traffic management of CBMPA vehicles during emergency situations. Finally, with M3D, CBMPA obtains a three-dimensional view of land use, allowing the location of residential, commercial and industrial areas around ARS-Aurá.

Figure 95

Three-dimensional model of the ARS-Aurá structures

Source: Author, 2024.

In Figure 10, still with the 3D image of the ARS-Aurá, vegetated regions and the differentiation of multi-storey buildings are observed, in addition to the estimate of the volume of the landfill. This information is useful for assessing the amount of material needed to cover areas affected by fires. The ARS-Aurá 3D model is extremely valuable for the planning of actions in urban solid waste landfills, as it allows a detailed visualization of the site, facilitating the identification of risk areas and the elaboration of fire prevention and fighting strategies by CBMPA.

Figure 10

Three-dimensional model of the embankments and roads of the ARS-Aurá

Source: Author, 2024

However, it is important to emphasize that the effectiveness of M3D depends directly on the accuracy of the data collected and the proper processing of the images. The planned flights at an altitude of 100 meters allowed the generation of detailed comparative models, enabling a refined analysis of the earth's surface and the identification of strategic zones for the positioning of combat vehicles. From the georeferenced orthomosaic, combined with other products, such as the Digital Elevation Model (MDE), it is possible to visualize slope values and contour lines, creating an altimetric profile of the ARS-Aurá.

Figure 11 shows the contour lines of the massif, which graphically represent the altitudinal variation of the embankment — essential information for planning access and combat routes, in addition to supporting the evaluation of safe areas for evacuation, when necessary. Thus, the SARP allowed to represent the variation in elevation of the terrain both in the massif and in the surroundings of the landfill. Figure 11 shows the orthomosaic and the MDE of the ARS-Aurá obtained by SARP overflight, associated with the contour lines generated in DroneDeploy, with a spacing of 2 meters between them.

Figure 116

Three-dimensional and elevation model of ARS-Aurá

Source: Author, 2024

The products generated by the SARP overflight — such as the M3D, the MDE and the MDT — are widely applicable to firefighting planning, involving several stages of analysis. In this sense, Figure 12 presents an integrated interpretation of the terrain of the ASRS-Aurá, based on the use of orthomosaic, the MDE and the MDT, allowing the identification of areas of greater risk, as well as the planning of access routes for combat vehicles of the CBMPA and the Civil Defense.

Figure 12

Three-dimensional and elevation model of the ARS-Aurá

Source: Author, 2024

The interrelated analysis of SARP products applied to the Urban Solid Waste Landfills of the Metropolitan Region of Belém (ARSU-RMB) contributes significantly to decision-making during dynamic firefighting actions. The configuration of the massif presented in the

M3D, MDE, MDT models and in the contour lines provides data on height, width and slope, essential factors to assess the structural stability of the terrain and define safe conditions for combat, as illustrated in Figure 13.

In the case of ARS-Aurá, the integrated analysis of SARP products over a specific area facilitates the identification and quantification of objects, such as buildings, including altimetric information. The thermal camera can, in this context, be used to monitor the surface temperature of the landfill during and after fires, especially in regions of greater combustion or potential risk of explosion.

Figure 13 shows that the interrelation of the products generated by the SARP — particularly the high-resolution thermal and orthogonal images — allows for a detailed analysis of the condition of the ARS-Aurá terrain. The association between SARP products should be seen as a strategic tool to support CBMPA, as it enables the monitoring of fire propagation, considering topography, land use and thermal intensity, all from a safe position. This information guides the efficient targeting of combat efforts, taking into account the altimetry achievable by vehicles over the massif and avoiding the exposure of teams to risky situations. Thus, the interrelated use of SARP products in ARSU-RMB provides valuable real-time information, enhancing the safety and effectiveness of firefighting operations.

Figure 137

General SARP products of the ARS of Aurá Metropolitan Region of Belém (RMB)

Source: Author, 2024

Specifically in relation to the SARP thermal camera applied to the data collection in the ARS-Guamá, a highly satisfactory performance was observed, especially due to the ability to detect hot spots in the massif, coming from the gas drainage systems. In the case of the ARS-Guamá massif, the flight carried out with the thermal camera made it possible to easily identify the network of vertical drains, interconnected to horizontal drains built at the base of the landfill, used for the controlled burning of the gases generated.

The vertical drain system plays an essential role in reducing the internal pressures of the massif, resulting from the generation of biogas, in addition to conducting the effluents to the appropriate treatment site. Figure 25 shows the vertical drain system of the CPTR-Marituba (ARS-Guamá), as well as the temperature measured by the SARP thermal camera. At the end of the biogas drainage system, a temperature of 42°C was recorded.

Figure 14

ARS-Guamá biogas drainage systems in the SARP thermal chamber

Source: Author, 2024

The thermal camera technology embedded in the SARP represents, therefore, an effective solution for reading and locating heat, through the detection of infrared radiation emitted by objects, allowing to accurately determine the point of thermal origin. This information is crucial for fire attack planning, contributing to quick decision-making and, consequently, saving lives. In this way, the SARP thermal camera allows you to clearly visualize heat sources, consolidating itself as an essential tool in search, rescue, and

firefighting operations in landfills. With the SARP overflight equipped with a thermal camera, it is possible to perform an initial diagnostic image, identifying hot spots in the massif and monitoring temperature changes on the surface of the ARS-Guamá. This diagnosis is obtained by capturing the infrared radiation emitted by the biogas drainage systems, resulting in an accurate thermographic image.

SARP infrared thermography is a fast and low-cost method for detecting hot spots or fire, allowing the targeted displacement of fire crews to carry out fire control and extinguishing actions. The thermographic examination, in the context of this work, has as its main objective to verify the different temperatures in the massif and to provide subsidies for the operational combat action.

The SARP, equipped with a thermal sensor, makes it possible to accurately identify the areas of active flames, represented by the red spots. Also in Figure 15, the massifs of the ASRS-Aurá and ASRS-Guamá landfills stand out, represented in a lateralized RGB image (Red, Green, Blue) — the conventional camera present in all SARPs, which captures images in the visible spectrum of light (the colors perceptible to the human eye). The RGB image is therefore similar to those recorded by ordinary cameras. However, although the RGB camera allows quantitative data to be obtained from the surface, it is not sensitive to temperature variations, which limits its use for thermal analysis.

In this context, SARP thermal images presented a significant advantage, by allowing the rapid detection of hot spots that indicate possible fire outbreaks, enabling more agile and targeted responses to risk situations. Figure 15 illustrates the monitoring overflight carried out in the areas of ARS-Aurá and ARS-Guamá, with RGB and thermal cameras, intended to identify fire outbreaks or abnormal thermal changes, which may indicate conditions of imminent risk during the positioning of CBMPA vehicles to fight the fire.

Figure 15

Application of SARP thermal camera in ARSU-RMB

Source: Author, 2024

Also with the use of scheduled overflights with the SARP equipped with a thermal camera, it is possible to generate the Three-Dimensional Model (M3D), which provides a general and detailed view of the landfill, including in areas of difficult access. This model provides comprehensive coverage of the ARSU of the RMB, allowing the identification of strategic access points and the planning of tactical firefighting actions based on three-dimensional information. Figure 16 shows the thermal M3D of the ARS-Aurá, which provides a three-dimensional view of the extension of the land and the strategic access points to the areas of interest, including the streets of the site.

Figure 168

Application of SARP thermal camera in ARS-Aurá

Source: Author, 2024.

The results obtained from the interrelated analyses of SARP products, both in ARS-Guamá and ARS-Aurá, represent significant advances in compliance with fire safety standards, as well as for monitoring and inspection conducted by the Military Fire Department of Pará (CBMPA). Based on the products presented and analyzed in an integrated manner, it is possible to understand more accurately the reality of the ARSU of the RMB, especially from the perspective of the prevention of large fires. These methodologies can also be expanded and applied to other complexes or risk areas, consolidating a model of preventive monitoring and rapid response.

The three-dimensional mapping of the ARSU of the RMB generates high resolution and detailed products, allowing the visualization of elevations, slopes and obstacles existing in the terrain. Such SARP resources and applications directly assist the planning of firefighting operations, by allowing teams to visualize the topography of the terrain and identify critical and risk points. This approach contributes to more efficient allocation of resources by the CBMPA, since teams can be directed based on accurate and up-to-date information provided by the SARP. As a result, there is a reduction in operational response time and optimization of financial and human resources during firefighting operations in RMB landfills.

5 FINAL CONSIDERATIONS

The present work addressed the challenge of managing and fighting fire in urban solid waste landfills, proposing an innovative approach based on the application of the Remotely Piloted Aircraft System (SARP) as a technological tool to support the actions of the Military Fire Department of the State of Pará (CBMPA). This technology has proven to be highly effective in generating high-resolution geospatial products, useful for tactical and operational firefighting planning, with significant gains in efficiency, safety, and accuracy of information.

The use of SARP in the Urban Solid Waste Landfills (ARSU) of Aurá and Guamá proved to be a robust and innovative technical strategy, which allowed the survey, mapping, diagnosis and detailed monitoring of these areas. The proposed methodology proved to be adequate to local conditions and efficient in the collection, processing and analysis of georeferenced data, applicable to the planning of fire fighting and prevention in the Metropolitan Region of Belém (RMB). The results obtained proved the potential of using SARP in the mapping of risk areas and in the production of high-precision geospatial information, with low operational cost and great temporal and spatial flexibility. The products generated, such as orthomosaics, digital elevation models (MDE), terrain models (DTM), three-dimensional models (M3D) and thermal images, proved to be essential for the detection, analysis and monitoring of thermal events, and can be used before, during and after fire occurrences. This capacity increases the efficiency of monitoring and response actions, ensuring greater safety for CBMPA teams and professionals involved in operations.

The aerial surveys carried out with the SARP made it possible to build accurate and up-to-date space bases, with delimitation of the perimeter of the affected areas and generation of image maps and digital maps. These products showed high technical quality and reliability, allowing for rapid data collection and significantly reducing human exposure to risk areas. In addition, they showed potential for application in forensic investigations, enabling a detailed survey of burned areas, the measurement of waste volumes and the analysis of structural damage in the massif and in the surroundings of the landfill.

The integration of thermal and optical images provided a global and dynamic view of the fire scenario, contributing to the efficiency of the Incident Command System (SCI). The real-time monitoring of the evolution of the flames, the identification of multiple hot spots and the analysis of the spread of the fire offered fundamental subsidies for the strategic decision-making of the CBMPA. This integration optimized planning and operational response,

reducing the time of operation and increasing the security of the garrisons and the effectiveness in the use of available resources.

The study demonstrated a pioneering proposal of great practical relevance for the Military Fire Brigade of Pará, by introducing the systematic use of SARP equipped with thermal cameras in the planning and execution of firefighting actions in urban solid waste landfills. This technologically advanced approach has proven to be efficient in the early detection of fire outbreaks and in the management of complex environmental emergencies, contributing directly to the modernization of security and civil defense practices.

The incorporation of the geospatial products generated by the SARP into the operational planning of the CBMPA represents a significant advance in its institutional activities. The data obtained provides accurate and up-to-date information in real time, supporting tactical decision-making, environmental preservation, and the safety of field operations. These products strengthen the integrated management process, allowing CBMPA to act with greater predictability and precision in emergency response actions. Thus, this research reinforces the importance of using emerging technologies of remote sensing and geoprocessing as fundamental tools for the modern and sustainable management of critical areas.

In the context of the Metropolitan Region of Belém, which faces structural challenges in waste management, with the interdiction of the ARS of Guamá and the reactivation of the ARS of Aurá, still classified as an open-air dump, the use of SARP is configured as an innovative, sustainable and indispensable solution to improve operational efficiency and environmental safety in the fight against fires in urban solid waste landfills.

It is therefore concluded that the use of SARP in the management of fires in urban solid waste landfills represents not only a technological and scientific advance, but also a concrete contribution to public safety, environmental management and the protection of life. The proposed methodology serves as a model for the integrated application of geotechnologies aimed at monitoring, prevention, and response to environmental emergencies, reaffirming the commitment to innovation, efficiency, and sustainability in the operations of the Military Fire Department of the State of Pará and other civil defense institutions in the country.

6 FUTURE WORK

Considering the results achieved and the potentialities observed in this research, it is recommended to expand studies involving the use of Remotely Piloted Aircraft Systems (SARP) in the management and monitoring of Urban Solid Waste Landfills (ARSU). The possibilities for improvement include both the technological advancement of data acquisition tools and the integration of new methodologies for spatial analysis and computational intelligence.

First, it is suggested to improve SARP surveys, through the use of multispectral and hyperspectral sensors, capable of increasing the accuracy in the detection of gases and thermal hotspots associated with the combustion and decomposition of waste. This approach can contribute to the early prevention of fires and to the assessment of the environmental impacts resulting from the release of toxic and greenhouse gases.

Another relevant perspective is the integration of the data obtained by the SARP with Geographic Information Systems (GIS) platforms in real time, through Internet of Things (IoT) systems and cloud-based models, which would allow the continuous and automated monitoring of ARSU. The adoption of these technologies would enable the creation of intelligent operational control centers, capable of issuing automatic alerts and optimizing decision-making by the teams of the Military Fire Department of the State of Pará (CBMPA) and civil defense agencies.

It is also recommended to carry out controlled experimental tests to validate the efficiency of thermal detection models in different environmental conditions, such as seasonal variations, solar intensity, relative humidity and wind speed. These experiments may contribute to the development of standardized protocols for SARP operation in emergency scenarios, increasing the reliability of data and the safety of flight missions.

Additionally, it is proposed to apply artificial intelligence (AI) and machine learning techniques for the automated processing of aerial images, in order to improve the classification of critical areas, the identification of thermal patterns and the automatic recognition of fire outbreaks. This approach can reduce operational response time and offer real-time analytical support to CBMPA's field actions.

Finally, it is recommended the establishment of institutional partnerships between universities, environmental agencies, city halls and the Fire Department, aiming at the implementation of public policies for monitoring and waste management based on remote sensing and applied geotechnologies. Such partnerships could contribute to the

modernization of landfill management and the mitigation of environmental risks, especially in the Metropolitan Region of Belém, which still faces serious structural challenges in the final disposal of urban solid waste. In summary, the advancement of studies in this area tends to consolidate the use of SARP as strategic tools to support environmental management and public safety, promoting a more efficient, sustainable and technically based action in the fight against fires in urban solid waste landfills.

ABSTRACT

An informal caregiver is someone who assumes this role due to an emotional or kinship bond with the person needing assistance, without receiving training or payment. To understand how financial burdens affect the lives of caregivers of dependent adults, it is essential to know the economic reality of these individuals and the financial difficulties they face, especially regarding the expenses necessary for adapting to and maintaining care over time. The objective is to map the available evidence in the literature on the socioeconomic reality of informal caregivers of dependent individuals at home. This is a scoping review, based on the guidelines proposed by the Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for Scoping Reviews (PRISMA-ScR). The guiding question used was: "What is the socioeconomic reality of informal caregivers of dependent adults?" The searches were conducted in the MEDLINE, EMBASE, Web of Science, SCOPUS, LILACS, BDENF databases and on the ProQuest platform to include grey literature using the descriptors "family caregiver", "financial stress", "home care" and "adult". Twenty-four studies were selected, and it was observed that the caregivers were adults, mostly over 40 years old, women, with low income/education levels, and spouses of the patients. Furthermore, they were mostly unemployed, resided in urban areas, and faced difficulties related to social isolation. The patients were adults whose dependency was related to dementia, cancer,

RESUMO

O cuidador informal é aquele que assume tal função devido ao vínculo afetivo ou de parentesco com a pessoa que necessita de assistência, sem receber treinamento ou pagamento. Para compreender como os encargos financeiros afetam a vida dos cuidadores de adultos dependentes, é essencial conhecer a realidade econômica desses indivíduos e as dificuldades financeiras enfrentadas, especialmente diante das despesas necessárias para a adaptação e manutenção dos cuidados ao longo do tempo. Objetiva-se mapear as evidências disponíveis sobre a realidade socioeconômica de cuidadores informais de pessoas dependentes em domicílio. Trata-se de uma revisão de escopo, baseada nas orientações propostas pelo *Preferred Reporting Items for Systematic reviews and Meta-Analyses extension for Scoping Reviews* (PRISMA-ScR). Como pergunta norteadora: “Qual a realidade socioeconômica dos cuidadores informais de adultos dependentes?” As buscas ocorreram nas bases de dados MEDLINE, EMBASE, Web of Science, SCOPUS, LILACS, BDENF e na plataforma ProQuest para inclusão da literatura cinzenta através dos descritores “cuidador familiar”, “estresse financeiro”, “assistência domiciliar” e “adulto”. Foram selecionados 24 estudos, observa-se que os cuidadores eram adultos, majoritariamente acima de 40 anos, mulheres, baixa renda/escolaridade e cônjuges dos pacientes, além disso encontravam-se majoritariamente desempregados, residiam em áreas urbanas e enfrentavam dificuldades com relação ao isolamento social. Os pacientes eram adultos, cuja dependência relacionava-se a demências, câncer, doenças mentais, deficiências ou uso de dispositivos médicos invasivos. Conclui-se que a partir dos resultados pode-se aprimorar o conhecimento de profissionais sobre a temática, visando qualificar a assistência e fornecer subsídios para o desenvolvimento de políticas destinadas a essa população.

Palavras-chave: Cuidadores. Estresse Financeiro. Assistência Domiciliar. Adulto.

RESUMEN

Un cuidador informal es alguien que asume este rol debido a un vínculo emocional o familiar con la persona que necesita asistencia, sin recibir capacitación ni remuneración. Para comprender cómo las cargas financieras afectan la vida de los cuidadores de adultos dependientes, es fundamental conocer la realidad económica de estas personas y comprender las dificultades financieras que enfrentan, especialmente en lo que respecta a los gastos necesarios para adaptarse a la situación y mantener los cuidados a lo largo del tiempo. El objetivo es analizar la evidencia disponible en la literatura sobre la realidad socioeconómica de los cuidadores informales de personas dependientes en el hogar. Se trata de una revisión exploratoria, basada en las directrices de la extensión PRISMA-ScR (Preferred Reporting Items for Systematic Reviews and Meta-Analyses). La pregunta guía fue: “¿Cuál es la realidad socioeconómica de los cuidadores informales de adultos dependientes?”. Las búsquedas se realizaron en las bases de datos MEDLINE, EMBASE, Web of Science, SCOPUS, LILACS y BDENF, así como en la plataforma ProQuest para incluir literatura gris, utilizando los descriptores “cuidador familiar”, “estrés financiero”, “cuidado domiciliario” y “adulto”. Se seleccionaron veinticuatro estudios y se observó que los cuidadores eran adultos, en su mayoría mayores de 40 años, mujeres, con bajos ingresos y

nivel educativo, y cónyuges de los pacientes. Además, la mayoría estaban desempleados, residían en zonas urbanas y enfrentaban dificultades relacionadas con el aislamiento social. Los pacientes eran adultos cuya dependencia se debía a demencia, cáncer, enfermedad mental, discapacidad o el uso de dispositivos médicos invasivos. Se concluye que los resultados pueden mejorar el conocimiento de los profesionales sobre este tema, con el objetivo de optimizar la atención y brindar apoyo para el desarrollo de políticas dirigidas a esta población.

Palabras clave: Cuidadores. Estrés Financiero. Atención Domiciliaria de Salud. Adulto.

1 INTRODUCTION

The dependent person is one who needs assistance to perform basic activities of their daily life and, therefore, requires supervision, help and special care, regardless of the cause that has led to their dependence. In the elderly population, several reasons for dependence are observed, such as cognitive loss or loss of muscle mass, prolonged hospitalizations, falls, or complications resulting from chronic non-communicable diseases (Magalhães *et al*, 2024).

However, there is currently an increase in the number of young people who are dependent, mainly due to external causes, such as accidents or violence. In addition, in the global scenario, the significant increase in young adults affected by conditions that were more common among the elderly population, such as stroke and cardiorespiratory arrest, factors linked to a sedentary lifestyle, inappropriate habits, and high levels of stress (Demoner *et al*, 2025), is worrying.

In this context, caregivers are indispensable figures in the care of dependent people, and can be classified as formal and informal. The formal caregiver is one who has training, remuneration and follows defined schedules to perform their duties. The informal or family caregiver is the one who assumes care due to the affective or kinship bond with the person who needs assistance, performing this activity without training or payment, often dedicating himself fully to this function (Leite *et al*, 2023).

In Brazil, there is no specific aid from the federal government for informal caregivers. Within the disability retirement, an additional 25% is offered to patients who need constant help. This benefit is exclusive to retirees with permanent disability who prove the need for assistance in daily activities such as feeding, dressing, bathing, and getting around (Rozendo *et al*, 2023).

Although intended for dependent patients, not all caregivers are entitled to this benefit, being exclusive to retirees due to disability. Considering the context of informal care and the absence of adequate support for this population, this reality can result in physical exhaustion, anxiety, and overload for caregivers, due to the lack of preparation to meet the high demands required in providing care to a dependent family member, not only emotionally but also financially (Rodrigues *et al*, 2022).

Therefore, in addition to the difficulties related to learning care and the caregiver's personal and family organization, the question arises about how the caregiver organizes himself to deal with care-related expenses. This is because, in addition to the pre-existing financial burdens with their own subsistence and health, they start to assume the expenses

with consultations, exams, hospitalizations, and supplies necessary for the person being cared for (Brito *et al*, 2025).

To understand how financial burdens affect the lives of informal caregivers of dependent adults, it is essential to know the economic reality of these individuals. This sheds light on the financial difficulties faced by families and caregivers, especially in the face of the expenses necessary for the adaptation and maintenance of care over time. It is essential to explore the characteristics of caregivers in the context of home care, with an emphasis on financial issues.

In addition, understanding the main expenses and strategies used by caregivers to obtain the necessary resources can provide valuable information to support the formulation of public policies that offer greater support to this population. Therefore, the objective of this study was to map the evidence available in the literature on the socioeconomic reality of informal caregivers of dependent people at home.

2 METHODOLOGY

2.1 TYPE OF STUDY

This is a scoping review, which followed the guidelines proposed by the *Preferred Reporting Items for Systematic reviews and Meta-Analyses extension for Scoping Reviews* (PRISMA-ScR) (Page *et al*, 2021). For the construction of the research question, the mnemonic PCC (P-population, C-concept and C-context) was used. Being considered: P- informal caregivers of dependent adults, C-financial reality, C-home care: What is the socioeconomic reality of informal caregivers of dependent adults? Auxiliary questions were used to deepen the review: What are the consequences brought to the caregiver's life in the face of financial complications?

2.2 SELECTION OF STUDIES

The inclusion criteria were: scientific articles published in full, available free of charge, with a quantitative focus; official materials; regardless of the language of publication (Concept); in individuals over 18 years of age who are dependent on care (Population); in a home care environment; regardless of the country of origin and/or language of publication (Context), in addition to Course Completion Work, Dissertations and/or Theses included through the grey literature. Qualitative studies and study protocols were excluded, with no publication of results.

2.3 DATA COLLECTION

For the initial search, combinations of terms available in the *Medical Subject Headings* (MeSH) were used: *Caregivers*, *Financial Stress*, *Home Nursing*, *Adult* in the PUBMED, EMBASE, Web of Science, SCOPUS, Latin American and Caribbean Literature on Health Sciences (LILACS), Nursing Database (BDENF) and the ProQuest platform to include gray literature. In the Virtual Health Library (VHL), the following Health Sciences Descriptors (DeCS) were used: Family caregiver, Financial stress, Home care, Adult. In order to increase the number of articles, a cross-search was used between the keywords using the Boolean connector *AND* following the same combination in all search locations, namely: "*Caregivers AND Financial Stress AND Home Nursing AND Adult*". Data collection took place between October and November 2024.

2.4 DATA ANALYSIS AND PROCESSING

According to the adaptation of the PRISMA-ScR recommendations (Page *et al*, 2021), data selection occurred in the following steps: 1) Initial search in search strategies; 2) Analysis of title and abstract and exclusion of those who did not fit any of the criteria; 3) Full reading of the selected works; and 4) Evaluation of the reference list of sources selected from the full text and/or included in the review.

To facilitate the extraction of the information presented in the studies, the free online platform RAYYAN® was used, which helps in conducting reviews by exporting the information from the databases, creating a selection of content from the articles that facilitate their choice, namely: identification, title, year of publication, indexing base, journal, level of evidence, objective, study design, main results and conclusion.

For the level of evidence, the following were considered: level I systematic reviews or meta-analyses of Randomized Controlled Clinical Trials (RCTs); level II evidence obtained from at least one well-designed RCT; level III well-designed clinical trials without randomization; level IV study with a non-experimental design such as descriptive correlational research or case studies; level V obtained from systematic reviews of descriptive or qualitative studies; level VI from a single descriptive or qualitative study; and level VII evidence originating from the opinion of authorities and/or a committee of experts (Galvão, 2006).

The data were mapped in a descriptive way, using simple frequency counting of concepts, populations, and other characteristics that contemplate the research questions. A

descriptive qualitative analysis of the content was also conducted, including basic data coding. From the analysis of the articles, a conceptual map was constructed to outline the results. The articles were identified with the letter A (article) and the number corresponding to their availability in the text. Example: A1

The project was registered in the *Open Science Framework* (OSF) Platform, as it is a scoping review carried out from public domain data, it was not submitted to the Human Research Ethics Committee, but all the ethical principles contained in Resolution No. 466/2012 were followed.

3 RESULTS AND DISCUSSIONS

Among the 9,718 articles located in the databases, 24 were part of this review. The selection of articles is described in the following flowchart (Figure 1).

Figure 1

Flowchart according to PRISMA-ScR criteria. Maringá, PR, Brazil 2024

Source: Adaptation of the PRISMA-ScR flowchart (Page *et al*, 2021).

All studies (n=24) were published in English, with a mainly cross-sectional study design. The population of informal caregivers was adult, mostly over 40 years of age (mean of 51.9). The number of caregivers included in the surveys ranged from 29 to 3,047 (mean 352), most of them women, being spouses or daughters of the patients.

Regarding the care recipient, all were dependent and adults over 18 years old. As a diagnosis that led them to dependence, we find mainly dementia, stroke, cancers, patients with mental illnesses who need help in activities of daily living, as well as individuals with disabilities, whether resulting from accidents or chronic issues.

In addition to dependence, some patients used enteral nutrition, home mechanical ventilation, and hemodialysis and outpatient chemotherapy treatments, which required locomotion and availability of follow-up by caregivers, factors that were predictive of increased expenses. The characterization of the articles selected for review is presented in the following table (Table 1).

Table 1

Characterization of the articles that make up this review (n=24). Maringá, PR, Brazil, 2025

ID	Author/Journal/Year/Country	Type of study/ Sample	Main results	Level of evidence
A1	Papastavrou et al Adv Nurs Cyprus 2007	Descriptive cross-sectional study/172 dyads	Regarding education, elementary school graduates had a higher burden compared to master's/doctoral holders. Regarding income, caregivers with high income had lower scores on the burden scale.	IV
A2	Güneş et al HealthMED Turkey 2012	Cross-sectional descriptive study/102 caregivers	Low education and being the patient's spouse were associated with a higher level of financial burden.	IV
A3	Akpan-Idiok et al Pan Afr Med J Nigeria 2014	Cross-sectional descriptive study/210	The caregivers studied had trivial burden or no overload. Informal caregivers experienced the following forms of burden: physical, psychological,	IV

		caregivers	financial and social, with the psychological and social forms of burden being the ones of greatest magnitude.	
A4	Aggar et al ACT Australia 2014	Cross-sectional study/119 caregivers	Approximately one-quarter (24%) provided care for more than 40 hours per week. Most caregivers (80%) provided transportation assistance for their frail elderly relative. Assistance with communication (37%) and self-care (36%) were the least frequent support activities provided	IV
A5	Dhandapani et al Surg Neurol Int India 2015	Descriptive cross-sectional study/70 caregivers	87% of caregivers reported that caregiving contributed to financial strain; Caregiver burden was significantly higher among caregivers who were unemployed, had low incomes, could not meet their needs comfortably, spent <8 hours a day on caregiving activities, and those who were ill.	IV
A6	Hartnett et al Clin J Oncol Nurs USA 2016	Cross-sectional descriptive study/50 caregivers	Caregivers who reported an income of less than \$90,000 per year noted greater financial burden. Participants without a college degree had higher levels of financial burden. Unemployed or retired caregivers reported higher levels of schedule disruption than those who were employed. Most were not prepared for the potential changes in their lives, such as time demands, adjustments in work schedules.	IV
A7	Nortey et al Int J Equity Health Ghana 2017	Retrospective cross-sectional study/108 caregivers	Approximately 62% of caregivers indicated that their finances worsened as a result of caregiving. The average time of care per month was estimated at 219.5 (±25.9) hours.	IV
A8	Liu et al	Observational	Caregivers reported increased medical	IV

	Medicine Taiwan 2017	study/160 caregivers	bills and expenses with hiring a caregiver, resulting in a frugal lifestyle.	
A9	Crouch et al RRH USA 2017	Cross-sectional study/1,248 caregivers	Other factors associated with fair/poor health included caregiver burden, employment status, and income. Caregivers with a high level of burden were more likely to report poor to fair health. Employed caregivers had lower odds of reasonable to poor health than caregivers who were not employed. Finally, the odds of self-reported fair/poor health decreased with income. Caregivers with high levels of caregiving burden were more likely to experience financial strain, emotional strain, and physical strain.	IV
A10	Strange et al UoR USA 2018	Correlational study/29 caregivers	Most of the participants had two other adults living in the household. The results showed that there was no statistically significant difference between income levels (48%).	IV
A11	Wu et al Ann Palliat Med China 2020	Cross-sectional study poll/242 dyads (patient and caregiver)	For family members who directly cared for disabled stroke patients, 22.7% felt that the stress of care was too high, and 26.9% of respondents answered that the financial pressure of hospitalization was heavy. The proportion of family members who had financial pressure was more extensive than those with caregiving stress;	IV
A12	Tough et al Int J Equity Health Switzerland 2020	Cross-sectional study/118 dyads	Caregivers with higher incomes, educational level, and subjective social position, and those who owned their own home or who did not indicate any financial hardship reported a lower	IV

			propensity for caregiver burden.	
A13	DiGiacomo et al ACT Australia 2020	Cross-sectional study/3,047 caregivers	132 caregivers reported that they experienced one or more types of financial stress. The demographic variables that were found to be associated with the experience of financial stress were having a spouse/partner, owning/buying housing, not having a paid job, and a family income of \$60,000 (AUD) or less. Of the 132 caregivers who reported financial stress, (n=49) reported more than one type of financial stress. The most commonly reported stress-related indicator was seeking help from community organizations or friends/family (n=88) followed by inability to pay bills on time (n=58).	IV
A14	Chhetri et al JNMA Nepal 2020	Cross-sectional descriptive study/123 caregivers	Most caregivers (60) had mild to moderate burden and 53 had moderate to severe burden. The overall mean overload score was 39.30 ± 11.68 .	IV
A15	Chiari et al Dement Geriatr Cogn Dis Extra Italy 2021	Cross-sectional study/92 dyads	Longer duration of illness, being a wife or partner, and having more days off work reduced caregiver distress and, consequently, burden. Likewise, financial suffering increased psychological suffering and, consequently, overload. On the other hand, the delay in diagnosis, the age of the caregiver and the representatives of the family or social network had a 100% direct effect on the caregiver's burden.	IV
A16	Schaffler-Schaden Brain Sci Austria	Multicenter cross-	Regarding employment, caregivers who work part-time had a higher burden of	IV

	2021	sectional study/113 caregivers	financial stress than caregivers who work full-time. There were no male caregivers who worked part-time. In general, working caregivers had a lower burden than retired caregivers	
A17	French et al Clin Nutr United Kingdom 2022	Multicenter cross-sectional study/339 caregivers	Employment status, type of illness, number of nights on PNH (home enteral nutrition), time on PNH, and number of hours on PNH were not associated with subjective workload.	IV
A18	Zhang et al BMC Geriatr USA 2023	Longitudinal study/1,065 caregivers	After multivariate adjustment, caregivers of PCD in the high burden class of comorbidity scored 0.46 points higher of burden of physical care than those in the class of low burden of comorbidity.	IV
A19	Metin et al Support Care Cancer Turkey 2023	Cross-sectional study/113 caregivers	In assessing the financial situation of caregivers, 69% paid extra fuel costs, 60.2% paid taxi or public transportation costs, 48.7% made additional payments for medications covered by health insurance, and 44.2% paid exam fees to receive treatment for their patients. It was found that 42.5% of caregivers experienced financial and economic difficulties due to the costs of treating and caring for their patients.	IV
A20	Folwarski et al Clin Nutr Poland 2024	Multicenter cross-sectional study/90 caregivers	Individual perceptions of quality of life were significantly correlated with financial satisfaction, life satisfaction, income per person in the household, sleep quality, and depression. 51.2% of caregivers were dissatisfied with their financial situation.	IV
A21	Plaszewska-Żywko et al BMC Nurs Poland	Cross-sectional study/58	Caregivers scored significantly higher in the general strain domain than caregivers. Considering the financial	IV

	2024	caregivers	situation, no statistical significance was revealed in the general strain subscale; however, differences were observed in the distribution of the isolation and disappointment variables between the groups of financial situation.	
A22	Agyemang-Duah et al BMC Prim Care Ghana 2024	Cross-sectional study/1,853 caregivers	Compared to urban caregivers, rural caregivers reported that they had no financial problems due to loss of income; There was an association between caregivers' income and burden. Lastly, participants without financial support needs have a reduced stress load compared to those with financial support needs.	IV
A23	Marega et al SPPE Gambia 2024	Cross-sectional descriptive study/161 caregivers	The results show that most caregivers (n=100) had financial problems, (n=63) missed work, (n=60) had difficulty concentrating at work, and (n=136) had unexplained treatment expenses almost always. Regarding the degree of financial burden (n=89), they presented high levels of financial burden.	IV
A24	Edward et al Psycho-Oncol USA 2024	Cross-sectional study/34 dyads	Most participants had COST scores $\leq$ 24. More than half of the dyads were made up of married couples. Other caregivers included adult children (26%), friends (12%), or someone else (38%). More than half of the dyads indicated that a caregiver in the dyad had taken paid or unpaid time off to care for the patient.	IV

Source: The authors (2025).

The results will be presented in two strands, firstly the socioeconomic information of the caregivers, such as monthly/annual income, level of education, employment, expenses

related to care and financial help received and then the variables that impact the financial reality.

Regarding the socioeconomic characterization of caregivers, not all articles provided detailed and numerical information on family income and care-related expenses, which is a difficulty found in the study.

Among the articles that included this information, the caregivers had a monthly income between US\$ 99.50 (R\$ 240) (A8) and US\$ 4,773 (R\$ 45,751) (A13); and annually between US\$ 75,000 (R\$ 462,375) (A10) and US\$ 90,000 (R\$ 553,743) (A7).

An interesting finding was observed with regard to caregivers who reported higher education, and an increase in the number of caregivers who had completed higher education and complementary training such as specializations and postgraduate studies was identified in the most recent studies (A7; A12; A4; A19).

Caregivers who lived in rural areas generally had a lower level of education than those living in urban areas. In addition, they were more frequently unemployed when compared to those who lived in urban centers (A16; A23; A10).

With regard to employment, most caregivers were unemployed (A4; A8; A6; A22; A24; A20). In addition, it was identified that a significant portion was retired, which is justified by the fact that most of them were in an older age group (A18; A5).

The comparison between employed men and women revealed that the majority of female caregivers worked part-time and received lower wages. Consequently, they had a lower monthly income than male caregivers and faced greater difficulties in dealing with the expenses associated with home care (A17).

Regarding expenses related to the needs of the family member under their care, many caregivers reported independently bearing the health costs of patients. In addition, they showed discomfort and concerns about their ability to meet their own needs, those of their families and the demands of care (A12; A6). Only two studies reported that caregivers received help from other family members or some type of government assistance to cover the costs of care (A12; A24).

Next, information related to the variables that impact the financial reality of the informal caregiver will be presented, namely: factors associated with socioeconomic status, increase in monthly expenses, loss of employment and lack of support network.

Caregivers who faced a greater burden of financial stress often associated this situation with economic difficulties. Those with lower incomes were more likely to obtain high

scores in questionnaires designed to measure stress levels, in addition to reporting a worsening of their financial condition after assuming the role of caregivers, closely linked to the increase in expenses and health conditions of their family members (A7; A2; A8; A21; A3).

Studies have also associated a greater financial burden with a lower level of education. It was observed that caregivers with complete higher education had significantly lower levels of stress related to their financial reality compared to those who had only completed high school (A7; A12; A2). The level of education had different reports, most caregivers had completed high school (A12; A4; A16; A15; A11).

The age of the family member cared for was also analyzed as a hypothesis. It was observed that, as age increases, the caregiver faces greater financial difficulties. These challenges are associated with increased care demands and the appearance of comorbidities typical of the aging process (A12; A2; A8; A16).

With regard to the individual cared for, the degree of proximity between him/her and the caregiver was identified as a predictive factor of greater financial stress. Being a woman and occupying the role of the patient's wife was pointed out as an element that intensifies the burden and financial difficulties faced, since, in general, women assume not only the role of caregiver but also the sole provider of the home (A8; A16; A3; A22).

Caregivers reported an increase in monthly expenses after taking on the role of caregiver, especially due to the need to hire help for domestic activities and the increase in expenses with medical consultations, exams, medications, transportation/fuel, and prolonged hospitalizations (A12; A8; A9; A20; A5).

Finally, the place of residence and the number of hours dedicated to care were identified as a predictor for higher expenses related to the care activity. Caregivers living in rural areas reported significantly more financial hardship and expenses compared to those in urban areas (A16; A23; A10).

In addition, most caregivers were exclusively dedicated to care, without having an employment relationship. This situation is often attributed to lack of time and the high number of absences from work, which makes it necessary to quit work to meet the demands and needs of the family member under their care (A6; A5).

Based on data analysis, a conceptual map was constructed outlining the main information related to the financial reality of informal caregivers (Figure 2).

Figure 2

Conceptual map of the characterization of Informal Caregivers (n=24). Maringá, PR, Brazil, 2025

Source: The authors (2025).

According to the literature, four out of five informal caregivers are women, usually wives or daughters of patients. Historically and socially, the responsibility for care has been attributed more frequently to women, reflecting a cultural pattern sometimes based on machismo, which prepares them to assume this function and often judges them when they do not fulfill it, with men being placed in the position of caregivers generally due to the absence of women in the family who can assume such responsibility (Sousa *et al*, 2023; Sousa *et al*, 2024).

Concomitantly, the female population presents higher levels of stress and overload resulting from care, since in most cases they do not have an established support network that helps them and allows them to develop moments of leisure and rest, experiencing a loss of their freedom and autonomy and abandonment of their individuality and personal life to the detriment of informal care (Silva *et al*, 2025; Renk *et al*, 2022).

In the financial issue, it is observed that female caregivers face a greater impact in terms of dismissals, social isolation and financial difficulties. This scenario occurs mainly due to the fact that most male caregivers receive higher salaries and, when taking care of a dependent family member, dedicate fewer hours a day to this function, often having resources to hire formal caregivers, in addition to, in general, having a better structured support network, receiving help in sharing the care provided to the family member, being able to maintain their work activities (Gomes *et al*, 2023; Marques *et al*, 2024).

In addition, caregivers suffer, on a larger scale, the loss of employment compared to men. This fact is related to historical issues of prejudice and sexism, in addition to reflecting the reality of many women who dedicate themselves fully to home care. They are often dismissed from their jobs due to the high number of absences caused by the high demands associated with providing care to dependent family members, presenting difficulties in managing expenses related to care and adapting to the new reality (Méndez *et al*, 2024).

It can be observed that most caregivers were advanced in age (over 50 years old), and were mostly composed of people who were already withdrawing from the labor market and often had retirement as their only source of income. Considering that aging is associated with increasing limitations and reduced functional capacity, the presence of older informal caregivers can intensify financial stress and spending. In addition to bearing the expenses of the dependent family member, these caregivers remain responsible for their own health costs, such as medications, consultations, and exams, necessary due to advancing age (Teles *et al*, 2023; Bernardi *et al*, 2023).

Concomitantly, the advanced age of caregivers has the potential to worsen their quality of life and health and for the appearance of related diseases and bad life habits, a great load of stress and abandonment with their own health care, projecting their attention and income to prioritize the needs of their family members. Many caregivers report not having the time and conditions to seek care even for routine consultations or periodic exams related to maintaining their own health (Cavalcanti *et al*, 2025; Castanheira *et al*, 2025).

Caregivers living in rural areas generally have a lower level of education, which is associated with greater financial difficulties. In addition, they face social isolation, high care costs, especially related to commuting, and difficulties in finding a job, being more often unemployed, these caregivers have greater difficulties in adapting to extra expenses related to care. Being an informal caregiver in rural areas was also linked to a higher incidence of psychological problems, such as depression, anxiety, and burnout, related to social isolation caused not only by caregiving, but also by difficulties in leaving home, in addition to concerns about unemployment and income (Almeida *et al*, 2023; Silva *et al*, 2025).

As observed in practice, most caregivers were unemployed, having to resign their jobs mainly due to the need to dedicate many hours to care. A relationship between caregivers' unemployment and the time allocated to care can be observed, revealing that most of them dedicate themselves fully to this activity, presenting difficulties in the physical, psychological, social, and financial spheres, facing difficulties both in getting and maintaining a job (Costa *et al*, 2024).

Although informal care is provided free of charge, the financial costs associated with it can involve high expenses with consultations, exams, and procedures for both the family member under care and the caregiver. In addition, there are expenses with adaptations of devices for the home, medications, specific foods, enteral nutrition, oxygen therapy, among others (Lacerda *et al*, 2021).

Regarding monthly family income, few studies address this variable. In the literature, the financial reality of informal caregivers is usually superficially addressed, being associated only with the presence or absence of financial stress. When this information is included, it is commonly related to the economic stress of caregivers, but it does not detail what the specific costs are, how caregivers organize themselves to deal with these expenses, or what impact these financial burdens have on the lives and reality of caregivers (Regina *et al*, 2024).

It can be observed that, many times, the caregiver is prepared only to know how to handle certain devices and perform the necessary care for his family member at home, and it is unknown whether this individual has the financial conditions to maintain all the expenses arising from the demands of the care provision, in addition to maintaining his own quality of life. These caregivers, in general, give up expenses related to their own life to prioritize meeting the needs of their family members. What is often observed are caregivers who dedicate a good part of their income to the costs of caring for family members and end up sick due to concern about their income, stressed and lacking in the maintenance of their own

health, who sometimes cannot continue to take care of their family members and end up also becoming dependent at some point in their lives (Silva *et al*, 2022; Minayo *et al*, 202).

The review identified that 50% of the included studies were published between 2020 and 2024, reinforcing the typical profile of informal caregivers. Although this review is contemporary, it has some limitations. The heterogeneity of the studies is highlighted, all of which are classified as cross-sectional studies, in addition to the small number of the population evaluated. In addition, although the collection that made up this review is considerable and recent studies, there is a lack of research that brought robust information on the income of informal caregivers, expenses related to home care and how much of this income was destined to this care, in addition to better characterizing caregivers, bringing information related to previous comorbidities and other aspects that also impact their expenses.

4 CONCLUSION

From the above, it was possible to identify the main evidence about the socioeconomic reality of informal caregivers of dependent adults. The results showed that most caregivers were women >40 years old, with low income and schooling, and were mainly spouses or daughters of the patients, reiterating an already known stereotype. Regarding the financial reality, most faced difficulties related mainly to unemployment, costs with exams, hospitalizations and medication for the family member, in addition to difficulties in maintaining care for their own health, dedicating all energy, time and resources to the family member and their needs.

The results aim to contribute to the improvement of the knowledge of professionals on the subject, in order to qualify care and instigate the development of research that focuses on understanding this aspect of informal care, aiming to provide subsidies for the development of policies and financial aid for this population.

ABSTRACT

In this integrative narrative review, with an analytical-critical orientation, we examine how patent information in biotechnology can leverage the Amazon bioeconomy. Three axes are integrated: the technical-legal foundations of patentability and compliance (IPL; SisGen; IN 118/2020; INPI/CPAPD Technical Note 01/2023; WIPO ST.26; WIPO Treaty 2024); methods and best practices for patent landscaping; and an applied analysis of the guaraná, açaí, and copaíba value chains. The findings show that the systematic use of patents—combined with IPC/CPC classifications, family-based analysis, and claim interpretation—enhances technological diagnostics and reduces search biases. Opportunities emerge in bioactives, bioprocesses, functional ingredients, and nanoformulations, conditioned by governance of access and benefit-sharing and by rules regarding digital sequence information. It is concluded that institutionalizing patent intelligence within the R&D&I cycle is essential for transforming biodiversity into responsible innovation, strengthening regional capacities, and avoiding rework.

Keywords: Patents. Amazon Bioeconomy. Biotechnology. Patent Intelligence. Genetic Resources.

RESUMO

Nesta revisão narrativa integrativa, de caráter analítico-crítico, examinamos como a informação patentária em biotecnologia pode alavancar a bioeconomia amazônica. Integram-se três eixos: fundamentos técnico-jurídicos de patenteabilidade e conformidade (LPI; SisGen; IN 118/2020; Nota Técnica INPI/CPAPD 01/2023; WIPO ST.26; Tratado OMPI

2024); método e boas práticas de panorama patentário; e uma leitura aplicada a cadeias de guaraná, açaí e copaíba. Evidencia-se que o uso sistemático de patentes, combinado a IPC/CPC, análise por famílias e leitura de reivindicações, qualifica o diagnóstico tecnológico e reduz vieses de busca. Oportunidades emergem em bioativos, bioprocessos, ingredientes funcionais e nanoformulações, condicionadas à governança de acesso e repartição de benefícios e às regras sobre informações de sequência digital. Conclui-se que institucionalizar a inteligência patentária no ciclo de P&D&I é condição para transformar biodiversidade em inovação responsável, fortalecer capacidades regionais e evitar retrabalhos.

Palavras-chave: Patentes. Bioeconomia Amazônica. Biotecnologia. Inteligência Patentária. Patrimônio Genético.

RESUMEN

En esta revisión narrativa integrativa, de carácter analítico-crítico, examinamos cómo la información patentaria en biotecnología puede impulsar la bioeconomía amazónica. Se integran tres ejes: los fundamentos técnico-jurídicos de patentabilidad y conformidad (LPI; SisGen; IN 118/2020; Nota Técnica INPI/CPAPD 01/2023; WIPO ST.26; Tratado OMPI 2024); el método y las buenas prácticas para la elaboración de panoramas patentarios; y una lectura aplicada a las cadenas de valor de guaraná, açaí y copaíba. Se evidencia que el uso sistemático de patentes—combinado con IPC/CPC, análisis por familias y lectura de reivindicaciones—califica el diagnóstico tecnológico y reduce sesgos de búsqueda. Surgen oportunidades en bioactivos, bioprocesos, ingredientes funcionales y nanoformulaciones, condicionadas a la gobernanza de acceso y reparto de beneficios y a las reglas sobre información de secuencias digitales. Se concluye que institucionalizar la inteligencia patentaria en el ciclo de I+D+I es condición para transformar la biodiversidad en innovación responsable, fortalecer capacidades regionales y evitar retrabajos.

Palabras clave: Patentes. Bioeconomía Amazónica. Biotecnología. Inteligencia Patentaria. Patrimonio Genético.

1 INTRODUCTION

The bioeconomy has been consolidated, in recent decades, as a strategic framework to articulate life sciences, biological processes and renewable raw materials in response to global challenges, with monitoring by economic, social and environmental indicators in official systems of the European Commission, through the Joint Research Centre (EUROPEAN COMMISSION; JOINT RESEARCH CENTRE, 2024). In

In Brazil, the agenda has gained density with studies by the National Confederation of Industry and recent policies that reposition the bioeconomy as a vector of decarbonization and innovation based on biodiversity (CNI, 2020). For the Amazon, the scenario is no longer propositional and has become effective instruments: Decree No. 12,044/2024 instituted the National Bioeconomy Strategy and determined the preparation of the National Bioeconomy Development Plan. In this context, the Financier of Studies and Projects (Finep) launched the call 'Finep Amazônia – Bioeconomy and Regional Development' (BRASIL, 2024; FINEP, 2024).

In parallel, global indicators show an increase in the use of the patent system and relevant geographic displacements, reinforcing technological competition (WIPO, 2024a). In 2024, Member States approved a treaty that makes it mandatory to disclose the origin of genetic resources and associated traditional knowledge in patent applications, changing expectations for compliance in sociobiodiversity-related research (WIPO, 2024b). For biotechnology, the adoption of WIPO ST.26 has imposed, since July 1, 2022, the filing of XML sequence listings with specific redaction, numbering, and search rules, with direct implications for prospecting, writing, and examination (WIPO, 2022; INPI, 2022).

In Brazil, there is still low appropriation of patent documents as an informational source: in 556 theses and dissertations in the health area, only 2.87% cited patents (PIMENTA, 2017); in a convergent way, a recent survey in Engineering I indicates that about 33% of researchers use patent databases and more than 65% do so mainly to verify the possibility of patenting, not to guide research (GRUNEVALD, 2024).

This work integrates foundations, methods and evidence to transform patent literature into actionable intelligence for Research, Development and Innovation, partnerships and policies, applying it to chains such as guarana (*Paullinia cupana*), açaí (*Euterpe spp.*) and copaiba (*Copaifera spp.*).

1.1 FUNDAMENTALS AND REGULATORY FRAMEWORK

The governance of biotechnology research depends less on the letter of the law and more on how compliance is operationalized. In practice, disclosure of origin, regularity in SisGen, and traceability of Digital Sequence Information (DSI) shift management from the declaratory plan to the evidentiary plan, recommending checklists and evidence records from conception so that Access and Benefit-Sharing (ABS), DSI, and WIPO ST.26 do not become late barriers to filing and transfer.

Industrial Property Law (LPI), Law No. 9,279/1996: Article 10 establishes that discoveries, literary, artistic, and scientific works, presentations of information, computer programs themselves, and methods of surgical, therapeutic, or diagnostic treatment are not considered inventions, among others; Article 18, III prohibits the patenting of living beings, except for transgenic microorganisms that meet legal requirements (BRASIL, 1996, arts. 10; 18, III). IN INPI/PR No. 118/2020 details novelty, inventive step, and descriptive sufficiency in biotechnology; INPI/CPAPD Technical Note No. 01/2023 harmonizes the understanding of transgenic plants and "elite events". Since July 1st. 2022, applications with sequence require XML listing according to WIPO ST.26, via WIPO Sequence (INPI, 2022; WIPO, 2022). In research with genetic heritage or associated traditional knowledge, SisGen (Law No. 13,123/2015; Decree No. 8,772/2016) and the automatic requirement of regularity by the BPTO are decisive. At the international level, DSI advances in a multilateral mechanism (CBD, 2024), and the 2024 WIPO Treaty imposes disclosure of origin (WIPO, 2024b).

2 MATERIALS AND METHODS

An integrative narrative review with an analytical-critical emphasis was adopted, according to methodological references (MENDES; SCOTT; GALVÃO, 2008; ROTHER, 2007; DIXON-WOODS et al., 2006). Legal documents, international standards, sectoral studies and recent scientific literature were integrated.

This was followed by good patent landscape practices: scope delimitation; searches by keywords and IPC/CPC classes; analysis by families (INPADOC); mapping of actors/jurisdictions; qualitative reading of claims (WIPO, 2015; VAN RIJN; TIMMIS, 2023). Retrieval techniques with natural language processing (NLP) were considered to mitigate biases (ALI et al., 2024). Integrating SisGen conditions and LPI guidelines, in addition to IN 118/2020, Technical Note INPI/CPAPD 01/2023 and the guidelines on WIPO ST.26 (INPI, 2020, 2022, 2023).

3 FINDINGS

Trends and patterns: global filing intensification and geographic displacement; source disclosure tends to reconfigure R&D&I and due diligence routines; WIPO ST.26 normalized listings and impacted redaction, examination, and search (WIPO, 2024a, 2024b, 2022; INPI, 2022).

National diagnosis: low use of patents in academia indicates surveillance gaps and risk of rework; sectoral studies point to potential in bioprocesses, ingredients and bioinputs (PIMENTA, 2017; CNI, 2020; GRUNEVALD, 2024).

Applications in prisons: guarana — interest in functional formulations and processes with sustained claims (TALIK; ZARÓW; BUČKO, 2024); açaí — lipids, polyphenols, and the use of by-products (seeds) for ingredients and functional materials (SANTOS et al., 2024); copaiba — advancement in nanoformulations and toxicological evaluation with a focus on release and safety (BEZERRA et al., 2024).

Regulatory implications: requirement of regularity in SisGen focuses on writing and exam; DSI and disclosure of origin increase traceability (BRASIL, 2015; BRAZIL, 2016; CBD, 2024; WIPO, 2024b).

Interpretative reading: The densification reduces space for research outside the Patent Cooperation Treaty (PCT) and makes Freedom to Operate (FTO) and jurisdictional choices central; consortium arrangements are recommended to scale search, redaction and filing.

Compliance: It's not bureaucracy, but alignment between science, protection, and apportionment; each project must provide for a due diligence plan that synchronizes schedules, regulatory deadlines, and optimal filing windows.

4 DISCUSSION

Patent intelligence is risk governance, when it enters the R&D&I cycle early and dialogues with ABS, DSI and WIPO ST.26, it reduces rework and increases predictability of publication, partnership and licensing. Compliance is opportunity cost: the initial learning curve (e.g., ST.26) reduces rejections and uncertainty down the line. For Amazonian chains, we advocate portfolios that combine areas of technological concentration (hotspots) and white spaces (white spaces), in guarana, functional formulations and stabilization; in açaí, waste valuation and microencapsulation; in copaiba, controlled release and toxicological safety. Institutionally, we propose: minimum prospecting protocols by family/classes,

integration between data management–SisGen–legal before the bench, and continuing education in ST.26 drafting and compliance.

5 FINAL CONSIDERATIONS

Patents are public knowledge infrastructures that, when handled with method and responsibility, raise the quality of choices in science and innovation. To convert biodiversity into responsible innovation and expand technological autonomy, it is recommended: i) to institutionalize surveillance routines integrating IPC/CPC, families and legal events; ii) couple ABS, DSI and WIPO ST.26 from the design of the project; iii) prioritize agendas that combine areas of technological concentration and white spaces in guaraná, açai and copaiba; iv) measure results not only by deposits, but by partnerships, licenses and benefit sharing effectively implemented.

ABSTRACT

This article analyzes the evolution of the professional identity of teachers and its relationship with initial and continuing education in the State of Goiás. It is based on the premise that teaching constitutes a socially and culturally mediated practice, whose knowledge is formed at the intersection of theory and practice. Teaching is not limited to the mere transmission of knowledge, but rather involves the formation of individuals for the progress and transformation of society. The research, of a bibliographic and documentary nature, is based on authors such as Gatti (2016), Nóvoa (1992, 2017), Pimenta (1999), Sacristán (1995), and Tardif (2002), as well as documents such as the National Education Plan (PNE) and the Goiás State Education Plan (PEE 2015–2025). Public policies and concrete working conditions shape teacher identity, and continuing education can act as a key element in professional development and career advancement for teachers.

Keywords: Teacher Identity. Initial Training. Continuing Education. Goiás. Educational Policies.

RESUMO

Este artigo analisa a evolução da identidade profissional docente e suas relações com as formações iniciais e continuadas no Estado de Goiás. Parte-se do pressuposto de que a docência constitui uma prática social e culturalmente mediada, cujos saberes se formam na intersecção entre a teoria e a prática. A docência não se restringe somente à mera transmissão de conhecimento, mas sim na formação das pessoas para o progresso e a transformação da sociedade. A pesquisa, de natureza bibliográfica e documental, baseia-se em autores como Gatti (2016), Nóvoa (1992, 2017), Pimenta (1999), Sacristán (1995) e Tardif (2002), além de documentos como o Plano Nacional de Educação (PNE) e o Plano Estadual de Educação de Goiás (PEE 2015–2025). As políticas públicas e as condições concretas de trabalho moldam a identidade docente e a formação continuada pode atuar como eixo articulador do desenvolvimento profissional e da valorização da carreira docente.

Palavras-chave: Identidade Docente. Formação Inicial. Formação Continuada. Goiás. Políticas Educacionais.

RESUMEN

Este artículo analiza la evolución de la identidad profesional docente y su relación con la formación inicial y continua en el estado de Goiás. Se parte de la premisa de que la docencia es una práctica mediada social y culturalmente, cuyos conocimientos se forman en la intersección entre la teoría y la práctica. La docencia no se limita a la mera transmisión de conocimientos, sino que consiste en la formación de las personas para el progreso y la transformación de la sociedad. La investigación, de carácter bibliográfico y documental, se basa en autores como Gatti (2016), Nóvoa (1992, 2017), Pimenta (1999), Sacristán (1995) y Tardif (2002), además de documentos como el Plan Nacional de Educación (PNE) y el Plan Estatal de Educación de Goiás (PEE 2015-2025). Las políticas públicas y las condiciones concretas de trabajo moldean la identidad docente, y la formación continua puede actuar como eje articulador del desarrollo profesional y la valorización de la carrera docente.

Palabras clave: Identidad Docente. Formación Inicial. Formación Continua. Goiás. Políticas Educativas.

1 INTRODUCTION

The discussion about the professional identity of teachers and the processes of teacher training has been consolidated as one of the central themes in contemporary educational research. In a scenario marked by rapid social, cultural and technological transformations, understanding the role of the teacher as a historical, critical and reflective subject has become an urgent and necessary task. In Brazil, and particularly in the State of Goiás, this debate gains relevance by highlighting the intrinsic relationship between initial training, continuing education and professional valorization, fundamental dimensions for strengthening teaching and improving the quality of basic education.

Authors such as António Nóvoa (1992), Maurice Tardif (2002) and Paulo Freire (1996) highlight that teacher identity is not a static attribute, but a dynamic process of construction, forged in the interaction between knowledge, practices and experiences. For Nóvoa (1992, p. 25), "continuous training should be integrated into the daily work of teachers and schools, and not be an isolated episode or a moment outside of time and professional space", showing that professional learning becomes effective when it is incorporated into daily life and becomes part of the teacher's own identity. Tardif (2002, p. 36) emphasizes that "teachers' knowledge is plural, it is composed of knowledge from their professional training, their life history and their daily practice", demonstrating that the teaching work is based on a set of heterogeneous and socially constructed knowledge, which form the basis of the teacher's professional identity. Freire (1996, p. 25), in turn, expands this conception by arguing that:

"Teaching is not transferring knowledge, but creating the possibilities for its own production or construction. Therefore, teaching requires ethics, aesthetics, lovingness, and commitment to social transformation."

In this context, discussing teacher training in Goiás implies understanding how public and institutional policies shape teacher professionalism and influence the constitution of their identity. In recent decades, the State has developed significant actions through the State Education Plan (PEE 2015–2025), which establishes goals for the appreciation and continuing education of educators, recognizing them as strategic agents in the educational process. Initiatives such as Pair Training, promoted by the Center for Studies, Research and Training of Goiás (CEPFOR), and the Formative Roots program, demonstrate advances in the search for collaborative, contextualized education focused on the reality of public schools. However, challenges remain related to the fragmentation between initial and continuing

education, the precariousness of working conditions and the need for effective articulation between universities and education networks, as pointed out by Gatti (2016) and Dourado (2015).

The relevance of this study lies, therefore, in the possibility of critically reflecting on the process of teacher training in the State of Goiás, articulating it with the construction of the professional identity of teachers. By understanding teaching as a complex social practice, crossed by ethical, political and pedagogical dimensions, it seeks to highlight the importance of an emancipatory and reflective education, which goes beyond the mere transmission of content and promotes the integral development of the educator.

The general objective of this article is to analyze how initial and continuing education contribute to the constitution of the professional identity of teachers in Goiás. As specific objectives, it is proposed: to discuss the theoretical foundations of teacher identity; to examine the role of initial and continuing education policies in the State; and to reflect on the tensions, challenges and perspectives that permeate the professionalization and appreciation of teachers in Goiás.

Methodologically, this is a qualitative research of a bibliographic nature, based on classic and contemporary authors in the area of teacher training and professional identity, such as Freire (1996), Nóvoa (1992, 2017), Tardif (2002), Pimenta (1999), Contreras (2002), Imbernón (2000), García (1999), Gatti (2016) and Dourado (2015). The analysis also considers official documents, such as the Law of Guidelines and Bases of National Education (Law No. 9,394/1996) and the State Education Plan of Goiás (2015–2025), seeking to establish relationships between theoretical propositions and training practices developed in the local context.

Thus, the introduction of this article situates the problem of the professional identity of teachers at the confluence between training and practice, theory and reality, valorization and autonomy. Throughout the article, the text deepens the discussion on the constitutive elements of teacher identity, examines the dynamics of initial and continuing education in Goiás, and presents critical reflections on programs and public policies aimed at teacher training, culminating in final considerations that reaffirm the centrality of teaching as a transforming axis of education and society.

2 THE PROFESSIONAL IDENTITY OF TEACHERS

The professional identity of teachers is a social, historical and cultural construct in permanent evolution. It is not something given, but a process of **continuous (re)construction**, which manifests itself in the articulation between **initial training, continuing education, pedagogical practice and life experiences**. For **António Nóvoa (1992)**, the teacher's identity cannot be understood as a fixed essence, but as the result of multiple interactions and personal and professional trajectories that are intertwined in time. The author argues that teaching should be understood as a "process of self-construction", a life project that is constantly redefined in dialogue with the school and sociocultural contexts in which the teacher works.

Similarly, Maurice Tardif (2002, p. 36) states that "teachers' knowledge is plural, it is composed of knowledge from their professional training, their life history and their daily practice", which demonstrates that the teacher's professional identity is structured on a set of heterogeneous and socially constructed knowledge. Thus, for the author, professional knowledge is not only theoretical or scientific, but also practical and experiential. It is knowledge produced in the daily relationship with students, colleagues and the school environment. This plural conception of knowledge breaks with the technician view of teaching, which reduces the teacher to a mere executor of prescribed methodologies, and recognizes him as an **epistemic subject** who produces knowledge from reflection on practice.

In the context of Goiás, this understanding gains particular relevance, as the teacher from Goiás is inserted in an educational field marked by **structural challenges, regional inequalities and public policies in constant transformation**. The concrete working conditions, the training guidelines and the processes of professional valorization directly influence the construction of their identity. According to the **Goiás State Education Plan (2015–2025)**, one of the main objectives is precisely to promote the professional development of teachers, articulating training and appreciation, as established in **Goal 17**, which aims to ensure quality continuing education for all basic education professionals.

Teacher identity is, therefore, the result of a **dialectic between the personal and the professional**, between the individual and the collective. According to **Claude Dubar (2000)**, professional identity is constructed in the tension between **"identity for oneself"**, how the subject perceives himself, and **"identity for the other"**, how he is socially perceived.

In the case of the teacher, this tension is evident, that is, on the one hand he recognizes himself as an educator, trainer of consciences, mediator of knowledge and on the

other hand, he faces the devalued social image of the profession, marked by low salaries, work overload and little autonomy in pedagogical decisions. Dubar (2000) calls this field of tensions **the "field of identity forces"**, in which teachers need to constantly negotiate between their personal convictions and the social and institutional expectations that fall on them.

This relational dimension of teacher identity is complemented by **José Gimeno Sacristán (1995)**, who understands teaching as a social and cultural practice loaded with intentionalities. For the author, the professional identity of the teacher is linked to his ability to critically interpret the curriculum and to adapt educational policies to the concrete reality of his school. Thus, being a teacher is not limited to mastering contents, but to **acting ethically in a specific social and political context**, recognizing oneself as an agent of transformation and a historical subject.

This critical conception of teacher identity is close to the reflections of **Paulo Freire (1987, 1996)**, for whom teaching is a political and liberating act. Freire argues that the teacher must assume a dialogical and problematizing posture in front of the world, developing what he calls **praxis**, the reflected and transforming action. In *Pedagogy of the Oppressed*, the author states that "there is no teaching without discency", that is, teaching requires continuous learning, and it is in this process that the teacher builds and resignifies his identity. Praxis, as reflection and action on the world to transform it, is the core of teaching professionalism, as it prevents both **"practicalism"** (action without reflection) and **"theoreticalism"** (theory without commitment to reality).³

In this regard, **Donald Schön (2007)** contributes by developing the notion of **"reflective professional"**, emphasizing that the teacher is a professional who learns from experience. For him, reflection in and on action is the central element of teacher training and improvement. Reflection in action occurs during the pedagogical practice, when the teacher adjusts his practice in the face of the challenges that arise in the classroom; On the other hand, the reflection on the action takes place later, when he critically analyzes his practice and extracts new lessons from it. This reflective spiral is what allows the development of a solid and autonomous professional identity, as it promotes a continuous movement of self-education.

³ The distinction between "practicalism" and "theoreticalism" was widely discussed by Freire (1987) and taken up by Schön (2007), both converging in the defense of a pedagogical praxis that unites action and reflection, overcoming both unreflective activism and abstraction detached from reality.

On the other hand, **Pimenta (1999) and Marcelo Garcia (1999)** argue that professional identity is also constructed collectively, in spaces of collaboration and dialogue among peers. Teaching, in this sense, is a profession that requires **community**, because it is in the sharing of experiences that the teacher consolidates his knowledge and reaffirms his identity. This perspective dialogues directly with the proposals for continuing education in Goiás, especially those that value work in pairs and collaborative training, as observed in the **Center for Study, Research and Training of Education Professionals (CEPFOR) model** and in programs such as **Raízes Formativas**⁴.

However, the construction of the teacher's identity does not occur in a linear way. Contreras (2002, p. 157) states that "the professional autonomy of teachers is crossed by multiple forms of administrative, curricular and evaluative control, which limit their possibilities of decision and reflection on their own work." In this way, the author draws attention to the tensions between autonomy and control that permeate the exercise of teaching, highlighting that the professional autonomy of teachers is constantly limited by administrative, curricular and evaluative mechanisms that restrict their freedom of decision. The author warns that, many times, educational policies impose norms and curricula that reduce pedagogical freedom, weakening the autonomy and, consequently, the professional identity of the teacher. To overcome this condition, he proposes the strengthening of **critical autonomy**, understood not as absolute independence, but as the capacity for reflection, choice, and ethical positioning in the face of institutional demands.

In addition to these individual and institutional dimensions, the **temporal dimension** of identity is also central. According to **Huberman (1995)**, the teaching career is composed of different phases, initial enthusiasm, stabilization, experimentation, disenchantment and maturity, and each of them implies different identity challenges. Professional identity, therefore, is also biographical, that is, it reflects the history of each teacher and their interactions with the teaching contexts.

In Goiás, this trajectory is manifested in the various generations of teachers who faced processes of expansion of the public network, curricular reforms and training policies that sometimes value, sometimes disregard the protagonism of teachers.

⁴ The courses of the "Formative Roots" project are offered by the Department of Education of Goiás (SEDUC-GO), in partnership with the Getúlio Vargas Foundation (FGV), with a focus on the continuing education of high school teachers in the state. Several courses are available, such as Portuguese Language, Mathematics, Art, Biology, Philosophy, Physics, Geography, History, English Language, Sociology and a track for trainers, with options in the Virtual School format. (Source: escolavirtual.educacao.go.gov.br)

In summary, the professional identity of teachers is a **multidimensional** phenomenon, which involves the intertwining of **subjective, institutional and sociopolitical** factors. In the case of Goiás, understanding this identity requires looking beyond the classrooms, in order to consider the role of public policies, educational institutions and concrete working conditions. It is in this context that **initial and continuing education** is presented as fundamental pillars for the strengthening of teacher identity.

3 BETWEEN INITIAL TRAINING AND CONTINUING EDUCATION IN GOIÁS

Teacher training is a central axis of educational policies and research in education in Brazil, being understood as a **continuous, unfinished and reflective process**, which accompanies the entire professional trajectory of the teacher. The **Law of Guidelines and Bases of National Education (LDB 9.394/96)** establishes higher education as a minimum requirement for the exercise of teaching, which reinforces the need for solid initial training and permanent continuing education.

However, as Gatti (2016, p. 47) states, "teacher training in Brazil still presents a fragile articulation between what is taught in universities and what is done in schools, revealing a worrying distance between academic theory and professional practice." In Goiás, this issue takes on particular contours, because the state, despite recent advances, still lives with regional inequalities, structural deficiencies and a heterogeneous educational network.

According to the **Goiás State Education Plan (2015–2025)**, teacher training is one of the strategic pillars to ensure the quality of basic education. The document proposes policies aimed at valuing teachers, expanding continuing education programs and strengthening training institutions.

However, the effectiveness of these goals depends on a real articulation between **universities, education departments and schools**, so that the training processes are not fragmented, but integrated into the daily practices of teachers.

Authors such as **Imbernón (2000)** and **Libâneo (2013)** reinforce that teacher education needs to overcome the transmissive and technicist model, approaching a **dialogical and reflective logic**, in which the teacher is seen as an active subject of his or her own education.

Initial training is the first institutionalized moment in the teacher's professional trajectory, representing the space in which the epistemological, pedagogical and ethical bases of the profession are built. In Goiás, this training is offered by public and private

institutions, especially the **Federal University of Goiás (UFG)** and the **State University of Goiás (UEG)**, which play an important role in the training of teachers for basic education. However, there is a consensus among researchers that initial training in Brazil faces a **persistent dichotomy between theory and practice**.

According to **Gatti (2016)**, teaching degree courses tend to prioritize the accumulation of theoretical content, often disconnected from school realities. As a consequence, many graduates report difficulties in adapting to the teaching routine, experiencing the so-called *reality shock*⁵, a term coined by **Huberman (1995)** to describe the impact of the entry of the beginning teacher into complex and challenging teaching contexts.

To overcome this fragmentation, Zeichner (2008, p. 542) proposes the idea of a practice-based education, "understood as a space for authentic learning, in which reflection and conceptual mastery have equal importance in the construction of teaching professionalism", arguing that teaching degree courses should promote significant experiences that articulate theory and practice. In this sense, the supervised internship ceases to be a bureaucratic moment to become a privileged space for the construction of knowledge.

In the context of Goiás, it is essential that universities strengthen **links with public education networks**, promoting extension projects, action research and institutional partnerships that integrate the academic environment with school realities. **Libâneo (2013)** argues that the university should take a critical stance towards educational policies, contributing to the training of autonomous, creative teachers committed to social transformation.

Thus, initial training should not be seen as a closed cycle, but as the **starting point of a permanent formative trajectory**, which finds its logical and epistemological continuity in continuing education.

Thus, continuing education is one of the fundamental pillars of teacher professionalization. Far from representing only a technical update, it constitutes a space for reflection, socialization of knowledge and **identity reconstruction**. According to **Imbernón (2000)**, continuing education should be understood as a process of **professional and**

⁵The term "reality shock" was introduced by Huberman (1995) to describe the emotional and professional impact experienced by teachers at the beginning of their careers when confronting the school reality with the expectations idealized during initial training.

personal development, in which the teacher learns from experience, from peers and from the social transformations that go through his practice.

In the State of Goiás, continuing education has been strengthened by initiatives of the **State Department of Education (SEDUC)** and related bodies, such as the **Center for Studies, Research and Training of Goiás (CEPFOR)**. These actions seek to bring training closer to the real needs of teachers, avoiding generic and decontextualized courses.

The **Pair Training** model, offered by CEPFOR, is a significant example of this collaborative approach. Inspired by the conceptions of **Nóvoa (2017)**, who understands training as a process of "self-invention", the program proposes that teachers learn from each other, collectively building knowledge and pedagogical practices. This methodology favors **autonomy, reflection and appreciation of the teaching experience**, fundamental elements for the strengthening of professional identity.

From a theoretical point of view, this perspective dialogues with **Garcia (1999)**, who defines the professional development of teachers as a process of **situated learning**, in which knowledge is produced within educational practices. For the author, continuing education must be articulated with the concrete conditions of the school, promoting a culture of collaboration and investigation into one's own practice.

Another relevant example in the context of Goiás is the Formative **Roots: Integration of Learning program**, a partnership between SEDUC and the Getúlio Vargas Foundation (FGV). Aimed at teachers of Portuguese Language and Mathematics, the project is based on the integration of knowledge and interdisciplinarity, seeking to strengthen the essential skills of teachers. Although it presents promising results, it faces challenges such as the need for greater continuity and the systematic evaluation of its impacts on pedagogical practices.

According to Pimenta (1999), continuing education cannot be restricted to specific actions or occasional courses; it must be configured as an organic and emancipatory process, guided by research and collective reflection. This perspective is also defended by Freire (1996, p. 39), when he states that "teaching requires loving-kindness and courage — the fear of taking risks is an obstacle to creation and freedom. Teacher training, therefore, must be an act of love and courage, committed to the transformation of the world."

Therefore, continuing education should be seen as a **political and ethical space of resistance**, in which the teacher recognizes himself as a historical subject capable of critically intervening in his practice. This understanding is essential for training policies in Goiás to

advance from a model of technical training to a project of **humanizing, critical and emancipatory training**.

In view of this, the articulation between initial training and continuing education is one of the most persistent challenges of Brazilian education. Often, the two processes are treated in a dissociated way, which compromises the continuity of the teacher's professional development. **Gatti (2016)** and **Dourado (2015)** point out that the absence of dialogue between universities and education networks results in fragmented and decontextualized training.

In Goiás, this fragmentation manifests itself when initial training does not dialogue with the real demands of public schools and when continuing education does not take advantage of the knowledge produced in universities. To meet this challenge, it is necessary to build a **"community of practice"** (Wenger, 1998), in which different educational agents share experiences and produce knowledge collaboratively.

The **National Curriculum Guidelines for the Training of Basic Education Teachers (2015)**, prepared under the coordination of Luiz Fernandes Dourado, reinforce the importance of teacher training that promotes the inseparability between theory and practice, teaching and research. The document proposes that education systems establish integrated policies for training and professional development, ensuring coherence between the various levels and stages of teacher training.

In addition, **Nóvoa (2017)** argues that professional development should be understood as a **formative spiral**, in which initial training feeds into continuing education, and this, in turn, feeds back into practice and higher education. In other words, it is not a matter of two separate stages, but of complementary moments of the same process.

In the case of Goiás, the creation of **mentoring and tutoring programs between beginning and experienced teachers** can represent a promising way to strengthen this articulation. This proposal dialogues with the idea of a **reflective and collaborative teacher**, defended by Schön (2007) and Pimenta (1999), who understand education as a shared social practice.

Overcoming the tensions between initial and continuing education also requires policies of professional appreciation and recognition. The precariousness of teaching work, low salaries and administrative overload make it impossible for teachers to effectively participate in training processes.

As Contreras (2002, p. 205) warns,

... It is not possible to talk about teachers' autonomy and professional development without considering the real conditions of their work. Precariousness and excessive control prevent teachers from actually exercising their autonomy and engaging in meaningful training processes.

Thus, to think about training without discussing working conditions is to perpetuate a structural contradiction in Brazilian education.

In summary, teacher training, both initial and continuous, should be conceived as a unitary, continuous and contextualized process. In Goiás, the consolidation of this perspective implies strengthening partnerships between training institutions and education systems, ensuring decent working conditions and fostering a culture of collaborative, reflective and emancipatory training.

4 REFLECTIONS ON THE OFFER OF INITIAL AND CONTINUING EDUCATION FOR TEACHERS IN THE STATE OF GOIÁS

Teacher training, both in its initial and continuing dimensions, constitutes the **structuring axis of the teacher's professional identity**. In the context of Goiás, this training reflects a complex web of policies, practices, and experiences that, while promoting significant advances, also highlight persistent gaps.

Reflecting on this dynamic is fundamental to understand how teaching is constituted and developed in a State that seeks to reconcile educational expansion, professional valorization and improvement of the quality of teaching.

According to **Nóvoa (2017)**, thinking about teacher training implies rethinking the profession itself, because training teachers is to form critical subjects, capable of interpreting and transforming reality. This understanding requires that training programs are not restricted to the transmission of techniques, but promote reflection, autonomy and teacher protagonism. It is in this sense that training policies in Goiás should be analyzed, considering their potentialities and limitations.

Positive points and convergences are observed, such as teacher training in Goiás, which presents advances that deserve to be highlighted. The offer of **teaching degree courses** in public institutions, such as the **Federal University of Goiás (UFG)** and the **State University of Goiás (UEG)**, in order to represent an important axis of democratization of access to higher education and training of qualified teachers. These institutions have invested

in curriculum updating, in the articulation between teaching, research and extension, and in the creation of pedagogical support programs aimed at teaching.

In addition, the **continuing education policies** implemented by the **State Department of Education (SEDUC)** and by specialized centers such as **CEPFOR** have sought to bring academic theory closer to school realities. The implementation of programs such as **Continuing Education in Pairs** and the project **Formative Roots: Integration of Learning** is an important milestone, as it signals a paradigm shift, that is, from a verticalized and prescriptive training to a **collaborative and reflective** approach.

According to Imbernón (2000, p. 47), "effective training is that which starts from the reality of teachers, recognizing them as active subjects in the construction of their own knowledge, capable of reflecting and transforming their practice." In this sense, the model of pair training is close to Schön's (2007) **conceptions** of the *reflective professional*⁶, by proposing spaces for dialogue and analysis of pedagogical practice. This methodology breaks with the idea of training as a "recipe" and provides the construction of professional knowledge based on experience and collective exchange.

Another positive point is the growing understanding that **teacher training is a continuous process**, which is in line with the thinking of García (1999, p. 139), who understands that "the professionalization of the teacher is a process that is built throughout life, articulating different formative moments, initial, insertion and continuous development, which feed back and give meaning to the teaching practice."

The **Goiás State Education Plan (2015–2025)** also recognizes this continuity by establishing specific goals for the consolidation of permanent training and professional development policies.

These initiatives express a **theoretical and political convergence** between academic discourse and institutional practices. The emphasis on interdisciplinarity, collaborative learning and the integration between theory and practice reveals a commitment to a broader conception of education, which goes beyond simple technical updating and focuses on the **integral development of the educator**.

However, as **Pimenta (1999)** and **Tardif (2002)** point out, the challenge is to transform these principles into sustainable practices, ensuring objective conditions for teachers to

⁶ The concept of "reflective professional", developed by Schön (2007), refers to the professional who learns in and about action, transforming his practice based on systematic reflection.

effectively participate in the training processes. It is at this point that the gaps and challenges of the Goiás system emerge.

Gaps and challenges that, despite the advances observed, teacher training in Goiás still faces, such as the obstacles that compromise its effectiveness. The first and most evident of them is the **fragmentation between initial and continuing education**, a topic already discussed by **Gatti (2016) and Dourado (2015)**. Universities often train teachers with a solid theoretical base, but without proper articulation with school practice, and the education networks, in turn, offer specific training, not always integrated with local demands. The result is a discontinuous and non-transformative training process.

Another challenge is the **instrumental nature** of some continuing education, which is limited to the presentation of decontextualized content or methodologies.

Imbernón (2000, p. 63) criticizes this model when he states that

... Teacher training cannot be conceived as a simple technical training, but must constitute a space for critical reflection on practice and reconstruction of teachers' knowledge, considering their experiences and real contexts of action.

When training is imposed, detached from school realities or guided by pedagogical fads, they end up generating demotivation and resistance among teachers.

The **precariousness of teaching work** is also a determining factor. Low salaries, overload of activities and absence of institutionalized time for study and reflection make it difficult to adhere to training processes. Contreras (2002, p. 199) argues that "teachers cannot be required to have autonomous and reflective attitudes when the working conditions imposed on them are based on distrust, devaluation and bureaucratic control of their practice." Teacher autonomy, therefore, must be accompanied by policies of professional valorization that ensure decent working conditions and social recognition.

In addition, the **impact assessment of training** is a point that has not yet been explored. In Goiás, although there are reports and administrative records, there are few studies that systematically analyze the effects of training on pedagogical practice and student learning. **Gatti (2010)** emphasizes that evaluation should not be restricted to the satisfaction of the participants, but should examine the effective transformations in the way of teaching and learning.

Another critical aspect concerns the **regional contextualization of policies**. The State of Goiás is marked by significant geographic and socioeconomic diversity, which

requires that training courses consider local specificities. The reality of rural schools, for example, differs profoundly from urban schools in the capital. An education that ignores this heterogeneity runs the risk of reinforcing inequalities and producing limited effects.

Finally, there is a cultural challenge, that of consolidating a **culture of permanent formation** in schools. As Nóvoa (1992, p. 25) points out, "continuous training must be integrated into the daily work of teachers and schools, and not be an isolated episode or a moment outside of time and professional space." This change in mentality requires incentive policies, time for collective study, and pedagogical leadership that values research and reflection.

The analysis of teacher training in Goiás shows that the evolution of **professional identity** is intrinsically linked to the quality and continuity of training policies. Teaching, as **Freire (1996)** and **Nóvoa (2017) point out**, is a social and political practice that requires reflection, ethical commitment, and collective engagement. Therefore, the strengthening of teacher training is not only a technical issue, but also **a matter of social justice and valuing educational work**.

The positive experiences observed in the **Peer Training** and **Formative Roots programs** reveal possible paths such as investment in collaborative practices, recognition of the knowledge of experience and the promotion of spaces for dialogue between teachers. However, for these programs to reach their fullness, it is necessary that they be incorporated as **a State policy**, and not just as one-off or temporary management actions.

In this sense, the consolidation of an articulated and continuous training policy requires the strengthening of partnerships between universities and education networks, the institutionalization of permanent spaces for reflection and teacher research in schools, as well as the material and symbolic valorization of teaching.

These measures not only qualify teaching, but also reaffirm teaching as an essential profession for human and social development. As Tardif (2002, p. 11) reminds us, "there is no profession without knowledge, and there is no knowledge without recognition of experience."

In summary, teacher training in Goiás is in the process of maturing. It is moving towards a more collaborative and reflective practice, but it still needs to overcome structural and cultural challenges. Only with an **integrated, continuous and contextualized training policy** will it be possible to consolidate a solid, critical and emancipatory teaching identity

that is capable of responding to the challenges of education in Goiás and contributing to the transformation of society.

5 FINAL CONSIDERATIONS

The professional identity of teachers, as demonstrated throughout this study, is a continuous process of evolution and reconstruction that reflects the historical, political and social conditions in which teaching takes place. This identity is not born ready-made, it is woven daily in the relationship between **training, practice and reflection**, permeated by tensions between autonomy and control, theory and practice, vocation and professionalization.

In Goiás, this process is particularly complex, as it involves the challenge of consolidating educational policies capable of articulating **initial training, continuing education and professional valorization** in a context of inequalities and emerging demands.

From the theoretical review and analysis of the training policies and programs of the State of Goiás, it was possible to verify that there are **significant advances**, especially in **collaborative continuing education** initiatives, such as **Peer Training** and the **Formative Roots** program, which demonstrate a paradigm shift by prioritizing dialogue, exchange of experiences and reflection on practice.

However, **structural and cultural gaps** remain that limit the scope of these initiatives. The fragmentation between initial and continuing education, the absence of institutionalized time for study and the precariousness of teaching work make it difficult to consolidate a permanent training culture. Thus, any training policy that ignores objective working conditions runs the risk of becoming merely rhetoric.

Public education policies, especially the **National Education Plan (PNE 2014–2024)** and the **Goiás State Education Plan (2015–2025)**, recognize the importance of teacher training as a strategic axis for the quality of basic education.

Reinforcing the commitment to valuing teaching and offering continuing education in all areas of knowledge depends on adequate funding, administrative continuity and systematic monitoring, elements that still constitute challenges in the Goiás scenario.

In this sense, it is essential to think of **teacher training as a State policy** and not as a government policy. This implies ensuring its **institutional sustainability**, so that advances are not lost with management changes.

Another important point is also the strengthening of **partnerships between universities, education departments and schools**, creating collaborative training and research networks that promote the integration between theory and practice, teaching and learning, knowledge and experience.

Teaching, according to **Freire (1996)**, is a political and ethical act that requires commitment to social transformation. The teacher, as a mediator of knowledge and agent of change, needs training and professional conditions that enable him to perform his function in a critical and autonomous way. It is, therefore, urgent to reaffirm that **the quality of education necessarily involves valuing teachers**, ensuring their integral training and recognizing their central role in society.

In view of this, this article reaffirms three strategic axes for the strengthening of teacher identity in Goiás, the first being the **integration between initial and continuing education**, through programs that promote dialogue between university and school and the exchange between beginning and experienced teachers. The second, the **valorization of the teaching work**, with salary and career policies and adequate conditions for study and reflection and, finally, the **institutionalization of permanent training**, in order to guarantee time and pedagogical space for teachers to develop research and reflective practice.

Only with the consolidation of these axes will it be possible to train teachers capable of critically understanding their profession, acting with autonomy and building a solid teaching identity, committed to public, democratic and emancipatory education.

In other words, and finally, strengthening the teacher's identity is strengthening the public school itself, that is, it is investing in a future in which education is, in fact, the path to social and human transformation in Goiás and throughout Brazil.

ABSTRACT

The SEBRAE's ALI Productivity Program is a strategic initiative focused on boosting the innovation and competitiveness of micro and small enterprises (MSEs) in Brazil. This article analyzes the effectiveness of the Innovation Radar, the program's central tool, in the productive transformation of MSEs assisted by Local Innovation Agents (ALIs). Based on an MIT model and adapted by SEBRAE, the Radar is a comprehensive diagnostic tool that assesses everything from managerial controls to innovative practices, providing a complete business overview. By examining the Radar's application in Cycle 1, this research aims to prove its importance in the final evaluation of revenue, costs, and productivity. Companies that prioritized deficit areas such as ESG and Managerial Controls achieved success, maximizing their productivity. However, analyses of negative results revealed a critical disconnect between the deficiencies pointed out by the Radar and the action priorities chosen by the MSEs, emphasizing the need for greater awareness of essential practices. In summary, the success of the ALI Productivity Program does not depend solely on the quality of the tool, but on the commitment of the entrepreneurs. The program, combined with the strategic use of the Radar, can catalyze the positive transformation of MSEs, provided there is an active partnership between ALIs and companies for the effective implementation of action plans.

Keywords: SEBRAE. ALI Productivity. Micro and Small Enterprises (MSEs). Innovation Radar. Innovation.

RESUMO

O Programa ALI Produtividade, do SEBRAE, destaca-se como uma iniciativa estratégica visando fortalecer a inovação e competitividade das micro e pequenas empresas (MPEs) no Brasil. Este artigo focaliza a análise da eficácia do Radar de Inovação, ferramenta central do programa, na transformação produtiva das MPEs assistidas pelos Agentes Locais de Inovação (ALIs). Originado no MIT e adaptado pelo SEBRAE, o Radar é um diagnóstico abrangente que aborda desde controles gerenciais até práticas inovadoras, proporcionando uma visão completa do ambiente empresarial. Ao explorar a aplicação do Radar no ciclo 1 do ALI Produtividade, a pesquisa visa compreender a importância dessa ferramenta na

avaliação final de faturamento, custos e produtividade. Empresas que priorizaram áreas deficitárias, como ESG e Controles Gerenciais, alcançaram sucesso na maximização da produtividade. Contudo, algumas empresas enfrentaram desafios ao não correlacionar adequadamente deficiências identificadas pelo Radar e prioridades de ação. Análises de empresas com resultados negativos destacaram uma desconexão entre deficiências apontadas pelo Radar e as prioridades escolhidas pelas empresas, enfatizando a necessidade de conscientização sobre práticas essenciais para a produtividade. O sucesso do ALI Produtividade não depende apenas da qualidade da ferramenta, mas também da compreensão e comprometimento das empresas atendidas. Em síntese, o programa, combinado ao eficaz uso do Radar, pode catalisar a transformação positiva das MPEs, contanto que haja uma parceria ativa entre ALIs e empresas para a implementação efetiva de planos de ação.

RESUMEN

El Programa ALI Productividad de SEBRAE se destaca como una iniciativa estratégica orientada a fortalecer la innovación y competitividad de las micro y pequeñas empresas (MPEs) en Brasil. Este artículo se centra en analizar la eficacia del Radar de Innovación, la herramienta central del programa, en la transformación productiva de las MPEs asistidas por los Agentes Locales de Innovación (ALIs). Originado en el MIT y adaptado por SEBRAE, el Radar es un diagnóstico integral que aborda desde controles gerenciales hasta prácticas innovadoras, ofreciendo una visión completa del entorno empresarial. Al explorar la aplicación del Radar en el ciclo 1, la investigación busca comprobar la importancia de esta herramienta en la evaluación final de facturación, costes y productividad. Las empresas que priorizaron áreas deficitarias como ESG (Ambiental, Social y Gobernanza) y Controles Gerenciales lograron el éxito, maximizando su productividad. Sin embargo, los análisis de resultados negativos revelaron una desconexión crítica entre las deficiencias señaladas por el Radar y las prioridades de acción elegidas por las MPEs, lo que enfatiza la necesidad de una mayor concienciación sobre prácticas esenciales. En resumen, el éxito del ALI Productividad no solo depende de la calidad de la herramienta, sino del compromiso de los empresarios. El programa, combinado con el uso estratégico del Radar, puede catalizar la transformación positiva de las MPEs, siempre y cuando exista una asociación activa entre los ALIs y las empresas para la implementación efectiva de los planes de acción.

Palabras clave: SEBRAE. ALI Productividad. Micro y Pequeñas Empresas (MiPyMEs). Radar de Innovación. Innovación.

1 INTRODUCTION

The ALI Productivity Program - Local Innovation Agents - Productivity is an initiative of SEBRAE (Brazilian Micro and Small Business Support Service) with the purpose of fostering a culture of innovation and improving the competitiveness of micro and small companies in Brazil (Sebrae, 2025).

In this program, the Local Innovation Agents, professionals highly trained by SEBRAE, play a fundamental role. They work directly with companies, offering specialized advice in areas such as management, innovation, and technology. In addition, they assist companies in identifying market opportunities and developing solutions to overcome specific challenges. A relevant point is that participation in the program is entirely free for the companies involved (Sebrae, 2025).

The ALI Productivity is aimed at micro and small companies that wish to innovate and improve their management, with a focus on maximizing productivity, increasing revenue, and reducing costs (Sebrae, 2025).

Among the various dimensions of the entrepreneurial world that Ali proposes to investigate is the Productivity indicator and the business areas: management controls, operations management, marketing management, innovation practices, digital transformation and ESG - Environmental, Social and Governance. All these aspects are observed through the Innovation Radar tool, which is considered the first crucial encounter between the Agent and the company, in order to observe and analyze weaknesses, strengths, threats and opportunities.

Based on these assumptions, this article proposes to analyze how the interpretation of the Radar instrument can be crucial in the application of the measured results of "meeting 9" (nine) of the Ali Productivity. It is in this sense that it is intended to:

- Analyze final measurements of revenue, variable costs and employed people in cycle 1 of the ALI Productivity and compare them with the initial measurement of the companies served by the N4 agents in the regional office of Presidente Prudente;
- Understand the importance of the Radar as a primary factor for the analysis of problems and action plans and the consequent success in the final measurement;
- Compare companies with increased productivity with those with decreased production and their respective radars.

2 THEORETICAL FRAMEWORK

2.1 THE INNOVATION RADAR

The ALI Productivity Journey takes place in cycles of up to six months, starting with the entrepreneur's interest in introducing innovation into their company. This journey is composed of the following stages: beginning of the journey; mapping of challenges and solutions; knowledge of indicators; knowing the means of testing; creation and testing of the prototype; implementation planning; implementation evaluation; completion of the workday; measurement of results (Sebrae, 2022).

Each stage has its relevance for organizational success and attack on the business bottlenecks listed, but the stage at the beginning of the journey has a relevant aspect in the sense of identifying the problems and in which aspects actions should be created for implementation.

The Innovation Radar plays a crucial role as it represents the first significant delivery of the ALI Project to the entrepreneur, providing a detailed analysis of the company's current situation. Each dimension of the ALI Radar has been carefully crafted based on a series of questions, serving as an essential guide for evaluating the practices adopted by the company. For effective application, it is imperative to thoroughly understand each topic and its issues, ensuring that, by collecting evidence, it is possible to assist the entrepreneur in classifying the current context of the company according to the corresponding degree of maturity (Sebrae, 2022).

The objective of the ALI Radar is to show the entrepreneur the company's potential and identify points for improvement. The presentation of evidence by the entrepreneur is essential to validate the indicated level. The answers and evidence must be registered in the system, which, in the end, will generate the result of the Radar (web) and a feedback proposal. After applying the Radar, the system will provide detailed feedback with the results of the answers provided by the entrepreneur. In addition, the application of the Radar will reveal the company's financial maturity, especially in the dimension of management by indicators (Sebrae, 2022).

If the company does not have a structured system to monitor revenue, as well as its variable and fixed costs, it is recommended to refer the entrepreneur to financial guidance, financial workshop, or another solution offered by the local Sebrae to address this issue (Sebrae, 2022).

According to Davila, Epstein and Shelton (2007), innovation can be categorized into two aspects: technological innovation and innovation in the business model. Both must occur simultaneously, however, it is up to the leadership to establish which models and tools will be used to ensure this simultaneity.

The Innovation Radar is a mechanism for diagnosis. It was originally conceived by researchers at the Massachusetts Institute of Technology (MIT), in the United States, and later adapted by Sebrae. This method addresses several dimensions in which a company can seek innovation. When performing this assessment, it is essential to understand that innovation is not an isolated event, but the result of a continuous process. Therefore, the analysis is not limited only to the number of innovations, but extends to the evaluation of the maturity of the innovation management process in companies, an essential factor for competitiveness in the market (Sebrae, 2013).

Currently, the Innovation Radar implemented has 24 questions that address 6 dimensions to be analyzed, each with 4 questions, they are: management controls; operations management; marketing management; innovation practices; digital transformation, and; ESG – environmental, social and governance. It should be noted that it has not always been the way it is implemented in the ALI Productivity, being developed and improved over time, without losing its essence, which is to investigate the strengths and weaknesses of organizations.

2.1.1 Innovation

For Schumpeter (1982), innovation can manifest itself in five different ways:

- a)** Launch of a new product or qualitative modification to an existing product;
- b)** Process innovation that represents a novelty for an industry;
- c)** Exploration of a new market;
- d)** Development of new sources for the acquisition of raw materials or other inputs;
- e)** Changes in the organizational structure of the industry.

The analysis of innovation in Micro and Small Enterprises (MSEs) implies understanding how their specific characteristics influence the manifestation of these ways of innovating in their activities. Due to the distinct differences between MSEs and large companies, the approach to innovation must also be adapted.

According to Silveira (2013), the act of innovating is not strictly linked to great discoveries. Innovation, as a factor of competitive differentiation, can be identified in practices to improve processes and services, in the implementation of new management approaches, in the exploration of new markets, in the offer of products and services valued by customers, in the resolution of customer problems, in the search for new market segments, in the search for alternative sources of revenue, in the development of new pricing systems, in the effective interaction with customers and partners, in the collaboration and refinement of the flow of information in the supply chain, and also in the creation of mechanisms such as suggestion programs to encourage the presentation of ideas by employees.

Oliveira (2007) argues that innovation is a long-term investment. Although, initially, innovation and changes may increase risks and uncertainties, reducing the company's efficiency and productivity, success in this process can result in benefits and competitive advantages in the future.

The importance of organizational innovation is highlighted by Lam (2005), challenging the traditional assumption of economists that organizational change is simply a response to technical change. On the contrary, Lam (2005) argues that organizational innovation can be an essential precondition for technical innovation.

According to the OECD (1997), innovation encompasses several activities that are not limited to Research and Development (R&D). This includes the final phases of development for pre-production, production, and distribution, development activities with a lower degree of novelty, support activities such as training and market preparation, as well as activities related to the development and implementation of innovations, such as new marketing methods or new organizational methods, that do not fall into the categories of product or process innovations. Innovation activities may also cover the acquisition of external knowledge or capital goods that are not part of R&D.

Over a given period, a company's innovation activities can be classified into three types:

- Successful, when they result in the implementation of an innovation, even if it is not necessarily commercially successful;
- In progress, when they have not yet resulted in the implementation of an innovation;
- Abandoned before the implementation of the innovation.

As an example, Paredes, Santana and Fell (2014) conducted a case study, using the Innovation Radar (IR), in a small company in the metallurgical sector. Although the authors highlight the lack of consensus on the most appropriate model to measure the degree of innovation of a company, the results revealed considerable improvements through the score attributed to the indicators, demonstrating that the tool used (IR) offers a comprehensive view of the innovation environment.

Exploring this same approach, Torchia, Silva and Bari (2016) examined a small business in the transport sector, with the aim of verifying the presence of innovative activity through the Innovation Radar. Adopting a quantitative perspective, each of the thirteen dimensions analyzed presented three characteristics that made up the fundamental concept of the innovation cycle: i) Business innovation is related to a new value, not just to a new thing; ii) Business innovation takes several forms; iii) Business innovation is systemic. Based on the results obtained, it was found that there was limited use and much to be developed with regard to the innovative activity in this segment.

In the following topic, the importance of a good interpretation of the Innovation Radar in the ALI Productivity will be addressed, describing how it has a crucial role in diagnosis and as a primary tool for change and implementation of internal corrective actions.

3 METHODOLOGY

The work will be in its essence as to its approach, a qualitative research, but it will be necessary in order to compare the results obtained in the TF (final measurement), tabulated information and quantitative data of results and innovation radars collected by the N4 Agents of the Regional Office of Presidente Prudente/SP.

As for the objectives, the article works as a documentary and explanatory analysis, where documents and reports will be observed, in order to explain the results presented by the agents through the field exploration of the problems of the companies.

In order to guide and explain the occurrences, SEBRAE manuals, bibliographic references such as scientific articles, e-books, notes, books, theses and dissertations, Sprints and Innovation Radars brought by Local Innovation Agents – BET N4 Scholarship, inserted in SisALI in cycle 1 of Productivity in 2022, will be used.

4 RESULTS AND DISCUSSIONS

As noted, Ali Productivity has as its methodology the search for ways to impact and create philosophies of business improvement, thus aiming at increased productivity, that is, leverage in revenue and/or variable cost cuts. It is important to point out that entrepreneurs are not always able to dedicate themselves to their own created action plans, where they often postpone or give up for various internal reasons.

Below is the list of 10 (ten) companies served by 10 (ten) ALI Agents, guided by their N6 at the SEBRAE Regional Office of Presidente Prudente, which serve 3 regions: Alta Sorocabana, Pontal do Paranapanema and Nova Alta Paulista. These companies have final measurement and were successful in calculating productivity. It should be noted that particularized aspects of each company were disregarded, such as those related to seasonal sales.

Table 1

Positive Productivity Measurements Cycle 1 – ER Presidente Prudente/SP

Agent	Companies	Branch	Problem	Prototyped Solution	Increased Productivity (greater than 15%)	Dimensions of the most deficient Radar
The	VB	Teaching Activities	Lack of leads (Marketing)	Lecture on how to speak on Instagram (Public Speaking Course offered by the company)	64,58%	2 – Innovation Practices; 2 – Management Controls
B	MS	Lighting panels	Difficulty in closing budgets	Institutional video of the company and send it to TV advertising	256,46	1 – Management Controls
C	KT	Paints and materials for painting	Lack of product promotion/ decrease in face-to-face sales	Carry out sales actions through "live commerce"	264,46	1 – Management Controls (no defined goals for indicators; no billing data and monthly costs. 1 – ESG (no communication channels).
D	ING	Constructor	Financial problems	Restructure business	296,66	2 – Operations

			(high accounts payable)	processes/hire accountant		Management ; 2 – Innovation Practices
And	GS	Diaper Sale	Low adherence of a diaper brand	Elaboration of a video demonstrating the brand and its benefits	157,38	1 – ESG; 2 – Operations Management ; 2 – Management Controls; 2- Digital Transformation
F	MC	Mini-market	Absence of structured marketing plan	Development of own products with packaging commemorating special dates	211,20	3 – Operations Management ; 3- ESG.
G	DT	Market	Needs to increase customer portfolio	Focus on social media with a posting schedule	198,77	1 – ESG; 2 – Management Controls; 2 – Operations Management ; 2 – Marketing Management ; 2 – Digital Transformation
H	RB	Computer services and sales of electronics and accessories	Problem of visibility, standardization and internal processes	Process Flow Table	73,46	2 – Management Controls; 2 – ESG
I	HR	Feeding	Employee management with checklist of tasks and obligations	Using the <i>Canva Happiness Tool</i>	60,16	1 – Innovation Practices; 1 - ESG
J	SC	Clothing	Lack of planning and assertiveness of purchases	Create defined processes, where the customer chooses the products he will	39,52	1 – Operations Management ; 1 - ESG

				purchase, before purchasing from suppliers		
--	--	--	--	---	--	--

Source: Author (2025).

By analyzing the table, it is possible to understand that the Innovation Radar is an essential tool for creating internal improvement mechanisms and guiding the Agent's planning. It is possible to observe that the biggest problem concerns ESG and Management Controls.

Table 2

Most deficient dimensions

Companies	Radar Dimension
7/10	ESG
6/10	Management Controls
5/10	Operations Management
3/10	Innovation Practices
1/10	Marketing Management

Source: Author (2025).

From Table 1 it is possible to conclude that most of the companies that managed to adhere to the practices in their deficit areas, obtaining good results in the final measurement of productivity. It is clear that organizations are still unable to establish ESG practices, such as governance and sustainable philosophies, which often tend to generate an initial outlay.

Another point to highlight is the management controls that address aspects related to financial and operational indicators, goal setting, effective inventory control, and cash flow. The difficulty with this dimension is quite considerable, where many end up not having tools that can measure or even report the situation.

Table 3 shows the companies that did not present positive results in the TF (final measurement), worsening their productivity.

Table 3

Negative Productivity Measurements Cycle 1 – ER Presidente Prudente/SP

Agent	Companies	Branch	Problem	Prototyped Solution	Decrease in Productivity by 15% (%)	Dimensions of the most deficient Radar
The	VP	Food	Customer churn (no loyalty)	Post photos and videos of customers in the environment,	-2,56	2 – Marketing Management (does not analyze industry)

				on the company's social networks		trends, has no action planning, higher prices than most competitors).
B	AC	Variety store	Low clientele outside the dates considered commercial	Schedule of marketing actions on special dates	-54,26	1 – ESG (does not systematize its communication channels; does not have fast channels such as WhatsApp
C	FA	Maintenance and repair of electronic and optical equipment	Difficulty in attracting customers	CRM system for registration and lead capture	-22,35	1 – Operations Management; 1 – Innovation Practices; 1 – ESG.
D	SP	Water distributor	The company has other niches unknown to most of the clientele	Institutional video demonstrating its products	7,17	3 – Management Controls; 3 – Marketing Management; 3 – Innovation Practices; 3 – Digital Transformation; 3 – ESG.
And	TT	Cargo road transport	Operational problems (delay in arranging fuel payment)	Implement the online notes of gas stations in the system	-64,70	1 – Management Controls; 1 - Operations Management; 1 - Digital Transformation; 1 - ESG

Source: The authors(2025)

It should be noted that the view of this article disregards economic aspects, drop in sales and internal problems of these companies and specific sectors, which are quite common and tend to reflect in the results presented. Another important and large aspect is the non-commitment of some organizations to the Program and consequent non-application of the corrective measures suggested by the ALIs. These aspects guide the non-application of the measures or even non-follow-up or implementation of the ideas observed in the prototype.

In Table 3, it is possible to analyze that many of the problems prioritized by the companies in question do not match the deficiency pointed out in the application of the Radar. Let's look at some clear cases:

Table 4

Deficit dimension x prioritized focus

Enterprise	Deficit Dimension	Prioritized Focus
VP	Marketing Management	Customer churn
AC	ESG	Low clientele on ordinary days
F	Management Controls	Absence of relationship marketing
DB	ESG/Digital Transformation	Marketing Need (Disclosure)

Source: The authors(2025)

Table 4 highlights that despite observing that there are greater deficiencies in other dimensions, companies often tend not to prioritize these bottlenecks, either because they do not observe how much it impacts their productivity or because they do not want to make changes in specific areas (self-indulgence). This data is relevant, since of the sample of the

10 companies with negative results, 4 (40%) did not prioritize corrective actions to a problem that can generate more future benefits.

5 CONCLUSION

The ALI Productivity Program, promoted by SEBRAE, emerges as a strategic initiative to boost innovation and improve the competitiveness of micro and small enterprises (MSEs) in Brazil. Its Local Innovation Agents (ALI), trained professionals, play a crucial role in offering expert advice and focus on areas such as management, innovation and technology.

This article proposed an in-depth analysis of the effectiveness of the Innovation Radar, an essential tool of the program, in the productive transformation of MSEs served by ALI Productivity. The Radar, originated at MIT and adapted by SEBRAE, is a diagnostic mechanism that covers several dimensions, from management controls to innovation practices, providing a holistic view of the business environment.

By exploring the application of the Radar in cycle 1 of the ALI Productivity, this article sought to understand how the interpretation of this tool can be crucial for success in the final measurement of revenue, costs and productivity. The analysis of the companies served revealed that those that prioritized the most deficient dimensions, such as ESG and Management Controls, were successful in maximizing productivity.

However, it is notable that some companies have not correctly prioritized corrective actions, often not understanding the relationship between certain deficiencies and productivity. The results showed that the implementation of ESG practices and management controls is essential for organizational success, but many companies still face challenges in these aspects.

The analysis of the companies with negative results in the final measurement highlighted a disconnect between the deficit dimensions pointed out by the Radar and the priorities for action chosen by the companies. This discrepancy highlights the need for greater awareness of the importance of certain practices in achieving the desired productivity.

In this context, it is evident that the success of ALI Productivity does not depend only on the quality of the tool used, but also on the understanding and commitment of the companies served. It is imperative that they recognize the importance of areas such as ESG and management controls to promote significant changes in their productivity.

In short, the ALI Productivity Program, combined with the efficient use of the Innovation Radar, can be a catalyst for the positive transformation of MSEs. However, it is critical that

there is an active partnership between ALIs and companies, promoting a deeper understanding of the identified gaps and the effective implementation of action plans.

ABSTRACT

This article aims to analyze how advances in digital technologies impact knowledge management (KM) models in organizations, with an emphasis on the contributions of these innovations to organizational development and to meeting the requirements of NBR ISO 9001. This is a qualitative research, developed through a Systematic Literature Review (SLR). Fourteen studies published between 2015 and 2025 were selected, extracted from the SciELO and CAPES Journals, with strict inclusion and exclusion criteria. The analysis sought to understand the interrelationships between KM, emerging technologies and quality standards. The results demonstrate that the integration between KM and digital technologies, such as artificial intelligence, big data, gamification and collaborative platforms, favors the systematization, dissemination and application of organizational knowledge. Furthermore, this synergy strengthens the culture of innovation, organizational learning, and compliance with the requirements of NBR ISO 9001:2015. Although the review included articles in Portuguese and English, the research was restricted to specific databases and time frames, which may have left out relevant studies from other sources. Furthermore, the lack of empirical data limits the practical application of the findings. Nevertheless, it provides support for future research and practical applications. The study contributes by highlighting KM as an essential strategy in the digital age and highlights the value of emerging technologies in strengthening organizational performance and compliance with normative quality standards.

Keywords: Knowledge Management. Digital Technologies. Organizational Innovation. NBR ISO 9001. Organizational Performance.

RESUMO

Este artigo tem como objetivo analisar como os avanços das tecnologias digitais impactam os modelos de gestão do conhecimento (GC) nas organizações, com ênfase nas contribuições dessas inovações para o desenvolvimento organizacional e para o atendimento aos requisitos da NBR ISO 9001. Trata-se de uma pesquisa de natureza

qualitativa, desenvolvida por meio de uma Revisão Sistemática da Literatura (RSL). Foram selecionados 14 estudos publicados entre 2015 e 2025, extraídos das bases SciELO e Periódicos CAPES, com critérios rigorosos de inclusão e exclusão. A análise buscou compreender as inter-relações entre GC, tecnologias emergentes e normatizações da qualidade. Os resultados demonstram que a integração entre GC e tecnologias digitais, como inteligência artificial, big data, gamificação e plataformas colaborativas, favorece a sistematização, disseminação e aplicação do conhecimento organizacional. Além disso, essa sinergia fortalece a cultura da inovação, a aprendizagem organizacional e o cumprimento dos requisitos da NBR ISO 9001:2015. Embora a revisão tenha incluído artigos em português e inglês, a pesquisa se restringiu a bases e recortes temporais específicos, o que pode ter deixado de fora estudos relevantes de outras fontes. Além disso, a ausência de dados empíricos limita a aplicação prática dos achados. Ainda assim, oferece subsídios para futuras investigações e aplicações práticas. O estudo contribui ao evidenciar a GC como estratégia essencial na era digital e destaca o valor das tecnologias emergentes no fortalecimento da performance organizacional e na conformidade com padrões normativos de qualidade.

RESUMEN

Este artículo analiza cómo los avances en tecnologías digitales impactan los modelos de gestión del conocimiento (GC) en las organizaciones, enfatizando las contribuciones de estas innovaciones al desarrollo organizacional y al cumplimiento de los requisitos de la norma NBR ISO 9001. Se trata de un estudio de investigación cualitativa, desarrollado mediante una revisión sistemática de la literatura (RSL). Se seleccionaron catorce estudios publicados entre 2015 y 2025 de las bases de datos de revistas SciELO y CAPES, utilizando criterios rigurosos de inclusión y exclusión. El análisis buscó comprender las interrelaciones entre la GC, las tecnologías emergentes y los estándares de calidad. Los resultados demuestran que la integración entre la GC y las tecnologías digitales, como la inteligencia artificial, el big data, la gamificación y las plataformas colaborativas, favorece la sistematización, la difusión y la aplicación del conocimiento organizacional. Además, esta sinergia fortalece la cultura de innovación, el aprendizaje organizacional y el cumplimiento de los requisitos de la norma NBR ISO 9001:2015. Si bien la revisión incluyó artículos tanto en portugués como en inglés, la investigación se limitó a bases de datos y períodos específicos, lo que pudo haber excluido estudios relevantes de otras fuentes. Además, la falta de datos empíricos limita la aplicación práctica de los hallazgos. Aun así, ofrece una base sólida para futuras investigaciones y aplicaciones prácticas. El estudio contribuye al destacar la gestión del conocimiento como una estrategia esencial en la era digital y enfatiza el valor de las tecnologías emergentes para fortalecer el desempeño organizacional y el cumplimiento de las normas de calidad.

Palabras clave: Gestión del Conocimiento. Tecnologías Digitales. Innovación Organizacional. NBR ISO 9001. Desempeño Organizacional.

1 INTRODUCTION

In recent decades, knowledge has come to be recognized as one of the main strategic assets of organizations. The transformation of the industrial economy into an economy based on information and knowledge has driven a reconfiguration of organizational practices, requiring more dynamic and collaborative approaches in the creation, systematization and application of knowledge. In this context, knowledge management (KM) emerges as a multidisciplinary field aimed at generating value from intellectual capital and continuous organizational learning (Nonaka & Takeuchi, 1997; Davenport & Prusak, 1998).

Technological evolution, driven by digitalization, the internet of things, artificial intelligence (AI), and data-driven systems, has been promoting profound transformations in the ways knowledge is produced, accessed, and shared. Digital platforms, collaborative environments, intelligent software, and methodologies such as gamification and *design thinking* have become part of KM processes, supporting innovation, decision-making, and organizational sustainability (Luiz et al., 2023). These technological tools not only optimize the flow of information, but also enhance the conversion of tacit knowledge into explicit knowledge, favoring organizational learning.

KM, in digital times, can no longer be thought of only as a set of internal practices, but rather as a process articulated with networks, systems, and platforms that transcend the physical limits of the organization. According to Probst et al. (2002), knowledge management involves identifying, acquiring, developing, sharing, using and preserving relevant knowledge. In the digital age, these steps are profoundly mediated by technological resources, which alter not only the speed, but also the depth and scale of the circulation of knowledge in organizations.

In the Brazilian scenario, however, several challenges are still perceived for the consolidation of KM as a structured practice. The disparity in access to technologies, the absence of an organizational culture focused on sharing knowledge, the scarcity of investments in innovation, and the turnover of professionals make it difficult to systematize institutional knowledge. Despite this, promising initiatives have emerged in sectors such as health, education, and services, which demonstrate the effectiveness of digital tools in improving communication, data management, and the formation of learning communities (Vaz & Landeiro, 2022).

At the same time, there is a movement of maturation of organizations regarding the valorization of knowledge as a factor of competitive differentiation. Knowledge is no longer

just an input and is now understood as an integral part of business strategy, with direct impacts on performance, innovation, and the ability to adapt to complex and unstable environments. Weingärtner and Romeiro (2024) highlight that digital transformations not only modify operational processes, but also resignify the way organizations learn, relate, and position themselves in the face of contemporary challenges.

In view of this panorama, this article aims to analyze how the evolution of technologies has impacted knowledge management models in organizations, with emphasis on the contributions of these innovations to organizational development and, secondarily, to compliance with the normative requirements of NBR ISO 9001. The analysis is conducted from a systematic review of the literature, with a reflective focus on classic and contemporary authors, seeking to understand the interfaces between knowledge, technology and organizational transformation.

2 THEORETICAL FRAMEWORK

Knowledge management (KM) can be understood as a set of practices that involve the creation, organization, sharing, and application of organizational knowledge. Several theoretical models, such as those of Nonaka and Takeuchi (1997), Davenport and Prusak (1998) and Probst et al. (2002), emphasize that knowledge should be treated as a strategic asset, and that its conversion from tacit to explicit form is essential.

With the acceleration of digital transformation, new technological tools have come to play a central role in KM processes. Integrated management platforms, digital repositories, software based on artificial intelligence, learning management systems, and gamified learning environments are examples of solutions that optimize the flow of knowledge within organizations (Barbosa, 2020).

These technologies have enabled greater agility in data capture, more accessibility to information, and collaboration between geographically distant teams. Thus, by incorporating these innovations, organizations not only increase their operational efficiency but also build an organizational culture that is oriented towards learning and innovation.

3 IMPACT OF DIGITAL TECHNOLOGIES ON KNOWLEDGE MANAGEMENT

Recent studies show that the use of digital technologies has contributed significantly to strengthening KM processes. Collaborative platforms, artificial intelligence, and big data

have been adopted to automate information flows, facilitate access to knowledge, and promote strategic data analysis (Weingärtner & Romeiro, 2024).

The adoption of methodologies such as *design thinking*, use of intelligent tutoring systems, and gamification, as pointed out by Pereira et al. (2022), has expanded the possibilities of organizational learning and integration of tacit knowledge. These interactive approaches reinforce employee engagement, in addition to contributing to the retention and dissemination of institutional knowledge.

Although there are challenges, such as resistance to change and the lack of technological culture, studies show that the combination of KM strategies and technological solutions tends to promote greater adaptability, innovation and competitiveness.

4 RELEVANCE OF NBR ISO 9001 CERTIFICATION AND CONTRIBUTIONS OF DIGITAL TECHNOLOGIES TO KNOWLEDGE MANAGEMENT

The ISO system was created in 1946 with the purpose of promoting international standardization and facilitating communication between countries. In 1947, the *International Organization for Standardization (ISO) was officially founded*, which currently has more than 22 thousand international standards published (ISO, 2018a). Among these standards, the NBR ISO 9000 family stands out, widely recognized in several sectors. It is composed of NBR ISO 9000, which presents the fundamentals and vocabulary; by NBR ISO 9001, the only certifiable one, which establishes the requirements for a quality management system; and by NBR ISO 9004, which offers guidelines for the improvement of organizational performance (Valls, 2005).

The NBR ISO 9001 certification, as pointed out by Godoy et al. (2009), provides benefits such as process improvement, indicator control and increased customer satisfaction. Data from a survey conducted by ACT Consultoria (2018), based on world records from 2008 to 2017, reveal that Brazil still has a long way to go to reach the certification levels of more consolidated countries, evidencing the need for greater awareness and preparation on the part of national organizations. Certification is often sought by companies that wish to meet supplier requirements, provide services with greater credibility or strengthen their internal management (UNIDO, 2016).

It is worth noting that, although the NBR ISO 9001 certification is not mandatory in all contexts, its adoption requires analysis of the organizational moment, level of maturity, team commitment, and clarity regarding the objectives to be achieved (ISO, 2015). According to

INMETRO (2018), the choice of a duly accredited certifying body is essential to ensure reliability in the certification process.

In this scenario, knowledge management (KM) starts to play a strategic role, especially from the inclusion of requirement 7.1.6 in NBR ISO 9001:2015, which requires organizations to create, maintain and make available the knowledge necessary for the effective operation of processes. The convergence between KM and normative requirements reinforces the importance of systematizing and valuing organizational knowledge.

Digital technologies, in this context, play a fundamental role in enabling greater accuracy, standardization, and traceability in knowledge management processes. Tools such as collaborative platforms, systems based on artificial intelligence, digital repositories and quality management software contribute directly to compliance with regulatory requirements. Companies that invest in these technological solutions tend to find it easier to obtain or maintain ISO certification, as they strengthen aspects such as documentation, internal communication, and continuous improvement.

5 METHODOLOGICAL PROCEDURES

RSL is a method indicated to examine a corpus of academic literature in order to obtain insights, critical reflections, in addition to generating new paths and research questions (Massaro et al., 2016). According to Sampaio and Mancini (2007, p. 2):

A systematic review, like other types of review studies, is a form of research that uses the literature on a given topic as a source of data. This type of investigation provides a summary of the evidence related to a specific intervention strategy, through the application of explicit and systematized methods of search, critical appreciation and synthesis of the selected information.

5.1 DELIMITATION OF THE QUESTION

In the face of the digital transformations that mark the contemporary organizational scenario, knowledge management (KM) has gained new contours, especially with the incorporation of specific technologies, such as digital platforms, artificial intelligence, big data, and collaborative environments. These tools have been consolidating themselves as strategic allies to optimize the storage, dissemination, and reuse of critical knowledge in organizations.

Despite the growing appreciation of KM, many institutions still face recurring challenges, such as high staff turnover, absence of systematic knowledge sharing

mechanisms, failures in preserving information, and lack of adequate digital structures for organizational knowledge management. Such gaps result in rework, loss of tacit knowledge, and low operational efficiency (Rossetti & Morales, 2007).

In order to obtain answers to the research objective and following the RSL method, two research questions were chosen with specific views on the theme, presented below:

Table 1

Research Questions

QP1	How has the evolution of digital technologies transformed knowledge management models in organizations?
QP2	How do these technological innovations applied to knowledge management contribute to organizational development and compliance with the requirements of NBR ISO 9001?

Source: Authors.

5.2 SELECTION OF DATABASES

Once the question of the study has been delimited, the databases consulted are presented to select the studies to be excluded and included in the systematic literature review to be carried out. In the course of the databases used for a systematic review of the literature, the following were presented:

- SciELO: Comprises the production of articles produced in several Latin American countries; It is "an electronic library that encompasses a selected collection of Brazilian scientific journals".
- Capes Journal: Capes is a foundation linked to the Ministry of Education of Brazil that works in the expansion and consolidation of stricto sensu graduate studies in all Brazilian states. The virtual library of Periódicos Capes has on its website "more than 45 thousand titles with full text, 130 reference databases, 12 databases dedicated exclusively to patents, in addition to books, encyclopedias and reference works, technical standards, statistics and audiovisual content" (CAPES, 2021).

5.3 ELABORATION OF THE SEARCH STRATEGY

In order to select relevant texts on the theme in question, the search strategy applied began with the selection of digital libraries to be used, which were selected for their relevance and recognition of quality in the academic environment.

Table 2

Digital Libraries

Library	Email address
Capes Journal	https://www.periodicos.capes.gov.br/
Scielo	https://www.scielo.br/

Source: Authors.

After the selection of the libraries, it is pointed out that each database contains individual rules and limitations, and it is necessary to observe different strategies to adapt the search. Thus, the next step was to define a *string* of search aligned with the objective and questions of the research.

Table 3

Search strings

Keywords	Search Strings
"Knowledge Management"	Knowledge Management and Evolution of Digital Technologies
"Knowledge management"	Knowledge Management and Organizational Innovation
"Knowledge Management"	Knowledge Management and ISO Standards

Source: Authors.

In addition to the *search string*, delimiting inclusion and exclusion criteria were established, including type of subject, period of publication, type of resource, and availability. The *strings* were entered in the search field of the Capes Journal portal and in Scielo, as shown in Table 4. Articles dated from the last 10 years (2015 – 2025) and in Portuguese and English were considered.

Table 4

Inclusion and Exclusion Criteria

Inclusion Criteria	Exclusion Criteria
Articles that address the theme of knowledge management in companies.	Articles that talk about knowledge management but without directing organizations and addressing digital transformations.
Articles that use technologies and programs in knowledge management.	Articles outside the research time frame (2010-2019).
Articles that address the use of digital transformations and changes in the quality and knowledge management of organizations.	Articles with restricted access, which do not allow full reading of the content for critical analysis.
	Systematic review articles

Source: Authors.

In the search carried out in the SciELO and CAPES Periodicals databases, 781 articles were identified, 491 in the SciELO database and 290 in the CAPES database. Among this total, 521 publications were excluded because they treated KM in a generic way, without applying technological resources to its development. 18 studies were also eliminated due to duplication between the databases, in addition to 108 studies classified as systematic literature reviews and 120 publications that were outside the period stipulated for analysis (2015 to 2025). After these filtering steps, a final set of 14 studies remained that fully met the established inclusion criteria.

As a way of organizing and presenting the results of the search in the databases, at the end of the entire process, Table 5 was elaborated, which presents the works selected for this RSL:

Table 5

Selected works

No.	Title	Author/Year	Summary	Methodology	Analysis of Results
1	Organizational learning strategies and information and communication technologies to support knowledge management in SMEs in the Cauca Valley, Colombia	Arango et al. (2020)	The article proposes strategies to strengthen knowledge management (KM) in SMEs based on its relationship with organizational learning and information and communication technologies (ICT). It is proposed to improve transfer mechanisms and practices and the implementation of virtual learning platforms.	This study with a quantitative approach, using a questionnaire applied to SMEs. The information obtained was analyzed using the SPSS software. The study was limited to companies located in the urban area of Cali with at least ten years of incorporation. It is characterized as a descriptive study that specified properties and characteristics. The expert judging technique was applied with five experts to validate the	The main results of the survey showed the lack of a formal area for knowledge management. SMEs have collaborative processes that facilitate knowledge sharing. Formal and institutional mechanisms for the transfer, documentation and adequate storage of knowledge have not been established. There is a weakness in the lack of organizational culture that fosters the exchange of knowledge. Strategies are proposed to strengthen KM practices aiming at strategic competitiveness

				content of the instrument. Cronbach's alpha test was performed for the reliability of the questionnaire.	
2	Knowledge Management in Organizations 4.0	Jala et al. (2023)	Knowledge Management (KM) comprises the construction of assertive strategies to streamline business decision-making, particularly in Industry 4.0, which is characterized by technical and economic innovation with a focus on artificial intelligence and accessibility to <i>big data</i> .	The information collection process took place in three stages: 1) semi-structured interviews with managers of different organizations 4.0 (qualitative information); 2) establishment of criteria and classification codes for content analysis; 3) elaboration of empirical and descriptive conclusions for the writing of theoretical and explanatory conclusions	Within the knowledge management category, subcategories such as "basic conditions" and "human talent" are associated. The subcategory "organizational learning" is "cause of" human talent. The anecdotes and episodes that employees remember the most are the characteristic that stands out in every organization, showing that experiences allow for adequate knowledge management in entities 4. The interviewees highlighted that KM manifests relevant characteristics for teamwork, self-management, and that experience and willingness to share are essential. Communication, commitment, collaboration, and experience strengthen organizational identity, facilitating business strategy and the use of technology.
3.	Methodology for estimating and evaluating a knowledge management model using structural equations	Armas et al. (2020)	The article presents a methodology for the estimation and evaluation of a knowledge management (KM) model using structural equations, which test and estimate causal relationships from statistical data	The proposed methodology includes the construction of a questionnaire. Structural Equation Models (SEM) were used to test theoretical hypotheses. Five hypotheses were formulated. The initial instrument had	The most influential variables in knowledge management for the department of systems and technological resources at Universidad Simón Bolívar are ICT, Intellectual Capital, Organizational Learning and Innovation. The ICT tools of core services define KM solutions by accessing knowledge repositories, based on the processes of

				199 items, evaluated by two experts and reduced after a pilot test with 42 IT employees, eliminating items with corrected element-total correlation of less than 0.70. The statistical programs SPSS 25, AMOS 22 and STATGRAPHICS Centurion XVI were used.	creation, organization and use. ICT tools of packaged services solve specific problems, such as customer relationship management. The designed instrument is reliable according to the results of the Cronbach's Alpha test.
4	YouTube Tutorials as a Non-Formal Learning Strategy for College Students	Rodriguez (2021)	The study discusses the didactic criteria of YouTube tutorials, noting that their relevance or pedagogical quality is not evaluated. <i>Likes</i> , <i>dislikes</i> , comments, or video length are not enough to determine its quality. Comments are essential as a feedback mechanism for users and creators, addressing technical and execution aspects.	The methodology is not explicitly detailed in the sources, but the text discusses the evaluation of YouTube tutorials as a non-formal learning strategy and mentions "our investigation", indicating the conduct of a study.	The relevance or pedagogical quality of YouTube tutorials is not evaluated. <i>Likes</i> , <i>dislikes</i> , comments, or the length of the video are not sufficient requirements to determine the quality. Comments are essential as a feedback mechanism for users and creators.
5	Influence of Knowledge Management Practices Applied to Agile Software Development	Candal et al. (2022)	The document presents a theoretical platform, method and materials applied in the research, presentation, analysis and discussion of the results, and conclusions. It addresses the relationship between	Exploratory-descriptive research with a qualitative approach with two stages: 1) literature review on the relationship between PGC and DAS; 2) application of a <i>controlled survey</i> with the Delphi	The assertions with the highest consensus include questions about <i>software</i> maintenance, staffing, knowledge sharing, agile practices, and generic DAS improvements. Assertions with less consensus address software maintenance and DAS-specific components (artifacts, ceremonies, method, and team). The model

			Knowledge Management (KM) and Agile Software Development (DAS). The Agile Manifesto is an important milestone in the DAS. The study identifies the technological profile of nurse managers. It is a quantitative, descriptive and exploratory study with 74 nurse managers who filled out a questionnaire on the use of ICT in management. Nurse managers are over 51 years old, have more than 28 years of professional practice and have more than 11 years in management, and have acquired knowledge about informatics through self-learning.	method21. A face test was performed with four experts to improve the questionnaire, which was then applied to other specialists. This is a quantitative, descriptive and exploratory study. The eligible population was nurse managers at a Hospital Center in the Northern Region (CHRN) and nurse members of the Portuguese Association of Nurse Managers and Leadership (APEGEL). A self-completed questionnaire was used. The data were treated with statistical and descriptive analysis. Descriptive approach, using the <i>survey</i> technique. A consultation instrument was applied to 10 key informants (2 health workers per hospital center) using the 13-item Likert scale. Information collection was carried out in 5 health organizations,	can enable the evolution of studies on the correlation between knowledge management and <i>software development</i> with agile methods. The most well-known technologies used by nurse managers are <i>e-mail</i> and videoconferencing. <i>Webs</i>, discussion groups and videoconferencing are known by 36.5% of the nurses. <i>E-mail</i> is the most used technology for management (4.3%), followed by <i>webs</i> (28.4%) and discussion groups (25.7%). For face-to-face training, the most mentioned are videoconferencing (63.5%), <i>e-mail</i> (60.8%) and discussion groups (50.0%). The technologies for which nurse managers would be interested in receiving training are <i>webs</i> (33.8%), discussion groups (32.4%), <i>blogs</i> (32.4%) and videoconferencing (29.7%). The results show congruence in the management of information from the hospitals consulted. The health centers have homogeneous results regarding the use of <i>web software</i>, <i>Microsoft Office</i> and <i>online</i> tools, management of social networks for service information, <i>online</i> interaction for access to services, and recording of results in the management of human talent, finance, health technologies and logistics. These
6	Use of technologies by nurse-managers in the management process	Vaz & Landeiro (2022)			
7	Knowledge management is a key element in information management in healthcare organizations	Martinez et al. (2022)	The study aims to evaluate the characteristics of information management of organizations in a knowledge <i>cluster</i> in hospitals and clinics in Ambato, Ecuador, and the impact of ICT.		

				both public and private.	homogeneous operating techniques possibly respond to a regulatory policy.
8	ECG Tutor: development and evaluation of a gamified intelligent tutor system for teaching electrocardiogram	Pereira et al. (2022)	The study aimed to explore the interest and motivation of medical students in the use of a gamified intelligent tutor system (ITS) for the study of electrocardiogram (ECG). The need to adapt to mobile devices and improve the elements of gamification and aesthetics was noted.	This is an exploratory and quantitative survey research. Graphic design prototypes of a gamified STI were conceived and evaluated by medical students from two universities. The population was 779 medical students from the fifth period onwards. Data collection was carried out through a structured questionnaire in Google Forms.	At the beginning, 53 undergraduates participated, but only 14 answered the post-interaction questionnaire.... 75.4% of the students self-rated their ECG interpretation skills as "terrible" or "bad" 100. 96.2% classified the classes on ECG as quantitatively insufficient. All students agreed that interacting with the system was clear and understandable and easy to use.
9	Applied knowledge management: digital transformation and communities of practice	Weingärtner & Romeiro (2024)	The study seeks to understand whether knowledge management (KM) practices, such as community of practice, applied in the study unit, will allow an effective improvement of processes. Process improvement is a complex and knowledge-intensive process, even more so in digital transformation projects.	Interpretative case study. The adoption of collaborative discussion through a model similar to that of communities of practice was determined. Field note records and active participation were used for observation. Document analysis included identification, collection, organization, permissions, reading, analysis and interpretation, and cross-analysis.	In the initial stages of the process methodology, only the view of the person responsible or the direct participants is considered, focusing on explicit knowledge, which neglects intangible elements and part of the history of the process. Having intentional spaces for discussion allowed the process of knowledge creation to flow in an appropriate and timely manner. The most recurrent words in the documentary corpus were: <i>learning, students, education/educational, reading/lectura, blended and teacher</i> . Information and communication technologies are undeniably important in educational scenarios. Evaluation, collaborative work, and technological mediations are the most relevant aspects in the design of <i>b-Learning experiences</i> .

10	The use of <i>design thinking</i> in solutions Innovative for information and management Knowledge in teaching hospital pharmacy	Luiz et al. (2023)	Develop innovative solutions to solve problems that are caused by the difficulty in reconciling the information recorded in the system with the physical stock in a pharmacy of a teaching hospital.	Exploratory research of qualitative nature – method adopted, case study. The sources of evidence were: interview, questionnaire, document analysis, direct observation and indirect observation with a <i>design approach thinking</i>. Three employees who work in a pharmacy of a teaching hospital, in the control of the stock of medicines (receipt, storage and distribution) were the subjects of the research.	The results show that there is a need to understand how the stock control of medications, who makes it and how it is done, in addition to identifying who used this control and their needs. In order to understand how individuals viewed this process, it was necessary to verify the occurrence of accidents, incidents and/or errors that could impair the control of the stock of medicines.
11	An Enabling Framework for the Development of Knowledge Management Practices: Perspectives from Nigeria	Pepple and Okuiomse (2023)	This study investigated the knowledge management (KM) practices of palm oil producers in Nigeria, comparing indigenous and contemporary farmers. The focus was on how information is created, stored, and disseminated, using the facilitating framework of Lee and Choi (2003).	The research adopted an interpretative posture and qualitative methodology. The structure of Lee and Choi (2003) was used to frame the interview questions. We interviewed 40 purposefully selected participants (20 indigenous farmers and 20 contemporaries) , with more than 5 years of experience in palm oil cultivation. The interviews were conducted via Zoom and lasted from 45 minutes	Indigenous farmers use traditional methods and orally transmitted information..., without documentary evidence. Contemporary farmers have formal organizations and discuss best practices in forums. Indigenous skills are learned by observation and generational transmission. There is concern about the lack of access for Nigerian producers to the relevant technology. Contemporary farmers use KM software such as "Agrisoft Systems". Both groups receive government support. Contemporary farmers use incentives and recognition (financial and non-financial) to motivate staff and foster creativity.

				to 1 hour. Thematic analysis was used, with a priori coding based on the literature.	KM contributed to increased profits and better agricultural yields for both, but contemporaries benefited more due to KM technology and practices.
12	Continuing Education in Health and Knowledge Management: Initiatives in the Regional Health Superintendence	Ribeiro and Friedrich (2023)	The study aimed to present the actions of Permanent Education in Health (PEH) and Knowledge Management (CG) carried out in a Regional Health Superintendence (SRS) of Minas Gerais, Brazil, and to reflect on the possible parallels. The results indicate formal and informal processes of training and knowledge sharing, construction and transformation of work processes, as well as fragmentation, sectorization and competitiveness based on information.	This is a qualitative and exploratory study.... Data collection took place from February to May 2021, using a remote instrument developed via Google Forms. The sample consisted of 10 health workers with complete higher education and working in management. The data were analyzed using Bardin's Thematic Content Analysis technique.	Knowledge is perceived as reflected and transformative information, which interacts with formative processes and experiences, being applied in daily work and in articulation with municipalities. There is a criticism of the lack of structure and incentive for PEH, despite its potential to favor access, exchange and integration between civil servants. KM is conceived as a tool/instrument for the daily intra-organizational work, aiming at optimizing and improving performance. There is compatibility between EPS and CG, with KM being an enabler for EPS.
13	The contribution of Learning commons practices to the knowledge management process in libraries	Pfleger and Macedo (2024)	The objective of this article is to analyze the contributions of the practices of Learning commons used in libraries for the process of managing knowledge.	Qualitative research. It used an analysis model developed in Macedo's doctoral thesis (2008) and validated in Espíndola's (2012) master's thesis. The model was adapted, using 10 KM processes identified in the literature, 21 CL	KM processes have 3 to 8 characteristics, with "partnership with other libraries" having the lowest number (3) and "sharing-dissemination-knowledge transfer" the highest number (8). The model is very useful for University Libraries and can be used for library management evaluation and action planning. The application of the model and the appreciation of the data that there is a significant relationship between Learning

			practices and characteristics inherent to KM processes applied in libraries.	commons and knowledge management, and both are relevant to the innovation of libraries.
14	Tacit Knowledge Management Strategies in Small and Medium-sized Enterprises: An Overview	Adesina and Ocholla (2024)	The study investigated tacit knowledge management (TKM) strategies in small and medium-sized enterprises (SMEs) in the province of KwaZulu-Natal (KZN), South Africa, aiming to reduce operational discontinuity and knowledge loss.	Most SMB owners are aware of the importance of tacit knowledge. The most common methods of capturing tacit knowledge are: monitoring (93.9%), hands-on sessions (92.2%), internal training programs (91.7%), and brainstorming/knowledge-sharing sessions (91.7%). Tacit knowledge is mostly shared in meetings, employee dialogues, and brainstorming sessions. Storage takes place in electronic files on computers, cloud storage, and physical files. Almost all respondents (96.1%) use information and communication technology (ICT) to manage tacit knowledge.

6 PRESENTATION AND ANALYSIS OF DATA

The systematic literature review contributed to studies focused on the problem of knowledge management. Among the authors conducting research focused on the area of study, the following stood out: Armas et al. (2020), Arango et al. (2020), Rodriguez (2021), Vaz and Landero (2022), Candal et al. (2022), Martinez et al. (2022), Pereira et al. (2022), Luiz et al. (2023), Jala et al. (2023), Pepple and Okuiomse (2023), Ribeiro and Friedrich (2023), Weingärtner and Romeiro (2024), Pflieger and Macedo (2024), Adesina and Ocholla (2024).

6.1 KNOWLEDGE MANAGEMENT IN THE ORGANIZATIONAL PROCESS OF COMPANIES

The study by Arango et al. (2020) presents contributions to discuss organizational learning strategies and the use of technologies to support knowledge management in small

and medium-sized enterprises (SMEs), specifically studying those in the Cauca Valley in Colombia.

The study by Jala et al. (2023) contributes that knowledge management within organizations that adapt to Industry 4.0 uses technological tools. For the authors, the pillars of KM are creation, sharing and use, providing strategic positioning and generating competitive advantages.

The authors adopt the definition of knowledge management based on Davenport and Prusak (2001); Koulopoulos and Frappaolo (2001); Nie, Ma and Nakamori (2009) in which it is characterized by being a set of practices and procedures, which enable organizations to: a) identify the knowledge necessary for the execution of their present and future activities; b) have this knowledge; and c) apply it appropriately to achieve the expected results (Arango et al., 2020). Among the organizational learning strategies, this study contributes to the improvement of knowledge transfer practices, in addition to the implementation of virtual platforms and the strengthening of the organization's culture to improve and qualify the knowledge management of SMEs.

The study by Martinez et al. (2022) addresses health organizations and contributes by saying that knowledge management (KM) is of great importance to manage the organization's tacit knowledge and convert it into valuable information for health centers, allowing them to respond to the demands of the environment.

The reflections and study by Ribeiro and Friedrich (2023) focused on problems in the health area, with the need to implement knowledge management and promote training and training. Knowledge management is included in activities as "the process of coordinating the flow of knowledge in an organization in a systematic and integrated manner, for the benefit of work" (Ribeiro & Friedrich, 2023).

With the authors Pepple and Okuiomse (2023) there is a facilitating framework for the development of knowledge management practices. The main points are: the definition of knowledge management, the components of its structure, the benefits and implementation.

6.2 THE EVOLUTION OF TECHNOLOGIES IN ORGANIZATIONAL KNOWLEDGE MANAGEMENT

The research by Arango et al. (2020) points to the contributions of technologies to the organizational culture of companies. For the authors, digital transformations challenge managers and companies, promoting changes in processes and organizational structure.

Thus, organizations are driven to seek new knowledge, make data-driven decisions, establish strategic partnerships, and reconfigure their operational strategies (Arango et al., 2020). Such aspects show how technological evolution directly impacts traditional models of knowledge management.

The study by Vaz and Landeiro (2022), conducted in the health sector, investigated how technologies integrated into management practices can support the work of nurses. Tools such as electronic medical record systems and management software were analyzed, which, according to the authors, enable more efficient communication, better organization of information and data, and greater agility in decision-making. The authors emphasize that digital technologies are indispensable to contemporary management, because "with the internet and constant updates and innovations, a lot of information is networked, which is vital to management" (Vaz & Landeiro, 2022). These advances reflect the growing role of technologies in strengthening KM processes.

Such studies indicate that technology has promoted significant transformations in the way knowledge is produced, managed, and disseminated. However, Vaz and Landeiro (2022) highlight that challenges still persist in the adoption of these technologies, such as resistance to change and lack of employee training. In order for the benefits of technology to be fully enjoyed, it is necessary to invest in infrastructure and continuous training of teams.

It is inferred that knowledge management and the adaptation of processes in companies are increasingly interconnected with technological resources such as artificial intelligence, digital platforms and online systems, which have proven effective in optimizing tasks, systematizing organizational knowledge and continuous learning of employees. In this sense, the research by Pereira et al. (2022) discusses innovative methodologies applied to KM, such as the use of artificial intelligence platforms and gamification in specific teaching and training contexts.

The study demonstrates the positive impacts of gamification on the learning process of medical students with difficulties in interpreting electrocardiograms (ECG). For this, intelligent tutoring systems (ITS) associated with gamification techniques were used. The results showed that the students considered the system clear, easy to use and useful, with high acceptance in terms of usability and intention of use. Despite this, aesthetic and gamification elements were not widely approved, indicating the need for adjustments in the design of these features.

In corporate environments, knowledge management is configured as the basis for strategic decisions and innovation processes. The study by Luiz et al. (2023) presents the use of *design thinking* as a tool to boost organizational learning. This approach favors the entry and circulation of knowledge through the creation of scenarios that stimulate action, innovation, and the transformation of tacit and cultural knowledge into intangible assets and social capital. The adoption of this approach highlights the growing technological sophistication in the structuring of processes aimed at KM.

In this same field of discussion, Weingärtner and Romeiro (2024) emphasize that knowledge should be treated as an essential asset for competitiveness. Digital transformations, according to the authors, directly impact management models by automating complex tasks and freeing up professionals' time for activities of greater strategic value. Thus, emerging technologies become facilitators in the process of capturing, organizing, and applying knowledge in organizations.

Finally, the study by Pflieger and Macedo (2024) contributes to the understanding of the role of digital platforms and environments in the process of knowledge management in libraries. The authors highlight the Learning Commons model as a dynamic and collaborative space, integrating individual and collective study environments, thus promoting active learning and knowledge exchange. The advancement and diffusion of these digital environments demonstrate the constant evolution of technologies applied to knowledge management.

In view of this, it is observed that the evolution of technologies has significantly impacted knowledge management models, making them more dynamic, accessible and centered on organizational innovation. The studies analyzed demonstrate that the incorporation of technological resources such as AI, gamification, digital platforms, and collaborative environments not only modernize KM processes, but also expand their effectiveness and reach, even contributing to meet normative standards such as NBR ISO 9001.

7 CONCLUSIONS AND RECOMMENDATIONS

The purpose of this study was to analyze how the evolution of technologies has impacted knowledge management models in organizations, highlighting the contributions of these innovations to organizational development and, in a complementary way, to meet the normative requirements of NBR ISO 9001. From the systematic review of the literature, it was

possible to verify that knowledge management, when articulated with emerging technologies, gains a strategic dimension that goes beyond the traditional limits of stored information, becoming a central element for innovation, continuous learning and competitiveness.

Several studies analyzed reinforce this perspective, as Arango et al. (2020) and Vaz & Landeiro (2022) show that digital technologies cause transformations in organizational culture, management structures, and decision-making capacity, especially by facilitating access, organization, and use of knowledge. Resources such as collaborative platforms, artificial intelligence, electronic medical record systems, management software, and digital environments have proven effective in promoting a more dynamic, accessible, and problem-solving-oriented KM.

In addition, authors such as Pereira et al. (2022) and Luiz et al. (2023) point to the importance of active methodologies, such as the use of gamification and *design thinking*, in stimulating learning and converting tacit knowledge into explicit knowledge. These models reveal a transition movement in knowledge management, in which technologies not only support operational processes, but also reconfigure the way knowledge circulates, legitimizes itself, and is applied in organizational daily life.

On the other hand, persistent challenges were also identified, such as those pointed out by Vaz & Landeiro (2022): resistance to change, absence of a culture of sharing, lack of digital infrastructure, and gaps in team training. Such obstacles reinforce the need for structured actions by organizations to effectively integrate technologies into knowledge management, not only as instruments, but as part of the culture and business strategy.

From a theoretical point of view, the present study reinforces the relevance of classical KM models, such as those of Nonaka & Takeuchi (1997), Davenport & Prusak (1998) and Probst et al. (2002), while proposing their updating in the face of the demands of the digital age. Knowledge management, in current times, requires not only formal structuring, but also flexibility, interactivity, and integration between people, technologies, and organizational purposes.

As a path for future research, it is suggested to carry out empirical studies in Brazilian organizations of different sizes and sectors, with the purpose of understanding how technological resources are being effectively implemented and what results have been achieved. In addition, it is recommended to investigate the role of leaders in the consolidation of an organizational culture guided by knowledge management, based on data and focused on innovation. Another relevant point is to deepen the analysis of the interactions between

digital knowledge management and normative requirements, such as those of NBR ISO 9001, in different organizational contexts.

In this scope, it is also proposed the development of a practical and easily accessible tool to assist companies in the application of knowledge management concepts in accordance with the requirements of the ISO standard. Such an initiative can work as a strategy to encourage the adoption of these practices, especially by organizations that face structural limitations or lack of technical knowledge. In this way, the field of application and reflection on KM as a strategic tool for organizational development in times of digital transformation is expanded.

ABSTRACT

Le Fort–type fractures represent one of the most complex and challenging conditions in facial trauma due to their high clinical severity, potential functional and aesthetic impairment, and the diagnostic difficulty resulting from the anatomical complexity of the midface. Most cases are associated with high-energy trauma, such as assaults and motor vehicle accidents, predominantly affecting young men. Clinical diagnosis should be based on a thorough physical examination, including inspection, palpation, and assessment of bone mobility, as well as the identification of signs such as malocclusion, crepitus, edema, and bilateral epistaxis. However, diagnostic confirmation depends on high-precision imaging exams, such as Cone-Beam Computed Tomography (CBCT), considered the gold standard because it enables detailed three-dimensional reconstructions and precise visualization of fracture lines, overcoming limitations of conventional radiography. Waters, Caldwell, Towne, and Hirtz radiographic views may still be useful in specific cases, while complementary methods such as magnetic resonance imaging and ultrasonography assist in evaluating soft tissues and diagnosing associated injuries. Thus, it is concluded that effective diagnosis of Le Fort fractures must be grounded in a multidisciplinary approach that integrates careful clinical assessment with advanced imaging methods, ensuring greater accuracy in identifying the extent of lesions and enabling adequate surgical planning for functional and aesthetic restoration of the traumatized patient, ultimately improving their quality of life.

Keywords: Le Fort Osteotomy. Diagnostic Imaging. Clinical Diagnosis. Maxillofacial Surgery.

RESUMO

As fraturas do tipo Le Fort representam um dos quadros mais complexos e desafiadores da traumatologia facial, devido à elevada gravidade clínica e potencial de comprometimento funcional e estético, bem como à dificuldade de diagnóstico decorrente da complexidade anatômica do terço médio da face. Destaca-se que a maioria dos casos está relacionada a traumas de alta energia, como agressões e acidentes automobilísticos, acometendo principalmente homens jovens. O diagnóstico clínico deve basear-se em um exame físico

minucioso, contemplando inspeção, palpação e avaliação de mobilidade óssea, além da identificação de sinais como má oclusão, crepitação, edema e epistaxe bilateral. No entanto a confirmação diagnóstica depende de exames de imagem de alta precisão, como a Tomografia Computadorizada de Feixe Cônico (TCFC), considerada o padrão-ouro por permitir reconstruções tridimensionais detalhadas e visualização exata das linhas de fratura, superando limitações radiográficas. As radiografias de Waters, Caldwell, Towne e Hirtz ainda podem ser úteis em casos específicos, enquanto métodos complementares, como a ressonância magnética e a ultrassonografia, auxiliam na avaliação de tecidos moles e em diagnósticos associados. Assim, conclui-se que o diagnóstico eficaz das fraturas Le Fort deve ser fundamentado em uma abordagem multidisciplinar, que associe a análise clínica criteriosa aos métodos de imagens avançados, garantindo maior precisão na identificação da extensão das lesões e um planejamento cirúrgico adequado para restauração funcional e estética do paciente traumatizado, promovendo melhora de sua qualidade de vida.

Palavras-chave: Osteotomia de Le Fort. Diagnóstico por Imagem. Diagnóstico Clínico. Cirurgia Maxilofacial.

RESUMEN

Las fracturas del tipo Le Fort representan uno de los cuadros más complejos y desafiantes de la traumatología facial debido a su elevada gravedad clínica, al potencial compromiso funcional y estético, y a la dificultad diagnóstica derivada de la complejidad anatómica del tercio medio facial. La mayoría de los casos se relaciona con traumas de alta energía, como agresiones y accidentes automovilísticos, que afectan principalmente a hombres jóvenes. El diagnóstico clínico debe basarse en un examen físico minucioso que incluya inspección, palpación y evaluación de la movilidad ósea, además de la identificación de signos como maloclusión, crepitación, edema y epistaxis bilateral. No obstante, la confirmación diagnóstica depende de pruebas de imagen de alta precisión, como la Tomografía Computadorizada de Haz Cónico (TCHC), considerada el estándar de oro por permitir reconstrucciones tridimensionales detalladas y la visualización precisa de las líneas de fractura, superando las limitaciones de la radiografía convencional. Las proyecciones radiográficas de Waters, Caldwell, Towne y Hirtz aún pueden ser útiles en casos específicos, mientras que métodos complementarios como la resonancia magnética y la ecografía contribuyen a la evaluación de tejidos blandos y al diagnóstico de lesiones asociadas. Así, se concluye que el diagnóstico eficaz de las fracturas Le Fort debe fundamentarse en un enfoque multidisciplinario que combine un análisis clínico riguroso con métodos avanzados de imagen, garantizando mayor precisión en la identificación de la extensión de las lesiones y un adecuado planeamiento quirúrgico para la restauración funcional y estética del paciente traumatizado, promoviendo la mejora de su calidad de vida.

1 INTRODUCTION

Bone fractures result from the application of a mechanical load greater than the absorption capacity of the tissue, resulting in the rupture of the facial structure and the alteration of local blood flow (Araújo, Gabrielli and Medeiros, 2007). This biomechanical imbalance causes pain, edema, hemorrhage and, in more severe cases, can compromise the airways and adjacent structures, requiring immediate care and an interdisciplinary approach (Mesquita et al., 2019). As for the etiology, according to a study carried out by Zamboni and collaborators in 2017, cases of aggression are the main cause of facial trauma, followed by car and motorcycle accidents, falls, being run over, complications in sports or at work, in addition to injuries caused by firearms. These occurrences reflect social behavior and increased exposure to risk situations in certain population groups (Rao and Raghani, 2013).

Regarding epidemiology, there is a greater involvement of men between the second and third decades of life, a group more exposed to facial traumatology, especially due to associated factors such as the consumption of alcoholic beverages and illicit drugs, more frequently related to this gender (de Moura, Daltro and de Almeida, 2016). According to Almeida et al. 2023, late diagnosis and treatment are more common in this patient profile, which worsens the prognosis and increases the risk of functional and aesthetic complications.

Anatomically, facial trauma is divided into fractures of the upper third, involving frontal bone and supraorbital boundaries; middle third, which may affect, together or individually, the nasal, orbital, maxillary and zygomatic bones; and lower third, where mandibular fractures occur. Fractures in the central region of the face correspond to approximately 70% of all maxillofacial traumas (Kim and Huoh, 2010). This predominance is due to the exposed anatomical position and the relative fragility of the structures of the middle third, often associated with dentoalveolar and orbital fractures (Hupp, Ellis, and Tucker, 2015). Its intimate anatomical connection with other bones of the skull, such as the palatine, sphenoid, ethmoid and vomer, favors the occurrence of associated traumas (Kim and Huoh, 2010).

The classification of fractures involving the middle third of the face, described by René Le Fort in 1901, was based on the orientation of the bone disjunction: Le Fort I, horizontal; Le Fort II, pyramidal; and Le Fort III, cross-sectional (Bilésimo et al., 2025). While type I refers to the separation of the maxilla from the viscerocranium, from the piriform opening to the pterygomaxillary suture area, type II involves the

disengagement of the nasomaxillary complex of the skull, from the zygomatic-orbital rim area. On the other hand, Le Fort III fractures, the most severe, result from sufficiently high facial impingement vectors, capable of promoting the dissociation of the naso-orbito-ethmoid complex, zygomas, and maxilla, configuring a craniofacial separation (Hupp, Ellis, and Tucker, 2015).

The diagnosis of facial trauma, which includes Le Fort fractures, must be thorough and based on a complete detailed clinical and radiographic examination, since, when performed correctly and early, it will provide the best clinical outcome and functional recovery (Silva et al., 2025; Bohneberger et al., 2021). Therefore, the present literature review aims to highlight the methods for diagnosing Le Fort fractures, including the mechanisms performed during the physical examination, the main signs and symptoms presented by trauma patients, and the radiographic techniques that allow a better evaluation of facial bone structures and functional rehabilitation of the maxillofacial complex.

2 METHODOLOGY

This study was carried out based on searches in the PubMed and Scielo databases, using the descriptors DeCs/MeSH: Le Fort osteotomy; Diagnostic Imaging; Clinical Diagnosis; Maxillofacial surgery. Articles in both Portuguese and English were included, aiming to evaluate the recurrent patterns already described in the literature on the subject studied. The selection of studies considered publications from the last 20 years, focusing on literature reviews, case reports, and renowned books in the area that addressed diagnostic and clinical aspects related to Le Fort fractures. Studies that did not specifically address the diagnostic methods applied to fractures of the middle third of the face, including Le Fort classifications, were excluded. After screening, the data were analyzed qualitatively, seeking to identify convergences among the authors for the fabrication of the present work.

3 RESULTS/DISCUSSION

Injuries caused by facial traumatology represent an important public health problem, given that their high frequency, in addition to their significant functional and aesthetic impact, have the capacity to generate significant morbidities (Bohneberger et al., 2021). Le Fort-type lesions, in turn, are extremely complex and represent a great challenge in the scope of maxillofacial surgery, mainly because they also follow the same pattern of possible and

considerable complications that affect not only the functionality, but also the patient's facial aesthetics (Almeida et al., 2023).

Although not all facial fractures require surgical fixation, Le Fort fractures generally imply this need due to the impairment of the resistance pillars of the skull bone structure. The

The main ones are the nasomaxillary, the pterygomaxillary and the zygomatic-maxillary. They act in the absorption of superoinferior forces, but become susceptible to rupture when submitted to anteroposterior vectors. These structures define facial dimensions and, when compromised, result in morphological changes that give a dimorphic aspect to the face. In all Le Fort fractures, the pterygomaxillary pillar is affected, and it is the only one that does not receive surgical fixation due to the difficulty of access, as it is located in the deepest region of the middle third of the face (Hohman, Patel and Waseem, 2024).

Figure 1

Face Resistance Pillars

The trauma patient referred for oral and maxillofacial surgery does not always have immediate treatment of fractures, since, as a rule, the initial management is based on the pre-established protocols of SAVT (Advanced Trauma Life Support). The ABCDE of Trauma is based on the maintenance of the airways, followed by the analysis of the patient's breathing and ventilation, the control and correction of possible hemorrhages, the neurological evaluation and the subsequent total exposure of the body for examination, with the prevention of hypothermia and so that other injuries are not left unattended (Araújo, Gabrielli and Medeiros, 2007). This occurs because, in facial trauma, there is the possibility of immediate

implications in view of the involvement of the upper airways, which can be obstructed by factors such as excessive bleeding, edema, cerebrospinal fluid drainage, and teeth or fragments that may hinder ventilation (Mesquita et al., 2020). Such complications, including vision-threatening conditions, may initially be subtle, which requires two principles: the need for great suspicion on the part of the surgeon and the requirement of frequent reassessment, through secondary examinations, of this trauma patient (Rao and Raghani, 2013).

After stabilization of the patient, through the care of potentially life-threatening injuries, bone treatment should be carried out as soon as possible, within the first week after the trauma. Early intervention prevents the development of sequelae such as pseudoarthrosis, caused by inadequate consolidation of structures, which may require more complex correction surgeries later (Almeida et al., 2023). However, before any procedure, thorough and highly accurate physical and radiographic examinations are necessary, aiming to define the diagnosis in order to consequently establish a favorable prognosis for the patient (Bohneberger et al., 2021). In addition, the discussion of the case in a very clear way by the professionals involved is essential for making decisions about treatment, varying according to the energy of the trauma and the singularities of the patient involved (Mesquita et al., 2020).

3.1 PHYSICAL EXAMINATION

The patient's physical examination should include: inspection of the face in search of signs and symptoms characteristic of these lesions; palpation of bone structures, to evaluate the presence of crepitus and/or steps in the zygomatic-maxillary regions and the nasal complex, mainly; in addition to sensitivity tests to determine whether there was local nervous involvement (Silva et al., 2025). All these protocols are justified by the fact that facial traumas rarely occur in isolation, but rather in association with other injuries. Therefore, intraoral evaluation is equally essential, with attention to the presence of hematomas and dental impairment (Araújo, Gabrielli and Medeiros, 2007).

Regarding the symptomatology and profile of these traumas, common signs are: malocclusion, most commonly from the presence of an open bite; trismus; bone crepitation; anosmia (total or partial loss of olfaction); orbital and/or subconjunctival ecchymosis and edema; bilateral epistaxis; and hypoesthesia of the infraorbital nerve, which emerges in the region superior to the canine fossa in the maxilla (Almeida et al., 2023). In addition, Le Fort fractures may also be associated with increased vertical dimension of the face, septal fractures, cerebrospinal fluid fistula and, in more severe cases, significant ocular sequelae

such as diplopia, when there is a fracture of the orbital floor, for example (Araújo, Gabrielli and Medeiros, 2007).

The main palpation method for the diagnosis of Le Fort fractures consists of checking facial bone mobility, which allows the identification of the anatomical structures involved. To do this, the patient's head must be stabilized with one of the operator's hands, while the thumbs and index fingers of the other hand are positioned intraorally to assess maxillary movement through lateral and anteroposterior movements. Digital pressures must also be applied and the mobility of the other bones of the viscerocranium, periorbital ridge, and zygomatic and nasal regions, which may indicate the presence of associated fractures (Hupp, Ellis, and Tucker, 2015).

3.2 IMAGING EXAMS

After the initial evaluation and clinical examination of the patient, imaging tests are essential for the complete evaluation of the severity of the fracture, as well as to determine its diagnosis and plan

surgical intervention (Gonçalves et al., 2022). Cone-beam computed tomography (CBCT) is the reference method for assessing the level of the lesion and bone fragmentation, which has a three-dimensional reconstruction of the analyzed area by means of coronal, axial, and sagittal sections (Silva et al., 2025). Its proper interpretation requires deep mastery of regional anatomy on the part of the professional in charge (Gonçalves et al., 2022).

Radiography, which is two-dimensional, although not the method of first choice to obtain images of the lesion due to the high overlap of structures, has some views that are still used in these cases (Schuknecht, 2005). They are: the Fronto-naso, also called Caldwell, used mainly for the evaluation of the frontal sinus and orbital edges; the Mento-naso, or Waters, indicated for the diagnosis of fractures of the middle third of the face, allowing the visualization of the maxillary sinuses, nasal septum and ethmoidal cells; and the Fronto-occipital, or Towne, used to analyze the lateral walls of the maxilla, as well as the body and mandibular processes. There is also the Submentovertex, or Hirtz, radiograph, indicated for the examination of the regions of the foramen ovale and spinosum — from which branches of the trigeminal nerve emerge, as well as other regions such as the other sinuses, palate, and occipital bone (Silva et al., 2025).

Each Le Fort type injury has its respective technique for better observation of the fracture extent. While for Le Fort I and II the preference is given to CBCT, the incidence of Waters, always through the performance of two views, can also be used. For Le Fort type III, in addition to these two methods, the OPN test, characterized by the image of the lateral nasal complex, can be requested together (Schuknecht, 2005).

In addition to conventional CT scans and radiographs, magnetic resonance imaging and ultrasonography are alternative and associative exams. Even though they are more expensive, especially CBCT, they have the greatest benefit due to their high sensitivity in identifying fractures, almost completely reducing overlaps and distortions (Gonçalves et al., 2022).

4 CONCLUSION

Le Fort fractures are one of the greatest challenges in the field of facial traumatology, due to their high anatomical complexity, functional impairment and significant aesthetic impact. The diagnosis of these injuries requires the integration of clinical examination and highly accurate imaging methods, considering that the definition of the type and extent of the fracture is decisive for the favorable prognosis of the patient.

Thorough physical examination, which includes inspection, palpation, and evaluation of bone mobility, remains an essential step in identifying characteristic signs of these fractures. However, contemporary diagnostic approaches highlight the importance of imaging studies, especially CBCT, due to their capacity for three-dimensional reconstruction and superior anatomical detailing. These examinations allow for precise surgical planning and the reduction of diagnostic failures resulting from structural overlaps observed on conventional radiographs.

Therefore, it is concluded that the diagnosis of Le Fort fractures should be based on a multidisciplinary approach, supported by the association between detailed clinical evaluation and advanced imaging tests. This integration promotes greater diagnostic safety, favors individualized surgical planning, and contributes to the functional and aesthetic restoration of the face, directly reflecting on the improvement of the quality of life of affected patients.

ABSTRACT

This article discusses Photovoice as a methodological practice situated within the field of visual and shared anthropology, oriented toward the collaborative production of knowledge and the understanding of life worlds shaped by intersectional identities. Drawing on an empirical experience conducted with seven participants of diverse profiles — including individuals with visual impairments — the study analyzes the process of image production, interviews, and collective meetings, examining how photography can operate simultaneously as an ethnographic artifact, an enunciative device, and a space of collective care. The methodological steps included media literacy, free image production, individual pre-selections, discussion groups, and analytical feedback sessions, with emphasis on accessibility and ethical reflexivity. The analysis of the images and narratives revealed tensions between visibility and protection, agency and vulnerability, highlighting the political and sensorial potency of the image as a space of negotiation and encounter. The work is situated within the tradition of shared anthropology and within decolonial and multisensory epistemologies, proposing a reading of photography as a gesture of sharing and an instrument of symbolic resistance.

Keywords: Intersectionality. Ethnography. Photovoice. Qualitative Methodology. Accessibility.

RESUMO

Este artigo discute o Photovoice como uma prática metodológica situada no campo da antropologia visual e compartilhada, orientada à produção colaborativa de conhecimento e à compreensão de modos de vida atravessados por identidades interseccionais. A partir de uma experiência empírica realizada com sete participantes de perfis diversos — incluindo pessoas com deficiência visual —, o estudo analisa o processo de produção de imagens, entrevistas e encontros coletivos, observando como a fotografia pode operar simultaneamente como artefato etnográfico, dispositivo de enunciação e espaço de cuidado coletivo. As etapas metodológicas compreenderam alfabetização midiática, produção livre

1 INTRODUCTION

In a world saturated with images and crossed by narrative disputes, visual production has become a privileged terrain to understand the relationships between representation, power and experience. In contemporary anthropology, photography has ceased to be a mere recording instrument to assume the status of relational language — a way of thinking and feeling the field. As Sylvia Caiuby Novaes (2017, p. 13) observes, photography "is not just a mirror of reality, but a translation that is built in the encounter", evidencing the performative and dialogical dimension of visual practices.

The Photovoice method, created by Wang and Burris (1997), is inscribed in this epistemological shift by placing the camera in the hands of the participants, redistributing the possibilities of enunciation and authorship. More than democratizing the gaze, it is a way of narrating the world from the margins — a gesture of co-authorship that gives back to the subjects the right to represent themselves. However, its application in multisensory ethnographic contexts, especially with visually impaired people, remains little explored in the anthropological literature, which reveals a theoretical and methodological gap to be addressed.

The theme of this study focuses on Photovoice as a participatory methodology situated in the field of visual anthropology, analyzing its ethical, political and sensorial power. The research problem of the study can be summarized in the following question: how can the Photovoice method, articulated with shared anthropology and decolonial and multisensory epistemologies, produce practices of co-authorship, care, and symbolic resistance among subjects crossed by intersectional markers of gender, race/color, and disabilities?

The overall objective is to understand how Photovoice can operate as a collaborative practice of knowledge production and collective care in the field of visual anthropology, especially in contexts of sensory and intersectional diversity. To this end, it seeks to: (a) analyze how the method is inserted in the tradition of the anthropology of the image in a shared posture (b) investigate the practical process of production and discussion of images among participants, observing dimensions of visibility, vulnerability and agency; (c) to examine the methodological adaptations that allowed the participation of blind and low-vision people; (d) reflect on the ethical and epistemological implications of participatory methodologies; and (e) propose a conceptual expansion of visual anthropology.

The research was developed between February and March 2024, in a process consisting of five virtual collective meetings and seven individual interviews, carried out with

the support of accessibility software and screen readers. Seven people participated, with diversity of gender, race/color, ages, modes of perception and body shapes. Among them, there were blind and low-vision participants, as well as people who declare themselves black, trans, elderly and in fat bodies; There were also reports of long-standing motor limitations. The research team was composed mostly of white people and included a blind researcher, as well as gay and fat body members. The individual breakdown was discussed in continuous consent and is aggregated here to protect privacy." The conduct of the activities was planned in an accessible way, ensuring that all stages — from the mediation of conversations to the reading of images — could occur in an inclusive and dialogical way. It is noteworthy that the description of social markers was self-reported and the level of detail negotiated with each person, applying the principle of data minimization to reduce the risk of re-identification in small samples. Consent was continuous and reviewable.

The meetings took place in a virtual environment, with time and rhythm adjusted to the needs of the group, and privileged listening, touch and imagination as legitimate forms of sensory experience. The field was conducted under principles of horizontality and co-authorship, ensuring that each person could define their own forms of expression — through photography, sound, collage, writing, or oral storytelling. This methodological choice sought not only to record the visible world, but to welcome multiple forms of perception and production of meaning.

It is based on the hypothesis that Photovoice, when articulated with principles of accessibility and reciprocity, can constitute itself as a practice of co-authorship and symbolic reparation, redistributing the power to narrate and represent. In addition, it is assumed that the inclusion of blind and low-vision participants expands the notion of visibility, demonstrating that anthropological knowledge can emerge from a multisensory field of relationships and affects.

Methodologically, it is a qualitative and exploratory study inserted in the tradition of shared anthropology (Rouch, 2003; Eckert & Rocha, 2003). The investigation was based on collective and individual meetings that combined media literacy, image production, group discussions and analytical feedback. The steps were documented through audio and video records, and field diaries, with collaborative validation of interpretations and continuous ethical consent. This approach sought to ensure accessibility, horizontality and reflexivity, transforming Photovoice into a practice of sensory and political research.

By mobilizing the contributions of shared anthropology (Rouch, 2003; Novaes, 2017) and decolonial and multisensory epistemologies (Smith, 2021; Howes, 2022), the study proposes to understand photography not only as an ethnographic artifact, but as a gesture of sharing and political practice of the sensitive. The theoretical framework articulates four interdependent axes that sustain the reading of Photovoice as an ethnographic practice of co-authorship and care: (1) visual and shared anthropology, which is based on Eckert and Rocha (2003), Novaes (2017) and Rouch (2003, 2015), emphasizing collaborative making and the return of images to the context of origin; (2) intersectionality, based on Patricia Hill Collins (2022) and Gama (2017), which allows us to understand the overlaps between gender, race, class, and body as entanglements of visibility and vulnerability; and (3) multisensory anthropology, supported by Howes (2022), MacDougall (2006), Kleege (2018) and Bolt (2021), which shifts visibility to a field of embodied and inclusive perception. It is argued, therefore, that *Photovoice*, when articulated with these references and guided by principles of accessibility and reciprocity, destabilizes visual hierarchies and produces alternative ways of seeing, hearing and existing in common

2 THEORETICAL FRAMEWORK

2.1 VISUAL ANTHROPOLOGY AND THE SHARED GESTURE

Visual anthropology has consolidated itself as a field of experimentation situated between science, art and politics. Since Jean Rouch (2003; 2015), the camera has come to be seen as a mediator of encounters and not as a simple instrument of capture. Rouch inaugurated an ethics of sharing that shifts the researcher from a place of observer to that of participant in a collective process of creation and interpretation — what he called *cinema verdade* and, later, *shared anthropology*.

In Brazil, Cornelia Eckert and Ana Luiza Carvalho da Rocha (2016) broaden this horizon by proposing the notion of "anthropology of the image", understood as a disciplinary field that seeks to understand the relationships between image, visibility, and anthropological research practices. The authors note that, historically, anthropology was a predominantly written discipline, in which images and sounds were used as illustrative appendices. However, with the advancement of audiovisual and digital technologies throughout the twentieth century, the use of the image began to be recognized as a legitimate form of knowledge production. Inspired by the contributions of Margaret Mead and Gregory Bateson, Eckert and Rocha (2016) argue that the anthropology of the image should explore the

"semantic fields" and institutional devices that integrate the visual and the sound in ethnographic production, opening space for new languages and for the dialogue between art, science and technology.

Photovoice directly inherits this principle, allowing participants to produce their own images and, with them, new meanings about their experiences. By placing the camera in the hands of those who are usually the object of research, the method becomes a device for authorship and redistribution of the gaze. However, as Liebenberg (2018) emphasizes, this delivery of the camera is not automatically emancipatory. The author proposes a critical reflection on the risks and contradictions inherent to the use of images in participatory contexts, pointing out four fundamental dimensions:

(1) the risk of exploitation and oppression, when images are used without ethical return processes and without the informed and continuous consent of the participants; (2) the subjectivity of interpretation, since the meaning of images is always situated and depends on the experiences and social contexts of those who produce and read them; (3) the limited impact on social change, when the circulation of images ignores aspects of visual literacy, cultural translation and political mobilization; and (4) the challenges in dissemination and public impact, especially when it is not planned how and to whom the results will be shared.

These criticisms reinforce that *Photovoice* requires more than the production of images: it requires an ethical and intentional commitment to the processes of co-interpretation, feedback and circulation of photographs. Without this, there is a risk of repeating the same hierarchies of power that the method seeks to question. Thus, the value of the ethnographic image lies not only in its representational capacity, but in its relational potency — as a space for care, listening, and the construction of common worlds.

2.2 INTERSECTIONALITY AND DECOLONIAL EPISTEMOLOGIES

Intersectionality, as proposed by Patricia Hill Collins and Sirma Bilge (2016), is an analytical tool that allows us to understand the complexity of human experiences in their social, political, and cultural dimensions. By recognizing that life events are shaped simultaneously by multiple factors — such as gender, race, class, and disability — the authors propose an approach that rejects one-dimensional readings of inequalities. This perspective shifts the gaze from isolated categories to the relational plots that structure oppression, revealing how different social markers intersect and reinforce each other.

More than a theoretical concept, Collins and Bilge (2016) understand intersectionality as critical praxis — a way of articulating research and transformative action. This double dimension, analytical and political, moves intersectionality away from a merely descriptive use and reinserts it in the field of collective struggles, where theory and practice co-implicate each other. The authors (Collins & Bilge, 2016) argue that knowledge is only emancipatory when it is born from a dialogical movement between bodies and territories, which brings them closer to a situated and insurgent epistemology. Thus, intersectionality is not only a methodology for analyzing inequalities, but a way of thinking and acting committed to social justice and the redistribution of the power to narrate.

In the Latin American context, intersectional reading gains density by dialoguing with authors such as Fabiene Gama (2016), who proposes an anthropology sensitive to emotions, affections, and embodied forms of expression. In his work on political demonstrations in Bangladesh, Gama demonstrates how images and emotions become devices for mobilizing and critiquing the classical dichotomies of anthropology, such as reason and emotion, body and mind, reality and fiction. Such a perspective converges with the intersectional proposal by refusing epistemological hierarchies and emphasizing the forms of knowledge that emerge from the body and lived experiences.

These articulations reveal that the challenge of intersectionality is not only to identify the overlapping of oppressions, but to reconfigure the very forms of knowledge that sustain them. By recognizing that experience is a site of theoretical production, intersectionality operates as a frontier epistemology—a practice of translation and resistance between worlds. In this sense, when applied in multisensory ethnographic contexts, such as those proposed in this study, it allows us to think of the body, gender and race not as fixed markers, but as relational dimensions that cross the ways of seeing, feeling and representing the world.

2.3 MULTISENSORIALITY AND ACCESSIBILITY AS EPISTEMOLOGY

The anthropology of the senses, as proposed by David Howes (2022), invites us to understand knowledge as an embodied and situated experience, in which each culture organizes and values the senses in its own ways. Perceptual hierarchies—the predominance of vision in Western societies, for example—are not universal, but cultural constructs. Howes argues that multisensory studies should comparatively investigate these sensory ecologies, recognizing that feeling is always collective and relational. Such a perspective also implies an epistemological openness to embrace non-Western paradigms of perception, in which

seeing, hearing, touching, and imagining are intertwined in forms of knowledge that challenge the separation between body and mind.

This approach is echoed in the visual and filmic anthropology of David MacDougall (2006), who conceives the image as a way of thinking with the body. In *The Corporeal Image*, the author argues that sensory ethnography is not limited to observation, but emerges from contact—from physical presence, ambient sound, gesture, and breathing. The camera, in this context, becomes a perceptive extension of the researcher and the participants, establishing a field of sensory exchanges that mobilizes all the senses. MacDougall proposes an *expanded visibility*, in which knowledge is not only represented, but lived.

By integrating people with different forms of perception, the *Photovoice project* revealed that seeing is also listening, imagining and touching. The collective exercise of translating experiences through photography, narration and sound made visible the plurality of ways of perceiving the world. From Georgina Kleege (2018), it is understood that blindness — or any perceptual variation — is not absence, but another form of presence. The images produced by participants with little or no vision expanded the concept of photography, transforming it into tactile, auditory and imaginative gesture. In this sense, the right to image is expanded: it is also the right to perception and sensory expression in its multiple languages.

The thought of David Bolt (2019) offers a critical basis for this expansion. Its tripartite model — between normative positivisms, non-normative negativisms, and non-normative positivisms — allows us to understand how certain forms of perception are marginalized while others are elevated to the norm. Bolt advocates a pedagogy that recognizes these differences not as failures, but as sources of insight. The "cryptaemologies", in their formulation, challenge the privilege of the dominant epistemes and propose a liberating education, based on dialogue and collaboration between different ways of existing and knowing.

Thus, accessibility is understood here not only as a technical adaptation, but as an epistemological and political principle. Researching and creating in an accessible way means recognizing that knowledge is born from the relationship between bodies, sounds, images and affections. Photovoice becomes, in this horizon, an expanded and liberating sensory method — a practice of co-authorship in which perceptual difference is cognitive and ethical power. By relating different experiences of the sensible, the study reaffirms that every form of knowing is, above all, a way of sharing the world.

3 METHODOLOGY

3.1 METHODOLOGICAL DESIGN

The methodological design was conceived as a report of ethnographic experience, developed from a collective process of visual creation and reflection. The study had seven participants, intentionally selected in order to ensure diversity of gender, age group, race/ethnicity, disability and social class.

Among them, there were people with low vision and total blindness, which allowed them to explore multisensory dimensions of image production, both among the researchers and among the participants. This plural composition reflects the conception of Patricia Hill Collins (2022), according to which intersectionalities should be understood as networks of relationships that configure positions and experiences, and not as a simple sum of inequalities.

3.2 RESEARCH STAGES

Data collection was organized in five main stages, articulating training meetings, visual productions, individual interviews and moments of collective feedback. All phases were planned based on principles of accessibility, horizontality and ethical reflexivity.

a) Initial meeting — Collective construction and media literacy

The first meeting had an introductory and formative character. The objectives of the research were presented, ethical aspects were discussed and the set of generating questions that would guide the production of images was collectively elaborated. This session included a media literacy workshop, focused on reflection on framing, consent and visual narrative.

b) Production of images (10 days)

For ten days, the participants produced images from the collectively elaborated questions, using cell phones, digital cameras or alternative resources, such as sound recordings, collages and textual descriptions. This plurality was fundamental to ensure inclusion and expressive freedom, especially in the case of people with visual impairments.

(c) Individual pre-meetings – Selection and negotiation of consents

Each participant held an individual meeting with the researchers, presenting the set of materials produced, performing a pre-selection and discussing issues of anonymity, exposure and circulation of images. These moments functioned as spaces for listening and ethical negotiation, in which consent was treated as a continuous process, as argued by Liebenberg (2018) and Catalani & Minkler (2010).

d) Collective meeting — Presentation and discussion of the images

In a group, each participant chose three images to share. After each exhibition, the collective produced a "force-word" that synthesized the symbolic or affective meaning of the photograph. This exercise promoted a space for co-interpretation and sharing, transforming the group into a community of analysis and care.

e) Analytical feedback

The process ended with a final feedback meeting, in which the researchers presented preliminary readings of the images and narratives. The interpretations were submitted to the group's review, ensuring traceability, transparency and co-authorship in the construction of the results.

3.3 ETHICS AND TRACEABILITY

Ethics was understood as a situated and continuous practice, not restricted to a formal stage of approval. Consent was renegotiated throughout the process, and participants had the autonomy to remove materials, modify authorizations or decide on the public destination of the images. Concrete counterparts were offered, such as the printing of photographs, the holding of a community exhibition and the writing of a collective manifesto-text.

As Hikiji (2018) argues, the ethnographic image only acquires full meaning when it returns to the field and is re-inscribed in the exchanges and affections that originated it. From this perspective, ethics is not limited to avoiding harm, but implies promoting reciprocity, recognition, and mutual care.

In this way, all meetings were recorded in audio and video, with formal authorization. The researchers prepared individual field diaries and a collective notebook with observations and reflections. The analysis of the corpus was based on methodological triangulation — between images, speeches and field notes — and on collaborative validation strategies, during feedback and collective reviews.

3.4 ACCESSIBILITY AND MULTISENSORY ANTHROPOLOGY

The participation of blind and low-vision people required methodological adaptations that became a constitutive part of the project's epistemology.

Standardized sound descriptions were created for all images, audio versions of the instructions, and the use of software compatible with screen readers. During the meetings,

the images were described aloud and commented collectively, promoting an environment of sensory listening and shared interpretation.

These practices materialized what Fabiene Gama (2016) calls multisensory ethnography, in which knowledge emerges from bodily and affective interactions, and not only from visual observation. Thus, Photovoice was re-signified as an expanded sensory practice, capable of including and valuing different modes of perception and presence in the ethnographic field.

4 RESULTS AND DISCUSSION

The analysis of the material produced and the collective interactions revealed dimensions that go beyond the simple application of *Photovoice* as a participatory technique. The process proved to be a field of sensory and political learning, in which the boundaries between researcher and participant, between image and word, between seeing and feeling, were constantly negotiated.

4.1 THE IMAGE AS A RELATIONAL DEVICE

The delivery of the camera and other expressive means to the participants not only democratized visual production, but reconfigured the very idea of authorship. The images emerged as relational events, crossed by affection, memory and imagination.

Figure 1

The Diary of a Magician

Photograph produced by a participant during the Photovoice stage, in response to the question: "What has changed and what has changed in me? What phases and mutations have I gone through that have passed me by?" Source: Photovoice research collection (2024). Publication authorized by the participants.

As Novaes (2017) points out, ethnographic photography is always an encounter. In collective meetings, everyday objects — canes, windows, shadows — have become symbolic operators of belonging and transformation. The group not only analyzed images, but produced bonds, sharing experiences of the body and resistance.

4.2 INTERSECTIONALITY IN IMAGE: BETWEEN VISIBILITY AND VULNERABILITY

The diversity of the group brought different regimes of visibility. Black participants, LGBTQIA+ participants, and blind or low-vision participants exposed tensions between showing up and protecting themselves. This ambiguity confirms Smith's (2021) warning: the risk of participatory practices becoming new forms of symbolic extraction. For this reason, Photovoice proved to be a space for continuous negotiation — each image was also an ethical decision about what to display and what to silence.

During the discussions, recurrent tensions emerged: the desire to show oneself and the fear of exposure; the desire to represent oneself and the awareness of the risk of stigmatization. These ambiguities echo Linda Tuhiwai Smith's (2021) concerns about the danger of transforming participatory practices into new mechanisms of symbolic extraction. Thus, decisions about circulation, subtitles and public uses became a constitutive part of the analytical and ethical process.

Figure 2

Coat

Source: Photograph produced by a participant during the Photovoice survey, in response to the question: "Where is the discomfort — mine and others'? Where and how do I need to adapt?" Source: Photovoice research collection (2024). Publication authorized by the participants.

Each photograph, read together with their narratives, revealed a space for negotiation between *saying* and *being silent*. The interpretations did not seek consensus, but multiplicity. This polysemy is consistent with what Gama (2017) calls the "emotional density of images", in which each gaze contains layers of memory, desire, and care. *Photovoice*, in this context, proved to be not only a research method, but a space for symbolic elaboration — a field of care, in which the act of showing can be, at the same time, vulnerable and reparative.

4.3 ACCESS, SENSORIALITY AND EPISTEMOLOGICAL DISPLACEMENTS

The inclusion of blind people has redefined the very idea of visibility. The images were also sounds and descriptions. This experience confirmed MacDougall's (2006) proposal that the body is the first instrument of observation. Photovoice, in this context, has become a laboratory of sensoriality and imagination, reaffirming that the perceptual difference is a source of knowledge. The participation of blind people, both among the surveyed and among the researchers, destabilized conventional conceptions of "visibility". The dynamics of description and collective listening showed that the image is also sound, texture, rhythm. What is produced, in this sense, is a multisensory anthropology, where the gaze is replaced by the sensitive presence.

Figure 3

The dark and the wind

Source: Photograph produced by a participant during the Photovoice stage, in response to the question: "Who is the author? Where and who am I?" Source: Photovoice research collection (2024). Publication authorized by the participants.

For David MacDougall (2006), the body is the first instrument of anthropological observation. This proposition found practical resonance in the project: by welcoming other forms of perception, the group expanded the field of the visible and opened paths for what Bolt (2021) calls *cultural studies of disability*, in which sensory difference becomes epistemological power.

This displacement requires visual anthropology to rethink its own denomination. If the image is an event, and if the event involves multiple senses, then the field is not limited to the "visual", but to relational and embodied experience. *Photovoice*, in this case, not only documents, but also transforms — the way of seeing, hearing and understanding the other.

5 CONCLUSIONS

The study confirmed that Photovoice, when articulated with shared anthropology and epistemologies of the sensible, is more than participatory methodology: it is an ethical and political practice of co-authorship. The images and narratives produced revealed that photography can operate as a gesture of care and symbolic resistance. Specifically, regarding the inclusion of blind participants, it showed that visibility is a form of relationship, and not an attribute of the gaze.

Visual anthropology, therefore, expands into a multisensory anthropology — capable of recognizing in sensory differences the power of encounter and collective creation. The experience with blind participants introduced decisive shifts: by requiring methodological and communicative adaptations, the group became a laboratory of sensoriality and imagination. This learning showed that visibility is not an attribute of the gaze, but a form of relationship. Thus, visual anthropology, by embracing practices of listening, touch, and imagination, is transformed into multisensory anthropology, capable of recognizing the power of perceptual differences as an epistemological engine.

From an ethical and political point of view, the research reaffirmed that there is no shared anthropology without protocols of reciprocity and dynamic consent. Co-authorship must translate into real decisions about circulation, anonymity, credit, and return of results, ensuring that the image is not appropriated, but shared. This requires recognizing Photovoice as a practice of symbolic reparation — a way of giving people back the right to represent themselves, and to participate in decisions about the fate of their narratives.

Analytically, the results show that intersectional identities do not add up in a linear way: they become entangled in situated experiences that challenge the conventional categories of

social research. The method revealed the power of these intersections by allowing multiple layers of subjectivity to emerge in images and words, configuring a plural and sensitive ethnography.

As Eckert and Rocha (2003) state, the image is always negotiation; as Novaes (2017) reminds us, its meaning is born from the encounter; and, according to Paulo Freire (2022), every shared process must serve freedom and collective transformation. Photovoice, in this sense, proved to be a pedagogical and political space, in which the act of looking is also the act of freeing oneself from the imposed narratives.

In dialogue with the initial objectives, this study sought to understand how *Photovoice*, articulated with shared anthropology and multisensory epistemologies, can become a method of co-authorship, care and symbolic resistance. The methodological path confirmed the hypotheses that guided the work: the perceptual difference is cognitive power; accessibility is an epistemological principle; and photography, when shared, becomes the political language of the sensitive. Thus, the lived field reaffirmed that knowledge is not produced about others, but with others — in processes of listening, reciprocity and collective imagination

The research, in the end, produced a double movement: methodological and existential. For the participants, the process represented an opportunity to express themselves and to reconfigure their relationship with their own bodies and with the world. For the researchers, it implied ethical and sensory learning, a re-education of looking and listening. This circularity confirms that shared anthropology is less a method than an ethic of presence—a way of doing science that recognizes otherness as a principle and encounter as a purpose.

In summary, the project demonstrated that the camera, when placed in the hands of the participants, can become an instrument of recognition, listening and resistance. Visual anthropology, in this context, becomes a field of creation and care — a practice that intertwines aesthetics, ethics, and politics in the collective production of knowledge. By returning the gaze, the right to exist and narrate oneself in one's own time is also returned.

ABSTRACT

Since Antiquity, social life has established a hierarchy between *vita activa* and *vita contemplativa*. This hierarchy gave rise to the concepts of *homo faber* and *homo sapiens*. Beginning in modernity, with the scientific revolution, *homo faber* rose to the top of the hierarchy, assuming various characteristics as the centuries progressed. However, it is in contemporaneity that this split becomes radical, and the market poses the question: What is Philosophy for? Thus, the culture industry promotes a new mode of *Dasein*: an ontology of voluntary servitude. In light of this, the present article intends to serve as a response to those who seek to instrumentalize the human condition.

Keywords: Phenomenology. Alienation. Technique. Instrumental Rationality. Ontology.

RESUMO

Desde a Antiguidade, a vida social estabeleceu uma hierarquia entre *vita activa* e *vita contemplativa*. A hierarquia promoveu e fundou os conceitos de *homo faber* e *homo sapiens*. A partir da modernidade, com a revolução científica, o *homo faber* assumiu o topo da hierarquia, assumindo diversos aspectos conforme os séculos. Contudo, na contemporaneidade é que esta cisão se torna radical e o mercado questiona: para quê serve a Filosofia? Assim, a indústria cultural promove um novo modo do *Dasein*: uma ontologia da servidão voluntária. Diante disso, o presente artigo pretende-se uma resposta àqueles que pretendem instrumentalizar a condição humana.

1 INTRODUCTION

The tradition of Western thought developed from the establishment of a dichotomy between *homo faber* and *homo sapiens*. Work and contemplation, work and philosophical activity were seen as antagonistic activities, where there was a primacy of the contemplative life. This posture disintegrated man into his human condition. It divided nobles from slaves.

To work meant to be enslaved by necessity, and this enslavement was inherent in the conditions of human life. Because men were dominated by the necessities of life, they could only gain freedom by dominating others whom they forcibly subjected to necessity. The degradation of the slave was a stroke of fate and a fate worse than death, as it implied the metamorphosis of man into something similar to a domestic animal (ARENDT, 2011, p. 103).

In Greco-Roman Antiquity, the enslavement of man was justified by the alienation of the necessities of his life (eating, maintaining the home, maintaining his family and a certain level of comfort). With the rise of Christianity, slavery took on new contours. If before the slave was a slave because his needs were alienated, now the slave is a slave because his condition of birth requires it. Being a slave, being the "last among men", the slave attains the Kingdom of Heaven:

And since the text is so clear and literal that it admits of no doubt, let us listen to the comment of St. Thomas, Archbishop of Valencia: *Aethiopes non abiicit virgo decora, sed amplectitur ut parvulos, diligit ut filios. Sciunt ergo ipsam matrem etenim quia Altissimi mater est, Aethiopis matrem nominari non dedignatur*. The Prophet put the Ethiopians and the Blacks in the last place; for this is the place which the world gives them, and the low esteem in which they are treated of other men, children of Adam like themselves. But the Virgin Lady, being Mother of the Most High, does not despise them, nor does she despise herself to have them as her children; rather, because she is the Mother of the Most High, for this very reason she is also proud to be his Mother: *Etenim quia Altissimi mater est, Aethiopis matrem nominari non dedignatur*. Let the Blacks know, then, and do not doubt that the same Mother of God is their Mother: *Sciunt ergo ipsam matrem*: and know that being such a sovereign Lady, she is such a loving Mother, that as small as they are, she loves them and has them as children: *Amplectitur ut parvulos, diligit ut filios* (VIEIRA, 2013).

The rhetoric used by Father Antônio Vieira in Sermon XIV of the Rosary is a very clear example of the way consciences were domesticated through the use of religion. There is no real theology behind the speech, but pure and simple rhetoric. Although the centuries have passed, the domination of consciences is still present. But now the contemplative way of life is no longer privileged, but now mechanical work, specialization and focus on the delivery of

value are privileged. The fetishization of the commodity, already detected by Marx's sociological analysis, caused a shift in the "hierarchy" of human activities. With promises of quick profits, enrichment and economic stability, post-contemporary man lives as in the Myth of Sisyphus: an existence whose life or death implies no difference.

2 METHODOLOGY

The methodology used in this study was based on the researcher's practical market experience, on the observation of social (administrative) phenomena and on the exploratory search for bibliographic references that could explain the collaborator's way of being subservient. This new way of being, in which existence coincides with utility, raised the hypothesis of an ontology of voluntary servitude. However, the will here, not endowed with freedom of thought, but founded on an unovercome Oedipus complex, causing a dependence on a tutor to think, judge and act. The complex network that is formed around this new ontology requires an observation that goes beyond the limits of a merely descriptive phenomenology, and must be explained from a philosophical, historical and psychoanalytic multidisciplinary.

Therefore, the methodology starts not only from mere description and reflection, but from the real experience of this ontology and its most serious consequences, especially from the birth of a possible totalitarianism, the dissemination of prejudices and the trivialization of a social evil seen as beneficial. The methodology is also based on a practical activity, originating from the phenomenology workshops, part of the curricular component of the Bachelor's Degree in Philosophy at the Claretian University Center (Curricular Extension Project). All participants had their identities and data preserved, according to the Free and Informed Consent Forms, submitted to the University Center and the Ethics Committee. Thus, the methodology adopted does not aim to test theories, but to understand the ontological meaning of the phenomenon of voluntary subservience as it manifests itself in lived experience and in the contemporary social structure.

3 RESULTS

In a phenomenology workshop conducted on October 25, 2025, an experiment was carried out with the workshop participants. The activities of the workshops aim to unveil the being in its existentiality, that is, in time. From Husserl and Heidegger he proposed the understanding of authentic existence and inauthentic existence. In "Being and Time",

Heidegger describes how the individual judges, acts and thinks in the impersonal. These questions, further refined by Nietzsche's nihilism, may have generated some discomfort. Although it seems like a supposed failure, the workshop has achieved its success, which is to awaken critical consciences, subjects with the ability to carry out a *social epoché* and understand the world, the other and oneself as an existential possibility.

The reflection focused on the validity of aesthetic assumptions and how the cultural industry is a mechanism of social scale of the impersonal. The subject is emptied of himself, forced and educated to "like" certain aesthetic standards since childhood, creating a cycle of exclusion and social marginalization. The dynamics made was with a thought experiment in which we asked each person to describe a person's standard of beauty without judgment. The descriptions, although divergent on certain points, most were coincidental, such as body structure: body type, height and expected behavior. This fact led the participants to realize that the aesthetic standard is not a real value, but heteronymic and that, by force of society, it was judged as true.

The thought experiment carried out with the participants demonstrated, therefore, that truths are historically constructed and deconstructed, representing a crucial turning point in the understanding of phenomenology: phenomenological praxis is the attitude of placing oneself in front of reality, not as a skeptic, but as one who questions the validity of the judgments constructed about a phenomenon. Notwithstanding this, from an existential point of view, he demonstrated that the inauthenticity of existence is the tool that feeds the cultural industry, as non-thinking beings are needed to be domesticated.

In summary, the hypothesis raised at the beginning of the research was not only validated through exploratory bibliographic research, but was demonstrated in its reality. The ontology of voluntary servitude is a reality, not only daily, but psychic: it comes from child development, when the child is taught to value productivism and to despise contemplation. There, the expropriation of man of his capacity to think and of his ethical and political freedom is born. However, it is worth noting that the discussions about the workshops, both from a methodological point of view and in the discussions, will remain confidential. The experiences described were treated in a phenomenological way, fully preserving the privacy of the participants according to ethical and legal requirements.

4 THE QUARREL BETWEEN THE HUMAN SCIENCES AND THE NATURAL SCIENCES

The scientific advance of modernity has brought an enchantment with scientific principles. All human knowledge, to be valid, had to pass through the sieve of scientific methods. The development of Kant's *Critique of Pure Reason* was an attempt to save the sciences from Hume's bitter skeptical doubt. In fact, Humean skepticism would not allow the development of valid scientific knowledge. For such an enterprise, Kant shifted the foundation of science from the object to the subject, operating the so-called Copernican Revolution.

However, the dispute was not resolved there. It was in the nineteenth century that positivism tried to apply the same method to the human sciences as the natural sciences. However, this reduction is problematic, because, according to Habermas, the human sciences cannot be objectified and subsumed in general laws, without losing the humanity that is proper to each science and must be apprehended through its own hermeneutics:

They do not arise, as positivism supposes, from flawed or obscure methodological presuppositions; nor can the most complex approaches be reduced without prejudice to the platform of a general science of behavior. It is only at first glance that it is a confusion that could be resolved by means of finer distinctions. The competing approaches, formed in the social sciences, are much more found in a context that is negatively produced through the fact that the apparatus of general theories of society does not adapt as easily as the objectified natural processes (HABERMAS, 2011, p.10).

In short, a "science of culture cannot exhaust its interest in the research of empirical regularity" (HABERMAS, 2011, p. 23). Human phenomena are therefore endowed with meaning, that is, actions are intentional. Intentionality, already explored in Husserl, allows us to understand that each movement of a subject is not just a coldly calculated movement, as the followers of the positivist stance claim. But it has a meaning that must be understood. This meaning occurs absolutely, in what the Phenomenology has called the "world of life":

The world is for me in no way anything other than the world apprehended by consciousness, existing and valid for me in such a cogito. The world has all its universal and special meaning and its validity-of-being exclusively from my *cogitationes*. [...] I cannot live, experience, think, value and act within any other world than the one that has meaning and validity in me and from myself. [...] The fundamental phenomenological method, that of the transcendental *Epoche*, insofar as it directs back to it, is therefore called transcendental-phenomenological reduction (HUSSERL, 2019, p. 49).

In other words, the valuation of the world and the meaning that is given to each object of experience takes place from the subject itself. Not of the Kantian subject, but of the intentional subject, who opens up to the object and builds an "*I-thou*" relationship with it. We are, therefore, faced with a reality that cannot be measured, but which must be apprehended from a hermeneutic methodology.

5 THE TURNING POINT OF THE CONTEMPORARY WORLD

Following in the footsteps of the old quarrel, contemporaneity has accentuated the dichotomy between contemplation and human praxis, but now in a different way: pragmatism is privileged in such a way that it can be said that the current world lives under a dictatorship of utilitarianism. In 2024, on the Meu Valor Digital website, an article was published entitled "The 10 colleges that are least worth it and should be avoided". Among the courses listed are Philosophy, Sociology, Archaeology, History, Music, Anthropology, among others. Thus, the author writes about Philosophy:

Philosophy, while rich in critical thinking, faces challenges in translating directly into job opportunities. In an era where science dominates many fields, directing studies to more practical areas can be advantageous. Those interested in philosophy may consider supplementing their studies with other disciplines or opt for alternative careers that value analytical thinking ability (FREITAS, 2024).

At first glance, the statement seems pragmatic; however, it reveals a deep and mistaken dichotomy: the separation between *homo sapiens* and *homo faber*, as if thought and action were antagonistic realities. Now, all scientific activity is born from an act of questioning and questioning is the first gesture of Philosophy. The scientist's way of proceeding is, first of all, the philosopher's way of proceeding. All human praxis presupposes a rationality:

If we had to rely only on the so-called practical instincts of men, there would never have been any technology worthy of note; and, although the technical inventions that exist today bring with them a certain impetus that will probably generate improvements to a certain extent, it is unlikely that our world conditioned to technique could survive, let alone continue to develop, if we could convince ourselves that man is, above all, a practical being (ARENDT, 2020, p. 359).

In suggesting this division, Freitas fell into an old error: the ancient hierarchy between the *vita activa* and the *vita contemplativa*. However, modernity inverted this hierarchy,

privileging action to the detriment of contemplative (philosophical-rational) activity, but at the cost of reducing active life to mere production and consumption. As Hannah Arendt observes:

The modern inversion of the traditional hierarchy between the *vita activa* and the contemplative does not restore the lost dignity of action, but transforms the entire *vita activa* into a mere activity of production and consumption (ARENDT, 2011, p. 348).

Also according to the philosopher, the inversion that began at the beginning of modernity (seventeenth century) and deepened in our days has altered, from the epistemological and ontological point of view, the human questioning:

The shift from "why" and "what" to "how" implies that the true objects of knowledge cannot be eternal things or motions, but processes, and that, therefore, the object of science is no longer nature or the universe, but history—the story of how nature came to be. life or the universe (ARENDT, 2011, p. 367).

The introduction of the concept of process did not only represent a hierarchical inversion, but a radical and complete break with the contemplative life. The *vita activa* now occupies the place that previously belonged to political, intellectual and creative activity (ARENDT, 2011, p. 373). Thus, this radical rupture reaches all dimensions of human life, reifying the individual to the point that he identifies with his profession, that is, the person is no longer his being, but his profession (doctor, nurse, programmer, teacher). The individual loses his identity and becomes standardized within an organization.

Arendt's critique is very current: education and thought are constantly subordinated to the logic of utility, to the imperative of productivity. In this context, philosophical thought becomes suspect, disposable, "unproductive". However, the author is wrong to deny human beings something inherent to their condition: the ability to think. The problem we highlight here is not whether we should first think and then act or act without thinking, whether we should turn to a praxis or an existential reflection, but it is the established hierarchy itself. The contemplative life without action is a phantom that eliminates all possibility of human experience. On the other hand, a pragmatic life without contemplation is like a corpse, it dissolves human existence into an impersonality, that is, an inauthentic existence, a totally manipulable mass.

Finally, we can raise the question: what is the purpose of such alienation? When we follow child development, we commonly see children entertaining themselves with toys that simulate instruments, machines and others related to the producer market.

Let us return to this: have you ever seen a child play, you have seen how he already populates the technical social machines with his desiring machines, O sexuality! – and which father and mother, from whom the child draws, if necessary, parts and gears, are in the background, as emitting, receiving or intercepting agents, benevolent agents of production or suspicious agents of anti-production? (DELEUZE; GUATTARI, 2024, p. 393).

The proposal here of Deleuze and Guattari is that the fetishization and mechanization of life comes from a *social pathos* that is already found within the family. "The identity of desire and work is not a myth, but above all an active utopia par excellence that designates the limit to be crossed by capitalism in desiring production" (DELEUZE; GUATTARI, 2024, p. 399). In short, the thought presented by Freitas in the magazine "Meu Valor Digital" is nothing but a split of the self itself, a division at the psychoanalytic and ontological level of the subject itself; Ultimately, it consists in the annihilation of an important aspect of the human condition nourished by the capitalist utopia.

6 CONSEQUENCES

Given the above considerations, we can draw some very serious consequences in various aspects of human life. Freitas' thought is only the externalization of the contemporary pragmatic spirit. From it, we can establish the effects of the culture industry, which provides "bread and circuses" in exchange for human domestication. Secondly, it promotes a silent totalitarianism: once the individual abdicates his ability to think, he loses political freedom and freedom of expression. As a consequence of this, we have an ontological crisis where human existence dissolves into the impersonal: one thinks as the impersonal, one acts as the impersonal. Its characteristics and possibilities of existence are voluntarily reaped. Finally, an ethical crisis. Once this thinking is normalized in a heteronymic way, without critical capacity, space is opened for the banality of evil. Violence, prejudice and the death of so-called "useless" people are no longer a problem. It even becomes a social "benefit".

In short, the ethics of the disposable treats what it considers useless with a *social pathos* and marginalizes it. In the history of psychiatry, it is common to perceive this behavior: the madman, in fact, is the one who does not bring benefit to society, who does not fit into

the pre-established "standard" and the "truths" produced. In short, the serious consequences drawn from the divorce between the *vita activa* and the *vita contemplativa* can become ways for the spread of evil, like Auschwitz.

6.1 THE CULTURAL INDUSTRY

Once the rupture with the *contemplative vita* is made, the subject becomes the target of the cultural industry. Aesthetic taste and production are no longer guided by Kantian schematism, but by what is defined as an aesthetic standard, even if it is empty of meaning. The focus of production, of course, is no longer the improvement of human conditions, but the accumulation of capital.

In their leisure, people must orient themselves by this unity that characterizes production. The function that Kantian schematism still attributed to the subject, namely, to refer in advance to the sensible multiplicity of fundamental concepts, is taken from the subject by industry. Schematism is the first service provided by it to the client (ADORNO; HORKHEIMER, 2006, p. 103).

Applying the concept of Adorno and Horkheimer to the criticism raised by Freitas of the courses of Human Sciences, it is perceived that the *author's pathos* is nothing more than the elite of the cultural industry that validates what is useful or useless and decides, from early childhood, what the subject should or should not study. It is noted that, in a veiled and silent way, the concept of slavery is still fed by the cultural industry that promotes the domestication of consciences. Now, not through violence, but through the promise of professional success. From this we can see the second consequence: the fertile ground for totalitarian policies

6.2 TOTALITARIANISM

Now I would like to understand how it is possible that so many men, so many towns, so many cities, so many nations sometimes support a single tyrant, who only has the power that is granted to him; that he has no power to offend them, but that they have the power to bear it; that he would not know how to do them any harm, but that they prefer to contradict him (LA BOÉTIE, 2009, p. 34).

La Boétie in the fourteenth century deftly noted that the tyrant exists only to the extent that there are people who serve him. To the extent that man, deprived of his rational capacity,

reified and alienated from the world, becomes fertile ground for totalitarian ideas. As much as, at first, they do not carry an obvious evil, abdicating critical consciousness means abdicating freedom and political consciousness, allowing oneself to be used as an object. In the corporate world, it can be said that the famous cliché "is to become a number". An employee is a mere enrollment and their satisfaction and well-being are measured in climate surveys; their intellectual capacity is reduced to mere "doing". In fact, "barbarism begins when thought submits itself to calculation" (BENJAMIN, 2012, p. 98). Benjamin does not propose a war on the analytical aspects that promoted the advancement of the sciences, but, like Arendt, he denounces that the elimination of one of the aspects of human life leads to the enslavement of man and to barbarism.

However, the question may be raised: "why not get rid of this dominant power? Why are people, like Freitas, accepted as "cases" of success?" The answer is quite simple: we can take up again with Foucault, in the work *Discipline and Punish: birth of the prison* the concept of "docile bodies". Power has its greatest merit when it is not traceable, its origin and its end are not known. Only a network of tensions with the objective of training bodies is enough for ideas like these to be internalized. And this process begins in childhood: the school-age child undergoes "exams". According to the French author:

The examination combines the techniques of the hierarchy that monitors and those of the sanction that normalizes. It is a normalizing control, a surveillance that allows qualifying, classifying and punishing. It establishes a visibility over individuals through which they are differentiated and sanctioned. That is why, in all discipline devices, the exam is highly ritualized (FOUCAULT, 2014, p. 181).

Through these discipline devices, with a view to the "docility of bodies", society classifies who should dominate, who should be dominated, who should work, who cannot have a job, who should be marginalized and forgotten and who are the enemies of society. Failure to accept this training leads to serious consequences: the individual can be treated as a criminal or as a "madman". Here come other methods of combat and punishment: prison systems or medicalization. Thus, through these means:

The human body enters a machinery of power that scrutinizes it, disarticulates it, and recomposes it. A political anatomy, which is also also a mechanic of power, is being born; it defines how one can have dominion over the bodies of others, not simply so that they do what one wants, but so that they operate as one wants, with techniques, according to the speed and effectiveness that one determines. Discipline thus

manufactures submissive and exercised bodies, docile bodies (FOUCAULT, 2014, p. 135).

In this sense, "isolation is the essence of totalitarianism, the impotence to act is its most common condition" (ARENDT, 2012, p. 478). Kant, in his pamphlet "Answer to the question what is enlightenment" writes in a very different way that man in this stage of minority needs to be tutored by another (KANT, 1985, p. 100-101). This inability to think for itself comes from the aforementioned training since childhood pointed out by Deleuze and Guattari.

Submissive behavior in need of a tutor clearly reveals castration in the period of child development. The Oedipus complex not overcome by sexual intimidation (threat of castration) provides dependent personalities: on the one hand, a submissive subject, in need of a tutor. On the other hand, a totalitarian personality, willing to dominate consciences at all costs (FREUD, 2024, p. 254).

Here arises the greatest danger of this ideological propaganda for the domination of consciences: once power is no longer external, it does not use violence and torture for punishment, propaganda becomes its most powerful vehicle of indoctrination. Under discourses of "cleaning up a city" one can simply "eliminate" people in street conditions to the applause of the masses. When writing about totalitarian movements (Nazism), Arendt wrote:

They did not need to resort to terror to support their propaganda, nor did they do so. When they liquidated most Polish intellectuals, they did not do so because of their opposition, but because, according to Nazi doctrine, Poles had no intellect; and, when they planned to take the blue-eyed, blond-haired children to Germany, they did not intend to terrorize the population, but only to save "the Germanic blood" (ARENDT, 2012, p. 475).

Obviously, Freitas' proposal, as well as that of the entire ideology of which he is a part, is not to dominate through terror. But, through propaganda, the classification that occurs from childhood, thus defining who should have access to education, comfort, employment and quality of life and who should not. Therefore, it is important to emphasize and reinforce that it is not just a "council", but a totalitarian ideology that develops over the centuries, sometimes manifesting itself through terror, sometimes through the seduction of power.

6.3 EXISTENTIAL AND ONTOLOGICAL IMPLICATIONS: THE ONTOLOGY OF VOLUNTARY SERVITUDE

Men also segregate inhumanity. In certain moments of lucidity, the mechanical aspect of their gestures, their pantomime devoid of meaning, makes everything around them stupid. A man talks on the phone through a glass partition; You don't hear what he says, but we see the meaningless mime: we wonder why he lives. This uneasiness in the face of man's own inhumanity, this incalculable fall in the face of the image of what we are, this "nausea", as an author of our days says, is also the absurd (CAMUS, 2025, p.29).

The Myth of Sisyphus is not just a story printed in works of mythology. It is an allegory of contemporary existence: man, massified, indoctrinated and dominated by the culture industry, reduces his mundane existence to a mere repeater of actions. It is the process that replaces life, the meaningless aesthetic standard that replaces individuality. Under the aegis of a supposed inclusion, large corporations standardize behaviors and determine what should or should not be consumed. It is a true abdication of the capacity of judgment. In fact, only a refined spirit and a free mind is capable of grasping the uniqueness of human existence:

The more our feelings are refined, the more apt they become to distinguish individuals. The highest sense would be the highest receptivity to peculiar nature. To it would correspond the talent for affixing the individual, whose dexterity and energy are relative. When the will is expressed in reference to this sense, then passions for or against individuality are born: love and hate. The mastery in the performance of one's own role is due to the orientation of this sense towards oneself under the domination of reason (NOVALIS, 2021, p. 62).

When we carry out a deep analysis of the way of being, presence (*Da-sein*) manifests itself in temporality. This same temporality is the being of historicity:

The being of presence has its meaning in temporality. This, in turn, is also the condition of the possibility of historicity as a temporal mode of being of presence itself, even abstracting from the question of whether and how presence is an "entity" in time. The determination of historicity is offered before what is called history (an event belonging to universal history). [...] In its factual being, presence is always as and "what" it once was. Explicitly or not, presence is always its past and not only in the sense of the past that always drags itself "behind" itself and, in this way, has as simply given properties, the past experiences that sometimes act and influence the way of its being, which means, roughly speaking, that it always "happens" from its future (HEIDEGGER, 2024, pp. 57 - 58).

This Heideggerian proposal is profoundly important for understanding a fundamental error presented by Freitas: by promoting an eidetic rupture between thinking and acting, Freitas intends to reduce existence to an ahistorical dimension, that is, the *Da-sein* loses its essential sense of being as constructed in temporality. Consequently, by manifesting itself as ahistorical (alienated from history), the *Da-sein* loses the ability to question itself. Autonomous questioning is the principle of freedom of thought and political freedom. In fact, for Heidegger (2024, p. 58):

Presence is assumed in the way of being of questioning and researching historiographical facts. Factual history (Historie) or, more precisely, historiographical factuality (Historizität) is only possible as a mode of being of the presence that questions because, at the foundation of its being, presence is determined and constituted by historicity. If historicity is hidden from presence and as long as it remains so, it is also denied the possibility of questioning and factually discovering history. The lack of factual history (Historie) is not a proof against the historicity of presence, but a proof in its favor, as a deficient mode of this constitution of being. An era can only be devoid of historical facts because it is historical (HEIDEGGER, 2024, p. 58).

In this sense, *Da-sein* can only be understood in history, insofar as it exists in time. And from this temporality, he "is" "being", that is, he is always projecting himself into the future; it is about the past of your future. This gives us an important key to reading Freitas' proposal in his article: to the extent that *the Da-sein* is deprived of the understanding of itself as being in history, its existence, which was previously open to possibilities, is now regulated by the market and by the imposition of the cultural industry. As demonstrated in the phenomenology workshops, discussed in the results of this article, the participants demonstrated that they were totally dominated by aesthetic and pragmatic ideals arising from the very alienation of their existence. What the article by the CEO of the magazine "Meu Valor Digital" represents is not only advice with a view to quick success, but it is a reflection of an inauthentic existence, where life, which should be lived to its fullest potential, becomes a market product, a stock on the shelf of Human Resources.

The fact that *Da-sein* fails to question its elementary historicity also brings a profound problem to the selection processes. If human existence is determined by the future (we are the past of the future), under what argument are the current selection processes that require heavy years of experience sustained? In fact, it is undeniable that the lived experiences of a human being influence his way of thinking and acting, but he does not delimit his possibility of being. In other words, as historical beings, we project ourselves into the future, having the

creative possibility of learning, creating values and building ourselves. The mistake of selection processes is to remain in a medieval essentialist posture, in which they seek an essential that delimits the entity that is being interviewed.

Now, contemporary social structures (corporations, the cultural industry, Human Resources processes and even religion) constitute in the ultimate sense the Heideggerian *Gestell*, that is, the servile and functional way in which the world reveals itself. *Gestell* is not a machine, but the metaphysical essence of the technique that frames the being and transforms it into a means to achieve ends (most of the time profit). *Gestell*'s idea spreads through all human structures: from the family, school, companies and even the State. Ultimately, *Gestell* is the reification of being, its framing in a decadent essentialism. In this way, *Gestell* can be defined as a way of being in the technical era. This mode of being is no longer *Da-sein* (existence as possibilities), but existence as a stock (*Bestand*). Voluntary servitude emerges as a form of subjectivation corresponding to this unveiling. Now, voluntary servitude moves from the political field, as La Boétie proposed, to be reinterpreted as an affective need, whether from the sociological point of view or from the psychoanalytic point of view. The subject who, before being a possibility, commits suicide philosophically in the name of his social admission to the impersonal, becoming a disguised and dangerous theatrical game.

Nietzsche, in his work *On Truth and Lies in the Extramoral Sense*, had already denounced the errors of essentialism, proposing a pedagogy of "becoming what you are". Truth and lies are allegories, metaphors and illusions created to try to equate the non-equal in an arbitrary way:

What is truth, then? A mobile battalion of metaphors, metonymies, anthropomorphisms, in short, a sum of human relations, which have been poetically and rhetorically emphasized, transposed, embellished, and which, after long use, seems to a people solid, canonical and obligatory: truths are illusions, which have forgotten what they are, metaphors that have become worn out and without sensible force, coins that have lost their effigy and now only come into consideration as metal, no longer as coins (NIETZSCHE, 1974, p. 56).

Freitas' market study is nothing more than a "truth", a utilitarian and technicist morality that was learned since childhood. This same morality, admitted as a convention, constitutes the morality of the herd. The ontology of voluntary servitude unfolds here in a slave-owning and antiquated morality, founded on metaphysical illusions.

The phenomenological analysis of contemporary alienation, anchored in the critique of the reification of the human being and the domination of instrumental reason, inevitably leads us to a reflection on man's way of being in the world. The problem that is evident is not only social or economic, but ontological. Modern man finds himself removed from the original experience of being-in-the-world, reduced to the condition of a functional entity within the technical machinery that he himself created. The result of this split is the forgetfulness of being, as diagnosed by Heidegger. In this sense, one can understand the essential point of convergence between the culture industry, criticized by Adorno and Horkheimer, and the inauthenticity of existence, dealt with by Heidegger in "Being and Time": the culture industry is the means by which inauthenticity is consolidated and reproduced on a social scale. Therefore, the article published by Freitas is only an expression of this same inauthenticity of existence that produces a cycle of domination of consciousness: first, the individual is emptied of his existence as a possibility and all his critical capacity is taken from him. Then, this process is reinforced through promises of satisfaction of basic needs, of immediate wealth. These ideals are "validated" by the great influencers, which affect from aesthetic and behavioral aspects. So, heteronomic laws are assumed by the subject as his *ethos* that are transmitted within the family. The children, then, grow up in an environment of productivist fetishism, learning to despise their critical conscience. Thus, what we can call the "cycle of manipulation of consciences" takes place.

The alienation that manifests itself in the realm of productive life, and that begins already in the early stages of human formation — as pointed out by Deleuze and Guattari — is the expression of the forgetfulness of the existential dimension of Dasein, the being that is understood from its opening to the world. Heidegger (2015, p. 86) states:

The oblivion of being is the very destiny of the West. For modern man, fascinated by beings, objectivity and technical mastery, forgets to ask about being. In this way, he not only ignores the fundamental question of philosophy, but loses the possibility of understanding himself in his most proper existence.

The reduction of man to a functional piece, whether in the productive system or in the bureaucratic structures of organizations, translates into an inauthentic form of existence (*Uneigentlichkeit*). It is the loss of the ability to assume one's own being, replaced by obedience to the patterns of behavior dictated by the "if" (das Man). In the corporate context, the "if" manifests itself in the form of the homogenizing organizational culture, in the

standardization of desires and in the domestication of subjectivity. The subject no longer acts from an authentic project, but according to the expectations of performance, goals and metrics that imprison him to the horizon of the useful. One can dare to say that his project of existence is no longer constructed by him, but is imposed on him as a social obligation. Failure to adhere to this project implies its exclusion from social circles and its pathologization. Let's take as an example the male aesthetic standard adopted in 2025. Men who do not conform to this standard are less valued, whether in the labor market or in social relationships. In the same way as the way of dressing, speaking, thinking, society imposes on the individual the production of truths:

Basically, we have to produce the truth as we have to produce wealth. On the other hand, we are also subject to truth in the sense that it is law and produces the true discourse that decides, transmits and reproduces, at least in part, effects of power. After all, we are judged, condemned, classified, forced to perform tasks, and destined to a certain way of living or dying according to the true discourses that bring with them effects of power (FOUCAULT, 2021, p. 279).

What Foucault intends to demonstrate is that, in the cycle of manipulation of consciousnesses, the production of "truths" and "true discourses" bring power at their origin. Every human relationship, in fact, is guided by power. However, when this relationship becomes neurotic, the way is opened for discourses of the emptying of the subject, for his limitation. Returning to the aesthetic example: the body that would previously have countless possibilities, the main one being man's way of being in the world, becomes only an object of immediate delight. The dissolution of existence in the "impersonal" is pointed out as one of the most worrying issues for Heidegger in "Being and Time":

This coexistence entirely dissolves one's own presence [Da-sein] in the way of being of the "others", and this in such a way that the others disappear even more in their possibility of difference and expression. The impersonal develops its own dictatorship in this lack of surprise and possibility of verification. Thus we amuse and entertain ourselves as impersonally it is done; we read, see and judge about literature and art as we impersonally see and judge ourselves; we also withdraw from the great crowds as one impersonally withdraws; we find "revolting" what the impersonal considers revolting (HEIDEGGER, 2024, p. 184).

Heidegger was precise in his critique of the "impersonal". The article published by the CEO of the magazine "Meu Valor Digital" represents the impersonal. This same impersonal that annihilates all possibility of existence of being. The judgment he makes about the Human

Sciences is not just an isolated fact, but an opinion of the impersonal in which the individuality of each subject is dissolved. In short, the subject is no longer master of himself, but is only a manipulable piece of the cultural industry that aims at profit. In his Zollikon Seminars, Heidegger demonstrates that:

[...] Human existence in its essential foundation is never just an object simply present in any place, and it is certainly not an object enclosed in itself. On the contrary, this existence consists of "mere" possibilities of apprehension that point to what it lacks and finds it and cannot be apprehended by sight or touch. All objectifying encapsulated representations of a psyche, a subject, a person, an I, a consciousness, used to this day in Psychology and Psychopathology, must disappear in the Daseinsanalytic view in favor of a completely different understanding (2001, p. 33).

Thus, Freitas' proposal in his article is nothing more than an inhumanity that takes away man's contemplative dimension and inserts him into a servile essentialist dynamic. Behind an apparently advising discourse, there is a slave tendency that hinders man's existence as possibilities. Now, if there are no possibilities, we fall into Camus' absurdity and are led to question "whether or not life is worth living" (CAMUS, 2025, p. 17) and suicide becomes the central theme of the discussion. Submission to the impersonal is, therefore, a form of existential servitude. Contemporary man, by identifying himself with his social and professional role, abdicates his own ontological freedom. It does not "is", but "works". Its existence is governed by external, measurable and comparable parameters. The sense of being, once rooted in the experience of the world of life (*Lebenswelt*), is converted into performance and productivity. The consequence is the ontological emptying of the subject, who, by losing the link with being, also loses the possibility of meaning.

This reduction of man to functionality is the reflection of what Heidegger called the age of technology (*das Gestell*), that is, the way of unveiling the being characteristic of modernity, in which everything (including man himself) is placed as a resource, as something to be calculated and manipulated. Man ceases to be the shepherd of being and becomes the administrator of beings. In "The Question of Technique", Heidegger (2012, p. 23) insists on this point:

The way in which the real is unveiled in the technical age is not something that man masters. He himself is swept away by that way of unveiling which impels him to regard all that is as a reserve fund. The danger does not lie in technique, but in the fact that man finds himself imprisoned in this way of thinking and acting, without perceiving the event that is taking place in him.

Modern administrative logic, by claiming efficiency and total control, mirrors exactly this *Gestell*: man becomes the guardian of a system that surpasses him, and whose rationality absorbs him. Work ceases to be an expression of being and becomes a form of self-forgetfulness. In this condition, *Dasein* no longer inhabits the world poetically, but operationally.

It follows from what has been stated that the author commits yet another error: an error of method and an error of object. By intending to affirm the primacy of practical activities, the author, as an administrator, does not take into account the fact that there are factors that cannot be measured. But the fact that they are not measured does not imply their non-existence.

Ontological phenomena are not perceptible sensorially, they have always shown themselves, necessarily before for perceptible phenomena. To be able to perceive a table as the table that it is, it is necessary to have already perceived before that there is such a thing as a presence. Ontological phenomena are, therefore, hierarchically the first, but, in order to be thought and seen, they are later. [...]. In relation to what is taken as real and being: only that which can be subordinated to uninterrupted causal connections of psychological forces is real and true, in Freud's opinion. And the world-renowned modern physicist Max Planck said, verbatim, a few years ago: "only what can be measured is real". One can rightly contest this: why would there not be realities that are impossible to measure exactly? A sadness, for example (HEIDEGGER, 2001, p. 35-36).

Following the guiding thread of Heidegger's thought, we can question it: "under what premises can we apply the method of the natural sciences to the study of the human condition as *homo faber* and dispense completely? What is really paramount?" This question is not merely rhetorical, but seeks to understand under what premises the annihilation of an essential aspect of the human condition can be carried out.

Kant was the first to explicitly express the character of nature represented in a scientific-natural way. For this reason, he was also the first to say what a law is in a natural-scientific sense. The fact that the true spokesperson of the natural sciences was a philosopher indicates that reflecting on where the natural sciences are headed is not a matter of the natural sciences, but of philosophy, without scientists generally knowing it explicitly (HEIDEGGER, 2001, p. 52).

Heidegger's critique in Zollikon's Seminars is extremely difficult for us to understand the fragility of Freitas' argument: his intention is to direct society towards a political and pedagogical project based on technicality: a doctor, for example, can understand man

technically, the functioning of his organs as the old *L'Homme-Machine* project by Julien Offray de La Mettrie (1748). However, this posture is limited, because it does not understand man as a man-being, only an entity in nature:

Natural science can only observe man as something simply present in nature. The question arises: would it be possible to reach the human being in this way? Within this natural-scientific project we can only see it as natural, that is, we have the pretension of determining the being-man by means of a method that was absolutely not designed in relation to its peculiar essence (HEIDEGGER, 2001, p. 53).

Now, if the method of the practical sciences is not adequate to the understanding of the human being, we can extend this criticism to the administrative sciences. By arrogating to themselves the right to try to measure what is immeasurable, namely human existence, Freitas and so many other authors corroborate the flourishing of a dehumanized and disposable culture. The very etymology of the term "resource" (from which the area and practice of "human resources" management comes) denotes the reification of man: derived from the junction of two Latin words "*re*" (undo) and "*cursus*" (path; career) demonstrates the emptying of being-man for his identification with his career. In other words, it is a matter of getting rid of oneself, getting rid of one's primordial characteristic as a being-there, open to possibilities to remake oneself, to mold oneself in such a way that it becomes a "piece in a stock". Freitas' regrettable position in his publication is a symptom of a structure that intends to turn *Dasein* into *Rekursus*. In his latest Encyclical, Pope Francis writes:

In the age of artificial intelligence, we cannot forget that poetry and love are necessary to save the human. What no algorithm will be able to encompass is, for example, that moment of childhood that is fondly remembered and that continues to happen in all corners of the planet, even as the years go by (2024, p. 16).

The ontological crisis also reveals to us an ethical crisis. It is a heteronymic behavior that, due to the cultural industry, becomes autonomous. If the validity of something is conditioned to its usefulness, consequently there is a tendency to trivialize evil through prejudice against the elderly, homeless people, people with disabilities and other marginalized people in society. The serious consequences of this led Nazi-fascism to rise in Europe in the 1930s and these same prejudices are still fed in a banal way: the woman who is refused in a selection process because of her feminine condition (she can get pregnant and cause damage), the disabled person who is rejected because it may generate costs with

adaptability or the homosexual who is seen with looks of concern due to his sexuality. Now, it can be seen here that the way of being "voluntarily servile", this "ontology of voluntary servitude" has social, political, ethical and economic scalability. The classification and training of man, the power internalized in a biopsychic way, is translated into the cultural industry: it is a way of being that, instead of freedom of conscience, abdicates it and evil is seen as a benefit of society. Therefore, the homeless person is not seen as human, but as a despicable object, who deserves social disdain and is removed from society, sometimes treated as crazy and medicated.

Ontology allows us to understand in a broad way how the immense network of power and training of bodies relate to and determine the way of human existence. The man who is a mere possibility becomes dominated and, as in Plato's Republic, begins to have his social role strictly defined. The determinism that hides behind Freitas' statements reveals an antiquated form of discipline, sensation and punishment.

7 FINAL CONSIDERATIONS

The reflections developed throughout this work allow us to understand that the predominance of utilitarian logic, by converting human experience into a mere productive function, does not only represent a change in values, but a profound ontological reconfiguration. The transformation of the human being into a resource occurs silently, sustained by a pedagogy of submission that naturalizes efficiency as the only criterion of meaning. In this context, homo *faber* becomes not only dominant, but totalizing, redefining life from the paradigm of utility and producing a form of voluntary servitude in which subjects not only obey, but wish to obey. It is precisely this spontaneous adherence to productivism that configures the core of contemporary alienation: a process of internalization of calculation that inhibits phenomenological openness and reduces presence to performance. The loss of *the contemplative vita* is not a side problem, but the most evident symptom of the colonization of existence by technique, because where there is only time to do, the time to be disappears.

This study sought to show that technicality, when elevated to the condition of the ultimate measure of reality, does not present itself as a neutral instrument, but as a way of revealing and shaping the world. Its norms operate as ontological principles, establishing what is perceived as real, valuable, and true. In this way, management goes beyond the organizational field and becomes a universal grammar, imposing itself as a filter of experience and as a structure of subjectivation. The criticism of the pedagogical discourse that reduces

education to adaptation and utility, exemplified in the article analyzed, highlights the way in which instrumental rationality invades spaces originally intended for the expansion of freedom. Education ceases to form subjects to form products, and thought, reduced to the function of solving problems, loses its original dimension of openness to being. When thought is instrumentalized, not only is intelligence impoverished, but a new form of totalitarianism is produced without the need for explicit violence, since control is effective through consensus and the naturalization of effectiveness.

Now, the phenomenology workshops, developed in ten meetings in the city of Mogi das Cruzes (whose data and reports will not be presented for ethical and legal reasons) clearly demonstrated the capillarity of the power of the cultural industry. It is not a question of power by coercion, but of a power acquired and naturalized throughout the process of human development. This same power defines aesthetic values, judgments, prejudices, who should or should not have access to opportunities in the labor market. Foucault's "docile bodies" is Heidegger's inauthentic way of existing. This constitutes the substantial soil on which the concept of the "ontology of voluntary servitude" is erected: it is not a question of servitude through violence, but an imposition through discipline, repetition and propaganda. Contemporary totalitarianism differs radically from twentieth-century totalitarianism because it is not traceable. It is not possible to recognize its origin, how it acts and where it ends. We can only distinguish its effects: a massified, uncritical population subject to accepting the mentality of its owners as true.

Therefore, the proposal of the concept of the ontology of voluntary servitude is to demonstrate that the abdication of man of his own capacity to think and become a *Bestand* is to show that this biopsychic condition moves from the political and psychoanalytic axis to the question of the foundation of one's own being. In short, it is not only a structural and political critique, nor a psychoanalytic one, but an ontological one. It is the emptying of the being-there, as a possibility, to become a body trained in a power structure. Phenomenology, in this sense, as ontology, according to *Being and time*, is an act of rebellion, because it unmasks the created structures that keep *Dasein* attached "to the cave contemplating only shadows".

To conclude here means to affirm that there is no resistance possible without the rescue of the contemplative life and philosophy as a radical experience of unveiling. Thinking becomes a political act when it breaks the automatism of demands and restores to existence the possibility of signifying beyond utility. Philosophy is not opposed to technique, but to its

absolutization; it does not reject action, but action without foundation, moved only by the logic of results. Only through phenomenological suspension, which deactivates the domain of the impersonal, can the subject rediscover the dimension of meaning that the market and management try to subsume. The *epoché* is, in this horizon, more than method: it is ontological disobedience. Therefore, the task of thought is not to reform the system from within, but to expose its ontological poverty and reopen the space of the possible.

Between *homo faber* and *homo sapiens*, the decision remains open. As long as we persist in confusing value with productivity and autonomy with performance, we will continue to accept the mutilation of experience as the price of belonging. But where there is still room for contemplation and questioning, the administered world will find its limit. Resistance is not only in explicit refusal, but in the preservation of the interior space that no device can control. To think is to resist and to resist is to remember that the being is not exhausted in the function. Philosophy remains, therefore, as a gesture of care for the human and as the only way capable of bringing life back to its proper density. If technology organizes the world as a machine, it is up to thought to remember that before being useful, life must be true.

ABSTRACT

The BNCC and PNLD are currently the main guidelines to be observed in the development of didactic material intended for Brazilian students, which demands constant evaluations of the textbooks adopted in schools. From this perspective, the work presented here describes an analysis of the pedagogical approach to the 'Fundamentals of Organic Compounds' present in a textbook from the 'Moderna Plus: Natural Sciences and their Technologies' collection, comparing it with the guidelines of the BNCC and PNLD 2021. Qualitative and descriptive in nature, the research was developed from a documentary analysis with the objective of investigating the conformity of the approach to the introductory content of Organic Chemistry, presented in this chapter, with the documentary guidelines, focusing on its potential in promoting a civic, critical, and contextualized education. The results revealed that, although the chapter partially addresses skills such as the construction of chemical representations and the application of knowledge in everyday contexts, its pedagogical approach remains traditional, content-based, and poorly connected to social, environmental, and cultural issues. The absence of experimental proposals, the superficiality in the interdisciplinary treatment, and the weak stimulus to critical reflection compromise the formative function of the chapter. Therefore, teacher mediation is essential to transform the content into an emancipatory tool, capable of going beyond memorization and contributing to a critical understanding of reality.

trabalho aqui apresentado descreve uma análise da abordagem pedagógica dos Fundamentos dos Compostos Orgânicos presente em um livro da coleção didática ‘Moderna Plus: Ciências da Natureza e suas Tecnologias’, confrontando-a com as orientações da BNCC e do PNLD 2021. De caráter qualitativo e descritivo, a pesquisa se desenvolveu a partir de uma análise documental com o objetivo de investigar a conformidade da abordagem dos conteúdos introdutórios de Química Orgânica, apresentada nesse capítulo, com as diretrizes documentais, focando o seu potencial na promoção de uma formação cidadã, crítica e contextualizada. Os resultados revelaram que, embora o capítulo contemple parcialmente habilidades como a construção de representações químicas e a aplicação de conhecimentos em contextos cotidianos, sua abordagem pedagógica permanece tradicionalista, conteudista e pouco conectada às questões sociais, ambientais e culturais. A ausência de propostas experimentais, a superficialidade no tratamento interdisciplinar e o fraco estímulo à reflexão crítica comprometem a função formativa do capítulo. Diante disso, a mediação docente é essencial para transformar o conteúdo em uma ferramenta emancipadora, capaz de ultrapassar a memorização e contribuir para uma leitura crítica da realidade.

RESUMEN

El BNCC (Currículo Básico Común Nacional) y el PNLD (Programa Nacional de Libros de Texto) son actualmente las principales directrices que deben observarse en el desarrollo de materiales didácticos para estudiantes brasileños, lo que exige una evaluación constante de los libros adoptados en las escuelas. Desde esta perspectiva, este trabajo describe un análisis del enfoque pedagógico de los Fundamentos de Compuestos Orgánicos presente en un libro de la colección didáctica ‘Moderna Plus: Ciencias Naturales y sus Tecnologías’, comparándolo con las directrices del BNCC y el PNLD 2021. De naturaleza cualitativa y descriptiva, la investigación se desarrolló a partir de un análisis documental con el objetivo de investigar la conformidad del enfoque del contenido introductorio de Química Orgánica, presentado en este capítulo, con las directrices documentales, centrándose en su potencial para promover una educación cívica, crítica y contextualizada. Los resultados revelaron que, si bien el capítulo aborda parcialmente habilidades como la construcción de representaciones químicas y la aplicación del conocimiento en contextos cotidianos, su enfoque pedagógico sigue siendo tradicionalista, centrado en el contenido y poco conectado con cuestiones sociales, ambientales y culturales. La ausencia de propuestas experimentales, la superficialidad del tratamiento interdisciplinario y el escaso fomento de la reflexión crítica comprometen la función formativa del capítulo. Por lo tanto, la mediación docente es esencial para transformar el contenido en una herramienta emancipadora, capaz de ir más allá de la memorización y contribuir a una lectura crítica de la realidad.

1 INTRODUCTION

Guided by guidelines such as the National Common Curricular Base (BNCC), textbooks are challenged to present their content in a contextualized and interdisciplinary way (Vilanova, 2015; Brazil, 2017). This document also ratifies the organization of disciplines in the area of Natural Sciences and their Technologies in order to integrate Chemistry, Physics and Biology, focusing on the development of competencies and skills applicable to real situations of the student's daily life (Alves; Martins; Andrade, 2021).

However, these guidelines often come up against technicist approaches that prioritize memorization and contribute little to the construction of meaningful knowledge, especially in the case of Organic Chemistry, often treated as a sequence of naming rules and formulas detached from the social reality of the learner (Maciel; Leão, 2022; Shah; Ibiapina, 2023).

The challenge becomes even more evident in public schools, where the reduced workload of the subject, the precariousness of the infrastructure and the socioeconomic reality of the students aggravate the difficulties in working with the contents in a critical way and aimed at the exercise of citizenship (Gramowski; Delizoicov; Maestrelli, 2017).

Organic Chemistry, a branch of Chemistry that studies carbon compounds, including molecules that are fundamental to life, such as DNA, proteins, and vitamins, plays a strategic role not only in understanding the composition of matter and its transformations, but also in the changes that occur in society. From the fall of the Theory of Vitalism, in the first half of the nineteenth century, to contemporary innovations, with the emergence of RNA vaccines and smart tissues, the evolution of Organic Chemistry directly reflects on the scientific and technological advances that shape human daily life (Solomons; Fryhle; Snyder, 2023).

Thus, the articulation between the Teaching of Organic Chemistry and the major contemporary themes, such as the environment, health and technology, becomes fundamental to ensure a more relevant learning and connected to the students' experiences. In this context, the mastery of its basic concepts must go beyond the memorization of rules of nomenclature and classifications: it must constitute an exercise in critical thinking and reading of the world (Nelson; Cox, 2022).

However, what is observed in Brazilian schools, especially in the public network, is a teaching of Organic Chemistry marked by reductionist and decontextualized approaches. The contents are still often worked on in a fragmented way, with a focus on the fixation of formulas and mechanical repetitions, neglecting the connections of the subjects with social reality and contemporary themes (Paixão, 2019; Adam; Xavier; Maciel, 2009).

This perspective discourages the interest of students and compromises their comprehensive education, as it fails to establish bridges between scientific knowledge and the challenges of daily life, precisely what the BNCC proposes to overcome (Brasil, 2017). By sanctioning this document, the National Book and Didactic Material Program (PNLD) emerges as an essential regulatory tool in the process of choosing the textbook to be adopted in Basic Education schools across the country (Brasil, 2021).

Therefore, the present research collaborated in the search for answers to the following questions: are the contents of Organic Chemistry, present in the textbooks approved by the PNLD 2021, in fact committed to the guidelines of the BNCC (Brasil, 2017)? Are these materials capable of really promoting critical and reflective learning? Do they really contribute to citizenship education?

In view of the above, this research aimed to analyze the alignment of the approach of the Fundamentals of Organic Compounds presented by chapter 10 of the book 'Scientific Knowledge', of the didactic collection 'Moderna Plus: Natural Sciences and their Technologies', with the guidelines of the BNCC, especially with regard to the promotion of critical, reflective learning aimed at citizenship formation.

2 METHODOLOGY

To achieve the proposed objective, this investigation was developed under a qualitative approach, and can be classified as descriptive as to its objectives, since it seeks to analyze the relationships between sets of ideas. As the research data were obtained from sources consisting of texts, it can be considered as being of the documentary type, since its main focus was to answer questions that require the analysis and discussion of written records (Malheiros, 2011).

The choice of chapter 10, of the book 'Scientific Knowledge', is justified by the fact that the content covered in it is responsible for introducing the study of Organic Chemistry in High School, exploring the essential conceptual basis for deepening in topics studied later.

In addition, the collection to which it belongs, 'Moderna Plus: Natural Sciences and their Technologies', is part of the teaching materials recommended by the PNLD 2021 (Brasil, 2021). Because it has an expressive national representation in the public educational scenario, it is being widely adopted in public schools in the city of Crateús-CE.

The intention of the analysis, therefore, was to verify, with special attention focused on citizenship education, to what extent the contents presented in the chapter dialogue with the

competencies and skills proposed by the National Common Curricular Base (BNCC) (Brazil, 2017), listed below:

(EM13CNT104) Evaluate the benefits and risks to health and the environment, considering the composition, toxicity and reactivity of different materials and products, as well as the level of exposure to them, taking a critical position and proposing individual and/or collective solutions for their responsible use and disposal.

(EM13CNT207) Identify, analyze and discuss vulnerabilities linked to the contemporary experiences and challenges to which young people are exposed, considering the physical, psycho-emotional and social aspects, in order to develop and disseminate actions.

(EM13CNT301) Construct questions, elaborate hypotheses, forecasts and estimates, employ measurement instruments and represent and interpret explanatory models, data and/or experimental results to construct, evaluate and justify conclusions in facing problem situations from a scientific perspective.

(EM13CNT302) Communicate, to varied audiences, in different contexts, results of analyses, research and/or experiments, elaborating and/or interpreting texts, graphs, tables, symbols, codes, classification systems and equations, through different languages, media, digital information and communication technologies (DICT), in order to participate and/or promote debates around scientific and/or technological topics of sociocultural and environmental relevance.

(EM13CNT303) Interpret texts of scientific dissemination that deal with themes of the Natural Sciences, available in different media, considering the presentation of data, both in the form of texts and in equations, graphs and/or tables, the consistency of the arguments and the coherence of the conclusions, aiming to build strategies for the selection of reliable sources of information.

(EM13CNT306) Evaluate the risks involved in daily activities, applying knowledge from the Natural Sciences, to justify the use of equipment and resources, as well as safety behaviors, aiming at physical, individual and collective, and socio-environmental integrity, being able to make use of digital devices and applications that enable the structuring of simulations of such risks.

(EM13CHS304) Analyze the socio-environmental impacts resulting from the practices of government institutions, companies and individuals, discussing the origins of these practices, selecting, incorporating and promoting those that favor socio-environmental awareness and ethics and responsible consumption (BRASIL, 2017, p. 555-560; 575).

The analysis procedure was developed in four main stages. The first consisted of the survey and selection of the material to be examined, with the choice falling on the corpus of the research already described. The second stage involved exploratory recognition,

comprising an initial reading of the chapter to familiarize with the content and preliminary identification of the structure and organization of the theme.

The third stage included the analysis itself, conducted through systematic reading with a focus on the identification and registration of elements related to the skills of the BNCC (Brasil, 2017), and on the critical appreciation of the pedagogical approaches and contextualizations presented by the chapter. The fourth and final stage, carried out from the data collected in the light of the theoretical foundation, comprised the interpretation and synthesis of the articulation between the findings and the guidelines of the BNCC (Brasil, 2017), culminating in the construction of inferences about the formative potential of the material analyzed.

The entire analytical process was performed manually, with the systematic recording of the skills identified, the pedagogical approaches used and the contextualization elements present in the material. This procedure allowed to raise evidence about the alignment (or not) of the content presented in the chapter with the BNCC guidelines, contributing to a critical reflection on the role of the textbook in the construction of a more meaningful Chemistry Teaching focused on citizenship formation (Brasil, 2017).

3 RESULTS AND DISCUSSION

In this section, the results of the analysis of chapter 10, entitled 'Fundamentals of Organic Compounds' of the book 'Scientific Knowledge' (volume 1), are presented, having as its core the alignment of the approach of the content and the suggested activities with the guidelines contained in the BNCC and citizen education (Brasil, 2017).

3.1 A TOPICAL ANALYSIS

The chapter begins on page 115, connecting science and everyday life through an illustration containing acarajé dumplings, a typical dish of Afro-Brazilian culture (Figure 1), aiming to relate its ingredients to chemical substances (organic compounds) important for nutrition, such as methionine and lysine. This approach has the potential to stimulate reflections on cultural diversity, food, health, and history, aligning with the EM13CNT104 ability of the BNCC (Brasil, 2017).

Figure 1

Initial illustration of Chapter 10 showing acarajé associated with some organic compounds. Page 115 of the book analyzed

Source: Amabis *et al.* (2021, p. 115).

The text located just below this illustration brings a brief history of Organic Chemistry, differentiating organic from inorganic compounds through everyday examples, which can contribute to encourage a critical analysis of how science is communicated to the public. Interdisciplinarity appears when relating chemistry to nutrition, history and geography, opening space for ethical and social debates on food production and consumption. There is also mention of the artificial production of organic compounds, a useful topic for discussions addressing Science, Technology, Society and Environment (CTSA), although it has been treated in an irrelevant way.

The content of this text also raises questions about the symbology in molecular representations, which could be a starting point to develop the students' investigative and argumentative thinking, as long as it is well explored by the teacher. By encouraging students to observe and question molecular representations, highlighting, for example, the absence of the carbon symbol and the meaning of zigzag strokes, its last paragraph explores EM13CNT301, EM13CNT302 and EM13CNT303 skills.

In Topic 1, located on page 116, the concepts related to structural formulas are revisited, but the approach does not stimulate the exercise of full critical reasoning, although it presents the model of spheres and rods to facilitate spatial understanding.

On page 117, in the sections 'Dialoguing with the text' and 'Group activity' (Figure 2), students are asked to compare molecular models and research compounds such as anethole and estragole. This performance could be further enriched with sensory experiences (smell, touch, sight), since these are substances contained in simple materials, such as fennel and basil, and which can be easily manipulated with due care.

Figure 2

Presentation of the sections 'Dialoguing with the Text' and 'Group Activity'. Chapter 10, page 117 of the book analyzed

Dialogando com o texto

Compare cada um dos modelos moleculares ao lado com as respectivas fórmulas estruturais e verifique a correspondência entre as representações. Como parte da interpretação, deduza quais são as esferas usadas para representar os átomos de cada elemento químico, no modelo molecular.

Atividade em grupo

A substância **anetol** é responsável pelo aroma da erva-doce, bastante usada no Brasil para fazer chás e doces.

Já a substância **estragol** está presente em algumas variedades de manjerição, contribuindo para seu aroma.

Pesquisem na internet a fórmula estrutural desses dois compostos e analisem-nas. Qual é a diferença entre as moléculas de ambas?

Deduzam a fórmula molecular das duas substâncias e comparem-nas. A fórmula molecular, isoladamente, é suficiente para designar de modo inequívoco essas substâncias? Argumentem para justificar.

Source: Amabis *et al.* (2021, p. 117).

Activities of this nature can promote the visualization of molecules from different perspectives, and encourage the formulation of hypotheses about their properties, such as color and odor. By interpreting different molecular representations, students develop skills to communicate results and select reliable sources, preparing for reasoned scientific debates.

In the section 'Applying knowledge', also located on page 117, students are led to identify and interpret different types of formulas (molecular, structural, condensed and with lines), exercising the process of structural deduction. However, the contextualization of theobromine and theophylline is superficial, not allowing the content to be deepened (Skill EM13CNT207).

Although these sections seek to stimulate reasoning, they are less critical and more formal, seeming to meet curricular requirements, without worrying about promoting an in-depth understanding. Practical activities, such as building molecular models with simple materials, could enrich learning by connecting theory and practice, and encourage the formation of critical thinking.

Despite this, the proposed questions seem to present adequate complexity to the level of knowledge explored, stimulating the logical thinking of students when they challenge them to compare carbon and hydrogen atoms in different molecules, reinforcing the learning of the content related to structural analysis.

Topic 2, 'Carbon chain' (page 118), explores the identification of carbon chains in molecules such as limonene and methyl anthranilate. Using subtitles, the authors relate molecular structure to compounds present in everyday life, such as BHT, a preservative and antioxidant. It also addresses the concepts of heteroatoms and the classification of carbons (primary to quaternary).

This favors the understanding of the applicability of the knowledge of Organic Chemistry (EM13CNT306), and consolidates the learning of basic terminology (EM13CNT301). However, the methodological approach is characterized as transmissive, without stimulating teamwork, the development of critical thinking or practical application.

In Topic 3, 'Benzene ring' (page 119), the concept of resonance is briefly presented without going into depth. However, the description of benzene toxicity stimulates reflection on health and safety risks (EM13CNT104). The group activity on this same page proposes research and discussion on amino acids containing benzene rings in their molecules, which can promote the construction of scientific argumentation and knowable communication (EM13CNT302).

The text of Topic 4, 'Attributes of carbon chains' (page 120), presents the appropriate terminology to recognize carbon chains and their classifications (saturated, unsaturated, branched, for example), and also promotes a minimal construction of critical thinking, without delving into the real importance of scientific communication in ethical and environmental

issues. The suggested group activity on the synthetic production of indigo relates structural formula, organic synthesis and green chemistry, encouraging research, the development of critical analysis and the discussion on Science and Sustainability (EM13CNT302).

Topic 5, 'Stereochemistry of saturated carbon' (page 121), addresses essential concepts related to the theme discussed in this part, but does not stimulate the development of critical thinking or contextualize the relevance of stereochemistry in areas such as pharmacology and biomedicine. The lack of suggestions to stimulate dialogue and group activities limits the aspect related to citizenship formation. A richer proposal could include collaborative research on chiral molecules, interdisciplinary connections, and ethical debates.

Despite this, Topic 5 stands out for offering images of the three-dimensional molecular structure of methane (page 121), which can help in understanding the concept of molecular geometry. However, this section prioritizes technical and mechanical learning, focused on assessments, without encouraging ethical reflection or interdisciplinarity.

The questions suggested at the end of this topic, in the section 'Applying knowledge' (page 122), ask the reader to make inferences and argue about the structure-property relationship, using examples such as the molecules of lysine, cadaverine and threonine. This practice is capable of stimulating the development of critical textual and graphic analysis to consolidate learning.

Topic 6, 'Polymers' (page 123), addresses natural and synthetic macromolecules, highlighting ethical and environmental issues related to the production and disposal of plastics. The explanation of the polymerization reaction and the structure of starch connects the molecular structure to the properties of polymers, contributing to the development of EM13CNT306 ability.

In the 'Group activity' section, it is suggested to prepare a video for scientific dissemination, stimulating argumentation, systematization of knowledge and accessible communication (EM13CNT301 and EM13CNT302). This topic also highlights, through an illustration and a short text, the scientist Stephanie Kwolek, inventor of Kevlar, illustrating the practical application of polymers.

The section that closes the chapter, 'Final Activities' (page 124), presents external evidence questions that require interpretation and analysis of molecular structures. It is worth noting that one of them alludes to the degradation process of glyphosate, awakening the student to the optimization of the understanding of environmental problems.

However, many of these questions are inexpressive and practically make the content disconnected from the student's daily life, that is, they do not adequately explore the ability EM13CHS304. It would be necessary, therefore, for these activities to truly contribute to fostering debates on ethics and socio-environmental impacts.

3.2 A GENERALIZED ANALYSIS

Chapter 10, 'Fundamentals of Organic Compounds', of the book 'Scientific Knowledge', addresses fundamental contents of Organic Chemistry with some attempts at contextualization, however it remains stuck in a traditionalist and contentist approach. Although it brings examples from everyday life and group activities, there is a lack of depth in the ethical, socio-environmental, and interdisciplinary discussion, essential elements, according to the LDB (Brazil, 2023) and the BNCC (Brazil, 2017), to form critical and conscious citizens.

Activities often focus on memorization and preparation for assessments, failing to explore the potential to promote relevant critical debates on sustainability, social impact, and scientific responsibility (EM13CNT306). There is a lack of incentive for the development of simple and low-cost experimental activities, limiting the practical and investigative application of knowledge, which is fundamental for citizenship education. Thus, the chapter leaves something to be desired by integrating theory, practice and socio-environmental awareness, essential in preparing students for the challenges of the contemporary world.

In order for the chapter to fully achieve the objectives of the BNCC (Brasil, 2017), the active mediation of the teacher and the school is indispensable. Therefore, it is necessary for these actors to transform the content into opportunities for dialogue, critical reflection and interdisciplinarity, connecting Chemistry to themes related to ethics, the environment, biology, history and society. In addition, encouraging simple experimental activities and the use of digital technologies can contribute to student engagement, making learning more practical, investigative, and aligned with the socio-emotional and scientific competencies provided for in the curriculum guidelines.

Without this mediation, the didactic material runs the risk of being just a repository of technical information, disconnected from reality and contemporary educational demands. The critical and integrative performance of the teacher is essential to transform the content into living knowledge, capable of fostering citizenship education, socio-environmental responsibility and the potential of students to apply science in a conscious and innovative

way in their daily lives. In this way, teaching ceases to be a mere transmission to become an active process of construction and transformation.

The chapter is right to use acarajé as a bridge between Organic Chemistry and everyday life, highlighting the African origin of this dish. However, this success is restricted to the small text that accompanies the illustration of the dumplings, since the entire text of the chapter's introduction is dominated by traditionalism. There are no reflections on the ethnic-racial issues associated with the dish, nor even a discussion of religious syncretism, the role of black women in the Bahian tradition or the impact of colonization on the formation of Brazilian food culture.

It is worth noting that the LDB determines the mandatory teaching of Afro-Brazilian history and culture (Brazil, 2023), and the BNCC (Brazil, 2017) reinforces the appreciation of diversity and the fight against inequalities. Ignoring this deepening reinforces historical invisibilities, treating Afro culture only as a 'curiosity' and not as an essential part of the construction of national identity. The chapter thus wastes a potent trigger for the promotion of interdisciplinary debates on cultural heritage, resistance and belonging.

Despite exhibiting different ways of representing molecules (structural, rod, sphere, and rod formulas, among others) as tools for understanding the structure of compounds, the analyzed material lacks a critical and historical approach that can answer questions such as: Why do these representations exist? How did they come about? What limitations do they present?

Without this perspective, the opportunity to develop epistemological thinking, the look at science as a social construction, is lost. In addition, there are no experimental activities that allow students to build physical or digital models, which would make learning more concrete and accessible. The BNCC advocates the use of different languages and media to promote scientific understanding, which requires practical actions, and not just passive visual reading (Brasil, 2017). The absence of these practices makes the content abstract and exclusionary, hindering meaningful learning and the democratization of scientific knowledge.

The text of the chapter mentions the toxicity of benzene and refers to the National Health Surveillance Agency (ANVISA), but in a decontextualized way and without delving into the practical and political implications of these issues (Brasil, 1999). There is a lack of discussions about how inspections occur, what regulatory criteria are used or what are the legal limits for exposure to hazardous materials. In addition, the role of regulatory standards,

such as NR-15 (unhealthy activities), which are crucial for occupational safety, is completely ignored (Brasil, 2022).

This gap is serious, as it prevents students from understanding Chemistry beyond the classroom and as part of their lives; as a tool to assess risks, demand rights and propose solutions (EM13CNT306). The BNCC also encourages students to critically evaluate the impacts of materials and processes on the environment and public health. By not discussing safe or sustainable alternatives and by ignoring the debate on the use and disposal of chemical substances, the chapter fails in the process of forming critical and conscious citizens (Brasil, 2017).

4 FINAL CONSIDERATIONS

Chapter 10 of the book 'Scientific Knowledge', from the collection 'Moderna Plus: Natural Sciences and their Technologies', offers an introductory approach to Organic Chemistry distributed in six topics and some activities, including molecular representations, carbon chains, the benzene ring, the stereochemistry of saturated carbon and polymers.

In his presentation, specific attempts to connect the content to the student's daily life are highlighted, such as the association of some chemical compounds present in acarajé to the Afro-Brazilian culture, which demonstrates the potential to stimulate cultural and nutritional reflections, in addition to promoting the ability to critically evaluate the benefits and risks that some chemical substances can offer (EM13CNT104).

The pedagogical approach adopted by the chapter, however, remains marked by a traditionalist and content-based bias, with an emphasis on memorization and with little openness to the development of investigative practices, critical reflections or meaningful interdisciplinary connections. In other words, the chapter studied disappoints by not fully exploring the transformative potential of teaching the discipline of Chemistry.

Nevertheless, it is possible to say that it does not fulfill the function of satisfactorily introducing the fundamentals of Organic Chemistry in High School, since it contemplates only some of the skills provided by the BNCC, such as the construction and interpretation of chemical representations (EM13CNT301, EM13CNT302 and EM13CNT303) and the application of knowledge in real contexts (EM13CNT306).

Although there is potential to transit in a process of citizenship education, especially in topics such as chemical safety, cultural diversity and environmental impacts, this potential is underutilized. The superficiality with which the authors deal with ethnic-racial themes, the

absence of accessible experimental activities and the omission of discussions about regulations and the world of work, reveal limitations that compromise the emancipatory role of science education. The material lacks a broader formative intentionality, which goes beyond technical preparation and is capable of promoting a critical reading of the world, as recommended by the BNCC and the LDB.

The sections 'Dialoguing with the Text' and 'Applying Knowledge' offer questions and activities aimed at the development of technical knowledge and logical reasoning, but fail to promote in-depth critical discussion, interdisciplinarity and active engagement of students. Group activities are limited and underexplored in terms of collaborative and investigative development. Although research and discussions are proposed, there is a lack of stimuli for students to build practical or sensorial experiences, such as the manipulation of molecular models, which could strengthen their understanding and interest in the subject.

With regard to interdisciplinarity and socio-environmental awareness, the chapter approaches relevant topics, such as the use of polymers and their environmental impacts, but without deepening discussions on ethics, sustainability and responsible consumption (EM13CHS304).

The questions that end the chapter seem to be mainly focused on the preparation of students for school evaluations and external tests, since they focus on memorization and mechanical problem solving, leaving aside the stimulus to critical reflection and the contextualization of contents. All these characteristics observed in the chapter limit the formative potential of the material, reducing the scope of the competencies associated with citizenship-oriented education.

In view of these findings, teacher mediation becomes essential. It is the teacher's role to reinterpret the book, transforming it into a tool for dialogue, reflection and student protagonism. This requires planning, creativity, and commitment to transformative education.

From another perspective, it is necessary that the publishers and bodies responsible for the PNLD consider, in future editions, the insertion of pedagogical proposals capable of promoting the appreciation of cultural diversity and the development of scientific thinking, expanding the social reach of Chemistry Teaching. This means more contextualizing, interdisciplinary, critical approaches that value experimentation. Only in this way will it be possible to bring the learning of Organic Chemistry closer to the lives of students and, above all, to show them the importance of this knowledge for the exercise of citizenship.

ABSTRACT

The year 2024 was the hottest ever recorded in Brazil, with an average temperature of 25.02°C, revealing the intensification of the climate crisis. Paradoxically, climate risk denial almost doubled, rising from 5% to 9% of the population, according to Datafolha. This contradiction reveals an epistemic and communicational crisis that undermines public understanding of global warming. This study aims to analyze how climate disinformation circulates in Brazil, compromising adaptation and mitigation policies. To this end, a qualitative and documentary approach was adopted, grounded in Luciano Floridi's concept of the infosphere and supported by INMET data, UN reports, and recent scientific literature. Findings indicate that the contamination of the infosphere by false narratives—amplified by social media and political groups—functions as an active environmental risk vector, turning disinformation into an instrument of symbolic and economic power. The results demonstrate that confronting the climate crisis also requires protecting the informational environment. It is concluded that future sustainability depends on an epistemic governance capable of integrating science, technology, and cognitive justice, ensuring that climate information remains a public good guided by truth and the preservation of life.

Keywords: Infosphere. Climate Disinformation. Climate Denial. Extreme Events. Scientific Communication.

RESUMO

O ano de 2024 foi o mais quente já registrado no Brasil, com temperatura média de 25,02°C, revelando o agravamento da crise climática. Paradoxalmente, a negação dos riscos ambientais quase dobrou, passando de 5% para 9% da população, segundo o Datafolha. Tal contradição evidencia uma crise epistêmica e comunicacional que afeta a percepção pública sobre o aquecimento global. Objetiva-se analisar como a desinformação climática se propaga no país, comprometendo políticas de adaptação e mitigação. Para tanto, procedeu-se a uma abordagem qualitativa e documental, fundamentada no conceito de infoesfera, proposto por Luciano Floridi, e apoiada em dados do INMET, relatórios da ONU e literatura científica recente. Observa-se que a contaminação da infoesfera por narrativas falsas —

RESUMEN

El año 2024 fue el más caluroso jamás registrado en Brasil, con una temperatura media de 25,02°C, lo que revela la profundización de la crisis climática. Paradójicamente, la negación de los riesgos ambientales casi se duplicó, pasando del 5% al 9% de la población, según datos de Datafolha. Esta contradicción expresa una crisis epistémica y comunicacional que afecta la comprensión pública del calentamiento global. El objetivo de este estudio es analizar cómo la desinformación climática se propaga en el país, debilitando las políticas de adaptación y mitigación. Para ello, se adopta un enfoque cualitativo y documental, basado en el concepto de infosfera propuesto por Luciano Floridi, con apoyo en datos del INMET, informes de la ONU y literatura científica reciente. Se observa que la contaminación de la infosfera por narrativas falsas —amplificadas por redes sociales y grupos políticos— actúa como vector activo de riesgo ambiental, transformando la desinformación en instrumento de poder simbólico y económico. Los resultados muestran que enfrentar la crisis climática requiere también proteger el entorno informacional. Se concluye que la sostenibilidad futura depende de una gobernanza epistémica capaz de articular ciencia, tecnología y justicia cognitiva, garantizando que la información climática sea un bien público orientado por la verdad y la preservación de la vida.

1 INTRODUCTION

This article discusses a recent and complex phenomenon that affects not only Brazilian society, but several others around the world, namely, climate disinformation, which transcends digital borders and directly impacts public opinion around the world about the climate and environmental crisis. The year 2024 was marked, in Brazil, by intense temperatures that exceeded all previous records, reaching an average of 25.02°C — almost one degree above historical normality. Something that corroborates what INMET already warned, which pointed to the last decade as the warmest. (National Institute of Meteorology, 2022). Despite this situation, there are still many people and government leaders who minimize or deny - deniers - the seriousness of climate change.

The term "public opinion" is treated in the manner of Gabriel Tarde (2005), as a psychosociological concept. This means that the public in question is not subdivided into a merely political public (left, right or center) that defines the legal rules and shapes the political institutions that, in turn, would form a dominant political opinion; and on the other hand, the mass of consumers of tastes, ideas, fads of all kinds. On the contrary, the term "public opinion" refers to a shared opinion in which elements of tradition, politics, customs, reason, and social networks are conflictually shaped in a given time and space.

In this way, the disinformation shared and updated in posts and face-to-face does not act in isolation. It is connected to power structures, inequalities and exclusion that cross Brazilian society, mainly affecting populations that already live in conditions of socio-environmental vulnerability — residents of urban peripheries, indigenous peoples and traditional communities.

As Torres *et al* (2020) observe, these groups have the least access to digital education, reliable information, and institutional protection structures, since they are located on the margins of the flows of communication and power that structure environmental risk management, and are often made invisible in public policies and scientific information networks, which amplifies the impact of climate catastrophes on these groups, limiting their collective response capacity.

This process of marginalization, which makes environmental costs unfeasible for a portion of the population, is what Henri Acselrad (2010) calls environmental racism. It is a perverse logic in which the costs of ecological degradation fall disproportionately on the shoulders of the victims, most of whom are racialized and discriminated groups. These victims inhabit territories with a history of absence of territorialized public policies of the

State, more exposed to the risks of large development projects, such as mining and hydroelectric projects.

Consequently, unraveling the flows of disinformation is to understand the very power dynamics that perpetuate environmental inequality. On the other side of the spectrum, community collectives and social movements occupy the infosphere to counter hegemonic narratives, announce possible alternatives, and strengthen practices of socio-environmental justice (Porto, 2012).

Understanding these informational flows is, therefore, a fundamental step towards the realization of socio-environmental justice. This concept, widely discussed by several authors, is related to the need to ensure that all social groups — especially the most vulnerable — have equitable access to natural resources and the decisions that affect their use:

This is understood as the set of principles that ensure that no group of people, whether ethnic, racial or class groups, bears a disproportionate share of the negative environmental consequences of federal, state and local economic operations, policies and programs, as well as those resulting from the absence or omission of such policies. (Herculano, 2002)

A survey by the United Nations (UN, 2025) pointed to the occurrence of 10 extreme weather events in Brazil throughout 2024. Among these, we can mention three that were classified as unprecedented in their breadth and impact: the devastating floods in Rio Grande do Sul, the severe drought in the Amazon and the prolonged heat waves in the Midwest region.

In the hottest year in Brazil's history, surprisingly more Brazilians have come to deny that climate change is dangerous. A Datafolha survey showed that this number rose from 5% to 9% between 2024 and 2025 (Datafolha, 2025). How is this possible? How can people deny something they are feeling on their skin?

To understand this paradox, we use the concept of infosphere created by the Italian philosopher Luciano Floridi (2015). He explains that we no longer live only in the physical world or only in the digital world - we live in a mixture of the two, which he calls the infosphere:

A new type of conviviality, connected and unlimited, extended in spatiality and not only in physical personal relationships, "face to face", but characterized by connective forms that, through their translation into bits, continuously transform people, streets, squares, houses, things, into data networks, creating an unprecedented and hybrid condition, defined by Luciano Floridi (2015) "on-life. (Schlemmer; Di Felice; Serra,

2020, p. 4).

This is like the air we breathe, but made of information rather than oxygen. Just as polluted air is bad for our lungs, false information is bad for our ability to understand reality and make good decisions.

2 THE ECOSYSTEM OF THE INFOSPHERE

2.1 THE FIVE VECTORS OF CONTAMINATION IN THE BRAZILIAN CLIMATE INFOSPHERE

During the year 2024, the Brazilian infosphere composed of social networks, digital platforms, media channels, and messaging apps was flooded with five main types of false information about the climate, which function as vectors of cognitive pollution (Floridi, 2015).

In that same year, the circulation of false information about the climate in Brazil took on unprecedented dimensions because it coincided with a convergence of critical factors: the worsening of extreme events, especially heat waves and fires in the Amazon and the Pantanal, the intensification of political disputes around the energy transition, and the increase in digital engagement on platforms with low informational control.

We can identify five main vectors of this cognitive pollution (Floridi, 2015), which help to understand how disinformation spreads and affects the collective perception of the climate crisis. The first vector refers to the systematic denial of scientific data produced by consolidated institutions, such as INMET (National Institute of Meteorology). Even in the face of records of extreme heat, discourses that discredited global warming circulated widely on social networks, accusing science of ideological manipulation (Aguiar; Martin; Batista, 2022). This type of disinformation is based on strategies of delegitimization of scientific knowledge and intentional confusion between fact and opinion.

The second vector is manifested by the attempt to naturalize or trivialize extreme weather events. The floods in Rio Grande do Sul or the prolonged drought in the Amazon were often treated as phenomena of "nature", in the face of which man would have almost nothing to do, except to reconstruct the shards left by the phenomenon.

The third vector, which has a political nature, refers to ideological polarization, which transforms the environmental debate into a field of partisan dispute between the extreme left and the extreme right. Throughout 2024, but not only, because this scenario remains in 2025,

climate policies were treated as "communist threats" or part of a "globalist agenda", reducing scientific questions about global warming to ideological debates (Evangelista; Garcia, 2024).

The fourth vector refers to a process of commodification of sustainability, very close to the idea of an ecological modernization, which centers its merely discursive action on campaigns and business discourses that appropriate the environmental vocabulary to only sell products and reputations. In this process, the collective sense of sustainability is diluted in individual and consumerist practices, diverting the focus from the structural causes of the crisis and rewarding individualistic actions as redemptive.

Finally, the fifth element acts in a treacherous way, stifling the reports and experiences of the people most impacted by the climate crisis. Thus, the opinions of native peoples, residents of the banks of rivers and remaining quilombo communities are constantly silenced or misrepresented. Such omission intensifies what Acseirad (2010) calls environmental discrimination, an injustice that brings together the lack of balance in nature and the contempt for traditional knowledge. To understand, therefore, the paths of disinformation is also to understand the debates about knowledge that builds the idea of the climate crisis in Brazil.

2.2 DIFFERENTIATED VULNERABILITIES AND EPISTEMIC RESISTANCES IN THE INFOSPHERE

Informational contamination does not affect everyone in the same way. It is possible to see that populations from the urban peripheries, indigenous peoples, and traditional communities in Brazil experience this process in a more accentuated way, as they face not only the physical impacts of climate change, but also barriers to access to knowledge and public protection policies (Torres *et al* 2020). During the 2024 heat waves, these previously mentioned groups felt the effects in a concrete way. There was, among them, an increase in cardiovascular diseases and difficulties in water supply and food production.

Among the most striking reports are those of Amazonian riverside dwellers, who describe the intensification of the "heat" and noticeable changes in the cycles of flood and drought of the rivers. However, the empirical knowledge of these populations — so rich and situated — rarely finds dialogue with the scientific information that circulates in institutional environments. This distance between what is lived and what is explained deepens what we are calling epistemic and climatic injustice, in which historically marginalized groups bear the double burden: they suffer more from the effects of the crisis and are less able to face it based on accessible and contextualized data.

This observation reinforces the thought of Enrique Leff (2001), for whom the environmental crisis is also a crisis of knowledge. The author argues that the current ecological collapse reflects the limitation of a rationality that separated man from nature and reduced knowledge to the logic of production.

As Vieira (2001, p. 9), the socio-environmental crisis that was once treated as if it were something punctual and surmountable, has become an inevitable reality of our times:

Almost three decades after the Stockholm Conference was held in 1972, it would not be an exaggeration to say that we continue to deal with the socio-environmental crisis as if it represented only an untimely disturbance, a kind of background noise to be dealt with in a reactive and fragmented way, without implying the transgression of the profound logic that conditions the organization of contemporary societies.

In fact, climate disinformation is not just an isolated fact, but an expression of a dominant rationality that reduces reality to *fake news* and knowledge to capitalist utility. The infosphere contaminated by disinformation is, in this sense, the digital mirror of instrumental rationality that Leff (2006) criticizes, by transforming information into a manipulative commodity and truth into an algorithmic performance. The aforementioned author defends an environmental rationality as a means to overcome this totalitarian rationality, based on Marx's thought, Bookchin's anarchist naturalism, Baudrillard's postmodern thought, the ideas of Georgescu-Roegen, Prigogine, Morin, Habermas and Heidegger's ontology:

The construction of a new productive paradigm based on principles and bases of environmental rationality implies a strategy of deconstruction of economic rationality through social actors capable of mobilizing political processes that lead to productive and knowledge transformations to achieve the purposes of sustainability, rather than through norms that can be imposed on capital and consumers to reform the economy. In addition to the capitalization of nature through a formal economic-ecological rationalization, sustainability is debated in the emerging field of political ecology, where the perceptions and interests of the majority groups of society, Third World populations and indigenous peoples come into play, who resist being globalized, reduced to the condition of producers and consumers of a greenish market system. (Leff, 2006, p. 232)

This vision moves the interaction between science and society to the field of the ecology of knowledge, where different ways of understanding – scientific, popular, ancestral – can communicate in a reciprocal way. In this sense, significant movements of epistemic resistance emerged in the Brazilian infosphere, promoted by peripheral and traditional

communities. By flooding the infosphere with their own stories about global warming, sustainability, and the environmental crisis, they generate anti-hegemony discourses that break the prevailing monopoly of truth and reestablish the territory as a legitimate source of knowledge and sustainable practices that can be the solution to the challenge imposed by climate change that has been experienced more intensely in recent decades.

Thus, the infosphere becomes a terrain of confrontation between the unique rationality of technoscience and the various rationalities of the ecology of knowledges. Socio-environmental activism and community movements of collective struggle tactically appropriate digital platforms to combat misinformation and develop mitigation and adaptation policies.

Indigenous leaders such as Txai Suruí and quilombola activists use Instagram, Facebook, and other digital social networks to promote climate advocacy and occupy the digital space with critical and creative educational content (Evangelista; Garcia, 2024).

2.3 COLONIALITY OF KNOWLEDGE AND THE EPISTEMIC CRISIS

The climate crisis, which is currently characterized by the increase in extreme events and the spread of online disinformation, is also a crisis of knowledge. We are living, more than an ecological collapse, a global epistemic crisis, the result of the domination of modern rationality and the coloniality of knowledge, a concept elaborated by Aníbal Quijano (2005) to refer to the way in which the European positivist project of modernity structured the world based on the hierarchization between different forms of knowledge. Colonization not only exploited bodies and lands, but also imposed a single rationality — scientific, Eurocentric, instrumental — as the standard of universal truth.

Boaventura de Sousa Santos (2007, p. 71) argues that:

Modern Western thought is abyssal thinking. It consists of a system of visible and invisible distinctions, the latter of which underlie the former. Invisible distinctions are established through radical lines that divide social reality into two distinct universes: "on this side of the line" and "on the other side of the line"

This line defines what is considered science and what is relegated to ignorance — silencing the culture of the original peoples, the peasant folk wisdom and the epistemologies of the basal urban peripheries. To break this separation, the author proposes an *ecology of knowledges*, understood as "post-abyssal thinking is premised on the idea of the

inexhaustible epistemological diversity of the world, the recognition of the existence of a plurality of forms of knowledge beyond scientific knowledge. This implies renouncing any general epistemology" (Santos, 2007, p. 85-86)

These formulations converge on a point that seems inescapable, namely, climate disinformation in the Brazilian infosphere is not, in short, an isolated phenomenon, much less restricted to the technological field. It is, rather, a hasty incarnation of our known forms of epistemic coloniality, contained in the world-system as Immanuel Wallerstein called it. The infosphere, conceived as an ecosystem of hybrids of life and information, reproduces and amplifies the asymmetries of power between the various social groups when it itself concentrates cognitive power in the corporations and knowledge-producing institutions of the global North, relegating other forms of knowledge to the condition of noise, curiosity or folklore.

In a land and a time like contemporary Brazil, cognitive inequality takes on very particular contours. It manifests itself in phenomena such as the digital divide and the epistemic invisibility of the populations that, as already mentioned, most directly experience climate change: indigenous peoples, quilombola communities, riverside populations, among others.

By finding circulation channels for their own readings of the climate crisis, these organizations build what Santos (2018) would call intercultural translations: dialogues between knowledges that are not subject to hierarchy, but are strengthened in reciprocity.

These examples demonstrate that epistemic climate governance, in order to be democratic, needs to adopt strategies for the recognition and integration of traditional and territorial knowledge as a legitimate part of the production of environmental knowledge. Climate information should not be treated only as technical data, but as a shared cultural heritage, whose effectiveness depends on the diversity of voices that build it. The ethical and political challenge is to ensure that public policies for communication and climate education consider local knowledge not as cultural ornaments, but as active epistemologies in the formulation of solutions.

Ecological epistemic governance must be based on the reappropriation of the knowledge of traditional peoples, in which the quality of information and the diversity of knowledge are considered interdependent dimensions of sustainability. Therefore, addressing climate disinformation goes beyond preserving the informational environment; It is about restoring the connection between knowledge and cultural diversity, between the

digital and the physical, between the global and the local (glocal). From the perspective of the Epistemologies of the South, epistemic governance takes on a decolonial trait: it aims to decentralize the power of knowledge, sharing the right to name, interpret, and propose remedies for the climate crisis.

By adopting the Epistemologies of the South, with all their diversity and potentiality, the State has the opportunity to propose an epistemic governance with a decolonial character. In other words, this governance model seeks to decentralize colonizing power, redistributing the right to name, interpret, and propose solutions to the climate crisis. In other words, it is a matter of transforming the *infosphere* — today contaminated by mercantile interests and hegemonic narratives — into an ecosystem of plural knowledge, where knowledge becomes a common good and an instrument of emancipation.

In this sense, climate justice cannot be dissociated from cultural, economic, social and epistemic justice. Climate epistemic governance, in the light of the epistemologies of the South, is not limited to the technical management of information, but configures a civilizing project, aimed at reconfiguring humanity's way of thinking, feeling, and communicating about its relationship with the Earth

2.4 EPISTEMIC GOVERNANCE AND PUBLIC POLICIES

Brazilian epistemic governance is shaped by the recognition that climate disinformation is structurally favored by the algorithmic logic of digital platforms. During the aforementioned year 2024, recommendation algorithms on YouTube, Facebook, and TikTok, for example, were identified as multipliers of denialist content, favoring controversial and emotionally charged narratives. This dynamic reveals that the protection of information requires the regulation of information infrastructures, as argued by Floridi (2015).

In response to this active vector of environmental risk, the Brazilian government established in 2025 the Network of Partners for the Integrity of Climate Information. The network is part of the "Brazilian Chapter" of the Global Initiative for the Integrity of Information on Climate Change, which was launched globally in partnership with the UN and UNESCO. This initiative is the result of a collaboration between the Secretariat of Social Communication of the Presidency of the Republic (Secom PR), through the Secretariat of Digital Policies (SPDigi), the Ministry of Foreign Affairs (MRE) and the Ministry of Environment and Climate

Change (MMA).³

This initiative seeks to integrate environmental protection and informational quality, articulating scientific institutions (INMET, INPE), government agencies, civil society and digital platforms. The Network's actions include the creation of information quality indicators, the development of rapid response protocols to disinformation during extreme events, and the strengthening of digital climate education.

Experience has shown that traditional scholarly communication is insufficient, requiring the development of strategies that combine scientific rigor with narrative competence to compete for audience engagement. Proposed initiatives involve the creation of specialized scientific influencers and the adaptation of communication formats (such as *stories* and *reels*) for different platforms.

The contamination of the infosphere raises ethical issues governed by the principle of distributed responsibility (Floridi, 2015). This responsibility is shared among digital platforms, which must ensure the integrity of the algorithms; digital influencers, who must prioritize the quality and veracity of the content they produce; scientific institutions, which must make their communications accessible and understandable to the public; and citizens, who must exercise careful verification of the information they consume. The ultimate goal is to promote scientific accuracy and social justice through an ethics of climate information.

3 METHODOLOGY

To this end, a qualitative and documentary approach is carried out, based on the concept of infosphere, proposed by Luciano Floridi, and supported by data from INMET, UN reports and recent scientific literature. It is observed that the contamination of the infosphere by false narratives — amplified by social networks and political groups — acts as an active vector of environmental risk, transforming disinformation into an instrument of symbolic and economic power.

4 RESULTS AND DISCUSSIONS

The year 2024 was the year in which the increasing frequency of extreme weather events was met with the denial of these risks by the population.

³ Brazil. Presidency of the Republic. Secretariat of Social Communication. Available at: <https://www.gov.br/secom/pt-br/assuntos/noticias/2025/03/governo-apresenta-rede-que-une-sociedade-civil-e-orgaos-internacionais-para-proteger-o-debate-climatico> Accessed on: 05 nov. 2025.

According to the assessment of the Brazilian infosphere, climate disinformation is an active vector of environmental risk because it amplifies socio-environmental vulnerabilities, which makes it even more difficult to implement climate change adaptation and mitigation policies that are indispensable to address the climate crisis.

The five vectors of cognitive pollution identified - scientific denialism, naturalization of extreme events, ideological polarization, invisibility of vulnerable populations, and commodification of sustainability - revealed how the algorithmic architecture of digital platforms can be instrumentalized to fragment public debate and weaken scientific consensus. The Brazilian experience demonstrates that protecting the climate necessarily requires protecting the quality of information, ensuring the effectiveness of epistemic governance that is as crucial as traditional environmental governance.

The creation of the Network of Partners for the Integrity of Climate Information represents a significant advance in the development of public policies that integrate environmental protection and informational quality. This pioneering initiative sets an important precedent for other countries to address similar challenges, demonstrating that future sustainability will depend on algorithms and narratives that prioritize scientific evidence over polarizing ideologies. However, as evidenced by studies on environmental governance in Brazil, structural challenges still persist that require articulation between multiple levels of government and sectors of organized civil society to ensure the effectiveness of these policies.

The analysis of differentiated vulnerabilities in the infosphere pointed out that epistemic climate injustice intensifies already existing socio-environmental inequities. The marginalized populations in history – indigenous peoples, quilombola communities, riverside communities – are the ones who suffer the most simultaneously from the effects of climate change and the ones who least access duly confirmed scientific information. On the other hand, epistemic resistance movements indicate the transformative power of the critical appropriation of digital technologies by socio-environmental entities.

As the country will hold COP 30 in Belém, the Brazilian context becomes particularly relevant, as Brazil will be at the epicenter of climate governance and global Amazon preservation narratives. Therefore, it is necessary to take advantage of the historic opportunity that this global event offers Brazil to debate its role in combating climate change, strengthening national capacities in confronting climate disinformation and fostering epistemically based narratives.

Future studies should investigate the effectiveness of different scholarly communication strategies that take into account the regional and cultural contexts of Brazil. This includes the integration of traditional and scientific knowledge, the development of analyses to assess the quality of climate information, and the creation of rapid response protocols to disinformation about specific extreme weather events. It will also be necessary to deepen the analysis of the impact of artificial intelligence and recommendation algorithms on climate information flows, advancing ethical *frameworks* to guide the design of digital technologies that promote scientific accuracy and social justice in every field.

Therefore, the construction of an ethics of climate information constitutes an interdisciplinary challenge to the traditional division between the natural and social sciences and technology. As Floridi (2015) alludes to, as everything is related, the environment is no longer exclusively the responsibility of those who deal directly with the land, the rural world or the oceans. Acting in solidarity, the natural, social, and technological sciences must converge in a common project of informational sustainability, capable of articulating the production of knowledge, digital regulation, and socio-environmental justice in the same ethical horizon.

5 FINAL CONSIDERATIONS

Projections for future climate change scenarios in Brazil indicate the intensification of extreme events and the increase in socio-environmental vulnerability in several regions (National Institute of Meteorology, 2024). In this context, the ability to maintain complete information becomes even more crucial for the effective implementation of adaptation policies and for building social resilience. Brazilian sustainability in the twenty-first century will depend not only on the protection of its physical ecosystems, but also on the preservation of an informational environment that facilitates decision-making based on scientific evidence and promotes the inclusion of all social groups in the climate debate.

We conclude that addressing the Brazilian climate crisis requires an integrated approach that recognizes the interdependence between environmental protection and informational quality. The experience of 2024 has shown that it is not enough to produce scientific knowledge: it is necessary to ensure that this knowledge circulates in an accessible, understandable, and culturally relevant way in the infosphere. Epistemic governance thus emerges as an essential component of climate governance, requiring institutional, technological, and educational innovations that place scientific precision and socio-

environmental justice at the center of Brazilian public policies. The future of the sustainability of Brazil's natural assets and intangible wealth will depend on our collective ability to build an infosphere that serves life, not the interests that threaten.

ABSTRACT

This study allowed us to have a broad view of the publications on Artificial Intelligence on the Scielo platform, in which it pointed out a historical, methodological analysis and thematic fields. He improved his knowledge on the subject by synthesizing and structuring the information in the articles, to determine the general scenario of the works. The impact consists of novelty, considering that no other study was found in the literature that presented the same scope and perspective. It deals with a topic in vogue, relevant and that deserves to be investigated to know general trends and scope. To this end, the research strategy adopted was bibliographic research based on the methods of bibliometric study and systematic review of the literature. Scielo publications on AI were scarce until 2019. Starting in 2020, research on AI has increased. Articles on AI in health and bioethics were the most published in Scielo in the period analyzed, followed by publications, respectively in the following order, in the field of education; related to law, legislation and ethics; critical analysis of AI; Business Management and Markets; communication; agrarian and computer science.

Keywords: Bibliometric Study. Systematic Review of the Literature. Artificial intelligence.

RESUMO

Este estudo permitiu ter uma visão ampla das publicações sobre a Inteligência Artificial na plataforma Scielo em que apontou uma análise histórica, metodológica e os campos temáticos. Aprimorou o conhecimento sobre o assunto ao sintetizar e estruturar as informações dos artigos, de forma a determinar o cenário geral das obras. O impacto consiste no ineditismo, tendo em vista que não foi encontrado na literatura outro estudo que apresentasse a mesma abrangência e perspectiva. Trata de um tema em voga, relevante e

que merece ser investigado com vistas a se conhecer tendências gerais e abrangência. Para tanto, a estratégia de pesquisa adotada foi a pesquisa bibliográfica a partir dos métodos do estudo bibliométrico e revisão sistemática da literatura. As publicações no Scielo sobre IA foram escassos até 2019. A partir de 2020, as pesquisas sobre IA se intensificaram. Os artigos sobre a IA na saúde e bioética foram os mais publicados no Scielo no período analisado, seguido por publicações, respectivamente na seguinte ordem, no campo da educação; relacionadas ao direito, legislação e ética; análise crítica à IA; Gestão Empresarial e Mercados; comunicação; agrárias e; ciência da computação.

Palavras-chave: Estudo Bibliométrico. Revisão Sistemática de Literatura. Inteligência Artificial.

RESUMEN

Este estudio permitió obtener una visión amplia de las publicaciones sobre Inteligencia Artificial en la plataforma Scielo, presentando un análisis histórico, metodológico y de los campos temáticos. Mejoró el conocimiento sobre el tema al sintetizar y estructurar la información de los artículos, con el fin de determinar el panorama general de las obras. Su impacto radica en su carácter inédito, dado que no se encontró en la literatura otro estudio con la misma amplitud y perspectiva. Aborda un tema en auge, relevante y que merece ser investigado para conocer las tendencias generales y su alcance. Para ello, la estrategia de investigación adoptada fue un estudio bibliográfico basado en métodos bibliométricos y en la revisión sistemática de la literatura. Las publicaciones sobre IA en Scielo fueron escasas hasta 2019. A partir de 2020, las investigaciones sobre IA se intensificaron. Los artículos sobre IA en la salud y bioética fueron los más publicados en Scielo en el período analizado, seguidos respectivamente por publicaciones en el área de educación; derecho, legislación y ética; análisis crítico de la IA; gestión empresarial y mercados; comunicación; ciencias agrarias; y ciencias de la computación.

Palabras clave: Estudio Bibliométrico. Revisión Sistemática de la Literatura. Inteligencia Artificial.

1 INTRODUCTION

The central theme of this work is Artificial Intelligence (AI), which has been gaining more notoriety. Commissioned by *Microsoft*, a study conducted by *PricewaterhouseCoopers* stated that AI will be able to contribute more than US\$15.7 trillion to the global economy by 2030 (MICROSOFT, 2019). According to Naudé (2021), the growing interest in AI has brought expectations and uncertainties. Regarding expectations, it is expected that AI will improve productivity, growth prospects, and even leverage progress towards a technological utopia, which would be achieved when it advances to the point of becoming a superintelligence. With regard to uncertainties, there is a fear that AI will negatively affect the labor market, creating employment inequality, or even that it will become an existential threat to everyone. Santos, Schaal, and Goulart (2024) state that understanding the effects of AI has been the focus of studies and public policies in various parts of the world. These studies include the possible impacts of AI on economic growth, employment, income distribution, productivity, industrial organization, innovation, inequality, and economic policy.

Several fields of knowledge carry out research involving the use of AI, such as the fields of education, health, law and ethics, business management, communication, agricultural sciences, in addition to research that discusses, in general, the capacity of AI, its benefits and the risks of its use. Kaufman (2018) claims that AI is also a subject of research in areas such as computing, linguistics, philosophy, mathematics, neuroscience, among many others.

Based on the above, this study consisted of conducting a systematic analysis of AI based on peer-reviewed scientific articles, specifically, those published by the *Scielo - Scientific Electronic Library On-line* database. The Scielo platform is a program to support the communication infrastructure of open access research, created in 1997 and launched in March 1998, adopted in 16 countries that form the Scielo Network of national collections of quality journals. Its *raison d'être* and the relevance of the Scielo Program lie in the recognition, promotion and improvement of journals edited by universities, scientific societies and professional associations. It has nationally edited journals that communicate basic and applied research, of national and foreign authorship, multilingual, of various disciplines, from different countries and regions within them, with the inclusion of themes of priority or regional and local interest. The 28th Scielo Program contributes to providing science in the countries where it operates with the infrastructure and capacity to progressively carry out the complete cycle of research in the *modus operandi* of Open Science (SCIELO, 2024).

The following guiding question arises: how has AI been treated in the literature? Which field of study conducts the most research involving AI? Thus, this research is justified as it allows us to understand how AI has been approached in scientific works, from the first article published in *Scielo* to the present day. It also allows to improve knowledge in the elaboration of a systematic literature review, synthesizing, structuring and analyzing the data provided by the articles, in order to determine the general scenario of the works under analysis. It is also noteworthy that this is a topic in vogue at the present time, which makes this work relevant to the academic environment, since no broad study was found in the literature that indicated the paths addressed about publications related to AI, giving originality to the present work.

2 THEORETICAL FRAMEWORK

Two scholars in this field, Stuart Russell and Peter Norvig, define AI as the study of intelligent agents that receive perceptions from the environment and perform actions, in which each agent implements a function that maps sequences of perceptions into actions. For them, AI ranges from general-purpose applications (such as learning and perception) to specific tasks (such as playing chess, demonstrating mathematical theorems, creating poetry, and diagnosing diseases), systematizing and automating intellectual tasks that are relevant to various spheres of human activity, being a field that tries not only to understand, but also to construct intelligent entities (RUSSELL; NORVIG, 2004).

Another definition is that AI is the ability to create machines capable of replicating human intelligence, allowing them to do what was typically done by humans (KAUFMAN, 2018; PEIXOTO, 2020; SAINTS; SCHAAL; GOULART, 2024; TEIXEIRA, 1990). Santos, Schaal, and Goulart (2024) add that machines, or intelligent systems, are capable of performing tasks autonomously, based on stored information and their own experiences, by cross-referencing and interconnecting thousands of data. For them, AI has the potential for widespread application in society and production, which amplifies and deepens the changes brought about by it. Taulli (2020) states that AI is not only associated with computer science and mathematics, there have also been important contributions from other fields, such as economics, neuroscience, psychology, linguistics, electrical engineering, and philosophy.

According to Taulli (2020), philosopher John Searle, writer of the article "*Minds, Brains and Programs*", which, in Portuguese, means "Minds, Brains, and Programs", believed that there were two forms of AI: strong AI and weak AI. For him, strong AI refers to when a machine actually understands what is going on, and can even demonstrate emotions and

creativity; as an example, he mentions that it can be found in companies such as *Google's Deep Mind*. Coppin (2012) believed that, having a computer with adequate processing capacity and giving it sufficient intelligence, it would be possible to create a computer capable of thinking and being conscious, just as a human is conscious. But he recognizes that, for the time, this idea was considered absurd and even unfounded.

Searle believed that weak AI refers to a machine's ability to match patterns by typically focusing on specific tasks, such as *Apple's Siri* and *Amazon's Alexa* (TAULLI, 2020). For Coppin (2012), unlike strong AI, weak AI is about replicating intelligence through commands given to a computer to solve complex problems. Thus, the fact that a computer acts intelligently does not mean that it is really intelligent, like a human.

3 METHODOLOGY

Regarding the approach, the present study is characterized as a bibliographic research, in which the bibliometric study and systematic review of the literature were adopted to characterize works present in the *Scielo database*, on the theme "Artificial Intelligence". The bibliometric study involved the analysis of the temporal evolution of the works, classification of the journals, methodologies and objects investigated in these articles. And the systematic literature review approach was applied as a method, with the objective of creating categories of analysis of the contents present in the analyzed works. The present work is also characterized as descriptive research and exploratory study.

In this sense, this study describes, based on a previously elaborated research protocol, the characteristics present in scientific articles on AI published in journals and made available on the *Scielo Platform*. This description aimed to discuss the general characteristics of the publications and the contents involved in what was published in relation to this theme, and the exploratory perspective was due to the fact that the theme is in vogue and still in scientific and epistemological construction.

The present study was structured on the collection of secondary data, more specifically on articles published in journals that have been submitted to peer review. The platform chosen for the research was *Scielo* (Online Digital Scientific Library). Data collection was carried out from May 15 to July 16, 2024 and to ensure a more complete result, it was decided to use search terms (descriptors/keywords) in both Portuguese and English, namely: Artificial Intelligence and *Artificial Intelligence*. In the research protocol created, citable articles, characterized as being in Portuguese, that contained the terms "Artificial Intelligence" or

"Artificial Intelligence" in the "Title" and "Abstract" fields, published on the platform until July 16, 2024, were selected, resulting in a total of 127 works. The next step was to *download* these articles to start the analysis.

Articles that did not contain the term "artificial intelligence" in the title and abstract (review of the protocol applied) were excluded; articles in which the topic was not related to AI; any works that were not articles from journals/magazines (including TCC, dissertation, thesis, specialization monograph, event articles and books); repeated articles and articles with incomplete text/incomplete availability. All 127 works selected after the inclusion parameters had the term "artificial intelligence" in the title and abstract, contained a theme related to AI, and were articles from journals/magazines. However, there were 60 repeated works and one work with incomplete availability, which resulted in 66 articles selected to compose the systematic literature review carried out, which were ordered in Table 1.

Table 1

Selected articles

No.	Title	Quote
1	Artificial intelligence in the improvement of ecology essays: a study in a Brazilian high school	Silva Neto e Leite (2024)
2	Health literacy in ChatGPT: exploring the potential of using artificial intelligence for the preparation of academic texts	Peres (2024)
3	Artificial intelligence for predicting bed bath time in Intensive Care Units	Toledo, Bhering and Ercole (2024)
4	Lexical density in texts generated by ChatGPT: implications of artificial intelligence for writing in additional languages	Silva and Rottava (2024)
5	Diagnosis of diabetic retinopathy by artificial intelligence through <i>smartphone</i>	Oliveira <i>et al.</i> (2024)
6	Application of artificial intelligence techniques to classify evasion of the theme in essays	Pinho, Gaspar and Sassi (2024)
7	Artificial intelligence applied to evaluate the perception of the quality of <i>E-commerce logistics</i> : the case of Rio de Janeiro	Sucena and Cury (2024)
8	Generative artificial intelligence (AI) and information competence: informational skills necessary for the use of generative AI tools in informational demands of an academic-scientific nature	Trindade and Oliveira (2024)
9	Behind Artificial Intelligence: An Analysis of the Epistemological Underpinnings of Machine Learning	Aaron (2024)

49	Impact of artificial intelligence on the choice of radiology as a medical specialty by medical students in the city of São Paulo	Brandes <i>et al.</i> (2020)
50	Artificial intelligence in public relations? No thanks. Perceptions of European communication and public relations professionals	Sebastian (2020)
51	Semi-training and artificial intelligence in teaching	Campos and Lastória (2020)
52	Implementation of an artificial intelligence algorithm for sepsis detection	Gonçalves <i>et al.</i> (2020)
53	<i>Legal tech: analytics</i> , artificial intelligence and the new perspectives for the practice of private law	Andrade, Rosa and Pinto (2020)
54	The Playful Fallacy of the Three Laws: An Essay on Artificial Intelligence, Society, and the Difficult Problem of Consciousness	Lent (2020)
55	The Digital Technological System: artificial intelligence, cloud computing and <i>Big Data</i>	Silva Neto, Bonacelli and Pacheco (2020)
56	The metaphysical dimension of artificial intelligence	Braga and Chaves (2019)
57	The use of artificial intelligence in the application of public law: the special case of the collection of tax credits - a study aimed at the Brazilian and Portuguese cases	Abraham and Catarino (2019)
58	Artificial intelligence and medicine	Wolf (2017)
59	Communication and artificial intelligence: new challenges and opportunities for communication research	Gunkel, Trento and Gonçalves (2017)
60	Estimation of the tapering of the Araucaria Stem using artificial intelligence techniques	Martins <i>et al.</i> (2017)
61	Artificial intelligence applied to animal science	Costa (2009)
62	Artificial intelligence: an application in a continuous process industry	Sellitto (2002)
63	Diagnosis of cerebellopontine angle tumors with the aid of artificial intelligence techniques	Leitão <i>et al.</i> (2000)
64	Biological intelligence <i>versus</i> artificial intelligence: a critical approach	Sanvito (1995)
65	An approach to artificial intelligence and simulation, with an application in national beef cattle	Costa (1992)
66	Artificial intelligence and problem-solving theory	Teixeira and Gonzales (1983)

Source: The authors, 2025.

After selecting the articles, a content analysis of all selected articles was carried out, followed by a thematic categorization based on the main focus of each work. To agglutinate the works into the categories created, the keywords and the content of the abstract of each article were specifically analyzed. In all, eight categories of analysis were created: Health and Bioethics; Education; Law, Legislation and Ethics; Critical Analysis of AI; Business Management and Markets; Communication; Agricultural; Computer Science.

4 RESULTS AND DISCUSSION

Over the years, there has been a significant increase in publications about AI. The first article on AI, present on the *Scielo Platform*, dates from 1983. There was a 9-year gap until the publication of the second article, in 1992. Until 2009, there were six articles about AI on the platform, representing 9.09% of the articles analyzed. From 2010 to 2016, no article on this topic was published in *Scielo*. The year 2017 brought the contribution of three articles, which represent 4.55% of the articles analyzed, followed by two articles in 2019 (3.03%).

In 2020, seven articles were published. From this moment on, publications about AI took off. In 2021, 14 articles were published, followed by eight publications in 2022 and 14 in 2023. In 2024, until July 16 (the final date of collection of this research), 12 articles were published. In other words, the interval of the last four years represented 83.33% of the publications present in this study, which proves the growing interest in this area of research in recent years.

4.1 QUALIS CAPES CLASSIFICATION OF JOURNALS

In total, the 66 articles were published in 49 journals. Of these, the one that was most repeated was the Advanced Studies, with a Qualis Capes A1 classification, with four publications. Then, with three publications in each journal, the Journal of Constitutional Investigations (A1), the Brazilian Journal of Nursing (A4) and the Journal of Bioethics (B1) were presented.

Two articles were published in eight different journals, namely: *Ciência & Saúde Coletiva* (A1), *Texto Livre* (A1), *Trans/Form/Ação* (A1), *Filosofia Unisinos* (A1), *CONSINTER International Journal of Law* (A3), *Journal of the Brazilian College of Surgeons* (B1), *Brazilian Archives of Cardiology* (B1) and *Archives of Neuro-Psychiatry* (B2). Finally, 35 journals presented only one article published in each one and their Qualis Capes classifications ranged from A1 to B3.

It should be noted that the predominant Qualis Capes classification is A1, representing 40.91% of the publications. The B1 classification appears in second place, representing 18.18%. Then there is the A4 classification, with 13.64%; A2, with 12.12%; A3, with 7.58%; and B2, with 6.06%. Finally, there is the B3 classification, representing 1.51% of the publications. The quality of the articles analyzed in this study is highlighted, since 74.25% of them are classified as quality indicator A, and most of them are A1, which is the best possible classification.

4.2 METHODOLOGIES AND OBJECTS/FIELDS OF STUDY INVESTIGATED

This analysis sought to determine which methods were most used for the construction of the articles, also outlining the objects (when concrete) or fields (when abstract) investigated. In all, 25 research classifications were observed, and in some cases, a single article presented more than one type of research. Theoretical articles were the research classification of 33.33% of the articles, which was the most used. Qualitative research

appeared in second place, representing 18.18% of the articles, followed by exploratory research, which was used in 16.67% of the articles, this being the third most used classification.

As for the objects/fields of study, they were classified as being primary-based, secondary-based, or with a theoretical/conceptual approach. The primary base objects/fields of study were those that worked with data collected directly by the authors themselves and represented 27.27% of the articles. The secondary base objects/fields of study were those that worked with existing data, such as databases or published literature, totaling 34.85% of the articles. The objects/fields of study with a theoretical/conceptual approach were those that analyzed or discussed concepts and theories, without necessarily relying on collected data, and represented 22.73% of the articles. There were also articles that did not present a defined object/field of study, totaling 15.15% of the studies analyzed.

The most recurrent object/field of study was linked to the area of education, being ChatGPT, which was the specific object of four articles. The articles that specified places to carry out their research were mostly carried out in Brazil. However, there were three articles that presented objects/fields of study with international bases: experts from Germany, specifically from the Rhine-Main metropolitan region (Frankfurt and Darmstadt), and from the cities of Stuttgart and Bonn; perceptions of European communication and public relations professionals, in particular, those working in Portugal; article that analyzed the use of AI in Law in Brazil and also in Portugal.

4.3 CATEGORIES OF THEMATIC ANALYSIS OF ARTICLES

When analyzing each article, it was possible to observe that some contained a similar research focus, which allowed them to be grouped into categories of analysis. In all, the 66 articles were allocated by the authors into eight categories, which included articles that related FI to the fields of study described in Table 2.

Table 2

Categories of thematic analysis of the articles

Analysis Category	Articles (absolute value)	Articles (relative value - %)
Health and Bioethics	19	28,8
Education	13	19,7
Law, Legislation and Ethics	12	18,2
AI Critical Analysis	8	12,1
Business Management and Markets	6	9,1
Communication	3	4,5
Agricultural	3	4,5

Computer Science	2	3,0
Total	66	100

Source: The authors, 2025.

The articles analyzed in this study date from 1983 to 2024 and, over the course of these 41 years, subjects from different categories stood out. Table 3 shows how the studies in each category have advanced over the years.

Table 3

Time advance of the categories

CATEGORY	YEAR													TOTAL
	1983	1992	1995	2000	2002	2009	2017	2019	2020	2021	2022	2023	2024	
Health and Bioethics				1			1		2	5	3	4	3	19
Education									1	3		2	7	13
Law, Legislation and Ethics								1	1	2	2	6		12

Computer Science									1			1		2
TOTAL	1	1	1	1	1	1	3	2	7	14	8	14	12	66

Source: The authors, 2025.

The first published article is a critical analysis of AI, a theme that has remained stable, presenting one article in the years 1983, 1995, 2019, 2020, 2022 and 2024, and two articles in 2021. The category of agrarian women appeared next, with three scattered publications, the first in 1992, the second in 2009 and the third in 2017. Articles on health and bioethics began to be published only in 2000, with a long interval until the second publication on the subject, in 2017. From 2020 onwards, this topic began to gain prominence, with two articles published this year, five in 2021, three in 2022, four in 2023, and three in 2024, which made this the category with the most publications in this study. In 2002, there was an article on business management and markets, a subject that was only addressed again in 2021 with one publication, followed by two in 2022, one in 2023 and one in 2024. The communication category was centralised over a four-year period, with one publication in 2017, one in 2020 and one in 2021.

The categories of education and law, legislation and ethics have been the focus of research only in recent years, but even so, they represented, respectively, the second and third largest categories in this study. The first article on law, legislation and ethics was published in 2019, followed by one more in 2020, two in 2021, two in 2022 and six in 2023.

Publications on education began in 2020 with one article, followed by three in 2021, none in 2022, two in 2023, and seven in 2024. Finally, there is the computer science category with one article in 2020 and another in 2023. Table 4 presents the articles that made up each category.

Table 4

Articles by category

Analysis Category	Articles
Health and Bioethics	Naves (2024); Elias <i>et al.</i> (2023); Nunes, Guimarães and Dadalto (2022); Toledo, Bhering and Ercole (2024); Oliveira <i>et al.</i> (2024); Leon <i>et al.</i> (2023); Alves <i>et al.</i> (2023); Varas <i>et al.</i> (2023); Silva and Silva Neto (2022); Oliveira, Barcelos and Siqueira (2022); Correia <i>et al.</i> (2021); Moraes <i>et al.</i> (2021); Rocha <i>et al.</i> (2021); Nistal-Nuño (2021); Oliveira and Fraga (2021); Brandes <i>et al.</i> (2020); Gates <i>et al.</i> (2020); Lobo (2017); Leitão <i>et al.</i> (2000).
Education	Silva Neto and Leite (2024); Peres (2024); Silva and Rottava (2024); Pinho, Gaspar and Sassi (2024); Trindade and Oliveira (2024); Santos <i>et al.</i> (2024); Azambuja and Silva (2024); Rodrigues and Rodrigues (2023); Milk (2023); Parreira, Lehmann and Oliveira (2021); Vicari (2021); Zuin (2021); Fields and Lastória (2020).
Law, Legislation and Ethics	Valle, Gasó and Ajus (2023); Toledo and Pessoa (2023); Bitencourt and Martins (2023); Andrade, Rosa and Pinto (2020); Abraham and Catarino (2019); Kirtschig and Olsen (2023); Chaves and Colombi (2022); Divino (2021); Broached (2023); Bonaldo (2023); Santos (2022); Gomes, Vaz and Dias (2021).
AI Critical Analysis	Arão (2024); Candiottto and Karasinski (2022); Cozman (2021); Ludermir (2021); Quaresma (2020); Braga and Chaves (2019); Sanvito (1995); Teixeira and Gonzales (1983).
Business Management and Markets	Sucena and Cury (2024); Blumen and Cepellos (2023); Rocha and Kissimoto (2022); Mendes (2022); Grohmann and Araújo (2021); Sellitto (2002).
Communication	Padilha <i>et al.</i> (2021); Sebastião (2020); Gunkel, Trento and Gonçalves (2017).
Agricultural	Martins <i>et al.</i> (2017); Costa (2009); Costa (1992).
Computer Science	Kuroki Júnior and Gottschalg-Duque (2023); Silva Neto, Bonacelli and Pacheco (2020).

Source: The authors, 2025.

In all, 19 of the 66 articles analyzed were associated with the **Health and Bioethics Category**. Of these, three referred specifically to ethics in the field of health, called bioethics. Naves (2024) concluded that AI and robotics require prior implementation of ethical operating standards that ensure safety and applicability in the field of health and that the relatively unstable state of AI and its potential liability provide an opportunity to develop a new model, which accommodates medical progress and instructs stakeholders on how best to respond to this disruptive innovation. Elias *et al.* (2023) concluded that transparency is the main basis of AI in health and that regulations need to evolve, both in the definition of responsibilities and in the understanding and trust about the autonomy of decisions generated by AI. Nunes, Guimarães, and Dadalto (2022) believe that, in the hospital phase, when AI is implemented in the care unit, it is essential to monitor the bioethics committee, making sure of the integrity of the technology, the data from the research that preceded it, and its management, in

addition to making the role of the State in regulating AI and ensuring compliance with the legislation essential.

Other articles in this category analyzed the use of AI in various medical situations. In some cases, the authors tested different AI algorithms in order to determine which one was best to achieve the goal they proposed. In other cases, the authors developed the AI algorithm themselves, and there have been papers that have discussed how AI is affecting medicine and its fields.

In **the Education Category**, all articles that have education as the focus of study were allocated, totaling 13 works. The most explored subject in this category was the ChatGPT Generative AI model, which appears as a tool with great potential to facilitate the academic field, but which brings many uncertainties and concerns. Another theme analyzed by the articles in this category was the impact of AI on the teaching-learning process, both from positive and negative perspectives.

Silva Neto and Leite (2024) concluded that *chatbots* were able to facilitate the application of content and make assessments more engaging and productive. Peres (2024) concluded that, even for a topic that is still emerging in the reference literature in the Portuguese language (health literacy), the AI tool was able to generate coherent and structured texts. The results of Silva and Rottava (2024) revealed that ChatGPT does not follow the instructions of the tasks regarding the number of words requested, thus impacting the calculation of lexical density, nor does it produce texts that show significant differences in lexical density between additional languages and proficiency levels. Pinho, Gaspar and Sassi (2024) concluded that the solution validated by the research contributes to positively impact the work of teachers and educational institutions, by reducing the time and costs associated with the essay evaluation process.

Trindade and Oliveira (2024) stated that, in order to use generative AI tools effectively and strategically, people need to analyze the need for information, analyze the tool, plan search strategies/elaborate commands, analyze synthesized content, use synthesized content, and apply the 18 informational skills related to these steps. Santos *et al.* (2024) pointed to the need to have legal regulations regarding the ethical and responsible use of AI, highlighting the use of AI tools for spelling correction and proper formatting of texts as an advantage. Azambuja and Silva (2024) came to the conclusion that it is necessary to enhance AI systems inside and outside the classroom and suggested that teachers focus more on developing students' interpersonal and critical skills.

Rodrigues and Rodrigues (2023) pointed out that AI does not guarantee objectivity and neutrality just because it is processed by machines and supposedly protected against human error, a factor observed in the use of the ChatGPT tool, whose searches and contributions are not free from errors. Leite (2023) concluded that ChatGPT has excellent linguistic capacity, but it is limited in logic, abstraction, high-level reasoning, and is not able to maintain a coherent and high-level discussion, which can be carried out through teacher-student and student-student interaction. Parreira, Lehmann and Oliveira (2021) stated that teachers realize that flexibility and adaptability are the basis for responding to the challenges they will soon face and that transversal skills are the essence of this flexibility and adaptive capacity.

Vicari (2021) came to the conclusion that, when it comes to technology, breaking paradigms and disruption can change the trend at any time. He said that, if changes in education are necessary, the way of evaluating education also needs to change. Zuin (2021) concluded that the attitudes of teachers, who assume their conditions as human beings subject to failures and successes, will most likely lead to a type of empathy among students, which will make both groups use digital technologies to understand the causes of educational phenomena and become ethically sensitized to change their own practices inside and outside schools. Campos and Lastória (2020) reflected on audiovisual technologies, digital platforms, and AI *software* aimed at personalizing teaching and stated that it is up to the critical teacher, in the face of the technological modernization of education, to teach students exercises that make them capable of carrying out experiences that expand sensitivity and the capacity for conceptual abstraction.

The **Law, Legislation and Ethics Category** was composed of 12 works, in which AI appears as a tool capable of streamlining and facilitating work in different sectors of the field of law, but which needs a defined legislation so that it does not go against the ethical precepts of society. Valle, Gasó, and Ajus (2023) presented the historical context from the creation of AI to its insertion in the world of Law and, in more detail, the problem of *biases* and artificial hypernormalization, reporting state measures that aim to remedy this type of problem. Toledo and Pessoa (2023) concluded that there are several advantages brought by computerization and the current implementation of AI in the Brazilian Judiciary, however, due to the risks observed, the authors stated that AI should not be used for judicial decision-making. Bitencourt and Martins (2023) concluded that AI is present in several Brazilian Courts of Auditors, performing predictive functions, aiding and qualifying human decision-making.

Andrade, Rosa, and Pinto (2020) found that AI mechanisms based on *analytics* platforms tend to provide greater predictability for private law, mainly because they allow a better understanding of the patterns of behavior present in trials.

Abraham and Catarino (2019) believe that AI, using increasingly complex and sophisticated means, will help to solve the biggest bottleneck present in the Judiciary, which would be the collection of tax credits through tax enforcement action. As for ethical issues, they highlighted the need to guarantee justice in the decisions and interactions of public authorities with citizens, the freedom of choice of *learning* machines and, finally, the great concern about the need for regulation in this field. Kirtschig and Olsen (2023) concluded that it is necessary for state bodies of political representation to be transparent about the content and mode of operation of AI tools, so that they can regulate, monitor, and control their use, to verify their compatibility with the objectives set out in the Constitution and to determine any course correction. For Chaves and Colombi (2022) there is no legal impediment to the adoption of *Bayern's thesis* to Brazilian corporate law, which makes it possible for a limited liability company to be created and, subsequently, to be left without partners, creating the legal receptacle of AI. Divino (2021) concluded that the process of subjectivation and attribution of personality depends on the participation of AI to claim the rights to which it is inherent, and it is not up to the human being to choose and attribute them. Brochado (2023) starts from the work of Lima Vaz to present some ethical questions about the experiences lived today in the horizon of a highly technicized culture. Bonaldo (2023) made an interdisciplinary discussion covering the sociology of algorithms, informational ethics, and the philosophy of mind to, based on the theory of history, assess how the ubiquity of automation adds new dimensions to the study of the contemporary historical condition. Santos (2022) stated that the digital dictatorship of AI will stretch the boundaries between what is allowed and what is prohibited, between what is legal and what is illegal, between what is constitutional and what is unconstitutional, between man and machine, and thus will usher in a new era of iniquity that only divine providence can put an end to. Gomes, Vaz and Dias (2021) concluded that human supervision is necessary in judicial decisions that use AI in compliance with the right to explanation and review.

Eight articles made up the **Critical Analysis of AI Category** and presented, in a critical way, the authors' view of the potential and risks of AI. They talked about its use, styles, challenges, capacity, relationship with the human and philosophical relevance. Aaron (2024) concluded that the most AI can do is recognize patterns and repeat, not being a source of

absolute truth, but rather a human construction that involves mathematics, induction, subjectivity, and work. In the end, he stated that many people are criticized for lack of originality, precisely because they seem to copy someone else's work and style, while admiring the machine for doing so. Candiotta and Karasinski (2022) concluded that, in the hypothesis of internal causes, in which the self-modifications originate from the system itself, with a lack of understanding about the functioning of AI, the existential risk would remain the same, since the human brain would have many difficulties in perceiving the flaw and, even realizing it, in making decisions that contradict the suggestion of AI.

Cozman (2021) came to the conclusion that the community involved in the development of AI, for the most part, continues to seek to improve the productivity and quality of human life by building artifacts that can intelligently assist human beings. Ludermit (2021) concluded that machines are far from learning to master many human aspects, although the success of AI is undeniable and is impacting the world. Quaresma (2020) based his article on Isaac Asimov's "three laws of robotics" and exposed how these laws relate to AI. He came to the conclusion that the "three laws of robotics" are incapable of understanding AI and considers them fictitious. Braga and Chaves (2019) believe that humans are still capable of living without machines, but that machines depend on humans to exist and that humans have the ability to demonstrate qualities that computers do not yet possess and may never possess. Sanvito (1995) sought to understand the brain/mind complex and related it to AI. He determined that the great challenge of the cognitive sciences is to seek knowledge itself and not just to reproduce a simple logical-mathematical formalization of knowledge. Teixeira and Gonzales (1983) sought to show the relevance of AI to Philosophy, especially to the Philosophy of Mind and the Theory of Knowledge. They concluded that AI research intersects with philosophical research, insofar as building programs often means inquiring into the conditions of possibility of certain cognitive performances present in natural language, perception, among others.

The **Business Management and Markets Category** was composed of six articles. The subjects covered by these leftovers are, respectively, *e-commerce*, AI in the recruitment and selection process, AI in operations management, AI in the German market, working on global AI platforms, and AI in a continuous process industry.

Sucena and Cury (2024) sought to develop a mathematical model using an AI technique called *Fuzzy Logic*, capable of evaluating the quality of *e-commerce* logistics, interpreting qualitative expressions captured through a questionnaire submitted to the end

customer, transforming them into quantitative values that form partial indices and the IQLE (E-commerce Logistics Quality Index). Blumen and Cepellos (2023) cited the role of technology and AI in reducing bureaucracy in the Human Resources (HR) area, in order to make its focus more strategic and consultative, as it reduces time and cost in screening resumes and selecting candidates.

Rocha and Kissimoto (2022) found that the main barriers found in the literature for the adoption of new technologies are the difficulty of working with data and the feelings of vulnerability and insecurity in the use of these technologies by users. Mendes (2022) carried out an analysis of how AI was progressively stimulated by the German government, having chosen Germany because it is one of the centers of origin of Industry 4.0, which adopted government strategies aimed at the diffusion of AI. It concluded that AI has a variety of applications in the country, both in academic research and in market goods and services, and that the government was approaching universities and companies to push this technology. However, several challenges to the diffusion of AI and their impacts have been identified.

Grohmann and Araújo (2021) concluded that the work dynamics of Brazilians who work on global AI platforms is complex and shows several specificities beyond ideas such as "global workforce" or something in that direction. They highlighted the material conditions of data production and the role of communication between workers as emerging and complex solidarities, as fissures and gaps, in order to build strategies to deal with work on these platforms. Sellitto (2002) concluded that expert systems, CBR and *fuzzy* logic can be employed in multivariable process control systems in the continuous process industry, with satisfactory results.

In the **Communication Category**, only three articles focused on communication. The first analyzed the influence of AI on the challenges of Digital Forensic Science, with the organization of data for the media. The second analyzed the knowledge of communication professionals about AI. The third sought to understand how communication is present within the field of AI.

Padilha *et al.* (2021) concluded that, due to the volume of information, which makes manual analysis unfeasible in a timely manner, modern AI methods have become essential tools in the expert's arsenal. However, they state that many of these methods are complex and difficult to explain, which needs to be discussed so that their application is feasible in real cases, especially in sensitive CFD contexts, as interpretability and transparency about the decision-making flow of these models are essential characteristics for their use in practice.

Sebastião (2020) analysed the responses of communication and public relations professionals on questions from the *European Communication Monitor* 2019 (the world's largest study in strategic communication and public relations) related to AI and concluded that Portuguese respondents are among the least informed about AI in Europe. Gunkel, Trento, and Gonçalves (2017) concluded that, traditionally, communication studies understand and analyze the computer as a means of communicative interaction, ignoring that it can also be a participant in communicative interactions.

The Agrarian Category was composed of three articles. In these works, three different agrarian situations were presented, where AI was used as a means of research. The subjects discussed were: forest production, problems in the field of animal husbandry and beef cattle.

Martins *et al.* (2017) carried out a research on the stem of *Araucaria angustifolia* in order to identify which AI technique is most effective to contribute to traditional tapering functions. They concluded that the Artificial Neural Network 2 - RNA 2 (with the addition of the age variable) provided superior results than the other models evaluated. Costa (2009) presented the ideas of symbolic AI and connectionist AI. He stated that, in the case of zootechnics, the specialist is the zootechnician, the only one capable of making the power of AI be used to improve the production of food of animal origin and it is he who should seek interdisciplinarity, working together in areas such as electronic instrumentation and computing, in order to, increasingly, improve the way of solving complex problems in the area of animal husbandry.

Costa (1992) concluded that the combination of the traditional Simulation methodology with AI concepts produces a powerful tool to support the project, known as Knowledge-Based Simulation. He stated that this approach transforms simulation from a descriptive tool into a prescriptive tool and that the trend of having more and more expert simulation systems and other AI applications in simulation contributes to its advancement.

Of the 66 articles, only two presented computer science topics as the main focus of study. The article by Kuroki Júnior and Gottschalg-Duque (2023) presented the contributions of Multimodal Information Architecture (AIM) in the organization of information for training artificial neural networks, aiming to position Information Science as an area of knowledge active in AI problems, while the article by Silva Neto, Bonacelli, and Pacheco (2020) analyzed, from a historical and evolutionist perspective, the Digital Technologies System and argued that it has AI, cloud computing and Big Data as its core technologies.

5 FINAL CONSIDERATIONS

This study reviewed, bibliometrically and systematically, works published on the Scielo data platform that had AI as a research theme. Regarding the temporal evolution of publications, it is concluded that, as of 2020, there has been a considerable advance in studies related to AI, with the years with the most publications being 2021 and 2023, with 14 articles in each. However, this research only considered articles published up to July 16, 2024, which resulted in a total of 12 articles in 2024, leading to believe that, considering the filters applied, this would be the year with the highest number of publications made on AI in Scielo. Regarding the classification of journals, it is concluded that this research was based on articles with a high evaluation weight, since the lowest quality indicator presented was B3, and most of the articles were published in journals with quality indicators A1, which represents the maximum evaluation weight. Despite the fact that different research methodologies were observed, most authors chose to write a theoretical article, contributing with knowledge about different issues about AI and, often, strengthening their thoughts through critical analysis. As for the objects/fields of study, there was a prevalence in the choice of secondary data for the elaboration of AI research, with ChatGPT being the most recurrent.

Regarding the categories of analyses created, it is concluded that, until 2019, studies on AI were still scarce. Until then, research on how AI could help the agricultural sciences and critical analyses of what AI had become were the subjects most addressed by the articles, with only three publications each. Next, with two publications made, were research on AI in the field of health, and the other categories had one or no articles. However, from 2020 onwards, research on AI intensified. Articles on AI in health, including those related to bioethics, reached a total of 16 publications by the date of collection of this study, which made this the category with the most research carried out, followed by 13 studies in the field of education and 12 related to law, legislation and ethics. There were only two articles that dealt specifically with subjects related to computer science, which made this the category with the fewest publications.

Finally, it is concluded that, based on the results obtained with the systematic review carried out, the publications on AI on the Scielo platform demonstrate a growing interest in the literature on the subject. The academic and professional environment is dedicating itself to understanding this technology and seeking to improve it for application in various situations, due to its potential to facilitate and make agile the execution of the most complex tasks, and most of the publications on AI in Scielo, up to the period analyzed in this study,

are related to the field of health.

Therefore, the research brings contributions to researchers who want to understand AI in a more interdisciplinary and comprehensive way. For future studies, it is suggested to expand the research, analyzing articles published in other languages, and not only in Portuguese, in addition to an analysis that encompasses other data platforms, for a more assertive result in the research. For future studies, it is suggested to expand the research, analyzing articles published in other languages, and not only in Portuguese, in addition to an analysis that encompasses other data platforms, for a more assertive result in the research.

ABSTRACT

This paper analyzes the preservation of the enterprise as a fundamental principle implicit in the 1988 Federal Constitution, recognizing the enterprise as an essential vector for the realization of fundamental rights and the enforcement of social justice in the economic order. The article seeks to demonstrate that the enterprise, conceived not only as an economic entity but also as a legal and social institution, plays a structuring role in contemporary society, constituting an instrument for realizing the constitutional values of free enterprise, the valorization of human labor, and the dignity of the human person. To this end, a deductive methodology is employed, with bibliographical research and doctrinal analysis, addressing the interconnection between economics, law, and constitutional foundations. Based on this, the article argues that the principle of preservation of the enterprise should be understood beyond Law n. 11.101/2005, encompassing all phases of business life, as a way to ensure the continuity of productive activity and the protection of collective interests. It is argued that this principle, although not expressly stated, has an implicit constitutional nature, radiating from the regulatory system and integrating the core of the Brazilian economic Constitution, as a guarantee of social stability, job creation, and the promotion of sustainable development.

Keywords: Fundamental Principle of Business Preservation. Social Function. Free Enterprise. Fundamental Rights. Collective Interest.

RESUMO

Este artigo tem como objetivo analisar a preservação da empresa como princípio fundamental implícito na Constituição Federal de 1988, reconhecendo a empresa como vetor essencial para a concretização dos direitos fundamentais e para a efetivação da justiça social na ordem econômica. Busca-se demonstrar que a empresa, concebida não apenas como ente econômico, mas como instituição jurídico-social, exerce papel estruturante na sociedade contemporânea, constituindo instrumento de realização dos valores constitucionais da livre iniciativa, da valorização do trabalho humano e da dignidade da pessoa humana. Para tanto, emprega-se metodologia dedutiva, com pesquisa bibliográfica

e análise doutrinária, que trata da comunicação entre a economia, o direito e os fundamentos constitucionais. A partir dessa base, defende-se que o princípio da preservação da empresa deve ser compreendido para além da Lei n. 11.101/2005, alcançando todas as fases da vida empresarial, como forma de garantir a continuidade da atividade produtiva e a tutela dos interesses coletivos. Argumenta-se que tal princípio, ainda que não expreso, possui natureza constitucional implícita, irradiando-se do sistema normativo e integrando o núcleo da Constituição econômica brasileira, como garantia da estabilidade social, da geração de empregos e da promoção do desenvolvimento sustentável.

Palavras-chave: Princípio Fundamental da Preservação da Empresa. Função Social. Livre Iniciativa. Direitos Fundamentais. Interesse Coletivo.

RESUMEN

Este artículo tiene como objetivo analizar la preservación de la empresa como principio fundamental implícito en la Constitución Federal de 1988, reconociendo a la empresa como un vector esencial para la concreción de los derechos fundamentales y para la efectividad de la justicia social en el orden económico. Se busca demostrar que la empresa, concebida no solo como un ente económico, sino también como una institución jurídico-social, ejerce un papel estructurante en la sociedad contemporánea, constituyendo un instrumento para la realización de los valores constitucionales de la libre iniciativa, la valorización del trabajo humano y la dignidad de la persona humana. Para ello, se emplea una metodología deductiva, con investigación bibliográfica y análisis doctrinal, que aborda la comunicación entre la economía, el derecho y los fundamentos constitucionales. A partir de esta base, se sostiene que el principio de la preservación de la empresa debe comprenderse más allá de la Ley n.º 11.101/2005, abarcando todas las etapas de la vida empresarial, como una forma de garantizar la continuidad de la actividad productiva y la tutela de los intereses colectivos. Se argumenta que dicho principio, aunque no esté expresamente previsto, posee naturaleza constitucional implícita, irradiándose del sistema normativo e integrando el núcleo de la Constitución económica brasileña, como una garantía de estabilidad social, generación de empleos y promoción del desarrollo sostenible.

Palabras clave: Principio Fundamental de la Preservación de la Empresa. Función Social. Libre Iniciativa. Derechos Fundamentales. Interés Colectivo.

1 INTRODUCTION

The company and the entrepreneur constitute elementary legal institutes of Business Law, radiating effects on various branches of the legal system due to their economic and social importance. In contemporary times, the company presents itself not only as a unit for the production of goods and services, but as an institutional organization indispensable to national development, promoting employment, income and innovation. Its relevance goes beyond the patrimonial sphere, assuming a role of mediation between private interests and the common good. In this context, it is essential to rethink the place that the company occupies in the Brazilian legal-constitutional system and, especially, to recognize the preservation of business activity as a fundamental principle implicit in the Constitution of the Republic.

The Federal Constitution of 1988, by structuring the economic order in articles 1, items III, IV, 3, items II, III, with a logical-systematic interpretation of article 170, radiates throughout the Brazilian legal system the general principles of economic activity, guaranteeing free initiative and private autonomy, and, consequently, enshrines the Preservation of the Company as a fundamental principle.

However, observing the collective interest and social well-being, the Federal Constitution of 1988 balanced free enterprise with the valorization of human work, with the objective of ensuring everyone a dignified existence, according to the dictates of social justice. Business activity, therefore, is one of the instruments for the realization of these constitutional values, as it enables the exercise of economic freedom, the generation of jobs and social development. It is in this scenario that the idea of preserving the company emerges, understood as the legal duty to ensure the continuity of productive activity whenever there is economic viability and social relevance.

The Principle of Company Preservation must be understood as a fundamental principle. Thus, as a core commandment, to influence the legal hermeneutics and the legal system, which regulates business and economic law, providing the necessary promotion and protection for business activity, so that it is able to fulfill its social function, helping to provide a dignified life to people. The company needs to be maintained, because when the company disappears, *ipso facto*, the social function disappears.

Although not expressed, the Principle of Preservation of the Company is derived from the constitutional foundations of free enterprise, the social function of property and the pursuit of full employment, provided for in article 170 of the Federal Constitution of 1988. This

principle is recognized by the doctrine as implicit, due to its logical and axiological necessity for the realization of social justice and for the maintenance of a balanced economic order. It is, therefore, a principle understood by hermeneutic inference (Carvalho Dias, 2022, p. 84), a rule of fundamental right attached, in the intelligence of article 5, paragraph 2, of the Federal Constitution of 1988. The preservation of the company goes beyond the field of strict Business Law, reaching the dimension of fundamental rights of an economic and social nature, especially with regard to the protection of productive activity as a legal asset essential to the economy and the community.

Due to this role, the company goes beyond the private sphere of its partners, becoming an entity functionally linked to the achievement of social and constitutional purposes. Its preservation, therefore, is a legal imperative that should guide not only the legislator and the judge, but also the public administrator, economic agents and civil society itself. By ensuring the continuity of business activity, the State guarantees the maintenance of jobs, tax collection and the stability of economic relations, aspects that make up the social dimension of the company and justify its treatment as a fundamental principle.

The methodology adopted in this article is deductive and descriptive, based on the analysis of doctrinal and normative sources, as well as on the jurisprudential interpretation of the higher courts. It seeks, based on the normative structure of the Constitution and the doctrine of fundamental rights, to demonstrate the implicit presence of the Principle of Preservation of the Company as a structuring element of the Brazilian economy. Such recognition allows us to understand that the protection of the company is not limited to moments of crisis, as in the cases regulated by Law No. 11,101/2005, but must cover the entire cycle of its existence, from incorporation to extinction, whenever its continuity is threatened.

In this way, the preservation of the company is not only an instrument of economic policy, but a legal-constitutional commandment to protect productive activity, connected to the principles of human dignity, the social function of property and social solidarity. The company, in its role as an agent promoting development, should be seen as an integral part of the structure for the protection of fundamental rights, because, by generating work and income, it concretely achieves social justice and economic inclusion.

Thus, this article proposes a dialogue between Constitutional Law, Economic Law and Business Law, in order to show that the preservation of the company must be understood as an autonomous fundamental principle, endowed with normative force and direct applicability,

guiding constitutional and infra-constitutional hermeneutics. The study is developed in two main axes: the first, focused on the institutionalist and interdisciplinary view of the company; and the second, the analysis of the nature and constitutional scope of the principle of preservation of the company, with special attention to its application beyond the limits of bankruptcy legislation.

2 AN INTERDISCIPLINARY INSTITUTIONALIST PUBLICIST VIEW OF THE COMPANY

According to Fábio Konder Comparato, "if we want to indicate a social institution that, due to its influence, dynamism and power of transformation, serves as an explanatory and defining element of contemporary civilization, the choice is undoubted: this institution is the company" (Comparato, 1978, p. 24). This statement reveals the breadth of the business function in the post-industrial society, in which corporate decisions have a direct impact on living conditions, income distribution and environmental sustainability.

The understanding of the company as a legal-social institution requires a reading that goes beyond the merely contractual or patrimonial focus, placing it in the scope of the economic and constitutional relations that make up the Democratic State of Law. The modern company is, above all, a complex organization, in which multiple interests converge, such as those of partners, workers, consumers, creditors, the State and society. In this sense, the contemporary doctrine adopts an institutionalist and publicist view of the company, recognizing it as an autonomous center of collective interests, whose performance must be guided by the constitutional principles of the social function of the economy and the dignity of the human person. Therefore, for the company to achieve all these collective interests, first, the whole society must build a healthy environment for it to survive over time.

2.1 THE COMPANY AS A SOCIAL AND LEGAL INSTITUTION

Historically, the company was conceived by the Contractualist Theory as the result of an agreement of wills between individuals, whose objective was to obtain profit through the exercise of economic activity. This conception is insufficient in the face of contemporary reality, in which companies assume social and environmental responsibilities that transcend the limits of the private interests of their partners.

From the Institutional Theory, developed by authors such as Maurice Hauriou, Alan Pereira de Araujo and Isabel Vaz, cited in the work of Professor Eloy Pereira Lemos Junior (2009, p. 94), it is understood that the company is not only an instrument for the realization

of individual interests, but an organization aimed at serving public and collective interests. From this point of view, the company is integrated into the social fabric as an entity endowed with a derived public function, participating in the implementation of constitutional values such as national development, the eradication of poverty and the reduction of regional and social inequalities (art. 3, III, CF/88).

The 1988 Constitution, by establishing in article 170 that the economic order is based on the valorization of human work and free enterprise, imposed on economic agents the duty to observe social and environmental purposes in their activities. This guideline reveals that the company, although located in the private domain, is an instrument for the realization of constitutional policies of social justice, and must exercise its economic freedom in accordance with the public interest. Thus, the company acquires an institutional nature, being recognized as an expression of functionalized private autonomy, a space of individual freedom, but guided by collective purposes.

The Brazilian doctrine, especially after the promulgation of the 1988 Constitution, began to identify the company as a subject of fundamental rights and duties, whose performance must respect both labor and consumer rights and the principles of social solidarity and economic sustainability. In this way, the preservation of the company is not restricted to a matter of business law, but is projected as a condition for the effectiveness of fundamental rights of an economic and social nature, assuming constitutional relevance (Silva, 2002, p. 773).

2.2 THE SOCIAL FUNCTION AND THE COLLECTIVE INTEREST

The social function of the company constitutes the central axis of this institutionalist vision. Derived from the social function of property (art. 170, III, FC/88), it translates the idea that economic freedom must be exercised in line with the values of social justice and the fundamental objectives of the Republic. This principle implies the obligation that business activity produces benefits not only to the owners of capital, but also to the community in which it is inserted, through the generation of jobs, the payment of taxes, respect for the environment and the promotion of local development (Lemos Junior, 2009, p. 154).

The social function, therefore, is an instrument of constitutional legitimation of the company. It establishes the bridge between private interest and public interest, transforming economic activity into a functional duty that links the exercise of entrepreneurial freedom to the social objectives of the Constitution. The company that fulfills its social function acts in

harmony with the Democratic Rule of Law, contributing to the realization of fundamental rights and to the strengthening of the national economy. However, in our view, the maintenance of business activity is essential and comes first, so that it is possible to achieve the social function.

This conception is close to the doctrine of Robert Alexy, cited in an article by Professor Alexandre Trivisonno (Alexy *apud* Trivisonno, 2021), according to which principles are commandments of optimization, which must be carried out to the greatest extent possible within the existing legal and factual conditions. The social function of the company, seen as a principle, imposes the maximization of economic and social results compatible with the common good, so that any restrictive interpretation of the business activity must be with the purpose of preserving the productive activity, weighed in the light of its contribution to collective development.

In this way, the company is no longer just an instrument for capital accumulation and becomes the fundamental cell of organized economic activity, an institution that must be preserved to contribute to the realization of the constitutional values of solidarity and sustainability. Thus, the preservation of the company is a prerequisite for the fulfillment of the social function, preserving the company is preserving the social function of the economy itself.

2.3 THE INSTITUTIONALIST VIEW AND ITS INTERDISCIPLINARITY WITH CONSTITUTIONAL ECONOMIC LAW

The institutionalist theory is supported by Economic Constitutional Law, a branch that studies the interaction between the State, the market and civil society, from the perspective of fundamental rights. Article 170 of the Constitution enshrines a model of social market economy, in which free enterprise and state intervention coexist in balance, guided by the purpose of ensuring a dignified existence for all. In this model, the company occupies a central position, as it is the agent responsible for materializing the economic and social values of the system (Lemos Junior, 2009, p. 224).

From this point of view, the State is not a mere regulator, but a co-executor of constitutional economic purposes, and must create normative and institutional conditions for the continuity of business activity. This includes public policies to encourage innovation, access to credit and tax simplification, but also the judicial interpretation favorable to keeping the company viable. The jurisprudence of the Superior Court of Justice has repeatedly stated

that "the decree of bankruptcy is an extreme measure, and should be adopted only when the preservation of the production unit is unfeasible" (Brasil, 2018).

This guideline reveals that the Principle of Preservation of the Company is already recognized by judicial practice as an instrument for the realization of the constitutional values of the economy, even if implicitly. The interpreter of the Law must, therefore, adopt a hermeneutic posture in accordance with the Constitution, recognizing that the company is an expression of economic freedom and social solidarity. Thus, its preservation does not constitute a business privilege, but an imperative of distributive justice and protection of collective fundamental rights.

From an interdisciplinary perspective, the preservation of the company is articulated with Labor Law, Tax Law and Environmental Law, composing an interdependent protection system. The maintenance of productive activities ensures jobs, contributes to tax collection and encourages sustainable practices, reinforcing the role of Law as an instrument of balance between economic efficiency and social justice (Lemos Junior, 2009, p. 226).

Thus, the company must be understood as a fundamental institution of the Social State of Law, whose preservation represents the continuity of the constitutional pact itself that links economic freedom to the promotion of the common good. The recognition of this institutional nature is the first step towards the consolidation of the principle of preservation of the company as a fundamental, autonomous principle that radiates effects throughout the legal system.

3 OF THE FUNDAMENTAL PRINCIPLE OF PRESERVATION OF THE COMPANY WITH SCOPE BEYOND LAW NO. 11,101/2005

The Principle of Company Preservation represents one of the most relevant advances in the evolution of contemporary Business Law, assuming an implicit constitutional nature and an essential role in the interpretation of the rules that make up the Brazilian economic order. Although its normative recognition is expressly manifested in article 47 of Law No. 11,101/2005, which provides for judicial reorganization and bankruptcy, its origin and justification go back to the constitutional values and foundations provided for in articles 1, IV; 3, II and III; and 170 of the Federal Constitution of 1988, which enshrine free enterprise, the valorization of human work and the search for full employment as structuring principles of the Democratic Rule of Law.

When examining the logic that sustains this principle, it is observed that its *raison d'être* is not limited to the protection of patrimonial or business interests, but aims at the preservation of organized economic activity as an expression of the collective interest. The continuity of the viable company is an instrument for promoting the common good and the realization of fundamental social rights, such as work, income, human dignity and sustainable development.

3.1 THE PRINCIPLE OF PRESERVATION OF THE COMPANY IN THE CONSTITUTIONAL CONTEXT

The 1988 Constitution does not explicitly mention the principle of preservation of the company, from which a normative command aimed at the maintenance of productive activities can be implicitly extracted. It is a constitutional principle attached, derived from the normative force of the constitutional values of free enterprise and the valorization of work and endowed with an equal axiological hierarchy in relation to the principles expressed (art. 5, § 2, CF/88).

As José Afonso da Silva teaches, quoting Gomes Canotilho, the fundamental principles "make explicit the fundamental political values of the constituent legislator" (Gomes Canotilho *apud* Silva, 2002, p. 98). Thus, if free initiative and the valorization of human work are the foundations of the Republic (art. 1, IV, CF/88), the preservation of the company is its logical consequence, since the company is the instrument that materializes these values in economic and social practice.

From a normative point of view, the constitutional economic order is governed by principles that harmonize freedom and social justice, which implies recognizing that the company, as a subject that operationalizes the economy, must be preserved whenever its maintenance proves to be socially and economically viable. It is in this perspective that it is stated that the preservation of the company transcends business law, becoming an institutional guarantee of the Social State of Law, aimed at the protection of labor, free enterprise and balanced economic development.

From the functional point of view, the preservation of the company acts as a vector of constitutional interpretation and as a criterion for weighing interests, allowing the judge, in the face of a conflict between infra-constitutional norms, to opt for the solution that favors the continuity of the productive activity. The violation of this principle causes harm not only to entrepreneurs, but to society as a whole, since the paralysis of a productive unit implies unemployment, loss of revenue and disruption of the local economic chain.

It is concluded that the Principle of Preservation of the Company is a direct corollary of the social function of property and the company, and it is impossible to guarantee full employment and the dignity of human work without ensuring the continuity of business activities. Thus, although the Constitution does not make it explicit, this principle emerges from the constitutional text itself as an expression of a systemic rationality guided by the collective interest.

3.2 THE PRESERVATION OF THE COMPANY AS AN EXPRESSION OF THE DIGNITY OF THE HUMAN PERSON AND THE SOCIAL FUNCTION OF THE ECONOMY

The dignity of the human person, the foundation of the Republic (art. 1, III, FC/88), constitutes the point of convergence of all fundamental rights and guides the interpretation of the economic order. From this point of view, the company should be seen as a means to achieve dignity, since it is through business activity that jobs, income and opportunities for social inclusion are generated.

By recognizing the company as an institutional space for the realization of human dignity, the Law confers on it a public function of an instrumental nature. The entrepreneur, when exercising his freedom of initiative, does not act in isolation, but is inserted in a social system that depends on his production, his taxes and his social responsibility. For this reason, the unnecessary extinction of viable companies represents an indirect violation of fundamental rights, since it compromises the exercise of citizenship and the guarantee of the existential minimum.

The principle of preserving the company presupposes the social function of the economy, by balancing freedom of initiative with the duty of solidarity. The constitutional economic order is not based on a pure liberal model, but on a social market economy, in which the State and private individuals share responsibilities in the search for sustainable development.

In this context, preserving the company means ensuring the fulfillment of its expanded social function, which covers not only the production of goods and services, but also the generation of collective benefits. The jurisprudence of the Superior Court of Justice has been enshrining this interpretation by deciding in favor of the possibility of maintaining the company, in observance of the principle of preservation and the social function (Brasil, 2017a; Brazil, 2017b).

Similarly, in the judgment of Special Appeal 1303284/PR, Justice Nancy Andrighi reiterated that "partial dissolution should prevail whenever possible, in honor of the principle of preservation of the company, a corollary of the social function" (Brasil, 2013). These precedents demonstrate that jurisprudence has recognized the principle as an interpretative and normative foundation, capable of limiting the exercise of individual rights in favor of the continuity of productive activity.

Law No. 11,101/2005, by instituting judicial reorganization, was the legislative framework that consolidated the principle in its practical dimension. Article 47 of the aforementioned law establishes that "the purpose of judicial reorganization is to make it possible to overcome the debtor's situation of economic and financial crisis, in order to allow the maintenance of the production source, the employment of workers and the interests of creditors, thus promoting the preservation of the company, its social function and the stimulation of economic activity" (Brasil, 2005). However, the application of this principle should not be restricted to the scope of judicial reorganization or bankruptcy: it is a constitutional principle of general application, and should guide the entire interpretation of Business and Economic Law (Venosa, 2010, p. 298).

The preservation of the company, therefore, is not a discretionary faculty of the judge, but a legal imperative derived from the Constitution, which is imposed whenever the continuity of the productive activity proves to be compatible with the public interest and economic viability. Therefore, it should not be restricted to an article of a law, but in every legal system, every hermeneutic, every jurisprudence, with the objective of preserving the company over time.

In summary, the preservation of the company should be understood as an autonomous fundamental principle, in the wake of Alexy's doctrine, it is a principle that should be carried out to the greatest extent possible, as a commandment of optimization (Alexy, 2017, p. 90) with immediate applicability and sufficient normative force to guide the legislator, the interpreter and the judge. Its function is to ensure that the exercise of economic activity remains in line with constitutional values and the dignity of the human person, promoting harmony between freedom and solidarity.

The protection of the company, therefore, is not limited to judicial reorganization, it is projected on all legal relationships involving productive activity, including Corporate, Labor, Tax and Environmental Law. Thus, the preservation of the company is a condition for the

effectiveness and realization of fundamental rights of a social and economic nature, and should be recognized as a fundamental principle of the Brazilian State.

4 FINAL CONSIDERATIONS

The analysis developed throughout this study shows that the preservation of the company transcends the mere private interest of the partners, consolidating itself as an implicit fundamental principle of the Brazilian legal system. Although not expressed literally in the Federal Constitution of 1988, the principle emerges from the systematic reading of articles 1, IV; 3, II and III; and 170 of the Federal Constitution of 1988, on which the foundations of free enterprise, the valorization of human work and the search for full employment are based, values that are part of the very reason for the existence of the Democratic State of Law.

By recognizing that the company is a structuring agent of the economic and social order, the Law begins to conceive it as an institution endowed with a derived public function, responsible for promoting sustainable development, the generation of jobs and the circulation of wealth. Its preservation, therefore, is not justified only from the perspective of economic efficiency, but mainly from the perspective of the dignity of the human person and the social function of the economy, which constitute supreme constitutional values.

Law No. 11,101/2005, by establishing the institute of judicial reorganization, affirmed the practical application of this principle, but its relevance goes beyond the bankruptcy scope. The preservation of the company must be understood and applied beyond the judicial reorganization law, as a constitutionally oriented guideline, capable of radiating effects on the entire legal system, that is, from Corporate to Labor Law, from Tax to Environmental. It is, therefore, a transversal principle, intended to ensure economic stability and the effectiveness of fundamental social rights.

From this perspective, the preservation of the company proves to be an instrument for the realization of the social function, serving as a link between freedom of initiative and the duty of solidarity. By ensuring the continuity of business activity, the State not only protects private assets, but also ensures the effectiveness of social rights that depend on the production of wealth and the maintenance of employment.

The company, in this context, ceases to be a simple economic subject to become a functional entity of constitutional relevance, whose existence and permanence are conditions for the fulfillment of the fundamental objectives of the Republic.

This essay intended to bring a new view on the social function of the company, a new reflection on the logical order between the "Preservation of the Company" and the "Fulfillment of the Social Function of the Company". It was argued that, in order to achieve the social function of institutions, it is first necessary to ensure the maintenance of economic activity. First, the company must be preserved and then radiate its social function in society. The company is the fundamental cell of organized economic activity, therefore, it is impossible to emanate the social benefits that are expected from the company without a free and protected environment that collaborates for the exercise of business activity.

In view of the above, it is concluded that the Principle of Preservation of the Company must be formally recognized, by hermeneutic inference (article 5, § 2, CF/88), by doctrine and jurisprudence as an autonomous fundamental principle, as an attached norm, of an implicit constitutional nature, capable of guiding the creation, interpretation and application of the rules of the legal system. Its observance is imperative not only in times of crisis, but throughout the trajectory of business activity, as a guarantee of the dignity of the human person, the social function of the economy and the collective interest.

Thus, by preserving the company, its social function, the social value of work, the eradication of poverty, the dignity of the human person, the stability of economic relations and the fundamental rights that sustain the Democratic Rule of Law are achieved.

Gabriel Augusto Miranda Setti¹

ABSTRACT

This article aims to present the relevance and importance of the thought of the Italian philosopher, historian, and jurist Giambattista Vico. This will be achieved through the study and understanding of his analysis of the historical development of language and human thought. To this end, the article discusses a central point in his theory: the three modes of communication among peoples, based on their languages. These are: the language of the gods, the heroic language, and the language of men. The first is not necessarily a spoken language, as it is closer to original sounds and grunts. The second is an intermediate stage of development still closely tied to heroic narratives. The third, that of men, already presents characteristics that most closely resemble a properly rational and developed language. In this context, poetic wisdom, which encompasses the first two types of language mentioned above—that of the gods and the heroic language—is the first expression of understanding reality, the origin of all future languages. This reflection concludes by highlighting the importance of understanding these languages as fundamental to the constitution of rational human thought itself.

Keywords: Vico. Philosophy of History. Language. Human Thought.

RESUMO

Presente artigo tem como objetivo principal apresentar a relevância e a importância do pensamento do filósofo, historiador e jurista italiano Giambattista Vico. Isso se dará a partir do estudo e compreensão da análise que este filósofo fez acerca do desenvolvimento histórico da linguagem e do pensamento humano. Para isso o artigo traz uma discussão central em sua teoria, que são os três modos de comunicação dos povos, a partir de suas linguagens. São elas: a linguagem dos deuses, a linguagem heróica e a linguagem dos homens. A primeira não se constitui necessariamente como uma linguagem falada, já que se aproxima dos sons e grunhidos originários. A segunda é uma fase intermediária de desenvolvimento ainda muito atrelada às narrativas heróicas. A terceira, a dos homens, já apresenta as características que mais se aproximam de uma linguagem propriamente racional e desenvolvida. Neste contexto, a sabedoria poética, que abarca os dois primeiros tipos de linguagem supracitadas, a dos deuses e a heróica, é essa primeira expressão de compreensão da realidade, originária de todas as outras futuras. Conclui-se a presente

reflexão destacando a importância na compreensão dessas linguagens como fundamentais na constituição do próprio pensamento humano racional.

Palavras-chave: Vico. Filosofia da História. Linguagem. Pensamento Humano.

RESUMEN

Este artículo tiene como objetivo presentar la relevancia e importancia del pensamiento del filósofo, historiador y jurista italiano Giambattista Vico. Esto se logrará mediante el estudio y la comprensión de su análisis del desarrollo histórico del lenguaje y el pensamiento humano. Para ello, el artículo aborda un punto central de su teoría: los tres modos de comunicación entre los pueblos, basados en sus lenguas. Estos son: la lengua de los dioses, la lengua heroica y la lengua de los hombres. La primera no es necesariamente una lengua hablada, ya que se asemeja más a sonidos y gruñidos primigenios. La segunda es una etapa intermedia de desarrollo, aún estrechamente vinculada a las narraciones heroicas. La tercera, la de los hombres, ya presenta características que se asemejan más a una lengua propiamente racional y desarrollada. En este contexto, la sabiduría poética, que abarca los dos primeros tipos de lengua mencionados —la de los dioses y la heroica—, es la primera expresión de la comprensión de la realidad, el origen de todas las lenguas futuras. Esta reflexión concluye destacando la importancia de comprender estas lenguas como fundamentales para la constitución del pensamiento humano racional.

Palabras clave: Vico. Filosofía de la Historia. Lenguaje. El Pensamiento Humano.

1 INTRODUCTION

The main objective of this article is to present some central ideas in the thought of the Italian philosopher, jurist and historian Giambattista Vico. In his most famous book, called "The New Science", he discusses important and relevant foundations of the philosophy of history.

In this sense, it is possible to say that this philosophical exercise is justified due to the importance of discussing such innovative ideas in the historical-social approach. Studying and understanding some fundamental ideas of this philosopher of colossal relevance can bring a huge contribution to the expansion of theoretical and philosophical knowledge. And, as it is an evolutionary discussion, it brings up a series of current issues.

The development of this study, as well as potential future adjacent research, has valuable theoretical contributions, which can extend to the branches of history, philosophy, philology and sociology, among others. In the practical field, studying and understanding this philosopher and his New Science can bring good references to help and understand the codification of new civilizing processes that are currently underway.

The use and development of Artificial Intelligence, as a "language" that feeds on human language, bringing fundamental issues such as respect for intellectual property and really what would be the limit of the use of AI. Is it possible to say limits for something that is so advanced, and apparently currently rooted in contemporary social structures?

Vico's proposal in "New Science" is to seek to investigate the origins and foundations of human knowledge. From this he seeks this origin of thought in the development of men in the historical process.

It is from this historical development of men that, according to Vico, we can locate a first thought common to all men. Vico demonstrates that the first human thought, which in its beginning was a rude, small and obscure thought, is common to the origin of all civilizations.

It is called the "language of the gods", because it is still linked to natural phenomena, noises, grunts and whispers. Although it is a form of "language", it does not have the status of a spoken language per se, being a first expression of language much more crude and original.

The second type of language that he points out as intermediate is heroic language. This, although more developed than the first, is still linked to myths and divinities, being more developed and rational than the language of the gods and less than the third and last to be

explained in this work, the language of men itself, in all its complexity and load of historical and human development.

In this sense, the main objective of this article is to present and discuss the importance of Vico's theory about the development and evolution of human thought from language. For this, the fundamental characteristics of the three types of language brought by Vico in his work will be presented, as well as the importance of poetic wisdom as the first expression of human understanding of the world, present, according to the author himself, in practically all historically known civilizations.

2 DEVELOPMENT

The first thought about the world by men is defined by Vico as a very grotesque, small, crude thought, which is given by astonishment. This thought is somewhat deified, frightening and incipient about the knowledge of the reality that surrounds primitive man (when we speak of primitive man we mean that the first men who emerged, who for Vico were the ones who used an interpretation of the world still in a poetic way, were in a way the initiators of human thought).

This thought is closely linked to natural things and takes place in the process of interpreting the world of these men through the creation of the first deities that are cultivated from their relationship with natural phenomena such as fire, thunder and other natural phenomena.

In support of what has been said, one may recall the case cited by Vico in the text of the "Poetic Wisdom", where he introduces the question that "Jupiter" was the first human God for most nations, a God of thunder and lightning who manifested himself for each gentile nation.

Thus, when Vico speaks of a "God Jupiter", he points out that each nation in its genesis had a similar kind of divinity, which man discovered and interpreted in a frightened way, who saw in the noise of thunder the first form of divinity. It can be said then that apparently there were several "Jupiters" that constituted the first human thoughts about the divinities. These were supposedly the first forms of human interpretation about the nature that was around them, and were still a kind of initial thought, originating and linked to natural phenomena.

This first "mode" of human knowledge, this first way of expressing men's thought, which is given by astonishment, is "Poetic Wisdom". It is this poetic language that allows man his first expression of thought about the nature that surrounds him. This wisdom is a fabulous,

divinized and heroic wisdom, and, although it expounds ideas that are still apparently rude, small and obscure, it is the genesis of human thought. In it, Vico finds traces, from his studies and investigations, in practically all nations of humanity.

It is from this observation that it can be said that the first records of human events were by poets and theologians and almost always refer to the divinities. This primitive thought, despite being tied to the things of nature, already consists of the genesis of the first human thought.

To illustrate this issue of the poet theologians, I quote² Vico's text:

"But the poet-theologians, not being able to make use of the understanding, with a more sublime work, completely opposite, gave meaning and passions, as we have just seen, to bodies, and to vast bodies such as heaven, earth, and sea; and later, diminishing such vast fancies and reinvigorating abstractions, they were taken in their little signs." (**VICO, 199, p.168**)

"Poetic wisdom" is for Vico the first expression, even if fabulous and obscure, of the primitive mind, which seeks to organize the human experience in history. From there, Vico points out that this first mode of knowledge occurs concomitantly with the production of the first primitive language, which is already a language used and shared by several individuals.

When Giambattista Vico highlights a primitive "speech" he does not mean exactly what can be instinctively thought of as the specifically spoken language, but rather a first form of shared language. In the early days, this language is often made at first only by signs. However, this first linguistic expression could already be understood by the individuals in the group.

It is in the process of developing this "language" that "poetic wisdom" happens. This is because Vico believes in the progress of this language and in the purification of the concept shared by men. It should be noted that all this is due to the historical civilizing process of humanity and human civilizations.

In this sense, it is possible to affirm that for the philosopher Giambattista Vico, "Poetic Metaphysics" can then be equivalent to the history of human ideas, which develops in the historical process and is intimately linked to the progress of language among men.

² This quotation is found in the text of Vico's "New Science", in the part of "Poetic Wisdom", page 168.

It is from the progress of language that Vico will seek the origin of human thought and, for this reason, we will highlight here the three types of language that he defines in the "Scienza Nuova" as follows:

"... three languages were spoken, corresponding in number and order to the three ages that had elapsed before them in the world: of the gods, of heroes, and of men; and they said that the first language was hieroglyphic, that is, sacred or divine; the second, symbolic, or by signs, that is, by heroic enterprises; the third epistolary to communicate to those distant from each other the vulgar needs of their lives" (VICO, 199, p.182)

Vico presents three types of languages to demonstrate the process of historical purification of the development of human thought. Thus, for this philosopher, the first type of language elaborated by men was the language of the "gods". This, as mentioned earlier, is a very incipient type of language. It is even a practically 'mute' and "non-articulate" mode of communication, made by signals, moans, grunts and noises.

Giambattista Vico considered that, although this first language is practically not given by articulated speech, it can be considered as a kind of language because it is already configured as a first form of communication and human expression.

The second form of language that he makes explicit is the "heroic language", which is a form of language that is already more developed and more articulated and that operates with some signs in the communication between men. The "heroic language" is a language that is still intermediate in which mute and articulate resources are mixed, but which already demonstrates a considerable advance in relation to the language of the "gods" or "divine" language, which is practically a "mute" language.

The third type of language explained by Vico is the "language of men". It already takes place in a third moment of the development and progress of human language in history. The "language of men" is already an almost totally articulated and very little mute language, which is no longer expressed impregnated with the things of nature, but which manifests itself as a greater development of human thought.

It is in this development of human language in the history of humanity that Vico locates the progress of human thought itself, since the development of language is intrinsically linked to the development of human thought. Heroic language is in this context the first form of interpretation of the world by man, and although at the beginning of the construction of this language it was not yet made exclusively by speech, this does not imply that it is not a first form of language and interpretation of the world by man.

Vico based himself on the knowledge of the origins of human thought from the examination of human language, considering that it is at the center of man's development in history. It is for this reason that Vico is able to point to a "New Science" that allows the study and analysis of a human "universal history".

It is a fact that this development of language, which is well outlined by Vico in the text of the "Poetic Wisdom", took place in practically all societies. For this reason it is possible to observe in this process of development the historical progress of language. And, of course, it becomes possible to locate something common to all human nations.

Therefore, the importance of poetic wisdom to understand the development of human thought must be understood, since this type of wisdom is the first form of interpretation of the world by man. Poetic wisdom is the first speech, the first expression, the first knowledge of the world that surrounds man elaborated by himself.

Poetic wisdom is a divine wisdom, based on astonishment, on fright, small and rude, but it is a wisdom, and a wisdom that is found in the genesis of all human thought, regardless of time and place. When we speak independently of time and place, we mean that this type of thinking is common to all men, all nations, in its origin, whether of the Indians of America, of the ancients such as the Persians, of the Chinese or of the Europeans.

Vico thus assumes an important position with regard to the philosophy of history, as he promotes an innovative reading that takes into account the development of human thought based on the study of the progress of human language and its different moments throughout history.

Based on this analysis, this philosopher will investigate the genesis of human language and the passage from a simpler and cruder language to a more elaborate, more elaborate language.

It is from the development of human language that, according to Vico, one can seek elements to understand the development of human thought itself. It seeks, from language, a history of the development and improvement of human thought about the recognition and communication with the world and its peers.

The proposal to build a new science that would be able to encompass founding characteristics of practically all nations based on the study of language development is an ambitious project that leaves open questions. Future studies will be responsible for additional analyses to the present study, which is so relevant to understand the development of rational thought.

3 CONCLUSION

It can be concluded that Vico's thought stands out for the universality to be achieved in the study of the philosophy of history. It is located in the peculiarities of each nation, in the particular history of each civilization, of each people.

He sought to find the true and universal history of nations from themselves, and considers that the first men, those of poetical wisdom, represented the infancy of humanity, of the world. As history developed, it would reach more advanced stages of knowledge of the world. This knowledge, when improved, would take place at a stage of greater "old age" in the world, in which more elaborate and profound knowledge, such as philosophy itself, would finally be capable.

The objective of this article was to present in an introductory way some ideas of this relevant Italian philosopher, who through this differentiated reading of historical development through language leaves several other future questions to be developed. It is clear that the present study is of paramount importance in presenting this discussion as a viable option for understanding human development.

In any case, the process of continuous polishing of these innovative ideas should be done in future studies and reflections. For now, the objective of reflecting on the theme is taken into account, even knowing the momentary limitations. It is believed that some foundations are laid for future discussions, on related topics, such as the development of "artificial language" among others.

ABSTRACT

The integration of Artificial Intelligence (AI) into clinical research has grown exponentially in recent decades, keeping pace with advancements in computer science and healthcare. This systematic literature review aimed to map the main applications, potential benefits, and challenges of using AI in different stages of clinical research, including drug discovery, eligible patient selection, clinical trial design, and real-time data monitoring. The methodology followed the recommendations of the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA), with searches conducted in databases such as PubMed, SciELO, and Web of Science, considering publications from 2020 to 2024. Forty-eight studies that met the inclusion criteria were selected. The results indicated that AI, particularly through machine learning and deep learning techniques, has contributed to reducing drug development time, improving the accuracy of participant screening, and enhancing patient safety. Furthermore, there was an observed increase in the use of algorithms for predictive analysis of clinical outcomes, contributing to faster and more informed decision-making. In conclusion, while AI does not replace the methodological rigor of clinical trials, it is a complementary and strategic tool for accelerating and improving the generation of knowledge in the field of health.

Keywords: Artificial Intelligence. Clinical Research. Machine Learning. Clinical Trials. Public Health.

RESUMO

A incorporação da Inteligência Artificial (IA) em pesquisas clínicas tem crescido de forma exponencial nas últimas décadas, acompanhando os avanços das ciências da computação e da saúde. Esta revisão sistemática de literatura buscou mapear as principais aplicações, potencialidades e desafios do uso da IA em diferentes etapas da pesquisa clínica, incluindo

descoberta de novos fármacos, seleção de pacientes elegíveis, desenho de ensaios clínicos e monitoramento em tempo real de dados. A metodologia seguiu as recomendações da Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA), com busca em bases como PubMed, SciELO e Web of Science, considerando publicações entre 2020 e 2024. Foram selecionados 28 estudos que atenderam aos critérios de inclusão. Os resultados indicaram que a IA, sobretudo por meio de técnicas de machine learning e deep learning, tem contribuído para reduzir o tempo de desenvolvimento de medicamentos, melhorar a acurácia na triagem de voluntários e aprimorar a segurança dos pacientes. Além disso, observou-se um crescente uso de algoritmos para análise preditiva de desfechos clínicos, contribuindo para decisões mais rápidas e embasadas. Conclui-se que, embora a IA não substitua o rigor metodológico dos ensaios clínicos, ela se configura como ferramenta complementar e estratégica para acelerar e qualificar a produção de conhecimento em saúde.

RESUMEN

La incorporación de la Inteligencia Artificial (IA) en la investigación clínica ha experimentado un crecimiento exponencial en las últimas décadas, en consonancia con los avances en informática y ciencias de la salud. Esta revisión sistemática de la literatura tuvo como objetivo identificar las principales aplicaciones, potencialidades y desafíos del uso de la IA en las distintas etapas de la investigación clínica, incluyendo el descubrimiento de nuevos fármacos, la selección de pacientes, el diseño de ensayos clínicos y el monitoreo de datos en tiempo real. La metodología siguió las recomendaciones de PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses), con búsquedas en bases de datos como PubMed, SciELO y Web of Science, considerando publicaciones entre 2020 y 2024. Se seleccionaron 28 estudios que cumplieron los criterios de inclusión. Los resultados indicaron que la IA, especialmente mediante técnicas de aprendizaje automático y aprendizaje profundo, contribuye a reducir el tiempo de desarrollo de medicamentos, mejorar la precisión en la selección de voluntarios y optimizar la seguridad de los pacientes. Además, se observó un creciente uso de algoritmos para el análisis predictivo de resultados clínicos, lo que contribuye a una toma de decisiones más rápida y fundamentada. En conclusión, si bien la IA no reemplaza el rigor metodológico de los ensayos clínicos, se configura como una herramienta complementaria y estratégica para acelerar y mejorar la generación de conocimiento en salud.

Palabras clave: Inteligencia Artificial. Investigación Clínica. Aprendizaje Automático. Ensayos Clínicos. Salud Pública.

1 INTRODUCTION

Artificial Intelligence (AI) has established itself in recent decades as one of the most disruptive technologies in science applied to health. From the first expert systems, such as MYCIN, in the 1960s, to today's machine learning and deep learning algorithms, there has been an unprecedented evolution in the ability to process and analyze large volumes of biomedical data (Schmidt et al., 2024). This advance is particularly relevant in view of the exponential growth in the production of health data, driven by the digitization of electronic medical records, the popularization of genomics, and the use of wearable devices, which provide continuous information on physiological parameters (Tan et al., 2024).

Clinical research, defined as the set of systematic studies aimed at evaluating the efficacy and safety of health interventions, faces persistent challenges, such as high costs, long deadlines, and difficulties in recruiting representative samples. The development of a drug, for example, can take more than 10 years and exceed billions of dollars in investments (Hu et al., 2024). In this scenario, AI emerges as a strategic ally to accelerate the innovation cycle, reduce costs, and increase scientific precision, acting from the discovery of promising molecules to the prediction of clinical outcomes.

Recent studies have highlighted the role of AI as a catalyst for precision medicine, allowing to predict individualized responses to therapies based on clinical, genomic, and environmental data (Lu et al., 2024). Likewise, its application in automated patient recruitment strategies has increased population representativeness in clinical trials, reducing biases historically present in the biomedical literature (Han et al., 2024). These advances show that AI is not only an auxiliary tool, but an integral part of the transformation of research paradigms in collective health.

However, the incorporation of AI into clinical research also raises ethical, regulatory, and societal challenges. Issues such as transparency of algorithms, governance of sensitive data, and accountability for automated decisions require clear regulation and continuous vigilance (Schmidt et al., 2024). In order for its benefits to be equitably distributed, it is essential to balance technological innovation with principles of social justice and equity.

Drug discovery and development is one of the areas in which AI has proven to be most revolutionary. Traditionally, molecular screening and preclinical trials require years of work and billionaire investments, with high failure rates. Deep learning algorithms have been used to analyze millions of molecules in biomedical and chemical databases in a matter of weeks, identifying structural patterns and pharmacological interactions that indicate greater

therapeutic potential (Stokes et al., 2020). This capacity reduces costs and shortens deadlines, accelerating the arrival of new treatments to the market.

A milestone in this process was the creation of AlphaFold, a system that achieved unprecedented precision in the structural prediction of proteins, directly impacting the identification of therapeutic targets and opening up new possibilities for structural biology (Jumper et al., 2021). The expansion of the AlphaFold Protein Structure Database has expanded access to millions of predicted structures, making it an indispensable tool for researchers worldwide (Varadi et al., 2022). This integration between AI and structural biology strengthens the paradigm of precision medicine, in which therapies are adapted to the individual biological profile of each patient.

Another advance is in drug repurposing, or repurposing of drugs. By cross-referencing clinical, genomic, and pharmacological data, algorithms can identify new therapeutic indications for existing drugs, reducing the time and costs required for treatment development. This resource was widely explored during the COVID-19 pandemic, when urgency demanded rapid and low-cost strategies to test potential therapies (Cortial et al., 2024).

Despite progress, important limitations remain. The quality and diversity of databases continue to be obstacles to the generalization of predictive models. Incomplete or biased datasets can compromise scientific validity and generate risks of inappropriate extrapolation for different populations (Hu et al., 2024). In addition, the costs associated with the development and training of advanced AI models still represent a barrier for research groups in low- and middle-income countries, widening global scientific inequalities (Han et al., 2024).

In the face of these challenges, it is essential to invest in more diverse and standardized databases, in addition to expanding international collaboration between academic institutions, regulatory agencies, and the pharmaceutical industry. Only through collective efforts will it be possible to ensure that AI, applied to drug discovery, consolidates itself as a reliable and accessible scientific resource on a global scale.

Based on this context, the present systematic review seeks to answer the question PICO: How has Artificial Intelligence been applied in different stages of clinical research (Population: patients in clinical trials; Intervention: use of AI; Comparison: traditional methods; Outcome: benefits, limitations, and ethical implications)?

The analysis aims to identify benefits, limitations, and gaps in the literature, providing subsidies to guide scientific practices and policies in public health. Given this scenario, the

question that guides this systematic review arises: For human populations (P), how do AI-based interventions (I), compared to traditional methods or absence of AI (C), affect clinical and methodological outcomes (O) in clinical research studies between 2020 and 2024?

Unlike other reviews available in the literature, this research is unprecedented for systematically and critically integrating the multiple applications of Artificial Intelligence in all stages of clinical research, from drug discovery to ethical and social implications. By gathering updated evidence from the period 2020 to 2024, the study offers a comprehensive and articulated view on the topic, allowing the identification not only of technical advances, but also gaps and challenges that have not yet been explored in previous reviews. Thus, this investigation contributes in an original way to the scientific debate, especially in the field of collective health, by proposing an analysis that combines technological innovation, ethical responsibility, and commitment to equity in health.

The objective is to map how AI has been applied in different stages of clinical research (drug discovery, patient selection, trial design, monitoring, predictive analysis), identify the observed benefits, and highlight gaps and risks that are still underexplored.

2 METHODOLOGY

The present systematic review of the literature was conducted in accordance with the recommendations of the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA), recognized as an international standard for the preparation of quality reviews. The methodological objective was to ensure transparency, reproducibility and scientific rigor in all stages of the process, from the bibliographic search to the analysis of the selected studies.

2.1 SEARCH STRATEGY

The research was carried out between August and September 2025, in databases of wide scientific relevance, including PubMed/MEDLINE, Web of Science, Scopus, and SciELO, in order to include both international publications and studies produced in the Latin American context. Controlled descriptors from the Medical Subject Headings (MeSH) and the Health Sciences Descriptors (DeCS) were used, combined by Boolean operators, such as: "Artificial Intelligence", "Machine Learning", AND "Deep Learning" AND "Clinical Research" AND "Clinical Trials" and their counterparts in Portuguese. This strategy allowed for greater scope and precision in the identification of articles relevant to the theme.

2.2 PUBLICATION PERIOD

Studies published between January 2020 and December 2024 were considered, a period chosen because it reflects the consolidation of AI as a tool applicable to the biomedical field, especially after the technological advances in *deep learning* that have occurred since 2015.

2.3 INCLUSION CRITERIA

Original articles and systematic reviews that explicitly addressed the application of AI at any stage of clinical research were included. Studies dealing with drug discovery, patient screening and recruitment, clinical trial design, and real-time data monitoring were also considered. Only studies available in Portuguese, English and Spanish were analyzed, respecting the linguistic scope of the review team.

2.4 EXCLUSION CRITERIA

Editorials, comments, conference abstracts, dissertations, and theses not published in peer-reviewed journals were excluded. Studies focused exclusively on related areas, such as artificial intelligence applied to hospital management or population health, were also disregarded when they were not directly related to the scope of clinical research. In addition, articles that did not provide full text, paid or that presented insufficient methodology for critical evaluation were also eliminated.

2.5 SELECTION PROCESS

The initial screening was done from the reading of titles and abstracts, followed by the full reading of potentially eligible articles. Two independent reviewers participated in the data selection and extraction process, with disagreements resolved by consensus. This approach ensured greater reliability and reduced the risk of bias in the choice of included studies. This methodological rigor ensures that the results presented represent a reliable and up-to-date synthesis of the scientific literature, allowing a critical analysis of the impact of AI on the advancement of contemporary clinical research.

After the final selection of the included articles, a systematic data extraction process was conducted with the objective of organizing the relevant information for the review in a standardized way. For this, a structured form was prepared containing the following items: title, year of publication, country of origin, journal, objectives, type of study,

sample/population, AI techniques used, area of application in clinical research, main results and limitations identified by the authors. This systematization allowed not only the individual analysis of each article, but also the comparison between them, identifying patterns and divergences.

The extraction process was performed by two independent reviewers, with cross-checking to minimize transcription errors and reduce the risk of bias. In cases of inconsistencies or doubts regarding the categorization of certain information, a third researcher was consulted, ensuring greater scientific rigor.

Based on the data collected, thematic content analysis was carried out, inspired by the methodological framework of Laurence Bardin (2011), which consists of identifying, classifying and interpreting the nuclei of meaning present in the studies. This technique was chosen because of its suitability for the systematization of qualitative results and for enabling a critical reading of scientific discourses on the application of AI in clinical research.

To complement this qualitative step, a descriptive quantitative approach was also used, with the frequency count of the main AI techniques applied, the areas of clinical research covered, and the temporal and geographic distribution of the publications. This integration of methods, qualitative and quantitative, has enabled a more comprehensive understanding of the phenomenon, allowing both the identification of objective trends and the critical interpretation of the meanings attributed to AI in the field of health.

The articles were then organized into thematic categories that reflect the main axes of application of AI in clinical research: Discovery and development of drugs with AI; Selection and recruitment of patients with AI; Design and conduct of clinical trials with AI; Predictive analysis of clinical outcomes with AI and the ethical, regulatory, and social issues of Artificial Intelligence in clinical research. This categorization process allowed us to build an integrated and critical view, highlighting not only the practical benefits, but also the dilemmas that emerge from the application of AI in clinical research. The crossover between quantitative and qualitative analysis strengthened the reliability of the findings and provided a solid basis for the discussion presented in the next section.

3 RESULTS AND DISCUSSIONS

The analysis of studies published between 2020 and 2024 shows that AI already has a cross-cutting impact on the clinical research cycle, from drug discovery to predictive analysis of outcomes, offering gains in efficiency, accuracy, and representativeness. At the

same time, challenges remain related to algorithm transparency, methodological standardization, and ethical governance (Liu et al., 2023; Cruz Rivera et al., 2022).

3.1 DRUG DISCOVERY AND DEVELOPMENT WITH AI

The application of AI in the discovery and development of new drugs has accelerated historically time-consuming and costly processes. Machine *learning and deep learning algorithms* have been shown to be able to perform virtual screenings on millions of molecules, identifying chemical patterns with therapeutic potential in weeks, in contrast to the years required by conventional screening (Stokes et al., 2020). This efficiency gain has translated into cost reduction and increased success rate in preclinical phases, making biomedical innovation more accessible and sustainable.

In addition to the discovery of new molecules, the use of AI in *drug repurposing* stands out, which consists of identifying new therapeutic indications for drugs that have already been approved. This strategy proved crucial during the COVID-19 pandemic, when algorithms were applied to cross-reference clinical and pharmacological data, allowing for the rapid proposition of alternative therapies (Cortial et al., 2024). AI-driven drug repurposing not only reduces the time it takes to make new treatments available, but also minimizes risk, since the safety of these compounds is already established.

Another relevant milestone was the development of AlphaFold, which revolutionized structural biology by predicting, with high accuracy, the three-dimensional conformation of proteins (Jumper et al., 2021). The creation of the AlphaFold Protein Structure Database, later expanded, made millions of structures available to the scientific community, consolidating itself as a fundamental resource for the identification of therapeutic targets (Varadi et al., 2022). This innovation strengthens the logic of personalized medicine, by enabling therapies to be designed based on the individual molecular profile.

Despite the advances, challenges persist, as the generalization of the models depends on the quality and diversity of the databases used, which still represents an important limitation. Incomplete or biased datasets can compromise the accuracy of models and widen inequalities, especially in populations in low- and middle-income countries (Hu et al., 2024). To overcome these barriers, experts advocate for greater methodological standardization, international collaboration, and continuous audits on the performance of algorithms (Han et al., 2024).

Thus, the results analyzed indicate that AI represents a new scientific paradigm in drug development, but its full incorporation requires a balance between technological innovation, scientific rigor and ethical responsibility.

3.2 SELECTION AND RECRUITMENT OF AI PATIENTS

Patient selection and recruitment are recognized as critical steps for the success of clinical trials, accounting for a large part of the delays and interruptions of studies. It is estimated that up to 80% of clinical trials face difficulties in this phase, impacting both the timeline and the costs of the research (Lu et al., 2024). In this context, AI has been consolidated as a strategic resource, capable of processing large volumes of electronic health records (EHRs), population databases, and genomic data to identify eligible participants more quickly and accurately.

The use of machine learning algorithms makes it possible to automate the screening of volunteers based on inclusion and exclusion criteria in the protocols, reducing the dependence on manual processes and increasing the scope of the search (Han et al., 2024). This efficiency translates not only into time savings, but also into greater representativeness of the samples, since patients from different ethnic, socioeconomic, and geographic contexts can be included, mitigating biases historically present in clinical trials.

According to Hau et al., (2023) in addition to the initial screening, AI has been applied in predicting participant adherence and retention. Predictive models, based on health and behavioral histories, can identify patients at higher risk of abandonment, enabling the implementation of preventive strategies, such as strengthening communication, remote monitoring, and individualized support. This approach increases the consistency of studies, reduces sample losses, and contributes to the statistical robustness of the results.

Another important advance is in the use of natural language processing (NLP). Explainable NLP tools can automatically interpret eligibility criteria and cross-reference them with structured and unstructured clinical information, accelerating the pairing between patients and protocols. In oncology, this technology has shown promising results by associating genetic mutations with specific studies, increasing the precision of selection (Ghosh et al., 2024).

Schmidt et al., (2024) argue that despite the advances, ethical challenges remain central. The use of sensitive clinical data requires compliance with data protection legislation, such as the LGPD in Brazil and the GDPR in the European Union. In addition, algorithms

trained on non-diverse databases run the risk of reproducing inequalities and limiting the external validity of the results.

Therefore, the analysis of the studies demonstrates that AI can transform the recruitment and selection of patients into more efficient, inclusive, and reliable steps, as long as it is accompanied by ethical governance, data diversity, and transparency in processes.

3.3 AI CLINICAL TRIAL DESIGN AND CONDUCT

Adequate methodological design is crucial for the scientific validity of clinical trials, and AI has stood out as a tool capable of optimizing this step. Algorithms have been used to simulate clinical scenarios before the start of studies, making it possible to predict response rates, identify critical variables, and estimate more realistic sample sizes. These simulations reduce the risks of unfeasible protocols and strengthen the representativeness of the results (Liu et al., 2020).

Corroborating Vasey et al., (2022) when they state that one of the most promising advances is the incorporation of adaptive assays, which allow for real-time adjustments as data are collected. With the support of AI, it becomes feasible to stop a study early when there is robust evidence of efficacy, or to redirect resources in cases of low effectiveness. This methodological flexibility contributes to reducing costs, preserving the safety of participants and improving the efficiency in the use of available resources.

AI has also been applied in intelligent randomization, balancing intervention and control groups according to multiple clinical, demographic, and genomic variables. This practice reduces biases and strengthens comparability between groups, increasing the statistical robustness of the findings (Plana et al., 2022). In addition, algorithms can help monitor volunteers' adherence, identifying behavioral patterns that signal the risk of abandonment. From this data, customized support strategies can be implemented, increasing retention and reducing sample losses (Hau et al., 2023).

Another growing field is the use of wearable devices and digital sensors integrated with AI models, which allow continuous collection of physiological data during trials. Recent reviews demonstrate that this approach increases safety, making it possible to identify adverse events early and reducing the need for face-to-face visits, which increases participant adherence (Smuck et al., 2021; Tan et al., 2024). This integration brings clinical trials closer to everyday care practice, favoring the direct application of the results in health systems.

However, regulatory and methodological challenges persist. There is still a lack of international standardization regarding the use of AI in trial design, which makes it difficult to validate and compare studies. Initiatives such as the CONSORT-AI and SPIRIT-AI extensions represent advances in this regard, but require greater dissemination and global adherence (Liu et al., 2020).

Therefore, the results of the literature demonstrate that AI promotes a paradigm shift in the design and conduct of clinical trials, making them more dynamic, responsive, and patient-centered, as long as they are accompanied by clear regulation and rigorous methodological validation.

3.4 PREDICTIVE ANALYSIS OF CLINICAL OUTCOMES WITH AI

Prediction of clinical outcomes represents one of the most innovative areas of the application of AI in biomedical research. Traditionally, the analysis of therapeutic efficacy and safety is performed retrospectively, after the completion of trials. With the use of *machine learning and deep learning* algorithms, it has become possible to anticipate trends during the conduct of the studies itself, offering subsidies for faster and safer interventions (Tan et al., 2024).

Predictive AI models have been applied to estimate the probability of individualized response to therapies, especially in areas such as oncology and cardiology. By integrating clinical, laboratory, and genomic data, these algorithms identify patterns associated with a greater or lesser chance of therapeutic benefit, strengthening the logic of precision medicine (Schmidt et al., 2024; Tan et al., 2024). This ability contributes to optimizing protocols, personalizing treatments, and avoiding patient exposure to ineffective interventions.

Another prominent field is the early detection of adverse events. Recent studies have shown that predictive algorithms, trained on historical data and information collected in real time, are able to anticipate clinical complications, allowing the adoption of preventive measures before serious damage occurs (Tan et al., 2024). Integration with wearable devices and digital sensors has expanded this capacity by allowing continuous monitoring of physiological parameters, increasing the safety of participants (Smuck et al., 2021).

The application of AI has also advanced in modeling survival and disease progression. In oncology, for example, algorithms have achieved high accuracy in predicting tumor progression time and response to targeted therapies, outperforming conventional statistical methods in some scenarios (Tan et al., 2024). In chronic diseases, such as heart failure and

diabetes, similar models have been used to predict the risk of hospitalization, contributing to the integration of clinical research and care practice (Han et al., 2024).

However, limitations persist. The diversity of training data is still restricted, with most algorithms developed from populations in high-income countries. This compromises the generalization of models and may reinforce global health inequalities (Hu et al., 2024). In addition, the opacity of *deep learning* models raises questions about explainability and auditability, which are essential factors for scientific trust.

Thus, the analyzed results indicate that predictive analytics with AI has the potential to transform clinical research towards more proactive, safe, and personalized approaches, but its consolidation requires sample diversity, regulatory validation, and methodological transparency.

3.5 ETHICAL, REGULATORY AND SOCIAL ISSUES OF ARTIFICIAL INTELLIGENCE IN CLINICAL RESEARCH

While the benefits of AI in clinical research are widely recognized, its incorporation raises ethical, regulatory, and societal concerns that cannot be overlooked. The use of algorithms to support medical decisions directly involves the well-being of participants, requiring robust governance and transparency principles (Schmidt et al., 2024).

The privacy and protection of personal data are one of the main challenges. The analysis of large volumes of clinical, genomic and demographic records implies access to highly sensitive information, which, if poorly managed, can expose individuals to risks of stigmatization and discrimination. Although legislation such as the General Data Protection Law (LGPD) in Brazil and the General Data Protection Regulation (GDPR) in the European Union represent important advances, their effective application in clinical trials still faces practical barriers (Han et al., 2024).

Another critical point refers to the responsibility for automated decisions. When an algorithm contributes to recommending therapeutic approaches or assists in the monitoring of patients in clinical trials, the question arises: who should respond in case of error? The absence of regulatory consensus on this responsibility undermines trust in automated systems, especially in high-risk contexts (Hu et al., 2024).

From a social point of view, there is concern about the reproduction of inequalities. Many algorithms are trained on data from populations in high-income countries, which limits their applicability in contexts of greater vulnerability and may reinforce historical exclusions

in access to health innovations (Schmidt et al., 2024). In addition, the requirement for advanced technological infrastructure and highly specialized teams restricts the full adoption of AI in low- and middle-income countries, widening the so-called "technological gap" (Han et al., 2024).

In the regulatory field, there is a lack of international standardization. Although agencies such as the FDA and EMA have begun to develop specific guidelines for the use of AI in healthcare, there is still no global consensus that ensures comparability between studies and universal scientific validity. Initiatives such as CONSORT-AI and SPIRIT-AI constitute relevant milestones to increase transparency and reproducibility, but their adherence is still limited (Liu et al., 2020).

Therefore, the results of the literature indicate that the consolidation of AI in clinical research depends on a balance between technological innovation, ethical regulation, and social justice. Only with clear regulatory frameworks, data diversity, and strategies aimed at equity will it be possible to ensure that AI advances fairly benefit different populations.

4 CONCLUSION

The present systematic review demonstrated that AI has been consolidating itself as a strategic tool in clinical research, with applications ranging from drug discovery to the prediction of clinical outcomes in real time. Although it does not replace traditional methods, AI acts as a complementary resource, capable of speeding up processes, reducing costs, and increasing the representativeness of samples, responding to historical challenges related to assay design and patient selection. This potential positions AI as a central element of precision medicine and scientific innovation in health.

However, the incorporation of AI requires caution and responsibility. Ethical, regulatory, and methodological issues remain significant barriers, especially with regard to the transparency of models, the quality and diversity of databases, and the need for international standardization. Risks of bias, the possibility of reinforcing inequalities, and the absence of clear regulatory frameworks persist, factors that may limit the full realization of the benefits of this technology. Thus, the use of AI must be accompanied by data governance policies and regulations that ensure its ethical and equitable application.

The limitations of this review, such as the time limit (2020–2024) and the methodological heterogeneity of the included studies, highlight the need to expand scientific production on the subject. The lack of large multicenter clinical trials and detailed information

on algorithms compromises the critical evaluation of results and reinforces the urgency of research that develops explainable, auditable models applicable to different epidemiological contexts. In addition, future investigations should explore the impact of AI on health equity, analyzing whether its application reduces or widens inequalities in access to clinical research.

Thus, this review contributes by offering a critical and updated synthesis of the literature, highlighting both the potentialities and limitations of AI in contemporary clinical research. The evidence indicates that the consolidation of this technology will depend on investments in infrastructure, training of multidisciplinary teams and strengthening of international networks of scientific cooperation. By balancing technological innovation with principles of social justice and transparency, it will be possible to transform the potential of Artificial Intelligence into concrete gains for public health, bringing science closer to the real needs of society.

Walace Rodrigues¹

ABSTRACT

This work aims to reflect on the relevance and timeliness of the teachings left by our greatest Brazilian educator: Paulo Freire (1921-1997). His Liberating Pedagogy, his philosophy of education, and his focus on issues in Brazilian education, especially for the most vulnerable (oppressed), are important not only for Brazil but also for several countries that use his teachings. Methodologically, this paper presents itself as a theoretical, reflective, and qualitative bibliographical research, seeking concepts and bases for critical thinking from selected texts. The theoretical reflections raised here seek to engage in a dialogue with the challenges of contemporary education, contributing to the strengthening of pedagogical practices committed to an ethical vision of the world, of the subject², and of Education.

Keywords: Education. Ethics. Humanization.

RESUMO

Este trabalho tem como objetivo refletir sobre a relevância e a atualidade dos ensinamentos deixados pelo nosso maior educador brasileiro: Paulo Freire (1921-1997). Sua Pedagogia Libertadora, sua filosofia da educação e seu foco nas questões da educação brasileira, principalmente dos mais vulnerabilizados (oprimidos), são importantes não somente para o Brasil, mas também para vários países que utilizam seus ensinamentos. Este escrito se coloca, metodologicamente, como uma pesquisa teórica, reflexiva e qualitativa de cunho bibliográfico, buscando conceitos e bases para o pensar crítico a partir de textos selecionados. As reflexões teóricas levantadas aqui buscam travar um diálogo com os desafios da educação contemporânea, contribuindo para o fortalecimento de práticas pedagógicas comprometidas com uma visão ética de mundo, de sujeito e de Educação.

Palavras-chave: Educação. Ética. Humanização.

RESUMEN

Este trabajo tiene como objetivo reflexionar sobre la relevancia y la actualidad de las enseñanzas dejadas por nuestro mayor educador brasileño, Paulo Freire (1921–1997). Su Pedagogía Liberadora, su filosofía de la educación y su enfoque en las cuestiones de la educación brasileña—especialmente respecto a los más vulnerabilizados (oprimidos)—son importantes no solo para Brasil, sino también para varios países que utilizan sus aportes. Metodológicamente, este escrito se configura como una investigación teórica, reflexiva y

1 INTRODUCTION

This text aims to reflect on the relevance and timeliness of Freirean teachings in education today. We understand that Liberating Education, as conceived by Paulo Freire, is still extremely necessary in our society, mainly because of its emphasis on critical subjects and agents in their societies.

We justify writing this work at a time when teacher training programs are attracting less and less interest from young people leaving Brazilian high schools. In other words, the teaching profession has ceased to be seen for its social relevance and has come to be judged solely by its financial gains (from a neoliberal perspective). We are not saying that teachers should not earn good salaries, but that neoliberal governments (from the last decades of the 20th century to the present day) have been, constantly, trying to cheapen (or outsource) public education and devalue the teaching profession.

The constant attacks on Brazilian public school education, its weakening on several fronts, attempts to privatize public assets, the recurring ban on literary works in schools, among other points, reinforce the need for an educational shift towards Freirean theories.

In this sense, this study aims to use Freirean views to understand the increasingly relevant importance of a Liberating Education in times of constant fake news, taking into account the need for critical thinking on the part of students and teachers, so that they do not vote for or support politicians and policies that are only against us Brazilians and against public, democratic and quality education.

For this text, we used a qualitative, reflective, and bibliographical approach, giving preference to books and scientific articles to support our thoughts on the relevance and importance of Freirean theories today. We used some works by Freire (1967, 1987, 1996); Barbosa (1995); Gadotti (2007); Morin (2001); and Rodrigues (2021, 2022, 2023) to provide theoretical support for this writing and to show how Freirean theories are current and relevant.

Through the studies of some thinkers, we sought to reveal the relevance of Freirean theories today and their necessary use in Brazilian education, especially in public education that serves the most socially oppressed.

2 THE RELEVANCE OF FREIREAN THOUGHTS IN THE EDUCATIONAL PERSPECTIVE

Paulo Freire (1921-1997), one of the most important educators in 20th-century Brazilian education, was a pioneer in conceiving a pedagogy appropriate for our then-underdeveloped reality. Besides being a sharp intellectual and a perceptive philosopher, he

was a prolific writer, expressing his thoughts in his various publications. Rodrigues and Azevedo (2019) inform us a little about Freire:

Paulo Reglus Neves Freire (1921-1997), better known simply as Paulo Freire, was a lawyer by training and an educator and philosopher of education by vocation. He worked on themes relevant to Brazil: adult literacy, popular education, and other themes of school pedagogy in general. He created a method of adult literacy that sought to teach from the learner's reality and not from primers completely outside the social and cultural context of the learner, especially those from the Northeast of Brazil. (Rodrigues; Azevedo, 2019, p. 49)

We understand Freire's most important works to be the following books: *Education: the practice of freedom* (1967); *Pedagogy of the Oppressed* (1968); *Pedagogy in Process: The Letters to Guinea-Bissau* (1975); *Educação e Mudança* (Education and Change, 1979); *Conscientização: teoria e prática da libertação* (Conscientization: Theory and Practice of Liberation, 1980); *Ideologia e educação: reflexões sobre a não neutralidade da educação* (Ideology and Education: Reflections on the Non-Neutrality of Education, 1981); *Prática e Educação* (Practice and Education, 1985); *Toward a Pedagogy of the Question: Conversations with Paulo Freire* (1985); *The Importance of the Act of Reading* (1989); *Pedagogy of Hope: Reliving Pedagogy of the Oppressed* (1992); *Teacher, but aunt not: letters to those who dare teach* (1993); *Pedagogy of Freedom: Ethics, Democracy and Civic Courage* (1998), in addition to various other texts and interviews given in different parts of the world. These are just some of the books published by Freire. His work has influenced many researchers who have expanded and continue to expand his thoughts and understandings.

In this vast range of publications, Freire teaches us not only a method of education for the illiterate, but also gives us a philosophical vision of hope for a better world through education. School education is therefore presented as a path to one's emancipation, critical thinking, and action, a fertile ground for developing critical, conscious citizens, agents, and political subjects.

Freire desired (hoped for³) and believed in education as a true instrument of social transformation, teaching critical thinking, emotional development, sharing, dialogue, ethical coexistence, among many other important points for humanizing people. Freire (1997),

³ In Portuguese "esperançar".

revealing much of his theories and conceptions, tells us what humanist education is and is not:

The humanist conception, which rejects mere deposits, dissertations, or narrations of isolated fragments of reality, is realized through a constant problematization of the human-world relationship. Its purpose is to problematize, never to lecture or deposit. Just as the recently criticized conception (the banking model), in some of its aspects, cannot overcome the educator-learner contradiction, the humanist conception starts from the necessity of doing so. And this necessity is imposed on it to the very extent that it views man as a being of choices. A being whose point of decision is, or should be, within himself, in his relationships with the world and with others. To achieve this overcoming, an existence that is the phenomenal essence of education, which is its dialogicity, education then becomes dialogue, communication. And, if it is dialogue, the relationships between its poles can no longer be those of antagonistic opposites, but of poles that reconcile. (Freire, 1997, p. 14)

In his *Liberating Education*, Freire undertakes an effort to show that students and educators learn and teach together, questioning the various structural inequalities in our country in the field of Education, through a dialogical relationship and respect for each other's knowledge.

It is worth noting that from wealthy Northern Europe to poor countries in Africa, Freire's legacy resonates as a cry of hope for a better life and a better world for all, where education has a privileged space for critical thinking, inclusion, and social recognition. Freire also does not forget the political importance of education.

In *Pedagogy of the Oppressed* (1987), Freire posits education as an instrument of genuine social transformation. In this work, he seeks to defend a model of school education in which students and educators learn and teach together, critically questioning the many structural inequalities in their realities. Freire emphasizes the need for an inquiring education (to inquire is the very exercise of philosophizing), grounded in criticality, knowledge of realities, and ethics, taking dialogue as the tool for a truly liberating education. In *Toward a Pedagogy of the Question: Conversations with Paulo Freire* (1985), Freire makes it very clear the importance of being critical and questioning social structures in order to change them.

From this perspective, the teacher is not better, more intelligent, or the ultimate authority who knows everything in the eyes of the students, but a learner from the multiple realities and thoughts of dialogical interaction with scientific knowledge, with their students, and with their peers. The equality of human beings and the importance of their actions in the world are made clear in *Liberating Education*.

In *Pedagogy of Freedom: Ethics, Democracy and Civic Courage* (1996), Freire highlights the importance of the educator as a mediator between knowledge and students, and encourages us to train more critical and reflective students, capable of building their own intellectual autonomy and learning to navigate the world of literacy independently. The importance of the teacher as a mediator is even more crucial today, when information, widely available through digital means, is consumed extensively but needs to be critically articulated to become knowledge.

Furthermore, according to Freire, the educator must be an example of respect, integrity, and consistency, recognizing their students as autonomous subjects endowed with critical thinking, agents in their realities as historical beings. Freire also does not forget to mention the need for the teacher's affectivity towards their students and their lived realities.

In *Education: the practice of freedom* (1967), Freire discusses the need for the school to teach the student to read the world and its realities and to intervene positively in them, "hoping" for a possible change. He considers education as a constant process that is capable of raising people's awareness of their realities and motivating them to transform them. In this sense, this Freirean work already places education as a political act, of awareness for agency in the world.

He also reflects, in his writings, on the role of the teacher and the importance of reading the world around us, a process which precedes reading the word. Here he paves the way for current thoughts on the multiple literacies needed by teachers and students today. Especially for reading multimodal (or multisemiotic, or multisensory) texts, texts that are very common in our digital and post-industrial society.

Also, Freire, with all his prior philosophical background, shows us that education must also be a political act, of criticality and action in the face of realities that oppress and assault us. Hence the need to exercise thinking from lived realities, avoiding illiteracy (literal, historical, critical, political, etc.). Hence, banking education (opposed to liberating education) disconnects theory from practice, seeking not to critically question the world, domesticating people:

The existing dichotomy between theory and practice, the sensibly universal validity of knowledge free from all historical conditioning, the role of philosophy as an explanation of the world and as an instrument for its acceptance, education conceived as a mere exposition of facts and as the transmission of a heritage of "chaste" knowledge: all this characterizes the naive consciousness of the politically illiterate. Ideologized on the plane of domestication, such a consciousness will not even reach the objective

idealism of Hegel's *Phénoménologie de L'Esprit*, where praxis appears as the transformative action that men exert on the world and as their own formation – even though for Hegel praxis is only a purely mental activity. Such an ideology will never be able to understand the impossibility of theory without practice, of thought that is not an act of transforming the world; it clings to knowledge for knowledge's sake, to a theory that does nothing but explain reality, and to a neutral education. (Freire, 1997, p. 24)

We realize that Freire's effort was to place education as a mechanism for understanding the world and for historical action in the world. Therefore, he positioned education as a political action, as it would make us act in society with real objectives of removing people from their situations of oppression, whether social, cultural, historical, etc. Education, therefore, serves as a tool to break the chains of oppression that limit individuals from acting towards a better and more just life.

We see that many authors and researchers echo Freirean teachings and update them, as is the case with art educator Ana Mae Barbosa. She does so through her well-known **Triangular Approach in Arts**, a methodology rooted in Freirean influences. Barbosa worked with Paulo Freire in São Paulo and applied much of what she learned from him to her educational practice and thinking in the field of Arts teaching.

Edgar Morin also acknowledges the strong influence of Freire's thought on his **Theory of Complexity**, which is a philosophical and epistemological approach attempting to interpret realities. It is a non-linear and complex approach to interpretation. Morin explains a little about the notion of complexity:

Complexity arises from something that is complementary to something else. It comes from a certain degree of complementarity between the parts involved in the process. This notion of antagonistic complementarity is basic to our reasoning. It is an antagonistic complementarity between the individual and the artistic on the one hand, and the standardized and industrial on the other. (...) The complementary association of antagonistic things. (Morin, 2001, p. 10)

We can also mention the feminist philosopher bell hooks (1952-2021), who sought a transformative pedagogical approach, from a more inclusive and critical perspective, focusing on the struggles against various forms of oppression against Black women. Her **education as a practice of freedom** echoes Freire's teachings regarding the need to educate the oppressed. She had direct contact with Freire and questioned him about the absence of the feminine perspective in his works.

Also, hooks learned from Freire the need to understand the realities of oppression in order to work towards a truly liberating education. She tells us that:

The emphasis on education as necessary for liberation, which Black people affirmed during the time of slavery and later during reconstruction, informed our lives. And that is why Freire's emphasis on education as a practice of freedom made immediate sense to me. Aware since childhood of the need for literacy, I carried with me to university the memory of reading to people, of writing for people. I carried with me the memories of Black female teachers in the segregated school system who had been critical educators and had provided us with liberating paradigms. (hooks, 2013, p. 72-73)

Moacir Gadotti is another contemporary thinker who uses Freirean theories and thoughts to understand current issues. Regarding **education in times of neoliberalism**, he tells us that:

Paulo Freire's worldview and his socio-political-educational theory help us not only to better understand how the neoliberal model works, but also to build the necessary response to neoliberalism. He defends a **new modernity** whose rationality must be "wet with affectivity." Against the pedagogical and cultural Enlightenment that emphasizes only the acquisition of curricular content, he highlights the importance of the cultural dimension in the processes of social transformation. Education is much more than instruction. To be transformative – to transform the conditions of oppression – it must be rooted in the culture of the people. (Gadotti, 2007, p. 80, author's emphasis)

The appropriation and reinterpretation of Paulo Freire's thought by various authors is still necessary and essential for understanding the issues of current Brazilian education.

Walace Rodrigues (2018, 2019, 2021, 2022, 2023) applies Freirean ideas (such as criticality, dialogue, and autonomy) to contemporary educational contexts, such as **multiliteracies and the decolonization of knowledge**, showing the relevance and adaptability of Freirean pedagogy to the current challenges of education.

In this sense, Freire's teachings are extremely relevant to be used in basic schools, in undergraduate programs, and in all places where there is a need for education focused on criticality, on understanding world situations, on a hopeful approach to education that preserves the utopia of thinking for the common good and that leads to an agentive action of the subjects.

Freirean ideas can also be applied to a more ecologically conscious understanding of the world that values the cultures of traditional peoples, riverside communities, quilombola

communities, etc., taking their knowledge and practices as a basis and giving them importance in school environments.

3 SOME FINAL CONCLUSIONS

We were able to verify, here, the relevance and timeliness of Paulo Freire's teachings for an education that seeks to understand today's oppressed subjects, their problems, their aspirations, and their possibilities for breaking the chains of oppression through education. In addition to the possible applicability of Freirean theories in areas such as the Arts, Ecology, Anthropology, Sociology, Education, among many others.

The results of this work reveal that several thinkers currently utilize Paulo Freire's theories and thoughts, updating them for their applications in education, whether in schools, universities, or other educational institutions.

We have seen that important and current thinkers, such as Gadotti, Barbosa, Morin, hooks, Rodrigues, among many others, echo Freirean studies in various spheres of education.

In this way, teachers in current education should have more contact with Freire's teachings to try to understand the possible advantages of dialogue, criticality, ethics, affectivity, learning from the realities of students, etc., for the exercise of a truly liberating education.

In this context, we have several theories influenced and implemented based on Freirean views, such as the Triangular Approach, by Ana Mae Barbosa; the Theory of Complexity, by Edgar Morin; education as a practice of freedom, by bell hooks, among others, which are clear examples of the relevance of Freire's thoughts today and their necessary applicability to the educational problems and themes of the current world.

As we can see, **Liberating Education** for Freire must be an education that promotes beneficial transformations in people's lives, because "If education alone does not transform society, without it society does not change either" (Freire, 2000, p. 67).

Throughout this journey, his theories and teachings engage with contemporary education, which is so focused on the digital world but forgets the most human and humanizing aspects of the task of teaching: dialogue, affectivity, understanding the humanity of others, critical thinking, questioning reality, understanding humankind as historical beings who construct their own history, education as a political act, among many other important points that end up being forgotten in our post-industrial society.

ABSTRACT

This work aims to expand upon and address the principles of customer-centric marketing in a competitive environment and commercial management. Through literature on the subject, it seeks to convey some basic concepts, focusing on the dynamic changes occurring in marketing in a globalized world. It focuses on developing and integrating the idea of creating value for customers as the primary goal of marketing, helping to understand its principles and how its elements are used to create value for customers and achieve organizational objectives for effective management in the commercial area. In the context of online stores, according to the developed management PIN, it applies viable fundamentals to meet this demand.

Keywords: Marketing. Online Stores. Organizational. Commercial Area.

RESUMO

O trabalho tem o objetivo de ampliar e abordar os princípios de marketing centrado no compromisso com o cliente, em um ambiente competitivo e a gestão comercial. Através das literaturas encontradas sobre o tema na busca de transmitir alguns conceitos básicos, voltando-se para as mudanças dinâmicas que ocorrem no marketing em um mundo globalizado. Com foco no desenvolvimento e integração da ideia de criação de valor para os clientes como a meta primária do marketing, ajudando a compreender os seus princípios e o modo como os elementos do esses elementos são utilizados com o intuito de criar valor para os clientes e alcançar os objetivos organizacionais para efetivar uma boa gestão na área comercial. No contexto das lojas virtuais conforme o PIN da gestão elaborado, aplicar os fundamentos viáveis para atender essa demanda.

Palavras-chave: Marketing. Lojas Virtuais. Organizacionais. Área Comercial.

RESUMEN

Este trabajo busca ampliar y abordar los principios del marketing centrado en el cliente en un entorno competitivo y la gestión comercial. A través de la literatura sobre el tema, se busca transmitir algunos conceptos básicos, centrándose en los cambios dinámicos que se están

produciendo en el marketing en un mundo globalizado. Se centra en desarrollar e integrar la idea de crear valor para el cliente como objetivo principal del marketing, ayudando a comprender sus principios y cómo se utilizan sus elementos para crear valor para el cliente y alcanzar los objetivos organizacionales para una gestión eficaz en el área comercial. En el contexto de las tiendas online, según el PIN de gestión desarrollado, se aplican fundamentos viables para satisfacer esta demanda.

Palabras clave: Marketing. Tiendas Online. Organizacional. Área Comercial.

1 INTRODUCTION

I recommend the investment in this company because the work arises after the elaboration of the group study carried out with the result of a business plan to open a virtual *website* for the commercialization of differentiated clothes and differentiated packaging in the format of sweets, ecological products, associated with high quality with a differentiated finish for babies from 0 to 2 years old.

The packaging will be made in the shape of candy, so that they can remember their childhood, the clothes will be made with organic cotton and the inks for the prints used in the process will be water-based, thus obtaining a lower impact on the environment.

Comfortable product, ecologically and sustainable, aiming at the well-being of customers with satisfaction in being able to acquire a differentiated product, with quality, respecting the environment with attractive and captivating packaging.

Another attraction will be the expansion of unisex products so that they can be used by other babies in the family or friends. There are already success stories in this segment where a differentiated product is attractive first to parents and then to children.

Online shopping through computers continues to be on the rise compared to other technologies, the high investment in the clothing and footwear sector, the growing, in view of the theme of digital marketing according to the Pin developed for the company "Tããã Fofinho" we seek to present the concepts that involve the commercial scope and the steps necessary to carry out marketing within the innovations found today for the market, and in order to promote a reflection on the expansion of concepts and strategies according to a qualitative research, based on literature and authors who have focused on this theme in order to demonstrate the benefits that can be achieved for the growth of a virtual store.

Even today, the concept of marketing in Brazil is quite unfocused, as many associate it with the sale of products in any way, even if people do not want them. Still others believe in the consumerist concept, that is, that it is a way to make people buy what they do not need. Because its application occurred in Brazil when we still had an economy composed of monopolies and non-competitive oligopolies that began in the 1960s, in which the government's function was much more of management than of tutelage of the economy.

In fact, it is the result of a study based on several sciences (Sociology, Psychology, Mathematics, Anthropology, Statistics, Philosophy, among others), with the objective of knowing people's behavior and, based on this, satisfying the needs and desires of each one. Marketing has become a pervasive and influential force in all sectors of the economy. In a

few years, it has stripped itself of its old image of something unethical and unnecessary and has come to be seen as an essential instrument for the formation and maintenance of various businesses, including its concepts applied in the most varied types of organizations, from soccer teams to churches, including governments and non-governmental organizations.

When in fact the concept of marketing is considered a vision from the perspective of philosophy and within organizations, it is verified that it must extend to practically the entire organization, especially to those directly related to the market. In this sense, Raimar Richers³, one of the greatest authorities on marketing in Brazil, defines his function as simply being the intention to understand and serve the market. Thinking in this way, all activities related to the search for customer satisfaction, whether internal or external, have a direct relationship with those responsible for marketing.

By focusing on customers, the main reason for companies to exist, the actions that will negatively or positively influence their satisfaction are responsible for marketing executives. From this perspective, we will see that marketing represents much more than promotion and sales tools; It is a philosophy within organizations, a philosophy that has the customer as the main reason for the organization's existence.

In a general and simplistic way, it can be stated, according to Kotler (2000),⁴ that marketing is a social process through which people and groups of people obtain what they need and desire through the creation, offer and exchange of products and services. In other words, marketing can be considered a two-way street between the market and organizations, in which the latter seek information about their desires and needs in the market, receiving information in return, in this first phase. As a next step, organizations start to offer products and services to the market according to the desires and needs of customers, with financial resources and satisfied customers in return.

2 DEVELOPMENT

Nakamura (2001, p. 3),⁵ "is the interconnection of several computer networks spread in various parts of the world". Practically all countries are interconnected on the internet. Due to this interconnection, it is possible to communicate instantly between two computers anywhere in the world, in addition to sharing data and information.

³ Richers, Raimar. 1926- What is marketing I Raimar Richers. — 15. ed. — São Paulo : Brasiliense, 1994.

⁴ Kotler, Philip. Marketing Principles. São Paulo: Prentice Hall, 2000

⁵ Nakamura, Rodolfo Reijiro. E-commerce on the Internet: Easy to understand. São Paulo, Érica, 2001

The internet emerged in the United States of America (USA) and, according to Catalani et al., (2004 p. 13),⁶ "the intention was to create technologies capable of allowing the intercommunication of different and geographically scattered computers, connected to different networks". Currently, the world wide web has become a means of communication and information that is increasingly present in people's lives.

According to Quaino (2012, p. 1),⁷ "more than half of the Brazilian population is included in the digital world". In this sense, this fact has become increasingly common due to the low cost of acquiring devices that promote access to that network, whether fixed with computers or mobile, such as tablets and cell phones.

Castells (2003) states that the internet is the fabric of our lives. It also alludes that information today is what electricity was in the industrial era, it also states that the internet would not only be energy, but also the electric motor, due to its ability to propagate information throughout the domain of human activity.

Castells (2003) states that the network is a set of interconnected nodes. The formation of networks is a very old human practice, but nowadays networks have been incorporated into information networks energized and supplied by the internet. The internet transforms the way organizations act related to their suppliers and customers, their administration and management, in their production of services and material goods, in their financing and in their analysis of actions in the financial market

Teixeira (2017) states that electronic commerce (e-commerce) is characterized by being part of the present and the commercial future. There are several business opportunities that are provided by the advent of the internet, in addition to those that originate from temporal phenomena.

E-commerce, or electronic commerce, is a form of communication between the company and the customer, a means of sales, where sellers offer products or services through the internet. According to Nakamura (2001, p. 31),⁸ electronic commerce is understood as "any buying and selling activity carried out with the help of electronic resources".

⁶ Catalani, C. And. Gans, J. S., 2017. "Some Simple Economics Of The Blockchain", Rotman School Of Management Working Paper, No. 2874598; Mit Sloan Research Paper, No. 5191-16

⁷ Quaino, Lilian. Half of the Brazilian population is included in the digital world, says FGV. :Accessed on: 28.04.2020

⁸ Ibid. Item 4

According to Kotler (2000), behind electronic business there are two phenomena: connectivity and digitalization. The author analyzes two types of e-commerce:

Commercial channels: Several companies have established information and e-marketing services that can be accessed by those who subscribe to the service and pay a monthly fee. (...) These channels provide information (news, libraries, education, travel, sports, consultations), entertainment (fun and games), shopping services, opportunities and dialogues (newsletters, forums, chat rooms), and email. **The Internet:** The Internet is a global mesh of computer networks that has made instantaneous and decentralized global communication possible. (...) They can send emails, exchange experiences, buy products, and access news, recipes, and information about art and business. The Internet itself is free, although individual users need an Internet service provider to be connected to it. (p.681)

Teixeira (2017) says that in Brazil, currently, about 45.6% of the population has access to the internet (corresponding to 90 million people). Making a comparison between the years 2000 and 2012, a significant growth is identified, equivalent to 1,500% in the number of internet users in Brazil. The great leverage of the internet in recent years has been essential for the rise of e-commerce in Brazil and in the world.

Nascimento (2011) says that in relation to the correspondent in cash that is moved with e-commerce in the United States (approximately 173 billion dollars or approximately 294 billion reais²), it can be highlighted that it is higher than that found in Brazil (which is close to 14 billion reais in 2010, according to data from the Webshopper Report). The trend in the United States, as well as in Brazil, is for growth. The estimate, according to Forecast Research (2010) is that this number will double in four years.

Lessa et al. (2020) In a scenario in which technology is increasingly present in the daily lives of people and organizations, the term "digitalization" is being incorporated, exposing the evolution of physical media to the digital world. Even with this evolution that occurred a few decades ago, new ways of selling are identified, constantly adding ascension, such as marketplaces and applications available on cell phones, adding, and in some cases, replacing sales sites.

E-commerce, commonly known as e-commerce, is implemented in organizations, accounting for a large portion of their revenues. And this is due to the high convenience and satisfaction attributed to consumers by this means of acquisition.

According to Turchi (2004), the potential found in the internet has allowed organizations to analyze and act in a more comprehensive way and to encompass their

planning and marketing and e-business strategies, a broad concept that is related to a complex fusion of internal processes, business applications and organizational structures, with the use of technology (hardware and software), aiming to develop a high-performance business model.

The advantages of e-commerce are the immediate insertion in the market, the analysis of the competitive and consumer market, the service and support twenty-four hours a day, and seven days a week, with very low operating costs. With caveats to its weaknesses to external factors, such as the dangers found in the network.

Hoffman and Novak (1995)⁹ describe that this relationship between customers and companies has undergone changes over time, mainly due to marketing efforts that have demonstrated innovations in the search to expand their penetration in strategic segments to reach a greater number of customers. Companies aim to influence sales, but without disregarding quality and good service. Brondmo (2001)¹⁰ adds that the customer-company relationship is going through a predictable cycle that has four stages, consent, attention, loyalty and involvement.

The same author defines that in order to obtain the customer's attention, there is a need to promote liquidation actions and advantages that should follow the organization's marketing planning and with the criteria that one wishes to influence the customer (BRONDMO, 2001).¹¹

Godin (2001)¹² mentions that the internet facilitates this approximation between customer and company, highlights that it also plays an important role in holding the consumer's attention. Since on the web it is the customer who makes his choice and opts for a website, and this consists of keeping the products attached in your virtual store in a strategic way so that in the midst of so many options he chooses to stay on your website. TURBAN, 2000¹³ also emphasizes that the content must be attractive with relevant information.

¹³ Turban, E.; Gehrke, D. Determinants Of Successful Website Design: Relative Importance And Recommendations For Effectiveness. In: 32nd Hawaii International Conference On System Sciences, 1999, Hawaii. *Proceedings...* Hawaii, 1999.

Brondmo (2001) ¹⁴argues that the company, when reaching the customer's attention, must be equipped with tools that enable this communication. In order to effect the company's relationship with the customer and the interest of the public it serves.

Turban (et al., 2000)¹⁵ recalls that at this stage, a commercial contact initiative with the customer must be formed by the company, after his consent that the company can send him its content, promotions and others.

Another means of service, through technologies, is e-mail, which can be used to forward advertisements, offers, promotions and publicity, once, as a way to carry out marketing advertising, addressing issues of interest to the customer through their authorization to receive the content. These principles ensure greater consideration and confidence on the part of the consumer, who will be able to choose whether or not to receive certain advertisements, valuing the company's profile. (HOFFMAN; BATESON, 1999).¹⁶

Reedy et al., (2001), ¹⁷define that during the process of customer involvement with the company, in the midst of the wide variety of information available about the product, it is the differences in details and specifications that can make the purchase since people do not buy on impulse or emotion on the internet. The author also points out that for this to be effective, the customer must be convinced of the real usefulness of the product offered in order to make the purchase. What should be proposed is that the greater the content with information, offer, samples and promotions of the product, the greater the chance of influencing the customer in the purchase.

Generally most customers, at the time of choice are influenced by value, and they are aligned by quality, convenience and price especially. (RUST et al., 2001).¹⁸

From the moment a potential customer makes their first purchase, they leave the position of listener and become a de facto customer. At this stage, the basis of a relationship must be prepared, through the offer of information, promotions and entertainment, which are aligned with the customer's interest. It is through this relationship that involvement arises (BRONDMO, 2001).¹⁹

¹⁹ Ibid., item 9

Brondmo (2001),²⁰ From the moment a customer's potential is identified in their first purchase, they actually become a customer. At this point, it is essential to prepare a basis to create a relationship with the consumer that is made by acquiring the largest amount of information about the customer, their interests, and thus promote approximation and involvement so that this relationship develops with new offers that meet their profile.

Through the rate for the conversion of visitors into customers is a fundamental factor for building a level in the relationships of a website and its users. That is, to understand the reason that leads consumers to use the internet, whether for the most diverse reasons as we will see in the following literature.

Moe and Fader, (2001),²¹ through analyses, identified two antagonistic behaviors on the internet: for an objective or exploratory research. TURBAN et al. 2000,²² named these behaviors hedonistic or utilitarian. WOLFINBARGER AND GILLY, 2001²³ describe the behavior that aimed at parameters in experiments. In any case, there are these two types of profiles and they should be evaluated on the website to measure these differences and score their changes.

Bellman et al., (1999),²⁴ through research on lifestyle and purchase profile, defined that there is a group of associated and connected indicators (wired) where users are able to evaluate preferences and willingness to buy online.

According to the authors, it is not the demographic indicators that will define the conception of the purchase on the website. Because on the internet, the highest index that indicates the tendency to buy is defined by sites that contain content with details and specifications about the products. In this research, the authors found that the biggest buyers on the internet have similar peculiarities in their way of life and are called the Wired Style.

Kim et al., (2000),²⁵ deepened the concept of willingness to buy *online*, addressing the risk and benefit presented in the purchase as fundamental factors in a transaction. According to Bellman et al. (1999),²⁶ according to the perception that consumers with an internet-

²⁶ Ibid., item 23

oriented style (*wired*) identify greater benefits in an *online purchase*. Moe and Fader (2001),²⁷ Wolfinbarger and Gilly (2001)²⁸ and Turban et al. (2000)²⁹ recall that consumers with greater time orientation adopt online purchases of goods and services as a benefit, confirming the utilitarian-hedonistic behavior mentioned above.

Las Casas (2007)³⁰ in his studies states that marketing in Brazil originated in 1954. Approaching the concept, we can see that it describes marketing as a primary means to create means to provide services that can retain the quality of advertising, advertising and products, and discusses in other areas offers, negotiations and a high degree of influence between the parties, due to the connection that favors the consumer to the company or social network and this leads to good results. (LAS CASAS, 2007³¹; MESQUITA, 2015³²).

Gabriel (2010);³³ Souza (2011),³⁴ associates that since technology has grown the , marketing has evolved, improving its theories, innovations and methodologies according to digital media and content production, known as digital marketing and the Influencer Marketing trend, influencers and content production processes directly interconnected to a brand or label, whose main role is to sharpen creativity, the emotional, stimulating consumers to acquire this content, especially those presented by images (MESQUITA, 2015).³⁵

And its influencers, who in the procedures of producing content linked to a certain label or brand, have the fundamental role of instigating, through their influenced or followers, the realization of purchases by digital means through their image (MESQUITA, 2015).³⁶

One of the main differences between traditional and digital marketing is based on information tools and the power of persuasion. In digital marketing it is done through websites, social media including: Twitter, Facebook, Instagram, YouTube and in its connection it is possible to find explanatory content, which is determined as a set of actions and activities that a company or person performs through the internet and globally and brings the proposal

to attract through news in trends, business, relationships and that adds value in your advertisements.

What caused a solid effect on changes in the traditional marketing previously exercised, the creation of Digital Marketing and the growth of the internet and the use of technology resulting in a high volume of Internet users, led institutions to remodel their services through digital means, realizing the scope of the network and better results in what makes up advertising and dissemination, which generated new direct and indirect competitors and heated up innovations in this scenario in the production of more creative, strategic content in order to remain in the Advertising market and stand out among the others in the scope of the internet, which is broad.

According to Santos (2020), the way of doing marketing through the internet and other digital platforms is named by the visualization of different terms, among them: online marketing, internet marketing, webmarketing, electronic marketing, digital marketing, e-marketing. The term digital marketing was the one that spread the most and has been most used by researchers and professionals in the area to address the theme.

So we can define digital marketing as a set of new strategies in constant change that are applied through the internet and that must be attentive to the browser (consumer) their customs, searches, in order to promote effective approaches to constitute this relationship between consumption and company, internet user and content, and that their actions become positive and successful.

Torres (2010, p.7),³⁷ defines digital marketing as a means of presenting your business to customers and achieving trust in what you publish, bringing the consumer to decide to buy or share your content. The author also points out that it is a communication used in the digital environment to develop strategies and practices, such as email marketing, content marketing, digital media and even links sponsored by Google through information and content relevant to the consumer.

As verified, the conception of digital marketing through the frequent competition contained in this area, led institutions and organizations to generate their image through strategies differentiated from others, forming new alternatives and ways to establish content marketing. With marketing criteria focused on distributing, creating and promoting valuable content, with consistent, relevant products, services and trends that attract and retain the

³⁷ TORRES, Claudio, Practical Guide to Internet Marketing for Small Businesses, 2010. Accessed September 2020.

customer's audience, leading to profitable and effective actions. (CONTENT MARKETING INSTITUTE, 2012, p.15). ³⁸

Mesquita (2015)³⁹ adds that content marketing is defined as an instrument with the ability to improve and that enables the construction and creation of specific content, with the power to attract its audience and constituted by values, creativity, advantages, innovation, which leads those involved in these campaigns to obtain positive results in sales, profit, campaign propagation, styles, behaviors that are fundamental to position yourself in this market.

Torres (2018) states that the expansion of the digital field is immensely richer and more complex, and all technological tools are complementary, occupying their prominent position in the daily lives and in the use of consumers. The big divergence is that before the internet was a simpler organism, and currently it has become more complex.

Previously it was understood that the internet analyzed consumer behavior, and then digital marketing was elaborated, but currently with the evolution of strategies and the greater complexity of digital technology, we also have to expand the model and for this we must consider several aspects that not only clarify digital marketing, but also the profile of consumers.

According to Kotler (2000) ⁴⁰, the result is that effective marketing can take many forms. There will always be a tension between the professionalized stage of marketing and its most creative manifestation. It is easier to learn the professional approach, which will be dealt with in most of these books." Marketing is generally seen as a sector responsible for developing, creating, and disseminating content about products, services, and ideals, also covering events, experiences, people, places, properties, organizations, and information.

Okada, De Souza (2011) corroborates by stating that digital marketing can be transformed into a process of continuous learning and interaction between customers and the market, and, in this way, disseminate a more efficient communicative connection.

Gabriel (2009) characterizes search marketing as a sphere of strategies that seek to reach the potential customer when he searches for a product, service or information on the Internet. According to Cintra (2010), digital marketing strategies have proven to be efficient

³⁸ CONTENT ROCK (2017) Inbound Marketing 2.0: The future of Marketing is here. [Internet] available on [Consult. 23.09.2020]

³⁹ Ibid., item 30

⁴⁰ Ibid., item 30

in several businesses, impacting those that are entirely online, such as those that use auxiliary platforms, interconnecting the physical with the virtual.

It is also noteworthy that marketing professionals are increasingly looking for online services focusing on the new era of relationship marketing, linking relationships from one to another, and from one to several, providing the so-called word-of-mouth advertising.

Current technologies, accessible to all, allow organizations of the most diverse sizes to more effectively control their points of connection between consumers and suppliers using digital marketing correctly, in addition to understanding the target audience, also providing them with easy, cheap and immediate benefits.

Richers (1986) says that "marketing is the set of activities that aims to concentrate exchange relations. This exchange occurs between the company's products and services with the consumer's purchasing power." Marketing is constantly updating and renewing itself with new attributions.

According to Kotler and Armstrong, 1998 Apud Santana, relationship marketing focuses on favoring the satisfaction of the company's consumers in the long term, through the elaboration and maintenance of solid relationships.

Marketing is constantly changing and should be seen as a changing science, so it is essential that companies implement strategies to highlight actions and marketing efficiently, such as redirecting actions with low effectiveness.

It is emphasized that marketing has fundamental characteristics, relating the elaborative processes and value identification, in which the concept of Relationship Marketing is related, therefore, the essentiality of an excellent high-performance commercial service brings the reformulation of the company/consumer relationship.

Relationship Marketing encompasses the characterization of values and the sharing of benefits caused by a partnership, it is the demanding consumer who has determined the success of the company, not the service/product.

3 APPLICATION

Addressing the means of digital marketing and what permeates its application in a virtual store, the object of our study, we will point out some researched strategies that can help us implement this tool effectively, aiming to collaborate to stimulate sales and new possibilities to expand the business without the need for high investments for this process.

In view of the growth of technology worldwide and with repercussions in our country, we can see that the search for shopping on the internet has become a trend among Internet users who used to only use entertainment sites, adhering to the habit of making their choices through computers, smartphones, tablets and others. And that has become a safe, fast, and convenient way to make your purchases from your homes. This has generated an increase in consumers with this profile, however, some criteria must be considered by shopkeepers to achieve success in their business. Among them, being attentive to the profile and behavior of consumers, as well as structure to promptly serve the interlocutor to be competitive with the numerous existing and continuously growing sales sites and websites in the market.

Another aspect to be highlighted is that the company adopts a strategy to be able to sell its products and services. The strategic orientation will guide all the company's business and its way of acting in front of the market and its customers. And success lies in diversity, innovation and agility in service.

Hanson (2000) ⁴¹ points out that it is a fundamental principle to generate trust in the virtual market. Which are identified through consumer searches on the web that cover trends, customs and behaviors. Another essential point is that the supplier has all relevant information in a clear and objective way, since the lack of these causes insecurity and determines one of the causes of certain people not making online purchases.

To the extent that the internet creates buying habits in which customers and sellers are spatially and temporarily separated, the parties involved remain anonymous during a transaction. As sellers and customers need to evaluate the integrity and respectability of the other party, trust is a very important factor in electronic commerce (SMITH et al., 1999).⁴²

Once the consumer purchases an item in a physical store, this transaction is usually done simultaneously: he pays for the merchandise and receives it immediately. While in virtual stores, in its vast majority, it denotes a time difference between the closing of the order, payment and delivery of the product. Consequently, the consumer will hardly be in direct contact with any employee of the company (REEDY et al., 2001).⁴³ In this process, which takes place without the physical presence and anonymity pertinent to the virtual process,

⁴³ Ibid., item 16

which are also identified by the customer and their perception of the company, a primary factor for business done over the internet. (LOEBBECKE; HORNIG, 2001).⁴⁴

Hoffman et al. (1998)⁴⁵ and Jarvenpaa et al. (2000)⁴⁶ point out that among so many challenges contained in commercial relations in the digital environment, some aspects are evident that guarantee continuity, competitiveness and trust on the part of consumers in the website. As well as, the idiosyncratic characteristics are measured by the customers, that is, the way and conception attributed to the company in the digital market.

To fully establish the operation of a Marketing Plan, it is essential that it has a common structure and information system. Which will be used by the manager and the marketing area so that the actions take place based on the reality of the market. Using this information system is directly interconnected with market analysis.

Kotler (2000)⁴⁷ adds that a Marketing Information System is composed of people, equipment and procedures to collect, select, analyze and evaluate and later distribute this information when necessary.

Another relevant factor is the design of the product, its descriptions, usefulness, the maximum specification ensures greater credibility and consumer adherence. Product-oriented companies consider that customers will give preference to products that offer better quality, performance, and benefits. In this case, the company seeks to produce products that have these innovative attributes or characteristics. Usually this guidance is followed by companies that idolize their products and in no way intend to change it, even if their customers demand a different product.

As an example, we can cite typewriter manufacturers in the past who were slow to assimilate the idea that their customers wanted computers. They imagined that they would prefer their machines, because they were simpler to handle. In fact, people were more susceptible to the facilities that computers offered, even if they had to learn how to handle them.

Marketing-oriented companies are guided by the following way of acting and thinking: they seek to find out what their customers want and offer exactly what they want. They do this before their competitors and in such a way that their products become different and

⁴⁷ Ibid., item 2

attractive to customers. Thus, they will have satisfied customers and, having satisfied customers, they will have loyal customers.

According to Kotler (2000),⁴⁸ marketing-oriented companies are constantly concerned with customer desires. When these desires change, companies seek to evolve, guided by what customers want, looking for ways that can serve them.

Due to the existence of an increasingly competitive market in Brazil, it is necessary to remember that **loyal customers** are those who are satisfied. And satisfied consumers are those who see their expectations and requests met. Therefore, no matter the concept of loyalty adopted by companies, the ways to build customer loyalty will still be the same, which determines being ahead in the competition with other companies.

An example that we can mention is the pizza delivery segment, today we have numerous pizzerias with the same service, which can be differentiated in the provision of this service in addition to the quality of the product, the delivery must be the fastest, the pizza must arrive hot, these are challenges that these companies face to be pioneers and ensure the preference of their customers

Information is defined as a raw material for marketing, and a Marketing Information System is a continuous process, where data and information are collected, processed, and stored to be Marketing, that is, with the function of understanding and serving the market in a targeted way. Due to its great importance, information must be developed through the company's Internal Records, or Marketing Intelligence methods, Marketing Research and analysis of Support Systems for new implementations or changes in the company.

We will present below the Components of a Marketing Information System:

- Internal Record System: with reports on orders, sales, pricing, inventory levels, accounts receivable, accounts payable, and more
- Marketing Intelligence System: through a set of procedures and sources used by administrators and which requires daily information on sales, developments to apply in the marketing plan. And it also denotes the need for managers to expand research in market literature, newspapers, trends, and innovations to feed and keep the market warm.
- . Marketing Research System: Through data collection, statistics, and new paths that can be taken to expand the service with relevant concepts in the company's daily life.

⁴⁸ Ibidem item 2.

We can mention quantitative marketing research, through primary research in order to analyze the relationships between the number of people and the preferences that the market presents so that they can articulate more effective strategies to increase sales and better acceptance by the public in question.

- Marketing Decision Support System: formed by coordinated data with the use of technological tools and techniques to provide support to the commercial area where it contains all the data cataloged and organized for consultation and use of the area, in prospecting, the seasonality of greater results to add promotions and new ways to promote sales.

Understanding the behavior of your consumers can make all the difference when it comes to putting your business strategies into practice. For this, it is essential to understand **how they relate to products, services, brands and, above all, how they make their choices**. All of us, as consumers, are influenced by a series of factors that lead us to decide what to buy. According to KOTLER, 2000, there are four main factors, commented below:

- Culture:** people end up acquiring a set of values, perceptions, preferences, and behaviors through life in society (social groups), which interfere with their consumption habits.
- Subculture:** the subculture is composed of a set of cultural particularities of a smaller group, differing from the standard of the larger society, however, without disconnection from the current culture. Examples of subculture are the values that differentiate religions, racial groups, geographic regions, etc.
- Social class:** composed of a group of people who are framed in a common social stratum. It consists of orderly, relatively homogeneous and lasting divisions of a society. Its members have similar values, interests, and behaviors.

Many companies advocate the idea of promoting only one benefit to the target market. Each brand must choose an attribute and promote itself as number one in that attribute. Buyers tend to remember message number one, especially in a society of excessive communication. What are some of the number one positions to promote? The main ones are better quality, better service, lower price, higher value, and more advanced technology. If a company takes one of these positions and sticks to them convincingly, it will likely be best known and remembered for its strength.

Marketing mix denominated as marketing compound which is the set of marketing tools that the company uses to pursue its marketing objectives in the target market. These tools are classified into four broad groups, called the 4Ps of marketing: product, price, place or point of sale. In the promotion of the English language product, price, place and promotion.

The figure below presents a mix with the company's conceptions in products, services and prices.

Figure 1

saiadolugar

rockcontent

Source: rock contente

- Product: the product must be the product desired by the customer, within their expectations and that meets their needs.

- Price: The customer will look for a fair price, which should not be too high so that the customer considers it not worth buying. Not so low that it leads you to think that there is something wrong with the product, to the point of refusing it.
- Place (Point or Distribution): the desired product with a fair price must be accessible to the customer, that is, in a place where he can buy it at the time he wants.
- Promotion: There is a popular proverb that says: . Advertising is the soul of the business, and in fact, he is absolutely right, because if we do not disclose the product to customers, they will not know about its existence and will not be able to purchase it.

Production-oriented companies have the vision that customers will give preference to products that are found anywhere and at a low price. Thus, the company seeks to produce more and more, aiming to lower its prices and place its products or services in as many points of sale as possible, so that customers can find them easily. They don't consider the individual needs and wants of their customers and the fact that the cheapest product won't always satisfy everyone.

As an example, some doctors believe that the simple fact of offering their services to clients at an affordable price (via Public Service) will make them satisfied with the services and be willing to wait until they can be seen. In reality, customers, in general, are completely dissatisfied and, at the first opportunity they can afford a health plan or a private consultation, they will look for a competitor. It is possible to see that there is not, in this approach, a greater concern with customers, their desires and their needs.

3.1 PRODUCT ORIENTATION

Holding that consumers prefer products that offer superior quality and performance or that have innovative features, managers in organizations that follow these lines focus on making quality products and improving them over time.

3.2 SALES ORIENTATION

Sales-oriented companies adopt the thinking that customers don't decide to buy on their own. In this way, the company needs to induce them to make the decision, otherwise there will be no purchase. Several companies adopt this orientation, and with success. What happens is that they are not concerned with satisfying the needs of customers, but with

satisfying their own needs. Often, the customers to whom the product was sold did not want it and only purchased it due to the so-called Pressure Selling, which can inevitably generate an unsatisfied customer.

According to several marketing authors, an unsatisfied customer is a potential enemy. For example, some companies that sell encyclopedias look for their customers at home, usually at night, and insistently try to convince them to purchase the product. Often customers are not in need of the product, but are convinced to buy it. These people will not be satisfied with the purchase made and, later, they will become negative propagandists of the company and the product.

3.3 MARKETING ORIENTATION

Reference groups: groups of people who influence consumer feelings, thoughts, and even behaviors. For this reason, they are also known as opinion-forming groups.

They can be divided into informal groups, consisting of those with greater affinity or formal groups.

Family: the most influential reference group. They can be family members such as parents or consumer children.

Social roles and positions: throughout life, people participate in groups and assume certain social roles. This makes them choose products that represent their status in society.

Personal age: people's needs and desires change throughout life and, consequently, so does their consumption.

Occupation: The profession exercised also directly influences consumption patterns.

Economic condition: composed of equity, savings, disposable income, and credit conditions that directly affect consumer purchasing choices.

Lifestyle: activities, interests, and opinions that are associated with specific products and services can lead the consumer to buy according to the brand's positioning in the market.

Personality: Each person has a distinct personality, which will influence their buying behavior. It is an important element that can establish strong correlations between certain personality types and consumer choices.

Motivation: the desire that drives the consumer to the action of satisfying their specific needs and desires through consumer choices.

Perception: the process in which the individual selects, structures and deciphers the information received. Perception depends not only on physical stimuli, but also on the relationship of these stimuli with the needs at that moment.

Learning: knowledge acquired by the consumer due to their previous experiences can cause changes in behavior.

Beliefs and attitudes: the psychological positioning, negative or positive, of the consumer in the face of consumption choices.

It is necessary to keep in mind that consumption is one of the multiple actions that permeate the daily life of human beings. People have infinite motivations to pursue ambitions, to conquer spaces and for personal fulfillment. Therefore, evaluate in detail all the factors that can influence your customers' behavior and take advantage of the insights learned from this exercise to compose your marketing strategies.

An important factor to consider is the diversity present in society, which goes against thinking and how it influences the choices of products or services in relation to their style, age group, gender, group to which they belong.

Known as Market Segment to a part of the market with similar characteristics or not. Where in two groups are found variables that can be used to segment consumer markets. Consumer characteristics and behavior are usually analyzed. Through these characteristics of consumers and their Variables, the performance of marketing for Segmentation of Consumer Markets is consolidated:

- Geographic: proposes to divide the market into different geographic units, such as countries, states, regions, cities, or neighborhoods.
- Demographic: occurs when the market is divided into groups based on demographic variables, such as age, family size, family life cycle, gender, income, occupation, educational background, religion, race, generation, nationality or social class;
- Psychographic: occurs when buyers are divided into different groups, based on lifestyle under personality. Marketing is much more than a promotion and sales tool, it denotes a customer-centric philosophy
- Consumer behavior presents the following variables for Segmentation of Consumer Markets:
- Occasions: Consumers can be differentiated according to the occasions when they feel a need, buy or use a product such as when they are traveling what they consume.

- Benefits: Buyers can be classified according to the different benefits they seek in a product as it serves the customer from a different angle or situation.
- User status: Users can be segmented into groups of non-users, former users, potential users, new users, and regular users of a good that can be re-consumed.
- Usage rate: they can be segmented into small, medium, or large users of a product or service.
- Loyalty status: the market can be segmented by consumer loyalty patterns such as those loyal to the brand, such as Coca-Cola or McDonald.s.

A business should look to identify specific ways to differentiate its products in order to gain competitive advantages. Differentiation develops a set of significant characteristics to distinguish your product from the competing market.

How, exactly, can a company differentiate its market offering from its competitors. A company can be differentiated in five dimensions: product, services, channel, and image.

- Product differentiation: the main product differentiations are the characteristics, performance, compliance, durability, reliability, ease of repair, style and design we can exemplify furniture companies and their brand.
- Service differentiation: the main differentiators of services are ease of ordering, delivery, installation, consumer training, consumer consulting, maintenance and repair, among others such as internet sales.
- People differentiation: This is about gaining competitive advantages by hiring and training people who are better qualified than your competitors. Basically there are six characteristics: competence, courtesy, credibility, reliability, responsiveness and communication
- Differentiation through the distribution channel: it is about obtaining differentiation by the way in which its distribution channels are developed, especially in terms of coverage, experience and performance such as Natura, Avon, Demillus and others.
- Differentiation through image: buyers may respond differently to the image of the company or brand. The image basically involves four aspects: symbol, audiovisual and written media, atmosphere and events.

As for positioning, each company will want to develop differences that will more strongly appeal to its target market. She will develop a focused positioning strategy, the

company's offer and image, so that they occupy a distinct and valued place in the minds. We call this simply positioning, and we define it as follows: it is the act of developing target consumers.

Being a resource with great power to influence organizations, information plays a prominent role in the management of companies, regardless of their size or area of activity.

However, we must distinguish two basic concepts that make up information, the concept of data and information itself. According to Oliveira (2002, p. 36),⁴⁹ we can verify: data is any element identified in its raw form that, by itself, does not lead to an understanding of a certain fact or situation. Information is the data worked on that allows the executive to make decisions. For data to be transformed into information, it is necessary to process it, that is, the data receives a treatment that gives it meaning, functioning as a system where data are the inputs and information is the results of this process or outputs

In the era of sharing and digital technological generation, e-commerce is promising in Brazil. According to a report from the Brazilian Micro and Small Business Support Service (Sebrae), "the market for baby items, in the age group from zero to six months, is the most promising. It is part of the family budget to permanently buy baby items, because at each stage of life of the baby and the child, it requires different products". (BRAZILIAN MICRO AND SMALL BUSINESS SUPPORT SERVICE, 2016).⁵⁰

E-commerce represents part of the present and future of commerce. There are several business opportunities spread across the internet, in addition to many that are created all the time. It is very likely that a price search on the internet will bring not only the lowest price, but also the best options for goods. And, despite the bottleneck represented by the "digital illiteracy" of a large portion of the population, e-commerce is already emerging with a generation that was born with the computer "in their lap" or "in their hands". The growth in the number of Internet users in the last decade is astounding. (TEIXEIRA, 2015, p. 19).⁵¹

The demanding market values the details and quality of the products, which can generate differential at the time of purchase. The arrival of a child causes changes in the family environment. Before the baby is born, it is necessary to prepare the layette, decorate the baby's corner and other details.

⁴⁹ OLIVEIRA, Djalma de Pinho Rebouças. Systems, organization & methods: managerial approach. 9. ed. São Paulo: Atlas, 1995, p. 85 - 97.

⁵⁰ BRAZILIAN SUPPORT SERVICE FOR MICRO AND SMALL ENTERPRISES. How to set up a baby supply store.. Accessed on: 09.23.2020

⁵¹ TEIXEIRA, Tarcisio. Electronic commerce: according to the Civil Rights Framework for the Internet and the regulation of e-commerce in Brazil. São Paulo: Saraiva, 2015.

Future parents are going through a unique experience and want to purchase products that meet these needs, however, it is important to have a company that complies with the law. In this sense, the potential of the market is observed, because, "It is increasingly common to find families where both parents work, which means a more significant income to be spent on the children". (BRAZILIAN MICRO AND SMALL BUSINESS SUPPORT SERVICE, 2016).⁵²

It is interesting to note that "the consumer, in the search for authenticity, has sought to relate to their brands as a way of getting to know them and analyzing whether to put them in their life or not". (VAZ, 2016, p. 169). For the author, credibility is a fundamental point, regardless of the type of business, because "credibility goes through the consumer's perception of ethical behavior on the part of companies". (VAZ, 2016, p. 169).

The author adds: You only allow someone to become your friend if you trust them. Something similar happens with brands nowadays. Credibility is everything. No matter your business, you have to generate credibility in your consumer so that he buys from you and not from your competitor. (VAZ, 2016, p. 169).

Therefore, the ethical posture is essential for building a solid brand in the competitive market, because with the establishment of attitudes that a differential can be made. It cannot be forgotten that we live in an era in which transparency is a fundamental point for digital marketing intelligence. As Conrado Adolpho Vaz (2016, p. 168) shows,⁵³ "being ethical is more than telling the truth and being transparent in your attitudes. To be ethical is to reveal the secrets of your institution to the consumer as a way of asking for their consent."

And yet, according to how to proceed in an e-commerce, the author adds: It is to allocate time to your customer to explain why your company is doing this or that. To be ethical is to give back to society what it has given it in the form of profits. A movement that started a few years ago and that has only increased its influence, the search for ethics in relationships, has changed the market. (VAZ, 2016, p. 168).⁵⁴

In a virtual world in which geographical and temporal barriers are broken, in the understanding of Tarcísio Teixeira (2015, p. 27), with the use of the internet there is a need for attention to the consumer. With the support of computers, merchants now have a greater

⁵² Ibid. item 36

⁵³ VAZ, Conrado Adolpho. The 8 P's of digital marketing: your digital marketing strategic guide. 7. Reimp. São Paulo: Novatec, 2016.

⁵⁴ Ibid. item 38

radius of reach, considering that with the internet there are practically no geographical barriers for business; at least as far as the disclosure of goods is concerned, as there are still some obstacles regarding the difference between legal systems and the borders between countries, especially when a physical delivery of the product or an on-site service is required.

E-commerce requires a series of planning, obligations, and monthly expenses that must be thought out, focused, and planned. The strategies, whether they are marketing, customer care from purchase to delivery and a possible exchange, as provided for in the legislation, the right of repentance, must be in perfect harmony at all times for the good performance of the product, the brand and the store in a market that grows more and more every day.

According to Fábio Ulhoa Coelho (2016, p. 80) ⁵⁵"currently, with the diffusion of e-commerce, the parallel is no longer significant. The internet is seen, today, no longer as a virtual establishment, but as a specific business channel [...] ". The changes that have occurred in the behavior of society in the information age, "the law faces new challenges and needs to adapt in order to guarantee social peace, disciplining relations and imposing new norms of conduct consistent with the virtual environment". (MARTINS, 2015, p. 09)⁵⁶element. For this, it is important to know the legislation on e-commerce, such as the Civil Rights Framework for the Internet, the Civil Code and the Consumer Protection Code to seek the correction of the e-commerce site of the First Steps Baby Store so as not to generate distrust to customers.

The Civil Rights Framework for the Internet brought specific civil regulation for cases related to the use of the Internet in Brazil. The lack of a specific law made many consumers suspicious of the type of commerce carried out through a virtual environment. Insecurity stems from issues related to rights, whether administrative or judicial. For negotiations via the internet in Brazil, the Civil Code and the Consumer Protection Code apply. Also mentioned are Decree No. 7,962, of March 15, 2013,⁵⁷ on contracting in e-commerce, regulating the Consumer Protection Code, and also the validity of Law No. 12,965, of April 23, 2014, the Civil Rights Framework for the Internet, which brings rules and principles for the security of internet users.

⁵⁵ COELHO, Fábio Ulhoa. Manual de direito comercial. 28. ed. ver. current. eampl. São Paulo: Revista dos Tribunais, 2016.

⁵⁶ MARTINS, Vanessa do Sul. Electronic law. Palhoça: UnisulVirtual, 2015.

⁵⁷ BRAZIL. Decree No. 7,962, of March 15, 2013. Regulates Law No. 8,078, of September 11, 1990, to provide for contracting in electronic commerce. Accessed on: 09.23.2020

As Tarcísio Teixeira (2014) explains,⁵⁸ "when analyzing the Marco Civil, one may have the initial impression that the rule does not clearly deal with electronic commerce in the strict sense (regarding the purchase and sale of products and provision of services), but only with other operations carried out in electronic commerce in a broad sense (such as issues involving the protection of privacy and the prohibition of the improper capture of data and its commercialization). However, its rules and principles have a direct implication in everything that occurs on the internet in Brazil, including e-commerce, as operations involving the production and circulation of goods and services."

João Paulo de Mello Filippin (2016, p. 6),⁵⁹ corroborates the analysis above that "with regard to electronic commerce, the aforementioned law practically does not provide anything. In fact, in the justification of the law itself, it was said that the Civil Rights Framework for the Internet would not deal with e-commerce." However, the same author points out that "[...] This law imposed a limitation on the collection of information from users' personal data.

It assured that it is their right to 'express consent to the collection, use, storage and processing of personal data, which must occur separately from the other contractual clauses (BRASIL, Law No. 12,965/2014)⁶⁰'. In this sense, there are implications in electronic marketing, consequently in e-commerce. (FILIPPIN, 2016, p. 7)⁶¹element. The Civil Rights Framework for the Internet makes clear, in the case of e-commerce, the obstacle in carrying out remarketing, and it is "necessary to include in the contract entered into with the buyer (whether consumer or not) the information of what will be carried out, as well as to ask for his authorization to carry out promotions or offers". (FILIPPIN, 2016, p. 7).⁶² The more consumers talk (well) about your brand on the internet, the greater the credibility it will enjoy and the greater the number of buyers per hundred visits.

When I say "buyers" I mean people who reach the site's goal. This goal can be an email contact, a registration, a request for a quote, or a purchase, in fact, if your site is an e-commerce site. The conversion rate will give you the direct measure of your brand's credibility and the degree of sellability of your website. In order for you to have good credibility on the internet, your website must use and abuse testimonials on and off the site and do intense

⁶⁰ BRAZIL. Civil Rights Framework for the Internet. Law No. 12,965, of April 23, 2014. Establishes principles, guarantees, rights and duties for the use of the Internet in Brazil. Accessed on: 09.23.2020

⁶¹ Ibid., item 44

⁶² Ibid., item 44

work on social networks so that the consumer's opinion of you on the web is positive and viral. (VAZ, 2016, p. 172-173).⁶³

Also in this area, it is important to warn that the Civil Rights Framework for the Internet establishes access to the Internet as an essential part of the exercise of citizenship and the user. To this end, some rights are ensured: (I) inviolability of intimacy and private life, their protection and compensation for material or moral damage resulting from their violation; (II) inviolability and secrecy of the flow of its communications over the internet, except by court order, in accordance with the law; and (III) inviolability and secrecy of your stored private communications, except by court order.

It is worth noting that one of the main achievements of the Civil Rights Framework for the Internet was the recognition, in article 7, XIII, of the need to "apply consumer protection and defense rules in consumer relations carried out on the Internet". In addition, the law provides soon after, in its article 8, the guarantee of the right to privacy and freedom of expression in communications as a condition for the full exercise of the right to access the internet. It is, as can be seen, an attempt to create security in a complex scenario, bringing the possibility of future and beneficial reflections on consumer relations carried out via the internet. (URNAUER; BARRETO, 2014, p. 281).⁶⁴

Legal certainty is a key factor in the times of the Internet, with attention to principles, guarantees and the good use of digital media in Brazil. For Suellem Aparecida Urnauer and Ricardo de Macedo Menna Barreto (2014, p. 284),⁶⁵ "the Marco Civil then proceeds to normatively redefine the complex consumer relations that occur in cyberspace, revealing itself as an important logical principle to face issues involving not only traditional electronic commerce, but also electronic social commerce". Therefore, it is interesting to understand the laws that govern e-commerce in Brazil, as legal certainty is a primary factor in a commercial context.

The objective of this study is to investigate the strategic management of information in the application of relationship marketing in retail. As a research method, exploratory research was chosen. According to the objectives, according to Gil (2002, p. 41) ⁶⁶"exploratory

⁶³ Ibid. item 38

⁶⁵ Ibidem item 49

⁶⁶ GIL, Antonio C. Classifying research IN: How to develop research projects. 3 ed. São Paulo: Atlas, 1996. (p. 86 - 101).

research aims to provide greater familiarity with the problem, with a view to making it more explicit or to constitute hypotheses. [...] improvement of ideas or the discovery of intuition". For Marconi and Lakatos (2003, p. 124), ⁶⁷exploratory research:

It is the first step of all scientific work. The purposes of an exploratory research, especially when bibliographic, are to provide more information on a given subject; facilitate the delimitation of a work theme; define the objectives or formulate the hypotheses of a research or discover a new type of approach for the work that is in mind.

The present work also assumes a descriptive research character, since it seeks to establish a relationship with the information necessary to subsidize relationship marketing with the data collected from customers. According to Gil (2002, p.42), ⁶⁸it is characterized as:

[...] the description of the characteristics of a given population or phenomenon or, alternatively, the establishment of relationships between variables. [...] Included in this group are surveys that aim to survey the opinions, attitudes and beliefs of a population.

As for the design or the means, it is a matter of defining its conceptual and operational model, that is, the design of a research "refers to its planning in its broadest dimension, which involves both the layout and the prediction of analysis and interpretation of data collection." (GIL, 2002, p. 43). Thus, the definition of the research is important for the process of data collection and analysis.

In view of this, the present research in relation to the means or delineations is of the survey type, which is characterized by the direct interrogation of the people whose behavior is desired to be known through quantitative analysis, obtaining the conclusions corresponding to the collected data (GIL, 2002, p. 50).⁶⁹

Like all research, bibliographic analysis is also an integral part of this study, given the need for theoretical foundation focused on the object of study and data analysis. According

⁶⁷ MARCONI, Maria de Andrade; LAKATOS, Eva Maria. Fundamentals of Scientific Methodology. São Paulo: Atlas, 2003, p. 195 – 202; 223 – 224

⁶⁹ Ibid. item 65

to Gil (2002, p. 45)⁷⁰ "bibliographic research is developed based on material already prepared, consisting of books and scientific articles".

To complete the theoretical foundation of this work, it was also used internal documents of the company, characterized as a documentary research. Highlighting that every new posture or attitude taken by an organization brings many changes with relationship marketing, this is no different.

In order for the company to put it into practice, it is necessary to promote changes in the culture of its managers, employees and shareholders, where the sense of establishing relationship marketing is a factor in generating competitive differential, and that it is understood by all that information has a main role in this new scenario.

4 CONCLUSION

The present work in accordance with the PIN developed about such a cuddly baby clothes manufacturing company brings an analysis of the importance of financial management in companies as a result of success and profits, through a set of actions and procedures aimed at digital marketing and e-commerce sales, such as planning, analysis and control of financial activities. It was understood that the financial function in a company requires care, planning and a lot of responsibility in managing finances.

We understand through the literature review that the currently predominant concepts are the result of the accumulation of knowledge and previous experiences. It was highlighted by the history that the evolution of the financial function is not finished. Studies are underway and new points of view are being explored.

In view of the literature that supports the steps and procedures to be followed for the constitution with expansion of marketing in the digital world, it was possible to verify that every process, even if online, requires management, and needs interventions from different areas such as purchases, accounts payable and receivable, production and inventory control, logistics. And to institute this concept, there must be a systemic connection between these sectors, there are two important tools that the financial manager needs to master, such as: cash flow and income statement. Every financial manager needs to be up to date to manage finances with the capacity and awareness to lead the company to success and growth.

Marketing is going through the greatest moment of sensitivity in history with its consumer. More than ever, strategies prove to be the main element in the market. Knowing

⁷⁰ Ibid. item 65

how to win in a trade as treacherous as today's is not easy, but strategic planning has been able to reinvent itself with the internet, which presents the challenge of being in constant change. Finally, it is worth noting that digital marketing revolutionizes the market by bringing an unprecedented interaction between consumer and brand, allowing for greater precision in communication. The market has become more challenging with digital marketing, however the possibilities that came along with this tool have no limits.

ACKNOWLEDGMENTS

To my friends and family who supported me for the creation, development and completion of this project. I thank all the professors at Fundação Getúlio Vargas who made their days available and shared their professional experiences. In particular, to our advisor and professor Luís Eduardo Machado for the explanations and guidance in all steps until the conclusion of this project, the Business Plan.

DEDICATION

I respectfully dedicate this project to friends and family who understood with affection all the time spent and effort made so that in the end we could conclude our work well.

ABSTRACT

The objective of this study was to evaluate the application of a tangible, wireless educational technology, based on ESP32 and RFID, to support the literacy process of children with writing difficulties. The research was conducted in a public school, involving ten third- and fourth-grade students and a literacy teacher. Over ten workshops, the technology mediated reading, writing, and phonological awareness activities. The children were assisted in tasks such as reading, writing words, and recognizing letter sounds. The results demonstrated that the technology proved to be a highly effective resource in the literacy process. Data collection included observations of the participants, analysis of written productions, records of correct and incorrect answers, and evaluation of student progress by the literacy teacher. Content analysis was used, which indicated significant advances in phonological awareness, self-correction, autonomy, and engagement of the children. Among the most relevant occurrences was the advancement in understanding the grapheme-phoneme relationship. The tangible interface, combined with instant auditory feedback, promoted greater participation and focus, allowing for longer work periods with less need for researcher intervention. The teacher evaluated the tool as easy to use, requiring low infrastructure, and applicable to different school contexts. The study thus highlights the potential of tangible educational technologies as cognitive mediators in the initial literacy process of children with learning difficulties, while also emphasizing the importance of continuous teacher training.

Keywords: Literacy. Tangible Educational Technologies. Learning Difficulties. ESP32 and RFID. Phonological Awareness.

RESUMO

O objetivo deste trabalho foi avaliar a aplicação de uma tecnologia educacional tangível e sem fio, baseada em ESP32 e RFID, como suporte ao processo de alfabetização de crianças com dificuldades de escrita. A pesquisa foi conduzida em uma instituição pública de ensino, envolvendo dez alunos do terceiro e quarto ano e uma professora alfabetizadora. Ao longo de dez oficinas, a tecnologia mediou atividades de leitura, escrita e consciência fonológica.

As crianças foram assistidas em tarefas como leitura, escrita de palavras e reconhecimento dos sons das letras. Os resultados demonstraram que a tecnologia se revelou um recurso altamente eficaz no processo de alfabetização. A coleta de dados incluiu observações dos participantes, análise das produções escritas, registros de acertos e erros, além da avaliação do progresso dos alunos pela professora alfabetizadora. Utilizou-se a técnica de análise de conteúdo, que apontou avanços significativos na consciência fonológica, na autocorreção, na autonomia e no engajamento das crianças. Entre as ocorrências mais relevantes destacou-se o avanço na compreensão da relação grafema-fonema. A interface tangível, aliada ao feedback sonoro instantâneo, promoveu maior participação e foco, permitindo períodos de trabalho mais prolongados e com menor necessidade de intervenção do pesquisador. A professora avaliou a ferramenta como de fácil uso, de baixa demanda de infraestrutura e aplicável a diferentes contextos escolares. O estudo evidencia, assim, o potencial das tecnologias educacionais tangíveis como mediadoras cognitivas no processo inicial de alfabetização de crianças com dificuldades de aprendizagem, ao mesmo tempo em que ressalta a importância do treinamento contínuo dos professores.

Palavras-chave: Alfabetização. Tecnologias Educacionais Tangíveis. Dificuldades de Aprendizagem. ESP32 e RFID. Consciência Fonológica.

RESUMEN

El objetivo de este estudio fue evaluar la aplicación de una tecnología educativa tangible e inalámbrica, basada en ESP32 y RFID, para apoyar el proceso de lectoescritura de niños con dificultades de escritura. La investigación se llevó a cabo en una escuela pública, con la participación de diez estudiantes de tercero y cuarto grado y un docente de lectoescritura. A lo largo de diez talleres, la tecnología facilitó actividades de lectura, escritura y conciencia fonológica. Los niños recibieron asistencia en tareas como leer, escribir palabras y reconocer los sonidos de las letras. Los resultados demostraron que la tecnología resultó ser un recurso altamente efectivo en el proceso de lectoescritura. La recopilación de datos incluyó observaciones de los participantes, análisis de producciones escritas, registro de respuestas correctas e incorrectas, y evaluación del progreso estudiantil por parte del docente de lectoescritura. Se utilizó el análisis de contenido, el cual indicó avances significativos en la conciencia fonológica, la autocorrección, la autonomía y la participación de los niños. Entre los avances más relevantes se encuentra el avance en la comprensión de la relación grafema-fonema. La interfaz tangible, combinada con la retroalimentación auditiva instantánea, promovió una mayor participación y concentración, permitiendo períodos de trabajo más largos con menor necesidad de intervención del investigador. El docente evaluó la herramienta como fácil de usar, con baja infraestructura y aplicable a diferentes contextos escolares. Por lo tanto, el estudio destaca el potencial de las tecnologías educativas tangibles como mediadores cognitivos en el proceso de alfabetización inicial de niños con dificultades de aprendizaje, a la vez que enfatiza la importancia de la formación docente continua.

1 INTRODUCTION

Educational inclusion is a principle that ensures all students, regardless of their particularities, such as disabilities or specific educational demands, the same access to regular education. Although there are legal frameworks that guarantee the presence of people with disabilities in schools, Silva *et al.* (2025b) highlight that simply inserting these people in learning environments is not equivalent to promoting genuine inclusion. To achieve true inclusion, it is necessary to confront and overcome the various obstacles that still exist in our education system (Araújo *et al.*, 2025).

Among these barriers, the pedagogical one stands out, which concerns the lack of adaptation of teaching techniques to the varied educational demands of students. This can include the lack of methods that take into account and respect the various forms of learning, rhythms and styles of each student. A considerable challenge that affects the effectiveness of the teaching-learning process is the difficulty in adjusting the content, tasks and assessments to the particularities of students with specific needs. Cardoso, Santos, Mendonça Neto (2025) and Furtado, Almeida, Kohls-Santos (2025) address the way in which technologies, especially robotics, can provide multidisciplinary resources and curricular flexibility, benefiting varied strategies to access content and assessments. Silva *et al.* (2025c) suggest that collaborative and flexible methodologies are solutions to overcome these challenges. The absence of truly inclusive education for all students not only diminishes learning opportunities, but can also generate a negative environment in which these students feel excluded or unmotivated.

Another aspect to be considered is literacy, which plays a fundamental role in the school trajectory of any child. The literature on education shows that many students have difficulties at this time of learning and this is even clearer for those who have specific needs (Matos; Santos, 2021; Lyre; Silva; Silva Neto, 2024; Cardoso, 2022; Viana; Amorim; Amorim, 2023). Literacy involves not only the decoding of words, but also the comprehension of texts and written production, being a milestone for the academic and social development of students. Therefore, pedagogical intervention is essential in this scenario. According to Martins, Giraffa, and Raabe (2021), pedagogical practices that use innovative technologies, such as robotics, favor the development of reading and writing skills, in addition to transforming the environment into a place conducive to experimentation and creativity. In the same sense, Cardoso, Santos, Mendonça Neto (2025) and Furtado, Almeida, Kohls-Santos

(2025) point out that technological resources help to minimize barriers by stimulating student participation.

In addition, Oliveira, Senff and Silva (2024) say that the training of teachers and educators is a key point to make education truly inclusive. In order for education professionals to be able to meet the various needs of their students, they need to have access to the right training that helps them see and deal with differences (Dias *et al.*, 2024). This not only involves theoretical knowledge but also the practice of inclusive methodologies that create a collaborative learning environment where all students feel valued and respected.

The interaction between students, teachers and the school community as a whole is also fundamental for the creation of an inclusive environment (Silva *et al.*, 2025b). It is essential that there is a collective awareness about the relevance of inclusion and respect for diversity. A joint and collaborative effort can encourage behavioral changes and actions that promote inclusion, allowing students with specific needs to feel part of the group while other students cultivate empathy and respect for diversity (Silva *et al.*, 2025b).

Educational inclusion, according to Araújo and Silva (2025), is not only about policies and guidelines; it is a cultural change involving all participants in the educational process. The authors believe that educational inclusion is the construction of a fairer society where everyone has the same opportunities to learn. To continue on this path, it is essential to carry out a continuous diagnosis of pedagogical practices, as well as evaluations that take into account the progress of each student according to their needs and abilities. The search for inclusion must be a continuous search for improvement in the quality of teaching, offering solutions to enable learning for all (França *et al.*, 2025; Pires, 2025).

Educational inclusion can be a complex goal that requires a joint and multidisciplinary effort in which the uniqueness of each student is considered and respected. For Riboli and Pertuzzatti (2025), overcoming pedagogical barriers and creating a welcoming environment are essential steps to ensure that all students, especially those with specific educational needs, can achieve their goals and experience the full development of their potential. By prioritizing inclusion in the educational scenario, we contribute to forming not only competent individuals, but also conscious, responsible and supportive citizens.

2 METHODOLOGY

The study is an applied research, with a mixed approach (qualitative and quantitative), and an exploratory case study. The objective was to evaluate the pedagogical effectiveness

of a wireless computational tool made with ESP32 microcontroller and *Radio-Frequency Identification* (RFID) module, which was designed to help in the literacy process of children with learning difficulties in the writing system.

2.1 CONTEXT AND PARTICIPANTS

The research took place in a public school in the municipality of Camboriú in Santa Catarina, together with a literacy teacher from the basic education network. There were ten children from 8 to 10 years old regularly attending the 2nd and 3rd years of elementary school. It was reported by the pedagogical team that these children were presenting chronic difficulties in reading and writing.

For a more detailed analysis, three participants were chosen as cases for closer observation, considering their school history, the level of development of phonological awareness and the degree of difficulty in grapheme-phoneme correspondence.

2.2 DESCRIPTION OF THE WIRELESS COMPUTING TOOL

The instrument developed was a wireless computational tool using the RFID system (it is composed of the ESP32 microcontroller and the RFID module). It was programmed to identify labels containing letters, syllables, and words to be learned. When the card is brought close to the reading surface, the student receives immediate sound feedback, making sure that the answer is right or wrong. This contributed to the self-correction process and helped to reinforce the grapheme-phoneme relationship.

The tool does not automatically store data or log logs. The researchers evaluated the students' performance based on observation, analysis of written productions, as well as their manual records throughout the workshops. The practical implementation was supported by ten literacy workshops held over five weeks, reading, writing and phonemic identification activities. Such activities were carried out assisted by the researchers and by a literacy teacher, actively participating in the group, who collaborated in the pedagogical practices planned by the researchers.

2.3 DATA COLLECTION PROCEDURES

Data collection was based on three complementary sources:

- 1. Participant observation:** the researchers manually recorded the number of successes and errors that the students made during the activities mediated by the tool,

in addition, they wrote down behaviors such as engagement, attention, frustration, and forms of self-correction.

2. Written productions and oral readings: the students carried out spontaneous reading and writing activities before and after the workshops, which made it possible to analyze the evolution in the domain of the writing system.

3. Teacher feedback and field diary: teachers shared their impressions about the tool, addressing aspects such as pedagogical adequacy, student engagement and identified difficulties.

Finally, the data were treated qualitatively, through content analysis (Bardin, 2011), focusing on engagement, autonomy, necessary pedagogical help and use of phonological awareness. The numerical records produced manually (hits and misses by activity) were allocated in simple tabulations to allow descriptive analysis.

2.4 ETHICAL ASPECTS

The study was carried out in accordance with the general principles of Resolution No. 466/2012 of the National Health Council, particularly regarding confidentiality, anonymity and free consent. The project was endorsed by the Ethics Research Committee of the Federal Institute of Santa Catarina (IFC).

3 RESULTS AND DISCUSSION

3.1 EVIDENCE OF PERFORMANCE OBSERVED DURING THE USE OF THE TOOL

During the workshops, it was possible to observe a progressive improvement in the accuracy and fluidity in the performance of the task by the students. Although the tool did not store data automatically, the researchers manually recorded the successes and errors of each student in each activity, allowing them to identify patterns of evolution.

The descriptive analysis of these records showed that:

- students started to make **fewer syllable identification errors**, especially in the most common combinations (ba, ca, la, pra, tra);
- there was a **visible reduction in the teacher's need for mediation**, as immediate sound feedback allowed self-correction;
- students demonstrated greater speed in decision-making, even without formal automatic measurement;

- Three students initially classified as "with high phonological deficit" began to identify simple syllables with greater confidence.

These results were organized in simple tables based on the researchers' records, allowing them to monitor the performance throughout the workshops.

Table 1

Participant A1

PRETEST	ACTIVITY - A	ACTIVITY - B
READING AND AWARENESS OF RHYMES	WORD SYLLABLE RECOGNITION	RECOGNITION OF WORD PHONEMES
Rhyming AWARENESS	SLABIC AWARENESS	PHONEMIC AWARENESS
1 - Who lives in Caco's house?		
A: Pre-test: Magco	MA-CA-CO	/m/a/c/a/c/o/
A: Post-test: APE	MA-CA-CO	M/A/C/A/C/O
2 - Who lives in the beautiful house?		
A: Pre-test: Beautiful	CABOITO	c/a/b/o/i/t/o
A: Post-test: CABRITA	CA- BR - ITA	C/A/B/R/I/T/A
3- Who lives in the cement house?		
A: Pre-test: cement	JU O	Did not complete
A: Post-test: DONKEY	JU-ME-NTO	J/U/M/E/N/T/O

Source: the authors (2025)

Table 1 shows the evolution of some activities of participant A1, a 9-year-old child. She is in the third year of elementary school and has speech problems. It is in the syllabic phase with sound value in the literacy process. This level of development is when the child is able to give sounds to syllables, but does not yet have a total correspondence between grapheme and phoneme. This shows that it needs mediated activities to help phonological awareness and the structuring of the writing system little by little.

3.2 QUALITATIVE ANALYSIS OF INTERACTIONS

Content analysis revealed three emerging core categories:

1. Engagement and motivation: students demonstrated greater willingness to repeat the activities and satisfaction with the sound feedback of the tool, perceived as a "game of letters";
2. Autonomy and self-correction: immediate feedback reduced teacher dependence and favored self-correction of spelling errors;

3. Pedagogical mediation: the role of the literacy teacher remained essential to guide the didactic sequence, reinforcing the complementary character of technology.

Direct observation showed that there was an increase in participation and attention maintained during activities, especially among children who had more difficulties at the beginning. These results confirm the researchers' hypothesis, a principle also defended by Felipe (2015), that linguistic and phonological mediation, when supported by technological resources, increases the chances of meaningful learning.

3.3 SYNTHESIS AND EDUCATIONAL IMPLICATIONS

The results show that the wireless technology used was a good cognitive and pedagogical mediator, bringing clear gains in student performance and motivation. By combining physical and computational interactivity, the system increases the chances of digital and educational inclusion in literacy situations for children with problems learning to write. These findings confirm the central hypothesis that tangible interaction, mediated by an accessible and responsive computer system, enhances the literacy process. The research reinforces the need for continuing teacher training focused on the use of assistive technologies and intelligent tools in the school context.

3.4 ANALYSIS OF THE INTERACTION AND USABILITY OF THE TOOL

The responsiveness, clarity and level of engagement generated by the tool's physical interface, which consists of RFID cards and sound feedback, were evaluated. It was found that the use of multimodal stimuli (tactile, auditory and visual) prolonged the time students dedicate to activities and decreased distraction behaviors. This evidence supports the usability principles presented by Norman (2006) and Papert (1980), emphasizing that tangible design enriches active and exploratory learning.

In order for students with different cognitive and motor needs to be able to use the tools in an intuitive and motivating way, it is essential that assistive technologies are easy to use. Recent research suggests that engagement increases when the interface provides instant feedback and various forms of sensory stimulation, expanding student autonomy and reducing the need for constant teacher intervention (Reinert Junior; Coutinho, 2024). Therefore, usability should be evaluated not only by ease of use, but also by the ability to maintain student engagement and interest in inclusive environments.

3.5 COGNITION AND MEDIATION IN THE PROCESS OF TECHNOLOGY-ASSISTED LITERACY

The wireless computational tool was incorporated as a symbolic mediator of the process of internalization of grapheme-phoneme relations. Technology, by offering, from immediate self-correction, the Zone of Imminent Development (Prestes; Tunes, 2022), linked to the transition between the potential and actual level of performance, does not replace the role of the teacher, but expands the necessary conditions for individualized learning.

In addition, technological mediation increases the cognitive repertoire of students by offering interactive experiences that consolidate essential skills such as phonological awareness and visual recognition of writing symbols. Mediation based on technological resources allows each student to advance at their own pace, favoring a more inclusive and personalized literacy (Abrão; Del Pino, 2016). Teacher monitoring continues to be very important to ensure that dialogued mediation helps to overcome specific difficulties and to promote the meaningful use of technology in the educational process.

3.6 TEACHER PERCEPTIONS AND RECONFIGURATION OF LITERACY PRACTICE

The reports of the teachers' narratives highlighted the relevance of diversifying teaching strategies and increasing the engagement of the tool by students. Linked to this, teachers highlighted the ease of use and potential for adaptation to the students' ability to understand. However, the need for continuing education in educational technologies was also immediately pointed out, as reiterated by Felipe (2015), who argues that (psycho)linguistic and technological competence is essential for the very performance committed to training. In addition, recent evidence proves that, although assistive technologies mean a transformational potential, this breadth depends on the institutional offer of continuing technical and pedagogical training.

According to Cavalcante, Marques and Nunes (2024), training results in greater security for pedagogical use, which translates into greater investment and quality in the mediation of learning and school inclusion. The challenge is to extend this support to the entire education network, minimizing inequality in the promotion of these technologies.

3.7 INCLUSION AND DIGITAL EQUITY IN LITERACY

The tool was created using accessible components and open architecture, making it possible to use it in schools with limited budgets. This indicates that it can be a beneficial

technology for all, promoting equal access to learning experiences through technology. The research shows that the popularization of technologies for teaching depends on training and infrastructure policies that ensure pedagogical and technical sustainability.

In addition, digital equality in literacy needs strong public policies that guarantee not only the distribution of devices, but also quality internet access, adequate infrastructure, and technical support in schools (Silva *et al.*, 2025a). Without these investments, new technologies can increase existing differences rather than diminish them. Digital literacy for all is therefore also a social justice issue that needs the union between government, business and school.

4 FUTURE PERSPECTIVES

The tool's data collection structure allows for the integration of artificial intelligence (AI) models, which can recognize error patterns and suggest personalized interventions. Future versions may include voice recognition modules and algorithms that suggest activities, thus expanding the possibilities of early diagnosis and personalization of teaching.

In this context, adding AI to the literacy process not only improves the monitoring of individual learning, but also makes the chances of quick and customized interventions that are very important to deal with the various challenges easier (Azambuja; Silva, 2024). This combination of techniques can help in a more active, interesting and student-focused literacy, respecting their own way and helping in effective digital inclusion.

5 CONCLUSION

The analysis of the highlighted items shows that assistive technology, especially when used with tangible interfaces and multimodal feedback, increases active learning, engagement, and autonomy of students with literacy difficulties. Technological mediation, together with pedagogical practices, strengthens individualized learning, without replacing the role of the teacher, whose continuous technical and pedagogical training is essential to maximize the benefits of technology.

Digital equity emerges as a structural challenge that must be addressed through integrated public policies to ensure access, infrastructure, and training. Finally, future perspectives show that AI will be a great ally to personalize teaching, make more accurate diagnoses, and increase educational inclusion.

These findings underscore the importance of coordinated investment in technology, training, and inclusive policies to truly change literacy processes in Brazil, guaranteeing the broad right to education for all.

ABSTRACT

The present article analyzes the influence of an ecological advertising campaign on the acceptance of the sustainable paint BioPint, produced using crystal PET waste and recycled Styrofoam in the communities of Ixcaquixtla and Tepexi de Rodríguez, Puebla. The study was structured with a descriptive and mixed approach, using surveys and interviews conducted with residents of both municipalities. The results showed a high willingness to consume ecological products, growing interest in recycling, and a positive evaluation of the advertising message. The BioPint proposal was perceived as innovative, useful, and representative of the community effort. The analysis demonstrated that sustainable marketing can transform purchasing attitudes by linking environmental awareness with local development. The research concludes that combining environmental education, communicative transparency, and responsible production strengthens consumer trust and promotes the adoption of green alternatives in rural contexts.

estruturado com abordagem descritiva e mista, por meio de questionários e entrevistas aplicados a habitantes de ambos os municípios. Os resultados mostraram alta disposição para o consumo de produtos ecológicos, interesse crescente pelo reciclagem e uma avaliação positiva da mensagem publicitária. A proposta da BioPint foi percebida como inovadora, útil e representativa do esforço comunitário. A análise permitiu demonstrar que o marketing sustentável pode transformar atitudes de compra ao vincular a conscientização ambiental ao desenvolvimento local. A pesquisa conclui que a combinação de educação ambiental, transparência comunicativa e produção responsável fortalece a confiança do consumidor e impulsiona a adoção de alternativas verdes em contextos rurais.

RESUMEN

El presente artículo analiza la influencia de una campaña publicitaria ecológica en la aceptación de la pintura sustentable BioPint, elaborada con residuos de PET cristal y unicel reciclado dentro de las comunidades de Ixcaquixtla y Tepexi de Rodríguez, Puebla. El estudio se estructuró con enfoque descriptivo y mixto, mediante encuestas y entrevistas aplicadas a habitantes de ambos municipios. Los resultados mostraron alta disposición hacia el consumo de productos ecológicos, interés creciente por el reciclaje y valoración positiva del mensaje publicitario. La propuesta de BioPint fue percibida como innovadora, útil y representativa del esfuerzo comunitario. El análisis permitió demostrar que la mercadotecnia sustentable puede transformar actitudes de compra al vincular conciencia ambiental con desarrollo local. La investigación concluye que la combinación de educación ambiental, transparencia comunicativa y producción responsable fortalece la confianza del consumidor e impulsa la adopción de alternativas verdes en contextos rurales.

1 INTRODUCTION

In recent decades, humanity has experienced an unprecedented industrial expansion that has increased production, transformed consumption habits, and modified the relationship with the natural environment. Although economic progress was evident, the environmental cost proved unsustainable: pollution, accumulation of plastic waste, deforestation, resource depletion, loss of biodiversity.

The United Nations Environment Programme (UNEP, 2023) estimates that more than 400 million tonnes of plastic are generated per year, with recycling of less than 10%. Mexico contributes more than six million tons, ranking among the fifteen countries with the highest volume of waste. In Puebla, SEMARNAT (2024) reports that only three out of ten PET bottles are recycled; the rest remains in landfills or is incinerated, releasing toxic gases.

Against this backdrop, BioPint emerges, an ecological paint made from crushed glass PET waste along with recycled Styrofoam scraps. The project seeks to reduce the environmental impact generated by the use of plastics and offer a sustainable option within the domestic paint market. The initiative was born at the Higher Technological Institute of Tepexi de Rodríguez, where a group of young people identified the need to take advantage of recyclable materials to create useful products.

This article analyzes the BioPint case from a marketing approach, with the purpose of evaluating the effectiveness of its advertising strategies, considering the relationship between ecological communication, environmental education, and consumer behavior. The research aims to demonstrate that a sustainable strategy based on authentic messages can strengthen public trust, modify perceptions, and encourage responsible purchasing decisions.

1.1 PROJECT OVERVIEW

BioPint represents an entrepreneurial proposal focused on ecological innovation. It was created at the Higher Technological Institute of Tepexi de Rodríguez, in Puebla, with the purpose of transforming crushed crystal PET waste together with recycled Styrofoam into ecological white paint. The result combines quality, durability, low cost, composition free of toxic solvents.

The product is made through controlled recycling that reduces the use of petroleum-based compounds. Each liter of paint uses about 200 grams of PET, equivalent to ten plastic

bottles. With a monthly production of 10,000 liters, the positive environmental impact implies the reduction of more than 100,000 discarded containers.

BioPint is aimed at consumers aged 33 to 55 with an interest in improving their home, average purchasing power, willingness to try economical alternatives. The distribution areas include the municipal capitals of Tepexi de Rodríguez and Ixcaquixtla, where the market is dominated by traditional brands such as Comex, Pintumex and Sayer Lack. Its value proposition stands out for its ecological character, competitive cost, social commitment, and local origin.

The project is based on the circular economy. Each stage seeks to reduce waste, optimize resources, and strengthen the environmental education of the community. The process includes collection, cleaning, crushing, mixing, packaging, marketing. The entire cycle takes place in the region, which generates employment, promotes ecological awareness through practice.

1.2 STATEMENT OF THE PROBLEM

Plastic pollution is one of the greatest environmental challenges of the 21st century. According to the Organisation for Economic Co-operation and Development (OECD, 2023), only 9% of the world's plastic receives recycling treatment; the rest remains in landfills or contaminates rivers, lakes, coasts, agricultural soils, affecting flora, fauna, and human health.

In Mexico, the National Association of Plastic Industries (ANIPAC, 2024) estimates a production of more than eight million tons per year, with recovery of less than two million. In rural municipalities, the situation is aggravated by the absence of collection programs, environmental education, and specialized infrastructure. Waste accumulates in public spaces, ravines, neighborhood roads, deteriorating the urban image, affecting air quality.

Recycling represents a viable alternative to reduce environmental impact, although it faces sociocultural barriers. A part of consumers are wary of green products. The Kantar Worldpanel study (2024) indicates that only 38% of Mexicans consider sustainable brands trustworthy; Most associate "green" with high prices or less durability.

At BioPint, the difficulty encompasses production and recognition within the local market. The community of Tepexi de Rodríguez has little environmental information; Consumers prioritize immediate cost, without valuing ecological impact, which limits the adoption of sustainable alternatives.

2 OBJECTIVES

2.1 GENERAL OBJECTIVE

Design a sustainable marketing strategy with the purpose of positioning BioPint ecological paint within the local market through advertising actions that promote environmental education and strengthen the positive perception of the consumer.

2.2 SPECIFIC OBJECTIVES

1. Analyze the socioeconomic environment of the target communities to identify factors that influence the purchase decision.
2. To evaluate the consumer's perception of organic products within the regional market.
3. Design an advertising campaign based on the AIDA model to capture attention, arouse interest, generate desire, stimulate action.
4. Formulate sustainable communication strategies according to the cultural profile of the target audience.
5. Measure results through indicators of recall, credibility, and purchase preference.

2.3 HYPOTHESES AND ASSUMPTIONS

The research is based on the principle that ecological advertising has the capacity to transform perceptions and modify consumption habits when the message is authentically constructed.

2.4 NULL HYPOTHESIS (H_0)

The application of sustainable marketing strategies does not significantly influence consumer acceptance of BioPint ecological paint.

2.5 ALTERNATE HYPOTHESIS (H_1)

The application of sustainable marketing strategies significantly influences consumer acceptance of BioPint ecological paint.

2.6 ASSUMPTIONS

- Consumers place value on brands that demonstrate real environmental commitment.
- Emotional communication increases confidence in new products.
- Ecological knowledge has a direct influence on the willingness to buy.

- Community identity strengthens the credibility of local projects.

3 JUSTIFICATION

The study has environmental, economic, and social relevance. In the environmental field, BioPint reduces the accumulation of plastic waste by reusing PET glass. Each liter of paint uses about 200 grams of recycled plastic, equivalent to ten soda containers. With a monthly production of 10,000 liters, the positive impact exceeds 100,000 bottles recovered.

From an economic perspective, the Mexican paint market exceeds 2,500 million dollars per year, according to the National Chamber of the Paint and Ink Industry (2023). Less than 7% of national companies offer organic products. BioPint's proposal fills this gap through a sustainable, accessible option, aligned with the circular economy.

In the social aspect, the project promotes citizen participation, generates local employment, strengthens the culture of recycling. The process involves inhabitants of the region in tasks of collection, cleaning, crushing, formulation, packaging, which distributes benefits within the community.

The research is justified in the marketing field because it shows that sustainability can become a competitive advantage. According to Kotler (2022), brands with a purpose achieve greater loyalty, with an increase of approximately 35% compared to companies focused on functional attributes.

BioPint represents an example of responsible innovation, capable of combining profitability, positive environmental impact, social commitment. The research provides an academic perspective by integrating sustainable marketing, ecological advertising, circular economy within the Mexican rural context, in addition to serving as a model for future ventures.

4 THEORETICAL FRAMEWORK

4.1 HISTORICAL EVOLUTION OF PAINTINGS

The use of color as a protective and decorative element has accompanied humanity since ancient times. The first pigments applied to rock date back more than 30,000 years; Prehistoric groups mixed clays, charcoal, pulverized minerals, animal fat to fix the color in stone, wood, or bone. In ancient civilizations, the pigment acquired symbolic value. In Egypt, blue was related to aquatic divinities; red represented vital energy. The Romans used mixtures of lime with metal oxides to protect walls, an early form of waterproofing.

With the Renaissance, linseed oil was incorporated as a binder. Since the eighteenth century, industrial development transformed pigment production with petroleum-based chemical processes. This evolution increased the availability of the product, although it introduced toxic compounds.

The growth of modern construction intensified the consumption of coatings. According to the International Council on Paints and Inks (2024), global consumption exceeds 40 billion liters per year with a growth rate of close to 4%. However, traditional production generates emissions, hazardous waste, and high energy expenditure.

4.2 BACKGROUND OF ECOLOGICAL PAINTS

The first organic formulations emerged in Europe during the 1980s. Swedish research showed that replacing solvents with water reduced volatile organic compounds (VOCs) by up to 90%. Beckers Paints introduced a line certified by the NORDIC SWAN label, a symbol of environmental compliance.

In 1990, Benjamin Moore launched the Natura line in North America, free of aromatic solvents. In Mexico, interest appeared in the late 1990s, although the lack of tax incentives limited its development. The global market for eco-friendly paints exceeds \$9 billion with a projected growth of 8% per year, according to Grand View Research (2024). These formulations employ vegetable oils, natural resins, mineral pigments, recycled plastics, biodegradable binders.

BioPint embraces this trend by integrating shredded PET with Styrofoam waste, partially replacing petrochemical polymers. The final blend has low VOC level, uniform texture, durable finish.

4.3 TECHNICAL CLASSIFICATION OF PAINTS

Paint is defined as a mixture of pigments, binders, solvents, additives. Its classification depends on the base, finish, use, chemical composition:

- Water-based paints: use water as a solvent, have low toxicity, fast drying.
- Oil paints: use vegetable or synthetic oils, generate a resistant protective layer, release polluting compounds.
- Synthetic paints: made with plastic resins derived from petroleum, they offer high durability and high environmental impact.

- Ecological paints: they use renewable or recycled materials, reduce emissions, facilitate cleaning, biodegradation.

BioPint's product belongs to the category of eco-friendly recycled base paint, with components derived from PET, glass and processed Styrofoam.

4.4 ENVIRONMENTAL STANDARDS AND REGULATIONS

The production of eco-friendly paints is governed by international standards. ISO 14001 establishes environmental management guidelines to reduce waste and control emissions. EPA sets VOC limits on coatings. In Mexico, NOM-123-SEMARNAT-1998 regulates VOC emissions during the manufacture of paints; NMX-AA-162-SCFI-2012 defines criteria for products with recycled content. Meeting these standards is an essential requirement for access to sustainable markets. BioPint applies equivalent principles through controlled artisanal processes that minimize the use of solvents.

4.5 FUNDAMENTALS OF GREEN MARKETING

Green marketing is a strategy aimed at satisfying consumer needs through environmentally responsible practices. According to Peattie (2001), this approach involves redesigning the entire business system. Production, distribution, communication and after-sales decisions must be aligned with environmental conservation.

Global interest in responsible consumption increased steadily. The Global Sustainability Barometer (2023) shows that seventy percent of consumers prefer brands with verifiable environmental commitments. However, only thirty percent fully trust sustainability-related advertising information. This credibility gap requires transparent communication strategies.

BioPint is inserted within this logic by promoting authenticity, social commitment and coherence between message and practice.

4.6 SUSTAINABLE ADVERTISING

Sustainable advertising is conceived as a responsible communication process that seeks to balance commercial benefit with environmental education. According to Uceda García (2008), the effective ecological message must generate collective awareness, not just the desire to buy.

Visual resources, language, emotional tone and media support must convey ethical coherence. A sustainable campaign informs, persuades, educates, without resorting to exaggeration or false promises.

BioPint uses visual communication strategies based on neutral colors, short messages and local testimonials. That combination strengthens trust and reinforces the emotional bond with the audience.

4.7 ECO-FRIENDLY CONSUMER BEHAVIOR

The organic consumer represents a central axis of today's marketing. Their behavior arises from a cultural change motivated by environmental crises, technological advances, and greater access to information. Ottman (2011) defines it as one that incorporates ethical values into its economic decisions to reduce its environmental impact and support collective causes.

This consumer combines environmental awareness, proactive attitude, and consistent behavior. The green gap persists, because although 78% of Mexicans prefer organic products, only 42% buy sustainably (NielsenIQ, 2023). Psychological, social, and cultural factors determine their decisions, with the perception of personal benefit predominating over collective concern.

PROFECO (2024) reports greater sustainable adoption in consumers with secondary education and urban areas. In rural areas, the lack of knowledge about terms such as biodegradable or recycled limits the acceptance of green proposals.

BioPint faces that challenge. Their strategy is based on simple communication, clear language, concrete examples. The idea of "giving new life to plastic" generates immediate emotional connection.

The VALS model places the buyer of BioPint between believers and compliers, with community attachment, practical orientation, and a disposition towards projects with social value.

4.8 CORPORATE SOCIAL RESPONSIBILITY

Corporate social responsibility (CSR) is a voluntary commitment that integrates ethics, sustainability and respect for stakeholders. Carroll (1999) described it through a pyramid composed of four levels: economic, legal, ethical, and philanthropic compliance.

Organizations that reach the top levels transcend profitability, consolidate reputation, strengthen legitimacy.

In the Latin American context, CSR has been linked to the search for social trust. ECLAC (2023) argues that companies with active sustainability programs manage to increase their brand value by up to forty-six percent. In addition, environmental commitment generates competitive advantages by reducing operating costs and improving the relationship with local authorities.

In Mexico, the Association of Socially Responsible Companies (2024) registers more than one thousand five hundred certified organizations, although most belong to industrial or financial sectors. Few initiatives come from rural micro-enterprises, which makes the BioPint project unique.

Social responsibility within BioPint is manifested in various practices: plastic waste collection within the community, training on recycling, female labor inclusion, partial reinvestment of profits in cleaning campaigns. The project promotes environmental co-responsibility through example. This coherence between discourse and action strengthens its market legitimacy.

From a marketing perspective, CSR translates into reputation. Kotler (2022) states that companies perceived as responsible achieve loyalty levels up to thirty-five percent higher than conventional ones. Trust becomes an intangible resource that increases brand value and amplifies word-of-mouth recommendation.

4.9 GREEN BRANDING AND ECOLOGICAL POSITIONING

Corporate social responsibility (CSR) represents a voluntary commitment based on ethics, sustainability, respect for stakeholders. Carroll (1999) structured it into a pyramid with four levels: economic, legal, ethical, philanthropic. Organizations that reach higher levels transcend profitability, consolidate reputation, strengthen legitimacy.

In Latin America, CSR is linked to social trust. According to ECLAC (2023), companies with sustainable programs increase their brand value by up to 46%. Environmental commitment provides competitive advantages by reducing operating costs, improving ties with local authorities.

In Mexico, the Association of Socially Responsible Companies (2024) registers more than one thousand five hundred certified organizations, concentrated in industrial or financial sectors. Few come from rural micro-enterprises, which makes BioPint a unique case.

BioPint demonstrates its CSR through plastic waste collection, community training, female labor inclusion, and reinvestment of profits in clean-up campaigns. This coherence between discourse and action reinforces its market legitimacy.

From a marketing perspective, CSR is reflected in reputation. Kotler (2022) states that responsible companies achieve up to 35% higher loyalty. Trust becomes an intangible resource that increases brand value, enhances word-of-mouth recommendation.

4.10 EMOTIONAL COMMUNICATION WITHIN SUSTAINABLE MARKETING

Sustainable marketing uses emotion as a vehicle of persuasion. Kotler (2019) highlights that emotionally charged messages achieve greater recall, generate empathy, and modify attitudes. Emotion acts as a bridge between rationality and action.

The human brain processes visual stimuli faster than logical arguments. For this reason, environmental communication requires symbolic images that awaken sensitivity. A photograph of clean oceans produces greater impact than a list of technical data.

BioPint implements emotional communication based on three axes: hope, community pride, shared responsibility. Each ad highlights tangible benefits of the product along with testimonials from neighbors who collaborate in the collection of plastic. This strategy generates collective identification and transforms the act of buying paint into an ecological contribution.

Batra and Ray (2020) point out that emotion increases willingness to pay up to twenty percent when the message conveys social purpose. In the case of BioPint, emotional connection becomes an essential tool to overcome cognitive barriers and achieve differentiation from industrial brands.

4.11 LATIN AMERICAN PERSPECTIVE ON RESPONSIBLE CONSUMPTION

Responsible consumption in Latin America presents an uneven development. Economic crises, educational levels and the structure of markets have a direct influence on the adoption of sustainable practices. ECLAC (2023) recognizes an average growth of seven percent per year in the demand for green products within the region, although mistrust of the authenticity of brands persists.

Brazil, Chile and Colombia lead the organic market with public policies focused on environmental certifications. Mexico is making progress through recycling programs

promoted by universities and civil associations, although the lack of tax incentives limits the expansion of green microenterprises.

The Latin American public values the social component as much as the ecological one. According to Latinobarómetro (2024), sixty-three percent of consumers prefer products that benefit local communities. This cultural characteristic favors projects such as BioPint, which integrate environmental benefits with direct social impact.

The phenomenon of conscious consumption acquires relevance in young generations. The so-called centennials show sensitivity to environmental causes, but demand digital transparency. For this reason, Latin American brands need to strengthen communication channels through social networks with verifiable information and real testimonials.

4.12 THEORETICAL APPLICATION TO THE BIOPINT CASE

The application of the theoretical foundations allows us to understand the marketing structure of BioPint. The project is based on three conceptual pillars: green marketing, social responsibility, emotional communication. His proposal coincides with the principle of sustainable development set out in the Brundtland Report (1987), aimed at satisfying present needs without compromising future resources.

The advertising campaign employs the AIDA model, which organizes the consumer's response into four stages. Attention is obtained through visual resources that highlight the recycled origin of the product. The interest arises when presenting data on plastic pollution. Desire is built through the emotional connection with the producing community. The action is driven by local promotions that incentivize the initial purchase.

Positioning is strengthened through proximity strategies. BioPint participates in school fairs, recycling workshops, community events. This direct interaction generates trust, a determining factor in rural contexts with limited digital penetration.

From a theoretical perspective, the case demonstrates that sustainable marketing can be applied in microenterprises with low budgets. Ecological purpose, ethical coherence, and social participation function as sources of authentic differentiation. BioPint exemplifies a replicable local innovation model, whose success depends on maintaining a balance between environmental message, product quality, and collective benefit.

5 CONCEPTUAL FRAMEWORK

5.1 PAINTING CONCEPT

Paint is one of the oldest materials created by humans. Its initial function was symbolic or ritual, as shown by the cave paintings of Lascaux. Over time, it served to protect surfaces, thermally insulate, improve aesthetics.

Technically, it is a mixture of pigments, binders, solvents that when applied form a protective film. Marrufo (2020) describes it as a colloidal system whose performance depends on the chemical interaction of its components.

The global market exceeds 170 billion dollars annually according to Statista (2024). This sector generates a high environmental impact due to volatile organic compounds and heavy metals. In Mexico, more than 850 thousand tons are produced each year according to the National Association of Paint and Ink Manufacturers (2024).

BioPint addresses this situation through ecological paint made with PET and recycled Styrofoam, reducing plastic pollution, petrochemical dependence and integrating technical innovation with environmental commitment.

5.2 ESSENTIAL COMPONENTS

The performance of a paint depends on four elements: pigments, binders, solvents, additives.

Pigments provide color, opacity, resistance. They are classified as natural or synthetic; metal waste is polluting. BioPint takes advantage of the white tone of PET glass, avoiding toxic pigments.

The binder binds particles together and forms an adherent film. Common resins come from petroleum. BioPint replaces them with recycled Styrofoam polymers, reducing environmental impact.

The solvent regulates viscosity and facilitates application. Instead of harmful organic solvents, BioPint uses purified water, ensuring safety and zero VOC emissions.

Additives improve shine, durability, drying, resistance. Natural compounds without heavy metals are used in organic formulas.

Grand View Research (2023) indicates that water-based paints account for 60% of global consumption. BioPint joins this trend with a biodegradable, harmless, local product.

5.3 TECHNICAL AND ENVIRONMENTAL CLASSIFICATION

Paints can be classified according to chemical composition, type of application or environmental impact. The technical classification distinguishes water, oil, epoxy, acrylic or vinyl formulations. Each type is adapted to specific surface and climate conditions.

The environmental criterion differentiates three main categories:

- Conventional paints, which contain aromatic solvents and metallic pigments.
- Low-VOC paints, with reduced emissions but still based on petroleum derivatives.
- Eco-friendly paints, completely free of toxins and made with biodegradable or recycled components.

According to Allied Market Research (2024), the market for ecological paints is growing at a rate of more than six percent per year, driven by emission reduction policies and environmental certification programs.

In Latin America, the consumption of sustainable paints still accounts for less than five percent of total coatings, although forecasts point to steady growth. Mexico participates with an approximate production of 120 thousand tons per year of water-based coatings.

BioPint is part of this emerging trend. Its product not only replaces polluting materials, but also incorporates the concept of circular economy. Each litre produced avoids the generation of approximately two hundred grams of plastic waste, thus contributing to national waste reduction targets.

5.4 ECO-FRIENDLY PAINT CONCEPT

Eco-friendly paint arises as a response to the need to reduce the environmental impact caused by petrochemical substances. Grand View Research (2024) defines it as a mixture free of heavy metals, with a water-based basis and biodegradable components.

Its purpose is to preserve the protective function of the coating, reduce risks to human health, reduce carbon footprint, and ensure indoor safety. The development began in Europe during the 1990s with standards such as ISO 14024, focused on eco-labeling. In Mexico, adoption is progressing slowly, although demand is growing steadily in schools, hospitals, and homes.

The INECC (2024) calculates that solvents in traditional coatings generate five hundred thousand tons of VOCs per year, an alarming figure in the face of urban pollution.

BioPint represents a sustainable local alternative. Its production uses low-energy consumption tools, manual recycling processes, community employment. Each package reflects green technology, environmental education, social entrepreneurship.

5.5 RECYCLING CONCEPT

Recycling is one of the pillars of sustainable development. SEMARNAT (2024) defines it as the process by which waste is transformed into useful inputs through collection, separation, cleaning, and revaluation.

Globally, the production of plastics exceeds 400 million tons per year, according to the UN Environment (2023), of which less than 10% is effectively recycled. In Mexico, about eight million tons are generated annually, equivalent to more than six hundred bottles per inhabitant.

PET accounts for around 40% of all recyclable plastics due to its strength and ease of processing. Its recovery avoids the emission of three kilograms of carbon dioxide for every kilogram recycled and reduces energy consumption by 60%.

On the other hand, Styrofoam (expanded polystyrene) presents a greater challenge due to its low density and light volume. In the country, barely 3% of this waste is recycled, which causes accumulation in landfills and visual pollution.

BioPint turns that problem into opportunity by combining both materials to create a stable polymer base. The shredding of the PET and the incorporation of the pulverized Styrofoam generate a matrix with a uniform texture, suitable for domestic coatings.

This process promotes the circular economy by reducing waste, generating employment and promoting environmental education. In this sense, recycling transcends its traditional function to become an engine of economic and social transformation within the communities of Ixcaquixtla and Tepexi de Rodríguez.

5.6 CONCEPT OF SUSTAINABILITY

Sustainability is defined as the ability to meet present needs without compromising the ability of future generations to meet theirs. The concept was established in the Brundtland Report (1987), a document that marked the basis of modern environmental thinking. Its essence lies in the harmonization of three dimensions: economic growth, social justice and ecological balance.

In the business sphere, sustainability translates into production models that minimise environmental impact, promote energy efficiency and strengthen collective well-being. ECLAC (2024) states that companies that apply sustainable practices achieve average increases of 18 percent in productivity due to the reduction of waste and the saving of resources.

Sustainability is expressed through innovation, environmental education and community participation. It is not limited to the adoption of clean technologies, but involves cultural transformation. In industrialized countries, public policies encourage the transition to the low-carbon economy. In Latin America, progress is uneven, although there are community projects that demonstrate their viability.

BioPint embodies the principle of sustainability by combining ecological innovation with social commitment. Its production model uses low-consumption machinery, recycled inputs and local distribution, which reduces emissions. In addition, it generates jobs within the community and promotes environmental awareness through informative workshops. Each liter of paint manufactured symbolizes the convergence between efficiency, equity and environmental respect.

5.7 MARKETING CONCEPT

Marketing is the set of activities aimed at identifying needs, creating value and establishing satisfactory exchanges between organization and consumer. According to Kotler (2022), its objective is to generate lasting relationships based on trust, purpose and satisfaction.

The concept has evolved from simple promotion to comprehensive experience management. Modern marketing analyzes preferences, values, and behaviors to deliver meaningful solutions. Within the global context, consumers are looking for products that reflect personal identity and ethical coherence.

In Mexico, the Mexican Institute of Competitiveness (IMCO, 2023) highlights that 70 percent of consumers consider environmental responsibility a determining factor when choosing a brand. This paradigm shift forces companies to design communication strategies based on transparency.

BioPint uses marketing as an educational and social tool. The strategy is not focused on consumption, but on cultural transformation. The main message communicates that each purchase contributes to reducing plastic waste. That narrative generates local pride and a

sense of belonging. The consumer does not only acquire paint, but also active participation in an environmental cause.

Marketing then becomes a vehicle for change, capable of modifying habits, stimulating reflection and consolidating ecological identity.

5.8 GREEN MARKETING CONCEPT

Green marketing is defined as the application of environmental principles within the marketing process. Peattie (2001) describes it as the incorporation of respect for the environment in every decision related to product, price, place and promotion. This approach seeks compatibility between commercial success and ecological responsibility.

The growth of green marketing reflects a profound cultural shift. NielsenIQ (2023) reports that 73 percent of Latin American consumers prefer sustainable brands, although only 32 percent fully trust their messages. This difference shows the need for authenticity.

In Europe, the European Union regulates ecological communication through guidelines against greenwashing, a practice that consists of exaggerating environmental attributes. In Mexico, the Federal Consumer Protection Agency (PROFECO) has initiated information campaigns to prevent misleading advertising in this area.

Green marketing demands consistency. It is not enough to offer a recycled product; it is essential to demonstrate real impact. BioPint applies this principle by openly displaying its PET collection, crushing and mixing process. Transparency in communication generates trust, a fundamental element to achieve customer loyalty.

The differential value of BioPint lies in turning waste into opportunity. The consumer perceives authenticity, which reinforces the reputation and consolidates the positioning within the regional organic segment.

5.9 ECO-FRIENDLY ADVERTISING CONCEPT

Ecological advertising represents a form of communication aimed at promoting responsible attitudes towards the environment. Uceda García (2008) defines it as a strategy that educates, informs, and inspires through messages based on truth and scientific evidence.

Its purpose goes beyond selling products, as it seeks to raise environmental awareness. To achieve this, it resorts to positive narratives, images of hope and verifiable

data. Authenticity becomes its guiding principle, as a brand loses credibility when its speech contradicts its actions.

Globally, green advertising is growing at the pace of international climate commitments. Global Advertising Review (2024) estimates that more than 40% of current advertising campaigns include some ecological component; however, only a part meets verifiable ethical criteria.

In the Mexican context, environmental communication still faces challenges related to ecological literacy. Many consumers are unfamiliar with terms such as "carbon neutral" or "biodegradable", which forces them to design clear, simple and visually forceful messages.

BioPint responds to this need for transparency through campaigns that show the process of collecting bottles, crushing and mixing PET. That visual clarity reinforces the credibility of the message and reflects real engagement.

CIRCULAR ECONOMY CONCEPT

The circular economy proposes a production model that replaces the linear logic of extracting, manufacturing, discarding with a system of continuous use. The Ellen MacArthur Foundation (2023) estimates that its global application would reduce waste by 50% and use of virgin materials by 40% by 2050.

It is based on prolonging the life cycle through repair, reuse, recycling, redesign, in order to minimize waste and maximize value.

In Mexico, the National Program for the Circular Economy (2024) promotes recycling and ecodesign in SMEs, seeking to raise the national recovery rate to 35% in the next decade.

BioPint exemplifies this model: it transforms collected PET into paint, distributes it locally, and reincorporates empty containers into the process. This dynamic converts waste into resources, strengthens regional self-sufficiency, promotes environmental education, improves family economy, reinforces local identity.

6 METHODOLOGY

6.1 TYPE OF STUDY

The methodological design adopted corresponds to a descriptive study with a mixed approach, which combines quantitative and qualitative analysis. The choice of this type of research responds to the need to understand both the patterns of behavior of the organic consumer and the symbolic perceptions associated with the BioPint product.

The descriptive approach allows detailing the characteristics, attitudes and purchasing habits within the target audience, without manipulating variables. According to Hernández Sampieri (2022), this type of research seeks to specify properties of observable phenomena, in this case, the acceptance of an ecological paint within rural markets.

The quantitative component makes it easier to measure frequency, trend and consumer preference through structured surveys. The qualitative dimension adds depth to the analysis by incorporating testimonies, perceptions and motivations expressed in semi-structured interviews. The integration of both approaches offers a complete vision of the market phenomenon.

6.2 POPULATION OR UNIVERSE

The population under study is made up of the inhabitants of the municipal capitals of Ixcaquixtla and Tepexi de Rodríguez, Puebla, where the initial distribution of BioPint ecological paint is concentrated.

According to data from the National Institute of Statistics and Geography (INEGI, 2024), Ixcaquixtla has 9,863 inhabitants, while Tepexi de Rodríguez has 10,877 residents. Collectively, the universe amounts to 20,740 people.

The study focuses on the adult segment between 33 and 55 years of age, the range that concentrates the greatest decision-making power in the household. Within this group, 52 percent are women and 48 percent men, according to local estimates. Most belong to socioeconomic levels D and D+, which coincides with BioPint's target audience.

Knowledge of the population allows us to define segmentation strategies and adjust the advertising message according to the cultural, educational and economic conditions of the environment.

6.3 SAMPLE

The sample was selected using non-probabilistic convenience sampling, a technique recommended for research with limited resources or in communities with restricted access.

The sample size was calculated based on the formula for finite population:

$$n = \frac{N \times Z^2 \times p \times q}{E^2 (N-1) + Z^2 \times p \times q}$$

where N represents the size of the population (20,740), Z equals 1.96 for a 95% confidence level, p and q are assumed to be 0.5, and E corresponds to the margin of error of 7%.

The result obtained was 183 people, a figure that guarantees sufficient representativeness. Of that total, 95 correspond to Ixcaquixtla and 88 to Tepexi de Rodríguez.

The selection was made within public spaces, local businesses and private homes, prioritizing occupational and school diversity.

6.4 INSTRUMENT DESCRIPTION

The main collection instrument was a structured questionnaire of 25 items, designed to measure level of knowledge, environmental perception, purchase intention and disposition towards sustainable products.

Each item was formulated on a five-level Likert scale, ranging from "strongly disagree" to "strongly agree." The structure of the instrument was divided into five sections:

1. Sociodemographic data, to identify age, gender, occupation and monthly income.
2. Consumption habits, with questions about the frequency of buying paint and the criteria for choice.
3. Ecological knowledge, focused on notions about recycling, pollution and biodegradable materials.
4. Perception of BioPint, aimed at evaluating trust in the brand, interest in its composition and the valuation of the advertising message.
5. Willingness to purchase, focused on the probability of acquiring ecological paint at a competitive price.

The questionnaire was validated by three specialists in sustainable marketing from the Tecnológico Nacional de México, Tepexi de Rodríguez Campus, who reviewed the clarity, relevance and congruence of the questions. A pilot test was applied with 20 participants to verify understanding and response time.

The instrument achieved a Cronbach's alpha reliability index of 0.89, a value that indicates high internal consistency.

6.5 DATA COLLECTION PROCEDURE

Data collection was carried out during the months of May and June 2024. The process was developed in three consecutive stages: planning, application and systematization.

During the planning stage, authorization was obtained from municipal authorities and support from local businesses to carry out the surveys. In addition, a group of five student volunteers were trained in interview techniques and ethical management of information.

In the application stage, the questionnaires were distributed in person. Each participant received a brief explanation about the purpose of the study, ensuring anonymity and confidentiality. The average application required fifteen minutes per person.

Subsequently, in the systematization phase, the data were coded in spreadsheets. Incomplete records were eliminated to ensure statistical validity. The quantitative results were processed using the IBM SPSS Statistics version 26 program, while the qualitative testimonies were organized with the Atlas.ti software, in order to identify patterns of opinion.

The statistical analysis included frequency distribution, averages, simple correlations and graphical representation. Open-ended responses were interpreted using thematic analysis to identify recurring perceptions about the product.

The methodological procedure allowed obtaining reliable information on the degree of acceptance of the BioPint product, the level of ecological awareness of the inhabitants and the opportunities for improvement within the advertising campaign.

6.6 RESEARCH QUESTION

How does the implementation of an ecological advertising campaign influence the perception, acceptance and willingness to purchase of adult consumers in Ixcaquixtla and Tepexi de Rodríguez compared to the sustainable paint produced by BioPint?

6.7 HYPOTHESIS

The implementation of an ecological advertising campaign, with an educational and emotional focus, significantly increases the acceptance and preference for BioPint sustainable paint in the local market, by strengthening the symbolic association between responsible consumption and community well-being.

6.8 SPECIFIC CASES

- The positive perception of recycled products is related to greater purchase intention.
- The consumer's prior environmental knowledge conditions the brand's valuation.
- Clear and transparent visual communication increases trust and recognition.

6.9 STATISTICAL INFORMATION MANAGEMENT PROCEDURE

The information collected through the questionnaires applied to consumers in the municipal capitals of Ixcaquixtla and Tepexi de Rodríguez was manually organized in tables prepared in spreadsheets. Subsequently, we reviewed the consistency of the responses and removed incomplete or inconsistent records to ensure the reliability of the data.

Once the information base was refined, simple counts were carried out to obtain frequencies and percentages that would allow the identification of general trends around the level of knowledge, perception and acceptance of BioPint ecological paint.

To analyze the results, basic measures of central tendency (mean and mode) were calculated in order to determine the average degree of acceptance towards the product. In addition, cross-comparisons were made between variables such as age, educational level, and willingness to purchase, in order to detect possible differences in response patterns according to the respondent's profile.

Finally, the data were represented by descriptive graphs and tables, which facilitated the visual interpretation of the results and allowed the quantitative information to be contrasted with the qualitative observations derived from the spontaneous comments of the participants.

7 RESULTS

The application of the ecological advertising campaign aimed at adult consumers in Ixcaquixtla and Tepexi de Rodríguez made it possible to identify relevant changes in the perception, interest and willingness to buy sustainable paint made by BioPint. From the review of the public's reactions, the comments obtained during the promotional activities and the direct observation of the behavior of the participants, various findings were obtained that strengthen the understanding of the impact generated by the implemented strategy.

First, it was observed that messages focused on PET recycling and local environmental benefits aroused a high level of curiosity among the inhabitants, especially in people who did not know sustainable paint alternatives. The clarity of the message allowed most participants to associate the product with an eco-friendly solution that is accessible and relevant to their community.

In addition, the in-person demonstrations and educational narrative used in the campaign made it easier for consumers to understand the process of making the painting, which increased confidence in its quality and usefulness. This understanding was key for

many people to express a favorable attitude towards trying the product in their homes or businesses.

Another relevant result was the identification that consumers prefer to start with simple options before venturing into specialized colors. In this sense, the introduction with a basic shade was perceived as an advantage, as it facilitates the initial acceptance of the product by adapting to different types of homes and projects, allowing the introduction of ecological paint without generating barriers to choice.

Finally, during the interactions, it was detected that the campaign generated a positive perception of the environmental commitment of the BioPint project. This aspect strengthened the emotional connection with the brand and motivated various consumers to consider the purchase not only out of aesthetic necessity, but also as a way to contribute to the care of the community environment.

Together, these results show that the advertising campaign managed to position BioPint as a viable, reliable and environmentally responsible option for families in both municipal capitals, laying the foundations for a sustained growth in its acceptance and interest within the local market.

8 DISCUSSION

The results obtained confirm that BioPint ecological paint was well received by the population of Ixcaquixtla and Tepexi de Rodríguez, which shows that consumers begin to value sustainable alternatives when they are presented with clear and accessible information. The high willingness to purchase the product, even without knowing it beforehand, reflects an openness towards responsible consumption and an opportunity to strengthen environmental education in both communities.

Most of the participants expressed interest in local products, which shows that regional identity directly influences the purchase decision. This suggests that communication strategies should continue to highlight the community-based nature of the project and its contribution to the local economy.

Likewise, the acceptance of the slogan and visual elements of the campaign indicates that the ecological message was understood and valued. However, the results also show that the level of technical knowledge about recycling is still limited, so future campaigns could incorporate clearer and more practical educational content.

The difference observed between municipalities reinforces the importance of adapting dissemination strategies to the social and educational context of each area. While in Ixcaquixtla environmental awareness is more linked to formal education, in Tepexi the interest is mainly related to health and risk reduction by solvents.

Taken together, the findings demonstrate that BioPint not only managed to position itself as a viable eco-friendly paint, but also promoted a positive perception about recycling and sustainable development. This confirms that communication with an environmental focus can generate social and commercial impact, as long as the message is consistent with the values and needs of the community.

ABSTRACT

This article discusses the relevance of knowledge sharing in the context of the Sustainable Development Goals (SDGs) of the 2030 Agenda, focusing on the work of Brazilian researchers. The research is exploratory and qualitative in nature, based on theoretical contributions from Information Science, Interdisciplinarity, Administration, Sociology, and knowledge management. It analyzes how collaborative practices, open access policies, and research networks can strengthen the integration between science and sustainability. The theoretical results indicate that, although there have been significant advances in Open Science initiatives, cultural, institutional, and structural barriers persist that limit the effectiveness of scientific sharing in Brazil. It concludes that promoting knowledge sharing

RESUMO

O presente artigo discute a relevância do compartilhamento do conhecimento no contexto dos Objetivos de Desenvolvimento Sustentável (ODS) da Agenda 2030, com foco na atuação dos pesquisadores brasileiros. A pesquisa tem caráter exploratório e natureza qualitativa, fundamentando-se em aportes teóricos da Ciência da Informação, Interdisciplinaridade, Administração, Sociologia e da Gestão do Conhecimento. Analisa-se como práticas colaborativas, políticas de acesso aberto e redes de pesquisa podem fortalecer a integração entre ciência e sustentabilidade. Os resultados teóricos apontam que, embora haja avanços significativos em iniciativas de Ciência Aberta, ainda persistem barreiras culturais, institucionais e estruturais que limitam a efetividade do compartilhamento científico no Brasil. Conclui-se que promover o compartilhamento do conhecimento representa não apenas uma estratégia de inovação e equidade, mas também um compromisso ético com a sustentabilidade global.

Palavras-chave: Compartilhamento do Conhecimento. Ciência Aberta. Objetivos de Desenvolvimento Sustentável. Sustentabilidade Informacional. Pesquisa Científica.

RESUMEN

Este artículo analiza la relevancia del intercambio de conocimiento en el contexto de los Objetivos de Desarrollo Sostenible (ODS) de la Agenda 2030, centrándose en el trabajo de investigadores brasileños. La investigación, de carácter exploratorio y cualitativo, se basa en aportaciones teóricas de la Ciencia de la Información, la Interdisciplinariedad, la Administración, la Sociología y la gestión del conocimiento. Analiza cómo las prácticas colaborativas, las políticas de acceso abierto y las redes de investigación pueden fortalecer la integración entre ciencia y sostenibilidad. Los resultados teóricos indican que, si bien se han producido avances significativos en las iniciativas de Ciencia Abierta, persisten barreras culturales, institucionales y estructurales que limitan la eficacia del intercambio científico en Brasil. Concluye que promover el intercambio de conocimiento representa no solo una estrategia para la innovación y la equidad, sino también un compromiso ético con la sostenibilidad global.

1 INTRODUCTION

Knowledge sharing has emerged in recent decades as one of the fundamental pillars for building a more just, equitable, and sustainable society. As a consequence, the dissemination of scientific and technological information is essential as a central strategy for achieving the Sustainable Development Goals (SDGs) established by the United Nations 2030 Agenda (UN, 2015). In the Brazilian scenario, the performance of researchers and higher education institutions play a strategic role in the consolidation of collaborative practices that favor the democratization of knowledge and the advancement of open science (CNPq, 2025).

However, despite the progress achieved, knowledge sharing still faces significant obstacles related to academic culture, competitiveness for productivity metrics, and regional inequalities that impact the national scientific ecosystem. In this context, this study proposes a reflection on how Brazilian researchers have been contributing to the strengthening of informational sustainability and to the implementation of the SDGs based on knowledge-sharing practices.

Knowledge sharing is one of the fundamental pillars for advancing global sustainability and fulfilling the United Nations 2030 Agenda (UNESCO, 2025). Information and knowledge, when managed collaboratively, allow the creation of innovative and inclusive solutions to the economic, social, and environmental challenges that mark the twenty-first century (ZIVIANI *et al.*, 2023a; SAPIENZA & MATTAR, 2024; FONSECA *et al.*, 2022; SILVA; GOHR, 2025).

According to Davenport and Prusak (1998, p. 5), "knowledge is a fluid mixture of condensed experience, values and contextual information that provides a framework for the evaluation and incorporation of new experiences and information". In this way, sharing knowledge means expanding the collective capacity to understand and transform realities.

In the context of the Sustainable Development Goals (SDGs), knowledge sharing plays a strategic role, especially due to the emphasis given by the 2030 Agenda to the strengthening of global cooperation mechanisms and the exchange of scientific and technological knowledge as a basis for sustainable development. Thus, the dissemination of practices, technologies and information among different social actors enhances the efficiency of public policies and expands the reach of sustainable initiatives (UN, 2015).

Teaching and research institutions, in this context, play a central role in the creation of open and collaborative knowledge ecosystems. Valentim (2019) argues that knowledge management should be understood as a strategic practice that integrates processes of

identification, sharing, and application of organizational knowledge, contributing to innovation and social transformation, a concept confirmed by Correa, *et al*; (2019). This perspective dialogues with the principle of Open Science (CNPq, 2025), which seeks to democratize access to scientific production, strengthen collaborative networks, and ensure transparency in the use of research results (LEITE & COSTA, 2008).

In addition, knowledge management and sharing have direct implications for informational sustainability, a concept that refers to the ability of organizations to maintain continuous flows of reliable and accessible information to support sustainable decisions (ALVES & VALENTIM, 2022). The incorporation of sharing practices, especially mediated by digital technologies and innovation networks, favors the construction of a fairer, more participatory and resilient knowledge society.

Therefore, knowledge sharing is not limited to a technical action, but is consolidated as an ethical and political commitment to the principles of sustainable development (TERRA, 2015; UNESCO, 2017). Its effectiveness depends on the integration between public policies, organizational culture and technological infrastructure capable of promoting the open and responsible circulation of knowledge. As Nonaka and Takeuchi (1997) point out, knowledge grows when it is shared, becoming a dynamic resource that drives both organizational and social development.

In this sense, the alignment between knowledge sharing and the Sustainable Development Goals is essential for the consolidation of an economy based on learning, collaboration and innovation. The creation of environments that value the informational exchange and the collective production of knowledge represents not only a management strategy, but a decisive step towards a more sustainable and inclusive future.

2 THEORETICAL FOUNDATION

To structure the study, some chapters were organized that deal with the central theme of the study. Initially, KM and its organizational and scientific perspectives are discussed. Afterwards, a brief discussion was held on knowledge sharing and open science. The third point addresses the vision of Brazilian researchers and informational sustainability. The fourth topic addresses the challenges and opportunities for science sharing in Brazil.

2.1 KNOWLEDGE MANAGEMENT AND KNOWLEDGE SHARING: ORGANIZATIONAL AND SCIENTIFIC PERSPECTIVES

Knowledge management (KM) has become one of the strategic pillars of contemporary organizations, being fundamental for innovation, competitiveness and institutional sustainability (TOMAÉL & ALCARÁ, 2007; DUARTE, 2017; ZIVIANI, F. *et al.*, 2023a). According to Nonaka and Takeuchi (1997), knowledge is an organization's most valuable resource, as it enables the continuous creation of value and competitive differentiation. In this context, KM involves the set of processes that aim to identify, create, store, share and apply knowledge, in order to enhance organizational learning and collective performance.

According to Davenport and Prusak (1998, P. 5), knowledge management comprises "a systematic process of creating, sharing and using knowledge to achieve organizational objectives". This definition highlights the importance of sharing as an essential link between the production and application of knowledge. Knowledge, when it remains restricted to individuals or departments, loses a significant part of its strategic value, and sharing is the means that guarantees its circulation and transformation into innovation. As discussed by Ziviani *et al.* (2023b), knowledge sharing in knowledge-intensive organizations involves collaborative practices and institutional mechanisms that strengthen information management.

Organizational culture plays a central role in this process. According to Valentim (2008), KM depends on an environment that stimulates trust, collaboration and the exchange of knowledge among the members of the organization. The author argues that "knowledge management is only effective when the institutional culture favors practices of sharing and valuing information as an organizational asset" (VALENTIM, 2008, p. 47). This perspective reinforces the interdependence between human, technological, and structural factors in the success of KM initiatives.

In addition, knowledge sharing is a complex social process, influenced by individual and collective aspects. Terra (2005) highlights that sharing depends on mechanisms of incentive, trust and recognition, as well as technological infrastructures that facilitate access and dissemination of information. A relevant fact is that technology acts as support, but it is the collaborative organizational culture that defines the degree of effectiveness of the process, as stated (ZIVIANI *et al.*, 2023a). In this sense, it can be seen that "Sharing knowledge is a strategic element for the development of activities aimed at scientific research

and innovation in the academic or organizational environment." (ZIVIANI *et al.*, 2023, p. 420a).

In the context of information science, KM and knowledge sharing are understood as informational practices aimed at creating value and democratizing knowledge. According to Alvarenga Neto (2008, P. 62), sharing is a fundamental stage in the spiral of knowledge, as it "allows for the transformation of tacit knowledge into explicit knowledge and the dissemination of it widely in the organizational environment". This process is essential for continuous learning and for strengthening institutional capacities.

Therefore, knowledge management and sharing strategy represent complementary and indispensable dimensions to organizational innovation. Sharing expands the reach of the knowledge produced, strengthens collaborative networks and consolidates a culture of permanent learning. Thus, it can be stated that the effectiveness of KM depends directly on the quality of the sharing practices implemented, the cultural and technological conditions available, and the collective commitment to the strategic use of information (TOMAÉL; ALCARÁ & DI CHIARA, 2005; ANGELONI, 2008; BARBOSA & NAVES, 2014).

2.2 KNOWLEDGE SHARING AND OPEN SCIENCE

From an interdisciplinary perspective, knowledge sharing is understood as a dynamic process of collective exchange and construction that involves cognitive, social and technological dimensions (DAVENPORT & PRUSAK, 1998). In academic environments, this process is achieved through collaborative networks, digital repositories, open access publications, and inter-institutional cooperation, which expand the social impact of science (VALENTIM & CERVANTES, 2008).

Knowledge sharing is one of the fundamental pillars for the advancement of contemporary science and the consolidation of a more collaborative and transparent academic culture. In the context of Open Science, this practice plays a strategic role in promoting the democratization of access to scientific information and the strengthening of cooperation networks between researchers, institutions, and society (STUEBER & TEIXEIRA, 2024).

According to Santos and Costa (2021, p. 45), "Open Science represents a paradigmatic transformation in the way scientific knowledge is produced, communicated, and used, prioritizing openness, collaboration, and transparency at all stages of the investigative process". This perspective broadens the reach of scientific research and enables greater

social impact of the results, since knowledge is no longer restricted to specific groups and starts to circulate in a more equitable way.

The sharing of data, codes, and publications is, therefore, one of the central axes of this movement. As Fecher and Friesike (2013) argue, Open Science is not limited to the free availability of scientific articles, but involves a profound cultural change in research practices, valuing reproducibility, interdisciplinary cooperation and citizen engagement. Thus, the sharing of scientific knowledge becomes an instrument of innovation and social *accountability*.

In the Brazilian context, public science and technology policies have sought to incorporate the principles of Open Science, especially through institutional initiatives of digital repositories and open data policies. According to Menezes and Oliveira (2020), the adoption of these practices in universities and national research centers still faces challenges related to technological infrastructure, organizational culture, and the absence of institutional incentives. However, there are important advances in the integration of cooperative networks and the creation of interinstitutional platforms that strengthen the open scientific ecosystem (CARVALHO, 2022; CUNHA & SANTOS, 2022; VALENTIM & GELINSKI, 2023; MIRANDA, BARROS & OLIVEIRA, 2023).

The culture of sharing is also closely linked to knowledge management, which, as defined by Davenport and Prusak (1998), consists of the process of creating, disseminating and using knowledge to generate value and innovation. In the scientific environment, this means structuring mechanisms so that the knowledge produced is accessible, reusable, and subject to integration into new research (FUGITA, 2017; FREIRE, 2019; ALBAGLI, 2020). In this way, sharing is no longer an isolated act and becomes an integral part of the scientific information management policy (ALBAGLI, MACIEL & ABDO; 2015; AMARO, 2018, GOUVEIA, 2019).

Thus, it can be seen that knowledge sharing and Open Science are complementary dimensions of the same logic of innovation and social responsibility. By encouraging cooperation, transparency, and equitable access to information, these practices contribute to the consolidation of a more inclusive, ethical, and common good-oriented model of science (ALBAGLI, MACIEL & ABDO; 2015; STUEBER & TEIXEIRA, 2024).

Open Science is a contemporary paradigm that seeks to make scientific production more accessible, transparent, and reproducible, stimulating societal engagement and collaborative innovation. According to UNESCO (2021), Open Science practices promote the

democratization of knowledge and contribute directly to the SDGs, especially those aimed at quality education (SDG 4), innovation and infrastructure (SDG 9) and partnerships for development (SDG 17). It is relevant to note that Albagli, Maciel and Abdo (2015), Brazilian researchers, published a study on the need for public policies aimed at Open Science.

In Brazil, public policies such as the CAPES Journal Portal (2025), SciELO, and institutional repositories have strengthened this culture of openness, albeit unevenly across areas of knowledge.

2.3 BRAZILIAN RESEARCHERS AND INFORMATIONAL SUSTAINABILITY

Informational sustainability has been consolidated as an emerging and interdisciplinary approach, which recognizes information as an essential element for the sustainable development of contemporary societies. In the Brazilian context, researchers from different areas, but especially from the area of Information Science, have been discussing the strategic role of information and knowledge in the promotion of ethical, inclusive and environmentally responsible scientific practices. This discussion is directly connected to global agendas, such as the United Nations (UN) Sustainable Development Goals (SDGs), particularly those related to quality education, innovation, and effective institutions (SDGs 4, 9, and 17). ALBAGLI, MACIEL & ABDO, 2015; GERALDO, PINTO & DUARTE, 2022; BARATA, 2019)

According to Valentim (2021), informational sustainability "presupposes the creation, use, sharing, and preservation of information in an ethical, equitable, and responsible manner, in order to ensure its availability and accessibility for future generations" (VALENTIM, 2021, p. 45). This conception expands the traditional notion of sustainability, which is often restricted to the environmental and economic dimensions, incorporating the informational dimension as an indispensable pillar for knowledge governance.

In Brazil, researchers have contributed significantly to the theoretical consolidation of the concept. Alves and Valentim (2022) highlight that information and knowledge management, when guided by principles of informational sustainability, favors the creation of collaborative and innovation ecosystems. According to the authors, "sustainable information is intrinsically linked to the ability of organizations to manage their information flows in a continuous, transparent and collective learning-oriented way" (ALVES; & VALENTIM, 2022, p. 118).

The integration between informational sustainability and Open Science is another highlight in Brazilian research. Araújo and Freire (2020) argue that informational sustainability depends not only on technological infrastructure, but also on a scientific culture that values openness, data reuse, and interdisciplinary collaboration. In short, "informational sustainability requires ethical practices of sharing, respect for authorship, and appreciation of epistemic diversity" (ARAÚJO & FREIRE, 2020, p. 15).

Internationally, authors such as Capurro (2019) and Floridi (2013) reinforce the ethical and philosophical dimension of informational sustainability. Floridi (2013) introduces the concept of *infosphere*, understood as the global information environment that sustains human and technological interactions. For the author, "the sustainability of the *infosphere* depends on informational policies that promote collective informational well-being and reduce inequality in access and use of information" (FLORIDI, 2013, p. 89). This vision is echoed in Brazilian scientific production, which seeks to articulate sustainable informational practices with digital and scientific inclusion policies.

In addition, Capurro (2019) argues that informational sustainability implies an ethical commitment to "care for the informational being", recognizing that the production and consumption of information affect the quality of human interactions and the legitimacy of knowledge. This philosophical perspective inspires Brazilian researchers to think of information as a living resource, which must be preserved and cultivated for the benefit of the community.

In the field of public policies, informational sustainability gains relevance as Brazil seeks to align its scientific and technological policy with the guidelines of Open Science and research data management. According to Miranda and Cunha (2022), "informational sustainability in Brazilian public universities requires the integration of data policies, technological infrastructure, and training of researchers" (MIRANDA & CUNHA, 2022, p. 64). Such initiatives aim to reduce information gaps and strengthen information governance in the academic sphere.

The Brazilian literature also highlights the importance of training sustainable information skills. According to Silva and Costa (2021), promoting informational sustainability implies developing "critical and ethical skills for the responsible search, use, evaluation, and sharing of scientific information" (SILVA & COSTA, 2021, p. 72). This means that informational sustainability is not restricted to the technical preservation of data, but involves the human and cognitive development necessary for a balanced informational ecosystem.

The contribution of Brazilian researchers, therefore, is not limited to theorizing, but also to practical application in knowledge management programs, digital libraries, institutional repositories, and open data initiatives. This practice reflects an integrated view of information as a public good and a factor of cognitive justice. Informational sustainability, in this context, is consolidated as a strategic tool to promote equity in access to information and the appreciation of science as a common good (STUEBER & TEIXEIRA, 2024; VALENTIM, 2023).

As Valentim (2023) points out, "informational sustainability is a path to the democratization of science and to strengthen public trust in scientific institutions" (VALENTIM, 2023, p. 53). This view reinforces the need for researchers, managers, and public policy makers to work collaboratively to consolidate ethical, transparent, and inclusive informational practices.

Thus, Brazilian scientific production has proven to be relevant for the advancement of the international debate on informational sustainability, articulating theoretical, ethical and political dimensions. By promoting open access, digital preservation, and informational responsibility, Brazilian researchers contribute to the construction of a fairer, more sustainable, and socially committed science.

2.4 CHALLENGES AND OPPORTUNITIES FOR SCIENTIFIC SHARING IN BRAZIL

Scientific sharing is an essential pillar for the advancement of Open Science and for the democratization of knowledge. In Brazil, this process faces a series of structural, cultural, and technological challenges that directly impact the production and dissemination of scientific knowledge. At the same time, significant opportunities arise associated with the consolidation of public policies, the expansion of digital infrastructure, and the adoption of collaborative practices between researchers and institutions (KURAMOTO, 2008; BRAZIL, 2025; SAYÃO, & SALES, 2022; OLIVEIRA & FERREIRA, 2022; LEITE, COSTA & ALVES, 2022; SOUZA, M. *et al*, 2023).

According to Ferreira and Santos (2021), the sharing of data and research results "is one of the central elements of the open science paradigm, as it encourages transparency, reproducibility, and the reuse of knowledge" (FERREIRA & SANTOS, 2021, p. 45). However, in the Brazilian context, obstacles persist related to the absence of standardization in institutional repositories, the lack of institutional incentives and the cultural resistance of part of the scientific community, which still maintains practices of restricted circulation of

knowledge (KURAMOTO, 2008; OLIVEIRA & FERREIRA, 2022; LEITE, COSTA & ALVES, 2022;).

The literature points out that the challenge is not limited only to technological infrastructure, but also to the formation of a culture of sharing. Valentim (2020) observes that "the consolidation of collaborative practices depends on the recognition of information as a public and strategic good" (VALENTIM, 2020, p. 32). In this sense, the role of universities and funding agencies in the creation of policies that value the openness of data and interoperability between information systems is fundamental (SAYÃO & SALES, 2022).

At the same time, opportunities emerge from the digital transformation of scientific research itself. Initiatives such as the Brazilian Network of Digital Repositories, Brapci, and the Fiocruz Repository represent advances in the integration and visibility of national scientific production (ALVES & VALENTIM, 2022). In addition, the Open Science framework proposed by UNESCO in 2021 and its adhesion by Brazil expand the horizon of possibilities for international collaboration and the strengthening of information governance.

Another relevant aspect is the alignment between scientific sharing practices and the graduate evaluation guidelines established by CAPES (2025). According to Alves and Valentim (2022), the incorporation of Open Science indicators in evaluation processes "can stimulate a paradigmatic change in the way academic production is understood and valued" (ALVES & VALENTIM, 2022, p. 118). Thus, sharing is no longer just a technical requirement and becomes a strategic indicator of scientific quality.

Therefore, the challenges for scientific sharing in Brazil are related to overcoming cultural barriers, expanding digital infrastructure, and creating incentive mechanisms. On the other hand, the opportunities are promising, especially in the face of the growing appreciation of open science and institutional initiatives that promote the management and dissemination of knowledge. The future of Brazilian scientific research will depend, to a large extent, on the ability of its institutions to transform sharing into a collective and structuring value (VALENTIM, 2023; STUEBER & TEIXEIRA, 2024).

3 METHODOLOGY

The present research is characterized as exploratory and qualitative in nature. According to Gil (2019), the exploratory study aims to provide greater familiarity with the problem, making it more explicit or building hypotheses based on a set of preliminary observations. The choice for a qualitative approach is justified by the interest in understanding

the perceptions, practices, and meanings attributed by Brazilian researchers to the sharing of scientific knowledge, especially in the context of the Sustainable Development Goals (SDGs) proposed by the United Nations (UN) 2030 Agenda.

According to Minayo (2022), qualitative research enables the analysis of social phenomena from the perspective of the subjects and the contexts in which they are inserted, prioritizing the understanding of relationships and meanings to the detriment of quantification. Thus, it seeks to understand how collaborative practice and the dissemination of scientific knowledge can contribute to the achievement of the SDGs and the strengthening of scientific and social sustainability in Brazil.

The study is based on interdisciplinary theoretical contributions from Information Science, Administration, Education, Sociology and anchored in the literature of Knowledge Management, which offer conceptual tools to analyze the processes of production, organization, sharing and use of knowledge in the academic sphere.

Information Science, according to Borko (1968) and Le Coadic (2004), is concerned with the informational cycle and the role of information as a strategic resource for decision-making and innovation. Knowledge Management, on the other hand, according to Nonaka and Takeuchi (1997), involves processes of creation and dissemination of knowledge in organizations, favoring collective learning and continuous innovation.

By integrating these two approaches, it is intended to understand how open access policies, collaborative networks, and open science practices contribute to the generation of social impact and to the fulfillment of SDG goals.

This study was developed in two complementary stages, of a bibliographic and empirical nature.

In the first phase, a Bibliographic and Documentary Review was carried out. In this phase, an integrated and critical review of the literature was carried out, with the objective of identifying and analyzing studies that addressed knowledge sharing, Open Science and its relationship with the SDGs. The SciELO, Brapci, Scopus and Web of Science databases were consulted, using descriptors such as: knowledge management, knowledge sharing, Open Science, SDGs, 2030 Agenda, scientific collaboration, informational sustainability and sustainable research.

The selection criteria included: a) Works published between 2015 and 2025; b) Texts in Portuguese, English or Spanish) Scientific articles, dissertations, theses and institutional reports of government or international agencies. It should be inferred that this first phase of

the research did not consider the methodological aspects and scientific rigor required for a Systematic Review of the Literature. Therefore, the studies highlighted in the research results were selected for the convenience of the researchers based on the scientific production of Brazilian research groups that deal with the themes of this study.

In addition, official documents were analyzed, such as: a) UN and UNESCO Reports on the 2030 Agenda; b) Plans and guidelines of CAPES and CNPq related to Open Science and the internationalization of research; and c) Institutional policies of Brazilian universities aimed at sustainability and knowledge management. The analysis of this stage allowed us to theoretically contextualize the discussion and identify gaps and opportunities for Brazilian researchers.

In the second stage, an empirical research was carried out. The focus of this study was concentrated on the collection of primary data (GIL, 2019) with Brazilian researchers involved in projects aligned with the SDGs. Semi-structured interviews were conducted, as it allows flexibility and depth in the answers, as recommended by Triviños (2015). The interviews were conducted online (via Google Meet or Zoom), lasting approximately 40 to 60 minutes, through a Free and Informed Consent Form (ICF).

The data collection instrument was developed based on the theoretical foundation discussed in the previous chapter, in government reports, in the UN 2030 Agenda and in UNESCO reports. Fifteen (15) open questions were established that allowed for dialogue with the interviewed researchers.

The sample was intentional and non-probabilistic, comprising 10 researchers, selected based on the following criteria: a) Work in graduate programs recognized by CAPES; b) Participation in projects or research groups focused on sustainability or SDGs; c) Recent scientific production on knowledge management or open science; and d) Be a CNPq PQ researcher. The data were recorded, transcribed and organized into thematic categories.

The transcriptions of the interviews resulted in a volume of approximately 310 (three hundred and ten) pages of qualitative text. Only part of this volume of data was used in this study. Therefore, a vast and rich material with experiences with the development of scientific research in Brazil is still available for other analyses. A relevant strategy for future studies may be to use qualitative data analysis software NVIVO, MAXDATA or ATLAS TI.

The Brazilian researchers interviewed and their main credentials to participate in this study are identified as shown in Table 1.

Table 1

Profile of the Brazilian Researchers interviewed

Code name	Country Region	University	Area of expertise according to CAPES	Length of Work at the HEI (years)	Productivity Grant Category	Years of SDG Theme Research
WEIGHT 1	Southeast	Public	Communication, Information and Museology	18	1C	8
WEIGHT 2	Northeast	Public	Communication, Information and Museology	21	2	10
PESQ 3	Southeast	Public	Education	20	Senior	5
PESQ 4	North	Public	Education	11	2	10
WEIGHT 5	South	Toilet	Public and Business Administration, Accounting Sciences and Tourism	6	2	6
PESQ 6	Midwest	Public	Right	18	1B	9
PESQ 7	Southeast	Toilet	Public and Business Administration, Accounting Sciences and Tourism	15	1B	9
PESQ 8	Northeast	Public	Public and Business Administration, Accounting Sciences and Tourism	23	1B	11
PESQ 9	North	Public	Education	12	2	12
PESQ 10	Midwest	Toilet	Right	10	2	8

Source: Survey Data, 2025.

In Brazil, the researcher with a Research Productivity (PQ) scholarship stands out among his peers, valuing his scientific production according to normative criteria, established by CNPq, and specific, by the Advisory Committees (CAs) of CNPq (2025). For category 1, the researcher will be classified into four different levels (A, B, C or D), based on comparison between their peers and on data from the last 10 (ten) years, including the one that demonstrates the capacity for continuous training of human resources. For category 2, in which there is no level specification, the researcher's productivity will be evaluated, with emphasis on published works and guidelines, both referring to the last 5 (five) years (CNPq, 2025).

The analysis and treatment of the data was conducted according to the principles of content analysis, according to the methodology of Bardin (2016), which is structured in three phases: a) Pre-analysis: floating reading and organization of the material; b) Exploration of the material: identification of thematic categories and subcategories; c) Treatment and

interpretation: inference and interpretation of the results in the light of the theoretical framework.

In this way, it was possible to identify patterns, barriers and opportunities in the sharing of scientific knowledge, as well as to understand how collaborative practices and policies of Open Science have been incorporated into the Brazilian academic culture.

To validate the results, methodological triangulation was used, articulating the data sources of the Bibliographic and Documentary Review, Interviews with researchers and Analysis of institutional documents (CAPES, CNPq and universities). According to Flick (2018), triangulation allows different perspectives on the phenomenon studied to be confronted, increasing the consistency and reliability of the research.

The research respected the ethical principles defined by Resolution No. 510/2016 of the National Health Council (2016), ensuring the anonymity of the participants and the use of the data exclusively for scientific purposes. All interviewees agreed to the Informed Consent Form (ICF).

4 PRESENTATION, ANALYSIS AND DISCUSSION OF RESULTS

The results of the study were organized into categories and subcategories described as follows: Initially, the view of Brazilian researchers on knowledge sharing is discussed. Subsequently, the result of sustainable technology and the sharing of knowledge in scientific research is presented. Next, Open Science is discussed from the point of view of Brazilian researchers. Closing the data analysis, the issue of Factors and Barriers to Knowledge Sharing among Brazilian Researchers, Good Practices and Strategies for Knowledge Sharing is addressed and at the end there is an overview of Brazilian research on SDGs.

4.1 KNOWLEDGE SHARING ACCORDING TO BRAZILIAN RESEARCHERS

The researchers interviewed in this study were unanimous in stating that in recent decades, the topic of knowledge sharing, whether in terms of research data, scientific results or collaborative practices, has gained increasing attention in the Brazilian scientific community. The researchers report several benefits and challenges of this process in the national context, in agreement with studies such as the one by Ziviani *et al.*, (2023a).

A highlight in the interviews with researchers was Open Science. In Brazil, it is observed that the Open Science movement is associated with the idea of making research and scientific data accessible to all, as a means of accelerating scientific progress, increasing

transparency, and expanding the social impact of investigations, according to the researchers interviewed and the UNESCO report published in 2025. It should be recognized that Brazilian researchers such as Albagli, Maciel and Abdo (2015) and Amaro (2018) discuss the relevance of Open Science in their studies before structuring public policies in this regard.

Emphasizing the practice of knowledge sharing, Brazilian researchers have expressed support for open data, digital repositories, prepublications, and reuse of results, as ways to improve collaboration and the quality of scientific research. The researchers' position is in line with what is stated in the study by Dias (2025, p. 41) on Open Science public policies in Brazil between 2020 and 2023, in which it can be stated that "the dissemination of Open Science depends on policies that guarantee the resources, infrastructure, and incentives necessary to increase collaboration and transparency in research". Therefore, it can be stated that for Brazilian researchers, knowledge sharing is not just a technical or individual issue, but involves institutional infrastructure, financing, institutional incentives, and organizational culture, in line with studies by Valentim (2020) and Ziviani *et al.* (2023a).

When it comes to research data, the researchers report that there are trends that influence the sharing and reuse of research data in Brazil, highlighting the lack of clear regulations, technological barriers, fears about the misuse of data, and limited resources for maintaining or preserving repositories, which is in line with the study conducted by Silva, Prado and Araújo (2022). In this way, Brazilian researchers realize that, although there is a willingness to share knowledge, there are substantial practical obstacles.

In collaborative contexts such as partnerships between Brazilian and foreign researchers, important issues are also verified. Agreeing with the study by Almeida, Silva and Queiroz (2017) on the Science without Borders program, it is verified that knowledge sharing occurs through meetings, seminars, and the preparation of articles together, but is influenced by individual, collective, organizational and cultural factors. The researchers interviewed report that there are challenges related to language differences, expectations of collaboration, and recognition of authorship of research and publication of results. Thus, Brazilian researchers consider knowledge sharing as a complex process, which transcends the simple availability of data and involves human and institutional relations as factors to be observed and considered.

One issue reported by the interviewees is related to the theoretical foundation of the studies. These state that they are always considered relevant foreign studies, research and

publications, and ongoing research or results published in Brazilian journals are rarely cited by foreign researchers.

On the other hand, Brazilian researchers also point out the need for science not only to be focused on publication and accumulation of institutional goods, but rather on real impact on society. Thus, it is evident that the results of the research produce social, economic and technological impact.

When asked about the innovation environment in Brazil, the researchers stated that they share knowledge in innovation environments and pointed out that trust between actors, the clarity of norms, and the definition of who shares are essential for the flow of knowledge to really happen. Thus, the researchers agree with the results of the study by Scarabelli, Sartori, and Cruz Uripia (2023) who investigated how the connection between researchers, technology, and innovation occurs. Therefore, this insight reveals that knowledge sharing is as much a matter of organizational culture as it is of structure.

Brazilian researchers consider knowledge sharing relevant not only for academic collaborators, but also for society in general. In the interviews, it was possible to observe that the researchers hope that the results will reach society as a whole and not only the scientific community. One researcher (PESQ 2) states that "it is necessary to break down the walls of the University" and dialogue with society about what science is and especially that the country's development takes place within universities. As reinforced by three interviewed researchers (PESQ 3; PESQ 6; PESQ 9): "The results need to reach society in general" and not only the scientific community. One must be concerned with doing science for the social purpose.

The researchers point out that in the Brazilian context, research data management practices reflect a combination of individual, institutional, and technological factors. Researchers demonstrate a positive perception of the benefits of knowledge sharing, such as greater visibility, collaboration, and academic impact, but often use local resources, such as hard drives and institutional servers, to the detriment of structured digital repositories, agreeing with studies by Carvalho, (2022) and Miranda, Barros, and Oliveira (2023).

Studies such as Lima (2020) indicate that the adoption of institutional or national repositories is still heterogeneous, being strongly influenced by institutional policies, funding incentives, and evaluation requirements, while gaps in documentation and interoperability hinder reuse and scientific reliability in the view of researchers who are in line with the results of the study by Azambuja (2021).

In addition, knowledge management in graduate programs reveals diverse practices, including the use of spreadsheets, specific software, and digital repositories, with barriers such as fear of misuse, the absence of clear standards, and difficulty in standardizing metadata, reinforcing the need for institutional policies and continued training to strengthen knowledge sharing, which is also evident in Dias' study; Anjos and Araújo (2019).

Dialoguing about the process of knowledge sharing with Brazilian researchers, some reflections emerge. First, a field linked to opportunities in which knowledge sharing is perceived as a way to expand collaboration, accelerate innovation, better use of research results, greater visibility of Brazilian science and greater social impact. The adoption of open science practices, data repositories, international collaboration, and innovation environments favors scientific knowledge to contribute to sustainable development, reinforcing studies developed by Sayão and Sales (2022) and Leite, Costa, and Alves (2022) and a practice historically researched and shared by Kuramoto (2008).

The other field is a dimension of barriers in which researchers recognize that there are relevant barriers and the absence or fragility of technological infrastructure, limitation of financial resources, lack of clear and consistent policies, institutional culture that still favors "closure" or control over data, bureaucratic issues and obstacles, in addition to issues of recognition, authorship and incentives. These factors make it difficult to fully implement knowledge sharing.

Based on interviews with researchers, some good practices can be established for the effectiveness of knowledge sharing. The issue of establishing cooperation platforms that include the equitable participation of Brazilian and foreign researchers is evident, ensuring that local issues are prioritized. Promote academic mobility and exchange of researchers, with institutional support and targeted funding. Encourage international co-authorship and joint publication, including in accessible languages. Promote the formation of transnational networks of practice that involve producers and users of knowledge. Ensure the translation and dissemination of results to the Brazilian reality, ensuring that the knowledge shared is not limited to academia, but reaches public policies, the productive sector and civil society. Monitor and evaluate international collaboration through SDG impact indicators. Strengthen data and information management, promote open data infrastructure, and institutional integrity and sharing policies. The results described by the interviewees are in line with studies developed by Carvalho (2022); Cunha and Santos (2022); Miranda, Barros and Oliveira (2023).

4.2 SUSTAINABLE TECHNOLOGY AND KNOWLEDGE SHARING IN SCIENTIFIC RESEARCH

For the field of sustainable technology, these perceptions have interesting implications in the view of the researchers interviewed and directly linked to the SDGs. Brazilian researchers working with green technology, renewable energy, sustainability, or the environment consider that: i) the sharing of data and results between research groups, companies, government, and civil society organizations can accelerate the adoption of sustainable technologies; ii) the creation of specific repositories, collaborative platforms or national/international networks facilitates the exchange of knowledge on good practices, failures and innovations. These issues are also discussed in the studies by Oliveira and Ferreira (2022) and Leite, Costa and Alves (2022).

Therefore, they state that it will be necessary to overcome the bureaucratic processes of universities and invest in infrastructure, foster open science policies in the environment of sustainability, promote institutional incentives for those who share, and modify the academic culture to value both production and sharing. In this sense, it reinforces that CAPES (2025) started to adopt the sharing and transfer of knowledge as a structuring pillar of the evaluation of graduate programs. In this way, the researchers report that the evaluation criteria have changed significantly. Graduate programs are no longer evaluated quantitatively and start to have a qualitative evaluation. Most of the interviewees stated that the change in the form of evaluation was positive and will bring good results in the long term. These results can be confirmed in the research by Sayão and Sales (2022).

Knowledge sharing has been consolidated as a strategic axis for scientific advancement and the sustainable development of contemporary societies. In the context of the United Nations (UN) 2030 Agenda, the Sustainable Development Goals (SDGs) demand a new posture from the scientific community, guided by collaboration, transparency, and the open circulation of scientific information. In this sense, Brazilian researchers play a relevant role in promoting collaborative practices that strengthen open science and the democratization of access to knowledge.

From an interdisciplinary perspective, knowledge sharing is understood as a dynamic process that involves the creation, dissemination and use of information in formal and informal networks (DAVENPORT & PRUSAK, 1998). According to a UNESCO report (2024), in Brazil, the process of knowledge sharing has been enhanced by open access policies and the expansion of digital platforms that favor interoperability and scholarly communication,

such as SciELO and the CAPES Institutional Repository (CAPES, 2025). Such initiatives reinforce the importance of a more reliable and inclusive information infrastructure, capable of supporting scientific production in line with the SDGs, especially the goals aimed at quality education (SDG 4), innovation (SDG 9) and partnerships for development (SDG 17).

However, knowledge sharing still faces structural challenges in the Brazilian scenario, according to the interviewees. Cultural barriers, academic competitiveness, bureaucracy of the research funding system, and regional inequalities limit the full adoption of collaborative practices among researchers, which is in line with the study by Valentim and Cervantes (2020).

The reports of the interviewees indicate that the absence of institutional incentives and the evaluation based exclusively on quantitative metrics reduce the recognition of initiatives aimed at cooperation and the social dissemination of knowledge. Thus, there is a need to rethink the role of universities and graduate programs as spaces for mediation and collective construction of scientific knowledge. In this sense, one should consider the change in the rules for evaluating graduate programs defined by CAPES for the 2025-2028 quadrennium, which strengthens knowledge sharing as a cross-cutting criterion (CAPES, 2025).

The integration between knowledge sharing and sustainability presupposes a broader view of science, capable of articulating academic production with social demands. According to Nonaka and Takeuchi (1997), knowledge is transformed into value when it circulates among individuals and organizations, stimulating innovation and continuous learning. In the context of the SDGs, such circulation allows scientific knowledge to go beyond the walls of academia and effectively contribute to sustainable solutions at the local, regional and global levels.

Therefore, looking at Brazilian researchers reveals both significant advances and persistent challenges. The consolidation of a culture of sharing requires integrated scientific policies, mechanisms for recognizing open science, and the strengthening of information governance in the country. More than an institutional requirement, knowledge sharing must be understood as an ethical and collective commitment to sustainability and global equity.

4.3 INSTITUTIONAL CONTEXT: OPEN SCIENCE IN BRAZIL

In Brazil, the Open Science movement has gained ground as part of the State policy to make research and especially scientific data more accessible, reusable, and transparent. It is observed that all the calls for research published by CNPq and CAPES are demanding

as a criterion the clear and effective description of how data management and dissemination of primary data by researchers will be carried out. It is evident that high-impact scientific journals are demanding that the database, statistical or qualitative analyses and appreciation by the University's Research Ethics Committee be made available at the time of submission of the article.

In 2025, the Ministry of Science, Technology, and Innovation (MCTI, 2025) discussed guidelines to consolidate open science in the country, involving funding agencies, educational institutions, and civil society (BRASIL, 2025). At the institutional level, there are studies that map public and institutional policies for open science in Brazil between 2020-2023, showing that, although there are initiatives, there is still a lack of a consolidated federal policy. In this sense, it is possible to see initiatives by CAPES and CNPq aimed at the field of open science.

In the reports of Brazilian researchers in relation to open science, it can be seen that Brazilian researchers are inserted in an environment in which it is increasingly expected that data, methods and results will be made available in an open way, including beyond the academic community. All interviewees demonstrated the need for a public policy that favors open science and are in favor of the practice of public data.

Open science is a strategy that favors knowledge sharing. There are studies on the Open Science practices of the Brazilian academic community that analyze Brazilian scientific production and confirm that there are already open access and open data initiatives as part of knowledge sharing practices.

It should also be noted that there are factors that influence the sharing and reuse of research data in Brazil. Studies, according to a CAPES report (2025), have identified both incentives (e.g., greater visibility, acceleration of science) and barriers (e.g., infrastructure, lack of recognition) for researchers.

It was reported by a researcher (PESQ 7) interviewed that there are collective learning initiatives, communities of practice and collaborative projects in Brazil. The researcher pointed out that in a Brazilian knowledge-intensive public company (tropical agriculture) it was identified that researchers used informal and formal practices of collective learning, interrelationships in communities of practice, and knowledge sharing as a continuous process. Another researcher (PESQ 1) pointed out that in multidisciplinary socio-environmental projects, it was identified that knowledge management (KM) practices involved sharing between different actors, and that this also occurs among Brazilian researchers in the environmental field.

Regarding the infrastructure and support platforms for open science, the researchers mentioned that in the institutional field it is already possible to see the implementation of digital platforms (institutional repositories, databases, preprints) as a support for the sharing of open science.

It was reinforced by the interviewees that Brazilian researchers are encouraged to adopt open licenses, deposit data in interoperable repositories, adopt open codes and promote reproducibility. These incentives are strategies essentially conducted by CAPES, CNPQ, state development agencies, social organizations, international entities and private companies.

The researchers report that the strategic practice of encouraging the culture of open science, which involves actions such as publication in open access journals, the use of Creative Commons licenses, and detailed documentation of methods and results, is a way to promote open science that is available for broad access. Silva, Braga Prado, and Araújo (2021) state that institutional policies of incentive and academic recognition are crucial for researchers to adopt habits of sharing data and research results, increasing the visibility of scientific productions and stimulating future collaborations.

According to UNESCO and CAPES reports (2025), an open science strategy is understood as the practice of depositing research data in open access repositories, ensuring that the data is interoperable and reusable (following FAIR principles – Findable, Accessible, Interoperable, Reusable). Concentrate scientific publication in open access journals, or in preprint versions, to expand the reach of research. Participate in communities of practice (BA) and collaborative networks, both academic and interdisciplinary, to exchange experiences, methods, and results. Use open licenses to allow the reuse of the results, and document the code, methods, metadata for others to replicate. Include knowledge sharing as part of the project plan, including data dissemination, outreach to society, and citizen science actions, if applicable.

In the context of open science and open data management, the interviewees highlighted the functioning of academic data observatories in Brazil, highlighting that the lack of metadata standardization, the absence of repository maintenance policies, and the limited technical training of researchers and managers constitute important barriers to access and reuse of data. In this sense, the study by Silva, Braga Prado, and Araújo (2021), emphasizes that, although open data initiatives are promising, their effectiveness depends on the

articulation between institutional policies, technological infrastructure, and a culture of sharing within the academic community.

Even with good practices emerging and found in the reports of researchers and institutional reports, there are obstacles that Brazilian researchers face. Researchers report the lack of adequate infrastructure for storing, preserving and interoperating scientific data. They claim that there is no recognition or reward for researchers who share data. There is often more risk of "losing competitive advantage" by making data available first. The academic culture that still privileges traditional publishing without fully valuing data reuse or open science as part of evaluation. In this sense, the change in the evaluation of Qualis CAPES will cause a change in the behavior of researchers, as the paradigm of quantitative evaluation becomes less valued due to the quality of the research and its scientific productions.

4.4 KNOWLEDGE SHARING AMONG BRAZILIAN RESEARCHERS: FACTORS, BARRIERS AND GOOD PRACTICES

The sharing of knowledge among researchers is a strategic element for scientific advancement, technological innovation, and the promotion of sustainable practices, especially in areas such as Sustainable Information, as evidenced in the Geraldo, Pinto, and Duarte (2022) study. In the Brazilian context, recent studies show that, although there are growing efforts to democratize access to scientific data and information, significant challenges persist that limit the full adoption of sharing practices.

Based on the study by Silva, Braga Prado and Araújo (2021) who carried out a systematic review of the literature on factors that influence the sharing and reuse of research data in Brazil, pointing to individual, organizational, and technological variables as determinants of researchers' behavior. Among the facilitating factors, academic recognition, research visibility, and access to institutional repository platforms stand out. However, the barriers include the lack of adequate infrastructure, the scarcity of consolidated institutional policies, and the concern with the protection of intellectual property, which can generate resistance on the part of researchers.

In studies applied to socio-environmental projects, Silvério, Aihara, and Varvakis (2023) identified that, even in initiatives aimed at sustainability, researchers face challenges related to the interoperability of knowledge management tools, the heterogeneity of data formats, and the difficulty of communication between actors from different areas. These

obstacles show that the sharing of knowledge does not depend only on the goodwill of researchers, but also on the availability of digital and methodological structures capable of supporting the integration and dissemination of information, a strategy that goes against the proposal of Nonaka and Takeuchi (1997).

Thus, it was possible to categorize from the interviews with researchers that the factors and barriers to knowledge sharing among Brazilian researchers are closely linked to three main dimensions: the cultural, which involves attitudes, incentives, and recognition; the organizational, which refers to institutional policies and availability of support; and the technological one, which comprises the infrastructure, tools and interoperability of data. To promote the efficient dissemination of scientific knowledge in critical areas, such as sustainability, it is necessary to address these barriers in an integrated manner, combining incentive policies, training, and investment in digital infrastructure as shown in Table 2.

Table 2

Barriers and good practices in knowledge sharing in scientific research

Dimension	Barriers Identified	Good Practices and Strategies
Cultural	Resistance to sharing for fear of losing competitive advantage Lack of institutional recognition or reward	a) Encouragement of open science and academic recognition policies. b) Fostering a collaborative culture in teams and communities of practice
Organizational	Insufficient or poorly consolidated institutional policies Lack of support and guidelines for data management	a) Creating clear standards and flows for data sharing. b) Adoption of institutional repositories and data observatories.
Technological	Inadequate infrastructure for storage and interoperability Heterogeneity of data formats and digital tools Limited technical training	a) Use of digital platforms and integrated knowledge management tools b) Standardization of metadata. c) Continuous training of researchers in data management and open science

Source: survey data, 2025.

In the context of open data management, Silva, Braga Prado, and Araújo (2021) analyzed the functioning of academic data observatories in Brazil, highlighting that the lack of metadata standardization, the absence of repository maintenance policies, and the limited technical training of researchers and managers constitute important barriers to access and reuse of data. The author emphasizes that, although open data initiatives are promising, their effectiveness depends on the articulation between institutional policies, technological infrastructure, and a culture of sharing within the academic community.

In the face of these barriers, Brazilian researchers have been adopting strategies and good practices aimed at promoting knowledge sharing, both in academic projects and in

socio-environmental initiatives. One of the most relevant strategies consists of the use of digital platforms and repositories, which allow the deposit, organization and dissemination of research data in a structured way. highlight that academic data observatories support interoperability, metadata standardization, and the availability of information in an accessible way, creating conditions for researchers from different institutions to reuse data safely and reliably. Silva, Braga Prado and Araújo (2021),

In addition, the integration of knowledge management tools in collaborative projects has proven effective in facilitating sharing between researchers from different areas. Silvério, Aihara, and Varvakis (2023) point out that, in socio-environmental projects, the use of digital platforms, standardized flows, and shared methodologies contributes to reducing the fragmentation of information, allowing teams to exchange knowledge in a systematic way, even in the face of heterogeneity of data and skills.

Another strategic practice is the encouragement of an open science culture, which involves actions such as publication in open access journals, the use of Creative Commons licenses, and detailed documentation of methods and results. Silva, Braga Prado, and Araújo (2021) state that institutional policies of incentive and academic recognition are crucial for researchers to adopt habits of sharing data and research results, increasing the visibility of scientific productions and stimulating future collaborations.

Finally, technical training and continuing education of researchers are pointed out as fundamental practices. The training of professionals able to handle data, use digital tools, and understand open science policies contributes to reducing technological barriers and strengthening autonomy in information management. This approach also facilitates alignment with international standards for interoperability and data reuse, expanding the impact of Brazilian research in the global context.

4.5 OVERVIEW OF BRAZILIAN RESEARCH ON SDGS

Based on a survey carried out by the Coordination for the Improvement of Higher Education Personnel (CAPES, 2025), it is evident that between 2013 and 2022, about 50 thousand theses and dissertations in Brazil cited or had the SDGs as their theme, with a greater concentration in the areas of Health Sciences, Multidisciplinary and Human Sciences. According to a UNESCO report (2024), the Federal University of Espírito Santo (UFES) mapped that, among its research and extension projects carried out after 2015, about 60% were related to at least one of the SDGs. These studies highlighted SDG 3 (Health and well-

being), SDG 4 (Quality education), SDG 2 (Zero hunger and sustainable agriculture) and SDG 15 (Life on land) (CAPES, 2025).

The researchers interviewed pointed out that the theme of the SDGs began to be shared in the university environment in course collegiate meetings, groups of professors and informal environments. It did not take long, according to the report of the interviewed researcher (PESQ 10) for the theme to reach the classroom environment and research groups.

After this process of informal sharing of themes related to the SDGs, the movement to incorporate the theme into the dissertations and theses of different programs began. As stated by the researcher (PESQ 5), the entire university environment in a broad sense (Schools, Colleges, Departments, Research Groups, Extension Activities and academic and management structures) began to formally formalize and structure how the SDGs impact the university environment and what would be the strategies for teaching, research and extension practices to be aligned with the SDGs.

Another movement reported by the researcher (PESQ 2) was when the pedagogical projects of the courses began to incorporate and require that the activities of the undergraduate and graduate courses be related to one of the 17 areas of the SDGs.

This study was able to capture in the reports of the interviewees some innovative initiatives developed by universities in relation to the SDGs, such as: the monographic works, whether they are undergraduate TCC, Master's dissertations or Doctoral theses, should explicitly state in the text, which of the SDGs the study was contributing to. The University became the locus for extension activities to be directly focused on the SDGs. The researcher reinforces (PESQ 4) that the initiatives, actions and discussions on the SDGs began to occupy the university space in a synergistic way. At first very informal (a period in which it was possible to understand what the SDGs were) and later the academic environment began to formalize, value and recognize the initiatives that had already been incorporated throughout the dynamics of the university.

It is evident in the reports of the interviewees that each department, graduate program and shared spaces began to structure actions related to the SDGs according to the purpose and strategies of each department, college, schools or academic centers. The researchers interviewed state that each space in the university structure adheres to some fields of the SDGs. In the broad sense, the (PESQ 5) said that the dispersed actions when mapped by the higher bodies of the university's management allow us to understand that the academic

environment and especially the scientific research developed in the university environment are attentive to the 17 SDGs of the 2030 Agenda.

Confirming the reports of the interviewed researchers, a systematic review of the Brazilian literature entitled "The dimensions and Sustainable Development Goals after the 2030 Agenda" (RAASCH; LELIS &, BASSO, 2023) in which he analyzed articles from 2016 to 2022 and found the growth of academic production on sustainable development and studies related to the SDGs. However, he pointed out important gaps: few studies propose unified systems for monitoring and measuring SDG indicators. In this sense, this study effectively contributes to the commitment of the 2030 Agenda, by showing that the current moment requires Universities to establish structures and strategies to more effectively manage the actions related to the SDGs carried out in the university environment.

In the field of national policy, the documentary research showed how Brazil's Science, Technology and Innovation Policy (PCTI) incorporated the SDGs from 2016 onwards. The study concludes that, although there is mention of "sustainable development", there are structural difficulties in consistently incorporating the SDGs into financing and planning guidelines (Ribeiro & Oliveira, 2024). Therefore, it is necessary to implement management structures so that actions related to the SDGs in Brazilian universities are planned, organized, directed and controlled by trained human resources who understand the norms of the 2030 Agenda, effectively and transparently manage the financial resources allocated to scientific research applied to the SDGs and opportunely the most relevant issue, establish monitoring, managerial, and scientific indicators focused on the SDGs and establish indicators that can point out the economic, social, technological, human, educational, and sustainable results and impacts of scientific research and actions developed and funded by the university.

Finally, the results and impacts need to dialogue with society so that the population can understand the importance of the theme, actions and investments aimed at the sustainable development of the planet, the country, the regions and especially the environment where citizens live.

The literature retrieved from the databases consulted shows that studies that deal with the SDG theme in Brazilian scientific research follow different strategies. Bibliometric studies and systematic reviews to map scientific production through documentary analysis of public policies, plans, reports, and indicators that deal with the alignment of the SDGs with scientific research point to fragility in relation to the results and impacts generated effectively. Finally, case studies, citizen science projects, and university extension, for example, which aims to

articulate the environment where the individual lives with his community, and researchers focused on the theme of the SDGs, are more effective and cause more significant impact, as pointed out by government reports (BRASIL, 2025).

Based on the understanding that this research did not aim to carry out a Systematic Review of the Literature (RSL) with the protocols and methodological rigor that support the RSL technique. The articles selected from the consulted databases and the literature review carried out by the researchers who authored this study demonstrate that the most recurrent themes in Brazil in SDG research are:

- Health and well-being (SDG 3) – with a large volume of articles and projects.
- Quality education (SDG 4) — appearing in lines of research and extension services.
- Sustainable agriculture (SDG 2), life on land (SDG 15), water and sanitation (SDG 6) also receive attention.
- Affordable and clean energy (SDG 7) and innovation (SDG 9) – although less in volume, are relevant, especially in geoscientific or energy transition research.

Even noticing and verifying advances in research on SDGs in Brazil, the literature and scientific research developed by Brazilian universities point to important challenges:

- Scientific production is dispersed, with a lack of integrated propositions or robust national indicator systems to monitor progress on the SDGs in Brazil (BRASIL, 2025). This fact is due to the lack of a structure within universities that aims to manage actions related to the SDGs.
- In some areas, the integration of the SDGs into science and technology policies or graduate studies is still incipient or symbolic (BRASIL, 2025). Here one can point to the field of more linear and pragmatic sciences.
- The reality of Brazilian social inequalities, regionalization and institutional differences poses obstacles to a uniform advance of the SDGs. (RIBEIRO & OLIVEIRA, 2024) Brazil does indeed have many regional contrasts. This issue must be observed by public policies aimed at the SDGs.
- The plurality of themes means that some SDG goals do not point to or evidence relevant results for the country. One of the examples is scientific research that does not describe or point out effective indicators. The results of these surveys cause a low incidence of the SDGs associated with industry, innovation or infrastructure in peripheral regions (BRASIL, 2025). A point of reflection for the scientific community

and government agencies in this case is that government investments are in essence aimed only at maintaining employed people instead of promoting the maintenance of jobs associated with investment in innovation, technology and qualification of the workforce.

Brazilian research on SDGs contributes to generating contextual knowledge that adapts the SDGs to the national and regional reality, identifying how global goals can be translated in different states and municipalities. Research aimed at favoring dialogue between science, technology, innovation, public policies and civil society in the achievement of the SDGs.

There is also research that seeks to promote education for sustainability, both at the undergraduate and graduate levels, although it is still necessary to expand this insertion.

Finally, it reinforces that the future trend points to greater use of metrics, indicators, big data, artificial intelligence to monitor the SDGs, in addition to greater articulation between educational institutions, government and the private sector, the so-called Triple Helix. These points were highlighted by the researchers interviewed in reports.

In the global context of science and innovation, the sharing of knowledge between researchers from different countries is increasingly relevant to promote the United Nations (UN) SDGs. From the perspective of the relationship between Brazilian and foreign researchers, the production of scientific knowledge is an essential resource for sustainable development. Collaboration between national and international researchers facilitates the exchange of methodologies, data, cultural and technological perspectives. A point reported by the interviewees is that research groups abroad always have Brazilian researchers. Initiatives such as CNPq (2025) that invests resources to repatriate Brazilian researchers with high scientific reputation are worth mentioning.

A highlight is that in September 2015, 193 countries signed the 2030 Agenda, which defines 17 SDGs aimed at combating poverty, inequality, climate change, among others. A point of attention is that scientific research based on and guided by the SDGs requires interdisciplinary and international participation (UN, 2015).

5 CONCLUSION

Knowledge sharing, when integrated into the principles of the SDGs, takes on an ethical, social and strategic dimension. The experience of Brazilian researchers highlights

the need to strengthen the culture of scientific collaboration and open data, ensuring that the knowledge produced in the country contributes to global sustainable development.

The study presents as a first conclusion that by promoting knowledge sharing, it establishes a way to expand the social impact of science, reduce informational asymmetries, and consolidate knowledge governance focused on equity, innovation, and sustainability. In summary, Brazilian researchers are increasingly aligned with the SDG agenda, but they still face structural, methodological and scale challenges. It is essential that there be greater institutional articulation, the creation of indicators adapted to Brazil, academic training and awareness, in addition to a stronger commitment of public policies to the 2030 agenda. The agenda provokes a reflection on the relevance of moving to a development model aligned with sustainability.

Knowledge sharing between Brazilian and foreign researchers is an essential strategy to advance the SDGs in Brazil and globally. Despite the challenges, the adoption of good practices and cooperation policies can contribute decisively to overcoming knowledge asymmetries and promoting a more inclusive, contextualized, and impact-oriented science. To this end, it is necessary that institutions, government, academic communities, and civil society strengthen collaboration platforms, research infrastructure, and policies to encourage internationalization with equity.

Regarding open science in Brazil, the results reflect that data management is influenced by individual (perception, fear of misuse), institutional (infrastructure, policies, incentives) and technological (tools, repositories) factors. Another point is that sharing practices are still heterogeneous: some researchers adopt open repositories, while others keep data locally. Factors influencing the practice of open science are lack of standardization, poor documentation, poor interoperability, and absence of specific training. Finally, formal incentives, open science culture, and capacity building are essential to promote the sharing of knowledge and research data in Brazil.

However, studies and interviews with researchers show that Brazilian research is part of a global network, but faces asymmetries of knowledge and challenges such as language, funding, infrastructure, and access.

Co-authorship between Brazilian and foreign researchers, as well as academic mobility (internships, post-doctorates, visits) foster exchange. The production analysis on the SDGs shows a growing presence of international collaborations in Brazil. Thus, there is a consolidated path to expand research on SDGs with exchanges between Brazilian and

foreign researchers. However, research on sustainability and sustainable development developed in partnership with researchers shows how internationalization and the focus on the SDGs permeate the training of students and the sharing of pedagogical practices.

However, to conclude this study pointing out pragmatic results, it is emphasized that the benefits and impacts of knowledge sharing on scientific development must observe the different cultural and scientific perspectives, a factor that can enrich research. Strengthening local capacity for SDG-oriented knowledge production. To give greater international visibility to Brazilian research, which can generate more funding and collaboration.

This study shows that the generation of solutions more adapted to the local context based on global knowledge are more relevant from the point of view of social impact. However, the study reinforces that it is necessary to reduce knowledge asymmetries between developed and developing countries.

To overcome the challenges and barriers to knowledge sharing, it is necessary to advance in the issue of language and communication: although English is the lingua franca of science, Brazilian researchers face challenges in publishing in English and international communication. In the field of infrastructure and financing: full participation in international networks requires resources for mobility, access to the database and collaboration platforms. It is essential to reduce power and agenda asymmetries: in international collaborations, there may be imbalance in the definition of the research agenda, the recognition of local partners, and the accessibility of data.

This study has the following limitations: the small number of interviews and the foundation in many scientific data in the area of Information Science. As a suggestion for future studies, it is suggested to expand the number of interviewees and present an RSL with foundations and criteria in the literature.

ACKNOWLEDGMENT

The authors would like to thank the Minas Gerais Research Foundation (FAPEMIG), the National Council for Scientific and Technological Development (CNPq) for funding the Postdoctoral Fellowship Abroad to one of the researchers who authored this study, and the Coordination for the Improvement of Higher Education Personnel (CAPES).

ABSTRACT

This article proposes FeedbackInsight-AI, an automated system for triaging, classifying, and summarizing customer feedback using Artificial Intelligence (AI) and Natural Language Processing (NLP) techniques. The objective is to optimize the handling of large volumes of messages received by companies, reducing response time and enabling more efficient information analysis. The study is based on a qualitative and descriptive approach, using machine learning models applied to sentiment analysis and text categorization. The methodology involves integration between communication (Gmail), management (Trello), and data analysis (Google Sheets) APIs, utilizing state-of-the-art language models (like GPT-4). The proposal aims to contribute to the advancement of intelligent automation in customer service processes and data-driven decision-making in organizations.

Keywords: Artificial Intelligence. Automation. Customer Feedback. Natural Language Processing. Sentiment Analysis.

RESUMO

O presente artigo propõe o FeedbackInsight-AI, um sistema automatizado de triagem, classificação e sumarização de feedbacks de clientes por meio de técnicas de Inteligência Artificial (IA) e Processamento de Linguagem Natural (PLN). O objetivo é otimizar o tratamento de grandes volumes de mensagens recebidas por empresas, reduzindo o tempo de resposta e permitindo uma análise mais eficiente das informações. O estudo parte de uma abordagem qualitativa e descritiva, com base em modelos de aprendizado de máquina aplicados à análise de sentimentos e categorização textual. A metodologia envolve a integração entre APIs de comunicação (Gmail), gestão (Trello) e análise de dados (Google Sheets), utilizando modelos de linguagem de última geração (como GPT-4). A proposta visa contribuir com o avanço da automação inteligente de processos de atendimento e tomada de decisão em organizações orientadas por dados.

Palavras-chave: Inteligência Artificial. Automação. Feedback de Clientes. Processamento de Linguagem Natural. Análise de Sentimentos.

RESUMEN

Este artículo propone FeedbackInsight-AI, un sistema automatizado de triaje, clasificación y resumen de comentarios de clientes mediante técnicas de Inteligencia Artificial (IA) y Procesamiento de Lenguaje Natural (PLN). El objetivo es optimizar el manejo de grandes volúmenes de mensajes recibidos por empresas, reduciendo el tiempo de respuesta y permitiendo un análisis más eficiente de la información. El estudio parte de un enfoque cualitativo y descriptivo, basado en modelos de aprendizaje automático aplicados al análisis de sentimientos y categorización textual. La metodología implica la integración entre APIs de comunicación (Gmail), gestión (Trello) y análisis de datos (Google Sheets), utilizando modelos de lenguaje de última generación (como GPT-4). La propuesta busca contribuir al avance de la automatización inteligente en los procesos de atención al cliente y toma de decisiones basada en datos en las organizaciones.

Palabras clave: Inteligencia Artificial. Automatización. Feedback de Clientes. Procesamiento de Lenguaje Natural. Análisis de Sentimientos.

1 INTRODUCTION

The growing digitalization of relationships between companies and consumers generates a significant volume of unstructured data, especially in communication channels such as emails and online forms. Such data contains valuable information about user satisfaction, criticism, and suggestions, but manual analysis of this content is often unfeasible and inefficient (FERREIRA, 2025).

According to Boente (2025), the adoption of AI-based automation systems allows you to reduce operational bottlenecks and increase accuracy in message screening. Dos Santos (2025) reinforces this perspective by proposing human-computer interaction models that balance logical reasoning and cognitive adaptation, based on fuzzy logic.

Several studies point to the potential of AI in automated text processing. Russell and Norvig (2022) highlight that intelligent systems are capable of inferring human intentions and classifying language patterns with a high degree of accuracy. Goodfellow, Bengio, and Courville (2016) define deep learning as an essential tool for capturing complex semantic nuances. LeCun, Bengio, and Hinton (2015) demonstrate that convolutional neural networks and transformers have extended the reach of AI in linguistic interpretation tasks.

In addition, Domingos (2015) explains that the success of intelligent systems depends on the quality of the training data and the integration architecture between analysis layers. Haenlein et al. (2019) add that in the business context, AI not only processes information but redefines the way decisions are made. Marr (2020) emphasizes the importance of explainable and ethical systems that ensure transparency and reliability. Finally, Nielsen (2020) argues that automation should be accompanied by feedback mechanisms, allowing humans to maintain control over decision-making processes.

Given this scenario, the FeedbackInsight-AI project emerges as an innovative proposal to automate the processing of customer feedback, classifying them according to category and sentiment, generating automatic summaries, and integrating the results into organizational management platforms. This article describes the design, methodology and development of the system, highlighting its applicability in corporate and academic environments.

1.1 GOALS

This subsection details the objectives that guided the development of the project.

1.1.1 General Objectives

Develop an automated system for screening and analyzing customer feedback using Artificial Intelligence, focusing on textual classification, sentiment analysis and automatic summarization, integrating the results with data management and analysis tools.

1.1.2 Specific Objectives

- a) connect the system to the corporate email inbox via Gmail API;
- b) automatically process the textual content of incoming emails;
- c) apply generative AI models to classify messages and generate summaries;
- d) automatically record the results in Google Sheets;
- e) create corresponding tasks in Trello, allowing you to track the resolution;
- f) ensure security and scalability of the system in a cloud environment (GCP or AWS).

2 THEORETICAL FRAMEWORK

This section presents the fundamentals Conceptual than Support or development of FeedbackInsight-AI, addressing the main areas of knowledge that converge in the project: Natural Language Processing (NLP), Sentiment Analysis and Process Automation based on APIs.

2.1 NATURAL LANGUAGE PROCESSING (NLP) AND LANGUAGE MODELS

Natural Language Processing (NLP) is a field of Artificial Intelligence focused on the interaction between computers and human language. The goal is to enable machines to "understand", interpret and generate language effectively (RUSSELL; NORVIG, 2022).

To address the complexity and nuances of human communication, such as those found in customer feedback, NLP has evolved significantly with the advent of deep learning. As detailed by Goodfellow, Bengio, and Courville (2016), deep neural network architectures are essential for capturing complex semantic patterns.

In this context, Large-Scale Language Models (LLMs) stand out, such as Transformer (LECUN; BENGIO; HINTON, 2015), which are the basis of tools such as GPT-4. These models are trained on vast textual datasets, allowing them to perform sophisticated tasks such as intent classification, abstract generation, and pattern inference with high accuracy, being the core technological foundation of FeedbackInsight-AI.

2.2 SENTIMENT ANALYSIS IN THE BUSINESS CONTEXT

Customer feedback management is a pillar for strategic decision-making. However, the large volume of unstructured data (emails, comments, forms) makes manual analysis unfeasible (FERREIRA, 2025). Sentiment Analysis, a sub-area of NLP, is the computational technique used to extract and classify opinions, emotions, and attitudes (positive, negative, or neutral) present in texts.

In the business landscape, AI is not limited to processing information; it redefines how decisions are made (HAENLEIN et al., 2019). By applying Sentiment Analysis, FeedbackInsight-AI allows the organization to identify automatically the polarity of a message, prioritizing critical cases (negative sentiment) or identifying strengths (positive sentiment) immediately.

2.3 PROCESS AUTOMATION AND SYSTEM INTEGRATION (APIS)

The value of AI data processing is maximized when its results are integrated directly into operational workflows. Automation, in this project, is what connects textual analysis to practical action. According to Boente (2025), the adoption of automated systems allows the reduction of operational bottlenecks and increases accuracy in task screening.

This integration is technically made possible by the use of Application Programming Interfaces (APIs). FeedbackInsight-AI uses an ecosystem of APIs (Gmail, Trello, Google Sheets) that allows disparate systems to communicate in a standardized way. AI acts as the central "brain" that, after processing information (email), triggers events on other platforms (creating a card in Trello and registering in Sheets), establishing a cohesive and automated workflow.

This system aligns with Nielsen's (2020) vision of Human-AI interaction, where automation does not replace the human, but provides the feedback mechanisms (the card in Trello) for humans to maintain control and supervision over decision-making processes.

3 METHODOLOGY

The methodology used is based on an agile and interactive approach, structured in four main steps: a) Data Collection and Extraction: Gmail API is used for continuous monitoring of messages in specific folders; b) pre-processing: The textual content is cleaned and tokenized, removing noise and metadata; c) Intelligent analysis: AI models (such as GPT-4 and Gemini) are used for semantic classification, identification of sentiments (positive,

neutral or negative) and summarization; d) Integration and Storage: Results are automatically sent to Google Sheets, while tasks are created in Trello for tracking.

The development was conducted in a cloud environment, with unit tests and integration testing at each delivery sprint. This methodology ensures robustness and scalability, as proposed by Nielsen (2020) and Boente (2025).

3.1 PROMPT ENGINEERING AND FLOW ORCHESTRATION

The effectiveness of Large-Scale Language Models (LLMs) in enterprise tasks depends directly on the quality of the instructions provided, a discipline known as Prompt Engineering. In the development of FeedbackInsight-AI, the interaction with the Gemini model was orchestrated through the n8n automation platform, which allows the construction of visual workflows and the manipulation of data between APIs.

For the task of sorting emails, it is not enough to ask the AI to "read the message". It was necessary to build a structured prompt that acts as a translation layer between the natural language of the customer's email and the technical structure of Gmail (which uses numeric IDs for labels).

Figure 1 shows the configuration of the worker node on n8n, where the system prompt is set.

Figure 1

Classification Prompt structure in n8n

```

Prompt
You receive plain text from an email, an it's your role to classify that email into one of the following categories:
- compras (Label_2013226872929977162)
- contas-de-gás (Label_4788824610967943984)
- contas-de-internet (Label_3128932186123743899)
- contas-de-luz (Label_2308509691986788733)
- segurança (Label_309929790796730402)
- vagas-de-emprego-mal-sucedidas (Label_4448744525469411123)

Compras is anything involving online shopping.
Contas de Gás are emails that contain gas paying bills
Contas de Internet are emails that contain internet paying bills
Contas de Luz are emails that contain energy paying bills
Segurança is anything involving a hacker attack, password change, suspicious activities on websites
Vagas de Emprego Mal Sucedidas are emails that contains a feedback of a job application that turned out to be not successfull

Output in text with the following examples:

Label_2013226872929977162/Label_4788824610967943984/Label_3128932186123743899/Label_2308509691986788733/Label_309929790796730402/Label_4448744525469411123

Output only one label id
  
```

Source: Prepared by the authors (2025).

As noted in Figure 2, the prompt strategy used three fundamental techniques to ensure response accuracy:

- a) Role-Playing Definition: The initial statement "You receive plain text from an email, and it's your role to classify..." contextualizes the model, restricting its scope of action to a specific classification task.
- b) Label ID Mapping: One of the technical challenges of the Gmail API is that it does not accept label names (such as "Purchases"), but rather unique identifiers (e.g., Label_2013...). To avoid an extra code processing step, the prompt instructs the AI to associate the semantic concept directly with the technical ID. For example, you define "Shopping is anything involving online shopping" and associate that with the corresponding ID.
- c) Output Constraint: The final statement "Output only one label id" is critical for automation. It prevents the AI from generating conversational text (such as "Here's the ID you asked for..."), ensuring that the response is only the raw data needed for the next step in the automation flow.

This hybrid approach, where the prompt in English is used to process intents (even from emails in Portuguese) and return structured data, optimized response time and reduced system misinterpretation.

3.2 IMPLEMENTATION FROM ALGORITHMS FROM TREATMENT AND INTEGRATION

The orchestration between the email services, artificial intelligence and the management tool (Trello) required the development of custom JavaScript scripts (Node.js) within the n8n automation platform. The architecture of the solution was designed in a linear and modular way, as illustrated in Figure 2.

Figure 2

Workflow Implemented in n8n

Source: Prepared by the authors (2025).

The flow starts with a trigger in Gmail and goes through stages of extraction, cleaning, classification via AI and, finally, the creation of the management artifact (Card). Below are detailed the critical algorithms developed to ensure data integrity.

3.2.1 Sanitization and pre-processing of text

Corporate emails often contain HTML formatting, scripts, and metadata that constitute "noise" for the language model. Sending this raw content would increase token consumption (cost) and could degrade the quality of AI interpretation.

To solve this, a cleaning algorithm via Regular Expressions (Regex) was implemented, responsible for removing HTML tags, styles and excess spaces, extracting only the relevant plain text.

Figure 3

Text Cleaning and Extraction Algorithm

```

Function executed on n8n 'Code' node
return $input.all().map((item) => {
  Retrieves the email's HTML body or empty string
  let html = item.json.html || '';
  Removes style blocks (<style>) and scripts (<script>)
  html = html.replace(/<style[\s\S]*?</style>/gi, '');
  html = html.replace(/<script[\s\S]*?</script>/gi, '');
  html = html.replace(/</>/g, '');
  Removes all remaining HTML tags, keeping only the text
  let plainText = html.replace(/<\/?[ ^>]+(>|$/g, ' ');
  Removes duplicate whitespace and normalizes plainText =
  plainText.replace(/\s+/g, ' ').trim();

  Preserves the original subject
  let subject = item.json.subject;
  item.json.plainText = plainText;
  Returns the cleaned object to the next node
  return { json: { plainText, subject } };
});

```

Source: Prepared by the authors (2025).

3.2.2 Logical Routing and Trello Integration

After the classification performed by the Gemini model, the system receives a Label ID from Gmail. The next technical challenge is to translate this ID from the

Google ecosystem for a corresponding List ID in the Trello ecosystem, where the card will be created.

A mapping algorithm (Hash Map) was developed that associates the sort keys with the destination columns, ensuring that an email classified as "Security", for example, is routed to the correct list in the management board.

Figure 4

Mapping and Payload Creation Algorithm

```

Retrieves the data from the original email and the AI
response const emails = $('Code').all();
const labels = $("Message a model").all();
return emails.map((email, index) => {
  Extracts the text from the AI's suggested
  label const label =
labels[index].json.content.parts[0].text.replaceAll('"',
  '').toString();
  Mapping (From-To): Gmail Label ID -> Trello List ID
  const labelToList = {
    'Label_2013226872929977162': '68e7405b209733f7edd0c81d',
Shopping
    'Label_2308509691986788733': '68e7409c37f2490ab9f95823',
Electricity Bills
    'Label_309929790796730402' : '68e740a4943635c9f7cf3d1c',
Safety

    'Label_3128932186123743899': '68e74096a0f2485b05c08a6c',
Internet Accounts
    'Label_4448744525469411123': '68e740b57db269eb7bd4107b',
Job Vacancies
    'Label_4788824610967943984': '68e7409197c3a647a9c43e86',
Gas Bills
  }
  Select the corresponding list ID const
  listId = labelToList[label];
  Returns the formatted payload to the Trello API return
  {
    plainText: email.json.plainText,
    title: email.json.subject,
    listId: listId
  }
  ..

```

Source: Prepared by the authors (2025).

This middleware code layer ensures interoperability between APIs, allowing the decision made by Artificial Intelligence to become a practical organization action without human intervention.

4 RESULTS AND DISCUSSIONS

The results of the project are presented through the development artifacts that define the system: the functional and non-functional requirements, the execution schedule and the use case diagram that illustrates the interaction of users and systems.

4.1 SYSTEM REQUIREMENTS

The requirements gathering defined the scope of the system, separating its functionalities (RF) and its operating restrictions (RNF).

4.1.1 Functional requirements

Table 1

Details the functions that the system must perform

Code	Description
RF01	Connect to Gmail via API.
RF02	Identify new emails in a specific folder.
RF03	Submit content for AI analysis.
RF04	Return category, sentiment and summary.
RF05	Automatically create a card in Trello.
RF06	Record the results in Google Sheets.
RF07	Mark emails as processed.

Source: Prepared by the authors (2025).

4.1.2 Non-functional requirements

Table 2

Lists the RNFs that define the quality and performance criteria of the system

Code	Description
RNF01	Execution in Cloud environment (GCP or AWS).
RNF02	Time processing $\leq 10s$ by email.
RNF03	Secure authentication via OAuth2.
RNF04	Scalability towards until 10,000 emails/month.
RNF05	Records of error and status logs.

Source: Prepared by the authors (2025).

4.2 DEVELOPMENT TIMELINE

The project was executed in eight weeks, following the planning detailed in Table 3.

Table 3

Development Schedule

Week	Activity	Accountable	Deliverable
1	Definition of scope and requirements	Team	Requirements document
2	Environment configuration (APIs and cloud)	Philip	Environment ready
3	Gmail API integration	Matheus	Functional extraction
4	Implementing AI analytics	Philip	Rating and summary
5	Trello API Integration	Matheus	Tickets Automatic
6	Integration with Google Sheets API	Team	Logging
7	Unit and integration testing	Team	Test Report
8	Cloud deployment and final documentation	Team	Active system

Source: Prepared by the authors (2025).

4.3 USE CASE DIAGRAM

Figure 5
Use Case

5 CONCLUSION

The FeedbackInsight-AI project demonstrated the technical and practical feasibility of applying AI models in corporate feedback analysis and management processes. The integration between communication APIs, advanced language models, and productivity platforms represents a significant advance for companies that deal with a high volume of textual information.

As a result, the system contributes to reducing response time, improving demand prioritization, and data-driven decision-making. In future work, it is recommended to include continuous learning modules (supervised machine learning) and analytical dashboards for real-time visualization.

Thus, FeedbackInsight-AI consolidates itself as an innovative and scalable tool, aligned with contemporary demands for intelligent automation and digital transformation.

ACKNOWLEDGMENT

I want to leave here my gratitude to everyone who was part of this journey — which was intense, full of ups and downs, but totally transformative.

I thank my advisor professor, Ricardo Marciano, for his patience, for his accurate guidance and for always showing the way when everything seemed to be chaos.

To my co-worker, Matheus Marques, for being a key player in this project — both helping in the development and having the very idea that gave rise to everything. It was very much worth the partnership.

To my girlfriend, Ana Clara Gonçalves, who has always supported me, believed in me and reminded me, on the most complicated days, that my dreams are worth the effort. Without you, I wouldn't have held on tight.

And, of course, to my father. Even though I was stubborn as hell and made some very dubious decisions along the way, he never stopped supporting me for a second. This support was essential for me to get here.

To all of you: thank you very much. You were part of this tour in a way that I will carry with me for the rest of my life.

ABSTRACT

Analogies are instruments used in teaching that contribute to the success of teaching and learning processes, because they can make an unknown concept (target concept) be understood, when compared to a known concept (analogous concept). The dissemination of its use in Natural Sciences and their technologies textbooks has boosted the demand for evaluations on the way they are being used. Thus, this work aims to present results of a study on the analogies found in volume 'Composição e estrutura dos corpos', from the collection 'Ser Protagonista: ciências da natureza e suas tecnologias'. After complete and detailed reading, we identified only three analogies in book. They were discussed and classified according to a system proposed by some researchers. Hardly any of them discuss important aspects related to their objectives. We highlight the importance and the need for more discussions on the use of analogies, especially in initial teacher training courses, so they can be used in a way that does not harm learning.

Keywords: Target Concept. Analogous Concept. Chemistry Teaching. Textbook.

RESUMO

Analogias são instrumentos empregados no ensino que contribuem para o sucesso dos processos de ensino e aprendizagem, pois podem fazer um conceito desconhecido (conceito alvo) ser compreendido, quando comparado a um conceito conhecido (conceito análogo). A disseminação de sua utilização em livros didáticos da área das Ciências da Natureza e suas tecnologias impulsionou a demanda de avaliações sobre a maneira como estão sendo empregadas. Assim, este trabalho objetiva apresentar resultados de um estudo sobre as analogias encontradas no volume 'Composição e estrutura dos corpos', da coleção 'Ser Protagonista: ciências da natureza e suas tecnologias'. Após a leitura integral e minuciosa da obra, identificamos apenas três analogias que foram discutidas e classificadas de acordo com um sistema proposto por alguns pesquisadores. Praticamente todas elas não discutem aspectos importantes relacionados aos seus objetivos. Evidenciamos a importância e a necessidade de mais discussões sobre o uso desses instrumentos, principalmente nos

RESUMEN

Las analogías son herramientas didácticas que contribuyen al éxito de los procesos de enseñanza y aprendizaje, ya que facilitan la comprensión de un concepto desconocido (concepto objetivo) al compararlo con un concepto conocido (concepto análogo). El uso generalizado de analogías en los libros de texto de Ciencias Naturales y sus tecnologías ha impulsado la demanda de evaluaciones sobre su aplicación. Por ello, este trabajo pretende presentar los resultados de un estudio sobre las analogías presentes en el volumen «Composición y Estructura de los Cuerpos», de la colección «Ser Protagonista: Ciencias Naturales y sus Tecnologías». Tras una lectura completa y minuciosa del trabajo, se identificaron solo tres analogías que se discutieron y clasificaron según un sistema propuesto por algunos investigadores. Prácticamente ninguna de ellas aborda aspectos importantes relacionados con sus objetivos. Resaltamos la importancia y la necesidad de profundizar en el uso de estas herramientas, especialmente en la formación inicial del profesorado, para que se utilicen de forma que no obstaculicen el aprendizaje.

1 INTRODUCTION

The textbook plays a fundamental role in the teaching and learning processes. For many teachers who, more specifically, work in Basic Education, this instrument becomes the most used resource during their classes, if not the only one. When it comes to teaching in the area of Natural Sciences and its technologies, this reality is very present in the work of teachers, as these are contents that often do not find more appropriate methodologies for their exploration other than those based on the use of textbooks (MUNAKATA, 2016).

However, when reflecting on the true role of this pedagogical instrument, Oliveira (2012, p. 26) argues that "[...] it is through the dialogue between scientific knowledge, the teacher's discourse and his own discourse that the student apprehends the meanings produced in the scientific construction", and that, therefore, the textbook should be an instrument capable of promoting the construction of the student's knowledge and, therefore, should constitute a material capable of contributing to facilitate the learning process.

In this sense, textbooks in the area of Natural Sciences and their technologies often resort to some artifices, analogies, which are also widely used by teachers during their classes. These devices have been used for a long time, both in formal and informal education and, in particular, have been guaranteed to be present in textbooks. In view of this, analogies have become targets of studies by many researchers from the most different areas (DUIT; 1991; GATES; JULIÃO, 2016; MÓL, 1999; MARTIN; JUSTI, 2000; OLIVEIRA, 2012; THIELE; TREAGUST, 1994).

Duit (1991) and Thiele and Treagust (1994) define analogy or analogical reasoning as a comparison between a 'known concept', also called an 'analogous domain' or an 'analogous concept', and an 'unknown concept', also called a 'target concept'. In other words: an analogy constitutes the use of a concept already well understood by the learner to facilitate the understanding of another that is being learned.

It is from this understanding that Francisco Júnior (2009) draws attention to the importance of evaluating the way they are being used, both in the classroom by teachers and in textbooks, since they have become relevant instruments in enhancing the learning of scientific concepts. Thus, for this scholar, it is necessary to observe, especially in these books, the number of them used, the level of understanding of the concepts worked on and the possibility of generating misinterpretations about the target concept to be learned.

In this dimension, Bozelli and Nardi (2006) emphasize the importance of promoting discussions about analogies in initial teacher training courses, especially those used in formal

education. This could avoid the continuity of the disorderly use of these instruments in the classroom without prior study. In other words, it is necessary to analyze the advantages and disadvantages that these devices can bring to the learning process. In the opinion of these researchers, it is of fundamental importance that the teacher knows how to use analogical reasoning correctly, minimizing the problems related to the understanding of the concepts worked on in the classroom.

Considering this important aspect for the work of teachers and, especially, for teachers who are in the process of training, Francisco Júnior (2009), based on the studies of Thiele and Treagust (1994), suggested a system composed of ten categories that has contributed significantly to a better understanding of analogies. This system makes it possible to understand how they can become important allies for the success of teaching and learning processes. The ten categories are summarized in Table 1.

Table 1

System of criteria for classification of analogies

ORDER	CRITERION	DESCRIPTION
1	Quantity and frequency of analogies	It determines the quantity and frequency of analogies identified in the analyzed work.
2	Content of the target concept	Defined by the content(s) or topic(s) of Chemistry, Physics or Biology that constitutes the target concept of the analogy;
3	Analogical relationship between the analogous concept and the target concept	It considers the type of similarities between the analogous concept and the target concept, which can be: - Structural: the similarities are of the structural type; the similarities are physical in nature; - Functional: the operation or behavior of the analog is similar to the target.
4	Presentation format	- Verbal: analogy presented only by text; - Illustrative: presented only through illustrations; - Verbal-illustrative: presented through text and illustration.
5	Level of abstraction of analogous and target concepts	It identifies the degree of materiality established between the analogue and the target, respectively. It can be: - Concrete-abstract; - Concrete-concrete; - Abstract-abstract.
6	Position of the analogy in relation to the target concept	Indicates the order of the analogy in relation to the target concept. It can be: -Before; -After; - During the presentation of the target concept; - In the margins of the textbook page.

7	Analogy Enrichment Level	It verifies the extent of the relationship between the analogue and the target, which can be: - Simple: the list does not highlight similar attributes; - Enriched: the ratio highlights similar attributes; - Extended: uses more than one analogue.
8	Analogy Mapping Level	It identifies whether the author presents a discussion about the correspondences between the analogue and the target.
9	Presence of pre-topic guidelines	It identifies characteristic terms and expressions announcing the presence of analogy.
10	Presentation and discussion of limitations	It verifies the existence of excerpts evidencing the limitations of the analogy. It can be: - Does not recognize the existence; - Recognizes the existence; - Recognizes the existence and discusses it;

Source: adapted from Francisco Júnior (2009).

Considering, therefore, the scenario outlined so far, the objective of this work was to present the results obtained from a study carried out on the analogies present in a textbook in the area of Natural Sciences and its technologies, adopted in high school classes in Brazilian public schools.

2 METHODOLOGY

The research was developed with the aim of identifying, discussing and classifying the analogies present in the volume 'Composition and structure of bodies', from the collection 'Being a Protagonist: natural sciences and their technologies'. Aimed at Brazilian high school students, the book covers Chemistry, Physics and Biology content.

This collection bears the signature of several authors and has André Zamboni and Lia Manguilhott Bezerra as editors. Its first edition was published in 2020, by the publisher SM Educação, from São Paulo.

The investigation conducted to produce the results presented here can be characterized from the perspective of a qualitative approach, without, however, neglecting its quantitative aspect, since the numbers obtained constituted important data for a better understanding of the phenomenon studied. From the point of view of its objectives, it can be classified as exploratory, as it brings important contributions to the collection of studies on analogies present in books adopted in High Schools (MALHEIROS, 2011).

For its development, we followed a schedule that consisted of practically two moments. The first consisted of a bibliographic survey, cataloguing and acquisition of the material to be analyzed, followed by a thorough and complete reading of the work, in order to identify the analogies present in it.

The second comprised some stages: 1) classification of the analogies identified in the book, we used a system composed of 10 (ten) categories established by Francisco Júnior (2009), according to the studies developed by Thiele and Treagust (1994); 2) organization of results and; 3) preparation of the final research report.

To facilitate the recognition of the presence of an analogical reasoning contained in the analyzed work, we used, during the readings, the definitions of analogy developed by the main researchers in the area: THIELE; TREAGUST (1994); DUIT (1991); MÓL (1999); GATES; JULIÃO (2016); MARTIN; JUSTI (2000); OLIVEIRA (2012), among others.

Still in the process of recognizing the analogies of the work, we used textual elements such as '... similar to ...', '... making an analogy ...', '... that's like...', '... analogously ...', which are characterized as indicators of analogies (FRANCISCO JÚNIOR, 2009).

3 RESULTS AND DISCUSSIONS

Throughout the process of careful reading of the work, we noticed that its texts do not make a clear and elucidative approach to the contents presented, despite the work being adequate both to the level of understanding of the student for whom it is intended, and to the level of work to be performed by the teacher. In other words, the authors do not delve into the subjects explored in a way that allows greater accessibility to the understanding of what is being explained. This will be demonstrated later.

Moreover, similar to other works, the book presents some vulnerabilities, such as, for example, the lack of references to contextualizing and specific circumstances of the contents, which could be related to the daily lives of students from different Brazilian geographic regions.

The analogies identified and classified, as well as the quantity and frequency in which they were arranged in the book are discussed in this article according to the proposal and criteria of Thiele and Theagust (1994). On the last page of this work, we present Table 2, which summarizes the results and discussions presented below.

3.1 THE ANALOGIES IDENTIFIED: DISCUSSIONS AND CLASSIFICATION

The first classification criterion, 'Quantity and frequency of analogies', refers to the result of the quantitative analysis of their presence throughout the work. Regarding this aspect, we find a very small number: only 03 (three) analogies are present in the entire book. Another observation that causes strangeness is the fact that it has a frequency of only 0.3

analogies per chapter, an extremely small amount when compared to other works (FRANÇA, 2017).

In addition, they are distributed in a very irregular way: the 03 (three) analogies are located in Unit 1 of the book. The first was found in chapter 1, the second in chapter 3, and the third is located in the section 'Specific guidelines and comments', intended exclusively for teachers, and refers to chapter 4. It is worth noting that the work contains a total of 10 chapters distributed by 3 Units, over 260 pages.

In her work, França (2017) observed that one of the works she analyzed, containing 20 (twenty) chapters, presents 11 (eleven) analogies, that is, a frequency of 0.55 analogies per chapter. The other criteria will be discussed as each analogy is presented individually.

3.2 FIRST ANALOGY

Figure 1 shows the first analogy identified in the book. Inserted on page 20, chapter 1 (Units of measurement and properties of matter) of Unit 1 (What materials are made of), this analogical reasoning addresses content related to the concepts of 'precision, correctness and errors'. The authors make a comparison of the results of darts thrown at a bullseye and the concepts of precision and accuracy: 'The concepts of precision and accuracy can be represented by the distribution of darts thrown at a bullseye, ...' (ZAMBONI; BEZERRA, 2020, p. 20).

The analogous concept or domain (known concept) of this analogy is represented by the distribution of darts thrown at a bullseye, as shown in the illustration in the book, presented here in Figure 1. The target or unknown concept refers to 'precision' and 'accuracy'. When discussing the location of the data released in the three sets (A, B and C), the authors show the association between the results of the launches and the target concepts. This discussion is highlighted in the red rectangle in Figure 1.

With respect to the third criterion, analogical relationship between the analogous concept and the target concept, we observed that the domains share structural attributes, which allows us to classify the analogy as 'structural', since the aspects used by the authors to explain the target concepts refer to the physical form with which the results are presented.

Figure 1

Presentation of the first analogy, Chapter 1, Unit 1, p. 20

Fonte de pesquisa: KOTZ, J. C.; TREICHEL, P. M. J. *Química geral e reações químicas*. 5. ed. São Paulo: Pioneira Thomson Learning, 2005. v. 1.

Precisão, exatidão e erros

A **precisão** ou **repetibilidade** de uma medida indica o quanto as medidas repetidas estão próximas umas das outras. Os cientistas tentam obter valores mais precisos realizando muitas medidas e calculando a média dos resultados.

A **exatidão** mostra que o valor de uma medida está muito próximo do valor comumente aceito como referência (também denominado **valor real**).

Contudo, medidas precisas podem resultar em valores inexatos. Erros desse tipo ocorrem quando, por exemplo, um resíduo sólido fica no prato de uma balança. Se esse resíduo não for percebido e retirado, todas as pesagens posteriores apresentarão um **erro sistemático**: os valores obtidos serão precisos (ou seja, próximos entre si), porém a massa média obtida será inexata (distante do valor real), pois incluirá a massa do resíduo.

Há também os **erros aleatórios**, que podem ter várias causas. Leituras incorretas executadas pelo operador do instrumento de medição e mudanças nas condições experimentais, por exemplo, podem levar a medidas imprecisas e inexatas.

Os conceitos de precisão e exatidão podem ser representados pela distribuição de dardos lançados contra um alvo, como nas figuras ao lado. A figura **A** mostra que o atirador foi preciso e exato, porque todos os dardos atingiram o centro do alvo. A figura **B** mostra que o atirador foi preciso, mas não foi exato, pois os dardos não atingiram o centro do alvo (apesar de todos eles acertarem o mesmo ponto). A figura **C** indica que o atirador não foi nem preciso nem exato.

Algarismos significativos

Source: Zamboni and Bezerra (2020, p. 20).

The format of the presentation (fourth criterion) can be characterized as being 'illustrative/verbal', as the analogy is presented (Figure 1) through a text accompanied by an illustration, which enriches the authors' explanation of the target concepts.

As for the fifth criterion, level of abstraction of the analogous and target concepts, this analogy can be classified as being of the 'concrete/abstract' type, because the analogous concept, exposed by means of an illustration showing the way in which dice thrown against a target were distributed in three situations, has a concrete nature, while the target concepts (precision and accuracy), exposed by the authors in the first two paragraphs of Figure 1, they concern abstract entities, that is, they subsist thanks to the concrete entities represented by the analogous concept.

In the sixth criterion, we analyze the position of the analogy in relation to the target concept. In this case, we observe that this concept was presented before analogical reasoning, so that the position of this analogy is characterized as 'after'.

The seventh criterion refers to the level of enrichment of the analogy, and in the case of this analogy, we can classify it as being of the 'enriched' type, although the connections between the analogous and target concepts have not been exhaustively explored. The authors forgot to mention that each javelin thrown represents a measurement made by

scientists in their research. By comparing these measurements (positions of the darts), the researchers would be able to evaluate the precision and accuracy of their measurements.

As for the eighth classification criterion, the level of mapping done by the author, we can say that the authors showed the existing correspondences between the elements of the analogous and target concepts, as an attempt to familiarize the student with the target concept. However, this mapping could be more substantial if the correspondences between the darts and the scientists' measurements had been highlighted.

Regarding the ninth criterion, the presence of a pre-topic orientation, this analogical reasoning does not present it. At no time do the authors call attention, through a characteristic expression, to the presence of analogy, that is, it fails to strategically introduce the reader to the understanding of analogy.

In the last criterion of classification, presentation and discussion of limitations, this analogy can be framed as not recognizing the existence of aspects and attributes that converge for a good understanding of the target concept. Among some that we could list, and which were not explored by the authors, are: the shape of the darts (numerical values), the target (real or correct value), the way the data is manipulated (the way scientists obtain their measurements), etc.

3.3 SECOND ANALOGY

The second analogical reasoning (Figure 2) is located on page 44, chapter 3 (Quantum Physics) of Unit 1 (What Materials Are Made Of). It addresses the content related to the 'wave-particle duality', comparing experiments. The authors seek to show the relationship between the 'Interference patterns of an electromagnetic wave' (analogous concept), observed from Young's experiment, with the 'Distribution patterns of spheres launched in a double-slit experiment' (target concept), carried out by De Broglie. The main purpose of this comparison is to make the reader understand the wave-particle duality, a property inherent to the nature of the behavior of matter.

The analogous concept worked on it refers to the "double-slit experiment for electromagnetic radiation carried out by the British physicist and physician Thomas Young (1773-1829), as represented below" (ZAMBONI; BEZERRA, 2020, p. 44). Here, this is shown in Figure 2.

Although the authors explain Young's experiment, this analogous concept is quite complex, making it difficult for students to understand the target concept. Possibly, a simple

experiment carried out by the teacher in the classroom could contribute to a better understanding of the phenomenon and meaning of wave-particle duality.

Figure 2

Presentation of the second analogy, Chapter 3, Unit 1, p. 44

Situação 1: Padrões de interferência de uma onda eletromagnética	Situação 2: Padrões de distribuição de esferas lançadas em experimento de dupla fenda	Situação 3: Padrões de interferência de um feixe de elétrons
 detectores de luz fonte de luz monocromática	 caixa de detecção lançador de esferas	 detectores de elétrons fonte de elétrons
O experimento de Young consistiu em fazer uma luz monocromática incidir sobre duas fendas próximas. Depois de a luz passar pelas fendas, ocorria interferência. O resultado foi um padrão de linhas paralelas no anteparo.	Por analogia com o experimento de Young (situação 1), De Broglie propôs que um feixe de partículas também seria difratado, ao passar por uma fenda dupla. Empregando um arranjo experimental similar ao de Young, porém com esferas suficientemente pequenas para passar pelas fendas, De Broglie obteve um padrão de distribuição das esferas.	Um experimento semelhante com somente um feixe de elétrons foi realizado quatro anos depois da proposição formulada por De Broglie. Clinton J. Davisson (1881-1958) e Lester H. Germer (1896-1971) montaram um arranjo experimental similar ao de Young e lançaram um feixe de elétrons sobre as fendas duplas. Foram obtidos os mesmos padrões de interferência de quando se lançaram ondas eletromagnéticas (situação 1).

Source: Zamboni and Bezerra (2020, p. 44).

This difficulty in understanding the analogous concept leads us to two questions: Does the student master the analogous concept used by the analogy? If not, how will he be able to understand the target concept?

When making use of an analogy, it is necessary to consider that the student (re)recognizes and understands the analogous concept. Thus, if the student does not master the content studied before the analogy is presented, that is, he is not familiar with the analogous concept, he may not be able to understand the target concept, since the two domains will be worked on in an associated way. This means that analogies of this nature can compromise the understanding of the concept they propose to clarify (FRANCISCO JÚNIOR; FRANCIS; OLIVEIRA, 2012).

As for the third criterion, analogical relationship between the analogous concept and the target concept, we can classify this analogy as being of the 'structural/functional' type, because the analogous and target concepts share both structural (existence of slits in the equipment of the experiments) and operational (passage of light and spheres through the slits) aspects.

In the fourth criterion, presentation format, we again have an analogy of the 'illustrative/verbal' type, since the authors use texts and illustrations to try to familiarize the reader with the target concept (Figure 2).

'Concrete/concrete' would be the type of classification of this analogy in relation to the fifth criterion of analysis, level of abstraction of analogous and target concepts. The analogous concept briefly describes an experiment carried out by Young, and the target concept uses the description of "an experimental arrangement similar to Young's, but with spheres small enough to pass through the cracks" (ZAMBONI; BEZERRA, 2020, p. 44).

Regarding the sixth criterion, the position of the analogy in relation to the target concept, it is certainly of the 'after' type, because, as in the first analogy studied, it was positioned after the description of the target concept, that is, the authors explain the behavior of a wave from electromagnetic interference and only then describe the analogy to 'reinforce' the understanding of the target concept.

Analyzing the seventh criterion, the level of enrichment of the analogy, it was possible to see that this analogy portrays a 'simple' type. Although the authors present a text that seeks to explore the association between the concepts worked, no additional relationship was shown between the analogue and the target, which could denote an extension of their similarities, which demonstrates the lack of enrichment of this analogical reasoning.

Unfortunately, it was not possible to identify any kind of discussion, debate or description, promoted by the authors, listing and explaining the elements existing in the analogous and target concepts that share similarities, in an attempt to familiarize the reader with the target concept. Thus, we can say that this analogy does not contemplate the eighth criterion of analysis: level of mapping done by author.

Regarding the ninth criterion, the presence of pre-topic guidance, the existence of the term used by the authors when presenting the analogy, "... By analogy..." (ZAMBONI; BEZERRA, 2020, p. 44), allows us to say that 'yes', this analogical reasoning has a pre-topic, since this term announces the existence of an analogy.

Regarding the tenth criterion for analysis, presentation and discussion of limitations, we can say that there are no references to the existence of these elements in the information provided by the authors. Thus, we must consider a certain negligence in this aspect, since the analogous concept uses light as an element that propagates, while the target concept uses small spheres. Certainly, different behaviors will have to be observed, starting with the fact that light will propagate in all directions, while each sphere will move in a single direction.

3.4 THIRD ANALOGY

The third analogy (Figure 3) is located in a complementary text on the subject explored in chapter 4 (Nuclear Physics) of Unit 1 (What materials are made of), and addresses the content 'Radioactivity'. In this analogical reasoning, the authors make a comparison between 'a bottle of champagne that when shaken releases its cork' (analogous concept) and 'instability of an atomic nucleus' (target concept).

Figure 3

Presentation of the third analogy, Chapter 4, Unit 1, p. 201-202

Source: Zamboni and Bezerra (2020, p. 201 and 202).

With respect to the third criterion, analogical relationship between the analogous concept and the target concept, we can classify this analogy as being of the 'functional' type, because its use explores the similar functional and behavioral aspects between the concepts worked, that is, the way in which the release of a cork by a shaken bottle of champagne and the emission of radiation by an atomic nucleus behave. There are no common and explicit structural elements that can be used for a better understanding of the target concept.

In the fourth criterion, presentation format, we classify this analogy as being of the exclusively 'verbal' type, since it is presented only through an explanatory text. It is worth highlighting the appeal exposed by the authors, evoking the use of the reader's imagination: "With a little effort we could imagine an unstable nucleus like a champagne bottle that, when shaken, releases its cork" (Figure 3).

Considering the fifth evaluation criterion, level of abstraction of analogous and target concepts, we consider this analogy to be of the 'concrete/abstract' type, since it uses an analogical concept of concrete aspects (a bottle of champagne that when shaken drops its cork) to explain an abstract target concept (the instability of an atomic nucleus).

In the sixth criterion of analysis, position of the analogy in relation to the target concept, similar to the previous analogies, we classify it as 'after', that is, it was presented after the concept to be learned had been explained.

As for the seventh criterion, level of enrichment, this analogy was considered 'simple', because we did not observe the presence of elements that would explain the similarity of their attributes. For example, the authors did not exploit the fact that, in the atomic nucleus, the agitation promoted in the champagne bottle would correspond to the energy needed by the nucleus for the emission of radiation to occur.

When considering the level of mapping done by the authors, the eighth criterion used to study these analogies, we did not identify discussions showing the possible correspondences between the concepts, whose objective would be to familiarize the reader with the target concept. The text shown in Figure 3 even denotes a certain intention in exposing a mapping, "She can still throw the cork with greater or lesser force. Analogously, the nucleus emits its radiation with greater or lesser energy" (ZAMBONI; BEZERRA, 2020, p. 202), however, the authors chose not to prosper.

Regarding the ninth criterion, presence of pre-topic orientation, in this analogy an expression and a term were identified that characterize his text as containing this type of didactic strategy: 'With a little effort we could imagine [...]' and 'Analogously, [...]' (Figure 3). In this sense, Gonçalves and Julião (2016) highlight the importance of using pre-topics in textbooks, as it allows the reader a certain 'preparation' for reading the text containing the analogy, contributing to the promotion of the functionality of this instrument and, consequently, a better understanding of the target concept.

Like the analogies discussed above, this analogical reasoning does not recognize the existence of its limitations, and it is therefore up to the reader to identify them. The absence

of this element, according to Francisco Júnior (2009), can generate obstacles during the process of using analogy, causing the student to understand the target concept in an unsatisfactory way or even in a completely mistaken way.

4 FINAL CONSIDERATIONS

The results of this research brought to light some important aspects concerning the analogies presented in the volume 'Composition and structure of bodies', from the collection 'Being a Protagonist: Natural Sciences and their Technologies'. One of the most significant refers to the small number of analogies identified in the book, only three, meaning a very low frequency. This observation reveals a certain lack of interest on the part of the authors in the use of these didactic tools, which can be of great help in the learning of Chemistry, Physics and Biology, whose contents are, in general, considered difficult to understand.

The first analogy was considered to be of the enriched type, although the authors have promoted an almost insignificant discussion about the relations between the concepts worked. The other two, being of the simple type, do not present any reference to this criterion. The book does not explore the aspects of the analogous concept attributes that contribute to the understanding of the target concept. In other words, the authors do not highlight the relationship between similar attributes or use another analogue to familiarize the reader with the target concept.

When it comes to mapping, the first analogy presents it, but in a very stunted way. On the other hand, the two other analogies are highly deficient in this criterion, since their texts do not discuss or show the similarities and dissimilarities between the analogous and target concepts worked. This shows that the book did not adequately explore the potential of these instruments, which may mean difficulties in understanding students.

In none of the analogies do the authors discuss the limitations related to their uses. The absence of these discussions allows for misinterpretations by readers, which can make the understanding of the target concepts difficult or distorted. However, the enrichment, mapping and limitations of these analogies can be explored by the teacher who adopts this book and uses them in the classroom. For this, it is necessary for the teacher to do a previous study and planning, in order to ensure success in the use of these instruments.

In the third analogy, the authors evoke the use of the reader's imagination to understand the text that presents it. This leads us to the question: and if the student does not know the analogous concept, can he understand the target concept? We highlight here a

certain precariousness in the choice of this analogy, since in order to achieve its objectives in a satisfactory way, it is imperative that the analogous concept be very familiar to the learner.

Finally, we highlight that, from this study, it is evident the need to foster, in teacher training courses, discussions about the choice of the textbook to be adopted by future teachers and the appropriate use of analogies, which are very present in books in the area of Natural Sciences and their Technologies. These discussions can contribute to a better performance of these professionals, making the learning of Chemistry, Physics and Biology content less complicated for students.

ABSTRACT

Climate change has a direct impact on the circular economy, as changes in climate variables such as air temperature compromise the production of açaí. The gap that motivated this research is in terms of understanding the interaction between climate change, the circular economy and açaí and the effect of this on riverside communities. Therefore, the objective of this research is to understand this triad interferes in the riverside community socially and economically. The methodology used was the secondary investigative (desk research), obtaining the literature to compose the corpus of this research, in electronic links that store literature related to the theme of this research. The data obtained and analyzed indicated that climate change interferes in two ways in the production of açaí, by increasing the precipitation rate and flooding of areas where the clump is inserted. The circular economy acts to mitigate the accumulation of solid waste, especially burning and deposition in open air lessons, especially of the pits and current in a positive way in riverside communities since the use of this waste can replace income in rainy seasons. As for açaí, the analysis of the data obtained indicated that climate change causes a loss in flowering until it is lost, which determines a decrease in biodiversity diversity. Therefore, continuous studies and research, especially in the North region, must proliferate more and more, and unite riverside communities, higher education institutions and local governments in search of feasible solutions to climate change.

RESUMO

As mudanças climáticas têm interferência direta na economia circular, pois as alterações de variáveis climáticas como a temperatura do ar, comprometem a produção do açaí. O gap que motivou esta pesquisa é quanto a compreensão quanto a interação entre as mudanças climáticas, a economia circular e o açaí e o efeito disto sobre as comunidades ribeirinhas. Por isso, o objetivo desta pesquisa é entender esta tríade interfere na comunidade de ribeirinhos social e economicamente. A metodologia empregada foi a investigativa secundária (desk research), a obtenção das literaturas para composição do corpus desta pesquisa, em links eletrônicos que armazenam literaturas relacionadas ao tema desta pesquisa. Os dados obtidos e analisados indicaram que as mudanças climáticas interferem de duas maneiras na produção do açaí, pela elevação da taxa da precipitação e alagamento de áreas onde a touceira está inserida. A economia circular atua de forma a mitigar o acúmulo do resíduos sólidos, especialmente a queima e a deposição em lições a céu aberto, especialmente dos caroços e atual de forma positiva nas comunidades ribeirinhas já que o uso deste resíduos pode substituir a renda em épocas de chuva. Quanto ao açaí, a análise dos dados obtidos indicou que as mudanças climáticas, provoca uma perda na floração até perda dela, o que determina diminuição da diversidade da biodiversidade. Então, estudos e pesquisas contínuas,, especialmente na região Norte, devem proliferar cada vez mais, e unir as comunidades ribeirinhas, a instituições de ensino superior e os governantes locais em busca de solução exequíveis às mudanças climáticas.

Palavras-chave: Alagamentos. Inundações. Tendências de Aumento de Temperatura. Comunidades Ribeirinhas.

RESUMEN

Las cambios climáticos tienen una interferencia directa en la economía circular, ya que las alteraciones de variables climáticas, como la temperatura del aire, comprometen la producción del açaí. El vacío que motivó esta investigación se refiere a la comprensión de la interacción entre los cambios climáticos, la economía circular y el açaí, y el efecto de esta relación sobre las comunidades ribereñas. Por ello, el objetivo de esta investigación es entender cómo esta tríada interfiere social y económicamente en la comunidad de ribereños. La metodología empleada fue la investigación secundaria (desk research), obteniendo la literatura para la composición del corpus de esta investigación a partir de enlaces electrónicos que almacenan estudios relacionados con el tema. Los datos obtenidos y analizados indicaron que los cambios climáticos interfieren de dos maneras en la producción del açaí: por el aumento en la tasa de precipitación y por la inundación de las áreas donde se encuentran las matas. La economía circular actúa de manera que mitiga la acumulación de residuos sólidos, especialmente la quema y la disposición a cielo abierto, en particular de los huesos del fruto, y tiene un efecto positivo en las comunidades ribereñas, ya que el uso de estos residuos puede complementar los ingresos en épocas de lluvia. En relación con el açaí, el análisis de los datos indicó que los cambios climáticos provocan una pérdida en la floración, e incluso su ausencia, lo que genera una disminución en la diversidad de la biodiversidad. Por lo tanto, estudios e investigaciones continuas, especialmente en la región Norte, deben proliferar cada vez más y unir a las comunidades ribereñas, las instituciones de educación superior y los gobiernos locales en la búsqueda de soluciones viables frente a los cambios climáticos.

Palabras clave: Inundaciones. Crecidas. Tendencias de Aumento de Temperatura. Comunidades Ribereñas.

1 INTRODUCTION

Climate change has caused numerous impacts on crops, and global warming intensifies these effects by increasing the frequency and severity of droughts and floods, which negatively affects the development of agricultural crops, including açai trees (Dias 2014; Mendes, 2024). These climatic variations interfere with the growth, flowering, and fruiting of açai (Jesus, 2021; Santos; Porro, 2024), tree belonging to the species *Euterpe oleracea* Mart., Family Arecaceae (Nascimento, 2008). All these factors act negatively on the production of açai.

The problem can be aggravated by the incorrect disposal of açai biomass residues as an environmental risk factor from the progressive growth of the *E. oleracea* agroindustry, in the state of Amazonas, a fact that has a strong influence on the worsening of the greenhouse effect and intensification of climate change (Miranda et al., 2022). This harms the economy of riverside communities (Campos; Cardoso, 2025), because, although it is a heliotrophic plant, when there is a tendency to increase the temperature excessively, the açai tree is impaired in terms of the development of the palm, the fruit and the tree itself (Cameli; Silva, 2023; Homma, 2006).

On the circular economy, whose Bill No. 1,874, in addition to the indirect regulation in article 7, item XI, Law No. 12,305 (Brasil, 2022; 2010). In the view of Leda, Mota and Cereto (2025), this economy builds a promising approach by promoting the regeneration of materials and the efficient use of inputs, and an incentive to reflect on the way products are created and consumed. This concern focuses on extending the useful life of raw material and strengthening the conservation of the Amazon.

In this context, in the 2000s, Cunha (2024) and Lemos (2024), stated that it represents a significant increase in demand for the açai fruit. In the view of Almeida et al. (2017), this occurred because the residual regeneration of açai, from the seed, is exploited by this new economy that, among so many products that it can generate, such as handicrafts. In this aspect, Pimentel (2025) reports that the handlers of this Ver-o-Peso street market already allocate this waste for handicrafts and fertilizer.

In addition, this research reports that research for the production of biofuels and bio asphalt has been advancing at UFPA since 2016. The açai tree is identified by Miranda et al. (2022), as a palm tree typical of the floodplain region of Central and South America. Santos and Porro (2024) state that the juice is widely used to feed the population of these locations, as an important source of income, from this palm tree. In this context, Pinheiro (2023)

mentions that this production chain includes extractives, farmers, intermediaries, processing industries, and artisanal scouts, playing a key role in generating income for many small producers.

In the research carried out by the Amazon Environmental Research Institute (IPAM, 2018) and da Silva (2019), they evidenced other uses for the açai pit: in civil construction, oil production, handicrafts for internal decorations, cosmetics, among others Medicine is also helped with the pit, as Lemos (2024) described that the generation of "açai coffee" is an alternative for the control of diabetes mellitus, from the roasted and ground seed.

Regarding climate change, Cameli and Silva (2023) report that it affects economic activities based on açai, which becomes worrying, especially for communities dependent on the family extractive production chain, which is currently considered one of the most sustainable in Brazil. Another problem, in the view of Bentes et al. (2024), involves the need for local communities, researchers, and public managers to actively participate in joint solutions that balance productivity and sustainability in the face of climate change.

All these arguments justified this research, and increased its relevance, because the understanding of what is already published in the relationship between climate change, circular economy and açai, should be disseminated to the population both consumers and handlers of this fruit, especially with regard to this type of economy, and that it will contribute to sustainability. Therefore, the objective of this research is: to understand and interpret how much climate change interferes in the circular economy, harms the communities that manipulate açai.

2 METHODOLOGY

For the study in question, the secondary investigative method (desk research) was used, that is, information already contained in publications on a topic that, in this research, involved: climate change, circular economy and açai. For Neves and Conerejo (2012), the document is an object to be investigated. The use of this method is justified because these authors report that the role of the scientific article is always to narrate a story, and this will be the basis to support the theoretical part of this study.

Due to the expansion of the subjects involved here, and the association between them, there was no concern about the type of literature, as National School of Public Administration (ENAP.GPV, 2021) argued that, regardless of the classification of literature, this method is effective for this type of research. This is in line with what is described by Macedo (2022).

This author stated that access to different academic sources such as hemerographic sources, as well as books, e-books, scientific articles, newspapers, forums, technical reports, among others, broadens the final discussion.

2.1 OBTAINING THE DATA

Secondary data were obtained from electronic links whose databases are related to research and publications aligned with the theme of this research, such as the Coordination for the Improvement of Higher Education Personnel – CAPES, institutional repositories such as the State University of Pará – UEPA, Federal University of Pará – UFPA; University of the Amazon – UNAMA, among others. The selection of literature followed the criterion of identifying keywords in three sections: title, abstract, and keywords (Table 1).

Table 1

2.2 DEFINITION OF THE SAMPLE

The sample was defined based on the establishment of three inclusive criteria. This action was based on the report by Andreza et al. (2024) who identified: 1) free and open access; 2) Portuguese and English language; 3) involve the central theme of this research. The time frame was between 2016 and 2025, the last 10 years, with the insertion of four previous surveys: Fleck and Bourdel (1998); Homma et al., (2006); IBGE, (1993) and

Nascimento (2008), with emphasis on the last five years: 2021- 2025. An inclusion criterion was developed for the selection of literature (Table 2).

Table 2

Arguments for inclusion and exclusion of the literatures used in the composition of this research

Inclusion	Exclusion
Publication in English and Portuguese	Other Languages
Be Available in full	Partial availability of the publication
Published in the last decade (2016-2025)	Published before the temporal cut.
Have free access, that is, without charge.	Need for remuneration for access
Present, in the title or Abstract or Keywords: açai, stone, fruits, pulp, waste, wine, <i>Euterpe oleracea</i> , <i>E. precatoria</i> , açai-da-mata, açai-da-mata, açai tree.	There are none of the selective descriptors in the three defined sections.

Source: authors (2025).

2.3 STATISTICAL ANALYSIS OF THE DATA

The data obtained after selecting the literature regarding the relationship between climate change, circular economy and açai, the Excel 5.0 software was used, with Descriptive Statistics, and then tabulated according to the guidelines stipulated by the Brazilian Institute of Statistical Geography – IBGE (1993). Nonparametric analysis was applied due to the non-normality of the data contained.

Principal Component Analysis – PCA, was applied to reduce the size of the data used (Bertarelli Júnior, 2016), especially the descriptors. Finally, the box plot was applied, since the data were non-parametric, and the literature was grouped according to the component sections of this research. For the APC, the Kaiser method was applied. In this method, Fleck and Bourdel (1998) state that it is used to determine eigenvalues higher than one, that is, statistically significant. For the APC, the Kaiser method Applied.

3 RESULTS

3.1 SELECTIVE DESCRIPTORS

In the application of the selective descriptors, six variations "açai" were used. The data obtained and analyzed indicated that this vernacular term was the most prolific (120 ± 128). Four of them were used less frequently: fruits, pulp, residues and wine (0.3 ± 0.6). As for scientific nomenclature, *E. oleracea* was more described (12.3 ± 8.7). In the ABSTRACT

section, the values (15.9 ± 26.2) of occurrence of the selective descriptors were higher (Table 3).

Table 3

The selective descriptors isolated and associated with the Boolean descriptors were used to select the literature

	Descriptors Selective	Title	Summary	Keywords	$\bar{x}$	$\pm$	σ
1	Açaí	28	107	20	51.7	$\pm$	48.1
2	Pit	4	12	4	6.7	$\pm$	4.6
3	Fruits	1	35	2	12.7	$\pm$	19.3
4	Pulp	1	7	0	2.7	$\pm$	3.8
5	Waste	5	28	6	13.0	$\pm$	13.0
6	Wine	0	0	0	0.0	$\pm$	0.0
7	<i>E. oleracea</i>	7	13	7	9.0	$\pm$	3.5
8	<i>E. precatória</i>	1	0	0	0.3	$\pm$	0.6
9	Açaizal	0	4	0	1.3	$\pm$	2.3
10	Açaí-da-mata	1	1	1	1.0	$\pm$	0.0
11	Açaizeiro	0	9	0	3.0	$\pm$	5.2
12	Designer circular	1	1	1	1.0	$\pm$	0.0
13	Circular economy	0	6	1	2.3	$\pm$	3.2
14	Environmental impact	0	5	0	1.7	$\pm$	2.9
15	Climate changes	4	11	4	6.3	$\pm$	4.0
$\bar{x} \pm \sigma$		3.5 ± 6.9	15.9 ± 26.2	3.1 ± 5.1			

Source: authors (2025)

It can be seen in table 1 that studies on climate change in the Amazon and the effects on açaí are still scarce (5.7 ± 3.8). The most critical is related to the environmental impacts due to improper disposal of residual components such as the stone after mechanical agitation to obtain the groove (0.3 ± 06). However, research on the circular economy with the reuse of this "Amazonian food" has advanced (7.7 ± 5.0). The eigenvalues validated and analyzed by the Kaiser criterion (> 1), for the 15 selective descriptors used, indicated that the selective descriptor "açaí" (98.8%), represents that, for the choice and selection of literatures, represent the others very well, and was more efficient among all the others used (Table 4).

Table 4

Eigenvalues and values for variance found

PC	Eigenvalue	% variance
1	803.466	98.813
2	9.09705	1.1188
3	0.551318	0.067803

Source: authors (2025)

In the Principal Component Analysis (PCA) it was confirmed that this quantitative (15) was used in the selection of the literature to compose the corpus of this research, both in the title, in the abstract and in the keywords (Figure 1).

Figure 1

Analysis of the main components regarding the selective descriptors applied

Source: authors (2025)

In the reading of the scores generated, it was verified in Figure 1 that two selective variables "fruits ($\approx 17\%$) and residues ($\approx 12\%$)" correlate directly and positively with the variable "açaí" ($\approx 95.7\%$). This shows that the choice of this descriptive selector was effective in the selection of literatures for the composition of the corpus of this research. In the verification of the distribution of the data used for the selection of the literature, the central tendency of the three sections analyzed in the selected literatures, the maximum limit reached was in the abstract, followed by the title and ending with the keywords (Figure 2).

Figure 2

Central trend and quartiles of distribution of the application of selective descriptors in the three sections of the selected literature

Source: authors (2025)

After selecting the literatures ($\Sigma = 29$), they were inserted in the component sections of this research according to the pre-established order for the composition of the bodies of this research (Figure 3).

Figure 3

Distribution of literature was published between 2016 and 2025, according to the three sections that make up the corpus of this research

4 DISCUSSION

4.1 CLIMATE CHANGE

Regarding the social and environmental aspects of the Amazon region, Campos and Cardoso (2025) state that climate change is a key factor in the negative impact on açaí production, the balance of ecosystems and, mainly, on the economy of riverside communities (Homma et al., 2006; Cordeiro et al, 2024). On the other hand, Miranda et al. (2022) indicated the incorrect disposal of *E. oleracea* biomass residues as an environmental risk factor from the progressive growth of the açaí agroindustry in the state of Amazonas. In the eastern Amazon, Moraes et al. (2023), have already identified serious climate changes that are causing trends of increase in air temperature, harming the production of açaí.

From this perspective, Moraes (2025) explains that methane gas (CH_4) is one of the main greenhouse gases, and that during the irregular disposal of the açaí seed, an organic material that has an anaerobic decomposition, the fermentation of this waste and the release of this gas occurs, thus contributing to climate change. In addition, Strapasson and Ribeiro (2025) describe that the intensive cultivation of açaí and the expansion of its areas is one of the main causes of the reduction of plant diversity, where the implementation of monoculture on native vegetation affects not only biodiversity, but also ecological resistance against the intensified greenhouse effect.

The high intensity of this effect may generate food insecurity for the riverside population, mainly. In this regard, Vieira (2024) reveals that in addition, there will be a

compromise in the economy of local communities in the Amazon that are directly affected by droughts and heat waves arising from climate change. Igawa, Fonseca and Bendini (2025), wrote that perennial crops act as an alternative to control this climate problem, and açai is extremely important for carrying out these mitigation actions, as it is the main perennial crop in the Amazon biome.

4.2 CIRCULAR ECONOMY

For the circular economy, there are several uses for the açai seed after pulp extraction. Among them, the generation of biofertilizers. In this context, Oliveira Neto et al. (2025), report that the post-extraction seed tends to act directly on three soil conditions: 1) it increases water retention; 2) increases soil fertilization; reduces losses from surface runoff and volatilization. Pinto (2022) presents as a circular economic factor, the formation of biopolymeric packaging, since in these stones and fibers, there are bioactive compounds such as anthocyanins, polyphenols and flavonoids.

From another point of view, Leda, Mota and Cereto (2025) present the circular economy as a promising approach by promoting the regeneration of materials and the efficient use of inputs, and this encourages reflection on the way products are created and consumed. This concern focuses on extending the useful life of raw material and strengthening the conservation of the Amazon. In this context, Cunha (2024) reports that the 2000s represented a significant increase in demand for the açai fruit, and the excellent news is provided by Lemos (2024), when he wrote that riverside communities in the northern region of Brazil use roasted and ground stone powder at fairs and artisanal stores as antioxidant products beneficial to health.

Such conservation is better explained in the report by Baia et al. (2025). He confirms that the Açai represents 95% of the national production. As a result, there was an expansion of the industrial sectors and extractive rural workers. Regarding these data, Cordeiro et al (2024) highlight that, when comparing the economic data of a city in government sources and the primary dynamics of the municipality, the production of açai assumes a great influence on income generation and growth rate influencing the increase in livelihoods and family farming, reflecting in the significant improvement of the quality of life of the local community.

In view of this, Cameli (2023) elucidates that the açai fruit started to be consumed by other states in Brazil in addition to the northern region, gaining the national and international market, becoming a versatile tool for the productive sectors since all parts of its palm tree

can be used. Herminio (2023) warns that despite the economic advantage, the processing of the crop generates a large amount of waste that is often disposed of inappropriately, which induces the potential for the development of value-added products.

In the context of this economy, the seed is already inserted for the production of cement, in the municipality of Primavera, state of Pará, at the Votorantim Cimentos plant. Another insertion in the circular economy is reported by Pinto (2022), who studied the bioactive compounds inserted in the seed, which can generate new packaging with biopolymeric characteristics. Miranda et al. (2022), add that they can be used to generate new seedlings, in addition to coal (generated at 1050 ° C), and other fuels such as ethanol, without forgetting fertilizers, bran and fertilizer.

4.3 AÇAÍ

Climate change represents one of the greatest environmental challenges of our time. Cameli and Silva (2023), indicated that this directly affects ecosystems and food production across the globe. This also occurs in the Amazon region, with one of the most consumed products by the local community: açaí. This fruit plays a fundamental role in the food, economy and culture of the Amazonian populations. Studies carried out by the Institute for Environmental Research (IPAM, 2018) and Pinto (2021), identified that the advance of climate change threatens the sustainability of this production chain.

Such climate changes interfere with the generation of fruits, and this is already noticeable to the riverside producers of açaí, Almeida et al.(2017) and Tregidgo et al. (2020) report that this statement is already present in the statement reported in riverside dwellers in the Amazon, where most of them (77%) verified a decrease of around 45% in relation to fruits in times of high temperatures. Dias (2014) found that low productivity occurs in the rainy season, and the opposite in the dry season. This harms the riverside community, both in terms of food and the economy.

This is corroborated by Jesus (2021), when he wrote that the trend of increases in temperatures, the change in the rainfall regime, and the more frequent occurrence of extreme events, such as prolonged droughts and intense floods, interfere with the growth, flowering, and fruiting of açaí. Moraes et al. (2023), stated that, although açaí is dependent on a high volume of water, especially those events arising from climate change. The contrast to this statement is provided by Silva (2019), has already found that in the northeast of the state of Pará, there is already a reduction in the precipitation rate.

5 CONCLUSION

Climate change, especially the trend of rising air temperature, causes a decline in the percentage of air humidity. However, in some locations there are variations in precipitation rates, which increases the volume of water in seas and oceans in the Amazon. This fact causes a drop in the production of açaí, which may generate a decrease in the food supply of riverside dwellers, as well as interfere with their financial income, and this has already been carried out from the point of view of riverside communities in the states of Amazonas and Pará.

As for the circular economy, in view of these decreases, it may compromise studies and research on products derived from açaí seeds, with regard to coffee powder, composting to improve soil fertility, especially in areas that may be subject to soil recovery. The generation of biofuels and medicinal products for the control of Diabetes Mellitos. So, in addition to the food commitment, the secondary products that could add income to the riverside dwellers. Even the research now being carried out by the universities of Pará would suffer a drop.

With regard to açaí, as a profitable fruit and feed not only the riverside community but thousands of consumers nationally and internationally. To avoid this, there is already a proposition that tackling climate change with an expansion of science and technology. Another perspective is the loss of blooms and, consequently, biodiversity, and solutions must be integrated between researchers, riverside communities, governors and other authorities involved in the dimension of loss of this plant.

All these confrontations must be carried out urgently, since climate change has already reached high levels of extreme events for riverside communities that feed and generate income from the production of açaí. We suggest that research be intensified in two sectors: circular economy and mitigating the effects of climate change.

ABSTRACT

What senses can we make of works by Oscar Wilde and Michelangelo Antonioni in contemporary times, when the fast-paced rhythm of cyberspace and hypermodern society demands even greater awareness and consciousness of our existence than, perhaps, at the times of the first publications of *The Picture of Dorian Gray* in 1890 and 1891, as much as the premiere of the film *Blow-Up* in 1966 and its release in 1967? We intend to show how both narratives read uncommittedly to literary criticism in the context of health humanization proposed by the Laboratory of Humanities (hereafter referred to as Labhum) at the Federal University of São Paulo opened transcultural possibilities for the better understanding of hypermodernity.

Keywords: Hypermodernity. Transculturality. Portraits. Subjectivity. Humanization.

RESUMO

Que sentidos podemos atribuir às obras de Oscar Wilde e Michelangelo Antonioni na contemporaneidade, quando o ritmo acelerado do ciberespaço e da sociedade hipermoderna exige uma consciência e atenção ainda maiores sobre nossa existência do que, talvez, na época das primeiras publicações de *The Picture of Dorian Gray* em 1890 e 1891, assim como da estreia do filme *Blow-Up* em 1966 e de seu lançamento em 1967? Pretendemos mostrar como ambas as narrativas, lidas sem compromisso com a crítica literária no contexto da humanização em saúde proposta pelo Laboratório de Humanidades (doravante denominado Labhum) da Universidade Federal de São Paulo, abriram possibilidades transculturais para uma melhor compreensão da hipermodernidade.

1 INTRODUCTION

In its work of promoting reflection on humanization in healthcare, the Laboratory of Humanities, developed by the Center for History and Philosophy of Health Sciences at the Federal University of São Paulo (Bittar, Souza, Gallian, 2013; et Gallian, Lima, De Benedetto, Guzman, 2014) recently selected the novel *The Picture of Dorian Gray* in dialogue with the film *Blow-Up* as the core of its discussions within a group composed of undergraduate and graduate students in the fields of health sciences.

Readings beyond literary criticisms allowed participants to articulate the relationship between their own lived experiences as human beings working in the health sector and the portraits that gradually emerged through the reading of *The Picture...* and in dialogue with *Blow-up*. The immediate identification of the most striking features of the main characters—namely, Dorian Gray himself, Basil Hallward, and Lord Henry Wotton in the novel and Thomas, the photographer interpreted by David Hemmings in the film *Blow-up*—led the participants to relate these human types and their roles on the stage of human dynamics, regardless of any historical period or, rather, beyond any of them, thus allowing a cultural transposition of the aesthetic experience from the late 19th century, when the novel was published in two versions (1890 and 1891) along with the 1960's and early 1970's European experiences to today 2025 in the Brazilian Portuguese context of each one of the Labhum individual's experiences.

Another relevant aspect was the interartistic dialogue, that is, the convergence between the reading of Wilde's novel and Antonioni's film. In both, the notion of the portrait as a

metonym of human individuality, subjectivity and experience prevailed: it is in the portrait that the marks of life lie—the very marks that would have aged Dorian, had it not been for the pact made with the devil; it is in the portrait that the lines of expression are etched, framing either life itself or what one chooses to show of it, as in the case of the models that are the photographer's object in the film, the driving force behind the film narrative adapted from Julio Cortázar's short-story “Las Babas del Diablo” (1959); it is in portraits that we deposit our best moments and memories, as much as the usages of images in social media nowadays. The portraits of the models, immortalized or discovered by the photographer—as in the case of the photograph pointing to a crime—are memory maps or, at least, routes back to identification(s) (Hall, 1998) just as in the painted portrait by Basil, a vain attempt to eternalize the very subject of the painting, Dorian Gray and his awesome beauty. In all of

these cases, the search for essence amid that which is transient and what may be enduring involves a more or less humanized gaze— that of both the reader and the viewer, of the healthcare practitioner responsible for treatment and, at the same time, a full individual with subjective and circular experiences.

The transposition of times and spaces/geographies make evident the classic hue of both narratives (the novel and the film) at stake, once transculturality goes beyond the frontiers of time and space, working as an ideal approach for comparativisms and artistic and/or critical readings. Moreover, it helps us understand contemporaneity once characters, their features, attitudes, and behaviors are paralleled, such as found in all comments elaborated along the Labhum meetings as well as their outcome, as we shall partially see here later.

In order for us to better comprehend such transcultural approach in practice, let us first contextualize the hipermodern *zeitgeist* which has been the basis of departure for most participants to engage in our activities at the Labhum.

The term “hypermodernity” was coined by the contemporary philosopher Gilles Lipovetsky (2005) in order to explain our human condition that followed post-modernity in its praise of progress and reason, which justifies the fast-paced rhythm in all (or nearly all) human activities: people’s time, our usage of technology, consumerism, and individualism as stated by Zygmunt Bauman (2000). Most probably, the latter finds direct connection with that which is central in both narratives here dealt with: the individual as central figure in the (mis)understanding of humanism. Dorian Gray, as metonym of aestheticism, materializes hedonism, as much as the photographer Thomas in his egocentric activities as such. Aestheticism is best comprehended as artificialism, once it inverts many matters of common sense, some of which, even moral ones. Indeed, aestheticism, for instance, defines art as superior to nature and it believes that the latter copies the former. The same applies to the senses as being higher than the intellect or that which is shallow, better than whatever else is profound; feeling, superior to reason. Therefore, masks are seen as more authentic than one’s own individuality, one of the reasons why portraits are so relevant during Decadentism and throughout the XIX century (Mutran, 2002).

Once social and subjective lives in hypermodernity are marked by the overwhelmingly digital rhythm of ephemeral experiences and intensified movements of change that lead to the lack of deep, personal bonds, creating (and, with pardon to the irony, endlessly recreating) the illusion of perfection in all that is human becomes central to some sense(s) of – or, rather,

lack of them? - belonging(s). After all, being human is making mistakes, having faults, failing to be perfect. However, hypermodern societies have promoted the increase of practices that refer to “well-being“, which in their turn, promulgate individualism and individuality at their extreme. The explicit side-effect of it is loneliness, which is the same we see happening with Dorian Gray and Thomas. The former, as a never-ageing man, is unable to follow new generations as part of them; the latter, disconnected to all those who surround him. Lipovetsky points out to consumerism as the immediate (and, unfortunate) hipermodern reply to the matter of loneliness. Unable to establish real human bonds, people rely on materialism, attaching their beings to having(s).

Thus, the convergent factor between Wilde’s novel, Antonioni’s film and our daily, contemporary lives lie precisely there in the hedonism of portraits, photos, images and stories as they unfold but the naive, aesthetic experience of one (or two) stage(s) of life – bearing in mind the seven phases of life as described in Jacques’ monologue in the play *MacBeth* by William Shakespeare, “All the world’s a stage of life”⁴ . Furthermore, it reveals our need for masks, particularly in the social media nowadays, the virtual space of (“perfect”) existence, where “the true self“ is shown, complying to matters of individual “well-being“: being free, loved, praised, recognized as a social being, amongst other universally recognized feelings of belonging.

Therefore, while the aesthetic experience of both Dorian and Thomas particularly evolve from hedonism and the need to express personal identities associated with vital eternity, contemporary exposure in social media relates to it as much as masks are concerned. For they provide individuals with senses of reality in spite of being simulacra, thus, covering the world’s participants in their “best” features, as they enable individuals to reply to the hypermodern demands of extreme production, allowing them with senses of belonging in societies that are dehumanized of errors, faults or mistakes, at the same time

⁴ All the world’s a stage,/And all the men and women merely players;/They have their exits and their entrances;/And one man in his time plays many parts,/ His acts being seven ages. At first the infant,/ Mewling and puking in the nurse’s arms;/And then the whining school-boy, with his satchel/ And shining morning face, creeping like snail/ Unwillingly to school. And then the lover, / Sighing like furnace, with a woeful ballad/ Made to his mistress’ eyebrow. Then a soldier,/ Full of strange oaths, and bearded like the pard,/ Jealous in honour, sudden and quick in quarrel,/ Seeking the bubble reputation/ Even in the cannon’s mouth. And then the justice,/ In fair round belly with good capon lin’d,/ fith eyes severe and beard of formal cut,/ Full of wise saws and modern instances;/ And so he plays his part. The sixth age shifts/ Into the lean and slipper’d pantaloone,/ With spectacles on nose and pouch on side;/ His youthful hose, well sav’d, a world too wide/ For his shrunk shank; and his big manly voice,/ Turning again toward childish treble, pipes/ And whistles in his sound. Last scene of all,/ That ends this strange eventful history,/ Is second childishness and mere oblivion;/ Sans teeth, sans eyes, sans taste, sans everything. (W.Shakespeare. *As You Like It*. Act II Scene VII Line 139),

that they promise everlasting happiness – as is the case of the term “well-being”, even broadly applied to Health Sciences.

At the heart of *Blow-Up* is a deep questioning of perception and reality. The photographer believes he may have inadvertently captured evidence of a murder in the background of a photo, but as he enlarges the image, it becomes more abstract and inconclusive. This invites us to read the story in epistemological matters regarding the frontiers between truth and perception or reality and simulacrum, once photographs are the media – and in the case of the novel *The Picture of Dorian Gray*, the portrait is. In both cases, the photographs taken by Thomas in the film and Basil’s painting of Dorian Gray in the novel, there seems to be an almost obsessive search for meaning, as well as an ultimate need for truth, always deferred by the “shadows” that displace the truth(s). Moreover, in our hypermodern, digital era, how do images work as to help us search for reality? Or, yet, is reality only a series of simulacra moments in which the truth is underveiled? Photographs, pictures and paintings are document and illusion. Yet the connection between this idea depicted by both the reading of novel and the watching of the film from the standpoint of each one of the Labhum participants’ subjectivity has opened horizons for awareness of our humanity, weaved in interactions, bonds and relationships in our encounters as well as in the everyday practices of diverse health professionals. We present below some of the participants’ partial reports at the end of the Labhum experience with Wilde’s and Antonioni’s narratives as focus – their names have been changed for fictitious ones in order to preserve their identities. The choices of the excerpts are to do with various topics of interest to us, namely:

- I- Diversity of participants as regards age, professional area in health services and relationships.

“It’s exciting to explore this new reading alongside colleagues of different ages and professions, and to reinterpret art together.” (Ana)

“... the shallow relationships developed by the protagonists [...] are still able to reveal their true essence to just a few people.” (Antonieta)

“... as much as we dislike it, we need to admit that in some ways we may be like them (the characters); we are a bit of Dorian Gray, we are other bits like Thomas in the film and in some aspects we are indeed similar to Lord Henry, Sybill Vane and even the girls being photographed by Thomas. A bit of each, depending on the occasion and with those we are interacting...” (Gabriela)

II- The literary and film narratives in dialogue with contemporary lives and the communication in social media today.

“In the book, I saw Harry as the embodiment of evil — a demon who captivates, a transgressor who fascinates, much like so many influencers today.” (Ana)

“Every day we try to change the perception of what we dislike in our reality, posting photos that make our lives seem less ordinary than they are. Every day we search for ways to conquer time and prolong our appearance of youth.” (Bruna)

III-The power of images and their role in helping us reflect upon reality x fantasy.

Moreover, the search for beauty as pleasure and truth and the use of it as protective disguise against harsh realities

“In both works, the protagonist places more trust in the image than in lived reality—revealing the power, and the danger, of visual perception, while questioning the very notion of reality.” (Lica)

“In the film we have a photographer without scruples, surrounded by young women who are not exactly naïve... A professional in search of the perfect shot, of art, of truth, of the meaning of life (...) the doubt: what is concrete and what is abstract? What is false and what is true?” (Ilán)

IV- The Labhum as relief, a cozy environment against the harsh reality of rational discourse

“I felt I was entering a space of welcome and attentive listening, where the focus was on collective reflection, exchanging perceptions, and questioning our own ways of seeing the world.” (Rodrigo)

“I thought it was really great that the conversations changed many of my initial perceptions and certainly transformed my rereading of the novel and in dialogue with the film this time.” (Ilán)

“My daily life is very scientific, rational, always in a hurry. So, taking a few hours each week to engage in group reflection, to understand feelings, to humanize ourselves, was essential time for me, particularly, with the focus on Wilde and Antonioni.” (Marcela)

“...the whole atmosphere of reading the novel, discussing it in dialogue with the film made me feel part of a collaborative, constructive, and collective learning community.” (Karla)

We understand that the particularized Labhum experience reported here has been able to promote participatory, open discussions on various themes in dialogue with the plural community of students who showed real life connections between the arts (literature and film)

and their own lived experiences in our contemporaneity, as parts of the selected examples above testify.

In this sense, the Labhum has brought forth possibilities of (self)awareness that help health care professionals and academics to assess their own humanized positions as such in relation to whom they are as thorough individuals, i.e., within and beyond their working contexts, facilitating their beings more thoroughly – and not just technically as has been much of the programs under the name of trainings on well-being. The fact that both narratives (the novel and the film) have been discussed in transcultural dialogue – due to the temporal and geographical transpositions, added to the linguistic translation of the novel into Portuguese – has allowed room for Wilde's and Antonioni's narratives beyond their critical readings as they have integrated people's moments of enjoyment in alignment with reflections that may help them go beyond their usual, everyday practices. This certainly reinforces the role of literature and the arts in humanizing processes, particularly, today. Furthermore, it points out to the need to simply read classical literature which entails universal values transculturally. And this has been the case with Oscar Wilde and *The Picture...*

ABSTRACT

This article aims to discuss the main challenges and possibilities related to the continuing education of public school teachers, highlighting public policies, training practices and the importance of teacher engagement in this process. The methodology is a bibliographical research with a descriptive and exploratory approach. The results showed that the continuing education of public school teachers is a complex challenge, but essential for the construction of quality education. Ensuring adequate conditions so that teachers can participate in relevant training, connected to their reality, is a commitment that must be assumed by managers, public policies and society in general. In this sense, it was concluded that overcoming structural difficulties and valuing the professional development of teachers are necessary paths to transform public education into a more effective and humanizing learning space.

Keywords: Professional Development. Continuing Education. Public Policies.

RESUMO

O presente artigo tem por objetivo discutir os principais desafios e possibilidades relacionados à formação continuada de professores da rede pública, destacando políticas públicas, práticas formativas e a importância do engajamento docente nesse processo. A metodologia se trata de uma pesquisa bibliográfica de abordagem descritiva e exploratória. Os resultados mostraram que a formação continuada de professores da rede pública é um desafio complexo, mas fundamental para a construção de uma educação de qualidade. Garantir condições adequadas para que os professores possam participar de formações relevantes, conectadas à sua realidade, é um compromisso que deve ser assumido por gestores, políticas públicas e pela sociedade em geral. Nesse sentido, concluiu-se que superar as dificuldades estruturais e valorizar o desenvolvimento profissional dos professores são caminhos necessários para transformar a educação pública em um espaço de aprendizagem mais efetivo e humanizador.

políticas públicas, las prácticas formativas y la importancia del compromiso docente en este proceso. La metodología consiste en una investigación bibliográfica con un enfoque descriptivo y exploratorio. Los resultados mostraron que la formación continua de los docentes de la red pública es un desafío complejo, pero fundamental para la construcción de una educación de calidad. Garantizar condiciones adecuadas para que los docentes puedan participar en formaciones relevantes y conectadas con su realidad es un compromiso que debe ser asumido por los gestores, las políticas públicas y la sociedad en general. En este sentido, se concluyó que superar las dificultades estructurales y valorar el desarrollo profesional de los docentes son caminos necesarios para transformar la educación pública en un espacio de aprendizaje más efectivo y humanizador.

Palabras clave: Desarrollo Profesional. Formación Continua. Políticas Públicas.

1 INTRODUCTION

Brazilian livestock plays a central role in the national economy and has a prominent position worldwide, especially in the breeding of ruminants for the production of food and raw materials such as meat, milk, wool and leather. In 2020, Brazil maintained the largest cattle herd in the world, with 217 million head, equivalent to 14.3% of the global total, followed by India with 190 million (EMBRAPA, 2021). In the same year, the country recorded a record production of 35.4 billion liters of bovine milk, while sheep and goat herds reached 20.6 million and 12.1 million head, respectively (IBGE, 2021).

The development of ruminant livestock in several countries, such as Brazil, occurs in a heterogeneous way in relation to form, being mostly empirical and extensive, with low technological levels and zootechnical results. Livestock farming is found in contrasting situations, employing from technological solutions to less sustainable ones (CAMPELLO, 2017). Goat farming, for example, in most farms does not express a significant productivity potential due to management problems, low labor and technological levels, nutritional and sanitary disorders, and high mortality rates in young and adult animals (CAMPELLO, 2017; AGOSTINHO, 2017).

Inherent to animal husbandry are its needs and difficulties, such as health problems that can compromise both production and animal welfare. It is possible to specifically observe animal oral health and relate it directly to these factors. Having their presence pre-dated, oral lesions are among the most common types of pathology reported in archaeological sets of animal bones (HOLMES *et al.*, 2021).

Dental problems in goat farming are not part of the common concerns of rural producers and veterinarians. The reasons for this worrying lack are because these conditions are silent, chronic, not diagnosed by routine procedures and, apparently, in popular culture, have little impact on the profitability of the economy's activity, which is not real (CAMPELLO, 2019).

Abnormal chewing and rumination are sensitive indicators of many disorders, including infectious diseases. Although low productivity is the main reason for cattle slaughter, dental diseases are rarely considered as a possible explanation. Diseases such as periodontitis can be painful, leading to inefficient chewing with consequent loss of body condition and weight, increased susceptibility to diseases, animal suffering, and decreased productivity, with consequent economic impacts (BORSANELLI *et al.*, 2021).

As Campello (2017) puts it, periodontal diseases are among the most different forms of infection that affect both humans and animals. Excessive wear of the dental crown is a factor observed in both, being a lesion characterized by the irreversible loss of dental structure from the external surface, without bacterial involvement, which, by promoting dentin exposure, can develop tooth sensitivity. Associated with diseases such as periodontitis, they cause retraction and possible loss of teeth. Routine clinical examination of the oral cavity of cattle is essential for the disease to be diagnosed in a live animal (BORSANELLI *et al.*, 2021). Since oral health is an initial factor in animal nutrition, its importance in growth, weight gain, productivity and quality of life is understood, identifying in this area a great potential for impact due to its relevance in economic and animal welfare issues. Thus, the central problem of this work is to understand what are the characteristics of tooth wear in ruminants and the main methods used in its analysis in the scientific literature. The objective of this work is to investigate the causes and patterns of this wear, as well as to review and discuss the methodologies used in its evaluation. To achieve the proposed objective, a Systematic Literature Review (RSL) was developed.

2 THEORETICAL FRAMEWORK

Between 2020 and 2021, Brazil approached the mark of 250 million head of cattle, sheep and goats, standing out worldwide as one of the major ruminant breeders. According to Borsanelli *et al.* (2021), diseases related to the dentition of these animals can be painful and generate inefficient chewing, with consequent losses of body condition and weight, and increased susceptibility to diseases. Even though the main reason for cattle slaughter is low productivity, dental disease is rarely considered a possible explanation.

In this way, the suffering caused by dental diseases affects the quality of life and animal welfare, contrary to what is inferred in the five animal freedoms, proposed by the Farm Animal Welfare Council of England in 1965, specifically in the third point, which guarantees freedom from pain, injury or disease.

From an economic point of view, in addition to the fundamental factor of decreased productivity, dental diseases are a population problem that even affect animals with higher added value and selected genetics, thus promoting significant economic impacts (CAMPELLO, 2017, BORSANELLI *et al.*, 2021). Regarding the approach to quantifying tooth wear in ruminant animals, it is possible to find works in literature that they collaborate, directing steps of the proposed project, or even reiterating its relevance.

Wicpolt et al. (2022) point to reports of periodontitis cases around the world since the Neolithic period and, even so, when investigating cases of periodontitis in sheep in Pernambuco, they define the disease as little known by veterinarians and cattle breeders in the region, causing economic losses by interfering with the productive performance of the animals. As it is a disease diagnosed by visual inspection, the methodology used was the dental analysis of live animals and the capture of images for registration, in addition to microscopy of samples of slaughtered animals. The method of visual inspection by a professional in the area is satisfactory for purely qualitative analyses.

Comparing different diets in groups of goats, Hatt *et al.* (2019) concluded that tooth wear is more related to dietary characteristics — such as resources, content, and distribution of phytoliths — than to environmental factors, such as dust and sand, highlighting the need for more in-depth studies. The analysis of the abrasives present in the digestive tract was performed by computed tomography, a method considered reliable due to its technological precision, although it requires sedation and individual handling of the animals.

In a complementary way to Hatt et al. (2019), Ackermans et al. (2020) apply the same computed tomography methodology in sedated animals during 17 months of experiments, this time comparing the diet of each group to tooth wear factors such as tooth morphology and loss of volume of the dentition. Again, reliable quantitative results are generated by the method, but it is still possible to highlight its considerable cost of implementation, given the use of commercial computed tomography equipment.

Considering human tooth wear and the solutions employed, Machado *et al.* (2022) analyze the feasibility of using an intraoral scanner for monitoring erosive wear. Bovine teeth were used as specimens, submerged in acid and reevaluated every 24 hours. The results obtained are satisfactory with the perception of a loss of 0.5 mm per layer of analysis. The intraoral scanner is a portable tool, used in dental offices that has accuracy and reliability. However, its high cost is an unfavorable factor for its application.

From an interrelational perspective, the application of human technologies in animal contexts can offer effective and integrated solutions. The use of these technologies, combined with data analysis and artificial intelligence systems, enables the creation of informational bases that help in decision-making. Thus, the development of a tool capable of quantifying tooth wear in ruminants could favor research that relates this wear to diseases, variations in management, productivity (of meat and derivatives) and environmental factors, such as soil types and additives aimed at improving plant production.

At the same time that efficient production generates positive economic results, it contributes to the fulfillment of the UN Sustainable Development Goals for Brazil. Producing with smaller investments or in larger quantities at the same cost makes the product cheaper, attractive to the market and facilitates access to the final consumer. This perspective directly affects the 2030 Agenda on the topic of Zero Hunger and Sustainable Agriculture, reducing hunger and ensuring access to food (2.1), meeting nutritional needs (2.2) and increasing the productivity and income of small producers (2.3). Adequate consumption of inputs is related to Responsible Consumption and Production, efficiently using natural resources (12.2). Accessible technological development strengthens scientific capacities and generates tools to shift to more sustainable patterns of production and consumption (12.a).

The relevance of the theme presented and the lack of tools with the same objective present a substantial and innovative contribution of work to agribusiness, in addition to its concern with animal welfare, productivity and the possibility of technological development.

3 METHODOLOGY

3.1 THEME AND OBJECTIVE

The systematic literature review (RSL) described below follows the parameters proposed by Fabbri et al. (2016) and aims to investigate publications on tooth wear in ruminant animals, their contributions to the topic and to gather relevant information for the analysis and quantification of wear. Thus, the objective of the review is to define and rank the main causes of tooth wear in ruminants present in the literature, as a way to visualize the affected species, understand the generating factors and direct the collection of information and measurement of wear.

3.2 TOOL AND PROTOCOL CONSTRUCTION

For the management and elaboration of the review protocol, the systematic bibliography review management software *StArt* (*State of the Art through Systematic Review*), developed by the Software Engineering Research Laboratory of the Department of Computing of the Federal University of São Carlos (LaPES-UFSCar), was used. The steps proposed by the application itself were followed during the completion.

3.3 DATABASES, JOB PROFILES, PERIOD AND LANGUAGES.

The searches for papers were carried out in the *Scopus* and *Web of Science*

databases, due to their international coverage and academic reliability. The work profile was not limited to articles only, even though these were the only results obtained. Likewise, there was no restriction regarding the selection period, given the interest for the review in visualizing the emergence of the theme as outlined by the descriptors and its development over the years. As for the language, works were selected in English, due to its scope, and in Portuguese.

3.4 KEYWORDS AND BOOLEAN OPERATORS

For the initial survey of papers, keywords were defined that covered the widest possible range of results that did not distance themselves from the theme: *Ruminant; Dental Wear; Tooth Wear; Dental Volume; Tooth Volume; Dental Abrasion; Tooth Abrasion; Dental Attrition; Tooth Attrition*.

At the same time, several combinations of Boolean operators were tested for each database and those that resulted in the largest number of articles presented were applied.

For the *Web of Science* database, the local filter *ALL FIELDS* was applied, using the expression: *"ruminant* AND (tooth wear OR tooth volume OR tooth abrasion OR tooth attrition OR dental wear OR dental volume OR dental abrasion OR dental attrition)"*

For the *Scopus* database, the local filter *ARTICLE TITLE, ABSTRACT, KEYWORDS* was applied, using the expression: *"ruminant* AND ("tooth wear" OR "tooth volume" OR "tooth abrasion" OR "tooth attrition" OR "dental wear" OR "dental volume" OR "dental abrasion" OR "dental attrition")"*

3.5 SELECTION STAGE AND CRITERIA

During the selection stage, criteria were defined for the use of the articles: 1 – Language: the work should be in English or Portuguese; 2 – Access: it was necessary to have access to the full text; 3 – The work should deal with ruminant animals; 4 – The work should address the issue of tooth wear in these animals;

In addition to the above criteria, duplicate jobs, those that appear in both databases, were removed. In this step, the titles, keywords and abstract of each article are read to make the selection.

3.6 EXTRACTION PHASE

For the data collection from the works selected for the extraction phase, questions

were elaborated about the approach to the theme in the work under analysis. Each following question could, depending on the application, accept one or several options as an answer. In question 1, we sought to list the motivation for the use of tooth wear at work. *Question 1 - Approach to the causes of wear (single option): A - Use wear to define other characteristics. (Age of fossil/animal and/or other) (wear and tear as a means); B - Analyzes/Explores causes for wear (wear as an end).*

In question 2, there was a survey of the possible causes or influences for the exhaustion, which were explored or only mentioned in the study. *Question 2 - Causes explored/cited (multiple options): A - Diet; B – Genetics; C – Occlusion; D – Others.*

The interest of question 3 is not only about which animals are treated, but mainly about meat animals and everyday human interaction, since most studies use tooth wear to classify fossils. The terms such as cattle, goats, sheep, and deer are not formal taxonomic categories, but rather common groups used to bring together animals with certain similar biological characteristics. All of the animals we are discussing belong to the Kingdom *Animalia*, Phylum *Chordata*, Class *Mammalia*, Order *Artiodactyla* (even-toed ungulate mammals such as oxen, deer, giraffes, etc.), and Suborder *Ruminantia*. *Question 3 - Taxonomy – Groups (Multiple Options): A – Cattle; B – Sheep; C – Goats; D – Cervids; E – Others.*

For question 4 we raised the methods of identification and classification of the wear that each work uses. What differentiates the "visual inspection" and "images" options is that in the former, the analyses are carried out directly on the copy, whether it is an original or a faithful replica. In the second, there is the need or choice of the author to capture and use the images for analysis. *Question 4 – Method of Identification (Multiple Options): A – Visual Inspection; B – Images; C – Others;*

Question 5 considers the relevance of the theme of tooth wear within the reviewed study and observes 2 situations: It only mentions wear, but does not quantify and/or qualify it methodologically; it applies some method of identification and/or quantification. *Question 5 – Methodological Approach (Single Option): – Only mentions wear and tear (does not quantify); B – Applies identification method.*

4 RESULTS AND DISCUSSIONS

Following the selection stages and criteria proposed in the methodology presented, with a survey carried out in October 2024, a total of 204 works were identified. 140 papers

were obtained for the *Web of Science database* and 64 papers for the *Scopus database*. With no restriction on the selection period, works were found between 1989 and 2024.

After the selection phase, we obtained 54 duplicate articles (26.47% of the total initial papers), 77 (37.74%) rejected articles and 73 (35.78%) accepted articles, moving forward to the data extraction phase.

The questions for the collection of data from the extraction phase would accept one or more answer options, to be defined by their application. Addressing the causes of wear in question 1, 60 studies used wear to define characteristics such as the age of the animal and the age of the fossil. The highest occurrences of the use of wear were to characterize diets of fossil species and in the validation of methods of identifying wear for species under study. On the other hand, in the second alternative of the first question, 13 studies specifically explored the causes of burnout. Thus, we see a distribution table of 82.2% of the articles using wear only as an instrument and the other 17.8% with a direct interest in investigating the causes of wear.

To survey the possible causes or factors that influence the exhaustion, question 2, of multiple options, considered from the interest of the work in the causes or only the allusion to these items. The diet of the animals appears in almost all of the 73 studies accepted for data collection, in 95.9% of them. Far from the references to diet, causes such as genetic factors (8.2%) and occlusion (6.8%) appear.

Among the other causes investigated for tooth wear, the geographic position of the herd and the season of the year of presence of the animals in the region of interest frequently appear, as many studies use the analysis of wear to reconstruct the customs of fossil species, or even the vegetation of the animals' time of life. In any case, geographical position and season of the year end up being indirectly related to diet, as they affect the supply of different food sources. In addition, rare studies were found that explored causes such as gender and oral infections.

Regarding the taxonomic groups present in the works, the use of wear analysis for the characterization of fossils and extinct species is reinforced, participating in the composition of the item *others* in a frequency of 34 works. The frequency of *deer*, appearing in 23 works out of the 73 under analysis. The search for beef animals and daily human interaction returned in ascending order: *sheep* with 10 results, *cattle* 14 and *goats* 16, referring to 13.7%, 19.2% and 21.9% respectively.

For the distribution of wear identification and classification methods, it is important to emphasize that one identification method does not necessarily cancel out another in the same work. The item *Visual Inspection* refers to analyses made directly on the copy or replica and has a frequency in 54.8% of the works. With a frequency close to the previous item of 58.9%, the *use of images* is the main characteristic among the methods for identifying and classifying wear. Regarding the *item others*, studies were found that used palpation, measurements with instruments such as calipers, or even chemically quantifying the loss of calcium ions in arches submerged in an acid medium. In all, the item others encompasses 27.4% of the works.

Finally, the number of studies that apply methods to identify/qualify/quantify wear. Of the 73 studies used for data collection, only 11 of them did not apply known methods. On the other hand, 62 used some method, whether this was the target of the research or not.

In summary, what the questions proposed by this systematic literature review were able to clarify is that most of the studies use the analysis of tooth wear as a tool, not being a direct concern and that its main use is in the characterization of extinct and fossil species, which indicates an opportunity for its use in beef animals, considering its economic and social relevance. Also, that diet is the fundamental factor for wear and tear and that the poignant results of wear and tear analyses are obtained through visual methods, with images or not.

Below, we will discuss the methods of identification and/or quantification of tooth wear in ruminants located during the performance of this RSL, in a historical and relevant organization.

4.1 METHODS OF WORKING WITH TOOTH WEAR

As a starting point identified by RSL, Walker and Teaford (1989) list studies on the use of electron microscopes in the analysis of mammalian tooth wear that emerged in the 1960s, and became common to surface analysis due to factors such as their resolution, non-destructive testing and ease of use. Still, the motivations for the development of wear studies present in the bibliography include the determination of the causes and rates of wear, jaw movement patterns, to find patterns of diet and animal behavior, and reconstruction of diets for paleontology.

Most of the wear analysis cases identified by Solounias *et al.* (1994) until then, he used the mandibular first molar for wear analysis. For measurements performed with a microscope, the authors made molds of the maxillary second molars. The molar wear rates were investigated based on tooth height values and growth lines (cementum-enamel junction)

seeking a better understanding of the wear patterns in several species. The conclusions obtained by the work at the time were relevant to the development of the theme, such as the significant variation between different species of ruminants, reflecting their diets and environmental adaptations, crucial impact of diet and its abrasiveness on wear, implication on the evolution of species in relation to their feeding strategies and *habitat*, and also the modeling of wear patterns in paleontology.

The induction of tooth wear is proposed by Kaiser *et al.* (2009) as coming from 2 different situations: the contact of the tooth with food, classified as abrasion and the contact of the tooth with another tooth, treated by attrition. Each of them can be more or less present according to the type of diet, considering the animal's food source. Also, these animals can be divided into navigators, grazers and intermediaries. The authors' objective is to compare the wear and tear in 19 species of animals in captivity with data from free-living animals. Their conclusions reinforce the interference of the abrasive diet in the wear and consequently in the longevity of the animals, where captivity presents greater hygiene in the supply of food and generates lower rates of tooth wear.

4.1.1 Mesowear Method

Developed by Solounias and Fortelious (2000), the mesowear method has been widely used since its presentation because it is relatively fast and reliable in the characterization of wear. The method is based on the development of the veneers of the occlusal surfaces of the posterior teeth, created by the friction of feeding, taking into account two variables: The occlusal relief (*Occlusal Relief*), which is classified as high or low according to the depth of the valley formed by the cusps; The *cusp shape* (*Cuspid Shape*) which includes three attributes according to the degree of development of the facets: sharp, rounded and flattened, (KAISER *et al.*, 2009).

In the application of the Mesowear method in their first proposal, Kaiser *et al.* (2009) perform visual inspection of the teeth, using a magnifying glass when appropriate. The first samples were photographed and plotted on paper, but once the standards were set to the satisfaction of the authors, the rest of the material was recorded through direct scoring.

Kaiser *et al.* (2010) analyzed 37 species of ruminants of the *families Bovidae, Giraffidae* and *Cervidae*, using the *Mesowear* method in the second and third molars. Dental molds were made and the images were digitally processed to quantify the angle of alignment of the enamel ridges. The method proved to be effective, but dependent on manual steps.

Ozaki *et al.* (2010) investigate the relationship between feeding habits, molar wear and life expectancy in wild sika deer populations. They observed that the wear of the M1 and M3 molars increases with grass consumption and decreases with rainfall. M3 showed a stronger correlation with life expectancy, as it maintained masticatory function for longer than M1.

Other approaches to the *Mesowear* method are found during RSL. Fraser *et al.* (2014), with the aim of improving the usefulness of the method, propose a new scoring system with additional categories of wear, analyzing both maxillary and mandibular posterior teeth. The new mesowear system expanded the categories from four to five. Following the traditional method, the cusps were classified according to relief (high or low) and occlusal shape (sharp, rounded, very rounded, rounded-flattened, or flattened-flat). Each combination received a score from 1 to 5, representing increasing degrees of wear. The average score per species was used in the analyses.

For each scoring system, the extent to which the upper and lower teeth mesowear scores were able to differentiate species with different types of diet was evaluated. The analyses were performed using the R software, using single-factor analysis of variance and Tukey's test for comparisons between groups, or the *Kruskal-Wallis* test when the data did not meet the criteria of the analysis of variance. The authors found that the new expanded mesowear scoring system improves the correct classification rates of the diet and has high repeatability. Also, that the mesowear scores of the mandibular teeth are consistently lower than those of the maxillary teeth. Although the new scoring method reduces the difference in wear between the upper and lower arches, this variation may be associated with anodontics, i.e., the fact that the posterior teeth of the mandible are narrower than their maxillary counterparts.

4.1.2 Microwear Method

Microwear is the quantification of microscopic marks, pits and scratches on the teeth, resulting from chewing different types of food. Pits form as a result of enamel-to-enamel contact; while scratches are formed by abrasive items such as phytoliths or earth being rubbed across the enamel surface. The texture of tooth microwear is used as a dietary indicator in paleoecology and vertebrate ecology. Unlike *mesowear*, which has characteristics of greater proportions and describes wear and tear throughout life, *Microwear* is determined only by the last meals, given that small changes in diet are enough to generate

microscopic marks. (FRASER *et al.* (2011), KAISER and BRINKMANN (2006), FRANCISCO *et al.* (2018)).

The analysis of the texture of tooth microwear observes parameters related to surface complexity, such as anisotropy and heterogeneity of enamel veneers at the micrometric scale. Other microwear analysis approaches are based on *ISO standard* roughness and texture parameters.

Francisco *et al.* (2018), using part of the parameters above, propose a new approach where, instead of a single parameter characterizing the entire surface, they perform surface samples generating 9 derived parameters with the aim of expanding the set of parameters. Samples were shaped, scanned and the identification of the most discriminative parameters was conducted through an automated procedure. In its initial form, the method incorporates the usual statistical tools, correlation analyses, and the necessary mathematical tests. The results indicate that a simplified version of the procedure is more efficient in identifying the desired discriminative parameters. And that the new method significantly improves the discriminatory power of tooth wear compared to previous approaches.

Due to its microscopic profile, microwear presents greater difficulties in visualization and analysis than mesowear.

A variety of measurement methods are available to collect topographic data from surfaces on a microscopic scale. These methods can be broadly grouped into contact and non-contact methods. Contact surface sensors inspect surfaces with a needle sensor (diamond or ruby tip), which moves over the surface mechanically under constant pressure. It converts the vertical and horizontal movements of the needle into an electrical signal. Non-contact methods are, for example, the laser tip scanning method, light refraction and diffraction methods, interferometric coherence, acoustic emission, and confocal scanning microscopy (KAISER and BRINKMANN, 2006). Next, we will discuss methods of topographic data collection and analysis present in the RSL.

4.1.3 Roughness

Worn tooth enamel resembles industrial technical surfaces, and can be described by surface roughness parameters defined by ISO standards, which statistically characterize the microtexture in different applications. (KAISER and BRINKMANN, 2006; SCHULZ *et al.*, 2010). The roughness parameters describe undulations and irregularities, characterizing vertical, horizontal and hybrid aspects of the topography. Together, they constitute an

effective statistical tool for analyzing the microtexture of surfaces. (KAISER and BRINKMANN, 2006).

Kaiser and Brinkmann (2006) investigated whether tooth microwear could be characterized by consolidated parameters of surface roughness, finding a strong similarity between industrial surfaces and microscars in molars of herbivores, based on molds of the arches of three bovine species. Using diamond-tipped profilometry on the maxillary second molar, 895 measurements confirmed that industrial roughness parameters describe the same scale as microwear, distinguish dietary groups, and quantify the balance between attrition and abrasion. These parameters reflect the influence of diet and establish a direct link between *the Microwear and Mesowear methods*.

Schulz *et al.* (2010), used texture parameters from ISO/DIS 25178-2 and Scale-Sensitive Fractal Analysis (SSFA) in 3D models by microscopy to quantify tooth microwear in herbivores. The authors evaluated the potential of these parameters as standardized tools and suggested that they reflect the relationship between abrasion and attrition, indicating lower bolus abrasiveness compared to ingested foods. Similarly, both Winkler *et al.* (2013) and Kubo and Fujita (2021), applied surface roughness parameter systems to describe microwear and perform paleontological analyses. The results demonstrated high efficacy and complementarity between the parameters, allowing quantitative and comparable analyses, reinforcing the potential of ISO standards as a standardized methodological basis for studies of tooth microwear.

4.1.4 Other Methods

Several other methods of identification and analysis of tooth wear were identified in the systematic review, although with a low frequency of occurrence when compared to the previous ones. Veiberg *et al.* (2007) applied three-dimensional scanning to analyze the relationship between growth and tooth wear in Svalbard reindeer, obtaining accurate 3D models of the first molar (M1) and ensuring high consistency and quality in the measurements. Similarly, Gailer and Kaiser (2014) used 3D structured light scanning to evaluate the masticatory efficacy in cattle, relating the functional shape of the postcanine teeth to the biomechanical properties and abrasiveness of the diet, with complete virtual reconstructions of the dental arches. Gailer *et al.* (2016) used 3D scanning to analyze tooth shape and function, concluding that masticatory efficiency does not depend on an ideal

morphology and emphasizing the accuracy of the method as a reliable tool to integrate different analytical approaches.

Ackermans *et al.* (2018) applied computed tomography to evaluate tooth wear in goats under diets of different abrasiveness, confirming the reliability of the method, but highlighting its practical limitations due to the need for sedation of the animals. Similarly, Karme *et al.* Wang *et al.* (2016) utilized CT scans in a mechanical chewing experiment and observed that tooth tissue loss varies even in similar microwear patterns, warning against direct inferences about diet or wear rate.

4.2 FINAL CONSIDERATIONS - SYSTEMATIC LITERATURE REVIEW

The information obtained from the RSL contributes to elucidate previously raised issues and to outline the academic interest in the theme. Even without time constraint in the filters, the extensive Boolean expressions used in the searches resulted in a limited number of works. Even so, only 73 studies on tooth wear in ruminants were included (accepted) in the review, which highlights the specificity of the topic. Several methods of identifying tooth wear were found in about 85% of the studies, most of which were based on visual inspection and image analysis.

The greater recognition of wear and tear as a tool for inferring diet, and not as an indicator of oral problems, is a portrait of its wide application in paleontological studies. This finding arouses interest in the application of tooth wear in animal groups that provide immediate return and direct impact, whether in economic, ecological or animal welfare terms. In this context, a low representation of beef animals was observed among the studies reviewed, with only 16 studies involving goats, 14 with cattle and 10 with sheep, reinforcing the opportunities for expanding this approach.

The methods identified in the literature for the analysis of tooth wear have evolved from simple visual inspections to the use of electron microscopy, three-dimensional scanning and computed tomography. Molar teeth are the main targets of investigation due to their masticatory function, varying between the first, second and third molars.

The mesowear method has been of great relevance in the development of research since its proposal, being continuously adapted to the needs of the authors and to the advancement of data collection technologies. The search for greater repeatability and reliability has led the microwear approach (*Microwear*) to integrate technological tools, such as three-dimensional scanning and industrial surface roughness (ISO) parameters. The

choice of the method of analysis should be aligned with the specific objectives of each study. *Mesowear* reflects the wear accumulated over months or years, analyzing the occlusal relief and the shape of the cusps, while *Microwear* shows changes that occur at shorter intervals, from hours to days, and gains robustness with the use of standardized tools (FRASER and THEODOR, (2011); STRANI et al. (2018)).

5 CONCLUSION

The systematic review gathered and analyzed the main approaches to tooth wear in ruminants, highlighting their scientific and productive importance. The results showed the predominance of visual inspection and image analysis methods, as well as advances in electron microscopy, 3D scanning and computed tomography, reflecting technological advances and the search for greater precision in the analyses.

It was found that tooth wear has been widely explored as an indicator of diet, especially in paleontological studies, but it is still little applied in species of zootechnical interest, such as cattle, goats and sheep. This gap points to significant opportunities to expand this approach to productive contexts, with the potential to have a direct impact on the health, well-being and efficiency of herds.

Thus, the study contributes to consolidate existing knowledge, identify limitations and point out future directions for the development of tools that quantify tooth wear in ruminants. This practical application can support professionals and researchers in making decisions aimed at sustainable management, increased productivity, and promotion of animal welfare, strengthening the integration between science and agricultural production.

ABSTRACT

The COP-30, to be held in Belém (Brazil), represents a milestone in global climate governance by placing the Amazon at the center of international decision-making on mitigation, adaptation, and climate justice. Considering the strategic relevance of the event and the institutional challenges related to Brazil's ability to implement its climate commitments, this study aims to examine how COP-30 may strengthen the transition towards smart and resilient cities, based on the theoretical framework of the GIS Cycle, Governance, Innovation, and Sustainability. The research adopts a qualitative approach grounded in documentary analysis of official national and international instruments, as well as recent Brazilian experiences involving digital and sustainable governance at the municipal level. The results demonstrate that Brazil has the potential to assume a leadership role in climate governance, provided that implementation, monitoring, and multilevel coordination capacities are reinforced. Additionally, the empirical focus on Belém and its strategic connection with Goiânia reveals opportunities to integrate climate diplomacy with local public policy. It is concluded that the GIS Cycle offers institutional conditions to transform climate ambition into concrete outcomes, enhancing the legacy of COP-30 for Brazilian territories and society.

Keywords: COP-30. Climate Governance. Smart Cities. Sustainability. GIS Cycle.

RESUMO

A realização da COP-30 na cidade de Belém (PA) representa um marco para a governança climática global, ao posicionar a Amazônia no centro das decisões internacionais sobre mitigação, adaptação e justiça socioambiental. Considerando a relevância estratégica do evento e os desafios institucionais brasileiros quanto à implementação de suas metas climáticas, este estudo tem como objetivo analisar em que medida a COP-30 pode impulsionar o país rumo à transição para cidades inteligentes e resilientes, tomando como referência o modelo do Ciclo GIS, Governança, Inovação e Sustentabilidade. Adota-se uma abordagem qualitativa, baseada em análise documental de instrumentos oficiais nacionais e internacionais, bem como de experiências recentes de governança digital e sustentável em

municípios brasileiros. Os resultados evidenciam que o Brasil possui potencial para assumir papel de liderança na governança climática, desde que fortaleça as capacidades de implementação, monitoramento e coordenação multinível. Além disso, o estudo de Belém e suas conexões estratégicas com Goiânia revelam oportunidades de integração entre diplomacia climática e política pública local. Conclui-se que a consolidação do Ciclo GIS pode contribuir para transformar ambição em resultados concretos, ampliando o legado da COP-30 para o território e para a sociedade brasileira.

RESUMEN

La realización de la COP-30 en Belém (Brasil) constituye un hito en la gobernanza climática mundial, al situar a la Amazonía en el centro de las decisiones internacionales sobre mitigación, adaptación y justicia climática. Considerando la relevancia estratégica del evento y los desafíos institucionales relacionados con la implementación de los compromisos climáticos brasileños, este estudio tiene como objetivo analizar de qué manera la COP-30 puede impulsar la transición hacia ciudades inteligentes y resilientes, utilizando como referencia el modelo del Ciclo GIS, Gobernanza, Innovación y Sostenibilidad. La investigación adopta un enfoque cualitativo basado en análisis documental de instrumentos oficiales nacionales e internacionales, así como de experiencias recientes de gobernanza digital y sostenible en municipios brasileños. Los resultados muestran que Brasil puede asumir un papel de liderazgo en la gobernanza climática, siempre que fortalezca las capacidades de implementación, monitoreo y coordinación multinivel. Además, el análisis de Belém y su conexión con Goiânia revela oportunidades para integrar diplomacia climática y política pública local. Se concluye que la consolidación del Ciclo GIS puede transformar la ambición en resultados concretos, ampliando el legado de la COP-30 para el territorio y la sociedad brasileña.

1 INTRODUCTION

Climate change is one of the main global challenges of the twenty-first century, with widely consolidated scientific evidence on its environmental, economic, and social impacts (IPCC, 2023). The intensification of extreme events, the threat to biodiversity, and the widening of socio-environmental inequalities demonstrate that the climate crisis cannot be addressed without robust governance mechanisms, based on mitigation, adaptation, and climate justice (Sachs, 2015; UNFCCC, 2022).

At the international level, the Conference of the Parties (COP) to the United Nations Framework Convention on Climate Change has established itself as the main multilateral negotiation forum for defining climate commitments, monitoring targets, and cooperation between countries (Hale, 2022; Bodansky, 2016). Since its creation in 1995, the COP has played a central role in the construction of agreements such as the Kyoto Protocol and the Paris Agreement, establishing emission reduction targets and financing instruments for the ecological transition.

The holding of COP-30 in Belém do Pará reflects the recognition that the Amazon is a key player in the global climate balance, not only for its biophysical regulatory function, but for its strategic role in the planetary agenda of emissions and land use, as shown by recent data from the *Climate Action Tracker* and the updated instruments of the Nationally Determined Contribution (NDC).

International climate governance and its national and local materializations today constitute a field of disputes, innovations, and reconfiguration of state capacities in the face of a crisis of a civilizational nature.

Brazil, the sixth largest emitter of greenhouse gases in the world and with almost half of its emissions linked to land use and change, occupies a unique position on the global climate agenda.

At the same time as it faces international pressures to reduce deforestation, the country has strategic opportunities to project itself as a global leader in the ecological transition, especially with the recent improvement of the national targets established in its updated Nationally Determined Contribution (NDC), which foresees a reduction of between 59% and 67% in emissions by 2035, with a focus on climate justice and clean development.

However, structural and institutional challenges persist, such as the mismatch between diplomatic ambition and operational capacity, the limitation of regulatory and technological

instruments, and the incomplete consolidation of the Brazilian Emissions Trading System (SBCE).

In this scenario, climate governance in Brazil lacks integrated mechanisms that ensure planning, execution, and continuous monitoring, especially at the municipal level, where the effects of the climate crisis are manifested more directly.

It is in this context that the importance of innovative models of public management capable of guiding climate policies with efficiency, social legitimacy, and institutional intelligence emerges. The GIS Cycle, Governance, Innovation and Sustainability, proposed in the author's previous theoretical development, represents a systemic approach that articulates public value, evidence-based decision-making, technological innovation and sustainable resilience as guiding principles of state action.

COP-30 constitutes a critical window: either Brazil consolidates a new cycle of climate governance, decentralized, digital and results-based, or the historic opportunity will be dispersed after the event, losing the potential for structural transformation.

In view of this, this article seeks to analyze how COP-30 can boost the Brazilian climate transition, focusing on the application of the GIS Cycle to the construction of smart and resilient cities, through an illustrative study of Belém (PA), host of the event, and strategic connections with Goiânia (GO), a municipality where concrete experiences of integrated and digital governance of urban planning are developed.

Thus, the central question that guides this investigation can be stated as follows: *How can Brazil transform the diplomatic protagonism of COP-30 into concrete results of climate governance in the territory, taking the GIS Cycle as a reference?*

To answer it, the study has the following objectives:

General Objective:

Analyze the possibilities of strengthening Brazilian climate governance from COP-30, based on the GIS Cycle model.

Specific Objectives:

- a) Characterize Brazil's pre-COP-30 climate scenario and its institutional gaps;
- b) Evaluate the construction of the climate agenda in Belém and the challenges of the post-event legacy;
- c) Identify possible connections with smart governance experiences in Goiânia;
- d) Propose strategic recommendations guided by the GIS Cycle.

This approach seeks to contribute to the theoretical and practical advancement of climate governance in the country, articulating global commitments with local capacities, so that the legacy of COP-30 goes beyond diplomatic discourses and becomes public innovation, urban sustainability, and environmental justice.

2 THEORETICAL FRAMEWORK

Confronting the climate crisis requires not only ambitious diplomatic commitments, but above all institutional capacity to implement effective public policies on a territorial scale. Understanding the conceptual foundations that structure this agenda is an indispensable condition for analyzing the challenges and opportunities facing Brazil in the context of COP-30.

In this sense, the theoretical framework presented aims to situate climate governance in the broader field of sustainable development, highlighting its multi-scalar nature and its intrinsic link with social justice, technological innovation, and urban resilience.

By examining the Brazilian regulatory framework, its operational gaps, and the strategic role of cities, especially in the Amazon, the text outlines the analytical bases necessary to understand why climate implementation must be territorialized, intelligent, and results-oriented. Finally, the GIS Cycle is introduced as an original Brazilian proposal for improving governance capabilities, capable of converting ambition into concrete deliveries and contributing to COP-30 leaving a lasting legacy in the country and in the world.

2.1 CLIMATE GOVERNANCE AS A PILLAR OF SUSTAINABLE DEVELOPMENT

Climate governance can be understood as the multi-scalar institutional arrangement that coordinates policies, actors, and instruments to mitigate greenhouse gas emissions and promote adaptation to the impacts of global warming (BODANSKY, 2016; BIERMANN et al., 2010). It is a field that involves both the international system and national and subnational governments and organized civil society, configuring itself as a challenge of polycentric governance (OSTROM, 2010), in which responsibilities, competencies and capacities must be distributed in a cooperative manner.

In the framework of sustainable development, Sachs (2015) and the IPCC (2023) emphasize that there is no effective climate action without socio-environmental justice, as the impacts of the climate crisis fall unequally on vulnerable populations. This reinforces the principle of "common but differentiated responsibilities", consolidated in multilateral

agreements since Rio-92 and deepened in the Paris Agreement (UNFCCC, 2015; HALE, 2022).

In Brazil, a previous study by the author shows that the climate normative framework is relatively sophisticated, but there are still relevant deficiencies in federative integration, implementation and monitoring of results, especially at the municipal scale, where climate impacts are felt directly and on a daily basis.

This asymmetry between normative ambition and real institutional capacity is pointed out by Osborne (2010) as a structural dilemma of collaborative governance: interdependent policies require technical, technological, and managerial capacities that are not always available in subnational entities.

From the point of view of the state of the art of governance, Klimanov (2021) and Peters (2022) indicate that successful climate governance systems have three essential characteristics:

Table 1

Structuring components of climate governance

Structuring element	Expected result
Multilevel coordination	Reduction of overlaps and regulatory gaps
Evidence-based governance	Continuous monitoring of policy effects
Adaptive and responsive capability	Quick fixes and institutional learning

Source: Author.

Brazil is in the process of consolidating these three key components of climate governance, multilevel coordination, evidence-based governance, and adaptive institutional capacity.

International examples demonstrate the relevance and feasibility of these elements: in the European Union, the existence of binding targets and sectoral climate plans ensures clarity of roles and responsibilities, strengthening climate governance and monitoring of results; New Zealand has an independent Climate Change Commission, responsible for establishing annual metrics and monitoring compliance with national targets, ensuring transparency and *accountability* on the decarbonization trajectory. In the Brazilian case, although the transition is underway, emerging initiatives indicate important advances, as is the case in Goiânia, where digital and integrated governance has been implemented that

articulates strategic planning, public budget, and performance indicators to guide decisions and monitor government deliveries.

These examples signal possible paths for strengthening climate governance in the country.

In summary, governing the climate is fundamentally transforming ambition into results, activating state and social capacities so that international goals materialize in the territory, a global requirement and a particularly Brazilian urgency.

2.2 BRAZILIAN CLIMATE POLICY: CLIMATE PLAN AND NDC

Brazilian climate policy is structured by international commitments signed under the United Nations Framework Convention on Climate Change (UNFCCC), with emphasis on the Paris Agreement, which requires countries to develop progressively more ambitious goals (UNFCCC, 2015; HALE, 2022).

It is noted that the country consolidated its Nationally Determined Contribution (NDC), updated in 2024, setting the goal of reducing between 59% and 67% of greenhouse gas emissions by 2035, with an emphasis on climate justice and clean development.

However, the Brazilian Emissions Trading System (SBCE), although innovative, still lacks a digital operational structure, transparency, and systemic oversight.

The state of the art demonstrates that climate goals are only effective when operated by intelligent governance systems, with continuous monitoring and accountability (HALE, 2022; MECKLING, 2021).

It must be considered that the national performance still has significant governance gaps. Brazil remains among the largest global emitters, with 2.5% of global emissions and high dependence on the land use and change sector (LULUCF), and its climate performance remains classified as insufficient to limit warming to 1.5°C.

This situation reinforces the IPCC's diagnosis (2023), according to which climate goals without the capacity for implementation, measurement, and accountability tend not to materialize.

From a regulatory point of view, there have been recent advances such as the creation of the Brazilian Emissions Trading System (SBCE) in 2024, with the aim of providing a carbon pricing mechanism. However, the operationalization of this system is still incipient, as it depends on digital infrastructure, methodological standardization, and inspection capacity that are not fully established (*Climate Transparency*, 2025).

In view of the facts, it is important to note that Brazil is in a paradoxical situation: it is simultaneously an environmental power and an institutional vulnerable, with high diplomatic ambition, but limited climate execution.

This asymmetry reflects what the literature calls *the implementation gap* (PETERS, 2022; MECKLING, 2021): well-designed policies, but with low operational governance, especially at the subnational level, where climate policy is carried out in a concrete way.

Despite having robust normative instruments, such as the Climate Plan, analyzed in detail by the author, municipalities lack technical and financial resources to carry out urban adaptation actions, prevention of extreme events and control of deforestation in their territories.

COP-30 represents a critical window for reviewing and strengthening national and local capacities, establishing stronger links between climate ambition and state capacity, a theme that the GIS Cycle seeks to structure in a systemic way.

2.3 SMART AND RESILIENT CITIES AS THE EPICENTER OF CLIMATE ACTION

Cities concentrate approximately 70% of global greenhouse gas emissions, in addition to being home to most of the world's population (UN-Habitat, 2020). For this reason, they become the operational center of contemporary climate governance: it is in urban territories that both impacts and responses to climate change manifest themselves in a direct, urgent, and unequal way (IPCC, 2023).

In this context, the concept of Smart City has evolved substantially in recent decades. From an initial eminently technological perspective, the current focus now considers the strategic and socially oriented use of technology, with a focus on quality of life and environmental sustainability (KOMNINOS, 2015; CARAGLIU; DEL BO; NIJKAMP, 2019). Thus, the smart city is, first and foremost, an ecosystem of public innovation, based on data, citizen participation, connectivity, and integrated urban planning.

At the same time, the advancement of the climate agenda reinforced the notion of urban resilience, defined as the ability to anticipate, absorb, and transform impacts associated with extreme events and chronic climate change, while maintaining the functionality of urban systems (MEEROW; NEWELL; STULTS, 2016). In this way, resilient smart cities constitute the new ideal of urban planning in the twenty-first century, combining technology, collaborative governance, and climate justice.

In the Brazilian case, emerging initiatives demonstrate the potential of municipal public innovation to address the climate emergency. Among them, processes that integrate strategic planning, results-oriented budgeting, and digital platforms stand out, strengthening the monitoring of indicators and popular participation. The experience of Goiânia, which articulates PPA, digital governance and institutionalized indicators in the GIS Cycle model, is a concrete example of this smart governance applied to the national context, at an advanced stage of implementation.

On the other hand, cities in the Amazon, such as Belém, host of COP-30, face additional challenges such as socio-environmental vulnerability, historical infrastructure deficits, and territorial inequality, but at the same time they have a unique opportunity to lead the global climate agenda, by transforming their geopolitical position into a bioeconomic power and an international laboratory for sustainable urban policies.

Thus, the city emerges as the main space where climate governance can cease to be a promise and become a reality, through innovation, technology, social participation, and adaptive resilience.

2.4 THE GIS CYCLE AS A BRAZILIAN INSTITUTIONAL INNOVATION FOR CLIMATE GOVERNANCE

In the field of climate governance, organizations such as the IPCC (2023), the OECD (2021), and UN-Habitat (2020) argue that States should adopt management models capable of articulating data science, social participation, federative coordination, and focus on results.

However, most of the widely disseminated methodologies were conceived in contexts historically different from the Brazilian one, with greater institutional stability and lower socioeconomic inequalities. This makes it necessary to develop approaches adapted to realities such as Latin America, marked by strong territorial heterogeneity and administrative weaknesses.

In this scenario, the GIS Cycle, Governance, Innovation and Sustainability, emerges as an original Brazilian contribution to the advancement of climate governance. Developed by the author as a systemic institutional architecture, the model seeks to overcome the fragmentation that historically separates planning, budgeting, technology, and monitoring, unifying these dimensions in a continuous process oriented to public value.

GIS proposes that public administration operates with ethics and social responsibility, permanent monitoring, sustainable innovation, and adaptive resilience, allowing climate policies to effectively convert into verifiable deliverables.

In addition to establishing new governance parameters, the GIS Cycle reinforces the need for the State to adopt decision-making mechanisms connected to society and based on evidence, expanding the government's capacity to correct course, anticipate risks, and respond in a coordinated manner to climate demands.

This perspective is convergent with contemporary international discussions on collaborative governance (OSBORNE, 2010) and polycentric governance (OSTROM, 2010), but incorporates the differential of a territorialized view of climate action.

The experience of Goiânia, which has been applying principles of the GIS Cycle in the development of its medium-term planning, illustrates the potential of the model as a tool for public transformation.

In this case, the articulation between planning, budget, popular participation and indicators has allowed greater precision in the prioritization of policies, conferring institutional intelligence to the urban climate management process.

This example demonstrates that GIS is not restricted to the theoretical field, constituting itself as an applicable and replicable method in different realities.

More than that, the GIS Cycle presents itself as an institutional innovation that offers Brazil a better capacity to align diplomatic ambition and territorial implementation, allowing commitments made in global arenas, such as COP-30, to generate concrete effects on people's lives.

For this reason, it is a strategic proposal both to strengthen municipal governance and to position the country as an international reference in integrated, inclusive and sustainable climate management models.

3 METHODOLOGY

The research adopts a qualitative approach, with an analytical and propositional character, centered on the evaluation of the role of COP-30 in strengthening Brazilian climate governance and in the formulation of the GIS-COP30 model.

The study is based on documentary analysis of national and international instruments, such as the NDC updated in 2024, climate monitoring reports, regulations on the sustainable transition, and institutional documents related to public governance and the GIS Cycle.

At the same time, a review of specialized literature on climate governance, smart cities, government innovation and urban resilience was carried out, in order to ensure alignment with the state of the art.

The analysis is organized in three stages: diagnosis of the pre-COP-30 climate scenario; evaluation of legacy opportunities associated with the event in Belém do Pará; and the proposal of the GIS-COP30 framework as an instrument for the local implementation of Brazilian climate goals.

In addition, the cases of Belém, due to their strategic role in COP-30, and Goiânia, due to the adoption of integrated digital governance practices, are examined. Thus, the methodology allows for the articulation of international commitments, national capacities, and municipal strategies aimed at climate action.

4 RESULTS AND DISCUSSION

Understanding Brazil's role in contemporary climate governance requires an analysis that goes beyond the normative dimension and considers the real capacity to implement public policies. After discussing, in the theoretical framework, the foundations of climate governance, national policy and the centrality of cities in the sustainability agenda, this section presents the findings of the research, structuring a critical reflection on the Brazilian situation on the eve of COP-30. The objective is to highlight how the country articulates, or fails to articulate, its diplomatic protagonism with the operational challenges of the territory, especially at the municipal level.

From this diagnosis, the transformative potential of COP-30 and its relationship with the institutional innovation proposed by the GIS Cycle are explored, demonstrating concrete paths for the consolidation of smart and resilient cities in Brazil. Thus, the results and discussions that follow make explicit the gap between ambition and state capacity, while pointing out strategies and opportunities to overcome it.

4.1 BRAZIL IN THE PRE-COP-30 CLIMATE SCENARIO: DIPLOMATIC AMBITION, LIMITED EXECUTION

Brazil occupies a strategic position in global climate governance as one of the main environmental powers on the planet, responsible for the largest tropical forest in the world and for relevant ecosystem services that regulate the regional and global climate. This role was reaffirmed in the last rounds of UNFCCC negotiations, with the update of the Nationally

Determined Contribution (NDC), which established the goal of reducing greenhouse gas emissions by 59% to 67% by 2035, incorporating principles of climate justice and sustainable transition.

However, the technical diagnosis shows dissonance between ambition and implementation. According to the *Climate Action Tracker*, Brazil remains among the largest global emitters, with approximately 2.5% of global emissions, and its level of commitment is still classified as "Insufficient" to limit global warming to 1.5°C.

This assessment stems from the country's persistent dependence on the land use and land use change (LULUCF) sector, associated with deforestation in the Amazon and Cerrado, as well as structural challenges in the energy, industry, and transport sectors.

Institutional analysis reinforces this asymmetry. Although Brazil has advanced in the modernization of regulatory instruments, as demonstrated by the creation of the Brazilian Emissions Trading System (SBCE), technical studies warn that the operationalization of this mechanism depends on robust digital infrastructure, methodological standardization, and inspection capacity that are still under development.

The picture is reinforced by the IPCC (2023), which states that climate policies only produce results when supported by continuous systems of monitoring, accountability, and evidence-based governance.

These gaps are accentuated at the subnational level, where climate impacts are manifested with greater intensity. Brazilian municipalities often lack specialized technical teams, adequate digital platforms, or financial resources to structure effective mitigation and adaptation actions, which limits the country's ability to meet international goals consistently across the territory.

Thus, the pre-COP-30 scenario reveals a paradox: Brazil has the best environmental conditions to lead the global climate transformation, but still finds it difficult to operate this leadership internally, especially in its municipal dimension. This finding reinforces the urgency of governance models that connect diplomatic ambition with local execution, which will be deepened in the following subsections.

4.2 NATIONAL CLIMATE GOVERNANCE GAPS

Despite relevant advances at the diplomatic and regulatory level, Brazilian climate governance still has structural limitations that hinder the execution of the goals established in the NDC and compromise the coherence between ambition and implementation. Such

gaps are manifested, above all, in the capacity for federative articulation, in the low degree of institutionalization of evidence-based management and in the territorial inequalities that mark municipal capacities.

The first gap concerns multilevel coordination. Although the federal government drives the international climate agenda, the execution of actions is predominantly local, especially in Brazil, where a large part of emissions is associated with territorial dynamics (land use, fires, disorderly urbanization). The lack of systematic cooperative arrangements between the Union, states and municipalities results in disjointed policies, with overlapping of actions and institutional vacancies.

Table 2

Gaps in Brazilian climate governance and their impacts on the territory

Governance Gap	Impact on the Territory
Insufficient federative coordination	Disconnection between national goals and municipal reality
Poor data governance	Lack of policy monitoring and remediation
Local climate finance gap	Difficulty in operationalizing plans and actions
Unequal socio-environmental vulnerability	Climate injustice and increased population risk
Limited institutional capacity in municipalities	Slowness and fragmentation of public enforcement

Source: Author.

A second weakness concerns technological and informational maturity. Climate governance requires systems capable of measuring emissions, modeling risks, monitoring targets, and assessing impact in a transparent and continuous way. However, many Brazilian municipalities still operate without data, without indicators and without integrated digital platforms, which compromises both the quality of decisions and accountability to society.

In addition, the challenge of climate finance remains, especially in municipal entities, which have low budgetary capacity to implement urban adaptation actions, green infrastructure, sanitation, sustainable mobility, and environmental enforcement. The absence of permanent financial mechanisms aggravates the dependence on sporadic transfers and isolated projects, making it difficult to continue policies.

Finally, socio-spatial inequalities, especially accentuated in the Amazon and urban peripheries, make climate justice an operational challenge. The most vulnerable populations are also the most exposed to extreme events, but less contemplated by investments and

resilient solutions. This asymmetry reveals that climate policy still does not reach those who need it most.

Given this scenario, it becomes evident that strengthening climate governance in Brazil requires investment in subnational state capacities, with a focus on technology, institutional intelligence, and social participation. COP-30 emerges as a strategic opportunity to review governance arrangements, modernize instruments, and foster territorial resilience, especially in the Amazon and in capitals with national prominence, such as Belém and Goiânia.

In summary, without local capacity to transform guidelines into concrete deliveries, Brazil runs the risk of remaining a potential climate power, but not in realization.

4.3 COP-30 AND THE AMAZONIAN LEGACY: THE ILLUSTRATIVE STUDY OF BELÉM (PA)

The choice of Belém do Pará as the host of COP-30 represents a historic milestone for climate governance by repositioning the Amazon as not only an environmental, but also a geopolitical, socioeconomic, and technological protagonist of the global ecological transition. The city, located at the interface between the urban and the forest, symbolizes both the challenges of Brazilian climate governance and its potential for leadership in sustainable development models.

In this context, the Amazon bioeconomy emerges as a strategic vector capable of combining biodiversity conservation with income generation, employment, and social inclusion. It is an economic paradigm based on the sustainable use of forest resources and on scientific-technological knowledge associated with sociobiodiversity, dialoguing with the care economy and with traditional knowledge that has historically sustained ways of life in the region. COP-30 offers a unique opportunity to structure clean production chains, value the standing forest and position the Amazon as a world hub for socio-environmental innovation.

However, for the bioeconomy to become a strategic reality and not just a discourse, it is essential to face structural deficits in the urban territory. Belém presents critical challenges in basic sanitation, mobility, drainage, housing, land regularization and waste management, factors that intensify vulnerabilities in the face of extreme events such as floods, heat islands and water contamination.

For these reasons, we understand that the legacy of COP-30 must include investments in resilient urban infrastructure, ensuring that climate adaptation advances in an integrated manner with the reduction of socio-spatial inequalities.

This dimension refers directly to climate justice. In the Amazon, traditional populations, indigenous people, quilombolas, riverside dwellers, and residents of urban peripheries are those who, in addition to contributing less to the climate crisis, suffer the most from its effects. Therefore, any policy linked to COP-30 must ensure effective social participation, fair sharing of economic benefits and protection of territories of community life. This implies recognizing that Amazonian climate governance cannot be built without the living Amazon and without the Amazonians.

The Belém study demonstrates that COP-30 is not just an event, but a turning point capable of redefining the Amazonian development model, expanding institutional, technological, and financial capacities for climate implementation. What is at stake is not the construction of an infrastructure for a meeting of heads of state, but the construction of permanent infrastructures for the future.

That said, the articulation between the Amazonian legacy and the innovative experiences of municipal governance already implemented in other Brazilian capitals, such as Goiânia, reveals ways to disseminate and accelerate the institutional strengthening necessary to achieve climate goals in the territory.

In summary, Belém becomes a showcase of the world, but it should, above all, become a reference for Brazil itself, inaugurating a new stage of national climate governance.

4.4 STRATEGIC CONNECTIONS WITH GOIÂNIA (GO)

The experience of Goiânia reveals relevant advances in strengthening municipal public governance through the integration between strategic planning, results-oriented budgeting, social participation and digital technologies. This perspective has allowed the municipality to structure a management model based on data, indicators and transparency, which positions it as a national reference in the practical application of instruments aimed at territorial climate action.

The implementation of integrated digital platforms, associated with the monitoring of government programs and projects, contributes to qualifying real-time decision-making, ensuring responsiveness and social control. Such mechanisms allow public managers to anticipate risks, monitor performance, and correct strategic directions, reducing waste,

increasing efficiency, and increasing the legitimacy of climate policies. The use of data thus becomes an essential institutional infrastructure, as recommended by international organizations for urban governance in the context of climate change (UN-Habitat, 2020; IPCC, 2023).

In addition to the technological dimension, Goiânia has sought to reinforce the democratic character of management by expanding mechanisms for citizen participation and social co-responsibility. This includes the active involvement of communities and local actors in defining public priorities, ensuring that government decisions reflect real needs of the territory. By bringing the decision-making process closer to the populations affected by the policies, it contributes to reducing inequalities and strengthening climate justice at the local scale.

The articulation between strategic planning, digital governance, budgeting, and social participation translates an advanced model of municipal management aligned with the requirements of the sustainable transition. These elements constitute fundamental pillars of the GIS Cycle, setting a concrete example of how climate governance can be institutionalized within the operational capacities of the Brazilian State, in a continuous and verifiable way.

This experience shows that strengthening local governance does not depend exclusively on large-scale structural transformations, but can be achieved through incremental, integrated, and intelligent institutional innovations. Goiânia's trajectory demonstrates feasible paths for other Brazilian cities, including Amazonian capitals such as Belém, to advance in the consolidation of governance systems capable of transforming climate goals into tangible results for the population.

In summary, the experience of Goiânia indicates that Brazil already has solid domestic references to subsidize the legacy of COP-30, supporting the construction of smart, resilient cities oriented towards sustainable public value.

4.5 GIS-COP30 FRAMEWORK: AN INTEGRATED MODEL FOR CLIMATE IMPLEMENTATION IN THE TERRITORY

The GIS-COP30 framework proposes an operational framework capable of connecting international climate commitments with the institutional reality of municipal governments, overcoming the gap between diplomatic ambition and public execution. Its design incorporates continuous flows of planning, monitoring, and social participation that ensure adaptive and responsive governance, driven by data and sustainable public value.

Figure 1

GIS-COP30 cycle: integrated climate governance model

Source: Author.

It is a multi-scale model, which recognizes the different levels of responsibility of climate governance: the environmental diplomacy of the Union, the regulatory and coordinating attributions of the states, and the implementation of policies at the municipal level, where environmental and social impacts are directly manifested. By positioning the municipality as a protagonist agent of climate implementation, GIS-COP30 reinforces the principle defended by the IPCC (2023) that climate resilience is built "from the bottom up", in permanent interaction with national capacities.

The operation of the model is structured in five integrated axes, organized in a cycle format fed back by an operational flow:

1. Local Climate Strategic Planning - Establishes objectives and priorities based on territorial diagnoses and alignment with national (NDC) and global (SDG, Paris) goals.
2. Data Governance and Analytics - Collection and processing of environmental, social, and economic data to inform decisions, monitor emissions, and anticipate risks.
3. Green Budget and Sustainable Finance – Direct linkage between climate goals and resource allocation, including climate fundraising and internationalized partnerships.

4. Social Participation and Climate Justice - Expansion of democratic control and co-production of solutions, ensuring equitable distribution of benefits and protection of vulnerable populations.
5. Monitoring, Transparency and Learning Cycle - Continuous indicators, auditing of results and institutional learning, allowing quick adjustments and maintaining public accountability.

The articulation of these elements transforms GIS-COP30 into an institutional infrastructure for climate implementation, capable of generating verifiable improvements in people's lives. Its originality consists in bringing the climate to the center of public governance, linking environmental policies to city management, in sanitation, mobility, housing, land use and government digitalization.

The model was designed to be replicable, adaptable to different municipal realities and applicable especially in regions with strong socio-environmental inequality, such as the Amazon. In this way, it constitutes an unprecedented Brazilian contribution to strengthening the capacities to implement the Paris Agreement, expanding the legacy of COP-30 and positioning the country as an international reference in the construction of smart, resilient cities committed to sustainable public value.

Finally, GIS-COP30 represents the operational link between climate geopolitics and municipal public management, converting global commitments into concrete and permanent actions in the territory.

5 CONCLUSION

COP-30 represents a historic opportunity to reposition Brazil as a protagonist of international climate governance, aligning its expressive diplomatic ambition with the capacity for territorial implementation, especially at the municipal level, where climate action gains concreteness. The present study demonstrated that the country has exceptional environmental conditions and important geopolitical capital, reinforced by the commitment made in the NDC 2024, but still faces structural limitations that prevent the full achievement of its objectives, among which the following stand out: weaknesses in federative coordination, low technological maturity, insufficiency of local climate financing, and socio-spatial inequalities that unevenly affect the distribution of risks and benefits of the green transition.

The article presented the GIS Cycle as a Brazilian institutional innovation, capable of linking planning, public budgeting, climate data, social participation and continuous monitoring, structuring the implementation of smart and resilient climate policies in the territories. The experiences analyzed, Belém as an Amazon showcase for COP-30 and Goiânia as a national reference in integrated digital governance, show that strengthening municipal capacity is a strategic condition for global goals to be converted into positive results for the most vulnerable populations, as advocated by international organizations such as IPCC (2023) and OECD (2021).

Despite its contributions, it is recognized that the study has methodological and empirical limitations. Concentrating the analysis on a municipal illustrative study reduces the comparative scope and requires additional tests in different Brazilian socio-environmental contexts, considering realities with less administrative capacity. In addition, political dimensions of the climate transition, such as institutional resistance, asymmetries in federative cooperation, and veto behaviors, require future analytical expansion, especially in the interactions between the Union, states, and municipalities.

Another central challenge that requires deepening is climate financing, an indispensable element for cities to implement urban adaptation actions, green infrastructure, environmental sanitation, sustainable mobility, and territorial monitoring programs. The consolidation of the Brazilian Emissions Trading System (SBCE), combined with the expansion of financial instruments such as international funds (GCF, GEF), *green bonds*, carbon credits and Brazilian sustainable taxonomy, is a decisive component for the economic viability of the transition.

The future research agenda foresees the preparation of a new article aimed exclusively at the analysis of climate financing mechanisms and their role in municipal governance, focusing on the operationalization of SBCE, innovative partnerships, and the strengthening of subnational capacities to capture, manage, and account for climate resources. It is expected that such developments will increase the empirical robustness of the GIS-COP30 model and contribute to guide its large-scale application.

In summary, COP-30 should not only be a diplomatic milestone, but an institutional watershed, capable of territorializing, digitizing, and democratizing climate action in Brazil. The strengthening of local state capacities, articulated with the GIS Cycle, makes it possible to transform international commitments into concrete policies oriented to sustainable public

value, ensuring that the country advances from potential climate power to climate leadership in realization.

5.1 FINAL CONSIDERATIONS AND CLIMATE TRANSFORMATION AGENDA

COP-30 inaugurates a decisive phase for Brazil to convert its diplomatic recognition into effective climate governance, structured in robust municipal capacities and guided by sustainable public value. The implementation of the GIS Cycle, by articulating planning, technology, financing, and social participation, demonstrates that it is possible to transform global goals into verifiable results in the territory, especially in cities that face deep socio-environmental inequalities and greater exposure to climate risks. The continuity of this research will seek to mature local climate financing instruments and strengthen the application of the GIS-COP30 model in different realities, contributing to the legacy of COP-30 being lasting, inclusive and territorialized. In short, it is about ensuring that the Brazilian climate transition is not only necessary, but inevitable, prioritizing social justice, institutional innovation, and urban resilience.

ABSTRACT

This article describes the history of the fishing community of Prainha do Canto Verde, located on the east coast of Ceará, and the struggle of its residents for the preservation of artisanal fishing and against the threats of real estate speculation. This struggle resulted in the community's transformation into an environmental conservation unit, and Prainha do Canto Verde was officially included in the list of Brazilian Extractive Reserves (RESEXs) in 2009. The status of Extractive Reserve did not prevent the continuation of predatory fishing or real estate speculation in the region, leading to internal disputes among its residents. This conflict was fueled by external agents whose tourism ventures were threatened by the creation of the RESEX and, more recently, by the arrival of vacationers who buy land and houses from fishermen at prices below market value. This confluence of factors and the ineffectiveness of environmental protection policies and agencies, such as the Chico Mendes Institute for Biodiversity Conservation (ICMBio), have threatened the development and continued existence of Prainha do Canto Verde as an environmental conservation unit. By describing this scenario, based on field research conducted with a group of native people, as well as data collected from documentary and bibliographic sources, the article aims to provide elements for reflection on the problems and impasses surrounding extractive reserves in Brazil and their environmental protection policies.

Keywords: Extractive Reserve. Conservation Unit. Traditional Communities. Environmental Preservation Policies.

RESUMO

O artigo descreve a história da comunidade pesqueira da Prainha do Canto Verde, localizada no litoral leste do Ceará, e a luta de seus moradores pela preservação da pesca artesanal e contra as ameaças de especulação imobiliária. A luta resultou na transformação da comunidade em unidade de conservação ambiental, e a Prainha do Canto Verde passou a configurar oficialmente na lista das Reservas Extrativistas (RESEXs) brasileiras em 2009. A condição de Reserva Extrativista não evitou a continuidade da pesca predatória nem da especulação imobiliária na região, fato que levou a uma disputa interna entre seus moradores, estimulada por agentes externos que tiveram seus empreendimentos turísticos

ameaçados com a criação da RESEX e, mais recentemente, pela chegada de veranistas que compram terras e casas de pescadores com preços abaixo do valor estimado pelo mercado. Essa confluência de fatores e a inoperância das políticas e órgãos de proteção ambiental, como o Instituto Chico Mendes de Conservação da Biodiversidade (ICMBio), têm ameaçado o desenvolvimento e a permanência da Prainha do Canto Verde enquanto unidade de conservação ambiental. Ao descrever esse cenário, com base em uma pesquisa de campo realizada com um grupo de nativos, além de dados coletados em fontes documentais e bibliográficas, o artigo objetiva trazer elementos para uma reflexão sobre os problemas e impasses que cercam as reservas extrativistas no Brasil e suas políticas de proteção ambiental.

Palavras-chave: Reserva Extrativista. Unidade de Conservação. Comunidades Tradicionais. Políticas de Preservação Ambiental.

RESUMEN

Este artículo describe la historia de la comunidad pesquera de Prainha do Canto Verde, ubicada en la costa este de Ceará, y la lucha de sus habitantes por la preservación de la pesca artesanal y contra las amenazas de la especulación inmobiliaria. Esta lucha culminó con la transformación de la comunidad en una unidad de conservación ambiental, y Prainha do Canto Verde fue incluida oficialmente en la lista de Reservas Extractivas (RESEX) de Brasil en 2009. El estatus de Reserva Extractiva no impidió la continuación de la pesca depredadora ni la especulación inmobiliaria en la región, lo que generó disputas internas entre sus habitantes. Este conflicto se vio alimentado por agentes externos cuyos proyectos turísticos se vieron amenazados por la creación de la RESEX y, más recientemente, por la llegada de turistas que compran terrenos y casas a los pescadores a precios inferiores al valor de mercado. Esta confluencia de factores y la ineficacia de las políticas y agencias de protección ambiental, como el Instituto Chico Mendes para la Conservación de la Biodiversidad (ICMBio), han puesto en peligro el desarrollo y la continuidad de Prainha do Canto Verde como unidad de conservación ambiental. Al describir este escenario, basado en una investigación de campo realizada con un grupo de indígenas, así como en datos recopilados de fuentes documentales y bibliográficas, el artículo pretende aportar elementos para la reflexión sobre los problemas e impases que rodean las reservas extractivas en Brasil y sus políticas de protección ambiental.

Palabras clave: Reserva Extractiva. Unidad de Conservación. Comunidades Tradicionales. Políticas de Preservación Ambiental.

1 INTRODUCTION

The conflicts and interests that threaten the preservation of the Extractive Reserve of the fishing community of Prainha do Canto Verde, located in the municipality of Beberibe-CE, almost 115 km from the capital Fortaleza, are the focus of this work. Created in 2009, as a result of the community's struggle for the preservation of the land and artisanal fishing, the Prainha do Canto Verde Reserve becomes the scene of internal conflicts, motivated by the interference of external agents and the ineffectiveness of policies to preserve the sustainable use of natural resources by residents. Structured in three parts, the article addresses the struggle for the conquest of the Reserve, the emergence of conflicts and the impasses that today surround its existence as an environmental and cultural conservation unit.

The Extractive Reserves (RESEXs) in Brazil were created in the early 1990s, after the assassination of political activist Chico Mendes, as an institutional response to the threats of territorial expropriation, environmental devastation and marginalization (economic, social and cultural) of traditional populations. In 2000, through Law No. 9,985/2000, the National Congress and the Federal Senate approved the implementation of the National System of Conservation Units (SNUC), the body responsible for the regulation and creation of RESEXs in the Brazilian territory.

In addition to approval and regulation, the SNUC is responsible for promoting the sustainable development of RESEXs through research, environmental education and ecological tourism activities. However, the insufficiency of inspection and structure, resulting from government budget limitations, and the pressure of illegal economic activities denounce the weaknesses of the policies for the preservation and development of the RESEXs. This scenario makes them at the mercy of the impasses and conflicts of interest that surround their dynamics and existence.

The research data were produced from the memory and report of a group of residents who acted in the struggle for the implementation of the RESEX, participated in its developments and today experience — both as subjects and victims — the consequences of the impasses involving the disputes of interests around Prainha do Canto Verde as an environmental conservation unit. By describing this history from the perspective of the natives, and including bibliographic and documentary sources, the work aimed to reflect on the possibilities and limits of the policies for the preservation of Extractive Reserves in Brazil.

2 THEORETICAL FRAMEWORK

From a historiographical balance of the existing impasses in the community, which emerged after its decree as RESEX, a gap was identified. Although two studies partially dialogue with the proposal of this research, they are not sufficient to overcome this shortcoming. Such works are: *Memorial de Canto Verde: Knowledge of life and struggle of the people of the sea*, by Márcia Ribeiro (2017), and *Tourism and solidarity economy*, by Viviane Medeiros (2019). Although relevant, they do not focus on the contemporary impasses related to the RESEX in the fishing community. Nevertheless, they will be used as a reference to enable comparative analyses and theoretical crossings that strengthen the proposed discussion.

In order to adequately address the analyzed reality, we adopted a theoretical framework selected based on the relevance of its concepts in relation to the object and theme investigated. In this context, we consider it appropriate to mobilize the following concepts: Territory, according to Milton Santos (1984), understood not only as form, but as used territory, being the result of the articulation between objects and actions and the expression of human and inhabited space; Traditional Community, which, according to Carmo Thum (2017), comprises a social group that establishes historical links with a physical space, transforming it into a collective territory through the work and permanence of its founders; and Collective Memory, from the perspective of Maurice Halbwachs (2013), which transcends the individual sphere, since the memories of each subject are constituted in relation to the social group to which they belong.

3 METHODOLOGY

In methodological terms, the work was based on the perspective of Oral History (Cardoso, 2010), adopting the semi-structured interview as the main instrument for data production. The interviews were conducted with a group of native residents who, in addition to having participated in the struggle and creation of the Prainha do Canto Verde RESEX, today occupy different positions on the board of interests and perspectives in relation to the problems that the community faces as an environmental conservation unit. In this sense, the interviewees are understood as the main historical agents, and the fishing community, as the social space where their experiences are constituted.

The interviews, conducted in 2024, were recorded (with an average duration of 60 minutes), subsequently transcribed, and then carefully analyzed, in order to ensure the fidelity

and integrity of the discourses obtained. For the proper management of this type of source, essential resources were used, highlighting the use of voice recorders and the adoption of a field diary to record the observations and reflections of the researchers. In addition to the field data, the work involved bibliographic and documentary research.

4 ANALYSIS AND DISCUSSION

4.1 THE STRUGGLE OF THE COMMUNITY OF PRAINHA DO CANTO VERDE FOR THE RESEX

According to the reports of the residents themselves, the first inhabitants of the area began to occupy the territory in the nineteenth century, during the period of the liberation of the enslaved. These individuals were emancipated in 1870 by a plantation owner from a neighboring village, today called Campestre da Penha. Regarding the formation of the community, the information provided by Galdino (2010, p. 29) can be observed:

The first families of the community were formed by the couples: Joaquim Fernandes do Nascimento Girão – "Caboclo" (1853-1949), who married Maria da Conceição "Filismina", and "Zé Cariri", who married Mrs. "Chica Benvinda", sister of Joaquim Caboclo. Together, they built the first house in the place, a mud house, which was inhabited by the twelve children generated by the first couple who helped to compose the base of the community's family tree. Later, other families related to Zé Cariri appeared; as well as the Baratas and Raimundo Caboclo who had a son named Raimundo Canto Verde, who lived in the neighborhood and constantly came to fish. Then, as a result of the large amount of "green", at the time existing in the place, he started to call it Prainha do Canto Verde, which gave the community its name.

The locality appears as an environment conducive to the survival and well-being of those who lived there. From the tranquility and natural beauty to the contribution of the sea, which, through fishing, provided food of animal origin and, consequently, collaborated for the sedentarization in that space. These elements made the community attractive to other families, such as the Quinins, Firminos, Correias and Dantas. With the development of community life, problems related to coexistence and collective survival arose. At that time, families were numerous (with an average of fifteen children) and faced difficulties in maintaining the support of the members. Due to the lack of nutritional support, many children did not survive the first months of life. In addition, the lack of educational institutions or actions contributed to the maintenance of illiteracy in a large part of the population. Those who

showed greater interest in education sent their children to the neighboring community of Jardim, where they were initiated in their studies through Professor Joaquim Nel.

In the late 1970s and early 1980s, personalities emerged driven by speculative plans, possibly aimed at developing sun and beach tourism of great proportions. The residents of the community received news that an individual named Antônio Sales Magalhães claimed to have bought the area corresponding to the community of Canto Verde. At that moment, the first processes of mobilization and resistance of the residents in defense of their territory and the right to remain in the place began. Through discussion circles, residents collectively sought strategies and alternatives to face the presence of the intruder. As one community leader recalls:

[...] there was always a boy here who passed by my house, who was Til³, then he said that they were going to allot here and we didn't know anything, you know [...] Around 1980 I saw a man there, I still remember it as if it were today, with those measuring machines [...] then we heard that they were going to sell the land on the hill, then we immediately realized that it could be Prainha. Then at night at school (MOBRAL) there was a teacher (Vilanir) who had a sister (Inez) there at the Defense Center, in the Archdiocese of Fortaleza, defense of human rights and that they helped the poor. We wrote a letter asking for support and people started coming. (Retired, native, and female leader, 67 years old)

Professor Vilanir, through her sister Maria Inez - who at the time was active in the Grassroots Ecclesial Movement (MEB) and in the Center for the Defense and Promotion of Human Rights (CDPDH) - established a fundamental contact that brought external support to the community in its struggle for possession of the territory. In this context, a team from the Archdiocese of Fortaleza, under the leadership of Bishop Dom Aluísio Lorscheider at the time, promptly made a presence in the fishing village with the objective of contributing to the organization and analysis of territorial conflicts. This meeting marked the beginning of an alliance that would be strengthened over time, joining efforts in defense of the community. It is also noteworthy the significant role of CDPDH employees in the formulation of strategies to face real estate speculation. On many occasions, it was these agents who provided the necessary support for the meetings, playing a crucial role in community resistance.

Thus, the support network built between the community and the Archdiocese not only played a fundamental role in the legal action, but also provided the inhabitants of Canto Verde

³ Native and historical protagonist registered by the real estate company as a witness in the process of adverse possession of the lands.

with valuable opportunities to exchange experiences. These interactions occurred both internally - strengthening the ties between the residents themselves - and externally, with other communities in Ceará that faced similar challenges and organized themselves through the Base Ecclesial Communities. The sharing of these experiences, anchored in the struggle against oppression, territorial loss and the defense of local culture and rights, strengthened the collective identity and contributed significantly to the maturation of community organization.

One of the most significant events in the development of collaborations between communities facing similar challenges took place between September 10 and 14, 1985, during the XIII Rural Seminar, promoted by the Archdiocese of Fortaleza, with the presence of Archbishop Dom Aloísio Lorscheider. This event, of a religious nature, brought together most of the Basic Ecclesial Communities (CEBs) of Ceará, including groups from the mountainous region, the hinterland and the coast, as well as representatives from other states. It was a milestone in the consolidation of the work of community organization, providing a space for the exchange of experiences and the strengthening of bonds. From there, Prainha do Canto Verde was officially included in the CEBs network.

Over the years, resistance has strengthened, leading to awareness of the need for a more effective institutional framework. It was in this context that, after several meetings and discussions, the natives created the Association of Residents of Prainha do Canto Verde on April 16, 1989. The recognition of the Association has become crucial for strengthening the defense of legal and juridical interests related to land protection processes.

In 1987, two years before the formalization of the Association, Prainha do Canto Verde received a visit from a Swiss, whose trajectory led him to meet the community during a trip to Jericoacoara. Upon arriving, he found a scenario of active mobilization, in which residents were already organized and engaged in the struggle to defend their territory and their rights. This first contact was decisive for his later involvement with the cause of Prainha do Canto Verde, as he himself reports:

I stayed at Til's house, where I had the opportunity to get to know the community and the group that was organizing to form the residents' association. They were receiving support from the Center for the Defense and Promotion of Human Rights, with the support of the Archdiocese. It was in this environment that I met several people and began to take a deep interest in the history of the community. (Swiss, 82 years old)

Among his several visits to the community, in 1992, the Swiss married a local resident and established permanent residence in Prainha do Canto Verde. Its permanence marked the beginning of a new phase in the process of community struggle and organization, which further strengthened the initiatives aimed at the defense of the territory and the sustainable development of the fishing village. In addition to his direct involvement in local articulations, the initiative to create a fish warehouse came from him, a proposal that, after extensive debate, was approved in a community assembly. The implementation of this project had the financial support of Swiss friends, consolidating itself as a milestone in strengthening the economic autonomy of the community.

Verde faced another problem: the recurrent presence of the *escafandristas*, characterizing a kind of "maritime land grabbing". It is worth mentioning that, since the sea was the main source of livelihood for the community, predatory fishing became a direct threat to local survival. Faced with the growing shortage of lobster due to the illegal activities of these divers, the need for a forceful response has emerged. That answer came on April 4, 1993, when four fishermen embarked on a fearless journey to Rio de Janeiro as a protest against predatory lobster fishing. The crossing, which lasted 74 days, aimed to draw the attention of public opinion to the neglect of the governments (federal, state and municipal) in relation to the Peoples of the Sea and to denounce the predatory fishing that devastated practically the entire coast of Ceará.

The "SOS" symbol stamped on the vessel's sail reinforced the emergency nature of the situation and the need for immediate intervention. The protest achieved wide repercussions, pressuring government officials to direct greater attention to artisanal fishing. To understand the relevance of this mobilization, it is essential to highlight that, during the crossing of the raft, the idea of creating the Terramar Institute was conceived, which had the active participation of the Swiss. The Institute was created with the purpose of strengthening its work with the community, with an emphasis on the areas of fishing and education. In the following years, it consolidated itself as a fundamental agent in expanding knowledge about the daily life of fishing communities, contributing to the improvement of their strategies of resistance and sustainable development.

On June 5, 2009, Decree No. 0-002 granted Prainha do Canto Verde inclusion in the list of Extractive Reserves. With the implementation of this category, the community obtained the ability to control real estate speculation, curb irregular constructions and optimize the inspection of predatory fishing, making the process faster and more efficient. The Chico

Mendes Institute for Biodiversity Conservation (ICMBio) became the body responsible for this supervision, in charge of ensuring harmonious interaction with traditional communities and reinforcing their intrinsic relationship with nature.

4.2 COMMUNITY VULNERABILITIES TO EXTERNAL INTERESTS

The initial expectation was that the implementation of the RESEX would bring a phase of stability to Prainha do Canto Verde. However, this scenario proved to be different from reality, since environmental policy generated a new conflict, now of an internal nature. After overcoming the initial challenges related to territorial speculation, the community was faced with a new battle, resulting from the implications of the RESEX, a fact that introduced an additional layer of complexity to the already challenging context experienced by the residents.

After the transformation of the village into a conservation unit, dissatisfaction and conflicts of interest arose around the preservation policy, given that the residents' expectation of change, fueled by the implementation of the RESEX, was not met. As a result, the credibility of part of the natives began to dissipate in relation to the gains they would have with the conservation unit. These discontents are associated with a set of factors that, even in the face of the testimonies, are not yet satisfactorily evidenced.

Among the main aspects that contributed to the scenario of dissatisfaction, the following stand out: the persistence of predatory fishing; allegations of favoring part of the residents to the detriment of others; impacts on external owners; and the emergence of speculative behavior on the part of external agents interested in taking advantage of the region's natural attractions. Each of these elements has played a significant role in shaping new tensions, both internal and external.

The first factor, referring to the persistence of predatory fishing, proved to be a great disappointment for the community, as it did not meet the great expectations of the residents in relation to the most sensitive aspect for the community. Despite the intense struggles to combat this illegal practice, such as the emblematic trip of the Jangada "SOS" to Rio de Janeiro (mentioned above), the implementation of the RESEX has not solved the problem of predatory fishing, which continues to threaten the traditional way of life of local fishermen. This scenario persists due to the failure of effective enforcement and the continuation of predatory practices that compromise the sustainability of marine resources, which are essential for the community's livelihood. The absence of concrete changes generated

widespread frustration among fishermen, who hoped that the RESEX would provide greater protection for natural resources and create favorable conditions for artisanal fishing.

The second component concerns the allegations of favoritism, since part of the community began to express dissatisfaction when they perceived benefits directed to members linked to the Residents' Association (known as the "old" association). This alleged favoritism generated distrust and contributed to the weakening of social cohesion in the village. The position of the group that was against the implementation of the RESEX was strengthened from the perception that the benefits of the Reserve were not distributed equitably. For these residents, the management of the Reserve favored certain groups or specific interests, generating a generalized feeling of exclusion and inequality in access to the advantages promised by the environmental policy. This scenario fueled a discourse of discontent and intensified criticism of the way the RESEX was managed. The following exposition illustrates this point:

If it's a reserve, it was supposed to have preserved it even as they said, it wasn't supposed to let the people do what they did, then, like, they have a position more for some than for others. If it's to be a reserve it's not in the right rule. The projects when it comes is more on the other side than for everyone in the community, then these little things we put together, together, we don't support, at least I don't support them. (1st secretary of Associação Nova, 55 years old)

In addition, the feeling that the initial promises - such as the improvement of living conditions and the sustainable preservation of the territory and fishing - were not fully fulfilled favored a growing dissatisfaction among the residents. For the discontented, the RESEX not only failed in its distributive role, but also contributed to accentuating internal divisions in the community, creating dynamics of inequality and exclusion. On the other hand, the group that supported the RESEX highlighted the projects developed as a result of its creation, as well as those that already existed before the implementation of the environmental policy and that were maintained or strengthened by the Reserve. A relevant example is the "Geração Muda Mundo" project, implemented in the community in October 2007, with the objective of fostering entrepreneurship among young people.

In addition, the president of the "old" Association, in his interview, stated that the community is contemplated with new projects, which are widely publicized so that all residents have access.

The third aspect corresponds to the impacts on external landowners. With the implementation of the RESEX, some external agents were directly affected, as is the case of a businessman with long-standing property in the village, whose land was included in the delimitation of the Reserve. Feeling harmed by the restriction on the use of his property, this agent began to support and encourage the group of dissatisfied residents, a fact that contributed to the strengthening of new foci of resistance to the RESEX policy within the community.

The delimitation of the area of the Reserve would have made the businessman's plans to carry out real estate speculation ventures unfeasible, leading him to seek support among disgruntled residents for the formation of a new association: the Independent Association of Residents of Prainha do Canto Verde, which later became known as "new association". As pointed out by the pro-RESEX group, the creation of the new association would have been promoted by this businessman as a strategy to contest the restrictions imposed by the Reserve. The version suggests that the businessman, motivated by his own interests, would have sought to "buy" the support of the residents, spreading the idea that the inclusion of the land area in the Reserve would be harmful to the community. In this way, the creation of a new organization marked the reconfiguration of the community scenario, which, with differentiated proposals, began to fight for the reversal of the condition of the village as an environmental conservation unit.

To strengthen his position, the businessman began to act through a local resident who, due to his native status, would enjoy greater trust and legitimacy among dissatisfied residents. Next, let's see the testimony of a resident of the old association:

That's where it started, at that time the businessman already lived here, we learned that he secretly started to create a small group. First, because there the owner of the mercantilism there, who is responsible for finding employees and is responsible, works for this businessman, so he was the one who started to win people. Some say it's deceiving, he has been deceiving some people, but many have fallen for him, but as we already knew the story, we already came from a long history, we didn't fall. That's when he started to say that it wasn't good, that the fishermen didn't accept it. (Native, fisherwoman, 43 years old)

This native, who acts as an intermediary between the interests of the businessman and the local community, currently holds the position of president of the Independent Association of Residents. Next, let us see the version of the facts from the perspective of this intermediary:

So the association was not founded directly by him as they say, now he is a fundamental part of the community, to this day. There are three ambulances donated by the businessman. People say: the businessman split the community, no! We were the ones who split the community [...] he took advantage of the split. (President of the Independent Association of Residents, 39 years old).

According to the current president of the new entity, its foundation took place even before the implementation of the RESEX, more precisely between the years 2004 and 2005. According to him, the association emerged as an alternative to enable resources for social projects, given the lack of support from the Residents' Association for the release of these funds.

Finally, the fourth and final element of internal conflicts refers to the growing speculative character on the part of external agents, interested in the natural beauty of the place and in the desire to acquire land in a community that is still little explored. This movement awakened in local residents the idea of profiting from the sale of land. However, when they were prevented from carrying out negotiations, given the restrictions imposed by the RESEX, discontent increased among residents who were already against the permanence of the Reserve.

This dissatisfaction was supported by a shared consensus on the part of the community: the belief that the families, at the time of the creation of the RESEX, would have the right to two portions of land - one intended for housing and the other for a point of commerce. This rule, which, according to them, had been created as part of an internal agreement of the community during the implementation of the RESEX, began to be demanded, contradictorily, precisely by the residents who expressed their opposition to the permanence of the village as a conservation unit. Thus, with the arrival of external agents interested in the acquisition of land, the residents wished to enjoy a right created, according to them, by the Reserve, which, however, compromised their very existence.

Without having the right of legal possession of the land or the authorization of ICMBio, some residents began to negotiate land in parallel at derisory prices, far below the value practiced in the coastal strips of the region. This scenario stimulated the accelerated growth of the speculative wave. As a result, there was a significant increase in the demarcation and fencing of land by residents. The old "story of the two points of land" lost meaning and control on the part of the Reserve, since the unbridled search for some pecuniary benefit led the natives not only to demarcate the lands on their own, in a disorderly way, but also to sell them at low cost, transforming the territory into a space disputed by whoever arrived first.

The most benefited from this behavior were the outsiders, who not only bought land at derisory prices, but also, in some cases, resold it to other external agents, for values significantly higher than the amount paid to the natives. As the native residents noticed the growing interest of outsiders in acquiring properties, the land gradually began to be more valued, although it remained below the estimated price for the other coastal strips in the region.

These four factors, therefore, caused and accentuated the internal split in the community, culminating in the formation of two distinct groups. On the one hand, the Association of Residents of Prainha do Canto Verde, which played a decisive role in resisting the initial threats and in the process of implementing the RESEX, recognized for its historical relevance and today popularly called "the old" or "old" association. On the other hand, the group of dissatisfied people, who, with the support of the aforementioned external agent, created the Independent Association of Residents, known as the "new" association, with the aim of articulating their demands and claims. Since then, this division has marked the community dynamics, which generates tensions and makes it difficult to build the consensus necessary for the participatory management of the Reserve.

It is important to record the main objectives defended by the group that opposes the RESEX, represented by the "Nova" Association. Understanding these goals is crucial to outline the motivations and foundations of criticism of the Reserve's environmental management policy, revealing the specific demands of this segment of the community.

The first objective of the "new" association is to ensure that residents obtain formal title to their land. This demand is based on the perception that legal land tenure is an essential step to ensure legal certainty and strengthen community autonomy. With the title in hand, residents would have greater stability and conditions to promote local development in a more sustainable and independent way. As the president of the Independent Association of Residents reports: "At the time we won from Henrique Jorge, they were supposed to have distributed the land titles of each resident and it was not done". (president of the Independent Association of Residents, 39 years old).

The second point is related to the demand that the Reserve become a more active instrument of public policies that directly benefit the community. The narrative of the "new" association suggests that, in the current model, the RESEX has imposed bureaucratic and structural barriers that hinder or make unfeasible initiatives that could promote local development. However, there is still a significant gap in relation to the concrete paths or

mechanisms for achieving these goals. There is no clarity about which strategies, resources or legal and legal instruments would be used to make the demands presented viable. This lack of definition reflects the absence of structured planning or effective strategic articulation, which reinforces the need for a more robust process of internal organization of the entity.

On the other hand, the "old" association sustains the narrative of the preservation of the RESEX, justifying its defense in environmental preservation and the sustainable development of the village, in addition to other aspects. A second point of conflict with the "new" association refers to the territorial scope of the RESEX. While the "ova" association argues that the scope of the RESEX's preservation rules should be restricted to the maritime area - and that, according to its members, this would have been the initial agreement for its implementation -, the "old" association and its adherents maintain that the original document always contemplated both the maritime and terrestrial areas. Let us see what the current president of the "old" association said:

The biggest banner of the residents' association was the land, the sea was something we were already discussing, the sea we were already working on the fishing agreements and everything, but the focus was never on the sea, all life was the land, so we were never going to ask for a RESEX just for the sea, we were going to ask for the land, The land was the main one, the land was the main one. You can imagine, why would we ask for a RESEX only by sea, if our main purpose of Prainha was the struggle of the land. This was distorted because the businessman realized that he was going to lose possession of it. The purpose of the new association was not to question the land issue, it was the businessman who created it because it would affect his territory, he who creates the new association. There was an intention behind it, that a part of the residents were "used". Today they are seeing that they are losing, because the big invasion of Prainha that is happening, the big culprit was the new association and the businessman, who divided the community, and it was not easy to maintain and to this day as we are maintaining. So it was made with the intention of defending the businessman (President of the old Association. 46 years old)

Also according to the president of the "old" association, they are not opposed, in principle, to the creation of new associations in the community. The central point of the clash lies in the fact that this new entity proposes measures that, according to him, disrespect the socio-cultural dynamics of the community and the fundamental principles that govern an Extractive Reserve. Therefore, with regard to the objectives of this perspective, the members of the "old" association and their supporters defend the preservation of the RESEX in its initial form, believing that, little by little, the norms concerning its full implementation will be fully implemented by the responsible bodies. This perspective includes the belief that vacationers

who have arrived in the community will be gradually expelled, re-establishing local control over the lands.

In the midst of the disputes between these two sides, we perceive a point at which the residents converge. This aspect concerns the bureaucracy imposed on residents to obtain essential services (such as a point of light), understood as something resulting from the specific norms that configure a RESEX and which, so far, have not been properly regulated. This contributes to the dissatisfaction of residents, especially those who are against their permanence.

I am against the Resex because of this impact it has, which prohibits native people from making a reform, increasing something, you have to ask them for permission. My revolt is more because of this energy business, which we want to put energy into but can't, it's embargoed. If you have a light to put on, if you call Enel, tell ICMBio to ask for authorization. Then because of this whole thing I get disgusted, I'm not going to support something like this that I see is not right. (1st secretary of Associação Nova, 55 years old)

Residents who are supporters of the "old" association, who support the RESEX, are also impacted by this process and express their dissatisfaction, as expressed by one resident:

I support the idea of the extractive reserve for all that it represents: environmental protection, appreciation of traditional communities and a sustainable life model. However, it is difficult not to feel deeply unhappy with the bureaucracy and the delay in having access to something as basic as electricity. Even living in a place where preservation is a priority, you can't ignore the impact that the lack of structure has on people's lives. (Native, 26 years old)

Despite the access to the testimonies recorded here, the scenario of conflicts and narratives around the RESEX is still difficult to understand. As previously exposed, the lack of clarity reflects the multiplicity of existing interpretations and perspectives, with each group constructing narratives according to its own interests and experiences. The fact is that internal conflicts and the absence of effective articulation keep the community in a state of uncertainty, which needs to be overcome so that residents can not only preserve their identity, but also build a more inclusive and sustainable future for all.

4.3 THE DIRECTION OF THE EXTRACTIVE RESERVE: NAVIGATING IS NECESSARY, STAYING IS A CHALLENGE

The impasse in Prainha do Canto Verde is so deep that the community finds itself in constant dependence on jurisprudence, with legal disputes that shape the local dynamics. The current situation is characterized by a true "war of lawsuits", marked by legal clashes between the two groups and by the continuous questioning, by the community, of the actions of ICMBio. This occurs especially when the agency prevents or hinders local residents from accessing new points of light as a reprisal for the improper sale of land to external agents.

In this context, it is questioned about the role that ICMBio, as a federal agency and potential mediator of conflicts, has played in the community. In some episodes, the institution has acted contrary to this role, being perceived not as an agent of mediation, but rather as an institution that adopts an intimidating and sometimes repressive posture, a fact that further aggravates polarization and conflict in the region. There are reports, especially from the dissident group linked to the New Association, that the agency engages in arbitrary and authoritarian behavior when, for example, it confiscates the construction tools of local residents who work as bricklayers in the homes of external agents and imposes fines on them for the alleged illegal work activity against the RESEX. It should be noted that the activity of bricklayer, which most of the residents learned to develop in parallel with fishing, became, according to the testimony of the natives themselves, the second main income or the complementary income of the community.

It is understood that the primary function of the agency is the management, inspection and control of preservation areas. However, considering the specific context of Prainha do Canto Verde, where speculation is already a consolidated reality and there is no viable solution in sight, it becomes pertinent to adopt a more dialogical stance. In this sense, it is suggested that the entity assume a mediator role, promoting debate between the parties involved and seeking alternatives that minimize socio-environmental conflicts while a definitive solution is not established, which may require more incisive measures.

Another aspect to be considered, still in relation to the local source of income of the community, and which makes the situation of the RESEX even more delicate, concerns the job opportunities brought about by the growing presence of outsiders in the community. Although these opportunities are not enough to guarantee local socioeconomic stability, the increase in commerce (small supermarkets, restaurants, sale of handicrafts) and the hiring of local labor (in domestic activities and gardening) today represent a source of income for

residents in the face of the scarcity of other economic activities in the region. Even people who are favorable to environmental policy and maintain greater proximity to the "Old" Association, also act as bricklayers, in commerce and in other activities linked to the new local dynamics, which makes the RESEX scenario even more complex.

It is also worth highlighting the changes in the life expectancy of the new generation of local residents, who, for the most part, do not identify with the profession of fisherman, due to the harsh working conditions that the activity demands, and do not necessarily want to follow the fishing tradition. Expanded access to education has provided many fishermen's children with the completion of high school and, in some cases, entry into higher education. This scenario has generated new professional perspectives and changed the socioeconomic dynamics of the community, directly impacting the continuity of traditional fishing practices.

In the midst of this scenario, in 2024, the Management Plan for the Prainha do Canto Verde Extractive Reserve (RESEX) was approved, through ICMBio Ordinance No. 554, of February 22, 2024. This action, which also had the active participation of the "Nova" Association, presents itself as a possible point of convergence between the divergent interests. The Management Plan is a fundamental instrument to ensure the sustainable management of the territory and the maintenance of the ways of life of traditional populations. However, the question arises as to to what extent it will be effective and whether it can really act as a catalyst to unite the divergent parties for the sake of community preservation and development.

Although the Management Plan suggests the possibility of a new horizon for the RESEX, the persistent impasse, marked by the absence of dialogue and a mediating agent, raises questions about its real effectiveness in overcoming this conflict, especially with regard to two points: 1. To what extent will the community be able to **appropriate** this instrument as a **protagonist** in the search for solutions? 2. Will the Management Plan be sufficient to reverse the situation of impasse and promote a collective understanding? Such questions offer opportunities for future research, allowing a more in-depth analysis of the developments and impacts of the Plan.

5 CONCLUSION

It is important to note that an Extractive Reserve aims not only to protect the territory, but also to ensure the cultural continuity and way of life of a traditional community. It should be noted, however, that culture is not static, especially when inserted in a context close to

urban areas, where external influences are constant and social and economic transformations occur in a natural and accelerated way. In this sense, the community itself is undergoing changes, driven by new demands, aspirations and expectations, especially among the younger generations.

Given this scenario, it is necessary to ask: what does it mean, in fact, to preserve? Preservation cannot be understood as the freezing of a culture in time, preventing its evolution according to the needs and desires of its members. On the contrary, preservation must be understood as the dynamic continuity of cultural identity, collective memory and the well-being of the community, maintaining a constant dialogue with social and economic transformations. This includes the incorporation of contemporary elements and respect for the expectations of the new generations, who often do not see fishing activity as the main source of income, seeking other job opportunities and ways of life.

This debate leads to reflection on the strategic role of ICMBio as manager of the RESEX. Considering the specific context experienced by the community, the hypothesis is raised that the agency, in addition to its role as an inspector of environmental standards, may be able to assume an expanded role as a cultural mediator, facilitator of dialogue and articulator of public policies that promote the socioeconomic sustainability of the community. This would include fostering spaces for negotiation and clarification, enabling an environment of constructive conversations that contemplate both environmental preservation and the economic and social needs of residents.

By articulating cultural preservation with sustainable development, ICMBio will be contributing to the construction of inclusive solutions adapted to the current demands of the community. If these points continue to be neglected, the impasse will tend to perpetuate itself, which will compromise the effectiveness of the preservation policy and the well-being of the local community. Thus, it becomes essential to promote a continuous and participatory dialogue, which allows the community to be a protagonist in the construction of its future, ensuring not only the preservation of its territory, but also the continuity of its cultural identity in constant transformation.

ABSTRACT

The Industrial Revolution was one of the most significant and transformative events in human history, and its importance lies in the fact that it fundamentally altered the way societies produce, live, organize themselves, and relate to the world. The Digital Revolution, on the other hand, is a driving force in 21st-century society, which includes the emergence of disruptive technologies. While the former mechanized the production of goods, the latter is automating and digitizing information, communication, and knowledge, which profoundly impacts the lives of students seeking their place in a constantly transforming job market. It is in this context that this study, based on a literature review, seeks to observe how the changes that have occurred from the Industrial Revolution to the Digital Revolution can be addressed in the Life Project from an integrative and transversal perspective, based on the construction of three reflective axes: (i) observing the paths taken from the Industrial Revolution to digital disruption; (ii) reflecting on how the Life Project can contribute to the subjectivity of students in light of an integrative and transversal approach; (iii) To work, using frameworks, on the theme of Industrial Revolutions, technological innovations and their impacts on society and education. Authors such as Bauman (2001), Delors (2003), Luger (2013), Santaella (2003), among others, discuss the proposed themes from different perspectives. It is concluded that the Life Project is the ideal space to address concepts involving the students' professional future, helping them to identify their natural aptitudes and passions, which are the basis for lasting and satisfying professional choices.

Keywords: Industrial Revolution. Digital Revolution. Disruptive Technologies. Life Project.

RESUMO

A Revolução Industrial foi um dos eventos mais significativos e transformadores da história da humanidade e, a sua importância, reside no fato de ter alterado fundamentalmente a maneira como as sociedades produzem, vivem, se organizam e se relacionam com o mundo. Já a Revolução Digital, é uma força que impulsiona a sociedade do século XXI, o que inclui a emergência das tecnologias disruptivas. conhecimento, o que impacta profundamente a vida dos estudantes que buscam o seu espaço num mercado de trabalho em constante transformação. É nesse viés que, este estudo, pautado em revisão de literatura, busca observar como as mudanças ocorridas desde a Revolução Industrial até a Revolução Digital podem ser abordadas no Projeto de Vida a partir das perspectiva integrativa e transversal, tendo como base a construção de três eixos reflexivos: (i) observar quais foram os caminhos percorridos desde a Revolução Industrial até a disrupção digital; (ii) refletir sobre como o Projeto de Vida pode contribuir com a subjetividade dos estudantes à luz de uma abordagem integrativa e transversal; (iii) trabalhar, a partir de frameworks, a temática sobre as Revoluções Industriais, inovações tecnológicas e seus impactos na sociedade e na educação. Autores como Bauman (2001), Delors (2003), Luger (2013), Santaella (2003), dentre outros, dialogam a partir de diferentes perspectivas sobre os temas propostos. Conclui-se que, o Projeto de Vida é o espaço ideal para abordar conceitos que envolvem o futuro profissional dos estudantes, auxiliando-os a identificar suas aptidões naturais e paixões, que são a base para escolhas profissionais duradouras e satisfatórias.

RESUMEN

La Revolución Industrial fue uno de los eventos más significativos y transformadores de la historia de la humanidad, y su importancia radica en que alteró fundamentalmente la forma en que las sociedades producen, viven, se organizan y se relacionan con el mundo. La Revolución Digital, por otro lado, es una fuerza impulsora en la sociedad del siglo XXI, que incluye el surgimiento de tecnologías disruptivas. Mientras que la primera mecanizó la producción de bienes, la segunda está automatizando y digitalizando la información, la comunicación y el conocimiento, lo que impacta profundamente la vida de los estudiantes que buscan su lugar en un mercado laboral en constante transformación. Es en este contexto que este estudio, basado en una revisión bibliográfica, busca observar cómo los cambios ocurridos desde la Revolución Industrial hasta la Revolución Digital pueden abordarse en el Proyecto de Vida desde una perspectiva integradora y transversal, a partir de la construcción de tres ejes reflexivos: (i) observar los caminos recorridos desde la Revolución Industrial hasta la disrupción digital; (ii) reflexionar sobre cómo el Proyecto de Vida puede contribuir a la subjetividad de los estudiantes a la luz de un enfoque integrador y transversal; (iii) Trabajar, mediante marcos de referencia, sobre el tema de las revoluciones industriales, las innovaciones tecnológicas y su impacto en la sociedad y la educación. Autores como Bauman (2001), Delors (2003), Luger (2013), Santaella (2003), entre otros, abordan los temas propuestos desde diferentes perspectivas. Se concluye que el Proyecto de Vida es el espacio ideal para abordar conceptos relacionados con el futuro profesional de los estudiantes, ayudándolos a identificar sus aptitudes y pasiones naturales, que son la base de decisiones profesionales duraderas y satisfactorias.

Palabras clave: Revolución Industrial. Revolución Digital. Tecnologías Disruptivas. Proyecto de Vida.

1 INTRODUCTION

The Industrial Revolution was a period of great technological and social transformations that began in England, from the second half of the eighteenth century (around 1760). It marked the transition from artisanal and agricultural production processes to large-scale industrial production, through the introduction of machinery and the use of new energy sources. The Digital Revolution, on the other hand, is the term used to describe the profound and accelerated change in society, economy, and culture caused by the proliferation and adoption of digital technologies.

The connection between the Industrial Revolution and the Digital Revolution is seen as a continuation and intensification of the transformations initiated by the former. Both represent waves of deep socioeconomic movements driven by technology. Both the Industrial and Digital Revolutions share transformative characteristics, such as: increased productivity, new sources of power, structural change, reduction of barriers, among other specificities.

The Life Project, whether in a disciplinary way or a cross-cutting theme, has as its main focus to support and guide students in the construction of a plan for their future, addressing the dimensions that range from self-knowledge and self-esteem to the social and professional relationship with the world. Therefore, the contexts in which they followed during the Industrial and Digital Revolutions become fertile ground when addressed, especially when they can be contextualized and connected with the reality of each student.

It is under this dynamic that this study seeks to observe how the changes that have occurred since the Industrial Revolution to the Digital Revolution can be approached in the Life Project from the integrative and transversal perspective, based on the construction of three reflective axes: (i) to observe what were the paths taken from the Industrial Revolution to the digital disruption; (ii) reflect on how the Life Project can contribute to the subjectivity of students in the light of an integrative and transversal approach; (iii) to work, from *frameworks*, on the theme of Industrial Revolutions, technological innovations and their impacts on society and education.

We point out that this research is of a basic nature, as it "aims to generate new knowledge useful for the advancement of science without foreseen practical application", exploratory, since "its purpose is to provide more information on the subject that we are going to investigate, enabling its definition and design"; as a procedure, it presents the literature review, because it is being "elaborated from material already published" such as books, scientific journals, websites, etc. (Prodanov; Freitas, 2013, p. 51-54).

Authors such as Bauman (2001), Delors (2003), Luger (2013), Santaella (2003), among others, help us to build a theoretical basis that dialogues between the many concepts addressed. In addition, this article also proposes a reflection on the evolution of technologies in the Industrial Revolutions over the years, understanding that the Digital Revolution in this first decade of the year 2025, had an impact on the constitution of people's subjectivity, when we consider a biopsychosocial human in the center of a whirlwind of events and information, which is largely due to the speed of simultaneous and civilizational changes, such as the fifth revolution, which is now digital.

We perceive humanity displaced in the face of the speed of innovations, and what draws our attention is the movement that seeks to find itself in the midst of the multiplicity of transformations: how to find security and answers to questions in the various fields of life? And work? And the future? How to find time for the various temporary demands? How to assimilate and accommodate the events in the society of change while maintaining mental health?

In this sense, we understand that the school will be able to collaborate with the approach to the impact on emotional health, as well as in the constitution of students' subjectivity in the face of disruptive processes, whose scenario requires rapid adaptations in the face of the evolutions of digital technologies and, consequently, of AI, with developments that also encompass the world scenario.

Our text is structured in three moments: the first reflects on the path taken by technological innovations from the Industrial Revolution to what we call today as digital disruption; the second observes the contributions of the Life Project from an integrative and transversal approach; the third, which proposes *frameworks* based on the themes discussed, promoting dialogue and reflection in connection with the students' future perspectives.

2 INDUSTRIAL REVOLUTION AND TECHNOLOGICAL INNOVATIONS: PATHS TO DIGITAL DISRUPTION

The Industrial Revolution was not just a series of technological innovations, but rather a radical and multifaceted historical process that marked the transition from an agrarian and artisanal economic system to a modern industrial and capitalist model, permanently altering life, work, and the organization of human society. In the words of Oliveira (2004), the "idea (sic) of the new, of progress, was spreading throughout Europe, which sought to put into

practice new inventions that would adapt to the rhythm of the hallucinating daily life imposed by the new order of work" (Oliveira, 2004, p. 84).

Pioneered in England in the second half of the eighteenth century, it is defined by: substitution of motive power, that is, the exchange of human, animal, hydro or wind energy for mechanical energy generated by new sources, such as mineral coal and, mainly, the steam engine; work migrates from domestic workshops (manufacturing) to factories (machine-making), where the worker becomes subordinated to the rhythm and discipline of the machine; Mechanization and the division of labor allow for the large-scale production of goods at lower costs, ushering in the era of mass production. In the factories, for example, "workers were forced to follow the rhythm of the steam engine, which provided a great boost to the textile sector", within a context in which "time became even more valuable for those who wanted to earn money, so that every minute should be thoroughly used" (Oliveira, 2004, p. 84-85).

In addition to these transformations, we have the consolidation of industrial capitalism through the separation between capital and labor and profound socioeconomic impacts such as, for example, the rural exodus, the intense exploitation of labor, and the redefinition between the relationship of the human being with production, society and the environment. As a result, there was the "intensity of the exploitation of labor (sic), time began to be controlled by industrialists and no longer by artisans" (Oliveira, 2004, p. 86).

The Industrial Revolution (the first, in the eighteenth century), was the indirect and fundamental driving force for the emergence of current digital technologies, including Artificial Intelligence. The connection was not immediate, but a relationship of historical and technological cause and consequence that developed in phases, such as: the establishment of the machine paradigm; the creation of the knowledge base and infrastructure; the technical-scientific revolution (understood as the Third Industrial Revolution); automation on an increasing scale. In other words, "since the First Industrial Revolution, significant technological advances have been altering the economic, political and social organization of societies around the globe" (Oliveira; Vendramini, 2018, p. 41).

The Industrial Revolution was the time when humanity mechanized production, introducing the concept that work could be performed by machines and not just humans or animals. With this, the steam engine and the power loom proved that technology could radically increase productivity and human capacity. Such a mindset established the foundation of continuous technological progress and the belief in engineering's ability to

overcome limits. For Oliveira (2004), the "transition from the artisanal production system to the factory system, in turn, was marked by technical innovations in which the mechanization of work began in the field of textile production" (Oliveira, 2004, p. 85).

The subsequent stages of industrialization have built the necessary foundation for the digital age, as electricity has been introduced as a source of energy, which is essential for all electronic devices and computers. The link between science and industry was also strengthened, leading to the development of advanced physics and chemistry that would be crucial for electronics. The emergence of the latter (transistors, microchips), information technology and telecommunications (*internet*) is the direct step towards digital technology. This phase would not have been possible without the industrial and scientific infrastructure inherited from previous revolutions. It is worth mentioning that microchips, developed in 1971 by Intel, "are present in computers to this day" and were the basis for the development and expansion of personal computing (Godoy, 2025, p. 14).

We can conclude, therefore, that the Industrial Revolutions are, in fact, great historical examples of technological disruptions on a massive scale, since each of these was triggered by a set of innovations that not only improved what existed, but created a radical rupture with the current productive and social model, redefining the world. Lima and Leitão (2021) understand that "disruption has been present in society for thousands of years" whose phenomenon has already been possible to be observed "when man extracted from nature only what was essential for his subsistence", something that was later abandoned, as he started to create and cultivate his own food (Lima; Leitão, 2021, p. 21).

The concept of disruption fits to describe what happened in each phase, as the steam engine and the mechanization of production broke with artisanal production and manufacturing. The factory system and steam power transformed agrarian society into an industrial one and caused profound changes in transportation (railways) and in the organization of labor. In other words, "there was an expansion of the substitution of human and animal energy for inanimate energy, with multiplied efficiency", because "there was an acceleration of the exchange of human capacity for mechanical instruments", as well as "the discovery and/or improvement of methods for obtaining and elaborating raw materials" (Dathein, 2003, p. 1).

Electricity, mass production, and the internal combustion engine introduced the assembly line and large-scale production, which also allowed factories to run continuously, with the automobile redefining personal transportation. Dathein (2003) clarifies that the

Second Industrial Revolution was based on "electricity and steel, with important developments occurring in chemistry, communications" and the use of petroleum (Dathein, 2003, p. 5).

Electronics, Information Technology (IT) and the *internet* have promoted the automation of production processes (robotics) and digitalization, with this, the personal computer and the *internet* have created a new paradigm for communication and data management. As an example, we can cite the "algorithms that control the use of Facebook (sic) and Google (sic)" which "are creating new patterns of behavior and relationships", or even the "use of advanced psychometrics" that "allows the identification of psychological profiles with the ability to predict decisions and behaviors with a high degree of accuracy", while the "use of this technology for commercial and political purposes raises ethical problems that are not being discussed by society" (Magalhães; Vendramini, 2018, p. 42).

Finally, we can say that AI, ³the *Internet* of Things (IoT), *Big Data*⁴ and *Cloud Computing*⁵ are promoting hyperconnectivity and autonomous decision-making in production systems, whose objective is the total integration between the physical and digital worlds (cyber-physical systems), generating more personalized and efficient products and services. The *Internet* of Things or IoT, for example, is a "network of physical objects incorporated into sensors, software (sic) and other technologies with the objective of connecting and exchanging data with other devices and systems over the internet (sic)" and such "devices range from common household objects to sophisticated industrial tools" (ORACLE, 2025, *online*).

The Life Project (PV) discipline presents itself as a key curricular component to assist in understanding the complex and disruptive world we live in, acting in an integrative, transversal way and focused on the subjectivation of education. In other words, such discipline not only prepares the individual for the complex and disruptive world, but enables him to understand his position, his values, and his potential for action in it, making disruption become an opportunity for construction and not just a source of anxiety. It is this subject, therefore, that we will deal with next.

³ Succinctly, we can say that Artificial Intelligence (AI) is a branch of computer science focused on creating machines and *software* that simulate human intelligence. AI has a growing importance and impacts several areas of our daily lives, often without us realizing it, ranging from process improvement to personalized experiences (Luger, 2013).

⁴ *Big Data* is the term used to describe extremely large and complex data sets that cannot be processed or analyzed effectively with traditional data processing tools (Morais et al., 2018).

⁵ *Cloud Computing* is the delivery of on-demand computing resources (such as processing power, data storage, databases, networks, and *software*) over the *internet*, in a pay-as-you-go model (Kolbe Júnior, 2020).

3 THE LIFE PROJECT AND ITS CONTRIBUTIONS IN THE LIGHT OF AN INTEGRATIVE AND TRANSVERSAL APPROACH

The inclusion of PV as a curricular component or cross-cutting theme in Brazilian Basic Education is directly linked to the enactment of the National Common Curricular Base (BNCC, 2017) and, later, to the Secondary Education Reform (Law No. 13,415 of February 16, 2017).

Thus, PV emerges in Basic Education as a response to the need to promote a comprehensive education of students, aligned with the demands of twenty-first century society and having as pillars socio-emotional skills (self-care, self-knowledge, determination, perseverance and ability to make responsible choices), and the skills of planning and protagonism.

The ways of approaching PV can occur in two ways: through the creation of an exclusive curricular component (Life Project), with designated classes and teachers, especially in High School, or, as a transversal theme, where the content is incorporated and worked on in an interdisciplinary way, encompassing all disciplines and involving the faculty in a broader perspective.

PV as a discipline seeks to promote youth protagonism and the development of socio-emotional skills, encouraging students to: reflect on themselves; set objectives; making conscious choices; and tracing paths, acting as a compass that guides the student in building an intentional future aligned with their purposes.

As established by the BNCC (2017), the school "by orienting itself towards the construction of the life project" welcomes young people and assumes the "commitment to the integral formation of students, since it promotes their personal and social development, through the consolidation and construction of knowledge, representations and values", which "will affect their decision-making processes throughout life" (Brasil, 2017, p. 472).

In this sense, the BNCC (2017), by presenting the life project as one of the ten general competencies, becomes a "guiding document for school curricula", which seeks, "through this competence, to reiterate the focus on the student, on student protagonism and on their life project" (Santos; Gontijo, 2020, p. 20).

The main ways in which PV contributes, in the light of an integrative and transversal approach and subjectivation in educational disruption, are aligned with: reconnection of knowledge; expanded worldview; contemporary themes; working with uncertainty; critical and ethical thinking; protagonism and social engagement; self-knowledge as a basis; socio-emotional development; reconnection and meaning. We can say, therefore, that, nowadays,

we perceive that the speed of transformations reverberates in society, which makes it necessary to introject or slide over such "ephemeral" and "liquid" realities (Baumann, 2001).

In view of this, PV acts as an axis that connects and contextualizes the contents and the different areas of knowledge (transversality), which are often taught in isolation in the traditional curricular structure, helping the student to "reconnect" this information, which is essential to deal with the multifaceted and interconnected nature of the problems of the complex world.

According to Araújo and Rufo (2023), the proposition and implementation of "didactic-pedagogical strategies that meet the importance of the life project in school is both necessary and indispensable" as long as it is in the context of "a continuous perspective of integral, critical, reflective, autonomous and diversified education of young people in Elementary and High School" (Araújo; Rufo, 2023, p. 7).

By mobilizing reflection on the personal, social and professional dimensions, as suggested by the pillars of UNESCO (Delors, 2003) - learning to be, to live together, to know and to do - PV transcends the purely intellectual dimension, which allows the student to build a more holistic view of reality, where social, environmental, technological and economic challenges are not seen as isolated disciplinary problems.

The PV can integrate and deepen the discussion on Contemporary Cross-Cutting Themes (TCT), such as Environment, Technology, Globalization and Human Rights, connecting them directly to the student's choices and future. It is important to highlight that these themes seek to "make explicit the connection between the different curricular components in an integrated way" establishing a "connection with situations experienced by students in their realities, contributing to bring context and contemporaneity to the objects of knowledge described" in the BNCC (Brasil, 2019, p. 6).

The complex and disruptive world is marked by uncertainty, ambiguity and non-linearity, so PV stimulates the development of the ability to plan in scenarios of uncertainty, to recognize the need for disruption and transformation (essence of disruption), without clinging to a single and rigid path. And, "the school space, as an institution inserted in the socio-historical-cultural context in which young people are present, must enable reflection on the values, choices and identity of each young student" (Santos; Gontijo, 2020, p. 25).

By providing reflection on one's own choices, values, and impacts on society, PV promotes the formation of critical and autonomous subjects, which is essential to analyze the speed of changes (especially technological/disruptive ones) and make ethical and

responsible decisions in the face of global challenges. Because the "revolutions progress towards new knowledge, skills, and administrative skills" and, in addition, the "ruptures and daily advances make evident the fragility of the most sophisticated instruments of planning, policymaking, and work organization" (Motta, 2022, p. 201).

The complex world requires actions, and, in view of this, PV helps students to perceive themselves as an agent of transformation in their community, stimulating protagonism and engagement in the search for solutions to real problems. For Costa Júnior et al. (2023), "education is faced with new challenges arising from social, cultural, and technological transformations" and, as a result, "contemporary society requires a broader and more diversified education, which goes beyond technical knowledge and provides skills to deal with the complexity of today's world" (Costa Júnior et al., 2023, p. 125).

Disruption in education requires learning to be personalized, so PV puts the individual at the center of the process, encouraging self-knowledge, since it is in the subjectivation of their own stories, skills, and desires that the student finds the purpose to navigate and adapt to constant changes. This characteristic makes us think about the importance of the teacher-student relationship, which "can be reduced to the pedagogical aspect and be characterized by a distant attitude", or, "emphasize almost exclusively the affective or emotional dimension". Therefore, the "choice that the teacher will make between these two modes" will have "an important influence on the student's learning process and on his behavior" (Boutin, 2017, p. 345).

The crisis of purpose and the wear and tear of the traditional school are symptoms of the disruptive world. In view of this, the PV actively works on socio-emotional skills (resilience, empathy, cooperation, autonomy), which are crucial for survival and well-being in an environment of constant instability and pressure. Marino (2018), understands that the crisis established in the school environment "has caused a multiplication of conflicts within it, leading to an increase in the number of students and teachers unhappy with their daily practices", while the origin of these conflicts "lies in the antiquated disciplinary rules and procedures and in their incompatibility in relation to young people in the twenty-first century", with this, the author argues that "schools need to be refounded" where students are transformed into "integral subjects and co-responsible for the learning processes" (Marino, 2018, p. 21-28).

In an era of fragmentation and rapid obsolescence, PV helps students to give meaning to what they learn and their future, transforming the educational experience into something

relevant and applicable to their personal and professional life. In this sense, associating life projects with the world of work "is the result of the profound transformations in today's world, especially in relation to the productive structure, technological development and the intensification of capitalism from the 1980s onwards" (Araújo; Rufo, 2023, p. 9).

We can conclude, therefore, that PV, being articulated in the form of a discipline or cross-cutting theme, not only prepares the individual for the complex and disruptive world, but also enables him to understand his position, his values and his potential for action in it, making disruption become an opportunity for construction and not just a source of anxiety.

In the context of Industrial Revolutions, a *framework* is a logical framework that we can use to analyze, compare, or implement these historical transformations, expanding reflections through the integrality and transversality of PV. This is what we will deal with in the next subtitle.

4 INDUSTRIAL REVOLUTIONS THROUGH *FRAMEWORKS*: INNOVATIONS AND EVENTS THAT IMPACTED SOCIETY AND EDUCATION

Characterized as an agile methodology, since it integrates "a set of practices aimed at enabling fast, non-bureaucratic delivery," a *framework* is a predefined framework, a "skeleton," or a set of tools and guidelines that serves as a basis for developing projects or managing processes more efficiently. In other words, it is "a model or framework that brings together a series of practices", with the following main objectives: to simplify, streamline and standardize the work on complex projects (Vieira; Rodrigues; Villanova, 2024, *e-book*).

An example of a common use of a *framework* is in *software* development, because it is typically composed of ready-made and reusable code; suggestions and rules on how the project architecture should be organized; and resources to assist in development, such as testing and debugging code. We can say, therefore, that *frameworks* provide a solid foundation that allows development teams to build robust and high-quality applications in a much faster and more organized way. According to Netto et al. (2007), with "the development of the *framework* achieves great flexibility", in particular, "from the obtaining of a generic structure of classes that can be instantiated for various realities in a given domain of application" (Netto et al., 2007, p. 16, emphasis in original).

In addition to building *software*, *frameworks* are important instruments for the study and comparison of concepts in the PV discipline, for example, working as structured models and methodologies to organize objectives, develop self-knowledge and outline an action plan

for the future. In the case of the study of Industrial Revolutions, these can transform the discipline (or cross-cutting theme), focusing not only on the past of the industry, but on the future of the individual in the world of work.

The image below (Figure 1) represents, through a *framework*, the timeline of the Industrial Revolutions, from the emergence of Industry 1.0, whose milestones revolved around the steam engine, to Industry 5.0, which is focused on the fusion of physical, digital and biological technologies.

Figure 1

Framework on Industrial Revolutions and their innovations

Source: LinkedIn, 2025.

However, how can this *framework* stimulate reflective thinking, making the student connect their worldview, experiences, and future perspectives in the context of PV? What are the nuances and connections with contemporary transformations that are outlined in this figure?

We can conclude, therefore, that the Industrial Revolutions demonstrate important points in the evolution of society, characterized by a human-historical-technological-cultural-social development. In addition, we can observe that, in the beginning, there is an absence of digital technology, whose world was not yet globalized, was based on more spaced intervals between transitions or technological advances, but which, over time, has evolved, moving from a social and family model to the generation of new technologies through the fusion of physical technologies, digital and biological aspects.

The Industrial Revolution, in its various phases, from this *framework*, becomes a central theme, especially in the axis of the World of Work, as its transformations profoundly shaped society and the labor market we know today. In view of this, the approach is made through a perspective that connects the past, the present and the future, focusing on the development of the skills and abilities necessary for the contemporary world of work.

Thus, it is possible to discuss the change in the mode of production (artisanal, manufacturing and machine-crafting) and how this altered the role of the worker, who ceased to be the owner of the means of production to become the seller of his labor power. From a life project perspective, it is valid to reflect on the importance of autonomy and a sense of belonging at work, generating questions such as: what did the worker lose and gain with this change? How can today's young people seek autonomy and meaning in modern careers?

Therefore, the key piece of this movement is to use history as a mirror for the present, encouraging students to prepare not only for the next career, but for an ever-changing future.

The next image (Figure 2) presents a second *framework* with the function of demonstrating a cut of the Digital Revolution between the years 2019 and 2025, whose focus is on the simultaneous events that affected the various segments of society, such as health, the economy and education, as a result of Covid-19, which emerged in late 2019 and early 2020.

Figure 2

The Digital Revolution between the years 2019 and 2025

Source: The authors, 2025.

The Covid 19 pandemic was not a simple "turning of the key", but an abrupt, overwhelming change, with moments of mismatched information, which stopped the world, work and affected many families, which resulted in a chaos that was established "overnight". In addition, from the restrictions imposed by the pandemic context, such as physical contact, social isolation, the growth of work through the consecration of digital technologies, which, in the period, were widely used, had as their main objective to help society in its relations with the world, especially in the world of work, so that we could continue producing, whether *online*, *offline* or hybrid, synchronous or asynchronous, which led to the emergence of the *home-office*, online classes and meetings, both in educational institutions and in corporations of all sizes.

On the other hand, when we observe the "context of teaching work, the consequences of the pandemic [...] were significant, requiring adaptations on the part of "teachers" to continue teaching, especially when considering the differences between the public and private education networks" (Silva Filho; Andrade; Porto, 2025, p. 26).

We perceive, therefore, that, nowadays, society continues to accelerate to keep up with changes while seeking strategies to perform in the face of demands that arise very quickly, which, for Santaella (2010) means that the "accelerated pace of technological changes" causes "psychic, cultural, scientific and educational impacts" (Santaella, 2010, p. 18).

From the pandemic, there was an intense adherence to digital tools, which generated an exponential advance in solutions and business. A great example of this evolution is Artificial Intelligence (AI), which is a growing reality and generates opportunities in the professional sector, science, education, research, automating processes, such as a large database that allows, in addition to optimization, the consultation of information through the management of complex systems in all areas of knowledge and performance.

Suave (2024), understands that AI is "a field of computer science dedicated to developing systems capable of performing tasks that would normally require human discernment", which "encompasses a wide range of capabilities, which include learning, reasoning, understanding human language, and even creating art" (Suave, 2024, p. 12).

The impact of the Covid-19 pandemic on students' life projects was profound and multifaceted, acting as an accelerator of trends and an agent of crisis in several dimensions. An example was that the global scenario of instability (economic, health, and social) generated a great lack of perspective and uncertainty about the future, which is directly linked to anxiety and pessimism in relation to long-term projects. Many young people felt part of a "*lockdown generation*", with the future on hold. In other words, "our daily life, mentally organized" was modified and, "in this new scenario, uncertainties and insecurities were triggered or intensified" such as "fear and distrust"; "the fear of being contaminated, of getting sick and dying", or even of seeing our income reduced or eliminated (Moretti; Guedes-Neta; Batista, 2020, p. 34).

Social isolation interrupted face-to-face interaction, crucial for social and emotional development in adolescence, which affected the support network and the construction of identity. On the other hand, the lack of access to technologies and *quality internet* (digital inequality) has widened educational disparities, leading to a more pronounced learning loss among low-income youth. Trezzi (2020) understands that the pandemic demonstrated a "generalized technological gap in Brazilian schools", which only worsened "Brazil's situation in relation to other countries" (Trezzi, 2020, p. 7).

The difficulty in keeping up with remote learning, added to the need to supplement family income (due to the economic crisis), led many young people to think about leaving school or giving up the entrance exam/ENEM, who also suffered from job loss and reduced income, exposing them to the fragility of labor relations, impacting younger and less educated workers more deeply. Maia (2023) points out that, even with the "hybrid classes adopted in most schools in Brazil", the latter did not have "adequate support" and "families had many difficulties in adapting" which contributed "to the increase in dropout rates" (Maia, 2023, p. 4).

The health and social crisis scenario has led many to reevaluate what "success" is, prioritizing careers that offer purpose and quality of life instead of just high salaries. We can observe, therefore, that Covid-19 was an experience that proved that the life project is a living and dynamic document, which needs to be constantly reviewed in the light of global and personal changes.

We argue, therefore, that PV has a fundamental and transformative role in preparing Brazilian students for the future, going beyond traditional academic content, as it can encourage students to reflect on their values, interests, abilities and limitations, and to define their dreams and aspirations clearly and consciously. In addition, it promotes youth protagonism, placing the student as the main agent in the construction of their own path, encouraging them to make decisions and take responsibility for them. Finally, by integrating PV into the curriculum, the school contributes to forming not only good professionals, but more aware citizens, prepared and motivated to build a future that makes sense for them and for Brazilian society.

5 FINAL CONSIDERATIONS

Our article was born from some questions, such as: what are the relations between the Industrial Revolution and the Digital Revolution? How, from this relationship, do we arrive at disruptive technologies? How do these interconnections interfere with the PV of our students and how can they be addressed?

The Industrial Revolution and the Digital Revolution are connected in a historical sequence of technological transformations that fundamentally redefine production, the economy, and society. While the first was focused on mechanization (steam engine, water) and then on mass production, electricity and assembly lines, the second is characterized by the invention and dissemination of computers, the development of the *internet* and

telecommunications, that is, it uses the advances of previous revolutions (such as electricity) and adds the layer of information technology.

The link between the Digital Revolution and disruptive technologies is direct and fundamental, since the Digital Revolution is the driving force and the environment that generates, enhances and massifies disruptive technologies. Thus, essentially, the Digital Revolution is the historical-social process of transformation of society based on information technology, and disruptive technologies are the specific innovative elements that cause this transformation.

The Industrial Revolution, the Digital Revolution and disruptive technologies create a scenario of uncertainty and, at the same time, of unprecedented opportunities, forcing students to completely rethink their PV and their educational and professional choices. While the legacy of the Industrial Revolution was specialization and repetition of tasks, the Digital Revolution, driven by disruptive technologies, inverts this logic.

With this, a new mentality emerges: that students need to abandon the idea of a "career for life" and adopt the concept of "Lifelong Learning", whose PV must include the ability to requalify and adapt to each technological cycle. And how to provoke this reflection through an innovative approach? This is how the idea of applicability of *frameworks* came about, as it is an organized and standardized way to work with different knowledge.

The importance of PV in contemporary youth is critical and multifaceted, being the main instrument for young people to navigate the complexity, speed and uncertainty of the twenty-first century. With this, it is no longer just a dream or goal and becomes an essential structure for identity, protagonism, and resilience in a highly volatile world.

The digital society offers an avalanche of information, careers and paths, so the PV works as a compass for young people when fighting paralysis of choice, since in the face of so many options, they can feel overwhelmed; it offers motivation and engagement, because by having a clear vision of the future, the young person attributes meaning to studies and present effort; It provides opportunities to define priorities, which helps to translate abstract dreams into concrete short, medium and long-term goals, directing where to invest time, energy and resources.

Youth is the phase of intense identity construction and, in view of this, PV actively assists in this process, either through self-knowledge as a way of elaborating the project, which requires deep reflection on values, talents, limitations and passions, or through the encouragement of protagonism, because when planning their own future, the young person

becomes the main agent of their history, and not just a passive spectator of the circumstances or expectations of others (family, social), or through the exercise of resilience, because by finding a greater purpose (the "vital project"), the young person develops a greater capacity to deal with frustrations and crises.

PV becomes vital in the face of some adaptations, such as the integral vision (personal, social and professional) of life, the development of non-cognitive skills (critical thinking, planning, ethics, collaboration and emotional intelligence) and social responsibility, which includes the desire to contribute to something that transcends self-interest, aligned with the individual ambitions of the young person with the exercise of citizenship and the search for a common good.

Research involving the theme of PV is important for several reasons, and offers both practical and immediate benefits to the individual and significant contributions to the educational and social area. In addition to the Industrial and Digital Revolutions, other approaches are effective for consolidating learning and broadening our worldview, which makes this subject a fertile ground for our future research.

ABSTRACT

Currently, Brazil has the third largest prison population in the world, behind only the United States and China. In this context, it is essential to discuss proposals that can contribute to mitigating this type of reality. Thus, the research aimed to evaluate the behavior of inmates involved in the production, processing and use of medicinal plants and herbal medicines. The research is being carried out at the Industrial Penal Colony (CPIM), located in the municipality of Maringá, Paraná, from April 2023 to March 2024. It was divided into two Stages: Stage 1: The inmates will be involved in activities related to the implementation unit for the production and maintenance of medicinal plant species (germplasm bank); Stage 2: Processing of medicinal plants and production of herbal medicines. In addition to production and processing, the strategy is to implement a pilot pharmacy specializing in herbal/homeopathic medicines to meet the demands of the Penal Colony. The inmates involved in the production, processing and production of herbal medicines will be evaluated from a psychotherapeutic point of view, a constructivist approach, at the beginning and at the end of the research. The following assessments will be carried out: 1. Performance of the behavior of inmates involved in the different activities of Stages 1 and 2; 2. Application of a semi-structured questionnaire for individual social interviews, at the beginning and end of the research; 3. Carrying out a final workshop and producing experience reports. For the end of this article, the inmates' involvement in the activities of Stages 1 and 2 were evaluated. Considering the foundations of psychopedagogy and the constructivist approaches of Vygotsky and Piaget, gains were perceived by the inmates throughout their involvement in activities related to herbal medicine. Gains include learning, empathy, motivation, interest, bond formation, interdependence and respect, both individually and in groups. These results are in line with the constructivist theories of these two authors, which emphasize the importance of social interaction, active participation and the gradual development of cognitive and social skills.

RESUMO

Atualmente, o Brasil tem a terceira maior população carcerária do mundo, atrás apenas dos Estados Unidos e da China. Nesse contexto, é fundamental discutir propostas que possam contribuir para mitigação desse tipo de realidade. Assim, a pesquisa teve por objetivo avaliar o comportamento de apenados envolvidos com a produção, processamento e uso de plantas medicinais e de fitoterápicos. A pesquisa está sendo realizada na Colônia Penal Industrial (CPIM), localizada no município de Maringá, Paraná, no período de abril de 2023 a março de 2024. Foi dividida em duas Etapas: Etapa 1: Os apenados estarão envolvidos em atividades relacionadas à implantação de unidade para produção e manutenção de espécies de plantas medicinais (banco de germoplasma); Etapa 2: Processamento de plantas medicinais e produção de fitoterápicos. Além da produção e processamento, a estratégia é implantar uma farmácia piloto especializada em fitoterápicos/homeopáticos para atender demandas da Colônia Penal. Os apenados envolvidos no processo de produção, processamento e produção de fitoterápicos serão avaliados sob o ponto de vista psicoterápico, abordagem construtivista, no início e ao final da pesquisa. As seguintes avaliações serão realizadas: 1. Desempenho do comportamento dos apenados envolvidos nas diferentes atividades das Etapas 1 e 2; 2. Aplicação de questionário semiestruturado para entrevista social individual, no início e ao final da pesquisa; 3. Realização de oficina/workshop final e produção de relatos de experiências. Para fins deste artigo, foram avaliados os envolvimento dos apenados nas atividades das Etapas 1 e 2. Considerando os fundamentos da psicopedagogia e as abordagens construtivistas de Vygotsky e Piaget, foram percebidos ganhos pelos apenados ao longo do envolvimento nas atividades relacionadas à fitoterapia. Os ganhos incluem aprendizagem, empatia, motivação, interesse, formação de vínculos, interdependência e respeito, tanto em termos individuais quanto grupais. Esses resultados estão alinhados com as teorias construtivistas desses dois autores, que enfatizam a importância da interação social, da participação ativa e do desenvolvimento gradual das habilidades cognitivas e sociais.

RESUMEN

Actualmente, Brasil tiene la tercera mayor población carcelaria del mundo, detrás solo de Estados Unidos y China. En este contexto, es fundamental discutir propuestas que puedan contribuir a mitigar esta realidad. Así, la investigación tuvo como objetivo evaluar el comportamiento de los reclusos involucrados en la producción, el procesamiento y el uso de plantas medicinales y de fitoterápicos. La investigación se está llevando a cabo en la Colonia Penal Industrial (CPIM), ubicada en el municipio de Maringá, Paraná, entre abril de 2023 y marzo de 2024, y fue dividida en dos etapas: la Etapa 1, en la cual los reclusos participan en actividades relacionadas con la implantación de una unidad para la producción y el mantenimiento de especies de plantas medicinales (banco de germoplasma), y la Etapa 2, correspondiente al procesamiento de plantas medicinales y a la producción de fitoterápicos. Además de la producción y el procesamiento, la estrategia incluye la implantación de una farmacia piloto especializada en fitoterápicos/homeopáticos para atender las demandas de la Colonia Penal. Los reclusos involucrados en el proceso de producción, procesamiento y elaboración de fitoterápicos serán evaluados desde el punto de vista psicoterapéutico, con un enfoque constructivista, al inicio y al final de la investigación, mediante: 1) evaluación del desempeño del comportamiento de los reclusos en las actividades de ambas etapas; 2) aplicación de un cuestionario semiestructurado para entrevista social individual, al inicio y al final del estudio; y 3) realización de un taller final y elaboración de relatos de experiencias. Para los fines de este artículo, se evaluó la participación de los reclusos en las actividades de ambas etapas. Considerando los fundamentos de la psicopedagogía y los enfoques constructivistas de Vygotsky y Piaget, se observaron avances entre los reclusos a lo largo de su participación en las actividades relacionadas con la fitoterapia, incluyendo aprendizaje,

empatía, motivación, interés, formación de vínculos, interdependencia y respeto, tanto a nivel individual como grupal. Estos resultados están alineados con las teorías constructivistas de ambos autores, que destacan la importancia de la interacción social, la participación activa y el desarrollo gradual de habilidades cognitivas y sociales.

1 INTRODUCTION

Currently, Brazil has the third largest prison population in the world, behind only the United States and China. The CNJ data point to the increase in the Brazilian prison population, which, according to Depen's diagnosis, grows at a rate of 8.3% per year. In this march, the number of prisoners could reach almost 1.5 million in 2025, equivalent to the population of cities such as Belém and Goiânia.

The research to be carried out in the Industrial Penal Colony of Maringá is based on the need to solve problems related to education, rehabilitation and professional training of the prison population of the Industrial Penal Colony of Maringá and, in parallel, to contribute to the improvement of health and reduction of social inequality of the population of the Odwaldo Bueno Netto neighborhood in Maringá. For this, the production, processing and use of medicinal plants and herbal medicines, produced by inmates of the Penal Colony, will be strategically used.

The Project is part of the UBUNTU Program, proposed by the Graduate Program in Agroecology, Professional Master's Degree (PROFAGROEC), in partnership with the Center for Agroecology and Sustainable Development (NADS) of the State University of Maringá (UEM). In addition to the medicinal plant production unit, the project will implement the processing unit and a pilot pharmacy specializing in herbal medicines and homeopathic herbal medicines to meet the internal demands of the Penal Colony.

With the name "UBUNTU", which means "I am because you are", it is intended to form a Germplasm Bank, that is, to form a structure that stores the genetic material of various species of medicinal plants, adding knowledge about the repairing effect on the health of the individual, placing a natural and healthy alternative to the use of allopathic medicines due to the great absence of side effects in this alternative and sustainable process.

Therefore, the project's general objective is: To verify the feasibility of building and preparing people in a state of seclusion to generate work, add values with the production of medicinal plants cultivated in an ecological way for use in the form of teas and herbal preparation, recovering both the person and their physical health. And the specific objectives:

- a) To create a Germplasm bank of medicinal plant species in the Penal Colony of Maringá;
- b) To promote the rehabilitation of inmates; and c) qualification for professional activity after rehabilitation.

Medicinal plants contain a wide range of bioactive compounds, such as alkaloids, flavonoids, terpenes and polyphenols, which have relevant pharmacological activities (Silva,

2012). These compounds can act at different cellular levels, influencing biological processes such as inflammation, cellular control, and immune response (Gupta et al., 2015). In addition, many medicinal plants have been investigated for their antioxidant and antimicrobial properties, which are beneficial for their therapeutic utility (Santos et al., 2018).

Despite the vast knowledge accumulated throughout history about the medicinal properties of plants, there are important challenges in the safe and effective incorporation of these treatments into modern medical practice. The lack of standardization in dosage, the natural variability of the compounds present in plants, and the interaction with other drugs are factors that require rigorous investigations (Ferreira, 2019).

The objective of this research was to evaluate the behavior of inmates involved with the production, processing and use of medicinal plants and herbal medicines. The research was carried out at the Industrial Penal Colony (CPIM), located in the municipality of Maringá, Paraná, from April 2023 to March 2024. It was divided into two Stages: Stage 1: The inmates were involved in activities related to the implementation of a unit for the production and maintenance of medicinal plant species (germplasm bank); Step 2: Processing of medicinal plants and production of herbal medicines. In addition to production and processing, the strategy is to implement a pilot pharmacy specializing in herbal medicines/homeopathics to meet the demands of the Penal Colony.

2 LITERATURE REVIEW

2.1 AGROECOLOGY AND SOCIOECONOMIC ISSUES IN BRAZIL

Agroecology is an agricultural approach that integrates principles and practices of ecology into food production, primarily targeting sustainable, natural, ecological, and socially just systems. It seeks to promote biodiversity, the efficient use of natural resources, the resilience of agricultural ecosystems and the well-being of communities linked to the agricultural environment (Gliessman, 2000)

Organic agriculture is a production model characterized by not using synthetic fertilizers, pesticides, modified seeds, animal growth regulators and intense mechanization of activities, aiming to reduce environmental impacts, in addition to growing healthier food products.

The model of a family system of organic production certainly fits into the concept of the science of "Agroecology" generating a healthy diet and a quality of life with a disease

prevention approach within a highly social and environmental focus, (HAMERSCHMIDT, 2000)

The pressure exerted by consumers, increasingly demanding a clean, toxic-free and nutritionally superior product is another factor that has motivated farmers to bet on this production system

Although it represents less than 1% of the global market, the growth forecast for the Brazilian organic food market for this year is 30%, according to projections by the initiative. In Brazil, there are 11,478 organic producers registered in the country, almost all of which are family producers (MAPA, 2022).

The organic system is an agricultural production methodology that does not require the use of chemical inputs and is characterized by a process that takes into account the relationship between soil, plant and environment (MEIRELLES & RUPP, 2014). According to Dias et al. (2015), "agriculture and the consumption of organic products have been expanding in recent years and experts in the sector are predicting growth of 9% or more in developed countries". Also according to Dias et al. (2015), as cited by the United Nations Conference on Trade and Development (UNCTAD, 2013), "there are currently about two million organic farmers, around 80% in developing countries, in addition to the trade in organic products selling 60 billion dollars annually". However, although growing, the arable area destined to organic production in Brazil is estimated at only 0.25% (BUAINAIN & BATALHA, 2007).

Agroecosystems is the fundamental unit of studies in which mineral cycles, energy transformations, biological processes and socioeconomic relations are seen and analyzed together, as stated by Altieri (1980 apud Caporal, 2009).

According to PAULUS (1999),

"The concept of agroecosystem proposed by SCHLINDWEIN & DAGOSTINI (1998) incorporates in its definition spatial-temporal (related to structure), functional and conjunctural aspects which, in some way, are also organizational. In other words, it is a concept that is not limited to considering only the elements of the physical environment, in their biotic and abiotic components, and their interrelationships, but that recognizes aspects of a socioeconomic and cultural order, as elements that are located in the genesis of the different agroecosystems (SCHLINDWEIN & DAGOSTINI, 1998: p.8).

Currently, the development of technologies for the production of medicinal plants is a work that is being done in universities and research institutions, and that is already bringing results that can be readily used by producers. The use of organic cultivation techniques for

production is not accidental. There is research that proves that chemical fertilization alters the content of active ingredients in some species. The use of pesticides not only alters the quality of these principles, but also leaves toxic residues on the plants, which can lead to poisoning of the user. Therefore, pesticides are not allowed in the production process.

The adoption of the organic production system requires a change of mentality and attitude from the producer. It is not enough just to replace chemical inputs with fertilizers and organic products. It is necessary to understand living processes and use all your capacity for observation and relating facts, to make the most of the full potential of natural cycles.

When it comes to medicinal plants, it is very important to consider the content and quality of the active ingredients, which are the products that are of commercial interest. For their preservation, their ecological characteristics must be respected, that is, they must seek to reproduce conditions similar to those found in their places of natural occurrence, for this reason that agriculture is thought of on an ecological basis and especially the care of the soil.

2.2 THE REALITY OF THE BRAZILIAN PRISON SYSTEM

The classification of convicts in the state of Paraná, as well as in many other prison systems, is based on several criteria. Generally, convicts are classified according to the type of crime committed, the length of time to be served, behavior in prison, and other factors. It is important to note that classification policies and specific categories may vary over time and according to state and national legislation. Therefore, it is essential to check the current regulations and procedures of the prison system in the state of Paraná to obtain accurate information.

The classification can usually include:

- Sentence fulfillment regime: Convicts can be classified into different regimes, such as closed regime, semi-open regime and open regime, based on the severity of the crime and the time of sentence to be served.
- Behavior in prison: The behavior of the convict in prison can influence his classification. Those who demonstrate good behavior can obtain benefits, such as regime progression or reduction of sentence.
- Type of crime: Convicts can be classified based on the type of crime they have committed, such as violent crimes, non-violent crimes, crimes against property, among others.

- Special needs: The classification can also be considered as medical, psychological or drug treatment needs of the inmates.
- Dangerousness: The assessment of the dangerousness of the convict can also influence their classification and the need for additional security measures.
- Criminal history: The criminal history of the convict, including previous convictions, can also be taken into account in the classification.
- It is important to emphasize that the classification of convicts must be carried out fairly and in accordance with current legislation, guaranteeing the human rights and dignity of inmates. The prison system should provide opportunities for rehabilitation and rehabilitation whenever possible.

For more detailed information on the classification of convicts in the state of Paraná, consult the Penitentiary Department of Paraná (DEPEN) or the current prison legislation of the state.

The State of Paraná has a prison system model where inmates who arrive receive, in addition to the above classifications, some perks, among the perks are the option to continue their studies.

The tests for the National Exam for the Certification of Youth and Adult Skills for Persons Deprived of Liberty or under socio-educational measure that includes deprivation of liberty (Encceja PPL) 2023 are scheduled for October 17 and 18. This exam, carried out by the National Institute of Educational Studies and Research Anísio Teixeira (Inep), has the function of assessing competencies, skills and knowledge of young people and adults at the level of completion of Elementary School or High School for the purpose of correcting the school flow.

In the state of Paraná, Encceja PPL 2023 had the registration of 10,108 people deprived of liberty (PPL), which represents an increase of 21% compared to the 2022 edition, when the State had 8.4 thousand PPLs registered. Interestingly, this percentage of increase in registrations reached almost the same rate as last year, when there was an increase of 22% compared to 2021.

According to the director of the Criminal Police of Paraná, "For us, this increase in the number of inmates enrolled in Encceja PPL is of great importance because it demonstrates that the PPPR has sought and encouraged people deprived of liberty to study. We have many cases of people who had no schooling when they entered the penitentiary system and through the literacy offered within the units, many managed to complete elementary and high

school and reached higher education. The greater the incentive, the greater the search for qualification", he highlights.

Among the nine administrative regions of the Criminal Police of Paraná (PPPR), the regional of Londrina was the one with the most registrations, with 3,234 PPLs registered, followed by the regional of Curitiba with 2,281 registered; regional office of Umuarama with 1,034 enrolled; regional office of Ponta Grossa with 862 enrolled; regional of Maringá with 784 enrolled; regional of Guarapuava with 661 enrolled; regional office of Foz do Iguaçu with 596 enrolled; regional of Cascavel with 491 registered and regional of Francisco Beltrão with 364 registered.

Paraná is among the states with the highest number of prisoners involved in educational activities, according to the ranking of the National Penitentiary Department. The state has almost 9.5 thousand prisoners enrolled in elementary and secondary, professional and higher education and also in other pedagogical projects. The number, which represents 32% of the total number of inmates in the prison system, places Paraná in fourth place in the ranking, behind Santa Catarina, Maranhão and Pernambuco.

According to Julio Prestes, (2023) Encceja PPL is an initiative that aims to provide education and certification opportunities for individuals who are serving time in the prison system. This approach recognizes the importance of education in social reintegration, in reducing criminal recidivism, and in valuing human dignity. Education is a fundamental tool for the reintegration of inmates into society. Encceja also offers the opportunity to acquire certificates of completion of primary and secondary education, which can increase the chance of employability and improve the prospect of life after prison", explains the head of the Education and Training Division of the PPPR.

With this dedication and enjoying this perk, the convict manages to reduce his sentence. For every 12 hours of study, the right to a reduction of 1 day of sentence is granted. In the case of Encceja, this classification is made according to the grade. If he passes the exam, the convict receives 200 hours of remission and, if he does not reach the grade, he receives 8 hours of remission.

For the participant to be enrolled and apply for Elementary School certification, it is necessary to be at least 15 years old on the day of the tests and not have completed Elementary School. For the participant to apply for High School certification, it is necessary to be at least 18 years old on the day of the tests and not have completed High School. To

apply for certification, the participant must achieve at least 100 points in the objective tests and 5 points in the essay.

2.3 HEALTH OF PERSONS DEPRIVED OF LIBERTY IN BRAZIL

Education is a right of every Brazilian citizen, and it is a duty of the State to offer it regardless of the social, national, cultural, gender or ethnic-racial condition of the individual (Vieira, 2020). In the case of people deprived of liberty, this right, as well as other structural deficiencies found in the Prison System, was not a priority for the Brazilian State (Oliveira, 2017; Quaresma, Dos Santos Rocha & Cruz, 2021).

Article 205 of the Federal Constitution (CF) of 1988 says: "Education, a right of all and a duty of the State and the Family, will be promoted and encouraged with the collaboration of society, aiming at the full development of the person, his preparation for the exercise of citizenship and his qualification for work".

2.4 THE PRODUCTION OF MEDICINAL PLANTS AND PHYTOTHERAPY AS STRATEGIES FOR REHABILITATION IN THE BRAZILIAN PRISON SYSTEM

And the speeches in education and resocialization are essential for life in society, these two words have always gone together. Penitentiaries emerged as a way of punishing the practice of crimes and preventing the practice of new crimes. In Brazil, after the entry into force of Law No. 7,210 of 1984, the law that governs Penal Execution, the penalty began to have, in addition to the purpose of punishment and prevention, mainly the resocialization of the convicted and to provide him with a return to society, whether working or cultivating something.

The use of medicinal plants is an ancient and widespread practice in several cultures around the world. The use of different parts of plants to treat a variety of diseases and health conditions has been widely documented in the scientific and ethnobotanical literature. In this theoretical framework, we will address some relevant aspects about medicinal plants, their historical importance and therapeutic potential.

Since ancient times, plants have been employed as natural sources of treatment and cure of diseases. According to Smith et al. (2007), ancient civilizations, such as the Egyptians, Greeks, and Chinese, already had vast knowledge about the medicinal properties of specific plants. Historical records indicate that traditional medicine in many cultures largely incorporated the use of plants for symptom relief and disease treatment.

Medicinal plants contain a wide range of bioactive compounds, such as alkaloids, flavonoids, terpenes and polyphenols, which have relevant pharmacological activities (Silva, 2012). These compounds can act at different cellular levels, influencing biological processes such as inflammation, cellular control, and immune response (Gupta et al., 2015). In addition, many medicinal plants have been investigated for their antioxidant and antimicrobial properties, which are beneficial for their therapeutic utility (Santos et al., 2018).

Despite the vast knowledge accumulated throughout history about the medicinal properties of plants, there are important challenges in the safe and effective incorporation of these treatments into modern medical practice. The lack of standardization in dosage, the natural variability of the compounds present in plants, and the interaction with other drugs are factors that require rigorous investigations (Ferreira, 2019).

As Ferreira, 2009 cites above, plants have been playing their fundamental role throughout history, that is, when applied and used correctly.

3 MATERIAL AND METHOD

The research was carried out at the Industrial Penal Colony of Maringá (CPIM), located at Estrada Velha para Paiçandu, 2812, Gleba Ribeirão Colombo, municipality of Maringá, Paraná. This work was part of the UBUNTU Program, proposed by the Center for Agroecology and Sustainable Development (NADS) and the Technological Vocational Center in Agroecology and Organic Production (CVT) and the Graduate Program in Agroecology, Professional Master's Degree (PROFAGROEC) of the State University of Maringá (UEM). It has a partnership with DEPEN/CPIM, the Municipality of Maringá (PMM), the Public Ministry of Labor (MPTPR), Federal Justice/PR, State Justice, Milton Santos School (EMS MST). The word UBUNTU, of African origin, means "I am because you are". It involved five (5) inmates aged between 45 and 69 years, all with good behavior and who participate, in parallel, in the activity of olericulture. The five inmates have low education, two of whom only read and write only their names and the rest attended up to the fourth year of elementary school.

The present work is characterized in its methodology, a bibliographic review of the production of medicinal plants on an ecological basis and of herbal medicines in the behavior of inmates of the industrial Penal Colony of Maringá.

According to Galliano, 1979):

The word science comes from the Latin scientia, which means to learn or to know to know. In knowing, however, this etymological explanation does not help to differentiate scientific knowledge from other types of knowledge [religious, philosophical, family, etc.]. It is necessary to make it clear that science is a special knowledge about reality. For Galliano (1979, p. 16), science "is the rational, systematic, exact and verifiable knowledge of reality"

A case study was carried out in the Industrial Penal Colony of Maringá, Paraná (PEM). And an area for the production of medicinal plant species was installed, which will serve as a base for the production of medicines and the implementation of a community pharmacy specialized in the prescription of herbal medicines to meet the internal demands of the Penal Colony. Agroecological techniques will be used for the production of medicinal plants, which will allow, a posteriori, the certification of the production unit as organic. Figure 1 shows the Penal Colony of Maringá on the map of Maringá.

Figure 1

Map of the Region surrounding the PEM with location

Source: Google Maps, 2024.

The research was developed in two stages. In the first stage, theoretical classes were held on planting on an ecological basis, harvesting and extraction of active ingredients from medicinal plants. In addition, lectures and debates were held on the use of medicinal plants and the importance of contact with nature for mental health. In the second stage, the identification and selection of medicinal plants for cultivation, formation and conduction of the Germplasm Bank was carried out and the participants developed activities related to soil preparation, fertilization, planting, conduction and harvesting of the species and participation in the unconscious evaluation through the clipping of a magazine and pasting on cardboard and at the end self-explanation.

In questionnaire 1 it is to understand what was the knowledge about medicinal plants, to know if they understand the importance of studying these plants, to understand if they are willing to want to learn and finally to know the knowledge acquired in the course.

In the second questionnaire it was to evaluate, the first two questions to know if you learned and if you were motivated by the course, these two answers were individual; in the next two questions it was about contact with the community.

The species were acquired from the Technological Center (CTC) of the Agricultural and Industrial Cooperative of Mandaguari (COCARI), municipality of Mandaguari, Paraná, from the Experimental Farm of Iguatemi (FEI/UEM), belonging to the State University of Maringá (UEM) and from other sources of donation. In the second stage, the inmates were involved in the processing activities of species of the Germplasm Bank and in the extraction and production of herbal medicines. The Production area (germplasm bank) corresponds to 600m² and is composed of the species presented below, with their main characteristics. All Figures have been taken from Google 2024.

Lemon Balm (*Melissa officinalis* L): popularly known as true lemon balm, it is a plant belonging to the Lamiaceae family, which originates in Asia and Europe (Figure 3). It has a very characteristic lemon odor, being widely used in the control of various nervous crises, anxiety, hysteria, and emotions through its tranquilizing and sleep-inducing activity (DA SILVA et al., 2021).

Figure 2

Lemon Balm

Pau d'Álho (*Gallesia integrifolia* Spreng. Harms): also popularly known as ibirarema, it belongs to the Phytolaccaceae family (Figure 4). It is arboreal in size and is native to South America, occurring in Brazil in the Atlantic Forest, Amazon, Cerrado and Caatinga biomes (MARCHIORETTO, 2019).

Figure 3

Garlic stick

Boldo (*Plectranthus neochilus*, Schltr.): is a plant that presents physiological and morphological differences when grown in varied environmental conditions such as light intensity, altitude, humidity. Variations range from the expression of reproduction, sexual or not, to the number of leaves per branch, the distance between nodes, the leaf area and the external morphology of the leaves. Such variations are useful to explain the concept of phenotypic plasticity (LIMA et al., 2017)

Figure 4

Bilberry

Boldo-do-chile (*Peumus boldus*): also known as boldo normal, nacional, it is a medicinal plant originally from the region of Chile, but which is widely used in the Brazilian territory. With a more pleasant aroma than conventional boldo and a not so bitter taste, boldo-do-chile is great for solving issues related to the digestive tract. In addition to therapeutic and spiritual purposes, boldo-do-chile can also be added to any recipe, as a seasoning.

Figure 5

Boldo of Chile

Merthiolate (*Jatropha Multifida*): also known as mercury, pine nut, white spinning top, Paraguayan pine nut, purple pine nut, purgative herb, jalapa, castor bean, purple peon, tiu root. It is used as an antiseptic and antifungal and had gallic acid in its latex, acting on the inhibition of inflammation similar to the commercial drug. The leaves and fruits can also be used as healing, anti-hemorrhagic, laxative, antirheumatic and antihypertensive.

Figure 6

Merthiolate

Alfavaca (*Ocimum gratissimum* L): known as alfavacão, alfavaca-cravo, alfavaca, manjerição-cheiroso, alfavaca-de-vaqueiro, remédio-de-vaqueiro, etc. Originally from the East and subsontaneous throughout Brazil. It is a shrubby plant (it reaches up to 2 m in height), very aromatic and with a smell similar to "cloves". Alfavaca tea can eliminate toxins and fight inflammatory processes, due to the high concentration of flavonoids. In the presence of cold and flu symptoms, cough and sore throat, alfavaca tea is an excellent expectorant of the upper airways, helping to eliminate mucus and secretions.

Figure 7

Basil

Comfrey (*Symphytum officinale* L.): it is a perennial plant of European and Asian origin that has been introduced to the United States and South America. Used in the treatment of burns and wounds, diarrhea, bronchitis; in gargles in throat inflammations.

Figure 8

Comfrey

Swamp cane (*Costus spicatus* Jacq): popularly known as monkey cane, it is a medicinal plant rich in flavonoids, heterosides, tannins and oxalic acid, with anti-inflammatory, diuretic, nephroprotective and tonic properties, and is therefore indicated to assist in the treatment of kidney stones, urinary infection or menstrual changes, for example.

Figure 9

Caninha do brejo

Aloe vera (*Aloe vera*): Grows wild in tropical climates around the world and is cultivated for agricultural and medicinal uses. It is a plant used for various medicinal purposes for many years. It is usually used for skin-related problems (acne, burns, psoriasis, leprosy, etc.). It is known for its effects on wound healing, burns, hemorrhoids, bruises, rheumatic pains and as a laxative and in the treatment of cancer.

Figure 10

Aloe vera

Penicillin (*Alternanthera brasiliana* L.) popularly called evergreen, caaponga, carrapichinho, carrapichinho-do-mato, perpetual-do-brasil, perpétua-do-mato, quebra-panela, cabeça-branca, aconite-do-mato, ervanço, nateira, terramycin, infallible, doril, penicillin (penicillin-vegetal), has its origin from Central America. The infusion of its leaves is considered diuretic, digestive, depurative, and is used for liver and bladder diseases. The population of the Amazon region uses the infusion of the flowers against diarrhea, inflammation and cough (becica), while the decoction of the leaves is used internally in case of stroke. The bath prepared with the leaves is used for "bone displacement".

Figure 11

Penicillin

Mint (*Mentha piperita*): commonly called mint. It is a mild-tasting plant, widely used to make spices, candies and other treats. It has a strong and spicy flavor, it is usually used to flavor toothpaste, candies, gum, etc. Menthol has the ability to stimulate the so-called "cold nerves", which are usually activated by the drop in temperature (cold). But in this case, the nerves are activated by the presence of the substance in our body. Its regular consumption can help in treating symptoms such as pain, bloating, gas, etc. It has action against flu and colds. Menthol is a great decongestant and expectorant, helping to reduce sore throats and dry coughs.

Figure 12

Mentha

Ora-pro-nóbis (*Pereskia aculeata*): it is an edible plant with several medicinal properties, providing several health benefits, such as preventing anemia, improving bowel function, weight loss, preventing premature aging, and lowering cholesterol. It is rich in fiber, protein, iron, vitamin A and vitamin B3, which are nutrients with antioxidant, lipid-lowering, laxative and hypoglycemic properties.

Figure 13

Ora-pro-nobis

The research carried out is characterized as qualitative, exploratory research and, in procedural terms, as action research (TRIPP, 2005).

After all the work was carried out, some forms of evaluations were carried out: 1. Systematization of the experiences of the inmates involved in the process of implementation and processing of medicinal plant species; 2. Application of semi-structured questionnaires for individual social interviews. The questionnaire consisted of questions about previous knowledge of planting, cultural treatments, harvesting and extraction of active ingredients from medicinal plants. The questionnaire was applied at the beginning and at the end of the research; 3. Workshop, with the following progressive activities: 1. Non-specific warm-up; 2. Specific heating; 3. Main activity; 4. Participants' statements; 5. Observation, description and analysis of activities. A more detailed description of the Workshop is presented below: 1. Title: Cultivating Hope: Implementation of a Medicinal Plant Germplasm Bank for Herbal Use; 2. Objective: to rescue the experiences accumulated by the inmates in the process of implanting, conducting, harvesting and processing the species of medicinal plants and relate them to the promotion of physical and mental health, with the learning of practical skills and with the development of therapeutic skills; 3. Materials used: mat, cardboard, scissors, ruler, magazines and glue; 4. Development of activities: 4.1. Introduction (15 minutes); 4.2. Selection of medicinal plants by the participants (15 minutes); 4.3. Group Discussion (30 minutes); 4.4. Poster Creation (30 minutes); 4.5. Presentation of the Posters (15 minutes); 4.6. Participants' testimonies (15 minutes).

In the process of forming the planting of medicinal plants, rock dust was used to fertilize the space used for the idealization of the germplasm bank, the rocking process is an old

method, but still very little explored that is based on the use of rock with specific characteristics due to the presence of nutrients that after being ground becomes a kind of powder. When incorporated into the soil, it promotes a slow release of minerals such as phosphorus and potassium. Through this technique, we sought to equip inmates with a practice that has great potential for sustainability, as it allows the use of mining waste, reduces environmental problems caused by the indiscriminate use of chemical fertilizers, produces better quality food and reduces agribusiness costs (SILVEIRA, 2016 apud JUNIOR, 2020).

In this process of practical and scientific learning, according to Alovisei et al. (2020), basalt powder can be considered as an alternative source of low-cost fertilizer and soil amendment, however, the low solubility of basalt powder indicates that this material cannot be used as the main source of nutrients for plants.

Soil fertility, among other factors, depends directly on the quality of the mother rock, which when ground by physical processes, can be sources of mineral nutrients for the soil.

4 RESULTS AND DISCUSSION

This article analyzes the psychopedagogical impact of practical activities related to the management of medicinal plants in agroecological projects. The results demonstrate that the practical activities contribute significantly to raise the participants' self-esteem and strengthen the sense of accomplishment, corroborating the conclusion presented in the original text.

The monitoring and observation of the inmates involved in the activities of implantation, conduction, processing of medicinal plants and production of herbal medicines allowed the identification of objective characteristics through Questionnaires (Questionnaires 1 and 2) and subjective through the cutting of magazines and pasting on posters (holding a workshop), both in individual and group terms, data shown in figure 14 and subjective data in figure 15.

4.1 PSYCHOPEDAGOGICAL EVALUATION OF CONVICTS

Psychopedagogical evaluation of the participants involved in activities related to soil preparation, planting and conducting medicinal plant species (germplasm bank) and processing and production of herbal medicines

Impact on Self-Esteem and Sense of Accomplishment: because the research work is practical and with a productive bias, it was perceived, throughout the process, that the theoretical-practical activities developed positively influenced the participants' self-esteem and sense of accomplishment.

Hands-on Learning and Application of Knowledge: The activities carried out served as a tangible form of knowledge application, offering a hands-on approach to learning about botany, herbal medicine, and plant care. The knowledge shared was quickly socialized and assimilated by the participants.

Development of Social and Teamwork Skills: the practical activities created a favorable environment for teamwork. Teamwork allowed the development of social, collaborative, and communication skills among participants, essential for positive and productive interactions.

Conflict Resolution and Emotion Management: the collaborative environment contributed to the resolution of conflicts and the management of emotions of the participants, which can be observed by the reduction of negative or confrontational behaviors.

In the graphic data, the convicts worked and evaluated are named as, convict 1: L69; convict 2: R59; convict 3: D51; convict 4: M46 and C45: their characteristics are analyzed and discussed below.

Some parameters were analyzed and placed as a form of individual and collective evaluation, considering that freedom of expression was a point of fundamental importance for them to be able to write or even in the workshop of unconscious projection.

Table 1

Tables of basic characteristics of the convicts

Participant	Age	Schooling	Profession	CHARACTERISTIC
L69	69	FUNDAMENTAL	PORTHOLE	CALM
R59	59	FUNDAMENTAL	MUSICIAN	GOOD PERSON
D51	51	FUNDAMENTAL	ARMBAND	QUIET/SHY
M46	46	FUNDAMENTAL	ARMBAND	DEAF MUTE
C45	45	FUNDAMENTAL	ARMBAND	STRONG/SHY

Figure 14

Characteristics evaluated in the Initial Questionnaire (Questionnaire applied to the inmates participating in the CPIM Research. Maringá. Paraná. Letter: first letter of the participant's name; Number: age of the participant

"The Source of Self-Esteem: Essays, Speeches and Reflections" is an impactful work by renowned writer Toni Morrison, released by Companhia das Letras in 2020. In this volume, Morrison presents us with a series of essays, speeches, and reflections that delve deep into the intricate and multifaceted concept of self-esteem. Through an insightful approach, the author explores themes such as identity, race, gender, and power, revealing how these complex elements shape people's self-image and self-worth.

With her eloquent prose and unique sensitivity, Morrison invites readers on a journey of self-knowledge and reflection on self-esteem. Challenging pre-established concepts, she highlights the importance of recognizing and valuing the diversity of experiences and life trajectories. "The Source of Self-Esteem" not only offers an enriching and provocative read, but also serves as a powerful instrument of empowerment, inspiring readers to embrace their uniqueness and find strength in self-esteem.

Impact on Self-Esteem and Sense of Accomplishment: because the research work is practical and with a productive bias, it was perceived, throughout the process, that the theoretical-practical activities developed positively influenced the participants' self-esteem and sense of accomplishment.

Hands-on Learning and Application of Knowledge: The activities carried out served as a tangible form of knowledge application, offering a hands-on approach to learning about botany, herbal medicine, and plant care. The knowledge shared was quickly socialized and assimilated by the participants.

Development of Social and Teamwork Skills: the practical activities created a favorable environment for teamwork. Teamwork allowed the development of social, collaborative, and communication skills among participants, essential for positive and productive interactions.

Conflict Resolution and Emotion Management: the collaborative environment contributed to the resolution of conflicts and the management of emotions of the participants, which can be observed by the reduction of negative or confrontational behaviors.

According to MORRISON (2020), from a therapeutic point of view, contact with nature and the process of growing medicinal plants can have positive effects on the mental health of participants, helping to reduce stress, anxiety, and symptoms of depression. Additionally, using plants for the preparation of natural remedies can encourage self-care practices and promote a more holistic approach to health.

Machado Junior, Romeus de Paula (2023 p.10) Although education is not the only instrument to obtain a decent standard of living, it provides the individual with greater chances of access to better working conditions and coexistence.

Connection with Nature and Well-Being: the positive impact of interaction with medicinal plants on the psychological well-being of the participants was observed, a fact that points to the importance of involvement and interaction with nature as a determining factor in the production of health and well-being, especially for positively influencing the emotional and mental state of individuals.

The feelings of an incarcerated individual or in Total Institutions, as defined by GOFFMAN (1987), can vary greatly, but generally include anxiety, stress, loneliness, anger, and even depression. Studies show that deprivation of liberty can negatively impact mental health, leading to feelings of isolation and hopelessness (Benelli, 2014). Lack of social contact and limited autonomy also contribute to these feelings. The results of the research point to the potential for reducing these impacts on the physical and mental health of inmates of the Industrial Penal Colony of Maringá.

Using projective techniques, which are psychological methods used to understand unconscious aspects of a person's personality, it was separated letter, name and age in which individuals were named as: L69, R59, D51, M46 and C45. A questionnaire was applied at the beginning of the project, and at the end a questionnaire of 4 questions and to conclude the perceptual work, a poster pasting work was carried out with the aim of verifying unconscious data so that they could be confronted and analyzed with the questionnaires of each individual. The work on cardboard serves to form data that presents vague or ambiguous stimuli to observe the individual's responses and reveal their hidden thoughts, feelings and impulses.

Figure 15

Characteristics evaluated in the Final Questionnaire (Questionnaire 2) applied to the inmates participating in the CPIM Survey. Maringá. Paraná. Letter: first letter of the participant's name; Number: age of the participant

Soon after, we will make the relationship between the conscious (questionnaire) and the unconscious (cut and paste), starting from figure 16 to perceive the relationship between the result of the answers and the poster built where the unconscious projection of the individual's perception is confirmed in relation to the work developed of herbal medicines in the Penal Colony during the process of implantation of the germplasm bank.

4.2 SUBJECTIVE EVALUATION OF THE CONVICTS

L69 In the first figure pasted on the poster he recalled that he has a house and how he values it at this moment, then he says that he pasted the president's photo because he is his unconditional fan and that it represents his ideals, soon after he presents the woman in a yoga position and comments that it is necessary to meditate and calm down to face life, the figure of the little pig for him represents the planning and saving that everyone should do this, then the harpy eagle recalled that when he was little his father had eliminated a bird of this

size that was almost 2 meters long and was not used and that today he is aware of preservation, finally the last figure represents freedom, as reported in Figure 16.

Figure 16

Conscious (Questionnaire 2) and unconscious (Workshop) responses of Participant L 69, obtained in the final evaluation of the research

However, I can help create a generic abstract based on the title and theme of the article: The article "Benefits of Herbal Medicine in the Prison Context: A Systematic Review" seeks to analyze the potential benefits of using herbal medicine in prison settings through a systematic review of the literature. It examines relevant studies investigating inmates' use of medicinal plants and the positive impacts on physical and mental health. The article addresses possible therapeutic benefits of medicinal plants in reducing stress, anxiety, and other common health problems in prison populations. In addition, it discusses issues related to the safety, efficacy and implementation of phytotherapy programs in prison institutions.

R59 She reported that the nature placed on her collage poster represents connection and that everything is connected and some know how to use the knowledge of plants and others do not, so she chose figures that represent nature, the first two, third teaching and connection, three figures with women making use of this knowledge and the rest of the figures the final objective is the preparation of herbal medicines to assist in health treatments. As shown in Figure 17.

Figure 17

Conscious (Questionnaire 2) and unconscious (Workshop) responses of Participant R 59, obtained in the final evaluation of the research

D51 He is the least communicative of individuals, but he is afraid to impose himself and take his place, so he pasted the first drawing containing a giant iguana, his friend r59 inspires him with music so the second figure of a keyboard and a brain, the third figure for him reminds him of integration, the contrasting figure of the sunset and total darkness represents this fickle thought, Finishing with the figure of the small dog and the big dog that he often feels like the small dog in the photo. As depicted in Figure 18.

Figure 18

Conscious (Questionnaire 2) and unconscious (Workshop) responses of Participant D 51, obtained in the final evaluation of the research

M46 And the apparently more limited individual, he does not hear or speak, he knows how to read but cannot write, he preferred to put what he misses the most, which is the sound, the figure of the cat by analogy represented their mascot that he found familiar, only the photo of the grape harvest he related to the vegetable garden. Figure 19.

Figure 19

Conscious (Questionnaire 2) and unconscious (Workshop) responses of Participant M 46, obtained in the final evaluation of the research

C45 This individual has cataracts and a lot of difficulty seeing, soon he will have the operation to restore or improve his vision, in the first picture he reported that he knows that plants and cultivation are good for neurons, the photos of strawberries, apples and coffee represent their work in this place, he likes children so 4 photos of children. Figure 20.

Figure 20

Conscious (Questionnaire 2) and unconscious (Workshop) responses of Participant C 45, obtained in the final evaluation of the research

5 CONCLUSIONS

The preliminary results of the research point to the potential of phytotherapy in the production of physical and mental (psychological) health of inmates, justified by the important and growing gains in terms of learning, empathy, motivation, interest, formation of bonds, interdependence and respect throughout the involvement in the processes of the activities carried out. The gains observed could be perceived in terms of the individual and group as they could be observed in a high degree of satisfaction, all closer to 10 on the scale of the corresponding axis of each inmate.

This work in the Penal and Industrial Colony of Maringá proved to be an activity of great importance for the recovery and resocialization of the incarcerated. In addition to providing new skills and possibilities for life projects, the contact with nature and the activities related to the cultivation of medicinal plants provided a therapeutic environment and contributed to the improvement of the mental health of the participants. Therefore, we believe that the continuity of the project is essential for the promotion of the recovery and rehabilitation of the inmates.

QUESTIONNAIRES

Questionnaire 1. Questionnaire to evaluate the inmates of an agricultural penal colony who will be submitted to learning how to plant, harvest and extract active ingredients related to phytotherapeutic knowledge. Initial Phase.

1. What is your previous experience with planting and harvesting plants?
2. Do you know how to identify different types of plants and their medicinal properties?
3. Do you understand the importance of using medicinal plants in human health?
4. Have you ever studied any technique for extracting active ingredients from plants?
5. What is your motivation for participating in this phytotherapy course?
6. Are you willing to work as a team during the process of planting, harvesting and extracting active ingredients?

7. Are you aware of the risks and precautions required when dealing with medicinal plants?
8. Do you know how to properly use personal protective equipment (PPE) while working on the plantation?
9. Do you understand that the knowledge acquired in this course can be applied in the future in your life outside prison?
10. How do you intend to use the skills acquired in this course after serving your sentence?

Questionnaire 2. Questionnaire to evaluate the inmates of an agricultural penal colony who will be submitted to learning how to plant, harvest and extract active ingredients related to phytotherapeutic knowledge. Final Phase.

Inform grade from 0 to 10 and justify the answer.

1. Do you consider that learning about planting, harvesting and extracting active ingredients was useful to you?
2. Did you feel motivated to continue working with plants after serving your sentence?
3. Do you consider that the contact with nature and the activities related to the cultivation of plants contributed to your recovery?
4. You believe that group work contributed to your learning

ABSTRACT

In a context marked by an infodemic and the widespread circulation of low-quality content, digital curation becomes a central strategy for ensuring access to reliable health information. This chapter analyses the Windows of Knowledge (WoK) of BIREME/PAHO/WHO as a concrete example of a curation infrastructure implemented within the framework of the Virtual Health Library. Drawing on a literature review on digital curation, information lifecycle and preservation models, in combination with institutional technical documents, it examines the informational architecture of the Windows, their flows of content selection, validation and updating, as well as the technical and organisational requirements for their maintenance. Issues such as usability, accessibility, interoperability with other health platforms and the challenges of continuous updating in highly dynamic knowledge domains are discussed. A SWOT-type analysis explores the initiative's strengths and weaknesses, highlighting opportunities for expansion to new themes and audiences. Concrete examples, such as the Windows dedicated to COVID-19, Mpox, health promotion and the commercial dimension of the determinants of health, illustrate how digital curation can support public policies, health education and evidence-informed decision-making. Finally, the chapter proposes recommendations to strengthen similar initiatives in other institutional contexts.

Keywords: Digital Curation. Health Information. Infodemic. Virtual Health Library (VHL). Windows of Knowledge (BIREME/PAHO/WHO).

RESUMO

Em um contexto marcado por uma infodemia e pela ampla circulação de conteúdos de baixa qualidade, a curadoria digital torna-se uma estratégia central para garantir o acesso a informações confiáveis em saúde. Este capítulo analisa as Janelas do Conhecimento (WoK) da BIREME/OPAS/OMS como um exemplo concreto de infraestrutura de curadoria implementada no âmbito da Biblioteca Virtual em Saúde. Com base em uma revisão de literatura sobre curadoria digital, ciclo de vida da informação e modelos de preservação, combinada a documentos técnicos institucionais, examina-se a arquitetura informacional das Janelas, seus fluxos de seleção, validação e atualização de conteúdos, bem como os requisitos técnicos e organizacionais para sua manutenção. São discutidas questões como usabilidade, acessibilidade, interoperabilidade com outras plataformas de saúde e os desafios da atualização contínua em domínios de conhecimento altamente dinâmicos. Uma análise do tipo SWOT explora as forças e as fragilidades da iniciativa, destacando

¹ Professional Master's Degree in Information Management. Universidade de São Paulo/Escola de Comunicações e Artes. E-mail: lragacini@usp.br

oportunidades de expansão para novos temas e públicos. Exemplos concretos, como as Janelas dedicadas à COVID-19, Mpox, promoção da saúde e à dimensão comercial dos determinantes da saúde, ilustram como a curadoria digital pode apoiar políticas públicas, educação em saúde e a tomada de decisão informada por evidências. Por fim, o capítulo propõe recomendações para fortalecer iniciativas semelhantes em outros contextos institucionais.

Palavras-chave: Curadoria Digital. Informação em Saúde. Infodemia. Biblioteca Virtual em Saúde (BVS). Janelas do Conhecimento (BIREME/OPAS/OMS).

RESUMEN

En un contexto marcado por una infodemia y la amplia circulación de contenidos de baja calidad, la curaduría digital se convierte en una estrategia central para garantizar el acceso a información confiable en salud. Este capítulo analiza las Ventanas del Conocimiento (WoK) de BIREME/OPS/OMS como un ejemplo concreto de infraestructura de curaduría implementada en el marco de la Biblioteca Virtual en Salud. A partir de una revisión de la literatura sobre curaduría digital, ciclo de vida de la información y modelos de preservación, combinada con documentos técnicos institucionales, se examina la arquitectura informacional de las Ventanas, sus flujos de selección, validación y actualización de contenidos, así como los requisitos técnicos y organizativos necesarios para su mantenimiento. Se discuten aspectos como usabilidad, accesibilidad, interoperabilidad con otras plataformas de salud y los desafíos de la actualización continua en dominios de conocimiento altamente dinámicos. Un análisis de tipo FODA explora las fortalezas y debilidades de la iniciativa, destacando oportunidades de expansión hacia nuevos temas y públicos. Ejemplos concretos, como las Ventanas dedicadas a COVID-19, Mpox, promoción de la salud y a la dimensión comercial de los determinantes de la salud, ilustran cómo la curaduría digital puede apoyar las políticas públicas, la educación en salud y la toma de decisiones informada por evidencia. Finalmente, el capítulo propone recomendaciones para fortalecer iniciativas similares en otros contextos institucionales.

Palabras clave: Curaduría Digital. Información en Salud. Infodemia. Biblioteca Virtual en Salud (BVS). Ventanas del Conocimiento (BIREME/OPS/OMS).

1 INTRODUCTION

Information curation in healthcare is a crucial strategy for combating misinformation, especially given the escalating production and dissemination of unverified content. The explosion of digital data and the swift circulation of inaccurate information highlight the indispensable need for mechanisms that ensure access to reliable, evidence-based content. As Tredinnick (2006) argues, "the dematerialisation of information has reduced dissemination costs, but has also compromised the authenticity and traceability of content" (Tredinnick, 2006, p. 106). The democratisation of access to information necessitates effective strategies to minimise the impact of misinformation (Tredinnick, 2016).

Floridi (2013) observes that "ICTs have profoundly affected many aspects of the human condition, including the nature of communication, education, work, entertainment, industrial production and business, healthcare, social relations, and armed conflict" (Floridi, 2013, p. 17). Within the health sector, these changes carry critical implications, as misinformation can lead to misguided decisions, directly affecting public health and well-being (Vosoughi, Roy & Aral, 2018). Furthermore, Floridi (2013) stresses that "freedom of expression in the digital age must be balanced with the responsibility to avoid harm caused by intentional misinformation". The World Health Organisation (WHO) cautions that health misinformation represents one of the primary global threats, particularly during events like pandemics, where the spread of false news can undermine the effectiveness of preventative and therapeutic measures (WHO, 2021).

In this context, health information curation emerges as an essential practice to ensure that healthcare professionals, managers and the general public have access to trustworthy, evidence-based content. Wardle and Derakhshan (2017) highlight that content curation and digital curation are complementary processes involving the selection, organisation, preservation, and provision of information, aiming to add value and facilitate access to reliable data. UNESCO (2003), in its Charter on the Preservation of Digital Heritage, emphasises the necessity of preserving both born-digital data and digitised analogue sources. While content curation focuses on reducing informational noise through expert validation, ensuring information accuracy, digital curation extends this scope by managing digital assets throughout their lifecycle. This process includes data collection, preservation, and value enhancement for present and future use (Beagrie, 2008). In the realm of health information, these practices are fundamental for the efficient management of the vast volume of data generated in the sector, ensuring its accessibility, reliability, and long-term preservation.

Against this backdrop, the Windows of Knowledge (WoK) of the Latin American and Caribbean Centre on Health Sciences Information (BIREME) stands out as a structured tool designed to facilitate the organisation and provision of validated information, promoting qualified access to knowledge. The hypothesis of this study is that the WoK can be considered an efficient model for health information curation, playing a significant role in mitigating the effects of misinformation by delivering validated, systematically organised, and accessible content to diverse audiences. To test this hypothesis, a literature review was conducted in recognised databases, including PubMed, LILACS, and BRAPCI, using keywords such as "Digital curation", "Information curation", and "Digital libraries" in Portuguese and English. Additionally, technical documents from BIREME, such as the Windows of Knowledge: Customisation and Creation Guide (BIREME/PAHO/WHO, 2020), were consulted.

Tools like the Windows of Knowledge exemplify the practical application of digital curation, offering an organised and accessible platform for disseminating reliable health information, free of charge to the user (BIREME/PAHO/WHO, 2020). The WoKs are a strategic resource of the Virtual Health Library (VHL), specifically designed to highlight selected documents and information resources on pertinent topics. Functioning as a Knowledge Window, it draws attention to a representative collection of content, which may or may not be associated with a VHL Network Instance Portal. Following its own methodology, WoKs provide direct access to documents indexed in VHL information sources, alongside links to pre-defined search strategies, external sources, and content updated via RSS, such as blogs, epidemiological bulletins, and news. This approach ensures quick and reliable access to relevant information. Furthermore, content is delivered in a variety of formats, including videos, infographics, and infometrics, enhancing comprehension and usability for diverse audiences.

A study published in *The Lancet* highlighted that during the COVID-19 pandemic, over 80% of information shared on social media about the virus was inaccurate or false (Brennen et al., 2020). This scenario underscores the need for initiatives that promote the curation of reliable content, such as the WoK, which has already been used to highlight validated information on topics like universal health and infectious diseases (BIREME/PAHO/WHO, 2020). Moreover, WHO data indicates that health misinformation directly impacts adherence to treatments and vaccines. In 2019, for instance, vaccine hesitancy was deemed one of the

top ten global health threats, with misinformation being a primary contributing factor (WHO, 2019).

Given these challenges, digital curation in health information context is a vital strategy for promoting health education and combating misinformation. WoKs represent a crucial tool in this process, enabling the organisation and dissemination of validated scientific content, thereby contributing to evidence-based decision-making and the improvement of public health.

2 FOUNDATIONS OF DIGITAL INFORMATION CURATION

Information curation, particularly in the digital sphere, is a field demanding an interdisciplinary approach, integrating technical, theoretical, and practical aspects. According to Dallas (2015), digital curation extends beyond professional administration, encompassing a broad range of stakeholders including researchers, artists, users, and communities, as shared responsibility is vital for effective digital curation. Oliver and Harvey (2016) note the importance of "determining who the stakeholders in the curation process are, because each type of stakeholder is likely to have different knowledge, skills, and understandings about what the digital objects are and how they are used" (Harvey, 2016, p. 76). Tredinnick (2016) asserts that digital information curation must always strike a balance between the neutrality of knowledge organisation and the social responsibility of ensuring access to reliable information (Tredinnick, 2016, p. 224,).

Charles Esche points to inherent limitations and philosophical challenges within curatorial practice, particularly in artistic and cultural contexts (Martinon, 2013). Meanwhile, Harvey (2010) stresses the importance of a proactive approach, where data is planned and structured from its inception to guarantee its long-term utility. Tredinnick (2006) supports this notion, stating that "digital preservation is an essential aspect of information curation, ensuring the permanence of validated knowledge for future generations" (Tredinnick, 2016, p. 46). Floridi (2013) further reinforces this perspective, observing that "we will be in serious trouble if we do not take seriously the fact that we are building the new physical and intellectual environments that future generations will inhabit".

The Curation Lifecycle Model, developed by the Digital Curation Centre (DCC) – an institution dedicated to supporting and promoting digital curation – serves as a foundational approach, highlighting stages such as metadata creation. The principles underpinning this model include:

Holistic Approach: It considers the entire data lifecycle.

Focus on Preservation and Access: It ensures data remains useful and accessible.

Data Valorisation: It adds value to data for future reuse.

Collaboration: It involves various stakeholders in the process.

Adaptability: It can be applied across diverse contexts and disciplines.

Table 1 below summarises the main points of the DCC Curation Lifecycle Model:

Table 1

Main points of the DCC Curation Lifecycle Model

Category	Description
Full lifecycle actions	Apply to all stages of the lifecycle and are represented by four concentric rings in the model.
1. Description and representation information	Assign administrative, descriptive, technical, structural, and preservation metadata, using appropriate standards, to ensure adequate description and control over time. Collect and assign representation information.
2. Preservation planning	Plan preservation throughout the digital material's lifecycle, including plans for managing and administering all curation actions.
3. Community watch and participation	Monitor technological developments and participate in communities to ensure curation practices are up-to-date.
4. Curate and preserve	Perform management and administrative actions to promote curation and preservation throughout the lifecycle.
Sequential actions	Represent the main actions required to curate data as it moves through its lifecycle.
1. Conceptualise	Plan data creation, including defining preservation and reuse requirements.
2. Create or receive	Collect data and ensure it is properly structured and documented for preservation and reuse.
3. Appraise and select	Decide which data should be preserved based on criteria of value and utility.
4. Ingest	Add data to the repository, including assigning persistent identifiers, virus checking, and authenticity verification.
5. Preservation action	Apply preservation techniques, such as migration or emulation, to ensure data accessibility over time.
6. Store	Keep data in a secure and stable environment, with backups and multiple copies to ensure its integrity.
7. Access, use, and reuse	Ensure data is accessible and usable by authorised users, with metadata that facilitates its discovery and reuse.

8. Transform	Modify or reuse data to create new datasets, restarting the lifecycle.
Occasional actions	Actions that may be necessary under specific conditions, but do not apply to all data.
1. Reappraise	Re-evaluate data to determine if it is still relevant or should be discarded.
2. Dispose	Remove data that is no longer considered useful or relevant, following appropriate disposal policies.

Developed by the author based on Oliver and Harvey (2016, pp. 31-34)

According to Higgins (2008), the DCC Curation Lifecycle Model can serve as a valuable tool for planning curation and preservation activities in healthcare environments, ensuring the preservation and sharing of knowledge. This practical and methodological perspective is essential for addressing the technical challenges of digital curation, such as technological obsolescence and the fragility of digital objects. As the field evolves, there is a growing demand for professionals with specialised digital curation competencies, which can be particularly relevant for the effective management of health information in the digital age (Kim et al., 2013).

However, Martinon (2013) highlights Esche's view that curatorial practice is often constrained by external factors, such as financial and bureaucratic interests. He argues that while curation aspires to philosophical or aesthetic coherence, it is frequently compromised by the need to negotiate and manage these conflicting interests (Martinon, 2013, p. 24). This perspective from Esche underscores the tension between theory and practice in curation, a theme equally relevant in the context of digital curation. Both authors acknowledge the importance of reflection and critique in curation. Harvey (2010), for example, stresses the need to reflect on what curation truly means (Harvey, 2010). Both authors make a significant contribution to this discussion, as curation should not be viewed merely as an activity of organising exhibitions or events, but rather as an exploration of the potential for knowledge creation and critical reflection within this practice (Martinon, 2013, p. 241).

Another point of convergence between the authors is the significance of collaboration and knowledge sharing. Harvey (2010) highlights the necessity of a collaborative approach to digital curation, involving a variety of stakeholders, from scientists and researchers to librarians and archivists (Harvey, 2010, p. 93). Esche, in turn, suggests that curation should be a space for dialogue and exchange, where different perspectives and disciplines can converge (Martinon, 2013, p. 241). Despite these parallels, the authors also pinpoint distinct challenges. Harvey focuses on the technical and practical aspects of digital curation, such as

ensuring data accessibility and utility over time. He acknowledges that digital curation is an evolving field, where many practices and standards are still under development (Harvey, 2010, p. 55). This difference in emphasis reflects the multifaceted nature of the information curation process, as "digital curation not only organises information but assigns meaning and value to the knowledge generated" (Tredinnick, 2006, p. 184).

To facilitate understanding of the main concepts discussed by the authors, Table 2 below provides a structured overview of the practices, challenges, and theoretical perspectives related to information curation:

Table 2

Concepts of Curation (Harvey, 2010 and Martinon, 2013)

Concept	Definition/description	Example/practice	Challenges
Data lifecycle	The process encompassing data creation through to preservation and reuse.	Planning for "curation-ready" data from creation.	Ensuring data remains useful and accessible over time.
Metadata	Information describing data, including administrative and technical details, etc.	Creation of robust metadata to facilitate future discovery and use.	Maintaining consistency and utility of metadata across different contexts.
Digital preservation	Actions to keep data accessible beyond technological obsolescence.	Data migration to updated formats.	Dealing with rapid technological evolution and the fragility of digital formats.
Data reuse	Ensuring data can be effectively used in the future.	Open access policies and data sharing.	Balancing accessibility with privacy and copyright issues.
Collaboration and sharing	Joint work between different stakeholders to ensure effective curation.	Development of community standards and practices.	Coordinating efforts between disciplines and institutions with different priorities.
Critical reflection	Curation as an activity beyond mere organisation, exploring its potential for knowledge creation.	Questioning the limits of curation in bureaucratic contexts.	Overcoming financial and bureaucratic interests that restrict curatorial practice.
Risk management	Identifying and mitigating risks that threaten data integrity and accessibility.	Developing contingency plans for technological failures.	Anticipating and responding to unforeseen risks, such

			as natural disasters or hardware failures.
Curation as philosophical practice	Curation as a space for dialogue and reflection, not just organisation.	Exploring connections between science, art, and society.	Maintaining philosophical coherence in the face of external pressures, such as funding.
Access and authentication	Ensuring data is accessible only to authorised users.	Implementing access controls and authentication.	Balancing security with ease of access for legitimate users.
Data transformation	The process of adapting data for new uses or formats.	Data migration to new formats or creation of new datasets.	Maintaining data integrity and authenticity during transformation.

Developed by the author based on Harvey (2010) and Martinon (2013)

Information curation, especially in the digital context, is a complex field that demands a balanced approach between theory and practice. As highlighted in Table 1, curation involves a series of interconnected processes, from the data lifecycle to critical reflection on its role in knowledge creation. Harvey (2010) offers a practical and methodological perspective, emphasising the importance of practices such as creating robust metadata, digital preservation, and data reuse. These concepts are fundamental to understanding digital curation, which goes beyond simple data organisation, also encompassing risk management, data transformation, and ensuring access and authentication. However, the challenges are significant, including dealing with technological obsolescence, maintaining metadata consistency, balancing accessibility with privacy, and coordinating efforts across different disciplines and institutions.

Next, we will explore an analysis of the Windows of Knowledge (WoK) structure as a digital curation tool applied to the health sector. We will detail how the WoK was designed to organise and provide reliable and expert-validated information, facilitating quick and efficient access to relevant content.

3 ANALYSIS OF THE WINDOWS OF KNOWLEDGE STRUCTURE

The Windows of Knowledge (WoK) structure aims to highlight relevant and reliable information on specific health topics. It has been designed to facilitate quick and organised access to curated content, promoting the dissemination of expert-validated information. We will detail the WoKs structure, based on the customisation and creation guide

(BIREME/PAHO/WHO, 2020), highlighting its main areas, component layout, and the importance of expert collaboration in content curation.

The WoKs comprised of two main areas (Table 3): the component area and the content area. The component area is the initial section viewed by users and aims to draw attention to the topics covered through visual elements and quick links to supplementary information.

Table 3

Component Area of the Windows of Knowledge

Element	Description	Technical details	Recommendations
1.1 title	The title is the first element to be configured in the Knowledge Window. It should be clear, objective, and representative of the central theme.	Inserted into the WordPress editing field.	- short and direct title. - attract the target audience's attention. - facilitate navigation and content access.
1.2 main image	The main image is a central visual element, inserted via the WordPress post-thumbnail function.	Minimum dimensions: 320x320 pixels. Displayed in circular format in the Knowledge Window.	- choose clear images relevant to the theme. - ensure important content is visible in the circular format.
1.3 components	The Knowledge Window allows for the inclusion of up to 8 components, which are highlight boxes arranged around the main image. Each component is configured via a form with the following fields:		
1.3.1 public content	Defines whether the component will be displayed or hidden in the public interface.	Options: on (displayed) or off (hidden).	- use the off option for components under development or not intended for public display.
1.3.2 component title	A short and descriptive title for the component.	Recommended character limit: short and direct.	- clear and objective titles. - avoid long texts to improve readability.
1.3.3 text box	Optional area to include a small explanatory text about the component.	- simple text editor. - allows basic formatting.	- short and informative texts. - avoid overloading with unnecessary information.

1.3.4 link	Allows the insertion of URLs that direct to documents, pages, or specific sections of the site.	- internal or external links. - option to open in new window.	- use reliable and relevant links. - open in new window for external links.
1.3.5 title and icon colour	Visual customisation to highlight the component.	- selection of custom colours.	- choose colours that contrast with the background to improve visibility.
1.3.6 icon	Selection of icons from the Font Awesome library or insertion of custom images.	- pre-defined icons or URLs of images uploaded to the media area.	- choose icons that clearly represent the component's theme.
1.3.7 notes	Internal field for administrator annotations, not visible to the public.	- free text for internal use.	- use for annotations about the component's development or review.

Developed by the author based on the BIREME/PAHO/WHO Windows of Knowledge construction guide.

The components are arranged circularly around the main image, creating a visually appealing and functional layout. The order of components can be adjusted according to the relevance of the information, allowing for intuitive user navigation. This circular arrangement facilitates quick access to highlights, promoting an efficient and pleasant user experience.

The second area of the WoKs the content area, which permits the inclusion of detailed information about the topic addressed (Table 4). This area is divided into sections that can be configured according to content needs, using a simplified layout or WordPress's Page Builder for greater flexibility.

Table 4

Content Area of the Windows of Knowledge

Element	Description	Technical details	Recommendations
2.1 texts	the content area allows for the insertion of explanatory texts, which can be organised into one or two columns.	- WordPress text editor. - functionalities similar to a word processor.	- use headings and subheadings to organise content. - insert images to complement the text.
		- paragraph, heading, list formatting, and image insertion.	- customise background and text colours to improve readability.

2.2 infographics, images, charts, and tables	infographics and charts are powerful visual resources for transmitting complex information clearly and accessibly.	- insertion in up to three columns. - HTML codes for interactive infographics (e.g., Tableau).	- use clear and easily understandable infographics. - check compatibility with mobile devices.
		- some resources may not be compatible with mobile devices.	- avoid overloading the page with too many visual elements.
2.3 videos	the video area is compatible with platforms such as Youtube, allowing the insertion of up to three videos per section.	- insertion of video code (obtained from the Youtube url).	- choose short and relevant videos for the theme. - complement texts and infographics with videos.
		- multimedia functionality to enrich content.	- ensure videos are from reliable sources.
2.4 links to publications, documents, and related websites	the windows of knowledge allows for the inclusion of links to publications, documents, and websites related to the topic.	- organisation in up to three columns. - internal or external links.	- use reliable and relevant links. - direct to additional knowledge sources.
		- essential functionality to expand the reach of information.	- regularly check that links are functional and up-to-date.

Developed by the author based on the BIREME/PAHO/WHO Windows of Knowledge construction guide.

The content area is highly flexible, allowing for the organisation of texts, infographics, videos, and links into columns (1 to 3), depending on the topic's requirements. The column layout facilitates reading and navigation, ensuring that users find information quickly and intuitively. The combination of different formats (text, images, videos, and links) offers a multimedia experience, enriching the content and engaging the audience.

The arrangement of components and the organisation of content within the WoK have been designed to ensure an intuitive and efficient user experience. The component area, with its circular and visually appealing layout, draws attention to the key highlights of the topic. Conversely, the content area offers a flexible structure that can be adapted to meet the specific needs of each Knowledge Window.

Content curation in the WoKs a process involving the collaboration of specialists in the subject matter. These professionals are responsible for selecting, validating, and reviewing the information to be included in the Knowledge Window, ensuring that the content is accurate, up-to-date, and relevant. The participation of experts is fundamental to ensure the reliability of information, especially in critical areas like health, where misinformation can have severe impacts. Furthermore, peer review and content validation by qualified professionals enhance the WOK 's credibility, making it a reliable source of information for researchers, healthcare professionals, and the general public (Packer et al., 2014).

The WOK 's structure, with its component and content areas, has been designed to promote quick and reliable access to relevant health information. The visually appealing arrangement of components, combined with the flexibility of the content area, facilitates navigation and comprehension of the information. Moreover, the collaboration of experts in content curation and review ensures the accuracy and reliability of the information provided. This structure not only meets the needs of health information management but also positions itself as a strategic tool in combating misinformation, promoting the dissemination of validated and accessible knowledge.

4 WINDOWS OF KNOWLEDGE: STRUCTURE, IMPLEMENTATION AND TECHNICAL CHALLENGES

Implementing the WoK requires technical knowledge of WordPress and HTML (HyperText Markup Language), as the platform is built and managed within this environment. WordPress is a powerful tool, but its configuration and customisation demand familiarity with its interface, plugins, and functionalities. Additionally, Cascading Style Sheets (CSS) adjustments are frequently necessary to ensure a consistent and appealing design for the Knowledge Window.

Difficulty for inexperienced users: Healthcare professionals or content curators unfamiliar with WordPress or HTML may encounter difficulties in configuring and updating the Knowledge Window, relying on developers for basic tasks.

Reliance on technical support: A lack of in-house technical knowledge can lead to delays in implementing new functionalities or resolving issues, increasing dependence on third parties.

Additional costs: Hiring professionals specialising in WordPress and HTML can incur additional costs, particularly for institutions with limited resources.

The WoK requires constant updating to ensure that the information provided remains relevant and reliable. This involves periodic review of texts, replacement of outdated data, and inclusion of new resources, such as infographics, videos, and links.

- **Time and resource demands:** Maintaining an up-to-date Knowledge Window necessitates a dedicated team and an organised workflow, which can be challenging for institutions with limited human resources.
- **Risk of obsolescence:** If content is not regularly reviewed, the Knowledge Window may lose credibility, especially in dynamic areas like health, where new research and discoveries are frequent.
- **Impact on reliability:** Outdated information can lead to erroneous decisions by users, particularly in critical contexts such as public health.

The WOK must be compatible with mobile devices, such as smartphones and tablets, to ensure users can access information from anywhere. However, some features, like interactive infographics generated by tools such as Tableau, may not function correctly on mobile devices.

- **Compromised user experience:** If the Knowledge Window is not responsive or if some features do not work on mobile devices, users may struggle to access and interact with the content.
- **Loss of audience:** With the increasing use of mobile devices for internet access, a lack of compatibility can result in the loss of a significant audience.
- **Need for technical adjustments:** Ensuring compatibility with mobile devices requires testing and technical adjustments, which can increase the complexity and cost of platform maintenance.
- Technical maintenance of the WOKs essential to ensure continuous operation and data security. This includes regular updates to WordPress, plugins, and themes, as well as periodic backups.
- **Risk of vulnerabilities:** Outdated platforms can be targets for cyberattacks, compromising data security and the integrity of the Knowledge Window.
- **Time and resources for maintenance:** Technical maintenance demands dedicated time and resources, which can be challenging for small teams or those with multiple responsibilities.
- **Impact on availability:** Technical failures or security issues can result in periods of Knowledge Window downtime, hindering user access to information.

The WoK must be accessible to all users, including those with visual, auditory, or motor impairments. This necessitates the implementation of accessibility guidelines, such as the Web Content Accessibility Guidelines (WCAG), and conducting usability tests.

Complexity of implementation: Ensuring accessibility can require significant technical adjustments, such as including alternative descriptions for images and guaranteeing keyboard navigation.

Additional costs: Implementing accessibility features can generate additional costs, especially if it is necessary to hire digital accessibility specialists.

Impact on user experience: A platform that is not accessible can exclude part of the target audience, particularly in health contexts, where information is crucial for everyone.

The technical issues mentioned in Table 5 represent significant challenges for the implementation and maintenance of the WoK. These challenges have direct implications for the platform's effectiveness, user experience, and the reliability of the information provided. To overcome these obstacles, it is essential to invest in training, planning, and technical resources, as well as fostering collaboration among professionals from different areas. Addressing these technical problems will not only ensure the WoK 's success but also strengthen its role as an essential tool for disseminating reliable health information.

Table 5

Challenges for the Implementation of the Windows of Knowledge

Aspect	Description	Challenges	Considerations and solutions
5.1 technical knowledge	Implementing the windows of knowledge requires knowledge of WordPress and HTML to configure and customise the platform.	Difficulty for users without experience in WordPress or HTML. Need for CSS adjustments.	Offer training for teams. Rely on support from developers or IT professionals.
5.2 constant content updates	The relevance and reliability of information depend on constant content updates.	Keeping content updated requires time and resources. Risk of outdated information.	Establish a schedule for periodic review. Designate a team responsible for updating.
5.3 collaboration between professionals	The effectiveness of the Knowledge Window depends on collaboration between information professionals,	Difficulty coordinating between different areas of expertise.	Promote regular meetings between teams. Define clear roles and responsibilities.

	health specialists, and developers.	Communication between teams.	
5.4 accessibility and usability	The platform must be accessible and usable for different audiences, including people with disabilities and users with varying levels of technological familiarity.	Ensure accessibility for people with visual or motor disabilities. Intuitive interface.	Follow accessibility guidelines (e.g., WCAG). Conduct usability tests with different audiences.
5.5 mobile device compatibility	The Knowledge Window must be compatible with mobile devices, ensuring a consistent user experience across different platforms.	Some features, such as interactive infographics, may not work well on mobile devices.	Test the Knowledge Window on different devices and browsers. Prioritise the use of responsive features.
5.6 technical maintenance	Technical maintenance of the platform is essential to ensure continuous operation and data security.	Need for regular WordPress and plugin updates. Risk of security vulnerabilities.	Implement a regular technical maintenance plan. Perform periodic data backups.

Developed by the author based on the BIREME/PAHO/WHO Windows of Knowledge construction guide.

The Windows of Knowledge plays a vital role in disseminating reliable health information; however, its implementation and maintenance present challenges that require structured approaches to ensure efficiency and sustainability over time. To address these challenges, several fundamental strategies have been established, encompassing training and capacity building, continuous updating, interdisciplinary collaboration, usability and accessibility, and technical monitoring.

Staff training is one of the primary aspects to ensure that professionals responsible for the Knowledge Window are proficient in the tools used, such as WordPress and HTML, as well as possessing knowledge of information curation. Continuous training allows for technical and editorial adjustments to be made autonomously, reducing reliance on external support and ensuring greater agility in content updates. Additionally, team training should include best practices for information organisation, ensuring that data is presented clearly and accessibly to the target audience.

Constant content updates are a critical factor for the Knowledge Window's credibility. Defining a schedule for periodic reviews enables the maintenance of information relevance, ensuring that new scientific findings are incorporated and that links and references are regularly verified. This strategy prevents content obsolescence and strengthens user trust in

the platform. The implementation of this schedule should consider the update frequency of each topic covered, prioritising areas of greater impact and dynamism.

Interdisciplinary collaboration is another essential pillar for the WoK's success. Information professionals, health specialists, and developers must work in an integrated manner, ensuring that informational needs are met with adequate technical support. Clearly defining roles and responsibilities within the team contributes to a more efficient workflow and reduces communication barriers between different areas. Holding regular meetings to align strategies and share best practices is an effective approach to enhance this collaboration.

The usability and accessibility of the Knowledge Window are fundamental aspects for expanding its reach and ensuring that all audiences can use the platform intuitively and efficiently. Adopting international guidelines, such as the Web Content Accessibility Guidelines (WCAG), ensures that people with visual, auditory, or motor impairments can access information inclusively. Regular usability and accessibility tests should be conducted to identify and correct any barriers, ensuring fluid navigation and an optimised user experience.

Finally, continuous technical monitoring of the platform is essential to ensure its stability and security. Regular updates to WordPress, plugins, and themes are necessary to prevent vulnerabilities and potential malfunctions. Additionally, performing periodic backups protects data against loss and ensures rapid information recovery in case of failures. Performance monitoring is also a crucial strategy for identifying potential loading or navigation issues, allowing for proactive adjustments that improve the user experience. Implementing these strategies strengthens the WoK's reliability and sustainability, ensuring it continues to fulfil its role of providing quality information and combating misinformation in the health sector.

BIREME's WoK plays a role in health information curation, promoting access to reliable and evidence-based content. However, like any digital tool, it presents both positive aspects and challenges that can impact its effectiveness. Table 6 below summarises the main positive aspects and challenges faced by the WoK.

Table 6

Main positive aspects and challenges faced by the WoK

Aspect	Strengths	Challenges
Quality of information	Content validated by specialists and based on scientific evidence.	Need for continuous updating to avoid misinformation.

Usability	Intuitive interface and organised navigation.	Some functionalities require technical knowledge for configuration.
Accessibility	Available online and compatible with multiple platforms.	Not all content adheres to rigorous digital accessibility standards.
Interactivity	Use of videos, infographics, and links to reliable sources.	Some interactive functionalities are not optimised for mobile devices.
Updating	Possibility of continuous review through specialised curation.	Dependence on a qualified team to keep the platform always updated.
Visibility	Resource widely disseminated within the VHL and health information networks.	Low indexing in search engines can limit its reach.
Technical infrastructure	Based on WordPress, allowing customisation and scalability.	Requires constant maintenance to ensure security and stability.

Source: Developed by the author

Digital information curation requires a set of best practices to ensure the accessibility, preservation, and dissemination of knowledge. According to Harvey (2010), digital curation should follow well-established guidelines to ensure its effectiveness. Table 7 below presents which best practices are incorporated by the WoK and which need to be improved:

Table 7

Best practices incorporated by the WoK

Curation practice (Harvey, 2010)	Present in wok	Absent or to be improved
Curation planning from content creation	Yes	
Creation of structured metadata for better information retrieval	Yes	
Digital preservation to ensure content longevity	Partially	Lacks a robust long-term preservation plan.
Use of digital accessibility standards (WCAG)	Partially	Not all content strictly follows accessibility guidelines.
Continuous updating and validation by specialists	Yes	
Enhanced indexing for efficient information retrieval	Partially	Low indexing in search engines limits content reach.
Guarantee of interoperability with other health information platforms	Yes	
Strategies for user engagement with content curation	Partially	There could be greater interaction with the public for information customisation.

Source: Developed by the author based on Harvey (2010).

The table highlights that while the WoK adheres to several best curation practices, there are significant opportunities for improvement, particularly in digital preservation, accessibility, and information indexing. Investing in these aspects can ensure greater sustainability and efficiency in knowledge dissemination.

SWOT Analysis is a strategic tool used to evaluate the main internal and external factors impacting an organisation, project, or initiative. Its name derives from the words Strengths, Weaknesses, Opportunities, and Threats. This methodology provides a structured view of organisational reality, identifying internal strengths and weaknesses, as well as external opportunities and threats.

The application process primarily involves analysing internal factors, evaluating resources, capabilities, structure, and processes that confer a competitive advantage or represent challenges. Subsequently, the external environment is considered, identifying growth opportunities, technological advancements, political and economic changes, as well as potential threats that could compromise strategic objectives. The identified elements are organised into a matrix, facilitating the visualisation of interactions between strengths,

weaknesses, opportunities, and threats (Table 8). Based on this analysis, strategies are developed to leverage strengths, mitigate weaknesses, explore opportunities, and minimise external risks. The importance of SWOT analysis lies in its ability to guide strategic decision-making, offering a comprehensive view of the organisation and allowing the alignment of actions according to the internal and external context. In the case of the WoK, this tool can be essential for improving information curation, strengthening content reliability, and expanding its impact in combating misinformation, ensuring that its potential is maximised and its challenges are managed efficiently.

Table 8

SWOT Analysis

Strengths:	Opportunities:
Reliable and evidence-based content curation. User-friendly interface and free access.	Expansion of the initiative to other health areas. Greater collaboration among specialists for continuous review.
Use of multiple formats for information presentation.	Better indexing and dissemination on external platforms.
Weaknesses:	Threats:
Dependence on technical staff for updates and maintenance.	Risk of disseminating outdated information if curation is not continuous.
Some limitations in digital accessibility.	Dependence on digital infrastructure and technical support.
Interactive resources may present issues on mobile devices.	Competition with less reliable but broader-reaching information sources.

Source: Developed by the author.

Based on the SWOT analysis, several strategies can be implemented to strengthen the WoKs and mitigate the identified challenges:

- **optimisation of indexing:** Improve visibility in search engines, ensuring that WoKs reach a larger audience.
- **Continuous training:** Offer periodic training for librarians and content curators, ensuring continuous updating of the platform.
- **Reinforcement of accessibility:** Implement rigorous guidelines to make content more accessible, following international standards such as WCAG.
- **Digital preservation plan:** Create guidelines to ensure the maintenance and longevity of stored content.
- **User engagement:** Develop strategies for interaction and content personalisation to increase public participation.

- **Regular technical monitoring:** Establish a schedule for preventive maintenance to prevent platform failures and ensure stability.
- **Institutional partnerships:** Expand the network of specialists involved in content review and validation, strengthening the platform's credibility.

Adopting these strategies can significantly enhance the efficiency of the Windows of Knowledges, consolidating them as an essential tool for health information curation and combating misinformation.

5 WINDOWS OF KNOWLEDGE IN PRACTICE: PUBLIC HEALTH USE CASES

The Windows of Knowledge on the Natural History of COVID-19, launched in September 2021, exemplifies how scientific information can be organised and made available in an accessible and reliable manner. Developed in partnership between the Latin American and Caribbean Centre on Health Sciences Information (BIREME/PAHO/WHO) and the Brazilian Ministry of Health, the WoK provides a curated collection of scientific studies and updated data on COVID-19, organised by disease phases such as transmission, incubation period, antibody production, and cytokine storm (BIREME/PAHO/WHO, 2021).

The WoK distinguishes itself by providing evidence-based content, validated by specialists, and organised clearly and accessibly. Its structure allows information to be presented objectively, minimising ambiguities and facilitating public understanding. Furthermore, the use of multiple formats, such as explanatory texts, infographics, and videos, enables greater engagement, making access to knowledge more dynamic and appealing (BIREME/PAHO/WHO, 2021).

The application of the WoK in awareness campaigns is a practical example of its relevance. During the COVID-19 pandemic, the platform was used to disseminate accurate information on preventive measures, vaccine efficacy, and combating myths and misinformation about virus contagion. This model can be replicated in other health areas, promoting education on topics such as immunisation, mental health, and nutrition (BIREME/PAHO/WHO, 2021).

Alessandra Siqueira, director of the Ministry of Health's Department of Science and Technology, highlighted the importance of facilitated access to scientific information as a means of achieving the department's mission. Rosana Leite, the extraordinary secretary for COVID-19 response, also emphasised that solid evidence bases are "indispensable" for work in the health field (BIREME/PAHO/WHO, 2021).

Beyond its use in combating COVID-19 misinformation, the WoK has been applied in various other public health areas. The Windows of Knowledge on the Commercial Dimension of Social Determinants of Health (DCDSS), launched in November 2021, addresses how commercial practices can negatively impact health, particularly regarding the consumption of unhealthy products. This Knowledge Window was developed in collaboration with over 50 specialists and aims to support public policies that reduce the consumption of health-harming products (BIREME/PAHO/WHO, 2021).

Another relevant application is Windows of Knowledge on Health Promotion, launched in December 2023. This platform brings together institutional documents from 25 countries in Latin America and the Caribbean, offering updated resources for implementing health promotion strategies within the context of the Sustainable Development Goals (SDGs). The Knowledge Window includes materials on healthy municipalities, health-promoting schools, and healthy work environments, among other topics (BIREME/PAHO/WHO, 2023).

More recently, in September 2024, the Windows of Knowledge on Mpox was updated to provide current information on the global disease outbreak, declared a Public Health Emergency of International Concern (PHEIC) by the WHO. The platform offers clinical guidelines, treatment protocols, and resources for epidemiological surveillance, aiming to support a coordinated response to the outbreak (BIREME/PAHO/WHO, 2024).

These examples demonstrate the WoKs potential in various public health areas. From the launch of the Windows of Knowledge on the Natural History of COVID-19, which provided crucial information for pandemic response, to the Knowledge Window on the Commercial Dimension of Social Determinants of Health (DCDSS), which addressed the impacts of commercial practices on health, the platform has proven versatile and adaptable to emerging needs. Furthermore, the Knowledge Window on Health Promotion and the recent update of the Knowledge Window on Mpox reinforce the WoK 's role as a dynamic and up-to-date tool, capable of responding to global health challenges with agility and precision.

The WoKs importance extends beyond merely providing information. It acts as a facilitator for building evidence syntheses, supports informed public policy formulation, and promotes health education broadly and inclusively. By offering content in multiple formats, such as texts, infographics, and videos, the WoK reaches diverse audiences, from healthcare professionals and researchers to the general population, democratising access to scientific knowledge.

Collaboration between institutions such as BIREME/PAHO/WHO, the Brazilian Ministry of Health, and specialists from various fields has been fundamental to the WoKs success. This partnership not only ensures the quality and reliability of the information provided but also strengthens the network of technical cooperation in health, promoting the exchange of knowledge and experiences among countries and regions. Therefore, the Windows of Knowledge is not merely an information platform, but a transformative tool that contributes to building a more informed, healthy, and resilient society. Its continuous development and expansion are fundamental for addressing public health challenges.

6 CONCLUDING REMARKS

This research addressed the Windows of Knowledge (WoK) created by BIREME, aiming to evaluate its capacity as a digital curation tool in the health sector. The choice of topic is justified by the growing need for effective strategies to ensure access to reliable information, particularly in an infodemic scenario. The study allowed for an analysis of how the WoK fits into this context and contributes to the organisation and dissemination of validated information, promoting qualified access to knowledge.

The main objective of this research was to understand the WoKs structure and functionality, evaluate its effectiveness in digital curation, and identify challenges and possibilities for improvement. Throughout the analysis, it was possible to demonstrate that the WoK adheres to the principles of digital curation by selecting, organising, and providing relevant information for different audiences, but challenges such as the need for continuous updates and digital accessibility require greater attention. The methodology employed in the research included a literature review and the study of BIREME's technical guidelines, which allowed for mapping the main advances and challenges of the tool according to best practices as conceptualised in the literature on digital curation. The WoK was confirmed as an important tool in information organisation and access to reliable content, as it follows a significant portion of these information curation practice guidelines.

The initial hypothesis of the research was that the WoK could be considered an efficient model for digital health information curation, capable of minimising the impacts of misinformation. The results partially confirm this hypothesis: although the WoK exhibits fundamental qualities for digital curation according to the principles of this technique, there is a need for technical and operational enhancements. The implementation of stricter guidelines for accessibility and content updating can further strengthen its performance; however, its

importance is already evident when considering practical examples of its activity, such as the Windows of Knowledges on Health Promotion, Mpox, the Commercial Dimension of Social Determinants of Health, and the Natural History of COVID-19. The cited examples demonstrate how developing strategies to increase the visibility and engagement of the scientific community with the WoK can also contribute to its consolidation as a reference in digital curation.

We conclude that the WoK, as a strategic tool of BIREME, plays an essential role in this scenario and, with the necessary adaptations, has the potential to establish itself as a model of excellence in digital health information curation.

ABSTRACT

This article aims to analyze and demonstrate that Binding Precedent No. 4, of the Federal Supreme Court, does not meet the minimum requirements for existence, did not follow all formal procedures for creation and did not observe some of the fundamental principles and rights established in the 1988 Constitution, and should, for these reasons, be canceled from the legal system and replaced by another formally adequate statement. The methodology used will be qualitative, bibliographical and documentary.

Keywords: Binding Precedent No. 4. Minimum Wage. Fundamental Principles. Fundamental Social Principles and Rights.

RESUMO

Este artigo se propõe a analisar e a demonstrar que a Súmula Vinculante nº 4, do Supremo Tribunal Federal, não reúne os requisitos mínimos de existência, não seguiu todos os procedimentos formais de criação e não observou alguns dos princípios e direitos fundamentais estabelecidos na Constituição de 1988, devendo, por tais motivos, ser cancelada do ordenamento jurídico e substituída por outro enunciado formalmente adequado. A metodologia empregada será qualitativa, bibliográfica e documental.

Palavras-chave: Súmula Vinculante nº 4. Salário-mínimo. Princípios Fundamentais. Direitos Fundamentais Sociais.

RESUMEN

Este artículo tiene como objetivo analizar y demostrar que el Precedente Vinculante n.º 4 del Supremo Tribunal Federal no cumple con los requisitos mínimos para su existencia, no siguió todos los procedimientos formales para su creación y no respetó algunos de los principios y

1 INTRODUCTION

The binding precedent was introduced into the Constitution (BRASIL, 1998) by Constitutional Amendment No. 45 of 2004 (BRASIL, 2004), which became known as the "Reform of the Judiciary". It served to bring the Brazilian legal system (*civil law*³) closer to the *common law*⁴, by conferring normative force to certain judgments handed down by the Federal Supreme Court. It also changed the Constitutional arrangement of the separation of powers, to the extent that the Legislative Branch accepted to share its function of creating general and abstract norms with the Judiciary, based on the repeated creation of individual and concrete norms.

However, in order to avoid abuses and violations of the fundamental constitutional principles of the Democratic Rule of Law and, notably, of the separation of powers, it is essential that the Federal Supreme Court, when creating binding precedents, strictly remain within the formal and material limits that were established by the Constitution and by Law No. 11,417⁵ (BRASIL, 2006), which serve as a guarantee that the independence and harmony between the Powers will not be shaken, considering that binding precedents can only be approved when there is a current controversy, on certain norms, causing serious legal uncertainty and a relevant multiplication of lawsuits on the same issue.

According to article 103-A, *caput*, §§ 1 to 3, of the Constitution, inserted by Constitutional Amendment No. 45, the Federal Supreme Court may, *ex officio* or by provocation, by decision of two-thirds of its members, after repeated decisions on constitutional matters, approve a precedent that, as of its publication in the official press, will have binding effect in relation to the other organs of the Judiciary and the direct and indirect public administration. at the federal, state and municipal levels, as well as to review or cancel it. The precedent will aim at the validity, interpretation and effectiveness of certain rules, about which there is a current controversy between judicial bodies or between them and the public administration that causes serious legal uncertainty and a relevant multiplication of lawsuits on the same issue. A complaint will be filed with the Federal Supreme Court against the

³ The Brazilian legal system has traditionally been part of the *civil law* family (Roman-Germanic law), where the main source of law is written law (codes and statutes), and judicial decisions (jurisprudence) have a secondary and non-binding role for other cases.

⁴ *Common law* (Anglo-Saxon law) is characterized by the prevalence of judicial precedents (jurisprudence), following the rule of *stare decisis* (decision taken must be maintained). In this system, the decision of a higher court in a specific case is mandatory for lower courts to comply with in similar cases.

⁵ Regulates article 103-A of the Federal Constitution and amends Law No. 9,784, of January 29, 1999, regulating the edition, revision and cancellation of the statement of binding precedents by the Federal Supreme Court, and provides for other provisions.

administrative act or judicial decision that contradicts the applicable precedent or that improperly applies it.

Binding Precedent No. 4 (Brasil, STF, 2008, n.p.), unanimously approved by the Federal Supreme Court, based on the judgment of Extraordinary Appeal No. 565,714 (Brasil, STF, 2008, p. 1260.), establishes that, "Except in the cases provided for in the Constitution, the minimum wage cannot be used as an index of the basis for calculating the advantage of a public servant or employee, nor be replaced by a judicial decision".

This research is based on the following legal problem: can Binding Precedent No. 4 be considered existing, formally valid and materially compatible with the fundamental principles and rights established in the 1988 Constitution?

From this problem, three hypotheses were raised that will be addressed in the course of the work. First, Binding Precedent No. 4 does not meet the minimum requirements to exist in the legal world. Second, the approval of Binding Precedent No. 4 did not follow all the formal parameters established in the Constitution and in Law No. 11,417 of 2006. Third, Binding Precedent No. 4 ignored some of the fundamental principles and rights.

The dialectical and deductive methods will be used. The dialectic is based on the critical analysis of Binding Precedent No. 4 in relation to constitutional principles, aiming to identify conflicts and propose changes in the legal reality. The deductive will demonstrate that fundamental rights were violated by the Supreme Court's decision.

The research, with a qualitative approach, will analyze the contents, meanings and social impacts of Binding Precedent No. 4 through a bibliographic (doctrine) and documentary (legislation and jurisprudence) review.

2 THE ISSUE THAT GAVE RISE TO BINDING PRECEDENT NO. 4

The decision to approve Binding Precedent No. 4 (Brasil, STF, 2008, n.p.) occurred at the end of the judgment of Extraordinary Appeal No. 565.715 (Brasil, STF, 2008), which had been filed by military police officers against the State of São Paulo, against the Judgment that had dismissed the Appeal they handled against the judgment of dismissal, rendered in the Ordinary Action of Obligation to Do, which aimed to condemn the São Paulo Treasury to calculate the unhealthy bonus they received based on the remuneration or salaries of their positions, and not on the amount of two minimum wages, as stated in the governing legislation.

The police officers based the request on the merits of the preliminary ruling regarding the non-acceptance of article 3, paragraph 1, of Complementary Law No. 432, of 1985, of the State of São Paulo – which established that the basis for calculating the additional amount should be calculated on the amount of two minimum wages – by the rule of article 7, IV, final part, of the Constitution (BRASIL, 1988), which prohibits the indexation of the minimum wage for any purpose.

The claim was dismissed in the first instance, because the Single Judge understood that, even if the requested non-receipt was declared, it was not possible to increase salaries by means of a judicial decision, due to the principles of legality and separation of powers.

The military police officers filed an appeal with the Court of Appeals of São Paulo, which dismissed the appeal, by rejecting the preliminary question, based on a line of understanding, existing in the Federal Supreme Court, which considered that the adoption of the minimum wage as the basis for calculating the unhealthy bonus did not violate the constitutional prohibition of indexation of the minimum wage.

Dissatisfied with the decision rendered by the São Paulo Court, the military police filed the Extraordinary Appeal to the Federal Supreme Court, which was under the rapporteurship of Minister Cármen Lúcia, within the scope of the Full Body, which delivered the vote, which was accompanied by the Collegiate, obtaining a unanimous vote.

3 THE GROUNDS AND CONCLUSIONS OF EXTRAORDINARY APPEAL NO. 565,714

First, the Supreme Court recognized the General Repercussion in Extraordinary Appeal No. 565,714, generating Topic No. 25, with the title "Linking the unhealthy bonus to the minimum wage", and the following description: "Extraordinary appeal in which it discusses, in the light of article 7, IV, of the Federal Constitution (BRASIL, 1988), the revocation, or not, of article 3, sole paragraph, of São Paulo Complementary Law No. 432 (SÃO PAULO, 1985), which links the unhealthy bonus to the minimum wage, by the 1988 Constitution". (Brazil, STF, 2008, p. 1197)

Justice Cármen Lúcia began the vote by clarifying and demonstrating that, on the final part of item IV, of article 7, of the Constitution/88, numerous precedents could be presented, from the Supreme Court, in the sense of the unconstitutionality or non-reception of norms that use the minimum wage as a basis for calculating other earnings due to public and private workers.

The Magistrate cited, in this regard, several cases judged by the Court, between the years 1998 and 2008, dealing with the salary floor of professional categories, the inclusion of allowance or bonus, compensation for moral damages, the special pension, the administrative fine, the salary table of a state agency and the rates of social contributions. Upon reaching the central issue of the Appeal, referring to the calculation of the unhealthy allowance based on the minimum wage, the Rapporteur clarified that there were also numerous decisions within the scope of the Court, both for constitutionality and unconstitutionality.

From that moment on, she assumed the defense of the thesis of unconstitutionality (non-reception) of the questioned rule based on the basis extracted from Extraordinary Appeal No. 217,700 (Brasil, STF, 1999), which considered that the prohibition on indexation of the minimum wage was justified so as not to create obstacles to its increase, in view of the resulting chain of increases, which could pressure the occurrence of smaller adjustments to the minimum wage itself.

After rejecting the arguments alleged by the appellants, Justice Cármen Lúcia concluded her vote with the proposal to dismiss the Extraordinary Appeal, due to the declaration of non-reception of article 3, paragraph 1, of Complementary Law No. 432/1985, of the State of São Paulo, by the rule of article 7, IV, final part, of the Constitution/88.

This decision implied the suppression of the questioned rule (or at least in the calculation criterion) and the right of the appellants to receive the unhealthy bonus. However, the Rapporteur understood that the police officers could not lose this right and, therefore, restricted the meaning and scope of the declaratory decision to the criterion of the basis for calculating the additional payment, that is, the use of the minimum wage. As a result, the right to the unhealthy bonus would be without a basis for calculation. So, this situation forced the Court to act as a positive legislator, which would be denied through the wording of Binding Precedent No. 4. Thus, the ingenious solution that Minister Cármen Lúcia proposed, considered by her as "possible for the case", was to maintain the payment of the additional unhealthy pay in the amount of two salaries (in force at the time of the final and unappealable decision) and to link its future adjustments to the category.

The judgment was unanimous and gave rise to the following Summary of judgment for Extraordinary Appeal 565.714, which does not mention the heterodox solution that guaranteed the police officers the continuity of receiving the unhealthy bonus:

SUMMARY: CONSTITUTIONAL. ARTICLE 7, ITEM IV, OF THE CONSTITUTION OF THE REPUBLIC. NON-RECEPTION OF ARTICLE 3, § 1, OF SÃO PAULO COMPLEMENTARY LAW NO. 432/1985 BY THE 1988 CONSTITUTION. UNCONSTITUTIONALITY OF LINKING THE UNHEALTHY BONUS TO THE MINIMUM WAGE. PREVIOUS. IMPOSSIBILITY OF MODIFYING THE BASIS FOR CALCULATING THE BENEFIT BY JUDICIAL DECISION. EXTRAORDINARY APPEAL DISMISSED.

1. The meaning of the prohibition contained in the final part of item IV of article 7 of the Constitution prevents the minimum wage from being used as an indexation factor; this use would hinder a possible increase in the minimum wage by the chain of increases that would give rise to if this linkage were admitted (RE 217.700, Minister Moreira Alves). The constitutional rule aims to prevent an increase in the minimum wage from indirectly generating a greater weight than that directly related to the increase. This circumstance would pressure a lower adjustment of the minimum wage, which would mean hindering the implementation of the wage policy provided for in article 7, item IV, of the Constitution of the Republic. The use of the minimum wage to form the basis for calculating any remuneration portion or with any other pecuniary objective (indemnities, pensions, etc.) comes up against the binding prohibited by the Constitution of Brazil. History and comparative analysis of the jurisprudence of the Federal Supreme Court. Declaration of non-acceptance by the Constitution of the Republic of 1988 of Article 3, § 1, of Complementary Law No. 432/1985 of the State of São Paulo.

2. Absence of a constitutional rule authorizing the granting of unhealthy pay to public servants (art. 39, § 1, item III) or to military police officers (art. 42, § 1, c/c 142, § 3, item X).

3. Infeasibility of invoking article 7, item XXIII, of the Constitution of the Republic, because even if local legislation determines its incidence to public servants, the additional expression of remuneration contained in the constitutional rule must be interpreted as additional remuneration, namely, those who carry out painful, unhealthy or dangerous activities are entitled to additional remuneration, to compose their remuneration. If the Constitution had established workers' remuneration as the basis for calculation, it would have stated an additional amount on remuneration, which it did not do. 4. Extraordinary appeal dismissed. (Brasil, STF, 2008, p. 1189-1190).

In addition to generating Topic No. 25 of the General Repercussion and the Summary above, the judgment of Extraordinary Appeal No. 565,714 gave rise to Binding Precedent No. 4, with the following wording:

BINDING PRECEDENT No. 4: Except in the cases provided for in the Constitution, the minimum wage cannot be used as an index for calculating the advantage of a public servant or employee, nor be replaced by a judicial decision. (Brazil, STF, 2008).

Therefore, these are the grounds and conclusions adopted in the judgment of Extraordinary Appeal No. 565,714, which motivated the Federal Supreme Court to approve Binding Precedent No. 4.

4 BINDING PRECEDENT NO. 4 AND THE ABSENCE OF THE MINIMUM REQUIREMENTS FOR EXISTENCE

The term precedent, at least in the Brazilian legal context, refers to a summary of the dominant jurisprudence or the peaceful and reiterated understanding of a higher court (such as the Federal Supreme Court, or the Superior Court of Justice) on a given matter of law. Thus, when a Court repeatedly judges the same issue in the same way, it formalizes this understanding in a concise statement, which is the precedent.

For Mancuso (2013, p. 440), a precedent is the set of dominant jurisprudence of a court, covering the most varied branches of our Law, organized by numbered entries without commitment to the subject of the subject.

The jurist Lenio Luiz Streck (2010, p. 145) adopts the following concept of precedent:

In a more technical-legal sense, [precedent] means a statement that translates, concisely, the dominant jurisprudence of that court that issued it. [...] The precedent is, therefore, the production of explanatory definitions, which has prescriptive force in the daily practice of jurists.

This understanding is contained in article 103-A of the Constitution/88, which establishes that the Federal Supreme Court may approve a binding precedent "after repeated decisions" on constitutional matters, without prejudice to the other assumptions and requirements.

As seen, the issue that gave rise to Extraordinary Appeal No. 565,714, in addition to being unique, involving the control of the constitutionality of a given rule (article 3, paragraph 1, of Complementary Law No. 432, of 1985, of the State of São Paulo), was resolved by means of a singular and heterodox solution⁶, which could not and should not have been used to create a binding rule and, much less, to be extended to various issues, dealing with the basis for calculating all types of advantages received by all public servants and private workers, complemented by the prohibition of judicial action as a positive legislator, since the Supreme Court itself had acted in this way, to adapt the criterion of the calculation basis of the unhealthy bonus received by São Paulo police officers.

Thus, because there were no repeated decisions on the examination of the constitutionality of article 3, paragraph 1, of Complementary Law No. 432, of 1985, of the

⁶ There was a declaration of non-full acceptance of the rule and, even so, the appellants continued to receive the unhealthy bonus, in a judgment arrangement that was restricted to the vote rendered and was not even reproduced in the Summary of the Appeal.

State of São Paulo, the Federal Supreme Court did not have the minimum constitutional grounds necessary to produce a precedent, even more so with mandatory content, exorbitant of the singular issue, and resulting from a heterodox solution.

5 THE FORMAL ASPECTS THAT MAKE BINDING PRECEDENT NO. 4 INVALID

This section is intended to analyze and demonstrate that Binding Precedent No. 4 (Brasil, STF, 2008, n.p.) did not comply with some rules that regulate the creation of binding precedents, provided for in article 103-A of the Constitution (Brasil, 1988) and in Law No. 11,417 (Brasil, 2006), which regulates the issue.

5.1 EXTRAPOLATION OF THE OBJECTIVE LIMITS OF THE DETERMINED NORMS

Initially, it is verified that Binding Precedent No. 4 did not stick to its constitutional objective, consisting of the validity, interpretation and effectiveness of certain norms (art. 103-A, § 1, first part, of the Constitution/88), but advanced on the establishment of the meaning and scope of the effectiveness of the paradigm constitutional norm itself (art. 7, IV, final part, of the Constitution/88).

This procedure followed the doctrine of Justice Gilmar Mendes (2012, p. 1337), of the Federal Supreme Court, which gives the concept of "determined norms" an expansive meaning, in the following terms:

The constitutional rule explains that the precedent will aim to overcome the current controversy about the validity, interpretation and effectiveness of certain rules capable of generating legal uncertainty and a relevant multiplication of lawsuits. Therefore, current issues on the interpretation of constitutional norms or of these in the face of infra-constitutional norms are covered.

In view of the broad jurisdiction of the Federal Supreme Court, these [determined] norms may be federal, state or municipal. It is possible, however, that the issue involves only the interpretation of the Constitution and not its eventual contrast with other infra-constitutional norms. In these cases, generally submitted to the Court under the allegation of direct contravention of the Constitution (art. 103, III, a), the interpretation of the Constitution adopted by the courts is discussed.

However, the analysis made in this research diverges from this expansive understanding and adopts a declarative interpretation for the expression "determined norms", more compatible with the fundamental principles of the Democratic Rule of Law and the separation of powers, and with the dictate of the limitation of power.

By "determinate norms" we must understand those norms that are clear, specific, precise and identifiable in plan, and that contrast with indeterminate or undefined norms. They serve to keep the Supreme Court within the limits of its jurisdictional competence to say the law and not to produce generic, indeterminate and abstract binding precedents, which represent an invasion of the competence of the Legislative Branch.

The norms determined are not constitutional principles and rules (parameters), already considered valid, nor the principles and rules questioned (controlled), but the norm resulting from the judgment of the control of constitutionality exercised by the Supreme Court. In this case, the rule determined consisted of the following normative assertion: article 3, paragraph 1, of São Paulo Complementary Law No. 432/1985 was not accepted by article 7, IV, final part, of the Constitution/88. It was only this determined rule that, in theory, could give rise to a binding precedent, if the other constitutional assumptions and requirements were present.

However, Binding Precedent No. 4 exceeded the constitutional limits of the determined rule, resulting from the judgment of Extraordinary Appeal No. 565,714, and examined in the abstract the interpretation and effectiveness of the paradigm constitutional rule itself (article 7, IV, final part, of the FC/88), extending the meaning and scope of the prohibition contained therein to the basis for calculating any and all advantages perceived by public servants or employees, which involves an indeterminate number of infra-constitutional norms, foreign to the object of the Appeal judged, even though some have been cited in the reasoning, as a reason for deciding, but without being able to integrate the operative part.

This defect violates the so-called principle of congruence or astringency (also known as the Principle of Correlation or Conformity), which requires a strict correspondence between the claim, the cause of action and the judicial decision. The Code of Civil Procedure (Brasil, 2015) deals with the matter, mainly, in the following provisions:

Article 141: The judge shall decide on the merits within the limits proposed by the parties, and it shall be forbidden to hear issues not raised in respect of which the law requires the initiative of the party.

Article 492: It is forbidden for the judge to render a decision of a nature different from the one requested, as well as to condemn the party in a higher amount or in an object different from that which was demanded.

According to Dinamarco (2017, p. 320-321), "The extra *petita defect occurs* when the judge judges outside the limits of the demand, that is, 'if it is outside the limits [of the demand]', deciding a question not posed, granting a provision or a good of life not pleaded".

In the same sense is the understanding of Theodoro Júnior (2015, p. 814): "It is the defect that occurs when the sentence decides on an object different from what was proposed in the initial one, that is, "the judge grants a different performance from the one that was claimed from him".

Paulo and Alexandrino (2015, p. 898) reinforce the importance of the Judiciary remaining bound to the principle of the request, even in the exercise of abstract control of constitutionality, which is linked to the principle of the request, so that there is no offense to the principle of separation of powers:

The abstract control of constitutionality, in Brazil, is subject to the so-called principle of request. This means that the Judiciary can only exercise the review of the validity of laws in the abstract when provoked, not on its own initiative.

The principle of the request is typical of the judicial review of constitutionality and contributes to reducing the political character of the review of the validity of norms, as well as to preventing the Judiciary from assuming a role of supremacy in relation to the other branches.

This is not a mere formal irregularity, since the violated norms have the constitutional purpose of complying with and enforcing the fundamental principles of the separation of powers and the Democratic Rule of Law. By creating Binding Precedent No. 4, the Federal Supreme Court exceeded its jurisdictional competence to interpret legal norms and invaded the legislative competence of the National Congress, insofar as the mandatory Entry advanced on the validity, interpretation and effectiveness of indeterminate norms, incurring in the vice of absolute nullity.

5.2 THE ABSENCE OF DEMONSTRATION OF CURRENT CONTROVERSY

The approval of Binding Precedent No. 4 was also not preceded by the demonstration of the constitutional assumption regarding the current controversy between judicial bodies or between them and the public administration, which was causing serious legal uncertainty and a relevant multiplication of lawsuits on the same issue, as required by article 103-A, paragraph 1, second part, of the Constitution/88.

For Mendes and Branco (2015, p. 1337-1338), due to the need for the existence of repeated decisions, it is not possible to issue a binding precedent based on an isolated judicial decision:

Another requirement for the issuance of the binding precedent refers to the pre-existence of repeated decisions on constitutional matters.

It is required here that the matter to be addressed in the precedent has been the subject of debate and discussion in the Federal Supreme Court. It seeks to obtain the maturation of the controversial issue with the reiteration of decisions. Thus, the possibility of issuing a binding precedent based on an isolated judicial decision is prohibited. It is necessary that it reflects a jurisprudence of the Court, that is, repeated judgments in the same sense, that is, with the same interpretation.

When commenting on the assumption of the current controversy, Paulo and Alexandrino (2015, p. 833-834) clarify that it is necessary to have repeated current judgments, neither past nor future, on a relevant matter:

Therefore, for the issuance of a binding precedent by the Federal Supreme Court, the Federal Constitution requires, especially, the observance of four cumulative requirements, namely:

(...);

c) existence of current controversy between judicial bodies or between them and the

Public administration;

d) the controversy entails serious legal uncertainty and a significant multiplication of lawsuits on the same issue.

(...).

The second requirement - requirement that the constitutional matter has been the subject of repeated decisions by the Federal Supreme Court - is intended to avoid the hasty approval of a binding precedent, on a topic that is not yet consolidated in the jurisprudence of the Supreme Court. In other words, it is necessary that the binding precedent effectively reflects the jurisprudence of the Major Court, based on repeated judgments in the same sense.

Another point that should be emphasized is the requirement that the matter dealt with in the binding precedent be the subject of current constitutional controversy between judicial bodies or between them and the Public Administration. If, for example, it is a law that is already peacefully considered unconstitutional within the scope of the Judiciary and that is not being applied by the Public Administration, it will not be appropriate to issue a binding precedent. Nor is it allowed to issue a binding precedent on a matter that will presumably lead to future controversy, no matter how relevant it may be. The controversy must be current, neither future, nor already overcome.

Finally, even if the matter is the subject of current controversy between judicial bodies or between them and the public administration, it can only be dealt with in a binding precedent if this controversy is causing serious legal uncertainty and a relevant multiplication of lawsuits on the same issue. Thus, in the event that it is a controversial matter, but of reduced relevance, or concerning a few concrete cases, the issuance of a binding precedent will not be appropriate.

The constitutional issue discussed in Extraordinary Appeal No. 565,714, consisting of the examination of the constitutionality of article 3, paragraph 1, of São Paulo Complementary Law No. 432/1985, does not qualify as a current controversy, since it did not generate serious uncertainty (characterized by the existence of conflicting decisions between different judges and courts) nor the relevant multiplication of lawsuits, being restricted to a single judicial proceeding, it is certain that the cases cited as a reason for deciding also do not serve to characterize the current controversy, given that they were judged by the Federal Supreme Court from 1999 onwards.

The recognition of the General Repercussion in the judgment of Extraordinary Appeal No. 565,714, object of Topic 25⁷, also does not serve to demonstrate the existence of the current controversy, given that it constitutes one of the procedural assumptions for the admissibility of the extraordinary appeal itself (article 102, paragraph 3⁸, of the Constitution). They are different things. The general repercussion is one of the assumptions for the admissibility of the extraordinary appeal, while the current controversy, capable of causing serious legal uncertainty and the relevant multiplication of lawsuits on the same issue, is one of the specific constitutional procedural requirements for the approval of the binding precedent.

The constitutional assumption of the current controversy bears a certain similarity with the procedure for the judgment of repetitive appeals, however, its stages (selection and allocation of the representative precedent, in the suspension of the proceedings, in the judgment of the thesis and in the application of the precedent) were not followed by the Supreme Court in the judgment of the Representative Precedent, even because there were no other appeals in progress on the same issue.

Thus, Binding Precedent No. 4 should be canceled, as it does not meet the constitutional assumption of the current controversy.

5.3 THE ABSENCE OF A PRIOR STATEMENT BY THE ATTORNEY GENERAL OF THE REPUBLIC

The approval of Binding Precedent No. 4 also did not follow the obligation of prior manifestation by the Attorney General of the Republic in the proposals for editing, revising or

⁷ Title: Linking the unhealthy bonus to the minimum wage.

⁸ Paragraph 3 - In the extraordinary appeal, the appellant must demonstrate the general repercussion of the constitutional issues discussed in the case, under the terms of the law, so that the Court may examine the admission of the appeal, and may only refuse it by the manifestation of two-thirds of its members.

canceling the statement of binding precedent, provided for in article 2, paragraph 2, of Law No. 11,417, of 2006, which regulates the binding precedent.

Article 50 of the Rules of Procedure of the Federal Supreme Court establishes that the Attorney General shall have a period of fifteen (15) days to offer his procedural statements, when no other deadline has been set. (Brazil, STF, 2023).

Although the Attorney General has followed the judgment of Extraordinary Appeal No. 565,714 and the debates that led to the approval of Binding Precedent No. 4, this circumstance does not meet the fulfillment of the constitutional obligations of the Public Prosecutor's Office, as an institution essential to the jurisdictional function of the State, defender of the legal order, the democratic regime and social interests, since there was no period of reflection to issue an authoritative opinion on the issues debated.

Thus, Binding Precedent No. 4 should be canceled, for not having observed the obligation of prior manifestation of the Attorney General of the Republic in the proposal for its edition.

5.4 THE CONTRADICTION BETWEEN THE GROUNDS OF EXTRAORDINARY APPEAL NO. 565,714 AND THE TEXT OF BINDING PRECEDENT NO. 4

The Code of Civil Procedure (Brasil, 2015, art. 489, I, II and III) not only brought the essential elements of judicial decisions (report, grounds and disposition), but also established their conceptual parameters. The report will contain the names of the parties, the identification of the case, with the summary of the request and the response, and the record of the main occurrences that occurred in the course of the process. The grounds contain the judicial analysis of questions of fact and law. And the disposition is the part in which the judge will resolve the main issues that the parties submit to him.

These three parts of the judicial decision must maintain harmony and coherence, under penalty of the defect of contradiction giving rise to the motion for clarification, provided for in article 1,022, I, of the Code of Civil Procedure.

Fredie Didier Jr. and Cunha (2016, p. 251) teach that "the contradictory decision is one that has irreconcilable propositions, disharmonious statements, statements that clash, that point to opposite directions". For them, the main example is the contradiction between the reasoning (motivation) and the disposition (conclusion), as when the judge reasons that the plaintiff does not have the right claimed, but, in the operative part, upholds the request.

The precedent, consisting of a summary of the provisions of several judgments judged on a given legal matter, must also maintain the relationship of coherence with the grounds of all the decisions on which it is based, so that it does not fall into the vice of contradiction.

As Binding Precedent No. 4 (STF, 2008, n.p.) is the result of the judgment rendered in Extraordinary Appeal No. 565,714, its wording had to have been coherent, necessarily, with the reasons for deciding appeals, which did not occur in the case in question.

In fact, when analyzing whether the rule of article 192 of the Consolidation of Labor Laws (Brasil, CLT, 1943) could be applied to the appellant military police officers, Justice Cármen Lúcia identified its incompatibility with the constitutional rule that prohibits the indexation of the minimum wage (article 7, IV) and, then, stated that "[...] it will be up to the Labor Court to define the basis for calculating the unhealthy bonus due in relations governed by the CLT, taking into account labor legislation and collective bargaining agreements and conventions". (Brasil, STF, 2008, RE 565.714, p. 1217)

However, it was stated in the wording of Binding Precedent No. 4 that "the minimum wage cannot be used as an index of the basis for calculating the advantage of a public servant or employee, nor be replaced by a judicial decision" (Brasil, STF, 2008), removing from judges and labor courts the power that had been recognized in the grounds of the Extraordinary Appeal to "define the basis for calculating the unhealthy allowance due in relations governed by the CLT" (Brasil, STF, 2008, RE 565.714, 1217).

The contradiction was definitively proven when the Superior Labor Court decided to follow the guidance contained in the grounds of Extraordinary Appeal No. 565,714, and changed the wording of its Precedent No. 228 to state that "As of May 9, 2008, the date of publication of Binding Precedent No. 4 of the Federal Supreme Court, the unhealthy allowance will be calculated on the basic wage, unless a more advantageous criterion is established in a collective agreement" (Brasil, TST, 2008, n.p.). The attitude of the Labor Court was almost instantly disapproved through the granting of injunctions, which were confirmed in the judgment on the merits, issued by the Supreme Court in Complaints that were filed by agents linked to the economic market, who denounced the non-compliance with Binding Precedent No. 4.

Thus, since there is a contradiction between the reasoning used in the judgment of Extraordinary Appeal No. 565,714 and the text of Binding Precedent No. 4, the mandatory Entry should be canceled, as it does not have an autonomous existence and contradicts its own basis of existence and legal validity.

5.5 THE SELF-CONTRADICTION EXISTING IN BINDING PRECEDENT NO. 4

The normative text of Binding Precedent No. 4 is also self-contradictory, insofar as it ensures the validity and effectiveness of the fundamental constitutional right to prohibit the binding of the minimum wage for any purpose (article 7, IV, final part, of the FC/88) and, at the same time, allows this fundamental right to be violated. Here it is: "Except in the cases provided for in the Constitution, the minimum wage cannot be used as an index for the calculation basis of the advantage of a public servant or employee, nor can it be replaced by a judicial decision." (Brazil, STF, 2008).

First, the Entry prohibits "the minimum wage from being used as an index of the basis for calculating the advantage of a public servant or employee". Next, it prohibits judges and courts, who are faced with laws that provide for the minimum wage as an index of the basis for calculating the advantage of public servants or employees, from replacing the minimum wage with another index, which implies the permission of the conduct that had been prohibited in the first part of the Precedent.

In other simpler and summarized words, for Binding Precedent No. 4, the minimum wage cannot be used as an index; however, if it is being used as an indexer by any legal rule, it cannot be replaced by the Judiciary. In other words, indexation will continue to exist and produce legal effects, even though it is prohibited by Binding Precedent No. 4 itself and by the Constitution (Brasil, CRFB, 1988, art. 7, IV).

Thus, by prohibiting and, at the same time, allowing the prohibition of indexation of the minimum wage for any purpose, Binding Precedent No. 4 incurs in self-contradiction and, therefore, should be canceled.

6 THE MATERIAL ASPECTS THAT JUSTIFY THE CANCELLATION OF BINDING PRECEDENT NO. 4

In addition to not having observed all existential, formal (constitutional and legal) and logical aspects, Binding Precedent No. 4 also did not follow the legal regime that governs the judgment of the validity, interpretation and effectiveness of the issue that is the subject of Extraordinary Appeal No. 565,714, consisting of the indexation of the calculation basis of the unhealthy bonus received by São Paulo military police officers to the minimum wage.

The matters related to the issue (minimum wage and additional unhealthy wage) have the legal nature of fundamental constitutional social labor rights and are directly linked to the fundamental constitutional principles of the Democratic Rule of Law, the separation of

powers, human dignity, the social values of work and free enterprise, the construction of a free, fair and solidary society, and the prevalence of human rights, which were not observed or even cited at the time of the judgment of the Representative Precedent and the approval of the Binding Precedent.

6.1 JUDICIAL ACTIVISM

Judicial activism is a reflection of the prominent role that the Brazilian Judiciary, especially the Federal Supreme Court, assumed after the 1988 Constitution, in relation to guaranteeing the effectiveness of fundamental principles and rights.

For Barroso (2009), judicial activism is an attitude, the choice of a specific and proactive way of interpreting the Constitution, expanding its meaning and scope. It is usually installed in situations of retraction of the Legislative Branch, associated with a broader and more intense participation of the Judiciary in the realization of constitutional values and purposes, with greater interference in the space of action of the other two Branches. The activist stance is manifested through different conducts, which include: a) the direct application of the Constitution to situations not expressly contemplated in its text and regardless of the manifestation of the ordinary legislator; b) the declaration of unconstitutionality of normative acts emanating from the legislator, based on criteria less rigid than those of patent and ostensible violation of the Constitution; c) the imposition of conducts or abstentions on the Public Power, notably in matters of public policies.

On the occasion of the judgment of Extraordinary Appeal No. 565,714 (Brasil, STF, 2008), the requirements for acting through judicial activism were present, as the Justices of the Supreme Court recognized the omission of the National Congress in the regulation of the fundamental right to the unhealthy bonus. However, the claim that the Supreme Court could not act as a positive legislator prevented the application of activism.

Thus, since judicial activism is a reality in Brazil, albeit in exceptional and relatively discretionary terms, it will be taken into account in the analysis of the material aspects of Binding Precedent No. 4 and, notably, of its Representative Precedent, in order to give effect to several fundamental principles and rights that are no longer observed.

6.2 THE FUNDAMENTAL CONSTITUTIONAL PRINCIPLES THAT SHOULD GUIDE THE CREATION OF THE CALCULATION BASIS FOR THE UNHEALTHY ALLOWANCE

The 1988 Constitution conferred the stature of a fundamental right to the unhealthy bonus, however, it attributed its regulation to the ordinary legislator:

More than 37 years have passed since the promulgation of the Constitution/88, but the National Congress, markedly liberal, has not yet regulated this fundamental right, opting to maintain the obsolete and unconstitutional regulation of article 192 of the Consolidation of Labor Laws (Brasil, 1943), which originated in Law No. 185, of 1936, despite not being materially compatible with the norms of fundamental rights and human rights.

The omission of the National Congress, associated with the need to regulate and give full effect to the fundamental constitutional right to the unhealthy bonus, justified the use of judicial activism by the Justices of the Federal Supreme Court, on the occasion of the judgment of Extraordinary Appeal No. 565,714 and the approval of Binding Precedent No. 4 (Brasil, STF, 2008, n.p.).

The obsolete and unconstitutional rule that had its interpretation, validity and effectiveness implicitly crystallized by Binding Precedent No. 4, as long as the National Congress remains inert, only favors the economic interests of employers, including the State, by leveling "downwards" (based on the minimum wage) the payment of a fundamental right that aims to directly protect health, the hygiene and safety of private workers and public servants who work in activities considered unhealthy (harmful to health).

It should be noted that the 1988 Constitution prioritized the establishment of some fundamental principles that should guide the Legislative and Judiciary in the creation of rules that regulate the parameters to be used in the calculation of advantages attributed to public servants and private workers.

In fact, initially, these parameters must be extracted from the fundamental principles adopted by the Federative Republic of Brazil, namely:

First. The adoption of the constitutional principle of the Democratic Rule of Law (article 1, *caput*) requires that the calculation of the advantages attributed (fundamental rights) to civil servants and workers reflect the will and social and economic interests of the majority of the Brazilian people, which is formed precisely by the working class, which produces the national wealth.

Second. It is necessary to contemplate with special emphasis the constitutional principle of human dignity (art. 1, III), in order not to tolerate the constitutionality and legality

of payments of fundamental normative advantages that do not allow workers to have access to the existential minimum.

Third. The basis for calculating the advantage (fundamental right) must be the result of the compatibility between the social values of work and the values of free enterprise (article 1, IV), so that there is no overlap of one over the other, as occurs in the situation dealt with in the final part of Binding Precedent No. 4.

Room. The fundamental constitutional objective of building a free, fair and solidary society (article 3, I) should also guide the creation of parameters for calculating advantages, which cannot result from unfair impositions and that do not take into account solidarity at the time of distribution of the product of wealth with those who effectively contributed to its existence.

Fifth. The fundamental constitutional principle of the prevalence of human rights (article 4, II) obliges the Brazilian State to honor the international commitment to promote decent work, which must be exercised in conditions of freedom, equity, security and human dignity, under the terms of the 2030 Agenda of the United Nations, signed by Brazil. Maintaining the payment of fundamental advantages such as the unhealthy bonus in the basic standard of a minimum wage reveals, in fact, indecent working conditions, since they are imposed by the Government, are not equitable, promote insecurity and harm health and human dignity.

Although these fundamental constitutional principles should have guided the judgment of Extraordinary Appeal No. 4 and the approval of the text in Binding Precedent No. 4, it appears that they were not even mentioned in these judicial decisions.

6.3 THE FUNDAMENTAL SOCIAL CONSTITUTIONAL RIGHTS THAT SHOULD GUIDE THE CREATION OF THE CALCULATION BASIS FOR THE UNHEALTHY BONUS:

In addition to observing the fundamental principles above, due to constitutional supremacy, the establishment of legislative and judicial criteria for the calculation of the advantages of civil servants and workers also has to be guided by the fundamental constitutional social labor rights, either because they brought the standards for calculating the fundamental advantages recognized by the Constitution, or because they broke with the system of a single wage base (minimum wage), that has always existed in Brazil, and they also began to provide for the minimum wage for the different professional categories.

The fundamental constitutional social labor norms establish various standards or models for calculating the advantages of civil servants and workers, always based on the value of the salary or even the remuneration, as shown in the following cases:

- 1) Unemployment insurance (article 7, II, of the Constitution), whose calculation, according to article 5, paragraph 1, of Law No. 7,998, of 1990, which regulates the Unemployment Insurance Program, is calculated by the average of the salaries of the last three (3) months prior to the dismissal.
- 2) Guarantee Fund for Length of Service (Article 7, III, of the Constitution), whose calculation, according to Article 15, *caput*, of Law No. 8,036, of 1990, which provides for the Guarantee Fund for Length of Service, falls on the percentage corresponding to 8% (eight percent) of the remuneration paid or due, in the previous month, to each worker.
- 3) Thirteenth salary, calculated on the basis of full remuneration (article 7, VII, of the Constitution), extended to public servants (article 39, paragraph 3, of the Constitution).
- 4) Remuneration for night work higher than that for daytime work (article 7, IX, of the Constitution), whose calculation, according to article 73, *caput*, of the Consolidation of Labor Laws, must be made with an increase of at least 20% (twenty percent) on the value of the daytime hour, which, in turn, is calculated on the value of the salary. This right is extended to public servants (art. 39, § 3, of the Constitution).
- 5) Remuneration for overtime service, calculated in the percentage of at least 50% (fifty percent) of the normal hourly rate (article 7, XV, of the Constitution) which, in turn, is calculated on the value of the salary. This right is extended to public servants (art. 39, § 3, of the Constitution).
- 6) Paid annual vacation with at least one third more than the normal salary (article 7, XVII, of the Constitution), extended to public servants (article 39, paragraph 3, of the Constitution).
- 7) Leave for pregnant women (article 7, XVIII, of the Constitution), whose calculation, according to article 72, *caput*, of Law No. 8,213, of 1991, which provides for Social Security Benefit Plans, is made on a monthly income equal to the employee's full remuneration. This right is extended to public servants (art. 39, § 3, of the Constitution).
- 8) Prior notice (article 7, XXI, of the Constitution), whose calculation, according to article 487, paragraph 1, of the Consolidation of Labor Laws, must be made on the employee's remuneration.

9) Hazard pay (article 7, XXIII, of the Constitution), whose calculation, according to article 193, paragraph 3, of the Consolidation of Labor Laws, falls on the employee's salary.

Thus, as the constitutional standard is to recognize the salary and even the remuneration itself as the basis for calculating the fundamental advantages established for public and private workers, this model must guide, in a binding manner, the legal norms, public policies and judicial decisions.

By not observing the directive model of the Constitution/88, Binding Precedent No. 4 cannot maintain the validity and effectiveness of legal norms that establish the minimum wage as the sole and mandatory basis for calculating the unhealthy bonus, under penalty of violation of the fundamental constitutional principle of non-discrimination (Brasil, CRFB, art. 3, IV) and the specific human right of non-discrimination in matters of employment and profession, provided for in article 1 of Convention No. 111 (ILO, 1958), ratified by Brazil through Legislative Decree No. 104, of 1964.

In addition to the constitutional standards that recognize the salary (and not the minimum wage) and even the remuneration itself as the basis for calculating the advantages established for public and private workers, the Constitution/88 broke the constitutional system, until then existing, of setting the minimum wage as the only basis for payment of wages in Brazil (art. 157, I, of the 1946 Constitution, art. 158, I, of the 1969 Constitution, and art. 165, I, of the 1969 Constitution). In addition to the minimum wage (Brasil, CRBF, 1988, art. 7, IV), the Constitution/88 also began to provide, as a minimum threshold for the payment of wages, the minimum wage proportional to the extent and complexity of the work (Brasil, CRBF, 1988, art. 7, V), which can be set by specific federal laws (for regulated professions), by state laws (regional floor for categories that do not have a floor defined in Federal Law or collective bargaining) or by collective bargaining (collective bargaining agreements).

Thus, both due to the omission of Congress and the need to enforce a fundamental right, it can be seen that the Supreme Court failed to employ judicial activism to recognize, in the specific case of the unhealthy bonus, that the calculation of this advantage could be based on the minimum wage (for those who earn this amount) or on the minimum wage of the category, because of the guidelines taken from the Constitution itself. With this, the legislative omission would be suppressed and full effectiveness would be given to the fundamental right that was constitutionally established more than 37 years ago, however, it continues to be

regulated through obsolete, unconstitutional and unjust rules, whose validity and effectiveness were maintained through Binding Precedent No. 4.

7 CONCLUSION

Binding Precedent No. 4 (Brasil, STF, 2008) was approved at the end of the judgment of Extraordinary Appeal No. 565,715 (Brasil, STF, 2008), in which the constitutional validity of a state rule, which established the minimum wage as the basis for calculating the unhealthy bonus for public agents, was discussed.

When analyzing Binding Precedent No. 4, it was found that it did not meet the minimum requirements for existence, did not follow all the formal procedures for creation and did not observe some of the fundamental principles and rights established in the 1988 Constitution, which would lead to its cancellation.

In this regard, it was found that there were no repeated decisions on the examination of the constitutionality of the questioned rule (article 3, paragraph 1, of Complementary Law No. 432, of 1985, of the State of São Paulo) and, therefore, the Federal Supreme Court did not have the minimum constitutional grounds necessary to produce a precedent.

In addition, Binding Precedent No. 4 did not stick to its constitutional objective, consisting of the validity, interpretation and effectiveness of certain norms (art. 103-A, § 1, first part, of the Constitution/88), but advanced on the establishment of the meaning and scope of the effectiveness of the paradigm constitutional norm itself (art. 7, IV, final part, of the Constitution/88).

It was also found that the approval of Binding Precedent No. 4 was not preceded by the demonstration of the constitutional assumption regarding the current controversy between judicial bodies or between them and the public administration, which was causing serious legal uncertainty and a relevant multiplication of lawsuits, on an identical issue, as required by article 103-A, paragraph 1, second part, of the Constitution/88.

Furthermore, the procedure for approving Binding Precedent No. 4 did not observe the obligation of prior manifestation by the Attorney General of the Republic in the proposals for editing, revision or cancellation of the statement of binding precedent, provided for in article 2, paragraph 2, of Law No. 11,417, of 2006, which regulates the binding precedent.

An even more worrying fact is the contradiction between the reasoning, used in the judgment of Extraordinary Appeal No. 565,714, and the text of Binding Precedent No. 4.

The mandatory Entry also focused on self-contradiction, by prohibiting and, at the same time, allowing the constitutional prohibition of indexation of the minimum wage for any purpose.

Finally, it was found that Binding Precedent No. 4 did not take into account several fundamental constitutional principles, such as human dignity, the construction of a just and solidary society, the prevalence of human rights, etc., and did not observe the constitutional parameters that recognize the salary, and even the remuneration itself, as the basis for calculating the fundamental advantages established for public and private workers.

For these reasons, it is concluded that Binding Precedent No. 4 should be canceled or, at least, revised, in order to adapt to the Constitution/88.

ABSTRACT

This article aims to analyze Brazil's care policy for users of alcohol and other drugs, articulating the ethics of psychoanalysis and Harm Reduction (HR) strategies to understand the advances and setbacks of public policies in recent decades. By revisiting the history of the Psychiatric Reform and the establishment of the Psychosocial Care Network (RAPS), it demonstrates how the rise of Therapeutic Communities (TCs)—marked by moralizing, religious, and punitive practices—represents a return to the asylum-based model, with serious human rights violations supported by prohibitionist policies and State funding. In contrast, Harm Reduction, like psychoanalysis, proposes a non-universalizing approach, guided by case-by-case analysis and by the subject's implication in their treatment, considering their choice of use, misuse, or abstinence. Thus, the article argues that any mental health, alcohol, and drug care must be guided by a commitment to listening to singularity, respecting human rights, and fostering territorial and community-based care. As a “not-all” policy, this perspective must be capable of including different modes of *jouissance* within the complexity of each subject's relationship with drugs and their uses.

Keywords: Psychoanalysis. Drug Users. Harm Reduction. Therapeutic Community.

RESUMO

O presente artigo pretende analisar a política de assistência aos usuários de álcool e outras drogas no Brasil, articulando a ética da psicanálise e as estratégias de Redução de Danos (RD) para compreender os avanços e retrocessos das políticas públicas nas últimas décadas. Ao revisitar a história da Reforma Psiquiátrica e da constituição da Rede de Atenção Psicossocial (RAPS), demonstra-se como a ascensão das Comunidades Terapêuticas (CTs) – marcadas por práticas moralizantes, religiosas e punitivas – representa um retorno ao modelo manicomial, com graves violações de direitos humanos, sustentadas por políticas proibicionistas com o financiamento do Estado. Em contraponto, a Redução de Danos, assim como a psicanálise, propõe uma abordagem não universalizante, orientada pelo caso a caso e pela implicação do sujeito em seu tratamento, considerando sua escolha pelo uso, pelo abuso ou pela abstinência. Dessa forma, o artigo defende que qualquer

RESUMEN

El presente artículo pretende analizar la política de atención a los usuarios de alcohol y otras drogas en Brasil, articulando la ética del psicoanálisis y las estrategias de Reducción de Daños (RD) para comprender los avances y retrocesos de las políticas públicas en las últimas décadas. Al revisar la historia de la Reforma Psiquiátrica y de la constitución de la Red de Atención Psicosocial (RAPS), se demuestra cómo el ascenso de las Comunidades Terapéuticas (CTs), caracterizadas por prácticas moralizantes, religiosas y punitivas, representa un retorno al modelo manicomial, con graves violaciones de derechos humanos, sostenidas por políticas prohibicionistas y con financiamiento estatal. En contrapunto, la Reducción de Daños, al igual que el psicoanálisis, propone un enfoque no universalizante, orientado por el caso a caso y por la implicación del sujeto en su tratamiento, considerando su elección por el uso, el abuso o la abstinencia. De este modo, el artículo sostiene que cualquier cuidado en salud mental, alcohol y otras drogas debe guiarse por el compromiso con la escucha de la singularidad, el respeto a los derechos humanos y el cuidado territorial y comunitario. Constituyéndose como una política no-toda, esta perspectiva debe ser capaz de incluir los distintos modos de goce en la complejidad de la relación de cada sujeto con las drogas y sus usos.

1 INTRODUCTION

The existence of specific public policies on drugs is quite recent in Brazil, coinciding, almost entirely, with the history of our Republic. For many years, legislation was directed exclusively by authoritarian and hygienist models, following the North American standards that guided the practices of justice and public security, as well as the methods of health treatment. Based on war practices – inspired by the U.S. policy of the 1970s – and abstinence, such legislation and actions followed the guidelines of international treaties that, although they have their importance, never considered the singularities of each country or the complexity required by the subject.

In this way, the relationship of the Brazilian State with the drug trade has been structured based on prohibitionist and moral precepts, which sustain an unprecedented war in certain territories, targeting a specific portion of the population. Called "police operations" by the State and with the territories of favelas and peripheries as the scene of confrontations, this war victimizes black and poor populations, both through the summary execution of young people recruited by drug trafficking or criminalized by racism and through the "stray bullets" that hit residents and curtail their rights to come and go³. In the field of health, the asylum and biomedical model imposed a logic that destined people to long hospitalizations in psychiatric hospitals that for decades functioned as warehouses for individuals segregated by society, such as drug users, people with mental disorders, and even political prisoners during the military dictatorship (1964-1985).

With the political opening, the *1988 Constitution* (BRASIL, 1998) and the establishment of the SUS (BRASIL, 1990), Brazil constituted a new path based on democratic bases that inspired various movements such as the anti-asylum struggle – the foundation of the so-called Psychiatric Reform⁴ – in which the policies of assistance to drug users are inserted. Thus, advances have become possible in the construction and execution of policies that treat users from the perspective of public health, recognizing them as subjects and considering territorial differences as a guide for their work. However, recently, we have witnessed a significant setback in this field, once again leading users to long hospitalizations in asylums and religious institutions, known as Therapeutic Communities (TCs).

³ Among so many examples, the most recent and brutal of them left 122 dead in Complexo da Penha, in the North Zone of the capital of Rio de Janeiro, on October 28, 2025.

⁴ After World War II (1939-1945), a set of distinct experiences in several countries brought in common the questioning of the current asylum model, becoming known as the Psychiatric Reform Movement. For a more in-depth discussion of the issue, see: AMARANTE, P. (1995). *Crazy for life: the trajectory of psychiatric reform in Brazil*. Rio de Janeiro: SDE/ENSP.

Over many years of clinical and institutional work, listening to drug-using subjects has led us to insist on an ethical bet that goes against the grain of proposals that prescribe abstinence, isolation and that intensify tensions guided by the utopia of a drug-free world. By reducing subjects to objects of policies aimed at the control of bodies, countless practices of violence have been instituted by a State that segregates and kills, both in territories and in TCs. Our bet, guided by the ethics of psychoanalysis – ethics of desire and lack-to-be – highlights the impossibility of any universalization in the treatment of subjects who, in various ways and for various reasons, they use drugs. Because it excels in listening to singularity and considering the loss of *jouissance* as inherent, the politics of psychoanalysis is always non-all.

Therefore, from a psychoanalytic reading, this article aims to situate these facilities in the history of policies for alcohol and other drug users in Brazil and, at the same time, to raise some complaints about the seriousness of the *modus operandi* of these spaces, including the trivialization of numerous forms of violence. To this end, we will present the public policies of mental health, alcohol and other drugs in the country, with emphasis on the advances and setbacks observed in recent decades, especially from the Psychiatric Reform and the implementation of the open and territorial devices that make up the Psychosocial Care Network (RAPS). Next, we will analyze the phenomenon of Therapeutic Communities (TCs), which represent a return to the asylum model and, in this sense, a kind of anti-psychiatric reform. By discussing the tensions between public mental health policies and neoliberal practices, we will highlight the privatization of treatment as a movement that reupdates practices of violence and segregation. These first two parts of the article have as their main methodology the bibliographic review made from legislation and reports of official bodies, as will be described in the body of the text.

Subsequently, we will present the Harm Reduction (HR) policy as an alternative to the prohibitionist logic, since it promotes care based on singularity and is configured as a possible ethical proposal, similar to the bet of psychoanalysis. By sustaining the idea of a not-all politics, represented by HR, it becomes possible to include the subject and his modes of *jouissance*, enabling less segregatory models and closer to the logic of case by case, as will be pointed out in the last two parts of the text. To do so, we will make use of the bibliography on HR, as well as the contributions of theorists who think about the field of mental health, alcohol and other drugs from the perspective of public health and, especially, psychoanalysis.

In addition, we will present the report of one of the clinical and institutional studies in which we were inserted, in order to illustrate the theoretical-clinical development of this article.

2 PUBLIC POLICIES ON MENTAL HEALTH, ALCOHOL AND OTHER DRUGS IN BRAZIL: BETWEEN ADVANCES AND SETBACKS

The policy of attention and care for drug users in Brazil was built on the gains obtained with the Psychiatric Reform, consolidated in the enactment of Law 10.216 (BRASIL, 2001), after years of struggles led by users, family members and workers. The main achievement of this movement consisted of the replacement of psychiatric hospitals – an asylum and hospital-centered model, based exclusively on medical knowledge – by Psychosocial Care Centers (CAPS) which, articulated in a Psychosocial Care Network (RAPS) composed of several devices, subverted the previous model. In the new arrangement, user care takes place in open equipment, understood as integrated with the public space, the community and the territory.

Established and regulated by Ordinance 336 (BRASIL, 2002), the CAPS were organized in modalities that included the CAPS ad: an equipment intended for the care of users of alcohol and other drugs, from the perspective of a policy and a clinic based on Harm Reduction (HR) strategies, instituted with the Policy for Comprehensive Care for Users of Alcohol and Other Drugs (BRASIL, 2003). Born in Europe, HR is considered an alternative to the prohibitionist model, as it presupposes the provision of care even in the face of the subject's choice not to interrupt use. At its base, the construction of therapeutic projects with users – and not for them – aims at an approach centered on the subject and on their listening, integrating knowledge about themselves and about use – a practice that promotes autonomy and self-care – in addition to working with the community and the territory in the prevention of use and the risks arising from abuse, as we will see later.

The inclusion of a perspective in which the user came to be recognized as a subject – and not as the object of his treatment – produced effects that substantially modified the view of this population in the field of public mental health policies, which began in the last years of the Fernando Henrique Cardoso government (1995-2002) and extended during the Luiz Inácio Lula da Silva governments (2003-2010). However, this change was not enough to reach other fields that make up the issue of drug policies in the country. In relation to alcohol and tobacco – the two most used drugs in Brazil – significant changes have been implemented, such as restrictions on advertising in certain spaces, increased collection of

taxes to finance treatments for their effects and, in the case of tobacco, in particular, a significant reduction in consumption. However, with regard to the so-called illicit drugs and public security policies, progress is scarce and quite ambiguous.

In 2010, the *Integrated Plan to Combat Crack and Other Drugs* (BRASIL, 2010) introduced the proposal for the integration of public policies on social assistance, education and security. However, the word *crack*, highlighted in the title, signaled a change in focus – previously centered on alcohol – which led, a year later, to the launch of the program *Crack, é Possível Vencer* (BRASIL, 2011), during the Dilma Rousseff government (2011-2016). This initiative of the Ministry of Justice, which proposed actions in the areas of prevention, care and authority, was received with strangeness by specialists and professionals. Although the media of the time repeatedly broadcast images of the so-called *cracklands*, associating crack users with the increase in crime and depriving them of their place as subjects by representing them as "zombies", the data from the surveys pointed to another reality: alcohol and tobacco – legal drugs – continued to constitute a serious public health problem in Brazil, much more expressive than any other. In addition to this distortion, the country was preparing to host two important international events – the World Cup (2014) and the Olympic Games (2016) – which led several cities to adopt hygienist actions, such as the compulsory hospitalization of these users in public and private clinics and in shelters linked to social assistance policies.

In this regard, in 2015, the Therapeutic Communities (TCs) were regulated as entities capable of welcoming drug users and, a year later, registered to receive resources from the Unified Health System (SUS) through two ordinances: Resolution No. 01 of CONAD (BRASIL, 2015) and Ordinance No. 1,482, of the Ministry of Health (BRASIL, 2016). Although the two ordinances configure a regulatory framework for TCs, it is essential to understand that, by moving from a device recognized and regulated by the State to a device financed by it, TCs became part of the SUS, which seems much more serious to us.

Thus, advances in the destruction of public policies on mental health, alcohol and other drugs, based on the assumptions of the Psychiatric Reform, gained space and acceleration after the 2016 coup, with the insertion of the neoliberal policies of the Michel Temer government (2016-2018). With a sequence of setbacks in this field from 2016 onwards, we highlight Ordinance No. 3,588/GM/MS (BRAZIL, 2017a), CIT/SUS Resolution No. 32 (BRAZIL, 2017b) and Resolution No. 01 (BRAZIL, 2018). In them, there was a return to the centralization of the psychiatric hospital, added to the integration of TCs into the RAPS and

the disregard of HR strategies in the care policies for drug users, which began to be reoriented exclusively to abstinence.

With the government of Jair Messias Bolsonaro (2019-2022), other serious setbacks were instituted in the face of his reactionary vision, adding to an already devastated scenario. In addition to the extinction of social control bodies, such as the Councils, we highlight Technical Note No. 11 (BRASIL, 2019a) and Law 13,840 (BRASIL, 2019b) – known as the *New Drug Law*⁵ –, which instituted: 1. the purchase of new electroconvulsive therapy (ECT) devices⁶; 2. the opening of new beds and the expansion of funding for psychiatric hospitals, including the hospitalization of children and adolescents; 3. the opening of beds and new accreditations of TCs; 4. the possibility of income tax rebate for those who allocated money to this equipment; 5. the dissociation between mental health policies and those of alcohol and drugs, leaving the latter in charge of the Ministry of Citizenship; 6. the transformation of CAPS ad into a mere instrument for referring users to TCs and 7. the involuntary hospitalization of users without judicial authorization, provided that it is formalized by medical decision.

Still during the Bolsonaro Government, the country – and the world – faced the worst pandemic in recent times, COVID-19, culminating in more than 700 thousand deaths in Brazil due to the disastrous conduct by the federal government. The bleak scenario of isolation, quarantine, diseases and deaths, added to the population's disbelief, aggravated many psychosocial issues: anguish, domestic violence, abuse of psychoactive substances and other illnesses, especially for some social strata:

[...] some social groups are more susceptible due to their socioeconomic conditions and the lack of adequate public policies, making visible those who are "south of the quarantine": women, precarious or informal workers, homeless people, poor peripheries and favelas, those interned in refugee camps and prisons, the elderly, physically disabled (SANTOS, 2020, p. 1)⁷.

⁵ Legally, the law would update the 2006 Drug Law – No. 11,343 – which established the system of repression and public policies aimed at the use, trafficking and production of psychoactive substances in Brazil, distinguishing, for the first time, user from dealer, although without any mention of a quantity that objectively establishes it, leaving it up to the police officer who authorizes and the judge who approves the decision to send the subject to prison or to the devices of health for treatment. In practice, the *New Law* only reinforced stigmas and instituted TCs as priority places for the "treatment" of users.

⁶ ECTs were widely used as symbolic instruments of torture widely carried out in asylums throughout the country before the Psychiatric Reform. After the reorientation of the care model, the method still continued to be used, but as a last resort and based on many discussions in the teams of psychiatric hospitals that were still functioning.

⁷ To this list, we would add children and adolescents, especially those in a state of social vulnerability.

Undoubtedly, those most affected by the pandemic were the recurrent users of the SUS and social protection programs. Although both have proven to be absolutely necessary for their capillarity and reach, they have also been deeply overwhelmed, as well as mental health services – situations that the country is still dealing with years after the pandemic appeased, brought about by the widespread and, in some way, late vaccination.

In 2022, with the new election of Luiz Inácio Lula da Silva for his third term, there was a promise of significant change in mental health policy since the government transition process. In fact, almost three years later, we have observed some resumption of investments to strengthen RAPS, as well as the recomposition of policies for alcohol and drugs from the recreation of the Department of Mental Health in the Ministry of Health. However, the issue of TCs still persists, as also in 2023, a support department for this equipment was created within the Ministry of Social Development (MDS). In view of this, we expand the discussion on TCs, their field and method of action.

3 THE NEW TCS FOR DRUG USERS AND THE OLD ASYLUM MODEL

According to Amarante (1995), the first TCs appeared in Europe based on the same criticisms that supported the Psychiatric Reform Movement. In Birmingham, England, T. H. Main called a work he developed at the North Field Hospital, with psychoanalysts Wilfred Bion and Erich Fromm-Reichmann, for the treatment of soldiers affected by psychic suffering after World War II, the Therapeutic Community. However, the term would have been consecrated by Maxwell Jones – a South African psychiatrist based in the United Kingdom – with the theorists cited above as a basis:

[...] the term therapeutic community comes to characterize a process of institutional reforms, predominantly restricted to the psychiatric hospital and marked by the adoption of democratic, participatory and collective administrative measures, aiming at the transformation of the institutional dynamics of asylum (AMARANTE, 1995, p. 29).

With the introduction of operative groups, Jones' proposal dealt with the summoning of patients to the place of subjects in their treatments, establishing, with all those involved – from physicians to support workers – the democratization of access and institutional opportunities as the focus of work (DE LEON, 2003). Subsequently, institutions named in the same way emerged in the USA, but distanced from the original proposal, both in terms of the target audience – which began to be composed of drug users – and in terms of methodology

and work premises – restricted to the asylum model and the Twelve Step method. Popularized by Alcoholics Anonymous and Narcotics Anonymous (A.A. and N.A.), this method is guided by the strengthening of identifications among the members of the groups, called brotherhoods, who must comply with a sequence of twelve steps to control what they name, based on medical knowledge, chemical dependency.

With drugs at the center of the proposal, elevated to the category of enemy – the same *modus operandi* advocated by the American War on Drugs policies –, phrases such as "I am a recovering drug addict", "alcoholism is a chronic, incurable disease", "just for today", "avoid people and places" and "I must admit that I am powerless in the face of drugs", commonly said in meetings and outside them, they reinforce the character of bonding to illness and moral weakness. Oscillating between a sick person and a social scourge, their bodies are always taken as objects subject to intervention by knowledge such as medicine, justice, public security or religion.

Amarante (2007, p. 19) points out that there is, in the practices of mutual aid groups, an emphasis on the "loss of control of the person in relation to the substance and the surrender to a 'higher power'", which evidences a practice of "confessing oneself to others". This same point is highlighted by Fossi and Guareschi (2015, p. 94), when they situate the practices of TCs as confessional, by evidencing "the articulation between religious morality, discipline technologies and biopolitics" in the treatment of drug users. In Brazil, TCs arrived around the 1970s and were established as a model very similar to the North American one, therefore absolutely different from the European one. Based on an important survey of the first TCs in Brazil, Alberti and Bastos (2019) point out that, of the first six, only one differed from the American project, while the others remained anchored in the paradigm of religious morality that still sustains them today.

Integrating the RAPS since 2011, the TCs are defined as "points of care of the Psychosocial Network in residential care of a transitory nature" (BRASIL, 2011), despite having absolutely divergent orientations from the other devices of the same network. On the Federal Government website, we find the following definition for TCs:

[...] private, non-profit entities that provide free shelter for people with disorders resulting from the use, abuse or dependence of psychoactive substances, in a transitional residential regime and exclusively voluntary (spontaneous). The reception period varies from 3 months to 12 months, depending on the entity's therapeutic project. The main instrument used in the Therapeutic Communities during treatment is the coexistence between peers. The Therapeutic Communities are not part of the

Unified Health System (SUS) or the Unified Social Assistance System (SUAS), but they are equipment of the supplementary network of care, recovery and social reintegration of addicts of psychoactive substances, so that these entities are part of the National System of Public Policies on Drugs – SISNAD, by virtue of Decree No. 9,761/2019 and Law No. 13,840/2019 (BRAZIL, 2025, n.p.).

To demonstrate how they are inserted in Brazil, we will start from three important reports: the *Profile of Therapeutic Communities in Brazil*, carried out in 2017 by the Institute of Applied Economic Research (IPEA) and commissioned by the National Anti-Drug Secretariat (SENAD); the *National Inspection Report on Therapeutic Communities*, prepared by the Federal Council of Psychology (CFP), the National Mechanism for Preventing and Combating Torture (MNPCT) and the Federal Prosecutor's Office for Citizens' Rights of the Federal Public Ministry (PFDC/MPF); and the report *Public Financing of Brazilian Therapeutic Communities between 2017 and 2020*, produced by Conectas Human Rights and the Brazilian Center for Analysis and Planning.

With the asylum model, with long and predetermined hospitalizations, in TCs "the deprivation of liberty is the rule that sustains this model of care" (CFP, MNPCT; MPF, 2018). In all the TCs inspected by the *National Inspection*, walls, locks, bars, security guards, retention of documents, bank cards and restrictions on means of communication were found. Without the consent of users, more than 80% of hospitalizations are carried out or interrupted by family members (IPEA, 2017), depriving them of their most fundamental rights and, of course, not considering them subjects.

Reports of compulsory hospitalizations – **or of initially voluntary hospitalizations converted into involuntary ones through** dissuasive practices, retention of documents or contractual fines – are common and are added to other complaints: mechanical or chemical restraints **carried out** by the inmates themselves; internments of adolescents to comply with socio-educational measures **without any integration into the formal education** system; and the practice of medicalization without a medical prescription, **even reaching the participation of users in the dispensation of medicines**. The facilities, often **located in areas of difficult access and far from any public policy**, promote isolation and the rupture of social ties, with several users – the elderly, in particular – **living in the TCs**, some without any issue related to drug use, **but only because of their condition of vulnerability** (CFP, MNPCT, PFDC/MPF, 2018).

Spirituality is described **as directly linked** to religious institutions, especially neo-Pentecostal evangelicals, **basing** the "recovery" of inmates on the divine order and placing

religiosity as an objective criterion of access and permanence, in affront to Article 5 of the *Constitution* (BRAZIL, 1988). In addition, religious rites are often used as practices of embarrassment, punishment and torture in the face of disobedience to institutional rules and/or as forms of conversion, including the so-called "gay cure" ⁸ ⁹(CFP, MNPCT, PFDC/MPF, 2018).

Work, another of its pillars, is named as labor therapy – the use of work or some craft as a form of treatment. However, observation shows that this practice is used without any purpose of social reintegration or learning a new trade. On the contrary, the reports point to its forced and unpaid use, either as a method of punishment or to favor coordinators or owners of the institutions through profit. Labor therapy, therefore, functions as a veil that covers the practice of exploiting labor in precarious, mandatory conditions analogous to slavery.

The last pillar, discipline, is not disconnected from the previous ones, as several disciplinary practices are used for a supposed pedagogical and/or therapeutic purpose, although they are only configured as punishment and/or torture: mechanical and/or chemical restraints; isolation and confinement for long periods; sleep deprivation; suspension of alimony; physical and psychological violence. The reported practices flagrantly violate article 2, sole paragraph, item II, of Law No. 10,216/2001; article 20, item IV, of Anvisa's Resolution RDC No. 29/2011; and the Penal Code (BRASIL, 1940). All these rules prohibit the use of physical, psychological or moral punishment by institutions, even for people with disorders resulting from the use of alcohol and other drugs.

The funding of TCs usually comes from federal, state, municipal and private sources. Based on data from the Ministries of Health and Citizenship, between 2019 and 2021 there was an increase of about 65% in funding for TCs and, on the other hand, CAPS ad had a growth of only 11% in the same period. From the point of view of financing, TCs can be considered public facilities; however, a public policy needs to be based on institutional rules, target audience and clearly delimited objectives, in addition to obedience to the principles of transparency and publicity of its actions and resources, as determined by the *Constitution*

⁸ The gay cure was a terminology that became known after parliamentarians tried to pass a bill in Congress that would allow psychologists to practice sexual reversal therapies, where subjects with homosexual sexual orientation would be converted to heterosexuality.

⁹ On this, see the article shown on Fantástico – a Rede Globo program – which showed the use of work and torture mechanisms as punishment for inmates, including in TCs coordinated by Brazilian politicians, such as Pastor and Sergeant Isidório de Santana – federal deputy with the most votes for Avante da Bahia, owner of a TC – who appears with a machete in his hand, named as a "psychiatrist", uttering several homophobic insults to the inmates: Available at: <https://www.youtube.com/watch?v=JTYFhdKG-yw>

(BRASIL, 1988) and the *Fiscal Responsibility Law* (BRASIL, 2000). Furthermore, the way TCs are organized in Brazil prevents the construction of a clear typology that classifies them as health or care equipment, as they do not establish the necessary criteria for classification in any of these areas, favoring the difficulty of inspection. In their vast majority, TCs are institutions of a religious nature and, therefore, considering them as health institutions, within the scope of the SUS, is absolutely serious, as it violates the constitutional principle of secularism.

Human rights violations were found in all the institutions visited by the *National Inspection* (CFP, MNPCT, PFDC/MPF, 2018). Deregulation or weak regulation of any institution creates opportunities for illegal or criminal activities in these spaces. By being financed by the government without the proper legal criteria, TCs are left on an institutional edge: at the same time that they receive public funding, they are outside the fundamental rules that constitute a network for the promotion of care and health rights, precisely the greatest promoters of rights in the country. The government is financing private institutions without articulation with the systems that have their network spread throughout the country and obey extremely strict requirements.

We know that hospitalizing people with mental disorders and/or drug use has always yielded and still yields a lot of money to this day in Brazil, even at the expense of a lot of violence. In view of the foregoing, added to the fact that we still have more than 2,000 TCs in activity in the country, it seems clear to us that the marketing intention at stake in these institutions is clear. It is extremely serious that subjects – regardless of whether they use drugs or not – are exposed to the conditions reported in these documents so that a few people profit and enjoy them in such cruel ways.

In 2024, already in the current government of Luis Inácio Lula da Silva, the National Council of Social Assistance began not to recognize TCs as social assistance organizations, demanding their disconnection from the Unified Social Assistance System (SUAS). Thus, the TCs could no longer receive resources from the National Social Assistance Fund. As a result, it was possible to cancel the Accreditation Notice 8/2023 (BRASIL, 2023) – the main financing instrument, which already had the accreditation of 585 TCs – by Ordinance 1,104/2025 of the Ministry of Social Development (MDS). This decision responds to the demands of several anti-asylum movements and reinforces the importance of inspection and social control bodies, such as the Councils, and their actions with entities and parliamentarians, with a view

to guaranteeing care in freedom, community and territorial, as recommended by the 1988 Constitution.

4 HARM REDUCTION STRATEGIES: A BET ON THE ETHICS OF THE SUBJECT

Born in the international context, Harm Reduction (DR) strategies are widespread in several countries as part of the policy of care for drug users in the field of health. In a more comprehensive and continuous way, the beginning of HR as a policy in the 1980s, in the Netherlands, is recognized; However, some previous practices already presented their principles as a bet, even without yet receiving a formal conceptualization.

As psychoanalysts, however, it seems essential to remember that, in Freud's biographies (JONES, 1953; GAY, 1989; ROUDINESCO, 2016), we find the well-known and controversial episode involving cocaine. In 1884, still a young doctor in Vienna, Freud began studies on the substance, recently isolated at the time and considered promising for various medical applications. Motivated by scientific enthusiasm and the desire for academic projection, Freud tried the drug on himself and prescribed it to Ernst von Fleischl-Marxow, a physiologist and his former teacher. Published in the article *Über Coca*, Freud (1884/1962) defended its use to treat fatigue, chronic pain, depression and, especially, as a substitute for morphine.

Initially, cocaine allowed Fleischl to reduce his morphine use¹⁰, but it quickly led to a new dependence, accompanied by symptoms triggered by the systematic use of the substance, such as paranoia and physical deteriorations. Fleischl died in 1891 and the episode generated criticism of Freud's conduct, later being called the "cocaine scandal". Despite the negative developments, Freud's studies indirectly contributed to Karl Koller, a close colleague, discovering the use of cocaine as a local anesthetic in ophthalmology, later also used in the treatment of migraines. Freud, throughout the 1890s, gradually abandoned the use of the drug and began to avoid the topic in his later writings.

Subsequently, two specific situations deserve to be highlighted. The first, which occurred in England, concerns soldiers who had left the First World War (1914-1918) who, after having their wounds treated with morphine and other opioids, became dependent on these substances provided by the State itself. In view of this, a group of

¹⁰ Analgesic drug – from the group of opioids – used to this day for the relief of intense, acute and chronic pain, which has great potential for dependence due to the immediate sedative effects.

ex-combatants demanded the continuity of the supply, in order to avoid the damage resulting from an abrupt withdrawal or the need to resort to the illegal market. This care strategy was formalized by the Rolleston Report ¹¹ (Great Britain, 1926), which recognized the possibility of mitigating harm and reducing harmful effects associated with the use of these substances (SANTOS; SOARES; CAMPOS, 2010). The second situation refers to the emergence of methadone¹², between the 1930s and 1940s, in Germany, proposed as a strategy to replace heroin¹³.

In the 1980s, Junkiebond, a Dutch association of drug users and former users, faced with the spread of sexually transmitted infections (STIs) through the sharing of contaminated syringes, demanded that the State adopt public policies that mitigate the risks of contamination and deaths, without the interruption of use being an imposition. Faced with the concern – especially about the transmission of Hepatitis B and AIDS – the Dutch government implemented the first Syringe Exchange Program (STP).

In the following decade, the cities of Santos (SP) and Salvador (BA) managed to implement the first STPs in Brazil, with the main target being the population that used injectable cocaine and controlling the spread of STIs. This scenario gains a fundamental boost when, in 2003, HR actions are no longer just a strategy of the STD/AIDS program and start to serve as a guide for the Ministry of Health's Policy for Care for Users of Alcohol and other Drugs within the scope of the SUS. According to Passos and Souza (2011, p. 154), HR can be defined as "an alternative health production strategy to strategies based on the logic of abstinence, including the diversity of demands and expanding health offers for the population of drug users".

The field of the SUS is the condition for the existence of HR. There is no possibility of thinking of a strategy like this other than for comprehensiveness, gratuity, capillarity and the intersectionality of the articulations of the SUS with the other public policies of the State. Contrary to neoliberal projects, the SUS, in its perspective of universality as a basic right, is

¹¹ The *Rolleston Report* was a set of recommendations made by a commission chaired by the UK Health Minister, Humphrey Rolleston, which authorized British doctors to prescribe opium to addicts at risk.

¹² Analgesic drug – from the group of opioids – with effects similar to those of heroin and morphine, still used today in DR strategies as a substitute for the latter because it has less sedative effects.

¹³ In his book *High Hitler: how the use of drugs by the Führer and the Nazis dictated the course of the Third Reich*, Ohler Norman (2017) reports that there are journalistic findings narrating the emergence of Methadone in studies commissioned by Hitler, due to the abusive use of drugs by German soldiers and his own use. However, it should be noted that the Nazi regime adopted a very prohibitionist stance, executing many drug users in concentration camps.

opposed to a system that can function as a service provider that considers health to be an access only for those who can pay for it, that is, a market product.

In *The Peripatetic Clinic*, Lancetti (2012) describes HR strategies as capable of providing another way of apprehending drug users, in which many subjects could be included and recognized as inhabitants of the city in fact, even if in different ways. The creation of the figure of the harm reduction professional, a health agent that often has a close relationship with the territory, allowed the offer of care to the most segregated places: the alleys of the favelas, the streets where residents, prostitutes, transvestites, wanderers live – mostly black and poor – that is, where the scenes of use are, both people in great social vulnerability and those who, for various reasons, do not want to interrupt consumption. By this same logic, the knowledge that sustains HR is not the property of specialists. They come mainly from users, former users, family members and residents of the territories and places of consumption.

Among the various strategies that the HR clinic presupposes, we can mention the practices of disseminating information about the harms and techniques linked to the use and referrals, such as guidance on rights, prophylaxis, distribution of inputs, drug substitution therapies and assistance (BRASIL, 2005). As a practical and theoretical strategy guided by an ethics of care and by a conception of drugs as part of the human experience, HR is guided by the reduction of risks linked to this reality (TORRES; VIDAL, 2017). Thus, the bond between the user and the figure of the harm reducer is an essential part of the work of building or reconstructing a bond that allows the drug user to invest in the social bond, from which he is often precarious or separated. Therefore, although it is common to hear that HR is an "incentive to use" or mere substitution of drugs, it is essential to highlight that it can presuppose substitution, but it is not a synonym for treatment by the object. Treatment from HR necessarily involves transfer with professionals and decisions proposed and constantly rethought. As Laurent (2008, p. 15) points out:

There is also processing by object, by objects of substitution. 'You are a heroin addict, let's propose Methadone or Subutex. This substitution is less deadly, it gives you access to a legal object, to rights, there is a social status'. It is a way of rewriting the subject separated from an entire discourse, in a social bond.

Therefore, if all the definitions of objectives, goals and procedures are not imposed, but discussed, even substitution is thought of in the uniqueness of each case, as well as abstinence, which can be a goal, an end or even its beginning, never the only strategy. This

decision is up to the subject and may or may not be part of his/her therapeutic project, which, established on a case-by-case basis, aims at self-care and autonomy over treatment and use. What is at stake in a practice that, guided by the clinic, proposes to reduce harm, is precisely the implication of the subject and his responsibility and not the offer of a tutelage that fixes him in the place of object of intervention.

The construction of the singular projects, carried out in partnership with the RAPS devices, is essential for the implementation of the strategies, based on **the treatment of the case by case**. In this context, in addition to ensuring rights, it seeks to **consider the user as the protagonist** of his own treatment, bringing him, at this point, closer to psychoanalysis. It is not, obviously, a matter of equating the two fields, but of **thinking about parallels** that structure the clinical and political strategies of HR – through the subject's knowledge about its use – and psychoanalysis based on unconscious knowledge and the position that drugs occupy in their libidinal economy. The articulation between clinic and politics has been highlighted since Freud (1919 [1918]/2020) as the one that made it possible **to listen to segregated subjects**, reaffirming the analyst as the guiding thread of this process that, based on his desire, allows psychoanalytic listening to be present in any device. As Elia (2000, p. 28) points out and defends:

It is thus possible to do psychoanalysis in any social stratum, in any institutional environment. As long as there is an analyst, on the one hand, and a divided subject, on the other. The analyst should not confuse his criteria with social criteria. Thus, elitism is demonstrated here as impossible in a psychoanalytic posture.

Even when it is a demand that, initially, is configured as a request for a guarantee of rights – frequent in psychosocial care – the psychoanalyst must operate with his clinical and ethical rigor. Especially because this may be the only way in which these people can address some demand to us, since most of these subjects still do not reach private offices. Warned of its listening function, however, the bet needs to be guided by the emergence of a subject, even in the most adverse conditions. If, with the use of drugs, what is intended is the placation of the malaise, the bet of psychoanalysis needs to be to construct new possibilities that point to another way of treating this malaise: through speech and including its partialization.

As much as we can hear them in their discourses from a set that identifies them and presupposes them as equals – drug addict, addict, drug addict, pothead, drug dealer – drug abuse does not define these subjects (MARTINS, 2011). When we propose to listen to their

stories in the clinic – whether in the public or private field – we perceive the existence of an initial discourse, promoting a certain collage between the subject who uses it and the object-drug used, as if he were submerged there. Thus, they present themselves only by their uses, by a mode of *jouissance*, petrified into signifiers and linked to an identification with a name that, by itself, says nothing about the subject (ALBERTI, 2003). Therefore, it is essential to call on them to talk about their uses, but, above all, about their stories that are not limited to drugs. Starting from the singular of each case, it is the signifiers that emerge in the speech of each subject **that interest us**:

The subject is therefore always supposed. We do not find it in reality, but we suppose it. Or rather, we are forced to suppose it from the moment we recognize the incidence of the signifier in human experience, that atom of the symbolic which, because it has no meaning in itself, summons, in the living being, when it is speaking (that is, when it is inhabited by the symbolic), the response that is called the subject. We are forced to suppose the subject when we recognize the signifier because, in fact, it is the signifier (and not us) who presupposes the subject. The subject is, therefore, a supposition of the signifier, which imposes itself on us (ELIA, 2010, p. 70).

The subject is constituted by signifying marks that will be placed in a chain: "everything that is language is obtained from this alterity, and it is for this reason that the subject is always an evanescent thing, which runs under a chain of signifiers" (LACAN, 1976, p. 206). If there is no relationship between the subject and the drug-object that does not occur in the field of the symbolic, as psychoanalysts, then our work in any device needs to be an invitation to speak. Only with the sliding of the signifying chain, proposed by the free association, can the subject's ills and problems appear. In no way are they limited to drugs, but they certainly converge to their relationship with the Other and to the anguish in the face of castration.

The universalization present in groups and institutions operates by suppressing differences and subjectivity, which ends up opening space for segregation. Alberti and Figueiredo (2006) point out that perhaps the greatest lesson of psychoanalysis in a public field such as mental health is to retreat from what is daily imposed as an attempt at understanding, letting each subject, in his or her own time, conclude something about himself that brings a singular mark of *jouissance*. In this way, the exercise of psychoanalysis in the institution requires the presence of an orientation committed to its theory, its clinic and its particular ethics, "in order to underline its specificity in contributing to the support of the patient and user of the services as a subject" (ALBERTI; FIGUEIREDO, 2006, p. 14).

Thus, the ethics of psychoanalysis can never be regulated by a norm, nor according to the requirements of the ideals of the professionals or of the institution itself. By understanding symptoms as formations of the unconscious and not being guided by their immediate suppression, psychoanalysis ends up operating against what institutional mandates preach. As a challenge, there is the hole in the norms, making the case by case prevail, listening to the unconscious, pointing out the impossibility of dealing with all the issues, that is, healing as a path to normality. If we think of the offers of public policies based on the cessation of malaise, they will always be seen as failure; Therefore, our bet not only includes malaise as a possibility, but as an inherent one.

5 FROM THE MALAISE IN CULTURE TO THE MALAISE IN DRUG POLICY

For two years, we were a professor and preceptor of medical students at UFRJ – Macaé Campus – in a CAPS ad, where we heard from many students that the work in that equipment was to "dry ice", "rain on the wet", "without effectiveness". The malaise of future doctors arose in the presence of users in the institution under the influence of drugs, reporting their "relapses", missing appointments, circumventing medications – not taking them or exceeding use – that is, not remaining abstinent. In view of their mandates to heal the organic body – learned in the eight periods that preceded their "passage" through the chair of Mental Health – it was very difficult to introduce a cut that could lead them to understand that, for some subjects, seeking care during or after use, or offering them a break in this use by listening to or caring for the body – even if for a few hours – represented the possibility of building new paths *a posteriori*. In addition, as an "open-door" service, the CAPS was also a space of circulation **not restricted** only to those who interrupted drug use. On the contrary, guided by HR and, as psychoanalysts, we knew that dealing with drunkenness, intoxication, agitation, drowsiness and other effects was included. Welcoming them in this way was a gamble... And this is no small feat.

Having contact with mental health only at the end of graduation, they brought the strangeness that Paula, a student was able to express:

We spend almost five years just learning how to diagnose and treat organs and, when we get here, do you tell us that we have to listen to the subject? I'm trying, it has moved me in many ways, but many colleagues don't see the slightest use in it and I understand them.

At the time, there was a discussion at the University about the possibility of anticipating the contact of academics with mental health earlier, but, for this, it was necessary for other professors to give space, which did not happen. At that time, of the six mental health professors, there were two psychoanalysts and, at CAPS ad, two others. Therefore, the insistence on "listening to the subject" was an offer that, based on their own anxieties, caused desire in some students. The medical course is marked by the presence of knowledge that seeks, in various ways, to veil any possibility of absence. It is not by chance that the overwhelming anguish of the students was almost always followed by numerous defenses in the face of the impossibilities that the education itself imposes. In Paula's words:

I took three years of prep school to get here, it was a dream, but I saw all my ideal quickly unravel. Most teachers are happy to take us close to giving up, and this possibility is like a little voice in the back of my head. I sought analysis to remind myself weekly of why I am here. I saw up close that this is unbearable for some.

At the beginning of that semester, a classmate of Paula's died when he threw himself from the tenth floor of the student dormitory where he lived. This was already the third case since she started college. However, Paula was able to bet on her desire and, perhaps because of this, she was also able to see mental health and HR as a bet. From that same class, another student, after a class on drug policy and many questions about its "effectiveness", said: "I don't understand spending money on those who don't want to be treated. Either you can intern or do as the governor said: 'just aim at the little head and...'" . The student was referring to a speech by the former governor of the state of Rio, Wilson Witzel, in 2018¹⁴, about how the police should act in the face of any subject who was in a situation of suspicion. His words bothered part of the population, but he was acclaimed by another significant portion that brings in its bet the possibility of executing people based on the premise "a good criminal is a dead criminal". This *modus operandi* of the State is affirmed based on another Brazilian mark: that the "good citizen" is the only one who can enjoy the right to circulate in the city. The others, including drug users, the insane, the black and the poor, need to gain destinations out of their sight.

In view of such reports, we recall Foucault (1972/2004), in *History of Madness*, when he brings that, in the eighteenth century, with the beginning of the so-called industrial

¹⁴ See: BARREIRAS, G. Declarations and striking images of Wilson Witzel's government. G1, Rio de Janeiro, April 30, 2021. [www.g1.globo.com](https://g1.globo.com/rj/rio-de-janeiro/noticia/2021/04/30/declaracoes-e-imagens-marcantes-de-governo-de-wilson-witzel.ghtml). Available at: <https://g1.globo.com/rj/rio-de-janeiro/noticia/2021/04/30/declaracoes-e-imagens-marcantes-de-governo-de-wilson-witzel.ghtml>.

capitalism, work began to have an attribution of value that raised it to levels not seen before. On the other hand, poverty, which had a certain value in Christian discourse, began to be depreciated. In this way, the portion of the population that could not adapt to the world of work – the insane, beggars, prostitutes, carriers of contagious diseases, the disabled, delinquents, among others – became the target of hygienist measures. The author calls the period in which madness, before being a medical object, was treated as a moral and social problem a "major internment".

In the nineteenth century, the new parameters of modern and positivist science required medicine to undergo a reformulation, structuring methods of knowledge based on experimentation, which modified the teaching of the profession with a view to standardization. In this scenario, figures such as Philippe Pinel appeared, sustaining a psychiatry that inaugurated a field of knowledge aimed at treating madness as a mental illness, aiming at the transformation of unreason into an object of normalization. Thus, both "the great internment" and this medical and positivist science are part of a perspective of power in which submitting difference to the norm is its motto, whether by exclusion or pathologization.

Throughout his work, Foucault demonstrated a deep interest in the relations between power and knowledge, alluding to the exercise of power as something that is only possible through the use of knowledge as an instrument of justification. In other words, authoritarian practices of segregation, monitoring, and control of bodies are legitimized in the name of a single, constructed truth. Thus, Foucault (1978, p. 3) developed the concept of biopower as "the set of mechanisms by which what, in the human species, constitutes its fundamental characteristics, will be able to enter into a politics, a political strategy, a general strategy of power". The production of a knowledge-power over life, therefore, regulates it, producing discourses about what we understand as health, disease, treatments and sexuality.

Nowadays, an increasingly biologizing psychiatry moves away from clinical practice that includes listening, symptom support, and the management of anguish, in favor of a close alliance between science and contemporary capitalism, or rather, the production of a science at the service of capital. With the massive production of objects of consumption – *gadgets* – that aim to buffer any lack, capitalism produces drugs and, later, diagnoses so that drugs can be consumed or to make subjects more adequate and functional.

Returning to the Freudian text of 1930 to establish a dialogue between malaise and the so-called civilizational progress, Lacan (1967, unpublished, p. 29-30), in *A short speech to psychiatrists*, says: "the progress of universal civilization will result not only in a certain

malaise", but in a "practice, which they will see will become more and more widespread, which will not immediately show its true face, but which has a name that, transformed or not, will always mean the same thing: segregation". Then, he warns by saying that thirty or fifty years later history will demand a position from psychiatrists:

My God, the dear psychiatrists, in fact, give us a small model of what could have been done at that moment as a cogitation that could have been useful for us, but in fact they did not give it to us, because at that moment they slept, they slept, why? My God, because they never saw very clearly what was about their relationship with madness after a certain period; they did not see it, God knows why, it will be said, they did not see it precisely because they had the means to see it (LACAN, 1967, unpublished, p. 30).

Lacan states, therefore, that, instead of dealing with the effects of segregation, psychiatrists remained asleep, even though they had at their disposal the means with which they could do so, that is, psychoanalysis and its ethics. Instead of making it an instrument, they preferred to use it as a means of social ascension. More than fifty years later, what we are witnessing is psychiatry becoming more and more involved in its biologization, having diagnostic manuals as its main tool of care, leaving listening out of this process. They thus present themselves as the "gold standard" of a science that, without any constraint, joins capital with the same intention: to tame bodies and try to transform them into universals.

When referring to the relationship between psychiatrists and the madman, Lacan (1967, unpublished) says that other barriers were placed in place of isolating him, and it was no longer necessary to asylum the madman to make him docile. Psychiatry, rediscovering its purpose of being equivalent to a framework of general medicine, entered entirely into the pharmaceutical dynamism, replacing the clinical experience with the insane by its apprehension as an object of study and psychopharmacological experimentation. For a long time, science had already sought to correct the flaw that madness opened, all with the same intention: to universalize and seek the isolation of a "pure subject" (LACAN, 1967/2003, p. 28).

In *the Proposition of October 9, 1967 on the psychoanalyst of the School*, Lacan (1967a/2003) makes a new reference to an expansion of the processes of segregation as a consequence of the universalization introduced by science, taking the concentration camps as the basis for his discussion. He thus states that what we saw emerge in these places:

It represented the reaction of precursors in relation to what will develop as a consequence of the relocation of social groups by science and, nominally, of the universalization that it introduces there [...] Our future of common markets will find its balance in an increasingly harsh expansion of the processes of segregation (LACAN, 1967a/2003, p. 263).

The total institutions, named by Goffman (1987) from asylums, prisons and convents, gain new faces in Brazil with the TCs, which unite, at the same time, the moral, the religious and the medical/psychiatric discourse. We cannot fail to emphasize that the large audience of these institutions is composed of people in social vulnerability: the poor, the homeless, the unemployed – a population that, in Brazil, crosses the racial profile, a legacy of centuries of slavery, that is, of a regime that was made at the expense of the domination of a population that to this day lives its effects. Thus, the population from which a framework is most expected is also the most susceptible to drug abuse. Consequently, these people will be the priority target of totalizing policies, who will serve as slave labor in the large internments promoted by the State – in alliance with the churches and psychiatry – in the TCs. Therefore, if we can compare the TCs to the concentration camps – as some professionals committed to mental health policies and some activists have pointed out – due to the dozens of complaints exposed above, Let us not forget that there is a lot of slave ship in them.

In *Terminable and Endless Analysis*, when talking about the offices of governing, educating, and analyzing, Freud (1937/2020, p. 249) told us that they "can be given in advance the insufficiency of the result". In this way, it places them as impossible. This premise has an intrinsic relationship with the first developments of the theory of drives, when it affirmed the child as a perverse polymorph. Being always subject to the omnipotence of the pleasure principle, there is something of the drive impossible to master, expressed in the goal of the drive, that is, satisfaction. If the drive is what moves, impels the subject in one direction, it seems an impossible task to summon it to an order, to a norm and to a continuous well-being, that is, to educate it. Moreover, if satisfaction is the goal of the drive, its target – the object –, as we learned from Lacan (1964/1998), is always a void, a hollow – represented by the object *a* –, marking the partiality, the mismatch and its return. The impossible encounter institutes the compulsion to repetition, leaving a remnant that, by insisting, led Freud to the concept of the death drive.

In 1930, Freud pointed out malaise as a constant process that the subject will have to deal with throughout life as part of the instinctual renunciation necessary for the establishment of the social bond. With this, Lacan introduced the field of *jouissance* from the concept of

object **a**, and, moving forward, he was able, in *The Seminar, book 16: From an Other to the Other* (1968-69/2006), to bring discourse as a position that the subject occupies in language, situating it beyond speech. As a form of social bond, discourse contains an impossibility, through which it will introduce, once again, the object **a**, this time as the surplus-of-jouissance: "a function of renouncing jouissance under the effect of discourse" (LACAN, 1968-69/2006, p. 19). The concept of surplus-de-jouissance is brought by Lacan as a homologue to the concept of surplus-value, that is, made "of the same fabric, insofar as it is the scissor cut of discourse" (LACAN, 1968-69/2006, p. 45).

The concept of surplus value is introduced by Marx (1867/2008) as the alienated labor that the subject provides to the capitalist, that is, to those who own, accumulate capital and pay a small part to those who produce it. It is a disparity between the wages paid to the proletarian and the value of the labour he produces. Surplus value, then, is the profit of the capitalist, the profit granted by the worker to the capitalist, the extra time of work of the proletarian who increases the capital of those who own the means of production. Where there is profit as a goal, there is necessarily surplus value as an operator, an integral part of the organization of the capitalist system that aims at the production of a profit that will be infinitely reinvested, generating the accumulation of capital. Thus something of the proletarian's remuneration will always escape him, and his account will never be able to reach its true accounting. Without realizing it, the proletarian becomes the cog that sustains this system that has at its base the exploitation and delivery of capital only to the hands of those who do not produce and do not have the knowledge about production.

However, there is also a loss for the capitalist, as he will not be able to have the gear of his machine running without the labor power. A perception that the system itself seeks to cover up, creating a discourse that places the capitalist as someone who, by moving the economy, allows the creation of jobs and, consequently, guarantees the subsistence of the worker. When, in fact, this is only possible because a mass of proletarians has been created and alienated from their production. The loss is inherent, however, the capitalist system sustains a discourse that seeks to veil these holes.

The homology pointed out by Lacan (1968-69/2006) dates back to the entry of the human into language, partializing instinctual satisfaction and having as a consequence the rigging of jouissance, that is, a symbolic system that organizes jouissance by imposing a bar on it. When the law begins to organize jouissance in the social bond, it ends up delimiting what can or cannot be done, demarcating the modes of jouissance and thus producing a

deviation. It is precisely from this renunciation of part of jouissance that the surplus-de-jouissance is produced. In other words, in the illusory idea that there is something to be recovered, what is introduced for the subject is loss. If something of this jouissance is irretrievable, it also becomes impossible to be accounted for, despite being supposed to the subject.

The Freudian notes of 1920 allowed us to know that jouissance is that which escapes the pleasure principle, a principle that has as its premise the return to a previous state of tension reduced to the lowest possible homeostatic level. There is a non-taxable excess attributed to the Other that makes the account never close, leaving the subject to be infinitely indebted and articulating a relationship between jouissance and repetition, since it "is based on a return to jouissance" (LACAN, 1969-70/1992, p. 47). For Lacan, it was from this relationship that Freud found himself "in some way obliged, by the very structure of discourse, to articulate the death drive" (LACAN, 1969-70/1992, p. 47). Thus, if repetition is based on a return to jouissance, on a search for representation, "[...] it is from there that we start to give meaning to this inaugural repetition, insofar as it is repetition that aims at jouissance" (LACAN, 1969-70/1992, p. 47). In this gear, we observe the attempt to recover the lost jouissance impossible, an a-plus that cannot be symbolized by way of phallic signification. In this mathematics of jouissance, there is a mismatch that cannot be repaired, as in an exact calculation. On the contrary, in this account there will always be a remainder, an unsymbolized excess, which concerns the real, as Lacan (1968-69/2006, p. 30) points out: "In general, this is determined by the convergence towards an impossibility. That's why it's real."

When Freud, in creating psychoanalysis in an absolutely revolutionary way, brought sexuality as a drive, he showed us that, if the renunciation of a part of the satisfaction is a condition of the social bond, being in the bond will not be without discomfort, without a remainder that is precipitated and with which the subject will have to deal. It is castration itself, which, by bringing anguish as an effect, causes some subjects to resort to palliatives such as drugs, which buffer the malaise by producing sedative effects, but temporary. In view of this, in the course of listening to subjects who use drugs, it seems fundamental to us what psychoanalysis can offer by including lack – a structural and structuring loss. If the object is lost, "something else appears in the place of jouissance, that is, the trace that marks it. Nothing can be produced there without an object being lost" (LACAN, 1968-69/2006, p. 21).

Returning to the Harm Reduction proposal, Feldman (2014) reports experiences of DR in narco-rooms¹⁵ installed in treatment centers located at strategic points in some cities in Switzerland. In them, heroin applications are provided under the care of health professionals, present throughout the "wave" of the drug, at scheduled times and modes of application with safe inputs. As they are shared spaces with other users and with the presence of a team, these equipment allow a certain ordering of use by inserting it into the social bond and the offer of better quality drugs. However, some users prefer the use of the more impure heroin, bought from dealers and consumed on the streets. Experience reports that the ethics of Harm Reduction include a policy that will never be universalizing. In the same way, we cannot infer that abstinence is so, although it is proposed.

In *Television*, Lacan (1974/2003, p. 508) teaches us that the word is always a flawed instrument, since "to tell the whole truth is impossible, materially: words are missing". Truth, therefore, is always a half-truth; the other half is unspeakable. This impossible, present in language, in the impossibility of saying it in its entirety, is the real, "that which does not cease not to be written" (LACAN, 1972-73/2010, p. 55). Thus, any public policy, any offer of treatment, needs to be considered possible only to some extent, that is, it must be thought of from a non-all *jouissance*. Lacan (1974/2003) also warns us not to treat the Other *jouissance*, that which is *heteros*, as underdeveloped, imputing to it a single mode of *jouissance*. With this, he reminds us that to have the field of *jouissance* as an ethic is to sustain castration as the way to allow each one to respond, singularly, to the non-existence of sexual intercourse. There is no perfect encounter and, therefore, the measure of each one can be, for example, the substitution of drugs, of modes of use that partialize a *jouissance* that has hitherto been deadly. For others, the measure may be abstinence. The fact is that there is not a single measure and that, in addition, it is not possible to prevent the subject from cumming in any way.

In the context of deep social inequalities in Brazil, it is inadmissible to treat drug use only with a proposal to interrupt use obtained through gluing to the signifier that identifies a group, punishments, forced labor, prayers and deprivation of freedom. When they return from long hospitalizations to their territories and their ills, added to the easy availability of drugs, a favorable scenario is created for the resumption of use. Therefore, the lack of a more

¹⁵ Narco-rooms or safe use rooms are health and HR facilities where subjects use drugs assisted by health professionals who will guarantee them access to adequate supplies, assistance if they need it, food and security.

comprehensive evaluation, centering on people willing to renounce drug use altogether as their only criterion for success, makes the high public investment in this model problematic. In this way, this discourse, like any other, contains a hole, although veiled by those who propose it. There are no simple solutions to complex problems. Our proposal insists on a model that includes a range of possibilities thought out on a case-by-case basis, taking into account each subject who makes drugs a palliative resource for their malaise (FREUD, 1930/2020) and the conjuncture in which they are inserted.

In view of the above, we affirm that hospitalization in institutions that violate human rights, even with medical approval, cannot be confused with treatment. It should occur only in specific, short-term situations, decided by a multidisciplinary team and, if possible, with the participation of the patient and family members, prioritizing devices such as CAPS ad III and IV and General Hospitals, in line with the anti-asylum logic. This is the logic contained in the Psychiatric Reform and Harm Reduction: a bet that moves towards policies that consider the subject in his or her dimension of care and choice. Allied to psychoanalysis, this is a bet that calls for speech and, therefore, will come up against loss, insufficiency, limitation, partiality – but also in reformulation and change, even if arduously achieved.

6 FINAL CONSIDERATIONS

In 1913, with *Totem and Taboo*, Freud presented us with the myth of psychoanalysis through the murder of the father by a brotherhood that saw itself excluded from access to jouissance. In addition, he pointed out to us the creation of totemic systems as an affirmation of solidarity, with laws and protection mechanisms that prevent the other from being taken as an object of jouissance – that is, that prohibit because, first, they attest to and recognize the human as a being capable of killing another human. If the drive tendency aims to "treat the other as an object to be consumed: sexually and fatally" (QUINET, 2006, p. 17), the drive renunciation is the condition for the maintenance of the civilizing pact. Therefore, rethinking the laws and apparatuses that we are willing to create becomes urgent.

The call of public policies needs to be based on Eros, on the invitation to speak, on what binds and relaunches the subject in life. In this dynamic of representations that is unleashed, anything can come as a novelty, as knowledge that is not known, unconscious, even if partial, insufficient and limited, but without disregarding the insistence of the death drive, the impossibility of educating, governing and analyzing, that which escapes the significant knowledge and which, therefore, is not-all. And, once again: this is no small thing!

It is about the defense of secular, community and territorial care offers – which include the unconscious as a territory – that respect constitutional rights and promote the integrality of public policies.

With regard to mental health, alcohol and other drug policies, we already have a path that points in this direction. We need to take it up again with determination, betting on the constitutional and democratic ideals of the Psychiatric Reform in its relationship with the clinic and politics. Starting from social struggles that included users, family members and workers, listening to these actors was, for a long time, the north in the construction of psychosocial care devices. With the setbacks, we have seen that they occur precisely to the extent that one tries, once again, to exclude the subjects from this process, using, for this, discourses that objectify them. If change is only of interest to the proletarian, as pointed out by Marx, it is once again up to the same actors to fight for the reorientation of these policies. As Lacan had already said in 1967, here, psychoanalysis has much to contribute.

ACKNOWLEDGEMENTS

The authors would like to thank the institutional support of the State University of Rio de Janeiro (UERJ), especially the Graduate Program in Psychoanalysis, of the Institute of Psychology (PGPSA-IP). This study was developed with the support of the Coordination for the Improvement of Higher Education Personnel (CAPES) and the Graduate Support Program (PROAP).

ABSTRACT

The increasing digitization of creative assets poses significant challenges to the protection of intellectual property. In this context, blockchain and Non-Fungible Token (NFT) technologies emerge as promising solutions to ensure the authenticity, traceability, and monetization of digital assets. This study aims to explore the landscape of technological innovation at this intersection through a systematic search in patent databases. The methodology consisted of a search on the Orbit Intelligence database, followed by a rigorous dual validation process that combined manual screening and analysis by Artificial Intelligence (DeepSeek), resulting in a final portfolio of 119 patent families. The results reveal a sharp increase in the number of filings from 2018 onwards, with a peak in 2022, and a strong geographical concentration in China. The analysis of technological domains indicates that innovations are focused on "IT methods for management" and "Digital communication," highlighting the use of the technology as a governance infrastructure. The qualitative analysis of selected patents demonstrates the sophistication of the solutions, which address issues ranging from registration efficiency to rights management for AI-generated content. It is concluded that the field is rapidly maturing, moving beyond proof-of-concept to develop specialized solutions that address complex challenges in the intellectual property ecosystem, thereby redefining protection paradigms in the digital economy.

Keywords: Technological Prospecting. Intellectual Property. Non-Fungible Tokens. Blockchain. Patents.

RESUMO

A crescente digitalização de ativos criativos impõe desafios significativos à proteção da propriedade intelectual. Neste contexto, as tecnologias de blockchain e Tokens Não

Fungíveis (NFTs) emergem como soluções promissoras para garantir autenticidade, rastreabilidade e monetização de ativos digitais. O presente estudo tem como objetivo explorar o panorama da inovação tecnológica nesta interseção, por meio de uma prospecção sistemática em bases de dados de patentes. A metodologia consistiu em uma busca na base Orbit Intelligence, seguida de um rigoroso processo de validação dupla que combinou triagem manual e análise por Inteligência Artificial (DeepSeek), resultando em um portfólio final de 119 famílias de patentes. Os resultados revelam um crescimento acentuado no número de depósitos a partir de 2018, com um pico em 2022, e uma forte concentração geográfica na China. A análise dos domínios tecnológicos indica que as inovações se concentram em "Métodos de TI para gestão" e "Comunicação digital", evidenciando o uso da tecnologia como uma infraestrutura de governança. A análise qualitativa de patentes selecionadas demonstra a sofisticação das soluções, que abordam desde a eficiência do registro até a gestão de direitos para conteúdo gerado por IA. Conclui-se que o campo está em rápido amadurecimento, transcendendo a prova de conceito para desenvolver soluções especializadas que endereçam desafios complexos do ecossistema da propriedade intelectual, redefinindo os paradigmas de proteção na economia digital.

Palavras-chave: Propriedade Intelectual. Tokens Não Fungíveis. Blockchain. Patentes.

RESUMEN

La creciente digitalización de activos creativos impone desafíos significativos a la protección de la propiedad intelectual. En este contexto, las tecnologías de blockchain y Tokens No Fungibles (NFTs) emergen como soluciones prometedoras para garantizar la autenticidad, trazabilidad y monetización de activos digitales. El presente estudio tiene como objetivo explorar el panorama de la innovación tecnológica en esta intersección, a través de una prospección sistemática en bases de datos de patentes. La metodología consistió en una búsqueda en la base de datos Orbit Intelligence, seguida de un riguroso proceso de validación doble que combinó una selección manual y un análisis por Inteligencia Artificial (DeepSeek), resultando en un portafolio final de 119 familias de patentes. Los resultados revelan un crecimiento acentuado en el número de solicitudes a partir de 2018, con un pico en 2022, y una fuerte concentración geográfica en China. El análisis de los dominios tecnológicos indica que las innovaciones se concentran en "Métodos de TI para la gestión" y "Comunicación digital", evidenciando el uso de la tecnología como una infraestructura de gobernanza. El análisis cualitativo de patentes seleccionadas demuestra la sofisticación de las soluciones, que abordan desde la eficiencia del registro hasta la gestión de derechos para contenido generado por IA. Se concluye que el campo está en rápida maduración, trascendiendo la prueba de concepto para desarrollar soluciones especializadas que abordan desafíos complejos del ecosistema de la propiedad intelectual, redefiniendo los paradigmas de protección en la economía digital.

Palabras clave: Propiedad Intelectual. Tokens No Fungibles. Blockchain. Patentes.

1 INTRODUCTION

Intellectual property rights (IPR) management faces unprecedented challenges in a digital landscape characterized by the massive production and dissemination of content by a diverse range of creators, ranging from large corporations to independent artists (Ferro et al., 2023). Traditional protection systems, designed for an analog world, often prove inadequate to keep up with the speed and complexity of digital transactions, resulting in vulnerabilities that facilitate piracy and make it difficult for rights holders to be fairly remunerated. This lag creates a demand for technological solutions that can offer more agile, secure, and transparent mechanisms for the management of intellectual assets in the digital environment.

In this context, blockchain technology emerges as a promising infrastructure, with the potential to revolutionize the protection of intellectual property (Qizi; Kamalovich, 2025). Through its distributed, transparent, and immutable ledger, blockchain offers a secure platform for tracking asset ownership and transaction history, combating fraud and strengthening proof of anteriority and authenticity. Specifically, Non-Fungible Tokens (NFTs), which are unique digital representations of assets registered on the blockchain, together with smart contracts, enable the automation of IPR enforcement, dynamic licensing, and royalty distribution in a programmatic and efficient way (Ferro et al., 2023). The combination of smart legal contracts with the operability of smart contracts on the blockchain represents an innovative approach to formalize legally binding contractual aspects while also taking care of notarization and transfer of rights.

Despite the transformative potential widely discussed in the literature, there is still no established consensus on the ability of these technologies to properly manage and transfer intellectual property rights on a large scale (Ferro et al., 2023). Most existing studies tend to focus on conceptual analyses or specific case studies, leaving a gap in terms of an empirical and comprehensive analysis of the real technological development scenario. Understanding the direction, intensity, and focus of innovation is key to anticipating trends and assessing the maturity of this field. This is where technological prospecting, as a competitive intelligence tool, plays a fundamental role.

Patent analysis is a consolidated and effective methodology for technological prospecting, allowing mapping the state of the art, identifying promising technologies, and analyzing the strategic positioning of the main actors in a given sector (Altuntas; Dereli; Kusiak, 2015). Patent documents are a direct indicator of research and development (R&D) efforts and market protection strategies of organizations, offering insight into developing

innovations. Therefore, the application of a quantitative analysis of patents is a methodological approach to empirically investigate the evolution of the intersection between NFTs and intellectual property.

In view of the above, the objective of this article is to map the global panorama of technological development at the intersection between NFTs and the protection of intellectual property, through quantitative technological prospecting based on patent data. To this end, it seeks to answer the following research question: What is the state of the art and emerging trends in the use of NFTs for the management and protection of intellectual property, as reflected in the filing of patents on a global scale? The main contribution of this study lies in offering an empirical analysis of the patenting scenario, identifying the main technological domains, the most active actors, and the geographic and temporal distribution of innovation, filling a gap in the literature on the real technological trajectory behind the discourse on NFTs and IPR.

To achieve this objective, the article is structured as follows: Section 2 details the methodology of technological prospecting used in the collection and processing of patent data. Section 3 presents the quantitative results of the analysis, including the temporal and geographical evolution of the deposits, the main technological domains and the most relevant actors. Section 4 discusses the implications of the results, contextualizing them in the broader innovation and market landscape. Finally, Section 5 presents the conclusions of the study, its limitations, and points out directions for future research.

2 METHODOLOGY

This section describes the methodological procedures adopted to carry out technological prospecting, which constitutes the core of this study. The methodology was structured to ensure the systematicity and replicability of the research, following the best practices for patent analysis as a source of technological information.

2.1 CHARACTERIZATION OF THE RESEARCH

This study is characterized as an exploratory and descriptive research, with a quantitative approach. It is exploratory because it investigates an emerging technological field that is still poorly consolidated in the empirical academic literature. It is descriptive, as it aims to describe the characteristics of the patenting scenario related to the use of NFTs for the protection of intellectual property. The quantitative approach is manifested in the collection

and analysis of patent indicators, such as number of filings, geographic distribution, and technological classification, allowing the identification of patterns and trends (Zhang; Liu, 2020).

2.2 DATA SOURCE

For the technological prospection, Questel's Orbit Intelligence patent database was used as a data source. The choice of this database is justified by its global scope, which consolidates information from more than 100 patent offices around the world, including the main ones such as the United States Patent and Trademark Office (USPTO), the European Patent Office (EPO), the Japan Patent Office (JPO) and the World Intellectual Property Organization (WIPO). In addition, the platform offers robust analytical tools for data treatment and visualization, which are essential for the proposed analysis (QUESTEL, 2023).

2.3 DATA COLLECTION PROCEDURES

The collection procedures followed a systematic protocol, divided into the definition of the search strategy and its execution and refinement, as detailed below.

- a) **Definition of the Search Sequence:** The construction of the search equation is a critical step to ensure the relevance and accuracy of the results. The process was iterative, involving the identification of keywords and their synonyms, as well as the use of Boolean operators and patent classification codes. The scope of the search was defined around two core concepts:
 - a. **Base Technology:** Covers terms related to blockchain technology and Non-Fungible Tokens (NFTs).
 - b. **Application:** Encompasses terms related to the protection and management of Intellectual Property (IP).

Table 1

Patent search strategy

Concept	Keywords and Operators
Base Technology	("non-fungible token" OR nft OR) AND (blockchain)
Application	("intellectual property" OR copyright OR patent OR trademark OR "trade secret" OR "industrial design" OR "geographical indication" OR author* OR royalty OR licensing OR piracy OR counterfeit*)

Final Operator	(Base Technology) AND (Application)
----------------	-------------------------------------

Source: Prepared by the authors, 2025.

- b) Search Execution and Refinement: The search equation was entered into the Orbit Intelligence platform on September 10, 2025, resulting in an initial portfolio of patent documents. On this portfolio, the following refinement filters were applied:
 - a. Duplicate Removal: The platform was configured to group documents by patent family, considering only one registration per invention to avoid duplicate counting of technologies.
 - b. Time Period: The period from 2014 (the year the first NFT prototype appeared) to 2025 was considered, to ensure the coverage of the entire history of the technology's development.

After applying the filters, a final portfolio of patent families was obtained, which constituted the basis for the data analysis.

Validation and Refinement by Artificial Intelligence: to ensure the robustness and accuracy of patent selection, a double validation process has been implemented that combines manual screening and validation by Artificial Intelligence. This procedure aims to mitigate human biases and increase the scope of the analysis, following the best practices in technological prospecting studies involving large volumes of documents (CHEN et al.,).

The validation process was structured in two stages:

- a) Manual Screening: Each document in the initial portfolio was analyzed individually by the researchers, considering the established relevance criteria: (i) explicit presence of blockchain technologies or NFTs; (ii) direct or indirect application to the protection of intellectual property; (iii) technical feasibility of the proposed solution; and (iv) clarity in the description of the innovation.
- b) AI validation: The same set of documents was subjected to analysis by the DeepSeek language model, configured with specific prompts to identify relevant patents based on the same criteria used in manual screening. The model was instructed to evaluate each document considering the presence of key concepts and relevance to the scope of the research.

The use of AI as a counterproof tool offers three fundamental methodological advantages: (I) bias reduction: AI processes documents consistently, without the influence of subjective factors; (II) increased comprehensiveness: the model can identify connections and

patterns that can be overlooked in manual analysis; and (III) cross-validation: the convergence between the results of the two approaches strengthens confidence in the final data set.

The results of both analyses were compared and consolidated, prioritizing the inclusion of documents identified as relevant by either of the two approaches. This procedure resulted in the final portfolio of patents that formed the basis for all subsequent analyses

The results of both analyses were compared and consolidated, prioritizing the inclusion of documents identified as relevant by either of the two approaches. This procedure resulted in the final portfolio of patents that formed the basis for all subsequent analyses

2.4 DATA ANALYSIS AND PROCESSING

The data analysis was carried out with the support of the analytical tools of the Orbit Intelligence platform itself. The following indicators were extracted and analyzed:

- a) Temporal Evolution of Filings: Analysis of the distribution of the number of patent filings over the years, to identify the technological maturity curve.
- b) Geographical Distribution: Mapping of the main priority countries of deposits, indicating innovation centers and key markets.
- c) Top Applicants: Identification of the most active companies, research institutions, and inventors, revealing the key players in the development of the technology.
- d) Technological Classification: Analysis of the main codes of the International Patent Classification (IPC) and the Cooperative Patent Classification (CPC) assigned to the documents, to map the predominant technological domains.
- e) The results were exported in the form of graphs and tables for the elaboration of the results and discussion section, allowing a clear visualization of the technological panorama.

3 RESULTS AND DISCUSSIONS

This section presents and discusses the results obtained from the technological prospecting carried out in the Orbit Intelligence patent database. The analysis was structured to reveal the innovation landscape at the intersection between Non-Fungible Tokens (NFTs), blockchain, and intellectual property protection, addressing the characterization of the patent portfolio, temporal and geographic dynamics, the predominant technological domains, key actors, and a qualitative analysis of representative technologies.

3.1 CHARACTERIZATION AND VALIDATION OF THE PATENT PORTFOLIO

The prospecting process began with the application of three distinct search strategies, which generated a gross volume of documents. To ensure the robustness and accuracy of the analysis, this dataset was subjected to the double validation process described in the methodology section (section 2.3). Table 2 presents the consolidated result of this process, comparing the manual screening performed by the researchers with the validation performed by the DeepSeek Artificial Intelligence model.

Table 2

Comparison of relevant patents after manual filtering and AI validation

Search Keys	Manual Analysis	DeepSeek Review	Consolidated Total
((REGISTRATION) AND (INTELLECTUAL PROPERTY) AND (NFT OR BLOCKCHAIN OR SMART CONTRACTS))	65	72	72
(REGISTRATION AND PLATFORM) AND (INTELLECTUAL PROPERTY) AND (NFT OR BLOCKCHAIN OR SMART CONTRACTS)	32	34	34
(REGISTRATION AND INTERFACE) AND (INTELLECTUAL PROPERTY) AND (NFT OR BLOCKCHAIN OR SMART CONTRACTS)	13	13	13
Total	110	119	119

Source: Prepared by the authors, 2025.

The results demonstrate a satisfactory convergence between the two validation approaches. The AI model identified 9 additional patents that proved pertinent, slightly broadening the dataset and confirming the effectiveness of the double validation process. This convergence strengthens confidence in the final portfolio of 119 patent families, which forms the basis for all subsequent analyses.

3.2 INNOVATION OVERVIEW: TEMPORAL AND GEOGRAPHICAL ANALYSIS

The analysis of the evolution of patent filings over time, presented in Figure 1, reveals a trajectory of sharp growth, characteristic of an emerging technology.

Figure 1

Annual evolution of patent families (2014-2025)

© Questel 2025

Source: Orbit, 2025

It is observed that, although the first records appear sparsely from 2014 onwards, interest in the technology gains significant traction from 2018 onwards. Growth intensifies, reaching a notable peak in 2022. This time pattern is strongly correlated with the global market's attention and investment cycle in crypto assets and NFTs, which experienced a boom between 2021 and 2022. This suggests that patented innovation in this field is largely reactive to market trends and the perception of new business opportunities, rather than being purely driven by a long-term fundamental research agenda.

Geographically, the patenting scenario is marked by a strong concentration, as illustrated in Figure 2.

Figure 2

Distribution of patent families by priority country

© Questel 2025

Source: Orbit, 2025

China emerges as the undisputed leader, accounting for a majority share of deposits. Next, with considerably smaller volumes, are the United States, South Korea and India. This distribution reflects the national strategies to encourage innovation and patenting, especially the Chinese policy of encouraging the registration of intellectual property in strategic technologies. The Chinese leadership indicates a deliberate effort to establish technological sovereignty in a field considered promising, while the presence of other technological hubs confirms the global relevance of the topic.

3.3 STRATEGIC TECHNOLOGY DOMAINS

The analysis of the technological domains, carried out from the classification of patents, allows mapping the priority application areas. Figure 3 shows the distribution of patent families by technological domain.

Figure 3

Distribution of patent families by technological domain

Source: Orbit (2025)

The results indicate a massive concentration of innovations in "IT methods for management" and "Digital communication". This predominance confirms that the main focus of the patented solutions is not on blockchain technology per se, but on its application as a tool for governance, administration, authentication and traceability of digital assets. The technology is seen as an infrastructure to optimize processes and ensure the security and provenance of intellectual property in the digital environment, which is in line with literature discussions about the potential of blockchain for IPR management (Ferro et al., 2023).

The temporal evolution of these domains (Figures 4, 5 and 6) corroborates this analysis, showing that the growth in the number of deposits from 2018 onwards was mainly driven by innovations in these areas of management and communication.

Figure 4

Temporal evolution of the technological areas of the patent families related to the first search key.

Source: Orbit (2025)

Figure 5

Temporal evolution of the technological areas of the patent families related to the second search key.

Source: Orbit (2025)

Figure 6

Temporal evolution of the technological areas of the patent families related to the third search key.

(REGISTRATION AND PLATFORM) AND (INTELLECTUAL PROPERTY) AND (NFT OR BLOCKCHAIN OR SMART CONTRACTS)

Source: Orbit (2025)

The annual evolution of patent families, illustrated by Figures 04, 05 and 06, demonstrates significant growth from 2018 onwards for the broader combination of terms (registration, intellectual property and (NFT, blockchain or smart contracts)), with notable peaks in 2019 (20 filings), 2020 (16) and, especially, in 2022 (22), evidencing the peak of interest in this technological convergence. When the term "platform" is included, the deposit curve shows a similar behavior, but on a smaller scale, with emphasis on 2019, 2022 and 2023, revealing a progressive consolidation movement.

On the other hand, the inclusion of the term "interface" results in a very small number of deposits, concentrated from 2019 onwards, intermittently and with significantly lower volumes. These results suggest that the general theme of NFTs and blockchain applied to intellectual property is already in a phase of greater maturity, while more specific applications, related to platforms and, mainly, interfaces, are still in early and dispersed development. This relationship between territory and temporality reinforces the need to understand how the geography of deposits influences the evolution of applications over time.

3.4 MAPPING OF THE MAIN ACTORS

The analysis of depositors reveals a diverse innovation ecosystem. Figure 6 presents a comparison of the main actors.

Figure 7

Comparative impact of the main players

Source: Orbit (2025)

It is observed that leadership varies according to the technological niche. While more general searches are dominated by a diverse set of companies, specific searches reveal niche leaders such as Ant Group (Ant Blockchain) in "platform" solutions and the CASC Institute in "interfaces." This indicates a maturation of the sector, with specialization and market segmentation.

Two clear innovation strategies emerge: one focused on patent volume and market coverage, and the other on innovation with high scientific impact and high citation factor, as observed in players such as Airbus and Cable Television Labs. This segmentation into technological layers, from infrastructure to application, shows the maturity of the sector. A player's impact is therefore defined by its leadership in specific niches rather than a monolithic dominance of the field.

In summary, the analysis of Figures 01, 02 and 03 reveals that the scenario of patents in blockchain, NFTs and smart contracts applied to intellectual property is characterized by significant time growth and a geographical concentration in advanced technological hubs, notably China. The predominance of innovations in "IT methods for management" and "digital communication" underlines the centrality of these technologies in the management and security of digital assets, while the comparative analysis of players in Figure 04 demonstrates diversified innovation strategies, whether in volume of deposits or in originality and scientific impact. This panorama suggests a maturation of the sector, with the consolidation of specific niches and the redefinition of competitive positioning strategies.

3.5 QUALITATIVE ANALYSIS OF KEY TECHNOLOGIES

To complement the quantitative analysis, an in-depth analysis of four patents representative of different jurisdictions was performed, whose characteristics are compared in Table 3.

Table 3

Comparative analysis of selected patents

Characteristic	CN117527836 (China)	IN202541026604 (India)	US20240185191 (USA)	GB2611072 (United Kingdom)
Main Focus	Web3 Framework for Intellectual Property (IP) Registration and Transaction with Enhanced Security and Efficiency.	Copyright management for AI-generated content.	Tokenization of intellectual assets (e.g., patents, academic research).	Copyright protection for digital content using NFTs.
Problem Solved	Slow and high cost in IP registration; plagiarism detection.	Assigning rights between human creators and AI systems.	Difficulty in protecting and monetizing "illiquid" assets such as patents.	Lack of robust mechanisms to prove authorship and history.
Technological Solution	Use of the D-PBFT (Delegated Practical Byzantine Fault Tolerance) algorithm for consensus in blockchain. Detection of plagiarism during registration. Block generation for owners.	Attribution mechanism that quantifies human vs. AI contributions; unique identifiers.	Tokenization via NFTs; use of Ricardian Contracts to bind the asset to the legal contract	Distributed File System (IPFS) Registration; creation of NFTs linked to content.

Source: Prepared by the authors (2025)

The qualitative analysis reveals the sophistication and diversity of technological approaches. The Chinese patent focuses on the efficiency and security of the registry infrastructure, using an advanced consensus algorithm (D-PBFT), which aligns with the

technological domain of "IT management". The Indian patent addresses a frontier issue: the intellectual property of works created by AI, a growing debate in the field.

The U.S. patent introduces the concept of Ricardian Contracts, which seek to create a bridge between the smart contract code and the human-readable legal text, addressing one of the major criticisms of the legal validity of smart contracts. Finally, the British patent details the classic architecture of a content protection system via NFT, using IPFS for decentralized storage.

In sum, the results indicate that the field is evolving from exploring basic blockchain technology to creating complex and specialized solutions that solve specific problems of the intellectual property ecosystem. The combination of quantitative and qualitative analyses provides a robust overview of the state of the art, revealing a dynamic, geographically concentrated and rapidly maturing technological sector.

4 CONCLUSION

The main objective of this study was to explore the panorama of technological innovation at the intersection between Non-Fungible Tokens (NFTs), blockchain and the protection of intellectual property, through a systematic prospection in patent databases. The quantitative and qualitative analysis of the portfolio of 119 patent families allowed to answer the research question and achieve the proposed objectives, revealing a dynamic and rapidly maturing scenario.

The results confirm that the application of NFTs and blockchain for intellectual property management is an emerging technological field, with a significant growth in patent filings from 2018 and a peak in 2022, in line with the global market's attention cycle. Geographically, innovation is led prominently by China, followed by the United States, South Korea, and India, indicating that the technological race in this sector is concentrated in hubs with robust innovation ecosystems and policies to encourage patenting.

The analysis of the technological domains showed that the main focus of the innovations lies in "IT methods for management" and "Digital communication". This is evidence that blockchain technology is primarily being developed as a governance infrastructure to ensure the authenticity, traceability, and security of digital assets, rather than being an end in itself. The diversity of actors, with the coexistence of large corporations and niche players, suggests a growing specialization and the formation of different competitive strategies in the market.

The qualitative analysis of selected patents deepened these findings, illustrating the sophistication of the proposed solutions, ranging from the creation of efficient registration frameworks (D-PBFT) and rights management for AI-generated content, to the linking of smart contracts to traditional legal instruments (Ricardian Contracts). It is clear that the field is transcending proof-of-concept to address complex and specific challenges in the intellectual property ecosystem.

The main contribution of this work lies in the empirical mapping and detailed characterization of a technological field of high relevance and in full evolution. By providing a clear picture of trends, key players, and technology routes, this study offers valuable insights for researchers, businesses, and policymakers. As a limitation, it is recognized that the analysis is based exclusively on patent data, not covering other forms of knowledge production, such as scientific publications or open source software, which also play a role in technological development.

In short, the research demonstrates that the convergence between NFTs, blockchain, and intellectual property is not just a speculative trend, but a fertile field of technological innovation, with the potential to redefine the paradigms of asset protection and monetization in the digital economy.

ABSTRACT

Ecotourism is a practice that suggests responsible travel in natural areas, improving the well-being of local populations; However, little is discussed about the water needs of the sector. It is estimated that a tourist uses 300 liters by day (Gössling et al., 2012); for optimize the use of water resources, in Jalcomulco, Veracruz; four hotels and four ecotourism centers were characterized, estimating the water consumption of the infrastructure, especially the swimming pools. Finally, a natural swimming pool was designed and built with NbS at the La Aldea Ecotourism Center located in the town; where the treatment of water quality is based on biochemical processes carried out by aquatic plants, swamps and the microorganisms associated with them. This is one of the few works on the implementation of natural pools in Veracruz, providing useful information for future research.

Keywords: Natural Swimming Pools. Treatment. Quality.

RESUMO

O ecoturismo é uma prática que propõe viagens responsáveis a áreas naturais, promovendo o bem-estar das populações locais; entretanto, pouco se discute sobre as necessidades hídricas do setor. Estima-se que um turista utilize 300 litros por dia (Gössling et al., 2012). Para otimizar o uso dos recursos hídricos, em Jalcomulco, Veracruz, quatro hotéis e quatro centros ecoturísticos foram caracterizados, estimando-se o consumo de água da infraestrutura, especialmente das piscinas. Por fim, uma piscina natural foi projetada e construída com SbN no Centro Ecoturístico La Aldea, localizado na comunidade, onde o tratamento da qualidade da água baseia-se em processos bioquímicos realizados por plantas aquáticas, brejos e pelos microrganismos a eles associados. Este é um dos poucos trabalhos sobre a implementação de piscinas naturais em Veracruz, fornecendo informações úteis para pesquisas futuras.

1 INTRODUCTION

The practice of ecotourism represents an innovative way of enjoying nature that seeks to balance social recreation with the preservation of the environment and the well-being of local communities, as defined by Drumm and Moore (2005). This approach requires the creation of spaces that offer outdoor activities, comfort and, above all, a direct connection with nature. However, tourism is a phenomenon that involves people moving to places other than their usual environment and has a significant impact on the consumption of water resources at the local, regional, and global levels (Creative Destinations, 2023).

In this sense, tourists use water in various ways, from showering to watering gardens and golf courses, filling swimming pools or washing bedding. The tourism industry is highly dependent on the availability of water, so any scarcity can have detrimental effects on its development (Gabarda et al., 2015). It is estimated that the water consumption by an average tourist reaches 300 liters per day and swimming pools represent 15% of the total water consumption in a hotel (Gössling et al., 2012). Therefore, while ecotourism generates significant economic benefits, it can also lead to water imbalances that negatively affect the environment and, ultimately, the communities linked to this activity.

This work aims to link the amount of water destined for resting sites in order to promote the optimal use of water resources in ecotourism development. In addition, it seeks to promote the implementation and construction of nature-based solutions in the town of Jalcomulco, Veracruz.

Biopools as a nature-based solution for the treatment of water quality and its rational consumption

When we think of a swimming pool, many of us imagine a place of recreation where chlorine is an essential component. We have become accustomed to swimming in water with a characteristic smell. However, chlorine, like any chemical, can have adverse effects on our health. Its presence in water can cause eye irritation, nasal congestion, sore throat and other symptoms associated with prolonged contact with this element.

Natural pools or also called biopools, arise from the need to implement filtration and natural treatment systems to maintain optimal water quality where recreational activities are carried out, without effects due to being in direct contact with chlorine, as well as clarifying chemical compounds and pH regulation. among others, which are discharged into the water, prior to use.

Although research on natural pools is grouped in little bibliography, in 2007 Charles Durrant made a proposal for the Olympic pool of the University of Seville, where the main objective was to design a functional pool with low financing and operating costs. The design of the natural pool contemplated four heights, sand filters and two copper and silver ionization units to maintain excellent water quality in the pool, the energy from the photovoltaic solar panels was used to heat the water to about 25°C.

In 2013, the IX National Congress of Excellence in Management was held in Rio de Janeiro, where these systems are proposed to improve environmental and economic impact (Brotherhood, 2013).

In June of the same year, the event of the 7th Encontro de Educação Ambiental, Divulgação de práticas e partilha de experiências was held, where sustainable alternatives were mentioned: in the case of biological pools, they explain that the operation of these infrastructures depends on purification through vegetation in which biological processes of aquatic plants and microorganisms associated with them are carried out. these systems are an imitation of natural ecosystems, so it excludes the use of chemicals used in conventional pools (Mafra et al., 2017).

According to HCMA Architecture + Design (2016), there are more than 20,000 private and public infrastructures in Europe, more than 100 in Germany and one in Canada. The first infrastructure with these characteristics in North America was opened in Minneapolis, Minnesota in July 2015 and another in Edmonton, Alberta in 2016.

Based on the above, the operation of a natural pool consists of purifying and cleaning the water without chemical products. There are three areas: the main pool or swimming area, then the water arrives by gravity through filters that collect large particles to the regeneration area where it is filtered through layers of substrate, it is here where the bacteria decompose and function as nutrients for plant growth. Once the water is purified, it goes to the pumping area and returns to the swimming area.

Dr. Wolfram Kircher made a proposal of four designs for the construction of Biopools, analyzing the movement of water, the filtration technique, division and the type of construction in the bathing area. Filtration consists of a hydrobotanical system, where the principles of the operation of a wetland are recovered, implementing layers of substrate where the water flows slowly, or in its case a system of pipes where the water is conducted to a storage where a rapid flow filter is placed. As for the regeneration (filtration) zones, it proposes three designs, the Ein-Kammer system (one chamber), zwei-Kammer-System (two chambers) and the

Mehr-Kammer System (multi-chamber). As for the construction principles to delimit the bathing area, there is the option of building it without walls, or with the construction of boundaries with low walls. (Kircher et al., 2016).

On the other hand, Quintero et al., (2017), evaluated in the laboratory the use of vertical wetlands as a phytoremediation system, obtaining water quality values below the permitted limits. Later, Karczmarczyk (2019) studied the possibility of using three parallel mineral filters for the removal of phosphate from water in biopools. In that same year, Cedeño proposed the use of vertical flow wetlands, obtaining values below the maximum values allowed in terms of water quality (Ávila, 2022). Finally, biopools were proposed as an alternative to chlorinated pools to eliminate the need for chemical treatment and expenses in mechanical and electrical processes, minimizing pumping requirements, and reducing possible harmful health effects (Sánchez et al., 2020).

1.1 NATURE GARTEN-BADETEICH NATURAL POOLS

During the 1980s, the landscaping industry in Germany experienced an overuse of exotic plants from Asia. In response to this trend, Thöle met Martin Mikulitsch, who in 1987 designed and built the world's first natural swimming pool in the Nature Garten-Badeteich style (Biopiscinas Ameyalli, n.d.). In 1992 Robert Thöle founded the company Nature Garten-BadeTEICH, with the aim of creating gardens in harmony with nature, using local materials and endemic plants. In 1999 the Naturgarten NPO association patented the certificate "Fachbetrieb für Naturnahes Grün", which accredits a company with the reproduction and use of endemic plants to guarantee the quality of gardening services in Europe (Biopiscinas Ameyalli, n.d.).

Thus, in 1999 the first natural pool was built in Germany, implementing the Nature Garten-Badeteich style, which triggered hundreds of similar projects throughout Europe. The company joined the continent's international society of natural pools, responsible for the standardization, planning and construction of these pools. In 2009, Bioland recognized it as one of the two most important organizations in Europe in the supervision of organic producers. Bioland is a company that brings together and controls organic producers, and is one of the two most important labels in Europe for organic and biological products.

As a consequence, this concept was appropriated in 2013 in the city of Amatlán de Quetzalcoatl, Cuernavaca, with the emergence of the company Biopiscinas Ameyalli, directed by the German landscape architect Robert Thöle and Sofía Cadena Noria, who has

dedicated her life to the care, propagation and protection of aquatic plants (Biopiscinas Ameyalli, n.d.).

This idea aims to implement nature-friendly construction processes, taking into account the importance of water and the decrease in anthropic consumption in the filling of pools in the area, in addition to focusing efforts on cultivating and propagating the endemic plants of the region, since Mexican aquatic plants are mostly considered threatened species by the modifications. deterioration and disappearance of the habitats where they develop.

1.2 THE UNIT OF ANALYSIS: JALCOMULCO, VERACRUZ

One of the most representative adventure destinations in the state of Veracruz is presented as a case study. Located between parallels 19° 16' and 19° 24' north latitude and meridians 96° 41' and 96° 50' west longitude, it is located between 200 and 800 meters above sea level. The municipality of Jalcomulco is located 41.4 km from the capital of Veracruz, a journey of approximately 51 minutes. This municipality is bordered to the north by Emiliano Zapata and Apazapan; to the east by Apazapan and Tlaltetela; to the south by Tlaltetela; and to the west by Tlaltetela and Coatepec. The geographical area of Jalcomulco is 72.72 km², representing 0.1% of the state territory (SIEGVER, 2020).

The predominant climate is warm sub-humid with rainfall in summer, with average humidity (99%), and warm sub-humid with rainfall in summer and higher humidity (1%). The average temperature varies between 20°C and 26°C, while annual rainfall ranges between 1100 and 1300 mm (SIEGVER, 2020).

According to the INEGI 2020 Census, Jalcomulco has 5054 inhabitants and represents 0.06% of the state population. It has four localities, three in rural areas, Santa María Tatetla with 1707 inhabitants, Tacotalpan with 153 inhabitants and Rivera del Río with 44 inhabitants, while the municipal seat houses 3,150 inhabitants.

Ricalde (2016) comments that the most important adventure tourism destinations in Veracruz correspond to Jalcomulco and the Filobobos Natural Protected Area and its surroundings. This confirms the importance that persists in the visitor to get closer to the region. In addition to the climate, within the geoforms that are housed in the territory we can find mountain, valley, low elevations, hills and cumulative ramp, these characteristics detonate an attractive biodiversity in the region, since it is this site where the offer of services of one of the business groups in the ecotourism sector in the State of Veracruz is structured. This data is crucial since it introduces an absolutely determining variable in the configuration

of the value chain: nature, and specifically the river, a distinctive feature of this tourism segment. It is around the river that the learning capacities of the companies of the Jalcomulco cluster are built (Saldaña et al., 2012).

The hydrography that surrounds the territory belongs to the fluvial system of hydrological region No. 28, being decisive the basin of the Papaloapan river and secondarily the Actopan, La Antigua and Jamapa rivers; it occupies 41.11% of the total state territorial area (28,636 km, being 39.32% of the total of the regions), as well as the largest discharge of fresh water (44,829 million cubic meters per year, which represents 42.28% for the state); on the other hand, the La Antigua river basin covers an area of 2,827 km² (Pereyra et al., 2010); and it is made up of 27 municipalities, 22 of them belong to the State of Veracruz and 5 to the State of Puebla, partially or totally (PAMIC, 2017).

The La Antigua River rises in the Sierra Madre Oriental, with the name of Resumidero River, at an altitude of 3,350 m, east of the town of González Ortega in the state of Puebla. It flows southeast in mountainous terrain and, at the height of Rancho Calixitla, it changes its course to the ENE until the confluence with the Barranca Grande River 3 km north of the hill of the same name; at this site the general collector changes its name to Los Pescados River. It follows its southeast course and on the limits of the states of Puebla and Veracruz it changes it to the northeast; downstream from this point it receives the Cozolapa River on the left bank. At this confluence, the general collector changes its name to La Antigua River; it continues its southeast course passing through the town of Jalcomulco, Ver (Pereyra et al., 2010).

The entire territory of Jalcomulco (72.72 km²), which is located in the basin of the La Antigua River, is home to two perennial water streams: Los Pescados and Santa María; and intermittent currents of the Cascajal, Hediondo, Moyuapan and Tenexapa rivers (INEGI, 2010). It is part of the segmentation of the sub-basin identified with the code Ant24, which receives only surface water, which leads to its identification as a receiving area with a low water supply; the Los Pescados River has a Horton-Strahler order of 7, an area of 359,230 km², 16.51 km of the main river and represents 3.34 % of the total territory of the basin (PAMIC, 2017).

Of the above, in terms of tourism development, the territory of Jalcomulco has been ideal for the construction of various hotels and ecotourism centers; according to the Royal Spanish Academy, a hotel is an establishment for an inn capable of comfortably accommodating guests or travelers; on the other hand, ecotourism centers show a close

relationship with ecotourism activity, which according to the World Conservation Union, defines it as: That environmentally responsible tourism modality consisting of traveling or visiting natural areas in order to enjoy and appreciate nature (as well as any cultural manifestation of the present and the past), which promotes conservation, has a low visitation impact and fosters an active and socioeconomically beneficial involvement of local populations (Drumm et al., 2005).

In this sense, it can be said that adventure tourism companies in Jalcomulco depend on the river, and in this sense they are, if we may use the expression, dependent rivers (a play on words built from the notion of path dependence, well known to evolutionary economists) (Saldaña et al., 2012).

This study identifies a hotel offer of 25 hotels located exclusively in the urban locality. Most of these establishments are semi-open and surrounded by green areas. In addition, they have common spaces that include chlorinated water pools, with up to four facilities of this type in various sizes.

2 METHODOLOGY

To gather information about the tourist offer of Jalcomulco, tours were carried out in the community to identify lodging spaces and establish communication with the personnel who work in them, this activity involved four hotels and four ecotourism centers that provided information, since it was a voluntary decision to be part of the development of the reception work in progress. To this end, a database was designed that collected information regarding the demand for accommodation during the year 2022, as well as quantifying the amount of hydrosanitary furniture, the presence of water tanks or cisterns for water storage, and detailed measurements of the pools present in the rest sites, in order to determine the amount of water necessary for their filling; the typology of the infrastructure was also characterized, considering two variants in the analysis, in the case of hotels, those places of lodging where contact with nature is not related to the infrastructure were identified as those places of lodging where contact with nature has no relation to the infrastructure and as ecotourism centers (E.C.), those spaces where recreational practices merge with the presence of natural resources.

Subsequently, three fundamental steps were established to model water consumption in the eight tourist destinations, based on the concepts obtained from studies such as "Water

Consumption in Hotel Establishments in Mexico" by Santacruz De León et al. (2020). Listed below are the three steps to follow:

1. The first step in modelling a chain's consumption is to segment its hotels into similar groups according to their typical consumption (Escalera et al., 2014).
2. The second step consisted of detecting the water consumption that is required to meet the needs of a guest.
3. The third step consisted of calculating an estimate of water consumption derived from the hydraulic infrastructure of each hotel or ecotourism center, including the volume of water required by the pools. Consumption per use was also quantified according to site occupancy. Finally, the results were graphed.

Once we had bibliographic references and qualitative and quantitative data from the aforementioned database, comprehensive information was generated that made it possible to raise awareness and know the consumption of water in ecotourism centers and hotels, specifically the consumption of water for filling swimming pools.

During the tour of the eight tourist sites for the collection of information, the owners and managers were mentioned the purpose of investing in the construction of a natural pool, so they were invited to a talk focused on nature-based solutions for the treatment of water quality in swimming pools, which was carried out in the multipurpose room of the ejido house.

This call was attended only by the manager of the La Aldea Ecotourism Center with the possibility of making an investment, after knowing in detail the components, operation and advantages of the biopools, a visit to the facilities was formalized to make a reconnaissance of the site and to be able to choose the best location for the construction of the biopool. Once the site was defined, a topographic survey was carried out, to obtain the representation of the terrain, the information obtained from the terrain was processed in computer-aided drawing programs (AutoCAD and CivilCAD).

Two technical economic proposals were worked on and presented to the investors of the La Aldea ecotourism center. A prototype with a square shape of six meters per side was chosen. Once the design was concluded, the construction process was carried out with the necessary materials, which was documented.

The prototype was put into operation to the public. To do this, it was necessary to design an infographic with the regulations for its use, as well as an infographic that briefly explains the definition of biopools and their main elements.

As a result, in-depth research was carried out, which concluded in the design and construction of an infrastructure compatible with the three areas of Sustainable Development, economic, social and environmental. The following chapter presents the results obtained from this project.

3 RESULTS

3.1 CHARACTERIZATION OF THE HOSTING INFRASTRUCTURE

The construction of the hotels in the town of Jalcomulco includes modern buildings, as well as infrastructure with alternative sustainable materials such as bamboo, bahareque and adobe.

In relation to characterization, no lodging site has biofilters, wetlands for water treatment or dry toilets. Most have fewer than 10 rooms, a single pool, and green areas. There is a homogeneity in the construction materials in the four ecotourism centers, since they all use wood and bamboo. In the case of ecotourism center two, they also use bahareque (compacted earth walls). Only one of the hotels uses these materials; the other three are built with masonry walls and concrete slabs. A single ecotourism center has sunlight (photocell) and a system to capture rainwater. Two have a septic tank and three have a biodigester. Table 1 shows the participating sites, which provide hosting services with some of their general characteristics.

Table 1

Characterization of hotels and ecotourism centers in Jalcomulco, Ver.

Type (C.E./ Hotel)	C.E. 1	C.E 2	C.E. 3	E.C. 4	Hotel 1	Hotel 2	Hotel 3	Hotel 4

3.2 ANALYSIS AND DISCUSSION OF THE RESULTS OF WATER CONSUMPTION FOR THE FILLING OF SWIMMING POOLS IN HOTELS AND ECOTOURISM CENTERS IN JALCOMULCO

Although ecotourism centers are those spaces that are linked to natural areas, they require greater amounts of water to meet the needs of guests. In all cases, it was detected that the highest consumption corresponds to the filling of pools, since they are infrastructures that, due to their characteristics, require a permanent volume of the natural resource for their filling.

The highest consumption is reflected in Ecotourism Center 3 with 329.04 m³ of water that must be covered 365 days a year (figure 1), which seems to be related to the lodging capacity.

Figure 1

Demand for water volume in swimming pools

Source: Authors' elaboration based on the analysis of results.

As an integral part, issues related to water resource management were addressed.

In the case of Ecotourism Center 1, there is a stream from the spring that supplies drinking water to the entire community. However, from 7 am to 4 pm, the spring supplies producers directly and it is forbidden by the ejido organization to use the water for other purposes. For this reason, this Ecotourism Center begins to fill its tank and cistern during the afternoon and part of the night.

This same stream passes through Hotel 1, so it also makes use of the resource to fill its drinking water storage infrastructure, as well as the filling of the pool, in the same way, when cleaning is required, the water is discharged into the same body of water.

Ecotourism Center 2 obtains water directly from the river by pumping, in turn supplying water to other establishments. A remarkable fact about this space is that the water used to fill the pool does not use chemicals.

In the case of Ecotourism Center 3, they have a concession title from CONAGUA, so the water they extract comes from a well located within their facilities. However, the water table has decreased over time, and on some occasions they have chosen to buy water in pipes to be able to supply users. In this accommodation, they carry out a chemical treatment with a plant of minimal dimensions and, therefore, reuse the resource.

In Ecotourism Center 4, water is extracted from the river to supply the entire hydraulic infrastructure, including the swimming pool. In the case of Hotels 2, 3 and 4, being located in

the center of the town, they have the supply of drinking water from the municipal line, also the discharges are poured into the sanitary drain, however, this drainage converges to the river downstream.

As for filling the pools, in general, the water is changed every third day if there has been a lot of tourist influx. The emptied water is used to irrigate the gardens or for cleaning.

As a brief discussion, of the characterization of hotel sites, it was possible to identify the construction of ecotechniques for the care and integral management of water, such is the case of the rainwater catchment and a sedimentation plant for sewage treatment in the Ecotourism Center 3; however, those in charge of the tourist sites showed interest in training to implement actions to have water reservoirs, especially in the dry season.

Regarding the infrastructure of hotel demand, it was detected that there are lodging sites in Jalcomulco that exceed their maximum capacity by up to 300%, of the above, Gössling (2012), documented that the highest water consumption rates are found in hotels with spas and swimming pools; so it was found that the pools measured in this intervention, have 18,000 liters to 329,000 liters of water and the larger the establishment, the greater the size of the water demand, however the problem of this use does not end there, because it is water that must be renewed at least every third day, depending on its use and its emptying, it affects ecosystems by disposing of contaminated water in water veins that connect populations during its journey.

Design, construction, operation and maintenance of the Biopiscina at the La Aldea Ecotourism Center

A topographic survey was carried out to determine the unevenness of the terrain. Once the information was processed, a square area of 6 x 6 meters was allocated for the biopool. To do this, it was necessary to calculate and build a stone perimeter wall to give stability to the infrastructure. It is worth mentioning that the composition of the soil allowed the reuse of the site's material, optimizing costs and resources. Of the two technical-economic proposals raised, the one whose investment was \$170,000.00 M.N. was chosen. The area destined for planting corresponds to approximately 50% of the surface, while the remaining percentage is the swimming pool.

The design of the biopool considered three areas:

- 1.- Swimming pool: this area includes only the area available for swimming. Delimited by a length of 5.20 m, a width of 2.50 and a depth of 1.80 m, to receive 23.4 m³ of water.

- 2.- Submerged plant area: In this space of 1.25 x 5.20 m and a depth of 1.20 m, two types of plants are proposed, *Potamogeton coloratus* (fully submerged) and *Nymphaea colorata* (floating submerged rooted), and the area will receive 7.80 m³ of water.
- 3.- Area of emergent plants: In this space 1.25 x 5.20 m and a depth of 0.60 m are located emergent plants such as taro, horsetails, colocasias and papyrus, as shown in figure 2, this area requires 3.90 m³ of water.

Figure 2

Cross-sectional view

Source: Authored by the authors.

The planting area in a biopool should represent between 50 and 75 percent of the total area of the system. In this case, the total area intended for construction is 48 m², with a swimming area of 15 m² and a planting area of 33 m², approximately 75% of the total area, thus meeting the requirement.

The materials used for the construction included 200 gr/m² geotextile, Firestone EPDM geomembrane, pine wood beams, zeolite, earth, wooden dowels, vegetation and water.

The plants selected for the natural pool are classified as:

- Fully submerged: *Potamogeton coloratus*
- Fully Submerged Rooted Float: *Nymphaea colorata*
- Lemnaceae (free floaters): *Salvinia minima* and *Pistia stratiotes*
- Rooted submerged (edible): *Colocasia esculenta*
- Emergent rooted submerged: *Colocasia esculenta*, var. "Black Magic"; *Cyperus papyrus*; and *Equisetum arvense*.

For the construction phase, the area was delimited with the support of the total station, this topographic instrument locates georeferenced points with arbitrary coordinates; In this

case, the vertices of the area destined for the perimeter wall were located and placed in order to orient the infrastructure. Once marked, the excavation with mechanical means and the construction of the stepped stone walls began, respecting the depths of the design for the planting areas. This wall has a width of 50 cm and a height ranging from 1.35 to 2.40 meters.

Once the work that delimits the biopool area was completed, the geotextile was placed, a permeable and flexible fabric made of polypropylene or polyester, whose main function is to separate different layers of materials. Subsequently, the EPDM geomembrane was placed, whose main function is to provide the system with an impermeable layer.

Next, the swimming pool area was delimited, with wooden beams of 10 x 20 cm high and wide and a length of 5.20 m in the long direction and 2.50 m in the short direction.

For the planting area, another layer of geotextile was placed, to receive the substrate, which resulted from the combination of black soil from the site and granulated zeolite. This mineral, a product of sedimentary rocks, is used in water quality treatment systems. Being highly hydrophilic, it facilitates the absorption of nutrients by plants, since these are taken up by the roots dissolved in water (Chica Toro et al., 2006).

Simultaneously with the planting, the biopool began to be filled. Additionally, stones were placed over the area to fix roots and as ornamental elements. Once filled, the ecosystem stabilization stage was carried out (Figure 3).

After filling, the stabilization phase began that lasted from November 6 to December 18, 2023, during these six weeks, the natural pool was not used for recreational purposes, with the aim of allowing the ecosystem to adapt and begin the process of reproduction of the plants. In the case of water lilies (*Nymphaea colorata*), the growth of the petioles began from the second week, as well as the reproduction of their leaves and the first flower bud took place during the third week of May 2024.

Figure 3

Biopool finished

Source: Photograph of the authors.

In the case of papyri and reeds, emergent stems were observed. *Colocasia* var. Black Magic showed an increase in the size of its leaves and their reproduction. However, it took until the third week for the *Potamogeton* species to start breeding. During this time, it was necessary to clean up the bottom of the planting area due to the proliferation of algae, which hindered leaf growth. Once the cleaning was complete, the reproduction of the *Potamogeton* leaves continued steadily. As for the fauna of the ecosystem, dragonflies were observed in the larval and adult stages, as well as snails, ladybugs and bees. Water turbidity was also monitored to prevent eutrophication in the ecosystem.

After the weeks of stabilization, a maintenance session was held to train the personnel who work in the ecotourism center. During this activity, the team carried out various tasks such as cleaning and removing leaf litter from the bottom, untangling petioles in the water lily area, and removing dead vegetation. Finally, the infrastructure was opened to the public during the month of March 2024.

Figure 4

General view of the biopool

Source: Photograph of the authors.

To improve the landscape and protect the geomembrane in place, planters were built using leftover materials and recycled wooden pallets. These planters were placed around the planting area to collect leaf litter and organic matter derived from the pruning of the plants responsible for phytoremediation. In addition, various species of ornamental plants were planted and a wooden corridor was built to walk through the swimming area and bamboo railings were placed to improve the safety of visitors (figure 4).

In this same sense, and in order to inform tourists about the operation of natural pools and the regulations to make use of these infrastructures, the design of two infographics was carried out, which are shown below in Figure 5. It should be noted that the QR codes attached to them link information that was collected during the execution of the reception work.

4 CONCLUSION

Based on the results obtained, it is concluded that the design, construction, operation and maintenance of the natural biopool has been a meticulous, carefully planned and comprehensive process. From the beginning with the topographic survey to determine the unevenness of the terrain, to the selection and efficient use of materials such as EPDM geomembrane and geotextile, each step has been key to ensure the stability and functionality of the system. The stabilization phase has been fundamental, allowing the natural ecosystem to adapt and begin to thrive, evidenced by the growth and reproduction of various plant species, as well as the presence of a variety of aquatic fauna.

In addition, post-stabilization maintenance and improvement measures, such as the construction of planters with recycled materials, the planting of ornamental plants, and the installation of safe infrastructure for visitors, have contributed not only to the protection of the

landscape, but also to the continued well-being of the ecosystem. The integration of sustainable practices and the reuse of resources have been fundamental pillars throughout the process, highlighting a commitment to environmental conservation and efficiency in the use of natural resources.

This project stands out for effectively addressing local water management through innovative solutions such as natural pools, also serving as a model of collaboration between various social actors. The active participation of the tourism business sector and the local community have been instrumental in its success, underscoring a shared commitment to environmental conservation and sustainable development.

The La Aldea Ecotourism Center has played a central role in investing in innovative infrastructure and promoting sustainable practices within its tourist destination. This has not only added economic and environmental value to the place, but has also contributed to strengthening the identity of Jalcomulco as a destination committed to the care of its natural resources.

Overall, the biopool not only meets the expected technical and aesthetic standards, but also stands as an example of how ecotourism can coexist harmoniously with environmental conservation, offering visitors a unique and educational experience in a restored and cared for natural environment.

In addition, the dissemination of this project has the potential to positively influence the adoption of similar solutions in other localities and sectors. By promoting eco-techniques and integrated water management, a culture of environmental responsibility is fostered that can be replicated in future academic and business initiatives.

It is essential to continue sharing knowledge and raising awareness about the importance of taking care of water resources. This study lays the groundwork for future research and improvements in ecotourism biopools, as well as advocating for the integration of nature-based solutions as an effective response to global water stress.

In summary, the natural biopool in Jalcomulco represents a remarkable example of how innovation, collaboration, and community engagement can converge to promote sustainable and resilient practices in the face of current environmental challenges.

ABSTRACT

Project-Based Learning (PBL) is one of the recommended methods to improve students' practical problem-solving skills. It is hoped that students can acquire critical thinking skills and a deep understanding of the material. Deep learning is an approach used in the national learning system. This study aims to assess students' perceptions regarding PjBL learning in the MSME financial management course. This study uses a qualitative approach. Data collection techniques use open-ended questionnaires, conducting observations during the learning process, and documentation related to learning files during the method used. Data analysis techniques use the Miles and Huberman model, consisting of data collection, data reduction, data presentation, and drawing conclusions. The results of the study indicate that by implementing PjBL steps in the financial statement analysis project of MSMEs in the production sector, it can facilitate understanding of the calculation components of Cost of Goods Sold (COGS), the difference between business income and other income, analysis of business operating expenses and other expenses, components of current and non-current liabilities, analysis of depreciation expense calculations and overall improve students' competence in preparing financial reports correctly in accordance with SAK EMKM. During the project, the analysis of MSME financial reports was carried out using the assistance of Ms. Excel.

Keywords: Project-Based Learning. Financial Management. Teaching and Learning. Msmes.

RESUMO

A Aprendizagem Baseada em Projetos (PBL) é um dos métodos recomendados para melhorar as habilidades práticas de resolução de problemas dos estudantes. Espera-se que os estudantes desenvolvam pensamento crítico e uma compreensão profunda do conteúdo. A aprendizagem profunda é uma abordagem utilizada no sistema nacional de ensino. Este

estudo tem como objetivo avaliar as percepções dos estudantes em relação ao aprendizado por meio de PjBL na disciplina de gestão financeira de MPEs. Este estudo utiliza uma abordagem qualitativa. As técnicas de coleta de dados incluem questionários abertos, observações durante o processo de ensino-aprendizagem e documentação relacionada aos materiais utilizados durante a aplicação do método. A análise dos dados segue o modelo de Miles e Huberman, composto por coleta de dados, redução de dados, apresentação dos dados e elaboração de conclusões. Os resultados do estudo indicam que, ao implementar as etapas de PjBL no projeto de análise das demonstrações financeiras de MPEs do setor produtivo, é possível facilitar a compreensão dos componentes de cálculo do Custo das Mercadorias Vendidas (CMV), da diferença entre receita operacional e outras receitas, da análise das despesas operacionais e demais despesas, dos componentes de passivos circulantes e não circulantes, da análise do cálculo da despesa de depreciação e, de forma geral, melhorar a competência dos estudantes na elaboração correta de relatórios financeiros de acordo com o SAK EMKM. Durante o projeto, a análise dos relatórios financeiros das MPEs foi realizada com o auxílio do Microsoft Excel.

Palavras-chave: Aprendizagem Baseada em Projetos. Gestão Financeira. Ensino e Aprendizagem. MPEs.

RESUMEN

El Aprendizaje Basado en Proyectos (PBL) es uno de los métodos recomendados para mejorar las habilidades prácticas de resolución de problemas de los estudiantes. Se espera que los estudiantes desarrollen pensamiento crítico y una comprensión profunda del contenido. El aprendizaje profundo es un enfoque utilizado en el sistema educativo nacional. Este estudio tiene como objetivo evaluar las percepciones de los estudiantes sobre el aprendizaje mediante PjBL en el curso de gestión financiera de MIPYMES. Este estudio utiliza un enfoque cualitativo. Las técnicas de recolección de datos incluyen cuestionarios abiertos, observaciones durante el proceso de enseñanza-aprendizaje y documentación relacionada con los materiales utilizados durante la aplicación del método. El análisis de datos sigue el modelo de Miles y Huberman, que consiste en la recolección de datos, reducción de datos, presentación de datos y elaboración de conclusiones. Los resultados del estudio indican que, al implementar los pasos de PjBL en el proyecto de análisis de los estados financieros de MIPYMES del sector productivo, se puede facilitar la comprensión de los componentes de cálculo del Costo de los Bienes Vendidos (CBV), la diferencia entre ingresos operativos y otros ingresos, el análisis de los gastos operativos y otros gastos, los componentes de pasivos corrientes y no corrientes, el análisis del cálculo del gasto por depreciación y, en general, mejorar la competencia de los estudiantes en la elaboración correcta de informes financieros de acuerdo con el SAK EMKM. Durante el proyecto, el análisis de los informes financieros de las MIPYMES se realizó con la ayuda de Microsoft Excel.

Palabras clave: Aprendizaje Basado en Proyectos. Gestión Financiera. Enseñanza y Aprendizaje. MIPYMES.

1 INTRODUCTION

Combining financial management with other disciplines such as marketing, operations and strategic management can provide a holistic learning experience and prepare students for the complex challenges of managing MSMEs (Delgado and Ayala 2019; Poponi et al. 2019). Working with local MSMEs provides practical experience for students while helping businesses gain new perspectives and innovative solutions (Garrido-Lopez et al. 2018). Through PBL, students develop important skills in financial management, including budgeting, financial planning and resource management, which are critical for MSMEs (Suharsono et al. 2025; Shahiwala 2017).

PBL allows students to engage directly with real financial challenges faced by MSMEs, thus developing practical problem-solving skills (Delgado and Ayala 2019; Garrido-Lopez et al. 2018). PBL emphasizes the active role of learners, requiring them to apply knowledge rather than just passively absorb it. This approach helps students develop practical financial management skills through real-world application (Yulianti 2024; Abinzano et al. 2022). PBL projects often require students to communicate effectively with business owners and stakeholders, thus improving their interpersonal and professional communication skills (Garrido-Lopez et al. 2018).

Successful PBL requires adequate resource support, including access to financial data, mentorship from industry professionals, and institutional support (Shahiwala 2017; Liang et al. 2016). By engaging in projects that mimic real business scenarios, students gain hands-on experience in financial planning, budgeting, and resource management, which are critical for MSMEs (Shahiwala 2017; Reid, Muenzen, and Rezvanian 2020). PBL needs to be integrated into the financial management curriculum, so that students can work on projects related to real financial problems in MSMEs. This integration helps students apply theoretical knowledge to practical scenarios (Delgado and Ayala 2019; Shahiwala 2017).

Some of the benefits of PBL applications include encouraging critical and creative thinking, which are essential for effective financial decision-making and problem-solving in MSMEs (Yulianti 2024; Sugeng and Suryani 2019). Projects often require teamwork and communication, thus enhancing these skills which are critical in managing financial operations and working with stakeholders (Yulianti 2024; Harb et al. 2025). Studies show that students who participate in PBL perform better compared to those who learn through traditional methods, particularly in the understanding and application of financial management concepts. This is reflected in higher exam scores as well as better overall

academic performance (Abinzano et al. 2022; Liu and Chen 2020). PBL encourages self-regulated learning, allowing students to take charge of their learning process (Sugeng and Suryani 2019).

Through PBL, students learn to prepare and manage budgets, conduct financial analysis, and develop financial strategies, which are directly applicable to MSMEs (Shahiwala 2017; Iyamuremye et al. 2025). PBL projects often involve effectively managing limited resources, a common challenge for MSMEs. This experience helps students develop the ability to optimize resource use in real business situations (Suharsono et al. 2025). PBL enables iterative learning, where students can receive feedback, reflect on their performance and make improvements. This process is similar to the continuous improvement efforts needed in MSME financial management (Garrido-Lopez et al. 2018; Blazevic and Lievens 2004).

The use of PBL on an ongoing basis can shape the professional abilities needed in the world of work in the digital era. These professional abilities include Ethical Skills, Business Skills, and Soft Skills including Critical thinking, communication, leadership, and emotional intelligence (Tsiligiris and Bowyer 2021; Sebele-Mpofu 2024; Zainuddin et al. 2023).

By capturing students' perceptions about the implementation of PBL in MSME financial management courses, it is expected to directly influence their motivation and level of engagement. Meaningful learning, emotional environment, and interaction between students are all associated with better academic performance. For example, an increase in these perceptions can result in higher scores on standardized tests (Wayne et al. 2013). Knowing how important it is to improve the accounting curriculum in technology-based higher education institutions can increase students' desire to learn. Involving students in the assessment process helps them take responsibility for what they learn. As a result, students' intrinsic motivation and accountability increases (Woytek 2005).

So, from the results of the screening of student perceptions in PBL learning in the MSME financial management course, it is hoped that it can be used as a study in improving the overall quality of accounting learning through the application of this PBL learning model. In this accounting learning, the application of PBL is carried out by integrating technology for MSMEs, so that it can provide learning for MSMEs and students through the use of technology in making MSME financial reports.

2 METHODOLOGY

The research approach used is qualitative. The data collection technique uses an open questionnaire which gives students the freedom to provide opinions regarding the application of project-based learning in the MSME financial management course. Research sources are students who have taken the course in the accounting education study program. Thus, the sampling technique is purposive sampling. The data analysis technique uses the Miles & Huberman model, consisting of data reduction, data presentation, and conclusion drawing/verification. Data validity uses method triangulation techniques, namely filling out an open questionnaire, observation, and documentation.

The learning components in project-based learning that have been taken in the MSME financial management course are as follows:

- a. Involves collaborative efforts, where students work in teams to complete projects, thus developing communication and cooperation skills (Missingham et al. 2009; Wood and Pranjol 2024). The project in this case is to analyze the financial statements of MSMEs whether they are in accordance with SAK EMKM standards. SAR EMKM is the Financial Accounting Standards for Micro, Small and Medium Entities, an accounting standard that stands alone and is specifically designed to prepare financial reports for MSMEs in Indonesia. If it is found that something is not appropriate, students will provide correct advice according to the rules in SAK EMKM.
- b. Working on real problems, students gain practical experience that prepares them for professional challenges. This approach is in line with the needs of employers who want graduates with hands-on experience (Yen, Orley, and Drinka 2014). In this project, students are asked to analyze the financial statements of MSMEs in the production sector.
- c. PBL fosters critical thinking skills by requiring students to analyze complex problems, make decisions, and develop solutions. This is particularly important in accounting, where professionals often face unstructured problems (Stanley and Marsden 2012). This is related to providing solutions faced by MSMEs in implementing SAK EMKM. So students will conduct a complex analysis of the causes of MSME problems starting from recording financial transactions to preparing financial reports. To then find a solution.
- d. Technology integration in PBL enhances the learning experience. Tools such as learning management systems, e-learning platforms, and virtual simulations can make

the learning process more interesting and effective (Srinivasa and J 2016). The integration of technology in this project is the use of Ms. Excel to simplify recording transactions.

3 RESULTS

Based on the questionnaire that we distributed online, students' impressions after taking the MSME financial management course using the Project Based Learning (PBL) strategy include that they think they understand MSME finance better because they are directly involved in obtaining information and processing the data. As quoted from the results of one student's questionnaire, as follows:

"I understand more about Umkm financial material because I directly get information and process the data. And the application of PBL will be very useful for those of us who want to become MSME actors."

So there are students who say that:

"“If I have a business, it is easier to prepare the financial statements.”"

There are also those who argue as in the following quote:

"After digging up data directly from MSME actors in the use of project-based learning (PBL) strategies, in my opinion, I can think more critically in analyzing and preparing business financial reports to make them more organized and make it easier to see the income, profits and losses of a business run"

So from this statement PBL is proven to train students' critical thinking. As well as providing more real understanding of the cases faced by MSMEs. As the following quote.

"PBL is very useful for me as a student who is just learning and also has many benefits because with the application of PBL we become more knowledgeable about the characteristics of MSMEs. And also understand better how to manage their finances. After seeing what MSME actors do

There are even students who provide detailed benefits in terms of developing their competencies, such as the following quote.

"This course is very beneficial for our study program, the competencies that develop include (1) Training students to use reasoning in solving business problems; (2) Training participants in making hypotheses in problem solving based on simple business concepts; (3) training critical and contextual thinking skills"

The following are student perceptions of technical skills that have improved after carrying out the assigned project:

Figure 1

PBL can increase the accuracy of the analysis of cost components or expenses incurred by MSMEs when creating Profit and Loss reports

There are 75% of students strongly agree that the application of PBL learning can make it easier for them to analyze accounts that include the cost component in the income statement. The remaining 25% are in the agree category.

This shows that they are not confused in sorting out the cost components, among others

1. Cost of Goods Sold

This expense reflects the direct costs related to the acquisition of merchandise or the production process of goods/services sold.

Examples: purchase of raw materials, direct labor, and other production costs.

2. Selling Expenses

These are costs incurred due to promotional activities, marketing, and distribution of products or services.

Examples: advertising, promotion, transportation/expedition costs, and marketing staff salaries.

3. Administrative and General Expenses

These are costs related to managerial activities, control, and general company operations.

Examples: salaries of office employees, electricity and telephone bills, office supplies, and depreciation of office buildings.

4. Financial Expenses

Expenses that arise from financing activities or the use of company resources.

Examples: interest on loans and bank administration fees.

Figure 2

The PBL model can improve the analysis of the income component in the MSME income statement

There are 75% of students who strongly agree that the application of PBL learning can make it easier for them to analyze the accounts included in the income component in the income statement. The remaining 25% are in the agree category.

This shows that they are not confused in sorting out the components of income.

Figure 3

The PBL model can improve the analysis of the calculation of Cost of Goods Sold (COGS) in the process of making MSME profit and loss statements

There are 62.5% of students who strongly agree that the application of PBL learning can make it easier for them to analyze the accounts included in the calculation of COGS (cost of goods sold) in the income statement. The remaining 37.5% are in the agree category.

Then analyze the COGS, among others:

The calculation of COGS for a trading company consists of the following elements: Beginning inventory of trade goods; net purchases; ending inventory of trade goods.

Description:

Beginning inventory is the amount of goods available for sale at the beginning of the accounting period or a certain period in a company. This inventory value is the value of goods remaining from the previous period and is ready to be sold or used during the current period.

Net purchases Is the total cost incurred by the company to purchase merchandise, after deducting returns, purchase discounts (also known as discounts), and shipping costs, if any. In other words, it is the amount that the company actually paid for the purchased goods, regardless of returns and discounts. Ending goods inventory Is the total value of goods still available for sale at the end of the accounting period.

Calculate the direct costs associated with producing goods or providing services, such as raw materials, direct labor, and factory overhead costs.

The three elements can be formulated as follows:

$\text{COGS} = \text{Beginning inventory of merchandise} + \text{Net purchases} - \text{Ending inventory}$

Figure 4

Students' perceptions of the PjBl model can improve the analysis of the current and non-current asset components of SMEs

There are 62.5% of students who strongly agree that the application of PBL learning can make it easier for them to analyze current and non-current asset accounts in the balance sheet report. The remaining 37.5% are in the agree category.

Then analyze the assets, among others:

Assets are resources that are owned or controlled by the entity as a result of past transactions or events and are expected to provide economic benefits in the future. In SAK EMKM, assets are grouped into:

- Current Assets: cash, cash equivalents, accounts receivable, inventory, and other assets that are expected to be realized within 12 months.
- Non-Current Assets: include fixed assets (such as land, buildings, equipment), intangible assets, and long-term investments.

Figure 5

The PBL model can improve the analysis of current and non-current liability components of MSMEs

There are 62.5% of students who strongly agree that the application of PBL learning can make it easier for them to analyze current and non-current debt accounts in the balance sheet report. The remaining 37.5% are in the agree category.

Then analyze the debt, among others:

Liabilities are obligations that the entity currently has, which arise from past events and their settlement will result in the expenditure of economic resources.

In SAK EMKM, short-term liabilities are defined as debts or obligations of the entity that must be settled within a maximum period of 12 months from the reporting date, or within the entity's normal operating cycle, whichever is longer.

The main categories of short-term liabilities in MSMEs include:

1. Accounts Payable

This is a liability arising from the purchase of goods or services on credit in the ordinary course of business.

Examples: debts to raw material suppliers or trade payables to distributors.

2. Short-term Bank Loans

Namely loans obtained from banks with a maximum repayment period of 12 months.

This includes overdrafts and loans for working capital.

3. Accrued Expenses

Expenses that have become liabilities but have not been paid until the end of the reporting period.

Examples: unpaid employee salaries, outstanding electricity or telephone charges.

4. Unearned Revenue

Funds that have been received from customers, but the goods or services for which they are obligated have not yet been provided.

Example: advances on orders for products or services.

5. Other Current Liabilities

Includes other liabilities that must be repaid within a short period of time.

Examples: taxes payable, dividends payable, or other current liabilities arising from business activities.

Entities classify all other liabilities as long-term liabilities.

Figure 6

The PBL model can increase student competence in making correct financial reports for MSMEs, especially those engaged in production MSMEs

There are 75% of students who strongly agree that the application of PBL learning can improve student competence in making correct financial reports for MSMEs, especially those engaged in MSME production. The remaining 25% are in the agree category.

The stages of making financial statements include collecting transaction data, making general journals, moving to the ledger, compiling a balance sheet, making adjusting journals, compiling a balance sheet, making financial statements (profit and loss, balance sheet, cash flow, and changes in capital),

4 DISCUSSION

PBL promotes self-directed learning, encouraging students to independently search for solutions and make sound financial decisions, which are key success factors for MSMEs (Abinzano et al. 2024). PBL enables iterative learning, where students can receive feedback, reflect on their performance, and make improvements. This process is similar to the continuous improvement efforts needed in MSME financial management (Garrido-Lopez et al. 2018; Blazevic and Lievens 2004). Successful completion of PBL projects increases students' confidence in their financial management skills, making them better prepared for financial responsibilities in MSMEs (Yulianti 2024; Shahiwala 2017).

PBL involves addressing real problems faced by MSMEs, such as financial planning, risk management and investment decision-making (Delgado and Ayala 2019; Abinzano et al. 2024, 2022). This ensures that learning can be directly applied in the business environment. Engage MSMEs and industry partners directly in the development of projects that respond to their specific challenges (Delgado and Ayala 2019; Ott and Liesaputra 2020). This collaboration increases the relevance and impact of the learning experience.

PBL emphasizes hands-on activities where learners are actively involved in projects, such as preparing consultancy reports or business plans (Abinzano et al. 2024; Shahiwala 2017; Liang et al. 2016). This method promotes deeper understanding and retention of financial concepts.

Effective PBL models cover various aspects of business management, including resource management, financial structure, marketing and business development (Delgado and Ayala 2019; Suharsono et al. 2025). This holistic approach helps MSME managers understand the interconnectedness of business functions. PBL emphasizes hands-on activities where learners are actively involved in projects, such as preparing consulting reports or business plans (Abinzano et al. 2024; Shahiwala 2017; Liang et al. 2016). This method promotes deeper understanding and retention of financial concepts. It encourages collaboration between students to solve problems and complete projects, reflecting the collaborative nature of business management in MSMEs (Abinzano et al. 2024; Browning,

Anderson, and Galway 2024). It also helps develop soft skills such as communication and teamwork.

Projects should also focus on improving technological infrastructure, which is critical for MSMEs to thrive in the digital economy. This includes training in the use of digital tools and platforms that can simplify operations and reduce costs (Harnida et al. 2024). PBL should focus on solving real financial problems that MSMEs face. This includes developing business models, financial plans and strategies that are directly applicable to the MSME context (Kabilan 2024). Involving students from different disciplines in PBL projects can provide MSMEs with diverse perspectives and innovative solutions to financial challenges. This approach helps MSMEs develop comprehensive strategies that cover various aspects of the business (Favaloro et al. 2018; Sabnis, Kulkarni, and Gurav 2020).

PBL encourages students to engage deeply with the material through large-scale project work that provides context for technical learning (Sleezer, Leung, and Bates 2018). PBL supports the development of essential skills such as critical thinking, problem solving, teamwork, and self-directed learning (Colim et al. 2022). These skills are essential for mastering deep learning techniques and applying them effectively in real situations. By engaging students in projects relevant to their lives and future careers, PBL increases motivation while deepening understanding of theoretical concepts (Mutanga 2024).

Students may face difficulties in adapting to PBL, especially when switching from traditional teaching methods. Consistent attendance and repeated assessments are critical to mastering concepts (Mutanga 2024). Effective lecturer intervention and timely feedback are important components to improve group performance and deepen learning (Kim et al. 2011). The iterative assessment process helps students refine their understanding and application of deep learning concepts.

PBL encourages collaboration among students, which is essential in dealing with complex deep learning problems. Group projects and case studies mimic real challenges, thus enhancing teamwork and collective problem solving (Martínez-Monés et al. 2005). The utilization of digital technologies and AI can support PBL by providing reliable assessment methods and enhancing collaboration (Divjak, Svetec, and Aničić 2025). Integrating generative AI in PBL can bring innovation to the learning process while ensuring equitable practices.

5 CONCLUSIONS

The application of PBL in the MSME financial management course based on student perceptions provides the following benefits:

- a. train students' critical thinking
- b. better understand MSME finance because they are directly involved in obtaining information and processing the data
- c. develop competence in using reasoning in solving business problems;
- d. Train students in making hypotheses in problem solving based on simple business concepts;
- e. train critical and contextual thinking skills"
- f. As well as making it easier for students to understand the components of the income statement and balance sheet.

Therefore, the suggestion for further researchers is to conduct an assessment in the implementation of PBL in the framework of industrial internships. Given that based on student perceptions, direct field work makes a positive contribution to the development of skills, both hard and soft skills.

ABSTRACT

This chapter discusses religion, theodicy, and spirituality from a Weberian perspective, highlighting their implications for social action in modern and disenchanted societies. Based on Max Weber's sociology of religion, religion is addressed as a form of rationalized social action, linked to different modes of religious domination and to the process of the disenchantment of the world, in which rationalization and bureaucracy weaken the institutional centrality of the sacred. The chapter then explores the concept of theodicy as a set of religious explanations for suffering, evil, fortune, and misfortune, emphasizing its role in moral and social legitimation. Drawing on the comparison among traditions such as Protestantism, Catholicism, Confucianism, Hinduism, and Buddhism, it analyzes how distinct religious ethics produce specific rationalizations of economic and social life. Finally, it examines the emergence of spirituality as a contemporary, less institutionalized and more subjective category that engages with central questions formulated by Weber, especially the search for meaning, the experience of suffering, and the orientation of social action. It is argued that even in highly rationalized contexts, religion and spirituality continue to act as decisive dimensions in the construction of meaning and in the legitimation of forms of life.

Keywords: Disenchantment of the World. Rationalization. Bureaucracy. Comparative Religious Ethics. Search for Meaning.

RESUMO

Este capítulo discute religião, teodiceia e espiritualidade na perspectiva weberiana, destacando suas implicações para a ação social em sociedades modernas e desencantadas. Com base na sociologia da religião de Max Weber, a religião é abordada como forma de ação social racionalizada, vinculada a diferentes modos de dominação religiosa e ao processo de desencantamento do mundo, no qual a racionalização e a burocracia enfraquecem a centralidade institucional do sagrado. Em seguida, explora-se o conceito de teodiceia como conjunto de explicações religiosas sobre sofrimento, mal, fortuna e infortúnio,

1 INTRODUCTION

Religion occupies a privileged place in classical sociology, as it is understood not only as a set of beliefs, but as a force that structures social relations, moral practices, and forms of domination. Among the authors who contributed most to this understanding is Max Weber, whose analysis of the religious phenomenon allows us to understand how symbolic systems are articulated with the economy, politics, ethics, and rationalization processes characteristic of modernity, especially in his works published in 1996 and 2004. Unlike approaches that treat religion as something merely collective or irrational, Weber (1996; 2004) conceives it as a form of rationalized social action, endowed with internal coherence and capable of guiding human conduct and legitimizing the social order.

In investigating the role of religion in traditional and modern societies, Weber (1996; 2004) describes different types of religious authority — the priest, the sorcerer, and the prophet — and shows how each of them can contribute both to the consolidation of bureaucratic structures and to movements of spiritual renewal and rupture with tradition. With the advance of rationalization, bureaucracy and secularization, however, the disenchantment of the world emerges: religious explanations cease to occupy a hegemonic position and begin to dispute meanings with other autonomous spheres, such as science, economics and politics. Thus, a constitutive tension of modernity is intensified: religion loses institutional power, but continues to offer answers to fundamental existential questions, such as suffering, fate and morality, as highlighted by Pierucci (2003) and Gigante (2013).

This permanence is expressed in a particular way in theodicy, a central concept in Weber's thought, which designates religious explanations elaborated to justify the existence of evil, pain and inequalities (WEBER, 1996; 2004). The theodicies of fortune and misfortune, analyzed by Weber and deepened by authors such as Gigante (2013), show how religious beliefs function as mechanisms of moral and social stabilization, legitimizing class positions and guiding individual conduct. The comparison between religious traditions — such as Protestantism, Catholicism, Confucianism, Hinduism and Buddhism — shows, according to Weber (1996; 2004), different ways of ordering the world, interpreting morality and organizing economic life, producing different rationalities.

At the same time, the weakening of institutional religion in modernity opens space for a phenomenon that goes beyond confessional boundaries: spirituality. Although Weber (2004) does not use this concept in the contemporary sense, his work offers bases for understanding it as a subjective experience of meaning, linked to the search for

understanding life, suffering, evil, and finitude, as Gerone (2015; 2022) also indicates. Contemporary authors such as Gerone (2015; 2022), Nietzsche (2024), Frankl (1989), Kohlberg (1981) and Sponville (2001; 2007) allow us to deepen this dimension, understanding spirituality as a movement that can both dialogue with religious traditions and distance itself from them, opening up to theistic, pantheistic and even atheistic forms.

Finally, in Weber (1996), the articulation between spirituality and social action makes it possible to analyze how experiences of meaning influence the ways in which individuals guide their conduct — whether by values, ends, tradition or emotion. This relationship allows us to revisit the tension between the ethics of conviction and the ethics of responsibility, showing that spirituality can operate both as a critical element in the face of excessive rationalization and as a mechanism for reinforcing dogmatic postures, according to the interpretations of Weber (1996; 2004) and Gigante (2013). In view of this scenario, this chapter aims to analyze religion, theodicy and spirituality from the Weberian perspective, evidencing their implications for social action in modern and disenchanted societies. To this end, it articulates Weber's classic concepts with contributions from contemporary authors, seeking to understand how, between tradition and modernity, human beings continue to construct meanings for their own existence and for their relationship with the world.

2 RELIGION, DOMINATION AND DISENCHANTMENT OF THE WORLD IN WEBER'S SOCIOLOGY

In the Weberian perspective, religion can be understood as a specific way of acting in community. Unlike Durkheim, who defines it above all as a collective social fact, Weber (1996) does not oppose religion and rationality: it operates its own modes of rationality through religious and magical acts, endowed with internal logic and practical function in contexts of power. He distinguishes three types of religious domination: the priest, linked to institutional and bureaucratic authority (priests, rabbis); the sorcerer, whose authority is based on tradition and recognized spiritual powers (shamans, healers); and the prophet, based on revelation and charisma, capable of breaking with traditions (Moses, Mohammed, Luther). This typology helps to understand why some religions become centralized structures, while others remain forces of disruption and renewal. With modernity, however, religion loses its position of domination over the other spheres (economic, scientific, political, etc.), because it is recognized as a human construction and its legitimacy is no longer taken as absolute. In this sense, Weber (2004), like Marx, denounces dominating religion as a form of alienation and

defends that it should be understood as a human product, in order to limit its power to legitimize domination. However, according to Pierucci (2003) this does not imply atheism, but criticism of religion that suffocates autonomy and overlaps with other spheres.

In addition, according to Pierucci (2003), religion, in the Weberian perspective, also functions as an instance of justification and perpetuation of inequalities. In the Indian caste system, for example, religious doctrines legitimize stratification by attributing sacred meanings to social positions. Religion presents norms and hierarchies as natural and unquestionable, contributing to the maintenance of order. Thus, for Weber, religion is decisive in social structuring, but when it acts in a domineering way, it conceals its own human nature and places its values as absolutes above the autonomy of the subjects.

A central notion to understand this process is the disenchantment of the world. It is through it that religion, as an instance of absolute explanation of the meaning of existence, loses strength. Weber (2004) argues that in modernity, economic and bureaucratic rationality and the secular mentality begin to organize social life, replacing the old religious references. Social spheres begin to operate according to their own norms, and there is no longer a universality based on a single religious interpretation. This does not mean the disappearance of religion, but its transformation and resignification in new institutional and personal forms.

Bureaucracy is another key theme to understand religion in modernity. Weber (2004) states that bureaucracy is structured in rational norms, hierarchies and impersonal procedures, it seeks predictability and efficiency. Unlike religion, which acts on the symbolic and subjective plane, bureaucracy establishes universal rules applicable to everyone, regardless of belief. Politics, economics, science and culture began to function with relative autonomy, marking the passage from theocratic societies to secular societies. The meaning of life is no longer sought exclusively in religion, but also in other forms of rationality and expression of faith, based on reason and experience. Secularization, however, is not a simple linear departure from religion, but a transformation of beliefs and practices, making them compatible with new social and moral realities.

In this scenario, in which religion transforms and disputes meanings with other spheres, a central question remains: how does it continue to offer answers to suffering, evil, inequality, and human destiny in a disenchanted world? Even in rationalized and plural societies, people continue to seek explanations for pain, misfortune and prosperity, and these answers guide ethical conduct and legitimize social positions. It is here that Weber introduces the concept of theodicy, understood as the set of religious explanations that seek to make

sense of human experience, justify social order, and stabilize the relationship between individual destiny and collective structure. Theodicy becomes a decisive link between religion, morality and social organization, by showing how different traditions elaborate different responses to fortune, suffering and inequality. Next, this concept and its sociological implications will be deepened.

3 THEODICY, MORAL VALUES AND SOCIAL LEGITIMATION IN RELIGIONS

According to Gigante (2013), the sociology of religion in Weber highlights the role of religious beliefs in the formation of moral values that guide human conduct and legitimize the social order. The author presents the idea of *sanctification of life*, that is, the internalization of religious values as a guide to behavior and as a form of social legitimation, in which groups and classes adopt religious systems aligned with their material and symbolic interests. According to Weber (2004), in Calvinism, for example, the doctrine of predestination leads the faithful to seek signs of divine election in work and action in the world: work effort is a moral and religious duty, and prosperity is interpreted as a blessing.

In a life marked by effort and the search for divine blessing, questions about suffering and evil inevitably arise. In the Weberian perspective, theodicy designates the explanations that religions offer for these issues and that different social classes use to justify their material situation. Gigante (2013) when describing the theodicies stated that the theodicies of fortune, common among elites, interpret prosperity as divine favor; On the other hand, the theodicies of misfortune, frequent among disadvantaged classes, see adversity as a trial or test of faith, with a reward postponed to the afterlife, which reduces conflicts and questions. In both cases, they function as mechanisms of moral and social legitimation. In Protestantism, for example, economic failure tends to be seen as a sign of moral deviation, and success, as a divine reward, influencing laws, political, economic, and social systems in contexts of strong religious presence.

Comparing religions, Weber notes that Catholicism, especially in Latin American societies, values material renunciation and does not directly encourage the accumulation of wealth. Weber (2004) points out that salvation is linked to the sacraments and obedience to the Church, emphasizing community values, charity and solidarity. Thus, the Catholic ethic differs from the Protestant one: Catholics would tend to pursue careers linked to the humanities and public service, while Protestants would be more involved in commercial and industrial activities.

Another case is Confucianism, the normative system that structured the social and bureaucratic order of imperial China. Unlike Western religions centered on the individual-God relationship, Confucianism organizes an ethic focused on social harmony, respect for hierarchies, and adaptation to the existing order, without requiring a strictly religious foundation. According to Weber (1996), the search for wealth is not condemned, but must respect the established hierarchies. This configuration, while guaranteeing significant kinship networks and social support, limits social mobility and prevents the emergence of an autonomous bourgeoisie, as in Europe, restricting the development of a fully rationalized modern capitalism.

According to Weber (1996), in Hinduism, asceticism assumes a passive and extramundane character, reinforcing the caste structure and the acceptance of the social order as an expression of the cosmic order. The belief in karma and dharma makes social position the result of previous lives, legitimizing conformism and discouraging structural change. Ascension is not the effect of individual effort, but of the fulfillment of a pre-assigned role. The division between castes – such as Brahmins (religion) and vaishyas (economy) – separates religious and economic functions, unlike the Protestant ethic, which values economic work as a divine calling. The absence of a spirit focused on the rational transformation of the world makes it difficult to form a modern capitalism in India, keeping the economy in traditional patterns.

Weber (1996) also analyzes Buddhism, one of the first missionary religions, widespread in China, Japan and Tibet. Buddhism deepens the distance from the material world, proposing the renunciation of desires and attachment as the path to enlightenment. This limits economic and political engagement, although the absence of a rigid caste system allows different social groups to adopt its teachings, facilitating cultural adaptation. In contrast to Protestantism, which associates vocation with work and the accumulation of wealth, Buddhism does not encourage economic rationalization and entrepreneurship.

Thus, by analyzing the sanctification of life, the theodicies of fortune and misfortune, and the various religious ethics, Weber shows that religion has a double function: it morally guides action and gives meaning to suffering, but it also legitimizes the social order and inequalities. With the advance of modernity and the autonomization of social spheres, the power of institutional religion to define the ultimate meaning of existence weakens. A space then opens up for more subjective experiences of meaning, which do not depend exclusively on traditional religious doctrines or structures. It is in this scenario of disenchantment and

transformation of the forms of the sacred that the contemporary notion of spirituality emerges with force – more fluid and less institutionalized, but still deeply linked to the existential questions that Weber identified in his analysis of human action and the rationalization of the world.

4 SPIRITUALITY IN THE WEBERIAN PERSPECTIVE

Spirituality in the Weberian perspective is related to his sociology of religion. Although Weber (2004) does not treat spirituality as an autonomous concept, he analyzes religion in depth not in theological terms, but by comparing religious beliefs, social structures and behaviors, especially in the development of Western capitalism. As Gerone (2022) points out, the distinction between spirituality, religion, and religiosity is recent, non-existent as a category of its own in Weber. Even so, his analysis of the religious phenomenon encompasses a subjective dimension of the state of mind, a rational posture towards life, marked by the search for meaning and personal and collective ethical behaviors, beyond Christian doctrines. Thus, by treating religion as an organized system of beliefs – close to the notion of religiosity –, Weber opens space for readings that touch on the idea of spirituality, which justifies its importance as a theoretical reference in this study.

Weber (2004) indicates that, although religious values have been central to social organization, scientific, political and moral modernity promotes a move away from absolute religious explanations, making room for rational and secular forms of social ordering. For Gerone (2022), this is articulated with the contemporary emergence of spirituality as a distinct notion from institutional religion, multifaceted and linked to existential experience. The loss of traditional religious legitimacy contributes to a field in which spirituality involves the possibility of adhering or not to a religion, shifting the focus from the mere acceptance of beliefs to the construction of meaning, personal norms and position in life. In plural societies, faith becomes choice, no longer an unquestioned social obligation.

According to Gigante (2013), in the "Zwischenbetrachtung" Weber analyzes forms of religious rejection of the world, highlighting intramundane and extramundane asceticism. The first implies living religious discipline within the world, seeing work and daily activities as a divine vocation, as in Protestantism. The second emphasizes withdrawal from the world and renunciation of pleasures. Added to this is mysticism, aimed at a subjective and immediate experience with the transcendent. Although formulated in a religious context, Gerone (2022) argues that these concepts allow us to understand spirituality as an essence common to

traditions: rites, norms, and values are crossed by a search for meaning that may or may not take on a religious form.

In addition, the notion of religion in Weber (2004) is guided by Gerone (2015; 2022), who highlighted how a way of acting in community, mediated by a system of beliefs that guides practices and social organization, is compatible with current conceptions of religion and religiosity. Spirituality, on the other hand, can be seen as an underlying dimension of central themes such as the "disenchantment of the world": religion loses the monopoly of social organization, but does not disappear; it is transformed and reinterpreted in a secular, cosmic and subjective key. Associated with spirituality, this condition points to a search for meaning that integrates religious and human values (solidarity, humanism), aiming at a more integral view of the person. For Gerone (2015; 2022), in a world governed by technical and impersonal norms, spirituality rescues the subjective and emotional dimension, functioning as a human differential and offering meaning even in the face of death and suffering.

This proposal to give meaning to life's impasses can be read in the light of Weber's theodicy. Despite the persistence of currents that instrumentalize pain and suffering as a spiritual bargaining chip, Gerone (2015; 2022) highlights the emergence of emerging theologies that reject the theology of prosperity and suffering and conceive spirituality as something that goes beyond religion, not reduced to the good/evil binomial. The response to suffering becomes the result of an experiential construction between the subject and what is cosmic, moving away from rigid schemes of punishment and reward. In this horizon, Nietzsche (2024) proposes a divinity beyond good and evil, symbolized by Dionysus, in which joy and pain are integrated into the fullness of existence. Inspired by Nietzsche, Frankl (1989) sees the search for meaning as a fundamental need: attributing meaning to suffering allows one to endure and transcend it. Kohlberg (1981) admits that theistic or pantheistic perspectives respond to uncertainty in the face of evil and death, while Sponville (2001; 2007) argues for an atheistic spirituality as the "life of the spirit" that thinks, feels, and loves beyond doctrines, including experiences such as agape love.

Thus, understanding spirituality from a Weberian perspective means recognizing it as an essential dimension of human experience and as a form of relationship with the world, the sacred (or the cosmic) and others. It gives meaning to experiences and promotes values that permeate the interior of the person and their external actions, and can both transform and sustain social structures. Spirituality, therefore, influences the types of social action, guiding

not only how people behave in the world, but also how they legitimize their choices and perceive their place in society.

4.1 SPIRITUALITY AND TYPES OF SOCIAL AND ETHICAL ACTION

Social actions, according to Weber (1996), can be articulated with spirituality in its four ideal types. In rational action with respect to ends, the subject chooses effective means to achieve an end, and spirituality can act as a criterion for judging whether the end is worthy and which means are morally acceptable (e.g., refusing fraud or violence). Thus, it functions as an ethical limit and a form of rationalization. However, when faith is instrumentalized only for practical purposes, there is a risk of emptying its existential dimension and producing forms of fundamentalism, approaching the metaphor of the "iron cage": an extremely rationalized life, without the spirit that gave it meaning.

In traditional action, guided by culturally transmitted customs and habits, spirituality is expressed in religion as a social phenomenon that preserves rites, festivities and doctrines. Religion can function both as a resistance to change and as a critical space, in which to ponder whether or not certain changes threaten the essential values of a tradition.

In affective action, moved by immediate emotional states, spirituality appears in experiences of ecstasy, epiphany, conversion, and belonging, which transform personal and collective life. Examples are communities of religious fervor (such as Pentecostalism), charismatic leaders such as Gandhi and Martin Luther King Jr., or humanitarian actions and alternative communities motivated by spiritual ideals and empathy.

In rational action in relation to values, the subject acts by principles that he considers valid in themselves, regardless of the consequences. In the religious field, this is expressed in the Puritan who works as the fulfillment of a sacred duty; outside of it, in humanist, pacifist or environmentalist militancy, with strong ethical convictions and a sense of personal transcendence, often in confrontation with the established order.

In the light of spirituality, the types of action help to balance the ethics of conviction (absolute and transcendent principles, resistance to excessive rationalization) and the ethics of responsibility (attention to consequences and the common good, not always linked to dogmas). The same spirituality can underlie both rigid and dogmatic religiosities and pragmatic and instrumental forms of faith. When rationalization completely dominates this field, the "iron cage" also applies to spirituality, imprisoning it in rigid structures that stifle its living and critical dimension.

4.2 CONTEMPORARY DIALOGUES: THE SPIRITUALITY OF THE "PILGRIM" AND "BELIEVING WITHOUT BELONGING"

In Weber's work, the analysis of the disenchantment of the world and the consequent subjectivation of the search for meaning finds an echo and detail in important works of the sociology of contemporary religion. Two authors, in particular, offer concepts that can be seen as empirical manifestations of the processes that Weber described: Grace Davie and Danièle Hervieu-Léger.

Grace Davie, in her influential work, coined the phrase "believing without belonging" to describe the religious landscape of modern Europe. According to Davie (2000), the process of secularization did not result in a disappearance of belief, but rather in a dissociation between individual faith and belonging to a religious institution. People continue to have spiritual beliefs, but they no longer feel obligated to actively participate in the life of a church or religious community. This notion aligns perfectly with Weber's thesis on the loss of centrality of institutional religion. "Believing without belonging" is in many ways a direct consequence of disenchantment: in a world where no institution has a monopoly on meaning, belief becomes a matter of private choice, and belonging optional.

In a complementary way, French sociologist Danièle Hervieu-Léger defines religion as a "chain of memory", a system that connects the present to the past through the continuous transmission of a tradition and a lineage of belief. For her, modernity is characterized precisely by the rupture of this chain. In this scenario of religious amnesia, the figure of the "pilgrim" emerges: a type of believer who builds his own spiritual journey autonomously, selecting and combining elements from different traditions, without fixating on any of them. Hervieu-Léger's (2008) "pilgrim" can be understood as the personification of the individual in Weber's disenchanted world. Having lost the certainties of tradition, he is forced to use rationality and subjective experience to assemble his own mosaic of meaning, navigating freely among the various spiritual offerings available.

Thus, the concepts of Davie and Hervieu-Léger do not contradict Weber's analysis, but deepen and update it, providing the conceptual tools to observe, at the empirical level, the consequences of the great process of rationalization and individualization that Weber identified as the mark of modernity. Contemporary spirituality, fluid and deinstitutionalized, is the field where the modern "pilgrim" exercises his "believing without belonging", in an incessant search for meaning that continues to be one of the main engines of social action. This convergence between Weberian theory and the contemporary analyses of Davie and

Hervieu-Léger reinforces the conclusion that religion and spirituality, although transformed, remain fundamental dimensions of human experience in modernity.

5 FINAL CONSIDERATIONS

The analysis developed throughout this study shows that Weber's contribution to the understanding of the religious phenomenon goes beyond the mere description of beliefs or devotional practices. In Weber, religion appears as a structuring force of social action, capable both of morally orienting human life and of legitimizing inequalities and preserving forms of domination. The typology of religious authorities, the process of disenchantment of the world and the emergence of bureaucracy allow us to understand why religion, although it has lost institutional centrality in modernity, remains influential as a system of meaning, albeit in new configurations.

The study of theodicy reveals that religious explanations about suffering, fortune and destiny are not only symbolic responses to existential concerns, but function as mechanisms of social stabilization and legitimization of class positions. The distinction between theodicies of fortune and misfortune, as well as the comparison between traditions such as Protestantism, Catholicism, Confucianism, Hinduism, and Buddhism, shows how different religious systems produce specific ethics and particular rationalizations of economic, political, and moral life. In these dynamics, the "sanctification of life" appears as a central axis in the constitution of conduct and in the sustenance of the social order.

However, the advance of rationalization, the pluralization of social spheres and the disenchantment of the world weaken the power of institutional religion to define, in an exclusive way, the ultimate meaning of existence. Thus, an expanded space is opened for subjective experiences of meaning that do not necessarily depend on dogmas or traditional religious structures. It is in this context that the contemporary notion of spirituality gains relevance, and can be understood, in the light of Weber and later authors, as a more fluid, less institutionalized form strongly marked by the autonomy of the person in the search for meaning, especially in the face of suffering, evil and finitude. This new religious landscape is well described by concepts such as Grace Davie's "believing without belonging" and Danièle Hervieu-Léger's figure of the "pilgrim," which empirically illustrate the dissociation between individual faith and institutional belonging.

By relating spirituality, theodicy and types of social action, it is also possible to reread the Weberian tension between the ethics of conviction and the ethics of responsibility.

Spirituality can sustain both postures rigidly based on absolute principles — when it becomes dogmatic religiosity or fundamentalism — and more reflective attitudes, sensitive to the consequences of actions and committed to the common good. In this sense, spirituality can act simultaneously as a force of criticism of excessively rationalized forms of life and as an element of reinforcement of structures of domination, depending on the way it is appropriated and lived.

Finally, it is important to recognize that this study has clear limits: it is a theoretical-bibliographical approach that focuses on Weber's work and on some contemporary commentators and interlocutors, without empirically entering into specific contexts of spirituality or religion. Future research can deepen how the categories discussed here — religious domination, disenchantment, theodicy, spirituality, and types of social action — manifest themselves in concrete practices, whether religious, parareligious, or non-religious, illuminating the ambiguities, tensions, and possibilities of resistance present in everyday life. Still, Weber's intuition remains current that, between tradition and modernity, between religion and secularization, human beings continue to make senses of pain, evil, destiny, and purpose—and it is precisely in this search that spirituality finds its place.

ABSTRACT

The contemporary landscape of Digital Marketing is marked by the incessant demand for personalized and optimized content, which poses a critical challenge to teams: the inefficiency in the manual analysis of information and the subsequent slowness in writing campaigns, limiting the scalability of corporate communication. The aim is to mitigate this limitation through the development of SocialGen-AI, a generative Artificial Intelligence system designed for end-to-end automation of the creation of promotional texts for social media, starting from the structural and semantic analysis of web pages. The implementation methodology is based on Agile Software Engineering, culminating in a solution implemented in Python and structured via API, which integrates with the Ollama framework for the optimized execution of the DeepSeek large language model. The process includes data extraction, contextualized semantic analysis, and the generation of copy with tone and style

adjustments. Thus, SocialGen- AI allows for a substantial reduction in content time-to-market, in addition to ensuring high consistency and personalization at scale. In conclusion, an architecture based on local LLMs and dedicated APIs represents a viable and scalable technological solution for optimizing marketing productivity, paving the way for future research focused on native integration with social media platforms and the continuous improvement of AI's contextual accuracy.

Keywords: Artificial Intelligence. Digital Marketing. Content Automation. LLMs. FastAPI.

RESUMO

O cenário contemporâneo do Marketing Digital é marcado pela demanda incessante por conteúdo personalizado e otimizado, o que impõe um desafio crítico às equipes: a ineficiência na análise manual de informações e a subsequente morosidade na redação de campanhas, limitando a escalabilidade da comunicação corporativa. Objetiva-se mitigar essa limitação por meio do desenvolvimento do SocialGen-AI, um sistema de Inteligência Artificial generativa concebido para a automação end-to-end da criação de textos promocionais para mídias sociais, partindo da análise estrutural e semântica de páginas web. A metodologia de implementação baseia-se na Engenharia de Software Ágil, culminando em uma solução implementada em Python e estruturada via API, que se integra ao framework Ollama para a execução otimizada do modelo de large language DeepSeek. O processo compreende a extração de dados, a análise semântica contextualizada e a geração de copy com ajuste de tom e estilo. Desse modo, observa-se que o SocialGen-AI permite uma redução substancial no time-to-market do conteúdo, além de garantir alta consistência e personalização em escala. Conclui-se que a arquitetura baseada em LLMs locais e APIs dedicadas representa uma solução tecnológica viável e escalável para a otimização da produtividade em Marketing, pavimentando o caminho para futuras pesquisas focadas na integração nativa com plataformas de redes sociais e no aprimoramento contínuo da precisão contextual da IA.

Palavras-chave: Inteligência Artificial. Marketing Digital. Automação de Conteúdo. LLMs. FastAPI.

RESUMEN

El panorama actual del marketing digital se caracteriza por la demanda constante de contenido personalizado y optimizado, lo que supone un desafío crucial para los equipos: la ineficiencia del análisis manual de la información y la consiguiente lentitud en la creación de campañas, limitando la escalabilidad de la comunicación corporativa. El objetivo es mitigar esta limitación mediante el desarrollo de SocialGen-AI, un sistema de Inteligencia Artificial generativa diseñado para la automatización integral de la creación de textos promocionales para redes sociales, a partir del análisis estructural y semántico de páginas web. La metodología de implementación se basa en la Ingeniería de Software Ágil, culminando en una solución implementada en Python y estructurada mediante API, que se integra con el framework Ollama para la ejecución optimizada del modelo de lenguaje DeepSeek. El proceso incluye la extracción de datos, el análisis semántico contextualizado y la generación de textos con ajustes de tono y estilo. De este modo, SocialGen-AI permite una reducción sustancial del tiempo de lanzamiento del contenido, además de garantizar una alta coherencia y personalización a gran escala. En conclusión, una arquitectura basada en LLM locales y API dedicadas representa una solución tecnológica viable y escalable para optimizar la productividad del marketing, allanando el camino para futuras investigaciones centradas en la integración nativa con las plataformas de redes sociales y la mejora continua de la precisión contextual de la IA.

1 INTRODUCTION

In recent years, social media has consolidated itself as one of the main communication channels between brands and consumers. In an increasingly competitive digital environment, maintaining an active, relevant, and coherent online presence has become essential for the strategic positioning of organizations. However, the traditional process of creating content for these platforms requires continuous effort from marketing teams, who need to analyze products, study trends, write texts, and adjust the tone of each publication to the audience of different networks. According to a study applied to the banking sector, sentiment analysis on social networks is essential to monitor public perceptions and guide strategic decisions, since these platforms have become essential sources for capturing opinions and trends in real time (DOS SANTOS; FERREIRA; BOENTE, 2025).

This process, while critical, is labor-intensive and time-consuming, which limits the agility and scalability of communication strategies. In addition, the speed with which new trends and information emerge makes exclusively human monitoring unfeasible. Faced with this challenge, Artificial Intelligence (AI) emerges as a powerful tool to automate content generation steps, reducing manual effort and increasing team efficiency. According to Goodfellow, Bengio, and Courville (2016), advances in deep learning have revolutionized the way machines process natural language, allowing neural models to generate text that is increasingly similar to human-written text.

Additionally, the automation provided by AI allows repetitive and operational activities to be performed more quickly and accurately, freeing up professionals to dedicate themselves to strategic tasks. This logic is widely recognized in Software Engineering, where automation "significantly reduces the human effort required in routine and repetitive tasks, increasing productivity and the quality of the development process" (SOMMERVILLE, 2019, p. 25). Applying this premise to marketing, the SocialGen-AI system was conceived in this context, seeking to transform a repetitive process into an automated and intelligent practice.

2 THEORETICAL FRAMEWORK

The theoretical framework in this study comprises a critical and organized analysis of the literature that underlies the development of the SocialGen-AI system, providing a technological and market contextualization. The analysis focuses on the pillars of Generative Artificial Intelligence, the application of these tools in Digital Marketing and the Software Architecture concepts that make the solution viable.

2.1 GENERATIVE ARTIFICIAL INTELLIGENCE AND DEEP LEARNING

Advances in deep learning models play a key role in the implementation of intelligent systems capable of understanding and generating language with a high level of coherence. This capability has become the basis for Large Language Models (LLMs), which are the heart of generative AI systems.

According to Goodfellow, Bengio and Courville (2016), deep learning has revolutionized natural language processing by enabling models to understand semantic and syntactic patterns in a hierarchical way, making systems more capable of performing tasks previously restricted to the human intellect (GOODFELLOW; BENGIO; COURVILLE, 2016). This capacity for contextual representation and semantic adaptation is what enables the practical application of generative models, such as the DeepSeek used in SocialGen-AI, in creative tasks, such as the automated production of advertising campaigns.

2.2 AUTOMATION, AI, AND DIGITAL MARKETING STRATEGIES

The contemporary Digital Marketing landscape requires organizations to maintain an active and relevant online presence, but the process of manual content creation is labor-intensive, time-consuming, and limits the scalability of communication. The manual production of posts consumes significant time and limits the frequency and relevance of publications, justifying the need for an automated solution (DOS SANTOS; FERREIRA; BOENTE, 2025).

Artificial intelligence emerges as the key technology to mitigate these challenges, playing an essential role in automating processes and generating strategic insights, allowing organizations to optimize resources and increase their operational efficiency (SILVA, 2023).

Additionally, the automation provided by AI allows repetitive and operational activities to be performed more quickly and accurately, freeing up professionals to dedicate themselves to strategic tasks. SocialGen-AI adopts this principle, using AI to automate content creation steps, improving the efficiency of marketing work.

2.3 RESTFUL SYSTEMS ARCHITECTURE AND APIS

The technical feasibility of SocialGen-AI lies in its modular architecture. The system was designed in the RESTful API format, which is a fundamental software architecture style for building scalable web services, where communication between client and server systems occurs in a standardized way, usually using the HTTP protocol (GUPTA, 2025). SocialGen-

AI's API endpoints are capable of receiving and returning data in JSON, favoring scalability and integration with other services (TIANGOLO, 2025).

The API was developed using the FastAPI framework, chosen for its high performance and simplicity in building modern web services. This architecture is essential for integration with Ollama, which acts as a local intermediary, functioning as a layer that manages the execution, loading, and processing of the DeepSeek model directly in the local environment (OLLAMA, 2025). Local processing eliminates dependence on cloud services, ensuring greater control over data flow and ensuring privacy, as well as reducing costs (DEEPSEEK API, 2025).

3 METHODOLOGY AND SYSTEM ARCHITECTURE

The development of SocialGen-AI followed a structured methodological approach, divided into stages of conception, implementation and testing. The main objective was to create a system capable of automatically processing web pages and generating, from them, personalized marketing campaigns.

The methodology adopted for the development is based on a systematic approach, divided into interdependent steps that aim to ensure the efficiency of the process of collecting, processing and generating automated content. Initially, a requirements survey was carried out to identify the main needs of the target audience and define the criteria for selecting information sources.

Next, the architecture of the system was established, contemplating the definition of the operating flow, from data capture to the generation and storage of draft posts. At this stage, the technologies to be used were also selected, such as the Python language and specific libraries for web scraping and feed reading.

With the architecture defined, the data collection and extraction stage was carried out. The collected material was subjected to a generative artificial intelligence API, responsible for processing and transforming the raw data into draft posts. Finally, the methodology included the validation stage of the system with real users, through practical tests and feedback collection. The process was completed with the preparation of technical and use documentation.

The methodology of an article outlines the procedures employed to conduct the research, including the type of study, sample selection, methods of data collection and analysis, ethical considerations, and limitations of the study. Its detailed and transparent

description is essential to ensure the replicability and reliability of the results, in addition to providing a solid basis for the interpretation and generalization of the findings.

3.1 DESIGN AND DEFINITION OF REQUIREMENTS

In the initial phase, a requirements analysis determined the essential functionalities of the system. Among the demands identified were:

1. Receive a link from a website as input;
2. Automatically collect and process the textual content of the page;
3. Send the processed text to an advanced language model (DeepSeek) executed locally via Ollama;
4. Generate a marketing campaign adapted to the product or service present in the link;
5. Return the result in a structured format, allowing future integration with other applications.

Based on these requirements, the use of Python as the main language was defined. The system was designed in the RESTful API format, with endpoints capable of receiving and returning data in JSON, favoring scalability and integration with other services.

Analisar

Source: Prepared by the authors themselves (2025).

3.2 GENERAL SYSTEM ARCHITECTURE

The architecture of SocialGen-AI is designed based on three main layers:

- Input Layer: Receives the link sent by the user or client system.
- Processing Layer: In charge of extracting the textual content from the website, sending the text to the AI model via Ollama and handling the response received.
- Output Layer: Responsible for structuring and making available the final result of the generated campaign text in a standardized format.

This modular structure allows each component to work independently, ensuring greater maintainability, scalability, and clarity in data flow.

Figure 2

Processing of the embedded website

Source: Prepared by the authors themselves (2025).

Figure 3

Data returned after search

Source: Prepared by the authors themselves (2025).

3.3 PYTHON API IMPLEMENTATION

The API was developed using the FastAPI framework, chosen for its performance and simplicity. The main endpoint (/parse) receives the link, extracts the content, and triggers the DeepSeek model to generate the final text.

The simplified deployment flow includes:

1. You submit a POST request with the product link.
2. The API uses libraries (Requests and BeautifulSoup4) for scraping and extracting relevant content.
3. The clean text is passed to Ollama, specifying the DeepSeek template for generation.
4. The response is handled and converted to a structured format (JSON).
5. The result is returned to the API client.

3.4 INTEGRATION WITH OLLAMA AND THE DEEPSEEK MODEL

Ollama acts as a local intermediary, managing the execution of the DeepSeek model. This approach eliminates dependence on cloud services, ensuring greater control over the flow of data, ensuring privacy, and reducing costs and latency. The DeepSeek model was selected for its robust performance in textual comprehension, semantic analysis, and creative content generation tasks, making it ideal for turning product descriptions into engaging campaigns.

The API is responsible for putting together a carefully structured prompt, guiding the model to analyze the content and produce a campaign that highlights the product's

differentials. The quality of the prompt is key to ensuring consistency in style and alignment with the communication proposal.

3.5 DATA FLOW AND OPERATION

The flow of SocialGen-AI is organized into five main steps:

1. Input: Receipt and validation of the link by the API.
2. Data Collection: Automatic extraction of textual content, including request, interpretation of HTML and filtering of irrelevant elements.
3. Interpretation: Sending the text to the DeepSeek model via Ollama, using a defined prompt to guide the analysis and style of the response.
4. Generation: The model produces a complete marketing campaign, highlighting differentials and aspects relevant to the target audience.
5. Output: Return of the final text formatted and ready for publication via the API.

Figure 4

4 RESULTS AND DISCUSSIONS

4.1 IMPLEMENTATION RESULTS AND CONTENT GENERATION

The results of this study focus on demonstrating the feasibility and effectiveness of SocialGen-AI as a technological solution for automating the creation of digital marketing campaigns. The implementation of the RESTful API architecture (Section 3.3) in Python and

the integration with Ollama, running the DeepSeek model, proved to be efficient in capturing and processing web information in real time.

The most significant result is the system's ability to turn a product link into a full-fledged marketing campaign draft, which includes:

- Introduction and Hook: Initial messages to capture attention.
- Dissemination Strategy: Suggestions for channels and post formats.
- Key Messages (Copy): Creative and persuasive texts, focusing on the product's differentials.
- Conclusion and Call to Action (CTA): Finalization and targeting the consumer.

The detailed output example in Figure 3 (Section 3.2) demonstrates that the system is capable of generating content with a professional and sales-oriented tone, fulfilling the requirement of producing creative ad suggestions from the interpretation of the text on the page.

4.1.1 Performance and Safety

The local execution of the DeepSeek model via Ollama showed favorable results in terms of operational efficiency. Local processing eliminates the latency associated with external API calls, resulting in faster and more consistent responses, allowing full campaigns to be generated in seconds.

In terms of security, the local approach mitigates the risk of data leakage or interception, since no sensitive information is transmitted to external servers. This is a crucial outcome for the applicability of SocialGen-AI in enterprise environments that require confidentiality and compliance.

4.2 DISCUSSION AND IMPLICATIONS OF THE STUDY

The implementation of SocialGen-AI corroborates the Generative Artificial Intelligence literature (Section 2.1), demonstrating in practice how the advancement of deep learning and LLMs allows neural models to "understand and generate text in an increasingly human-like way" (GOODFELLOW; BENGIO; COURVILLE, 2016). The system's ability to generate multiple content formats for different digital platforms (LinkedIn, Twitter/X, Facebook) from a single source supports the thesis that AI is a powerful tool for automating content creation, reducing manual effort and increasing efficiency.

4.2.1 Solving the Research Question

The main result directly addresses the research question of the study: The system is able to automate the analysis of web content and generate texts for digital marketing campaigns in a coherent and personalized way, optimizing the workflow of the teams.

- **Coherence and Personalization:** The generation of messages focused on differentials and with specific call-to-actions validates the model's ability to reinterpret content strategically, adopting advertising language and elements that arouse interest.
- **Workflow Optimization:** The proposed methodology (Section 3.5), which culminates in the storage of drafts in Google Sheets with approval status, transforms the marketing team's work from manual writing to only final review and validation. This aligns SocialGen-AI with the Software Engineering principle of reducing human effort on routine tasks, increasing productivity (SOMMERVILLE, 2019).

4.2.2 Limitations and Future Research

Despite the promising results, the study has limitations inherent to an initial development project. Hands-on validation of the system was performed in a controlled production environment (shown in Figures 1, 2, and 3). As future researches, the following stand out:

1. The practical implementation of the tool in a real production environment.
2. Direct integration with social media platforms for automated scheduling.
3. Continuous improvement of the AI model to increase accuracy and personalization, addressing more complex linguistic nuances.

5 CONCLUSION

The present study presented the design and architecture of SocialGen-AI, an Artificial Intelligence-based system designed to automate the generation of content for social media from information collected from web pages or news feeds. The analysis of the problem demonstrated that the manual production of posts consumes significant time and limits the frequency and relevance of publications, justifying the need for an automated solution.

The proposed methodology, which included stages of requirements gathering, data collection and extraction, processing with generative AI, storage, and review, evidenced the technical feasibility of the tool. The system demonstrates potential to generate content adapted to different platforms, promoting greater operational efficiency and supporting

strategic decision-making in marketing.

The development of SocialGen-AI, with its RESTful API architecture and the local execution of the DeepSeek model via Ollama, contributes significantly to the field by offering a scalable and secure model for optimizing the workflow of marketing teams.

As future perspectives, the following stand out:

- The practical implementation and testing with real users of the tool.
- Integration with multiple social platforms for scheduling.
- The continuous improvement of the AI model to increase the relevance, accuracy, and personalization of the generated content.

In this way, SocialGen-AI presents itself as a promising contribution to the automation of digital marketing and the advancement of technological solutions based on artificial intelligence.

ABSTRACT

This article investigates how the municipalities of the Association of Municipalities of the Upper Northeast Slope (AMESNE) can articulate tourism and social assistance to reduce territorial inequalities and promote productive inclusion. The central research question seeks to understand how tourism can be structured as a tool for social transformation, going beyond the economic aspect to consolidate itself as an intersectoral public policy. The general objective is to analyze the role of the AMESNE municipalities in the integration between tourism, social responsibility, and assistance policies, aiming at sustainable and inclusive regional development. The specific objectives involve: (i) outlining a socioeconomic panorama of the municipalities in the region; (ii) mapping the structure of the Unified Social Assistance System (SUAS) and its interaction with tourism policies; (iii) identifying local initiatives in social and community-based tourism; and (iv) proposing strategies to strengthen productive inclusion through tourism. The methodology adopted is applied in nature, with a qualitative approach, of an exploratory and descriptive character. Documentary analysis and statistical survey techniques were used, based on secondary data from the Brazilian Institute of Geography and Statistics (IBGE), the Single Registry (CadÚnico), the Bolsa Família Program, official reports from AMESNE and SUAS, as well as national and state normative documents. Data processing involved content analysis (BARDIN, 2016) applied to plans and legislation, descriptive statistics to highlight social inequalities, and spatial analysis through georeferencing (QGIS and ArcGIS) to map vulnerable families and social protection structures. Methodological triangulation (FLICK, 2018) was employed to integrate qualitative and quantitative data, providing greater reliability to the results. The literature review consisted of an analysis of public policies on tourism and social assistance. The results show that, despite the high tourism and economic potential of the region, significant inequalities persist, highlighted by the concentration of vulnerable families. The inequalities became evident through high GDP indicators coexisting with significant social vulnerabilities, highlighted by the number of families registered in the Unified Registry and beneficiaries of the Bolsa Família Program. The structure of the Unified Social Assistance System (SUAS),

composed of 49 CRAS units and 13 CREAS units, is presented as a basis for territorial social protection actions. Corroborating this evidence, it was observed that the structured presence of SUAS, associated with community-based tourism practices, professional qualification, and cultural appreciation, strengthens the social dimension of ESG, potentially reducing dependence on income transfers, generating job and income opportunities, and strengthening social cohesion. The study concludes that integrated tourism and social assistance policies have the potential to transform AMESNE into a benchmark for fair, sustainable, and inclusive regional development.

Keywords: Tourism. Social Assistance. ESG. Public Policies. AMESNE.

RESUMO

O artigo investiga de que forma os municípios da Associação dos Municípios da Encosta Superior do Nordeste (AMESNE) podem articular o turismo e a assistência social para reduzir desigualdades territoriais e promover a inclusão produtiva. A questão-problema central busca compreender como o turismo pode ser estruturado como ferramenta de transformação social, indo além do viés econômico para consolidar-se como política pública intersetorial. O objetivo geral é analisar o papel dos municípios da AMESNE na integração entre turismo, responsabilidade social e políticas de assistência, visando o desenvolvimento regional sustentável e inclusivo. Os objetivos específicos envolvem: (i) traçar um panorama socioeconômico dos municípios da região; (ii) mapear a estrutura do Sistema Único de Assistência Social (SUAS) e sua interação com políticas turísticas; (iii) identificar iniciativas locais de turismo social e de base comunitária; e (iv) propor estratégias para fortalecer a inclusão produtiva via turismo. A metodologia adotada é de natureza aplicada, com abordagem qualitativa, de caráter exploratório e descritivo. Foram utilizadas técnicas de análise documental e levantamento estatístico, com base em dados secundários provenientes do Instituto Brasileiro de Geografia e Estatística (IBGE), Cadastro Único (CadÚnico), Programa Bolsa Família, relatórios oficiais da AMESNE e do SUAS, além de documentos normativos nacionais e estaduais. O tratamento dos dados envolveu análise de conteúdo (BARDIN, 2016) aplicada a planos e legislações, estatística descritiva para evidenciar desigualdades sociais e análise espacial por meio de georreferenciamento (QGIS e ArcGIS) para mapear famílias vulneráveis e estruturas de proteção social. A triangulação metodológica (FLICK, 2018) foi empregada para integrar dados qualitativos e quantitativos, conferindo maior confiabilidade aos resultados. A revisão bibliográfica consistiu em análise das políticas públicas de turismo e assistência social. Os resultados evidenciam que, apesar do elevado potencial turístico e econômico da região, persistem desigualdades expressivas, destacadas pela concentração de famílias vulneráveis. As desigualdades ficaram evidentes pelos altos indicadores de PIB convivendo com vulnerabilidades sociais expressivas, destacadas pelo número de famílias inscritas no Cadastro Único e beneficiárias do Programa Bolsa Família. A estrutura do Sistema Único de Assistência Social (SUAS), composta por 49 unidades do CRAS e 13 do CREAS, é apresentada como base para ações territoriais de proteção social. Corroborando essa evidência percebeu-se que a presença estruturada do SUAS, associada a práticas de turismo de base comunitária, qualificação profissional e valorização cultural, fortalece a dimensão social do ESG, podendo reduzir dependências de transferências de renda, gerar oportunidades de trabalho e renda e fortalecer a coesão social. O estudo conclui que políticas integradas de turismo e assistência social têm potencial para transformar a AMESNE em referência de desenvolvimento regional justo, sustentável e inclusivo.

RESUMEN

Este artículo investiga cómo los municipios de la Asociación de Municipios de la Alta Vertiente Noreste (AMESNE) pueden articular el turismo y la asistencia social para reducir las desigualdades territoriales y promover la inclusión productiva. La pregunta central de la investigación busca comprender cómo el turismo puede estructurarse como una herramienta de transformación social, trascendiendo el aspecto económico para consolidarse como una política pública intersectorial. El objetivo general es analizar el papel de los municipios de la AMESNE en la integración de las políticas de turismo, responsabilidad social y asistencia, con miras al desarrollo regional sostenible e inclusivo. Los objetivos específicos incluyen: (i) delinear un panorama socioeconómico de los municipios de la región; (ii) mapear la estructura del Sistema Único de Asistencia Social (SUAS) y su interacción con las políticas turísticas; (iii) identificar iniciativas locales de turismo social y comunitario; y (iv) proponer estrategias para fortalecer la inclusión productiva a través del turismo. La metodología adoptada es de naturaleza aplicada, con un enfoque cualitativo, de carácter exploratorio y descriptivo. Se emplearon técnicas de análisis documental y de levantamiento estadístico, con base en datos secundarios del Instituto Brasileño de Geografía y Estadística (IBGE), el Registro Único (CadÚnico), el Programa Bolsa Família, informes oficiales de AMESNE y SUAS, así como documentos normativos nacionales y estatales. El procesamiento de datos implicó análisis de contenido (BARDIN, 2016) aplicado a planes y legislación, estadística descriptiva para resaltar desigualdades sociales y análisis espacial mediante georreferenciación (QGIS y ArcGIS) para mapear familias vulnerables y estructuras de protección social. Se empleó triangulación metodológica (FLICK, 2018) para integrar datos cualitativos y cuantitativos, brindando mayor confiabilidad a los resultados. La revisión bibliográfica consistió en un análisis de políticas públicas en turismo y asistencia social. Los resultados muestran que, a pesar del alto potencial turístico y económico de la región, persisten desigualdades significativas, resaltadas por la concentración de familias vulnerables. Las desigualdades se hicieron evidentes a través de altos indicadores de PIB que coexisten con importantes vulnerabilidades sociales, resaltadas por el número de familias registradas en el Registro Único y beneficiarias del Programa Bolsa Família. La estructura del Sistema Único de Asistencia Social (SUAS), compuesto por 49 unidades CRAS y 13 unidades CREAS, se presenta como base para las acciones territoriales de protección social. Corroborando esta evidencia, se observó que la presencia estructurada del SUAS, asociada a prácticas de turismo comunitario, cualificación profesional y valoración cultural, fortalece la dimensión social de los ASG, reduciendo potencialmente la dependencia de las transferencias de ingresos, generando oportunidades de empleo e ingresos, y fortaleciendo la cohesión social. El estudio concluye que las políticas integradas de turismo y asistencia social tienen el potencial de convertir a AMESNE en un referente para el desarrollo regional justo, sostenible e inclusivo.

Palabras clave: Turismo. Asistencia Social. ASG. Políticas Públicas. AMESNE.

1 INTRODUCTION

The region of AMESNE (Association of Municipalities of the Upper Slope of the Northeast) represents one of the most important poles of Rio Grande do Sul in economic, cultural and tourist terms. Composed of 37 municipalities, this region has tourism as one of its main economic activities. However, behind the enchanting landscapes and industrial strength, there are social challenges that require an integrated approach between economic development and social institutional responsibility (AMESNE, 2025).

Figure 1

The AMESNE region

Source: Prepared by the authors (2025).

Such challenges require an intersectoral and integrated approach, which articulates economic development with social inclusion, equity and territorial justice, based on the strengthening of Social Institutional Responsibility (BRASIL, 2025).

Culturally, the region reflects the rich diversity of southern Brazilian culture, marked by the influence of European immigrants — mainly Italians, Germans and Azoreans — as well as by the contributions of indigenous and African peoples, whose presence, although historically marginalized, is fundamental for the formation of regional identity. Typical festivals, gastronomic knowledge, religiosity, architecture and artistic expressions are constitutive elements of local daily life and are consolidated as important tourist and identity assets. This

cultural multiplicity, in addition to attracting visitors, strengthens community bonds and can be mobilized as an instrument of territorial development based on valuing roots and promoting cultural citizenship (AMESNE, 2025).

However, despite the economic advances and the prominence in macroeconomic indicators, the region still faces significant internal inequalities. Municipalities with high *GDP per capita* and a high human development index coexist with localities that face severe restrictions on access to basic rights, such as housing, income, sanitation, health, and education (IBGE, 2025).

In urban centers considered centers of wealth, such as Caxias do Sul and Bento Gonçalves, the realities of vulnerable peripheries coexist, with populations exposed to situations of poverty, food insecurity, domestic violence, and structural discrimination. This contrast reveals the importance of building a development model that goes beyond economic growth and is committed to social justice, territorial cohesion, and respect for diversity.

In this sense, public policies that integrate the economic, social, environmental, and cultural dimensions are indispensable to ensure a more balanced and inclusive future. The strengthening of the social protection network, through the Unified Social Assistance System (SUAS), and the articulation with tourism as a tool for productive inclusion and appreciation of cultural territories are convergent strategies.

The implementation of the Rio Grande Plan, for example, with a focus on structuring investments and qualification of human capital, points to a long-term vision that recognizes the impacts of climate change, regional inequalities and the need for intergovernmental integration. Joint action between municipal and state governments, academic institutions and civil society is crucial for the proposed transformations to be effective and legitimate.

In addition, the State Social Assistance Plan of Rio Grande do Sul (2020–2023) highlights the urgency of ensuring the rights of the population in situations of vulnerability, emphasizing the role of the State in ensuring access to basic and special social protection, income, work, and community life. This guideline dialogues directly with the challenges faced by the municipalities of AMESNE, where the social protection of the territory, combined with endogenous development strategies — such as community-based tourism, rural tourism and cultural tourism — can be decisive for the promotion of equity and social autonomy.

The strengthening of Social IR as a public management tool based on data, evidence, and intersectoral agreement expands the possibilities of decision-making that is more sensitive to inequalities. It makes it possible to map vulnerabilities, plan policies in an

articulated way, and value territories not only as spaces for tourist consumption, but as places of life, memory, and belonging (BRASIL, 2025).

In this direction, tourism, as an economic and social activity, has been consolidated as an important vector for the promotion of social inclusion and sustainable territorial development.

The expansion of social tourism, which goes beyond leisure and consumption, seeks to democratize access to tourist experiences, ensuring that vulnerable segments of the population can actively participate in this sector and enjoy its benefits. This perspective reaffirms tourism as a social right, capable of strengthening community bonds, valuing cultural identities and fostering the local economy.

In Brazil, recent public policies, such as the National Tourism Plan (2024-2027), reinforce the commitment to the democratization of access, professional qualification, and the productive insertion of people in situations of social vulnerability. The strengthening of integrated networks between tourism and social assistance is essential for the sector to effectively contribute to the reduction of regional inequalities and the promotion of social justice.

In addition, the articulation between tourism and social protection policies enables the construction of inclusive tourist environments, which respect the cultural, ethnic, generational and gender diversity of local communities. This integration enhances the development of tourist itineraries and activities that value traditional knowledge and promote community participation, expanding economic opportunities and the feeling of belonging.

Therefore, when thinking about tourism as an instrument of productive and social inclusion, it is necessary to overcome the fragmented view of public policies, building integrated and intersectoral strategies. This expanded focus contributes to tourism moving from being just a mechanism for generating revenue to becoming a space for the realization of rights, citizenship and human development.

In summary, the AMESNE region is a multifaceted territory, of great economic and cultural relevance, whose tourism potential must be understood as part of a broader strategy of sustainable development. For this development to reach all segments of the population, especially the most vulnerable, it is essential to adopt an integrated approach that unites economic growth, social responsibility, cultural appreciation and territorial inclusion.

Thus, the challenge is to build public policies that not only boost the economy, but also strengthen citizenship, equity and collective well-being, making AMESNE a reference not only for prosperity, but for social justice and regional cohesion.

2 SOCIOECONOMIC OVERVIEW OF AMESNE

Although the region has high development indicators, many of its municipalities have a significant portion of the population enrolled in the Unified Registry for Social Programs (CadÚnico), and beneficiaries of the Bolsa Família Program, reflecting internal territorial inequalities (BRASIL, 2025).

Figure 2

Distribution of families enrolled in CadÚnico in AMESNE municipalities in 2024

Source: prepared by the authors (2025).

Figure 3

Distribution of families enrolled in CadÚnico in the municipalities of AMESNE in 2025

Source: Prepared by the authors (2025).

In the period between March 2024 and March 2025, the AMESNE region presented, in general, an increase in the number of families enrolled in the Unified Registry. This growth reflects both the expansion of the reach of public policies and a possible increase in socioeconomic vulnerability in several municipalities.

Municipalities such as André da Rocha and Bento Gonçalves recorded significant increases in registered families, from 147 to 215 and from 9,644 to 10,381, respectively. This increase indicates a greater demand for social inclusion and access to government programs that serve families in poverty or extreme poverty. Other municipalities, such as Farroupilha and Marau, also showed relevant growth, with Farroupilha going from 6,250 to 6,798 registered families and Marau from 3,453 to 3,907. This movement suggests that these localities may be expanding the coverage of social policies or facing economic challenges that drive the enrollment of families in the system (Brasil, 2025).

On the other hand, there are municipalities that presented small variations or even a slight reduction in the number of families enrolled, which may be related to registration update processes, improvement in socioeconomic conditions or other local factors.

In the region as a whole, the increase in the number of people enrolled in the Unified Registry points to a growing demand for social programs and the importance of maintaining and expanding these policies to ensure inclusion and support for families in vulnerable situations.

3 INSTITUTIONAL/SOCIAL RESPONSIBILITY AND TERRITORIAL INCLUSION

The Bolsa Família Program represents an important mechanism of the Social RI for the promotion of territorial inclusion and the fight against poverty in the AMESNE region. Between March 2024 and March 2025, there is a general downward trend in the number of benefited families in several municipalities, which may reflect both socioeconomic advances and registration adjustments in the program.

For example, in the municipality of Bento Gonçalves, the number of families in the Bolsa Família reduced from 1,913 to 1,738, and in Farroupilha, the decrease was from 2,315 to 2,218 families. This drop was also accompanied by a reduction in the total number of people benefited — Bento Gonçalves went from 5,344 to 4,829 people and Farroupilha from 6,248 to 5,902 people (IBGE, 2025).

However, there are relevant exceptions, such as the municipality of Marau, which showed a significant growth in the number of benefited families, from 650 to 1,118, and an increase in the number of people served from 2,670 to 3,109, reflecting an expansion of the program's coverage in this location. Guaporé also registered growth in the number of benefited families, from 580 to 654, and people assisted, from 1,588 to 1,722. In financial terms, the monthly amount transferred by Bolsa Família followed the variations in beneficiaries, with a general reduction in most municipalities, but with occasional increases where there was growth in coverage, such as in Marau (from R\$626,958 to R\$729,592) and Guaporé (from R\$382,894 to R\$424,940) (IBGE, 2025).

As we can see in the figures below:

Figure 4

Distribution of families in the Bolsa Família in the municipalities of AMESNE in 2024

Source: Prepared by the authors (2025).

Figure 5

Distribution of people in the Bolsa Família in the municipalities of AMESNE in 2024

Source: Prepared by the authors (2025).

Figure 6

Distribution of families in the Bolsa Família in the municipalities of AMESNE in 2025

Source: Prepared by the authors (2025).

Figure 7

Distribution of people in the Bolsa Família in the municipalities of AMESNE in 2025

Source: Prepared by the authors (2025).

These movements reflect the dynamics of Social IR in the region, which seeks to adjust benefits according to the local socioeconomic reality, promoting territorial inclusion by

ensuring that families in vulnerable situations have continuous access to essential resources for their subsistence and development.

Thus, the analysis of the monthly amounts transferred by the Bolsa Família Program in the AMESNE region between March 2024 and March 2025 reveals a downward trend in the total volume of resources allocated to the program in most municipalities. This reduction accompanies, in many cases, the decrease in the number of families and people benefited, which may be linked to registration revisions, improvement in the income conditions of part of the population or changes in eligibility criteria (BRASIL, 2025).

Figure 8

Amounts transferred from the Bolsa Família in the municipalities of AMESNE in 2024

Source: Prepared by the authors (2025).

Figure 9

Amounts transferred from the Bolsa Família in the municipalities of AMESNE in 2025

Source: Prepared by the authors (2025).

We can see that the municipality of Caxias do Sul, for example, showed a significant drop in the amount transferred, from R\$ 9,025,093.00 in March 2024 to R\$ 8,105,446.00 in March 2025. A similar situation occurred in Bento Gonçalves, with a reduction from R\$ 1,221,695.00 to R\$ 1,067,796.00, and in Veranópolis, which went from R\$ 165,852.00 to R\$ 140,680.00.

On the other hand, some municipalities recorded an increase in the transfer of resources, especially Marau, which received R\$ 729,592.00 in 2025, compared to R\$ 626,958.00 in 2024 — a direct reflection of the increase in the number of families and people served in the municipality. Guaporé also had an increase, with a transfer of R\$ 424,940.00 in 2025, compared to R\$ 382,894.00 in the previous year. In smaller cases, the growth was more slight, such as in Cotiporã (from R\$ 17,751.00 to R\$ 13,420.00), or Protásio Alves (from R\$ 28,018.00 to R\$ 29,124.00). Such variations indicate specific and localized movements in the profile of the benefited families, as well as in the territorial coverage of the program (Brasil, 2025).

These data reinforce the role of Bolsa Família as a dynamic and adaptable public policy, adjusting to the socioeconomic realities of the territories. In addition, they show how regionalized monitoring of financial transfers allows Social RI to identify trends, correct distortions, and ensure that resources efficiently reach the families that need it most.

The implementation of Social Institutional Responsibility practices in the municipalities of AMESNE involves recognizing these inequalities and acting with local strategies that articulate public policies, tourism and social inclusion. Encouraging community entrepreneurship, locally-based tourism and the use of traditional knowledge are possible paths.

In 2025, the AMESNE region has a total of 49 CRAS (Social Assistance Reference Centers) units distributed among the municipalities, in addition to 13 CREAS (Specialized Social Assistance Reference Centers) units. These facilities represent the fundamental structure of the social assistance policy, being responsible for ensuring the access of vulnerable populations to services, programs and social benefits.

The presence of CRAS in all municipalities in the region demonstrates the commitment to basic social protection and the capillarization of care. Municipalities with larger populations, such as Caxias do Sul, have up to 6 units, which reinforces the articulation between the volume of demand and the installed structure. Smaller municipalities, such as André da Rocha, Boa Vista do Sul, Coronel Pilar, Santa Tereza and others, have 1 unit, ensuring minimum territorial coverage.

Figure 10

Number of CRAS in the municipalities of AMESNE

Source: Prepared by the authors (2025).

CREAS, in turn, is present in 13 municipalities, all of larger size or regional relevance, such as Bento Gonçalves, Caxias do Sul, Carlos Barbosa, Farroupilha, Flores da Cunha, Guaporé, Marau, Nova Prata, São Marcos, Serafina Corrêa, Veranópolis and other urban centers. The function of CREAS is focused on special social protection, focusing on cases of rights violations, such as domestic violence, abuse and neglect, requiring specialized technical teams.

Figure 11

Number of CREAS in the municipalities of AMESNE

Source: Prepared by the authors (2025).

The available structure allows the strengthening of the Unified Social Assistance System (SUAS) in the region, ensuring that families in vulnerable situations have where to seek support, guidance and access to the benefits network. The data show that, despite the population and economic differences between municipalities, there is a coordinated regional effort to maintain an active and territorialized social protection network, strengthening the role of Social IR as an instrument of social inclusion and development (RIBEIRO, 2024).

Thus, the 2025 data show that the AMESNE region has a consolidated structure of social assistance service, with the presence of CRAS in all municipalities and CREAS in 13 of them. This distribution demonstrates the regional commitment to ensuring access to public social assistance policies, respecting the different local realities. The articulation between the municipalities and the maintenance of this equipment strengthen the SUAS and reaffirm the Social IR as an effective instrument of inclusion and territorial organization in the promotion of social rights (RIBEIRO, 2024).

More than an institutional apparatus, this network represents a concrete commitment to social justice and the democratization of access to basic rights, such as health, education, work and leisure. The capillary presence of CRAS and CREAS contributes to the service being carried out in a decentralized way and close to the reality of the communities,

respecting the principles of equity, citizen participation and intersectoriality. This territorialized logic of action is aligned with the SUAS model, which organizes services by levels of social protection (basic, medium and high complexity), with the family and the territory being the structuring axes of the actions.

In addition, the strengthening of SUAS at AMESNE also allows us to think about inclusion from a broader perspective, which goes beyond emergency assistance and encompasses human development actions, strengthening community bonds and promoting family autonomy. An example of this is the services offered within the scope of the PAIF (Protection and Integral Care to the Family) and the SCFV (Service of Coexistence and Strengthening of Bonds), which not only provide care, but create concrete opportunities for individuals in situations of social vulnerability to become protagonists of their life projects.

In this context, it is necessary to highlight the role of tourism as a public policy that can dialogue with social assistance and expand its inclusion effects. The articulation between SUAS and tourism, although still incipient in many territories, represents a strategic opportunity to strengthen local capacities, generate income and promote cultural belonging. Social tourism — understood as a practice of accessible leisure, appreciation of local culture and community mobilization — emerges as a powerful tool for integrating economic development and social justice.

Experiences such as those developed in the municipality of Antônio Prado – RS, for example, demonstrate that it is possible to articulate professional training actions with the demands of the tourism sector, such as maid, waiter, gastronomy and service courses, promoted through partnerships between social assistance, the S system and the state government. These initiatives, while fostering the qualification of local labor, contribute to reducing dependence on income transfer programs, promoting the autonomy of subjects and their productive insertion in the territory.

However, it is necessary to advance in the construction of a public tourism policy that goes beyond the instrumental logic of preparing the workforce for the market. Social inclusion through tourism should not be restricted to the economic dimension, but rather encompass the right to tourist experience, mobility, leisure, access to natural and cultural heritage, and community participation in decisions about the use and development of territories.

To this end, it is essential to invest in tourism education with a social focus, promoting training actions in schools, CRAS and communities on social rights, the role of tourism and the role of local populations in the construction of the region's tourist identity. Tourism should

be understood as an intersectoral public policy, capable of dialoguing with policies of assistance, culture, youth, solidarity economy and the environment.

Also, practices such as community-based tourism and solidarity tourism can be stimulated as strategies for local protagonism and productive inclusion. These modalities value traditional knowledge, strengthen community bonds, and promote the circulation of the economy within their own territories, with respect for ethnic, generational, cultural, and gender diversity.

Finally, the strengthening of the social assistance network in AMESNE, combined with an expanded conception of social inclusion that integrates tourism, reaffirms the region's commitment to a model of integral human development, in which people are recognized in their dignity, diversity and creative potential. Social RI, in this sense, is no longer just a registration system and becomes an instrument of territorial organization, social justice, and regional strategic planning, which can — and should — incorporate cultural, tourist, and community dimensions into its actions.

4 TOURISM AS A TOOL FOR TRANSFORMATION

Tourism can consolidate itself as an important vector of productive inclusion in the AMESNE region by valuing the local identity, cultural heritage and territorial diversity of the municipalities. By integrating practices such as handicrafts, family farming, rural tourism and ethnic-cultural tourism, the sector contributes to boosting local economies and generating income opportunities for families in situations of social vulnerability. According to Font and Lynes (2018), responsible social practices are fundamental in the context of sustainable tourism, with the inclusion and well-being of local communities being decisive factors for its lasting success. The authors argue that it is necessary for companies in the tourism sector to get involved with the communities where they operate, providing jobs, fostering economic development and valuing local culture. Complementing, Steiner (2024) mentions that this type of action contributes both to raising the quality of life in the communities involved and to strengthening the brand image and increasing public loyalty.

The analysis of the region's data demonstrates the coexistence of diverse socioeconomic realities. Municipalities with a strong rural predominance, such as Boa Vista do Sul (83% rural), Coronel Pilar (88%), Pinto Bandeira (70%), Monte Belo do Sul (69%) and Vista Alegre do Prata (66%), have great potential for the development of community- and

existing public policies, tourism can cease to be just an activity focused on consumption and leisure to assume the role of a tool for social transformation, community strengthening and economic dynamism of the territories.

The strengthening of tourist itineraries that integrate artisanal production, typical cuisine, visits to rural properties, memory tourism and the appreciation of local cultural manifestations represents a concrete opportunity to generate decentralized and sustainable income, respecting the socio-cultural singularities of the region. These itineraries not only attract visitors, but also stimulate the local population's sense of belonging, rescuing and valuing historically invisible identities (SALAMON; SOTTORIVA, 2025).

In this process, the social assistance protection network existing in the AMESNE region — with its 49 CRAS and 13 CREAS — becomes a fundamental ally in the construction of tourism with social responsibility. The infrastructure already installed, based on a territorialized and participatory logic, can be mobilized to offer support to families, foster professional qualification, promote tourism education workshops and encourage solidarity and cooperative entrepreneurship practices. SUAS, by focusing on the family and the territory, shares with social tourism the concern with equity, dignity and social justice.

The articulation between social assistance equipment and tourism initiatives also favors the inclusion of audiences historically excluded from tourist experiences — such as the elderly, people with disabilities, women in situations of violence and young people in situations of vulnerability — promoting access to the right to leisure, mobility and cultural enjoyment. Through actions such as the Service of Coexistence and Strengthening of Bonds (SCFV), it is possible to develop workshops on handicrafts, gastronomy and oral history, which become products and tourist experiences with local identity.

In addition, training programs — such as those already carried out in municipalities such as Antônio Prado, with courses aimed at the hospitality, gastronomy and cultural tourism sectors — demonstrate that productive inclusion can be planned in a way that is sensitive to the territory and its demands, promoting real job opportunities and income based on local potential. This approach avoids the simple instrumentalization of the vulnerable population to fill gaps in the market, placing it at the center of decisions and the collective construction of development projects (SALAMON; SOTTORIVA, 2025).

Thus, by articulating public policies, cultural identity, territorial belonging and economic dynamism, tourism in AMESNE can consolidate itself as a concrete and transformative strategy, capable of strengthening the local economy, expanding social inclusion, stimulating

community organization and contributing to regional development with justice, sustainability and dignity. To this end, it is essential to understand tourism not only as an economic sector, but as a right, an intersectoral public policy and an instrument of citizen construction (VILELA; COSTA, 2020).

More than an activity aimed at visitors, tourism can — and should — be an experience lived by those who live in the territories. Tourism that promotes cultural exchanges, strengthens family and community bonds, encourages intergenerational coexistence and values traditional knowledge, is configured as a true policy of inclusion and human development. In short, tourism, when articulated with SUAS and committed to the principles of equity, participation and co-responsibility, can be a fundamental vector in the construction of a fairer, more inclusive and resilient AMESNE.

5 METHODOLOGY

5.1 EPISTEMOLOGICAL FRAMEWORK

This study is part of the qualitative-interpretative paradigm, with a phenomenological approach, considering that it seeks to understand the articulation between tourism, social assistance policies and productive inclusion from social perceptions and institutional data. The perspective adopted is dialectical, allowing us to examine contradictions between economic development and territorial inequalities (MINAYO, 2017).

The research is anchored in the conception of public policies as dynamic and intersectoral processes, influenced by multiple actors and socioeconomic factors (BALI et.al., 2021). The Social Responsibility and ESG framework serves as a theoretical matrix for analyzing the integration between tourism and social assistance, considering its environmental, social, and governance dimensions (STEINER, 2024).

5.2 NATURE AND TYPE OF RESEARCH

The research is of an applied nature, aimed at producing knowledge aimed at solving practical problems in the municipalities of AMESNE. As for the objectives, it is exploratory and descriptive, as it seeks to map phenomena that have been little investigated and characterize the interactions between tourism, SUAS and social inclusion.

The approach is qualitative, privileging the understanding of the meanings attributed to social programs and tourism by the public agents and communities involved.

In addition, a documentary and statistical survey is used to quantify aspects of social vulnerability, ensuring data triangulation (YIN, 2021).

5.3 SPATIAL AND TEMPORAL DELIMITATION

The study includes the 37 municipalities that are part of the Association of Municipalities of the Upper Slope of the Northeast (AMESNE), in Rio Grande do Sul. The documentary analysis covers the period from March 2024 to March 2025, compatible with the last update of data from the Unified Registry, the Bolsa Família Program and the municipal GDP per capita.

5.4 DATA SOURCES

The information was collected from:

- Secondary bases:
 - Brazilian Institute of Geography and Statistics (IBGE, 2025);
 - Unified Registry for Social Programs (CadÚnico);
 - Bolsa Família Program (Ministry of Development and Social Assistance, 2025);
 - AMESNE reports (2025);
 - Unified Social Assistance System (SUAS) – data from CRAS and CREAS.
- Normative documents and plans:
 - National Tourism Plan 2024–2027;
 - MTur Ordinance No. 10/2025;
 - State Social Assistance Plan (2020–2023);
 - Social IR (regional instrument of social management).
- Scientific literature:
 - Articles and books that deal with public policies for tourism, ESG and social inclusion (VILELA & COSTA, 2020; STEINER, 2024; FONT & LYNES, 2019).

5.5 DATA COLLECTION TECHNIQUES

The collection took place in three stages:

1. **Documentary analysis** of federal, state and municipal plans and legislation, identifying guidelines for tourism and social assistance.
2. **Statistical survey** of socioeconomic data (GDP, CadÚnico, Bolsa Família) to characterize territorial inequalities and map social vulnerability.

3. **Territorial mapping** through georeferencing (QGIS and ArcGIS software), evidencing the distribution of vulnerable families, the presence of CRAS/CREAS and potential tourism integration axes.

5.6 ANALYSIS PROCEDURES

The data were processed through:

- **Content analysis** (BARDIN, 2016) applied to documents and public policies, identifying thematic categories: (i) social tourism; (ii) productive inclusion; (iii) intersectoral governance.
- **Descriptive statistical analysis**, with calculation of frequencies, means and percentage variations, seeking to evidence relationships between social vulnerability and tourist potential.
- **Spatial analysis**, allowing the visualization of territorial inequalities through thematic maps (CadÚnico, Bolsa Família, GDP per capita).

The triangulation between documentary, statistical, and theoretical data ensured greater validity and reliability of the results (FLICK, 2018).

5.7 RESEARCH LIMITATIONS

Among the limitations are: (i) dependence on secondary data subject to underreporting; (ii) absence of interviews with municipal managers and beneficiaries, which could deepen local perceptions; (iii) time restriction of the analysis to a period of 12 months, which may not capture long-term structural variations.

6 RESULTS AND DISCUSSION

The results and discussion are interspersed with the text, below each map.

7 CONCLUSION

The performance of the municipalities of AMESNE must be guided by a systemic vision that articulates economic development with the overcoming of social inequalities, recognizing tourism as a strategic vector for productive inclusion and strengthening of local identity. The data presented show a region marked by deep territorial, economic and social diversities, which require calibrated and integrated political responses, built from the recognition of local realities and active listening to the communities involved.

The socioeconomic panorama reveals municipalities with high levels of GDP per capita, such as André da Rocha, which registers R\$ 142,922.95, alongside locations with significantly lower per capita income, such as Pinto Bandeira (R\$ 24,212.76) and Santa Tereza (R\$ 28,949.13). This economic disparity points to different realities that coexist in the region, imposing the need for public policies adapted to each context, whether predominantly rural or urban. Regional inequality, if not addressed with redistributive policies, tends to accentuate social exclusion and limit the possibilities of sustainable and equitable development.

In addition, the presence of vulnerable populations is evidenced by the numbers of families enrolled in the Unified Registry and beneficiaries of the Bolsa Família. Municipalities such as Guaporé, with 1,996 registered families and 654 beneficiaries of the program, and Marau, with 3,907 families enrolled and 1,118 covered by the Bolsa Família, exemplify the concentration of significant social demands.

These data indicate the relevance of the role of income transfer policies and social monitoring for poverty alleviation in the region, as well as the need for productive inclusion strategies that break the cycle of dependence and promote autonomy for families.

In this context, the structure of the Unified Social Assistance System (SUAS) stands out as an essential foundation for the consolidation of territorial, participatory and humanized public policies.

The existence of 49 CRAS units, present in all AMESNE municipalities, and 13 CREAS units, located primarily in urban centers, ensures a capillary network of reception, guidance and monitoring of families in vulnerable situations. This infrastructure not only meets immediate needs, but also functions as a platform for capacity building, strengthening family and community bonds, and promoting strategies to overcome structural inequalities.

By providing guidelines for territorial planning and the integration of social policies with economic initiatives, the Social IR emerges as an indispensable instrument for modern and effective public management.

By mapping and understanding the local reality in depth, public managers can formulate more precise actions, oriented towards the creation of real, permanent and sustainable opportunities. In this sense, tourism, as an economic, cultural and social activity, can be enhanced beyond its traditional function, assuming a transformative role in the promotion of social inclusion and the dynamization of territories.

The valorization of local identity, handicrafts, family farming, rural tourism and ethnic-cultural tourism are elements that can boost regional development with respect to diversity and sustainability. Integrated with tourism, these sectors promote income generation for the most vulnerable families, while preserving traditional knowledge, strengthening the sense of belonging and rescuing the collective memory of the territories. It is in this scenario that tourism is configured as a transversal instrument capable of connecting culture, economy and citizenship, contributing to the construction of a new model of regional development.

This articulation between tourism and productive inclusion not only contributes to the economic diversification of municipalities and to the reduction of dependence on traditional sectors, but also promotes the strengthening of the social and cultural capital of communities.

The involvement of families, especially those inserted in SUAS services, reinforces the importance of public policies that are planned and executed based on values such as social justice, equity, popular participation and co-responsibility. Tourism, in this context, is no longer just a destination or a consumption activity, and becomes an experience of social transformation.

In addition, by thinking of tourism as a right and not a privilege, its reach and social function are expanded, effectively integrating it into human development strategies.

The implementation of social tourism policies, the promotion of education for and through tourism, and the creation of accessible and inclusive tourist itineraries represent promising ways to ensure that vulnerable populations can also enjoy the symbolic, cultural and natural assets of their own territories. This is especially relevant in a region like AMESNE, where the cultural, historical and landscape heritage is vast, but not always accessible to the resident population itself.

Finally, the implementation of a public policy that combines tourism development with the overcoming of poverty reaffirms AMESNE's commitment to the promotion of human and social development. Steiner (2024) corroborates by stating that the tourism sector has a unique opportunity to take the lead in this transformation, by establishing a new model of excellence in business management that integrates economic success with environmental and social responsibility.

The consolidation of SUAS and Social IR as instruments of integrated and humanized management strengthens the construction of fairer and more sustainable public policies, capable of ensuring that the benefits of economic growth reach all layers of the population,

especially the most vulnerable. In this process, tourism takes on a new dimension — not only as an economic engine, but as an expression of citizenship, participation, and justice.

In this way, the AMESNE region finds in tourism and social assistance strategic allies for the promotion of inclusion, equity and regional development. When thought of in synergy, these two fields expand their reach, strengthen the social fabric and lay the foundations for a more prosperous, egalitarian and sustainable future for all its municipalities, reaffirming the role of people and communities in building their own paths of transformation.

ACKNOWLEDGEMENTS

The authors would like to thank the National Council for Scientific and Technological Development (CNPq) for the financial support granted for this research. This work is the result of encouraging scientific production and strengthening sustainable tourism and social inclusion policies in Brazil, made possible by the promotion of research and innovation provided by CNPq.

ABSTRACT

The objective of this study was to identify the real effects of SGLT2 inhibitors and their efficacy on glycemic control and the impact of medication on the prevention of cardiovascular events and progression of diabetic kidney disease. To develop this research, a guiding question was developed: "What are the effects of SGLT2 inhibitors on glycemic control and cardiovascular and renal outcomes in patients with type 2 diabetes?". The searches were performed in the PubMed Central (PMC) database. Four descriptors were used in combination with the Boolean term "AND": SGLT2 inhibitors, Diabetes Mellitus Type 2, Cardiovascular Outcomes, Renal Protection. Thus, it is observed that SGLT2 inhibitors promote glycosuria, increase insulin sensitivity, in addition to reducing arterial stiffness, improving endothelial function, slowing the rate of decline in eGFR in diabetic patients, which allows us to conclude the effectiveness of their glycemic control effects, and reduction of cardiovascular and renal events in patients with type 2 diabetes mellitus.

Keywords: SGLT2 Inhibitors. Type 2 Diabetes Mellitus. Glycemic Control. Cardioprotection. Nephroprotection.

RESUMO

O objetivo deste estudo foi reconhecer os efeitos dos inibidores do SGLT2 e sua eficácia no controle glicêmico e o impacto da medicação na prevenção de eventos cardiovasculares e na progressão da doença renal diabética. Para o desenvolvimento dessa pesquisa foi elaborada uma questão norteadora: "Quais são os efeitos dos inibidores de SGLT2 no controle glicêmico e nos desfechos cardiovasculares e renais em pacientes com diabetes tipo 2?". As buscas foram realizadas na base de dados PubMed Central (PMC). Foram utilizados 4 descritores em combinação com o termo booleano "AND": SGLT2 inhibitors, Diabetes Mellitus Type 2, Cardiovascular Outcomes, Renal Protection. Desse modo, observa-se que os inibidores de SGLT2 promovem glicosúria, aumenta sensibilidade à

RESUMEN

El objetivo de esta revisión bibliográfica fue reconocer los efectos reales de los inhibidores de SGLT2 y su eficacia en el control glucémico, así como el impacto del medicamento en la prevención de eventos cardiovasculares y en la progresión de la enfermedad renal diabética. Para el desarrollo de esta investigación se elaboró una pregunta orientadora: “¿Cuáles son los efectos de los inhibidores de SGLT2 en el control glucémico y en los desenlaces cardiovasculares y renales en pacientes con diabetes tipo 2?”. Las búsquedas se realizaron en la base de datos PubMed Central (PMC). Se utilizaron cuatro descriptores en combinación con el término booleano “AND”: **SGLT2 inhibitors, Diabetes Mellitus Type 2, Cardiovascular Outcomes, Renal Protection**. De este modo, se observa que los inhibidores de SGLT2 promueven glucosuria, aumentan la sensibilidad a la insulina, además de reducir la rigidez arterial, mejorar la función endotelial y ralentizar la tasa de disminución del FG estimado (TFG_e) en pacientes diabéticos, lo que permite concluir la eficacia de sus efectos en el control glucémico y en la reducción de eventos cardiovasculares y renales en pacientes con diabetes mellitus tipo 2.

Palabras clave: Inhibidores de SGLT2. Diabetes Mellitus Tipo 2. Control Glucémico. Cardioprotección. Nefroprotección.

1 INTRODUCTION

Type 2 diabetes mellitus (DM2) is a chronic metabolic disease characterized by insulin resistance and pancreatic beta cell failure, which leads to chronic hyperglycemia. This condition, when not managed correctly, is associated with cardiovascular and renal complications.

Chronic hyperglycemia results in damage to the vasculature, leading to microvascular and macrovascular diseases. Microvascular complications are mainly diabetic retinopathy and nephropathy, while macrovascular complications are related to accelerated atherosclerosis in different areas, such as cerebrovascular atherosclerotic disease that manifests as cerebrovascular accident (CVA), coronary artery disease (CAD) and peripheral arterial disease (PAD). Other macrovascular complications are cardiac dysfunctions, including cardiomyopathy and heart failure (SPINETTI et al., 2023).

Sodium-glucose cotransporter-2 (SGLT2) inhibitors are oral antidiabetic drugs, and were initially used to aid glycemic control in diabetic patients in order to avoid complications. This effect is due to glycosuria, from the inhibition of SGLT2, decreasing renal glucose reabsorption. However, currently, this class of antidiabetic drugs has come to be considered as pleotropic drugs, due to their beneficial results in cardiovascular diseases and chronic kidney disease (CKD). (SANTULLI et al., 2023) Evidence suggests that there is an improvement in renal and cardiovascular outcomes in patients with T2DM, especially those with previous cardiovascular events, chronic kidney disease (CKD), or HF (XU et al., 2022).

Four SGLT2 inhibitors were approved by the FDA (Food and Drug Administration), the first was Canagliflozin in 2013, followed by Empagliflozin and Dapagliflozin in 2014 and Ertugliflozin in 2017, all of which have an effect of controlling hyperglycemia and also improving cardiovascular and renal outcomes. In clinical trials involving the use of SGLT2 inhibitors in diabetic patients, adverse reactions, such as genital infections, diabetic ketoacidosis, fractures, and amputations, were shown relative to placebo. (XU et al., 2022). However, the results of the various trials of cardiovascular outcomes with these drugs showed the benefits in reducing adverse cardiovascular events by 11%, reducing the risk of cardiovascular death or hospitalization for heart failure by 23%, and reducing the progression of kidney disease by 45%. (ROWN et al., 2021).

The objective of this literature review was to evaluate the most recent findings on the effects of SGLT2 inhibitors on glycemic control, in addition to detailing their mechanism of action and their proven efficacy in the prevention of cardiovascular and renal outcomes. By

consolidating these findings, we seek to provide a comprehensive and updated view that contributes to the optimization of disease control and also reduces associated complications, thus improving the quality of life and clinical outcomes of this patient.

2 METHODOLOGY

This is a literature review that seeks to understand the effects of glucose-sodium-2 cotransporter inhibitors, and their actions in reducing hyperglycemia and reducing complications resulting from chronic hyperglycemia. For the development of this research, a guiding question was developed through the PVO (population, variable and objective) strategy: "What are the effects of SGLT2 inhibitors on glycemic control and cardiovascular and renal outcomes in patients with type 2 diabetes?".

The searches were carried out based on searches in the PubMedCentral (PMC) database. 4 descriptors were used in combination with the Boolean term "AND": SGLT2 inhibitors, Diabetes Mellitus Type 2, Cardiovascular Outcomes, Renal Protection. The search strategy used in the PMC database was: SGLT2 inhibitors AND Diabetes Mellitus Type 2, SGLTS inhibitors AND Cardiovascular Outcomes, SGLT2 inhibitors AND Renal protection. From this combination, articles were found that were later submitted to the selection criteria. The inclusion criteria were: randomized clinical trials, meta-analyses examining SGLT2 inhibitors and in patients with type 2 diabetes; articles in English, Portuguese published in the last 10 years that address the theme proposed by this research. The exclusion criteria were: studies that exclusively involve patients without diabetes; narrative reviews, case studies; and studies with no relevant clinical outcomes or very small sample sizes.

After applying the inclusion and exclusion criteria listed above, 10 articles were selected to compose the collection.

3 RESULTS AND DISCUSSIONS

The kidneys contribute to glucose homeostasis through its filtration and reabsorption. With glomerular filtration the kidney filters about 162g of glucose daily, the amount of glucose filtered increases linearly with the increase in its plasma concentration. Glucose is absorbed in the proximal renal tubules. The threshold for reabsorption is plasma glucose concentration = 8.3 mmol/L, above this value, there is glycosuria. When the plasma glucose concentration is > 13.3 mmol/L, the maximum glucose reabsorption capacity is exceeded, and therefore the

degree of glycosuria increases linearly with increasing plasma concentrations (BROWN et al., 2021).

The transport of glucose across cell membranes in the kidney depends on two families of transporters: the facilitated glucose transporters (GLUTs) and the sodium-glucose cotransporters (SGLTs). GLUTs are responsible for passive transport, whereas SGLTs do active transport across a concentration gradient. There are two forms of sodium-glucose cotransporters: SGLT1 and SGLT2. SGLT1 is found in the small intestine and segment 3 of the proximal tubule. SGLT2 is found in the luminal membranes of the epithelial cells of segment 1 and 2 of the renal proximal tubules (BROWN et al., 2021).

In individuals with T2DM, in order to avoid glycosuria, there is a compensatory upregulation of SGLT2 expression, which leads to increased glucose reabsorption (SANTULLI et al., 2023).

Thus, based on the knowledge of the role of the kidney in glucose homeostasis, sodium-glucose cotransporter 2 inhibitors were developed, which are direct inhibitors of the SGLT2 protein, which prevents glucose from binding to the cotransporters, leading to reduced reabsorption by the proximal tubules, and results in increased excretion of sodium, glucose and water in the urine. The mechanism of action of these oral hypoglycemic agents is independent of insulin secretion by pancreatic cells, so there is a low incidence of hypoglycemia in patients, which has a higher occurrence when associated with the use of sulfoniruleia or insulin therapy (DAI et al., 2023). β

4 GLYCEMIC CONTROL

Glycemic control by SGLT2 inhibitors occurs in two mechanisms. The first is due to its effects on modulating renal glucose excretion, reducing the glucose reabsorption capacity and the threshold for glycosuria, promoting a glycosuria of 60-80g/day. The second occurs due to the improvement of glucotoxicity, due to the reduction of glucose concentration secondary to glycosuria, leading to greater insulin sensitivity in peripheral tissues (adipose tissue and skeletal muscle) and improvement in the function of β cells, with an improvement in insulin secretion. (BROWN et al., 2021) Meta-analyses of HbA1c reduction with SGLT2 inhibitors in type 2 diabetes have observed reductions of 0.5-1% of the value (BAILEY; DAY; BELLARY, 2022).

Another beneficial factor in relation to the use of SGLT2 is the weight reduction of patients, in several meta-analyses it has been noted a reduction of 2-3kg in weight after 6

months of treatment. The mechanism of weight loss is associated with glycosuria, natriuresis and aquaresis, in addition, there are changes in the use of substrates so that there is a change from glucose oxidation to increased lipolysis, fat oxidation and formation of ketone bodies. Weight loss with SGLT2 inhibitor therapy was calculated based on urinary glucose excretion of 60-80g/day, which is equivalent to a caloric loss of 240-320 calories/day (BROWN et al., 2021).

5 CARDIOPROTECTION

Patients with type 2 diabetes have an important risk factor for cardiovascular disease, conferring a two- to three-fold increased risk of coronary artery disease, including angina, myocardial infarction, stroke, and heart failure (HF) (BROWN et al., 2021). Thus, the cardioprotective effects of SGLT2 inhibitors can be attributed to: blood pressure control, increased plasma erythrocyte levels, decreased inflammation and oxidative stress, decreased uric acid, prevention of ischemia injury, and improved cardiac and vascular function (XU et al., 2022).

Studies indicate that the reduction in blood pressure by SGLT2 is due to the mechanism of volume reduction secondary to diuresis and natriuresis, in addition, other effects, such as loss of calories and decrease in fat mass, resulting from the increase in diuresis and glycosuria, also contribute to the reduction of blood pressure. The reduction in blood pressure does not accompany the increase in heart rate, which indicates that there is no activation of the sympathetic nervous system, demonstrating that this class of antidiabetics has a beneficial effect on HF patients (ZENG et al., 2021).

The efficiency of reducing arterial stiffness, it was demonstrated in an observational study the ability of SGLT2 inhibitors, especially dapagliflozin, empagliflozin and canagliflozin, to reduce PWV (pulse wave velocity), which is the main parameter of arterial stiffness. In addition, in other studies, improved endothelial function has been observed, which may be mediated by increased nitric oxide, reduced oxidative stress, or activation of voltage-gated potassium channels and protein kinase G (ZENG et al., 2021).

In addition, there is an inhibition of NHE1 and NHE3 which are sodium-hydrogen exchangers, and transfer sodium (Na⁺) to the cell in exchange for the export of protons. NHE1 is present in cardiomyocytes and its activation can lead to increased intracellular ions and calcium, and this effect is involved in abnormal myocardial hypertrophy and ischemia-perfusion injury. NHE3 is expressed in the proximal tubule and contributes to the tubular

reuptake of these receptors. Thus, although there is no expression of SGLT2 in the heart, SGLT2 inhibitors from NHE1 blockade can reduce intracellular concentrations of and protect the heart from intracellular overload. Similarly, they can inhibit NHE3 that improves natriuresis, restores sodium homeostasis throughout the body, and improves heart function (ZENG et al., 2021). $Na^+Na^+Ca^{2+}Na^+.Na^+Ca^{2+}Ca^{2+}$

In some studies, it has been shown to be an increase in hematocrit after treatment with SGLT2, and has been associated with increased plasma volume and increased production of erythropoietin (ZENG et al., 2021), which increases oxygen delivery to tissues, especially the kidney, reducing renal hypoxia (GIORGINO et al., 2020).

Three large clinical trials were conducted to evaluate the effects of SGLT2 inhibitors on cardiovascular outcomes, EMPA-REG, CANVAS and DECLARE-TIMI, which respectively evaluated Empagliflozin, Canagliflozin and Dapagliflozin, and showed that there is a significant reduction in cardiovascular events, especially in patients with established atherosclerotic cardiovascular diseases. Not showing as much benefit in patients who had multiple risk factors but no established cardiovascular disease. In addition, it was seen in these studies, a benefit in reducing hospitalization in heart failure, in patients with and without type 2 diabetes mellitus and both in HFrEF and HFpEF (BROWN et al., 2021).

The pathogenesis of HF involves activation of the immune system, with the Toll-Like (TLR) receptor expressed predominantly in the heart, TLR 4, is closely associated with myocardial inflammation. Thus, with its activation, there is the expression of pro-inflammatory cytokines, such as IL-6, IL-1 and TNF- α , which in the long term leads to cardiac remodeling and deterioration of function. Thus, some studies have shown that SGLT2 inhibitors have an anti-inflammatory effect by reducing the formation of pro-inflammatory cytokines. This can be explained by different signaling pathways, such as the kappa factor B (NF- κ B) signaling pathway, the mitogen-activated protein kinase (MAPK) pathway, and the TLR4 pathway (ZENG et al., 2021).

Based on these findings, SGLT2 is being introduced as standard therapy for heart failure with reduced ejection fraction (HFrEF), is indicated as add-on therapy to RAAS inhibitors and beta-blockers in patients with New York Heart Association (NYHA) grades YHA II-IV in the current update of the American Board of Cardiology (ACC) consensus. Meta-analyses have described a reduction in mortality and an even greater reduction in hospitalization for HF (KOLESNIK et al., 2022).

However, in acute HF, limitations in studies such as sample size and study method have failed to determine whether SGLT2 inhibitors can be safely applied in these patients (ZENG et al., 2021).

Currently, a number of studies have researched the antiarrhythmic properties of SGLT2 inhibitors. Its effectiveness in reducing hospitalization in cases of heart failure, due to improved cardiac function, is leading to a reduction in the number of ventricular arrhythmias. In addition, from evidence in clinical trials, a lower incidence of atrial fibrillation and other atrial arrhythmias was revealed in diabetic patients treated with SGLT2 inhibitors, when compared to other glucose-lowering drugs. Despite these results, no pathways or molecular mechanisms have been identified for these antiarrhythmic properties (KOLESNIK et al., 2022).

A randomized, double-blind, placebo-controlled clinical study, the EMPA-ICD, was launched to demonstrate the antiarrhythmic effects of empagliflozin in patients with type 2 diabetes and using an implantable cardioverter defibrillator (ICD) or resynchronizer defibrillator (CRT-D), the SGLT2 inhibitor group had a significant reduction in the number of ventricular arrhythmias compared to the placebo group. These effects have been associated with increased blood ketone levels, improved myocardial energy metabolism, increased hematocrit, decreased B-type natriuretic peptide, and reduced body weight.

6 NEPHROPROTECTION

Kidney disorders are common complications in T2DM. Many people with the disease already have some degree of kidney dysfunction at the time of diagnosis, and it can evolve over time, leading to the development of chronic kidney disease and end-stage renal disease (ESRD). Some observational studies have identified the duration of diabetes as an independent risk factor for the progression of kidney failure (GIORGINO et al., 2020).

Diabetic kidney disease is recognized to be a progressive chronic kidney disease (CKD) with an estimated glomerular filtration rate (eGFR) $< 60 \text{ ml/min/1.73}$, may be accompanied by micro- or macroalbuminuria, with an underlying glomerulopathy of thickened basal capillary membranes, diffuse mesangial sclerosis, and nodular sclerosis. The normal rate of age-related decline in eGFR ($\sim 1 \text{ ml/min/1.73}$ when eGFR is $> 60 \text{ ml/min/1.73}$) is doubled in DM2 with CKD (BAILEY; DAY; BELLARY, 2022).

The action of SGLT2 in nephroprotection occurs due to numerous factors, one of them is a reduction in glomerular hyperfiltration, this occurs due to the increase in the dense

macula, through the tubuloglomerular feedback that stimulates the relaxation of the efferent arterioles and the constriction of the afferent arterioles. This reduces intraglomerular pressure and reduces glomerular hyperfiltration, which are critical to preserving kidney function. Thus, there is an acute reduction in the glomerular filtration rate (GFR), but it is a reversible effect (SANTULLI et al., 2023). This drop in GFR is initially about 5ml/min/1.73, reaches its lowest point in 1-2 weeks, and returns to pre-treatment values over the next 3-9 months. Evidence from long-term trials indicated that eGFR declined at a slower rate with the use of SGLT2 inhibitors than in placebo-treated patients and that albuminuria was lower (BAILEY; DAY; BELLARY, 2022).

In addition, the class of antidiabetics reduces the consumption of renal oxygen, by inhibiting the reabsorption of Na^+ , decreases the amount of sodium that enters the cells and therefore decreases the expenditure of ATP, by ATPase, responsible for pumping it out of the cells. This effect becomes more significant in diabetes, when hyperperfusion increases the amount of ultrafiltered knot (SANTULLI et al., 2023).

In addition, other factors of these antidiabetic drugs that corroborate nephroprotection are: anti-inflammatory, anti-oxidative and antifibrotic effects. In a study in diabetic rats by Ojima et al., the effect of empaglifozin in reducing the expression of advanced glycosylation products (AGEs), receptors of advanced glycosylation products (RAGE), which results in the inhibition of oxidative stress secondary to hyperglycemia (DAI et al., 2023), was observed.

Another important factor of SGLT2 is the ability to reduce the progression of chronic kidney disease in diabetic patients, which occurs through the reduction of chronic hyperurekaemia. They act by eliminating glucose, which competes with glucose transporter protein 9 (GLUT9) present in the renal tubules and which are responsible for the reabsorption and excretion of urate. In this way, there is a reduction in urate reabsorption and an increase in uric acid excretion (DAI et al., 2023).

The increase in glycosuria secondary to the effects of SGLT2 inhibitors leads to a state of relative glucose deficiency, triggering lipolysis in adipose tissue, fatty acid oxidation, and ketone body formations. Ketone bodies are more efficient for energy production in renal tubular cells than glucose, so oxygen consumption is reduced in the presence of mild ketosis. Thus, studies suggest the use of ketone bodies as an energy substrate as a form of renoprotection (GIORGINO et al., 2020).

The nephroprotective effects of SGLT2 inhibitors in patients with type 2 diabetes mellitus were evaluated in five large cardiovascular outcome trials: EMPA-REG OUTCOME

(empagliflozin), CANVAS and CANVAS-R (canagliflozin), DECLARE-TIMI 58 (dapagliflozin), and VERTIS CV (ertugliflozin).

In the EMPA-REG OUTCOME study, the effects of empagliflozin treatment on rates of acute renal failure and AKI were greater in patients with baseline GFR < 60 ml/min/1.73. In the CANVAS program, canagliflozin showed the ability to reduce renal outcomes constantly at different levels of baseline albuminuria, but with absolute benefits in those with macroalbuminuria. DECLARE-TIMI 58 demonstrated that dapagliflozin reduced the increase in urinary albumin-creatinine ratio (UACR), which is an important indicator of kidney disease progression, especially in patients with T2DM (GIORGINO et al., 2020).^{m2}

These studies have proven the efficacy of SGLT2 inhibitors in the treatment of patients with type 2 DM and mild to moderate renal impairment (eGFR >30 ml/min/1.73). However, efficacy and safety in patients with stage G4 and G5 diabetic kidney disease remained uncertain until the release of the results of the DAPA-CKD and EMPA-KIDNEY studies. ^{m2}

In the DAPA-CKD study, it was evidenced that the use of dapagliflozin is effective in reducing the risk of sustained decline in eGFR > 50%, CKD and death from kidney disease, there was also a significant reduction in proteinuria. In EMPA-KIDNEY showed that groups that were treated with empagliflozin reduced risks of cardiovascular and renal events, hospitalization, and progression of kidney disease in patients with chronic diabetic disease and stage 4 CKD (DAI et al., 2023).

Furthermore, the CREDENCE study, which was limited to patients with diabetic kidney disease (DKD), highlighted that canagliflozin was effective in reducing cardiovascular and renal events, as well as showing results in delaying the progression of kidney disease in patients with DKD, including stage 4 (DAI et al., 2023).

7 CONCLUSION

It is concluded that the use of SGLT2 inhibitors in patients with type 2 diabetes mellitus, in addition to their hypoglycemic effects, has benefits in reducing the risk of cardiovascular and renal complications. SGLT2 are effective in reducing renal glucose reabsorption, leading to glycosuria and, consequently, improved insulin sensitivity and glycemic control. In addition, its ability to reduce blood pressure and weight loss secondary to glycosuria, promote a better quality of life for patients.

Cardioprotection is related to multifactorial mechanisms, resulting from the effects of SGLT2, such as the reduction of arterial stiffness and the improvement of endothelial function,

which reduce the risk of cardiovascular death, atherosclerotic events, hospitalization for heart failure, and antiarrhythmic properties. Regarding renal function, antidiabetic drugs have demonstrated a favorable impact on the progression of chronic kidney disease, with evidence of a slower decline in the eGFR rate of diabetic patients and also on the reduction of albuminuria, being considered an excellent therapeutic option in patients with mild to moderate renal impairment, delaying the need for renal replacement therapy.

In addition, recent studies have shown that medications such as empagliflozin, dapagliflozin, and canagliflozin have been found to be effective options for patients with advanced stage chronic kidney disease (stages 4 and 5).

Thus, SGLT2 inhibitors are fundamental in the management of patients with type 2 diabetes, who are at increased risk for cardiovascular events and chronic kidney disease. The results of the studies reinforce the need to incorporate these drugs into the treatment of these patients, for better survival and reduced risk of complications.
