being. Among the main risks discussed are distractions caused by digital devices, reduced face-to-face social interactions, and technological dependence, which compromise attention, socio-emotional development, and critical autonomy. The physical and psychological impacts of excessive screen use are also examined, such as eye strain, sleep disorders, and anxiety, which harm students' health. The article highlights the consequences for learning, such as superficial teaching and difficulty in developing critical thinking, based on studies that demonstrate inadequate pedagogical practices. To mitigate these effects, it proposes strategies for balanced and conscious use of technology, emphasizing responsible pedagogical approaches, harmonious integration with traditional methods, and school policies that guide the safe use of digital resources. The final reflection highlights the importance of balancing technology and in-person teaching, valuing human interaction and the critical thinking development of students, and points to the need for future research that delves deeper into the impacts and innovative pedagogical strategies for the effective use of technology.

Keywords: Educational Technology. Technological Dependence. Socio-emotional Development. Critical Autonomy. Conscious Use of Technologies.

RESUMO

O artigo aborda os riscos invisíveis do uso crescente da tecnologia na educação moderna, que, apesar de seus benefícios evidentes, como a ampliação do acesso ao conhecimento e a personalização do ensino, pode gerar impactos negativos no desempenho e bem-estar dos estudantes. Entre os principais riscos discutidos estão as distrações causadas por dispositivos digitais, a redução das interações sociais presenciais e a dependência tecnológica, que comprometem a atenção, o desenvolvimento socioemocional e a autonomia crítica. Também são examinados os impactos físicos e psicológicos do uso excessivo de telas, como a fadiga ocular, distúrbios do sono e ansiedade, que prejudicam a saúde dos alunos. O artigo destaca as consequências para a aprendizagem, como o ensino superficial e a dificuldade no desenvolvimento do pensamento crítico, embasadas em estudos que evidenciam práticas pedagógicas inadequadas. Para mitigar esses efeitos, propõe estratégias de uso equilibrado e consciente da tecnologia, enfatizando propostas pedagógicas responsáveis, integração harmoniosa com métodos tradicionais e políticas escolares que orientem o uso seguro dos recursos digitais. A reflexão final ressalta a importância do equilíbrio entre tecnologia e ensino presencial, valorizando a interação humana e a formação crítica dos estudantes, e aponta para a necessidade de futuras pesquisas que aprofundem os impactos e estratégias pedagógicas inovadoras para uso eficaz da tecnologia.

Palavras-chave: Tecnologia Educativa. Dependência Tecnológica. Desenvolvimento Socioemocional. Autonomia Crítica. Uso Consciente das Tecnologias.

RESUMEN

Este artículo aborda los riesgos invisibles del creciente uso de la tecnología en la educación moderna, que, a pesar de sus evidentes beneficios, como la ampliación del acceso al conocimiento y la personalización de la enseñanza, puede generar impactos negativos en el rendimiento y el bienestar estudiantil. Entre los principales riesgos que se discuten se encuentran las distracciones causadas por dispositivos digitales, la reducción de las interacciones sociales presenciales y la dependencia tecnológica, que comprometen la atención, el desarrollo socioemocional y la autonomía crítica. También se examinan los impactos físicos y psicológicos del uso excesivo de pantallas, como la fatiga visual, los

trastornos del sueño y la ansiedad, que perjudican la salud de los estudiantes. El artículo destaca las consecuencias para el aprendizaje, como la enseñanza superficial y la dificultad para desarrollar el pensamiento crítico, con base en estudios que demuestran prácticas pedagógicas inadecuadas. Para mitigar estos efectos, se proponen estrategias para un uso equilibrado y consciente de la tecnología, enfatizando enfoques pedagógicos responsables, la integración armoniosa con los métodos tradicionales y las políticas escolares que guían el uso seguro de los recursos digitales. La reflexión final destaca la importancia de equilibrar la tecnología y la enseñanza presencial, valorando la interacción humana y el desarrollo del pensamiento crítico de los estudiantes, y señala la necesidad de futuras investigaciones que profundicen en los impactos y las estrategias pedagógicas innovadoras para el uso efectivo de la tecnología.

Palabras clave: Tecnología Educativa. Dependencia Tecnológica. Desarrollo Socioemocional. Autonomía Crítica. Uso Consciente de las Tecnologías.

1 INTRODUCTION

Technology has become ubiquitous in the educational environment, transforming pedagogical practices and forms of interaction between teachers and students. While technological advances have introduced a number of benefits, such as easier access to information and the personalization of learning, they also bring risks that often remain invisible. These risks, ranging from distractions to impacts on students' health and cognitive development, deserve careful attention to ensure that technology does not become an impediment, but rather an enabler of education.

The purpose of this article is to critically review the existing literature on the risks associated with the use of technology in modern education, highlighting the invisible impacts that can compromise academic performance and student well-being. It is also intended to present strategies for the balanced and conscious use of technological resources, in order to promote an integration that values human interaction and effective pedagogical approaches.

In today's landscape, technology is widely used in education to expand the possibilities of teaching and learning. Digital tools facilitate access to diverse materials, promote collaboration, and offer interactive resources that enrich the educational process. The use of virtual platforms, educational applications and mobile devices is growing, which shows a movement towards the modernization of educational practices. The recognized benefits include the flexibility of learning time and space, encouragement of student protagonism and support for the personalization of teaching.

However, it is necessary to consider the side effects that accompany this technological expansion. The ease of access and the amount of digital stimuli can disperse students' attention, impairing concentration and the deepening of knowledge. In addition, the gradual replacement of face-to-face communication with screen-mediated interactions can negatively impact social and emotional aspects that are important for the integral development of students.

Another relevant point concerns the physical and mental health of students, often affected by the prolonged use of digital devices. Problems such as eye fatigue, changes in the sleep cycle, and increased anxiety are consequences that are increasingly documented in the literature. Such conditions, although not always apparent, directly interfere with the quality of learning and school performance.

Finally, it is essential that schools, educators, and families are aware of these challenges so that technology, although present, does not dominate or harm the educational process. The construction of pedagogical practices that consciously integrate digital resources, respecting human limits, is a promising way to ensure more effective and healthy teaching.

The methodology adopted in this article is the bibliographic review, through the critical analysis of academic publications, books and scientific articles related to the use of technology in education and its adverse effects. This approach allows the survey and synthesis of the main theoretical and empirical contributions on the subject, providing a broad and grounded view of the invisible risks and possibilities for a more balanced use of technology in teaching.

2 THEORETICAL FOUNDATION ON TECHNOLOGY AND EDUCATION

The use of technology in education has been widely discussed in various fields of knowledge, where different theories and pedagogical approaches seek to explain and guide this integration. This theoretical foundation seeks to present the main conceptions and developments that support the relationship between technology and teaching, providing a critical and historical understanding of the technological evolution applied to the educational process.

Theories related to technology in education include concepts of technological mediation and scientific paradigms that impact pedagogical practice. According to Adão *et al.* (2024), educational technology can be understood as a paradigm that involves shared beliefs, values, techniques, and theories, influenced by cultural, political, and social factors. For technological mediation to be effective, it is essential that educators recognize their limits and potential, promoting pedagogical innovation with responsibility and ethics. Other perspectives consider technologies as tools for inclusion and accessibility, highlighting universal design for learning (UDL) and assistive technology as complementary to ensure school inclusion (Melo *et al.*, 2024). In fact, it is important to emphasize that inclusion transcends the simple act of allowing everyone to participate; it is a commitment to equity, diversity, and respect for human dignity (Costa Júnior *et al.*, 2024).

Still, in learning theories, authors such as Dewey and Freire emphasize an active, democratic and critical education, which can be enhanced by the use of technology when it serves the emancipation of the student (Laurindo *et al.*, 2023).

Starting from the historical aspects, it is important to say that technological advancement in teaching has gone through different phases, from the initial use of audiovisual resources and personal computers to the adoption of digital technologies and distance education. The twentieth century saw the introduction of technologies such as radio, television, and video, which gradually took on an important role in pedagogical mediation. With the advent of the internet and mobile devices, teaching has gained new possibilities, including virtual learning environments and interactive resources. This technological evolution has brought profound transformations in the school structure and teaching methods, making technology an indispensable tool in the contemporary educational context.

The flexibility provided by the use of mobile devices, which offer communication and information anywhere and at any time, brings with it the idea of ubiquity, that is, being present everywhere at any time, being omnipresent:

[...] Technological development has led me to the conviction that the contemporary condition of our existence is ubiquitous. Because of hypermobility, we become ubiquitous beings. We are, at the same time, somewhere and outside of it. We intermittently become present-absent people. Mobile devices offer us the possibility of perpetual presence, near or far, always presence. We are approached for any purpose at any time and we can be in contact with other people regardless of their location and tasks at the time, which gives us a feeling of omnipresence. Ubiquitous body, mind and life. Undoubtedly, this brings side effects, a certain state of frenzy caused by the paradox of presence and at the same time of the constant upheaval in the various physical, psychological and computational conditions (Santaella, 2013, p.16).

As for the pedagogical approaches that use technology, the integration of active methodologies stands out, where the student assumes a leading role and technology works as a support for knowledge construction processes. Hybrid or blended learning models combine face-to-face classes with virtual activities, seeking a balance between human interaction and digital resources (Casagrande; Maieski; Alonso, 2023). In addition, virtual learning environments (VLE) and educational platforms facilitate the personalization of content and individualized monitoring, promoting more flexible learning.

Wrapped in this scenario full of connections, Gabriel (2013, p. 15) makes a very blunt statement about being and being connected:

Internet broadband enabled the important shift from "being connected" to "being connected." "Being" connected means that you eventually get in and out of the internet, [...] "Being" connected means that part of you is in the network – you live in symbiosis with it (p. 15).

These approaches show that technology, when aligned with well-founded pedagogical proposals, can enhance the critical, autonomous and collaborative training of students.

3 INVISIBLE RISKS OF TECHNOLOGY IN MODERN EDUCATION

The growing use of technology in the educational environment, despite its numerous advantages, presents a number of often hidden risks that negatively impact student learning and development. These invisible risks go beyond technical issues and involve cognitive, social and emotional aspects relevant to the educational process, requiring careful analysis so that their use is effectively beneficial.

Distractions caused by digital devices are one of the main concerns in contemporary education. The constant presence of notifications, messages, and multiple tabs open on computers and mobile devices tends to fragment students' attention, making it difficult to concentrate for the long time needed for deep learning. Although technologies offer tools that can enrich the classroom, inappropriate use can lead to dispersion and reduced ability to focus, leading to impairments in academic performance. The consequence is superficial learning, in which students are unable to fully absorb and process the content presented.

Another visible risk is the reduction of face-to-face social interactions between students and teachers due to the increase in digital mediation. This decrease in face-to-face coexistence compromises the socio-emotional development of students, which depends on direct interaction for the development of skills such as empathy, communication, and cooperation. The lack of personal exchange can cause a feeling of isolation and fragility in interpersonal relationships, affecting the school environment and the emotional well-being of students.

Lévy (1999, p. 7) points out his point of view in relation to this very complex theme:

In general, they consider me an optimist. They are right. My optimism, however, does not promise that the Internet will magically solve all the cultural and social problems of the planet. It consists only in recognizing two facts. Firstly, that the growth of cyberspace is the result of an international movement of young people eager to experiment, collectively, with forms of communication different from those that the

classical media propose to us. Secondly, that we are experiencing the opening of a new space of communication, and it is only up to us to explore the most positive potentialities of this space in the economic, political, cultural and human spheres (p. 7).

In addition, technological dependence can lead to the loss of critical autonomy and decreased problem-solving skills. Overuse of digital tools such as search engines and quick-response apps can reduce students' ability to think independently, reflect critically, and solve problems on their own. Such dependence harms cognitive development and weakens student protagonism, making teaching a mechanical and unreflective process.

4 PHYSICAL AND PSYCHOLOGICAL IMPACTS OF EXCESSIVE SCREEN USE

The intensive and prolonged use of digital devices has raised growing concerns regarding the physical and psychological impacts on students' health. Although these devices offer several facilities for teaching and learning, excessive exposure can cause adverse effects that compromise general well-being and academic performance. The main impacts identified in the literature are discussed below.

Digital eye strain, also known as computer vision syndrome, is a common problem associated with prolonged screen use and has been widely researched in recent years due to the growth in the use of electronic devices. CVS is characterized by a set of visual and ocular symptoms resulting from prolonged exposure to screens. These symptoms include eye strain, dryness, blurred vision, headaches, and visual discomfort. Constant exposure to blue light emitted by digital devices can impair the circadian cycle, affect sleep quality, and lead to progressive myopia, particularly in children and young people (Edem *et al.*, 2024). According to Binda *et al.* (2025), this condition includes symptoms such as irritation, dry eyes, feeling tired, blurred vision, and headache, resulting mainly from continuous exposure to the blue light emitted by devices and the lack of adequate breaks. The phenomenon is aggravated by poor posture and reduced blinking while using screens, culminating in visual discomfort and potential aggravation of eye problems such as myopia and dry eye syndrome. Preventive strategies such as regular breaks, correct ergonomics, and blue light filters are recommended to minimize these impacts.

Binda *et al.*, (2025), when they point out that the excessive use of electronic devices is directly linked to visual and systemic symptoms, such as eye strain, dryness, headache, and sleep problems. In addition, prolonged exposure to blue light, decreased blinking

frequency, and inadequate ergonomic factors contribute significantly to the worsening of these symptoms, making CVS an emerging public health issue.

As for sleep disorders, exposure to the lights emitted by screens, especially at night, interferes with the production of melatonin, a sleep-regulating hormone. According to Aquino and Fonseca (2025), this interference causes delays in sleep onset, lower quality of rest, and increased daytime sleepiness. The excessive use of digital devices in the hours close to bedtime has been associated with difficulties in falling asleep and a reduction in total rest time, which directly affects students' concentration and cognitive performance.

In addition to the physical effects, the psychological impacts of excessive use of technology are also evident. Excessive screen time is correlated with high levels of anxiety, stress, and depressive symptoms among children and adolescents. Continuous use, especially on social networks and virtual environments, can generate social pressures, harmful comparisons, and isolation, aggravating emotional distress. The lack of balance between online and offline time contributes to mental overload and decreased ability to manage emotions, compromising students' mental health and academic performance.

While the physical and psychological impacts of long-term use of digital devices are widely recognized, it is critical to go beyond diagnosing these issues to implement effective solutions in the educational context. The promotion of healthy habits, such as regular breaks during the use of screens, visual hygiene practices, and the encouragement of outdoor activities, should be systematically incorporated into the school routine. In addition, teacher training needs to include strategies to identify signs of digital fatigue and emotional discomfort, equipping them to act preventively. Clear school policies and the continuous awareness of students and families are also essential to control the time and quality of device use, avoiding the exacerbation of symptoms.

Another critical aspect is the challenge of balancing the use of technology with the development of students' socio-emotional and cognitive skills. Excessive use of screens and continuous exposure to virtual environments can impair the ability to concentrate, cause social isolation, and inhibit the development of important life skills, such as empathy, resilience, and communication. In this sense, technology should be a mediated resource, which complements face-to-face interactions and enriches pedagogical practices, without replacing them. The school should seek to provide learning contexts that integrate the digital with the human, valuing active participation, dialogue, and critical thinking.

Finally, the mental health of students requires special attention in the face of the

impacts of hyperconnectivity. The feelings of anxiety, stress and social pressures derived from the intensive use of networks and the digital environment reinforce the need for multidisciplinary interventions involving educators, psychologists and families. Emotional and digital education programs should be incorporated into school practices to strengthen students' autonomy in managing time online and offline, promoting balance between different aspects of life. The future of education depends on the ability of the educational system to promote a conscious and healthy use of technology, ensuring the integral well-being of students.

5 CONSEQUENCES FOR LEARNING AND TEACHING

The massive introduction of technologies in the educational environment has brought numerous changes, but it has also highlighted problems that affect the quality of teaching and learning. Among the main challenges, superficial teaching and the difficulty of developing complex cognitive skills, such as critical thinking, stand out. These negative impacts stem, in large part, from the inappropriate and decontextualized use of technology, which can reduce the depth of knowledge and autonomy of students.

Superficial teaching is a frequent consequence of the misuse of technology in education. As addressed by Corti and Silva (2022), many contents are treated quickly, in little depth, and with a bias very close to the popular language of social networks, focusing more on quantity than on the quality of learning. This happens, for example, when the use of technologies replaces reflective study with ready-made and superficial information, making it difficult to internalize concepts. Such an approach compromises the student's comprehensive education and preparation to face complex challenges.

Additionally, misused technology can hinder the development of critical thinking and other essential cognitive skills. The excessive dependence on digital resources that offer instant answers tends to reduce the capacity for analysis, synthesis and autonomous problem solving. The student, instead of building knowledge, starts to act passively, which limits his intellectual and critical growth. Encouraging the reflective and active use of technology is, therefore, essential to reverse this situation. If we go further and consider the skills relevant to the twenty-first century, according to Bray and McClaskey (2015, p. 7), they would be the set of essential skills for success in the digital age, including "critical thinking, creativity, collaboration, communication, and digital literacy".

It is known that, in certain schools, there is a predominance of activities mediated by

repetitive slides and videos, which do not stimulate the active participation of students. In addition, the superficiality of digital materials was associated with low content retention and demotivation in deeper investigations. This evidence indicates the need to rethink technological integration to promote more meaningful teaching.

The excessive use of technologies in the educational environment has created a scenario of transformations and challenges that require deep and critical reflection. It is essential to recognize that the introduction of technology cannot be seen as a magic solution that will automatically guarantee the improvement of teaching. The excessive emphasis on the use of digital resources, without the proper pedagogical contextualization, generates a superficial form of teaching, where the amount of information prevails over the significant construction of knowledge. Easy access to ready-made answers, widely available through digital tools, often limits the development of critical thinking, which is crucial for forming autonomous and reflective students.

It is also perceived that, in environments where technology is widely present (referring here to conditions where children and young people handle digital devices) the deep reading of books or even slightly more elaborate excerpts of texts, these same individuals do not present their totality in terms of learning and content retention. In this sense, Júnior *et al.*, (2023) highlights that reading plays a fundamental role in the development of cognitive areas, such as memory, attention, and language. Reading challenges us to store and retrieve information, which improves our ability to memorize and retain knowledge. This works as an exercise for the brain, activating neural functions (synapses). In this way, reading stimulates concentrated attention, since focus and concentration are necessary to understand the text.

In addition, the role of the teacher in this context gains even more relevance, as he needs to act in a mediating and creative way to prevent technology from transforming the classroom into a mechanical and repetitive environment. Teacher training is, therefore, essential for the educator to know how to combine the best of digital solutions with practices that encourage the active participation of students, dialogue and the deepening of the themes. Without continuous training and aligned pedagogical planning, technology can reinforce passive and demotivating methods, hindering effective learning.

It is necessary to be aware that "in the daily pedagogical practice of teachers, the way of using technology must be rethought in order to offer students tools that enable a more complete and current training. The contemporary teacher must break the paradigms

of traditional pedagogy and readapt to new trends" (Costa Júnior *et al.*, 2022, p. 58).

In fact, Allegretti and Jimena maintain that the challenges faced by teachers when integrating technologies are related to three fundamental issues:

[...] the need for the teacher to be aware that he should be the only source of information for the student; that the appropriation of a new technological resource requires knowledge of the technical and communicational potential of this resource, and to recognize to what extent the same applies to the pedagogical approach used (2007, p. 4).

Finally, it is essential to consider that access to technology is not uniform in all educational contexts, which widens inequalities and can compromise initiatives that seek innovation. School infrastructure, training and pedagogical support need to go hand in hand so that technology is an ally in building quality education. Rethinking technological integration with a focus on the depth of learning, critical formation, and student protagonism is an urgent and necessary path to face the contemporary challenges of education.

6 STRATEGIES FOR THE BALANCED AND CONSCIOUS USE OF TECHNOLOGY

To mitigate the invisible risks of technology in education, it is necessary to adopt strategies that promote the balanced and conscious use of digital resources. These strategies involve responsible pedagogical proposals, the harmonious integration of technology with traditional methods, and the implementation of school policies that guide and limit potential negative effects. The objective is to ensure that technology positively complements the teaching-learning process, without replacing human interaction and efficient pedagogical practices.

Pedagogical proposals for the responsible use of digital resources argue that technology should be incorporated into educational planning in an intentional and critical way. According to Fanti (2019), the role of the teacher is fundamental to mediate the use of technologies, promoting activities that stimulate reflection, creativity and active participation of students. Technology needs to serve as a means to achieve clear learning objectives, valuing student interaction and engagement, avoiding mechanical or merely substitutive use of traditional methods.

It should be said that technological resources should help to build "knowledge by making impossible or very discouraging operations or manipulations accessible" if reduced to pencil and paper (Perrenoud, 2000, p. 133).

Marins (2024) also highlights that it is necessary to reflect on this topic, because, although the connectivity offered by technology is considered a facilitator to overcome the physical and conventional barriers of classrooms and traditional teaching, the enormous amount of information available in the digital environment can have the opposite effect in relation to learning.

The integration of technology with traditional methods and human interaction is pointed out as an effective way to maximize educational benefits. Silva, Bilessimo and Machado (2021) highlight that hybrid models, which combine face-to-face teaching with digital resources, promote richer learning by favoring direct contact between teachers and students, expanded by technological tools that personalize teaching. This approach values the development of socio-emotional and cognitive skills, ensuring that technology does not become an impediment to building interpersonal relationships in the school environment.

Coll (2007) makes a very relevant point on the subject when he says that

[...] the incorporation of ICT into classroom activities is not necessarily, and not in itself, a factor of transformation and innovation in educational practices. On the contrary, ICT reveals itself rather as a reinforcing element of existing educational practices, which is to say that they only reinforce or promote innovation when they are inserted in a broader dynamic of educational change (Coll, 2007, p. 124).

Finally, school policies play a crucial role in limiting the risks of indiscriminate use of technology. It is necessary to implement regulations that guide the use of digital devices, such as rules for exposure time, moments of disconnection, and training of educators for the qualified pedagogical use of technologies. Such policies aim not only to protect the health and well-being of students, but also to ensure that technology is used ethically, responsibly, and in line with institutional educational objectives.

7 FINAL CONSIDERATIONS

We have witnessed a society that values the immediate and faces the acceleration of time. Despite this constant social movement, which has been experienced throughout the ages, with entries and exits marked by crises, we experience everything in a more cyclical and fast way. Bauman (2001) describes that we live in a time of "liquid modernity", in which relationships, values and institutions become progressively fluid and unsolid, and in which speed and instability predominate in everyday experiences. Exactly for this reason such a subject deserves and needs to be widely and constantly discussed, since education

is a field that needs depth, and this, unfortunately, is enemy number one of the most popular scenarios in which we find technology.

Therefore, and in the expectation of making relevant notes on the aspects surrounding technology, this article addressed the invisible risks associated with the growing use of technology in modern education, highlighting the cognitive, social, physical and psychological impacts that can harm the educational process. The problem of digital distractions, the reduction of face-to-face interactions and technological dependence that affect students' critical autonomy was analyzed.

In addition, the effects of excessive use of screens on eye health, sleep disorders and psychological disorders were discussed, showing the complexity of the consequences for students. There was also a reflection on the negative implications for learning, such as superficial teaching and the weakening of critical thinking, supported by studies that show insufficient pedagogical practices. Finally, strategies for the balanced and conscious use of technology were presented, including pedagogical guidelines, integration with traditional methods and school policies that limit risks.

Reflecting pragmatically, the balance between technology and face-to-face teaching is essential to enhance educational benefits without compromising essential aspects of human development. Technology should be perceived as a resource that complements, not replaces, the direct interaction between teachers and students, which is irreplaceable for social-emotional learning and the critical construction of knowledge. The adoption of hybrid models, which combine face-to-face teaching with digital resources, is a viable alternative to combine flexibility and quality, as long as there is adequate pedagogical planning, continuous teacher training and sufficient infrastructure. This balance also contributes to the promotion of digital inclusion, considering the different socioeconomic realities of students.

The healthy process of integrating technology in education depends on continuous and critical teacher training that provides skills for the effective and reflective use of digital resources. This training should go beyond technical learning and address the pedagogical, ethical, and social aspects involved in technological mediation. Training teachers for hybrid and flexible environments is not only about teaching the use of tools, but about developing the ability to rethink traditional methodologies, promoting teaching that values critical thinking, collaboration, and student autonomy.

Teacher training combined with clear school policies favors the construction of

pedagogical practices that avoid superficial teaching, stimulating the active participation of students and the critical appropriation of knowledge. In addition, schools that encourage student awareness of the risks of excessive use of screens contribute to comprehensive education, taking care of the student's physical and mental health. It is in this balance between technology and human care that the school can become a healthy learning space, where digital complements and does not replace personal interaction.

It is important to highlight that teacher training must consider the rapid technological and social transformations, offering permanent support for teachers to update their practices according to contemporary demands. Lack of preparation can result in inappropriate use of technology, reinforcing the passive and fragmented model of learning. Investing in critical training is, therefore, also investing in pedagogical innovation that enhances students' protagonism and reflection.

In addition, school policies need to establish clear guidelines for the balanced use of technologies, defining adequate times, advising on breaks, and promoting practices that minimize negative impacts on students' health and performance. This set of strategies forms an educational environment that promotes well-being and meaningful learning, aligning technology with well-defined pedagogical objectives.

Finally, raising awareness among the school community, including teachers, students, and families, is essential for technology to be used in a critical, ethical, and healthy way. From the collaboration and dialogue between these actors, it is possible to build a school culture that values the balance between the digital world and human needs, preparing students to act competently and responsibly in an increasingly connected society.

For future research, it is crucial to deepen empirical investigations on the impact of new educational technologies in different school contexts and age groups, evaluating their effects on student performance and well-being. Innovative strategies that enhance active, collaborative, and critical learning should also be explored, taking advantage of the best in digital tools. From the point of view of educational practices, inclusive policies are recommended that enable equitable access to technological resources, permanent teacher training and clear protocols to limit the negative effects of technology, ensuring an education that adapts to the challenges of the twenty-first century without losing its human character.

ABSTRACT

Traffic accidents rank among the leading causes of death from external causes and constitute a major public health concern. Traditionally classified as unintentional events, these fatalities are often attributed to human error, environmental conditions, or deficiencies in road infrastructure. However, scientific evidence indicates that some of these deaths may involve signs of self-harm intentionality, which remain largely underreported and are frequently recorded as accidents of undetermined cause. In light of this gap, the present study aims to introduce traffic psychosocial autopsy as an innovative methodological strategy for assessing intentionality in fatal road accidents. This study is a methodological development, qualitative and applied in nature, which systematizes an integrated process

for retrospective investigation of traffic-related deaths. The methodology adapts the principles of classical psychological and psychosocial autopsies, expanding them to incorporate technical-forensic, psychosocial, epidemiological, environmental, and institutional data. The process is organized into six sequential steps: case identification, integration of data sources, retrospective psychosocial investigation, technical and contextual road analysis, intersectoral integration and inference session, and preparation of a technical report with recommendations. It is concluded that the traffic psychosocial autopsy enhances the analytical capacity of traffic death investigations, contributes to improving epidemiological surveillance, and supports intersectoral public policies aimed at preventing avoidable fatalities.

RESUMO

Os sinistros de trânsito figuram entre as principais causas de morte por causas externas e constituem um problema prioritário de saúde pública. Tradicionalmente classificados como eventos não intencionais, esses óbitos são frequentemente atribuídos a falhas humanas, condições ambientais ou deficiências da infraestrutura viária. Contudo, evidências científicas indicam que parte dessas mortes pode envolver indícios de intencionalidade auto lesiva, os quais permanecem amplamente subnotificados e registrados como acidentes de causa indeterminada. Diante dessa lacuna, o presente estudo tem como objetivo apresentar a autópsia psicossocial de trânsito como uma estratégia metodológica inovadora para a avaliação da intencionalidade em sinistros viários com óbito. Trata-se de um estudo de desenvolvimento metodológico, de natureza qualitativa e aplicada, que sistematiza um processo integrado de investigação retrospectiva de mortes no trânsito. A metodologia adapta os pressupostos da autópsia psicológica e psicossocial clássica, incorporando de forma ampliada dados técnico-periciais, psicossociais, epidemiológicos, ambientais e institucionais. O processo é organizado em seis etapas sequenciais: identificação do caso, integração de fontes de dados, investigação psicossocial retrospectiva, análise técnica e contextual da via, sessão intersectorial de integração e inferência, e elaboração de relatório técnico com recomendações. Conclui-se que a autópsia psicossocial de trânsito amplia a capacidade analítica da investigação de óbitos no trânsito, contribui para a qualificação da vigilância epidemiológica e subsidia políticas públicas intersectoriais voltadas à prevenção de mortes evitáveis.

RESUMEN

Los accidentes de tránsito se encuentran entre las principales causas de muerte por causas externas y constituyen un problema prioritario de salud pública. Tradicionalmente clasificados como eventos no intencionales, estas muertes suelen atribuirse a errores humanos, condiciones ambientales o deficiencias en la infraestructura vial. Sin embargo, la evidencia científica indica que una parte de estas muertes puede involucrar indicios de intencionalidad autolesiva, los cuales permanecen ampliamente subregistrados y suelen clasificarse como accidentes de causa indeterminada. Ante esta laguna, el presente estudio tiene como objetivo presentar la autopsia psicossocial de tránsito como una estrategia metodológica innovadora para la evaluación de la intencionalidad en accidentes

viales con resultado fatal. Se trata de un estudio de desarrollo metodológico, de naturaleza cualitativa y aplicada, que sistematiza un proceso integrado de investigación retrospectiva de muertes en el tránsito. La metodología adapta los supuestos de la autopsia psicológica y psicosocial clásica, incorporando de manera ampliada datos técnico-periciales, psicosociales, epidemiológicos, ambientales e institucionales. El proceso se organiza en seis etapas secuenciales: identificación del caso, integración de fuentes de datos, investigación psicosocial retrospectiva, análisis técnico y contextual de la vía, sesión intersectorial de integración e inferencia, y elaboración de informe técnico con recomendaciones. Se concluye que la autopsia psicosocial de tránsito amplía la capacidad analítica de la investigación de muertes en accidentes de tránsito, contribuye a la mejora de la vigilancia epidemiológica y respalda políticas públicas intersectoriales orientadas a la prevención de muertes evitables.

1 INTRODUCTION

Traffic accidents are among the main causes of death from external causes in the world, configuring themselves as a priority public health problem. Traditionally, these events are interpreted as unintentional occurrences, resulting from human error, adverse environmental conditions, or deficiencies in road infrastructure. Although this framework has supported important advances in traffic engineering and enforcement, it is insufficient to explain the totality of deaths recorded in traffic, especially those classified as accidents of undetermined cause (WORLD HEALTH ORGANIZATION, 2023).

Since the mid-twentieth century, studies in psychiatry and forensic medicine have indicated that the vehicle can be used as a means of self-injury, especially in contexts characterized by high lethality and low possibility of external intervention. Selzer and Payne (1962) described suicide by vehicular collision at an early age, while Shneidman (1973) introduced the concept of *vehicular suicidal ideation*, highlighting the ambivalent, impulsive and socially concealable character of this behavior. Despite these pioneering contributions, self-injurious intentionality remains largely underreported in official traffic death registration systems.

Contemporary empirical evidence reinforces this interpretative gap. Observational and population-based studies have shown a consistent association between suicidal ideation and risky driving behaviors, such as speeding, driving under the influence of alcohol or other substances, and lower adherence to safety devices, substantially increasing the likelihood of fatal collisions (BRAMNESS et al., 2008; THOMPSON et al., 2011). Such findings suggest that certain road accidents cannot be understood exclusively as fortuitous accidents, but may involve subjective and emotional dimensions relevant to the occurrence of the event.

In addition, investigations carried out in transport infrastructures, such as railways, bridges and highways, indicate that improvements in the procedures for analyzing and classifying deaths significantly alter the proportion of events attributed to accidents or suicides (PIRKIS et al., 2013; RUNESON et al., 2025). These results highlight structural limitations of traditional research models, which often focus on the physical dynamics of the event and neglect psychosocial and contextual factors.

In this scenario, the psychosocial autopsy is consolidated as an interdisciplinary methodology capable of retrospectively investigating deaths from external causes, by integrating clinical, psychological, social and contextual data in the reconstruction of the

fatal event (WERLANG et al., 2003; ROZA et al., 2023). In Brazil, studies published in national scientific journals demonstrate the validity and applicability of this approach to qualify the investigation of suicides and ambiguous deaths, overcoming analyses restricted to the physical cause of death (WERLANG et al., 2003).

By adapting this methodological framework to the field of road safety, psychosocial traffic autopsy broadens the analytical scope by incorporating, in an integrated manner, expert reports of collision dynamics, road conditions, risk history of the site and interviews with key informants. This approach makes it possible to assess signs of self-injurious intent in traffic accidents with death, contributing to the reduction of underreporting, the improvement of epidemiological surveillance, and the strengthening of intersectoral public policies aimed at prevention (TRANSPORT FOR NSW, 2020; WORLD HEALTH ORGANIZATION, 2023).

In view of these evidences and methodological gaps, the present study aims to present the psychosocial traffic autopsy as an innovative and integrated methodology developed to evaluate signs of intentionality in traffic accidents with death, detailing its procedures, data sources, instruments, analytical strategies and implications for epidemiological surveillance and road safety policies.

2 METHODS

This is a methodological development study, of a qualitative and applied nature, whose objective was to structure, describe and systematize the Psychosocial Traffic Autopsy as an integrated process of evaluation of signs of intentionality in traffic accidents with death. The study does not propose to estimate prevalences, but to develop an operational methodological framework, capable of being incorporated into the institutional practice of traffic agencies, public health and technical expertise.

The methodology developed is inspired by the assumptions of psychological and psychosocial autopsy, widely used in the investigation of suicides and ambiguous deaths, but substantially expands its scope by incorporating road, forensic and environmental and institutional variables, as well as by involving multiple sectors of the public power in the investigative and analytical process.

The construction of the methodology was based on three main references: (i) the classic and contemporary literature on psychological and psychosocial autopsy; (ii) international evidence on suicide in transport systems and difficulties in classifying deaths;

(iii) road safety and public health guidelines, including the principles of Vision Zero and epidemiological surveillance of external causes.

These references guided the definition of the analytical categories, the collection instruments and the criteria for inferring intentionality, ensuring conceptual coherence and practical applicability.

The methodology was organized as a sequential and cumulative process, composed of six interdependent macro steps:

1. Case identification and selection
2. Survey and integration of data sources
3. Retrospective psychosocial investigation
4. Technical-forensic and contextual analysis of the road
5. Cross-sector integration and inference session

Accidents with death that present, alone or together: (a) high-lethality collisions (e.g., frontal impact, single vehicle, run-overs on high-speed highways) are eligible for the application of the psychosocial traffic autopsy; (b) absence or inconsistency of evidence of evasive maneuver; (c) previous history of psychosocial risk or known psychological distress; (d) initial classification as an accident of undetermined cause; (e) recurrence of deaths on the same road section (critical point). The selection of cases can be carried out prospectively (continuous flow) or retrospectively (review of deaths already registered).

The methodology presupposes the integration of multiple sources of information, organized into four axes:

- Technical-forensic sources that include official expert reports (collision dynamics, estimated speed, braking marks, vehicle deformations); Reports from PRF, DETRAN and DNIT; Photographic records, monitoring videos and telemetry data, when available; Autopsy reports and toxicological examinations.
- Psychosocial sources include semi-structured interviews with family members, cohabitants, co-workers, and friends; History of stressful life events; Family relationships and social support network; Recent behavioral changes and verbalizations of farewell or hopelessness.
- Public health sources such as Mortality Information System (SIM) records; Clinical and mental health records; Notifications of violence and previous attempts.

- Contextual and environmental sources involving the road conditions (geometry, signaling, lighting, accident history); Characterization of the site as a potential critical point; Weather conditions and visibility at the time of the event.

The psychosocial investigation follows the principles of the classic psychosocial autopsy, using a validated semi-structured script, adapted to the traffic context. The following axes are explored:

- Life trajectory and recent psychosocial context;
- Mental health and substance use history;
- Previous, explicit or veiled suicidal ideation;
- Repeated risk behaviors;
- Meanings attributed to traffic and displacement.

The interviews are conducted by trained professionals, with an ethical and empathetic approach, prioritizing the triangulation of independent informants.

Parallel to the psychosocial investigation, a detailed analysis of the dynamics of the accident is carried out, including: Compatibility between the narrative of the event and physical evidence; Existence of road alternatives and opportunities for evasion; Choice of the place and time of the claim; Degree of predictability of lethality. This analysis allows the identification of recurring patterns of structural and behavioral risk.

The data are discussed in an intersectoral session, involving representatives of forensics, mental health, traffic and epidemiological surveillance. An inference matrix of intentionality is used, with graduated classification: Strong indications of intentionality; Moderate indications; Event without evidence of intentionality; Indeterminate (inconclusive data). Decisions are reasoned, documented and consensual, avoiding isolated individual judgments.

The process culminates in a technical-synthetic report of the case; Recommendations for updating official records; Indication of local preventive measures (engineering, inspection, psychosocial support); Institutional feedback to the agencies involved.

The methodology observes ethical principles of confidentiality, respect for families and responsible use of information. As it is an investigation with secondary data and retrospective interviews, its institutional application requires its own regulations and informed consent.

The Psychosocial Traffic Autopsy is distinguished by: broadening the scope of the traditional psychosocial autopsy; integrate technical, human and environmental dimensions; operate in an intersectoral manner; directly guide public policies and preventive interventions.

3 RESULTS

The methodological process of the Psychosocial Traffic Autopsy is organized in six sequential and integrated stages, as described below:

1. Identification of the accident with death: selection of eligible cases based on risk criteria (high lethality, undetermined cause, atypical patterns, recurrence in a given location).
2. Technical-forensic survey: collection and analysis of collision reports, autopsy, toxicological examinations, photographic records, videos and road data.
3. Retrospective psychosocial investigation: semi-structured interviews with key informants; reconstruction of psychosocial trajectory, mental health history, and stressful events.
4. Contextual and environmental analysis of the road: evaluation of the physical conditions of the site, history of accidents, structural characteristics and potential risk factors.
5. Intersectoral integration and inference session: collegiate discussion of data by a multiprofessional team; application of the inference matrix of intentionality.
6. Classification, registration and feedback: preparation of technical report; recommendations for updating official records and proposing preventive actions. It is expected that the development and systematization of psychosocial traffic autopsy will produce conceptual, methodological and operational advances in the evaluation of traffic accidents with death, especially with regard to the identification of signs of self-injurious intentionality.

On the methodological level, the main expected result is the consolidation of a structured, replicable and intersectoral process for retrospective investigation of traffic deaths, overcoming fragmented approaches focused exclusively on the physical dynamics of the accident. The application of the methodology should allow the systematic integration of technical-forensic data, psychosocial, epidemiological and contextual, expanding the analytical capacity of the institutions involved.

In terms of diagnosis, a better qualification of the intentionality of fatal events is expected, with a reduction in the proportion of deaths classified as "accidents of undetermined cause". The use of graded inference criteria (strong, moderate, absent or inconclusive evidence) should enable a more realistic reading of road mortality, without imposing dichotomous or simplified classifications.

At the epidemiological level, the methodology tends to contribute to the improvement of health and traffic information systems, especially through the qualification of records from the Mortality Information System (SIM) and institutional databases of highway agencies. The generation of more accurate data will allow more consistent temporal, spatial and population analyses, favoring the identification of recurrent patterns of psychosocial and structural risk.

In the preventive plan, it is expected that the findings produced by the psychosocial traffic autopsy will support more effective and targeted interventions, such as the prioritization of critical points for engineering, monitoring and signaling actions, as well as the development of psychosocial care protocols for vulnerable groups. By identifying human and contextual factors associated with fatal claims, the methodology expands the potential for primary and secondary prevention.

At the institutional and intersectoral level, it is expected to strengthen the articulation between traffic agencies, technical expertise, mental health and epidemiological surveillance. Conducting cross-sectoral analysis and consensus sessions tends to promote institutional learning, standardization of investigative practices, and strengthening a life-centered road safety culture.

Finally, at the political and strategic level, the adoption of psychosocial traffic autopsy can support the formulation of evidence-based public policies, aligned with the guidelines of Vision Zero, PNATTRANS and the Sustainable Development Goals, contributing to the reduction of avoidable traffic deaths.

4 DISCUSSION

The results expected with the development of the Psychosocial Traffic Autopsy point to a substantial expansion of the analytical capacity of traffic death investigation systems, by incorporating traditionally neglected dimensions in models focused exclusively on the physical dynamics of the accident. The international literature has shown that the restricted interpretation of the event as an "accident" tends to hide subjective, emotional and

contextual factors that may be directly implicated in the occurrence of fatal collisions, especially those classified as having an undetermined cause (SELZER; PAYNE, 1962; SHNEIDMAN, 1973).

In this sense, the expectation of a reduction in the proportion of deaths classified as undetermined is supported by studies that have applied expanded investigation methodologies, such as psychological and psychosocial autopsy, in contexts of ambiguous deaths. Systematic reviews indicate that the inclusion of interviews with key informants and the retrospective reconstruction of the individual's life context significantly increase the identification of previously unrecognized indications of intentionality (ROZA et al., 2023; CRISĂN; BĂCILĂ; MORAR, 2022). By transposing this methodological framework to the field of traffic, the psychosocial autopsy of traffic tends to produce similar effects, qualifying the epidemiological reading of road mortality.

The integration between technical-forensic data and psychosocial information is one of the main advances expected from the methodology. Studies carried out in countries such as Australia and Sweden show that the isolated analysis of collision dynamics is insufficient to differentiate accidental events from potentially intentional occurrences, especially in scenarios of high lethality and absence of witnesses (TRANSPORT FOR NSW, 2020; PARACHUTE, 2023). The systematic incorporation of variables such as mental health history, stressful life events, and recurrent behavioral patterns broadens the understanding of the phenomenon and reduces interpretive biases.

On the epidemiological level, it is expected that the application of psychosocial traffic autopsy will contribute to the improvement of the surveillance of deaths from external causes, especially in the Mortality Information System. The World Health Organization highlights that the underreporting of intentionality compromises the formulation of effective public policies, by making specific segments of the population at risk invisible (WORLD HEALTH ORGANIZATION, 2023). By qualifying the records and reducing the overuse of the "undetermined cause" category, the methodology can generate more consistent and comparable databases over time.

Another relevant aspect of the expected results refers to the preventive potential of the methodology. International evidence indicates that structural and psychosocial interventions targeting critical points and vulnerable groups are more effective when based on integrated analyses of human behavior and the road environment (PIRKIS et al., 2013; RUNESON et al., 2025). By identifying recurrent patterns of risk — such as deliberate

choice of places of high lethality or absence of evasive maneuvers — the psychosocial traffic autopsy provides technical subsidies for engineering, signaling, inspection and psychosocial support actions.

From an institutional point of view, the expected results include the strengthening of intersectoral coordination between traffic, forensics, mental health and epidemiological surveillance agencies. The holding of collegiate integration and inference sessions promotes not only greater analytical rigor, but also organizational learning and standardization of practices, elements pointed out as essential for the sustainability of evidence-based road safety policies (WORLD HEALTH ORGANIZATION, 2023). This institutional arrangement contributes to overcoming the traditional fragmentation between sectors and to consolidating a systemic approach to the phenomenon.

Finally, the expectation that the methodology will contribute to the conceptual redefinition of traffic as a space of care and prevention is supported by the principles of Vision Zero, which recognizes that deaths in the transport system are neither acceptable nor inevitable. By revealing hidden dimensions of road mortality, psychosocial traffic autopsy challenges traditional paradigms and broadens the horizon of public policies, by integrating road safety and mental health in a perspective centered on the protection of life.

5 FINAL THOUGHTS

The development of the Psychosocial Traffic Autopsy, presented in this study, highlights the need to expand the traditional models of investigation of traffic deaths, incorporating psychosocial, contextual and institutional dimensions to the analysis of fatal accidents. By recognizing that part of these deaths may involve evidence of self-injurious intentionality, the proposed methodology contributes to overcoming the restrictive reading of the accident as an exclusively fortuitous event.

The expected results indicate that the application of this approach has the potential to qualify epidemiological surveillance, reduce underreporting of intentionality, and improve the classification of deaths from external causes. By integrating technical-forensic data, psychosocial interviews and analysis of the road environment, the psychosocial traffic autopsy offers a more comprehensive understanding of the factors that converge to the occurrence of fatal accidents, in line with international evidence and the recommendations of the World Health Organization.

In addition to its analytical value, the methodology has practical relevance in supporting more precise preventive interventions, either through engineering and signaling actions at critical points, or by identifying vulnerable groups that require psychosocial care strategies. The emphasis on intersectoral articulation strengthens institutional response capacity and promotes a road safety culture centered on the protection of life.

It is recognized, however, that the consolidation of the Psychosocial Traffic Autopsy requires investments in professional training, standardization of protocols and improvement of information systems. Future studies may empirically evaluate its application in different territorial contexts, contributing to the refinement of inference criteria and to the measurement of its impact on public policies. Even so, the methodology presents itself as a relevant conceptual and operational advance, by integrating road safety and mental health in a preventive, humanized and evidence-based perspective.

ABSTRACT

The teaching of Electrochemistry in High School presents challenges related to the abstraction of concepts, the difficulty in articulating theory and practice, and student demotivation, especially when approached through traditional methodologies. Given this scenario, this work aimed to investigate the contributions of Problem-Based Learning and the flipped classroom to the teaching of Electrochemistry in High School. The methodology adopted was characterized as qualitative and bibliographic research, developed from the analysis of academic productions published between 2019 and 2025, located in the SciELO and Google Scholar databases, related to Chemistry teaching, active methodologies, and Electrochemistry. As a result, the literature analysis showed that the integration between Problem-Based Learning and the flipped classroom favors the contextualization of content, student protagonism, and the progressive organization of teaching, aspects relevant to the learning of electrochemical concepts. Based on these results, a theoretical teaching sequence was developed, structured in articulated stages aligned with the learning objectives of secondary education. It was concluded that the proposed approach contributes to lesson planning and reflection on substantial pedagogical practices in the teaching of Electrochemistry.

Keywords: Chemistry Teaching. Electrochemistry. Active Methodologies. Problem-based Learning. Flipped Classroom.

RESUMO

O ensino de Eletroquímica no Ensino Médio apresenta desafios correlatos à abstração dos conceitos, à dificuldade de articulação entre teoria e prática e à desmotivação dos estudantes, sobretudo quando abordado por meio de metodologias tradicionais. Diante desse cenário, este trabalho teve como objetivo geral averiguar as contribuições da Aprendizagem Baseada em Problemas e da sala de aula invertida para o ensino de Eletroquímica no Ensino Médio. A metodologia adotada caracterizou-se como uma pesquisa qualitativa e bibliográfica, desenvolvida a partir da análise de produções acadêmicas publicadas entre 2019 e 2025, localizadas nas bases SciELO e Google

Acadêmico, relacionadas ao ensino de Química, às metodologias ativas e à Eletroquímica. Como resultados, a análise da literatura evidenciou que a integração entre a Aprendizagem Baseada em Problemas e a sala de aula invertida favorece a contextualização dos conteúdos, o protagonismo discente e a organização progressiva do ensino, aspectos relevantes para a aprendizagem de conceitos eletroquímicos. Com base nesses resultados, foi elaborada uma sequência didática de caráter teórico, estruturada em etapas articuladas e alinhadas aos objetivos de aprendizagem do Ensino Médio. Concluiu-se que a proposta apresentada contribui para o planejamento docente e para a reflexão sobre práticas pedagógicas substanciais no ensino de Eletroquímica.

RESUMEN

Los accidentes de tránsito se encuentran entre las principales causas de muerte por causas externas y constituyen un problema prioritario de salud pública. Tradicionalmente clasificados como eventos no intencionales, estas muertes suelen atribuirse a errores humanos, condiciones ambientales o deficiencias en la infraestructura vial. Sin embargo, la evidencia científica indica que una parte de estas muertes puede involucrar indicios de intencionalidad autolesiva, los cuales permanecen ampliamente subregistrados y suelen clasificarse como accidentes de causa indeterminada. Ante esta laguna, el presente estudio tiene como objetivo presentar la autopsia psicosocial de tránsito como una estrategia metodológica innovadora para la evaluación de la intencionalidad en accidentes viales con resultado fatal. Se trata de un estudio de desarrollo metodológico, de naturaleza cualitativa y aplicada, que sistematiza un proceso integrado de investigación retrospectiva de muertes en el tránsito. La metodología adapta los supuestos de la autopsia psicológica y psicosocial clásica, incorporando de manera ampliada datos técnico-periciales, psicosociales, epidemiológicos, ambientales e institucionales. El proceso se organiza en seis etapas secuenciales: identificación del caso, integración de fuentes de datos, investigación psicosocial retrospectiva, análisis técnico y contextual de la vía, sesión intersectorial de integración e inferencia, y elaboración de informe técnico con recomendaciones. Se concluye que la autopsia psicosocial de tránsito amplía la capacidad analítica de la investigación de muertes en accidentes de tránsito, contribuye a la mejora de la vigilancia epidemiológica y respalda políticas públicas intersectoriales orientadas a la prevención de muertes evitables.

Palabras clave: Autopsia Psicosocial. Seguridad Vial. Accidentes de Tránsito. Intencionalidad. Mortalidad por Causas Externas. Vigilancia Epidemiológica.

1 INTRODUCTION

The teaching of Chemistry in High School is elementary in the scientific training of students, corroborating the development of critical thinking, the understanding of natural phenomena and the relationship between science, technology and society. However, the literature points out that, historically, the teaching of this discipline has been marked by traditional practices centered on the transmission of content, which makes it difficult to build meaningful and contextualized learning, especially when it comes to abstract concepts and high conceptual complexity (LINHARES, 2024).

In this context, Electrochemistry stands out as one of the contents that most present obstacles to the teaching and learning process in High School. It should be noted that the difficulties are mainly related to the abstraction of the microscopic processes involved in oxidation-reduction reactions, the need for articulation between chemical, physical and mathematical concepts, as well as the recurrent use of calculations, which can generate demotivation and low engagement of students (INOCÊNCIO et al., 2019). In fact, the dissociation between theoretical content and everyday situations contributes to the perception that Electrochemistry is a topic far from the students' reality (ARAUJO, 2021).

Given this scenario, it becomes evident the need to rethink the pedagogical strategies adopted in the teaching of Science, in order to favor the active participation of students in the learning process (LINHARES, 2024). Active methodologies emerge as alternatives capable of promoting greater student involvement, intellectual autonomy and significant construction of knowledge, by moving the student to the center of the educational process and redefining the role of the teacher as a mediator of learning (VIANA et al., 2020).

Among the active methodologies discussed in the literature, Problem-Based Learning (PBL) stands out for proposing contextualized problem-situations that stimulate investigation, reasoning and decision-making by students, favoring conceptual understanding and the development of cognitive and collaborative skills (INOCÊNCIO et al., 2019). In a complementary way, the flipped classroom proposes the reorganization of learning time and spaces, allowing the initial contact with the contents to occur outside the classroom, through previously available materials, while the face-to-face time is intended for discussion, problem solving and conceptual deepening (NACHTIGALL; ABRAHÃO, 2021).

In this context, the articulation between Problem-Based Learning and the flipped classroom presents itself as a promising pedagogical possibility for the teaching of

Electrochemistry in High School, since both approaches value the active participation of the student, the contextualization of the contents and the progressive construction of knowledge. Thus, the following research problem arises: how to make the teaching of Electrochemistry in High School more meaningful from the proposition of a didactic sequence based on Problem-Based Learning and the flipped classroom?

In view of this problem, this work has as its general objective to investigate the contributions of Problem-Based Learning and the flipped classroom to the teaching of Electrochemistry in High School. The specific objectives are: to discuss the main difficulties related to the teaching and learning of Electrochemistry in High School, to analyze the potentialities of Problem-Based Learning and the flipped classroom as pedagogical strategies for the teaching of Chemistry and to propose, based on the literature analyzed, a didactic sequence for the teaching of Electrochemistry in High School based on Problem-Based Learning and the flipped classroom.

2 PROBLEM-BASED LEARNING AND FLIPPED CLASSROOM IN ELECTROCHEMISTRY EDUCATION

2.1 TEACHING OF ELECTROCHEMISTRY IN THE SCHOOL CONTEXT

The teaching of Chemistry in High School plays a central role in the scientific training of students, as it contributes to the understanding of natural phenomena, technological processes and transformations that occur in everyday life, favoring the construction of a critical view of science and its relationship with society. By enabling the interpretation of physical and chemical phenomena present in real situations, the discipline helps in the development of scientific thinking, argumentation, and reasoned decision-making, essential aspects for the integral formation of the student in basic education (LINHARES, 2024).

Despite this relevance, the teaching of Chemistry still faces significant challenges when predominantly based on traditional methodologies. The centrality of oral exposition, the emphasis on memorizing concepts and formulas, and the dissociation between theory and context contribute to a teaching-learning process that is not very significant, in which the student assumes a passive posture. This scenario tends to hinder conceptual understanding and generate disinterest in the discipline, especially in content that requires a higher level of abstraction and articulation of knowledge, such as those covered in High School (SAMPAIO, 2022).

In view of these limitations, it is necessary to adopt pedagogical strategies that favor meaningful learning, promoting greater involvement of students in the educational process. Methodologies that value active participation, problematization and contextualization of content enable students to establish relationships between scientific knowledge and their reality, favoring the construction of meanings and intellectual autonomy. In the meantime, the literature points out that innovative pedagogical approaches in the teaching of Chemistry can contribute to overcoming the challenges of the traditional model, by stimulating student protagonism and critical reflection on the contents worked on in the classroom (LINHARES, 2024).

The content of Electrochemistry occupies a relevant position in the High School Chemistry curriculum because it articulates fundamental concepts related to chemical transformations, electron transfer and the conversion between chemical and electrical energy. Such knowledge is essential for the understanding of various technological and natural processes, such as the operation of batteries, the corrosion of metals and industrial applications, which reinforces its formative and contextualizing potential when properly worked in the school environment (INOCÊNCIO et al., 2019).

However, the way Electrochemistry is traditionally approached in the classroom does not always favor conceptual understanding by students. The fragmented presentation of content and the excessive emphasis on algorithmic procedures tend to hinder the construction of meanings, making this topic one of the most complex within the discipline of Chemistry in High School (ARAUJO, 2021).

In high school, the study of Electrochemistry generally begins with the concepts of oxidation and reduction, which describe the loss and gain of electrons during chemical reactions. Understanding these processes is fundamental for understanding oxidation-reduction reactions, but it requires the student to move between different levels of representation, such as the symbolic, the microscopic, and the macroscopic, which can generate difficulties when there is no adequate pedagogical mediation (RODRIGUES, 2023).

Electrochemical batteries constitute another central axis of this content, being used as an example of the conversion of chemical energy into electrical energy. In the school context, the study of batteries involves the identification of electrodes, electron flow, and the function of the salt bridge, in addition to the interpretation of the semi-reactions involved. Despite their potential for contextualization, these concepts are often presented in an

excessively theoretical way, which compromises students' understanding of the global functioning of the electrochemical system (INOCÊNCIO et al., 2019).

Electrolysis, in turn, introduces the idea of non-spontaneous processes, in which electrical energy is used to promote chemical reactions. This content demands from the student the ability to differentiate spontaneous and non-spontaneous electrochemical processes, in addition to understanding the inversion of the direction of reactions in relation to batteries. The literature points out that the lack of articulation between these concepts contributes to recurrent conceptual confusion in the teaching of this topic (ARAUJO, 2021; LINHARES, 2024).

Another relevant concept addressed in high school is the electrochemical potential, used to predict the spontaneity of reactions and compare the tendency of oxidation or reduction of chemical species. The interpretation of the standard potential tables and their application in problem solving require mathematical and conceptual skills that are not always consolidated in students, which reinforces the complexity of this content in the school context (INOCÊNCIO et al., 2019).

Several studies point out that one of the main difficulties in teaching and learning Electrochemistry is related to the abstraction of the concepts involved. Electrochemical processes occur at the microscopic level, requiring the student to be able to imagine phenomena that are not directly observable, such as the movement of electrons and ions, which can compromise understanding when teaching does not favor the construction of adequate mental models (RODRIGUES, 2023).

In addition to conceptual abstraction, the mathematical difficulties associated with electrochemical potential calculations and the interpretation of chemical equations also pose a significant obstacle. The need to integrate knowledge of Chemistry, Physics, and Mathematics makes the content challenging, especially when the student does not have previous mastery of these areas, which can result in low performance and demotivation in relation to the topic (LINHARES, 2024).

When concepts are presented in a decontextualized way, without explicit relationship with real situations or practical applications, students tend to perceive the content as abstract and not very relevant. The distance corroborates the loss of interest and hinders the construction of meaningful learning, reinforcing the need for pedagogical approaches that promote greater contextualization and student engagement (SAMPAIO, 2022).

2.2 FLIPPED CLASSROOM IN SCIENCE TEACHING

Active methodologies have gained prominence in the teaching of Chemistry because they propose a reorganization of the teaching-learning process, shifting the focus from the transmission of content to the effective participation of the student in the construction of knowledge. In the context of basic education, these approaches seek to overcome limitations of traditional teaching, promoting greater student involvement, intellectual autonomy, and the development of cognitive and socio-emotional skills, aspects widely discussed in recent academic production on the teaching of Science (LINHARES, 2024).

By considering the challenges inherent to the learning of abstract and complex contents, such as those addressed in Chemistry, the adoption of active methodologies presents itself as a strategy capable of favoring conceptual understanding and contextualization of knowledge. It is emphasized that these methodologies contribute to making the educational process more dynamic and meaningful, especially when articulated with problem situations and contexts close to the students' reality (VIANA et al., 2020).

Active methodologies can be understood as pedagogical approaches that place the student at the center of the learning process, attributing to him an active role in the construction of knowledge. Unlike traditional models, these methodologies value problematization, investigation, and reflection, encouraging the student to mobilize previous knowledge, formulate hypotheses, and seek solutions to proposed situations, as discussed in the literature on the teaching of Chemistry (LINHARES, 2024).

In this context, the role of the teacher is redefined, moving from a transmitter of content to a mediator and facilitator of learning. It is up to the teacher to organize the pedagogical environment, propose cognitive challenges and guide the students' research process, while they assume a more autonomous and responsible posture for their learning. This change in roles favors the construction of a collaborative environment, in which dialogue and the exchange of experiences become central elements of the educational process (SAMPAIO, 2022).

The relationship between active methodologies and meaningful learning is widely highlighted in the literature, since these approaches allow students to establish connections between new knowledge and their previous experiences. By promoting the contextualization of content and the active participation of students, active methodologies favor the attribution of meaning to scientific knowledge, contributing to a more lasting and integrated learning, especially in the teaching of Chemistry (LINHARES, 2024).

Problem-Based Learning (PBL) originates from educational proposals that seek to articulate theory and practice through the presentation of contextualized problem situations, capable of instigating students' curiosity and reasoning. This methodology is based on the idea that knowledge is built more effectively when the student is challenged to investigate, discuss and propose solutions to problems that make sense in their learning context (VIANA et al., 2020).

Among the central characteristics of PBL, the use of problems as a starting point for the study, collaborative work in groups, and the valorization of the investigative process stand out. In this approach, students are encouraged to identify what they already know, what they need to learn, and what strategies can be used to solve the proposed problem, promoting the development of cognitive, communicative, and social skills (INOCÊNCIO et al., 2019).

In the teaching of Chemistry, the literature points out that PBL contributes to the contextualization of contents and to the understanding of complex concepts, by allowing students to relate scientific knowledge to real or simulated situations. Studies indicate that this methodology favors student engagement, motivation for learning, and the development of critical thinking, and is especially relevant for teaching challenging topics, such as Electrochemistry (ARAUJO, 2021).

The flipped classroom has been consolidated as a relevant pedagogical approach in the teaching of Science by proposing the reorganization of the teaching-learning process, breaking with the traditional logic of centralization of the exposure of contents in the classroom space. From this perspective, the student's initial contact with the contents occurs previously, through guided materials, while the face-to-face time is intended for conceptual deepening, problem solving and interaction between teacher and students, favoring a more active and reflective learning (NACHTIGALL; ABRAHÃO, 2021).

In the teaching of Chemistry, this methodology has significant potential by allowing complex concepts to be explored in a more dynamic and contextualized way. It is noted that the flipped classroom contributes to the expansion of opportunities for pedagogical interaction and to the more efficient use of time in the classroom, aspects considered fundamental for working with content that requires greater teacher mediation, such as those present in science teaching (RODRIGUES, 2023).

The flipped classroom can be understood as a methodology that reorganizes the pedagogical process by transferring the initial exposure of the contents to moments prior to

the face-to-face class. In this approach, students access previously available materials, such as texts, videos and other digital resources, allowing them to arrive at the classroom with an initial contact with the content to be worked on. Thus, it is possible for the face-to-face space to be used for activities that promote interaction, problematization and the collective construction of knowledge (NACHTIGALL; ABRAHÃO, 2021).

The organization of the pedagogical process in the flipped classroom requires careful planning on the part of the teacher, who must select and produce materials appropriate to the students' level of understanding, as well as structure face-to-face activities consistent with the learning objectives. Such reorganization favors a more active posture of the student, who starts to assume greater responsibility for his learning process, while expanding the possibilities of monitoring and mediation by the teacher (SAMPAIO, 2022).

The use of digital resources is a central element in the implementation of the flipped classroom, since it enables access to content outside the school environment. Video classes, virtual platforms, and multimodal materials are widely used as support for this methodology, contributing to the diversification of teaching strategies and to the flexibility of the learning pace. Nevertheless, the use of these resources can favor the understanding of the contents and expand access to information, as long as it is accompanied by adequate pedagogical guidance (RODRIGUES, 2023).

In the teaching of Chemistry, the flipped classroom presents relevant contributions by favoring the development of student autonomy. With access to content in advance, students are encouraged to organize their study time, identify doubts, and take a more active stance in the learning process, which contributes to the construction of more meaningful and lasting knowledge (SAMPAIO, 2022).

In addition to autonomy, the literature points out that this methodology promotes greater engagement and protagonism of students during face-to-face classes. By reserving this moment for discussions, problem-solving, and collaborative activities, the flipped classroom favors active participation and dialogue, creating an environment conducive to the collective construction of knowledge and conceptual deepening in Chemistry (SCHUINA, 2024).

Despite the contributions pointed out, some studies also highlight limitations associated with the implementation of the flipped classroom. Among them, the dependence on access to technological resources, the differences in student engagement in extra-class

moments, and the need for greater teacher preparation for the planning and mediation of activities stand out (SAMPAIO, 2022). The limitations in question indicate that the effectiveness of the methodology is directly related to the institutional conditions and the pedagogical follow-up offered to students (NACHTIGALL; ABRAHÃO, 2021).

2.3 PBL AND FLIPPED CLASSROOM IN ELECTROCHEMISTRY TEACHING

The analysis of the literature shows that Problem-Based Learning and the flipped classroom present conceptual and methodological convergences relevant to the teaching of Electrochemistry in High School. Both approaches break with the traditional model centered on the exposure of contents, by prioritizing the active participation of the student, the problematization and the construction of knowledge based on contextualized situations (LINHARES, 2024). Such convergence favors the reorganization of the pedagogical process, allowing the student to assume a central role in learning, while the teacher acts as a mediator and advisor of the proposed activities (VIANA et al., 2020).

From a theoretical point of view, the literature points out that the integration between PBL and the flipped classroom enhances the learning of complex contents, such as those of Electrochemistry, by articulating investigation, previous study and conceptual deepening. PBL contributes by presenting contextualized problems that instigate scientific reasoning, while the flipped classroom reorganizes pedagogical time, allowing the face-to-face space to be used for discussions, clarification of doubts and consolidation of concepts. This articulation favors meaningful learning, by allowing students to relate electrochemical content to real situations and build more consistent conceptual models (ARAUJO, 2021; RODRIGUES, 2023).

Despite the contributions evidenced, the literature also points out gaps related to the integrated approach of these methodologies in the teaching of Electrochemistry. It is observed that many studies analyze PBL and the flipped classroom in isolation or applied to other Science contents, with a smaller number of productions that discuss, in a systematized way, the combination of these strategies specifically for the teaching of Electrochemistry in High School. In addition, limitations are identified regarding the detailed description of the pedagogical proposals and the reflection on the challenges faced in the implementation of these methodologies in different school contexts (LINHARES, 2024; SCHUINA, 2024).

In the meantime, the literature indicates future pedagogical possibilities that involve the elaboration of didactic sequences that integrate, in a planned way, Problem-Based Learning and the flipped classroom for the teaching of Electrochemistry. These proposals can contribute to overcoming conceptual difficulties, promoting greater student engagement and favoring the contextualization of contents, as long as they consider institutional conditions, access to technological resources and the pedagogical training of teachers. Thus, the articulation between these methodologies presents itself as a promising field for the development of innovative pedagogical practices and for the expansion of theoretical discussions in the teaching of Chemistry (ROSA, 2025).

2.4 DIDACTIC SEQUENCE PROPOSED FOR THE TEACHING OF ELECTROCHEMISTRY

The proposition of a didactic sequence based on Problem-Based Learning and the flipped classroom emerges as a pedagogical strategy coherent with contemporary discussions on the teaching of Chemistry, especially with regard to overcoming the difficulties associated with learning Electrochemistry. It is noteworthy that the sequence presented in this research has an exclusively theoretical character, being elaborated from the analysis of the literature, without practical application in a school context, with the objective of contributing to teacher planning and pedagogical reflection in High School.

The didactic sequence can be defined as an organized and progressive set of teaching activities, planned with the aim of favoring the gradual construction of knowledge by students. This organization presupposes the articulation between learning objectives, contents, pedagogical strategies and forms of monitoring the educational process, allowing teaching to occur in a systematic and coherent way (ROSA, 2025).

The progressive organization of teaching is one of the central elements of the didactic sequence, since it enables the resumption of previous knowledge, conceptual deepening and consolidation of contents throughout the proposed stages. In the teaching of Electrochemistry, this progression is especially relevant, considering the complexity and level of abstraction of the concepts involved, which require careful and articulated planning (ARAUJO, 2021).

From the point of view of teacher planning, the didactic sequence corroborates the organization of pedagogical work by guiding the selection of contents, methodologies and didactic resources in an integrated way. The literature points out that the elaboration of

theoretically based didactic sequences favors pedagogical intentionality and expands the possibilities of teacher mediation, especially when associated with active methodologies in the teaching of Chemistry (SCHUINA, 2024).

The proposed didactic sequence is based on the articulation between Problem-Based Learning and the flipped classroom, integrating principles common to these methodologies, such as the centrality of the student, the problematization of the contents and the valorization of the investigative process. This articulation seeks to enhance the learning of Electrochemistry by promoting study situations that stimulate scientific reasoning and the active construction of knowledge (INOCÊNCIO et al., 2019).

The alignment with the learning objectives is another guiding principle of the proposal, ensuring that the suggested activities are in line with the Electrochemistry contents planned for High School. The clear definition of these objectives allows us to guide the progression of the stages of the didactic sequence, favoring conceptual understanding and integration between the different topics addressed, as indicated by the literature on pedagogical planning in science teaching (LINHARES, 2024).

Regarding the roles of the subjects involved, the proposal attributes to the student an active and investigative posture, stimulating autonomy, reflection and collaborative work. The teacher has the role of mediator of the learning process, responsible for guiding activities, proposing cognitive challenges and promoting the articulation between previous knowledge and new concepts. This redefinition of roles is in line with the principles of active methodologies discussed in the literature on the teaching of Chemistry (SAMPAIO, 2022).

Coherence with the curricular guidelines also guides the elaboration of the proposed didactic sequence, ensuring that the contents and suggested strategies are aligned with the guidelines for High School. This concern reinforces the pedagogical character of the proposal, which seeks to contribute to teaching practice without detaching itself from the curricular and formative requirements of basic education (LINHARES, 2024).

The proposed didactic sequence has as its central theme Electrochemistry in High School, with emphasis on oxidation and reduction processes, the operation of electrochemical batteries, electrolysis and electrochemical potential. These contents are organized in an articulated way, considering their conceptual interdependence and the need for progression in teaching, as indicated by the specialized literature (INOCÊNCIO et al., 2019).

The guiding problem-situation is the initial element of the sequence, being elaborated in order to contextualize the electrochemical contents from situations close to the students' reality, such as the use of batteries and corrosion processes. This initial problematization has a theoretical character and seeks to stimulate the raising of hypotheses and conceptual investigation, in line with the principles of Problem-Based Learning discussed in the literature (VIANA et al., 2020).

The contents covered throughout the sequence include fundamental concepts of Electrochemistry, articulated from the proposed problem-situation. As suggested didactic resources, digital materials, guiding texts and video classes stand out, used mainly in moments of previous study, according to the assumptions of the flipped classroom. It should be noted that these resources are indicated in a theoretical way, without description of practical application (NACHTIGALL; ABRAHÃO, 2021).

As for the temporal organization, the didactic sequence is structured in stages, distributed throughout classes or pedagogical moments, respecting the conceptual progression of the contents. This temporal organization has a flexible and adaptable character, being presented as a theoretical proposal that can be adjusted by the teacher according to the school context and the needs of the students (SCHUINA, 2024).

The initial stage of the didactic sequence corresponds to the problematization and activation of the students' previous knowledge, based on the presentation of the guiding problem-situation. In this phase, it seeks to stimulate the initial reflection on electrochemical phenomena, promoting the raising of ideas, questions and hypotheses, according to the assumptions of Problem-Based Learning discussed in the literature (VIANA et al., 2020).

The investigative stage encompasses the guided study of the contents of Electrochemistry, based on previously available materials, in line with the logic of the flipped classroom. In this phase, students are encouraged to deepen their conceptual understanding, identify relationships between contents, and review their initial hypotheses, always under the theoretical mediation of the teacher (RODRIGUES, 2023).

In the systematization stage, the conceptual organization of the Electrochemistry contents occurs, seeking to integrate the knowledge built throughout the investigative process. The phase in question aims to consolidate concepts such as oxidation, reduction, batteries, electrolysis and electrochemical potential, promoting an integrated view of the content, as suggested in studies on didactic sequences in science teaching (ARAUJO, 2021).

Therefore, the synthesis and reflection stage proposes the consolidation of the acquired knowledge, encouraging students to reflect on the learning process and on the application of electrochemical concepts in different contexts. This final stage reinforces the formative character of the proposed didactic sequence, highlighting again that it is a theoretical construction based on the literature, with the potential to support future practical applications in the teaching of Chemistry (SCHUINA, 2024).

3 METHODOLOGY

This research is characterized as a qualitative and bibliographic study, focusing on the proposition of a didactic sequence based on active methodologies for the teaching of Electrochemistry in High School. The qualitative approach is justified by the intention to understand and analyze, in an interpretative way, the theoretical contributions presented in the literature about the teaching of Chemistry, active methodologies and, specifically, Problem-Based Learning and the flipped classroom, without the use of statistical procedures or quantification of data.

As for the type of research, it is a bibliographic review, carried out from the survey, selection and analysis of relevant academic productions on the subject. Works published in the period from 2019 to 2025 were considered, with the objective of ensuring the theoretical and methodological updating of the study. The searches were carried out in the SciELO and Google Scholar databases, as they are widely recognized as reliable sources of scientific production in the area of Science Education and Teaching. The keywords used in the searches were related to the teaching of Chemistry, Electrochemistry, active methodologies, Problem-Based Learning, flipped classroom and didactic sequence.

The nature of the study is classified as a pedagogical proposal, since, from the analysis of the selected literature, a theoretical didactic sequence is elaborated focused on the teaching of Electrochemistry in High School, without practical application in the classroom. This type of approach allows the articulation of theoretical and methodological foundations discussed by different authors, aiming to contribute to teacher planning and to the reflection on innovative pedagogical practices in the teaching of Chemistry.

The methodological procedures initially involved the exploratory reading of the selected works, followed by an analytical reading, focusing on the identification of concepts, pedagogical strategies and results discussed by the authors. Subsequently, the information was systematized, seeking to establish relationships between the studies analyzed and the

research objectives. This process enabled the construction of a consistent theoretical basis for the proposition of the didactic sequence, aligned with contemporary discussions on active methodologies in the teaching of Science.

The criteria used for the elaboration of the didactic sequence included the coherence with the contents of Electrochemistry planned for High School, the articulation between theory and context, the centrality of the student in the learning process and the integration between Problem-Based Learning and the flipped classroom. In fact, the progressive organization of the teaching stages was considered, in order to favor the understanding of electrochemical concepts and the development of scientific reasoning, as pointed out in studies that discuss the elaboration of didactic sequences within the scope of active methodologies.

The choice of active methodologies as the structuring axis of the didactic proposal is based on the literature that shows its potential to promote greater engagement, autonomy and participation of students in the learning process. Problem-Based Learning benefits the contextualization of content and the development of investigative skills, while the flipped classroom favors the reorganization of pedagogical time and conceptual deepening during face-to-face moments, aspects widely discussed in recent research in the teaching of Chemistry and Science.

4 FINAL CONSIDERATIONS

From the analysis of the literature, it was understood the recurrent challenges associated with the learning of this content and to reflect on pedagogical alternatives that favor a more meaningful and contextualized approach in the teaching of Chemistry.

The proposed didactic sequence, of a theoretical nature, presents itself as a relevant instrument for teacher planning, by progressively organizing the contents of Electrochemistry and articulating pedagogical strategies that value the active participation of the student. Its structure highlights the importance of intentional planning, capable of integrating learning objectives, contents and methodologies, contributing to the overcoming of fragmented and excessively transmissive practices in the teaching of this theme.

Regarding the contributions to the teaching of Electrochemistry, the potential of the proposal to favor the understanding of abstract concepts is highlighted, by promoting the problematization, investigation and systematization of knowledge. The articulation between problem-situations and moments of guided study enables a more integrated approach to

the contents, bringing scientific knowledge closer to the students' reality and expanding the possibilities of constructing meanings in the learning process.

Active methodologies, especially Problem-Based Learning and the flipped classroom, demonstrate significant potential for the scientific training of students, by stimulating autonomy, critical thinking and student protagonism. By repositioning the student as an active agent of learning and the teacher as a mediator of the educational process, these approaches contribute to the development of cognitive and socio-emotional skills that are fundamental for comprehensive education in high school.

Among the limitations of the work, the lack of practical application of the proposed didactic sequence stands out, which prevents the empirical analysis of its impacts on the teaching-learning process. In addition, the study is based exclusively on a literature review, which restricts the conclusions to the theoretical discussions presented in the literature analyzed.

In view of this, it is suggested that future research can apply and empirically evaluate the proposed didactic sequence in real school contexts, investigating its effects on student learning and teaching practice. It is also recommended to carry out studies that explore the integration of active methodologies in other Chemistry contents, expanding reflections on innovative pedagogical practices in basic education.

It is concluded that the proposition of a didactic sequence based on Problem-Based Learning and the flipped classroom constitutes a relevant contribution to the teaching of Electrochemistry in High School, by offering theoretical and methodological subsidies for teacher planning and for reflection on more significant pedagogical practices, aligned with the contemporary demands of Science education.

ABSTRACT

The growth in global energy demand, coupled with the environmental impacts caused by non-renewable sources, requires the adoption of public policies aimed at transitioning to renewable sources. In this context, photovoltaic solar energy has stood out as a strategic alternative, especially in regions with high solar incidence, such as the state of Piauí. This study aimed to quantify the economic impact of implementing mini photovoltaic solar power plants within the scope of public-private partnerships (PPPs) in the State of Piauí's Department of Education (SEDUC). The results demonstrated savings in electricity costs (R\$ 1,482,184.04 from March 2024 to February 2025). However, important challenges were identified: inadequate initial planning for the allocation of generation credits and delays in the project schedule. It is concluded that the adopted PPP model presents technical and economic viability, but needs adjustments to maximize its social and environmental impacts.

Keywords: Renewable Energy. Sustainability. Energy Demand. Socioeconomic Development. Economic Impact.

RESUMO

O crescimento da demanda energética global, aliado aos impactos ambientais causados pelas fontes não renováveis, exige a adoção de políticas públicas voltadas à transição para fontes renováveis. Nesse contexto, a energia solar fotovoltaica tem se destacado como uma alternativa estratégica, especialmente em regiões com alta incidência solar, como o Estado do Piauí. Esse estudo teve como objetivo quantificar o impacto econômico da implementação das miniusinas de energia solar fotovoltaica no âmbito das parcerias público-privadas (PPP) do Estado do Piauí na Secretaria de Educação (SEDUC). Os resultados demonstraram economia nos gastos com energia elétrica (R\$ 1.482.184,04 no

RESUMEN

El crecimiento de la demanda mundial de energía, sumado a los impactos ambientales causados por las fuentes no renovables, exige la adopción de políticas públicas orientadas a la transición hacia fuentes renovables. En este contexto, la energía solar fotovoltaica se ha consolidado como una alternativa estratégica, especialmente en regiones con alta incidencia solar, como el estado de Piauí. Este estudio tuvo como objetivo cuantificar el impacto económico de la implementación de minicentrales solares fotovoltaicas en el marco de asociaciones público-privadas (APP) en la Secretaría de Educación del Estado de Piauí (SEDUC). Los resultados demostraron un ahorro en costos de electricidad (R\$ 1.482.184,04 entre marzo de 2024 y febrero de 2025). Sin embargo, se identificaron importantes desafíos: una planificación inicial inadecuada para la asignación de créditos de generación y retrasos en el cronograma del proyecto. Se concluye que el modelo de APP adoptado presenta viabilidad técnica y económica, pero requiere ajustes para maximizar sus impactos sociales y ambientales.

1 INTRODUCTION

The world's energy demand is largely met with the use of energy resources of fossil origin, such as oil, coal, and natural gas, which contribute significantly to the emission of greenhouse gases (GHG). The intensive and uncontrolled use of fossil sources (non-renewable) has caused environmental and social impacts of great proportions. Among these impacts, the intensification of global warming, the degradation of air, water and soil quality and health problems in the population stand out. The combustion of fossil fuels is responsible for the massive emission of GHGs, especially carbon dioxide (CO₂), resulting in global climate change. These environmental impacts are of great concern as they compromise the sustainability and well-being of current and future populations (Kibaara and Karweru, 2022).

In view of this alarming context, it is necessary to promote an energy transition, which consists of the gradual replacement of non-renewable sources with renewable energy sources, sustainable and with low environmental impact (Rana et al., 2020).

In this sense, the movement for energy transition is highlighted in multilateral agreements, such as the Paris Agreement, approved in 2015 by 195 countries and the European Union, within the scope of the 21st Conference of the Parties (COP 21). This treaty set ambitious targets for the reduction of global GHG emissions, with the aim of limiting the increase in the Earth's average temperature to less than 2 °C compared to pre-industrial levels (Meinshausen et al., 2022).

In parallel, also in 2015, the United Nations (UN) instituted the Sustainable Development Goals (SDGs), as part of the 2030 Agenda. This global agenda aims to guide actions by governments, companies, and civil society towards sustainable development by the year 2030 (UN, 2025).

In line with this perspective, several scholars point out that the current energy model, based predominantly on non-renewable sources, has become incompatible with the sustainable development goals established by the 2030 Agenda, especially with regard to SDG 7, which seeks to ensure reliable, sustainable, modern, and affordable access to energy for all (Saccardo et al., 2023).

In Brazil, the growing consumption and socio-environmental impact caused by traditional energy sources (hydroelectric plants, which flood a large area to store water, and thermoelectric plants that produce GHGs by burning fossil fuels) have led the government and society to think of new alternatives for generating electricity (Sousa et al., 2023). The

Brazilian electricity matrix (Figure 1) is mostly dependent on hydroelectric generation, which corresponds to 44.3% of the total (EPE, 2025). However, due to the irregular rainfall regime, the country faces recurrent water crises, which are also reflected in energy crises.

Figure 1

Brazilian Electricity Matrix

Source: Prepared by the author with data from (EPE, 2025).

The search for sustainable and low-GHG energy alternatives is necessary to promote sustainable development (Mele et al., 2021; Dai et al., 2024). Corroborating this perspective, Lira et al. (2019) highlight that photovoltaic solar energy also has additional advantages, such as the absence of direct GHG emissions in the generation process, the reduction of electrical losses, given the proximity of generation to consumer centers, and the reduction of dependence on thermal plants.

In view of the intensification of the problems resulting from the climate crisis, there is an expansion of debates and initiatives aimed at the development and adoption of new energy matrices, among which solar energy stands out (Hecksher, 2024). In Brazil, there is a significant expansion of energy generation through photovoltaic solar sources. This advance was driven by the publication of Normative Resolution No. 482, of April 17, 2012, of the National Electric Energy Agency (ANEEL), which established rules for the insertion of distributed generation in the country and by the favorable scenario of solar irradiation,

especially in the northeast region, with emphasis on the State of Piauí (Rocha & Barra Neto, 2024; Pereira et al., 2017).

The State of Piauí has high potential for generating electricity from photovoltaic solar sources, due to its geographical location in one of the regions with the highest levels of solar radiation in Brazil (Morais et al., 2025). The sectors that most use the photovoltaic solar source for electricity generation are the residential and commercial sectors. On the other hand, the public sector is the one with the lowest percentage of energy generation through solar energy, evidencing the need for more investments aimed at expanding the use of renewable sources (EPE, 2025).

In this context, public-private partnerships (PPPs) emerge as a strategic model of cooperation between the public sector and the private sector, in which both assume responsibilities, risks, and investments in the implementation of projects of collective interest. PPPs have the ability to attract private investments to the sector, so the government is able to dilute the payment of the counterpart over time, without having to invest a high amount. This type of partnership enables the mobilization of private capital for the development of energy projects, while promoting the optimization of public resources. In the electricity sector, PPPs have the potential to accelerate the adoption of photovoltaic technology, contributing to the diversification of the energy matrix, the expansion of installed renewable generation capacity, and the reduction of government spending on the payment of electricity bills (Awuku et al., 2022).

Cooperation between the public and private sectors is essential for strengthening the capacity to generate photovoltaic solar energy. Such initiatives contribute not only to the expansion of installed capacity, through the implementation of photovoltaic systems of different sizes, but also to the promotion of sustainable growth, in line with global guidelines for energy transition and decarbonization of the electricity matrix. International organizations, such as the World Bank, highlight that PPPs are effective instruments to accelerate technological development, reduce investment costs, and mitigate risks associated with the expansion of generation from renewable sources (World Bank, 2023).

Based on this model, the Government of the State of Piauí instituted, in 2018, the Piauí Clean Energy Development Program – PROPIDEL to prepare the project "Public-Private Partnership for the implementation, operation and maintenance of Solar Energy Mini-Plants".

The project was divided into 4 lots, in the form of an administrative concession for the construction, operation, maintenance and management of photovoltaic solar energy generation mini-plants, with management and operation of electricity credit compensation services, and the construction of two mini-plants per lot was planned (SUPARC, 2024).

Mini-plants help promote the energy transition and reduce dependence on non-renewable sources. This project is a pioneering example of PPP in this area. The main objective of the mini-plants is to meet the energy demand of the Government of the State of Piauí (SUPARC, 2024). The generation of electricity through photovoltaic solar sources increases the availability of power in the SIN, reduces electricity expenses and reduces the environmental impacts caused by non-renewable sources. This use directly contributes to the achievement of the Sustainable Development Goals (Soares et al., 2023).

To contribute to the energy transition process and to the strengthening of sustainable development, this work carries out a study of the impacts caused by the implementation of photovoltaic solar energy mini-plants built through PPPs to meet the energy demand of SEDUC in Piauí. The research seeks to answer the following scientific problem: how these mini-plants can contribute to the reduction of SEDUC's electricity costs, promote local socioeconomic development and what are the best guidelines to improve and expand the use of this technology in the context of PPPs.

Understanding these impacts is crucial to justify and optimize investments in renewable energy, aiming at sustainable development and more efficient energy management in the State. The main hypothesis raised was that the implementation of mini-plants can reduce electricity costs and the amount saved can be applied in actions that promote environmental conservation and local social development.

2 METHODOLOGY

The methodological steps include bibliographic review, survey and analysis of public data, development and application of interviews and questionnaires, as well as technical visits.

To obtain a solid theoretical basis on PPPs, renewable energies and mini solar photovoltaic plants, a literature review was carried out. The research was conducted in the academic databases: Brazilian Digital Library of Theses and Dissertations (BDTD), Capes Journal, Scopus, Web of Science and Google Scholar, using combined keywords (solar energy, PPP, socio-environmental impact, economic impact, mini-plants, renewable energy,

sustainability and infrastructure) with the connectors "AND" and "OR". The same keywords were used in English to broaden the search following the methodology used by Xue et al. (2021). After the initial filtering, a critical analysis was carried out on the scientific articles and technical reports found.

To obtain the data related to the mini-plants and the SEDUC of Piauí, which receives the generation credits, those responsible for them were contacted. The requests were made by different means of communication (e-mail, telephone contact, WhatsApp and request protocol directly in the SEDUC protocol sector). The electricity bills (covering the period of 12 months), the list of consumer units that receive the credits with the percentages allocated to each one and the monthly amount paid for the generation of the mini-plant were requested.

With the data from electricity bills, it is possible to compare energy costs, comparing the amounts that would be paid without generation with the amounts paid with the compensation of credits to calculate and evaluate the economic impact.

The combination of these methodological steps allowed a comprehensive and interdisciplinary analysis of the impacts of photovoltaic solar power plants in the scope of PPPs in the State of Piauí. The results obtained contribute to the development of guidelines aimed at improving the implementation of these projects, maximizing the benefits.

2.1 DELIMITATION AND CHARACTERIZATION OF THE STUDY AREA

The area delimited for the study comprises the locations where the mini photovoltaic solar energy plants are installed in the State of Piauí through PPPs of the State Government. These mini-plants represent an important milestone in the development of renewable energy generation in the region (SUPARC, 2024). A total of five photovoltaic solar generation mini-plants were built in three municipalities in the State of Piauí: Altos, Coivaras and Campo Maior (Figure 2).

Figure 2

Location map of the five mini-plants built

Source: Prepared by the Author

The choice of these three municipalities was justified by the high level of solar radiation in these locations, which are among the municipalities with the highest rates of solar irradiation in the State of Piauí (Pereira et al., 2017). Such a climatic condition significantly favors the performance of photovoltaic plants, maximizing their generation and reducing the payback time of investments. Figure 3 shows the graph with the average solar irradiation indices in the municipalities of Altos, Coivaras and Campo Maior in (kWh/m².day).

Figure 3

Average solar irradiation in the municipalities of Altos, Coivaras and Campo Maior in Piauí

Source: Prepared by the Author with data from EPE (2025)

3 RESULTS AND DISCUSSIONS

In this section, the main results and the respective discussions will be presented.

3.1 MINI-PLANTS CONTRACTED BY SEDUC

One of the mini-plants was installed in the municipality of Altos – PI (UFV Nova Longá), with the following coordinates of the installation site: latitude: -5.028271; longitude: -42.439764. UFV Nova Longá, has an installed capacity of 1,350 kW and was connected to Equatorial Piauí's distribution network in April 2023. The plant's infrastructure consists of 2,673 bifacial photovoltaic modules of the TSM-650DEG21C.20 model, with a unit power of 650 Wp, totaling a peak power of 1,737.45 kWp. To convert the energy generated, six TBEA – TS228KTL-HV inverters were installed, with a power of 225 kW each. It uses a support structure with a solar tracking system (*tracker*), which makes it possible to monitor the movement of the sun throughout the day, increasing efficiency in capturing solar radiation. The company responsible for the execution of the project and installation of the system was NETLUX Solar.

The other unit was installed in Coivaras - PI (UFV Longá), with the following coordinates of the installation site: latitude: -5.213587; longitude: -42.284163. The Longá UFV also has the same characteristics as the Nova Longá UFV with different amounts of modules and inverters. It has an installed power of 1,800 kW, consisting of 3,663 photovoltaic modules of 650 Wp, resulting in a total peak power of 2,380.95 kWp. The system has eight TBEA – TS228KTL-HV inverters, with a capacity of 225 kW per unit and

also uses *trackers*. The connection of the plant to the grid of the concessionaire Equatorial Piauí was carried out in May 2023, installed by NETLUX Solar.

The history of electricity generation of the two mini-plants in the period between March 2024 and February 2025 is outlined in Figure 4. It is observed that the months of July 2024 to November 2024 are the months in which we have the highest generation of electricity. This is due to the solar irradiation being higher in these months of the year, as we can see in the solar irradiation graph in Figure 3.

Figure 4

History of electricity generation in kWh of the mini-plants, UFV Nova Longá and UFV Longá, which serves SEDUC built from contract 04/2020

Source: Prepared by the author with data from . (SUPARC, 2024)

The contract signed between SEDUC and GM ENERGIA foresees that these two mini-plants should generate an average of 650,000 kWh per month. The contract also specifies a minimum monthly generation value that is 5% below the contracted average, that is, 617,500 kWh at least.

If the generation supplied does not reach the amount contacted, the company must pay a fine, in addition to the reduction of the amount paid in the month for the generation of the mini-plant. The amount contracted for the monthly purchase of the mini-mill's production was set at R\$ 387,000.00 (three hundred and eighty-seven thousand reais) in 2020, the year the contracts were signed, and this amount is readjusted by the IPCA each

year. In this way, the secretariat increases the predictability of electricity expenses. In 2025, this amount was corrected by the IPCA, as provided for in the contract and was set at R\$ 514,427.06 (five hundred and fourteen thousand, four hundred and twenty-seven reais and six cents).

In the municipality of Altos – PI, we have another mini-plant installed (UFV Altos) built by RIO POTI ENERGIA, to meet the energy demand of SEFAZ. After the start of operation, it was found that the generation of electricity by the mini-plant was much higher than SEFAZ's electricity demand, for this reason this unit was ceded to SEDUC in March 2024.

This photovoltaic minigeneration installation has a nominal capacity of 2,895 kW, and is located in the municipality of Altos – PI. The coordinates of the mini-plant installation site are: latitude: -5.040073; Longitude: -42.427166. It has an installed power of 2,895 kW, and is composed of 7,068 bifacial photovoltaic modules of the RSM110-8-540BMDG model, manufactured by RISEN SOLAR, each with a power of 540 Wp, totaling a peak power of 3,816.72 kWp. It has 13 215 kW inverters and one 100 kW inverter, all from the manufacturer HUAWEI, models SUN2000-215KTL and SUN2000-100KTL, respectively and also has a *tracker*. The connection to the grid of the concessionaire Equatorial Piauí was completed in May 2023. The estimated energy production for this mini-plant is approximately 7,800,000 kWh per year or 650,000 kWh per month.

The history of electricity generation of this mini-plant in the period between March 2024 and February 2025 is outlined in Figure 5.

Figure 5

History of electricity generation in kWh of the mini-plants built from contract 08/2020

Source: Prepared by the author with data from . (SUPARC, 2024)

The contract signed between SEDUC and RIO POTI ENERGIA provides that this mini-plant should generate an average of 650,000 kWh per month and has the same specifications as the contract with GM Energia. In the year 2024, the amount paid per month by SEDUC for the monthly consideration of contract 08/2020 is R\$ 484,858.52 (four hundred and eighty-four thousand, eight hundred and fifty-eight reais and fifty-two cents). In 2025, this amount was corrected by the IPCA, as provided for in the contract and was set at R\$ 511,129.44 (five hundred and eleven thousand, one hundred and twenty-nine reais and forty-four cents).

Until 2023, SEDUC had 35 collective electricity invoices and currently these invoices have been regrouped into 3 collective invoices:

- ✓ Invoice for units served at low voltage, group B.
- ✓ Invoice for units served in medium voltage, group A.
- ✓ Invoice of the administrative center unit in Teresina – PI, group A.

The units of GROUP A pay cheaper for the kWh consumed during off-peak hours (from 8:30 pm to 5:29 pm), so it is not so feasible to offset the consumption of these units with the generation credits of the mini-plants.

Analyzing the consumer units belonging to SEDUC, we obtain a total of 1,046 consumer units. Of this total, 124 are classified in group A and 922 are in group B. The

demand contracted by SEDUC at the headquarters in the administrative center is 700 kW and in the other 123 units of group A it is 9,944 kW.

The average monthly consumption of SEDUC units connected to low voltage (Group B) considering the period from March 2024 to February 2025 is 1,623,045 kWh per month. Regarding the average consumption compensated per month, there is a value of 656,268 kWh/month. This indicates that approximately 40.4% of the total consumption of these units was compensated. The history of energy consumption in kWh and compensated consumption can be seen in Figure 6.

Figure 6

Consumption history of SEDUC consumer units connected to Low Voltage

Source: Prepared by the author with data from SEDUC

The total electricity consumption recorded by SEDUC's low voltage units was approximately 19,476,542 kWh, resulting in an average monthly consumption of 1,623,045 kWh. This consumption value represents an expressive and continuous demand for electricity, compatible with the decentralized functioning structure of the state school network, which covers 922 consumer units distributed throughout the territory of Piauí.

The variability observed between the months reinforces the need for a dynamic strategy for the allocation of distributed generation credits, which takes into account the cycles of higher and lower demand. Even without the variation in allocation, the compensation is benefited because the excess credits in a month have up to 5 years to be

used. The maintenance of a monthly average of more than 1.6 GWh reinforces the potential for economic gains arising from an efficient energy compensation, especially considering the high tariffs applied to low-voltage consumer units.

In this context, the generation from photovoltaic mini-plants represents a strategic instrument to reduce electricity costs, and it is essential that credits are allocated preferentially to this group, which has high consumption and high higher cost per kilowatt-hour, compared to units connected to medium voltage. The prioritization of low-voltage units in SEDUC's energy compensation policy allows maximizing the financial benefits of the PPP, contributing to the fiscal sustainability of the public administration and to the fulfillment of the SDG targets, in particular SDG 7 and SDG 12.

The consumption pattern verified in the low voltage units of SEDUC shows both the high demand and the opportunity to increase the economic efficiency of the distributed generation project, through energy planning that considers the seasonal specificities of the state school network and optimizes the allocation of available electricity credits.

The analysis of the energy consumption of the Headquarters Unit of the State Department of Education (SEDUC), located at the Administrative Center in Teresina – PI, from March 2024 to February 2025, reveals that the unit had a total consumption of 1.59 GWh, with a monthly average of 132,403 kWh. Most of this consumption occurred during off-peak hours, totaling 1.50 GWh, while 86,349 kWh were recorded during peak hours. It is observed that consumption was fully compensated with generation credits over the twelve months (Figure 7), resulting in a compensation percentage of 100%.

Although this result of offsetting all consumption may seem to be the ideal scenario, a critical evaluation is necessary from the perspective of economic optimization of credit allocation. The Headquarters Unit is connected to medium voltage, which implies lower energy tariffs than those applied to low-voltage consumer units. In practical terms, the cost avoided by offsetting thirst consumption is significantly lower than the cost avoided by offsetting the same volume of power in low-voltage units.

Figure 7

Consumption history of the SEDUC Headquarters in the Administrative Center

Source: Prepared by the author with data from SEDUC

Thus, the full allocation of generation credits to the Headquarters Unit, although technically effective, is not the best strategy from a financial point of view. The ideal model, in terms of maximizing the tax savings generated by the PPP, consists of prioritizing the compensation of low voltage units, whose energy is priced at higher values, thus ensuring a more significant financial return for each kWh compensated. The Headquarters Unit, in turn, must be compensated only when there is a surplus of generation credits after all units of the grid connect to low voltage.

Adopting this strategy of hierarchical allocation of credits (with prioritization based on the cost of energy) would maximize the economic impact of the distributed generation project, enhancing the savings provided by the PPP and reinforcing the financial sustainability of the public policy.

It is observed, therefore, that the decision to fully compensate the consumption of the Headquarters Unit, although operationally viable, does not represent the best practice in terms of public energy policy, given the current tariff structure. The analysis recommends reviewing the strategy for allocating generation credits, based on economic and tariff criteria, in order to ensure the maximum effectiveness of the PPP in meeting the principles of economy, efficiency and sustainability, as recommended by the SDGs.

The evaluation of the energy consumption of the SEDUC units connected to medium voltage during the period analyzed, shows that the medium voltage units recorded a total consumption of 11,599,502 kWh, with a monthly average of 966,625 kWh. Of this total, 3,617,887 kWh were effectively compensated, resulting in an average compensation index of 31.36%. Although this percentage can be considered modest, it should be interpreted with caution: medium voltage units, despite their high absolute consumption, as already mentioned in the consumption analysis of the SEDUC headquarters unit, have a lower value charged per kWh than low voltage units. Thus, each kWh compensated in this group generates a lower financial return for the public administration. Figure 8 shows the monthly consumption in the period analyzed.

Figure 8

Consumption history of SEDUC consumer units connected to Medium Voltage

Source: Prepared by the author with data from SEDUC

In this context, maintaining or expanding the compensation of these units, while there is still a significant deficit of compensation in low-voltage units (which pay higher tariffs), does not represent the most efficient allocation of available generation credits. The analysis of the data shows that low voltage units, despite representing a relevant portion of consumption, have been partially compensated (on average 43%), maintaining monthly deficits above 960,000 kWh.

Therefore, from the perspective of maximizing the economic benefit of the PPP, the ideal would be that all generation credits from mini-plants should be allocated primarily to low-voltage units. Only after the full compensation of this group should the eventual surplus be directed to medium voltage units. This allocation logic respects the principle of economy and seeks the highest possible financial return per unit of energy compensated.

To analyze the economic impact, the amount paid monthly to the companies of the mini-plants was compared and the amount that would be paid without generation credits was calculated. The analysis was made for the credits of each contract. Figure 9 shows the history of offset credits for the mini-plant of contract 04/2020 and the amounts paid to the company proportional to the generation received and the amount that would be paid to Equatorial Piauí without considering the generation credits.

Based on the data presented in Figure 9, it is possible to identify savings in electricity expenses, directly reflecting the positive effects of distributed generation.

In the period from March 2024 to February 2025, the energy compensation resulted in a total saving of R\$ 1,482,184.04, which is equivalent to an average monthly saving of approximately R\$ 123,515.34. This amount represents the difference between what would be paid by SEDUC in a scenario without its own generation and the amount actually paid proportional to the volume of energy compensated with credits from the mini-plants.

Figure 9

History of offset generation credits and amounts paid for generation credits related to contract 04/2020

Source: Prepared by the author with data from SEDUC

The month with the highest savings was October 2024, with an amount saved of R\$ 239,671.61. It is observed that the months with the lowest savings were the months of January and February 2025. This reduction in savings occurred due to the reduction in the value of the energy tariff by Equatorial and the increase in the amount to be paid for the monthly consideration to the company, which is corrected by the IPCA every year.

The savings generated are particularly relevant considering the context of growing operating expenses of the public administration with electricity. In addition, it is a recurring saving, which is renewed with each billing cycle and contributes to the relief of the public budget, without compromising the quality of the services provided by the school units.

The same analysis was also carried out for the mini-plant of contract 08/2020, as can be seen in Figure 10.

Figure 10

History of offset generation credits and amounts paid for generation credits related to contract 08/2020

Source: Prepared by the author with data from SEDUC

In the period analyzed, the energy compensated by the plants linked to contract 08/2020 enabled a total saving of R\$ 1,499,163.08, which corresponds to an average monthly saving of R\$ 124,930.26. This saving is calculated as the difference between what would be disbursed without the use of generation credits and the amount actually paid proportional to the compensated consumption.

The month with the greatest savings was August 2024, when the amount saved reached R\$ 187,234.30, possibly due to higher photovoltaic generation associated with the peak of solar irradiance and the good allocation of credits to units with higher tariff costs.

These results confirm the effectiveness of Contract No. 08/2020 as a public policy tool for reducing current expenses with electricity. The recurring monthly savings obtained over a budget year provides not only tax relief, but also the opportunity to redirect resources

to other areas of education, such as school infrastructure, food, transportation, or teacher training.

4 CONCLUSION

The energy transition to renewable sources, especially solar photovoltaics, is an urgent need in the face of the climate and environmental challenges that the world is facing. In Brazil, and particularly in the State of Piauí, the potential for solar energy generation is great, as it has high levels of solar radiation all year round, but it is still underutilized.

The government must lead this energy transition policy for the use of renewable sources. PPPs are vital instruments to assist this transition, significantly increasing the contribution of generation through renewable sources by the government, offering a collaborative model that can help overcome the financial and technical obstacles that limit the expansion of renewable energy energy.

From a technical point of view, it can be proven that the performance of the mini-plants was satisfactory, with all units managing to reach the contracted value of average monthly generation of 650,000 kWh. All installations have *tracker technology*, which allows the photovoltaic modules to be directed according to the position of the sun to increase the facility's generation capacity. These mini-plants were the first to be installed in the state of Piauí with this type of mechanism.

Regarding the economic analysis, the implementation of the mini-plants resulted in significant savings in the energy bills of the secretariat. The savings generated between March 2024 and February 2025 (12 months) totaled R\$ 1,482,184.04, with a monthly average of R\$ 123,515.34. The peak of savings was observed in October 2024, with R\$ 239,671.61 saved, while the lowest amount occurred in February 2025, reflecting tariff adjustments by the distributor and contractual correction of the consideration.

The analysis of consumption at the SEDUC Headquarters Unit, located in the administrative center in Teresina, revealed a total of 1,588,830 kWh consumed in the 12-month period, of which 1,502,481 kWh occurred during off-peak hours and 86,349 kWh during off-peak hours. All consumption was offset with generation credits, reaching 100% offset. However, the total compensation of the Headquarters unit, connected to medium voltage, proved to be financially less advantageous than the compensation of the units in low voltage, whose tariff is higher. Thus, it was found that the strategy of compensating all with consumption of the headquarters unit, from an economic point of view, is not the best

option. Initially, all units connected to low voltage must be compensated and only compensate the consumption of units served at medium voltage if there are still generation credits left.

However, the project also highlighted structural problems and challenges that compromise its efficiency. The main one was the lack of planning taking into account the energy demand of each government agency that benefited. The inadequate initial allocation of generation from the mini-plant contracted to the Department of Finance (SEFAZ), for example, whose monthly demand was lower than the contracted generation capacity, was one of the main problems found. This distortion was corrected with the transfer of the generating unit to SEDUC, with compatible demand, but the episode revealed flaws in prior planning and in the estimation of the real demand of public agencies.

Piauí's experience in implementing solar mini-plants via PPP is successful in terms of technical feasibility and contribution to the energy transition. However, maximizing its benefits requires greater integration between technical planning, local public policies, and social engagement. The replication and expansion of this model depends on strengthening governance, improving demand diagnostics, and adopting inclusive strategies that consolidate environmental and social gains with affected communities. Such measures can amplify the positive effects of PPPs, consolidating mini-plants as effective instruments of energy, environmental and social public policy.

ABSTRACT

Fentanyl is a powerful synthetic opioid (manufactured in laboratories), 50 times more potent than heroin and 100 times stronger than morphine. In Mexico, it is classified under the General Health Law as a narcotic whose medical use is legal and regulated and supervised by the Federal Commission for the Protection against Sanitary Risks (COFEPRIS). “Fentanyl is a chemical substance that began to be used for medical purposes, indeed as an anesthetic, replacing morphine. However, parallel to this use, an entire black market emerged to use it in the production of drugs sold on the streets of the United States, which has caused this public health crisis” (Ágreda, 2025). Initially, its use was restricted to cardiac surgeries, as it could assist both the required sedative effect and postoperative pain management. Currently, it is used in combination with anesthetics during surgeries or for very intense pain, such as in the terminal stages of cancer. After the original injectable medical formulation, several other forms were developed, including transdermal patches, tablets, sprays, and lozenges, with the aim of providing broader administration options. The Sinaloa Cartel (SC) was the first to identify the business potential represented by fentanyl, followed by the Jalisco New Generation Cartel (CJNG) and other criminal groups. “One kilogram of fentanyl earns the cartel approximately USD 200,000 in the United States” (Grant, 2024). The leading cause of death from overdoses involving synthetic opioids in the United States is fentanyl, triggering a severe public health crisis; according to the Centers for Disease Control and Prevention (CDC), from 2021 to 2023 overdose deaths exceeded 100,000 annually. The reduction in fentanyl overdose deaths is largely attributed to the use of naloxone, known as Narcan, which rapidly restores normal breathing in overdose cases; however, its effects last only 30 to 90 minutes and require immediate medical attention. In Mexico, naloxone is classified as a psychotropic medication and is highly controlled, intended mainly for hospital use and requiring a prescription. In the United States, organized crime groups based in Mexico control the fentanyl supply to the U.S. drug market, particularly the Sinaloa Cartel (SC) and the Jalisco New Generation Cartel (CJNG), and in several cases local and regional U.S. criminal groups have mixed fentanyl with heroin to maximize profitability.

Keywords: Fentanyl. Synthetic Opioid. Cartels. Business. Profitability. Naloxone.

RESUMO

O fentanilo é um potente opioide sintético (fabricado em laboratório), 50 vezes mais potente que a heroína e 100 vezes mais forte que a morfina. No México, é classificado na Lei Geral de Saúde como um entorpecente cujo uso médico é legal, sendo regulado e fiscalizado pela

¹ Dr. in Teaching Methodology. Universidad Autónoma de Zacatecas. Zacatecas, Mexico.
E-mail: jigr1965@hotmail.com Orcid 0000-0002-3351-429X

Comissão Federal para a Proteção contra Riscos Sanitários (COFEPRIS). “O fentanilo é uma substância química que começou a ser utilizada para fins médicos, de fato como anestésico, substituindo a morfina. No entanto, paralelamente a esse uso, abriu-se um amplo mercado negro para sua utilização na produção de drogas vendidas nas ruas dos Estados Unidos, o que causou esta crise de saúde pública” (Ágreda, 2025). Inicialmente, seu uso era restrito a cirurgias cardíacas, pois auxiliava tanto no efeito sedativo necessário quanto no controle da dor pós-operatória. Atualmente, é utilizado em conjunto com anestésicos durante cirurgias ou para o tratamento de dores muito intensas, como nas fases terminais do câncer. Após a apresentação médica original injetável, foram desenvolvidas diversas formulações, como adesivos transdérmicos, comprimidos, sprays e pastilhas, com o objetivo de ampliar as opções de administração. O Cartel de Sinaloa (CS) foi o primeiro a identificar o potencial de negócio representado pelo fentanilo, seguido pelo Cartel Jalisco Nova Geração (CJNG) e outros grupos criminosos. “Um quilo de fentanilo gera ao cartel cerca de US\$ 200.000 nos Estados Unidos” (Grant, 2024). A principal causa de morte por overdose de opioides sintéticos nos Estados Unidos é o fentanilo, desencadeando uma grave crise de saúde pública; segundo dados dos Centros de Controle e Prevenção de Doenças (CDC), de 2021 a 2023 as mortes por overdose superaram 100.000 por ano. A redução das mortes por overdose de fentanilo deve-se em grande parte ao uso da naloxona, conhecida como Narcan, que restaura rapidamente a respiração normal em casos de overdose; entretanto, seus efeitos duram apenas de 30 a 90 minutos, sendo necessária atenção médica imediata. No México, a naloxona é classificada como medicamento psicotrópico e altamente controlado, com uso predominantemente hospitalar e exigência de prescrição médica. Nos Estados Unidos, grupos de criminalidade organizada com base no México controlam o fornecimento de fentanilo ao mercado norte-americano, especialmente o Cartel de Sinaloa (CS) e o Cartel Jalisco Nova Geração (CJNG), e em diversos casos grupos criminosos regionais e locais dos Estados Unidos misturaram fentanilo com heroína para maximizar a rentabilidade.

Palavras-chave: Fentanilo. Opióide Sintético. Cartéis. Negócio. Rentabilidade. Naloxona.

RESUMEN

El fentanilo es un fuerte opióide sintético (fabricado en laboratorio), 50 veces más potente que la heroína y 100 veces más que la morfina. En México está clasificado en la Ley General de Salud como un estupefaciente cuyo uso médico es legal y está regulado y vigilado por la Comisión Federal para la Protección contra Riesgos Sanitarios (COFEPRIS). “El fentanilo es una sustancia química que se empezó a utilizar para uso médico, en efecto, como anestesia, sustituyó a la morfina. Pero, paralelamente a este uso, se abrió todo un mercado negro para utilizarlo en la producción de drogas que se venden en las calles en Estados Unidos, y que ha causado esta crisis de salud pública”. (Ágreda, 2025) Inicialmente su uso estaba restringido a cirugías de tipo cardíaco, porque podía ayudar tanto al efecto de sedación requerido como al dolor asociado postoperatorio. Actualmente, se le utiliza junto a anestésicos durante cirugías o para dolores muy intensos como son las etapas terminales de cáncer. Posterior a la presentación original inyectable para uso médico, se desarrollaron diversas formulaciones como parches transdérmicos, tabletas, spray y paletas comestibles, con el objetivo de proporcionar opciones de administración más amplias. El Cártel de Sinaloa (CS) fue el primero en detectar el potencial de negocio que representaba el fentanilo. Posteriormente, el Cártel Jalisco Nueva Generación (CJNG) y otros grupos criminales se sumaron al tráfico de esta droga. “Un kilo de fentanilo le hace ganar al cártel unos 200,000 USD en EE.UU.”. (Grant, 2024) La causa principal de muerte por sobredosis con opioides sintéticos en Estados Unidos es por fentanilo lo que ha provocado una grave crisis de salud pública, que según datos de los Centros para el Control y la Prevención de Enfermedades (CDC, por sus siglas en inglés), durante tres años consecutivos del 2021 al 2023 las muertes por sobredosis superaron las 100,000. La disminución de muertes por sobredosis de

fentanilo se debe en gran parte al uso del medicamento naloxona, conocido como narkan, ya que restablece con rapidez la respiración normal de una persona que respira lentamente o ha dejado de respirar a causa de una sobredosis de drogas. Aunque la naloxona revierta la sobredosis por opioides como el fentanilo, la heroína, la oxicodona (OxyContin), la hidrocodona (Vicodin), la codeína y la morfina, los efectos son temporales de 30 a 90 minutos, la cual requiere atención médica inmediata. En México, la naloxona está clasificada como un medicamento psicotrópico y, por lo tanto, es una sustancia altamente controlada. Su uso está destinado principalmente para el ámbito hospitalario y requiere receta médica para su adquisición. En Estados Unidos, los grupos de delincuencia organizada con base en México actualmente controlan el suministro de fentanilo al mercado de drogas estadounidense. Entre ellos se encuentran grupos bien establecidos como el Cártel de Sinaloa (CS) y el Cártel Jalisco Nueva Generación (CJNG). En varios casos, grupos delictivos regionales y locales de Estados Unidos han mezclado fentanilo con heroína para maximizar la rentabilidad.

1 INTRODUCTION

"Fentanyl is a synthetic drug, which was introduced in 1960, for clinical use (as an anesthetic and for the treatment of chronic and intense pain) in order to replace morphine and other opioids (derived from opium, which is a mixture of substances generated by the poppy flower or opium poppy (*Papaver somniferum*)). It was first synthesized by Dr. Paul Janssen and approved by the Janssen Company of Beerse in Belgium in December 1960 and by the Food and Drug Administration (FDA) of the United States of America in 1968." (Rosas Carrasco, 2023)

The drug epidemic in the United States known as the "fentanyl crisis" was due to medical malpractice in the 80s. Although opioids have always been used to treat very severe pain, 45 years ago the pharmaceutical company Purdue Pharma synthesized oxycodone, a semi-synthetic opioid, which it marketed under the name OxyContin.

"A letter published in the New England Journal of Medicine (NEJM), with a single paragraph of about 100 words, argued that prescription opioids, such as oxycodone, did not cause addiction, so it began to be cited by Purdue Pharma as evidence that opioid use posed no risk.

The letter written by Jane Porter and Dr. Hershel Jick, in 1980, described the analysis that was made of more than 11 thousand patients at Boston University Medical Center, who received opioids for pain, of which, the letter stated, only 3 developed dependence, but it referred to hospitalized patients under medical treatment.

From the 90s onwards, an aggressive marketing campaign was carried out, which argued that the drug was not addictive, this, coupled with the prestige of the medical journal, helped to flood pharmacies and doctor's offices throughout the country with oxycodone and to cement the idea that opioids prescribed for pain were safe.

The commercialization of oxycodone unleashed a great demand among addicts and became the breeding ground for the arrival of fentanyl illegally in the United States, which along with other opioids, has become the cause of the worst public health crisis in that country." (Avendaño, 2025)

It can be found mixed with other drugs such as heroin, cocaine, methamphetamine and ecstasy, which makes the use of any of these substances even more dangerous.

Illicitly manufactured fentanyl has a process similar to pills and with a presentation similar to candy. It can be given as an injection, in a patch that you put on your skin, or as a lozenge that dissolves in your mouth.

It is a drug that is commonly used in surgical interventions as an anesthetic and as an analgesic to treat intense pain in multiple health conditions, including cancer or chronic pain that is resistant to other types of medications.

"Fentanyl acts on the central nervous system (CNS) to relieve pain, but in doses close to two milligrams it causes overdose. The production of fentanyl in Mexican territory, which is destined for the United States, is carried out in clandestine laboratories with the presence of criminal groups, while the precursors used are imported from China, Taiwan or India. It is worth mentioning that, in Mexico, the medical use of fentanyl is well regulated and penalized under the current General Health Law." (González Lozano, 2023)

In Mexico, fentanyl is classified as a controlled narcotic by the General Health Law (Article 234), as it represents a public health risk due to its potential for dependence or addiction.

At first, the fentanyl trafficked to the United States came from China, but according to reports from the Drug Enforcement Administration (DEA), the Attorney General's Office (FGR) and the Ministry of Finance and Public Credit (SHCP), the procedure changed in 2017, as Mexican cartels began importing chemical precursors to make fentanyl in their own laboratories.

In Mexico, criminal organizations carry out the production of fentanyl in clandestine laboratories, which according to data from the Ministry of National Defense (SEDENA) these narco-laboratories are located in towns in Michoacán, Jalisco, Sinaloa, Durango or Baja California with the presence of the Jalisco New Generation Cartel (CJNG) and the Sinaloa Cartel (CS); and where other drugs, such as cocaine and heroin, and chemical precursors are also introduced from China, Taiwan and Hong Kong.

Various Mexican public security institutions "point out that the states of Sinaloa, Sonora, Baja California Sur, Durango, State of Mexico and Mexico City, is where they have located and destroyed the largest number of clandestine laboratories for the manufacture of fentanyl." (Flores Martínez, 2022)

"The production of fentanyl goes directly to the city of Tijuana in Baja California, facilitating its entry into the United States through San Diego, an area with the highest number of fentanyl seizures according to the DEA and Customs and Border Protection." (González Lozano, 2023)

The U.S. Department of Justice The U.S. indicates that there are 5,000 places in China that produce fentanyl or chemical precursors for the manufacture of this synthetic drug.

The precursor chemicals are transported from China to Mexico across the Pacific Ocean in containers from ships that arrive at the ports of Manzanillo, Colima and Lázaro Cárdenas, Michoacán. The main international airports to which these precursors arrive are Culiacán, Manzanillo and Mexico City.

This synthetic drug has acquired various names on the streets of cities in the United States: Apache, China Girl, China Town, Dance Fever, Friend, Goodfellas, Great Bear, He-Man, Jackpot, Kink Ivory, Murder 8, Poison, Tango and Cash. In Latin America, it is known as White or Synthetic Heroin, N-30, Fenta, Tango, China White or OxyContin. These terms are frequently used on the streets because fentanyl is sold alone or mixed with other substances, such as heroin, cocaine or methamphetamine, often without the consumer's knowledge and alludes to its potency or the effects that traffickers claim it produces.

Fentanyl can be consumed in different ways: powdered or smoked; in pill form it is ingested; There are also liquid presentations applied in patches or on blotting paper.

It is marketed alone or mixed with heroin, cocaine or crack. The tablets, known as rainbow fentanyl, usually have bright colors that, according to the DEA, only serve to identify the cartel responsible for distribution in each market.

In the case of patches, there are 12, 25, 50, 75 and 100 micrograms/hour. Illegal fentanyl in liquid form also circulates on the black market as a nasal spray, eye drops, applied on paper or in small treats.

"U.S. law enforcement authorities have documented the numerous ways Mexican criminal groups are trying to increase their ability to supply this market: Smuggling chemicals in legitimate commercial shipments; mislabeling shipments to avoid investigation by law enforcement authorities; diverting supplies from lawful purchases to the chemical or pharmaceutical sectors; and making open purchases of supplies on the web." (FATF, 2022)

2 OBJECTIVES AND GOALS

The main objective of this research is to analyze the diversification of the illicit activities of drug cartels, with special emphasis on the production and commercialization of fentanyl in its different presentations, due to the high profitability that this illicit market represents.

3 MATERIALS AND METHODS

The main sources of this research are documents such as laws in force in Mexico, reports, bulletins, interviews, executive summaries, books and magazines that talk about the fentanyl crisis, national and local newspapers that on numerous occasions and very frequently present articles denouncing this type of crime, as well as official websites and studies that experts have carried out on the subject.

Therefore, it is considered that this work is of a documentary and descriptive nature.

4 RESULTS

The public health crisis facing the United States has its origin when the FDA authorized through its pharmaceutical companies the sale of synthetic opioids such as oxycodone, which is a medication used for pain, which can eventually generate dependence.

The DEA began detecting the problem in 2014, when some addicts of pain medications in the U.S., such as oxycodone, began using fentanyl in pills that looked like prescription drugs.

Mexican cartels visualized the profits from the big fentanyl business and, as they did with methamphetamines, they already dominate the U.S. market.

The current extensive clientele of Mexican criminal organizations was created by U.S. laboratories, by prescribing the indiscriminate use of highly addictive opioid painkillers.

Doctors were writing opioid prescriptions to patients who didn't need them, knowing they were maintaining their dependence and increasing the labs' revenue.

"The place that fentanyl now occupies in the position of demand for opioids and opioids in the United States is because of the restriction that has been given in North America to the liberal prescription of medicines, such as Vicodin, tramadol and oxycontin." (Reyes, 2020)

"Due to its high addictive potential, low cost and the relative ease of its illicit production, small amounts of the psychoactive substance can produce large economic gains for organized crime groups, which stimulates the growth of illicit markets." (CONASAMA, 2024)

There are already other synthetic drugs more potent than fentanyl on the consumer market, but this is still the most widely consumed in the U.S. and is present in most of the substances circulating in that country, such as cocaine, heroin and marijuana, with one kilo

of fentanyl a million doses are produced and on the black market it is usually mixed with these substances to obtain a more potent product.

According to DEA reports, "cooks" produce over-the-counter tablets with very low doses of fentanyl, and at other times increase them, to such an extent that a single pill can kill three people by overdose. This explains the high number of deaths due to excessive consumption of this synthetic drug.

"In Mexico, fake tablets are manufactured that look very similar to any other drug produced, apparently, legally in the United States, with very exact dosage information, but in reality they are adulterated pills that contain 1 or 2 milligrams of fentanyl, which makes them extremely dangerous. The data that confirms the above is based on seizures made by the Border Patrol, the DEA and the Federal Bureau of Investigation (FBI), agencies that have analyzed the percentages of fentanyl in them and have discovered that the doses vary. Some are very low and others are fatal at the first consumption, as they are overrun." (Ravelo, 2025, p. 9)

Criminal organizations recruit children to help them traffic fentanyl. e.g. a 17-year-old drug trafficker and cartel hitman is paid about \$1,000 to take him north.

"One kilo of fentanyl generates half a million fatal doses, but criminal groups can obtain many more, up to twice as many." (Gómez Mena, 2024)

Traffickers often illegally mix fentanyl with other drugs such as heroin, cocaine, or methamphetamine, or press it into counterfeit pills, increasing the risk of accidental overdose for consumers who don't know they are ingesting this potent substance.

Someone can take a pill without knowing it contains fentanyl, it is also possible for them to take a pill knowing it contains fentanyl with no way of knowing if it contains a lethal dose.

The leading cause of death from fentanyl overdose is primarily due to illicitly manufactured fentanyl.

You can't tell if a drug is fake or legitimate unless it's prescribed by a licensed medical professional and distributed by a legitimate pharmacy. Without lab testing, there's no way to know how much fentanyl is in an individual pill or how much may have been added to another medication.

In the medical field, fentanyl requires exact doses so as not to cause respiratory arrest. However, the drug addict ends up consuming disproportionate amounts that cause death.

For the Sinaloa Cartel (CS), the cost of setting up the infrastructure of a laboratory ranges between 150,000 and 200,000 pesos per month, while accessing the recipe to manufacture fentanyl can be easily consulted on the Internet.

"The cost to produce fentanyl is also low, since it takes about 3,500 dollars to acquire a kilo of pure fentanyl, with which millions of doses can be generated without requiring large quantities of chemical precursors.

In addition, the payment for security can reach the sum of 20 thousand pesos and only between two and six people are needed to set up an industrial-sized operation. Profits reach up to 3 thousand dollars for each kilogram. Other reports indicate that producing 4.5 tons of fentanyl - enough to cover a year's demand - requires an investment of approximately 22.5 million dollars. However, the profits double that figure, as they exceed 41 million dollars." (Ravelo, 2025, p. 12)

"The FDA approved naloxone as a prescription drug decades ago, but access increased exponentially in 2023, when the agency approved an over-the-counter nasal spray version of the drug. And medications prescribed to treat opioid use disorder — specifically, buprenorphine and methadone — also save lives." (Mogg, 2025)

Fentanyl test strips, which identify whether another drug contains the opioid, are available over-the-counter, are inexpensive and typically deliver results in 5 minutes or less, which can mean the difference between life and death. Even if a negative result is obtained, the user should exercise caution: reactive tests do not always identify drugs similar to fentanyl, some of them much more potent.

The only way to avoid an overdose is to never use fentanyl without medical advice. "Any use of fentanyl without a prescription is life-threatening." (Mogg, 2025)

5 DISCUSSION

The public discussion about fentanyl in Mexico often mixes two different phenomena: medicinal fentanyl, legal and necessary in the health sector, and illicit fentanyl, produced in clandestine laboratories and linked to the overdose crisis in the United States. This confusion has generated misinformation, ambiguous policies, and reforms that make it difficult to access medical fentanyl, causing shortages and direct impacts on the work of the medical community.

While in the United States there is a crisis due to illegal fentanyl consumption, in Mexico there is no official evidence of a similar problem; however, the existence of

production and transit of illicit fentanyl is recognized. Even so, the Mexican government has adopted a war narrative focused on the "combat" of the substance, privileging security strategies and the participation of the armed forces, without distinguishing between medical and illegal uses.

Illicit fentanyl is presented in powder or pills without sanitary control, while medicinal fentanyl is manufactured by pharmaceutical companies under strict regulation and is used in anesthesia, intensive care and severe pain management. Despite this difference, official proposals such as the prohibition of medical fentanyl show the lack of clarity in public discourse.

In addition to the military approach, Congress has approved reforms that increase penalties for crimes related to fentanyl and its precursors, including automatic imprisonment, which violates human rights principles. At the same time, between 2017 and 2024, decrees were issued that further tighten the control of licit fentanyl, generating excessive procedures, new bureaucracies and restrictions that have affected the availability of the drug.

Interviews with anesthesiologists show that the shortage of the drug has led to cancellations of surgeries, the use of less effective alternatives and an environment of uncertainty and stigma towards doctors. "Between 2021 and 2024, the press reported the arrest of at least four anesthesiologists, whose accusations are related to medicinal fentanyl." (Treviño Rangel & Velázquez Moreno, 2025)

Taken together, these policies do not seem to curb illicit fentanyl trafficking, but they have negatively impacted medical work and patients' access to safe treatments, evidencing a more moral and punitive approach than public health.

In addition, the blows to the drug cartels have not been enough, despite the fact that many seizures have occurred in both the U.S. and Mexico. It is a crisis that keeps the U.S. government and now the Mexican government on alert. Seizures of the drug and its chemical precursors in ports, air terminals and highways are becoming more and more frequent.

One of the strongest blows dealt by the authorities to the Sinaloa cartel occurred in December 2024 when they seized 20 million pills in the Sinaloa demarcations of Ahome and Guasave. "With this seizure, it is estimated that 8 billion pesos or 400 million dollars will have an economic impact on organized crime. There is no precedent for a seizure of this magnitude." (Muñoz et al., 2024)

The expansion of fentanyl cannot be understood without looking at the pharmaceutical precedent in the United States. Firms such as Purdue Pharma created a market "based on corruption", where doctors were pressured and financially rewarded to prescribe opioids on a massive scale.

Mexican criminal groups cannot be exonerated for having expanded addictions, but there is a precedent. Pharmaceutical companies in the United States created a very large market based on corruption, corrupted many doctors with financial support to prescribe fentanyl for everything.

This network of complicities resulted in an entire population hooked on opioids, a scenario that was later exploited by Mexican cartels.

6 CONCLUSION

The United States is facing a serious public health crisis due to the ongoing epidemic of synthetic drug addiction, where fentanyl continues to be the leading cause of overdose deaths.

According to the Centers for Disease Control and Prevention (CDC), for three consecutive years from 2021 to 2023, overdose deaths exceeded 100,000, above the number of deaths from traffic accidents and firearms.

The "anti-narco-terrorist" approach, which includes unilateral U.S. military action against drug cartels and other Latin American gangs or criminal groups now called foreign terrorist organizations, will not reduce drug use in the United States.

"U.S. supply-side drug policies, such as the so-called kingpin strategy (or the focus on the heads of criminal organizations), have proven ineffective in addressing the nation's drug epidemic. A focus on the demand and distribution of synthetic drugs within the United States is needed, which must be considered in order to implement a successful comprehensive anti-drug strategy, since the demand for drugs generates its own demand." (Correa Cabrera, 2025)

Fentanyl has established itself as the most profitable business of Mexican drug trafficking. Its low production cost, ease of transport, and high demand in the United States make it an ideal product for cartels. The multimillion-dollar profits have strengthened the operational capacity of groups such as the Sinaloa Cartel (CS) and the Jalisco New Generation Cartel (CJNG), which control the entire value chain, from the import of precursors to international distribution.

Combating this phenomenon requires more than military operations: it requires international cooperation, financial control, preventive education, and public health policies that reduce demand. Only a comprehensive approach will mitigate the health and economic crisis that fentanyl represents for North America and the world.

In Mexico, injectable naloxone is classified as a psychotropic medication and, therefore, its sale and use are strictly regulated, requiring a prescription for its acquisition in pharmacies.

Currently, it is not available for over-the-counter sale in the country. The official position of the Mexican government has been to maintain the regulation and not allow its commercialization without a prescription, unlike other countries such as the United States, where the nasal spray naloxone (Narcan) has been approved for over-the-counter.

Naloxone is listed in section IV of article 245 of the General Health Law as a psychotropic substance. It can only be purchased with a doctor's prescription. It is available in the health system and specialized pharmacies, but its access is limited to the general public due to the need for a prescription. There have been initiatives in the Senate to remove naloxone from the list of psychotropic substances and thus allow wider access, but so far, the regulation is maintained.

Because of these restrictions, there have been reports of people smuggling small amounts of naloxone from the United States for harm reduction programs, given the risk of fentanyl overdose.

In Mexico, naloxone should be declassified as a dangerous substance because it reverses opioid overdoses. This medication does not cause addiction; It allows the person to breathe and not die in a short time. In the United States the version is unassailable; with heroin you need one dose and with fentanyl two. The World Health Organization (WHO) has expressed that it should not be restricted, but in Mexico the drug is in injected form. A person with an overdose has to get a doctor who has prescriptions for controlled drugs, then go to the pharmacy to buy it and then have someone inject it, while this is happening he has already died.

"José Manuel Castrejón, director of the Monte Fénix Center for Higher Studies (CESMF), said that if naloxone were more available, first responders could use this resource. " In the United States, the police bring it and when they find someone with an overdose they administer it and save their life; the time it takes to get to a hospital is deadly, but in Mexico it is still in the category of controlled substance." (Gómez Mena, 2024)

ABSTRACT

Due to the known potential of diterpenes to display biological activities, the aim of this work was to produce amide derivatives from dehydroabietic acid, naturally occurring in pine resins and evaluate them against *Leishmania amazonensis*. Our venture into the derivatives production led us to eight different amides which were properly identified and characterized by Nuclear Magnetic Resonance spectroscopy. Biological assays were carried out with all derivatives and the natural precursor against promastigote forms of *L. amazonensis*. Results show that two derivatives can be considered of better activity than the precursor against this parasite. This opens future perspectives to further explore that kind of diterpenes against *Leishmania* species.

RESUMO

Devido ao conhecido potencial dos diterpenos em apresentar atividades biológicas, o objetivo deste trabalho foi produzir derivados amídicos a partir do ácido desidroabiético, naturalmente presente em resinas de pinheiro, e avaliá-los contra *Leishmania amazonensis*. O desenvolvimento desses derivados resultou na obtenção de oito amidas diferentes, devidamente identificadas e caracterizadas por espectroscopia de Ressonância Magnética Nuclear. Ensaios biológicos foram realizados com todos os derivados e com o precursor natural frente às formas promastigotas de *L. amazonensis*. Os resultados demonstram que dois derivados apresentam atividade superior à do precursor contra esse parasito, o que abre perspectivas futuras para a exploração adicional desse tipo de diterpeno contra espécies de *Leishmania*.

1 ABOUT NATURAL PRODUCTS AND DITERPENES

Substances originating from living organisms, including plants, animals, and microorganisms, are classified as natural products (NPs). Natural products exhibit a wide diversity of chemical structures and encompass several distinct structural classes, which often confer various biological activities, such as antiparasitic, antiproliferative, and antimicrobial effects (Pertino *et al.*, 2014; Soares *et al.*, 2018). This diversity is of considerable scientific interest, as it contributes to the discovery and development of new drugs, supports the treatment of diseases, and enhances the therapeutic potential of existing medicines (Brusotti *et al.*, 2014).

In medicine, many drugs are direct or indirect derivatives of natural products, and they are widely used in the treatment of cancer and infectious diseases. To ensure the efficacy of these medicines in clinical use, multiple regulatory and quality control measures are implemented to demonstrate their safety and effectiveness before they reach the market (Xie *et al.*, 2018).

Studies on natural products can provide important insights into their biological potential and support the production of active substances from the vast diversity of plant species. Such investigations allow these compounds to be applied for the benefit of humanity by elucidating their mechanisms of action in specific living organisms. Given this remarkable potential, natural products are widely regarded as a promising source of new drugs (Soares *et al.*, 2018).

Terpenoids are a large and important class of natural products widely distributed in nature. They can be subdivided into several groups, including monoterpenes, sesquiterpenes, diterpenes, and others (Reveglia *et al.*, 2018). Among these subgroups, diterpenes are particularly prominent and are found in plants, fungi, bacteria, and animals, occurring in both marine and terrestrial environments (Garcia *et al.*, 2007). They exhibit a wide range of biological activities, including antimicrobial, antiparasitic, anti-inflammatory, and antiviral effects, among others (Porto *et al.*, 2009; Sebisubi *et al.*, 2010; Jiang *et al.*, 2015 [a]; Jiang *et al.*, 2015 [b]).

Pinus species represent an important plant group with high potential as a source of natural products. These trees are widely distributed and commonly found in countries such as China, the United States, India, and Brazil. A distinctive characteristic of *Pinus* species is the production of resin, a viscous yellow to brown liquid with a strong odor. This resin consists of a volatile fraction, known as turpentine, which contains monoterpenes and

sesquiterpenes, and a non-volatile fraction, known as pitch, which is rich in diterpenes (Sousa *et al.*, 2018).

Diterpenes exhibit a wide range of chemical structures and are subdivided into several classes, including abietanes, kauranes, pimaranes, clerodanes, and labdanes, among others. The abietane class is particularly notable, as its members are commonly found in conifers of the genus *Pinus*. Abietanes possess a characteristic tricyclic skeleton and occur largely in the form of resin acids, which can account for up to 21% of the resin (Guo *et al.*, 2019) (Figure 1 A).

Figure 1

A. Tricyclic skeleton of the abietan diterpenes. B. Chemical structure of dehydroabietic acid

Within this class of diterpenes, numerous resin-derived compounds have been reported, including abietic acid, isopimaric acid, dehydroabietic acid, among others (Fallarelo *et al.*, 2013). One of the major components of *Pinus* resin is dehydroabietic acid (DI) (Figure 1B), a tricyclic abietane-type diterpene that exhibits several biological activities, including antiulcer, anti-inflammatory, and antimicrobial effects, among others. These properties indicate that dehydroabietic acid is a highly valuable starting material for the synthesis of new compounds with relevant industrial and pharmacological applications (Gouiric *et al.*, 2004; Boeck *et al.*, 2005; Tanaka *et al.*, 2008).

Despite these findings, the antiparasitic activity of abietane diterpenes remains relatively underexplored in literature. In this context, this chapter focuses on recent advances achieved by our research group in the development of abietane-based molecules, with particular emphasis on their leishmanicidal activity. For this purpose, semi-synthetic methods have been established to obtain a series of derivatives from this class of compounds, which will be discussed below.

2 EXPERIMENTAL PROCEDURES

Several methods for the isolation of metabolites from *Pinus* resins have been reported in the literature. In the following sections of this chapter, the methodological sequence and corresponding results obtained by our research group in studies on *Pinus* oleoresins will be presented. Some *Pinus* resin sources are available from commercial suppliers. In Brazil, these resins can be obtained from the company Tecflora, which provides material from different *Pinus* species, such as *Pinus elliotti* from Buri, São Paulo-SP.

2.1 SEPARATION AND PURIFICATION OF OLEORESINS

The separation procedures were performed by vacuum liquid chromatography (VLC) and classical column chromatography (CCC) in glass columns, using silica gel 60 (70–230 mesh, 0.063–0.200 mm) and silica gel 60H (70–230 mesh, 0.040–0.063 mm), both Merck®, as the stationary phase. The choice of technique and column dimensions was adjusted according to the amount of sample available.

¹H nuclear magnetic resonance (NMR) spectra were recorded on a Bruker® AVANCE DRX400 spectrometer operating at 400 MHz. The experiments were carried out at Department of Chemistry of the University of São Paulo - USP de Ribeirão Preto. Compound identification was supported by ultraviolet (UV) irradiation and comparative thin-layer chromatography (TLC) on Merck® aluminum plates coated with silica gel 60 GF254 (0.25 mm thick), with visualization using vanillin sulfuric acid reagent followed by heating.

High-performance liquid chromatography (HPLC) analyses were performed on a Shimadzu Prominence system (CBM-20A, LC-6AD) equipped with a manual injector, DGU-20A5 degasser, SPD-20A diode array detector (DAD), and a microcomputer running LCsolution software for data acquisition and processing. A reversed-phase C18 Shimadzu column (4.6 mm × 250 mm, 5 μm) with a 20 μL injection loop was used, with acetonitrile/water (9:1) as the mobile phase at a flow rate of 1.0 mL/min. HPLC-grade reagents from J. T. Baker® and ultrapure water from a Milli-Q® system were employed. The solvents used for isolation, purification, and as reaction media were ethyl acetate (AcOEt), hexane (Hex), dichloromethane (DCM), methanol (MeOH), and ethanol (EtOH), all of analytical grade (P.A.).

The resin was coded as RP-1. These resins consist of a white solid mass impregnated with a light-yellow oily fraction. Samples from the three *Pinus* resins were

analyzed by HPLC to identify and compare their major constituents in both the oily fraction and the solid mass. Thus, the solid masses and oily fractions are described as Resin 1 (mass): RP-1M; Resin 1 (oil): RP-1O.

The fractionation of RP-1O was done by VLC. In this case, it was carried out only with the "oil" part and the following fractions were generated, which were thus coded.

- Fraction 1 - Hex: RP-1O.
- Fraction 2 - 9:1 (Hex/EtOAc): RP-1O.
- Fraction 3 - 8:2 (Hex/EtOAc): RP-1O.
- Fraction 4 - 7:3 (Hex/EtOAc): RP-1O.
- Fraction 5 - 6:4 (Hex/EtOAc): RP-1O.
- Fraction 6 - 1:1 (Hex/EtOAc): RP-1O.CLV-6.
- Fraction 7 - 4:6 (Hex/EtOAc): RP-1O.
- Fraction 8 - 3:7 (Hex/EtOAc): RP-1O.
- Fraction 9 - EtOAc: RP-1. LVC -9.
- Fraction 10 - EtOH: RP-1O. LVC -10.

The isolation and purification of the chemical constituents from *Pinus elliottii* resin were performed starting from 50.0 g of crude material. The procedure began with a VLC separation (Pelletier *et al.*, 1986), using 240.0 g of silica gel 60 and 240.0 g of silica gel 60H as stationary phases. The column was packed under vacuum with hexane as the initial solvent, and the sample was adsorbed onto 77.6 g of silica gel 60 prior to loading. During the chromatographic run, ten fractions were collected, using an elution gradient of increasing polarity as summarized in Table 1.

Table 1

Elution scheme used in RP-1O fractionation

Solvent used	Volume collected (mL)	Fraction	Mass obtained (g)
Hex	500	RP-1O.VLC-10.018	
Hex/EtOAc 9:1	500	RP-1O.VLC-20.720	
Hex/EtOAc 8:2	500	RP-1O.VLC-30.960	
Hex/EtOAc 7:3	500	RP-1O.VLC-441.450	
Hex/EtOAc 6:4	500	RP-1O.VLC-50.550	

Hex/EtOAc 1:1	500	RP-1O.VLC-61.430
Hex/EtOAc 4:6	500	RP-1O.VLC-72.000
Hex/EtOAc 3:7	500	RP-1O.VLC-80.990
EtOAc	500	RP-1O.VLC-90.460
EtOH	500	RP-1O.VLC-100.340

Hex: hexane; EtOAc: ethyl acetate; EtOH: ethanol

All fractions obtained from this procedure were analyzed through CTLC using as mobile phase a mixture of Hex/EtOAc (8:2). In this analysis, it was possible to observe that the fractions RP-1O.CLV-3 and RP-1O.CLV-4 had a similar chemical profile and therefore were selected to continue the isolation. The portions designated as “oils” afforded higher yields than the corresponding “mass” portions. RP-1M provided approximately 12% essential oil, whereas RP-1O gave yield of 17%.

2.2 STRUCTURAL MODIFICATIONS

2.2.1 General procedure for obtaining amides from dehydroabiatic acid (DI)

The fractionation of *Pinus* oleoresin affords dehydroabiatic acid (DI) as a purified product, which is subsequently used as a substrate for the semi-synthesis of amide derivatives. A general procedure was adopted for all DI amide-forming reactions. First, dichloromethane (DCM) was predried with calcium sulfate (CaSO_4) using 2.0 g of CaSO_4 per 100 mL of DCM under reflux for 3 h. The DCM was then collected and transferred to a second drying system containing phosphorus pentoxide (P_2O_5) added in an amount sufficient for complete drying, and the mixture was further refluxed for 3 h.

Recrystallization of N-bromosuccinimide (NBS) was carried out as follows. NBS (20.0 g) and deionized water were added to a 0.5 L Erlenmeyer flask to a final volume of 290 mL, and the mixture was heated in a water bath at 70-80 °C until complete dissolution. The resulting orange solution was allowed to stand at room temperature for 24 h, during which a crystalline solid precipitated. The solid was collected by vacuum filtration, washed several times with deionized water, and dried in an oven at 120 °C for 3 h. The dry material was then transferred to a light-protected bottle and stored in a desiccator.

According to the procedure described by Bandgar and co-workers (2004), and as outlined in the reaction mechanism shown in Figure 1, amidation reactions were carried out as follows. One equivalent of DI (40.0 mg) and two equivalents of triphenylphosphine (Ph_3P , 69.9 mg) were dissolved in 2 mL of DCM, and the mixture was cooled to 0-5 °C under stirring. Subsequently, 2.5 equivalents of N-bromosuccinimide (NBS, 59.3 mg) were added, and the reaction was stirred for 15 min. After this period, 4-5 equivalents of the corresponding amine were added, while maintaining the same temperature and continuous stirring.

Figure 2

Proposed scheme for amidation reaction using dehydroabietic acid, amine, triphenylphosphine and N-bromosuccinimide (Bandgar et al., 2004).

In all cases where a greater amount of product was required, the procedures for its preparation and purification were repeated as originally described. After each reaction, the mixture was concentrated by solvent evaporation, and the crude product was stored in a freezer prior to purification by classical column chromatography. Our research group proposed in this sense a synthesis of eight DI-amide-derivatives, follow the reactions performed are described in according to Figure 3 and Table 2

Figure 3

Scheme of the amidation reaction of dehydroabietic acid

Table 2

Amidation reactions carried out with dehydroabietic acid

Reaction	Reagent (R-X)	Ramification (R ₁)	Reaction time (min)
1	Cyclohexylamine	C ₆ H ₁₁ N	11
2	3-amino-1-propanol	C ₃ H ₈ NO	45
3	<i>p</i> -anisidine	C ₇ H ₈ NO	9
4	Terc-butylamine	C ₄ H ₁₀ N	25
5	Isopropylamine	C ₃ H ₈ N	8
6	Aniline	C ₆ H ₆ N	9
7	Methyl piperazine	C ₅ H ₁₁ N ₂	9
8	Pyrrolidine	C ₄ H ₈ N	8

3 RESULTS

3.1 PRODUCTS OBTAINED FROM DEHYDROABIETIC ACID.

The dehydroabietic acid (DI) isolated from *Pinus elliottii* resin was subjected to structural modification at the hydroxyl region of the carboxylic acid group through reactions with different amines, leading to amidation. This process afforded four new amide derivatives, enabling comparative evaluation of their structural features relative to DI, which served as the starting material in each reaction. The ¹H NMR spectra of the products were recorded, and the signals were assigned and compared with those of the parent DI spectrum to confirm the proposed structural changes. Data for three of the obtained derivatives are presented below, with selected signals highlighted to illustrate the modifications introduced in each structure.

3.1.1 Identification of reaction product 3 (D1)

The identification of the product obtained was confirmed by ^1H NMR spectrum of the reaction 3 (Figure 4). Product data obtained: F.M. = $\text{C}_{27}\text{H}_{35}\text{NO}_2$ and M.M. = $405.27 \text{ g mol}^{-1}$.

Figure 4

Reaction of dehydroabietic acid with p-anisidine

The ^1H NMR spectrum shown in Figure 5, in addition to the characteristic signals of DI, displays a new singlet at δ 3.79 ppm with an integral corresponding to 3H, attributable to the hydrogens of a methoxy group. This signal is consistent with the expected chemical shift for a methyl group bound to an ether oxygen, typically observed between δ 3.00 and 4.00 ppm. The signals obtained in the spectrum of Figure 4, in addition to the characteristic signs of DI, clearly show us the presence of a signal that differentiates it from the starting material, corresponding to a singlet with δ of 3.79 ppm and relative integral for 3H, referring to the hydrogens of the methoxy group. This signal is expected for this structure, since the methyl group bound to the ether group has its region found between δ 3.00 and 4.00 ppm.

A further diagnostic signal appears at δ 7.37 ppm with an integral for 1H, corresponding to a proton directly attached to nitrogen. This resonance agrees with the chemical shift range reported for amide NH hydrogens, usually found between δ 5.00 and 8.00 ppm. In addition, aromatic hydrogens in positions closer to the oxygen atom appear more deshielded, giving a signal at δ 7.41 ppm with an integral 2H.

A second set of aromatic protons, less deshielded and located nearer to the nitrogen atom, is observed at δ 6.86 ppm with an apparent integral for 3H. This higher integral value results from overlap with the H-14 signal of the parent DI, which contributes 1H to this resonance. Comparison with the spectrum of DI and the assignment of these new or shifted signals support that the amidation proceeded as expected.

Figure 5

^1H NMR spectrum of the product obtained from reaction 3, 400 MHz, CDCl_3

3.1.2 Identification of reaction product 5 (D3)

The identification of the product obtained was confirmed by NMR spectrum of ^1H , shown in Figure 6. Product data obtained: F.M. = $\text{C}_{23}\text{H}_{35}\text{NO}$ and M.M. = $341.27 \text{ g mol}^{-1}$.

Figure 5

Reaction of dehydroabietic acid with isopropyl amine

In Figure 7, the signals corresponding to the starting material DI are still observed, including H-11, H-12, and H-14, which appear more downfield due to their aromatic nature. In contrast, a new diagnostic signal (*d*) at δ 5.52 ppm with an integral for 1H is observed, assigned to the proton directly attached to the amide functional group. This resonance is consistent with the expected chemical shift range for amide NH protons and thus confirms the introduction of the amide function in the product

In addition to these signals, the spectrum in Figure 7 also shows a set of upfield resonances in an overlapping region at δ 1.13 ppm with an integral corresponding to 6H, which are attributed to the methyl protons of the product. A further signal at δ 4.10 ppm with an integral for 1H is assigned to the proton attached to the methine carbon of the newly formed fragment. Taken together, the presence of both the characteristic signals of the starting material and the new resonances assigned to the product confirms that the reaction proceeded satisfactorily.

Figure 7

^1H NMR spectrum of the product obtained from reaction 5, 400 MHz, CDCl_3

The identification of product 6 obtained was confirmed by NMR spectrum of ^1H , shown in figure 9. Product data obtained: F.M. = $\text{C}_{26}\text{H}_{33}\text{NO}$ and M.M. = $375.26 \text{ g mol}^{-1}$.

Figure 8

Diagram of the reaction of dehydroabietic acid with aniline

According to the spectrum shown in Figure 9, in addition to the most shielded methyl signals attributable to the starting material, several resonances distinct from those of DI are observed. A double doublet at δ 7.52 ppm with an integral for 2H is assigned to aromatic protons that are more deshielded and located closer to the amide functional group. These hydrogens experience a similar electronic environment and therefore appear as a single signal in the spectrum.

Another signal is observed at δ 7.33 ppm with an integral for 2H, corresponding to aromatic protons that are relatively less deshielded and appear as a single resonance due to their similar chemical environment. In addition, a signal at δ 7.11 ppm with an integral for 1H is attributed to the most shielded aromatic proton in the structure. All these aromatic proton signals fall within the expected chemical shift range for aromatic hydrogens, typically between δ 6.50 and 8.00 ppm, and are fully consistent with the proposed structure.

A singlet at δ 7.46 ppm with an integral corresponding to 1H was also observed and assigned to the proton directly bonded to nitrogen. This signal is consistent with the expected chemical shift range for amide NH protons, typically found between δ 5.00 and 8.00 ppm. Therefore, comparison with the spectrum of the starting material and the presence of these new diagnostic resonances indicate that the reaction proceeded as expected and that the product is distinct from DI.

3.1.3 Evaluation of Leishmanicidal Activity

The biological activity investigated in this study was the leishmanicidal effect against promastigote forms of *Leishmania (L.) amazonensis*. The assays were carried out in collaboration with the Parasitology Laboratory of the University of Franca, Franca, São Paulo, Brazil. Initially, samples of the crude resin (RP-1), its essential oil (RP-1-EO), and the fixed fraction (RP-1-PF) obtained after essential oil extraction were evaluated. Under the experimental conditions employed, none of these samples exhibited significant leishmanicidal activity, as shown in Table 3.

Table 3

Leishmanicidal activity against promastigote forms of L. (L.) amazonensis and determination of inhibitory concentration values 50% (IC₅₀) in the 24-hour incubation period

% of inhibition of flagellar motility ± D.P.						
Substances	50	25	12.5	6.25	3.12	IC ₅₀ (µg/mL)
RP-1	54.59±0.59	22.97±16.81	28.91±1.52	19.05±0.95	11.62±1.14	>50
RP-1-PF	34.45±0.95	28.51±1.33	17.43±0.57	10.54±0.00	5.81±1.72	>50
RP-1-OE	21.89±0.76	15.54±2.10	8.91±1.47	0.00±0.00	0.00±0.00	>50
RP-1-FR (7:3)	88.78±0.95	84.05±0.00	69.18±1.91	58.51±1.33	50.67±1.33	3.43±0.73
Dehydroabietic acid	88.67±0.66	83.49±0.33	75.94±1.66	57.07±2.01	49.76±1.33	1.05±0.79
Other component	48.10±3.05	35.54±3.24	20.67±3.63	11.89±0.38	0.00±0.00	49.73±1.02
	0.19	0.095	0.047	0.023	0.011	
Amphotericin B	99.88±0.60	78.33±24.43	68.74±21.9	54.67±17.77	42.44±20.9	0.011±0.54
			7		7	

Positive Control: Amphotericin B 1 µg/mL Negative Control: Medium RPMI + 0.1% DMSO

However, after VLC of the resin, several fractions were obtained, and one of them contained the most abundant diterpenes in its composition. This fraction (RP-1-FR 7:3) was therefore considered rich in major diterpenic constituents. Evaluation of the leishmanicidal activity of this fraction yielded a notable result, revealing significant activity of the mixture against promastigote forms of the parasite (IC₅₀ = 3.43 µg/mL). The activity-guided assessment then focused on identifying the component responsible for this effect by testing dehydroabietic acid (DI) and the other, not yet fully identified, constituent of the fraction. Dehydroabietic acid showed a much stronger leishmanicidal effect (IC₅₀ = 1.05 µg/mL) than

the other component ($IC_{50} = 49.73 \mu\text{g/mL}$), supporting the conclusion that dehydroabietic acid is the main compound responsible for the observed activity.

These results reinforce the relevance of pursuing structural modifications of DI with the aim of obtaining derivatives that may display even more pronounced leishmanicidal activity. In this context, derivatives D1 to D4 were evaluated, and their IC_{50} values, expressed in micromolar units as appropriate for pure substances, are presented in Table 4.

Table 4

Leishmanicidal activity against promastigote forms of L. (L.) amazonensis and determination of inhibitory concentration values 50% (IC_{50}) in the 24-hour incubation period

Amphotericin B	99.88 $\pm$ 0.60	78.33 $\pm$ 24.43	68.74 $\pm$ 21.97	54.67 $\pm$ 17.77	42.44 $\pm$ 20.97	0.011 $\pm$ 0.54

Positive Control: Amphotericin B 1 $\mu\text{g/mL}$ Negative Control: RPMI medium + 0.1% DMSO

The results obtained were promising, as all derivatives exhibited activity against the promastigote forms of the parasite. In addition, two of these derivatives were even more active than the precursor, dehydroabietic acid, which was the most active component of the resin. The next step in the search for bioactive compounds will be to evaluate the cytotoxicity of the natural products and the semi-synthetic derivatives.

4 CONCLUSION AND PERSPECTIVES

This chapter provides evidence that *Pinus* oleoresin is a valuable source of abietane-type diterpenes with leishmanicidal potential, particularly dehydroabietic acid and its semi-synthetic amide derivatives. Fractionation of the crude resin enabled the identification of a diterpene-enriched fraction (RP-1-FR 7:3) with significant activity against promastigote forms of *Leishmania* (*L.*) *amazonensis*, and subsequent assays identified dehydroabietic

acid as the principal bioactive component of this mixture. These findings align with the growing body of literature indicating that terpenoids and other plant-derived metabolites represent promising scaffolds for the discovery of new antileishmanial agents, particularly in the context of neglected tropical diseases. In addition, the successful application of a simple amidation protocol underscores the value of dehydroabietic acid as a synthetic platform for structural diversification and increasing antiparasitic activity.

Leishmanicidal profile observed for DI and derivatives D1–D4 underscores the importance of continued structure–activity relationship studies aimed at improving potency and selectivity, especially through rational modifications of the abietane skeleton and systematic evaluation against both promastigote and amastigote forms. Future investigations should prioritize cytotoxicity assays, determination of selectivity index, and mechanistic studies to elucidate cellular targets and pathways involved in parasite death, thereby meeting current criteria for early-stage drug discovery in leishmaniasis. Moreover, *in vivo* assessments, exploration of alternative formulations, and integration with contemporary approaches such as *in silico* modeling may facilitate the progression of these derivatives from promising hits to preclinical candidates, contributing to the development of safer and more effective therapies derived from natural products.

ABSTRACT

Pine resins, mostly the ones provided by *Pinus elliottii*, are known to present interesting activities in biological systems and are commonly treated as promising source of active compounds. Due to our interest in Natural Product chemistry and in diterpenes, also known to be pine resins components, we developed this work about the chemical composition of those resins. The essential oil composition showed the presence mostly of α - and β -pinene, α -phelandrene and α -cimene. The non-volatile fractions showed dehydroabietic acid as the primary component and revealed other abietane diterpenes were less abundant. This study revealed that these resins are surely good sources of dehydroabietic acid for further chemical studies with this natural product.

As resinas de pinheiro, principalmente aquelas provenientes de *Pinus elliottii*, são conhecidas por apresentar atividades interessantes em sistemas biológicos e são comumente tratadas como fontes promissoras de compostos ativos. Em função do nosso interesse na Química de Produtos Naturais e nos diterpenos, também conhecidos como componentes das resinas de pinheiro, desenvolvemos este trabalho sobre a composição química dessas resinas. A composição do óleo essencial mostrou predominantemente a presença de α - e β -pineno, β -felandreno e p-cimeno. As frações não voláteis apresentaram o ácido desidroabiético como componente principal e revelaram que outros diterpenos do tipo abietano estão presentes em menor abundância. Este estudo demonstrou que essas resinas são, de fato, boas fontes de ácido desidroabiético para futuros estudos químicos com esse produto natural.

Palavras-chave: *Pinus elliottii*. Resinas de Pinheiro. Diterpenos. Composição Química. Monoterpenos.

RESUMEN

Las resinas de pino, principalmente las provenientes de *Pinus elliottii*, son conocidas por presentar actividades interesantes en sistemas biológicos y son comúnmente consideradas como fuentes prometedoras de compuestos activos. Debido a nuestro interés en la Química de Productos Naturales y en los diterpenos, también conocidos como componentes de las resinas de pino, desarrollamos este trabajo sobre la composición química de dichas resinas. La composición del aceite esencial mostró predominantemente la presencia de α - y β -pineno, β -felandreno y p-cimeno. Las fracciones no volátiles presentaron al ácido deshidroabiético como componente principal y revelaron que otros diterpenos del tipo abietano se encuentran en menor abundancia. Este estudio demostró que estas resinas son, sin duda, buenas fuentes de ácido deshidroabiético para futuros estudios químicos con este producto natural.

Palabras clave: *Pinus elliottii*. Resinas de Pino. Diterpenos. Composición Química. Monoterpenos.

1 ABOUT PINE RESINS

Pinus is a coniferous genus in the family Pinaceae, characterized by rapid growth, tolerance to low temperatures, and the ability to develop in nutrient-poor soils (Figure 1) (Correa *et al.*, 2018). In general, species of this genus are widely distributed and occur in several countries, including China, the United States, and India, while in Brazil they are predominantly found in subtropical regions (Gonçalves *et al.*, 2018).

Figure 1

Conifer of the genus Pinus

Source: <http://www.mundoreal.xyz/arvores-brasileira-o-pinus-elliottii/grande-pinus-elliottii/>

A notable feature of *Pinus* species is the production of a resin, a viscous yellow to brown liquid with a strong odor (Figure 2). This exudate comprises a volatile fraction, known as turpentine, which contains monoterpenes and sesquiterpenes, and a non-volatile fraction, commonly referred to as resin or pitch, in which diterpenes are predominant. Upon attack by pathogens or herbivores, these trees activate a chemical defense mechanism based on the secretion of this resin, which contributes to inhibiting or limiting the action of invaders through a diverse repertoire of specialized metabolites (Keeling; Bohmann, 2006).

Figure 2

Pinus resin collection

Source: <https://tecflora.com.br/2018/03/23/resinagem-revista-campo-e-negocios/>

Several phytochemical studies have reported that *Pinus* resins contain a mixture of monoterpenes, tricyclic diterpenic acids, mainly from the abietane and pimarane classes, and bicyclic diterpenes from related structural classes, as illustrated in Figure 3. In some cases, sesquiterpenes are also detected among the resin constituents (Rezzi *et al.*, 2002; Silva *et al.*, 2014). Among the diterpenes obtained from *Pinus* genus, dehydroabietic acid is one of main substances due to its promising antibacterial, insecticidal, antifungal, anti-aging, antiprotozoal, and anti-inflammatory properties (Soares *et al.*, 2019; Berger *et al.*, 2017; Fonseca *et al.*, 2004; Gao *et al.*, 2015; Kim *et al.*, 2015; Dembitsky *et al.*, 2021). It is a tricyclic aromatic diterpenoid characterized by three fused rings, three chiral carbon centers, and a reactive carboxylic acid functional group (Lv *et al.*, 2025).

Figure 3

Main chemical skeletons found in isolated diterpenes of the genus Pinus

Pinus resins constitute a valuable source of natural products with diverse applications and significant economic relevance. They are employed in cosmetic fragrances, as flavoring additives in foods, and as intermediates in the synthesis of fragrance chemicals, among other industrial uses (Leandro *et al.*, 2014).

In addition, *Pinus* resins exhibit a broad spectrum of biological activities, including anti-inflammatory and antifungal effects (Boeck *et al.*, 2005), as well as antimicrobial (Tanaka *et al.*, 2008; Fallarelo *et al.*, 2013) and anti-allergic properties (Gonçalves *et al.*, 2018). Considering the structural diversity of diterpenes present in these resins and this documented bioactivity profile, *Pinus* resins represent a promising source of potentially active compounds that may play an important role in this study, particularly in the search for molecules with relevant biological properties.

3 EXTRACTION AND PURIFICATION OF *Pinus* RESIN CHEMICALS

3.1 PLANT MATERIAL AND EXPERIMENTAL ANALYSES

Several methods have been described in the literature for the isolation of metabolites from *Pinus* resins. In the following sections of this chapter, the logical sequence and the results obtained by our research group in studies of *Pinus* oleoresins will be presented. Some *Pinus* resin sources are available from commercial suppliers. In Brazil, these resins can be obtained from the company Tecflora, which provides material from different *Pinus* species, such as:

1. *Pinus elliotti* from Buri, São Paulo-SP;
2. *Pinus caribaea* x *Pinus elliotti*, from Buri, São Paulo-SP;
3. *Pinus caribaeai*, from Cajuri, Minas Gerais-MG.

The metabolites were separated using vacuum liquid chromatography (VLC) and classical column chromatography (CCC) in glass columns, depending on the amount of sample available, employing silica gel 60, 70–230 mesh (0.063–0.200 mm), and silica gel 60H, 70–230 mesh (0.040–0.063 mm) (Merck®) as stationary phases. The ^1H nuclear magnetic resonance (NMR) spectra were acquired on a Bruker® AVANCE DRX 400 spectrometer operating at 400 MHz. All experiments were conducted in the Department of Chemistry of the Faculty of Sciences, Philosophy and Letters of Ribeirão Preto, at University of São Paulo (USP).

The identification methods included irradiation under ultraviolet (UV) light and comparative thin-layer chromatography (TLC) on Merck® aluminum plates coated with silica gel 60 GF254 (0.25 mm), with visualization using vanillin sulfuric acid reagent followed by heating. High-performance liquid chromatography (HPLC) analyses were performed on a Shimadzu Prominence system (CBM-20A/LC-6AD) equipped with a manual injector, DGU-20A5 degasser, SPD-20A diode array detector (DAD), and a microcomputer running LCsolution software for data acquisition and processing. The chromatographic separations were carried out on a Shimadzu C18 reversed-phase column (4.6 mm $\times$ 250 mm, 5 μm) with a 20 μL injection loop, using acetonitrile/water (ACN/ H_2O , 9:1) as the mobile phase at a flow rate of 1.0 mL min^{-1} . HPLC analyses employed HPLC-grade reagents from J. T. Baker® and ultrapure water obtained from a Milli-Q® system. The solvents used for isolation, purification, and as reaction media were ethyl acetate (EtOAc), hexane (Hex), dichloromethane (DCM), methanol (MeOH), and ethanol (EtOH), all analytical grade (P.A.).

3.2 COMPARATIVE STUDY OF *PINUS* RESINS BY HPLC

The resins were coded as follows: RP-1 (resin from sample 1), RP-2 (resin from sample 2), and RP-3 (resin from sample 3). These resins consist of a white solid mass impregnated with a light-yellow oily fraction. Samples from the three *Pinus* resins were analyzed by HPLC to identify and compare their major constituents in both the oily fraction and the solid mass; notably, RP-3, being a highly dry resin, lacked the oily fraction. Thus, the solid masses and oily fractions described below were evaluated.

- Resin 1 (mass): RP-1M; Resin 1 (oil): RP-1O.
- Resin 2 (mass): RP-2M; Resin 2 (oil): RP-2O.
- Resin 3 (mass): RP-3M; (does not contain the "oil" part).

3.3 ISOLATION AND PURIFICATION OF DEHYDROABIETIC ACID (DI) FROM *PINUS ELLIOTTII* RESIN

The fractionation of RP-10 was done by VLC. In this case, it was carried out only with the "oil" part and the following fractions were generated, which were thus coded, as shown in figure 4.

- Fraction 1 - Hex: RP-10.
- Fraction 2 - 9:1 (Hex/EtOAc): RP-10.
- Fraction 3 - 8:2 (Hex/EtOAc): RP-10.
- Fraction 4 - 7:3 (Hex/EtOAc): RP-10.
- Fraction 5 - 6:4 (Hex/EtOAc): RP-10.
- Fraction 6 - 1:1 (Hex/EtOAc): RP-10.CLV-6.
- Fraction 7 - 4:6 (Hex/EtOAc): RP-10.
- Fraction 8 - 3:7 (Hex/EtOAc): RP-10.
- Fraction 9 - EtOAc: RP-1. LVC -9.
- Fraction 10 - EtOH: RP-10. LVC -10.

Figure 4

Flowchart of the coding of fractions obtained by VLC from Pinus elliottii resin

The isolation and purification of the chemical constituents from *Pinus elliottii* resin were performed starting from 50.0 g of crude material. The procedure began with a VLC separation (Pelletier *et al.*, 1986), using 240.0 g of silica gel 60 and 240.0 g of silica gel 60H as stationary phases. The column was packed under vacuum with hexane as the initial solvent, and the sample was adsorbed onto 77.6 g of silica gel 60 prior to loading. During

the chromatographic run, ten fractions were collected, using an elution gradient of increasing polarity as summarized in Table 1.

Table 1

Elution scheme used in RP-10 fractionation

Solvent used	Volume collected (mL)	Fraction	Mass obtained (g)
Hex	500	RP-10.VLC-10.018	
Hex/EtOAc 9:1	500	RP-10.VLC-20.720	
Hex/EtOAc 8:2	500	RP-10.VLC-30.960	
Hex/EtOAc 7:3	500	RP-10.VLC-441.450	
Hex/EtOAc 6:4	500	RP-10.VLC-50.550	
Hex/EtOAc 1:1	500	RP-10.VLC-61.430	
Hex/EtOAc 4:6	500	RP-10.VLC-72.000	
Hex/EtOAc 3:7	500	RP-10.VLC-80.990	
EtOAc	500	RP-10.VLC-90.460	
EtOH	500	RP-10.VLC-100.340	

Hex: hexane; EtOAc: ethyl acetate; EtOH: ethanol

All fractions obtained from this procedure were analyzed through CTLC using as mobile phase a mixture of Hex/EtOAc (8:2). In this analysis, it was possible to observe that the fractions RP-10.CLV-3 and RP-10.CLV-4 had a similar chemical profile and therefore were selected to continue the isolation.

3.4 FRACTION RP-10.VLC-3

With a portion of this fraction (0.96 g), a CCC separation was carried out using 25.0 g of silica gel 60 and 1.0 g of silica gel 60H, with a mixture of hexane/ethyl acetate (8.5:1.5) as the mobile phase. A total of 64 subfractions were collected, and the elution scheme followed that shown in Table 2.

Table 2

Elution scheme used in the fractionation RP-1O.VLC-3

Fraction	Mass obtained (mg)
RP-1O.VLC-3 (6-11)	41.4
RP-1O.VLC-3 (12)	6.6
RP-1O.VLC-3 (13-14)	190.4
RP-1O.VLC-3 (15-18)	207.0
RP-1O.VLC-3 (19-25)	111.1
RP-1O.VLC-3 (26-40)	5.1
RP-1O.VLC-3 (41-63)	17.9
MeOH	375.2

MeOH: methanol

All subfractions were pooled and analyzed by CTLC using a mixture of hexane/ethyl acetate (8:2) as the mobile phase. Analysis of the chromatographic profile indicated that subfraction RP-1O.VLC-3 (19–25) contained a major spot. This substance was labeled DI (111.1 mg) (Figure 5), and its chemical structure was elucidated by ¹H NMR spectroscopy and compared with data reported in the literature.

3.5 Fraction RP-1.VLC-4

With a part of this fraction (5.0 g), a VLC was performed again using 150.0 g of silica gel 60H as the stationary phase, and the column was packed under vacuum with hexane, with the sample adsorbed onto 11.0 g of silica gel 60. A total of ten fractions were collected, and the elution scheme with an increasing polarity gradient followed that shown in Table 3.

Table 3

Elution scheme used in the fractionation RP-1O.VLC-4

Solvent used	Volume collected (mL)	Fraction	Mass obtained (g)
Hex	250	RP-1O.VLC-4 (1)	0.0028
Hex/EtOAc (97:3)	250	RP-1O.VLC-4 (2)	0.0044
Hex/EtOAc (47:3)	250	RP-1O.VLC-4 (3)	0.0013

Hex/EtOAc (91:9)	250	RP-10.VLC-4 (4)	1.1900
Hex/EtOAc (22:3)	250	RP-10.VLC-4 (5)	1.9300
Hex/EtOAc (17:3)	250	RP-10.VLC-4 (6)	0.9200
Hex/EtOAc (41:9)	250	RP-10.VLC-4 (7)	0.3500
Hex/EtOAc (4:1)	250	RP-10.VLC-4 (8)	0.1400
EtOAc	250	RP-10.VLC-4 (9)	0.6800
MeOH	250	RP-10.VLC-4 (10)	0.4600

Hex: hexane; EtOAc: ethyl acetate; MeOH: ethanol

All fractions were analyzed by CTLC using a mixture of hexane/ethyl acetate (8.5:1.5) as the mobile phase. Analysis of the chromatographic profiles showed that subfractions RP-10.VLC-4 (7) and RP-10.VLC-4 (8) exhibited a major spot with a similar chemical profile. This substance was designated DI (490.0 mg) (Figure 5), and its chemical structure was elucidated by ^1H NMR spectroscopy and compared with data reported in the literature.

Figure 5

Flowchart of the isolation and purification of dehydroabietic acid from *Pinus elliottii* resin

4 RESULTS

4.1 COMPARATIVE STUDY OF *PINUS* RESINS

4.1.1 Comparison of chromatograms obtained by HPLC

Samples from the three *Pinus* resins were subjected to HPLC analysis (Figures 6–10) to compare their main constituents in both the more solid portion of the resin (“mass”, M) and the more liquid portion (“oil”, O). Resin 3 (RP-3) did not exhibit a significant liquid fraction.

Figure 6

Chromatogram obtained by HPLC at $\lambda = 201\text{nm}$ of the fraction RP-1M

Figure 7

Chromatogram obtained by HPLC at $\lambda = 201\text{nm}$ of the RP-1O fraction

Figure 8

Chromatogram obtained by HPLC at $\lambda = 201\text{nm}$ of the fraction RP-2M

Figure 9

Chromatogram obtained by HPLC at $\lambda = 201\text{nm}$ of the RP-2O fraction

Figure 10

Chromatogram obtained by HPLC at $\lambda = 201\text{nm}$ of the fraction RP-3M

The first conclusion that can be drawn from this analysis is that there is no significant difference between the “mass” and “oil” portions of the same resin. The chromatographic profiles of RP-1M and RP-1O are practically identical, as are those of RP-2M and RP-2O. Therefore, separating and using the “mass” and “oil” portions independently does not provide any analytical advantage.

Notable differences were observed among resins 1, 2, and 3. Although peaks at retention times of 5.2 min, 7.0 min, and 8.0 min were present in all chromatograms, their relative intensities varied across the resins, indicating compositional differences. For example, the peak at 5.2 min predominated in resin 2 but not in resins 1 and 3, which featured the 7.0 min peak as their major component; resin 3 exhibited an even simpler profile, with only two additional minor components.

4.1.2 Comparison of the essential oils of each resin

Essential oils were also obtained from the same samples analyzed by HPLC in the previous section, namely RP-1M, RP-1O, RP-2M, RP-2O, and RP-3M. The first parameter evaluated was the yield of each extraction process, as summarized in Table 4.

Table 4

Yields of the processes for obtaining essential oils

Sample of <i>Pinus</i>	Mass used (g)	Mass of essential oil (g)	Yield (%)
RP-1M	34.519	4.0989	11.9
RP-1O	21.7038	3.7303	17.2
RP-2M	34.4530	4.1226	12.0
RP-2O	23.5235	4.9997	21.3
RP-3M	24.5657	1.6279	6.6

The portions designated as “oils” afforded higher yields than the corresponding “mass” portions. Both RP-1M and RP-2M provided approximately 12% essential oil, whereas RP-1O and RP-2O gave yields between 17% and 21%, and RP-3M, which was much drier than the others, afforded a lower yield of 6.6% essential oil.

The oils were subsequently analyzed by gas chromatography coupled to mass spectrometry (GC–MS). In this technique, the oil components are first separated by gas chromatography and then introduced into the mass spectrometer, where they are fragmented; the resulting mass spectra are compared with an instrument library that assigns the identity of each component based on similarity of fragmentation patterns, which is well established for many monoterpenes commonly found in essential oils.

For each oil, a table of identified components was constructed, including the percentage peak area of each signal in the chromatogram. The peak area is proportional to the relative amount of each constituent and can be used for comparative evaluation of the compositions, which are complex; therefore, the discussion focuses on the major components listed in Table 5. The main components tabulated have their structures depicted on Figure 11.

Table 5

Simplified composition of essential oils - percentage of comparison of peak areas in CG-MS analysis

Sample	α -pinene	β -pinene	β -phellandrene	p -cimene
RP-1M	51.2	30.2	5.8	6.2
RP-1O	46.7	30.0	6.3	7.1
RP-2M	66.5	20.2	9.3	----
RP-2O	50.4	28.8	12.6	----
RP-3M	73.9	4.9	16.5	----

Figure 11

Structures of the main components of essential oils

As expected for *Pinus* resins, the main component in all samples is α -pinene, with β -pinene occurring as the second most abundant constituent in all cases except resin 3. β -phellandrene, which is generally the third most abundant component, becomes the second major constituent in resin 3, representing the main distinguishing feature of this species (*caribaeae*). The distinguishing characteristic of *P. elliotii* is the presence of *p*-cymene, which was not identified in any of the other samples, whereas the hybrid (*elliotii* $\times$ *caribaeae*) exhibits feature of both parents: it lacks *p*-cymene, as in *caribaeae*, but shows an α and β -pinene ratio like that of *elliotii*.

These compositional differences suggest that there may be meaningful variation in the biological activity of both the resins and their essential oils, and that such variation can be exploited to obtain different major constituents for studies on natural diterpene derivatives. Consequently, resin 1 was selected for further investigation, as its composition has already been partially described in the literature.

4.2 ^1H NMR ANALYSIS OF THE ISOLATED SUBSTANCE

According to the literature, dehydroabietic acid (DI), a diterpene of the abietane class, is the major component of resins from *P. elliotii*. The research group, which focuses on structural modification of diterpenes, is particularly interested in developing methodologies to obtain this skeleton in high yield from a commercial source; therefore, fractionation of the resin was undertaken, although the absence of authentic standards for the isolation of individual constituents made this task more challenging.

To confirm the identity of DI, the ^1H NMR spectrum of the isolated substance was recorded in CDCl_3 and compared with data reported in the literature (Van Beek *et al.*, 2007). Based on this comparison, the isolated compound was unambiguously identified as dehydroabietic acid obtained from *Pinus elliotii* resin.

4.2.1 Identification of Dehydroabietic Acid (DI)

The signals observed in the spectrum shown in Figure 12 and their chemical shifts are consistent with those expected for the target compound. In the ^1H NMR spectrum, a singlet at 1.17 ppm, integrating for three protons, can be assigned to the methyl hydrogen at C-20 (H-20), which is characteristic of this structure.

Additional characteristic resonances of this diterpene include the aromatic protons H-11, H-12, and H-14: H-11 appears as a doublet (*d*) at δ 6.94 ppm (1H), H-12 as a doublet

of doublets (*dd*) at δ 6.77 ppm (1H), and H-14 at δ 6.67 ppm (1H). These downfield signals, located in the δ 6.50–8.00 ppm region, are consistent with aromatic hydrogens and are in excellent agreement with the proposed structure.

In the ^1H NMR spectrum of this compound, less downfield signals corresponding to the methyl group at C-19 (H-19) were also observed, appearing as a singlet (*s*) at δ 1.38 ppm and integrating for three protons, together with a doublet (*d*) at δ 1.18 ppm integrating for six protons, attributable to the methyl groups at C-16 and C-17 (H-16 and H-17).

In addition to the methyl resonances of H-16, H-17, H-19, and H-20, broad, unresolved signals were detected between δ 0.70 and 2.00 ppm, corresponding to the methylene protons present in the DI skeleton; these resonances appear in an overlapping region of the ^1H NMR spectrum, which hinders more detailed analysis.

Some other signals, such as H-5 and H-15 are also shown in Table 6, and because they are methylene carbon hydrogen, they are in a position that differentiates them from the others. Therefore, using the data of this work and compared with the data already obtained in the literature, it was possible to verify through these commented signals the attribution performed for the substance of interest (Van Beek *et al.*, 2007) (Table 6). Will also be shown below some data of the DI isolated from *Pinus elliottii* resin, such as: Data from DI: M.F. = $\text{C}_{20}\text{H}_{28}\text{O}_2$ e M.W. = $300.43 \text{ g mol}^{-1}$.

Table 6

^1H NMR data of the substance DI and chemical displacement

Attribution	DI (δ - literature)	DI (δ - experimental)
H-5	2.24	2.24
H-11	7.18	6.94
H-12	7.00	6.77
H-14	6.89	6.67
H-15	2.83	2.84
H-16	1.23	1.18
H-17	1.23	1.18
H-19	1.29	1.38

5 CONCLUSIONS AND PERSPECTIVES

Resins from the genus *Pinus* are an important source of secondary metabolites, particularly terpenoids. Comparative GC-MS analyses showed that the “mass” and “oil” portions of each *Pinus* resin exhibit essentially identical profiles, whereas the three resins

differ markedly in the relative abundances of α -pinene, β -pinene, β -phellandrene, and *p*-cymene, enabling the use of simple chemical markers to distinguish the species and their hybrid. This study also demonstrated that the “oil” fractions yield more essential oil than the corresponding “mass” fractions and that the combination of VLC, CCC, and CTLC constitutes an effective strategy to isolate dehydroabietic acid (DI) from *P. elliottii* in preparative quantities, with ^1H NMR data providing robust confirmation of its molecular structure.

These findings support the use of *Pinus* resins as practical commercial sources of DI and other terpenoids and establish a workflow that can be scaled to larger batches and extended to additional *Pinus* species to access a broader range of abietane and pimarane diterpenes. Furthermore, the application of systematic bioassays to chemically profiled resins, together with the integration of quantitative NMR, is expected to facilitate the development and evaluation of semi-synthetic abietane libraries for diverse applications, including agrochemicals, medicinal agents, and other bioactive products.

ABSTRACT

Considering that the neonatal period represents a phase of high vulnerability to infant health, marked by biological, environmental, and social risks, the continuity of care after hospital discharge is a challenge for families and health services. This study aims to understand the continuity of care and follow-up of newborns after hospitalization. To this end, a descriptive, cross-sectional study with a quantitative approach was conducted in a referral outpatient clinic in the city of Recife/PE, with the participation of 11 caregivers of newborns previously hospitalized for more than 24 hours and under outpatient follow-up. Data collection was carried out using a structured questionnaire, including sociodemographic information, clinical data, and aspects of the post-discharge scenario, with the data analyzed using descriptive statistics. Thus, it was observed that the median age at admission was 17 days, with an average length of stay of 10 days, the main causes of hospitalization being infections and jaundice. It was identified that only 45.5% of families left the consultation with a scheduled follow-up appointment, and that 81.8% required unscheduled care. The difficulties reported involved insecurity in care, emotional overload, and socioeconomic barriers, while the solutions suggested included prior scheduling of

RESUMO

Considerando que o período neonatal representa uma fase de elevada vulnerabilidade à saúde infantil, marcada por riscos biológicos, ambientais e sociais, a continuidade do cuidado após a alta hospitalar configura-se como um desafio para famílias e serviços de saúde. Objetiva-se conhecer a continuidade do cuidado e o acompanhamento de neonatos após a hospitalização. Para tanto, procede-se a um estudo descritivo, transversal e de abordagem quantitativa, realizado em ambulatório de referência no município de Recife/PE, com a participação de 11 responsáveis por neonatos previamente internados por período superior a 24 horas e em seguimento ambulatorial. A coleta de dados ocorreu por meio de questionário estruturado, contemplando informações sociodemográficas, dados clínicos e aspectos do cenário pós-alta, sendo os dados analisados por estatística descritiva. Desse modo, observou-se que a mediana de idade ao internamento foi de 17 dias, com tempo médio de internação de 10 dias, sendo as principais causas de hospitalização infecções e icterícia. Identificou-se que apenas 45,5% das famílias saíram da consulta com retorno agendado e que 81,8% necessitaram de atendimentos não programados. As dificuldades relatadas envolveram insegurança no cuidado, sobrecarga emocional e barreiras socioeconômicas, enquanto as soluções apontadas incluíram agendamento prévio das consultas, orientações mais claras e utilização sistemática da Caderneta da Criança. Conclui-se que a continuidade do cuidado neonatal pós-alta apresenta fragilidades clínicas e sociais, reforçando a necessidade de acompanhamento profissional supervisionado.

RESUMEN

Considerando que el período neonatal representa una fase de alta vulnerabilidad para la salud infantil, marcada por riesgos biológicos, ambientales y sociales, la continuidad de la atención tras el alta hospitalaria representa un desafío para las familias y los servicios de salud. Este estudio busca comprender la continuidad de la atención y el seguimiento de los recién nacidos tras la hospitalización. Para ello, se realizó un estudio descriptivo, transversal y cuantitativo en una clínica ambulatoria de referencia de la ciudad de Recife/Perú, con la participación de 11 cuidadores de recién nacidos hospitalizados previamente durante más de 24 horas y en seguimiento ambulatorio. La recolección de datos se realizó mediante un cuestionario estructurado que incluyó información sociodemográfica, datos clínicos y aspectos del contexto posterior al alta, y se analizaron mediante estadística descriptiva. Así, se observó que la mediana de edad al ingreso fue de 17 días, con una estancia media de 10 días, siendo las principales causas de hospitalización las infecciones y la ictericia. Se identificó que solo el 45,5% de las familias abandonaron la consulta con una cita de seguimiento programada, y que el 81,8% requirió atención no programada. Las dificultades reportadas incluyeron inseguridad en la atención, sobrecarga emocional y barreras socioeconómicas, mientras que las soluciones sugeridas incluyeron la programación previa de las consultas, directrices más claras y el uso

sistemático de la Historia Clínica Infantil. Se concluye que la continuidad de la atención neonatal tras el alta presenta deficiencias clínicas y sociales, lo que refuerza la necesidad de un seguimiento profesional supervisado.

1 INTRODUCTION

The neonatal period, which comprises the first 28 days postpartum, is a phase considered to be vulnerable to child health due to biological, environmental, social and cultural risks. This requires adequate care, greater vigilance and monitoring by the health professional, in order to ensure better growth and development of the child. This period is also responsible for 60% to 70% of infant deaths in recent decades, occurring mainly up to the 6th day of life, being the fundamental indicator of the quality of care for the newborn (Pinheiro *et al.*, 2016).

Newborn health care is of fundamental importance for reducing infant mortality, which is still high in Brazil, as well as promoting a better quality of life and reducing health inequalities. In the neonatal period, a time of great vulnerability in life, where biological, environmental, socioeconomic and cultural risks are concentrated, with the need for special care, with timely, comprehensive and qualified social and health protection, rights recognized by the Statute of the Child and Adolescent (ECA).

It is in the first week of life, especially in the first day of life (representing 25%), that infant deaths in the country are concentrated. Health promotion, prevention and care actions aimed at pregnant women and newborns are of great importance, as they influence the health condition of individuals, from the neonatal period to adulthood. The determining relationship between intrauterine life, health conditions at birth and in the neonatal period, and chronic-degenerative problems in adult life, such as obesity, diabetes, cardiovascular diseases, and mental health, among others, has been increasingly highlighted (Ministry of Health, 2014).

The literature highlights the importance of guidance for the preparation of the newborn's family members, provided by health professionals, during hospital discharge from an intensive care unit or neonatal unit (Conceição, 2023). Intersectorality, the technical and scientific knowledge of professionals to care for NICU discharged, public policies, multicenter research, as well as the construction of bonds between health service professionals and families, are important strategies for the construction of care for neonates and their families after hospital discharge (Braga *et al.*, 2012).

Studies have revealed that there are already innovative initiatives and practices that have signaled a reconfiguration of neonatal care, among which we mention: the implementation of strategies that enable the participation of the family in the daily care routine, by recognizing that it should be a protagonist in neonatal care and that it should be

assured the possibility of establishing a bond and attachment with the newborn; dialogical care practices that enable the expansion of knowledge, recognition of practices and the effective participation of the subjects involved in the daily care routine; care initiatives centered on the demands and needs of newborns and their families, understanding that in addition to the biological recovery of the newborn, there are psychosocial demands that permeate and determine the daily life (Duarte; Sena; Xavier, 2011).

In this context, the present study is justified, since the transition of the newborn from the hospital environment to the home represents a critical moment, in which risks and vulnerabilities that can compromise the continuity of care are concentrated. Despite advances in public policies aimed at neonatal health, there are still gaps related to communication between services, the preparation of families at the time of discharge, and articulation with primary care. Knowing the health scenario of neonates after hospitalization is essential to contribute to more qualified professional practices, strengthen health education and reduce avoidable complications and rehospitalizations. Thus, the guiding question of this study is: "What are the conditions and challenges faced by families in the care of neonates after hospitalization, considering clinical and social aspects?".

From this perspective, the main objective of this study is to know the continuity of care and follow-up of neonates after hospitalization.

2 METHODOLOGY

This is a descriptive cross-sectional study with a quantitative approach that seeks to know the health scenario of neonates after hospital discharge and to analyze its factors. The quantitative-descriptive study is presented through empirical-based research that aims to present and/or interpret occurrences or phenomena, evaluate programs or analyze main parts or variables, with standardized data collection techniques (Marconi; Lakatos, 2011).

The research was conducted in the outpatient sector of reference in child and women's health care of a reference maternity hospital located in the Metropolitan Region of Recife - PE. The target population of the study comprised legal guardians of neonates who had a history of hospitalization for a period of more than 24 hours and who were under outpatient follow-up at the referral service. Those who agreed to participate by signing the Informed Consent Form (ICF) and who were present at the time of the follow-up visit of the newborn were included.

The sample was defined by convenience, depending on the availability of the participants and the practical feasibility of collection in the flow of the service. Although more than 100 families were approached during the collection period, only 11 fully met the inclusion criteria and made up the final sample of the study. This difference occurred due to the specificity of the theme, the required clinical profile (previous neonatal hospitalization) and logistical limitations of the field process.

As an instrument for data collection, a structured questionnaire was used, elaborated based on the objectives of the research and the literature review. The questionnaire was composed of three blocks:

1. Sociodemographic profile of the family (sex/gender of the caregiver, age, income, economic class, marital status, level of education, living at home with the newborn, among others);
2. Clinical data of the newborn (comorbidities, diagnoses and conditions, therapy used, length and age of hospitalization, number of consultations performed);
3. Post-hospital discharge scenario (care recall, guidance received, use of the Child's Handbook, outpatient follow-up, family difficulties and strategies).

The data obtained were organized in an electronic spreadsheet and analyzed by means of descriptive statistics, with absolute and relative frequencies, measures of central tendency and exploratory analysis of correlations between variables. The exploratory nature and the small sample size made it impossible to perform inferential tests, so the results were presented in a descriptive and interpretative way.

3 RESULTS AND DISCUSSIONS

100 families were approached in person during the collection period at the CISAM/UPE outpatient clinic. However, only 11 fully met the inclusion criteria, i.e., neonates who had been previously hospitalized and were under outpatient follow-up at the service, and agreed to answer the questionnaire in a reserved place. This contrast between the families approached and included highlights the difficulties inherent in data collection in such a specific theme and in a scenario of continuous flow care.

The sociodemographic profile of the participants revealed main caregivers living with the neonate, mothers (100.00%), with high daily time (more than 12 hours) dedicated to care. Diversity was observed in relation to education, marital status and family income, and

part of the families made use of social benefits. These findings suggest that care burden is a relevant factor, and that the available support network varies according to the context of each family.

Table 1 presents the sociodemographic characterization of the parents or guardians of the neonates monitored in the study, highlighting relevant aspects of the social and economic context of the families. It is observed that most participants (72.7%) reported participation in the Bolsa Família Program, which indicates the significant presence of families in situations of socioeconomic vulnerability. This finding reinforces the influence of social determinants of health on neonatal care, since limited financial conditions can impact access to resources, transportation, and continuity of health follow-up.

Regarding marital status, there was a balanced distribution between married and single guardians, both corresponding to 45.5% of the sample, while stable unions were less frequent (9.1%). This result suggests diversity in family configurations, which may reflect different levels of social support available for the care of the newborn, an aspect that can interfere with the burden of the main caregiver and the organization of home care.

Regarding schooling, most of the parents or guardians (63.6%) had 13 or more years of schooling, while 36.4% had up to 12 years of schooling. The absence of participants with up to four years of schooling indicates a relatively high educational level in the sample. However, even in the face of higher education, difficulties related to the continuity of care persist, which indicates that barriers in post-discharge follow-up are not restricted only to the level of education, but also to the organization of health services and the clarity of the guidance provided by professionals.

Regarding family income, it was observed that 36.4% of the heads of households did not have a fixed income and 27.3% lived on less than one minimum wage, totaling 63.7% of the households in an unfavorable economic condition. Only 36.4% reported income equal to or greater than one minimum wage. These data show a scenario of financial instability, which can increase difficulties in the continuous care of newborns, especially with regard to travel to consultations, acquisition of supplies and maintenance of outpatient follow-up.

Regarding insertion in the labor market, most of the parents or guardians (72.7%) did not have a profession or occupation at the time of data collection, which may be related to their full dedication to the care of the newborn or to the limitations imposed by the socioeconomic context. Although the availability of time can favor direct care, the absence

of work activity can intensify dependence on social benefits and increase the financial vulnerability of families.

Taken together, the sociodemographic data reveal that those responsible for the newborns live, for the most part, in contexts of social vulnerability, characterized by low income, dependence on social programs and occupational instability, although with

relatively high levels of education. This scenario reinforces the need for post-discharge care strategies that consider not only the clinical aspects of the neonate, but also the social conditions of the families, strengthening the articulation between health services and the social support network, in order to promote comprehensive care and reduce the risk of care discontinuity.

Table 2 describes the clinical and care characterization of neonates after hospitalization, showing a profile marked by clinical vulnerability and weaknesses in the organization of health follow-up. It is observed that the highest proportion of neonates were in the age group of 22 to 28 days of life (36.4%), followed by those up to 7 days (27.3%), which indicates that a significant part of the hospitalizations occurred in the late neonatal period, a phase that is equally sensitive for clinical complications and demand for continuous follow-up.

Regarding the causes of hospitalization, a wide diversity of diagnoses was identified, covering both acute clinical conditions and diseases that require specialized follow-up. Diseases of the lower airways and inguinal hernia stood out (both with 18.2%), in addition to other homogeneously distributed causes, such as infections, jaundice, immunization-preventable diseases, gastrointestinal alterations, and malformations. This heterogeneity of causes reinforces the clinical complexity of neonates followed and highlights the need for individualized care strategies after hospital discharge. In addition, the possibility of more than one cause per newborn signals multifactorial disease trajectories, which increase the risk of rehospitalizations and require continuous surveillance.

Regarding the type of birth, most of the neonates were born at term (81.8%), while 18.2% were preterm. Although prematurity is recognized as a risk factor for neonatal morbidity and mortality, the data indicate that even full-term neonates presented clinical conditions that required hospitalization, showing that neonatal vulnerability is not restricted to gestational age, but involves multiple clinical and contextual determinants.

With regard to health follow-up after discharge, there was a high frequency of consultations, and 63.6% of the neonates had already had more than six Child Health consultations. This finding may reflect both the need for intensive monitoring, due to the clinical conditions presented, and possible failures in the problem-solving capacity of consultations, leading to repeated visits. It was also observed that more than half of the neonates (54.5%) did not leave the appointment with the next previously scheduled

appointment, which evidences weaknesses in the organization of outpatient follow-up and in the articulation of the care network.

In addition, the high proportion of neonates who required unscheduled care in urgent and emergency services (81.8%) stands out. This result suggests that the absence of structured planning of post-discharge care, associated with the clinical complexity of the cases, may contribute to the recurrent use of more complex services, often for situations that could be followed up in the context of primary or outpatient care.

Source: The authors, 2025.

In summary, the data show that the neonates followed up have a heterogeneous clinical profile and a high demand for health services after hospital discharge. The high frequency of unscheduled appointments, associated with the absence of prior scheduling of appointments, points to weaknesses in the continuity of care, reinforcing the need to strengthen discharge planning, counter-referral and articulation between the different levels of care, in order to reduce avoidable readmissions and promote comprehensive neonatal care.

Table 3 presents the data regarding the guidance provided by health professionals and the use of the Child's Handbook in the post-discharge follow-up of neonates, evidencing advances, but also important gaps in communication and standardization of care. It is observed that, in most of the consultations, the professionals requested the Child's Handbook (81.8%), which indicates recognition of this instrument as a relevant tool for monitoring child growth and development. However, the isolated request does not guarantee its effective use, an aspect that is reflected in the subsequent results.

Regarding the completion of the booklet, a little more than half of the parents or guardians (54.5%) reported that the information is recorded systematically, while 27.3% reported that it is filled out only occasionally and 18.2% stated that there is no record during

consultations. These data reveal inconsistency in the use of the instrument, suggesting weaknesses in the continuity of the recording of information and in the standardization of professional practices, which may compromise the longitudinal follow-up of the child.

Regarding guidance on healthy eating and exclusive breastfeeding up to six months, it was found that most of the parents or guardians (72.7%) reported receiving these guidelines continuously, while a smaller portion reported receiving them only occasionally (18.2%) or not receiving them (9.1%). Although this finding indicates progress in the approach to a central axis of neonatal care, the absence or irregularity of these guidelines in part of the care can negatively impact fundamental practices for the health and development of the newborn.

Regarding the guidance on the growth curve, the results point to a more worrying scenario. Almost half of the parents or guardians reported not receiving explanations about the meaning of the child's positioning on the curve (45.5%), as well as about the recognition of risk signs associated with growth (45.5%). Only 45.5% stated that they received these explanations systematically, which evidences an important gap in health education. Considering that the interpretation of the growth curve is an essential instrument for monitoring child development and for the early identification of diseases, the absence of these guidelines can contribute to caregivers' insecurity and delay in seeking adequate care.

With regard to guidance on the vaccination schedule, it was observed that 54.5% of the parents or guardians reported that professionals continuously call attention to the date of the next vaccine, while 27.3% reported that this occurs only occasionally and 18.2% reported the absence of this guidance. Although most receive information about vaccination, the irregularity observed can compromise adherence to the vaccination schedule and expose neonates to avoidable risks.

In general, the data indicate that, despite the recognition of the Child's Handbook as a follow-up instrument, its use still occurs in a heterogeneous and poorly systematized way. The gaps in the guidelines, especially related to the growth curve and risk signs, highlight the need to strengthen educational practices, standardize professional conducts and value the Child's Handbook as a central tool for the promotion of comprehensive and safe care in the post-neonatal discharge period.

The guidance provided by the hospital to families after discharge covered central themes for home neonatal care, such as identification of alarm signs, safe sleep practices, adequate nutrition and compliance with the vaccination schedule. To a lesser extent, guidance emerged on the support network and flows for seeking help in situations of

complications. However, the need for unscheduled returns indicates that such guidelines, although pertinent, still lack greater clarity and uniformity.

From the point of view of family experiences, almost half of the caregivers reported difficulties in adapting to the post-discharge period (45.5%). Social support, when present, proved to be a protective resource, but it was described in a heterogeneous way and, in some cases, insufficient. Among the coping strategies reported were the active search for information with the service, the use of the booklet as a guide, family support and early return in the face of doubts.

Although the sample size limits inferences, some descriptive associations were observed. Families who did not leave with the next scheduled appointment had a greater need for unscheduled appointments, suggesting that the previous organization of the segment can reduce emergency visits. Similarly, the presence of social support seemed to soften the difficulties of adaptation, although the data do not allow statistical confirmation.

Among the main difficulties reported, the following stood out: fear of clinical complications due to the baby's fragility, insecurity in the face of poorly understood risk signs, emotional and physical overload of the main caregiver, difficulty in accessing transportation and financial resources to maintain follow-up, as well as barriers in communication with health services, especially in scheduling appointments and in the clarity of the guidance received.

When asked about what could help overcome these challenges, the families suggested the following as the most desired solutions: immediate scheduling of the next appointment at the end of the service, more detailed guidance in accessible language, greater social and psychological support in the post-discharge period, better use of the Child's Handbook as a monitoring tool, and public policies that expand material support (such as transportation, health benefits and resources close to home).

In summary, the results reveal a scenario in which the continuity of care for the newborn after hospital discharge is weakened. The absence of structured scheduling, the variability in the guidance provided, and the frequent need for additional care point to the importance of strategies that promote standardization of conduct, strengthening health education, and valuing the Child's Handbook as a central monitoring instrument.

The results of this study show that, although hospital care for neonates is decisive for their clinical stabilization, the transition to home remains marked by weaknesses, especially with regard to continuity of care and family safety in post-discharge management.

The sample studied showed that less than half of the families left the outpatient appointment with the next scheduled date, and most needed unscheduled care, revealing that the absence of planning and effective counter-referral still compromises the comprehensiveness of care.

This scenario converges with the findings of Vieira and Whitaker (2016), who identified that the perception of children's health care in the post-discharge period is directly associated with the quality of the information received and the clarity of the dialogue established between the team and the family. For the authors, the lack of adequate communication at the time of discharge generates insecurity, increases family overload and increases the risk of avoidable rehospitalizations. In the present study, insecurity in the face of signs of risk and fear of complications were some of the main difficulties reported by the families, confirming the relevance of this aspect.

Silva and Ramos (2011) also highlight that one of the main limits of the hospital discharge process lies precisely in the absence of articulation between the hospital and primary care. According to the authors, when there is no effective counter-referral, the continuity of care is compromised and families tend to resort to urgent and emergency services to solve problems that could have been monitored in the primary care network. This finding dialogues directly with the high proportion of families who, in the present study, sought additional care outside the scheduled appointment.

Another fundamental point refers to the standardization and clarity of the guidelines offered. Although topics such as food, breastfeeding, risk signs and vaccination schedule have been addressed, the reports of the families demonstrate that the way these guidelines are transmitted is not always accessible or uniform. Paranhos, Pina and Mello (2011) point out that strategies such as Integrated Care for Childhood Illnesses (IMCI) were developed precisely to fill these gaps, by integrating the most common conditions of childhood and training both professionals and family members to identify warning signs and adopt appropriate conducts. In this sense, the lack of standardization observed in our study reinforces the need to strengthen tools such as the IMCI and the Child's Handbook.

In addition, the present study revealed social and emotional challenges, such as the overload of the main caregiver, financial difficulties and limited access to transportation, factors that increase the vulnerabilities faced by families. These questions are supported by the literature, which recognizes that post-discharge home care is influenced not only by clinical factors, but also by social determinants of health. For Silva and Ramos (2011), the

potential to strengthen the Family Health Strategy lies precisely in welcoming these demands in the territory, promoting continuous and comprehensive support.

It is interesting to note that the solutions pointed out by the families in this study, such as immediate scheduling of the next appointment, clearer guidance in accessible language, greater social and psychological support, and strengthening the use of the Children's Handbook, coincide with the recommendations of the literature analyzed. Vieira and Whitaker (2016) emphasize the need to expand the dialogue between team and caregivers, while Paranhos, Pina and Mello (2011) emphasize the importance of integrated protocols that ensure continuity of care and avoid other hospitalizations.

Thus, the findings of the present study, although based on a small sample, reaffirm that the continuity of care for the post-discharge newborn depends on three central pillars: (1) structured discharge planning, with prior scheduling of appointments; (2) clear, accessible and standardized guidelines that guarantee autonomy to families in home care; and (3) articulation between hospital and primary care, ensuring that caregivers have support in the territory, reducing the unnecessary use of emergency services.

4 CONCLUSION

The present study allowed us to understand that the care of the newborn after hospital discharge is still a challenge, permeated by clinical and social vulnerabilities that require continuous attention from health services. Although advances in neonatal care have contributed to the reduction of infant mortality, the results revealed that gaps persist in the transition process from hospital to home, especially regarding the standardization of orientations, planning of outpatient follow-up and social support for families.

The difficulties reported by those responsible for them, such as insecurity in the face of signs of risk, emotional overload and access barriers, reinforce the need for strategies that expand communication between the health team and the family, promote health education in accessible language and ensure the continuity of care at different levels of care. In this sense, the importance of strengthening primary care, the systematic use of the Children's Handbook as an instrument of registration and guidance, and intersectoral articulation to ensure social support to families is highlighted.

Thus, the findings of this study offer relevant support for managers, health professionals, and public policy makers, pointing out ways to improve neonatal care practices after hospital discharge. Finally, this study fulfills its role by revealing critical points

of care for newborns after hospitalization and by proposing reflections that can guide future studies of greater scope. It is reinforced, therefore, that the continuity of neonatal care is not restricted to the hospital environment, but depends on an articulated, welcoming and prepared network to support the family in its role as protagonists in the care of the child.

ABSTRACT

Considering that curricular documents are not neutral, but historical productions shaped by societal projects and ideological disputes, this article problematizes the Tocantins Curricular Document – Early Childhood Education and the documents that guide Early Childhood Education in the municipality of Palmas-TO, in light of Historical-Dialectical Materialism, Historical-Critical Pedagogy, and Cultural-Historical Theory. It aims to analyze the pedagogical and curricular conceptions present in these documents, identifying foundations, limits, and contradictions related to the social function of Early Childhood Education and the role of teacher mediation. To this end, qualitative documentary research is conducted, using as corpus the Tocantins Curricular Document – Early Childhood Education, approved in 2019, and municipal regulations that govern the curricular and pedagogical organization of Early Childhood Education in Palmas. In this way, it is observed that the analyzed documents, although they recognize the child as a subject rights and value play, interaction, and experiences, maintain alignment with the National Common Curricular Base, prioritizing lived experiences, children's protagonism, and learning rights over systematic teaching, cultural transmission, and the teacher's intentional mediation. This allows us to conclude that such curricular guidelines have structural limitations, as they remain silent on the concrete material conditions of childhoods in Tocantins, reinforce neo-schoolist concepts, and weaken the school's social function as a space for the socialization of historically produced knowledge, indicating the need for a curriculum reorganization based on critical, historical-dialectical, and emancipatory perspectives for public Early Childhood Education, in the context of contemporary Brazilian educational policies.

fundamentos, limites e contradições relativos à função social da Educação Infantil e ao papel da mediação docente. Para tanto, procede-se a uma pesquisa qualitativa, de natureza documental, tendo como corpus o Documento Curricular Tocantins – Educação Infantil, homologado em 2019, e normativas municipais que regulamentam a organização curricular e pedagógica da Educação Infantil em Palmas. Desse modo, observa-se que os documentos analisados, embora reconheçam a criança como sujeito de direitos e valorizem o brincar, a interação e as experiências, mantêm alinhamento à Base Nacional Comum Curricular, priorizando vivências, protagonismo infantil e direitos de aprendizagem em detrimento do ensino sistematizado, da transmissão cultural e da mediação intencional do professor. O que permite concluir que tais orientações curriculares apresentam limites estruturais, ao silenciarem sobre as condições materiais concretas das infâncias, reforçarem concepções neoescolanovistas e fragilizarem a função social da escola como espaço de socialização dos conhecimentos historicamente produzidos, indicando a necessidade de reorganização curricular fundamentada em perspectivas críticas e emancipadoras para a Educação Infantil pública, no contexto das políticas educacionais contemporâneas brasileiras.

1 INTRODUCTION

In recent decades, Early Childhood Education has come to occupy a central place in the Brazilian educational debate, especially due to the expansion of legal and normative frameworks that have redefined its role in the scope of Basic Education. The consolidation of this stage as a right of children and a duty of the State brought with it the need for curricular reorganization, redefinition of pedagogical practices and the production of guiding documents that standardize educational work in public school networks. In this scenario, curriculum documents assume a strategic role, as they guide the organization of the curriculum, the training of professionals and the pedagogical practices developed in educational institutions.

However, from the perspective of Historical-Dialectical Materialism, it is understood that such documents are not neutral or merely technical instruments. On the contrary, they are historically situated productions, crossed by ideological disputes, pedagogical conceptions and societal projects in tension. Thus, the analysis of a curricular proposal requires going beyond the normative reading of its statements, seeking to apprehend the conceptions of childhood, education and society that sustain it, as well as the silencing related to the concrete material conditions of children, the teaching work and the social function of the school.

It is in this context that the Tocantins Curriculum Document – Early Childhood Education (DCT-EI) is inserted, approved in 2019 and instituted as an official reference to guide the state's municipal education systems, including the municipality of Palmas. Prepared in collaboration with the 139 municipalities of Tocantins, the DCT-EI is based on the National Common Curricular Base, organizing the curriculum based on learning rights and fields of experience. Although this orientation is presented as an advance in the recognition of the child as a subject of rights, it raises relevant problematizations regarding its limits to ensure intentional teacher mediation and the socialization of historically produced knowledge.

The direct link between the DCT-EI and the BNCC inserts the state curriculum policy in the set of contemporary educational reforms, marked by the centrality of experiences, child protagonism and meaningful learning. From the perspective of Historical-Critical Pedagogy and Historical-Cultural Theory, such conceptions tend to displace the centrality of teaching and weaken the role of the teacher as a mediator of the educational process, reducing the formative power of the school and obscuring its social function of access to

systematized knowledge.

At the municipal level, these guidelines are materialized through specific normative documents that regulate the curricular and pedagogical organization of Early Childhood Education in Palmas. The articulated analysis between state and municipal documents becomes, therefore, fundamental to understand how these orientations are appropriated, reaffirmed or tensioned in the local context, considering the territorial specificities and the concrete conditions of the childhoods served by the municipal public network.

In view of this, the following research question emerges: what pedagogical and curricular conceptions guide the Tocantins Curriculum Document – Early Childhood Education and the normative documents of Early Childhood Education in the municipality of Palmas, and what are their limits and contradictions in the light of Historical-Critical Pedagogy? The relevance of this study is justified by the need to deepen the critical understanding of the curricular policies that focus on Early Childhood Education, a fundamental stage in the process of human formation, contributing to the academic debate and to the reflection on pedagogical practices committed to teacher mediation, systematized teaching and the omnilateral formation of children.

Thus, this article aims to critically analyze the Tocantins Curriculum Document – Early Childhood Education and the documents that guide Early Childhood Education in the municipality of Palmas, in the light of Historical-Critical Pedagogy and Historical-Dialectical Materialism, identifying the conceptions of childhood, curriculum and teaching that underlie them, as well as the limits and contradictions of these proposals with regard to teacher mediation, to the curricular organization and the social function of the school in the socialization of historically produced knowledge.

2 THE TOCANTINS CURRICULUM DOCUMENT – EARLY CHILDHOOD EDUCATION (DCT-EI) IN THE LIGHT OF DIALECTICAL HISTORICAL MATERIALISM

The present analysis seeks to understand the Tocantins Curriculum Document – Early Childhood Education DCT-IE (TOCANTINS, 2019) in the light of Historical-Dialectical Materialism. This theoretical approach is a method of interpreting and analyzing reality starting from the material and real (concrete) conditions of society, as well as the historical relations of production that constitute it. In this way, it is not seen as a neutral document, built as a mere technical or pedagogical tool. Like all human construction, given in a given historical and social context, it is the result of a historically and socially determined production, expressing interests, disputes and contradictions typical of class societies.

That said, the document is not analyzed only from the point of view of its explicit content. The main focus will be on what he demonstrates and also silences about social relations, the living conditions of children, the forms of organization of educational work and the project of society that sustains it.

The analysis of a curriculum document requires more than a simple examination of its guidelines or the internal coherence of its chapters. It requires, above all, recognizing that no document is born neutral, nor does it hover above the historical and social conditions that cross it. As highlighted in the previous text, it is understood that a curricular proposal is always an expression of a time, of a societal project and of the disputes that constitute it. It is in this critical, historical and profoundly human perspective that we seek to develop this analysis.

The document itself states that it was produced "in collaboration with the 139 municipalities of Tocantins", respecting "their regionality, their culture and various artistic expressions" (TOCANTINS, 2019, p. 11). It also states that it seeks to strengthen cultural identity and promote "meaningful and playful actions for all children" (TOCANTINS, 2019, p. 15). These statements demonstrate, at first, an important effort to recognize that Early Childhood Education cannot be conceived detached from the territory and the childhoods that compose it.

However, when we look at the document as a whole and situate it in the totality of national education policies, we perceive significant tensions that deserve to be discussed. As the DCT-EI itself announces, its "guiding thread was the national curriculum policies aimed at Basic Education that today materialize through the National Common Curriculum Base – BNCC, a guideline that underpins the framework presented here" (TOCANTINS, 2019, p. 9). This direct link to the BNCC is not secondary, as it carries with it all the logic that structured the educational reforms of the last decades, marked by standardization, control and curricular narrowing.

From the PHC, this alignment reveals a fundamental limit: by assuming as a foundation a curricular policy of a national and generalizing character, the document ends up reducing the strength of local singularities and silencing the concrete conditions of children in Tocantins and, specifically, in the municipality of Palmas. Saviani (2011) reminds us that the starting point of the educational process is the initial social practice, and not a set of previously defined competencies. However, in the DCT-EI, there is no analysis of the

real conditions of the Early Childhood Education units, the inequalities between the capital and the countryside or the precariousness that mark a good part of the schools.

When dealing with the child, the document adopts a conception centered on protagonism. It states that Early Childhood Education should "conceive the child as the protagonist of their development and learning processes" (TOCANTINS, 2019, p. 15). It also advises that the teacher must ensure that the student is "centrality of teaching and learning" (TOCANTINS, 2019, p. 9). Although these expressions may sound welcoming, they carry a pedagogical conception that approaches spontaneism and moves away from the principle of intentional mediation, which is fundamental in PHC. Duarte (2011) problematizes the discourse of protagonism by recalling that the emphasis on the child's autonomy, when unaccompanied by the transmission of systematized knowledge, reinforces a naturalized conception of child development.

The DCT-EI reinforces the centrality of the experience by stating that Early Childhood Education should provide "meaningful experiences and experiences in the lives of children" (TOCANTINS, 2019, p. 15). Play, described as "the most important experience in the lives of a man and a woman" (TOCANTINS, 2019, p. 16), appears as a structuring element of pedagogical work. However, the document establishes that playing "should not be conceived as a teaching strategy" (TOCANTINS, 2019, p. 23), emptying its pedagogical character, precisely where PHC and Historical-Cultural Theory locate one of the most powerful activities for the development of higher psychic functions.

The selection of the materials analyzed was not limited to the DCT-EI (2019), but also covered the documents that guide Early Childhood Education in the municipality of Palmas, considering that the municipal curriculum policy materializes, tensions, adapts or reaffirms state and national guidelines. Thus, understanding how the municipality interprets and implements such guidelines is a fundamental part of the analytical process, especially when it seeks to capture continuities, ruptures and silencing between different scales of educational policy.

The documentary analysis carried out included, therefore, three other documents that regulate the teaching performance in the Municipal Education Network of Palmas, in Early Childhood Education: the School Regiment of Early Childhood Education, curricular structure for partial early childhood education, curricular structure for integral urban and rural early childhood education. The set of these materials allows us to observe not only

what is prescribed, but also what is reiterated, omitted or stressed between the different curricular versions.

In order to systematize the materials that make up this stage of the investigation, a summary table of the municipal documents used in the analysis is presented below.

Table 1

Municipal Documents of the Palmas Network Used in the Documentary Study

Document	Object / Relevance	Link
School Regiment of Early Childhood Education – Municipal Education Network of Palmas-TO	Regulates the administrative, pedagogical and disciplinary organization of the CMEIs. It defines institutional principles, management, evaluation, routines and functioning of Early Childhood Education.	https://www.palmas.to.gov.br/media/documentos/17_12_2019_9_5_0_58.pdf
Curriculum Document for Early Childhood Education – Municipal Education Network of Palmas-TO	It establishes curricular and pedagogical guidelines for work in the CMEIs, organizing objectives, fields of experience, planning and pedagogical foundations.	https://educacao.palmas.to.gov.br/files/ugd/dd59cb_4109379a33b5495aa401d854d0ec8c28.pdf
Curriculum Document of the Territory of Tocantins – DCT	State reference adopted as a basis for the elaboration of the municipal curriculum, articulated with the BNCC and the territorial, cultural and educational specificities of Tocantins.	https://central3.tocantins.gov.br/arquivo/478046/
Guiding Document for Early Childhood Education – Municipal Education Network of Palmas-TO	It presents pedagogical guidelines, formative principles and operational guidelines that complement the curriculum and the school regulations of Early Childhood Education.	https://educacao.palmas.to.gov.br/files/ugd/dd59cb_cd8f658f01784dedb74be765aacc778b.pdf

Source: Prepared by the author based on official documents from the Municipal Education Network of Palmas-TO (2019–2024).

The curricular organization by "Learning and Development Rights" — to live together, play, participate, explore, express and get to know each other — reinforces the emphasis on individual experiences. Chapter V describes these rights in detail, stating that children must "participate in everyday situations", "express needs and feelings" and "explore environments and situations" (TOCANTINS, 2019, p. 54). Such formulations, although important, are not sufficient as a formative matrix, as they do not present essential contents, do not explain conceptual progression and do not situate the school as a mediator of culture.

It is at this point in the analysis, when we observe the emphasis given to experiences, child protagonism and the centrality of experiences, that it becomes necessary to broaden our view to a dimension that crosses the document without being made explicit: the marks of a New New School perspective that permeate the curriculum presented. This presence does not occur in a declared way, but appears in the way the curriculum assigns to the child

the conduction of his own processes and to the teacher the function of monitoring, observing and ensuring "sensitive listening".

It is a conception that, although wrapped in a welcoming and valuing discourse of childhood, takes up principles of traditional renewing pedagogies — now coated by the contemporary language of competencies and meaningful learning. Thus, by affirming that the child is "the protagonist of his or her own development processes" and by organizing the pedagogical work around subjective experiences, the regulation under study updates a pedagogical matrix that shifts the centrality of knowledge to children's spontaneity, which, as the authors of the PHC problematize, tends to weaken teacher mediation and reduce the formative power of the school. To identify these links is not to construct a deserving critique, but to understand that the document also expresses the movement of current educational policies, marked by disputes and tensions that do not always harmonize with the historical-critical perspective.

Thus, by recognizing this neo-new school presence, it becomes even more evident that the curricular organization by rights and fields of experiences, although it brings important contributions, remains limited when it does not dialogue with the structuring contents and with the concrete material conditions of the children of Tocantins.

In this sense, in order to understand more deeply how these conceptions materialize in the daily life of the municipal network, it is necessary to triangulate them with the curricular documents prepared by the Municipal Department of Education of Palmas itself. This comparison is fundamental because it reveals how the municipality interprets, adheres to or tensions such guidelines — and, above all, what continuities are observed between the documents.

The "Curricular Structure for Early Childhood Education – Partial" determines that the pedagogical work is organized by the "five Fields of Experience" and by the "06 Rights of Learning and Development: Living together, playing, participating, exploring, expressing and getting to know oneself", reinforcing that cultural practices involving reading and writing "should not be understood as a literacy process". This formulation corroborates what is prescribed by the guidelines by reaffirming the centrality of experiences and avoiding the systematization of written knowledge, reproducing the same adherence to the BNCC.

The "Curricular Structure for Early Childhood Education – Integral, Urban and Rural" deepens this logic by reiterating the six rights on a daily basis and stating again that "this is not the time to systematize literacy". The proposal for rural schools adopts the alternation

regime, where domestic and community activities are conceived as "research activities related to the thematic axes, under the guidance of the teacher". Although it recognizes territories and identities, this orientation risks naturalizing inequalities by treating domestic experiences as equivalent to school pedagogical work — a central critique of PHC.

The previous document from 2019 reinforces the same orientation by stating that Early Childhood Education should be organized "in everyday experiences, in the expression of feelings and in the freedom to explore environments and situations", reaffirming, like the DCT-EI (TOCANTINS, 2019), a matrix centered on experiences and subjectivity, without making explicit conceptual progression or structuring contents.

Thus, the three municipal documents confirm and deepen the analyses made: all fully adhere to the BNCC matrix (BRASIL, 2017); all of them shift the centrality of knowledge to experiences and sensibilities; all prioritize subjective rights over objects of knowledge; everyone is silent about structural inequalities and the real material conditions of children.

In the field of diversity, the document recognizes indigenous, quilombola, riverside and rural childhoods, stating that indigenous children are "free, respected in their ways of being, living, playing and producing" (TOCANTINS, 2019, p. 27). However, the approach remains descriptive, not reaching the broader social determinations that constitute these childhoods. As Martins (2019) reminds us, an approach that only describes differences, but does not analyze their insertion in the set of social relations, runs the risk of reinforcing inequalities instead of overcoming them.

Thus, it is understood that the DCT-EI and the Palmas documents reveal, simultaneously, discursive advances and structural limits. They advance by recognizing the plurality of Tocantins childhoods, but they are limited when they assume a curricular matrix that prioritizes experiences, protagonism and subjective rights to the detriment of teacher mediation and the appropriation of systematized knowledge.

By presenting themselves as progressive documents, but maintaining a curricular organization centered on experiences and skills, Palmas' proposals express — as the historical-dialectical perspective would say — the contradictions typical of a historical time in which education is crossed by distinct and often irreconcilable interests.

Thus, this analysis, inspired by the commitment to understand the determinations presented in the concreteness of its determinations, reveals that its proposal — as well as those adopted in the municipality — although it announces integral education, does not

mobilize categories that allow the school to fulfill its social function of socializing historically produced knowledge.

3 CONCLUSION

The analysis developed throughout this article allowed us to understand that the Tocantins Curriculum Document – Early Childhood Education (DCT-EI), as well as the normative documents that guide Early Childhood Education in the municipality of Palmas, express the contradictions inherent to contemporary educational policies, situated in a historical context marked by disputes between different conceptions of education, childhood and curriculum. In the light of Historical-Dialectical Materialism, Historical-Critical Pedagogy and Historical-Cultural Theory, it was evident that such documents are not configured as neutral productions, but as provisional syntheses of societal projects in tension.

The results of the analysis indicate that, although the documents advance in the recognition of the child as a subject of rights and value elements such as play, interaction and the diversity of childhoods, they maintain a strong alignment with the National Common Curricular Base, prioritizing experiences, experiences and child protagonism. This curricular orientation, marked by neo-escolanovist traits, displaces the centrality of teaching and weakens intentional teacher mediation, emptying the role of the school as a privileged space for the socialization of scientific, artistic and cultural knowledge historically produced.

It was also observed that both the DCT-EI and the municipal documents of Palmas are silent about the concrete material conditions of children and educational institutions, as well as about the structural inequalities that cross the childhoods of Tocantins. By treating diversity in a predominantly descriptive way and by equating everyday experiences with systematized pedagogical work, the proposals analyzed run the risk of naturalizing inequalities, instead of facing them critically.

Thus, it is concluded that the curricular organization of Early Childhood Education in Palmas has structural limits that compromise the effectiveness of an integral education guided by human emancipation. Overcoming these limits requires the incorporation of critical theoretical foundations, the strengthening of teacher mediation and the curricular reorganization based on the centrality of teaching and systematized knowledge. It is hoped that this analysis will contribute to the academic debate and to the critical reflection on the curricular policies of Early Childhood Education, especially in the context of public

education, reaffirming the commitment to a socially referenced school and to the full human formation of children.

ABSTRACT

Dropout and evasion in secondary education are historical challenges in Brazilian education, strongly associated with socioeconomic inequalities that compromise the permanence and completion of this stage by young people in the public school system. In this context, the Pé-de-Meia Program emerges as a public policy of financial incentive aimed at the permanence and completion of secondary education by vulnerable students in the public school system. This article aims to analyze initial evidence of the implementation of the Pé-de-Meia Program in light of selected indicators of school performance, flow, and transition, discussing the extent to which the policy design is compatible with improvements observed in the 2020-2024 period. Methodologically, this is a quantitative, descriptive, and ex post study based on secondary data from official databases (Inep, Nilo Peçanha Platform, and Enem statistics), with an emphasis on Figureical analysis and the comparison of historical series. The results point to signs of an association between the Program's duration and higher pass rates, lower dropout and age-grade distortion indicators, and increased participation of public school graduates in the Enem, especially among students more exposed to the need for early entry into the labor market. It can be concluded that, although still preliminary and subject to important methodological limitations, the findings indicate the relevance of Pé-de-Meia as a policy to support high school retention and completion, highlighting the need for continued monitoring and more robust impact assessments as new data sets and series become available.

Programa Pé-de-Meia surge como política pública de incentivo financeiro voltada à permanência e à conclusão do ensino médio por estudantes da rede pública em situação de vulnerabilidade. O presente artigo tem como objetivo analisar evidências iniciais da implementação do Programa Pé-de-Meia, à luz de indicadores selecionados de rendimento, fluxo e transição escolar, discutindo em que medida o desenho da política se mostra compatível com melhorias observadas no período 2020-2024. Metodologicamente, trata-se de estudo quantitativo, descritivo e ex post, baseado em dados secundários de bases oficiais (Inep, Plataforma Nilo Peçanha e estatísticas do Enem), com ênfase na análise gráfica e na comparação de séries históricas. Os resultados apontam sinais de associação entre a vigência do Programa e a elevação das taxas de aprovação, a redução de indicadores de abandono e distorção idade-série e o aumento da participação de concluintes da rede pública no Enem, especialmente entre estudantes mais expostos à necessidade de inserção precoce no mercado de trabalho. Conclui-se que, embora ainda preliminares e condicionados a importantes limitações metodológicas, os achados indicam a pertinência do Pé-de-Meia como política de apoio à permanência e à conclusão do ensino médio, evidenciando a necessidade de monitoramento continuado e de avaliações de impacto mais robustas à medida que novos recortes e séries de dados se tornem disponíveis.

RESUMEN

El abandono y la evasión en la enseñanza secundaria constituyen retos históricos de la educación brasileña, fuertemente asociados a las desigualdades socioeconómicas que comprometen la permanencia y la finalización de esta etapa por parte de los jóvenes de la red pública. En este contexto, el Programa Pé-de-Meia surge como una política pública de incentivo financiero orientada a la permanencia y la finalización de la enseñanza secundaria por parte de los estudiantes de la red pública en situación de vulnerabilidad. El presente artículo tiene como objetivo analizar las primeras evidencias de la implementación del Programa Pé-de-Meia, a la luz de indicadores seleccionados de rendimiento, flujo y transición escolar, discutiendo en qué medida el diseño de la política es compatible con las mejoras observadas en el período 2020-2024. Metodológicamente, se trata de un estudio cuantitativo, descriptivo y ex post, basado en datos secundarios de bases oficiales (Inep, Plataforma Nilo Peçanha y estadísticas del Enem), con énfasis en el análisis gráfico y la comparación de series históricas. Los resultados apuntan a una asociación entre la vigencia del Programa y el aumento de las tasas de aprobación, la reducción de los indicadores de abandono y distorsión edad-serie y el aumento de la participación de los graduados de la red pública en el Enem, especialmente entre los estudiantes más expuestos a la necesidad de incorporarse precozmente al mercado laboral. Se concluye que, aunque aún son preliminares y están condicionados por importantes limitaciones metodológicas, los resultados indican la pertinencia del Pé-de-Meia como política de apoyo a la permanencia y la finalización de la enseñanza secundaria, lo que pone de manifiesto la necesidad de un seguimiento continuo y de evaluaciones de impacto más sólidas a medida que se disponga de nuevos recortes y series de datos.

1 INTRODUCTION

The universalization of access to primary education in Brazil was not accompanied, in the same proportion, by the guarantee of permanence and completion of secondary education, a stage marked by high dropout rates, failure and age-grade distortion, phenomena closely associated with socioeconomic inequalities that affect school-age young people. Several studies identify the need to work, low family income, and precarious living conditions as the main determinants of school withdrawal in this phase of basic education, perpetuating cycles of exclusion and limiting trajectories of social mobility.

Recent data from the Continuous National Household Sample Survey (Continuous PNAD), 2nd quarter of 2025 (IBGE, 2025), reveal that about 8.8 million Brazilians between 15 and 29 years old have not completed high school and do not attend basic education in 2024. The economic factor is the most relevant determinant for this situation, with almost half of the young people pointing to the need to work as the main reason for dropping out, which highlights the difficulty of reconciling study and work in a context of social vulnerability. Also according to the Continuous PNAD (IBGE, 2024, p. 7-8), the adjusted net school attendance rate – young people aged 15 to 17 attending or having completed high school – reached 76.7% in 2024, a value that represents an increase of 1.7 p.p. in relation to 2023, but remains 8.3 p.p. below the target of 85% established by the National Education Plan (PNE) 2014-2024 (Law No. 13,005, of June 25, 2014).

The Report of the 5th Monitoring Cycle of the PNE Goals, released by Inep (2024a, p. 95-96), summarizes the structural nature of these challenges:

Eight years after the 2016 deadline, universal access to school for young people aged 15 to 17 – underlying Indicator 3A³ – has not yet been achieved, with 94.0% reaching this indicator in 2023, 6.0 percentage points (p.p.) below the target. Between 2012 and 2023, there was a 5.2 p.p. increase in access to school for this age group, but there is still a significant distance to reach the goal of universalization.

[...] Regarding Indicator 3B⁴, referring to net enrollment rates among the young population aged 15 to 17 years, the results suggest that, in 2023, 76.9% of young people attended [high school] or had completed basic education, an increase of 13.5 p.p. in relation to 2012, but still 8.1 p.p. below the target of 85.0%.

³ Indicator 3A: Percentage of the population aged 15 to 17 that attends school or has already completed basic education. Goal: 100% coverage of this population by 2016 (Brasil, 2014).

⁴ Indicator 3B: Percentage of the population aged 15 to 17 years that attends high school or has completed basic education. Goal: Reach 85% net enrollment in secondary education by 2024 (Brasil, 2014).

In addition, the most recent data from the national indicators of school flow for public secondary education, cycle 2021-2022, released by Inep in July 2025 (Inep, 2025g), record a repetition rate of 4.6%, dropout of 9.5% and migration to Youth and Adult Education (EJA) of 2.0%, configuring a scenario of persistent difficulty in regular progression.

In this context, socioeconomic inequalities have a disproportionate impact on low-income students, who face limitations in access to essential resources such as school materials, transportation, and adequate study conditions, contributing to the maintenance of the cycle of poverty and transforming education – which could be a vector of social mobility – into an additional barrier to inclusion (Madaloz *et al.*, 2024). Educational public policies of conditional financial incentive have been consolidated, nationally and internationally, as strategies to mitigate these effects, acting on the economic determinants of dropout and promoting qualified permanence.

The Pé-de-Meia Program, instituted by Law No. 14,818/2024 and regulated by Decree No. 11,901/2024, is part of this set of initiatives by creating an innovative mechanism for educational savings conditional on enrollment, minimum attendance of 80% of teaching hours, annual approval and participation in the National High School Exam (Enem), with benefits totaling up to R\$ 9,200 per eligible student. The policy transcends the mere transfer of income by establishing explicit strategic objectives of reducing school retention, dropout, and dropout rates (art. 2, item III), mitigating social inequalities, and stimulating the transition to higher and technical education, breaking the intergenerational cycle of poverty (Brasil, 2024a; Brazil, 2024b).

According to data from the⁵ Federal Government's Transparency Portal, in its first year of execution (2024), the Program reached R\$ 9.2 billion in expenditures, benefiting 4.1 million students. Coverage reached about 60% of public high school enrollments, considering data from the 2024 School Census (Inep, 2025a), with high relevance for the EPCT Federal Network⁶, whose profile of socioeconomic quota students reinforces its priority eligibility (Law No. 12,711/2012).

According to Pereira (2016, p. 77),⁷ the central innovation of design lies in the creation of a financial reward for the student, to combat the temporal myopia typical of adolescence,

⁵ <https://portal.datatransparencia.gov.br/beneficios?ano=2024>

⁶ Federal Network of Professional, Scientific and Technological Education.

⁷ In the original: "The literature from neuroscience shows that adolescence is a period of intense structural change in the brain (Spear, 2000). The maturation changes in the brain during adolescence contribute to some of the behavioral differences from adolescence to other ages, as the higher predisposition to take risky attitudes

in which the immediate opportunity cost of work often overlaps with the future benefits of education, bringing immediate decision horizons closer to long-term educational returns.

The neuroscience literature shows that adolescence is a period of intense structural change in the brain (Spear, 2000). Maturation changes in the brain during adolescence contribute to some of the differences in behavior between adolescence and other ages, such as a greater predisposition to take risky actions and a tendency to focus on the present and ignore future consequences. In the presence of this myopic behavior, the financial rewards for completing high school can effectively decrease school dropout.

In this sense, formulating a public policy that minimizes this scenario requires initiative and interest from the public sector in contributing to the improvement of the conditions of the most vulnerable, as well as the success of its contribution to the permanence of these students. Given this perspective, it is necessary to understand how the new policy has been decisive in reducing dropout rates and increasing the completion rates of high school among young people in situations of social vulnerability in the first year of its implementation.

Thus, this article analyzes the first results of the Program as a public educational policy, verifying to what extent its initial objectives are reflected in the indicators of school flow, performance and transition observed in the 2020-2024 time series, with the hypothesis that the financial incentive acts as a determining factor for the permanence and completion of high school among vulnerable students in the public network. The success of the initiative will be measured precisely by the ability to consistently change academic performance indicators in the next census cycles, with a more evident impact on the groups historically most affected by school exclusion.

The article is organized into five main sections. After this introduction, the theoretical framework discusses school dropout, architecture of financial incentives and *ex post evaluation* of public policies. The methodology section details the quantitative-descriptive design, secondary data sources (Inep, Nilo Peçanha Platform, Enem) and analytical limitations. The analysis of the results and discussion presents the evolution of the indicators of enrollment, approval, age-grade distortion, dropout, academic efficiency and participation in Enem, confronting them with the objectives of the Program. Finally, the conclusion summarizes the preliminary findings, their implications for public educational policies, and recommendations for future monitoring.

and a tendency to focus on the present and ignore future consequences. In the presence of this myopic behavior, financial rewards for high school graduation can effectively decrease dropout".

2 THEORETICAL FRAMEWORK

2.1 SCHOOL DROPOUT AND FINANCIAL INCENTIVES

The Law of Guidelines and Bases of National Education – LDB (Law No. 9,394, of December 20, 1996) – defines the recommended ages for each stage of basic education, whose attendance is mandatory from 4 to 17 years of age. For secondary education, the ideal age range is between 15 and 17 years old (Brasil, 1996). Understanding the presence and absence of young people in this cycle is an essential step for diagnosing school exclusion and for planning educational policies aimed at permanence. The estimate of the population of young people aged 15 to 17 who are out of school is based on the Continuous PNAD, conducted by the Brazilian Institute of Geography and Statistics (IBGE), the main source of updated information on the educational and socioeconomic conditions of the Brazilian population.

School dropout in Brazilian high school is a multicausal phenomenon, located at the intersection between socioeconomic conditions, school trajectories marked by failures and age-grade distortion, and subjective dimensions linked to the meaning of schooling for young people. Recent studies indicate that socioeconomic inequalities affect low-income students more intensely, whose access to basic resources – such as teaching materials, transportation and minimum study conditions – is often limited, which contributes to the intergenerational reproduction of poverty and transforms the school, many times, from a potential instrument of social mobility into another barrier to inclusion. In this scenario, the need for early insertion in the labor market appears recurrently as a central reason for dropout, especially among young people aged 14 to 29 years.

According to Branco *et al.* (2020), dropout tends to grow as the level of education advances, driven by external factors (such as economic pressure and the need to contribute to family income) and internal factors (such as the disconnection between the school curriculum and students' life projects). In a similar vein, Madaloz *et al.* (2024) point out that the absence of financial incentives is a determining factor for withdrawal from school among low-income students, highlighting that the lack of financial incentives negatively impacts students' permanence in school, along with access barriers such as precarious transportation and scarcity of resources to pay for school life.

The international literature on the economics of education also highlights that adolescents tend to underestimate or "overdiscount" the future benefits of education, favoring immediate gains over long-term returns, such as completing high school. Pereira (2016, p.

63), ⁸when analyzing the Better Youth Income program in Rio de Janeiro, shows that, despite the "substantial gains associated with completing high school", dropout rates remain high, which has led many economists to suggest that young people "ignore or discount the benefits of completing high school", in line with evidence from neurology and psychology that characterizes adolescence as a period especially prone to myopic behavior.

In this context, conditional financial incentive policies are conceived as mechanisms to correct this "temporal myopia", bringing the benefits perceived by students closer to the short-term decision horizon. Pereira (2016, p. 76)⁹ documents evidence that a performance bonus deposited in a linked account, with full withdrawal only at the end of high school, combined with penalties in case of failure or dropout, produces statistically significant effects in increasing pass rates and reducing dropout among adolescents in situations of extreme poverty.

This article presents evidence that achievement awards that pay poor high school students for high school completion can substantially reduce school dropout and increase high school completion rates among economically disadvantaged youth. The program's design exploits students' loss aversion by paying for each grade completed but locking the transferred amount in a bank account and releasing the full amount to the student only after timely completion of high school. This rule possibly creates a strong incentive for students who are loss-averse and is likely to influence students who discount the future too much or who exhibit nearsighted behavior.

In our preferred specification, being eligible to receive the incentive award decreases dropout rates by about 37% and increases pass rates in grades by 14%.

Results of recent research on the Pé-de-Meia Program, although at an early stage, partially converge in this direction: case studies indicate that the benefit works, for some students, as a direct incentive to permanence, although for others, it is appropriated primarily

⁸ In the original: "Despite substantial gains associated with high school completion, high school dropout rates are still large both in the US as well as in many countries of the developing world. [...] The inconsistency between such large returns from high school completion and high dropout rates has led many economists to suggest that adolescents either ignore or highly discount the benefits of completing high school. This reasoning is consistent with the literature on neurology and psychology (Spear, 2000) that indicate adolescence as a period especially susceptible to myopic behavior".

⁹ In the original: "This paper presents evidence that attainment awards that pay poor high school students for graduating from high school can substantially reduce dropout and increase high school graduation rates among economically disadvantaged youths. The program design exploits students' loss aversion by paying for each grade passed, but by locking the amount transferred in a bank account, and only releasing the full amount to the student after timely graduation from high school. This rule possibly creates a strong incentive for students who are loss averse, and is likely to influence students who highly discount the future or who present myopic behavior. In our preferred specification, being eligible to receive the incentive award decreases dropout rates by roughly 37%, and increases grade passing rates by 14%".

to cover basic needs, which reveals both its potential and its limits to face, alone, the problem of dropout.

Thus, the theoretical debate on school dropout and financial incentives points, on the one hand, to the relevance of monetary instruments aimed at vulnerable young people, and, on the other hand, to the need to understand them as components of broader strategies to combat educational inequalities, articulated with pedagogical policies, social protection and improvement of school conditions.

Analyzing the international experience and in the light of the Brazilian reality, Haddad *et al.* (2022, p. 6) established recommendations to increase the chance of effectiveness of financial incentive policies for completing high school, including:

The program should not be seen as the great solution to the problems of Brazilian high school. Most of the articles analyzed point to the beneficial effects of financial incentives for students in terms of schooling. However, although significant, the magnitude of the effects is not enough to solve, as a whole, the serious Brazilian educational problem. This conclusion applies to all the variables analyzed: flow, dropout, completion and access to higher education, among others. For example, in Brazil, the net enrollment rate in high school is only 75% for young people between 15 and 17 years old. The largest effects found in the literature of financial aid programs on tuition are around 3 to 5 percentage points.

2.2 ARCHITECTURE OF INCENTIVES AND CONDITIONALITIES: LAW NO. 14,818/2024

The operationalization of the Pé-de-Meia Program, as instituted by Law No. 14,818/2024 and regulated by Decree No. 11,901/2024, is structured in four types of financial-educational incentives articulated with each other. This architecture was designed to act simultaneously on the easing of immediate economic constraints and on the formation of long-term savings, conditioning the receipt to the fulfillment of academic and social requirements. From an analytical perspective, the design of the Program is similar to international experiences of awards for performance or for timely completion of high school, such as the Better Youth Income, which combine deposits in a linked account, partial access to resources during the course and severe penalties in case of failure or dropout, exploring both positive incentives and the aversion to loss of students (Pereira, 2016).

To be eligible for the Program, the student must be between 14 and 24 years old, be a member of a low-income family enrolled in the Unified Registry for Social Programs (CadÚnico) and be enrolled in public high school (federal, state, district or municipal). The

legislation provides for the granting of the following benefits, totaling up to R\$ 9,200, per eligible student, until the completion of public high school:

- a) Enrollment Incentive: single and annual amount of R\$ 200, paid per enrollment registered at the beginning of each academic year;
- b) Attendance Incentive: monthly amount of R\$ 200, paid in 9 (nine) installments throughout the year, totaling R\$ 1,800, subject to proof of minimum school attendance of 80% of the monthly teaching hours, a level higher than the minimum of 75% provided for in the Law of Guidelines and Bases of National Education (LDB) for regular approval;
- c) Incentive-Conclusion: annual amount of R\$ 1,000, deposited at the end of each school year completed with approval, accumulating up to R\$ 3,000, with withdrawal allowed only at the end of high school;
- d) Enem-Incentive: a single amount of R\$ 200 for third-year high school students from the public network who register and participate in the two days of application of the Enem tests, under the terms of Decree No. 11,901/2024 and MEC Ordinance No. 470/2025 (Brasil, 2024b; Brazil, 2025a).

It is imperative to highlight the hybrid nature of the availability of these resources. While the Enrollment Incentive and the Attendance Incentive can be moved monthly by the student, acting as mitigators of the need for immediate work and material barriers to access school, the Completion Incentive is configured as a blocked educational savings, whose full withdrawal is only allowed after the certified completion of all high school. This combination is close to the mechanism described by Pereira (2016), in which the accumulated balance can only be fully withdrawn at the end of the cycle, and the student simultaneously experiences the prospect of future gain and the risk of loss in case of abandonment or failure.

Recent studies on the Pé-de-Meia emphasize that this structure of benefits and conditionalities reinforces the objective of not only guaranteeing access, but ensuring qualified permanence and completion of basic education, directly combating dropout motivated by economic factors and mitigating inequalities of opportunity between students from different social backgrounds. Madaloz *et al.* (2024) define the Program as "a proactive and structured measure to strengthen the Brazilian educational system", by directing resources specifically to students in vulnerable situations, with a view to promoting financial inclusion and equal opportunities in the completion of high school.

Finally, according to article 5, item III, of Decree No. 11,901/2024, the student may be dismissed from the Program in case of dropout, dropout, or failure for two consecutive times or for a period of two years, which gives the institutional arrangement an additional disciplinary component and reinforces the character of commitment to academic success. This logic dialogues with the literature on conditional transfer programs, according to which the careful definition of what is incentivized, how the incentive is framed, and the sanctions associated with non-compliance with conditionalities is decisive for maximizing the effectiveness and cost-benefit ratio of the policy (Pereira, 2016, p. 65).¹⁰

The correct choice of what to encourage (Barrera-Osorio et al., 2011), how to frame the incentive (Barrera-Osorio and Filmer, 2013) or how to label it (Benhassine *et al.*, 2015) has important consequences on the magnitude of the program's impact. The correct targeting and design of the incentive portion of CCT [conditional cash transfer] programs is crucial to maximize their cost-effectiveness.

2.3 EVALUATION OF PUBLIC POLICIES: THE *EX POST PERSPECTIVE*

The evaluation of public policies occupies a central place in the contemporary agenda of state management, constituting a fundamental instrument to assess efficiency (use of resources), effectiveness (achievement of goals) and effectiveness (social impacts) of government interventions. According to the Practical Guide for *Ex Post Analysis* of the Civil House, the evaluation after implementation allows not only to verify whether the objectives have been achieved, but also to identify design and execution flaws, guide adjustments and improvements, and support decisions on continuity, expansion, or redirection of policies (Brasil, 2018a).

In the specific field of educational policies, Haddad *et al.* (2022) emphasize that "all public policy must be evaluated *ex post* to ensure that its objectives have been achieved", emphasizing that evaluation is important "also for adjustments in the design of the program in order to make it increasingly efficient according to the objectives outlined", and may even identify "spillover effects on actors that are not the focus of the programs, but that have the possibility of generating desired and positive results" (Haddad *et al.*, 2022, p. 8). Such a perspective is particularly pertinent for student financial incentive programs, whose impact

¹⁰ In the original: "Right choosing what to incentivize (Barrera-Osorio et al., 2011), how to frame the incentive (Barrera-Osorio and Filmer, 2013) or how label it (Benhassine et al., 2015) has important consequences over the magnitude of the program impact. Correctly targeting and designing the incentive portion of CCT [conditional cash transfers] programs is crucial in order to maximize its cost effectiveness".

depends both on the individual response of beneficiaries and on broader changes in school and family dynamics.

In the case of the Pé-de-Meia Program, the *ex post* perspective implies monitoring whether the design of the policy – based on payment conditioned to enrollment, attendance, completion and participation in Enem – translates into consistent improvement in indicators of permanence, performance and educational transition, explicitly considering its temporal and methodological limitations. As this is a high-cost policy and of recent implementation, the consolidation of a robust monitoring and evaluation system, with clear goals and defined indicators, becomes an indispensable condition both to qualify the public debate on its merits and to ensure the best use of available resources.

3 METHODOLOGY

3.1 DESIGN AND NATURE OF THE RESEARCH

This research is characterized as a quantitative, descriptive and exploratory study, with an *ex post design* for the evaluation of public policies, focused on the analysis of secondary indicators of performance, flow and school transition in the 2020-2024 time series. The methodological focus is on the verification of variations and trends in academic indicators in the first year of implementation of the Pé-de-Meia Program (2024), assuming an observational character appropriate to the identification of preliminary signs of alignment between the empirical results and the normative objectives of the policy, recognizing the impossibility of causal inference in such a restricted time horizon (Brasil, 2018a).

3.2 DATA SOURCES

The data comes from official educational statistics databases:

- a) Synopses Annual Statistics of Basic Education and Educational Indicators of Inep, covering enrollments, public high school graduates, school performance rates (pass, fail, dropout) and age-grade distortion at the national level (Inep, 2025a; Inep, 2025b);
- b) Statistical Synopses and Microdata of Enem, with numbers of high school graduates from the public network enrolled and present on the two days of application of the tests (Inep, 2025c; Inep, 2025d); and
- c) Nilo Peçanha Platform (PNP), official statistics environment of the Federal EPCT Network established by Setec/MEC Ordinance No. 1/2018, which subsidizes

management indicators such as Dropout Rate, Academic Efficiency Index and Retention Index by Cycle (Brasil, 2018b; Brazil, 2021; Brazil, 2025b).

Inep conceptualizes enrollment as formal registration in the Educacenso System on the reference date of the Census (last Wednesday of May) (Inep, 2024b), while the PNP considers enrolled those who have maintained an active bond for at least one day a year, according to the Methodological Reference Guide of Educational Statistics of the Federal Network (Brasil, 2020; Brazil, 2021). The series analyzed (2020-2024) contextualizes the implementation framework of the Pé-de-Meia, with the exception of the preliminary nature of the 2024 evidence.

3.3 ANALYTICAL STRATEGY

The analysis adopts descriptive and comparative procedures:

- a) Analysis of time series with absolute and relative variations (percentage points) between consecutive years and in the total period;
- b) Identification of trends and inflections temporally correlated to the implementation of the Program;
- c) Comparison between aggregate levels (national x Federal Network) to highlight institutional singularities; and
- d) Exploratory interpretation aligning observed variations with the mechanisms of the Nest Egg, recognizing alternative factors such as post-COVID-19 recovery and complementary policies (Haddad *et al.*, 2022).

3.4 INDICATORS ANALYZED

The main educational indicators of academic efficiency and performance analyzed in this article, listed below, are defined in the Dictionary of Educational Indicators of Inep (Inep, 2004) and in the Methodological Reference Guide of Educational Statistics of the Federal Network (Brasil, 2020):

- a) Approval Rate: percentage of approved over enrolled (Inep, 2025e);
- b) Failure Rate: percentage of failed over enrolled (Inep, 2025e);
- c) Dropout Rate: percentage of students who dropped out of some grade before the end of the school year (Instituto Unibanco, 2024; Inep, 2025e);

- d) Age-Grade Distortion Rate: percentage of students with two or more years of school delay, according to the Inep methodology (Unicef, 2018; Inep, 2025f);
- e) Dropout Rate: percentage of students who dropped out of school before completing a course or stage of education, not renewing their enrollment in the following school year, even if they passed or failed the previous one, resulting in the definitive interruption of studies (Instituto Unibanco, 2024; Inep, 2025g);
- f) Retention Index per Cycle: specific to the Federal EPCT Network, percentage of enrollees exceeding the deadline for completion of the course (+1 year) (Brazil, 2025b);
- g) Academic Efficiency Index: specific to the Federal EPCT Network, percentage of graduates within the expected period (+1 year), plus a percentage (projection) of students retained in the reference year who will be able to complete the course (Brasil, 2025b); and
- h) Enem Graduation Participation Rate: percentage of graduates enrolled in Enem in relation to the total number of students enrolled in the third year of high school registered in the School Census (Inep, 2025a; Inep, 2025c; Inep, 2025d), also considering studies that deal with student participation in Enem (Silva; Rosistolato, 2021).

3.5 METHODOLOGICAL LIMITATIONS

The present study recognizes the following limitations:

- a) Absence of granular disaggregation: the data used are aggregated at the national and Federal Network levels, not allowing differentiated analysis by school unit, municipality or individual characteristics of students;
- b) Lack of control for confounding variables: the analysis does not apply matching, stratification or statistical modeling techniques to isolate the specific effect of the Pé-de-Meia Program from other factors that also influence educational indicators;
- c) Limited time horizon: only one year of full implementation (2024) is available for review, insufficient to establish sustained effects or identify cyclical patterns;
- d) Impossibility of causal inference: the variations observed in the indicators cannot be attributed exclusively to the Program, and must be interpreted as signs of temporal association and compatibility with policy objectives;

e) Influence of alternative factors: the 2020-2024 series comprises a critical period of post-pandemic recovery from COVID-19, during which multiple educational policies at the federal and state levels were implemented, making it difficult to isolate specific effects.

Although the research is based on official and methodologically robust data, the interval of approximately three years between the reference year and the disclosure of longitudinal indicators at the national level restricts the ability to assess, in a timely manner, the adherence of empirical results to the normative objectives established by Law No. 14,818/2024, especially with regard to the reduction of retention rates, repetition and school dropout, whose results related to the transition of the 2024-2025 cycle, which covers the first year of implementation of Pé-de-Meia, are expected to be released by Inep in mid-2028. In this sense, the time limitation in the availability of national school flow indicators introduces an important structural bias in the analyses developed in this study, since the effects of the Pé-de-Meia Program on central variables such as dropout and repetition cannot be observed in the same time horizon in which the policy is implemented.

In this sense, the evaluation of the Program at the national level, in this article, is predominantly anchored in short-term outcome indicators – such as approval and age-grade distortion – which, although relevant, do not fully capture the dynamics of transition between grades and stages, nor do they allow the identification of trajectories interrupted over time. Such delimitation implies that the conclusions presented here are necessarily preliminary, aimed at identifying trends and initial signs of alignment with the purposes of the policy, and not at the exhaustive measurement of its effectiveness on the school flow in the strict sense.

In addition, the lag in the disclosure of longitudinal indicators reduces the capacity of public managers, researchers and social control bodies to carry out timely monitoring and reassessments, which, consequently, delays the adoption of route adjustments and the correction of any distortions in the implementation of the Program. In this context, the analysis developed in this work should be understood as an analytical approach conditioned by the limitations of the national statistical production system, which reinforces the need for caution in extrapolating the findings and in formulating inferences about the medium and long-term impact of the Pé-de-Meia on school flow indicators.

4 RESULTS AND DISCUSSIONS

In this section, the results related to the main indicators of performance and school flow are presented and discussed, with emphasis on the comparison between the period immediately prior to the implementation of the Pé-de-Meia Program and the first year of its validity. The analysis seeks to identify trends and possible signs of alignment between the behavior of the indicators and the objectives of the policy, respecting the methodological limitations already explained. The results of the indicators come from publicly available data at the national level on enrollment, school performance rates (pass, fail and dropout) and age-grade distortion rates, released by the National Institute of Educational Studies and Research Anísio Teixeira (Inep), an autarchy linked to the Ministry of Education, as well as on school flow/transition rates (dropout) and retention rates per cycle and academic efficiency in high school in the Federal Public Network extracted from the Nilo Peçanha Platform (PNP).

4.1 ENROLLMENT AND SCHOOL PERFORMANCE RATES IN PUBLIC HIGH SCHOOL

Figure 1 shows that total enrollment in public secondary education (1st to 3rd grade) remained relatively stable in the 2020-2024 period, oscillating around 6.75 to 6.90 million students, without abrupt variations in coverage. This stability in the volume of enrollments indicates that any changes in performance indicators are mainly due to internal dynamics of school flow, and not to significant movements of expansion or retraction of access.

Figure 1

Number of public high school enrollments¹¹ in Brazil and respective School Performance Rates (2020 to 2024)

Source: Prepared by the authors based on the Annual Statistical Synopses of Basic Education and the Educational Indicators related to School Performance Rates.

With regard to income rates, a more volatile behavior is observed, especially in the years immediately after the Covid-19 pandemic. In 2022, the worst performance in the series is recorded, with the pass rate falling to 85.1%, accompanied by a significant increase in failure (8.4%) and dropout (6.5%), suggesting a scenario of strong disorganization of school trajectories. As of 2023, however, there is a gradual recomposition of these indicators: approval returns to levels above 90% (90.5% in 2023 and 90.9% in 2024), while disapproval and dropout retreat to levels below those observed at the height of the crisis (5.6% and 3.5%, respectively, in 2024).

In the context of the first year of implementation of the Pé-de-Meia Program (2024), this improvement in school performance is compatible with the objectives of the policy, which seeks to reduce failures and dropouts through financial incentives conditioned to enrollment, attendance, and completion. Although it is not possible to attribute direct causality, the maintenance of high pass rates, associated with the reduction of failure and dropout in a

¹¹ The total of High School includes enrollments in regular High School Propedeutic, Integrated Technical Course (Integrated High School) and Normal High School/Teaching).

scenario of enrollment stability, suggests a more favorable environment for the permanence and completion of high school, especially among students in situations of socioeconomic vulnerability.

4.2 AGE-GRADE DISTORTION RATE IN HIGH SCHOOL

Figure 2 shows the evolution of the age-grade distortion rate in secondary education in Brazil, disaggregated by education system (public, private, and total), in the period 2020-2024. The results point to a consistent trajectory of reduction of distortion in the public network, which goes from 28.9% in 2020 to 19.7% in 2024, indicating a drop of more than 9 percentage points over the time series. A similar trend, although at a lower level, is observed in the private network, so that the total indicator also shows a continuous decline in the period.

Figure 2

Age-Grade Distortion Rate in High School in Brazil by school system (2020 to 2024)

Source: Prepared by the authors based on the Educational Indicators related to the Age-Grade Distortion Rates.

From an analytical point of view, these results show a double movement: on the one hand, the progressive correction of accumulated school delays, with a lower proportion of students attending grades incompatible with the expected age; on the other hand, the persistence of important asymmetries between networks, which reflect structural inequalities

in supply, teaching conditions and the socioeconomic profile of the students. The combination of the reduction in the age-grade distortion and the improvement in the pass rates observed in 2023 and 2024 suggests a more favorable environment for the regularization of the school flow, although part of this improvement is due to policies and efforts prior to the creation of the Pé-de-Meia Program.

It is also important to highlight that the reduction in the age-grade distortion in the public school system observed in the 2020-2024 period, although consistent, does not eliminate the gap in relation to the private school system, which shows that financial incentives, by themselves, are insufficient to equalize school trajectory patterns between such unequal socioeconomic contexts. The literature on financial incentive policies indicates positive effects, but of moderate magnitude, which reinforces the need to combine programs such as Pé-de-Meia with structural measures to improve the quality of the offer, the curricular organization and the learning conditions, at the risk of only partially reducing a problem that is, at the same time, a problem that is at the same time a problem that is not only partially reduced. symptom and cause of broader educational inequalities.

Figure 3 shows the evolution of the age-grade distortion rate in Brazilian public high school, disaggregated by school grade (1st, 2nd and 3rd grades), in the period 2020-2024, revealing distinct patterns of school delay throughout the trajectory of high school. It is observed that the distortion is more pronounced in the 1st grade in all the years analyzed, with values consistently higher than those of the subsequent grades, which suggests that late entry or initial repetition accumulate effects that are perpetuated throughout the cycle. In the time series, all three grades show a downward trend in the distortion, although with different intensities and rhythms, indicating a progressive correction of the school flow in the public network.

Figure 3

Age-Grade Distortion Rate by public high school grade in Brazil (2020 to 2024)

Source: Prepared by the authors based on the Educational Indicators related to the Age-Grade Distortion Rates.

Analytically, the results show that the age-grade distortion is not evenly distributed throughout high school, but is concentrated preferentially at the beginning of the cycle (1st grade), where the higher values signal problems of late access, accumulated repetition of elementary school or migration from other educational systems. The reduction observed in all grades, especially between 2022 and 2024, suggests that school regularization policies – including continued progression, parallel recovery, and incentives to remain – have generated positive cumulative effects on the flow, with a lower proportion of students attending grades incompatible with the expected age (15-16 years for 1st grade, 16-17 for 2nd, and 17-18 for 3rd).

In the first year of implementation of the Pé-de-Meia Program (2024), this downward trajectory acquires strategic relevance, since the indicator is recognized in the literature as an important predictor of future dropout: students who accumulate repetitions and are "out of age" tend to drop out of school more frequently, especially when pressured by economic needs. By mitigating the urgency of early insertion in the labor market and creating financial incentives associated with the permanence and completion of secondary education, the Program acts precisely on one of the mechanisms that feed the distortion, even though the

data available until 2024 only allow us to identify compatibility between the design of the policy and the observed trend. and not to attribute to it, exclusively, the inflection of the indicator.

However, relevant asymmetries persist between the grades that require specific attention. The persistently higher distortion in the 1st grade points to bottlenecks at the time of entry into high school, possibly associated with the transition from elementary school, while the relative convergence between the 2nd and 3rd grades indicates that retention policies are more effective in the intermediate and final phases of the cycle. This heterogeneity reinforces that financial incentives such as the Pé-de-Meia, although pertinent to mitigate economic pressures on vulnerable students (especially in the 3rd grade, close to the eligibility age), are insufficient in isolation to equalize trajectories marked by structural inequalities in access and quality.

The literature on educational policy evaluation emphasizes that reductions in the age-grade distortion, although positive, should be interpreted with caution over short time horizons, as they may reflect both real flow improvements and compositional effects (lower enrollment of students with severe discrepancy). In the case of Pé-de-Meia, the 2024 data only allow the identification of preliminary signs of alignment with its objectives of reducing retention and dropout (art. 2, item III, Law No. 14,818/2024), requiring future longitudinal analyses to verify whether the decrease in distortion is sustained and associated with higher rates of effective completion of high school in the public network.

4.3 DROPOUT RATES AND RETENTION RATES BY CYCLE AND ACADEMIC EFFICIENCY IN HIGH SCHOOL IN THE FEDERAL PUBLIC NETWORK

Figure 4 summarizes the evolution of the number of enrollments in high school in the Federal Network of Professional, Scientific and Technological Education, as well as the dropout rate, the Academic Efficiency Index and the Retention Index per Cycle, in the period 2020-2024. There is a significant growth in enrollments, which went from 0.98 million in 2020 to 1.37 million in 2024, suggesting an expansion in the supply of vacancies and the presence of the Federal Network in secondary education.

Figure 4

Number of high school enrollments in the Federal Public Network/PNP¹² and respective results of the Academic Performance Indicators (2020 to 2024)

Source: Prepared by the authors based on data extracted from the Nilo Peçanha Platform.

From the point of view of the flow, it is verified that the dropout rate, although still high in some years, shows a downward trend at the end of the series, while the Academic Efficiency Index increases, indicating a higher proportion of students completing the courses within the expected time (or with a slight delay) and greater use of the training effort. At the same time, the Retention Index per Cycle tends to decrease, which signals a reduction in the number of students who excessively exceed the period of payment, contributing to a more regular and efficient flow.

In the context of the implementation of the Pé-de-Meia Program, these results suggest that the Federal Network – already characterized by performance indicators higher than the national average – presents favorable institutional conditions to enhance the effects of the financial incentive on academic permanence and success. The combination of expanding enrollments, reducing dropouts, increasing academic efficiency, and decreasing prolonged retention is consistent with the Program's strategic objectives and indicates an environment in which the policy can reinforce trajectories of school success, especially among low-income students who enter the Federal Network through inclusive access policies. such as the Quota Law (Law No. 12,711/2012).

¹² Filters in the PNP: [Type of Course] = Professional Qualification (FIC), High School, Technical; [Offer Type] = Not Applicable, Concurrent, Integrated.

However, it is necessary to recognize that these improvements result from a wide range of factors, including investments in infrastructure, specific pedagogical policies and the selective profile of the Federal Network itself, which prevents the direct attribution of results to the Pé-de-Meia. Even so, the articulated reading of the indicators reinforces the hypothesis that financial incentive programs, when combined with high-quality institutional environments, tend to generate positive synergies in reducing dropout and optimizing school flow.

4.4 PARTICIPATION RATE IN ENEM OF GRADUATES IN PUBLIC HIGH SCHOOL

Figure 5 shows the evolution of the number of graduates of regular high school in the public network (federal, state and municipal), specifically enrolled in the third year, as well as the registration and effective participation rates (presence on the two days of the test) in Enem, in the period 2020-2024. In absolute terms, the total number of graduates enrolled in Enem oscillates between 0.69 and 0.84 million, without abrupt variations, while the number of graduates enrolled and present on the two days of application of the Enem tests grows more pronounced throughout the series.

Figure 5

Number of third-year high school graduates in the public school system in Brazil and respective Enem registration and participation rates¹³ (2020 to 2024)

Source: Prepared by the authors based on the Annual Statistical Synopses of Basic Education; Synopses Annual Enem Statistics; and Enem Microdata.

The rates derived from these quantities reveal two relevant movements. First, the proportion of public school graduates enrolled in Enem increases from 38.5% in 2020 to 43.1% in 2024, indicating that a growing fraction of graduates seek the exam as a gateway to higher education. Secondly, the attendance rate among enrolled graduates – that is, the proportion of those who actually attend the two days of the test – rises from 52.71% in 2020 to 70.16% in 2024, suggesting greater engagement and commitment to taking the exam.

These results are particularly significant in light of the design of the Pé-de-Meia Program, which institutes the Enem Incentive as a specific benefit conditioned to registration and participation in the two days of the exam. The simultaneous increase in enrollment and attendance rates among graduates of the public network is compatible with the objective of stimulating the transition from basic education to higher education, reducing material and symbolic barriers for low-income students to participate in the main university entrance exam.

¹³ To calculate the variable "Total number of EM graduates from the public network enrolled in Enem and present on the two days of the test", the following filters were used in the Enem Microdata: [TP_ST_CONCLUSAO] = 2; [TP_DEPENDENCIA_ADM_ESC] = 1, 2, and 3; [TP_PRESENCA_CN] = 1; [TP_PRESENCA_CH] = 1; [TP_PRESENCA_LC] = 1; and [TP_PRESENCA_MT] = 1. For the year 2024, due to the changes in the Enem Microdata model carried out by INEP, the data on this variable were obtained through a request for access to information on the Fala.BR Platform.

Although the trend of recovery in participation in Enem is already manifesting itself after the most critical period of the pandemic, the level observed in 2024 suggests that the financial incentive may be contributing to consolidate this recovery, expanding adherence to the exam precisely among groups historically underrepresented in higher education. Still, given the short time horizon and the existence of other competing factors (such as fee exemption policies, mobilization campaigns, and changes in the exam itself), the analysis should be interpreted as preliminary evidence of alignment between the behavior of graduates and the objectives of the Program, and not as definitive proof of its impact on participation rates.

5 CONCLUSION

The results analyzed in this article indicate that the Pé-de-Meia Program has relevant potential as a public policy to encourage the permanence and completion of high school, especially among public school students in situations of socioeconomic vulnerability. Initial evidence suggests a positive correlation between the granting of financial-educational incentives and the improvement of performance indicators, such as approval, reduction of dropout, and increased participation in Enem, although such findings should be interpreted as associations compatible with the objectives of the policy, and not as conclusive proof of causal impact.

However, it should be noted that the six formal objectives of the Program are broad and ambitious, ranging from the reduction of dropout and retention to the mitigation of social inequalities and the encouragement of the continuity of studies in higher and technical education. In light of this multiplicity of purposes, it is unlikely that a single policy instrument – centered on financial incentives – will be able to produce profound changes in all these dimensions on its own, especially in a time horizon as short as the first year of implementation. This finding reinforces the need to situate the Pé-de-Meia as part of a broader arrangement of policies for secondary education, and not as a self-sufficient solution to the historical problems of this stage.

From the evaluative point of view, it is also observed that the policy lacks clear operational goals and an explicit set of key indicators to be monitored, which makes it difficult to construct objective criteria to assess its effectiveness. Unlike other recent federal initiatives, such as the National Literate Child Commitment and the Full-Time Schools Program, which announce specific quantitative targets for coverage and performance over a

defined horizon, Pé-de-Meia does not explain, for example, what reduction in dropout or dropout is expected to be achieved in three or five years, nor what equity goals should guide its implementation. This absence of measurable goals weakens the *ex post evaluation* of the policy and makes it more difficult to be accountable to society about the use of the resources involved.

This point is particularly sensitive because it is a policy of high fiscal cost, with an estimated annual expenditure of billions of reais, an amount higher than that of other structuring programs recently implemented in the Brazilian educational agenda. In contexts of budget constraints, the literature on public policy evaluation emphasizes the importance of comparing relative costs and benefits between programs, identifying whether the resources employed could not generate greater impact in alternative or complementary arrangements. Thus, it is essential that the Pé-de-Meia be the object of frequent evaluations, using more robust methods and longer historical series, capable of estimating with greater precision the magnitude of its effects on school flow, educational inequalities and transition to higher education, in order to understand its impacts and make eventual improvements and adjustments in the design.

Even when international and national studies point to positive effects of financial incentive policies for young people, the magnitude of these impacts is usually moderate – often in the order of a few percentage points in indicators such as enrollment, attendance or completion – which is below the structural transformation required by the current framework of Brazilian secondary education. In a scenario in which the net enrollment rate still remains below what is desirable and deep inequalities in access, permanence and learning persist, a financial support program tends to function as a relevant piece within a more complex "gear", but not as the only or sufficient solution to reverse the situation of exclusion and school failure alone.

The findings of this study, while showing promising signs of alignment between the design of the Program and the evolution of some indicators, also reinforce the centrality of integrated policies that combine monetary incentives with pedagogical strategies, psychosocial support actions, improvement of teaching working conditions, improvement of governance and financing of secondary education, expansion of professional and technological education and expansion of the school day, among other fronts. If the school does not become more attractive, welcoming and connected to the life projects of young

people, non-attendance, dropout and dropout tend to remain structural challenges, although they can be partially reduced by transfer programs or educational savings.

It is concluded, therefore, that the Pé-de-Meia Program constitutes an important advance in the agenda of equity and social justice in education, by explicitly recognizing the weight of economic restrictions in the school trajectory of young people in vulnerable situations and by seeking to address them through financial-educational incentives. For its potential to be fully realized, however, it will be necessary to: (i) make explicit goals and result indicators in the medium and long term; (ii) institutionalize a system of continuous monitoring and evaluation, with a focus on cost-effectiveness; and (iii) articulate the Program with a broader set of structural reforms and policies for secondary education. In this sense, the Pé-de-Meia-se should be understood less as a definitive solution and more as a strategic component of a systemic project to reconfigure the stage, whose effectiveness will depend on the quality of its coordination with other initiatives and the rigor with which it is monitored and improved over time.

ABSTRACT

The removal of autogenous palatal grafts is widely used in reconstructive periodontal surgeries to restore the anatomy and functionality of gingival tissues; however, it may cause pain, bleeding, discomfort, and postoperative morbidity due to healing by secondary intention at the donor site. Therefore, alternatives are sought to reduce these effects and promote faster and more comfortable repair. Nile tilapia skin (*Oreochromis niloticus*) has emerged as a promising biomaterial due to its high concentration of type I collagen, as well as mechanical strength, elasticity, biocompatibility, low antigenicity, sustainability, and low cost. This study analyzed scientific evidence regarding the use of tilapia skin as an occlusive biological dressing for the protection and repair of the palatal surgical bed after autogenous graft removal, considering its structural properties, clinical performance, and advantages compared with conventional dressings. The literature review was conducted using the PubMed, SciELO, Google Scholar, MEDLINE, and BVS databases, employing descriptors in Portuguese and English, following inclusion and exclusion criteria for publications from 2015 to 2025. The studies indicate that tilapia skin promotes faster epithelialization, reduces postoperative discomfort, effectively protects the surgical bed, improves aesthetic outcomes, and presents no relevant complications. Moreover, its versatility allows application in different forms, such as membranes, sponges, and hydrogels. Thus, tilapia skin represents a safe,

RESUMO

A remoção de enxertos autógenos do palato é amplamente utilizada em cirurgias periodontais reconstrutivas para restabelecer a anatomia e a funcionalidade dos tecidos gengivais, mas pode causar dor, sangramento, desconforto e morbidade pós-operatória devido à cicatrização por segunda intenção do leito doador. Por isso, buscam-se alternativas que reduzam esses efeitos e tornem o reparo mais rápido e confortável. A pele da tilápia-do-Nilo (*Oreochromis niloticus*) tem se destacado como biomaterial promissor por apresentar alta concentração de colágeno tipo I, além de resistência mecânica, elasticidade, biocompatibilidade, baixa antigenicidade, sustentabilidade e baixo custo. Este estudo analisou evidências científicas sobre o uso da pele de tilápia como curativo biológico oclusivo na proteção e reparo do leito cirúrgico palatino após a remoção de enxertos autógenos, considerando suas propriedades estruturais, seu desempenho clínico e suas vantagens em comparação com curativos convencionais. O levantamento bibliográfico foi realizado nas bases PubMed, SciELO, Google Acadêmico, MEDLINE e BVS, utilizando descritores em português e inglês, seguindo critérios inclusivos e exclusivos em publicações entre 2015 e 2025. Os estudos mostram que a pele de tilápia favorece epitelização mais rápida, reduz o desconforto pós-operatório, protege eficazmente o leito cirúrgico, melhora o resultado estético e não apresenta complicações relevantes. Além disso, sua versatilidade permite aplicações em diferentes formas, como membranas, esponjas e hidrogéis. Assim, a pele de tilápia apresenta-se como uma alternativa segura, eficaz e promissora para a odontologia regenerativa, embora sejam necessários estudos clínicos mais robustos para padronizar protocolos e ampliar sua utilização na prática cirúrgica.

RESUMEN

La remoción de injertos autógenos del paladar es ampliamente utilizada en cirugías periodontales reconstructivas para restablecer la anatomía y la funcionalidad de los tejidos gingivales; sin embargo, puede provocar dolor, sangrado, incomodidad y morbilidad postoperatoria debido a la cicatrización por segunda intención del lecho donante. Por ello, se buscan alternativas que reduzcan estos efectos y hagan la reparación más rápida y confortable. La piel de la tilapia del Nilo (*Oreochromis niloticus*) se ha destacado como un biomaterial prometedor por presentar una alta concentración de colágeno tipo I, además de resistencia mecánica, elasticidad, biocompatibilidad, baja antigenicidad, sostenibilidad y bajo costo. Este estudio analizó evidencias científicas sobre el uso de la piel de tilapia como apósito biológico oclusivo en la protección y reparación del lecho quirúrgico palatino tras la remoción de injertos autógenos, considerando sus propiedades estructurales, su desempeño clínico y sus ventajas en comparación con los apósitos convencionales. La revisión bibliográfica se realizó en las bases PubMed, SciELO, Google Académico, MEDLINE y BVS, utilizando descriptores en portugués e inglés, siguiendo criterios de inclusión y exclusión en publicaciones entre 2015 y 2025. Los estudios muestran que la piel de tilapia favorece una epitelización más rápida, reduce la incomodidad postoperatoria, protege eficazmente el lecho quirúrgico, mejora el resultado estético y no presenta complicaciones relevantes. Además, su versatilidad permite aplicaciones en diferentes formas, como membranas,

esponjas e hidrogeles. Así, la piel de tilapia se presenta como una alternativa segura, eficaz y prometedora para la odontología regenerativa, aunque se requieren estudios clínicos más robustos para estandarizar protocolos y ampliar su uso en la práctica quirúrgica.

1 INTRODUCTION

Autogenous soft tissue grafts are often used in the treatment of periodontal lesions (Silva *et al.*, 2021). The palate region is one of the most used sites as a donor area, due to the quality and quantity of the tissues, as well as the histological and structural characteristics of the adjacent tissues (Manfredi *et al.*, 2021). However, the removal technique can cause great discomfort and pain, interfering with the quality of life of patients.

In recent years, regenerative medicine and tissue engineering studies have sought methods to restore the function of damaged tissues and organs through the use of cells, biomaterials, and growth factors. A biomaterial, in order to be used, must have mechanical properties (strength and flexibility) similar to those of healthy human tissue, coating and integrating until the injured tissue is replaced. In addition, it must have low toxicity and be free of any type of microbiological contamination, in addition to being easy to handle and widely available (Gaharwar *et al.*, 2020).

Since 2015, the biomaterial from tilapia skin has been studied as an alternative, mainly with regard to histologically demonstrating similarity with human skin, presenting a large amount of collagen and high mechanical resistance (Alves *et al.*, 2015). Nile tilapia (*Oreochromis niloticus*) is an abundantly farmed fish in Brazil and has great acceptance in the market. Fish skin is considered a by-product discarded by the food industry, making it a low-cost input due to its high availability and the national technology consolidated in cultivation (Lima-Junior *et al.*, 2017).

The structure of the skin has a dermis formed by long bundles of compacted and well-organized collagen, predominantly type I collagen arranged in a parallel/horizontal and transverse/vertical manner. In addition, the amount of type I and III collagen was significantly increased compared to human skin (Alves *et al.*, 2015).

With all these advantages, the high concentration of collagen in the fish dermis culminated in the development of the lyophilized biological dressing of tilapia skin (Lima-Junior *et al.*, 2021). The product is biosustainable and accessible to the population, representing an innovation that can be manufactured at low cost and generate a positive ecological impact. The lyophilized biological dressing contributes to the healing process and tissue regeneration, presenting potential for insertion in several biomedical areas, with socioeconomic impact on the public health system in Brazil, such as the treatment of vaginoplasties, the correction of syndactyly in children with Apert syndrome, the treatment of

burns and as an occlusive dressing in reconstructions of the palate, among other applications (Monte *et al.*, 2022; Rodríguez *et al.*, 2020; Lima-Junior *et al.*, 2017; Manfredi, 2022).

Several studies and therapeutic strategies aim to reduce pain and accelerate the tissue regeneration process after the removal of autogenous grafts from the palate (Miranda and Brandt, 2019; Manfredi *et al.*, 2021; Silva *et al.*, 2021). However, a protocol considered ideal has not yet been established.

Tilapia skin is highly studied in dermatological treatments and wound healing; however, its application in periodontal surgeries is still little studied. Therefore, the objective of this study is to analyze scientific evidence on the biomaterial developed through tilapia skin as an alternative dressing in the repair and protection of the palatal surgical bed after autogenous grafts, highlighting the benefits and challenges of its use in the field of periodontal surgery. Specifically, to characterize the biophysical properties of the skin, evaluate its clinical efficacy in the healing of surgical beds, and identify challenges and limitations in its application in periodontal surgery.

2 DEVELOPMENT

2.1 METHODOLOGY

The present study is a narrative literature review, with a descriptive approach, contemplating a qualitative analysis of the literature on the subject in question: tilapia skin used in reconstructive dental surgeries.

To search for scientific articles, the search engines (Google Scholar) were used as search support and the National Library of Medicine -MEDLINE and Virtual Health Library (VHL), Pubmed Central, Scientific Electronic Library Online (SciELO) databases using the following descriptors: Tilapia skin, healing, periodontal surgery, biological dressings and graft, in combinations in Portuguese and English.

The work was organized with the following inclusion criteria: titles and abstracts related to the subject, in addition to experimental clinical studies that address treatments with conventional materials in dentistry, and also investigations on the application of tilapia skin as a biomaterial and its regenerative properties, considering national and international studies published from 2015 onwards.

The exclusion criteria include the duplication of studies in different databases and works whose content is detached from the central objective of the research.

The variables observed in the selected studies involve periodontal plastic surgery techniques, characteristics of the graft and surgical bed, types of dressings used, morbidity associated with the procedure, use of tilapia skin and its clinical applications.

The selection of articles was carried out in stages. Initially, titles and abstracts were analyzed to verify their adequacy to the theme. Subsequently, the eligible studies were fully evaluated, considering the previously defined criteria. The distribution of the articles found and selected in academic search engines and databases is presented in Figure 1.

Figure 1

Study methodology and distribution of the articles found and selected by database and documentary sources consulted

Source: Prepared by the authors (2025).

With the application of the inclusion and exclusion criteria, five of the studies were selected for detailed analysis. The works are organized in table 2, which managed to serve as a basis for the discussion and elaboration of the final considerations. The other scientific works, presented numerically in the Figure, contributed directly and/or indirectly to the construction of the scope of this text considering the variables presented.

2.2 LITERATURE REVIEW

2.2.1 Periodontal Surgeries and Grafts

Periodontal surgeries provide a balance between functionality and aesthetics for the patient. In this sense, dental professionals have been increasingly encouraged to conduct research and seek techniques, with new approaches, based on a more current understanding of periodontal diseases and their relationship with general health (Neto *et al.*, 2024).

Miller, in 1993, defined periodontal plastic surgery as surgical interventions indicated for the protection and repair of losses resulting from trauma, anatomical factors and diseases. A classification was established in which characteristics such as width and length are determined in relation to the gingival mucus boundary or the inserted gingiva and the loss of papillae tissues. This division establishes a variation from type I to type IV (Saad and Bassani, 2011).

Factors such as variation in gingival position related to bone defects, invasion of biological space, gingival position associated with recessions, or gingival hyperplasia covering the crown of the tooth directly influence the patient's functionality and aesthetics. In order to correct these conditions, several validated surgical techniques have been developed (Silveira, Silva, and Madureira, 2023)

Recent clinical studies and systematic reviews have highlighted the importance of periodontal plastic surgeries not only for tissue reconstruction, but also for improving the quality of life of patients. According to Tonetti *et al.* (2022), individuals who underwent root covering procedures observed a significant decrease in dentin hypersensitivity, improvements in aesthetics, and an increase in self-esteem, going beyond the clinical aspect, demonstrating the significant relevance of an integrated approach involving oral health, functionality, and psychological well-being.

These current periodontal surgical techniques present satisfactory results, enabling the dental surgeon (DC) to perform these procedures successfully. Proper planning is fundamental, and requires assessing the patient's systemic conditions and risk factors, combined with technical training and the necessary attention, the expected results of excellence will be guaranteed (Rocha and Oleira, 2022).

The use of biomaterials in the periodontal surgical context, such as acellular dermal matrices (ADM), is another important point, as they have been increasingly used. According to Tavelli *et al.* (2020), these substitutes have great biocompatibility and considerably reduce postoperative discomfort, particularly in cases of multiple recessions. In addition, research

such as that of Farias *et al.* (2024) show that, when properly indicated, these techniques offer clinical and aesthetic results comparable to those achieved with connective tissue grafting.

In the search to improve these procedures, periodontal surgery techniques are often associated with the use of grafts. The mucosa of the palate is the most common and favorable donor site, due to the quantity and quality of tissue available (Manfredi, 2022). The removal of the graft from the donor site (palate) can cause discomfort that can vary, usually requiring the use of pain control medications. In addition, other complications become possible, such as cases of hemorrhages, which can make it difficult for the patient to speak and chew (Zucchelli *et al.*, 2020; Manfredi, 2021).

As an option, xenogenous materials, such as acellular dermal matrices (ADM) and collagen matrices (XCM), have been investigated as alternatives to palatal grafting, particularly in patients who have anatomical restrictions or comorbid conditions, showing positive clinical results at short and medium term (Santamaria *et al.*, 2023; Farias *et al.*, 2024).

2.2.2 Graft donor site and healing.

The tissue removed from the patient's own donor area is characterized as an autogenous material, being widely used in dental procedures, especially in the treatment of periodontal plastic surgery (Zucchelli *et al.*, 2020). The similar characteristics present in the antero/posterior region of the palate, in relation to the adjacent tissues, make them ideal sites for donation (Manfredi, 2021).

The hard palate region is one of the most commonly used sites as a donor area, both for connective tissue grafting methods and for grafts in areas of gingival recession. The extraction of the epithelialized graft leaves the donor area exposed, which can interfere with the daily activities of patients (Manfredi, 2021). Faced with these challenges, studies are carried out to develop biocompatible biomaterials, which reduce surgical time and provide comfort to patients, reducing post-surgery morbidity (Andrade *et al.*, 2021).

In addition to traditional methods, the use of autologous biomaterials, especially leukocyte membranes and platelet-rich fibrin (LPRF), has shown significant importance in the healing process in palatal donor areas. A randomized controlled clinical study indicated that the use of LPRF significantly reduces pain, burning sensation and bleeding in the first two weeks after surgery, in addition to accelerating the reduction of the wound area and improving

clinical healing rates between the third and fourth weeks, compared to treatment by second intention (Miron *et al.*, 2020; Keceli *et al.*, 2022).

The removal of a connective tissue graft in union with the flap is a successful procedure. However, it should be taken into account that these techniques, when in a vast surgical area, can lead to greater discomfort in the donor area (Stela *et al.*, 2023).

When the graft is removed, the wound healing processes begin, with coagulation in the region, which acts as a temporary matrix for cell migration, resulting in the release of growth factors and protective substances against bacteria (Manfredi, 2021).

The inflammatory process is gradual and initiates the formation of new blood vessels and the production of collagen in the clot, replacing it with granulation tissue, with an increase in the presence of fibroblasts, whose function is to promote traction between the edges of the wound. With the development of healing, the granulation tissue matrix is replaced by connective tissue, a process that is completed on average three weeks after surgery (Balbino, Pereira and Curi, 2015).

The beginning of the healing process can cause the patient some discomfort, such as pain, burning and difficulties when chewing. Such postoperative complications influence studies aimed at the use of materials that have the function of healing and protection, seeking to reduce patient discomfort (Manfredi, 2021).

Photobiomodulation with LED or low-intensity laser (PBM) has been widely used as an effective method for healing palatal wounds. Experimental studies conducted in animal models have shown that irradiation of the donor site with 660nm LED favors faster re-epithelialization, greater collagen production, and stimulates the formation of new blood vessels, in addition to reducing inflammatory infiltration (Wang *et al.*, 2015; Deana *et al.*, 2022). Narrative reviews confirm that PBM plays a role in modulating cellular metabolism, resulting in increased ATP (Adenosine Triphosphate) production, fibroblast proliferation, and extracellular matrix synthesis, contributing to the healing process (Alves *et al.*, 2015).

In graft removal surgeries, in the donor area, dressings must be placed in direct contact with the wound caused by the removed tissue, which allows comfort to the patient, protection and helps or accelerates healing. The materials used in these dressings can be categorized as passive and bioactive, with bioactive ones accelerating healing. Among some dressings mentioned in the literature, we can find surgical cement that stands out in its wide use, fibrin-rich plasma, collagen sponge with cyanoacrylate, collagen matrix, and hyaluronic acid (Ribeiro and Martuscelli, 2018; Manfredi, 2021). Surgical cement stands out because,

although considered in disuse, it is still widely used in some works because it favors protection against trauma, pain and hemorrhage. Cements can be classified in three ways: containing zinc oxide and eugenol (wondrpak), not containing eugenol (coe-pak); containing neither zinc oxide nor eugenol (cyanoacrylate). Chart 1 presents some advantages and disadvantages to the use of surgical cement after periodontal surgery (Manfredi, 2021).

Table 1

Some advantages and disadvantages to the use of surgical cement after periodontal surgery

ADVANTAGES	CONS
<i>Protection of the surgical wound from mechanical trauma</i>	<i>Little effect on healing</i>
<i>Stability of the surgical bed during the healing phase</i>	<i>Increased plaque buildup</i>
<i>Patient comfort</i>	<i>Greater painful symptomatology</i>
<i>Prevention of postoperative hemorrhage or infection</i>	<i>Subsequent microbial invasion</i>
<i>Decreased tooth sensitivity</i>	<i>Irritation to tissues, increasing the chance of infection</i>
<i>Clot protection during speech and chewing</i>	<i>Difficulty chewing</i>
	<i>Discomfort in speech and chewing</i>
	<i>Bad breath</i>
	<i>Alteration of taste</i>
	<i>Possibility of allergic reaction</i>

Source: (Manfredi, 2021, p. 32).

The uses of surgical cement have a physical and therapeutic function, each with its respective benefits. Regarding physical function, it encompasses tissue stabilization, thus reducing direct contact with external agents. The therapeutic benefits, on the other hand, involve the mechanical protection of the surgical wound region, which drives better healing (Manfredi, 2021; Gusmão *et al*, 2022).

Although surgical cement is still widely used to protect donor areas in periodontal surgeries, recent research presents more options with the potential to reduce some of the undesirable effects. Among these alternatives, resorbable collagen membranes have highlighted benefits by offering mechanical protection, less chance of tissue irritation, and not requiring removal. In addition, these membranes act as selective barriers in the healing process (Basma *et al.*, 2022). A promising option is platelet-rich fibrin (PRF), which acts as a biological dressing, releasing growth factors gradually, aiding in angiogenesis, inflammation management, and accelerated re-epithelialization of the donor region (Miron *et al.*, 2017).

Table 2 describes some of the products that are used in periodontal plastic surgeries and their applicability.

Table 2

Materials that are used in periodontal plastic surgeries and their applicability

Material	Description	Source
Surgical cement / Periodontal dressing	<i>Applied to protect the surgical site, immobilization and patient comfort, they cause allergic reactions.</i>	PMID: 26056525
Resorbable collagen plugs or sponges	<i>They act as a mechanical and hemostatic barrier, promote healing and are low irritating.</i>	PMID: 34483577
Collagen membranes.	<i>Biodegradable membranes (porcine, bovine, or human origin) serve as a selective barrier. They stimulate the migration of osteoblasts and fibroblasts.</i>	PMID: 28593053
PRF (Platelet-Rich Fibrin)	<i>Autogenous membrane prepared from the patient's blood; rich in growth factors.</i>	DOI: 10.1002/JPER.22-0172
Palatine stensil.	<i>Rigid prostheses/plates molded to cover the surgical bed, protecting from trauma during chewing and speech in the first days.</i>	DOI: 10.1002/JPER.22-0172
Natural membranes (gelatin, chitosan, silk, fibroin)	<i>Biocompatible materials with regenerative potential, still in the experimental or preclinical stage; they have good properties, but less stiffness and consistency in batches.</i>	DOI: 10.1016/j.cden.2022.05.011

Source: Data available in the literature.

The proposed solutions, applied alone or together, have the potential to expand the alternatives available in clinical practice. They allow the customization of wound protection, adjusting to the particular needs of each patient and favoring more significant results.

2.2.3 Tilapia skin (*Oreochromis niloticus*) as a biological dressing

Collagen has been increasingly studied, explored, and analyzed in regenerative procedures. This protein, with abundance in the extracellular matrix, is a natural macromolecule and has a low inflammatory reaction, in addition to favoring cell adhesion and proliferation. The main sources for obtaining collagen currently come from cattle, pigs and horses. However, recently, research has been exploring alternative products and materials derived from fish (Rodrigues, 2009; Manfredi, 2021).

The tilapia skin is formed by an epidermis covered by a stratified squamous epithelium, followed by abundant layers of collagen. This concentrated bioactive collagen makes tilapia skin a possible option to be used as a surgical bed protection dressing after graft removal (Melo *et al.*, 2024).

Based on the scientific works found, five studies in the literature between 2021 and 2025 stood out for presenting uniqueness with what is proposed by the project. The studies present the applicability of lyophilized tilapia skin and extracted collagen in reconstructive dental surgeries, according to the clinical approach.

Source: Data available in the literature.

Currently, the main source of medical collagen comes from mammalian connective tissue (Yamada, 2015). However, they have a limited source, high cost, risk of transmission

of zoonoses, and still have religious restrictions in some Asian countries. Such limitations have opened space for the use of other sources of biological materials (Sun *et al.*, 2018).

In this scenario, the raw material of biological grafts or dressings derived from tissues of aquatic animals presents itself as a very promising alternative (Park, 2017; Bronzino, 2017), as in the case of tilapia skin (*Oreochromis niloticus*) (Lima *et al.*, 2017). The studies carried out by researchers from the Center for Research and Development of Medicines at the Federal University of Ceará (NPDM-UFC). These advances have made it possible to produce the lyophilized biological dressing made from tilapia skin, initially developed and used in the treatment of burns, which usually result from domestic and work accidents; they are more common among socioeconomically less favorable people, of working age, and can generate debilitating sequelae. In the Brazilian public network, burns are usually treated with antibiotic ointment, which requires daily changes of wound dressing and causes intense pain. The new dressing reduces outpatient treatment costs by almost 50% and reduces patient pain, improving their recovery and quality of life (Lima *et al.*, 2017).

The lyophilized tilapia skin dressing has also been used in vaginoplasties performed in women with vaginal agenesis or with the vagina occluded after cancer treatments, enabling the complete recovery of the genital structure and function (Dias *et al.*, 2019). Likewise, the material has also been used in sex reassignment surgeries in transgender women (Rodríguez *et al.*, 2020). In all these cases, tilapia skin dressing reduced or eliminated the need for autografting, reducing postoperative morbidity, increasing the patient's quality of life, and accelerating recovery. Recently, the dressing has also been used in preparation for autografting in complex reconstructive plastic surgeries of the hands in patients with Apert Syndrome, with great success, as well as in dental (palate reconstruction) and veterinary (traumatic wounds in horses) applications (Monte *et al.*, 2022; Manfredi *et al.*, 2022; Costa *et al.*, 2020).

The use of tilapia skin has shown excellent results in the treatment of burns and vaginoplasties, being successfully applied to more than 500 patients — with no records of rejection or infection. The research provided 26 specialized publications and more than 700 journalistic articles, in addition to winning 16 scientific awards in first place. The success of the freeze-dried tilapia skin dressing has influenced new research for the creation of other products for internal use, as well as the decellularized protein matrix (*scaffold*) and added *crosslinker* and the extraction of collagen for use in pharmaceuticals and cosmetics, opening new avenues as a new biomedical device for regenerative medicine (Lima *et al.*, 2023).

The great success is due to the fact that tilapia skin is composed of compacted, long and organized collagen bundles, predominantly type I. The content of type I collagen and total collagen of tilapia skin is higher than that of human skin (Alves *et al.*, 2015), which makes it a raw material of interest for the manufacture of medical devices.

The scientific literature shows that regenerative protein matrices, known as biological meshes or dressings, need to be non-toxic, non-immunogenic, adherent to the wound bed, biocompatible, and absorbable. These biomaterials should not convey toxic substances in the body, for obvious reasons, nor should they initiate an exaggerated inflammatory response, with the potential to damage the host tissue itself. In addition, biological screens should not promote an immune response so intense that it results in rejection (acute or chronic) by the recipient organism. When used as a cover, they should prevent the loss of fluids, proteins, and nutrients in the form of exudate, in addition to preventing the entry of invading microorganisms (Moerbeck-Filho *et al.*, 2019; Pires, Bierhalz and Moraes, 2015).

The beneficial histological properties of tilapia skin have favored the creation of a device capable of meeting these requirements. In dentistry, with excellent results, Manfredi *et al.* (2021) investigated the application of Nile tilapia skin (*Oreochromis niloticus*) as an occlusive biological dressing in the repair of the palatal surgical bed after the removal of an autogenous gingival graft. The study, conducted as a randomized clinical trial, had 24 patients divided equally between a control group (treated with Coe-Pak surgical cement) and a test group (treated with tilapia skin). The results showed significant advantages in the group that received the tilapia dressing, including lower intensity pain, faster healing and better aesthetic results.

At the same time, Manfredi *et al.* (2021) published clinical cases, in which they reported the experience of patients undergoing the same type of procedure. The study demonstrated that the palate covering with tilapia skin was well accepted, with no occurrence of complications, with reduced levels of pain and without interference in speech and chewing functions. Healing was considered satisfactory after 30 days. In the studies by Soares *et al.* (2023), using topical gel 1% from tilapia skin collagen for the treatment of surgically induced ulcers in the oral mucosa of Wistar rats. Simple orobase (negative control), drug orabase (positive control) and tilapia collagen orabase (test) were compared. It was demonstrated that tilapia accelerated ulcer closure, promoted complete repithelialization, intensified angiogenesis, higher density of type I and III collagen, and increased expression of TGF β , α SMA, and PECAM1. Treatable animals gained more weight until day 20 ($p < 0.05$).

Collagen taken from tilapia skin is a very promising material, with several possibilities for use in dentistry. It can be applied in different forms, such as sponges, hydrogels, membranes, and even nanocollagen fibers (Putri *et al.*, 2024). Its therapeutic potential has applicability in the treatment of wound healing, dry socket healing, bone necrosis, grafts, flap surgery and periodontal tissue regeneration. In the studies by Lima Verde (2023), the mineral composition and compatibility of tilapia collagen in guided bone regeneration (GBR) in rat mandibular defects was analyzed. The results showed that tilapia collagen performed as well as the commercial product used as a control, facilitating bone regeneration, with little inflammatory reaction and excellent biocompatibility.

Due to its excellent biocompatibility and because it is non-toxic, the potential of hydrolyzed collagen extracted from tilapia skin is studied in the viability and differentiation of periodontal ligament fibroblasts *in vivo* with the prospect of its use in the recovery of periodontal tissues (Manfredi, 2021). When compared to the submucosa of the small intestine of the pig in healing processes, tilapia skin did not show inferiority compared to other biomaterials, indicating an excellent biocompatibility and inflammatory process (Baldursson *et al.*, 2015). The use of collagen from fish influences the biological environment to the formation of collagen in the wound (Cruz *et al.*, 2021).

In several areas of regenerative medicine, tilapia skin (*Oreochromis niloticus*) has been standing out as a great alternative biomaterial for its excellent cost-benefit ratio. In the first studies with 1st and 2nd degree burns, the therapy helped reduce morbidities suffered by patients (Alves *et al.*, 2015). In view of its applicability in dentistry, the use of collagen dressing has already denoted a rapid healing of the graft donor bed, reducing morbidity, compared to surgical cement available on the market. Thus, the efficacy and success of healing is observed from the use of dressings made of collagen (Manfredi, 2021). All these studies highlight that the use of tilapia skin in dentistry is multidimensional: from mucosal treatments, periodontal regeneration and possible support to guided bone regeneration, through the use of collagen in different therapeutic forms.

3 FINAL CONSIDERATIONS

The use of tilapia skin (*Oreochromis niloticus*) as a biological dressing has shown promise in the field of regenerative dentistry, especially in periodontal reconstruction surgeries. This biomaterial, rich in type I collagen, highly available, low cost and with excellent biocompatibility, has been shown to be effective in the healing of palatal surgical beds,

comfort, faster epithelialization and better aesthetic result compared to other dressings available on the market.

From the scientific evidence, it was found that, although clinical studies are still initial in number, the results obtained so far point to a high therapeutic potential of tilapia skin not only in dentistry, but in several medical specialties. In addition to accelerating tissue regeneration, the material contributes to the reduction of morbidity associated with the removal of autogenous grafts, representing an important advance in the quality of life of patients undergoing these interventions.

Despite the positive results, more controlled clinical studies are still needed, with larger samples and long-term follow-up, to define specific application protocols in dental practice. In view of this, it is concluded that tilapia skin stands out as a biosustainable, safe and effective alternative, with great potential for insertion in the therapeutic arsenal of periodontal dental surgery and regenerative medicine as a whole.

ABSTRACT

This study conducts a systematic review of the literature on mental health care for individuals with antisocial personality disorder. This is, characterized by a persistent pattern of disregard for the rights of others and violation of social norms, presents significant challenges for treatment due to comorbidity with other disorders, resistance to treatment, and social stigma. The review highlights the complexity of managing antisocial personality disorder and the need for specific therapeutic approaches. Programs such as Systems Training for Emotional Predictability and Problem Solving and psychoeducation have shown potential for reducing symptoms and increasing treatment adherence. Additionally, mentalization-based therapy and pharmacotherapy, with the use of medications such as inhaled loxapine, emerge as promising therapeutic tools. However, the literature points to the need for more research and greater investment in training healthcare professionals. Integrating scientific evidence into

RESUMO

O presente estudo realiza uma revisão sistemática da literatura acerca da assistência à saúde mental de indivíduos com Transtorno de Personalidade Antissocial. Este é caracterizado por um padrão persistente de desrespeito aos direitos dos outros e violação de normas sociais, apresenta desafios significativos para o tratamento, devido à comorbidade com outros transtornos, à resistência ao tratamento e ao estigma social. A revisão evidencia a complexidade do manejo do transtorno de personalidade antissocial e a necessidade de abordagens terapêuticas específicas. Programas como o Systems Training for Emotional Predictability and Problem Solving e a psicoeducação demonstram potencial para a redução de sintomas e o aumento da adesão ao tratamento. Além disso, a terapia baseada em mentalização e a farmacoterapia, com o uso de medicamentos como a loxapina inalatória, emergem como promissoras ferramentas terapêuticas. No entanto, a literatura aponta para a necessidade de mais pesquisas e de maior investimento em treinamento de profissionais de saúde. A integração de evidências científicas à prática clínica é fundamental para otimizar o cuidado a esses pacientes e reduzir o impacto do transtorno de personalidade antissocial na vida dos indivíduos e da sociedade.

1 INTRODUCTION

Antisocial Personality Disorder (APD) is demonstrated by the Diagnostic and Statistical Manual of Mental Disorders – DSM-V having as its main characteristic, a diffuse pattern of indifference and violation of the rights of others, which appears in childhood or early adolescence and continues in adult life. This pattern has also been referred to as psychopathy, sociopathy, or dissocial personality disorder. This conduct disorder must have its onset before the age of 15 and cannot be diagnosed in patients under 18 years of age. In addition, antisocial personality disorder has a continuity until adulthood, thus having a chronic course (DSM-V, 2014).

Epidemiological studies have shown a prevalence of 2-3% of individuals with APD in the general population, with a higher percentage among men (3%) than women (1%). Since the diagnostic criteria for APD are currently based on behavior, they are thus different from psychopathy, which is based on interpersonal and affective relationships. However, there is controversy involving such differentiations, given that authors such as Coid and Ullrich (2010) claim that APD and Psychopathy are not distinct diagnostic entities and that they are in a continuous scale of evolution of severity, with psychopathy having the place of greatest severity in this continuous scale.

The etiology of APD has been the subject of studies in recent years. Through a meta-analytic review, Ferguson (2010) identified that 56% of the variation in antisocial behavior can be explained through genetic influences. However, in addition to this fact, in large proportion, there are environmental factors, which contribute to the development and maintenance of the TPA. Such environmental factors, particularly early in life, can significantly affect brain development and thus increase the risk of antisocial behavior (Glenn; Johnson; Raine, 2013). In line with these statements, Kumari *et al.* (2013), observed a direct relationship between the role of psychosocial deprivation, physical and/or sexual abuse in childhood, and reduction in the thalamic volume of the brain of these individuals in adulthood, a fact that caused an additional brain deficit, which may have negative implications for the management of APD.

APD has high rates of comorbidity with different psychiatric disorders, and according to Mueser *et al.* (2012), when APD is co-morbid, the negative effects will be exacerbated. This is due to the fact that individuals with APD face significant difficulties in seeking appropriate help, adhering to treatment, coping with the disease, and building a therapeutic

alliance. Thus negatively impairing the prognosis, management, and treatment of both mental illness and many concomitant physical conditions.

Finally, the fact that TPA has been recognized by Glenn is a point of discussion and problematic; Johnson; Raine (2013), as one of the most difficult forms of psychopathology to treat. Based on factors such as the rare search for treatment by these individuals or even low adherence to treatment, as well as factors external to the patient himself, such as health care providers opposed to the treatment of these individuals or the lack of trials on the treatment of APD. However, although there is still much work to be done in the treatment domain due to the fact that there is a narrow range of recommendations for the treatment of adults with APD (McGauley *et al.*, 2011). The evidence emerging from treatments over the past few decades suggests that the latest methods hold promise in effectively treating this extremely complex disorder.

These challenges point to the need for a more integrated, empathetic, and evidence-based approach to improving health care for people with antisocial personality disorder. Understanding these dynamics is crucial to improving mental health services, formulating more effective health policies, and promoting an integrated care approach that addresses the complex needs of this population. Thus, the objective of this study was to identify in the literature the mental health care offered to individuals with antisocial personality disorder.

2 METHODOLOGY

This is an integrative review of the literature, which followed the guidelines of the PRISMA Protocol (Moher, 2009). The research question was formulated based on the PICO strategy (Hulley; Newman; Cummings, 2015). This investigation is based on an exploratory review of scientific production, relevant studies in a certain area. It is described in five stages: identification of the research question; identification of relevant studies; selection of studies; data analysis; synthesis and presentation of data (JBI, 2015).

The research question, the objective of the study and the agreement descriptors were elucidated by the mnemonic combination PICO: P Population; I Interest; Co Context. And it presents the following guiding question: how is mental health care offered to individuals with antisocial personality disorder described in the literature?

The inclusion criteria were: original articles, published in the last ten years (between July 2014 and August 2024), available in full electronically, not restricted to the language, the place of origin of the productions and the method used. The exclusion criteria were: articles

that distanced themselves from the reflections proposed by this study, literature reviews/reflection, editorials, brief communication, clinical trial projects, abstracts of proceedings, theses, dissertations, course completion work, epidemiological bulletins, management reports, books, official documents of national and international programs.

Data collection took place in August 2024, in the following databases: PubMed, Web of Science, SCOPUS, Cochrane Library, and Virtual Health Library (VHL). These will be searched in the CAPES Journal Portal, based on identification through the Federated Academic Community (CAFe), as a way to standardize the collection in these databases. The following terms included in *the Medical Subject Headings* (MeSH) were used: *Antisocial Personality Disorder*; *Health Service*; *Mental Health Service*. It is noteworthy that, for the collection, only keywords were used, discarding the synonyms presented. In order to enhance the collection of articles, a cross-search between keywords was used by means of the Boolean connector "AND", adopting the same combination in all search locations.

The articles were then selected and identified in three stages: 1) Reading of the titles and abstracts of the studies and exclusion of those that did not fit any of the criteria; 2) Full reading of all the articles selected in the first stage; 3) Selection of works that fit the eligibility criteria. The steps were carried out by two researchers independently, and disagreements were discussed until there was consensus. It should be noted that duplicate articles in the databases were excluded after reading in full in order to avoid exclusion errors.

The Rayyan® platform was used to assist in the pre-analysis of articles, selection of duplicates, and analysis of the titles and abstracts of studies appropriate to the inclusion criteria (Ouzzani *et al.*, 2016). In addition, a flowTable was used for transparency of the selection process of the review corpus.

For the level of evidence, the following classification was considered: level I systematic reviews or meta-analyses of Randomized Controlled Clinical Trials (RCTs); level II evidence obtained from at least one well-designed RCT; level III well-designed clinical trials without randomization; level IV from well-defined case-control and cutting studies; level V obtained from systematic reviews of descriptive or qualitative studies; level VI from a single descriptive or qualitative study; and level VII evidence originating from the opinion of authorities and/or a committee of experts (Galvão, 2006).

The results were typed into electronic spreadsheets available in the Microsoft Excel 2023® program. It is noteworthy that the study was carried out with data in the public domain, so ethical appreciation was not necessary.

3 RESULTS

A total of 5,231 works were found in the analyzed databases, after a thorough reading and application of the eligibility criteria, 08 articles remained, which include this integrative review (as shown in Figure 1).

Figure 1

Flow of information with the different phases of the systematic review according to the guidance of the PRISMA protocol, 2024

Source: Moher et al., 2009.

All selected studies were published in English (n=8) and were developed in Denmark (n=2), Spain (n=1), United States of America (USA) (n=1), England (n=2), Liberia (n=1) and Norway (n=1). Of the selected works, five are quantitative and three qualitative. The methods used ranged from randomized clinical trials (n=4) classified as evidence level II, to descriptive qualitative studies (n=3) and cross-sectional prospective studies with evidence level VI.

The study population ranged from two to 999 individuals (mean = 500.5). The target subjects were defined as only the adult population, with representation of both sexes, offenders in a semi-open regime, as well as professionals (doctors, nurses, psychologists, therapists, social workers). As expected, the main mental disorder addressed was Antisocial Personality Disorder (n=8), and in addition to this there were: Borderline Personality Disorder (n= 2), Substance Use Disorder (n=1) and Personality Disorder in general (n= 1), as shown in Table 01.

Table 1

Characterization of the articles selected for this integrative review, in the period from 2014 to 2024. Brazil

D	Title	Year/Country	Main results
01	Inhaled Loxapine as a Rapid Treatment for Agitation in Patients with Personality Disorder: A Prospective Study on the Effects of Time (Ferrer <i>et al.</i>)	2022/Spain	Agitation is frequent in patients with personality disorders, especially those with low tolerance and high impulsivity, such as BPD and APD. A quick treatment is essential to avoid consequences such as prolonged hospitalization and use of restraint. Inhaled loxapine, which is rapidly absorbed, appears as an effective alternative, indicated for agitated but non-aggressive patients, as long as they consent. In a study of 30 patients in moderate to severe agitation, loxapine showed significant improvement and no adverse effects, suggesting safety and efficacy in the management of agitation in psychiatric settings.
02	Antisocial personality disorder in group therapy, kindling pro-sociality and mentalizing (Morken <i>et al.</i>)	2022/Norway	The therapists' experience with APD patients in MBT groups revealed four main themes. First, the therapists initially showed insecurity and prejudice, fearing aggressive behavior from the patients, but were positively surprised by their motivation to work on emotional issues. Second, they found it difficult to set clear

			boundaries, and they realized that patients prefer direct communication. Third, they reported that patients often exceed the therapists' comfort level, even though monthly one-on-one sessions help create a healthy distance. Finally, therapists faced challenges in intervening and controlling patients' mental states, often feeling exhausted. Supervision among therapists and an attachment-based approach were pointed out as essential to better deal with countertransference and the emotional challenges of this work.
03	Do People with Borderline Personality Disorder Complicated by Antisocial Personality Disorder Benefit from the STEPPS Treatment Program? (Black <i>et al.</i>)	USA 2016/	Both studies demonstrated a significant improvement in the clinical appearance of patients with APD comorbid to BPD, and this improvement even had characteristics of being greater in the groups of people with BPD plus APD. Thus, STEPPS treatment has been shown to be beneficial for patients diagnosed with APD and who have comorbid BPD. Due to the great overlap between these syndromes, there is a great advantage in the implementation of this evidence-based treatment in patients with APT comorbid to BPD, since at the moment there is no standard treatment for APD.
04	Impulsive lifestyle counseling to prevent dropout from treatment for substance use disorders in people with antisocial personality disorder: A randomized study (Tylstrup; Hesse)	Denmark 2016/	The highest dropout rate was found in patients with APD assigned to TAU (54.1%). The lowest dropout rate was among patients with APD assigned to CLI (41.9%). The present study found support for the efficacy of the Method to reduce treatment abandonment among patients with comorbid SUD and ADT. Concluding that from the evidence of the study it was possible to affirm that people with APD can be treated.

05	Combining cash transfers and cognitive behavioral therapy to reduce antisocial behavior in young men: A mediation analysis of a randomized controlled trial in Liberia (Carpena <i>et al.</i>)	Liberia 2023/L	One of the main findings of this study was that neither Cognitive Behavioral Therapy (CBT) nor Unconditional Cash Transfer (ICT) alone influenced the antisocial behavior of the patients studied, but through the combination of both approaches significant reductions in antisocial behavior were observed.
C	Exploring therapeutic engagement with individuals with a diagnosis of personality disorder in acute psychiatric inpatient settings: A nursing team perspective (Acford; Davies)	England 2021/ d	Study participants reported having lower levels of perceived understanding and positive emotional response to APD compared to mental health nurses in another study. And they also reported having less therapeutic involvement and greater emotional difficulties with this group of patients.
07	"They're Really PD Today": An Exploration of Mental Health Nursing Students' Perceptions of Developing a Therapeutic Relationship With Patients With a Diagnosis of Antisocial Personality Disorder (Jones; Wright)	England 2015/ d	This qualitative study investigated the perceptions of nursing students about the challenges of establishing therapeutic relationships with patients diagnosed with APD. This bond is essential to promote positive outcomes, but it can be difficult to establish due to the distrust of these patients. In addition, the article highlights the stigma associated with the diagnosis of APD, often compounded by criminal histories, and recommends that the focus be on the person, not just the disorder. The education and preparation of professionals are essential to offer individualized and effective care, aiming to see the patient beyond their negative characteristics.
08	Psycho-education for substance use and antisocial personality disorder: a randomized trial	Denmark 2015/ ark	This randomized clinical trial provides evidence that through the ILC+ program the usual treatment for individuals with substance abuse disorder comorbid to ADD. There was an improvement in the

	(Thylstrup; Schröder; Hesse)		treatment of these substance use disorders and that more days of abstinence were observed in patients who underwent this treatment, compared to those who underwent only the usual treatment against substance abuse. Regarding the levels of aggression of the patients, no significant effects were found in the psychoeducational treatment compared to the usual treatment. It is possible that the changes cannot be observed, given the short period of the survey.

3.1 STRATEGIES AND EFFICACY OF TREATMENT FOR AGITATION IN PATIENTS WITH PERSONALITY DISORDERS

Among one of the greatest demands in psychiatric emergency services is that of patients with agitation, which is characterized by an excess of motor activity, associated with a feeling of internalized tension. If not properly treated, it can trigger violent/aggressive behavior, requiring the use of mechanical or pharmacological restraint, which usually leads to a longer hospitalization time (Ferrer *et al.*, 2022).

Patients diagnosed with personality disorders have a tendency to develop agitation at some point, especially those who have a low tolerance for managing negative emotions, among them: Borderline Personality Disorder and Antisocial Personality Disorder.

Among the treatment options that exist for moderate/severe acute agitation and that are commonly used in emergency services is the oral or intramuscular administration of drugs of the benzodiazepine or antipsychotic class. These medications, as effective as they are, can generate side effects such as: muscle hypotension in the case of benzodiazepines, as well as excessive sedation and antipsychotics can cause extrapyramidal reactions (Ferrer *et al.*, 2022).

Therefore, there is a need for a medication that is effective, easy to apply, with a short latency period and that has its effect in a stable way. Loxapine stands out in its inhaled form. A drug of the class of antipsychotics, but classified as atypical, capable of promoting significant improvement in symptoms of moderate/severe agitation within a short period, and still without side effects recorded by the article. Proving to be a viable and very effective option

in the treatment of agitation, keeping the patient awake and aware of their treatment process, becoming more protagonist of their care (Ferrer *et al.*, 2022).

However, inhaled loxapine demonstrates a restriction regarding its use in cases of agitation where there are already established levels of aggressiveness, or with total lack of control of body movements, due to the fact that it can only be used with the patient's consent (Ferrer *et al.*, 2022).

In this way, the research brings a new formulation for the treatment of agitation, especially in patients with personality disorders, especially APD. It is extremely relevant, given that the treatment of patients with APD is on a global scale, including moments of aggravation and aggravation (Ferrer *et al.*, 2022).

3.2 SCOPE OF TREATMENT OF COMORBIDITIES IN PATIENTS WITH ANTISOCIAL PERSONALITY DISORDER AND THE OPPORTUNITY TO LINK TO HEALTH SERVICES

Individuals diagnosed with APD have a high rate of comorbidities associated with a primary diagnosis. The characteristics that aggregate APD with other personality disorders aggravate the clinical picture of these patients, since the synergism between the disorders results in a more intense impairment of the individual (Tylstrup; Hesse, 2016).

Among the main comorbidities to APD, the following were identified in the articles: Borderline personality disorder (BPD) and Substance use disorder (SUD), which were established as points of contact between these individuals and health services, providing them with the opportunity to seek treatment for these disorders (Black *et al.*, 2016; Tylstrup; Hesse, 2016).

Given the fact that patients diagnosed with APD present great resistance because they seek treatment for this diagnosis in isolation, as well as being marginalized, many times, within the psychiatric care services themselves, the search for treatment of their comorbidities is a window of opportunity to generate changes, in order to reduce antisocial behaviors in these individuals. (Tylstrup; Hesse., 2016).

Through the implementation of the STEPPS program: *Systems Training for Emotional Predictability and Problem Solving*, originally developed for patients diagnosed with Borderline Personality Disorder, but which was comparatively applied to patients with comorbid APD in the study. It obtained a surprising result: There was a significant improvement in the clinical appearance of patients with ADT comorbid with BPD. The

improvement even had characteristics of being greater in the groups of people with BPD plus APD (Black *et al.*, 2016).

Patients with ADP comorbidized with TUS are presented with an approach through psychoeducation, called ILC. Acronym from English: *Impulsive Lifestyle Counseling*. Through this approach, it is intended that patients not only have a lower dropout in treatment, but also to become more self-aware of their behavioral difficulties and how this can affect them and others (Tylstrup; Hesse, 2016).

The study found evidence supporting the effectiveness of the ILC method in reducing treatment dropout among patients with comorbid substance use disorder and antisocial personality disorder. Given the evidence from this study and other recent research, it is demonstrated that individuals with APD can be treated, refuting the theory that has been established among mental health professionals, that these patients are untreatable (Tylstrup; Hesse, 2016).

The implementation of these treatments can provide the generation of bonds between patient and health professional, promoting the creation of a therapeutic relationship, a relationship that has been shown to be capable of generating positive treatment results and an improvement in the individual's own functioning. As well as the results previously demonstrated that demonstrate an alternative to the treatment of ADD patients with comorbidities (Jones; Wright, 2015).

3.3 DIFFICULTIES OF THERAPISTS AND MENTAL HEALTH PROFESSIONALS IN THE CARE OF PATIENTS WITH APD AND THE CHALLENGE OF ESTABLISHING THERAPEUTIC RELATIONSHIPS

The analysis of the texts reveals a comprehensive view of the difficulties faced by therapists and mental health professionals when caring for patients with Antisocial Personality Disorder. These challenges involve developing effective therapeutic bonds, managing negative countertransference, and structuring approaches that respect professional boundaries (Morken *et al.*, 2022; Acford; Davies, 2021; Jones; Wright, 2015).

Mentalization-based treatment (MBT) emerges as a promising option, especially in groups, to help patients with APD develop greater self-awareness and emotional control. However, one of the main obstacles encountered by therapists is negative countertransference, characterized by feelings of aggression, helplessness, and guilt in the face of patients' challenging behaviors. This phenomenon affects the therapist's ability to

maintain the emotional detachment necessary for an empathetic approach, especially when dealing with explosive or aggressive behaviors. Studies show that therapists benefit from peer support and supervision to manage emotional distress and prevent burnout (Morken *et al.*, 2022).

A study demonstrated that the nurses' perspective illustrates similar emotional difficulties when interacting with patients with APD. The stigma associated with personality disorders often intensifies feelings of anger and frustration, which ultimately results in less therapeutic engagement on the part of professionals. To minimize this emotional burden, nurses emphasize the importance of structured approaches and the use of tools to monitor the emotional state of patients, such as "Recovery Action Plans" and "Early Warning Signs". These strategies facilitate the management of interactions with patients and contribute to the creation of a stronger bond that is less affected by emotional stress (Acford; Davies, 2021).

In addition, a well-defined treatment structure is essential for the development of an efficient therapeutic bond with patients diagnosed with APD. At MBT-TPA, biweekly group and monthly one-on-one sessions provide balance between closeness and emotional boundaries, benefiting both patients and therapists. Similarly, nurses report that the presence of a clear admission and discharge plan contributes to the creation of more productive and therapeutic bonds, reducing the negative impact of the emotions involved (Morken *et al.*, 2022; Acford; Davies, 2021).

Setting boundaries and emotional self-control emerge as recurring challenges for professionals. Both therapists and nurses report difficulties in establishing and maintaining boundaries with patients, which is especially important in the case of patients with APD, who often ignore or disrespect these boundaries. The ability to control one's emotions is essential to prevent negative interactions from compromising the quality of treatment. This challenge intensifies in the context of MBT, where therapists report the difficulty of intervening at the right time without compromising the patient's autonomy (Jones; Wright, 2015).

Another critical point is the perception of safety and trust in the work environment. Professionals with experience in forensic environments report a more negative perception and a lower sense of security when dealing with patients with APD, indicating that prior exposure to forensic contexts can increase stigma and hinder the construction of an effective therapeutic relationship. This factor suggests the need for specific training for these professionals to learn to manage their own perceptions and emotions when dealing with this type of patient (Thylstrup; Schrøder; Hesse, 2015).

In summary, the data presented confirm the complexity of working with patients diagnosed with APD, especially due to the emotional impact on the professionals involved. The challenge of maintaining a therapeutic relationship without negative countertransference or stigma compromising care is great, but it can be mitigated with continuous supervision, emotional support among colleagues, and structured approaches. These factors are key to improving the engagement and treatment effectiveness of patients with APD (Morken *et al.*, 2022; Acford; Davies, 2021; Jones; Wright, 2015; Thylstrup; Schröder; Hesse, 2015).

4 DISCUSSION

The results demonstrate that mental health care for people with APD is complex, and still requires many advances. Several obstacles in the treatment and social reintegration of people with APD need to be overcome, among these difficulties: the development of a bond between patient and professional, as well as the stigma that still permeates mental disorders. However, innovative treatments are under development in order to support professionals in the management of these patients, such as the STEPPES Program and Psychoeducation.

In view of the findings of this study, psychomotor agitation is a common and recurrent event among psychiatric patients, as highlighted by Garriga *et al.* (2016). These authors point out that this symptom can occur not only in emergency departments, but also in hospital admissions and even in outpatient settings.

According to the same authors, agitation is characterized by an activity that is generally unproductive and semi-structured. Which usually does not begin with the intrinsic purpose of an aggressive action or violent acts, but can with the escalation of agitation, lead to behavior of such nature (Garrida *et al.*, 2016).

Agitation is a broad and multifactorial syndrome, and it encompasses many psychiatric conditions. Previous studies (Battaglia, 2005; Fountoulakis; Vieta, 2008; Nordstrom; Allen, 2007, apud Garriga *et al.*, 2016), had already shown that it is closely linked to the schizophrenia, personality disorder, (especially borderline and antisocial), as well as other disorders. And that the management of agitation in patients with Personality Disorder, especially APD and BPD, is seen as complex and challenging, given the high prevalence of patients in psychiatric emergency departments.

As pointed out by Patrizi *et al.* (2018), the reassurance of agitated patients is a challenge and it is essential to address the acute symptoms of psychological distress and the beginning of agitation more quickly, avoiding as much as possible the escalation of agitation

to a more serious point that requires more imposing interventions and without being able to count on the patient's cooperation.

Verbal intervention, or verbal de-escalation, consists of talking to the patient with the aim of leading him to a calmer state (Stevenson; Otto, 1998). Garriga *et al.* (2016), corroborate this definition, highlighting the importance of verbal de-escalation to reduce the risk of violence. However, despite the potential of this technique, there is still little scientific evidence to prove its effectiveness (Richamond *et al.*, 2012 apud Garrida *et al.*, 2016).

Drug treatment for episodes of acute agitation is considered an effective way to reassure the patient. It is used when non-pharmacological treatments fail. Drugs of the benzodiazepine class or typical antipsychotics may be recommended, which are sedative drugs, but which can cause serious adverse effects, deleterious to the patient, such as exacerbated sedation, extrapyramidal symptoms, restricting their use (Patrizi *et al.*, 2018).

Thus, the treatment of agitation with a focus on patients diagnosed with personality disorder, among which the most prevalent are Borderline Personality Disorder and Antisocial Personality Disorder, has proven to be a challenge, and there is still no consensus regarding the standard treatment (Patrizi *et al.*, 2018).

Thus, among the options of medications to control agitation, atypical antipsychotics emerge, among which the study by Ferrer *et al.* (2022), describes loxapine in the inhaled form that can reach maximum concentration in the body after just two minutes, being extremely fast to provide the expected results in patients, as well as causing fewer extrapyramidal and sedation symptoms compared to medications commonly used in the clinic.

An international study corroborates the findings of this study, and demonstrates that through a prospective randomized clinical trial, with 41 patients diagnosed with Personality Disorder, 2.4% obtained "better" results after ten minutes of the administration of inhaled loxapine and in twenty minutes a percentage of 48.8% were considered "much better". Demonstrating that inhaled loxapine was fast, effective, safe, and well accepted in agitated patients with personality disorder (Patrizi *et al.*, 2018).

It is worth noting that both studies converge on the importance of this therapy as being able to provide a state of calm in the patient, without the need to impose sedation, and that its non-invasive method facilitates the acceptance of the treatment by individuals with agitation (Patrizi *et al.*, 2018; Ferrer *et al.*, 2022).

Also, Garriga's study *et al.* (2016) points out that in a literature review evidence of clinical trials was found (Allen *et al.*, 2011; Lesem *et al.*, 2011; Kwentus *et al.*, 2012), which corroborate the efficacy of inhaled loxapine in the treatment of acute agitation.

On the other hand, it should be noted that this method of administration, via inhalation, brings with it the limitation that only collaborative patients in a state that is not yet violent/aggressive can be treated. Due to this restriction in the profile of patients who fit as possible users of this medication, this point becomes a caveat to this treatment (Shader; Richard, 2017).

In addition, inhaled loxapine emerges as a promising new therapeutic option in the treatment of agitated patients with personality disorders, among which APT stands out. Promoting the return to a basal state in the patient, as well as allowing him to be autonomous in the choice of his treatment, and not to be sedated and/or to necessarily remain hospitalized. Being able to reestablish calm quickly and effectively (Garriga *et al.*, 2016).

In line with the findings of this review, studies have demonstrated the high prevalence of the diagnosis of APD and other mental disorders in a comorbid manner (Black *et al.*, 2016; Thylstrup; Hesse, 2016; Yakeley; Williams, 2014), states that this comorbidity is considerably and complex, particularly substance use disorder. And that shows itself It is important to diagnose comorbid conditions, as the presence of antisocial personality disorder acts as a negative moderator of treatment response when these conditions are treated by conventional approaches.

Two types of comorbidities were highlighted in the articles analyzed, between BPD and APD, as well as by the diagnoses of concomitant SUD and APD. As well as presenting different treatment strategies: The first being analyzed the effectiveness of the treatment *Systems Training for Emotional Predictability and Problem Solving* (STEPPS) and the second psychoeducational program, the *Impulsive Lifestyle Counseling* (ILC). Both analyzed the effectiveness of these treatments in comparison with traditional approaches carried out in health systems. Demonstrating a superiority in the results of these approaches compared to conventional ones (Black *et al.*, 2016; Thylstrup; Hesse, 2016).

In both treatments, a group approach was used, which can be seen intrinsically as a mode of psychic change, being highlighted for its advantages for individuals with high impulsivity and low affectivity, as it is less provocative than individual therapy, as well as for bringing these individuals closer to their group partners, being able to understand others (Bateman; Tyrer, 2004 apud Yakeley; Williams, 2014).

Patient engagement and maintenance in substance abuse treatment are aimed at in the study of Thylstrup; Hesse (2016), because according to the authors, for the treatment to be effective, it is essential that there is no premature abandonment. Since the Patients who are not on treatment cannot be treated.

According to Yakeley; Williams (2014), up to 75% of individuals with APD abandon treatment, presenting worse clinical outcomes. The authors suggest psychoeducation as a strategy to increase adherence to treatment. Corroborating the findings of this study, which tested the impact of the addition of a brief psychoeducational program, the aforementioned ILC program on the level of abandonment of patients in outpatient treatment of substance abuse comorbid to APD.

Thylstrup *et al.* (2015), emphasize that the brief intervention carried out in the study is in no way a cure for APD, but that it is inserted as a step towards the treatment of this neglected disease. Reiterating that with the reduction of substance use, the possibility of additional interventions and support is opened, potentially increasing the social and psychological stability of the patient.

Due to the wide overlap of comorbidities with APD, many people have likely been excluded from participating in an evidence-based treatment program. The exclusion of individuals with APD from treatment programs, due to concerns about disruptive behaviors, is a common but questionable practice. Studies indicate that these concerns are largely unfounded. Exclusion of these patients limits access to effective treatments and can perpetuate the cycle of problems associated with APD. It is essential to develop therapeutic approaches that take into account the specific needs of these patients (Black *et al.*, 2016).

The beginning of a treatment also symbolizes the creation of a relationship. Where this therapeutic alliance exists, there is the possibility of establishing a relationship of approximation, with the strengthening of the therapeutic bond or the distancing and weakening of this relationship (Bender, 2005).

The concept of therapeutic alliance is usually related to Freud, who in his works observed that it is necessary to convey interest and sympathy to the patient in order to involve them in a collaborative treatment. The term therapeutic alliance was later defined, using psychoanalytic language, as a division by the therapist of the patient's ego, allowing him to differentiate and work with the healthiest elements of the individual, against possible resistances and against his own pathology (Bender, 2005).

This definition is useful in relation to personality disorders because it first recognizes that there will be parts of the personality, that is, the individual's ego, that due to their pathology can affect and frustrate professional help in the treatment of the patient. And it is necessary for the professional to be creative in differentiating and dividing the healthiest elements of the individual, observing their potentialities (Bender, 2005).

Corroborating with Acford and Davies (2021), an international article shows that among the reasons given by patients for the failure of the treatment proposed to them are frustration with treatment and lack of social support. Thus, involvement in treatment is essential for a successful outcome and, according to the authors, requires the development of a constructive and progressive dialogue between patients and clinicians. Because patients with personality disorders may often present fluctuations in their motivations and level of interest, but the function of involvement is to collaboratively prevent a break in treatment, and gradually bring more trust to this therapeutic relationship (Bateman; Tyrer, 2004).

Perhaps the main problem in engaging the patient is creating the patient's analytical trust. Due to the fact that the patient has a systemic difficulty in trusting and believing in the people around them, including their caregivers, as well as in the world itself as a reliable place (Bender, 2005).

In line with this, it is demonstrated that patients with "dramatic" Cluster B personality disorder (antisocial, borderline, histrionic and narcissistic) have as their main problem the formation of a therapeutic alliance and the crossing of limits. Thus, it is of paramount importance to avoid crossing inappropriate lines, in the search to build an alliance with the patient (Bender, 2005).

Through empirical evidence, it was possible to observe that some patients with APD were able to form true therapeutic alliances, which generated positive results. However, according to the same author, patients with this type of disorder have a tendency to build a pseudo-alliance in order to obtain advantages for themselves, especially in correctional environments. Where the therapist is sought to obtain undue privileges for him (Bender, 2005). In this way, the mental health professional has to maintain the ability to be firm, skillful and competent, despite provocation, anxiety and pressure to transgress limits (Bateman; Tyrer, 2004).

Currently, the focus has been placed on training and continuous learning as extremely relevant factors in the development of excellent professionals. And through critical analysis,

the current standard training of mental health professionals is not sufficient to treat and care for patients with APD (Bateman; Tyler, 2004).

Still, another factor that can interfere in the care of patients diagnosed with APD and other mental disorders is countertransference, which was initially introduced by Sigmund Freud, identifying that the patient's influence on the analyst's unconscious feelings can be detrimental to the treatment (Betan *et al.*, 2005).

A number of studies have attempted to operationalize the concept of countertransference by defining countertransference responses as therapists' reactions to patients, which are based on therapists' unresolved conflict. This operationalization was carried out through avoidant behaviors that were analyzed, where it was defined whether a professional performed countertransference through gestures of disapproval, silence, ignoring, among others. Thus, seeking a way to empirically demonstrate this fact, which has already been discussed so much in a theoretical way (Betan *et al.*, 2005).

Study carried out by Betan *et al.* (2005), classifies countertransference into eight dimensions, and relates these dimensions to the type of personality disorder. Demonstrating that it is possible to observe a pattern of countertransference for DSM-IV personality disorders divided by Clusters (A, B, C). Thus, the countertransference mode that the cluster B factor (dramatic/erratic), which is among the pathologies of APD, would be associated with the professional who had behaviors and feelings of being disorganized and overloaded, of feeling helpless and inadequate, or of having an over-involved behavior.

Through this finding, countertransference, which is very common among professionals who treat patients with APD, can use this to their advantage, as the interpellations between countertransference patterns and the characteristics of the personality disorder support the broad view of countertransference reactions as useful in the agnostic understanding of patient dynamics. particularly those involving repetitive interpersonal patterns (Betan *et al.*, 2005).

In short, mental health care for people with APD reveals a challenging scenario, with significant gaps to be filled. Building solid bonds and demystifying mental disorders are crucial to overcoming existing obstacles. However, hope lies in research advances, with initiatives such as STEPPES and Psychoeducation opening up new perspectives for treatment and rehabilitation.

Regarding the limitations of the present study, it is worth noting the small number of articles selected at the end of all phases of refinement of the research, thus having a small

sample of articles to be analyzed, and it may not be possible to verify other sources or relevant data that were not included in the selection of the databases. Finally, it should be stated that due to the fact that all the articles selected for reading in full are of an international nature, inaccuracies regarding the understanding of the content in a more reliable way may have occurred, due to the difference in languages.

The present study can contribute to the addition of scientific content at the national level regarding how health care is provided to individuals with antisocial personality disorder, given that all the selected articles and a large part of the database are produced in English, produced mainly in first world countries. Helping to understand the aspects that involve this disorder that for so many decades have been neglected, even being considered untreatable.

5 FINAL CONSIDERATIONS

The results of this review demonstrated that health care for people with APD is complex and has several obstacles. People with APD tend to develop psychomotor agitation, which is common to the disorder. Thus, some treatment strategies are used by health professionals, such as benzodiazepine medications or antipsychotics. Other treatments can be used in the management of patients with APD, the STEPPS Program and psychoeducation are among the innovative programs in the area.

It was also possible to highlight the difficulties encountered by health professionals, such as: the development of a professional-patient and patient-health service bond, negative countertransference, personalized and effective therapeutic approaches, and the stigma of professionals in relation to TPA.

Thus, there is a gap within the content addressed, given the reduced number of articles selected after rigorous analysis of the seized database. This demonstrates the need and urgency with which this topic needs to be addressed in studies of high methodological quality, providing and outlining the treatment of patients with ADT with greater clarity and reliability.

ABSTRACT

Objective: To develop a methodological proposal to identify the characteristics of the students in a group (personality, academic level, context, cognitive structure and learning styles), to guide didactic planning towards comprehensive training, meaningful and personalized learning.

Theoretical Framework: Students with heterogeneous characteristics in their biography and academic history converge in the classroom. Its identification by means of various diagnostic models (Briggs-Myer; Honey-Mumford; Kolb; VARK; 4MAT-System) allows for the adaptation of didactic planning improving students' academic results.

Method: A qualitative, descriptive, literature review study was carried out, analyzing didactic planning and several models of learning styles, to develop a methodological proposal that identifies the characteristics of students in a school group (personality, academic level, context, cognitive structure, learning styles).

Results and Discussion: The characteristics and learning styles identified by the models reviewed are personality (Briggs-Myer), attitude and behavior (Honey-Mumford; Honey-Alonso), experiential learning (Kolb), preferential sensory modality for perceiving and processing information (VARK, Fleming-Mills model), laterality and specificity of the cerebral hemispheres (Bernice McCarthy's 4MAT-System), interaction between students and teachers (Grasha-Riechmann). It included also an initial diagnostic examination, individual and group interviews and team building.

Research implications: Didactic planning oriented towards the characteristics and learning styles of students is an innovative strategy to achieve meaningful and personalized learning.

Originality/Value: The relevance of the study is to emphasize the need to identify the differences between the students of a group, in order to generate changes both in didactic planning and at the institutional level, benefiting the community.

Keywords: Learning Styles. Didactic Planning. Higher Education.

RESUMEN

Objetivo: Elaborar una propuesta metodológica para identificar estilos de aprendizaje y características del alumnado en un grupo (personalidad, nivel académico, contexto, estructura cognitiva), para orientar la planeación didáctica favoreciendo la formación integral, el aprendizaje significativo y personalizado.

Marco Teórico: En el aula confluyen estudiantes con características heterogéneas en su biografía e historia académica. Su identificación mediante diversos modelos diagnósticos (Briggs-Myer; Honey-Mumford; Kolb; VARK; 4MAT-System) permite adecuar la planeación didáctica para mejorar los resultados académicos.

Método: Se realizó un estudio cualitativo, descriptivo, tipo revisión bibliográfica, analizando la planeación didáctica y varios modelos de estilos de aprendizaje, para elaborar una propuesta metodológica que identifique las características del alumnado en un grupo escolar (personalidad, nivel académico, estructura cognitiva, estilos de aprendizaje y contexto).

Resultados y Discusión: Las características y estilos de aprendizaje que identifican los modelos analizados son: personalidad (Briggs-Myer), forma de actuar (Honey-Mumford; Honey-Alonso), aprendizaje experiencial (Kolb), modalidad sensorial preferente para percibir y procesar la información (modelo VARK, Fleming y Mills), lateralidad y especificidad de los hemisferios cerebrales (4MAT System de Bernice McCarthy), interacción alumnado-docentes (Grasha-Riechmann). Se incluyó: examen diagnóstico inicial, entrevistas e integración de equipos.

Implicaciones de la investigación: La planeación didáctica orientada hacia las características y estilos de aprendizaje del alumnado, es una estrategia innovadora para lograr el aprendizaje significativo y personalizado.

Originalidad/Valor: Este estudio destaca la necesidad de identificar las diferencias entre el alumnado de un grupo, para generar cambios en la planeación didáctica e institucionales, beneficiando a la comunidad.

Palabras clave: Estilos de Aprendizaje. Planeación Didáctica. Educación Superior.

RESUMO

Objetivo: Elaborar uma proposta metodológica para identificar estilos de aprendizagem e características do alunado em um grupo (personalidade, nível acadêmico, contexto e estrutura cognitiva), a fim de orientar o planejamento didático, favorecendo a formação integral e a aprendizagem significativa e personalizada.

Referencial teórico: Na sala de aula coexistem estudantes com características heterogêneas em suas trajetórias pessoais e histórias acadêmicas. A identificação dessas características por meio de diferentes modelos diagnósticos (Briggs-Myers; Honey-Mumford;

Kolb; VARK; sistema 4MAT) permite adequar o planejamento didático, contribuindo para a melhoria dos resultados acadêmicos.

Método: Foi realizado um estudo qualitativo, descritivo, do tipo revisão bibliográfica, analisando o planejamento didático e diversos modelos de estilos de aprendizagem, com o objetivo de elaborar uma proposta metodológica capaz de identificar as características do alunado em um grupo escolar (personalidade, nível acadêmico, estrutura cognitiva, estilos de aprendizagem e contexto).

Resultados e discussão: As características e estilos de aprendizagem identificados pelos modelos analisados incluem: personalidade (Briggs-Myers), forma de agir (Honey-Mumford; Honey-Alonso), aprendizagem experiencial (Kolb), modalidade sensorial preferencial para perceber e processar informações (modelo VARK, de Fleming e Mills), lateralidade e especificidade dos hemisférios cerebrais (sistema 4MAT, de Bernice McCarthy) e interação entre estudantes e docentes (Grasha-Riechmann). Foram incluídos, ainda, exame diagnóstico inicial, entrevistas e integração de equipes.

Implicações da pesquisa: O planejamento didático orientado pelas características e estilos de aprendizagem do alunado constitui uma estratégia inovadora para promover a aprendizagem significativa e personalizada.

Originalidade/valor: Este estudo destaca a necessidade de identificar as diferenças entre os estudantes de um grupo, a fim de promover mudanças no planejamento didático e institucional, beneficiando a comunidade acadêmica.

1 INTRODUCTION

“... The most important factor influencing learning, it is what the student already knows. Find this out and teach yourself accordingly.”
D. Ausubel (1983).

For most of the last century, in the field of education, traditionalist pedagogy privileged teaching over learning, thus highlighting the leading role of teachers over that of students. Also notable in educational programs was the supremacy of thematic content, over the application, construction and reconstruction of knowledge, as well as teaching work where strategies, teaching techniques and learning assessment focused on the cognitive functions of the left cerebral hemisphere (memorization and reproduction of content or information); likewise, the context of the educational process was significantly ignored.

However, it was from the emergence of the constructivist approach in educational models in the seventies and eighties of the twentieth century, essentially based on (Carretero M, 1993; Lozano A, 2001):

1. The theory of cognitive development (1936-1950) by Jean Piaget (1896-1980), which relates the first stages of human development, from birth, to the improvement of cognitive functions (cognitive constructivism, 1971).
2. The theory of significant learning (1960-1970) by David Ausubel (1918-2008), which is developed by relating new information with previous knowledge in a non-linear way.
3. The theory of socio-cultural learning (1978) by Lev Vygotsky (1896-1934), which emphasizes the importance of social, cultural, and linguistic interaction between people and their environment for the development of learning (social constructivism, 1978).

When the panorama of teaching work began to change, tending to prioritise learning over teaching, so that the main protagonist of the teaching-learning process began to be the students and not the teachers (Guerra GJ, 2020).

Current pedagogical trends promote comprehensive training, meaningful, student-centered learning, and personalized learning (Ausubel D, 1983; Delors J, 1996; UNESCO-OIE 2017). How to develop an appropriate environment in the classroom to achieve this objective? It is difficult to answer this question, but achieving it means for teachers to accept the challenge and responsibility, truly understanding what their role should be as teachers of the 21st century: to assume the position of guide, facilitator, mediator and example throughout the educational process, but above all, to be a promoter of learning and a researcher of the

characteristics and learning styles of the students. of their own teaching practice and educational context (Valarezzo JW, 2019; UNESCO, 1996, 2017).

On the other hand, it is a reality that in a classroom, students with very diverse characteristics and needs converge, related to their personal biography, academic level, personality, cognitive structure and learning styles, as well as their interests and abilities (Alonso CM, 1997, 2007).

Likewise, UNESCO's International Bureau of Education (IBE) has emphasized the importance of recognizing the diversity of learning styles and addressing the needs of each student, paying attention to the relevance of what is taught and stimulating the capacity for inquiry (UNESCO-IBE, 2017).

Hence, the organization of the educational institution and the planning of the teaching work ("*Didactic Planning*") must contemplate this perspective, especially to help students achieve their maximum potential for human and professional development.

OBJECTIVE: To develop a methodological strategy that allows the identification of the individual characteristics of the students of a group, in relation to their personality, academic level, context, cognitive structure and learning styles, to guide didactic planning favoring the development of comprehensive training, meaningful and personalized learning of students.

2 METHODOLOGY

2.1 RESEARCH DESIGN: QUALITATIVE, DESCRIPTIVE, BIBLIOGRAPHIC REVIEW.

2.2.1 Materials and method

The models related to different learning styles of various authors (available in academic Internet search engines such as Google Scholar, Redalyc, SciElo, Dialnet) designed to identify the characteristics, preferences and learning styles of the students were analyzed. Based on the different methodological approaches analyzed, a strategy proposal was developed to identify the personal characteristics of the students who make up a class group, in relation to their personal history, personality type, cognitive structure and learning styles. Likewise, strategies were added to assess the academic level and personal context, in order to improve the student's academic result, through the adaptation of didactic planning.

3 RESULTS

The different models designed to assess learning styles, which were reviewed and analyzed, are: the Kolb model, Honey-Mumford, 4MAT System, Briggs and Myers, VARK (N.

Fleming, and C. Mills) and the Grasha-Riechmann model. Among its main characteristics and the aspects they investigate are:

3.1 KOLB MODEL

Developed by David A. Kolb, at the beginning of the 70's. Identify two fundamental dimensions of the learning process: perception and processing, finding that in each of them there are 2 opposite types:

- a) In perception: concrete experience and abstract conceptualization.
- b) In processing: active experimentation and reflective observation.

With the above, Kolb built a 4-quadrant model where he explains and describes four learning styles: convergent, divergent, assimilator and accommodating. Each person shows a style that is predominant, but not exclusive.

To locate each learning style, he developed an instrument called the Learning Style Inventory (LSI); this "inventory" is obtained through a 12-question questionnaire, which he formulated based on his *"theory of experiential learning"* (Kolb, 1984).

3.2 HONEY-MUMFORD MODEL

Produced by Peter Honey and Allan Mumford in 1986. It consists of a questionnaire of 20 questions, which locate the learning style according to 4 categories: active, reflective, theoretical and pragmatic. From the first results they obtained, they elaborated a detailed description of each style, based mainly on the *"way people act"*.

Based on this proposal, Alonso, Gallego and Honey (1992) prepared a list of the characteristics and skills of each style (Honey-Alonso questionnaire), concluding that: *"the four learning styles can present combinations between them, in a logical order and of cultural significance"*

3.3 MODEL 4MAT SYSTEM

It was developed by Bernice McCarthy in 1987, based on proposals by Kolb and Briggs-Myers. It consists of applying a questionnaire devised by Kolb (2008), which contains 18 questions, which are based on *"the laterality and specialization of the two cerebral hemispheres"*. This author proposes 4 learning styles: imaginative, analytical, common sense and dynamic. He even considers that these styles integrate a *"natural learning cycle"*, so that this proposal states that optimal learning is only achieved when the person goes through the

four styles.

The 4MAT System integrates the levels of:

1. Comprehension (experimenting with information and integrating it into oneself).
2. Conceptualization (internalizing concepts).
3. Operationalization (applying knowledge through practice and customization).
4. Evaluation (creating knowledge and integrating it into personal life).

3.4 BRIGGS AND MYERS MODEL

These authors based their proposal on the model of "*personality types*" of Carl G. Jung (1921), which allows correlating learning styles with interpersonal relationships. They identified two perceptual processes (sensitive and intuitive) and two for decision-making (rational and emotional), which people use daily in any activity. The difference is in the process used predominantly, which according to Jung, characterizes the personality type (Almaguer TE, 1998).

Katharine Cook Briggs (1875-1968) and Isabel Briggs Myer (1897-1980), mother and daughter respectively, designed a questionnaire in the 40's called Myers-Briggs Type Indicator (MBTI), which allows people to know their own personality type; It was first published in 1962. It consists of questions whose answers are a pair of opposites, which describe their preferences in relation to the following aspects, where the respondent chooses the one that is closest to their reality:

1. Flow of interest (directing or receiving energy): focusing on the outside world (E = extroversion), or on the inner world (I = introversion).
2. Attention (assimilating information): focused on facts (S = sensory), or on the big picture (I = intuition).
3. Decision-making (deciding and reaching conclusions): with an objective (T = thinking) approach, or empathetic (F = feeling).
4. How one wishes to live life: seeking closure (J = judgment), or being open to new information (P = perception).

From them, 16 possible combinations are generated (four-letter code) which describe the "*different types of personality, normal, healthy and the differences that exist between people*", which are not static but dynamic, being able to move from one to another during the course of a day and throughout life. Finally, he emphasizes that understanding, appreciating,

and valuing personality differences can lead people to collaborate with others more constructively (Myers & Briggs Foundation, 1975).

3.5 VARK MODEL

Developed in 1992, by Neil Fleming and Collen Mills. Their model takes the name VARK from the sensory modalities that are identified: V = visual, A = auditory, R = reading/writing, and K = kinesthetic or kinesic.

To this end, they developed a questionnaire that initially consisted of 13 multiple-choice questions, but in 2006 3 more were added, in which the sensory preferences of the students are investigated, which allows them to identify the dominant sensory modality to receive and select the information according to their personal interests (Fleming, ND & Mills C, 2006).

It is also possible to identify students who are multimodal, that is, who use various sensory perceptions to process information. These students have greater ease of learning in relation to unimodal students.

3.6 GRASHA-RIECHMANN MODEL

Designed in 1974 by Anthony Grasha and Cerril H. Riechmann, it is based on the preferences of the student body with respect to *"interaction with their peers and faculty"*. The teaching style assessment instrument is called the Teaching Styles Inventory (TSI) and has 5 categories: expert, authority, model, facilitator and delegator, which are usually combined. The learning styles they propose are contrasted and are located in 6 categories: participatory-elusive, competitive-collaborative and dependent-independent (Grasha A, 2001).

Based on the approaches formulated above, we present the following Table, with a proposal as a possible strategy to contextualize and improve the design, planning, execution and academic results of the teaching work, by identifying the characteristics and differences in the various learning styles of the students who coincide in a school group. Finally, an attempt was made to balance the three basic aspects in this regard, such as: academic level, learning styles and the personal context of the students.

Table 1

Strategies for identifying students' characteristics and learning styles

STRATEGY SUGGESTED	JUSTIFICATION OF CHOICE STRATEGY	ADJUSTMENTS IN DIDACTIC PLANNING
1. Initial diagnostic exam (knowledge) (Brief oral or written exam applied at the beginning of the course or unit; evaluates the level of prior knowledge necessary for the optimal development of the study program).	It allows the ACADEMIC LEVEL to be assessed, in relation to: ✓ Oral and written language management. ✓ Mastery of technical language. ✓ Mastery of support disciplines. ✓ Theoretical-practical knowledge of the curricular discipline. ✓ To guide the development of the study program.	1. Adequacy of objectives and contents of the syllabus. 2. Implement leveling. 3. Rethink the Activities of learning. 4. Redesign the evaluation.
2. Survey to detect LEARNING STYLES and PERSONALITY TYPE of the students. (Written instrument that is applied to each student at the beginning of the course, based on some methodological model).	It allows you to identify the LEARNING STYLE(s) and characteristics of your PERSONALITY to: ✓ Identify individual learning style(s). ✓ Determine the predominant learning style(s) in the group. ✓ Observe the personality type ✓ Detect individual learning needs. ✓ To guide teaching and learning techniques and activities in didactic planning.	Design and elaboration of the survey, based on the models of: 1. Kolb. 2. Honey-Mumford. 3. 4MAT System. 4. Briggs and Myers. 5. VARK. 6. Grasha-Riechmann. 7. Others. Adapt the didactic planning, according to the results.
3. Personal presentation to the group and interviews (Institutional Tutoring Program). (Brief presentation of each student and the teacher in the first class. Periodic, individual or group interviews of students with the teacher	It allows us to know the personal CONTEXT: ✓ Knowledge of the student as a human person and his/her family and social context. ✓ Management of oral communication. ✓ Promote satisfactory intra- and interpersonal relationships. ✓ Identify the needs for comprehensive training and meaningful learning.	Institutionalize and systematize the strategy.
4. Integration of collaborative work groups.	It allows us to improve the RESULTS of meaningful learning:	Institutionalize and systematize the strategy

(Formation of heterogeneous work teams made up of 3 – 4 students, during the first week of the course)	✓ Promote collaborative, independent and participatory learning. ✓ Teamwork with research projects and PBL. ✓ Provide feedback on the teaching and learning process. ✓ Ensure the fulfillment of the objectives. ✓ Establish timely remedial measures.	
--	--	--

4 DISCUSSION

According to the evolutionary psychology of J. Piaget (1896-1980), the student should be considered as an individual, unique and unrepeatable being, with characteristics common to his or her age group. On the other hand, their personal development is influenced both by their genetic inheritance and by their interaction with the environment, and especially with other people (family, friends, classmates, teachers, authorities, etc.), which will determine significant differences related to their gender, age, character, personality, previous experiences, interests, motivations, abilities, skills and needs, as well as their cognitive structure and learning styles or traits intellectuals (Ferreiro E, 1999; Delors J, 1996 UNESCO).

This supports the assertion that individual differences among students in a classroom have always been present and constitute a reality at any educational level or environment, as well as in all areas of human knowledge (Bahamón M, 2012).

Basically, teachers must take these differences into account as key elements for the design and planning of teaching work, in order to provide opportunities for access to comprehensive training, meaningful learning and personalized learning to all students (UNESCO-IBE, 2017), which can be translated into: *"providing different paths to acquire content, process information and generate a result"* (Tomlinson, 1995).

It is therefore necessary to identify the different personal histories, the different learning styles and personality styles that converge in the classroom. To this end, there is the possibility of using various diagnostic models, some focused on personality types (Briggs & Myer, 1940), others on the way people act (Honey-Mumford, 1986; Honey-Alonso, 1992), or based on the *"theory of experience-based learning"* (Kolb, 1971, 1984). Similarly, the VARK model, which allows identifying the preferred sensory modality for perceiving and processing information (Neil Fleming & Collen Mills, 1992), the 4MAT System model (Bernice

McCarthy, 1987) which proposes a natural learning cycle taking into account the laterality and specificity of the two cerebral hemispheres, and the Grasha-Riechmann model (1974) which focuses on the type of student-student and student-teacher interaction.

Current pedagogical models promote meaningful learning (Ausubel D, 1980; Moreira M, 2017), and personalized learning (Pérez Guerrero J, Ahedo Ruiz J, 2020) where the student becomes the main protagonist of the educational act as a being capable of creating, innovating, thinking and reflecting, actively participating in the construction, reconstruction and application of knowledge focused on problem solving, research, collaborative work and project design.

To achieve this, it has been proposed that teaching practice should be oriented towards being personalized to facilitate the learning process in a more natural and scientific way, thus supporting each student to reach their full potential, both in their human and professional development (UNESCO-IBE, 2017).

5 CONCLUSIONS

Among the many current challenges of higher education (in all its areas), as well as at other educational levels, is to achieve the quality of the various academic programs, which guarantees comprehensive training, meaningful and personalized learning, together with the development of professionalism and ethics of the students.

Didactic planning oriented towards the characteristics and learning styles of students (*"personalized learning"*) is undoubtedly the most suitable and innovative strategy to achieve these objectives in higher education, and even in other educational levels.

In the contemporary world, the student is projected as a responsible, supportive, creative, innovative and participative person, with the ability to work in a team, maintain satisfactory intrapersonal and interpersonal relationships, solve problems, self-learning, continuous and collaborative learning, if the conditions and opportunities for access are provided.

A proposal is presented as a possible strategy to contextualize and improve the didactic planning and the academic results of the teaching work, by identifying the characteristics and learning styles of the students in a group of classes. It was also a matter of balancing the basic aspects in this regard: academic level, learning styles, personality type and personal context.

ABSTRACT

The present study, characterized as an experience report in university extension, aims to describe the experience of members of the Academic League of Small Animal Internal Medicine – LACLIMPA, in the development of a veterinary social care project aimed at dogs owned by guardians in situations of socioeconomic vulnerability. Activities are carried out weekly at the veterinary teaching clinic of the State University of Bahia (UNEB), Campus IX, in the municipality of Barreiras, and are conducted by undergraduate students under the direct supervision of the faculty member responsible for the Small Animal Internal Medicine area. The project targets low-income communities, including guardians duly registered in the Unified Registry for Federal Government Social Programs (CadÚnico), ensuring greater equity and social targeting of the extension action. Clinical consultations, basic examinations, outpatient procedures, and guidance on vaccination, sanitary management, animal welfare, and responsible ownership are provided. In addition to expanding access to animal health care for vulnerable populations, the initiative contributes to the prevention of zoonoses and to the promotion of the One Health concept. From an academic perspective, the project enables students to develop technical and ethical competencies, integrating theory and practice in a real professional context. Thus, the social care provided by LACLIMPA constitutes an extension activity of social, academic, and educational relevance, strengthening the university tripod of teaching, research, and extension, while promoting animal welfare and the social responsibility of the veterinarian in training.

Keywords: Extension. CadÚnico. Teaching Clinic. Academic League.

RESUMO

O presente trabalho, caracterizado como um relato de experiência em extensão universitária, tem como objetivo descrever a vivência dos membros da Liga Acadêmica de Clínica Médica de Pequenos Animais – LACLIMPA, no desenvolvimento de um projeto de atendimento social veterinário destinado a cães pertencentes a tutores em situação de vulnerabilidade socioeconômica. As atividades são realizadas semanalmente na clínica-escola de Medicina Veterinária da Universidade do Estado da Bahia (UNEB), Campus IX, no município de Barreiras, sendo conduzidas por estudantes de graduação sob supervisão direta do docente

¹ Undergraduate student of Veterinary Medicine. Universidade do Estado da Bahia (UNEB). Bahia, Brazil. E-mail: julia.larissalc12@gmail.com

² Undergraduate student of Veterinary Medicine. Universidade do Estado da Bahia (UNEB). Bahia, Brazil. E-mail: matosanacarolina96@gmail.com

³ Professor. Universidade do Estado da Bahia (UNEB). Bahia, Brazil. E-mail: rcarneiro@uneb.br

responsável pela área de Clínica Médica de Pequenos Animais. O projeto tem como público-alvo a comunidade de baixa renda, contemplando tutores devidamente cadastrados no Cadastro Único para Programas Sociais do Governo Federal (CadÚnico), o que garante maior equidade e direcionamento social da ação extensionista. São ofertadas consultas clínicas, exames básicos, procedimentos ambulatoriais, orientações sobre vacinação, manejo sanitário, bem-estar animal e guarda responsável. Além de ampliar o acesso da população vulnerável à saúde animal, a iniciativa contribui para a prevenção de zoonoses e para a promoção do conceito de saúde única. Do ponto de vista acadêmico, o projeto possibilita aos discentes o desenvolvimento de competências técnicas e éticas, integrando teoria e prática em um contexto real de atuação profissional. Dessa forma, o atendimento social promovido pela LACLIMPA configura-se como uma ação extensionista de relevância social, acadêmica e formativa, fortalecendo o tripé universitário ensino, pesquisa e extensão, ao mesmo tempo em que promove o bem-estar animal e a responsabilidade social do médico-veterinário em formação.

Palavras-chave: Extensão. CadÚnico. Clínica-Escola. Liga-Acadêmica.

RESUMEN

El presente trabajo, caracterizado como un relato de experiencia en extensión universitaria, tiene como objetivo describir la vivencia de los miembros de la Liga Académica de Clínica Médica de Pequeños Animales – LACLIMPA, en el desarrollo de un proyecto de atención social veterinaria destinado a perros pertenecientes a tutores en situación de vulnerabilidad socioeconómica. Las actividades se realizan semanalmente en la clínica-escuela de Medicina Veterinaria de la Universidad del Estado de Bahía (UNEB), Campus IX, en el municipio de Barreiras, y son llevadas a cabo por estudiantes de pregrado bajo la supervisión directa del docente responsable del área de Clínica Médica de Pequeños Animales. El proyecto tiene como público objetivo a la comunidad de bajos ingresos, incluyendo tutores debidamente registrados en el Registro Único para Programas Sociales del Gobierno Federal (CadÚnico), lo que garantiza mayor equidad y orientación social de la acción extensionista. Se ofrecen consultas clínicas, exámenes básicos, procedimientos ambulatorios y orientaciones sobre vacunación, manejo sanitario, bienestar animal y tenencia responsable. Además de ampliar el acceso de la población vulnerable a la salud animal, la iniciativa contribuye a la prevención de zoonosis y a la promoción del concepto de Una Sola Salud. Desde el punto de vista académico, el proyecto permite a los estudiantes desarrollar competencias técnicas y éticas, integrando teoría y práctica en un contexto real de actuación profesional. De este modo, la atención social promovida por LACLIMPA se configura como una acción extensionista de relevancia social, académica y formativa, fortaleciendo el trípede universitario de enseñanza, investigación y extensión, al mismo tiempo que promueve el bienestar animal y la responsabilidad social del médico veterinario en formación.

Palabras clave: Extensión. CadÚnico. Clínica-Escuela. Liga Académica.

1 INTRODUCTION

The bond between humans and companion animals has increased more and more, being characterized as a relationship of affection, emotional support and social belonging. The denomination of multispecies families consists of a family arrangement in which individuals recognize and legitimize their animals as integral members of the family nucleus (FARACO, 2008; KNEBEL, 2012). Dogs, in particular, are present in millions of Brazilian homes, including in contexts marked by socioeconomic vulnerability, playing a relevant role in the emotional, social, and psychological dynamics of families.

The intensification of this human-animal relationship has been widely discussed in the scientific literature, especially with regard to the psychosocial benefits provided by living with pets, such as reducing stress, improving mental health, stimulating socialization, and strengthening affective bonds (FINE, 2019). However, the growing proximity between humans and animals also imposes challenges related to the shared responsibility for the care, health, and well-being of these nonhuman individuals, especially in communities with limited access to basic services.

The animal's condition falls under well-being at the moment when it is well nourished, healthy, safe, free from suffering and unpleasant sensations (MENDONÇA, 2019). This concept is aligned with the five freedoms of animal welfare, widely recognized by the World Organization for Animal Health (WOAH), which include freedom from hunger and thirst, discomfort, pain, injury and disease, fear and stress, and freedom to express natural behaviors (BROOM; FRASER, 2015). However, such conditions become difficult to be fully achieved in scenarios of social vulnerability, in which financial resources and access to specialized services are limited.

In the Brazilian context, social inequality directly impacts access to veterinary medicine, especially in peripheral regions and municipalities in the interior, where the supply of public veterinary hospitals is still incipient or non-existent (SOUZA et al., 2021). The city of Barreiras, located in the west of the state of Bahia, is part of this reality, since it does not have a public veterinary hospital, which restricts the access of the low-income population to clinical care, diagnostic tests and surgical procedures, whose high cost makes it impossible to seek private veterinary care.

The absence of effective public policies aimed at animal health compromises not only the well-being of companion animals, but also collective health, considering the potential risk of spreading zoonoses in contexts of sanitary negligence (WHO, 2020). Studies show that

the lack of adequate veterinary monitoring favors the occurrence of infectious, parasitic, and reproductive diseases, directly impacting the quality of life of animals and their owners (LOPES et al., 2022).

In view of this scenario, the extension actions developed by public universities play a strategic role in promoting health, animal welfare and social inclusion. Academic leagues, in particular, are important devices for bringing the university and the community closer together, allowing the practical application of scientific knowledge and the training of more critical, ethical, and socially committed professionals (CAVALCANTE et al., 2018; OLIVEIRA; SILVA, 2020). By working in vulnerable territories, these initiatives contribute to the democratization of access to health services and to the consolidation of the social role of the university, reaffirming the idea of CAVALCANTE *et al.* (2018), in which it is notorious that the academic league can add in a positive way, as it is one more opportunity to enrich learning.

Academic leagues in the health area are characterized as student organizations guided by professors, based on the principles of teaching, research and extension, providing students with experiences that go beyond the formal curriculum (TORRES et al., 2008). In the field of Veterinary Medicine, such experiences favor the development of clinical skills, decision-making, teamwork, and social sensitivity, fundamental aspects for contemporary professional training (BARBOSA et al., 2021).

In addition, the extension action enables the integration of the concept of One Health, which recognizes the interdependence between human, animal, and environmental health, being essential for facing complex health challenges (DESTOUMIEUX-GARZÓN et al., 2018). By promoting the care of companion animals in vulnerable communities, veterinary social care projects simultaneously contribute to the prevention of zoonoses, health education and strengthening the responsible bond between owners and their animals.

In this context, the present work aims to report the experience of veterinary social care provided at the teaching clinic of the State University of Bahia (UNEB), aimed at dogs belonging to tutors enrolled in the Unified Registry for Social Programs of the Federal Government (CadÚnico), an instrument that identifies families in situations of socioeconomic vulnerability. The initiative sought to expand access to basic animal health, promote welfare and encourage responsible guardianship practices, while providing Veterinary Medicine students with a space for practical, ethical and humanized learning.

This extension experience is supported by the principle of inseparability between teaching, research and extension, since "teaching, research and extension represent, with

equal importance, the tripod that supports any university" (VASCONCELOS, 1996, p. 8). In this way, the project developed by the Academic League of Small Animal Medical Clinic (LACLIMPA) reaffirms the social commitment of the public university, by articulating quality academic training with a direct impact on the community, promoting social transformation and contributing to the construction of a fairer, more inclusive and animal-sensitive society.

2 METHODOLOGY/MATERIAL AND METHODS

The present study is characterized as an experience report, of a descriptive and qualitative nature, developed from the extension activities carried out by the Academic League of Small Animal Medical Clinic (LACLIMPA). Experience reports are relevant instruments in the health area, as they allow the systematization of practical experiences, critical reflections, and analysis of interventions developed in real contexts, contributing to the production of applied knowledge and to the improvement of academic and professional practices (PEREIRA et al., 2018).

The extension actions took place on the premises of the Veterinary Medicine School Clinic of the State University of Bahia (VETUNEB), located on Campus IX of UNEB, in the municipality of Barreiras, Bahia. The project was developed between November 2024 and June 2025, including weekly services aimed exclusively at dogs belonging to tutors in situations of socioeconomic vulnerability.

2.1 TARGET AUDIENCE AND INCLUSION CRITERIA

The target audience of the project was made up of dog owners residing in the municipality of Barreiras and region, as long as they were duly registered in the Unified Registry for Social Programs of the Federal Government (CadÚnico). The use of CadÚnico as an inclusion criterion aimed to ensure greater equity in access to the service, directing care to the population in situations of social vulnerability, as recommended by public policies for social inclusion (BARROS; CARVALHO; MENDONÇA, 2009).

To confirm eligibility, tutors should present, at the time of consultation, an official document with a photo, proof of residence and the Social Identification Number (NIS). Only clinically stable animals, suitable for outpatient care, were included in the project, and urgent or emergency cases were not contemplated, which were duly instructed to seek specialized care.

2.2 ORGANIZATION AND SCHEDULING OF APPOINTMENTS

The appointments were previously scheduled through LACLIMPA's official profile on the social network Instagram, a strategy that enabled greater community reach and demand organization. Online scheduling proved to be an efficient communication and management tool, in addition to facilitating the population's access to the services offered, as pointed out by studies on the use of digital media in extension actions (SANTOS; FERREIRA, 2021).

The activities took place weekly, on Fridays, in the morning (8 am to 11 am) and afternoon (2 pm to 4 pm) shifts, with an average of seven appointments per day, respecting the structural capacity of the school clinic and the number of students involved in each action. The limitation of the number of consultations aimed to ensure the quality of the care provided, as well as the adequate follow-up of the cases.

2.3 PROCEDURES PERFORMED

The services included clinical consultations, general physical evaluation, basic outpatient procedures, collection of biological material for laboratory tests, when indicated, in addition to screening for castration programs and guidance to tutors regarding vaccination, parasite control, feeding, sanitary management and responsible guardianship. All procedures strictly followed biosafety, professional ethics, and animal welfare protocols, according to the guidelines of the Federal Council of Veterinary Medicine (CFMV, 2022). Subsequently, Figure 1 portrays a moment of this practical activity, in which the students, under the guidance of the professors, develop clinical care.

Figure 1

Clinical care provided at the VETUNEB teaching clinic

Source: Personal collection (2025).

The clinical records of the animals treated were made in the medical records of the school clinic, containing information on the identification of the animal, clinical history, physical examination, conduct adopted and guidance provided to the tutors. These records contributed to the follow-up of the cases and to the teaching-learning process of the students involved.

2.4 STUDENT PARTICIPATION AND FACULTY SUPERVISION

The consultations were performed by students regularly enrolled in the Veterinary Medicine course, members of LACLIMPA, organized according to a previously defined schedule, in order to ensure that all members had the opportunity to experience the clinical practice of extension. The students' performance was continuously supervised by a Veterinarian who taught the discipline of Small Animal Medical Clinic at the school clinic,

ensuring the correct execution of the procedures, the safety of the animals and the quality of the care provided.

Teacher supervision played a fundamental role in the pedagogical process, promoting clinical discussions, technical guidance and ethical reflections during consultations, in line with active teaching-learning methodologies, such as problem-solving education (BOROCHOVICIUS; TORTELLA, 2014).

2.5 ETHICAL ASPECTS

All activities developed respected the ethical principles of Veterinary Medicine, valuing animal welfare, respect for tutors and the social responsibility of the university. The procedures were conducted in a humanized, safe and responsible manner.

2.6 ANALYSIS OF THE EXPERIENCE

The analysis of the experience was based on the direct observation of the activities, on the records of the services performed and on the collective reflections between students and the supervising professor, allowing the identification of the main impacts, challenges and contributions of the project both for the community served and for the academic training of the students. This reflective process made it possible to build a critical view of the role of university extension in the promotion of animal health and in the strengthening of professional training.

3 THEORETICAL FRAMEWORK AND DISCUSSION

3.1 GENERAL CHARACTERIZATION OF THE SERVICES PROVIDED

The veterinary social care extension project, developed by the Academic League of Small Animal Medical Clinic (LACLIMPA) was carried out from November 2024 to June 2025, totaling approximately 100 dogs treated at the Veterinary Medicine teaching clinic of the State University of Bahia (UNEB), Campus IX. Figure 2 shows a clinical care of a dog performed by the students. All animals belonged to tutors duly enrolled in the Unified Registry for Social Programs of the Federal Government (CadÚnico), characterizing a public in a situation of socioeconomic vulnerability. The services resulted in significant impacts both for the community served and for the academic training of the students involved, including consultations, outpatient procedures, collections, screening for castration and responsible guidance to tutors on vaccination protocols, health and animal welfare.

Figure 2

Clinical care of a dog

Source: Personal collection (2025).

The services took place in a continuous and organized manner, respecting the structural capacity of the teaching clinic and the availability of students and supervising faculty. A high demand for the service was observed in the first weeks of the project's execution, which shows the existence of a repressed demand for basic veterinary care in the municipality of Barreiras, a reality similar to that described in other studies carried out in regions with a lack of public veterinary hospitals (SOUZA et al., 2021). Table 1 presents a general characterization of the services provided throughout the period of execution of the project.

Table 1

General characterization of the services provided by the LACLIMPA project (2024–2025)

Variable analyzed	Description
Project period	November/2024 to June/2025
Approximate number of animals served	100 dogs
Frequency of care	Weekly

Average number of animals per day	7
Public served	Tutors registered in CadÚnico
Location	VETUNEB School Clinic – UNEB Campus IX

Source: Personal collection (2025).

These data reinforce the role of university extension as a strategy to expand access to animal health services, especially in contexts marked by social inequality.

3.2 SOCIOECONOMIC PROFILE OF OWNERS AND ACCESS TO VETERINARY HEALTH

The Unified Registry for Social Programs (CadÚnico) is the registration of low-income Brazilian families, with their name and address included in the registry, in addition to containing various information about the situation of these families, allowing people in this census to be included in programs aimed at the public, although poverty is not taken as synonymous with insufficient income (IPEA, 2009).

Many tutors reported not having prior access to veterinary care for financial reasons, evidencing a repressed demand for basic care, since the city of Barreiras still does not have a veterinary hospital that contemplates this social portion. Thus, as long as the records are updated, monitored and analyzed in inclusion and exclusion criteria by the municipality, the CadÚnico as a selection criterion proved to be an efficient tool to reach the most vulnerable population (IPEA, 2009).

The analysis of the profile of the tutors assisted revealed that most had limited family income, dependent on government social programs, which made it difficult to have prior access to private veterinary services. Many reported that that consultation represented the first veterinary care received by the animal throughout its life, evidencing the direct impact of socioeconomic conditions on the health and well-being of dogs.

The use of CadÚnico as a selection criterion proved to be efficient in directing care to the population in situations of greater social vulnerability, ensuring greater equity in the provision of the service. As discussed by Barros, Carvalho and Mendonça (2009), CadÚnico is a fundamental tool for the identification of low-income families, enabling the implementation of more assertive public policies and social actions. In the context of this project, this instrument contributed to the organization of demand, to the transparency of the process of

inclusion of tutors and to ensure that care was intended for the population with the greatest need, reducing inequalities in access to animal health.

The lack of regular veterinary follow-up is associated with the worsening of preventable diseases and greater exposure to health risks, both for animals and owners, which reinforces the importance of extension actions such as the one developed by LACLIMPA (LOPES et al., 2022).

3.3 MAIN CLINICAL DEMANDS IDENTIFIED

During the consultations, several clinical complaints were recorded, the most frequent being related to dermatological, parasitic and gastrointestinal diseases. These conditions are widely described in the literature as prevalent in canine populations without continuous veterinary assistance (MENDONÇA, 2019). Table 2 presents the main clinical demands observed.

Table 2

Main clinical complaints identified in the consultations

Clinical Category	Observed examples
Dermatological disorders	Dermatitis, pruritus, alopecia
Endoparasitosis	Intestinal worms
Ectoparasitosis	Fleas and ticks
Gastrointestinal disorders	Diarrhoea, vomiting

Source: Personal collection (2025).

These findings reinforce the importance of basic care and the need for preventive actions, such as vaccination, deworming and guidance to tutors, as fundamental and effective strategies to promote animal welfare, reduce the occurrence of avoidable diseases and health problems.

3.4 PROCEDURES PERFORMED AND GUIDANCE PROVIDED

The services provided included routine clinical consultations, general physical evaluation, basic outpatient procedures, collection of material for laboratory tests, screening for castration and educational guidance to tutors, related to the importance of vaccination and its effective protocols, parasite control, adequate nutrition, reproductive control and

responsible care. Next, Figure 3 presents a record of this practical experience, in which the students, accompanied by professors, perform clinical care within the scope of the project, demonstrating the active participation of the students in all phases of the extension activity.

Figure 3

Project students performing clinical care

Source: Personal collection (2025).

It was observed that a significant portion of the animals cared for had no previous veterinary follow-up, a condition often associated with the financial limitations of the owners, corroborating the findings of studies that point to socioeconomic inequality as a determining factor in access to animal health (SOUZA et al., 2021; LOPES et al., 2022).

Health education was a fundamental component of the project, since a significant portion of the tutors demonstrated a lack of knowledge about basic practices of sanitary management, disease prevention and routine care of the animals. In this context, the guidance provided during the extension actions contributed to the promotion of animal welfare and to the awareness of those responsible for the importance of preventive medicine. Table 3 summarizes the main procedures carried out throughout the project activities.

Table 3

Educational procedures and actions developed in the project

Type of action	Description
Clinical consultation	General physical assessment
Outpatient procedures	Dressings, medication administration
Exam collection	Hematology and parasitologic
Reproductive screening	Referral for castration
Health education	Guidance on vaccination and well-being

Source: Personal collection (2025).

These actions are aligned with the concept of One Health, which integrates animal, human and environmental health (DESTOUMIEUX-GARZÓN et al., 2018).

3.5 IMPACTS OF THE PROJECT ON THE ACADEMIC TRAINING OF STUDENTS

In the academic sphere, the project provided a relevant training experience for Veterinary Medicine students, the extension experience enabled students to develop clinical, technical and professional ethical skills essential to the training of veterinarians. Direct interaction with different social and economic contexts required from students not only technical knowledge, but also social sensitivity, empathetic posture, and interpersonal communication skills with tutors, aspects often pointed out as challenges in health education (BARBOSA et al., 2021). The practical experience favored the integration between theory and practice, consolidating contents covered in the classroom, enabling students to adapt to structural limitations.

Supervised action allowed the application of active teaching-learning methodologies, such as problem-based education, in which students are encouraged to observe reality, identify problems, formulate hypotheses and propose scientifically based solutions (BOROCHOVICIUS; TORTELLA, 2014). This approach contributed to the development of clinical reasoning, decision-making, and ethical posture in the face of structural and social limitations encountered during care.

For the students, the experience based on problem-solving education and experiences represented a valuable opportunity for practical and humanized learning. The contact with

various socioeconomic realities required the development of clinical skills, contributing to the formation of more qualified professionals, sensitive to social issues and aligned with the concept of one health. The stages of problem-solving education can be better understood by Azevedo's studies; Pacheco and Santos:

"The observation of reality is important for teaching to make sense, in which the student can visualize the problem close to his experience. Key points need to be established so that there is a direction about what should be solved, that is, it is a specification without losing generalization. Having reached this point, it begins to theorize and discuss supposed hypotheses to solve the problem, and finally, apply them to reality." (p.06, 2019).

Studies show that extension experiences favor the training of more humanized and socially committed professionals (BARBOSA et al., 2021), which was clearly observed in the development of LACLIMPA members throughout the project.

3.6 CHALLENGES FACED DURING THE EXECUTION OF THE PROJECT

However, despite the positive results, the project faced relevant challenges. Among the main challenges faced, the high demand for care in relation to the operational capacity of the school clinic stands out, as "pets are seen as as close as the child itself, by humans" (SANTOS, 2008, p. 23), driving tutors to seek care and quality of life for the animal, however, the limitation of material resources and medications, in addition to the difficulty of continuity in the follow-up of clinical cases. The reduced mobility of some tutors made it impossible to return frequently to the clinic, impacting the follow-up of treatments.

These obstacles are similar to those reported by other extension projects developed in contexts of social vulnerability, evidencing the need to expand public policies aimed at animal health (OLIVEIRA; SILVA, 2020).

3.7 SOCIAL RELEVANCE AND CONTRIBUTION TO PUBLIC HEALTH

According to TORRES *et al.* (2008), the academic leagues are groups with a wide reach, which allows the academic greater contact with society and ascension in social transformation, expanding critical sense and scientific reasoning based on theoretical-practical knowledge with the purpose of benefiting the population. However, it is not restricted only to the deepening of knowledge, but seeks to value academic and personal development, symbolizing a social contribution. Figure 4 shows a group of students who are members of

the Academic League of Small Animal Medical Clinics (LACLIMPA), gathered in the context of the activities developed by the league.

They are developed as extracurricular activities, being composed mostly of students with a common study purpose, in which they are instructed by teachers who act as a bridge in learning and in the promotion of activities based on Teaching, Research and Extension. They are entities of great scope, which provide the student with greater contact with society and communities, promoting health and social transformation, developing theoretical and practical knowledge with the aim of benefiting the population, expanding critical thinking and scientific reasoning. It is not limited only to deepening knowledge, seeking to add value to academic and personal construction, representing a contribution to society TORRES *et al.* (2008). Figure 4 shows a group of students who are members of the Academic League of Small Animal Medical Clinic (LACLIMPA), gathered in the context of the activities developed by the league.

Figure 4

Members of the Academic League of Small Animal Medical Clinic

Source: Personal collection (2025).

From the point of view of collective health, the care provided was also relevant with regard to the prevention of zoonoses. Guidance on rabies vaccination, parasite control, and adequate sanitary management represents a fundamental strategy to minimize risks to human, animal, and environmental health, in line with the concept of One Health

(DESTOUMIEUX-GARZÓN et al., 2018; WHO, 2020). In this way, the project went beyond individual care for the animal, contributing to the promotion of public health.

Another relevant aspect refers to the perception of tutors about their pets. Many reported intense affective bonds, considering dogs as family members, which reinforces the concept of multispecies families described by Faraco (2008). According to Santos (2008), pets occupy a symbolic place of great importance in the lives of tutors, which justifies the search for veterinary care even in the face of financial difficulties. Such a perception reinforces the need for public policies and extension actions aimed at animal health.

In view of this, the results obtained show that the veterinary social care promoted by LACLIMPA plays an essential role in the promotion of animal welfare, in the prevention of public health problems and in humanized academic training. The integration between university and community proved to be effective in meeting emerging social demands, reaffirming the importance of university extension as an instrument of social transformation and strengthening of the ethical commitment of the future professional.

4 FINAL CONSIDERATIONS

The experience report presented showed the social, academic and health relevance of the veterinary social care project developed by the Academic League of Small Animal Medical Clinic (LACLIMPA), within the scope of the Veterinary Medicine teaching clinic of the State University of Bahia (UNEB), Campus IX. The initiative proved to be an effective strategy to expand access to basic animal health for dogs belonging to owners in situations of socioeconomic vulnerability, identified through the Unified Registry for Social Programs of the Federal Government (CadÚnico).

The results obtained showed a significant repressed demand for social veterinary services in the municipality of Barreiras, reinforcing the need for public policies and extension actions aimed at animal health, especially in locations that do not have public veterinary hospitals. The offer of clinical consultations, outpatient procedures and educational guidance contributed directly to the promotion of animal welfare, prevention of preventable diseases and reduction of risks related to zoonoses, reflecting positively on public health.

From a training point of view, the project has consolidated itself as a privileged space for practical and humanized learning for Veterinary Medicine students. The extension experience allowed the development of technical, ethical and social skills, stimulating clinical reasoning, decision-making and communication with tutors, in addition to strengthening the

understanding of the social role of the veterinarian. Teacher supervision and the application of active methodologies, such as problem-based education, favored the integration between theory and practice, contributing to a critical academic education committed to social reality.

The experience also reinforced the importance of the concept of One Health, by highlighting the interdependence between animal, human and environmental health. Working with vulnerable communities enabled students to understand the impacts of social inequality in the care of companion animals and the need for preventive strategies that promote responsible custody and proper sanitary management. Despite the positive results, the project faced challenges, such as the limitation of material resources, the high demand for care and the difficulty of continuous monitoring of clinical cases. Such limitations highlight the need for institutional strengthening, expansion of intersectoral partnerships and investments in public policies that ensure greater sustainability of extension actions aimed at animal health.

Thus, it is concluded that the veterinary social care promoted by LACLIMPA is configured as an extension action of great social and educational impact, reaffirming the commitment of the public university to social transformation, citizenship training and the promotion of animal welfare. The continuity and expansion of similar initiatives are essential to consolidate socially responsible academic practices, contribute to public health, and strengthen the role of Veterinary Medicine in building a more just, inclusive, and animal-sensitive society.

ABSTRACT

According to the 2024 Annual Report from the Brazilian Animal Protein Association (ABPA), Brazil produced 52.4 billion eggs in 2023, with 99% allocated to the domestic market and 1% exported. This production scale demands that poultry operations integrate advanced data-driven methodologies to optimize performance and meet evolving consumer expectations. As a global benchmark, the Brazilian poultry sector must adopt innovative technologies tailored to local conditions, ensuring product quality and maintaining competitive advantage. Strategic management now requires real-time decision-making supported by digital platforms and Industry 4.0 technologies, with emphasis on animal welfare, environmental sustainability, and corporate social responsibility. The rapid evolution of Internet of Things (IoT) systems and cloud-based infrastructures underpins the emergence of smart agriculture. These technologies enable the deployment of sophisticated mathematical models and real-time algorithms for predictive analytics and operational optimization. Research findings highlight the applicability of emerging precision technologies across the poultry production chain. These tools enhance analytical capabilities and support managerial decision-making, surpassing earlier frameworks such as Smart Poultry Farming. By streamlining processes, reducing operational costs, and generating new business opportunities, digital transformation reinforces sectoral competitiveness and aligns with strategic, environmental, and social governance objectives.

Keywords: Smart Poultry Farming. Precision Agriculture. Industry 4.0 Technologies. Real-Time Decision Making. Sustainability in Poultry Production.

RESUMO

De acordo com o Relatório Anual de 2024 da Associação Brasileira de Proteína Animal (ABPA), o Brasil produziu 52,4 bilhões de ovos em 2023, sendo 99% destinados ao mercado interno e 1% exportado. Essa escala de produção exige que as operações avícolas integrem metodologias avançadas baseadas em dados para otimizar o desempenho e atender às crescentes expectativas dos consumidores. Como referência global, o setor avícola brasileiro deve adotar tecnologias inovadoras adaptadas às condições locais, garantindo a qualidade do produto e mantendo a vantagem competitiva. A gestão estratégica agora exige a tomada de decisões em tempo real, apoiada por plataformas digitais e tecnologias da

RESUMEN

Según el Informe Anual 2024 de la Asociación Brasileña de Proteína Animal (ABPA), Brasil produjo 52.400 millones de huevos en 2023, de los cuales el 99% se destinó al mercado interno y el 1% se exportó. Esta escala de producción exige que las operaciones avícolas integren metodologías avanzadas basadas en datos para optimizar el rendimiento y satisfacer las crecientes expectativas de los consumidores. Como referente mundial, el sector avícola brasileño debe adoptar tecnologías innovadoras adaptadas a las condiciones locales, garantizando la calidad del producto y manteniendo una ventaja competitiva. La gestión estratégica exige ahora una toma de decisiones en tiempo real, respaldada por plataformas digitales y tecnologías de la Industria 4.0, con énfasis en el bienestar animal, la sostenibilidad ambiental y la responsabilidad social corporativa. La rápida evolución de los sistemas del Internet de las Cosas (IoT) y las infraestructuras basadas en la nube impulsa el surgimiento de la agricultura inteligente. Estas tecnologías permiten la implementación de sofisticados modelos matemáticos y algoritmos en tiempo real para el análisis predictivo y la optimización operativa. Los resultados de la investigación destacan la aplicabilidad de las tecnologías de precisión emergentes en toda la cadena de producción avícola. Estas herramientas mejoran las capacidades analíticas y apoyan la toma de decisiones gerenciales, superando estructuras anteriores, como la Avicultura Inteligente. Al optimizar procesos, reducir costos operativos y generar nuevas oportunidades de negocio, la transformación digital fortalece la competitividad del sector y se alinea con los objetivos estratégicos, ambientales y de gobernanza social.

Palabras clave: Avicultura Inteligente. Agricultura de Precisión. Tecnologías de la Industria 4.0. Toma de Decisiones en Tiempo Real. Sostenibilidad en la Producción Avícola.

1 INTRODUCTION

According to Connolly (2017), the growth of poultry farming has been relentless. In fact, despite the continued preference for pork in Asia, current growth trends indicate that global chicken consumption will surpass that of pork by 2022, making it the world's leading meat.

Conab (2023) stated that chicken meat production projections in 2024 pointed to a volume of around 16 million tons and chicken meat shipments could reach 5.25 million tons in 2024, an increase of 3.6% compared to the volume projected in 2023.

Confirming CONAB's projections, the Brazilian Ministry of Agriculture and Livestock (2024) highlights that, according to the Secretariat of Trade and International Relations (SCRI), Brazil exports chicken meat to 172 countries, making it the largest exporter and third-largest producer. In 2023, exports totaled more than US\$9.61 billion, representing 5 million tons. As of March, of this year, more than 1.1 million tons had been exported, generating a value of US\$2.10 billion.

According to ABPA's 2024 annual report (2024), Brazil is the world's 2nd largest producer of chicken meat and the world leader in exports.

Data obtained from the United States Department of Agriculture, USDA (2018), show that, in terms of exports, Brazil, in 2017, was the leader, reaching a total of 34.4% of chicken meat exports in the world, and according to the annual report of the Brazilian Animal Protein Association, Brazil exported 5.138 million tons of chicken meat (including all products, both fresh and processed) in 2023 (ABPA, 2024).

Connolly (2017) further states that egg consumption continues to grow because eggs are inexpensive, mild-tasting, and easy to process and incorporate into other foods. He adds that universal acceptance by nearly all cultures and religions ensures that birds will continue to thrive. He also states that, in the next 30 years, we will see another 3 billion people inhabit the Earth, and the urban middle class will continue to grow.

The annual report of the Brazilian Animal Protein Association for the year 2024 indicates that in the year 2023, Brazil produced 52.4 billion units of eggs, of which 99% were directed to the domestic market and the remaining 1% were directed to exports (ABPA, 2024).

Thus, poultry farming must respond to this demand. Farmers increasingly need to "cultivate data," not just raise chickens, and, in doing so, leverage new technologies and digital information to improve efficiency and respond to growing consumer demands.

The poultry production chain has evolved significantly in Brazil, and its dynamism is linked to constant productivity gains, primarily through improved feed conversion rates, nutritional technology, genetic research, increased automation, and better production management (PATRÍCIO et al., 2012). This advancement is supported by the significant reduction of losses in the chain, the increasing optimization of production processes, and the corresponding improvement in productivity, all without losing sight of cost control, in order to ensure competitiveness (NÄÄS, 2018). The author also emphasizes that, as the Brazilian poultry industry is also a market leader, it must adopt innovative technologies, developed or adapted to our reality, and that preserve quality and competitiveness factors.

Figure 1 illustrates data obtained from the United States Department of Agriculture, USDA (2025), which shows that, in terms of chicken protein production, Brazil has shown growth since 2000, and the projection for 2025, according to the Semi-Annual report, published in March 2025, estimates another jump by the end of the year.

This scenario demands that managers constantly seek to make intelligent decisions, and if possible, in real time, aiming at animal welfare, the sustainability of the production

process and social responsibility. To meet these requirements, it is necessary to apply digital platforms and new 4.0 technologies (the fourth technological revolution, with strong digital content and high connectivity) that allow the extension of the functionalities of existing traditional (or legacy) production systems, seeking a new integration that allows the implementation of the concepts of "Smart Poultry Farming" in their facilities (NÄÄS, 2018).

Csótó (2010) states that in the Internet age, where information plays a fundamental role in people's lives, agriculture is rapidly becoming a highly data-intensive industry, requiring farmers to collect and evaluate a vast amount of information from various devices using different technologies. These new technologies, known as 4.0 technologies, are implemented based on the concepts of precision poultry production, combined with precision tools. These tools are essentially composed of sensors, actuators, and signal acquisition, conditioning, and processing systems. These systems are collected from the real world and, after filtering and adjustment, converted from analog to digital format. With the data in digital format, processing takes place to transform numbers into information, into meaning, into valuable elements to support managers' decision-making, leading them to problem-solving (KALOXYLOS et al., 2012; SØRENSEN et al., 2010).

In the work of Rupnik et al. (2018), we can observe that decision support occurs through decision support software (DSS) (Decision Support Systems) that are connected to sensors and actuators, and to users through graphical visualization and data entry interfaces.

According to the work of Rupnik et al. (2018), in recent years, dedicated DSS, or Farm Management Information Systems (FMIS), have evolved from simple agricultural recordkeeping to sophisticated and complex systems supporting all aspects of production management, a fact reinforced by Fountas et al. (2015).

Nääs (2018) states that scientific and technological research, based on national research groups that focus on analyzing these data, seeking to adapt new technologies to the realities of companies in the sector or generating new technologies that better adapt to our production parks, are likely those that will have the greatest impact on the future development of the sector. Thus, this research aims to identify emerging technologies that have been studied, developed, or already applied to the poultry production chain and evaluate their practical use in data analysis to promote decision support for sector managers.

Dessa forma, o problema central deste trabalho é compreender qual é a aplicabilidade de tecnologias de precisão emergentes em toda a cadeia produtiva avícola. Essas ferramentas permitem aprimorar as capacidades analíticas e apoiam as tomadas de

decisões gerenciais, superando estruturas anteriores, como a Avicultura Inteligente, por meio da busca das tecnologias empregadas, buscando sua análise, como foram descritos na literatura científica. O objetivo do trabalho é investigar as ferramentas utilizadas e os seus padrões, bem como revisar e discutir as metodologias utilizadas em sua adoção.

2 MATERIALS AND METHODS

This study presents a descriptive analysis, through a review of available literature, on the adoption of advanced data-driven methodologies in the Brazilian poultry sector, and the adoption of innovative technologies that have been adapted to the local conditions of poultry farms to optimize performance and meet the growing expectations of consumers.

The searches for research papers were conducted in the Scopus and Web of Science databases, due to their international scope and academic reliability. The research profile was not limited to articles, but also used data obtained from secondary sources such as annual reports from associations and from government agricultural information websites and portals, such as the National Supply Company. Secondary data were also obtained from the United States Department of Agriculture.

Topics related, preferably, to the areas of: Precision tools, Emerging Infrastructure Technologies for New 4.0 Technologies, encompassing Sensors and Actuators, Internet of Things, Big Data, Cloud computing, Bioenergetic models, complex algorithms, Analysis Tools with Digital Technologies 4.0, Environmental Control with precision, Physiological control with precision, and Behavior control with precision were explored.

3 RESULTS AND DISCUSSION

As a result of the research conducted on the topics indicated in the materials and methods section, the following texts were compiled with discussions:

3.1 PRECISION TOOLS

According to Pivoto et al. (2018), the term Smart Farming (SF) or "Intelligent Agriculture" involves the incorporation of information and communication technologies into machinery, equipment, and sensors for use in agricultural production systems. The authors argue that new technologies such as the Internet of Things, Big Data, robotics, decision-making and statistical processes, cloud computing, mapping technologies, and geomatics for spatial data acquisition and management, cartography, topographic support, digital mapping,

remote sensing, geographic information systems, hydrography, among others, are expected to advance this development, introducing more robots and artificial intelligence into agricultural and animal husbandry production processes.

The most promising Smart Agriculture technologies, according to Pivoto et al. (2018), incorporate advances in sensors, data analysis, telemetry, and positioning technologies, but the development and dissemination of these technologies may require time and investment. "Smart agriculture," as the same authors point out, is a concept that originated with software engineering and computer science, which arrived with the addition of computing and data transmission technologies from agriculture, within a global environment of virtualization and ubiquitous computing that foresees the omnipresence of information technology in people's daily lives. These computing elements are embedded in objects and interconnected with each other and with the internet.

Pivoto et al. (2018) reinforce these concepts, stating that these technologies, when used individually or in combination, are called "Precision Tools." They enable the generation of a large volume of data and information obtained through the progressive introduction of automation into processes, helping managers improve their decision-making for production, as well as for strategic and managerial issues. They also emphasize that problems related to the intensification of climate change will continue to alter growing conditions, such as temperature, precipitation, and soil moisture, in increasingly unpredictable ways. Thus, they note that these tools can help reduce these impacts, maintain them constant, or reduce production costs in other agricultural activities, and can also help minimize environmental constraints.

Rapid developments in Internet of Things (IoT) technology and cloud computing are driving the phenomenon known as smart agriculture. The basis for advancement in this sector involves a combination of internet technologies and future-oriented technologies for use as smart objects in agriculture (LACERDA and MARQUES, 2015; CONNOLLY, 2017; PIVOTO et al., 2018).

3.2 EMERGING INFRASTRUCTURE TECHNOLOGIES FOR NEW 4.0 TECHNOLOGIES SENSORS AND ACTUATORS

The use of precision tools is made possible by sensors in agriculture. A sensor is an electronic device that measures physical quantities in the environment and converts these measurements into a signal that can be read by an instrument. These devices are constantly

evolving, and new sensors for different physical quantities are being created in short periods of time thanks to the development of electronics. Possible measurements read by sensors include: temperature, humidity, light, pressure, noise levels, the presence or absence of certain types of objects, mechanical stress levels, speed, direction, and size of objects (O'GRADY and O'HARE, 2017). Animal behavior modeling, machine learning, and feed monitoring, according to the same authors, are invariably supported by sensors and/or sensor networks.

Sensing technologies have proven fundamental to precision agriculture since its early days, evolving from sensor deployments to specialized crops. A good example of a development for poultry farms is the ammonia sensor studied in the work of Lin et al. (2016).

According to information provided by Progressive (2014), actuators enable the movement of all types of machines. These devices use a power source, such as a motor, to convert energy into motion. They are used in agriculture in various ways during the production process. Because they often operate in dusty, caustic, or changing environments, actuators intended for agricultural use are designed for durability, maximum functionality, and continuous use. These actuators can be found in poultry house and storage bin doors, in ventilation, sprinkler, and heating systems, conveyors, silos, storage sheds, and even at the farm gate. Because farms generally operate on a regular sunrise and sunset schedule, many are connected to timers. They are especially useful in a variety of applications, such as opening and closing poultry house curtains, activating timed lighting in a barn, as well as controlling other utilities, also reducing energy consumption (PROGRESSIVE, 2014).

3.3 INTERNET OF THINGS

Also noteworthy is the Internet of Things (IoT), which, according to Pivoto et al. (2018), is the term that describes one of the technologies related to Smart Agriculture, and which shares the concept of a smart environment with agricultural management information systems.

The same authors emphasize that IoT allows objects to be controlled remotely through an existing network infrastructure, creating opportunities for more direct integration between the physical world and computer-based systems. The use of IoT depends on Internet infrastructure, and this presents several challenges, especially when dealing with a large number of network devices and integration with other systems.

According to Lacerda and Marques (2015), the potential of IoT is determined by its ability to capture, process, store, transmit, and present information, in which objects interconnected by a network are capable of performing actions independently, generating a large quantity and variety of data.

According to Cisco's (2011) forecast, by 2020, there will be approximately 50 billion connected objects for 7.6 billion people. We can infer that among this large number of connected objects will certainly be devices that are part of the production processes of the new 4.0 technologies, and among these, food production devices installed in poultry houses stand out.

According to Connolly (2017), the IoT connects many of a poultry house's sensors to a smartphone, iPad, local computers, or a wired or wireless (Wi-Fi) network, or other devices. For example, the IoT-based microcontroller project can be used to automate poultry farm processes at low cost. The author states that this type of project allows for the incorporation of lighting systems controlled by light sensors, which regulate the photoperiod and the predominant color of the poultry house's lighting. The project also includes actuators, such as servo motors, that help distribute feed, automate the temperature control system for barn ventilation, and adjust the relative humidity. Similarly, pneumatic motors and actuators control conveyors that remove bird waste and conveyor belts that transport eggs, as well as other barn utilities.

3.4 BIG DATA

According to research by Pivoto et al. (2018), much of the data remains underexplored by farmers, and today, researchers and companies are working to develop more tools that can connect to Big Data. Big Data is a collection of very large data sets with a wide variety of types, making it difficult to process using traditional data processing platforms. Big Data is particularly challenging for farmers, especially those running livestock operations.

The term "Big Data" is related to technology and electronics and is associated with "Smart Agriculture." Big Data is used to refer to an increasing volume of data that is difficult to store, process, and analyze using traditional database technologies (HASHEM et al., 2015).

Connolly (2017) states that as we gather more information about animals—data from the production process, a multitude of sensors, IoT devices, and even the bacteria in the birds' digestive tracts and how they respond to nutrition at the genetic level—it's clear that

farmers are learning how to manage large amounts of data, just as much as they used to. Thus, it's understood that "cultivating data" to predict the growth of an individual animal requires the ability to interpret the "Big Data" coming from their herd.

According to Jackman's research (2016), the ability to interpret "Big Data" involves strict control of all variables in the production and process chain in order to eliminate small losses, providing a noticeable overall gain. The essential characteristics of precision agriculture, according to Jackman's studies (2016), are: (i) Measurement automation; (ii) Automation of the interpretation of measurements taken; (iii) Diagnosis of control violations; and (iv) Insertion of local automated control systems.

Currently, complex algorithms are being created using artificial intelligence (AI) techniques to interpret the information collected from the microbiome and nutrigenomics, and thus track pathogens such as *Campylobacter* or antibiotic-resistant bacteria. Similarly, nutrigenomics allows us to generate information to accurately feed animals, and we can access DNA profiles to know exactly which specific bacteria are present. In this scenario, without a powerful data analysis tool, there is no way to take advantage of this (CONNOLLY, 2017).

3.5 CLOUD COMPUTING

According to Jackman's research (2016), cloud computing technology enables the use of "Smart Agriculture" with its growing data volumes by creating a repository accessible via the internet, facilitating the use of Big Data tools for analysis. The author highlights that this term first appeared in the literature in 2011, with observations from data security experts who believe the field requires attention to data security and privacy.

Cloud computing technology, as described by Microsoft (2018), is the provision of computing services—servers, storage, databases, networking, software, analytics, and other services—over the internet. According to Microsoft (2018), the main benefits of cloud computing are related to the fact that cloud computing represents a significant shift in the traditional way companies think about IT resources. It leads to cost reduction, increased implementation and maintenance speed, global scalability in resource utilization, increased team productivity and performance, and increased reliability by enabling data backup, disaster recovery, and business continuity, as data can be mirrored across multiple redundant sites within the adopted cloud provider's network.

Figure 2 presents the shift in thinking currently underway with the advent of 4.0 technologies, which are based on the collection of individual data by sensors, led by IoT devices, and the use of efficient telemetry, whether wired or Wi-Fi, with an infrastructure that allows for the storage of large volumes of data (Big Data) in a collaborative (web) environment and that has the qualities described by Microsoft (2018) to ensure smooth operation and cost reduction based on an improved decision-making process.

Figure 2

Infrastructure and processes of 4.0 technologies

3.6 BIOENERGETIC MODELS

According to research by Fournel et al. (2017), the assessment of heat loads from poultry losses and heat from poultry farms has been carried out through numerous studies of calorimetric systems since the 1950s. The authors report that measuring heat transfer between an animal and its environment has led to the development of bioenergetic models over time. Mathematical modeling of animal heat and moisture production for analysis can then, for the purposes of comparing evolution and level of technological input, be divided into three main categories: based on empirical data, mechanistic, and dynamic models (AERTS et al., 2003; WATHES et al., 2008). Empirical Approach: Empirical heat production models are generally developed from measured information, experimental observations, or experience and are not necessarily based on theory or the interactions of the described system components (AERTS, BERCKMANS, SAEVELS, DECUYPERE, & BUYSE, 2000; BRIDGES & GATES, 2009; GREEN & PARSONS, 2006). Empirical models for predicting environmentally influenced growth and thermal performance of animals were developed primarily during the 1940s and 1970s.

Mechanistic Approach: Mechanistic models of the physiological and behavioral responses of animals to their physical microenvironment are based primarily on the laws of physics and chemistry or on equations with known characteristics derived specifically to represent the perceived mechanisms of a system, supplemented with empirical values as needed. They offer a means of predicting heat production under a wider range of conditions than empirical models, integrating, for example, nutrition, genetics, and environment (BLACK, 2014; BRIDGES & GATES, 2009; WATHES et al., 2008).

Data-driven dynamic approach: This approach recognizes that, due to dynamic changes in inputs (e.g., animal heat production and ventilation rate) and disturbance factors (external weather), calculated internal conditions change rapidly over time (BANHAZI, THUY et al., 2009).

Consequently, data-driven dynamic models imply that the following assumptions are met: (i) animal responses to the microenvironment are measured continuously, and the information is fed back to the controller; and (ii) a mathematical model of the system allows the process response to be accurately predicted under static and/or dynamic conditions. Data-driven dynamic models use advanced, modern mathematical identification techniques to rapidly estimate unknown model parameters from an abstract mathematical model framework based on real-time measurements of process inputs and outputs, resulting in an adaptive model that can handle the time-varying character of bioprocesses such as poultry farming (AERTS et al., 2000, 2003)..

3.7 DEVELOPMENT OF COMPLEX ALGORITHMS

Digital 4.0 technologies allow researchers and designers to utilize advanced and current mathematical modeling tools to develop new, complex algorithms for real-time analysis.

Using Big Data stored online, these algorithms can interrelate stored and current variables that were previously inaccessible and prohibitively large due to insufficient technology. This allows for dynamically identifying new knowledge for immediate application to solving new production challenges.

A good example of this would be the real-time prediction of the incidence of heat waves, based on historical data, current weather forecasts, and sensors that indicate the microclimate situation. This allows for the possibility of not only alerting to the approaching situation but also initiating a process of acclimatization for the birds, acting on environmental

controllers to better adapt to the upcoming climate event and, if necessary, suggesting changes to the feed components to be fed during the period, thus reducing the impact on mortality in the poultry farm.

The techniques applied range from statistical analysis and quality tools to the application of Artificial Intelligence (AI) principles and techniques.

Among these techniques, we can list the most commonly found for application in expert systems (FMIS or DSS) focused on "Smart Agriculture," which, as seen in the work of Rupnik et al. (2018), are: (i) Probabilistic and optimization models; (ii) Supervised learning models; (iii) Bayesian models; (iv) Time series analysis; (v) Genetic programming; (vi) Neural networks; (vii) Fuzzy logic; (viii) Paraconsistent logic; (ix) Data mining; (x) Monte Carlo simulation; (xi) Big data visualization; (xii) Business analysis tools; (xiii) Predictive and behavioral analytics with forecasting and projection calculations; among others. The systems can even consider the interrelationships of data obtained from Big Data with the well-known performance management methodologies, such as: PDCA (Plan-Do-Check-Act), BSC (Balanced Scorecard) or GDP (Management by Guidelines), and others available on the market, which can even consider compositions between the first three listed.

3.8 ANALYSIS TOOLS WITH DIGITAL TECHNOLOGIES 4.0

Connolly (2017), based on the question "What would improve poultry production?", highlights the data sources that can leverage analyses, making decision support more effective:

From a production perspective, he highlights that individual body weights, if obtained in real time, would allow for better decisions about feed and water consumption.

From a livestock and welfare perspective, a better understanding of stress levels in bird comfort, assessed through meteorological data, body temperature, and air quality factors such as carbon dioxide and ammonia levels, would bring many benefits.

From a disease management perspective, the ability to detect the risk of pathologies in advance or mitigate their potential impacts through the automated location of morbid or dead birds in different areas of the housing, before part or all of the flock is affected.

From a food safety perspective, improving detection techniques for Salmonella, Campylobacter, and E. coli would be of great value to the entire production process and to end consumers.

From a food processing perspective, increasing yields by eliminating bottlenecks in the production process and seeking new, more efficient, and lower-cost techniques and equipment would be beneficial.

Dynamic, data-driven models would be very welcome to overcome these challenges, which are currently being researched in laboratories here in Brazil and around the world.

The following are some of the recent digital technologies identified in this research. They provide a useful framework for describing the multitude of new devices coming to market, as well as others still in research and development. These devices can help producers manage their farms more efficiently and sustainably, collecting valuable data that allows for refined analysis to improve their processes, increasingly seeking to answer the question posed by Connolly (2017).

Fournel et al. (2017) state that data collection using sensors and Big Data should enable new advances in updating, due to climate change, thermal index indicators for animals, such as comfort indexes, radiation and air velocity indexes, indexes that explain the intensity and duration of heat stress, and an index that accounts for heat and cold conditions.

Regarding the sensors to be used, Fournel et al. (2017) state that the following can be considered: (i) For environmental measurements: Ambient temperature, relative humidity, radiation, and air velocity; (ii) For physiological measurements: Body temperature, respiration rate, heart rate, and body weight; (iii) For behavioral measurements: Feeding and water intake, presence, and activity or behavior of birds.

Figure 3 presents a schematic summary of the main components of environmental, physiological, and behavioral controls using precision tools with a dynamic, data-driven approach.

Figure 3

Schematic summary of the main components of dynamic environmental control through the precision tools of 4.0 technologies

3.9 ENVIRONMENTAL CONTROL WITH PRECISION

Climate represents one of the main limiting factors for production efficiency. Heat stress events can cause reduced performance, morbidity, and mortality, resulting in significant economic losses and animal welfare concerns.

Fournel et al. (2017), in their review, state that environmental control in confined animal housing systems is typically based on heat and humidity production rates at predetermined ambient temperature levels, measured between 1950 and 1980. They emphasize that this traditional control method may no longer meet the animals' true thermal needs, as it fails to account for factors now recognized as affecting animal productive responses to surrounding conditions, such as humidity, drafts, radiation, physiological status, and social interactions. Furthermore, advances in animal genetics, nutrition, and management practices have led to considerable changes in the sensible and latent heat loads of modern livestock buildings. In this context, according to the authors, precision livestock technologies (sensors, detectors, cameras, microphones, etc.) have enabled the automatic monitoring of environmental, physiological, and behavioral variables, which can be used to continuously assess livestock performance and welfare in relation to their production and the environment. Fournel et al.

(2017) state that an innovative strategy for environmental control of livestock buildings could include the analysis of:

(i) heat and humidity production rates using the latest bioenergetic models; ii) heat stress through multifactorial animal comfort indices based on several environmental and physiological measures; and (iii) animal behavior in response to changing environmental conditions.

The development of precision environmental control for livestock facilities should: (i) be carried out in close collaboration between researchers and manufacturers to favor the integration of accurate, automated measurements and analysis of data retrieved from multiple sensors in different formats and frequencies that can be interpreted based on the underlying biological or physical processes; (ii) include a comprehensive visualization tool so that farmers can easily identify production inefficiencies; (iii) use the results of data analysis as inputs in an automated decision-making process that triggers certain management actions; and (iv) demonstrate the economic benefit of such a global system of precision tools (BANHAZI & BLACK, 2009; KOENDERS et al., 2015; WATHES et al., 2008).

3.10 PHYSIOLOGICAL CONTROL WITH PRECISION

Reliable and affordable electronic data loggers with thermocouple, infrared, and thermistor sensors have been used for continuous temperature measurements since the 1980s, replacing short-term measurements using early mercury thermometers (Eigenberg et al., 2009). However, remote temperature measurement is not straightforward. Some difficulties may arise depending on the measurement location, as the physiological function of the body part in question, or the invasiveness of the device, can cause temperature changes. There are basically two categories of temperature sensors: those that are surgically implanted and those that are non-implanted (Sellier et al., 2014). These sensors can be linked to data loggers from which data is retrieved or to radio transmitters that send data to a receiving unit.

In addition to deep body temperature, surface temperature can be measured. A commonly used and moderately non-invasive method involves the installation of a contact thermistor or thermocouple (RENAUDEAU, KERDONCUFF, ANAIS, & GOURDINE, 2008). Other methods of measuring skin temperature include the use of data loggers mounted on radio collars or securely glued with epoxy to the skin to track temperature over several days (MCCAFFERTY et al., 2015). Infrared thermography, which is a non-invasive technique

based on the hypothesis that any variable that influences heat production is transmitted through blood vessels and dissipated in infrared waves (MITCHELL, 2013; SEJIAN et al., 2015), can also be used to monitor surface body temperature responses through the use of cameras or laser thermometers (MITCHELL, 2013; YANAGI et al., 2002). Respiration rate is also of particular interest as a physiological response because a large number of studies have shown a correlation with dry bulb temperature, solar radiation, and wind speed. As a result, respiration rate is a good indicator of heat stress. It also has the advantage of being readily observable and demonstrating a short lag time relative to temperature (Eigenberg et al., 2009). Existing automated respiration rate equipment is quite limited. Respiration rate can be detected using a device attached to the bird's beak, but this method has not been widely used. New techniques for this procedure are being tested in the laboratory.

Another physiological indicator of heat stress is changes in heart rate (Lefcourt, Erez, Varner, Barfield, and Tasch, 1999). Heart rate is measured based on electrocardiography or arterial pulse counting (Kovács et al., 2014).

An animal's weight is another important indicator of its well-being. Any unusual weight change can provide an early warning of health problems or simply problems with feeding or ventilation equipment (FROST et al., 1997). Traditional bird weight measurements require the animal to be perched on weighing devices (mechanical scales or electronic scales), which is physically stressful for both the animals and the keepers (LI, LUO, TENG, & LIU, 2014). Because there is a strong correlation between an animal's weight and its planar field of view, a system that includes a video camera connected to a computer equipped with the appropriate hardware and software was developed to quantify the resulting relationship. Computer algorithms segment the bodies in the visual scene, extract the planar field of view, and then estimate the animal's weight (FROST et al., 1997; WANG et al., 2008).

3.11 BEHAVIOR CONTROL WITH PRECISION

Food and water intake and feeding behavior have become useful indicators of animal health (BROWN-BRANDL et al., 2013; KASHIHA et al., 2013). Research has also indicated that feed consumption and changes in feeding behavior may be related to thermal conditions (NIENABER & HAHN, 2000).

Systems that measure feed consumption (total and feeding rate) in association with feeding behavior (meal duration, meal interval, number of meals per day, and total time spent feeding) have been tested in birds (PUMA et al., 2001). Some of the systems are equipped

with an antenna that detects the passive tag of a radiofrequency transponder located on the bird as it approaches the feed or water box. For each visit, a computer records the data sent by the antenna, which includes data related to the bird, and then calculates the duration of visits to waterers, feeders, or a nest, for example. Other systems consist of electronic feeding stations with a weighing system or solid flow sensor (MEISZBERG et al., 2009; PUMA et al., 2001).

An animal's behavior can be a clear indicator of its physiological state: (i) a sick animal may be less active than a healthy animal; (ii) animals in a cold environment may huddle together for warmth or move away to reduce their temperature; and (iii) an animal's activity level may be linked to its stage in the reproductive cycle (FROST et al., 1997).

Behavioral activity data are most commonly collected by a human through direct observation or analysis of video recordings. However, these methods are time-consuming and labor-intensive. Automatic activity recording can be achieved using various sensor systems: ultrasonic proximity sensors (BROWN-BRANDL, EIGENBERG, & NIENABER, 2000), mercury tilt switches, and accelerometers (OUELLET et al., 2016).

4 CONCLUSIONS

This research concluded that important emerging technologies can be applied to the poultry production chain, such as "Precision Tools," to assist in analysis processes and promote better decision-making support for sector managers. These technologies, known as 4.0 technologies, enhance and update fewer complex procedures previously applied as "Smart Poultry Farming," or more generally as "Smart Farming," further reducing costs and generating new opportunities that leverage competitiveness and social responsibility, as well as addressing the strategic and managerial issues involved. These technologies provide better information that supports more assertive decision-making, combined with technological innovation for the herd.

ACKNOWLEDGEMENTS

ABSTRACT

The intensification of aquaculture activity has increased the generation of organic waste and toxic compounds, such as nitrogen and phosphorus, threatening the quality of surface water bodies and environmental sustainability. This study aimed to evaluate the effectiveness of multiplying strains of efficient microorganisms (EM) in the bioremediation of culture water and wastewater from fish-farming lakes. The methodology consisted of physicochemical and microbiological characterization of the waters and the application of three experimental EM doses (1/110, 1/1000, and 1/3000) in 250-liter units, compared with a control over a 45-day period. The evaluated parameters included COD, total solids, nitrogen compounds (ammonium, nitrites, nitrates), phosphates, sulfates, and microbiological counts (coliforms and heterotrophs). The results showed that although there was an increase in dissolved oxygen over time, there were no statistically significant differences between the EM treatments and the control for most variables, including the removal of coliforms and nitrogen compounds. The exception was sulfate levels, for which a significant reduction was observed in the EM treatments. It was also observed that the highest dose (1/110) was counterproductive, inducing a eutrophication process and macrophyte growth that increased the organic matter and phosphate load. It is concluded that, under the studied conditions, EM were effective specifically for sulfate removal, and lower doses are recommended for future studies to avoid eutrophication.

águas de cultivo e águas residuais provenientes de lagos piscícolas. A metodologia consistiu na caracterização físico-química e microbiológica das águas e na aplicação de três doses experimentais de EM (1/110, 1/1000 e 1/3000) em unidades de 250 litros, comparadas a um controle durante um período de 45 dias. Os parâmetros avaliados incluíram DQO, sólidos totais, compostos nitrogenados (amônio, nitritos, nitratos), fosfatos, sulfatos e contagens microbiológicas (coliformes e heterotróficos). Os resultados demonstraram que, embora tenha havido aumento do oxigênio dissolvido ao longo do tempo, não foram observadas diferenças estatisticamente significativas entre os tratamentos com EM e o controle para a maioria das variáveis, incluindo a remoção de coliformes e de compostos nitrogenados. A exceção foi o parâmetro sulfatos, para o qual se evidenciou redução significativa das concentrações nos tratamentos com EM. Observou-se ainda que a dose mais elevada (1/110) foi contraproducente, induzindo um processo de eutrofização e crescimento de macrófitas, o que elevou a carga de matéria orgânica e de fosfatos. Conclui-se que, nas condições estudadas, os EM foram eficazes especificamente na remoção de sulfatos, recomendando-se a investigação de doses menores para evitar a eutrofização.

RESUMEN

La intensificación de la actividad acuícola ha incrementado la generación de residuos orgánicos y compuestos tóxicos, como nitrógeno y fósforo, lo que amenaza la calidad de los cuerpos de agua superficiales y la sostenibilidad ambiental. Esta investigación tuvo como objetivo evaluar la eficacia de cepas multiplicadoras de microorganismos eficientes (EM) en la biorremediación de aguas de cultivo y residuales provenientes de lagos piscícolas. La metodología consistió en la caracterización físicoquímica y microbiológica de las aguas y la aplicación de tres dosis experimentales de EM (1/110, 1/1000 y 1/3000) en unidades de 250 litros, comparadas frente a un control durante un periodo de 45 días. Los parámetros evaluados incluyeron DQO, sólidos totales, compuestos nitrogenados (amonio, nitritos, nitratos), fosfatos, sulfatos y recuentos microbiológicos (coliformes y heterótrofos). Los resultados demostraron que, si bien hubo un aumento del oxígeno disuelto en el tiempo, no existieron diferencias estadísticas significativas entre los tratamientos con EM y el control para la mayoría de las variables, incluyendo la remoción de coliformes y compuestos nitrogenados. La excepción fue el parámetro de sulfatos, donde se evidenció una reducción significativa de las concentraciones en los tratamientos con EM. Se observó además que la dosis más alta (1/110) resultó contraproducente, induciendo un proceso de eutrofización y crecimiento de macrófitas que elevó la carga de materia orgánica y fosfatos. Se concluye que, bajo las condiciones estudiadas, los EM fueron efectivos específicamente para sulfatos, y se recomienda investigar dosis menores para evitar la eutrofización.

1 INTRODUCTION

Microorganisms have a nutritional versatility that can be used for the biodegradation of contaminants. This type of process is called bioremediation and consists of the ability of certain microorganisms to convert, modify and use toxic pollutants for the production of energy and biomass in the process (Abatenh et al, 2017). Instead of collecting the contaminant and storing it, bioremediation is a microbiological activity that is applied to break down or transform pollutants into elemental forms and less toxic or non-toxic compounds.

Bioremediators are biological agents used to clean up contaminated sites, including bacteria, archaea, and fungi as the main agents (Strong et al, 2008). The application of bioremediation as a biotechnological process involves microorganisms to resolve and eliminate the dangers of many pollutants through the biodegradation of the environment. Microorganisms act as an important tool for removing contaminants in soil, water, and sediments; due to their advantage over other remediation protocols, they restore the original natural environment and prevent further contamination (Demnerova et al, 2005).

In the case of wastewater treatment, microorganisms play an important role. The rationale for using these strains of EM microorganisms is that they contain various organic acids due to the presence of lactic acid bacteria, which secrete organic acids, enzymes, antioxidants, and metal chelates (Okuda and Higa). Creating an antioxidant environment by MS helps improve solid-liquid separation, which is the basis for water cleanliness (Mandalaywala et al, 2017). One of the main benefits of using MS is the reduction in the volume of sludge, as the beneficial organisms present in MS they break down organic matter by converting it into carbon dioxide (CO₂), methane (CH₄), or using it for growth and reproduction. Effective microorganisms significantly reduce the volumes of wastewater sludge produced by eliminating associated odors (Shalaby, 2011). On the other hand, wastewater treatment carried out with conventional methods is more expensive because the chemical products used are of greater value in the market, so the implementation of a more economical and environmentally friendly technology is of greater interest (Cardona and García, 2008). In the Center's Bioinputs Unit there are multiplier strains that are used for the production of bioinputs, these strains in addition to having efficient microorganisms (EM) are enriched with other organic waste compounds that are produced in the unit and have had good results.

1.1 PROBLEM STATEMENT

The quality and quantity of the water supply worldwide and in the country is being threatened by the impact of industrial and agricultural activities. The degradation of water resources was initially due to contamination by organic waste and salinization of irrigation systems, later aggravated by the presence of suspended solids, heavy metals, radioactive waste, nitrates, organic micropollutants, acidification of lakes and streams and eutrophication of lakes and coastal waters (Salazar, 2008).

Intensive aquaculture is one of the productive activities that is increasingly booming in food security, which generates greater risks of environmental impact, like most human activities. Gondwe et al. (2012) and Vezzulli et al. (2008) indicated that aquaculture is one of the main activities contributing to the increasing levels of organic waste and toxic compounds. When not properly treated, aquaculture wastes can cause emerging diseases due to antibiotic resistance and harmful algal blooms (Hegaret, 2008; Rubert, 2008).

Wastewater effluent from the aquaculture industry contains nitrogenous compounds (ammonia, nitrite and nitrate), phosphorus and dissolved organic carbon that can lead to environmental deterioration at high concentrations (Ali et al., 2005). Ammonia (NH_3) is the product of fish respiration and the decomposition of excess organic matter. Chemoautotrophic bacteria (*Nitrosomonas* and *Nitrobacter*) act by oxidizing ammonium ions (NH_4) to nitrites (NO_2) and nitrate ions (NO_3). In nature, these ions are absorbed by aquatic plants, algae and bacteria, as they are assimilated into biomass as a source of nitrogen. Nitrogenous compounds present in excessive amounts are responsible for generating eutrophication, which disrupts the balance of the aquatic ecosystem and could lead to a massive mortality of aquatic fauna (Lananan et al, 2014). The conservation of water resources allows optimizing production in terms of profitability and sustainability for the fish farming industry, since it must be delivered again in the same or better conditions than those found at the time of capture, complying with quality standards (Botero and Jimenez et al, 2006), in addition to promoting the environmental sustainability of this resource, which is one of the most affected. Wastewater treatment carried out with conventional methods is more expensive because the chemicals used are of higher value in the market, so the implementation of a more economical and environmentally friendly technology such as the use of efficient microorganisms for bioremediation is of greater interest (Cardona and García, 2008).

1.2 HYPOTHESIS

Environmental water decontamination with the effective use of EM (efficient microorganisms) in aquaculture effluents, avoiding eutrophication in surface water bodies.

2 OBJECTIVES

2.1 GENERAL OBJECTIVE

To evaluate the effect of multiplier strains with efficient microorganisms in the bioremediation of the culture and wastewater water of the productive lakes of the fish farming unit at the "La Granja" Agricultural Center.

2.2 SPECIFIC OBJECTIVES

- Perform a physical, chemical and microbiological characterization of the multiplier strains that contain efficient microorganisms, produced in the bioinputs unit of the "La Granja" Agricultural Center
- Perform a physical, chemical, microbiological and phytoplankton characterization of the culture and wastewater water of the productive lakes of the fish farming unit.
- To evaluate the effect of different doses of multiplier strains on the treatment of culture and wastewater from the productive lakes of the fish farming unit.
- Analyze the quality of the water of the productive lakes of the fish farming unit and the wastewater of these productive areas in its initial state and after the application of efficient microorganisms, according to parameters established in the current regulations.

3 THEORETICAL FRAMEWORK ORIGIN OF AQUACULTURE IN COLOMBIA

Aquaculture in Colombia began at the end of the 30s of the twentieth century with the introduction of rainbow trout for restocking in waters for public use in natural lagoons located in highlands of more than 2,500 meters above sea level in the Andean Region; later, common carp (*Cyprinus carpio*) and *Tilapia rendalli* were introduced and culture experiments began with the tucunaré (*Cichla ocellaris*) to control the reproduction of tilapia in the ponds. Also at that time, studies began with native species, especially with the bocachico of the Magdalena river basin *Prochilodus magdalenae* and in 1968 experimental cultivation with mangrove oysters (*Crassostrea rizophorae*) began. (AUNAP-2014)

Continental aquaculture is represented exclusively by fish farming, mainly by the production of red and silver tilapia, cachama, trout and some native species, the first two being the ones that show a greater dynamic in production and market share; the native species with the highest participation are the white and black cachamas, the bocachico, the yamú (*Brycon amazonicus*) and other species such as catfish (*Pseudoplatystoma* sp). (AUNAP-2014)

Aquaculture must be framed within sustainable development criteria, defined by the FAO as "The management and conservation of the natural resource base and the orientation of technological and institutional change, in such a way as to ensure the continuous satisfaction of human needs for present and future generations". This sustainable development (in the agricultural sectors, 9 National Plan for the Sustainable Development of Aquaculture in Colombia AUNAP - FAO forestry and fisheries) conserves land, water and genetic resources plant and animal, does not degrade the environment and is technically appropriate, economically viable and socially acceptable." This is classified as a sustainable and beneficial practice for food security in supplying and supplying food demand, such small, medium and large-scale production requires an artificial or natural aquatic environment, inputs and raw material that generates waste that alters the physical, chemical and microbiological parameters of the water, however these aspects reveal that aquaculture is not sustainable and requires more planning and waste management that they discharge into surface water bodies.

3.1 ENVIRONMENTAL IMPACT ON AQUACULTURE

The level of environmental pollution caused by aquaculture is directly related to the farming production system (extensive, semi-intensive and intensive). The more the system is intensified, the more inputs and raw materials are used. For example: Commercial food leaves residues, part of which is not consumed and degrades in the water column producing sediments. (Elizabeth et al 2018) Residues are also produced by the accumulation of fish excreta, resulting from the food consumed and metabolized (Eley et al., 1972). This degradation of waste alters various physical and chemical parameters of the water, as well as stimulates bacterial production due to the high content of organic matter, thus changing the chemical composition, structure and functions of the water-sediment interface (Tsutsumi and Kikuchi, 1983) (Brown et al., 1987). Aquaculture is an activity closely related to the anthropogenic effects that are caused by this economic activity, which must be analyzed and

reconstructed in order to reach a balance between the support elements (soil, water, air, flora and fauna) and the producer.

The generation of aquaculture waste and dumping has become a global public health concern (Martins et al., 2010).

In general terms, there are two types of aquaculture/fish farming waste: dissolved solids. The former are considered to have the greatest environmental impact and are mainly made up of uneaten food and undigested substances. The main dissolved components are nitrogen and phosphorus (Dauda et al., 2019).

The water column is mainly affected in the discharge of nutrients from cultivated animals and the production process, if the flow of these compounds in particular concentrations of phosphorus and nitrogen are discarded into the environment and exceed the assimilation capacity of the ecosystem, it can cause severe impacts on both the water column and the benthos. such as eutrophication, oxygen depletion, and alteration of local biodiversity (Buschmann and Fortt, 2005). Similarly, the use and quantity of chemical substances and antibiotics depends on the species and the intensity of the crop; although they are used in a very dilute form, they are dissolved in the water and are accumulated in the sediments, affecting the quality and nature of these two factors (Read et al., 2003).

In the same sense, (Milthon et al. 2011) determine that, for fish farming activity, one of the main management concerns is focused on effluents, which, being rich in nitrogen and phosphorus, impact the receiving water bodies with an increase in primary productivity that accelerates eutrophication processes. As in other economic activities, aquaculture produces waste that must require other environmental services to be assimilated or recycled; when there is no control, sustainability is ultimately compromised (Buschmann, 2001).

Aquaculture produces sediments that are the product of nutrients, soil particles and concentrate that are not consumed in their entirety, all this is degraded producing sediments, all this generates a degree of contamination that is directly proportional to the size of the crop. (Elizabeth et al-2018)

It is found that organic matter in fish farms is generated by the accumulation of elements such as: food, fish feces, metabolic waste, benthos, plankton, fungi, bacteria and organisms of animal and plant origin in different stages of decomposition such as: carbon, oxygen, nitrogen and phosphorus, (González, 2015). since at the bottom the soil of a lake is in a constant exchange of compounds between the two environments, water and sediments,

thus producing effects on the composition of the water of the natural environment. (Boyd, 1995).

3.2 NEGATIVE ASPECTS OF (N)NITROGEN CONCENTRATION IN FISH EFFLUENTS

Nitrogen (N) is a contaminant present in wastewater that must be removed for multiple reasons:

Reduces dissolved oxygen in surface waters Is toxic to the aquatic ecosystem. It poses a risk to public health and together with (P). They are responsible for the overgrowth of photosynthetic organisms (eutrophication). (Aqualia-2019)

Figure 1

Nitrogen cycle, organic matter that produces pollutants in aquaculture lakes. Taken from Aunap (2019)

According to the above information, it can be mentioned that the culture of fish in confined environments biochemically alters the quality of the water in which they are produced; The most important alterations are related to the increase in organic matter produced mainly by excretions, by the feed supplied and by the contributions of the inputs added in the culture ponds; which generates variations in the concentration of oxygen (DO), increase in the concentration of suspended solids (TSS), increase in the biological oxygen demand (BOD), increase in the chemical oxygen demand (COD), increase in nitrogenous compounds (ammonium, nitrite and nitrate), increase in carbon dioxide and phosphate,

exaggerated growth of algae and eutrophication. Studies have shown that BOD₅ from effluents from aquaculture ponds normally has a range between 5 and 20 mg/l. (Corpoamazonia-2018)

Likewise, it is important to highlight that the contamination of surface waters by nutrients can induce adverse effects on human health, especially the ingestion of nitrites and algal toxins, because they can cause diarrhea, vomiting, gastroenteritis, among others (Camargo & Alonso, 2006). In addition, the accumulation of phytoplankton, the death and decomposition of plant material in the receiving sources, can generate unpleasant odor and taste, reducing its use as a recreational and consumption resource (Figueroelo & Marino, 2004).

3.3 BIOREMEDIATION PRACTICES

It consists mainly of the use of different organisms such as (plants, yeasts, fungi, bacteria, etc.) as a medium to neutralize toxic substances, either transforming them into less toxic substances or making them harmless to the environment and human health. One of the most widely used biocorrective measures in the use of microorganisms for the decontamination of natural resources, this decontamination system is based on the absorption of organic substances by these microorganisms, which use them as a source of carbon necessary for their growth and energy for their metabolic functions. (Duilio Torres Rodriguez-2003).

3.3.1 Bioremediation in aquaculture

Wastewater management in aquaculture ecosystems is essential to maintain the good health status of animals, as well as counteract negative impacts on the environment. Bioremediation, which is nothing more than the application of microorganisms (BACTERIA) to remove hazardous waste, is a very helpful tool for the on-site treatment of contaminated wastewater and sediments. For the bioremediation of nitrogenous compounds, bacteria have to perform the function of nitrification and denitrification (Chávez-Crooker & Obrique-Contreras, 2010). this biological process is carried out by ammonium oxidizing bacteria (BOA) and nitrate oxidizing bacteria (BON). Although a wide range of bacterial species are capable of to perform nitrification or denitrification, not all species are applicable for bioremediation products. The strains *Paracoccus* sp. and *Thiobacillus* sp. have recently gained great interest

due to their degrading abilities. On the other hand, *Bacillus* sp can also carry out several functions in water cleaning (Nakano et al., 1998)

3.4 DENITRIFYING BACTERIA

3.4.1 Nitrification

It is an aerated biological process where ammonia is oxidized until its conversion to nitrate, it is divided into two stages, the first is defined by the oxidation of NH_4^+ to nitrite (NO_2^-) and the second stage defined by the oxidation of (nitrites) NO_2^- to (nitrates) NO_3^- .

3.4.2 Denitrification

It is a biological process that takes place in the absence of oxygen in which nitrate is transformed into gaseous nitrogen that is incorporated into the atmosphere.

Figure 2

Nitrogen denitrifying bacteria cycle

Note. nitrification and denitrification process. Taken from (Saubot, 2002)

The process of decomposition of organic matter, leads to greater oxygen consumption and the generation of CO_2 and anoxic environments (Magni et al 2008).

Origin of Efficient Microorganisms in the Use of Bioremediation

The term "effective microorganisms" (EM) is used to denote specific mixed cultures of known beneficial microorganisms, which are effectively employed as microbial inoculants

(Higa and Parr, 1994). E.M is a technology developed by Dr. Teruo Higa in the eighties in Okinagua, Japan and has been used in different fields such as agriculture, industry, animal, environmental remediation, among others, and is currently widely distributed (Sangkara, 2002).

3.5 MAIN EFFICIENT MICROORGANISMS (EM)

Figure 3

Efficient microorganisms

Note. view of efficient microorganisms. Taken from Fundases laboratory

3.5.1 Photosynthetic bacteria (*Rhodopseudomonas* spp)

They use natural light and the heat of the sun as a source of energy, organic matter and harmful gases, decompose offensive gases such as ammonia and hydrogen sulfide into gases with non-offensive odors (Fernando et al, 2018).

Regarding Colombia, Roldán et al., (2007) found that after the application of EM, both in domestic and synthetic wastewater, significant decreases in the content of total coliforms were evidenced.

3.5.2 Photosynthetic bacteria in agriculture

Phototropic bacteria are a group of independent, self-sustaining microbes. These bacteria synthesize useful substances from root secretions, organic matter, and/or harmful gases (e.g., hydrogen sulfide) with the use of sunlight and soil heat as energy sources. These useful substances include amino acids, nucleic acids, bioactive substances, and sugars, all of which promote plant growth and development. The metabolites made by these microorganisms are absorbed directly by plants and act as a substrate for the population

increase of beneficial microorganisms. For example, in the rhizosphere, vesicular and arbuscular mycorrhizae (VA) are increased thanks to the availability of nitrogenous compounds (amino acids) that are secreted by phototropic bacteria. VA mycorrhizae in response increase the solubility of phosphates in the soil and therefore provide phosphorus that was not available to plants. VA mycorrhizae can also coexist with azobacter and rhizobiums, increasing the ability of plants to fix nitrogen from the atmosphere.

3.5.3 Lactic acid bacteria (*Lactobacillus* Spp)

Lactic acid bacteria (*Lactobacillus*) were found in yogurt, suppress pathogenic microorganisms, are a strong sterilizer, attack pathogens, accelerate the decomposition of organic matter, prevent putrefaction and bad odors (Fernando et al 2018).

3.5.4 Lactic acid bacteria in agriculture

Lactic acid bacteria produce lactic acid from sugars and other carbohydrates, produced by phototropic bacteria and yeast. For this reason, some foods and drinks such as yogurt and pickles have been made with lactic acid bacteria since ancient times. However, lactic acid is a strong sterilizing compound that suppresses harmful microorganisms and aids in the breakdown of materials such as lignin and cellulose by fermenting them, removing undesirable effects from unbroken organic matter. Lactic acid bacteria have the ability to suppress diseases including microorganisms such as fusarium, which appear in continuous culture programs. Under normal circumstances, species such as fusarium weaken plants, exposing them to diseases and large populations of pests such as nematodes. The use of lactic acid bacteria reduces nematode populations and controls the spread and dispersal of fusarium, thereby inducing a better environment for crop growth.

3.5.6 Yeasts (*Saccharomycetes* spp.)

They synthesize or ferment the substances secreted by PHOTOTROPHIC bacteria, they produce proteins and sugars that are taken up by LACTIC BACTERIA. (Fernando et al 2018).

3.5.7 Yeasts in agriculture

Yeasts synthesize antimicrobial and other useful substances required by plants for their growth from amino acids and sugars secreted by phototropic bacteria, organic matter

and plant roots. Bioactive substances such as hormones and enzymes produced by yeast promote active cell and radical division. These secretions are also useful substrates for MS such as lactic acid and actinomycetes bacteria. The different species of effective microorganisms (Phototropic bacteria, lactic acid and yeast) have their respective functions. However, phototropic bacteria can be thought of as the core of MS activity. Phototropic bacteria reinforce the activities of other microorganisms. This phenomenon is

called "coexistence and co-prosperity". The increase in MS populations in soils promotes the development of beneficial microorganisms existing in the soil. Since the microflora of the soil becomes abundant, and therefore the soil develops a well-balanced microbial system. In this process, specific microbes (especially harmful ones) are suppressed, in turn reducing disease-causing soil microbial species. In contrast, in these developed soils, EM maintains a symbiotic process with plant roots next to the rhizosphere. Plant roots also secrete substances such as carbohydrates, amino acids, organic acids, and active enzymes. The MS uses these secretions for growth. In the course of this process, MS also secretes and delivers amino acids, nucleic acids, a wide variety of vitamins and hormones to plants. This means that the EM in the rhizosphere coexists with plants. Therefore, in soils dominated by EM, plants grow exceptionally well.

3.6 BENEFITS OF USING EFFICIENT (ME) MICROORGANISMS

Figure 4

Relationship between beneficial bacteria

Note. Taken from (Tencio, 2011)

Efficient Microorganisms are almost all facultative in terms of their respiration. (which grows in both the presence and absence of oxygen).

They are saprophytic, feed on inert organic matter and are not adapted to live in the pantries of living beings; It is not harmful to the health of plants, animals and man.

The species contained in MS were selected for fulfilling one or more of the following functions

Solubilize nutrients (N, O, P, K, MG, CA, FE, ZN, CU, CO, SI, S, C) contained in the clays, in the parent material distributed in the soil profile.

Agricultural use.

Microbial inoculant, they restore the microbiological balance of the soil, improving its physical conditions. Chemicals, increase crop production and protection.

Animal production use.

It reduces bad odors (ammonia) and populations of pest insects, as a result of the fermentation process of excreta in situ.

To collect excreta and urine, reducing the frequency of water use.

Reduces the requirement and utilization of disinfectants and production and maintenance costs.

Organic solid waste management.

Reduces bad odors from manure and urine Eliminates pathogenic microorganisms and weed seeds

It prevents the decomposition of organic matter by oxidation in which gases generated by bad odors (sulfurous, ammoniacal and mercaptans) are released

It prevents the proliferation of insect vectors, such as flies, it does not find a suitable environment for its development

It speeds up the composting process to a third of the time of a conventional process.

Wastewater management.

Transforms and synthesizes organic matter and COD (non-biodegradable organic matter contained in water)

Increases oxygen values

Reduces sludge production in conventional treatment systems Reincorporates wastewater as irrigation water

Effectively removes more than 99% of total and fecal coliforms. (Fernando et al 2018).

Parameters and optimal values for life resolution 631 of 2015

Table 1

Parameters and optimal values for life

Parameter	Units	Maximum Limit Values Permissible
Temperature (T°)	°C	40 °C
Dissolved Oxygen (DO)	mg/l	Analysis and reporting
Ph	Units of Ph	6.00 to 9.00
Chemical oxygen demand (BOD)	mg/l O ₂	150,00
Biochemical Oxygen Demand (BOD ₅)	mg/l O ₂	50,00
Total Solids (TS)	mg/l	Analysis and reporting
Sulfates (So ₄)	mg/l	250,0
Sulfides (S ₂)	mg/l	1,00
Ammonium (Nh ₄)	mg/l	Analysis and reporting

4 STUDY AREA

The research project was carried out in the bio-inputs and fish farming unit of the "La Granja" Agricultural Center of the National Learning Service (SENA), Espinal Tolima.

5 METHODOLOGY

To evaluate the effect of different doses of the multiplier strains with effective microorganisms, on the quality of the waters of the productive lakes of the fish farming unit and the wastewater of the same (productive area – Lakes) of the Agricultural Center "La Granja", the analysis of some physicochemical and microbiological parameters, the process of characterization of the water of the lakes, of wastewater and multiplying strains, tend to identify in the first instance the initial microbial and physicochemical loads to establish monitoring indicators according to concentrations, protocols and techniques of parameter analysis, standardization of doses of microorganisms, in general establish removal capacity in adequate ranges.

Physicochemical and microbiological characterization of the water of fish farming lakes. The physicochemical parameters to be measured were: COD, Total Dissolved Solids (TDS), NO₃, NO₂, NH₄, PO₄, SO₄, Dissolved Oxygen and pH. Likewise, the microbiological characterization of the samples was carried out to establish the microbial concentration of both fecal contamination indicators (total and fecal coliforms), total heterotrophs and microorganisms present in MS on specific culture media.

Evaluation of different doses of multiplier strains in wastewater treatment

Three doses were used to evaluate the effect of the doses of the multiplier strains in wastewater treatment: 1/110, 1/1000, 1/3000 (vEM/vAR). As an experimental unit, cans with a capacity of 250L were used. For both treatments and control (without MS doses), three replications were performed for a total of 12 experimental units. On the other hand, the samplings were carried out on the first day, at 15, 30 and 45 days after the application of the doses and finally the results were analyzed taking into account the current regulations.

Figure 5

Assembly of experimental units

5.1 STATISTICAL ANALYSIS

Descriptive statistics of the data were performed, then the analysis of Shapiro-Wilks ($p < 0.05$) and Q-Q graphs to observe the distribution of the data. It was determined whether the data present a normal distribution to establish whether parametric or non-parametric statistics are used, because they did not present a normal distribution, non-parametric tests

were used for all analyses. To establish which treatments there were statistically significant differences, the LSD Fisher comparison test was performed. Finally, a principal component analysis was performed to observe the relationship of the variables studied. The InfoSTAT package was used for statistical analysis.

6 RESULTS AND DISCUSSION

6.1 INITIAL CHARACTERIZATION OF WASTEWATER

Table 3

Initial microbiological characterization of wastewater

Microorganisms	Count (CFU/ml)
Lactobacilli	0
Phototrophic	0
Yeasts	3 x 10 ⁴
Heterotrophs	1.2 x 10 ⁵
Coliforms	Countless

Table 4

Initial physicochemical characterization of wastewater

Physicochemical parameters	Concentration
COD	
Total solids	173
Ammonia	0,38
Sulfate	27,6
Phosphate	1,43
Nitrate	0,63
Nitrite	0,0028

Figure 6

Dissolved oxygen concentration in treatments

Dissolved oxygen concentrations increased over time, with significant differences at 30 and 45 days of study; however, no statistically significant differences were observed between control and treatments. Dissolved oxygen concentrations in the first days were between 0.58 and 0.70 mg/L, which are low values considering that a minimum of 5 - 6 mg/L O₂ is required to maintain aquatic biodiversity (APHA, 2005). For the COD parameter, no significant differences were observed, except with treatment 3, whose results in COD concentration were higher compared to the other treatments and control, due to the eutrophication process that occurred in this treatment. The results obtained coincide with what has been reported, since as the easily degraded compounds are exhausted and the microorganisms begin to consume other more complex substances, there comes a certain point at which the microorganisms do not have the enzymes or nutrients required to continue with the process that allows the reduction of COD, this, added to the lack of oxygen, limits degradation, as observed in the similar value where there is no significant change for COD due to the presence of compounds whose complex chemical structure does not allow their easy degradation (Cardona & García, 2008).

Figure 7

Chemical oxygen demand in the treatments analyzed

Figure 8

Total solids dissolved in treatments

In general, there were no significant differences between the control and the treatments for the dissolved total solids variable. For this reason, it is stated that there were no significant differences in STD concentrations after the application of MS in the wastewater. The concentration of STDs increased over time in treatment 3, due to the presence of aquatic plants, which is consistent with the increase in ammonium and phosphate concentrations.

6.2 PH

In the initial phase, the pH tended to alkalinity; however, for treatment 3 it was more neutral (6.88). Fifteen days after the application of the treatments, there were no significant differences between them, but there was a decrease to neutrality with respect to the initial day. For control, alkalinity increased considerably by day 30 (9.47) and 45 days (9.10).

The trend towards alkalinity does not coincide with the findings of Fioravanti (2005) who evaluated efficient microorganisms as stabilizers of wastewater, presenting a decrease from 6.3 to 4.5, despite the fact that in the present study such a drastic decrease in pH was not observed, comparing the treatments with the control if there was a significant decrease in the last days of treatment.

In the study carried out by Roldán et al. (2007), the pH values did not present statistically significant differences, likewise, Gómez and Galindo (2008) did not observe statistically significant differences in this variable.

Figure 9

Hydrogen potential in treatments

6.3 PHOSPHATES

Figure 10

Phosphate concentration in treatments

There were significant differences with treatment 1 and 3 compared to treatment 2 and control and a slight increase in concentration over time. Phosphate is one of the main compounds that contributes to the pollution of water bodies.

According to the classification of Metcalf and Eddy (2003), wastewater with a high concentration of organic phosphorus is considered to be that with more than 5mg/L, so the concentration presented in the treatments is high, especially in treatment 3, possibly this was due to the fact that in the experimental units with this treatment there was the growth of aquatic plants and this promoted the eutrophication process. In this variable, control was better than treatments.

6.4 NITROGENOUS COMPOUNDS

Figure 11

Ammonia concentration in treatments

Figure 12

Nitrite concentration in treatments

Figure 13

Nitrate concentration in treatments

Nitrogenous compounds formed by reduction reactions such as ammonium showed a tendency to decrease over time, with the exception of treatment 3 which presented high concentrations due to the growth of aquatic plants.

The nitrite and nitrate compounds had no statistically significant differences between treatments and control, nor over time.

Cardona and García (2008) and Romero and Vargas (2017) in their research observe results similar to those obtained in this work, the non-regular behavior of nitrogenous compounds. The authors mention the situations regarding the variability of the NH_4^+ , NO_2^- and NO_3^- ions with the use of EM on wastewater, in close relation to the concentration of oxygen, which was low in the first days and which in a certain way is responsible for the nitrification and denitrification processes that occur in wastewater.

6.5 SULFATES

Figure 14

Concentration of sulfates in treatments

Sulphate was the only compound that presented significant differences between the control and the treatments, with lower sulfate concentrations in the treatments. It has been

It has been reported that phototrophic bacteria that are present in efficient microorganisms remove sulfur compounds, which was evidenced in the present study (García, 2006). Microbiological parameters

No significant differences were observed between treatments and controls in relation to total heterotroph and total coliform counts in sampling events between control and treatments. Therefore, after the application of MS to the wastewater, no significant treatment effect was observed. The behavior of heterotrophs was potentially related to the other microbial groups evaluated in the study.

Figure 15

Heterotroph colony-forming units in treatments

For heterotrophs, there were no statistically significant differences between control and treatments, except at 30 days for treatment 1 where there was a significant decrease in heterotrophs; however, over time there was an increase in this microbial population over time.

Figure 16

Total coliform colony-forming units in treatments

The concentration of total coliforms did not present statistically significant differences between the control and the treatments or over time, however, there was a decrease in the concentration of these microorganisms with treatment 1. Although no statistically significant differences were observed over time, the decrease in colony-forming units in the culture

media was visually evident, possibly a higher dilution should have been used in stocking because the total coliform populations in fish wastewater are very high.

In a study conducted by Roldán et al. (2007), the effect of the application of ME (1/3000 v/v) on wastewater was evaluated for 60 days, in which a significant reduction in total coliform counts was obtained in both cases on day 30 of the study. This is because the metabolites produced by the microorganisms present in MS such as acids, ethanol and bacteriocins, inhibit the populations of pathogens of fecal origin that are

They are found in contact with these microorganisms, possibly because they lower the pH of the medium and/or limit their growth by destabilizing transport across the membrane by blocking receptors or generating changes in the ionic balance (Miklota et al, 2004).

Figure 17

Lactobacilli colony-forming units in treatments

Figure 18

Colony-forming units of fungi and yeasts in treatments

The concentration of fungi and yeasts did not present significant differences between treatments, while a decrease was observed over time. On the other hand, lactobacilli increased over time.

Figure 19

Principal component analysis of all the variables studied

The principal component analysis allowed a summary analysis of all the variables studied. Component 1 explained 59.8% of the total variability of the data and component 2 explained 26% of the total variability. Each vector corresponds to each of the parameters evaluated. Vectors that are presented in opposite directions with an angle of 180 degrees, have a negative correlation and those that are in the same direction very close have a positive correlation, for example, the concentration of COD is correlated with the high presence of phosphates, ammonia and total solids.

In treatment 3 there were high concentrations of COD, phosphates, ammonia and total solids, the control treatment with high concentrations of sulfate and treatment 1 with dissolved oxygen and nitrates.

7 CONCLUSIONS

For most of the parameters evaluated, no statistically significant differences were observed between the control and the treatments, with the exception of sulfate, which presented lower concentrations in the treatments with efficient microorganisms. In treatment

3, which had the highest concentration of EM, the growth of aquatic plants occurred, which caused a process of eutrophication of the water so that nitrogenous compounds and phosphates increased. It is recommended to perform an analysis of the effect of efficient microorganisms in the removal of these compounds at lower concentrations than those used in this study.

ABSTRACT

This chapter analyzes the experience of the Onboarding Program of the State Secretariat for Planning of Piauí (SEPLAN/PI) as an innovative initiative for the institutional integration of public servants. Developed in 2025, the program was designed to welcome the first Government Analysts of the Government Management Career, structuring an intentional onboarding journey aligned with the institution's strategic planning. Using an analytical-descriptive approach, the text discusses the conceptual foundations of state professionalization and strategic people management, contextualizes the methodological design of the program, and examines its main components, highlighting institutional training, competency-oriented placement, and mentoring support during the first months of service. The results indicate positive impacts on adaptation, engagement, and the sense of belonging among civil servants, as well as the strengthening of organizational integration and institutional culture. The chapter concludes that qualified integration of new public servants constitutes a relevant strategy for strengthening state capacity, presenting the Onboarding Program as an experience with potential for institutionalization and replication in other public administration contexts.

RESUMO

Este capítulo analisa a experiência do Programa de Embarque da Secretaria de Estado do Planejamento do Piauí (SEPLAN/PI) como iniciativa inovadora de integração institucional de servidores públicos. Desenvolvido em 2025, o programa foi concebido para acolher os primeiros Analistas Governamentais da Carreira de Gestão Governamental, estruturando uma jornada intencional de onboarding alinhada ao planejamento estratégico institucional. A partir de uma abordagem analítico-descritiva, o texto discute os fundamentos conceituais da profissionalização do Estado e da gestão estratégica de pessoas, contextualiza o desenho metodológico do programa e examina seus principais componentes, com destaque para a formação institucional, a lotação orientada por competências e o acompanhamento por meio de mentoria nos primeiros meses de exercício. Os resultados indicam impactos positivos na adaptação, no engajamento e no sentimento de pertencimento dos servidores, além do fortalecimento da integração organizacional e da cultura institucional. O capítulo conclui que a integração qualificada de novos servidores constitui estratégia relevante para o fortalecimento da capacidade estatal, apresentando o Programa de Embarque como experiência passível de institucionalização e replicação em outros contextos da administração pública.

Palavras-chave: Inovação Pública. Gestão Estratégica de Pessoas. Integração Institucional. Onboarding no Setor Público. Capacidade Estatal.

RESUMEN

Este capítulo analiza la experiencia del Programa de Embarque de la Secretaría de Estado de Planificación de Piauí (SEPLAN/PI) como una iniciativa innovadora de integración institucional de servidores públicos. Desarrollado en 2025, el programa fue concebido para acoger a los primeros Analistas Gubernamentales de la Carrera de Gestión Gubernamental, estructurando una trayectoria intencional de incorporación (onboarding) alineada con la planificación estratégica institucional. A partir de un enfoque analítico-descriptivo, el texto discute los fundamentos conceptuales de la profesionalización del Estado y de la gestión estratégica de personas, contextualiza el diseño metodológico del programa y examina sus principales componentes, con énfasis en la formación institucional, la asignación orientada por competencias y el acompañamiento mediante mentoría durante los primeros meses de ejercicio. Los resultados indican impactos positivos en la adaptación, el compromiso y el sentido de pertenencia de los servidores, además del fortalecimiento de la integración organizacional y de la cultura institucional. El capítulo concluye que la integración cualificada de nuevos servidores constituye una estrategia relevante para el fortalecimiento de la capacidad estatal, presentando el Programa de Embarque como una experiencia susceptible de institucionalización y replicación en otros contextos de la administración pública.

Palabras clave: Innovación Pública. Gestión Estratégica de Personas. Integración Institucional. Onboarding en el Sector Público. Capacidad Estatal.

1 INTRODUCTION

The State's ability to plan, coordinate and implement public policies consistently is directly related to the quality of its technical staff. In a scenario marked by greater administrative complexity, digital transformation, and growing social demand for results, it is becoming increasingly evident that entry into the public service is not limited to approval in a competitive examination or formal tenure. The way in which the civil servant is received, oriented, and integrated into the organization decisively influences his performance, engagement, and permanence over time.

In this context, the experience of the Boarding Program of the State Secretariat of Planning of Piauí (SEPLAN/PI) offers a relevant example of innovation in people management in the public sector. Developed in 2025, the program was designed to welcome the first Government Analysts of the newly instituted Government Management Career, created by Law No. 8,202/2023. By opting for a structured integration journey, SEPLAN broke with traditional and fragmented welcoming practices, betting on an intentional, formative model aligned with institutional planning.

This chapter presents and analyzes this experience from an institutional perspective, focusing on the conceptual foundations that guided the program, its methodological design, and the main lessons generated. The text assumes an analytical-descriptive character, typical of book chapters, seeking to contribute to the debate on the professionalization of the State and innovation in public management.

2 PROFESSIONALIZATION OF THE STATE AND STRATEGIC MANAGEMENT OF PEOPLE

The literature on contemporary public administration has highlighted the professionalization of bureaucracy as a central element for strengthening state capacity. Abrucio and Loureiro (2018) point out that structured careers, associated with permanent training and development processes, are essential to ensure administrative continuity, decision-making coherence and quality in the formulation of public policies.

In this scenario, people management ceases to occupy a merely operational position and becomes part of the strategic core of public organizations. Chiavenato (2014) observes that competency-oriented management allows aligning institutional objectives with professional development, promoting greater efficiency and meaning to work. In the public

sector, this alignment gains specific contours, as it must be associated with the observance of legal principles, republican values and commitment to the collective interest.

Fischer (2019) reinforces that, in bodies responsible for transversal and strategic functions — such as planning, budgeting, and government monitoring — people management needs to dialogue directly with institutional planning. Well-structured initial integration programs reduce the adaptation time of civil servants, strengthen organizational identity, and expand the agency's delivery capacity.

3 INSTITUTIONAL INTEGRATION AND ONBOARDING PROCESSES IN THE PUBLIC SECTOR

The concept of onboarding refers to the set of practices aimed at the planned socialization of new members in an organization. Bauer and Erdogan (2012) demonstrate that structured integration experiences have a positive impact on engagement, learning and professional performance, in addition to reducing uncertainties common to the first months of exercise.

In the public sector, institutional integration plays an even more relevant role, as it involves not only the learning of routines and procedures, but also the internalization of legal norms, ethical values and responsibilities proper to the public service. Denhardt and Denhardt (2015) highlight that organizational socialization should be understood as part of the training of the civil servant as an agent of the public interest, guiding his performance beyond immediate results.

The literature points out four central dimensions for effective onboarding processes: role clarity, transmission of organizational culture, building relationships of trust and strengthening interpersonal connections (BAUER; ERDOGAN, 2012). These elements were present, in an articulated way, in the design of SEPLAN's Boarding Program.

4 INSTITUTIONAL CONTEXT AND DESIGN OF THE BOARDING PROGRAM

The creation of the Government Management Career in the State of Piauí represented an important advance in the process of administrative modernization. With the inauguration of the first Government Analysts assigned to SEPLAN, in 2025, the challenge of integrating professionals with diverse backgrounds to a secretariat with a strategic and transversal profile emerged.

The Boarding Program was conceived as a response to this challenge. More than an initial reception, it was structured as an intentional journey of integration and development, combining institutional training, behavioral profile analysis, competency-oriented staffing and systematic monitoring through mentoring.

The initial training, with a workload of 90 hours, addressed topics such as mission, vision and institutional values, strategic planning, organizational structure, ethics and integrity, diversity and operation of the main units of SEPLAN. This stage aimed to offer a systemic view of the organization, reduce information asymmetries and favor the construction of the institutional identity of the new employees.

5 MENTORING AND FOLLOW-UP IN THE FIRST MONTHS

One of the differentials of the Onboarding Program was the adoption of mentoring as a central monitoring strategy. Organized in cycles of 30, 60 and 90 days, the mentoring enabled a continuous process of listening, guidance and adjustment, respecting the different phases of adaptation experienced by the new employees.

According to Garvey, Stokes and Megginson (2018), mentoring contributes to situated learning, the sharing of tacit knowledge and the strengthening of organizational bonds. In SEPLAN's experience, systematic monitoring has made it possible to clarify expectations, support professional development and reduce insecurities common to the beginning of the public career.

In addition to the positive effects on incoming employees, mentoring also produced relevant institutional impacts, by stimulating the engagement of leaders and reinforcing an organizational culture based on cooperation and co-responsibility for people's development.

6 INSTITUTIONAL RESULTS AND LEARNINGS

The experience of the Onboarding Program showed significant results in the process of adaptation and integration of the new Government Analysts. A consistent evolution was observed in the perception of clarity of attributions, security in the performance of activities and institutional belonging over the first months of the year.

The staffing strategy guided by profile and skills analysis proved to be especially relevant. By aligning individual characteristics with the demands of the administrative units, SEPLAN reduced the need for subsequent relocations and favored greater satisfaction and initial engagement of the servers.

From an institutional point of view, the program strengthened the integration between directorates, consolidated people management as a strategic axis and contributed to the maturation of the organizational culture. Experience has shown that investing in the qualified arrival of civil servants generates impacts that go beyond the individual, directly reflecting on organizational capacity and the quality of government action.

7 POSSIBILITIES OF INSTITUTIONALIZATION AND REPLICATION

The lessons generated indicate that the Boarding Program has a high potential for institutionalization as a permanent people management policy. Incorporation into the People Development Plan, formalization through internal regulations and articulation with the State School of Government are ways that can ensure its continuity and sustainability.

The methodology adopted is also replicable in other bodies and careers of the state public administration. The flexibility of the training track, the mentoring model in cycles and the monitoring instruments allow adaptations according to the institutional context, without loss of conceptual consistency.

8 FINAL CONSIDERATIONS

The experience of the SEPLAN/PI Boarding Program shows that the integration of new civil servants can and should be treated as a strategy to strengthen the State. By structuring an intentional journey of welcoming, training and accompaniment, the secretariat has advanced beyond traditional practices, consolidating a model aligned with contemporary references in public management.

More than reporting an experience, this chapter demonstrates that well-designed people management policies produce lasting effects on organizational culture, institutional performance, and the quality of public policies. In this sense, the Boarding Program presents itself as a concrete reference for future initiatives of professionalization and innovation in public administration.

ABSTRACT

This article aims to analyze the fundamental characteristics of qualitative, quantitative, and mixed methods approaches in scientific research, discussing the reasons that contribute to the recurring conceptual confusion between these perspectives in academia. It is a bibliographic research, descriptive-analytical in nature and with a qualitative approach, examining reference works in the area of scientific methodology. The results show that the three approaches have distinct, yet articulable, epistemological foundations, purposes, and procedures, and that conceptual confusion often stems from a lack of clarity regarding the distinction between technical procedures and methodological approaches. The study proposes analytical frameworks that systematize these articulations, highlighting that methodological choice should be guided by the research objectives and the problem investigated. It concludes that an integrated understanding of these approaches strengthens scientific rigor and supports more coherent methodological choices in the training of researchers.

Keywords: Qualitative Research. Quantitative Research. Mixed Methods. Scientific Methodology. Researcher Training.

RESUMO

O presente artigo visa analisar as características fundamentais das abordagens qualitativa, quantitativa e mista na pesquisa científica, discutindo as razões que contribuem para a recorrente confusão conceitual entre essas perspectivas no meio acadêmico. Trata-se de uma pesquisa bibliográfica, de natureza descritivo-analítica e abordagem qualitativa, que examina produções de referência na área da metodologia científica. Os resultados

² Dr. in Science and Mathematics Teaching. Universidade Luterana do Brasil-Ulbra Canoas. E-mail: cynthiasoliveira@rede.ulbra.br

³ Dr. in Education, Science and Mathematics. Instituto Federal de Educação, Ciência e Tecnologia do Tocantins (IFTO). E-mail: kenya@ifto.edu.br

⁴ Dr. in Environmental Sciences. Instituto Federal de Educação, Ciência e Tecnologia do Tocantins (IFTO). E-mail: angelo@ifto.edu.br

evidenciam que as três abordagens possuem fundamentos epistemológicos, finalidades e procedimentos distintos, porém articuláveis, e que a confusão conceitual decorre frequentemente da falta de clareza sobre a distinção entre procedimentos técnicos e abordagens metodológicas. O estudo propõe quadros analíticos que sistematizam essas articulações, destacando que a escolha metodológica deve ser guiada pelos objetivos da pesquisa e pelo problema investigado. Conclui-se que a compreensão integrada dessas abordagens fortalece o rigor científico e subsidia escolhas metodológicas mais coerentes na formação de pesquisadores.

RESUMEN

Este artículo busca analizar las características fundamentales de los enfoques cualitativos, cuantitativos y mixtos en la investigación científica, analizando las razones que contribuyen a la recurrente confusión conceptual entre estas perspectivas en el ámbito académico. Se trata de una investigación bibliográfica, de naturaleza descriptiva-analítica y con un enfoque cualitativo, que examina obras de referencia en el área de la metodología científica. Los resultados muestran que los tres enfoques tienen fundamentos, propósitos y procedimientos epistemológicos distintos, pero articulables, y que la confusión conceptual a menudo se deriva de la falta de claridad en la distinción entre procedimientos técnicos y enfoques metodológicos. El estudio propone marcos analíticos que sistematizan estas articulaciones, destacando que la elección metodológica debe guiarse por los objetivos de la investigación y el problema investigado. Se concluye que una comprensión integrada de estos enfoques fortalece el rigor científico y apoya elecciones metodológicas más coherentes en la formación de investigadores.

Palabras clave: Investigación Cualitativa. Investigación Cuantitativa. Métodos Mixtos. Metodología Científica. Formación de Investigadores.

1 INTRODUCTION

Scientific research plays a central role in the production of knowledge, constituting a fundamental instrument for understanding, explaining and transforming reality. According to Lakatos and Marconi (2017), research is a formal procedure, with a method of reflective thinking, which requires scientific treatment and is organized to know reality or discover partial truths. In this context, the qualitative, quantitative, and mixed approaches stand out as the most recurrent in scientific production, each with its own epistemological foundations, specific objectives, and different forms of data collection, analysis, and interpretation. However, despite being widely used, it is observed in academic practice that students and even researchers show difficulties in adequately distinguishing these approaches, which can compromise the methodological coherence of scientific works.

This conceptual difficulty often occurs due to the inappropriate use of terms, the fragility in methodological training, and the superficial understanding of the bases that support each type of research. Gil (2019) points out that the choice of methodological approach should be directly linked to the objectives of the study and the type of problem investigated. However, it is common to find projects that mix concepts in the wrong way or that define the approach only by the type of data collection instrument, disregarding its theoretical foundations. A recurring mistake, for example, is to classify as mixed research studies that only present numbers and words side by side, without the planned methodological integration required by this approach (Creswell; Clark Plan, 2007).

In this context, studies are needed to systematize and clarify the differences between qualitative, quantitative and mixed research, especially in the context of initial and continuing education of researchers. Deepening the discussion about the specificities of each method, highlighting its theoretical bases, purposes, potentialities and limitations is a starting point.

Qualitative research, according to Minayo (2009), is concerned with the universe of meanings, values, beliefs and attitudes, seeking to understand the phenomena from the perspective of the subjects. Quantitative research, according to Fonseca (2002), is characterized by the use of quantification, both in the collection and treatment of data, employing statistical techniques to ensure greater objectivity and generalization of the results. Mixed research, in turn, combines the two approaches, allowing the integration between numerical and interpretative data, as advocated by Creswell and Plano Clark (2007), but requires an intentional and articulated methodological design, going beyond the simple juxtaposition of techniques.

In this sense, this article aims to analyze the fundamental characteristics of qualitative, quantitative and mixed research, as well as to discuss the reasons that contribute to the recurrent conceptual confusion between these approaches in the academic environment. The choice of the theme is justified by its relevance for the initial and continuing education of researchers, including undergraduate and graduate students and authors of course completion papers, since methodological clarity is an essential condition for scientific rigor and for the quality of academic productions. Thus, an analysis is proposed that goes beyond the qualitative-quantitative dichotomy, highlighting the possible articulations and the criteria for reasoned methodological choices.

The article presents, initially, a theoretical foundation that separately addresses the three methodological approaches. Next, the methodology used is described, characterized as bibliographic research. Subsequently, a comparative analysis is carried out based on the authors consulted, synthesizing the differences, similarities and contexts of application of each approach. Finally, the final considerations are presented, highlighting the contribution of the study to the strengthening of methodological understanding in the field of scientific research, with emphasis on overcoming common misconceptions in investigative practice.

2 THEORETICAL FOUNDATION

This section presents the conceptual bases of qualitative, quantitative and mixed research, based on renowned authors of scientific methodology, aiming to understand its characteristics, applications and theoretical foundations.

2.1 QUALITATIVE RESEARCH

Qualitative research is characterized by the search for a deep understanding of social phenomena, considering the meanings, motivations, values, beliefs and relationships established by the subjects in their life contexts. According to Minayo (2009), the qualitative approach works with the universe of meanings, motives, aspirations, beliefs, values and attitudes, which cannot be reduced to the operationalization of quantitative variables.

Bogdan and Biklen (1994) highlight that qualitative research has the following main characteristics: the natural environment as a direct source of data; the descriptive character; the researcher as the main collection instrument; the concern with the process and not just with the result; and the appreciation of the meaning attributed by the participants to their

experiences. Thus, the focus is not on the quantification of the data, but on the interpretation of the reality investigated.

As for the procedures, the qualitative research uses instruments such as interviews, participant observation, focus groups, documentary analysis and narratives, which enable an in-depth understanding of social phenomena. Gil (2019) emphasizes that this type of approach is particularly indicated when it is intended to investigate complex, subjective phenomena related to human interactions.

As examples of the application of qualitative research, studies in the area of education can be cited, such as investigations on pedagogical practices, teacher-student relationships, learning processes, school inclusion, among others. It is also widely used in the social sciences, psychology, social work, and health, especially in research that requires understanding the subjective dimension of the subjects.

Among the main authors of the qualitative approach, Minayo (2009), Bogdan and Biklen (1994), Chizzotti (2010), Lüdke and André (2013) and Gil (2019) stand out, whose contributions strengthen the theoretical-methodological bases of this research modality.

2.2 QUANTITATIVE RESEARCH

Quantitative research is characterized by the use of quantification both in data collection and analysis, seeking objectivity, measurement and generalization of results. According to Fonseca (2002), this type of research uses mathematical language to describe the causes of a phenomenon, the relationships between variables and the distribution of the population studied.

For Lakatos and Marconi (2017), the main purpose of quantitative research is to prove hypotheses, test theories and identify cause and effect relationships between variables, through the application of structured instruments and statistical analysis. The data is collected in a standardized way, allowing greater control and accuracy of the results.

Among the main characteristics of quantitative research are: objectivity, the neutrality of the researcher, the use of structured instruments (such as closed questionnaires, scales and tests), the possibility of generalizing the results and the use of statistical techniques for data analysis. Gil (2019) states that this approach is especially suitable when seeking to measure phenomena, identify patterns, and make inferences about large populations.

The stages of quantitative research usually involve: definition of the problem and hypotheses, literature review, definition of variables, choice of collection instruments,

application of instruments, tabulation of data, statistical analysis and interpretation of results. These steps ensure greater methodological rigor to the study.

Quantitative research is widely used in areas such as administration, economics, health, education, engineering, and exact sciences, and is appropriate for survey studies, experimental research, and correlational research.

2.3 MIXED METHODS

Mixed Methods Research, also known as Mixed Methods Research, is characterized by the integration of qualitative and quantitative approaches in the same study, enabling a broader and deeper understanding of the phenomenon investigated. According to Creswell and Plano Clark (2007), this type of research allows the combination of numerical and narrative data, favoring the triangulation of results and increasing the reliability of the analyses.

In the debate presented by Minayo and Sanches (1993), the complementarity between quantitative and qualitative methods is defended as essential for a more complete investigation in public health. While the quantitative approach operates at observable and measurable levels, such as epidemiological data and health indicators, the qualitative approach delves into the meanings, intentions, and subjective contexts of social actors. This distinction implies the possibility of methodological integration, in which each approach contributes with its specificities to the understanding of social reality.

Thus, mixed research emerges as a methodological strategy that overcomes the false dichotomy between methods, articulating statistical generalization with interpretative depth. As suggested in the article, the quantitative study can generate questions for qualitative investigation, and vice versa, promoting a more dialectical and multidimensional analysis. This integration enriches the investigation and reflects a more realistic and comprehensive view of health phenomena, aligning with the principle that both approaches are necessary (Minayo & Sanches, 1993).

For these authors, the main advantage of mixed research is the possibility of compensating for the limitations of one approach with the potential of the other. While quantitative research offers generalization and statistical precision, qualitative research provides interpretive depth and contextual understanding.

There are different mixed survey models. Among the main ones, the following stand out:

- a) Convergent model, in which qualitative and quantitative data are collected simultaneously and analyzed in an integrated manner;
- b) Explanatory sequential model, in which the quantitative stage occurs first, followed by the qualitative one to deepen the results;
- c) Exploratory sequential model, in which qualitative research precedes quantitative research, helping in the construction of instruments and hypotheses.

According to Sampieri, Collado and Lucio (2013), mixed research requires greater methodological mastery from the researcher, as it implies planning, executing and integrating two distinct approaches in a single research design. This modality has been widely used in educational, social, health and public policy evaluations.

Therefore, mixed research is configured as a robust and flexible approach, capable of expanding the possibilities of interpretation and strengthening the results of scientific investigation.

2.4 TYPES OF RESEARCH AND THEIR RELATIONSHIP WITH METHODOLOGICAL APPROACHES

In scientific methodology, it is essential to distinguish between the nature of the research (whether it is basic or applied), the technical procedures (how data is collected and analyzed) and the methodological approach (qualitative, quantitative or mixed). These dimensions are not mutually exclusive, but complementary, and can be combined in different ways according to the research problem and the objectives of the study (Lakatos; Marconi, 2017). This section explores these articulations, showing how the same type of research can be conducted under different approaches.

2.4.1 Basic and applied research: Articulations with the approaches

Basic research aims to generate new knowledge, without immediate concern for practical application, aiming at theoretical advancement and understanding of phenomena (Gil, 2019). Applied research, on the other hand, seeks to solve concrete problems, producing knowledge that can be used in specific contexts. Both can adopt any of the three methodological approaches.

Table 1

Examples of types of research according to purpose and methodological approach.

Purpose of the Research	Methodological Approach	Example
Basic Research	Qualitative	This study investigates, through interviews and discourse analysis, how the professional identities of teachers in initial training are constructed, focusing on the understanding of subjective and symbolic processes, with no intention of immediate intervention.
Basic Research	Quantitative	This study measures the correlation between hours of study and performance in standardized tests of high school students through questionnaires and statistical analysis, seeking to generalize patterns.
Basic Research	Mixed	Study that combines a (quantitative) survey to map student engagement profiles with focus groups (qualitative) to understand the motivations behind the different profiles, integrating the data to build a more robust theoretical typology.
Applied Research	Qualitative	Action research in a school to understand the local causes of school dropout, using participant observation and interviews with the community, aiming to propose a specific action plan.
Applied Research	Quantitative	Experimental study to test the effectiveness of a new educational software, comparing grades and retention rates between control and experimental groups.
Applied Research	Mixed	Evaluation of a government digital inclusion program that uses questionnaires to measure reach and satisfaction and qualitative case studies to understand impacts on the routine of families, integrating the results to recommend adjustments in the policy.

Source: Prepared from Gil (2019) with support from ChatGPT Business (2025).

2.4.2 Bibliographic and documentary research in the different approaches

Both bibliographic research (analysis of already published material) and documentary research (analysis of unpublished primary sources) are technical procedures that adapt to different approaches, depending on how the data are treated.

Qualitative bibliographic research: involves the interpretative and critical review of the literature, as a theoretical analysis of the concept of "curricular justice" in scientific articles, identifying nuances and constructing arguments (Gil, 2019).

Quantitative literature search: it is characterized by a systematic review with meta-analysis, where data from multiple primary studies are collected, coded, and submitted to statistical analysis to synthesize results and calculate effect sizes.

Mixed bibliographic research: it can integrate, for example, a meta-analysis (quantitative) with a thematic analysis of the discussions and limitations pointed out in the reviewed articles (qualitative), offering both a numerical and interpretative synthesis of the field.

Qualitative documentary research: hermeneutic analysis of teachers' class diaries or minutes of school councils, seeking to understand decision-making processes and organizational culture (Lakatos; Marconi, 2017).

Quantitative desk research: Coding and statistical analysis of data contained in medical records (e.g., frequency of diagnosis, length of hospital stay) or in educational administrative databases (e.g., pass rates by grade).

Mixed documentary research: a study that quantitatively analyzes the frequency of certain terms in a corpus of educational laws and, qualitatively, the context and argumentation in which these terms appear, to understand the evolution of political discourse.

2.4.3 Case study, survey and experimental research: Possible articulations

The most common technical procedures can also be planned under different methodological logics.

Qualitative case study: in-depth ethnographic investigation of a single school, using observation and interviews to understand its internal culture (Yin, 2015).

Quantitative case study: intensive statistical analysis of data from a single municipality (a "case") to model economic and educational factors, using regressions and other tests.

Mixed case study: research on an inclusion policy in a university that combines institutional data analysis (quantitative) with interviews with managers and students (qualitative), integrating the perspectives for a comprehensive evaluation.

Quantitative survey: the most traditional form, with closed questionnaires applied to a representative sample to generalize results (Fonseca, 2002).

Qualitative survey: less common, but possible, such as the application of questionnaires with extended open questions to a large group, whose answers are analyzed by content.

Mixed Survey: convergent model where the same group answers a questionnaire with scales (quantitative) and a set of open questions (qualitative), and the results are integrated for analysis.

Quantitative experimental research: the gold standard in the natural and health sciences, with control and experimental groups, randomization, and statistical analysis of results.

Qualitative experimental research: less common but possible design in social sciences, such as narrative or observational experiments where the focus is on understanding the processes and meanings attributed by participants to the experience.

Mixed experimental research: An experiment that measures objective outcomes (e.g., grades) and then conducts interviews with participants to understand their perceptions and experiences during the experiment (explanatory sequential model).

To illustrate how the same research theme can be conducted from different methodological perspectives, Chart 2 presents a concrete example related to the implementation of active methodologies in higher education, detailing how the formulation of the problem, the objectives, the procedures and the analysis vary according to the approach adopted.

Table 2

Implementation of active methodologies in higher education

Aspect	Qualitative Research	Quantitative Research	Mixed Research
Example title	"Teachers' perceptions about the challenges in the implementation of active methodologies in undergraduate courses"	"Impact of active methodologies on academic performance: an experimental study with university students"	"Implementation of active methodologies in higher education: a mixed analysis of perceptions and results"
General objective	Understand the experiences, challenges and meanings attributed by teachers to the adoption of active methodologies.	To measure the effect of the use of active methodologies on the final grades of university students.	Integrate quantitative data on academic performance with qualitative perceptions of professors and students about the implementation process.
Technical procedure	Field research with participant observation and semi-structured interviews.	Experimental research with control and experimental groups, application of pre and post-tests.	Field research (qualitative) + survey (quantitative) in a convergent model.
Instruments	Interview script, field diary, recordings.	Standardized questionnaires,	Mixed questionnaire (scales + open

Aspect	Qualitative Research	Quantitative Research	Mixed Research
		performance tests, Likert scales.	questions), interviews, document analysis.
Sample	15 professors from one institution (intentional sample).	200 students, randomized into two groups.	150 students (survey) + 10 teachers (interviews).
Data analysis	Thematic content analysis (Bardin).	Inferential statistics (t-test, ANOVA).	Descriptive statistical analysis + qualitative thematic analysis, with integration into the discussion.
Result example	Emerging categories: "institutional resistance", "inadequate training", "satisfaction with interaction".	Significant difference ($p < 0.05$) in the scores of the experimental group.	Triangulation: high student satisfaction (87%) related to the pedagogical flexibility perceived in the interviews.

Source: Prepared by the authors based on the theoretical references discussed.

The framework shows how the implementation of active methodologies in higher education can be approached from different methodological perspectives, each with specific objectives, procedures and forms of analysis. While the qualitative approach prioritizes the understanding of the experiences and meanings attributed by the actors involved, the quantitative approach focuses on measuring effects and testing causal relationships. The mixed approach, in turn, integrates these two dimensions, allowing not only to quantify results, but also to contextualize them based on the narratives and perceptions of the participants. This exemplification reinforces that the choice of approach should not be guided by the theme itself, but by the research questions and the types of understanding that are

intended to be achieved, as defended by Gil (2019) and Creswell and Plano Clark (2007). Thus, methodological clarity becomes fundamental for the coherence of the project and for the robustness of the results obtained.

2.4.4 Articulated synthesis: Differentiating technical procedures and methodological approaches

As demonstrated, the technical procedure defines the "how" the data is obtained, while the methodological approach defines the "how" it is treated and interprets these data. A case study is not inherently qualitative; A survey is not necessarily just quantitative. Chart 3 summarizes these possible articulations, with examples that illustrate the flexibility of research designs, showing that the same procedure can be conducted under different analytical logics, depending on the objectives and the treatment given to the data.

Table 3

Articulation between technical procedures and methodological approaches

Technical Procedure	Qualitative Approach (Example)	Quantitative Approach (Example)	Mixed Approach (Example)
Case Study	Ethnography of a school community.	Statistical analysis of municipal data (the municipality as a case).	Case of a policy: institutional data (QUANT) + interviews with beneficiaries (QUAL).
Survey	Questionnaire with open questions analyzed by content.	Questionnaire with Likert scales and statistical analysis.	Questionnaire with closed (QUANT) and open (QUAL) parts, integrated into the analysis.

Technical Procedure	Qualitative Approach (Example)	Quantitative Approach (Example)	Mixed Approach (Example)
Experimental Research	Observational experiment focused on interaction and perception.	Randomized controlled trials with outcome analysis.	Experiment with objective measures (QUANT) and post-test focus groups (QUAL).
Bibliographic Research	Theoretical-conceptual analysis of the literature.	Systematic review with meta-analysis.	Meta-analysis (QUANT) + critical analysis of the discussions in the articles (QUAL).
Desk Research	Discourse analysis of minutes or diaries.	Statistical analysis of historical series in archives.	Frequency analysis of terms (QUANT) and contextual analysis of their use (QUAL) in documents.

Source: Prepared by the authors, based on the authors cited. Note: The examples illustrate possibilities of articulation; The final definition depends on the objectives, treatment and integration of the data.

In addition to the relationship between procedures and approaches, it is also important to consider the nature of the research (basic or applied). Chart 4 integrates these three dimensions: approach, nature, and procedures.

Table 4

Relationship between research approach, nature and procedures

Approach	Nature of the Research	Possible Technical Procedures	Key features
Qualitative	Basic	Bibliographic research; documentary research; case study; ethnographic research; Field research	Emphasis on meanings, subjectivities, social contexts and interpretation of phenomena.
Qualitative	Applied	Case study; action research; participant research; Field research	Resolution of social, educational and institutional problems through an in-depth understanding of reality.
Quantitative	Basic	Bibliographic research; survey; experimental research; Correlational research	Use of numerical data, measurement of variables, statistical tests and generalization of results.
Quantitative	Applied	Survey; experimental research; Evaluative research	Focus on decision-making, evaluation of results, diagnosis and objective interventions.
Mixed	Basic	Combined literature search; case study with statistical data; Exploratory and descriptive research	Integration of qualitative and quantitative data to broaden the understanding of phenomena.

Approach	Nature of the Research	Possible Technical Procedures	Key features
Mixed	Applied	Case study with survey; evaluative research; educational research; Health Research	Complementarity between numbers and interpretations, strengthening analysis and decision-making.

Source: Prepared by the authors, based on Gil (2019), Lakatos and Marconi (2017), Creswell and Plano Clark (2007), Sampieri, Collado and Lucio (2013).

The qualitative, quantitative and mixed approaches are not to be confused with the nature or procedures of research, but are articulated in a complementary way, enabling different methodological combinations according to the objectives and the problem investigated. Thus, the same research can be, for example, basic or applied, bibliographic, documentary or case study, and also assume a qualitative, quantitative or mixed approach.

The methodological choice must be made in layers: first, the problem is defined and whether the nature is basic or applied; then, the most appropriate technical procedure to access the data is selected; and, finally, the approach (qualitative, quantitative or mixed) that will guide the analysis and interpretation is determined, ensuring internal coherence and scientific rigor to the research project.

2.5 COMPARATIVE ILLUSTRATIVE STUDY OF METHODOLOGICAL APPROACHES

To elucidate the epistemological and procedural distinctions between the qualitative, quantitative, and mixed approaches, this section presents an example applied to the same relevant educational problem: the factors that influence the permanence and learning of students in high school, with a focus on specific populations such as quilombola students. The comparative analysis demonstrates how the formulation of the problem, the objectives, the collection and the analysis of data are reconfigured according to the logic of each approach, as discussed by Creswell and Plano Clark (2013) and Sampieri, Collado and Lucio (2013).

All research must indisputably have a central research problem; We exemplify this one, to better clarify the reader: what are the factors that influence the permanence and

learning of students in the 1st grade of IFTO High School, with emphasis on populations in situations of social vulnerability, such as quilombola students? The choice of this theme is justified by its social and educational relevance, allowing us to illustrate how different approaches can shed light on different dimensions of the same complex phenomenon.

2.5.1 Quantitative Approach Research

Continuing, we have an example focusing on statistical associations, as it is a quantitative research. A good title option would be: factors associated with dropout and failure of students in the 1st grade of IFTO High School: a quantitative study. Thus, the general objective can be: to analyze, through quantitative data, the factors statistically associated with student dropout and failure.

The specific research problem would be: which socioeconomic, pedagogical and infrastructure variables (income, transportation, attendance, performance) present a significant correlation with dropout and failure rates? For data collection in a quantitative research, it is feasible to apply a structured questionnaire, with closed questions and scales (e.g., Likert), to a representative sample of approximately 200 students. Variables would include family income, commuting time, attendance, grades, internet access, and motivation.

For data analysis, the use of descriptive statistics (frequencies, means, standard deviations) and inferential statistics (correlations, chi-square, logistic regression) is recommended. The results are presented in tables and graphs, seeking to identify measurable patterns and relationships (Fonseca, 2002). Regarding the epistemological characterization, this approach, of a positivist nature, seeks objectivity, the generalization of the results to the population and the testing of predetermined hypotheses. Its strength lies in numerical precision and the identification of broad trends; their limitation, in the inability to grasp the meanings and contexts behind the numbers (Gil, 2019).

For a second example, focusing on a specific population, we would have the title: Factors associated with the permanence and learning of quilombola students in IFTO High School: a quantitative study, with the general objective of quantifying the relationship between living conditions, perception of discrimination and academic performance among quilombola students. The specific research problem would be: Is there a statistical association between the perception of racial discrimination (measured by scale), the conditions of transportation/income and the school performance of these students? The collection and analysis would be similar to the previous example, but with instruments adapted to capture

specific variables, such as perception of discrimination and access to retention policies, and the analysis would compare performance averages between groups (e.g., high vs. low index of perceived discrimination).

2.5.2 Qualitative Approach Research

On the other hand, the qualitative approach would focus on the perceptions and meanings attributed by the actors involved. An example would be entitled: perceptions of students and teachers about the factors that influence dropout and failure in the 1st grade of IFTO High School, with the general objective of understanding, from the perspectives of the actors involved, the meanings, challenges and dynamics that influence school (dis)continuity.

The specific research problem would be: how do students, teachers and managers interpret and experience the processes that lead to dropout and failure in the specific context of IFTO? Data collection would take place through semi-structured interviews, focus groups and participant observation with an intentional sample of 15 to 25 participants, where the focus is on depth, not on numerical representativeness.

Data analysis would be carried out through thematic content analysis (Bardin, 2016) or discourse analysis, involving transcription, coding, emergent categorization (e.g., "hostile school climate", "identity conflict", "lack of pedagogical support") and hermeneutic interpretation of the data (Minayo, 2009). The epistemological characterization here is interpretative or phenomenological based, prioritizing depth, contextualization, and understanding of social processes, without seeking statistical generalizations, but offering a dense and analytical description of the phenomenon in its natural context (Bogdan; Biklen, 1994).

Another example, focusing on the quilombola experience, could be entitled: Here inside and outside: narratives of quilombola students about the challenges of permanence and learning in IFTO High School, with the general objective of analyzing the identity narratives and social experiences of quilombola students in the institutional school environment. The specific research problem would be: how do identity trajectories, cultural encounters and disagreements, and experiences of (in)visibility impact the process of permanence and learning? The collection and analysis would use narrative interviews, oral history or discussion groups, with the analysis focused on the construction of meanings about race, belonging and education, going beyond material factors.

2.5.3 Mixed Approach Research (Qualitative + Quantitative)

Mixed research, on the other hand, is characterized by the planned and interpretative integration of qualitative and quantitative approaches in a single study, aiming at a more comprehensive understanding of what would be possible with a single approach (Creswell; Clark Plan, 2007). According to Sampieri, Collado and Lucio (2013), its main advantage is the methodological triangulation, which compensates for the limitations of one approach with the strengths of the other.

Among the main models, the explanatory sequential (QUANT → QUAL) stand out, where the quantitative phase identifies patterns and relationships and the qualitative phase deepens and explains these results; the exploratory sequential phase (QUAL → QUANT), in which the qualitative phase explores a little-known phenomenon and substantiates instruments or hypotheses for the subsequent quantitative phase; and the convergent (parallel), where the two phases are conducted simultaneously and the results are integrated into the final interpretation.

An applied example of the explanatory sequential model would be entitled: Factors that influence the dropout of students from the 1st grade of IFTO High School: a mixed-methods study, with the integrative research problem: How do the factors quantitatively most associated with the intention to drop out manifest themselves and are experienced in the daily lives of students? In the quantitative phase, a survey is applied with 200 students, whose statistical analysis reveals that 42% of students point to "problems with transport" as the main barrier to permanence, this being the most frequent variable.

In the qualitative phase, semi-structured interviews are conducted with 15 students who indicated transportation as a critical problem, and the narratives reveal that the obstacle goes beyond the distance metric, involving insecurity on the way, constant vehicle delays, overcrowding, and the resulting physical and mental fatigue.

Integration and triangulation, the central stage of the mixed research, qualifies and contextualizes the quantitative data: the number "42%" answers "what" and "how much", while the interviews answer "how" and "why" this fact is decisive. The integrated interpretation concludes that transportation-related evasion is not a mere logistical problem, but a psychosocial phenomenon that undermines motivation, increases absenteeism, and generates a feeling of helplessness. This dialogical articulation between the numerical and the narrative is what effectively characterizes the research as mixed.

It is a common mistake, even in academic papers, to consider a survey as mixed due to the simple joint presence of numbers and words. Mixed research requires: intentional planning of the two components in the research design; specific and rigorous data collection for each approach; own analysis for each data set; and explicit stage of integration in interpretation, where one piece of data illuminates, complements, expands or questions the other.

A qualitative survey that only enumerates frequencies in its categories (e.g., "80% of respondents mentioned lack of faculty support") is making use of an internal descriptive quantification, but is not conducting a mixed survey. The absence of an integrated design, valid quantitative instruments and statistical analysis prevents this classification. The example above of transportation illustrates precisely the difference between measuring a prevalence (42%) and integrating this measure with contextual meanings to generate a more robust conclusion.

Another example, following the sequential exploratory model with a quilombola focus, could be entitled: Factors of permanence and learning of quilombola students of IFTO: an exploratory mixed-methods study, with the general objective of developing and validating a quantitative instrument based on a preliminary qualitative understanding of the dimensions relevant to quilombola permanence.

The specific research problem would be: which constructs and dimensions, qualitatively identified as central to quilombola students, can be measured and validated on an expanded scale? The design would first involve a qualitative phase with interviews and focus groups to explore the theme, identifying categories such as "institutional discrimination", "identity strengthening" and "community support"; then, a development phase to build a questionnaire with scales based on these categories; and, finally, a quantitative phase with the application of the questionnaire to a larger sample to validate the constructs and test their relationships.

The presentation of these examples makes it clear that mixed research is not the simple juxtaposition of numbers and words. As Creswell and Plano Clark (2007) state, it requires an intentional integrated design, with clear phases and a final interpretation that dialogues with both types of data. It is a common mistake, as pointed out in the literature, to classify as mixed a qualitative research that only mentions descriptive frequencies (e.g., "10 of the 15 interviewees reported...").

Table 5 summarizes the key differences between the approaches in the context of the problem presented

Table 5

Comparison of Approaches in the Study of School Permanence

Aspect	Quantitative Approach	Qualitative Approach	Mixed Approach
Central Question	"What?" and "How much?" (Prevalence, association)	"How?" and "Why?" (Meaning, process)	Combines "What/How much?" with "How/Why?"
Epistemological Logic	Positivist, objectivist	Interpretive, constructivist	Pragmatic, integrative
Typical Design	Survey, experimental	Case study, ethnography	Sequential (explanatory/exploratory), Convergent
Main Result	Generalization, hypothesis testing	Contextual understanding, grounded theory	Extended explanation, triangulation
Example in IFTO	Correlation between income and dropout	Meaning of dropout for the student	Explain how low income leads to dropout

Source: Prepared by the authors based on the theoretical frameworks discussed (Gil, 2019; Lakatos & Marconi, 2017).

Therefore, the choice between these approaches should be guided not by fads, but by a rigorous reflection on which set of questions and which type of understanding best meets the objectives of the research, thus ensuring the methodological rigor essential to quality scientific production, especially in complex areas such as Education.

Table 6

Classification of the types of research according to the nature, objectives and technical procedures

As to Nature	Regarding the Objectives	Regarding Technical Procedures
Basic Research	Exploratory	Case Study
(Generates knowledge)	Descriptive	Participant Research
	Explanatory	Ex-Post-Facto Research
Applied Research		Desk Research
(Generates products/processes)		Bibliographic Research
		Experimental Research
		Operations Research

Source: Prepared by the authors based on the theoretical frameworks discussed (Gil, 2019; Lakatos & Marconi, 2017).

This table systematizes how these categories are articulated and highlights the flexibility and complementarity of the research designs, reinforcing that the methodological choice must be coherent with the problem and the objectives of the investigation.

3 METHODOLOGY

The present study is characterized as a bibliographic research, with a qualitative approach and a descriptive-analytical nature, whose objective is to understand, discuss and systematize the different methodological approaches of scientific research, qualitative, quantitative and mixed, based on the analysis of consolidated academic productions in the area.

Bibliographic research was adopted because it enables the survey, reading, analysis and interpretation of already published works, such as books, scientific articles, theses and dissertations, allowing the researcher to come into direct contact with the knowledge produced on a given topic, as highlighted by Gil (2019) and Lakatos and Marconi (2017). This type of research is especially suitable when seeking to understand concepts, theoretical foundations, methodological classifications, and different epistemological perspectives.

The qualitative approach was chosen due to the interpretative character of the study, since the focus of the investigation is not on the measurement of numerical data, but on the understanding of the meanings, conceptions, characteristics and purposes attributed to the research approaches by the different authors analyzed. In this sense, the analysis favors the critical interpretation of the texts, conceptual categories and theoretical arguments, according to the assumptions of qualitative research defended by Minayo (2009).

As for the descriptive-analytical nature, the study seeks, initially, to describe the main characteristics of the qualitative, quantitative and mixed approaches, and, later, to analyze them in a comparative way, evidencing their differences, approximations, limits and potentialities. The analytical dimension allows the concepts to be presented, as well as to interpret them in the light of the specialized literature and reviewed empirical studies.

The selection of bibliographic material was based on criteria of thematic relevance, scientific rigor and recurrence of citation in the area of research methodology, prioritizing classic and contemporary authors widely used in the academic environment, such as Gil (2019), Minayo (2009), Creswell and Plano Clark (2007), Gatti (2012) and Sampieri, Collado and Lucio (2013). In addition, scientific articles published in indexed journals, especially in the areas of education, social sciences, and health, which explicitly presented the use of qualitative, quantitative, or mixed approaches were included.

The searches were carried out in academic databases and institutional repositories, such as SciELO, Google Scholar and repositories of public universities, using descriptors such as: research methodology, qualitative research, quantitative research, mixed research and mixed methods. After the initial survey, the titles, abstracts and, later, the full texts were read, selecting only the studies that presented direct adherence to the objectives of this research.

The data analysis was developed through interpretative and comparative reading of the selected works, seeking to identify how each author conceives the research approaches, which theoretical foundations are mobilized, which methodological procedures are valued and how these approaches are applied in empirical studies. Then, the main elements were organized into analytical categories, such as: research objectives, type of data, collection instruments, forms of analysis and purposes of the study.

In addition, the empirical studies analyzed were classified according to the approach adopted (qualitative, quantitative or mixed), allowing the construction of a comparative

synthesis table, which systematizes the main methodological elements observed in each type of research.

4 DATA ANALYSIS AND DISCUSSION

The discussion of the data obtained from the selection and examination of scientific articles that used the qualitative, quantitative and mixed approaches is presented. The analysis was conducted in an interpretative and comparative way, in the light of the theoretical references presented in the Theoretical Foundation, seeking to identify how these approaches have been effectively applied in scientific production and how their main methodological characteristics are confirmed in practice.

4.1 ANALYSIS OF STUDIES WITH A QUALITATIVE APPROACH

The studies analyzed, based on the qualitative approach, have as a central characteristic the search for an in-depth understanding of the phenomena in their natural contexts, considering the meanings, perceptions, social relations and processes experienced by the subjects. According to Minayo (2014), qualitative research works with the universe of senses, values, beliefs and attitudes, aspects that cannot be reduced to numerical data. This definition is confirmed in the studies examined, which prioritize the interpretation of social reality based on human experiences.

In the work 'The methodological construction of research in education', Gatti (2010) highlights that qualitative research plays a central role in educational investigations, especially because it allows the understanding of pedagogical practices, institutional relations and subjectivities involved in the educational process. For the author, unlike positivist approaches, qualitative research recognizes the complexity of the educational field and values the interaction between researcher and research subjects, an aspect also evidenced in the studies analyzed.

Similarly, Lüdke and André (2013) highlight that qualitative research in education values the natural environment as a direct source of data and the interaction between researcher and participants, fundamental aspects for understanding educational processes in their complexity.

Another recurrent element in qualitative studies is the use of flexible data collection instruments, such as semi-structured interviews, participant observation, document analysis, and focus groups. According to Bogdan and Biklen (1994), these instruments allow the

researcher to capture reality in a more sensitive and contextualized way, since the natural environment is the main source of data. In the studies examined, this centrality of the context and the valorization of the detailed description of the investigated phenomena are clearly perceived.

In the article published in the journal *Ciência & Saúde Coletiva*, Nagai and Queiroz (2011) use the qualitative approach to understand phenomena related to the insertion of complementary and alternative medicine in the basic network of health services. The study shows that this methodology is not restricted to the educational field, but is also widely used in the health sciences and social sciences. Through the analysis of the participants' narratives, the authors were able to apprehend social, subjective and institutional dimensions of the investigated phenomenon, aspects that would hardly be captured through exclusively quantitative methods.

When comparing the conceptions of Minayo (2014), Gatti (2010) and Bogdan and Biklen (1994), a theoretical convergence is observed regarding the understanding of qualitative research as an interpretative process, in which the researcher actively acts in the construction of knowledge. All authors argue that this type of research does not seek statistical generalizations, but rather a deep understanding of the phenomena in their complexity, which is confirmed in the studies analyzed.

In general, the analysis of the works shows that qualitative research is especially indicated when the objective of the study is to understand social, educational, cultural or institutional processes in depth. As Gil (2019) points out, this approach is appropriate when one wants to explore little-known realities, investigate perceptions, behaviors, and interactions, or understand meanings attributed by the subjects. Thus, the studies analyzed confirm, in practice, the theoretical foundations discussed in the grounds of this article.

4.2 ANALYSIS OF STUDIES WITH A QUANTITATIVE APPROACH

Studies classified as quantitative are generally characterized by the predominant use of structured data collection instruments, such as closed questionnaires, scales, standardized tests, and objective forms, as well as by the application of statistical procedures for analyzing the results. This approach focuses mainly on the measurement of variables, the identification of patterns, trends, and relationships between phenomena, in addition to the possibility of generalizing the results to larger populations, as highlighted by Gil (2019) and Lakatos and Marconi (2017).

In the studies analyzed with this approach, it is observed that the research objectives were directly related to the quantification of behaviors, opinions, levels of satisfaction, academic or organizational performance. This type of design confirms the conception presented by Fonseca (2002), when he states that quantitative research is based on objectivity, on the standardization of instruments and on the search for measurable and replicable results.

Another recurrent aspect in quantitative studies is the clear definition of the sample and the variables investigated, as well as the control, albeit partial, of external influences. The data, after being collected, are organized in spreadsheets, tables and graphs, and are submitted to descriptive and, in some cases, inferential statistical analyses, such as correlation, regression and significance tests. This procedural rigor reinforces the idea that quantitative research seeks to minimize the subjectivity of the researcher in the analysis of the results.

The methodological literature, such as that presented by Sampieri, Collado and Lucio (2013), highlights that quantitative research is especially appropriate when the researcher wants to test hypotheses, verify relationships between variables or evaluate the impact of certain interventions. The studies analyzed confirm this theoretical orientation, as they present formal structures for data collection, analysis and interpretation, aligned with previously defined statistical models.

However, it is also observed that, although quantitative research offers numerical precision and the possibility of generalization, it has limitations in terms of a deep understanding of the meanings, motivations and subjective experiences of the participants. This limitation is widely discussed by Gil (2019), when he states that the objectivity of numbers is not always sufficient to explain the complexity of social and educational phenomena.

In general, the quantitative studies analyzed confirm that this approach is indicated when it comes to measurement, control of variables, objectivity, and the possibility of comparison between groups. The results reinforce the theoretical foundations of this approach presented in the Theoretical Foundation, evidencing its relevance for investigations that demand statistical precision, but also pointing out the need for articulation with other approaches when the objective of the research requires greater interpretative depth.

4.3 ANALYSIS OF MIXED APPROACH STUDIES

The studies classified as belonging to the mixed approach show the systematic integration between quantitative and qualitative data, both in the collection process and in the analysis and interpretation of the results. Contrary to what is often assumed in the academic environment, mixed research is not characterized only by the simultaneous presence of numbers and speeches, but by the methodological articulation planned between the two approaches, as highlighted by Creswell and Plano Clark (2007).

The literature points out that mixed methods can take on different designs, among which the sequential models (explanatory and exploratory) and the convergent model stand out. In the explanatory sequential model, for example, first the quantitative collection and analysis takes place and, later, the qualitative stage is used to deepen or explain the numerical results. In the convergent model, the two approaches are applied simultaneously, and the results are integrated in the interpretative phase.

In the studies analyzed, it is observed that those that are really configured as mixed studies present, in an explicit way, the planning of the two approaches, the clear definition of the steps, the justification for the use of methodological integration and the explanation of how the data were articulated in the final analysis. This rigor confirms the conception of Sampieri, Collado and Lucio (2013), according to which mixed research requires greater methodological mastery, precisely because it operates in two distinct epistemological fields.

However, it was also found that there is significant conceptual confusion regarding the definition of mixed research. Many studies use the term "mixed" only because they present some numerical data together with descriptive information, without there being, in fact, structured methodological integration. This practice reinforces the misconception pointed out in the literature that not all research that uses quantitative and qualitative data can be automatically classified as mixed.

According to Creswell and Plano Clark (2007), for a study to be effectively considered mixed, it must comply, at least: (a) the collection of quantitative and qualitative data; (b) the analysis of both types of data; (c) the explicit integration between these data at some point in the research; and (d) the theoretical and methodological justification for the adoption of this approach. The absence of any of these stages compromises the characterization of the research as mixed.

Thus, the analysis of the studies shows that the mixed approach, when correctly applied, significantly expands the explanatory potential of the research, by allowing the

combination of the objectivity of the numerical data with the interpretative depth of the qualitative analyses. On the other hand, it also reveals that the lack of conceptual clarity and methodological rigor is still one of the main challenges for the proper use of mixed methods in the scientific field.

4.4 COMPARATIVE SYNTHESIS OF APPROACHES IN THE ANALYZED STUDIES

The analysis of the studies shows that the qualitative, quantitative and mixed approaches have distinct but complementary applicabilities. While qualitative studies prioritize the understanding of the meanings, perceptions, and experiences of subjects in their social contexts, quantitative studies focus on the objective measurement of variables and the possibility of generalizing the results. Mixed studies, on the other hand, articulate these two dimensions, expanding the interpretative and explanatory possibilities of the phenomena investigated.

It is observed, therefore, that the studies analyzed confirm, in practice, the theoretical bases discussed throughout this article. It is evident that the choice of the methodological approach should not occur arbitrarily, but in line with the objectives of the research, the problem investigated and the type of data necessary for the analysis, as defended by Gil (2019), Minayo (2014) and Creswell and Plano Clark (2007). Thus, each method responds to different investigative demands.

This synthesis reinforces the importance of the researcher mastering the conceptual, epistemological and operational differences between the approaches, avoiding methodological mistakes and ensuring greater scientific rigor to academic productions. Clarity in the choice of method contributes directly to the internal coherence of the scientific work and to the validity of the results obtained.

The analysis of the literature reveals that the qualitative, quantitative and mixed approaches have different purposes, although they can be used in a complementary way. Qualitative research stands out for its ability to understand complex, subjective and contextualized phenomena, prioritizing the interpretation of meanings, values and social practices. Its flexible methods allow for a deeper understanding of the realities investigated.

On the other hand, quantitative research is based on the objective measurement of reality, using instruments capable of producing numerical data that can be statistically analyzed. Its focus is on verifying hypotheses, identifying patterns, and generalizing results, and is widely used in studies that require precision, control, and replicability.

Mixed research, in turn, is configured as an integrative proposal, bringing together the potentialities of qualitative and quantitative approaches. The literature points out that this methodology enables data triangulation, greater analytical richness, and reduction of biases, especially when a single type of data is not sufficient to explain a given phenomenon. Models such as the explanatory sequential, the exploratory sequential and the convergent are often cited as structured forms of articulation of this approach.

When comparing the three methodologies, it is observed that the conceptual confusion between students and researchers is mainly due to the lack of clarity regarding the objectives, characteristics and purposes of each method. It is often mistakenly believed that qualitative and quantitative are hierarchical or exclusionary approaches, when, in reality, they represent different epistemological perspectives for different research problems. The mixed approach, in turn, raises doubts due to the complexity of its application and the requirement for greater methodological mastery.

Thus, the analysis shows that an adequate understanding of the three approaches directly contributes to the coherent methodological choice in academic research, avoiding misunderstandings and strengthening scientific production. The conceptual and technical mastery of these methodologies expands the investigative possibilities and qualifies the results of the research.

5 FINAL CONSIDERATIONS

The present study showed that the qualitative, quantitative and mixed approaches have their own characteristics, distinct epistemological foundations and specific purposes in the field of scientific research. The literature analyzed demonstrates that the conceptual confusions often found in the academic environment are largely due to the superficial understanding of the particularities of each method and the mistaken belief that they are opposite, hierarchical or automatically complementary.

Qualitative research stands out for privileging the deep understanding of social, cultural and subjective phenomena, while quantitative research focuses on the objective measurement of data, the testing of hypotheses and the statistical generalization of results. The mixed methodology, on the other hand, integrates, in a planned and systematic way, elements from both perspectives, with the objective of broadening the understanding of the phenomena investigated, giving greater interpretative robustness to the results.

In this sense, it is essential to highlight that the mere presence of numerical data in a survey is not enough to characterize it as mixed. As stated by Creswell and Plano Clark (2007) and Sampieri, Collado and Lucio (2013), a research can only be considered of a mixed nature when there is intentional, planned and methodologically articulated integration between quantitative and qualitative data, in specific phases of the study (explanatory sequential, exploratory sequential or convergent), from collection to analysis and interpretation of the results.

In many essentially qualitative studies, numerical data may appear with a merely descriptive function, as a way of characterizing the participants, frequency of phenomena or initial organization of the data, without this altering their epistemological nature. In these cases, the numbers do not fulfill an explanatory, inferential or hypothesis testing function, which prevents their classification as mixed research. Thus, the punctual use of numbers in qualitative research does not imply, by itself, the adoption of the mixed methodology.

On the other hand, in mixed research, quantitative data are used for specific purposes, such as expanding the explanation of qualitative results, validating findings, comparing groups, identifying patterns, or producing generalizations that complement interpretative analyses. Likewise, qualitative data play an essential role in understanding the meanings, contexts and experiences underlying the numerical results, configuring a relationship of effective methodological complementarity.

By clarifying these differences, this article contributes to the improvement of the methodological understanding of students and researchers, supporting more coherent choices in the planning and execution of scientific research. It is recommended that future studies deepen this discussion through concrete empirical examples, especially in the field of education, in order to strengthen methodological training and avoid recurrent mistakes in the classification of research approaches.

ABSTRACT

Introduction: Caffeine is one of the most studied and widely used ergogenic substances by endurance athletes, with consistent evidence of improved physical performance. Objective: To conduct a systematic review of the literature on the effects of caffeine supplementation on the performance of athletes in endurance sports, analyzing dosages, timing of administration, mechanisms of action, and possible adverse effects.

Methods: A systematic search was performed in PubMed, Scopus, Web of Science, and SPORTDiscus databases, using the descriptors 'caffeine', 'endurance', 'performance', 'supplementation', and 'athletes'. Randomized clinical trials published between 2010 and 2024 involving endurance athletes were included.

Results: 47 studies met the inclusion criteria. Caffeine supplementation (3-6 mg/kg) significantly improved performance in endurance events ($p < 0.05$), with an average increase of 2-4% in time to exhaustion and a 1-3% reduction in race time. Mechanisms include adenosine receptor antagonism, increased fatty acid mobilization, reduced perception of effort, and improved muscle contractility. Adverse effects were reported at doses above 9 mg/kg.

Conclusion: Caffeine is an effective and safe ergogenic aid for endurance athletes when used at doses of 3-6 mg/kg, administered 45-60 minutes before exercise. Future studies should investigate individual variability in caffeine response and supplementation periodization strategies.

Keywords: Caffeine. Athletic Performance. Endurance Sports. Nutritional Supplementation. Ergogenic Aids. Exercise Physiology.

RESUMO

Introdução: A cafeína é uma das substâncias ergogênicas mais estudadas e amplamente utilizadas por atletas de resistência, com evidências consistentes de melhora no desempenho físico. Objetivo: Realizar uma revisão sistemática da literatura sobre os efeitos da suplementação de cafeína no desempenho de atletas em esportes de resistência,

analizando dosagens, timing de administração, mecanismos de ação e possíveis efeitos adversos.

Métodos: Foi realizada uma busca sistemática nas bases de dados PubMed, Scopus, Web of Science e SPORTDiscus, utilizando os descritores 'caffeine', 'endurance', 'performance', 'supplementation' e 'athletes'. Foram incluídos ensaios clínicos randomizados publicados entre 2010 e 2024, envolvendo atletas de resistência.

Resultados: Foram identificados 47 estudos que atenderam aos critérios de inclusão. A suplementação com cafeína (3-6 mg/kg) demonstrou melhorar significativamente o desempenho em provas de resistência ($p < 0.05$), com aumento médio de 2-4% no tempo até a exaustão e redução de 1-3% no tempo de prova. Os mecanismos incluem antagonismo dos receptores de adenosina, aumento da mobilização de ácidos graxos, redução da percepção de esforço e melhora da contratilidade muscular. Efeitos adversos foram relatados em doses superiores a 9 mg/kg.

Conclusão: A cafeína é um ergogênico eficaz e seguro para atletas de resistência quando utilizada em doses de 3-6 mg/kg, administrada 45-60 minutos antes do exercício. Estudos futuros devem investigar a variabilidade individual na resposta à cafeína e estratégias de periodização da suplementação.

RESUMEN

Introducción: La cafeína es una de las sustancias ergogénicas más estudiadas y ampliamente utilizadas por atletas de resistencia, con evidencia consistente de mejora del rendimiento físico.

Objetivo: Realizar una revisión sistemática de la literatura sobre los efectos de la suplementación con cafeína en el rendimiento de atletas de resistencia, analizando dosis, momento de administración, mecanismos de acción y posibles efectos adversos.

Métodos: Se realizó una búsqueda sistemática en las bases de datos PubMed, Scopus, Web of Science y SPORTDiscus, utilizando los descriptores “caffeine”, “endurance”, “performance”, “supplementation” y “athletes”. Se incluyeron ensayos clínicos aleatorizados publicados entre 2010 y 2024, que involucraron atletas de resistencia.

Resultados: Se identificaron 47 estudios que cumplieron con los criterios de inclusión. La suplementación con cafeína (3–6 mg/kg) mejoró significativamente el rendimiento en pruebas de resistencia ($p < 0.05$), con un aumento promedio del 2–4% en el tiempo hasta el agotamiento y una reducción del 1–3% en el tiempo de prueba. Los mecanismos incluyen el antagonismo de los receptores de adenosina, el aumento de la movilización de ácidos grasos, la reducción de la percepción del esfuerzo y la mejora de la contractilidad muscular. Se reportaron efectos adversos con dosis superiores a 9 mg/kg.

Conclusión: La cafeína es un ergogénico eficaz y seguro para atletas de resistencia cuando se utiliza en dosis de 3–6 mg/kg, administrada 45–60 minutos antes del ejercicio. Estudios futuros deben investigar la variabilidad individual en la respuesta a la cafeína y las estrategias de periodización de la suplementación.

1 INTRODUCTION

The search for nutritional strategies that optimize athletic performance has been a constant in sports science. Among the various ergogenic substances available, caffeine stands out as one of the most studied and widely used by athletes of different modalities, especially in endurance sports¹. Caffeine (1,3,7-trimethylxanthine) is a naturally occurring alkaloid found in a variety of plants, including coffee beans, tea leaves, cocoa, and guarana, and is consumed worldwide in beverages and supplements².

Historically, caffeine was included in the list of prohibited substances by the World Anti-Doping Agency (WADA) until 2004, when it was removed due to the difficulty in establishing clear boundaries between therapeutic use and doping³. Since then, its use has become even more prevalent among athletes, with studies indicating that up to 74% of elite athletes consume caffeine before or during competitions⁴.

Endurance sports, characterized by prolonged activities of moderate to high intensity, such as cycling, long-distance running, triathlon and swimming, impose significant metabolic demands on the body⁵. In this context, caffeine has demonstrated beneficial effects through multiple physiological mechanisms, including antagonism of adenosine receptors in the central nervous system, increased mobilization of free fatty acids, improved muscle contractility, and reduced subjective perception of exertion⁶⁻⁷.

Despite the extensive body of evidence on the ergogenic effects of caffeine, there are still important issues to be elucidated, such as optimal dosage, timing of administration, individual variability in response, the effects of habituation to chronic consumption, and possible interactions with other nutritional strategies⁸. In addition, the form of administration (capsules, coffee, gummies, gels) may influence the bioavailability and, consequently, the ergogenic effects⁹.

In view of this scenario, it is essential to carry out systematic reviews that synthesize the most recent scientific evidence on caffeine supplementation in endurance athletes, providing subsidies for the clinical practice of sports nutritionists, sports physicians and physical education professionals. Therefore, the aim of this study is to perform a systematic review of the literature on the effects of caffeine supplementation on the performance of athletes in endurance sports, analyzing dosages, timing of administration, mechanisms of action, and possible adverse effects.

2 METHODS

2.1 SEARCH STRATEGY

This systematic review was conducted following the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses)¹⁰ guidelines. The search was carried out in the electronic databases PubMed/MEDLINE, Scopus, Web of Science and SPORTDiscus, covering the period from January 2010 to December 2024. The search strategy used the following descriptors in English and their combinations: 'caffeine' OR '1,3,7-trimethylxanthine' AND 'endurance' OR 'aerobic' OR 'resistance exercise' AND 'performance' OR 'athletic performance' AND 'supplementation' OR 'ergogenic aid' AND 'athletes' OR 'trained individuals'.

2.2 ELIGIBILITY CRITERIA

We included randomized, double-blind, placebo-controlled trials published in English, Portuguese, or Spanish that investigated the effects of caffeine supplementation on the performance of athletes or individuals trained in endurance sports. The specific inclusion criteria were: (1) participants aged ≥ 18 years; (2) recreational, amateur or professional athletes; (3) intervention with caffeine in any form of administration; (4) evaluation of at least one outcome related to physical performance (time to exhaustion, race time, average power, oxygen consumption, subjective perception of exertion). Animal studies, narrative reviews, case studies, congress abstracts, and studies that combined caffeine with other ergogenic substances without a control group isolated for caffeine were excluded.

2.3 SELECTION OF STUDIES AND DATA EXTRACTION

Two independent reviewers performed the initial screening of titles and abstracts, followed by the complete reading of potentially eligible articles. Disagreements were resolved by consensus or by consulting a third reviewer. The extracted data included: participants' characteristics (age, gender, level of training), supplementation protocol (dose, timing, form of administration), type of exercise, performance outcomes, reported adverse effects, and main conclusions.

2.4 EVALUATION OF METHODOLOGICAL QUALITY

The methodological quality of the included studies was assessed using the PEDro (Physiotherapy Evidence Database) scale, which scores studies from 0 to 10 based on

criteria such as randomisation, blinding, intention-to-treat analysis and statistical adequacy¹¹. Studies with a score ≥ 6 were considered to be of high methodological quality.

3 RESULTS

3.1 SELECTION OF STUDIES

The initial search identified 1,247 records in the databases. After removing duplicates (n=312), 935 titles and abstracts were screened, of which 128 articles were selected for full reading. Of these, 47 studies met the inclusion criteria and were included in this systematic review. The main reasons for exclusion were: no placebo control group (n=34), combination of caffeine with other substances without an isolated group (n=21), non-athletic population (n=15), and non-performance outcomes (n=11).

3.2 STUDY CHARACTERISTICS

The 47 included studies involved a total of 1,089 participants (mean age: 26.4 ± 4.2 years), 78% of whom were male. The sports modalities investigated included cycling (n=21), running (n=15), triathlon (n=6), swimming (n=3) and rowing (n=2). The majority of studies (n=39, 83%) used anhydrous caffeine capsules, while 8 studies used coffee, gels or chewing gum. The dose of caffeine ranged from 2 to 9 mg/kg body weight, with most studies (n=32, 68%) using doses between 3-6 mg/kg. The timing of administration ranged from 30 to 90 minutes before exercise, with a predominance of 45-60 minutes (n=35, 74%).

3.3 EFFECTS ON PERFORMANCE

Caffeine supplementation demonstrated significant ergogenic effects in 42 of the 47 included studies (89.4%). The main findings were:

- Time to exhaustion: Mean increase of 2.8% (95% CI: 1.9-3.7%, $p < 0.001$) in time-to-exhaustion tests at intensities between 70-85% of VO_2max (n=18 studies).
- Race time: Average reduction of 1.7% (95% CI: 1.1-2.3%, $p < 0.001$) in time to complete fixed distances in cycling and running (n=24 studies).
- Average power: 3.1% increase (95% CI: 2.2-4.0%, $p < 0.001$) in average power during time trial tests (n=15 studies).
- Subjective perception of effort: Significant reduction ($p < 0.05$) in the Borg scale in 28 studies (59.6%).

- VO_2max : There was no significant change in maximal oxygen uptake ($p>0.05$), suggesting that ergogenic effects are not mediated by changes in maximal aerobic capacity.

3.4 DOSE-RESPONSE RELATIONSHIP

The analysis of the dose-response relationship revealed that doses of 3-6 mg/kg produced the greatest ergogenic effects with the lowest incidence of adverse effects. Doses below 3 mg/kg ($n=6$ studies) have shown inconsistent effects, with only 50% of studies reporting significant improvement in performance. Doses greater than 6 mg/kg ($n=9$ studies) did not provide significant additional benefit and were associated with a higher incidence of adverse effects, including tremor, anxiety, tachycardia, and gastrointestinal disturbances.

3.5 MECHANISMS OF ACTION

Studies have identified multiple mechanisms by which caffeine exerts its ergogenic effects:

1. Antagonism of adenosine A1 and A2A receptors in the central nervous system, reducing the feeling of fatigue and increasing alertness¹²⁻¹³.
2. Increased mobilization of free fatty acids from adipose tissue, potentially sparing muscle glycogen during prolonged exercise¹⁴.
3. Improvement of muscle contractility by increasing calcium release from the sarcoplasmic reticulum¹⁵.
4. Reduction of the subjective perception of exertion, allowing athletes to maintain higher intensities for prolonged periods¹⁶.
5. Effects on the autonomic nervous system, with increased sympathetic activity and release of catecholamines¹⁷.

3.6 INDIVIDUAL VARIABILITY

Eight studies specifically investigated individual variability in caffeine response. The main factors identified were:

- Genetic polymorphisms: Variations in the CYP1A2 gene, responsible for caffeine metabolism, influence the ergogenic response. Fast metabolizers (genotype AA) showed greater benefits compared to slow metabolizers (AC/CC genotypes)¹⁸⁻¹⁹.

- Habituation: Habitual caffeine consumers (>300 mg/day) demonstrated attenuated ergogenic response in 4 studies, although 3 studies found no significant differences^{20–21}.
- Gender: Three studies have suggested that women may be more sensitive to the effects of caffeine, possibly due to differences in body composition and hormone metabolism.

3.7 ADVERSE EFFECTS

Adverse effects were reported in 23 studies (48.9%), being more frequent at doses above 6 mg/kg. The most common effects included:

- Gastrointestinal disturbances (nausea, abdominal discomfort): 18.7% of participants
 - Anxiety and nervousness: 12.3%
 - Tremors: 9.8%
 - Tachycardia: 8.2%
 - Post-exercise insomnia: 15.4% (when administered <6 hours before sleep)
- No serious adverse events were reported. Most effects were classified as mild to moderate and did not result in discontinuation of study participation.

3.8 METHODOLOGICAL QUALITY

The mean PEDro score was 7.2 ± 1.3 (range: 5-10), indicating good overall methodological quality of the included studies. Forty studies (85.1%) obtained a score ≥ 6 , being classified as high quality. The main strengths were adequate randomization (100% of studies), blinding of participants and raters (95.7%), and appropriate statistical analysis (91.5%). The most common limitations were the absence of intention-to-treat analysis (31.9% of the studies) and lack of blinding of the therapists (25.5%).

4 DISCUSSION

This systematic review synthesized the evidence from 47 randomized controlled trials on the effects of caffeine supplementation on the performance of athletes in endurance sports. The results consistently demonstrate that caffeine, when administered at doses of 3-6 mg/kg approximately 45-60 minutes before exercise, produces significant ergogenic effects, with a 2-4% improvement in time to exhaustion and a 1-3% reduction in race time. These findings are particularly relevant in the competitive context, where 1-2% differences in performance can determine wins or losses²³.

The mechanisms by which caffeine exerts its ergogenic effects are multifactorial and complex. Antagonism of adenosine receptors in the central nervous system is considered the primary mechanism, reducing the perception of fatigue and increasing alertness^{12–13}. Functional neuroimaging studies have shown that caffeine increases the activation of brain areas related to motor control and motivation during exercise²⁴. In addition, caffeine promotes the mobilization of free fatty acids, which could theoretically spare muscle glycogen during prolonged exercise¹⁴. However, recent studies question the practical relevance of this mechanism, suggesting that the core effects are predominant²⁵.

The dose-response relationship observed in this review indicates that doses of 3-6 mg/kg represent the ideal balance between efficacy and safety. Lower doses may be insufficient to produce consistent ergogenic effects, while doses higher than 6 mg/kg provide no additional benefit and significantly increase the risk of adverse effects. These findings are consistent with the recommendations of the International Society of Sports Nutrition (ISSN), which suggests doses of 3-6 mg/kg as optimal for endurance athletes²⁶.

Individual variability in caffeine response is an important aspect that deserves attention. Polymorphisms in the CYP1A2 gene significantly influence caffeine metabolism and, consequently, its ergogenic efficacy^{18–19}. Fast metabolizers (genotype AA) show greater benefit, while slow metabolizers (AC/CC genotypes) may even experience negative effects on performance at high doses. This genetic information can be useful for personalizing supplementation strategies, although genetic testing is not yet widely accessible in sports practice.

The issue of habituation to chronic caffeine consumption remains controversial. While some studies suggest that habitual consumers develop tolerance to ergogenic effects²⁰, others have not found significant differences between habitual and nonhabitual consumers²¹. One potential strategy would be the periodization of caffeine consumption, with reduction or abstinence in periods of basic training and strategic use in important competitions. However, this approach requires more scientific investigation before it is widely recommended.

The safety profile of caffeine at ergogenic doses (3-6 mg/kg) has been shown to be favorable, with generally mild and transient adverse effects. However, healthcare professionals should be aware of specific contraindications, including cardiac arrhythmias, uncontrolled hypertension, anxiety disorders, and pregnancy. In addition, the timing of administration should consider the potential impact on sleep quality, especially when training or competitions take place in the afternoon or evening²⁷.

This review has some limitations that should be considered. First, heterogeneity in exercise protocols, populations studied, and forms of caffeine administration made it difficult to perform quantitative meta-analyses for some outcomes. Second, most studies predominantly included male participants, limiting the generalizability of findings to female athletes. Third, few studies have investigated the effects of caffeine in adverse environmental conditions (heat, altitude), which are relevant to many endurance competitions. Finally, most studies evaluated acute effects of supplementation, with a lack of data on long-term strategies and periodization.

5 PRACTICAL APPLICATIONS

Based on the reviewed evidence, the following practical recommendations can be established for endurance athletes and healthcare professionals:

1. Recommended dose: 3-6 mg/kg body weight, administered 45-60 minutes before exercise or competition.
2. Method of administration: Anhydrous caffeine capsules have shown greater consistency in effects, although coffee, gels, and gummies are also effective.
3. Individual test: Athletes should test supplementation during training before use in competitions, to assess tolerance and individual response.
4. Genetic consideration: When available, CYP1A2 genotyping can assist in personalization of the supplementation strategy.
5. Timing: Avoid administration <6 hours before the usual sleep schedule to minimize impacts on sleep quality.
6. Hydration: Maintain adequate hydration, as caffeine has a slight diuretic effect.
7. Monitoring: Professionals should monitor for possible adverse effects and adjust dosages as needed.
8. Education: Athletes should be educated about caffeine sources, dosages, and potential risks of overconsumption.

6 CONCLUSION

Caffeine is an effective and safe ergogenic for endurance athletes when used in doses of 3-6 mg/kg, administered 45-60 minutes before exercise. Ergogenic effects are primarily mediated by antagonism of adenosine receptors in the central nervous system, resulting in reduced perception of fatigue and improved physical performance. The magnitude of the

effects (2-4% improvement) is clinically relevant in the competitive context. Individual variability in response, influenced by genetic factors and habituation, requires a personalized approach. Adverse effects are generally mild and transient at recommended doses. Future studies should investigate periodization strategies, effects on female athletes, interactions with other nutritional strategies, and applicability in adverse environmental conditions. Healthcare professionals should consider caffeine supplementation as part of a comprehensive nutritional strategy for performance optimization in endurance sports.

ABSTRACT

Introduction: Dentoalveolar trauma refers to injuries affecting both hard and soft tissues, caused by various social, cultural, and even socioeconomic factors. The characteristics of these traumas in children are relatively uncommon due to pediatric physiology and anatomy. Dental treatment for pediatric patients must be carefully planned based on the child's age and the complexity of the specific case.

Methods: This research employed a mixed-methods approach, as it incorporated both quantitative and qualitative data. It followed a descriptive research design with a non-probability convenience sampling method. The sample consisted of 57 eighth-level dental students from San Gregorio de Portoviejo University. A literature review was conducted using scientific articles published in databases such as PubMed, Web of Science, Latindex, and SciELO.

Results: Of the 57 students surveyed, 32 were male and 25 were female. The study aimed to identify the most frequently observed type of malocclusion in their clinical practice. The results, ranked from most to least frequent based on the number of responses, were as follows: "Class I malocclusion" with 20 votes, "Class II Division 2 malocclusion" with 19 votes, "Class II Division 1 malocclusion" with [insert number] votes, and "Class III malocclusion" with 19 votes.

Conclusions: Primary dentition plays a crucial role in functions such as mastication, space maintenance for permanent teeth, and stimulation of maxillary growth.

RESUMO

Introdução: O trauma dentoalveolar refere-se a lesões que afetam tanto os tecidos duros quanto os tecidos moles, sendo causado por diversos fatores sociais, culturais e até socioeconômicos. As características desses traumas em crianças são relativamente incomuns devido à fisiologia e à anatomia pediátricas. O tratamento odontológico em pacientes pediátricos deve ser cuidadosamente planejado com base na idade da criança e na complexidade do caso específico.

Métodos: Esta pesquisa utilizou uma abordagem de métodos mistos, incorporando dados quantitativos e qualitativos. Adotou-se um delineamento de pesquisa descritiva, com amostragem não probabilística por conveniência. A amostra foi composta por 57 estudantes do oitavo nível do curso de Odontologia da Universidade San Gregorio de Portoviejo. Foi realizada uma revisão de literatura utilizando artigos científicos publicados em bases de dados como PubMed, Web of Science, Latindex e SciELO.

Resultados: Dos 57 estudantes entrevistados, 32 eram do sexo masculino e 25 do sexo feminino. O estudo teve como objetivo identificar o tipo de má oclusão mais frequentemente observado na prática clínica dos participantes. Os resultados, classificados do mais ao menos frequente com base no número de respostas, foram os seguintes: “Má oclusão Classe I”, com 20 votos; “Má oclusão Classe II Divisão 2”, com 19 votos; “Má oclusão Classe II Divisão 1”, com [inserir número] votos; e “Má oclusão Classe III”, com 19 votos.

Conclusões: A dentição decídua desempenha um papel fundamental em funções como a mastigação, a manutenção do espaço para os dentes permanentes e a estimulação do crescimento maxilar.

RESUMEN

Introducción: Los traumatismos dentoalveolares son lesiones de los tejidos duros y blandos provocados por diversos factores sociales, culturales, e incluso socioeconómicos. Las características de estos traumatismos en niños son poco comunes debido a la fisiología y anatomía pediátrica. El tratamiento odontológico que se debe aplicar a un paciente pediátrico debe establecerse bajo una planificación en base a la edad y a la complejidad del caso que presente.

Método: Está investigación tuvo un enfoque mixto, debido a que se basa en datos de naturaleza cuantitativa y cualitativa, con un tipo de investigación descriptiva, de estudio no probabilístico por conveniencia. La muestra estuvo conformada por 57 estudiantes de octavo nivel de la Universidad San Gregorio de Portoviejo. Se realizó una revisión bibliográfica de artículos científicos publicados en bases de datos como PubMed, Web of Science, Latindex, y SciELO.

Resultados: De la encuesta realizada a 57 estudiantes 32 de ellos pertenecen al género masculino y los 25 restantes al género femenino. se busca identificar cual es el tipo de maloclusión que se presenta con mayor frecuencia en sus clínicas odontológicas, obteniendo como resultados de mayor a menor con base en los votos adquiridos: con 20 votos

"maloclusión clase I", con 19 votos "maloclusión clase II división 2", con votos "maloclusión clase II división 1" y, con votos "maloclusión clase III".

Conclusiones: La dentición temporal desempeña funciones importantes, como la masticación, el mantenimiento del espacio para los dientes permanentes y el estímulo del crecimiento de los maxilares.

Palabras clave: Trauma. Oclusión. Mantenedor.

1 INTRODUCTION

Dentoalveolar trauma is injury to the hard and soft tissues caused by various social, cultural, and even socioeconomic factors. The characteristics of trauma in children are uncommon due to pediatric physiology and anatomy. The loss of the tooth as a result of Dentoalveolar trauma brings with it the inclination of the adjacent teeth, causing the loss of the necessary physiological space ^(1,2).

The dental treatment that should be applied to a pediatric patient must be established under a plan based on the age and complexity of the case presented, for this reason the international association of pediatric dentistry defines a series of possible conditions to develop in the deciduous dentition, however, the premature loss of teeth is established as the main consequence of the origin and progression of dental caries, because it acquires the ability to establish an imbalance process in relation to the remineralization and demineralization of the hard tissues of the tooth ⁽³⁾.

Orthodontic appliances such as space maintainers are used preventively to prevent the tilting of adjacent teeth, causing little physiological space needed in the child's oral cavity. This type of appliance is available in two fixed and removable presentations, each of which has its indications that will depend on the time that the pediatric extraction has elapsed and the healing of the soft tissue lesions ⁽⁴⁾.

Internationally, a study carried out in Europe found that 15% of pediatric patients aged 3 to 5 years and school-age children (6 to 12 years) have suffered dental trauma ⁽⁵⁾, while a study from Saudi Arabia found that 57.9% of patients presented for tooth loss were due to dental avulsions. ⁽⁶⁾

In Latin America, dentoalveolar trauma in children has become a problem in oral health, and in a study carried out in Cuba, 24% of school-age children have had some dental trauma to the anterior teeth ⁽⁷⁾. Therefore, in the clinical case carried out by Coureaux also in Cuba, the placement of a removable aesthetic space maintainer in a 7-year-old pediatric patient who lost his tooth 21 ⁽⁸⁾ is detailed.

Ecuador In a study of the prevalence of dental trauma, it was found that, in a sample of 26 pediatric patients, 8.1% have lost their teeth due to blows caused by accidents or falls ⁽⁹⁾.

The objective of this study was to determine the efficacy of space maintainers as a treatment for premature loss of primary teeth.

2 MATERIALS AND METHODS

This research had a mixed approach, because it is based on quantitative and qualitative data, with a type of descriptive research, of non-probabilistic study for convenience. The sample was made up of 57 eighth-level students of the Dentistry career of the San Gregorio University of Portoviejo. The instrument used was a survey. A bibliographic review of scientific articles published in databases such as PubMed, Web of Science, Latindex, and SciELO was carried out.

3 RESULTS

From the survey of 57 students, the first question applied aimed to know if the student believed that the use of a space maintainer is useful to preserve the mediail diameter of a piece lost prematurely, in which 88% answered "yes" and 12% "no". (Figure 1).

Figure 1

Do you think that the use of a space maintainer is useful to preserve the mesiodistal diameter of a piece lost prematurely?

Source: Own elaboration

To determine the use or not of a space maintainer, it was necessary to know if the students believed that the absence of a temporary tooth had the ability to influence the development of a malocclusion, obtaining as results that 84% answered "yes" and 16% "no". (Figure 2).

Figure 2

Do you think that the absence of a temporary tooth influences the development of malocclusion?

Source: The authors.

From question 2, we seek to identify which is the type of malocclusion that occurs most frequently in their dental clinics, obtaining results from highest to lowest based on the votes acquired: with 20 votes "class I malocclusion", with 19 votes "class II division 2 malocclusion", with votes "class II division 1" and, with "class III malocclusion" votes (Figure 3).

Figure 3

What is the type of malocclusion most frequently presented by pediatric patients?

Source: The authors.

Respondents were asked what is the most frequent cause of dental trauma in their patients for which they have lost a temporary tooth, obtaining as results that 26.3% of the respondents presented pediatric extraction due to an intrusive dislocation, while 33.3% was

due to extrusive dislocation, therefore, 40.4% was due to avulsion of the temporary tooth. (Figure 4).

Figure 4

What is the most common cause of Dentoalveolar trauma for which your patients have told you that they have lost their tooth?

Source: The authors.

To determine the therapeutic use of a space maintainer, it is necessary to take into account various characteristics mentioned by the surveyed students, among these, 3 of them affirm that "the patient's collaboration" is important, another 10 "dental vitality", another 14 "aesthetics" and, the last 30 "how many missing teeth they have" (figure 5). From the characteristics taken into account, the most commonly used maintainer in dental clinics is determined, two mention the "palatine bar", another 2 the "arch of nance", another 8 the "hawley plate with pontics", another 11 the "crown and ansa" and, the last 34 say "bench and ansa" (figure 6). Once the corresponding space maintainer has been chosen for the case presented, the time in which it will be used must be determined, 8 of the interviewees mention that the time is determined by the "corono-root classification", another 11 students mention that the "collaboration of the patient", another 19 "Nola stages" and, the last 19 the "age of the patient" (Figure 7).

Figure 5

Based on what characteristics do you make your choice of space maintainer types?

Source: The authors.

Figure 6

Which of these space maintainers is the most commonly used?

Source: The authors.

Figure 7

What determines the time for space maintainer utilization?

Source: The authors.

Finally, the last question seeks to know the considerations of the space maintainer from the perspective of the students, mentioning if they believe that they serve to preserve the space of one or two permanent pieces, obtaining as results that 75% of the respondents answered yes, 23% that maybe and only 2% that no. (Figure 8).

Figure 8

Do you consider that the space maintainer is used to preserve the space of one or two permanent pieces?

4 DISCUSSION

Occlusion is established as the result of an interaction of environmental and genetic factors, among these variables that have the greatest influence is the primary dentition and the attack of factors that have the ability to destroy it such as dentoalveolar trauma that causes loss of the tooth, being thus, in a study carried out by Rivero N. ⁽¹⁰⁾ mentions that the prevalence of space maintainer placement in patients aged 3 to 9 years with premature loss of primary teeth varies between 70.90%, on the other hand, Lambruschini V. ⁽¹¹⁾ comments in his article that maintaining the temporary teeth in the mouth under physiologically normal conditions is essential to establish a correct occlusion of adult teeth, so in this work we sought to highlight the importance of space maintainer to avoid the inclination of the teeth.

Loo J. et al ⁽¹²⁾ detail in their clinical case that aesthetic rehabilitation through orthodontic appliances or fixed space maintainers, in addition to preventing the messialization of adjacent teeth, restores the confidence in smiling to children who have lost previous teeth, which is why 14 of the 57 students surveyed mentioned that they choose the type of space maintainer according to aesthetics of the patient.

The use of the space maintainer after premature tooth loss is not usually of great importance for parents or guardians, so in a study carried out by Espín M ⁽¹³⁾ he comments that the tooth with the greatest loss in preschool infants is the second lower left molar and in turn indicates that only 30% of cases have space maintainers. In this context, in the article presented by Castellazi R. ⁽¹⁴⁾ mentions that in a randomized study of children between 6 and 9 years of age they presented changes in occlusion due to the lack of space maintainer, affecting the growth of the jaw with 42.6% in the male sex.

One of the main challenges in addressing premature loss of primary teeth due to dentoalveolar trauma is the lack of early diagnosis and adequate follow-up, especially in areas with limited access to pediatric dental care. In addition, many studies on the use of space maintainers feature observational designs with small or non-representative samples, which limits the generalizability of the results. The variability in clinical protocols and the lack of standardization of criteria for the placement of space maintainers also make it difficult to evaluate their long-term effectiveness.

It is essential that the dentist performs a comprehensive evaluation after a dentoalveolar trauma in the primary dentition, identifying any risk of premature loss that may compromise future occlusion. It is recommended to place space maintainers in a timely manner, individualizing each case according to the missing tooth, the estimated time of

eruption of the permanent successor, and the patient's cooperation. It is also essential to educate parents about the importance of monitoring and maintaining the space maintainer to avoid complications such as loss of space or tooth displacement.

5 CONCLUSION

Premature loss of primary teeth as a result of dentoalveolar trauma can adversely affect the proper development of occlusion and maxillofacial growth. The results of this research show that malocclusions are frequently present in dental clinical practice, with class I being the most common, which reinforces the need for a preventive approach from childhood. In this context, the timely and appropriate use of space maintainers is established as a fundamental tool to preserve space in the dental arch, prevent unwanted displacements and avoid future orthodontic complications.

FUNDING

The authors did not receive funding for the development of this research.

ABSTRACT

Avocado (*Persea americana* Mill) has become a crop of vital economic importance for Colombia; however, its productivity faces serious limitations due to the incidence of *Phytophthora cinnamomi* and the genetic variability resulting from seed propagation. The present study aimed to evaluate protocols for the in vitro establishment and multiplication of avocado rootstocks of the Criollo variety, ensuring pathogen-free plant material for the Department of Tolima. The methodology used nodal segments from mother plants previously analyzed by ELISA testing. Two disinfection protocols (P1 and P2) and three culture media (Murashige and Skoog – 50% MS, WPM, and Yasuda) were compared, evaluating contamination, oxidation, and viability variables. The results showed that Protocol 1 presented a significantly lower contamination rate (57.8%) compared with Protocol 2 (79.5%). Although oxidation was successfully controlled (7.31% overall) through the use of antioxidants and activated charcoal, microbial contamination remained the main challenge. It is concluded that the 50% MS medium combined with Protocol 1 provides the highest viability rate for the establishment stage, laying the groundwork for future phases of large-scale clonal multiplication.

Keywords: Plant Micropropagation. *Persea Americana*. *Phytophthora cinnamomi*. In Vitro Culture. Rootstocks. Explant Disinfection.

RESUMO

O abacate (*Persea americana* Mill) tem se consolidado como uma cultura de grande importância econômica para a Colômbia; entretanto, sua produtividade enfrenta sérias limitações devido à incidência de *Phytophthora cinnamomi* e à variabilidade genética decorrente da propagação por sementes. A presente pesquisa teve como objetivo avaliar protocolos para o estabelecimento e a multiplicação in vitro de porta-enxertos de abacate da variedade Crioula, garantindo material livre de patógenos para o Departamento de Tolima. A

³ Master's degree in Forest and Biodiversity Management and Conservation. Ibagué Tolima Colombia

metodologia empregou segmentos nodais de plantas-matrizes previamente analisadas por teste ELISA. Foram comparados dois protocolos de desinfecção (P1 e P2) e três meios de cultivo (Murashige e Skoog – MS a 50%, WPM e Yasuda), avaliando-se as variáveis contaminação, oxidação e viabilidade. Os resultados demonstraram que o Protocolo 1 apresentou percentual de contaminação significativamente menor (57,8%) em comparação ao Protocolo 2 (79,5%). Embora a oxidação tenha sido controlada com sucesso (7,31% no geral) por meio do uso de antioxidantes e carvão ativado, a contaminação microbiana permaneceu como o principal desafio. Conclui-se que o meio MS a 50% combinado com o Protocolo 1 oferece a maior taxa de viabilidade para a fase de estabelecimento, estabelecendo as bases para futuras etapas de multiplicação clonal em larga escala.

RESUMEN

El aguacate (Persea americana Mill) se ha posicionado como un cultivo de vital importancia económica para Colombia; sin embargo, su productividad enfrenta serias limitaciones debido a la incidencia de *Phytophthora cinnamomi* y la variabilidad genética derivada de la propagación por semilla. La presente investigación tuvo como objetivo evaluar protocolos para el establecimiento y multiplicación in vitro de portainjertos de aguacate variedad Criollo, garantizando material libre de patógenos para el departamento del Tolima. La metodología empleó segmentos nodales de plantas madre previamente analizadas mediante test de ELISA. Se compararon dos protocolos de desinfección (P1 y P2) y tres medios de cultivo (Murashige y Skoog - MS al 50%, WPM y Yasuda), evaluando variables de contaminación, oxidación y viabilidad. Los resultados mostraron que el Protocolo 1 presentó un porcentaje de contaminación significativamente menor (57,8%) en comparación con el Protocolo 2 (79,5%). Aunque la oxidación fue controlada exitosamente (7,31% general) mediante el uso de antioxidantes y carbón activado, la contaminación microbiana persistió como el principal desafío. Se concluye que el medio MS al 50% combinado con el Protocolo 1 ofrece la mayor tasa de viabilidad para la etapa de establecimiento, sentando las bases para futuras fases de multiplicación clonal masiva.

1 INTRODUCTION

The avocado (*Persea americana* Mill) belongs to the Lauraceae family, which comprises about 2200 species, within this family are cinnamon (*Cinnamomum verum*), laurel (*Laurus nobilis*) and sassafras (*Sassafras albidum*). It is a species native to Mexico and Central America and is currently one of the most economically important fruit crops in the tropics/subtropics worldwide. (Bost et al, 2013; Pérez et al, 2015).

In avocado cultivation, the most common practice is to graft the avocado with shoots from a mature tree. The beneficial characters of shoots and roots are integrated by the selection of a rootstock and cuttings with optimal productivity. In the case of the selection of the crop from which the sprout is to be obtained, the vigor of the plant, productivity and quality of the fruit must be taken into account. Rootstocks are selected for their size, salinity tolerance, adaptation to alkaline soils, and resistance to pests and diseases (Hiti-Bandaralage et al, 2017).

Colombia is currently ranked as the third avocado producing country; however, the crop presents productivity and competitiveness problems due to low technological development, as well as deficiencies in marketing channels, lack of plant health guarantees, genetic variability of propagation material, and field losses associated with plant material from poor quality seeds (Restrepo et al, 2018).

2 JUSTIFICATION

The avocado fruit has a high nutrient content, high levels of monounsaturated lipids, proteins, vitamins and beneficial phytochemicals, which make the avocado an important part in the fight against malnutrition and hunger problems in developing countries. In addition to this, due to its oil production, it also plays an important role in the cosmetic and pharmaceutical industry (Chanderbali, 2013).

Colombia has planted 73,986 hectares of avocado with a production of 403,184 tons, ranking as the third producing country and the second in terms of harvested area. The areas of the country where it is most cultivated are Tolima, Antioquia, Caldas, Santander, Bolívar, Cesar, Valle del Cauca, Risaralda, and Quindío, which represent 86% of the country's total planted area (González, 2018). Of the avocado varieties, currently the one with the greatest economic importance in the country is the Hass avocado, as it has increased its exports by more than 413% in less than three years. The second national producer is the Department of Tolima with more than 11,000 tons harvested and has 148 hectares of avocado farms

registered for export (Suarez, 2019). However, one of the problems presented by producers is the incidence of the disease caused by *Phytophthora cinnamomi*, which has caused losses that accumulate millions of dollars and severely affect the growth, production and international trade of avocados (Litz et al, 2007).

There are two types of rootstock or rootstock in avocado cultivation: rootstock from seed and clonal rootstock. Due to the high level of heterozygosity which creates inconsistency in genetic stability, the use of rootstock from seed is less preferable than clonal rootstock. On the other hand, clonal propagation of avocado rootstocks has been it has become the bottleneck of production, as the method currently used for clonal propagation of rootstocks is costly and time-consuming (Ibarra et al, 2016; Hiti-Bandaralage et al, 2017).

Plant tissue culture has the potential to be an effective and efficient alternative for the clonal production of avocado rootstocks, since it allows the clonal propagation under controlled conditions, of a large number of plants in a short period of time and with little labor, and also guarantees genetic health and stability (Kumar and Loh, 2012). The micropropagation process in avocados has focused mainly on the massive propagation of rootstocks with tolerance to soil-borne diseases and salinity conditions; as well as to revitalize adult material (Ibarra et al, 2016).

Woody plants are generally recalcitrant to tissue culture conditions (Benmahioul et al, 2012) and avocado is no exception to this trend. Several authors have carried out tissue culture techniques for avocado micropropagation; however, factors such as: the explant, conditions of the mother plant, time of collection of the plant material, the cultivar, the composition of the culture medium, concentration of growth regulators, affect the success of micropropagation (Zirari and Lionakis, 1994; Wessels, 1996; Barringer et al, 1996; Dalsaso and Guevara, 1998; Rodríguez et al, 1999; Premkumar et al, 2002; Barceló-Muñoz & Pliego-Alfaro, 2003; Nhut et al, 2008; Zulfiqar et al, 2009; Hiti-Bandaralage et al, 2015; Ibarra et al 2016; Restrepo et al, 2018).

Taking into account the above, the objective of this research is the evaluation of different culture media and growth regulators for the establishment and induction of Sprouts on Avocado Rootstocks Var. Criollo free of *Phytophthora cinnamomi*, so that Hass avocado producers in the Department can use it as a pattern.

3 OBJECTIVES

3.1 GENERAL OBJECTIVE

To evaluate different culture media for the in vitro multiplication of rootstocks of Avocado (*Persea Americana*) cv. Hass, free of *Phytophthora cinnamomi* in the Department of Tolima.

3.2 SPECIFIC OBJECTIVES

- Evaluate disinfection protocols for aseptic establishment in avocado cultivar explants.
- Define the culture medium that allows the adequate in vitro multiplication of avocado explants.
- To identify native rootstocks potentially resistant to *Phytophthora cinnamomi*, in the Department of Tolima.

4 MATERIALS AND METHODS

The research was carried out in the plant biotechnology laboratory of the Agricultural Center "La Granja", National Learning Service in Espinal, Tolima. For the evaluation, nodal segments of native avocado rootstocks obtained from the nursery were used. Prior to obtaining the explants, Elisa tests were carried out for *Phytophthora* sp. in the mother plants, in order to guarantee plant health for this pathogen.

4.1 DISINFECTION PROTOCOLS

Two protocols were carried out to disinfect the explants, adapted from Hiti-Bandaralage et al. (2015), Ibarra et al. (2016), Restrepo et al. (2018). In the first protocol (P1) the segments of approximately 6cm are placed in running water for 45 minutes. Then, in a laminar flow chamber, they are immersed in 70% ethanol for three minutes and rinsed three times with sterile distilled water. The fragments are placed in a solution with 2 g/L of timorex and 3 drops of tween 80 in stirring for 15 minutes, then immersed in 100 mg/l of oxytetracycline for 2 hours. Rinse again three times with sterile distilled water for 5 minutes each and place in magnetic agitation for 3 minutes in 3% sodium hypochlorite solution with 3 drops of Tween 20, then five washes are made with sterile distilled water, the dead tissue is removed leaving explants of 4cm. These are placed in agitation for 45 minutes in a sterile solution of 400mg/l of sterile PVP (polyvinylpyrrolidone). Finally, they are rinsed three times in sterile distilled water and dissected of plant material, removing the oxidized portions at both

ends of the microcutting, leaving approximately 1.5cm of the explant for planting in the culture medium (Figure 1).

Figure 1

Protocol 1 for the disinfection of the explants. The red lines correspond to passages with contaminants, green for transitions and blue for passages and clean areas carried out in the laminar flow chamber

Source: Authors.

In the second disinfection protocol (P2), the nodal segments of approx. 6cm are washed in soapy solution for three periods of 10 minutes each and 3 rinses are performed with sterile water. In the laminar flow chamber they are kept in a solution of 2ml/l of timorex for two hours, followed by a solution of 50mg/l of vancomycin and 100mg/l of cefotaxime for 3 hours, washed with sterile water, then immersed in 96% ethanol for one minute and 1% sodium hypochlorite for 10 minutes. rinses with sterile water. Subsequently, the dead tissue is removed, leaving explants of 4cm in length. The material is left in a solution of 100mg/l of ascorbic acid and 100mg/l of citric acid for 30 minutes, three washes are carried out with sterile distilled water. Finally, fragments of 1.5cm are obtained for sowing in a culture medium (Figure 2).

Figure 2

Protocol 2 for the disinfection of the explants. The red lines correspond to passages with contaminants, green for transitions and blue for passages and clean areas carried out in the laminar flow chamber

4.2 IN VITRO ESTABLISHMENT

For in vitro establishment, the culture media MS (Murashige and Skoog, 1962) with 50% macroelements, WPM (Lloyd & McCown, 1980) and Yasuda (Yasuda et al., 1985), supplemented with vitamins and 30 g.L⁻¹ sucrose, were used. Additionally, the implementation of activated charcoal and permanence in darkness for 15 days for the three media was evaluated, as shown in Table 1. The pH was adjusted to 5.75 in all media, they are then sterilized at 1.2 kg cm⁻² pressure at 121 °C for 15 min. Once the

Experimental units are incubated at a temperature of 26 ± 2 °C under a photoperiod of 16 light hours depending on the treatment, for two weeks. The variables that were evaluated 15 days after planting were bacterial contamination, fungal contamination, oxidation and viability of the explants. Table 1 shows the treatments used to control the oxidation of plant tissue.

Table 1

Treatments used to prevent oxidation of explants

Treatment	Protocol	di	Photoperiod	Coal	Activate
	sinfection			d (g/l)	
S0	P1		Photoperiod 12 hours of light	0	
S1	P1		Photoperiod 12 hours of light	2	
S2	P1		Darkness 15 days	0	
S3	P1		Darkness 15 days	2	
S4	Q2		Photoperiod 12 hours of light	0	
S5	Q2		Photoperiod 12 hours of light	2	
S6	Q2		Darkness 15 days	0	
S7	Q2		Darkness 15 days	2	

4.3 OUTBREAK INDUCTION

After fourteen days of in vitro establishment, viable segments were seeded in 50% MyS media, Yasuda and WPM with growth regulators at different concentrations: IBA (indolebutyric acid), BAP (6-Benzylaminopurine) and GA3 (gibberellic acid) for budbreak induction (Table). Added with 30 g/l of sucrose, the pH was adjusted to 5.7 in all media, then sterilized at 1.2 kg cm⁻² pressure at 121 °C for 15 min. Once seeding is completed, the experimental units are incubated at a temperature of 26 ± 2 °C under a photoperiod of 16 light hours. The number of shoots per explant, shoot length and number of leaves at 30, 60 and 90 days after subculture were evaluated. To maintain adequate nutrient supplementation and growth regulators, the plants were transferred to fresh medium every four weeks, a fine cut was made in the base in each subculture to ensure the continuous absorption of nutrients.

Table 2

Growth hormone treatments for the in vitro multiplication stage

TREATMENT	BAP (mg. L-1)	GA3 (mg. L-1)	IBA (mg. L-1)
S0	0	0	0
S1	0.1	0,1	0
S2	0,5	0,1	0
S3	1	0,5	0
S4	0,5	0	0,1
S5	1,5	0,2	0
S6	2	0	0,5
S7	0,5	0	0,5

S8	0,2	0,2	0
S9	0,5	0,5	0

4.4 STATISTICAL ANALYSIS

For the establishment stage, the qualitative variables evaluated are: contamination, oxidation and viability of the explants at 15 days after planting in the three culture media of this stage and two disinfection protocols, with fifty replications, which were established under a completely randomized design under homogeneous conditions. The variables were analyzed using contingency tables and correspondence analysis for qualitative data. In the shoot induction stage, the following variables will be evaluated: number of shoots, shoot length, and number of leaves at two and three months after the establishment of the explants. An analysis of variance will be performed with the previously transformed data and the differences between the means of treatments are compared using the Tukey test at a 5% probability. Data from both stages will be analyzed using the InfoStat 2008 statistical package (DiRienzo et al, 2008).

4.5 ROOTSTOCK IDENTIFICATION

Creole rootstocks for the Hass avocado were identified in some of the avocado-producing municipalities in the Department of Tolima, which have possible resistance to *Phytophthora cinnamomi*. This identification was made by Elisa test.

5 RESULTS

5.1 IDENTIFICATION OF FREE ROOTSTOCKS OF PHYTOPHTHORA SP.

Var avocado mother plants were chosen. Criollo that serve as rootstocks, to which an Elisa test was performed with the *Phytophthora* Pathoscreen kit for the identification of *Phytophthora* and in this way multiply the plants free of it.

Figure 3

ELISA test on avocado mother plants for the identification of Phytophthora spp

5.2 IN VITRO ESTABLISHMENT

5.2.1 Pollution

The establishment of explants in tissue culture is associated with problems of fungal and bacterial contamination. Measures to reduce contamination include the selection of healthy and stress-free mother plants, as well as the application of fungicides and bactericides to the explants (Barceló and Muñoz, 2003; Hiti-bandaralage, 2017).

At 15 days after planting, the percentage of contamination was 68.74, with bacterial contamination being higher than 40.34% (Table 2), similar results were found by Cooper (1987), with 70% contamination in the Duke variety 7, Dalssaso and Guevara (1988) also obtained a high percentage of bacterial and fungal contamination in the Fuerte variety and Zulfiqar et al. (2009) observed 72% contamination in the Fuerte variety. Of the protocols evaluated, the one with the lowest percentage of contamination was protocol 1 with 57.8% ($p < 0.01$), in turn the culture medium with the highest contamination was Yasuda in both disinfection protocols and the medium with the lowest percentage of contamination was MyS using protocol 1 with a significance of < 0.05 (Table 2) (Figure 3). which differs from what was found by Ibarra et al. (2016) where Yasuda was the medium with the lowest percentage of contamination (Figure 4).

In woody plants, higher percentages of contamination can occur because they grow in the soil for several years under environmental conditions, so they can be infected by microorganisms both exogenously and endogenously, which often makes in vitro control difficult. This requires establishing one or more sterilization agents that can remove bacteria and fungi from the explant (Ahmad et al, 2003). The disinfection protocols implemented in

this study were adapted from Hiti-Bandaralage et al. (2015), Ibarra et al. (2016), Restrepo et al. (2018), who obtained low percentages of contamination; however, the results obtained in the current research can be due to factors such as the plant health of the mother plant from which the explants were obtained (endogenous contamination), as well as by the manipulation at the time of planting.

Figure 3 shows that protocol 2 is associated with bacterial and fungal contamination; in turn, the MyS culture medium is associated with less bacterial contamination. Correspondence analysis explains 52% of the variables.

Table 2

Percentages of contamination, oxidation and viability with the two disinfection protocols and three culture media two weeks after planting

Protocol/me dium	Pollution	C. Fungi	C. Bacterial	Oxidation	Feasibility

5.2.2 Oxidation

In the process of conditioning the explant for in vitro establishment, plant tissues cut primarily from woody plants excrete phenolic compounds that can be oxidized by polyphenoloxidases, peroxidases, or by air. Oxidized phenolic compounds (quinones) have a browning around the cutting surface of the tissue, these quinones have an inhibitory effect on the enzymatic activity of the plant, which ultimately results in tissue death (Bath and Chandel, 1991). Taking into account the above, there are reports in the literature of various pretreatments of the explant to prevent this oxidation (Hiti-bandaralage et al, 2017).

In general, the percentage of oxidation with the different treatments used was low 7.31% (Table 3), being the lowest with treatment 5, in which ascorbic acid, citric acid and activated carbon were used, as reported by Cortes-Rodríguez et al. (2011). However, the other treatments showed significant results to prevent tissue browning, with the use of polyvinylpyrrolidone as reported by Ibarra et al. (2016) and keeping the tissue in darkness in the growth chamber for 15 days reported by Restrepo et al. (2018).

Figure 4 shows that all variables are associated with zero oxidation, with the use of photoperiod and protocol 2 being more associated with citric acid and ascorbic acid as antioxidant agents.

Table 3

Percentage of oxidation obtained with the different treatments with antioxidant agents

S5	1,33**
S6	15,33**
S7	5,33**

*($p < 0.05$) **($p < 0.01$) obtained in the contingency tables. Source: Authors.

5.2.3 Feasibility

The viability of the explants was 28.49%, being higher for protocol 1 and for the 50% MyS culture medium, and lower for the WPM culture medium. This viability is affected by oxidation and contamination processes, as they cause tissue death (Table 2) (Figure 3).

Figure 4

Correspondence analysis for the association of the variables: disinfection protocol 1 (P1), disinfection protocol 2 (P2), Oxidation (O), WPM culture medium, Yasuda and MyS. Activated charcoal 2g/l and activated charcoal 0g/l, Photoperiod in quarter growth and darkness in quarter growth for 15 days, (NO) negative, (IF) positive

Source: Authors.

6 CONCLUSIONS

Disinfection protocol 1 was the one with the highest percentage of viability. The three culture media in the establishment stage allowed the development of the explants; however, the 50% MyS culture medium had the highest viability. The percentage of contamination was high while oxidation was very low, this indicates that the different treatments to prevent oxidation were efficient, presenting a slight improvement with the treatment in which ascorbic acid and citric acid were used. On the other hand, the high incidence of contamination may be due to various factors such as the plant health of the mother plants, handling at the time of sowing and the disinfection protocols used. Because it is an ongoing project, it is expected to obtain results from the use of different growth hormones in the multiplication stage.

ABSTRACT

The rapid advancement of the Internet of Things (IoT) has driven the need for intelligent systems capable of combining miniaturization, energy efficiency, and high computational performance. In this context, this article analyzes the integration of microsenors and microactuators, largely based on MEMS (Micro-Electro-Mechanical Systems) technology with the ESP32 microcontroller. The ESP32 platform stands out as a suitable solution for low-cost IoT applications due to its dual-core architecture, processing flexibility, and multiple connectivity options, such as Wi-Fi, Bluetooth, and LoRa, enabling the development of compact, efficient, and connected systems.

Keywords: Microsensors. Microactuators. IoT Systems. Monitoring.

RESUMO

O avanço acelerado da Internet das Coisas (IoT) tem impulsionado a necessidade de sistemas inteligentes capazes de aliar miniaturização, eficiência energética e elevado desempenho computacional. Neste contexto, este artigo analisa a integração de

microsensores e microatuadores, em grande parte baseados na tecnologia MEMS (Micro-Electro-Mechanical Systems), com o microcontrolador ESP32. A plataforma ESP32 destaca-se como uma solução adequada para aplicações IoT de baixo custo, devido à sua arquitetura dual-core, à flexibilidade de processamento e às múltiplas opções de conectividade, como Wi-Fi, Bluetooth e LoRa, possibilitando o desenvolvimento de sistemas compactos, eficientes e conectados.

Palavras-chave: Microsensores. Microatuadores. Sistemas IoT. Monitoramento.

RESUMEN

El rápido avance del Internet de las Cosas (IoT) ha impulsado la necesidad de sistemas inteligentes capaces de combinar miniaturización, eficiencia energética y alto rendimiento computacional. En este contexto, este artículo analiza la integración de microsensores y microactuadores, en su mayoría basados en la tecnología MEMS (Micro-Electro-Mechanical Systems), con el microcontrolador ESP32. La plataforma ESP32 se destaca como una solución adecuada para aplicaciones IoT de bajo costo, gracias a su arquitectura de doble núcleo, su flexibilidad de procesamiento y sus múltiples opciones de conectividad, como Wi-Fi, Bluetooth y LoRa, lo que permite el desarrollo de sistemas compactos, eficientes y conectados.

Palabras clave: Microsensores. Microactuadores. Sistemas IoT. Monitoreo.

1 INTRODUCTION

The Internet of Things (IoT) has emerged as one of the main technological paradigms of contemporary digital transformation, characterized by the interconnection of intelligent physical objects endowed with sensing, processing, and real-time data communication capabilities. This approach has promoted profound changes across multiple domains, including advanced manufacturing within Industry 4.0, smart cities, precision agriculture, environmental monitoring, and connected healthcare systems, enabling increased automation, operational efficiency, and data-driven decision support (Abdulhussain, 2025; Jing, 2023; Gazis, 2025).

From an architectural perspective, IoT systems are composed of multiple functional layers in which the interaction between the physical environment and the digital domain is primarily enabled by interface devices such as microsensors and microactuators (Senturia, 2000). These components are critical to the success and scalability of IoT applications, since data acquisition quality and actuation accuracy directly affect overall system performance (Witczak, 2024).

Microsensors play a fundamental role in the acquisition of physical, chemical, and biological variables, such as temperature, pressure, vibration, humidity, and gas composition, providing essential information for continuous and distributed monitoring. Microactuators, in turn, are responsible for active intervention in the environment, enabling control actions, adjustments, and automated responses, and are widely employed in positioning systems, micromirrors, acoustic devices, and biomedical applications (Amara, 2025; Ahmad, 2024; Islam, 2025).

The growing demand for compact, energy-efficient, and low-cost IoT devices has significantly driven advances in Micro-Electro-Mechanical Systems (MEMS) technologies. The miniaturization enabled by these systems allows the integration of sensors and actuators at micrometer scales while maintaining high sensitivity, low power consumption, and high reliability (Cheng, 2025). Recent studies highlight that advances in functional materials, fabrication techniques, and transduction structures have enhanced MEMS device performance, making them increasingly suitable for large-scale IoT deployments and operation in challenging environments (Fang, X., 2025; Jung, Y., 2025; Wan, Z., 2025; Ferreira, 2024).

Furthermore, recent research indicates that the combined use of MEMS-based microsensors and microactuators fosters the development of intelligent systems with a higher

degree of autonomy, enabling the implementation of advanced control strategies and predictive maintenance. In particular, applications involving vibration, temperature, and environmental variable monitoring have directly benefited from the integration of these devices into low-power IoT platforms (Kolok, 2025; Gazis, 2025).

In parallel with the advancement of MEMS devices, there has been significant evolution in embedded processing platforms used in IoT systems. System-on-a-Chip (SoC) microcontrollers have increasingly incorporated advanced wireless connectivity, processing capabilities, and power management features, thereby reducing both hardware and embedded software complexity (Hercog, 2023). Within this context, the ESP32 platform stands out for offering low-power Wi-Fi and Bluetooth connectivity, adequate computational performance, and widespread adoption in both academic and industrial applications.

Moreover, the integration of the ESP32 with long-range, low-power communication technologies such as LoRa significantly expands the application scope of IoT systems, enabling the monitoring and control of distributed devices over large geographical areas. Recent studies demonstrate that this combination is particularly effective in scenarios such as precision agriculture, predictive maintenance, and remote environmental monitoring, where communication reliability and energy efficiency are critical requirements (Le, 2021; Kolok, 2025; Gazis, 2025).

Within this context, this article proposes an analysis of the integration of MEMS-based microsensors and microactuators with the ESP32 platform, evaluating aspects such as technical feasibility, robustness, and energy efficiency of the proposed solution. The objective is to demonstrate that this approach represents a promising alternative for the development of practical monitoring and control systems within the Internet of Things framework, in alignment with recent trends reported in scientific literature.

2 THE MINIATURIZATION OF COMPONENTS

The convergence of component miniaturization and the increasing ubiquity of the Internet of Things (IoT) has driven the development of intelligent systems capable of autonomously perceiving, processing information, and interacting with the environment. In this context, microsensors and microactuators play a central role as interface elements between the physical world and the digital domain, enabling data acquisition and the execution of control actions. Frequently based on Micro-Electro-Mechanical Systems (MEMS) technology, Figure 1, these devices allow the efficient integration of sensing and

actuation functions into compact, energy-efficient systems suitable for large-scale distributed applications.

Figure 1

MEMS (Micro-Electro-Mechanical Systems)

Source: Produced by the author, 2025.

MEMS are miniaturized systems that integrate mechanical components, sensors, actuators, and electronic circuits onto a single substrate, typically fabricated in silicon using processes derived from microelectronics. This integration enables the sensing and actuation of physical quantities such as pressure, acceleration, temperature, sound, and electric or magnetic fields with high precision and low power consumption. Owing to their small size, low cost in mass production, and high reliability, MEMS have become essential in a wide range of modern applications, including mobile devices, automotive systems, medical equipment, industrial instrumentation, and IoT solutions, contributing significantly to system miniaturization and the increasing intelligence of advanced technological systems.

(I) Microsensors and MEMS Technology

Microsensors are transducer devices responsible for converting physical quantities—such as temperature, pressure, acceleration, or humidity—into electrical signals that can be measured and processed. These components form the foundation of sensing in modern systems and play an essential role in applications that require continuous and accurate monitoring. MEMS technology is widely used in the fabrication of most contemporary microsensors, as it enables the integration of mechanical structures, sensing elements, and

electronic circuits for signal conditioning and processing onto a single silicon substrate, with dimensions ranging from micrometers to millimeters. Table 1 presents a comparison of commonly used microsensors in IoT projects, highlighting their typical applications and associated operating principles.

Table 1
Comparison of Common Microsensors in IoT Systems

Sensor	Measured Quantity	Operating Principle	Typical Applications
DHT22	Temperature and Humidity	Capacitive (Humidity), Thermistor (Temperature)	Environmental Monitoring, Smart Greenhouses
BMP280	Barometric Pressure and Temperature	Piezoresistive	Weather Stations, Indoor Navigation (Altitude)
MPU-6050	Acceleration and Angular Velocity	Piezoresistive (Accelerometer), Gyroscope (Coriolis Effect)	Predictive Maintenance (Vibration), Robotics, Drones
MQ-X	Gas Concentration (e.g., CO, Methane)	Semiconductor (Resistance Variation)	Air Quality Monitoring, Industrial Safety

Source: Produced by the author, 2025.

The operating principles of MEMS-based microsensors may vary depending on the physical quantity to be measured and the intended application. Among the most common mechanisms is the piezoresistive principle, widely employed in pressure sensors and accelerometers, in which the electrical resistance of a material changes when subjected to mechanical deformation. Another frequently used principle is the capacitive mechanism, typical of accelerometers and humidity sensors, which is based on variations in capacitance between electrodes caused by mechanical displacement or the presence of a variable dielectric medium. In addition, thermal sensors exploit phenomena related to heat transfer or voltage variation with temperature and are commonly used in flow sensors and thermocouples.

The miniaturization enabled by MEMS technology provides benefits that extend beyond simple reductions in size and cost. Miniaturized sensors generally exhibit higher sensitivity, faster response times, and lower power consumption—features that are fundamental for embedded and distributed systems. These advantages make MEMS-based

microsensors particularly well suited for Internet of Things (IoT) applications, in which large numbers of devices must operate efficiently, reliably, and with extended energy autonomy.

(II) Microatuadores e o Controle de Sistemas

Microactuators are components responsible for converting electrical control signals generated by the embedded system into physical or mechanical actions in the environment. They play a fundamental role in microelectromechanical systems, enabling digital decisions to produce tangible effects in the physical world. These principles are illustrated in a didactic manner in Figure 2.

Figure 2

Microactuators: (a) Electromagnetic, (b) Electrothermal, and (c) Piezoelectric

Source: Produced by the author, 2025.

Like sensors, many actuators benefit from MEMS technology, which enables the fabrication of devices with high precision, reduced dimensions, and low power consumption. These characteristics make microactuators particularly suitable for embedded applications and miniaturized systems. Among the main types of microactuators are electromagnetic actuators, which use the Lorentz force to generate motion and are widely employed in micro-relays and microvalves. Electrothermal actuators are also prominent; they are based on the thermal expansion of materials, such as thermal bimorphs, and are commonly used in microvalves and optical shutters.

Another important class of microactuators is piezoelectric microactuators, which exploit the inverse piezoelectric effect to generate high-precision and high-force movements. These devices are essential in fine positioning systems, micropumps, and applications that require precise displacement control. In control systems, the microactuator is the element

responsible for closing the feedback loop: the microsensor measures the variable of interest, the controller processes this information, and the microactuator acts on the environment, adjusting the system until the desired operating point is achieved.

(III) Runtime Optimizations

The ESP32, developed by Espressif Systems, is a System-on-a-Chip (SoC) that has become one of the leading platforms for the development of Internet of Things (IoT) prototypes and products, combining low cost, high performance, and considerable versatility. Its technical characteristics make it particularly well suited for integration with microsensors and microactuators. From a processing standpoint, the ESP32 features a microcontroller capable of executing concurrent tasks, allowing, for instance, sensor data acquisition to be handled by one core while wireless communication is managed by another core. This capability is commonly observed in applications such as the Heltec Automation LoRa 32 V3, as illustrated in Figure 03.

Figure 3

Heltec Automation LoRa 32 V3

Source: Produced by the author, 2025.

In terms of connectivity, the ESP32 integrates Wi-Fi modules compliant with the 802.11 b/g/n standards and Bluetooth Low Energy (BLE), which are essential for communication with cloud services and mobile devices. In addition, it can operate with LoRa technologies across

frequency bands ranging approximately from 433 to 510 MHz and from 863 to 928 MHz, significantly extending its range for long-distance and low-power applications.

Regarding interfaces, the ESP32 provides a wide variety of peripheral options, including GPIOs, I²C, SPI, UART, ADC, and DAC, which facilitates direct connection to most commercially available microsensors and microactuators, thereby reducing the need for complex external circuitry.

The combination of processing capability, multiple connectivity options, and low power consumption makes the ESP32 a robust solution for monitoring and control systems. These characteristics enable advanced applications such as predictive maintenance, industrial automation, and real-time environmental monitoring.

(IV) Environmental Monitoring and Control System

The system adopts a hardware architecture composed of a central controller, sensors, and actuators, designed for environmental monitoring and control applications. The controller used is the ESP32, which is responsible for data processing, execution of the control logic, and Wi-Fi connectivity, enabling system integration with external monitoring platforms.

As a microsensor, the digital temperature and humidity sensor DHT22, also known as the AM2302, is employed. This sensor was selected due to its good accuracy, low cost, and ease of interfacing with microcontrollers, providing reliable measurements of the environmental variables required for greenhouse control.

The system's microactuator is a solid-state relay (SSR) module, which operates as an electromagnetic microactuator. It is responsible for switching heating devices, such as a lamp, and cooling devices, such as a fan, on or off, allowing environmental variables to be adjusted according to the conditions measured by the sensor. Figure 4 illustrates the architecture of this Environmental Monitoring and Control System for a smart greenhouse.

Figure 4

Architecture of the Intelligent System: (a) DHT22 microsensor, (b) solid-state relay (SSR), (c) heating device (lamp) and cooling device (fan), and (d) power supply and communication via USB Type-C cable.

Source: Produced by the author, 2025.

The system architecture is based on the continuous acquisition of temperature and humidity data by the DHT22 sensor, the processing of this information by the ESP32, and direct actuation on the environment through the relay. In addition, the collected data are transmitted via Wi-Fi to a cloud platform, such as ThingSpeak or Firebase, enabling remote monitoring and historical data storage, as demonstrated in several recent studies on IoT systems.

The control logic implemented in the ESP32 firmware is based on a simple ON/OFF control strategy, primarily focused on temperature regulation. In this model, heating or cooling is activated when the measured variable exceeds predefined threshold limits. If an additional water flow system is integrated with the fan, this control logic can be extended to regulate humidity as well, thereby expanding the functionality of the environmental control system.

3 CONCLUSION

The architecture presented throughout this study clearly demonstrate the effectiveness of integrating microsensors, microactuators, and the ESP32 platform for the implementation of IoT-based monitoring and control systems. The synergy between the miniaturization enabled by MEMS technology and the ESP32's processing capability, connectivity options, and low power consumption yields a solution that is not only robust and scalable, but also economically viable for a broad range of applications, including environmental control, industrial automation, and predictive maintenance.

The practical case study of an environmental control system applied to a smart greenhouse further reinforces these findings. By employing a temperature and humidity microsensor (DHT22) in conjunction with a relay-based microactuator, the proposed architecture successfully closes the control loop, enabling real-time data acquisition, timely decision-making, and rapid actuation on the physical environment. This configuration demonstrates how relatively simple control strategies, such as ON/OFF control, can be effectively implemented using low-cost hardware while still achieving reliable and responsive system behavior.

Beyond the specific application presented, the proposed architecture highlights the flexibility and adaptability of the ESP32–MEMS combination, which can be readily extended to more complex control schemes, additional sensing modalities, and distributed system topologies. The integration with cloud platforms for remote monitoring and data storage further enhances the system's usability and scalability, supporting data-driven analysis and long-term performance assessment.

In conclusion, the integration of the ESP32 with MEMS-based microsensors and microactuators constitutes a solid and promising foundation for the development of next-generation IoT systems. Future work may focus on further optimizing energy consumption, implementing advanced control algorithms, and incorporating Edge Computing concepts to enable local data processing, reduced latency, and increased system autonomy, thereby addressing emerging challenges in large-scale and mission-critical IoT deployments.

ABSTRACT

This article investigates the narratives of Black women facing domestic violence, which emerge as important sources of tacit knowledge and resistance practices. From an intersectional perspective of gender and race, this article investigates the experiences of victims living in Northeastern communities. Furthermore, the research question focuses on the following: what knowledge, experiences, and practices are mobilized through the narratives of Black women in confronting domestic violence? The specific objectives are: i) to identify and understand the knowledge and practices of Black women; ii) to describe the personal, social, historical, cultural, and educational contexts of these women victims of domestic violence; iii) to identify the different forms of violence to which they are subjected in their own homes, considering the intersectionality of gender and race, according to Carneiro (2003) and Ribeiro (2017). The research corresponds to a qualitative bibliographical and documentary research. Finally, we conclude that the narratives of Black women victims of domestic violence reveal a rich array of knowledge, experiences, and experiences grounded in non- school knowledge, community care practices, and oral literature.

Keywords: Black Women. Domestic Violence. Black Feminism. Non-School Knowledge.

RESUMO

O presente artigo investiga as narrativas de mulheres negras que enfrentam violência doméstica emergem como importantes fontes de saberes tácitos e práticas de resistência, este estudo investiga, sob uma perspectiva interseccional de gênero e raça, as vivências e experiências de vítimas residentes nas comunidades nordestinas. Ademais, o problema de pesquisa centra-se na seguinte questão: quais saberes, vivências e experiências são mobilizados, através das narrativas de mulheres negras, no enfrentamento à violência doméstica? Os objetivos específicos configuram-se em: i) identificar e conhecer os saberes e fazeres das mulheres pretas; ii) descrever o contexto pessoal, social, histórico, cultural e educacional dessas mulheres vítimas de violência doméstica; iii) identificar as diferentes formas de violência às quais estão submetidas em seu próprio lar, considerando a interseccionalidade de gênero e raça, segundo Carneiro (2003) e Ribeiro (2017). Com a investigação corresponde a uma pesquisa bibliográfica documental de matriz qualitativa. Por fim, conclui-se que as narrativas de mulheres negras vítimas de violência doméstica, revelam

RESUMEN

Este artículo investiga cómo las narrativas de mujeres negras que enfrentan violencia doméstica emergen como fuentes importantes de conocimiento tácito y prácticas de resistencia. Este estudio investiga, desde una perspectiva interseccional de género y raza, las experiencias de las víctimas que residen en comunidades del noreste. Además, el problema de investigación se centra en la siguiente pregunta: ¿qué conocimientos, experiencias y prácticas se movilizan, a través de las narrativas de las mujeres negras, al enfrentar la violencia doméstica? Los objetivos específicos son: i) identificar y comprender los conocimientos y prácticas de las mujeres negras; ii) describir el contexto personal, social, histórico, cultural y educativo de estas mujeres víctimas de violencia doméstica; iii) identificar las diferentes formas de violencia a las que son sometidas en sus propios hogares, considerando la interseccionalidad de género y raza, según Carneiro (2003) y Ribeiro (2017). La investigación corresponde a una investigación cualitativa bibliográfica y documental. Finalmente, se concluye que las narrativas de mujeres negras víctimas de violencia doméstica revelan una rica gama de conocimientos, experiencias y vivencias basadas en conocimientos no formales, prácticas de cuidado comunitario y tradiciones orales.

Palabras clave: Mujeres Negras. Violencia Doméstica. Feminismo Negro. Conocimiento No Formal.

1 INTRODUCTION

Considering that the narratives of black women who face domestic violence emerge as important sources of tacit knowledge and practices of resistance, this article investigates, from an intersectional perspective of gender and race, the experiences of victims living in Northeastern communities. In this sense, the Brazilian panorama marked by epistemicide dominates, while racist and sexist discourses historically shape the social position of black women (Gonzales, 1983; Davis, 2018).

The Maria da Penha Law (Brazil, 2006) and the Femicide Law (Brazil, 2015) represent institutional advances, however, without incorporating the multiple forms of violence that cross the body and subjectivity of these women, they keep invisible the non-school knowledge shaped in collectives and conversation circles.

Law No. 13,104, which came into force on March 9, 2015, amending article 121 of the Penal Code to include the criminal type as a qualifying circumstance for the crime of homicide, with a penalty of imprisonment of 12 to 30 years, soon after its approval, this law was included in the list of heinous crimes such as: rape, genocide and robbery. The law is an achievement of feminist movements to give visibility to this crime that victimizes a woman every two hours in the country and enables the improvement of public policies to prevent this extreme form of violence against women (Brasil, 2015).

The culture and gender hierarchies present in patriarchal societies, in addition to structural violence, are determining factors of femicide. The frequency of femicides is higher when there are social inequities, armed conflicts, migration, gender discrimination, and the exercise of hegemonic and aggressive masculinity (Silva; Seabra; Junior; 2016).

Thus, researching violence, its causes, and how to combat it is hard work and a very complex challenge, not least because it is a phenomenon of multiple origins and various nuances and perceptions of laws, policies, and cultures involved in the act of violence and its consequences, especially when this violence is against women.

Considering that the patriarchal structure is sexist in nature, based on the domination and power of men over women, that is, a world of the male gender par excellence. In patriarchal society, there is a homeland that is recorded as if it were (and in fact was) the amplified family itself, whose male figures stood out. This domination or sexist conception generated social results that were not always positive (Silva; Seabra; Junior; 2016).

In line with Ricoeur (2012), narrative construction assumes a central role in revealing not only trajectories of pain, but also strategies for reencountering one's own body, enhancing

the becoming-woman proposed by Deleuze and Guattari (1995) as a tool for deconstructing the hegemonic narrative. In this way, it seeks to problematize how ancestral knowledge, orality and community practices are articulated in the production of attitudes towards domestic violence.

In light of this problem, the general objective of this study is to analyze the narratives of black women who face domestic violence emerge as important sources of tacit knowledge and practices of resistance. In view of the above, the research problem focuses on the following question: what knowledge, experiences and experiences are mobilized, through the narratives of black women, in confronting domestic violence?

The specific objectives are configured as: i) to identify and know the knowledge and practices of black women; ii) describe the personal, social, historical, cultural and educational context of these women victims of domestic violence; iii) identify the different forms of violence to which they are subjected in their own home, considering the intersectionality of gender and race, according to Carneiro (2003) and Ribeiro (2017).

The article aims to fill gaps in the literature by articulating theory and life history, enhancing the production of critical knowledge for the formulation of more effective public policies, aligned with black feminist epistemologies (Gomes, 2019; Pereira; Carneiro, 2019).

In view of these premises, the structure of this article is divided into five main sections, strictly following the ABNT standards. The first section comprises the theoretical framework, in which basic concepts such as non-formal education (Trilla, 2011), body-writing (Maluf, 1999) and narrativity (Benjamin, 2001; Cardoso, 2007).

This is followed by a description of the qualitative and bibliographic methodology adopted, complemented by visits to the Specialized Women's Police Stations, to the Maria da Penha Patrol of the Military Police. In the analysis section, the narratives collected in the periodicals are presented and interpreted, illustrated by the ethnographic scene of a black feminism meeting in the Brazilian Northeast. as described by Strathern (2016).

Finally, the final considerations summarize the main findings and indicate paths for future research and for the strengthening of public policies. In addition, in accordance with CNS Resolution No. 510/2016, there is no need for evaluation by the CEP, given the documentary and low-risk nature of the research.

2 METHODOLOGY

In line with Creswell (2014), a qualitative approach of a theoretical nature was adopted, based on bibliographic research and documentary analysis of laws, official reports and scientific articles, which defines this path as one based on multiple meanings and historical-social perspective.

Considering that scientific research is present in every field of science, in the field of education we find several published or in progress. It is a process of investigation to solve, answer or deepen a question in the study of a phenomenon.

According to Bastos and Keller (1995, p. 53) define: "Scientific research is a methodical investigation of a given subject with the objective of clarifying aspects under study". For Gil (2002, p. 17) "Research is required when there is not enough information to answer the problem, or when the available information is in such a state of disorder that it cannot be adequately related to the problem".

Bibliographic research is mainly inserted in the academic environment and has the purpose of improving and updating knowledge, through a scientific investigation of works already published.

In this context, bibliographic research is a fundamental skill in undergraduate courses, since it constitutes the first step for all academic activities. A laboratory or field research necessarily implies preliminary bibliographic research. Seminars, panels, debates, critical summaries, monographs do not dispense with bibliographic research.

It is mandatory in exploratory research, in the delimitation of the theme of a work or research, in the development of the subject, in citations, in the presentation of conclusions. Therefore, if it is true that not all students will carry out laboratory or field research, it is no less true that all, without exception, in order to prepare the various works requested, must undertake bibliographic research (Andrade, 2010, p. 25).

The instruments that are used in the bibliographic research are: books, scientific articles, theses, dissertations, yearbooks, magazines, laws and other types of written sources that have already been published.

Bibliographic research, according to Fonseca (2002), is carried out "based on the survey of theoretical references already analyzed, and published by written and electronic means, such as books, scientific articles, web site pages". Thus, any scientific work begins with a bibliographic research, which allows the researcher to know what has already been studied on the subject.

There are, however, scientific studies that are based solely on bibliographic research, looking for published theoretical references with the objective of collecting information or prior knowledge about the problem to which the answer is sought (Fonseca, 2002, p. 32).

In this way, sources were explored, such as visits to the social networks of the Specialized Women's Police Stations, the Maria da Penha Patrol of the Military Police, complemented by institutional documents (Association of Women Against Violence, 2018; Brazilian Yearbook of Public Security, 2021). This triangulation of data sought to confront official narratives with community knowledge, as recommended by Wolcott (2010 apud Creswell, 2014), giving greater validity to the study.

Questions guided the collection of information: How do the individual narratives of black women articulate with collective articulations in non-school spaces? How do these reports show tacit knowledge of coping with violence? The initial stage consisted of systematic bibliographic mapping in databases such as Scielo, Capes and Google Scholar, using descriptors such as "black women", "domestic violence", "black feminism" and "non-school knowledge".

Subsequently, qualitative content analysis was carried out, according to Bardin (2011), to identify emerging thematic categories, such as body writing and community care. In addition, texts by classic and contemporary authors were consulted, ensuring the required temporal and conceptual diversity (Adorno, 1997; Benjamin, 2001; Gonzales, 1983; Davis, 2018; Ricoeur, 2012).

3 RESULTS AND DISCUSSIONS

This section presents the theoretical and conceptual basis that supports the study. It defines the context of the research, explains the key concepts related to the topic and demonstrates the relevance of the study through the discussion of previous theories and research. As in the Maria da Penha Patrol of the Military Police of Maranhão (PMMA), which acts in the execution of the Maria da Penha Law through standard operating procedures and projects for prevention and care for women in situations of violence.

This law defines various types of violence (physical, psychological, sexual, patrimonial) and the PMMA aims to protect victims and punish aggressors, based on Law No. 11,340/2006, which also provides mechanisms for the protection of women's rights (Brasil, 2006).

Since 2017, the Maria da Penha Patrol has provided 42 thousand services throughout Maranhão. Of these procedures, 580 are arrests for non-compliance with protective measures. The group has its own personnel, vehicles and a partnership with justice agencies. It was created by State Decree No. 31,763, of May 20, 2016. The group is an organ of the Military Police of Maranhão and is part of the Community Security Command, which are linked to the State Secretariat of Public Security (SSP).

The Maria da Penha Patrol works in the care and monitoring of women in vulnerable situations, victims of domestic and family violence, holder of emergency protective measures, granted by the competent authority, supervising compliance with it. To fulfill this mission, it carries out ostensible and preventive policing, with daily assistance through visits, rounds and telephone contacts.

Welcome, security and guarantee of dignity to women who are victims of violence. The work of the Maria da Penha Patrol is consolidated as one of the most important tools for the combat, prevention and control of crimes against women. Maranhão has 13 groups of these, strategically implemented in regional offices that reach more than 40 municipalities and surrounding areas.

The most extreme manifestation of violence against women is that which culminates in death. Deaths resulting from the practice of gender violence are currently called femicide.

In addition, the overwhelming majority of these crimes are committed by men, especially by partners or ex-partners, and result from situations of abuse in the home, threats or intimidation, sexual violence, or situations in which women have less power or fewer resources than men. However, before scrutinizing the minors of femicide itself, it is necessary to start with an analysis and understanding of the very conception of gender violence (Redondo; Pimentel; Correia, 2012; Alarcão, 2006).

Furthermore, considering that violence has always been associated with the human experience, and that the individual is part of the suprasystems of community and society, this is a phenomenon with cultural and historical roots, legitimized by traditions and accompanied by the complicit silence of the witnesses in the community and the victims (Krug et al., 2002; Lisbon; Vicente; Barroso, 2005).

It is worth noting that the family's behavior in the face of violence as a crisis can be predicted through the study of previous patterns, and it is common to find, during the elaboration of the history of this family, previous situations in which the aggressor witnessed

conjugal violence or being himself, or someone from the phratry, a victim of mistreatment or sexual abuse (Minuchin, 1982; Rolland, 2000; Alarcão, 2006).

Women are the most common victim, one in three women in the world have been beaten, forced to have sex, or abused in one way or another in their lives, and the aggressor is usually someone close to the woman, and 40% to 70% of homicides in which the victim is female are the culprit is her husband or boyfriend (Krug et al., 2002).

In this lamiré, it is possible to recognize that the struggle of the various feminist movements to make public the violence suffered by women, in order to recognize it as a problem that involves society in general, still encounters an obstacle in the face of family power, which manages to silence such a situation (Bandeira, 2014).

In this context, the assumption that violence against women is a type of violence apprehended during the primary processes of socialization and displaced to the sphere of society in secondary moments of socialization and in the sociability of adult life. This, therefore, is not characterized as a pathology or as an individual deviation, but rather as "social permission" granted and agreed with men in society (Soares, 1999).

Thus, from this perspective, the concept of non-school knowledge takes center stage in the understanding of learning constituted throughout life, in daily relationships and in community practices. According to Trilla (2011, p. 19), "non-formal education is any organized, systematic, educational activity, carried out outside the framework of the official system".

Furthermore, Pedreño (2017, p. 280) argues that this tacit knowledge "transforms us, shapes our lives and shapes them, in the sense of producing attitude and conduct". In this context, Nilma Lino Gomes (2019) highlights the black educator movement as a locus for the construction of critical epistemologies, while Sueli Carneiro (2003) demonstrates, in "Enegrecer o feminismo", how colonial violence shaped imaginaries about the black body, eroticizing and objectifying it.

In addition, Angela Davis (2018) in "Woman, race and class" points out the interconnection between oppressions, showing that knowledge of resistance is produced in multiple spaces, from congada circles to meetings of feminist collectives, according to Hooks (2018).

In line with Anderson (2007 apud Cardoso, 2007), narration is not reduced to a simple historical reconstruction, but acts as a device for the co-construction of meaning. Walter

Benjamin (2001, p. 37) warns that "the narrator holds in himself the accumulation of experience, and transmits an experience to the other".

Thus, *oralituras*, a term expanded by Martins (2003), allude to the sociocultural phenomenon in which body, memory and writing are intertwined, creating body-writing that resists epistemological erasure.

On the other hand, Deleuze and Guattari (1995) propose the concept of becoming-woman, which allows us to glimpse trajectories of escape from the gender binary and racial subalternity, materializing as a tool for re-signification of everyday experience. Upon This analysis, it is worth highlighting the conceptual contribution of intersectionality, defended by black feminism and authors such as Djamila Ribeiro (2017), to understand the simultaneity of gender, race, class, and sexuality oppressions.

Furthermore, Salisbury (2019) and Lopes (2014) corroborate this view by pointing out that the experience of black women in Brazil cannot be dissociated from community care practices, food preparation, and ancestral knowledge transmitted through generations.

In addition, Ricoeur (2012) offers an important framework for understanding the intertwining between time and narrative, showing how subjective experiences are rewritten day after day, projecting themselves into the future and reappearing in the present, tensioning the notions of the past and becoming.

On the other hand, research such as Gregori (1989) and Fonseca and Lucas (2006) describe the psychological and social consequences of domestic violence, pointing out gaps in the traditional approach, which often makes the racial profile invisible.

Bianchini, Bazzo and Chakian (2022) emphasize that the Maria da Penha Law (BRASIL, 2006) and the Femicide Law (Brasil, 2015) need to incorporate specific policies for black women, otherwise they will reinforce structural inequalities.

In this sense, the articulation between black feminist epistemologies and public policies emerges as a path to the full recognition of the knowledge and practices of resistance of these women, becoming an instrument of emancipation and promotion of human rights.

The narratives and experiences found in the bibliographic research revealed ancestral knowledge shared in groups of children and in the collective preparation of typical Afro-Brazilian foods, configuring care practices that, according to Nilma Lino Gomes (2019), constitute epistemologies of resistance.

Through this analysis, it was observed that sitting on mats and cushions, described in a scene similar to the June 2017 meeting, becomes a rite of passage, as Martins (2003)

highlights, to give visibility to the body-writing, a word that synthesizes experiences of discrimination and community affection. These narratives are loaded with metaphors, such as "my treasure is my body" (Participant, 62 years old), which explain subjective processes of resignification.

On the other hand, reports on types of violence — physical, psychological, patrimonial and sexual — were pointed out in an interconnected way, confirming the intersectional approach of Davis (2018).

One woman reported having been prevented from working, constituting patrimonial violence, while another mentioned recurrent racist insults: "black monkey" and "hard hair", echoing the colonial eroticization described by Carneiro (2003).

These words reflect the naturalization of racist and sexist discourses, corroborated by Gonzales (1983), which permeate public and private institutions, determining social roles, according to Carvalho et al. (2016).

Another emerging dimension refers to the strengthening through participation in black women's collectives, in which there was reconstruction of self-esteem and political empowerment.

This is close to Gomes' (2019) idea of the "black educator movement", revealing that knowledge acquired in non-formal spaces enhances complaints and referrals to protection networks, such as the Maria da Penha Patrol. This process of empowerment resonates with the concept of becoming-woman of Deleuze and Guattari (1995), evidencing trajectories of rupture with cycles of violence.

In addition, the narratives about coping strategies point to practices of articulation with public agencies, the use of solidarity networks and the use of social networks as a tool for collective denunciation. Pinto and Amazonas (2006, p. 34) state that the social visibility of contemporary women challenges subservient models, which materializes in the use of the internet to expose violent behaviors and mobilize support.

In this context, the production of oral narratives presents itself as an important technology of resistance, according to Costa (2015) and Cardoso (2007), enabling the voice of each woman to be heard and recognized.

4 CONCLUSION

In view of the above, it is concluded that the narratives of black women victims of domestic violence in the Brazilian northeast reveal a rich range of knowledge, experiences and experiences based on non-school knowledge, community care practices and orality.

These elements, accompanied by processes of resignification of the body-writing, shape strategies of resistance that go beyond traditional institutional approaches.

In this sense, the importance of public policies aligned with black feminist epistemologies is evident, as suggested by Bianchini, Bazzo and Chakian (2022), to promote effective actions to confront gender and race violence. In addition, the articulation of ancestral knowledge and everyday experiences shows that non-formal education plays a vital role in the construction of attitude and coping behavior (Pedreño, 2017; Trilla, 2011).

It was also observed that, even in the face of hegemonic discourses of racial and gender subjugation, black women have repertoires of resistance that are manifested through collective and individual narratives, acting as devices of empowerment and denunciation.

Nevertheless, the results reinforce the need for critical reflection on the gaps in current laws, such as the Maria da Penha Law (Brazil, 2006) and the Femicide Law (Brazil, 2015), which need to incorporate racial perspectives into their prevention and protection strategies.

From this perspective, policies to strengthen the SUS, psychosocial care, and include the knowledge of black women should be prioritized, as advocated by Davis (2018) and Ribeiro (2017).

Finally, the absence of structured interviews and the need to deepen concrete actions of support networks are pointed out as limitations of this study. Therefore, new empirical studies that integrate participatory methodologies, action research, and evaluation of public programs are recommended. At the same time, the relevance of incorporating the voice of black women at all levels of public policy formulation is reinforced, ensuring that their reports and knowledge feed practices to confront domestic violence in an integral and intersectional way.

ABSTRACT

This article analyzes demographic and socioeconomic aspects that differ between these excluded populations - indigenous and Afro-descendants, in contrast to the rest of the population. Mexico is a multi-ethnic country with a diverse population composed of European descendants, Afro-descendants, and Indigenous groups, the result of thirty thousand years of an evolving nation until the colonial invasion (1519 to 1521), followed by the colonial period (1521 to 1821), the trafficking and slavery of one hundred and fifty thousand African people, the independence wars (1810 to 1821), a Revolution (1910 to 1920) and the consolidation of the constitutional state, which includes eugenics by the Western assimilation of original peoples and African-descendants through education. This study compares three population groups according to their specific demographic variations in civil status, age at marriage, number of children, family structure, and level of education. The objective is to understand how these racialized groups differ in family behavior and the intersections between demographic and household characteristics. The quantitative methodology includes demographic methods to describe the patterns and differences between ethnically racialized groups and to explain how population reproduce racism conforming to structural and family inequalities. The results show that the demographic transition is less accelerated among indigenous and Afro-descendants, related to their lower level of education and other socio-economic vulnerabilities, but also to fertility and family structure and composition, leading to the need for support for the racialized women and elderly in the next decades, and multi-generational families. Conclusions show the need for specific affirmative policies oriented to support families of Indigenous and Afro-descendants.

Keywords: Indigenous. Afro-Descendant. Family. Ethnic-Racial Inequalities.

RESUMO

Este artigo analisa aspectos demográficos e socioeconômicos que diferem entre essas populações excluídas — indígenas e afrodescendentes — em contraste com o restante da população. O México é um país multiétnico, com uma população diversa composta por descendentes de europeus, afrodescendentes e povos indígenas, resultado de trinta mil anos de formação de uma nação em constante evolução até a invasão colonial (1519 a 1521), seguida pelo período colonial (1521 a 1821), pelo tráfico e pela escravização de cento e cinquenta mil pessoas africanas, pelas guerras de independência (1810 a 1821), por uma Revolução (1910 a 1920) e pela consolidação do Estado constitucional, que incluiu a eugenia

por meio da assimilação ocidental dos povos originários e dos afrodescendentes via educação. Este estudo compara três grupos populacionais de acordo com variações demográficas específicas no estado civil, idade ao casamento, número de filhos, estrutura familiar e nível de escolaridade. O objetivo é compreender como esses grupos racializados diferem no comportamento familiar e as interseções entre características demográficas e domiciliares. A metodologia quantitativa inclui métodos demográficos para descrever os padrões e as diferenças entre grupos etnicamente racializados e para explicar como a população reproduz o racismo em conformidade com desigualdades estruturais e familiares. Os resultados mostram que a transição demográfica é menos acelerada entre indígenas e afrodescendentes, relacionada ao menor nível de escolaridade e a outras vulnerabilidades socioeconômicas, mas também à fecundidade e à estrutura e composição familiar, levando à necessidade de apoio às mulheres e aos idosos racializados nas próximas décadas, bem como às famílias multigeracionais. As conclusões apontam para a necessidade de políticas afirmativas específicas voltadas ao apoio às famílias indígenas e afrodescendentes.

RESUMEN

Este artículo analiza aspectos demográficos y socioeconómicos que difieren entre estas poblaciones excluidas —indígenas y afrodescendientes— en contraste con el resto de la población. México es un país multiétnico, con una población diversa compuesta por descendientes de europeos, afrodescendientes y pueblos indígenas, resultado de treinta mil años de conformación de una nación en constante evolución hasta la invasión colonial (1519 a 1521), seguida del periodo colonial (1521 a 1821), el tráfico y la esclavización de ciento cincuenta mil personas africanas, las guerras de independencia (1810 a 1821), una Revolución (1910 a 1920) y la consolidación del Estado constitucional, que incluyó la eugenesia mediante la asimilación occidental de los pueblos originarios y de los afrodescendientes a través de la educación. Este estudio compara tres grupos poblacionales de acuerdo con variaciones demográficas específicas en el estado civil, la edad al matrimonio, el número de hijos, la estructura familiar y el nivel educativo. El objetivo es comprender cómo estos grupos racializados difieren en el comportamiento familiar y las intersecciones entre las características demográficas y del hogar. La metodología cuantitativa incluye métodos demográficos para describir los patrones y las diferencias entre grupos étnico-racializados y para explicar cómo la población reproduce el racismo conforme a desigualdades estructurales y familiares. Los resultados muestran que la transición demográfica es menos acelerada entre los pueblos indígenas y los afrodescendientes, relacionada con su menor nivel educativo y otras vulnerabilidades socioeconómicas, pero también con la fecundidad y la estructura y composición familiar, lo que conduce a la necesidad de apoyo a las mujeres y a las personas mayores racializadas en las próximas décadas, así como a las familias multigeneracionales. Las conclusiones evidencian la necesidad de políticas afirmativas específicas orientadas al apoyo de las familias indígenas y afrodescendientes.

1 INTRODUCTION

In Latin America, Indigenous and Afro-descendant families play a fundamental role in preserving the culture, traditions, and identity of their communities. Indigenous communities belong to more than five hundred ethnic languages and groups (World Bank, 2015), organized into extended kinship systems that include not only parents and children, but also uncles, aunts, grandparents, and community members. The traditional education system is based on oral transmission of knowledge and customs through community ties and networks. They live based on a subsistence economy of traditional agriculture, fishing, and crafts, combined with informal trade and community tourism. Therefore, in Mexico, people self-define themselves Indigenous as people sharing norms, values and culture in households and communities, independent of whether they speak the language. Indigenous identity and population measures rely on self-declaration, considering whether individuals speak an original language and if they self-identify with original values and customs.

2 LANGUAGE AND SELF-ADSCRIPTION

In Mexico, there are 68 Indigenous groups, each speaking their own native language, which together have 364 variants. (INPI, 2019).

In 2020 there were 23.2 million self-declared Indigenous people or 19% of the total population (INEGI, 2022). Mexico is the country with the largest Indigenous population on the American continent. However, only 7.4 million people aged five and older speak an Indigenous language, and 11.8 million live in a household where the head speaks an Indigenous language. Of the Indigenous language speakers, 2.7% are monolingual, and the majority are older women. Integrationist or assimilation policies have managed to reduce the number of Indigenous language speakers. (INALI, 2009; Nolasco, 2021; INEGI, 2022; INEGI 2024; CONAZA, 2023).

The percentage of the Indigenous-speaking population fell from 6.6% in 2010 to 6.1% in 2020. It is worth remembering that in 1930 it was 16%. Indigenous languages are disappearing due to prevalent discrimination (Nolasco, 2021) from colonization, slavery, and continued with eugenics — a Modern pseudoscience that legitimated social Darwinism, the idea of the European supremacy over all other ethnic groups (Ansley, 1997). At the end of the 18th century, the independency of American colonies continued discrimination by eugenics. The legacy of Africans slavery -- justified with Christianity beliefs, was replaced

with the legitimacy of pseudoscience -- Social Darwinism, Modern biology, and genetics. Eugenics was massively financed and implemented by the Western powers around the world as obligatory discipline in the curricula from basic school until post-graduation, as well as among all the scientific, intellectual, and political framework, as well as in social, reproductive, health, family, and migration policies. In Mexico, the integrationist policy legitimized the Western cultural assimilation, forcing the adoption of Spanish as the only official national language and promoting the *mestizo* identity instead of Indigenous identity. All ethnic groups were forced to abandon their languages and to deny their values and customs, continuing historical-colonial discrimination and population decline. The aspiration of *mestizaje* means whitening population through interethnic marriage, legitimizing racism against Non-European people, values, beliefs and practices. (Ansley, 1997; Gomes, 2024).

Mexican ruling elites and dominant classes are mostly of European origin or *mestizos*, while the Indigenous population are those who recognize themselves as descendants of the original population living in Mesoamerica more than 500 years ago, before the Conquest, preserving their language, values, beliefs, and customs, and a sense of belonging with their land and families (Sandrín, 2016; Nolasco, 2021). Despite after 1970 Mexico adopted multicultural legislation and policies, following international agreements, “the elders do not teach the language to subsequent generations to avoid discrimination.” (Nolasco, 2021).

Afro-descendants arrived in Latin America at the beginning of colonization, with the colonizers, and then became widespread through African slavery, to substitute the Indigenous labor force, decimated by colonization. (Darién, 1995). Modern slavery trafficked millions of Africans to Brazil, Colombia, Mexico, Ecuador, Peru, Central America, and the Caribbean. Colonization and slavery resulted in the displacement and disruption of original families and cultures. Nevertheless, certain communities and individuals maintained ancestral traditions, including music, dance, cuisine, and religions. African families reproduce through matrilineal ties and networks of mutual support, working mostly in informal works and cultural economy, even facing structural racism, stigmatization, and vulnerable social conditions. Afro-descendants are particularly exposed to social and racial violence, and some groups like *quilombolas* (descendants of escaped slaves) fight for land ownership, and, like the Indigenous, they were also displaced from the territories where they have lived for centuries (Gomes, 2024; Lezama 2023; Valdivieso, 2016 Velasco et al, 2014; Gandelman, 2011; Bello and Rangel, 2002; Navarrete, 2004).

In 2020, Afro-Mexicans total 2.6 million or 2% of the Mexican population (INEGI, 2024). Structural racism has predominated with slavery and continued through eugenics, which recognized only Indigenous and Euro-descendants as composing “The Mexican Cosmic Race” (Stern, 2000). Black people are invisible since their arrival until 2020 when, for the first time, they achieved social recognition in Mexico. Despite its official invisibility, their integration into the *mestizo* culture preserved African cultural heritage, whose influences are in dances (*jarocho*, dance of the devils), music, and cuisine, mixed with Indigenous groups living with strong community and cultural cohesion. (Velázquez, 2015; Villafuerte, 2011).

The municipalities where Afro-Mexicans are mostly located in the Costa Chica region, behind the mountains of Guerrero and Oaxaca, where predominated the miscegenation with Indigenous groups; therefore, they do not possess the strong racial or cultural group identity with their African ancestors, like Indigenous people do. (INEGI, 2022)

Forced to adopt Western culture after the Conquest and the legacy of colonization, slavery, Catholic religion, racial miscegenation, Spanish education, and Modern eugenics, Indigenous and Afro-descendants have been racialized and discriminated in all the social and political spheres of the society. Contemporary globalization and migration add new threats to their cultural preservation (Velasco et al, 2014).

In Mexico, structural racism hidden behind jokes, nicknames like “Negro” or “Indio Ladino,” and segregates Indigenous people and Black people from childhood, at school, institutions, in social positions, and in public spaces. The multicultural approach continues the discrimination against miscegenation, hiding the presence of Afro-Mexicans in the population (Gomes, 2024; Navarrete, 2004).

Despite their less visible communities, there are recent advances in legal recognition of African slavery and African descendants in Mexican, who were legitimized as ethnic groups with specific rights since 2019 in the Constitution and in the National Program for Afro-descendants (2021), focused on health and education, as well as with including this ethnic category in the census (Valdivieso, 2016).

Despite colonization, slavery and racism, Indigenous and Afro-descendant families are pillars of Latin American cultural diversity. Numerous Indigenous live in extended families, whit other members residing together within the same household. And Indigenous and afro-descendant women play a key role in cultural transmission and the domestic economy and cultural preservation. Afro-descendant families maintain traditions (music, cooking, religion) and are frequently headed by women, with heavy economic burdens (Gandelman et al,

2011). Despite marginalization, both groups are resilient preserving their community and family values and practices.

3 VALUES, LAND, REPRODUCTION, AND HEALTH.

The collective ownership of the land implies the recognition of ancestral rights and reflects their historical massive participation in the Wars of Independence for the end of slavery and in the Revolution of 1910 for agrarian reform (León-Portilla, 2010). The connection that Indigenous peoples have with the land involves economic, social, identity, and religious elements. Afro-descendants in rural areas also conceive access to land not only as a guarantee of subsistence but also as continued cultural identification. For both, Indigenous people and Afro-descendants, land property, reproduction, family, and health are related to traces of ancestral values, beliefs and customs, as well as to Indigenous languages, all of this interwoven with Indigenous identity and sense of community. (Velasco et al, 2014; Gandelman, 2011; Bello and Rangel, 2002)).

Human reproduction is part of broader processes of social and cultural reproduction; of structures and networks of social relations, framing differences in the exercise of power, reproductive, sexual and family practices of individuals and their groups (Salles and Tuirán, 2001). The Indigenous youth have little autonomy and maintain strong family and social ties (Szasz and Lerner, 2010).

Beliefs and values about reproduction influence family size and contraceptive use, which differ among *mestizos* and Indigenous groups (Navarrete, 2004). Being indigenous reduces the probability of using some form of contraceptive by 45% compared to non-indigenous young women, and the most significant explaining variables are a) completing primary or secondary school, b) having the ideal number of children equal to or higher than four, and c) believing that women's role is to continue studying or working (No-family) (Ssandrín, 2010; Hicks, 1974).

Indigenous women have difficulty accessing basic sexual and reproductive health services, which has a significant impact on the average number of live births per woman: 3.3, compared to 2.2 for non-Indigenous women (UNFPA, 2021). Between 1999 and 2009, the fertility of non-Indigenous women decreased from 3.5 to 2.4 children per woman, while that of Indigenous women fell from 4.1 to 3.2 children per woman, with significant differences between the various Indigenous groups. (Sandrín, 2010; Sandrín, 2016).

Moreover, fertility among Indigenous adolescents aged 15 to 19 is higher than among non-Indigenous women, at 83 and 62 births per thousand adolescent women, respectively. Sixty-five percent of Indigenous adolescents are not in school. (Nolasco, 2021).

Barriers to accessing Western health services are distance, poverty, language and discrimination. In Mexico, only 15.4% of the Indigenous population has access to health services, in contrast to the national population, which has 16.3%. (Bello and Rangel, 2002). Moreover, due to male migration, 23.4% of indigenous households have a woman as a head. (Nolasco, 2021).

Reproduction, fertility, family formation and expansion are related to education level and socioeconomic inequalities, which are analyzed in the next section.

4 EDUCATION, WORK AND POVERTY

The most important challenges for Indigenous and Afro-Mexicans are socio-economic disadvantages — poverty and migration — that threaten indigenous autonomy and cultural preservation. (Gandelman, 2011; INPI, 2019). Even after decades of integration policies, Indigenous people continue discriminated against at school and in other social positions, mainly because of their language, clothing, and behavior.

Both groups live mostly in social exclusion – in poverty, geographical isolation, with lack of access to basic services (health, education), displacement due to territorial conflicts, elite control, capital-intensive agriculture, occupation and dispossession of their lands due to megaprojects like mines exploitation, agribusiness, infrastructure, as well as a secular decline in rural productivity and employment, aggravated by economic and land property reforms), financial sector liberalization and privatization, as well as migration. From the perspective of world systems, all these phenomena occur in interrelation with national and local contexts and have become increasingly frequent throughout the world in recent decades (Wallerstein, 2004; Gandelman et al, 2011; Sánchez, 2003).

Both groups have lower levels of education and income compared to their counterparts (Bello and Rangel, 2002). In Mexico, their income is unaffected by either increases or declines in national poverty rates and being indigenous increases by 30% the probability of being poor (Hall and Patrinos; 2006).

In Mexico, 31.1% of the Indigenous population has educational gaps, while the national percentage is 15.4%. 8.4 million Indigenous people live in poverty and 3.4 million live in extreme poverty. Indigenous women who migrated to cities have an average 6.2 years

of schooling, compared to the 9.1 years of schooling for women in the country. They work primarily in the informal sector, without social benefits, and survive from day to day, with an income that is also day by day in nature. (Nolasco, 2021).

Half of labor and income gaps between the Indigenous and non-Indigenous is related with the low educational attainment, and the other half by discrimination (Parker et al, 2005).

Parker et al. (2005) found that language barriers are related to the lower performance of Indigenous children, particularly among monolingual Indigenous, whereas bilingual children perform almost equivalent to their non-Indigenous counterparts in Mexico.

The low educational level of the mother, father's profession, and child labor reproduce among generations, since these are the main determinants affecting Indigenous children's enrollment at school and, subsequently, their labor discrimination and income disadvantages. (Román, 2013).

Qualitative studies indicate that that Indigenous children have high school expectations. Although Indigenous students often maintain high aspirations despite their parents' limited education, low parental cultural capital restricts the transfer of knowledge and skills necessary to sustain educational engagement and progress. Consequently, these students exhibit lower academic performance, higher rates of grade repetition and dropout than non-Indigenous peers, and frequently enter the labor market early, typically in precarious employment. (Espinoza et al, 2014).

In Mexico, in 2015, the educational attainment of the Indigenous was lower than for Afro-descendant people and speaking an Indigenous language or identifying as Indigenous has a negative effect of a larger magnitude compared to being Afro-descendant. Moreover, contrary to expectations, there is no evidence that Afro-descendants had a lower status in the labor market through occupational status, and even more remarkably in schooling. (Torre-Cantalapiedra and Sánchez-Soto, 2019)

Due to the migration of a considerable number of men to urban areas or overseas, women serve as heads of 23.4% of indigenous households. (Nolasco, 2021). Although migration to the US divides families, remittances help maintain international family connections and networks; however, migration and cultural loss also put pressure on collective land holdings (*Ejidos*) (Velasco et al, 2014).

5 METHODOLOGY

This article analyzes demographic and socioeconomic aspects that differ between these excluded populations — indigenous and Afro-descendants — in contrast to the rest of the population, comparing these three racialized population groups in Mexico according to age and family structure, civil status, number of children, and level of education.

The article develops an understanding as to how these population groups differ and the intersections between demographic and social characteristics in racialized groups.

The methodology includes the estimation of demographic indicators, graphs, and maps to describe and analyze the patterns, distribution, and differences between ethnically racialized groups, comparing proportions, population pyramids, and spatial distribution of Indigenous, Afro-descendants (AD) and other groups (OG) in Mexico. Indigenous populations are classified as those who speak an Indigenous language (IL) or self-defined as Indigenous (ISD).

Results from statistical correlations and logistic regression models demonstrate the factors likely to be associated with each ethnically racialized population, compared to their counterparts, as well as the main characteristics related to inequalities between groups.

The source of information is the National Survey of Demographic Dynamic --ENADID, field-applied in 2023 and whose results were released in 2025 (ENADID, 2025).

The dependent variable has two categories, representing one ethnically racialized group in contrast with the rest of the population. The independent variables studied are age, sex, marital status, level of education, area of residence (rural vs urban), household structure, health service affiliation, migration, and labor activity.

6 RESULTS

The Mexican population is mostly young and young-adult, with high proportions of them between 10 and 29 years old, and strong reductions in the number of children up to 9 years old, a result of the progressive reductions in the birth rates since the 1970s, which is observed in all racialized groups, although birth rates declined much later among Indigenous groups. The population is lower in this age group because Indigenous language data is collected for those over three groups. Indigenous (IL and ISD) have older population structures, compared to AD and OG. Their pyramids show a strong lack of male and female adults between the ages 25 and 44 and higher proportions of generations over 60 years old. This population structure is the result of long-term internal and international migration by Indigenous men and women from rural and Indigenous regions to Mexican urban centers and

the United States, leading to older Indigenous individuals remaining in both rural and urban areas. (Figure 1).

Figure 1

Population Pyramids of Ethnic-Racialized Groups in México, 2023

Source: Own estimations from the National Survey on Demographic Dynamics (ENADID, 2023)

Among AD and OG populations, the age groups 10-14, 15-19, and 20-24 years old are the most populated, followed by slight decreases until 60-64, and then sharp decreases in the older age groups. The only exception is Afro-descendant men, who have a lack of representation between 30 and 50 years old, like Indigenous groups.

Afro-Mexicans (AD) show strong differences by sex: the female population structure is younger than the other groups, while the male age structure is older, with a lack of adult men, like Indigenous groups. As Afro-Mexicans are concentrated in specific rural areas of the

country (the mountains and coasts of the States of Guerrero and Oaxaca), it would be due to the migration of Afro-descendant adult men to find work, while Afro-Mexican women stay living in their area of origin.

Data from the National Survey on Demographic Dynamics (ENADID, 2025) show similar trends.

Spatial distribution

Afro-Mexicans reside mostly in Guerrero, Morelos, Colima, Oaxaca, México, Tabasco, Nuevo Leon, and Chiapas.

People who speak some Indigenous Language (IL) live mostly in the states of Oaxaca, Yucatán and Chiapas, followed by Quintana Roo, Guerrero, and Campeche, all of them on the Pacific or Atlantic coasts, as well as in Hidalgo, in the Central region, where they represent between 9% and 27% of the total population. These states have historically concentrated Indigenous populations.

Indigenous communities live mostly in the states of Oaxaca, Yucatán, Quintana Roo, Guerrero, Campeche, Hidalgo, Tabasco, and Puebla, mostly situated along the coast. Self-identified Indigenous people make up 48% to 74% of the population in these states, which is higher than those who speak an Indigenous language. All the other states have between 15% and 48% of the population who self-declare to be Indigenous, but self-declared mestizos and European-descendant people predominate. The elevated proportions of individuals self-identifying as Indigenous are associated with the recent addition of an option to indicate family and ethnic background in censuses and surveys. Educational policies oriented to development have erased their language from everyday use over the course of a century, forcing the use of Spanish, the denial of their indigenous identity and, instead, adopting the mestizo identity, in a process of inclusion by assimilation. (Figure 2).

Figure 2

Spatial Distribution of Ethnic-Racialized Groups in Mexico, 2023

Source: Own estimations from the National Survey on Demographic Dynamics (ENADID, 2023)

Other groups (OG) who do not identify as Indigenous or Afro-descendants are in the North and Central regions of the country, with over 80% residing in Baja California, Coahuila, Tamaulipas, Durango, Zacatecas, Aguascalientes, Jalisco, and Mexico City. In these more developed states, a sizable portion of the population may identify with values commonly associated with contemporary Western societies. In these advanced states, most people align with modern Western values.

6.1 FAMILY FORMATION AND EXPANSION

The marital status is similar in the AD and OG populations — in both groups' half of the adults are married, followed by single people — around 40% of men and 30% of women. 5–9% live separated and 2–3% are divorced. The rates of widowhood differ by gender: for men, it is 2.8% and 2.3%, while for women, it is 8.7% and 8.1%. This variation is associated with differences in life expectancy between men and women.

In contrast, the Indigenous (IL) population has higher proportions of marriage (68.1% for men and 60.2% for women), lower proportions of separated (3.3%) and divorced (0.5%) of both sexes (7.3% and 0.6% respectively), as well as lower proportions of single men (23.3%) and women (19.6%), but higher proportions of widowed men (4.8%) and women (12.2%), due to their higher mortality and lower life expectancy. This result confirms the culture of family preservation and almost universal marriage among IL, compared to all other groups.

The following Indigenous group (ISD) has a similar marriage pattern to the IL, but slightly lower proportions of married men (57%) and women (53.1%), as well as higher proportions of separated (5.2% for women and 8.9 % for men), divorced (1.1% and 1.7% respectively), and single (33.5% and 26.4% respectively), and lower percentages of widowhood (3.2% and 9.9% respectively). Although this group preserves marriage and family values compared to other racialized groups, these values are lower than in the IL group, who

also preserve their Indigenous Language. Although assimilation policies and Western cultural influences led to language loss, family and marriage values stayed stable.

Table 1

Marital Status of Ethnic-Racialized groups in Mexico, 2023

Marital Status	Afro descendant (AD)		Indigenous Language (IL)		Indigenous Self-declared (ISD)		Other groups (OG)	
	Men	Wome	Men	Women	Men	Women	Men	Wome
Married	53.1	49.9	68.1	60.2	57.0	53.1	50.8	49.0
Separated	4.9	9.5	3.3	7.3	5.2	8.9	5.0	7.7
Divorced	2.2	3.2	0.5	0.6	1.1	1.7	1.8	2.7
Widow	2.8	8.7	4.8	12.2	3.2	9.9	2.3	8.1
Single	37.0	28.6	23.3	19.6	33.5	26.4	40.2	32.5

Source: Own estimations from the National Survey on Demographic Dynamics (ENADID, 2023)

The age at first union is low among the IL population (21.4), followed by the ISD group (21.5), the OG population (22.4 years old), and the latest to marry is the AD group (22.6) — more than one year later than Indigenous groups. The Afro-descendant population marries at a similar average age to the self-declared Indigenous.

Table 2

Average age at the first union in Mexico, 2023

<i>Total population</i>	22.1
<i>Afro descendant population</i>	22.6
<i>Indigenous population, language</i>	21.4
<i>Indigenous population, self-declared</i>	21.5

<i>Population with an inability</i>	22.6

Source: Own estimations from the National Survey on Demographic Dynamics (ENADID, 2023)

In brief, Indigenous groups marry in higher proportions and earlier, particularly the IL population, while Afro-descendant people marry in lower proportions and much later than Indigenous and compared to other population groups.

Indigenous women tend to marry younger and at higher rates, resulting in longer exposure to sexual activity and pregnancy risk. As a result, they also have a higher number of children, compared to Afro-descendants and other population groups. (Figure 3)

Figure 3

Average Fertility by racialized groups, México, 2023

Source: Own estimations from the National Survey on Demographic Dynamics (ENADID, 2023)

6.2 HOUSEHOLD SIZE, STRUCTURE AND COMPOSITION

Indigenous households are larger (33.1% of them have up to five members) than Afro-descendant households (25.1% have up to five members). The smaller households are among the OG population, related to their lower marriage rates and higher separation, divorce and single rates, as well as their higher age at marriage and lower fertility. In contrast,

Indigenous populations have consistent indicators related to the persistence of strong family values — higher proportions of marriage, lower proportions of separation and divorce, a lower age of marriage and a higher fertility.

Indigenous households are, on average, larger (3.9 members) than Afro-descendant (AD) households (3.5 members) and Other Groups (OG) households (3.3 members). Indigenous and Afro-descendant households each have, on average, 2.2 members who either speak an Indigenous language or self-identify as Afro-descendant.

Table 4

Household size by ethnic-racial condition in Mexico, 2023

Size	Afro descendant (AD) Households		Indigenous Households		Other Groups (OG) Households	
	N	%	N	%	N	%
Total	1,442,497	100.0	3,291,684	100.0	34,124,263	100.0
1	150,986	10.5	294,946	9.0	4,983,030	14.6
2	295,054	20.5	631,474	19.2	7,531,023	22.1

5 +	362,756	25.1	1,089,623	33.1	7,387,032	21.6

Source: Own estimations from the National Survey of Demographic Dynamics (ENADID) 2023.

The predominant proportion of nuclear households is aligned with the preference for marry and having children for the three groups, with slightly proportions for Afro-descendants and Indigenous. The second more frequent type of household is the extended with another member of the family, confirming the preference for collective values in both groups, compared to the rest of the population. Moreover, Afro-descendant people have higher proportion of unipersonal household and lower proportion of extended hosehold, compared to Indigenous and the other group, a less shared network of family relationships, suggesting a kind of isolation as individuals.

Figure 4

Household structure by racialized groups, Mexico, 2023.

Source: Own estimations from the National Survey on Demographic Dynamics (ENADID, 2023)

As a result, the proportion of members declaring an ethnic-racial condition within their households or among all the members of their households is small — in all households, they represent less than 10 % of the total number of members in the family composition. Indigenous and Afro-descendant individuals comprise less than 5% of family members.

Table 5

6.3 LEVEL OF EDUCATION

Indigenous people have the lowest level of education, 22.8 % of them do not complete the basic school education, 19.1 % complete the basic school education, 18.9 % the secondary school education, but 17.9 % have no education; only 11.1 % of them finish the higher secondary level education. In contrast, Other Groups (OG) achieved 33.4 % with higher secondary education and 36.2 % at university; and Afro-descendant people are in an intermediate position, with 19.5 % with complete secondary education, 21.1 % in higher secondary education and 19.7 % at university.

The proportion of people with no education is also higher among the Other Groups (OG), but this could also be related to their higher life expectancy, and the survival of the elderly generation who didn't have access to the universalization of the educational system, that happened 70 years ago.

Table 6

6.4 MULTIVARIATE DEMOGRAPHIC AND SOCIOECONOMIC CONDITIONS

The logistic models contrast Indigenous and Afro-descendant populations to their counterparts, controlling family and other social variables. Both vulnerable groups — Indigenous and Afro-descendants— have a higher and significant probability to have a lower education level and to live in rural areas, compared to their counterparts. Additionally,

Indigenous people are likely to be women, living in extended households, while Afro-descendants are likely to be older and not affiliated to health services.

Table 7

Source: Own elaboration based on National Survey of Demographic Dynamics (ENADID) 2023.

Despite the differences observed in descriptive data, marital status and migration were not sufficiently significant to explain the differences between each vulnerable group separately in contrast with others.

7 CONCLUSIONS

Both indigenous and Afro-descendant households have higher marriage and birth rates and start early unions and fertility than the rest of the mestizo and European-descendant

population, especially in rural areas, as well as early marriage and traditional gender roles, along with high but declining fertility rates and lower access to healthcare. These results confirm results from previous authors (Pino et al, 2020; Costa et al, 2022).

In certain Indigenous communities, teenage pregnancy aligns with cultural norms supporting fertility and marriage. But there are also cases related to violence against Indigenous and Afro-descendant adolescents. Extended families often reside together in villages, with multiple family units participating in local governance based on established customs and traditions. Women are often the guardians of languages and traditions, particularly in cooking, textiles, and handcrafts.

Indigenous people preserve their family culture with universal marriage and children, as well as the culture of sharing the household with other relatives. While Afro-Mexicans are likely to be older than other groups and share the households with other relatives. This results in strong challenges to health, because they are the oldest, and exposed to having a higher prevalence of chronic and degenerative illness but, at the same time, they suffer a strong lack of access to education and health services, as well as lower participation in the labor market and lower income levels, compared to the rest of the population.

Both groups present specific dynamics, influenced by socio-economic discrimination and cultural resilience. (Lezama, 2023; Costa et al, 2022).

As a conclusion, we could say that the predominant characteristics of Mexican Indigenous people are the socioeconomic exclusion and discrimination, as well as their resilience to preserve collective and family values, customs and practices, through the predominance of marriage and larger number of children, as well as the value of sharing the household with other relatives, facing collectively economic adversities and discrimination. While African-Mexicans are likely to be older than other groups, this results in strong challenges to health, because they are the oldest, and exposed to having a higher prevalence of chronic and degenerative illness but, at the same time, they suffer a strong lack of access to health services, more than other groups (Costa et al, 2022).

Ethnic and racial disparities within the population are evident in relation to existing structural and familial inequities. The ageing process is less accelerated among indigenous and Afro-descendants, related to their lower level of education and other socio-economic vulnerabilities, but also to their higher fertility and family structure and composition, leading to the need for support for the racialized women and elderly in the next decades, and multi-generational families.

ABSTRACT

This article focuses on researching a segment of the Bantu peoples, originating from Central-Western Africa and later from East Africa, sub-Saharan regions below the Equator. This is because they were the first Black population absorbed by the Atlantic Diaspora. In Brazil, the Bantu people were distributed across various regions, mainly through the ports of the Southeast, particularly Rio de Janeiro, especially the Baixada Fluminense, given its predominantly Bantu composition. Therefore, the overall objective is to encourage global society to delve into the past and, through the African continent and the Atlantic Diaspora, understand itself, considering Darwinian theory asserts the emergence of "Homo sapiens" precisely in the lake region, a demographically Bantu area. This fact is reinforced by research on the presence of melanin in the inhabitants of that area, due to climatic conditions. So, by immersing ourselves in the past, this time in reverse order, or rather, from the Baixada Fluminense, Rio de Janeiro, Brazil, until we reach the place of origin of the intelligent being (the maker of things). From there, we analyze from this angle to understand why the statement is made: "The whole world is Bantu, yes sir." Clues point to facts that show that the traditions and cultural references of this people were fundamental in the construction of Brazilian identity. This set of traditional and cultural values remains alive in the daily lives of families, in Candomblé temples, in the streets, in the markets, in the samba school grounds (large, medium and small), and in the avenues of their official parades. All this, before, during and after Carnival or in other types of popular festivals, as well as in any other place of Afro-descendant human concentration, mainly through their language, dance and musicality. These expressions remain anonymous regarding their countries of origin. They are generalized in the classrooms of this region, as well as in other regions of Brazil, simply as black or African. Thus, Africa, geographically, socially, and politically, is treated as a region devoid of any solidarity, forgetting that it constitutes the "Cradle of Civilization." The methodology used was qualitative-quantitative, with a descriptive nature, since it began with the collection and measurement of demographic data of the specific African population, supported by its strata, which brought the religious culture of the Bantu peoples to Brazil. The scientific paradigm followed to make the methodological choices was pragmatic, which facilitated the identification and description of the religious culture of the Bantu peoples in the diaspora of enslaved Africans subjected to the South Atlantic slave trade. The expected results revolve around combating racism, recognizing and valuing the identity of the Bantu black person, due to being the pioneer in the descent of Homo sapiens, in the construction of Brazil, and the formation of the Brazilian language, among other influences.

RESUMO

Este artigo tem como objeto de pesquisa parte dos povos denominados Bantu, oriundos da África Centro-Occidental, e posteriormente da África Oriental, regiões subsaarianas, abaixo da linha do Equador. Haja vista, ter sido a primeira vertente negra absorvida pela Diáspora Atlântica. No Brasil, o povo bantu foi distribuído por várias regiões, principalmente, pelos portos do sudeste, com destaque para o Rio de Janeiro, privilegiando a Baixada Fluminense, haja vista, a sua formação, majoritariamente banta. Dessa forma, o objetivo geral é provocar, a sociedade mundial mergulhar no passado para através do Continente Africano e a Diáspora Atlântica, conhecer a si mesma, haja vista, a teoria darwinista afirmar, o surgimento do “homo sapiens”, precisamente, na região dos lagos, área demograficamente banta. Fato este reforçado por pesquisas diopianas quanto a melanina existente nos seres habitantes daquela área, por conta das condições climáticas. Então, ao realizar essa imersão no passado, desta feita, em ordem inversa, melhor dizendo, da Baixada Fluminense, Rio de Janeiro, Brasil, até chegar ao local de surgimento do ser inteligente (fazedor de coisas). Daí então, analisar por este ângulo para entender o porquê da afirmativa: “Todo o Mundo é Bantu Sim Senhor”. Pistas apontam para fatos que levam às tradições e referências culturais desse povo, terem sido fundamentais na construção da identidade brasileira. Esse conjunto de valores tradicionais e culturais permanece vivo no dia a dia das famílias, nos terreiros de candomblé, nas ruas, nos mercados, nas quadras das grandes, médias e pequenas escolas de samba, e nas avenidas de desfiles oficiais delas. Tudo isso, antes, durante e depois do carnaval ou em outros tipos de festas populares, bem como em qualquer outro lugar de concentração humana afrodescendente, principalmente por meio de sua linguagem, dança e musicalidade. Estas expressões, permanecem anônimas quanto aos seus países de origem. São generalizadas nas salas de aulas dessa região, bem como, em outras regiões do Brasil, apenas como negras ou africanas. Assim, a África, geográfica social e politicamente, é tratada como uma região descompromissada de qualquer olhar de solidariedade, e esquecem de que esta constitui-se como o “Berço Da Civilização”. A metodologia utilizada foi quali-quantitativa, com natureza descritiva, uma vez que se iniciou com a coleta e mensuração de dados demográficos da população africana específica, apoiada por seus estratos, a qual, trouxe a cultura religiosa dos povos bantos para o Brasil. O paradigma científico seguido, para realizar as escolhas metodológicas, foi o pragmático, o que permitiu facilitar a identificação e descrição da cultura religiosa dos povos bantos, na diáspora dos africanos escravizados, submetidos ao tráfico do Atlântico Sul. Os resultados esperados giram em torno do combate ao racismo, reconhecimento e valorização da identidade do negro bantu, por conta de ser o pioneiro na descendência do homo sapiens, na participação na construção do Brasil, e formação da língua brasileira, entre outras influências.

RESUMEN

Este artículo se centra en la investigación de un segmento del pueblo bantú, originario de África Centro-Occidental y posteriormente de África Oriental, en las regiones subsafricanas situadas por debajo del ecuador. Esto se debe a que fueron la primera población negra absorbida por la diáspora atlántica. En Brasil, el pueblo bantú se distribuyó por diversas regiones, principalmente a través de los puertos del Sudeste, en particular Río de Janeiro, y en especial la Baixada Fluminense, dada su composición predominantemente bantú. Por lo tanto, el objetivo general es animar a la sociedad global a profundizar en el pasado y, a través

del continente africano y la diáspora atlántica, a comprenderse a sí misma, considerando que la teoría darwiniana afirma el surgimiento del "Homo sapiens" precisamente en la región de los lagos, una zona demográficamente bantú. Este hecho se ve reforzado por la investigación sobre la presencia de melanina en los habitantes de esa zona, debido a las condiciones climáticas. Así, al sumergirnos en el pasado, esta vez en orden inverso, o mejor dicho, desde la Baixada Fluminense, Río de Janeiro, Brasil, hasta llegar al lugar de origen del ser inteligente (el creador de las cosas), analizamos desde esta perspectiva para comprender por qué se afirma: «El mundo entero es bantú, sí señor». Las pistas apuntan a hechos que demuestran que las tradiciones y referencias culturales de este pueblo fueron fundamentales en la construcción de la identidad brasileña. Este conjunto de valores tradicionales y culturales se mantiene vivo en la vida cotidiana de las familias, en los templos de candomblé, en las calles, en los mercados, en los recintos de las escuelas de samba (grandes, medianas y pequeñas) y en las avenidas de sus desfiles oficiales. Todo esto, antes, durante y después del Carnaval o en otros tipos de fiestas populares, así como en cualquier otro lugar de concentración humana afrodescendiente, principalmente a través de su lengua, danza y musicalidad. Estas expresiones permanecen anónimas respecto a sus países de origen. En las aulas de esta región, así como en otras regiones de Brasil, se generalizan simplemente como negros o africanos. Así, África, geográfica, social y políticamente, se trata como una región carente de solidaridad, olvidando que constituye la "Cuna de la Civilización". La metodología empleada fue cualitativa-cuantitativa, de naturaleza descriptiva, ya que comenzó con la recopilación y medición de datos demográficos de la población africana específica, respaldada por sus estratos, que trajeron la cultura religiosa de los pueblos bantú a Brasil. El paradigma científico seguido para la toma de decisiones metodológicas fue pragmático, lo que facilitó la identificación y descripción de la cultura religiosa de los pueblos bantú en la diáspora de africanos esclavizados sometidos a la trata de esclavos del Atlántico Sur. Los resultados esperados giran en torno a la lucha contra el racismo, el reconocimiento y la valoración de la identidad de la persona negra bantú, por ser pionera en la descendencia del Homo sapiens, en la construcción de Brasil y en la formación de la lengua brasileña, entre otras influencias.

Palabras clave: Bantú. Baixada Fluminense. Río de Janeiro. Brasil. Mundo.

1 INTRODUCTION

The Atlantic Slave Deterritorialized about 12.7 million Africans, mostly Bantu, between the sixteenth and nineteenth centuries, impacting the formation of colonial societies. African workers were fundamental to the production of wealth, being responsible for different trades and economic activities, such as agriculture, navigation, land transport, domestic services and the different forms of production in the urban world, such as street commerce, stevedoring, among others (Bezerra, 2011). It is necessary to think that this process also meant an African diaspora, not only demographic, but also technological, since the knowledge of trades such as navigators, cooks, masons, blacksmiths, architects, among others, were widely practiced by Africans long before they were deterritorialized and sent to the Americas. Likewise, it is necessary to identify that African peoples also impacted the Brazilian cultural formation. Although not recognized by coloniality, the African peoples of Banta origin were the main responsible for the formation of most of the Brazilian cultural expressions, coming from Angola, such as: samba, capoeira, maracatu, jongo, tambores de mina, among others. Even in the cases of cultural expressions of Iberian origin, such as the folias de reis, the samba schools and carnival, the Bantu and their descendants resignified these expressions, transforming them into symbols of freedom, resistance and resilience of the black population that forms the majority of Brazilian society in contemporary times. Among the popular expressions of Brazilian culture, Candomblé stands out for preserving civilizing principles against colonials, that is, in a society marked by domination, slavery and the extermination of peoples and cultures through colonization, African peoples bequeathed a religiosity whose philosophies and existence offer other cosmogonic possibilities. Thus, other perspectives and epistemologies for Brazilian society are fundamental for thinking about contemporary social issues resulting from a process of slavery that inaugurated a necropolitics. Thus, this article's main function is to bring to light, through the products mentioned below, the preponderant role of the Bantu black in the construction of Brazil and the formation of the Brazilian language, in order to maintain the preservation of the Bantu culture as a strengthening of the identities of black youth in the territory, as well as to provide opportunities for educational training and professional preparation for the insertion of individuals from the popular classes in the productive market. (Adolfo, 2010), (Bezerra, 2011), (Costa e Silva, 2006), (Lopes, 2014), (Redinha, 1958), (Ribas, 1958), (Slenes, 2008), among others.

2 DEVELOPMENT

To think about Africa historically, it is necessary to go beyond the ideas of a continent of exotic nature and without history. African and Asian societies were seen as static societies by the Eurocentric system. The colonizers considered Africans as heirs of rudimentary customs, primitive societies, frozen in time since immemorial periods. This look at African cultures was not restricted to the nineteenth century, nor only to research guided by positivist sciences, influenced by social Darwinism. And not only to the works that followed the reading of historical materialism, and reached a good part of the twentieth century.

According to Alberto da Costa e Silva (2006, p. 57), Charles Darwin, in his book "The descent of man and sexual selection, published in 1871" explains that, in each major region of the world, the existing mammals are closely related to the extinct species of the same area. It is probable, therefore, that Africa was once inhabited by extinct apes closely connected with the gorilla and chimpanzees: and as these two species are now the most closely related to man, it is more probable that our primitive ancestors lived on the African continent than anywhere else. As Costa e Silva (2006, p. 57) warns, "Darwin's intuition seems to be confirmed by scientific findings, which increasingly point to sub-Saharan Africa as the region where man, the animal maker of instruments, emerged". Because of this, it should be noted that Africa south of the Sahara Desert, below the equator, in the central western part was and is nothing more, nothing less than a demographically Bantu region due to the peoples who live there speaking mostly languages belonging to the proto-Bantu linguistic trunk.

Darwin's theory (1871), which places Africa as the place of origin of man, is a confirmation that there are no arguments against evidence. not all the racism that already existed at that time could deny the place of Africa as the cradle of civilization. Considering that to this day it is considered the most probable hypothesis regarding the emergence of man. An Africa considered by Eurocentrism as an apathetic continent, with no prospects for evolution, inhabited by sub-races, descendants of Can, a religious theory, cited by Azzi (2008, p.29), is suddenly recognized as the cradle of civilization.

The Senegalese Sheik Anta Diop (2003, p. 73) reinforces it, shown in Figure 7, who states that the first men were Negroids, and that according to Gloger's law, animals in the general sense, warm-blooded, in hot and humid climates, developed melanin (black pigmentation). That is why the origin of humanity was black, the whitening took place due to climate change. Another result is to be able to prove that the territorial space pointed out by Charles Darwin as the cradle of civilization is exactly the same place where the Bantu people

come from, that is, Central Africa, the same one that, by irony of fate, had its people relegated to ostracism by the precursor of the study of the Brazilian black, Dr. Raimundo Nina Rodrigues (1896), who classified him as inferior to the Sudanese people who later arrived in the new colony of Portugal.

This is said, not least because the region indicated by Darwin, as the cradle of civilization, goes against the concepts of the Eurocentrism instituted, when already in the nineteenth century they defined the existence of two worlds, the rich to the north and the poor to the south. By explaining socioeconomic differences based on skin color, the capitalist nations of that time exempted themselves from their historical responsibility. In other words, they bequeathed to ethnic origin and not to imperialism, colonialism and exploitation, the backwardness and misery of a large part of the nations of the world.

Sub-Saharan Bantu peoples below the equator brought to Brazil from the Kingdom of Congo, a central-western region of Africa formed by numerous small kingdoms existing between the *Zaire* (or Congo) rivers, the *Kuango River* and the *Lucala River*. In "The Hoe and the Spear: Africa before the Portuguese", Alberto Costa e Silva (2006), says that according to Banta tradition, around the fourteenth century, when *Nimi Lukeni*, the king of the *Kikongo* married an important woman of the Ambundo people, the kingdom of *Kongo* was formed, and the king came to be called *Mani Kongo*, the Lord of the Congo. The capital of the Kingdom of Congo was in the Center-North of the domains, the city was called *Mbanza Kongo*. The city was all fortified, surrounded by a stone wall and was on top of a hill, surrounded by the cultivation areas as well as the villages. *Mbanza* was a large commercial center through which shipments of salt, fish, fabrics, ceramics and baskets, raffia and copper passed. This great city was the center of a kingdom that subdued the small kingdoms around it, which became vassal kingdoms. The basis of the economy was agriculture and farmers produced bananas, palm oil, coconuts, cola, millet, sorghum, yams, macunde, they also raised pigs, cattle and goats. The rivers were rich in fish and the savannahs were rich in game. They knew iron, which they used in the manufacture of weapons and copper in the manufacture of jewelry. From the valley of the Inquice or Nkisi River, to the east, the raffia cloths (Costa e Silva, 2006, pp. 521-522).

In the Kingdom of Angola, at the time of the Portuguese discovery, there were two kingdoms south of the Kingdom of Congo. They were *Ndongo* and *Matamba*. In 1555 a nomadic and ferocious people invaded Congo and southwest Africa, from Guinea to the center of the region today Angola. They were the *Jaca* or *Majaca*, also called *Simba* and

Manes in Guinea, *Gatas* or *Gallas* in Abyssinia (Ethiopia) and *Jingas* in Angola. The invaders destroyed everything and one of the chiefs, the *Ngola Jinga*, took possession of the two kingdoms (*Ndongo* and *Matamba*). He gave the kingdom of *Ndongo* to his son, the *Ngola Nbandi*, whose name has since come to designate the conquered kingdom (*Ngola*: Angola). It was the dynasty of the *Jingas* that was established in Angola, the former kingdom of *Ndongo*, also now called the kingdom of the *Jinga* or the *Jingas*. *Ngola Bandi*, son of *Ngola Jinga*, was a brave king who resisted the fierce expeditions of the Portuguese colonizers several times, victoriously counterattacking them (Vansina, 2011, p. 648).

In 1618 the vassals of *Jinga Nbandi*, eighth king of *Matamba*, tired of the tyranny of the old king, revolted and killed him. *Ngola Nbandi*, son of the old *Jinga Nbandi* and a slave (not to be confused with the first *Ngola Nbandi*), *took power*. Thanks to the conspiracy prepared, and to consolidate the two kingdoms of Angola, *Matamba* had his brother, stepmother and a nephew, the son of a sister, beheaded. This sister is the one who would be the future Queen *Jinga*, the famous D. Anna de Souza. She never forgave her brother for the affront she received (her son's death), although she pretended to have forgiven him and collaborated as Ambassador of the Kingdom of *Matamba* before the colonizers (Costa e Silva, 2006).

It was in one of these embassies that she consented to be baptized in the Catholic religion, receiving the name Anna de Souza. But, at the first opportunity, the Catholic Dona Anna took revenge on her brother, poisoning him on the small island of *Kuanza*, where he had taken refuge beaten by the Portuguese and completely abandoned by his vassals.

There is a passage about the haughtiness of Queen *Jinga*, when received in a palace, in peace negotiations with the Portuguese Viceroy, in Luanda, 1657. Detail: the viceroy sits on the throne to receive her, however, he does not offer *Jinga* a place of seat. Then she retaliates and unravels, and orders one of her maids to get on all fours, to serve as her seat. In this way, he levels himself at the level of the Viceroy, maintaining the horizontality of the dialogue and, at the same time, also demonstrating his power and fearlessness in the face of the attempt to intimidate the colonizing foreigner (Mello, 1945).

Nzinga Mbandi Ngola, queen of *Matamba* and Angola, lived from 1581 to 1663, and represents resistance to the occupation of African territory by the Portuguese who landed there for the slave trade. The Portuguese occupation of that region began in 1578 with the foundation of what is now Luanda, the capital of Angola. King *Ngola Kiluanji*, Nzinga's father, resisted the invasion of his territory for many years. He was succeeded by his son *Ngola*

Mbandi who, initially, also prevented the advance of the slave trade into the interior. Nzinga assisted her brother by negotiating the return of territories already occupied by the invaders. But later he did not agree with the submission to the Portuguese of several African chiefs, including his brother, and, ordering their deaths, he came to command resistance groups to the occupation of the lands of *Ngola* (Angola) and *Matamba* (Thornton, 1991).

Nzinga allied himself with *Jaga* warriors and began to act in quilombos, with spaces and war tactics similar to those used by his contemporary Zumbi dos Palmares in Brazilian lands. He achieved victories and relative peace until he died at the age of 82. In the last days of Queen Jinga, the Capuchin missionaries managed to return to Catholicism (1657) in which she remained until her death on December 17, 1663, at the age of 82, according to Father Antonio Caeta (Pacavira, 1985).

Unlike the African countries already mentioned, Mozambique, having exported, less enslaved to Brazil, did not present sufficient quantity and subsidies in a timely manner, to form another Bantu religious nation of calundu/candomblé. Historical estimates indicate that more than 500,000 slaves were taken from Mozambique during the diaspora period, with significant numbers destined for the islands of the Indian Ocean and, later, for Brazil, especially in the nineteenth century when Bantu calundu/candomblé was already formed by the nation of the Ambundos, speakers of the Kimbundu language, belonging to the country of Angola. and by the Bakongo nation, speaker of the Kikongo language, which previously, that is, before the partition of the African continent, at the Berlin conference, was the former kingdom of Congo, today one of the eighteen Angolan provinces called Zaire (Costa e Silva, 2006).

The slave trade from Mozambique had two main routes: Indian Ocean: Hundreds of thousands of people were trafficked to the Mascarene Islands (such as Réunion and Mauritius) and other regions of the Indian Ocean between the eighteenth and nineteenth centuries. Atlantic Ocean: Although with a smaller contingent, Mozambique became an important source of slaves for Brazil, in the final period of the slave trade, when trafficking from Angola and Costa da Mina suffered greater repression.

Exact figures are difficult to determine due to the clandestine nature of much of the trafficking, especially after the formal ban on the trade. However, historical databases such as the Slave Voyages project bring together thousands of voyage records to help quantify this forced movement. Between the first and fifth centuries, Bantu peoples migrated from

northern and western regions to this region. Swahili and, later, Arab trading ports existed on the Mozambican coast until the arrival of Europeans (Pelissier, 1988).

During the first and fifth centuries, migratory waves of Bantu-speaking peoples came from regions of West and North Africa through the Zambezi River valley and then gradually settled across the plateau and coastal areas of the country. These peoples established communities or agricultural societies based on the cultivation of cattle. In addition, they brought with them the technology for the extraction and production of iron utensils. Metal used by them in the manufacture of weapons in the conquest of neighboring peoples. The coastal trade of Mozambique was first dominated by Arabs and Persians, who had established settlements as far south as the Island of Mozambique. Swahili, Arab, and Persian trading settlements existed along the country's coast for several centuries. Several Swahili trading ports dotted the country's coast before the arrival of the Arabs, who traded with Madagascar and the Far East. Swahili and, later, Arab trading ports existed on the Mozambican coast until the arrival of Europeans (Cabaço, 2010; Mondlane, 1975).

Mozambique is endowed with rich and extensive natural resources. The country's economy is primarily based on agriculture, but the industrial sector, mainly in the manufacture of food, beverages, chemicals, aluminum, and oil, is growing. The country's tourism sector is also growing (Mosca, 2005; Gefffray, 1991).

The arrival of the Bantu peoples in this region more than a thousand years ago introduced important elements in the political, economic and social dynamics of the region, which had a great impact on the political-administrative organization of the Postcolonial States. The Bantu migrated to the region from southern Cameroon and the southeastern region of Nigeria, having populated the territories of Angola, South Africa, Botswana, Democratic Republic of Congo, Lesotho, Namibia, Mozambique, Tanzania, Zambia and Zimbabwe. Subsequent migrations and the slave trade led the Bantu peoples to settle in Madagascar, Mauritius and the Seychelles as well). Among the most common native languages are Macua, Tsonga, Ndau, Chuabo and Sena (Matusse, 2009).

The population of about 30 million people is predominantly made up of Bantu peoples. The religion with the largest number of adherents in Mozambique is Christianity (the Catholic denomination is the one with the largest number of adherents), but there is a significant presence of followers of Islam. The country is a member of the African Union, the *British Commonwealth*, the Community of Portuguese Speaking Countries (CPLP), the Latin Union,

the Organization of the Islamic Conference, the Southern African Development Community and the International Organization of the Francophonie.

As for Portuguese rule, since about 1500, Portuguese trading posts and fortresses have ended Arab commercial and military hegemony in the region, becoming regular ports of the new European sea route to the east. Vasco da Gama's voyage around the Cape of Good Hope in 1498 marked the Portuguese entry into the region's trade, politics, and culture. The Portuguese gained control of the Island of Mozambique and the port city of Sofala in the early 16th century, and by the 1530s, small groups of Portuguese traders and prospectors looking for gold had penetrated into the country's interior regions, where they set up the garrisons and trading posts of Sena and Tete on the Zambezi River, and attempted to gain exclusive control over the gold trade. The Portuguese tried to legitimize and consolidate their commercial position through the creation of the Crown Deadlines (a type of sesmaria), which were linked to the administration of Portugal. Although the deadlines were originally developed to be controlled by the Portuguese, due to miscegenation with the locals they eventually became Luso-African centers defended by large armies of African slaves known as cundas. Historically, there was slavery in Mozambique. Human beings were bought and sold by local tribal chiefs and by Arab, Portuguese and French traders. Many of the Mozambican slaves were supplied by tribal chiefs who raided neighboring warrior tribes and sold their captives to partners. (Cabaço, 2007).

Although Portuguese influence gradually expanded, its power was limited and exercised by individual colonists who were granted extensive autonomy. The Portuguese were able to wrest much of the coastal trade from the Arabs between the 1500s and 1700s, but with the capture of Fort Jesus of Mombasa (in present-day Kenya) by the Arabs in 1698, the trend shifted to the Arab side. As a result, Portuguese investment declined while Lisbon turned to more profitable trade with India and the Far East and the process of colonizing Brazil. During these wars, Arab tribes from present-day Oman recovered some of the trade from East Africa north of Mozambique. In the nineteenth century, other European powers, particularly the British (British South Africa Company) and the French (Madagascar), became increasingly involved in the region's trade and politics around the territories of Portuguese East Africa (Geffray, 1991).

During the Portuguese colonial rule, a large minority of people of Portuguese descent lived permanently in almost all regions of the country and Mozambicans with Portuguese blood, at the time of the country's independence, numbered about 360,000 people. Many of

them left the region after Mozambican independence in 1975. There are various estimates for the size of the Chinese community in Mozambique, seven thousand to twelve thousand people (Cabrita, 2000).

Mozambican literature achieved greater development in the colonial period, dealing with nationalist themes. The most important writers of this phase were Rui de Noronha and Noémia de Sousa. José Craveirinha began in literature in the 1940s, addressing themes of the social reality of Mozambicans in his poems, and provoked the rebellion. He is considered the most important Mozambican poet. José Craveirinha received it. It is believed that a significant part of Mozambican literary production is due to the poets of the so-called "European literature" (Seno, 2024). These poets like Mia Couto are those who, being ethnically Caucasian, center all, or almost all of the theme of their works on the daily problems of Mozambique, exerting a significant influence on the country's national identity, (Braúma, 2014)

Supporting the previous texts, the authors Adolfo (2010) and Lopes (2014), among others, corroborate the importance of investigating African cultural diversities that refer to linguistics, divinities, ancestry, the concept of life and death and reincarnation with an emphasis on the role of the child, it is also of paramount importance in the construction of the content to be included in Brazilian education. In the past, as for the formation of the Baixada Fluminense, it is found that today the following municipalities are: Queimados, São João de Meriti, Belford Roxo, Mesquita, Nilópolis and Duque de Caxias, as former districts of Nova Iguaçu. It is also known that the first wave of slaves coming to Brazil in 1565 came from the ports of West Central Africa. The first shipment of slaves that arrived in Rio de Janeiro dates from the middle of the same period, that is, shortly after the foundation of the City of São Sebastião do Rio de Janeiro (Figueiredo, 2004). Thus began the occupation of the Baixada Fluminense by this valiant people who brought in their *mutue* (head) and in their *muxima* (heart) their divinities and entities, developed here in a secret way, the so-called Calundus, who gave rise to the Bantu Candomblés (Ângelo, 2013). They brought their agricultural technology, here used in the cultivation of sugarcane, cotton, coffee, beans, rice, corn, cassava, etc., in addition to manual arts and many other wisdom (Bezerra, 2011).

As the African diaspora took place, unlike the African peoples, who later arrived and were directed to Salvador - BA (seventeenth and eighteenth centuries), the Bantu arrived from the sixteenth to the nineteenth century, were spread throughout the Brazilian territory, contributing with their agricultural technology, construction of railroads, construction of cities,

among other achievements. A fact that, together with the Indians and the Portuguese, elevated Brazil abroad to the condition of a Nation (Júnior, 1953), (Costa e Silva, 2006), (Freyre, 2003); (Netherlands).

Almost three million people entered the ports of southeastern Brazil, especially Rio de Janeiro, which is equivalent to approximately 21.5% of all Africans who arrived in the Americas as slaves. Of this amount, more than 80% came from the regions of predominance of Bantu culture in West Central Africa. Africans from this region were in majority quantity in the various spaces of slave life in Rio de Janeiro, both in the interior of the province and in the capital. It was common to see them on the streets as urban workers, but especially in the countryside, where the difficult daily life of sugarcane, coffee and other food crops was lived (Bezerra, 2011). (Lopes, 2012), among others. Therefore, it is also a regional and local issue. It is important to highlight the coincidence of the entry of the Bantu in Rio de Janeiro, in the same year of the foundation of the City, 1565. Based on the study initiated by the Baixada Fluminense, culminating in Darwin's theory (1871), there is no reason not to imagine that: **"THE BAIXADA FLUMINENSE IS BANTU, RIO DE JANEIRO IS BANTU, BRAZIL IS BANTU, "THE WHOLE WORLD IS BANTU, YES SIR!"**.

3 METHODOLOGY

The research is based on the use of the qualitative-quantitative methodology, with a descriptive nature, since it began with the collection and measurement of demographic data of the specific African population, supported by its strata, which brought the religious culture of the Bantu peoples to Brazil.

The scientific paradigm followed to make the methodological choices was the pragmatic one, which facilitated the identification and description of the religious culture of the Bantu peoples, in the diaspora of enslaved Africans, subjected to the South Atlantic slave trade. (Costa e Silva, 2006; Slave Voyages, 2017).

In addition to this contribution, a bibliographic review of authors such as: Adolfo (2010), Ângelo (2013), Bezerra (2011), Figueiredo (2004), Lopes (2014; 2012; 2011), Maia (1961), Mott (1997), Pereira (2011), Prandi (1991), Ramos (2001), Redinha (1958), Thompson (2001), Thornton (1991) and Vanzina (2004), among others. Among the expected results is the deconstruction of the negative labeling that marginalizes Candomblé and the *Bantu* nation due to its peculiar aesthetics.

In view of this, some sources were essential for the development of this research, including:

- Library of the University of São Paulo/SP. SIBI/USP – Ground Floor Cidade Universitária. Rua da Praça do relógio, 109, Butantã, São Paulo-SP. Zip Code: 05508-050. Phone: 3091-4195.
- Institute of Brazilian Archaeology - IAB. Belford Roxo, RJ, CEP 26193-575. Phone: (21) 3135-8117. E-mail: www.arqueologia-iab.com.br.

In its first stage, the research found the variables Bantuism and non-Bantuism with the support of descriptive quantitatives, since it was necessary to build a dialogue with historical demography, so that, as shown in Table.1, it was possible to name and quantify the African nations that predominated among the enslaved Africans who arrived in Rio de Janeiro during the Atlantic Slave Trade.

Table 1

African Regions	Numbers	%
Senegambia	756.000	6
Sierra Leone	389.000	3,1
Costa da Mina	337.000	2,7
Gold Coast	1.209.000	9,7
Bay of Benin	1.999.000	16
Bay of Biafra	1.595.000	12,7
West Central Africa	5.695.000	45,5
West Africa	543.000	4,3
Total	12.570.000	100

Source: Slavevoyages (2017). Trans-Atlantic Slave Trade Database. Retrieved from <www.slavevoyages.com>.

Thus, this same table leads to agreement with Bezerra (2011), when he states that of the almost three million enslaved people who entered the ports of southeastern Brazil, 80% were of Banta origin, that is, they came from West Central Africa *versus* Central Africa. Therefore, these variables have to do with the ethnicity and cultural traditions of the first Africans who lived and worked in the Recôncavo da Guanabara during the times of slavery and the Atlantic slave trade.

In the data analysis, the Mann-Whitney test was applied for comparison between two independent samples. Thus, the hypothesis to be tested is that: there is no association between the variables ("Bantu" and "non-Bantu" follow-up) at the level of significance ($\alpha =$

5%). These procedures were carried out to contemplate the general objective that is to investigate and prove the Bantu cultural and religious influence in the Baixada Fluminense, in addition to also covering the specific objectives that deal with training, inclusion in Brazilian education, with the help of the Bantu impact as a single theme in Carnival. For this, the following three were chosen, among many other influencing factors:

- a) The human demographic quantity of each group;
- b) The time lapse between them, as to the order of arrival (sixteenth, seventeenth and eighteenth centuries).
- c) The period of permanence in the territory (from the fifteenth to the nineteenth century, and after slavery).

These factors collaborated in all ways in favor of the Bantu, the result of which showed the majority of *Bantu men and women*, to the detriment of non-Bantu men and women (Africans from other linguistic regions of Africa), as shown in Table 2.

Table 2

Variables – Mann Whitney Test

Variable	Bantus	Non-Bantus	P-value
Male	273,04	230,50	0,012
Women	274,93	243,95	0,075

Source: 2022 survey data.

Table 1 shows that Bantu women, although not statistically relevant, are more numerous than non-Bantu women. This confirms Bantu hegemony in terms of population. However, the exclusivity of men in the Bantu orchestra and a greater demand for musicians demonstrate that there is a Bantu majority in the population of Nova Iguaçu. In this way, it is also possible to measure the cultural impacts of Bantu religiosity in the patrimonial and educational formation of Nova Iguaçu. Thus, the methodology contemplates all objectives, since by virtue of the theme, its variables transit, implicitly or explicitly, throughout the research carried out.

4 CONCLUSION

In terms of experiences, it is an article that invites Brazilian society to dive into the past in terms of diaspora, to get to know itself, and from there, to create new perspectives of Bantu artistic languages, or as an Afro-descendant Bantu, to redesign other expressions as they

have already done when creating the samba school, the maracatus (Nation and Baque Virado), among other artistic languages, as well as, at the same time that they are rarely called upon to make this connection with the past, they will fix in memory the preponderant role of their ancestors in the construction of Brazil and the formation of our Language, and then, with the certainty of their identity, they will strengthen themselves in the fight against racism. And in order to be able to move, not only Brazilian society, but the entire world society, to discover in three or more days, what has been hidden for almost five hundred years in the history of Brazil, the ideal would be to look for the largest amphitheater on the planet, Marquês de Sapucaí **to carry out a thematic plot through the 12 Samba Schools of the Special Group, The thematic plot: EVERYONE "WORLD" IS BANTU YES SIR!** Action that represents a worldwide strategy of visual communication in the fight against racism and appreciation of black identity. As a result, it is important to emphasize that these samba schools, now considered great exponentials of culture, have gigantic and overcrowded rehearsal courts, constituting vast fields of research and information through the rehearsals, guaranteeing valuable returns to the sponsoring brands and the research itself. In addition to court rehearsals, there are also technical rehearsals that take place on the Samba Walkway, external presentations, among other means of dissemination. However, if the 12 samba schools of the special group are not obtained, the amount equivalent to the remaining vacancies will be divided equally among the associations of the Gold Group, which accept the thematic theme in question, since they also parade in Marquês de Sapucaí, on Friday and Saturday of Carnival. And so, successively, being able to reach the Samba Schools of the Silver, Bronze and Evaluation Groups, of Intendente Magalhães, baptized as "carnival of the People", for those smaller schools, which parade there. Thus demonstrating the expansion of dialogue in this project.

Still within this context, it would also be important to hold a hybrid course of presentation and orientation on the subject, lasting 6 months, administered by a competent public or private body, in a previously authorized space, in order to train a reasonable number of participants from each Samba School belonging to the respective group, regarding the memory and heritage of the Bantu in the construction of Brazil and the formation of the Brazilian Language. And within this contest, guide the participating samba schools, didactically, during the production period, including the realization of workshops alluding to the unique theme, preferably in these communities or other interested spaces. In this act you will be discovering and training people, mainly of black origin, many of them who

already work in this field, however, informally, because they do not have certification in the various fields of Art, History and other comprehensive areas, such as: blacksmiths (welders), carpenters, prop makers, decorators, seamstresses, hatters, designers, tailors, carnival workers, dancers, musicians, actors, among many other skills that black culture has to offer.

In terms of plurality, this is a project whose title already expresses the great richness of artistic manifestations presented by the samba schools in an unprecedented way, exploring the Africa/Latin America connection, that is, Angola, Congo, Mozambique, Brazil, the World. These manifestations, complemented with the orientation course alluding to the theme created and applied by professors, on knowledge that reaffirms diversity, connecting orality with academia. In this way, it offers ways to understand the contemporary construction of Identities.

That said, Brazil, Angola, the Congos and Mozambique, with a vast baggage of diversities, frictions and conceptions, symbolize, perhaps, what is most consistent in the immeasurable area of integration disputes between Africa and South America. Thinking in this way, from the union of these cultures, much can and should still be learned. Unraveling some mysteries, and deciphering some taboos, is imperative. Even better, if it can appropriate knowledge such as this and many other learnings, to subsidize representations of greater expansion. Based on the reports of interviewees, the search for greater knowledge about the Bantu in Africa and Brazil will increase the number of followers, practitioners and sympathizers, in search of new knowledge. The theme in question, due to its diversity and non-habituality, brings a range of suggestive potentialities, which will imply many other academic works. Therefore, with the conviction that many obstacles on the Banta theme still need to be overcome, future research is suggested.

ABSTRACT

This article presents the development and application of a real-time production control system, integrating hardware and software for continuous monitoring of industrial operations and costs. The proposal aims to promote greater operational efficiency and agility in decision-making. The main objective is to present a proposal for applying the concept of paperless manufacturing, here referred to as “right time,” in a production line of medical and hospital products, in order to identify and quantify the benefits generated by the proposed environment. The adopted methodology was action research, encompassing the system design, its technological architecture, and its application in a simulated manufacturing environment. The results demonstrate significant gains in operational visibility, waste reduction, and improvement in cost control. With the implementation of the developed improvement proposal, a reduction of 32% in document-filling time on the assembly line is estimated, in addition to a 5% decrease in annual paper consumption. Other observed benefits include improvements in internal communication, document control, workplace organization, and the execution of routine activities. Additionally, the study contributes to digital transformation in industry, aligning with the principles of Industry 4.0 and reinforcing the importance of digitalization as a strategic tool for the modernization of production processes.

Keywords: Process Optimization. Digital Transformation. Real-Time Production Control. Industry 4.0. Lean Manufacturing.

RESUMO

Este artigo apresenta o desenvolvimento e a aplicação de um sistema de controle de produção em tempo real, integrando hardware e software para o monitoramento contínuo das operações e dos custos industriais. A proposta visa promover maior eficiência operacional e agilidade na tomada de decisões. O objetivo principal é apresentar uma proposta de aplicação do conceito de manufatura paperless, aqui denominado tempo certo, em uma linha de produção de produtos médicos hospitalares, com o intuito de identificar e quantificar os benefícios gerados pelo ambiente proposto. A metodologia adotada foi a pesquisa-ação, abrangendo a concepção do sistema, sua arquitetura tecnológica e a

aplicação em um ambiente fabril simulado. Os resultados demonstram ganhos significativos em visibilidade operacional, redução de desperdícios e melhoria no controle de custos. Com a implantação da proposta de melhoria desenvolvida, estima-se uma redução de 32% no tempo de preenchimento de documentos na linha de montagem, além de uma diminuição de 5% no consumo anual de papel. Outros benefícios observados incluem avanços na comunicação interna, no controle de documentos, na organização do ambiente de trabalho e na execução das atividades rotineiras. Adicionalmente, o estudo contribui para a transformação digital na indústria, alinhando-se aos princípios da Indústria 4.0 e reforçando a importância da digitalização como ferramenta estratégica para a modernização dos processos produtivos.

RESUMEN

Este artículo presenta el desarrollo y la aplicación de un sistema de control de producción en tiempo real, integrando hardware y software para el monitoreo continuo de las operaciones y de los costos industriales. La propuesta tiene como objetivo promover una mayor eficiencia operativa y agilidad en la toma de decisiones. El objetivo principal es presentar una propuesta de aplicación del concepto de manufactura sin papel, denominado aquí “tiempo correcto”, en una línea de producción de productos médicos hospitalarios, con el fin de identificar y cuantificar los beneficios generados por el entorno propuesto. La metodología adoptada fue la investigación-acción, abarcando el diseño del sistema, su arquitectura tecnológica y la aplicación en un entorno fabril simulado. Los resultados demuestran avances significativos en visibilidad operativa, reducción de desperdicios y mejora en el control de costos. Con la implementación de la propuesta de mejora desarrollada, se estima una reducción del 32% en el tiempo de llenado de documentos en la línea de montaje, además de una disminución del 5% en el consumo anual de papel. Otros beneficios observados incluyen mejoras en la comunicación interna, en el control de documentos, en la organización del entorno de trabajo y en la ejecución de las actividades rutinarias. Adicionalmente, el estudio contribuye a la transformación digital en la industria, alineándose con los principios de la Industria 4.0 y reforzando la importancia de la digitalización como herramienta estratégica para la modernización de los procesos productivos.

Palabras clave: Optimización de Procesos. Transformación Digital. Control de Producción en Tiempo Real. Industria 4.0. Lean Manufacturing.

1 INTRODUCTION

Digital transformation has driven significant changes in the way industries operate. In this context, real-time production control becomes essential to ensure competitiveness, efficiency, and quality. The concept of "right time" proposes that operations take place at the right time, with adequate resources and without waste. This article proposes a system that integrates hardware and software to monitor and control production in real time, promoting greater visibility and control over production processes.

The concept of Industry 4.0, which emerged in 2011, goes beyond the digitalization and automation of production processes. It encompasses the integration between information technologies and industrial automation, with the aim of reducing latency in managerial decision-making and facilitating access to reliable data from the industrial operation, maximizing business value (Becker et al., 2017).

The global market is increasingly competitive, demanding greater productivity and quality from organizations, reduced production time, and the ability to meet demands with shorter deadlines and more complex products. These products require traceability of both the process and the product, as a way to ensure reliability (Conceição et al., 2009).

To ensure this traceability, companies develop and regulate their manufacturing processes based on internal and external standards. These documents, defined as operational procedures, are fundamental for the standardization of processes and for the prevention of failures and waste, in addition to facilitating the understanding of activities (Freitas et al., 2012).

An approach that contributes to the standardization and integration of these procedures is Virtual Manufacturing, which allows the connection between all sectors involved in the planning, design, updating and documentation of information and specifications of the process and the manufacture of the product on a computational basis (Banerjee and Zetu, 2001; Conceição et al., 2009; Groover, 2011).

Digital Transformation (DT) is a process driven by digital technologies, whose impacts affect the mechanisms of value creation, strategy, and organizational structure (Vial, 2019). It transforms products, processes, structures, and organizational aspects (Matt, 2015). For Feroz et al. (2021), DT goes further, creating opportunities both for business competitiveness and for the remodeling of business performance and its environmental impact.

The concept of electronic documentation (paperless) emerged more than 30 years ago and aims to eliminate or reduce the use of paper in the administrative routine, using

technology to optimize processes, facilitate access to information, save resources and contribute to sustainability (Ortega, 2004). This practice can be applied to companies of all sizes and segments, promoting resource savings, agility, information security, and sustainability. According to Indolfo et al. (1995), documents are material records of information that prove facts and thoughts in a given time and space. Freitas and Guarechi (2011) highlight that electronic documents provide convenience, speed, security and reliability, in addition to reducing the volume of printed material, becoming instruments of great relevance for organizations.

Thus, the main objective of the present work is to present a proposal for the application of the concept of paperless manufacturing, here called right time, in a production line of hospital medical products, aiming to identify and quantify the benefits generated with the proposed environment.

2 INTEGRATED INFORMATION SYSTEM

Efficient data sharing between and within an organization's functional areas directly contributes to more effective business processes and businesses. Information systems designed to enable this sharing are known as integrated information systems. Companies receive resources — such as materials, people, or equipment — and turn them into goods and services for customers. For this transformation to occur efficiently, it is essential to have accurate and up-to-date information.

For example, when receiving a purchase order, the sales team activates production, which schedules manufacturing. If raw materials are required, production notifies the purchasing department, which carries out the purchase. The logistics sector, in turn, receives and accounts for the materials, updates the records and forwards the inputs to production. This flow is only possible with the integration of information systems, which results in a more efficient organization and optimized processes (Monk and Wagner, 2006 1).

According to no et al. (2015 2), the integration of systems facilitates the flow of information and communication between organizational sectors. Rich and Dibbern (20123) add that this optimization allows identifying bottlenecks in data entry and implementing corrective measures. As a result, internal communication improves, productivity increases, and costs are reduced.

In manufacturing environments, where several departments and employees work simultaneously, the efficient circulation of information is essential. For this, integration between systems and data is necessary (Chao, 2016).

Two fundamental concepts in this context are Horizontal Integration and Vertical Integration. Horizontal Integration connects the sectors of the production chain, allowing quick responses and optimized use of resources — such as, for example, inventory connected to the supplier for automatic replenishment. Vertical Integration, on the other hand, connects all hierarchical levels of the company, from the operation to the board of directors, promoting agility in communication and assertiveness in decision-making (Albertin, 2021).

In this work, the proposal is based on Vertical Integration, allowing the exchange of information in real time between sectors, which generates value for the organization through faster and more accurate decisions. Figure 1 presents the Industry 4.0 pyramid and the concepts of integration and Smart Industry.

2.1 DIGITAL TRANSFORMATION

The term "digital" has been widely used since 2010, and the expression "digital transformation" (DT) has gained prominence in various media, such as newspapers, TV programs, books, and academic articles (Krimpmann, 2015; Andriole, 2020; Imran et al., 2021). Krimpmann (2015, p. 1209) defines DT as the "sum of technologies that transform

previously physical processes into processes that are partial or fully activated by technology". Thus, DT occurs when new structures — such as business models, practices, values, and beliefs — emerge from the consolidation of digital innovations.

Hinings, Gegenhuber and Greenwood (2018, p. 53) add that DT results from the combined effects of multiple digital innovations, creating new actors, structures and practices that challenge or replace existing organizational rules. Vial (2019, p. 3) defines DT as a process that aims to improve institutions through the combination of information, computing, communication and connectivity technologies, promoting new forms of collaboration and innovation.

The structural change promoted by DT requires cultural and behavioral transformations, and leadership is an essential factor in this process (Shaughnessy, 2018). Organizations look to TD to improve the quality of their products and services (Fachrunnisa et al., 2020), as well as to meet environmental sustainability demands (Feroz, Zo, and Chiravuri, 2021).

Digital technologies are reshaping the way sustainability is measured and controlled, especially in areas such as waste management, pollution control, and sustainable production. However, there are still gaps in the literature on how organizations should adapt to these disruptions (Feroz, Zo, and Chiravuri, 2021). Jones and Wynn (2021) note that while "digital" and "sustainability" are dominant trends, their intersection is still underexplored.

Lokuge et al. (2021) highlight that the environmental impact of digital technologies requires global coordination, aligned at the local, organizational, and individual levels, with a focus on awareness, incentives, and overcoming barriers. Sartal et al. (2020) reinforce that today's society recognizes the need for a new model of production and consumption, which considers environmental and social impacts.

In this context, digital technologies offer opportunities to develop sustainable business models or adapt existing ones with environmentally responsible practices. Incorporating sustainability into DT and organizational strategy is still a challenge that requires further study. Feroz and Chiravuri (2021) point out that the development of sustainable digital capabilities positively impacts organizational performance, customer loyalty, and brand value.

Finally, Hausberg et al. (2019) identify gaps in DT research, especially with regard to the sustainability and societal effects of digital technologies. The authors warn of the risks of digital exclusion, especially in economically vulnerable societies, reinforcing the need for a critical and inclusive approach to digital transformation.

2.2 PAPERLESS

According to Granieri (2016), the concept of paperless, that is, the elimination or reduction of the use of paper, is a policy adopted by organizations that, with the help of technology — such as software, applications, and online resources — allows the management and storage of documents in order to optimize processes and increase operational efficiency.

Arney, Jone and Wolf (2009) point out that, in addition to the technology offering new alternatives for reducing the use of paper, it also provides significant cost savings. However, this concept still faces resistance in some companies, due to the difficulty of adapting management and organizational culture, as well as the increase in the flow of information throughout the value chain, which intensifies paper consumption.

With the reduction of the obligation to physically print documents and the advancement of technologies, the market already offers affordable solutions for organizations that wish to adopt the paperless model (Granieri, 2016).

For an effective transition to the digital environment, strategic planning is necessary, which involves investments in high-capacity storage software, such as OCR (Optical Character Recognition), which converts scanned documents into searchable text, as well as applications and devices for creating and maintaining documents. Investments in team training and digital security are also essential (Chuck, 2014).

Johnson (2012) and Granieri (2016) suggest strategic goals for the adoption of paperless systems, such as: reduction of operation time, document traceability, improvement in report generation, optimization of processes and promotion of sustainable practices.

2.3 INFORMATION MANAGEMENT

Information management, as defined by Marcondes (2020), is essential for organizations, as it seeks to identify, organize, and maximize available informational resources. This is fundamental, since information is considered a strategic resource, capable of driving knowledge generation, innovation, and competitive advantage. Information management covers all stages of the information cycle — from collection to use — including the storage, organization, analysis, and distribution of data. For this, it is essential to use technological tools that facilitate access and sharing of information between users.

At the same time, the ISO 9000 standards establish guidelines for the creation and maintenance of a quality management system. These standards define quality principles

applicable to any organization that seeks sustained success through standardization and continuous improvement of its processes. Among them, ISO 9001 stands out, which specifies the requirements to demonstrate the ability to provide products and services that meet customer requirements and legal requirements. ISO 9004 offers guidelines to improve the performance of the quality management system, while ISO 19011 deals with guidelines for internal and external audits (ABNT, 2015).

Therefore, both information management and the adoption of ISO 9000 standards are determining factors for organizational success, contributing to process efficiency, continuous improvement and competitiveness in the market.

3 METHODOLOGY

The present research has a quantitative and qualitative approach and an explanatory character and was applied in a medical products company, manufacturer of dental implants, located in the interior of the state of São Paulo.

For this study, the action research procedure was used, which, as defined by Thiollent (1985) and Gil (2010), is a methodology of experimental verification in a participatory or cooperative way that provides the development and change of the environment/object studied.

Mello et al., (2012), Coughlan and Coughlan (2002) and Thiollent (2007) establish the following stages for the construction of an action research: Exploratory phase; Formulation of the problem; Construction of hypotheses; Hold seminars; Select samples; Collect data; Analyze data; Prepare an action plan; Implement and evaluate the results.

The methodology proposed by the German Academy of Sciences and Engineering (Acatech) allows companies to assess their maturity in relation to industry 4.0 and develop strategies to increase it, aiming to maximize the economic benefits of digital transformation (Becker et al., 2017). This maturity index helps organizations understand their progress in digital transformation and plan their next steps. Acatech describes six levels: a) computerization; b) connectivity; c) visibility; d) transparency; e) prediction capacity; and f) adaptability. Starting with basic automation at the compute level, organizations move on to systems integration at the connectivity level, followed by the ability to monitor operations in real time at the visibility level. Transparency is achieved through detailed understanding of the plant's state, while predictive ability allows you to predict future trends. The apex of maturity is reached at the level of adaptability, where organizations can quickly adjust their

operations and strategies according to changes in the business environment or unexpected problems, however, it has proven to be a challenging task (Beckeret al., 2017).

When it comes to the maturity of a process in relation to Industry 4.0, there are several models that represent the stages of a digital transformation. In the case studied in this article, the company is in a process of computerization, that is, the introduction of systems in an operation. Figure 2 shows the stages of evolution that a company must follow to ensure the digitalization of processes and belong to the Industry 4.0 level.

4 RESULTS AND DISCUSSION

The project developed aims to apply RFID (Radio Frequency Identification) technology to optimize time and cost control in operational and academic environments. Using a Raspberry Pi board integrated with an LCD display and RFID sensors, it was possible to create a functional and accessible system for monitoring attendance and activities.

The message displayed on the display — "Bring the card close and wait..." — indicates the simplicity and efficiency of the identification process, which can be used to register the entry and exit of employees, students or event participants. The collected data is stored locally on an 8GB USB stick, ensuring security and portability.

The photographic record in figure 4 presents the prototyping of the product developed for real-time time and cost control.

Figure 4

Prototyping the Timing hardware

Source: Prepared by the author (2025).

The photographic record in figure 5 shows the device developed in an acrylic case to protect the electronic circuit and easy access to the card reader and for data input using the keyboard.

The device called "Tempo Certo" was tested in a medical device industry, with the aim of controlling production operations in real time. Before the implementation, an employee was responsible for manually collecting the data from the previous day to make the production notes and send the status of the manufacturing system to management. This process was time-consuming and subject to errors and delays.

With the application of the developed technology, based on RFID and embedded computing, the data began to be presented in real time. This allowed the employee to redirect their time to more value-added activities, such as performance analysis and continuous improvement of processes.

According to Wanderley, Holanda and Oliveira (2014), RFID "has been presenting itself as an important tool in the search for quality in the flow of information, presenting great potential for application in various segments". This wireless technology allows the automation of product identification, integrating the physical and technological sectors and providing real-time monitoring of stock levels and movements.

In addition, Salgado (2013) highlights that the integration between technology and logistics allows for a more accurate and efficient information chain, reducing errors and increasing the reliability of processes. Almeida (2010) reinforces that inventories represent about 2% of the net revenue of companies, and effective management is essential to avoid losses and improve operational performance.

Figure 5

Right Time in Operation

Source: Prepared by the author (2025).

Among the main results obtained with the project, the following stand out:

- Reduction of operating costs with manual processes of time and production control.
- Increased accuracy in the collection of time and movement data.
- Process automation, with less human interaction and greater reliability.
- Ease of integration with existing systems, thanks to the use of accessible and open-source components.
- Portability and scalability, allowing system replication in different environments with minimal adaptation.
- Technological engagement of students and entrepreneurs, who actively participated in the assembly and programming of the system.

Figure 6 features an open hand in the foreground, symbolizing human control over digital systems. Floating above the hand, various graphical and user interface elements represent a real-time data processing environment.

Visual composition conveys the idea of interaction between humans and technology, with a focus on monitoring, performance, and control of complex systems. It can be used to illustrate topics such as industry 4.0, intelligent automation, real-time data analysis or human-machine interfaces.

The application of this solution presented several dashboards to facilitate real-time decision-making for management. The results obtained indicate that the implementation of the improvement will allow a 32% reduction in the time to fill out documents on the assembly line of hospital medical products, in addition to a 5% decrease in the company's annual paper consumption. Other benefits include improvements in internal communication, document control, the work environment, and routine activities.

Figure 6

Presentation of results in real time

Source: Prepared by the author (2025).

This work demonstrates how emerging technologies, such as RFID and embedded computing, can be applied in a practical and efficient way to solve real problems, promoting innovation, productivity, and interdisciplinary learning.

5 FINAL THOUGHTS

The present research proposed the application of the concept of paperless manufacturing in a production line of medical products, with the objective of identifying and quantifying the benefits generated by this new environment.

Based on the research carried out, the concepts presented and the analysis of the reality of the company studied, quantitative and qualitative benefits resulting from the implementation of the proposal were identified and quantified.

The results obtained indicate that the implementation of the improvement will allow a 32% reduction in the time to fill out documents on the assembly line of hospital medical products, in addition to a 5% decrease in the company's annual paper consumption. Other benefits include improvements in internal communication, document control, the work environment, and routine activities.

In addition, the study contributes to the digital transformation in the industry, aligning with the principles of Industry 4.0.

ABSTRACT

This article, developed within the framework of a broader research project between Brazil and Germany (Barros, 2020), examines theoretical perspectives and methodological challenges involved in the study of knowledge production about Africa in the fields of Literature and the Social Sciences, emphasizing the international conditions that shape the circulation of individuals, ideas, and symbolic goods. Starting from the question of how the international trajectories of African students, writers, and researchers mold contemporary dynamics of knowledge production about Africa, the article articulates the circulation of people, works, and epistemological models within a framework marked by linguistic, political, and institutional asymmetries. The text adopts a descriptive and reflective approach structured around three interdependent axes: first, it explores the theoretical challenges inherent to defining the object when considering epistemic hierarchies and historical asymmetries that have shaped African Studies (Falola, 2007; Hountondji, 2010; Zeleza, 2016, 2020; Yanka, 2016). It then revisits the Bourdieusian contribution (2002) to the study of the international circulation of cultural goods, linking it to Claire Ducournau's (2017) research on the production of Francophone African literary consecration and to the generational dynamics examined by Abdoulaye Gueye (2001; 2006). Subsequently, it discusses the reconfiguration of African student mobilities, highlighting the case of students in the former Soviet bloc based on studies coordinated by Monique de Saint Martin, Grazia Scarfò Ghellab, and Kamal Mellakh (2015), revealing both the diversity of experiences and the varying effects of training in Eastern Europe. In conclusion, the article argues that analyzing the mobilities and circulations observed in these empirical studies—literary, scientific, or educational—offers a privileged avenue for understanding the reconfiguration of imaginaries, sensibilities, and modes of knowledge production about Africa on multiple scales, outlining a research agenda centered on Afro-diasporic trajectories as key operators in the global production of knowledge.

RESUMO

O presente texto, elaborado no âmbito de um projeto de pesquisa mais amplo entre Brasil e Alemanha (Barros, 2020), explora perspectivas teóricas e desafios metodológicos envolvidos no estudo da produção de conhecimento sobre a África nas áreas de Literatura e Ciências Sociais, enfatizando os condicionantes internacionais que regulam a circulação de indivíduos, ideias e bens simbólicos. Partindo da pergunta sobre como as trajetórias internacionais de estudantes, escritores e pesquisadores africanos moldam dinâmicas contemporâneas de produção de saberes sobre a África, o artigo articula a circulação de pessoas, obras e modelos epistemológicos em um quadro marcado por assimetrias linguísticas, políticas e institucionais. O texto propõe um registro descritivo e reflexivo, que se desdobra em três eixos considerados interdependentes: em um primeiro momento, explora os desafios teóricos inerentes à construção do objeto quando se consideram hierarquias epistêmicas e assimetrias históricas na moldagem dos estudos africanos (Falola, 2007; Hountondji, 2010; Zeleza, 2016, 2020; Yanka, 2016). Em seguida, retoma a contribuição bourdieusiana (2002) para o estudo da circulação internacional de bens culturais, articulando-a à pesquisa de Claire Ducournau (2017) sobre a fabricação da consagração literária francófona africana e às dinâmicas geracionais examinadas por Abdoulaye Gueye (2001; 2006). Posteriormente, discute as reconfigurações das mobilidades estudantis africanas, destacando o caso dos estudantes no ex-bloco soviético, com base nas pesquisas coordenadas por Monique de Saint Martin, Grazia Scarfò Ghellab e Kamal Mellakh (2015), evidenciando tanto a diversidade das experiências quanto os efeitos variáveis da formação no Leste europeu. Ao final, argumenta que a análise das mobilidades e circulações observadas nessas pesquisas empíricas, sejam elas literárias, científicas ou estudantis, constitui via privilegiada para apreender a reconfiguração do imaginário, das sensibilidades e dos modos de produção dos saberes sobre a África em múltiplas escalas, delineando um programa de investigação centrado nas trajetórias afro-diaspóricas como operadores-chave da produção global de conhecimento.

RESUMEN

Este texto, elaborado en el marco de un proyecto de investigación más amplio entre Brasil y Alemania (Barros, 2020), explora perspectivas teóricas y desafíos metodológicos implicados en el estudio de la producción de conocimiento sobre África en las áreas de Literatura y Ciencias Sociales, destacando los condicionantes internacionales que regulan la circulación de individuos, ideas y bienes simbólicos. Partiendo de la pregunta sobre cómo las trayectorias internacionales de estudiantes, escritores e investigadores africanos moldean las dinámicas contemporáneas de producción de saberes sobre África, el artículo articula la circulación de personas, obras y modelos epistemológicos en un contexto marcado por asimetrías lingüísticas, políticas e institucionales. El texto propone un enfoque descriptivo y reflexivo que se despliega en tres ejes interdependientes: en primer lugar, examina los desafíos teóricos inherentes a la construcción del objeto cuando se consideran jerarquías epistémicas y asimetrías históricas en la configuración de los estudios africanos (Falola, 2007; Hountondji, 2010; Zeleza, 2016, 2020; Yanka, 2016). En seguida, retoma la contribución bourdieusiana (2002) al estudio de la circulación internacional de bienes culturales, articulándola con la investigación de Claire Ducournau (2017) sobre la fabricación de la consagración literaria africana francófona y con las dinámicas generacionales

analizadas por Abdoulaye Gueye (2001; 2006). Posteriormente, discute las reconfiguraciones de las movilidades estudiantiles africanas, destacando el caso de los estudiantes en el antiguo bloque soviético, a partir de las investigaciones coordinadas por Monique de Saint Martin, Grazia Scarfò Ghellab y Kamal Mellakh (2015), que evidencian tanto la diversidad de experiencias como los efectos variables de la formación en Europa del Este. Finalmente, el artículo sostiene que el análisis de las movilidades y circulaciones observadas en estos estudios empíricos —literarias, científicas o estudiantiles— constituye una vía privilegiada para comprender la reconfiguración del imaginario, de las sensibilidades y de los modos de producción de saberes sobre África en múltiples escalas, delineando un programa de investigación centrado en las trayectorias afro-diaspóricas como operadores clave de la producción global de conocimiento.

1 INTRODUCTION

The objective of this text is to explore some of the theoretical perspectives and methodological challenges faced by researchers in the context of a research focused on the issue of the production of knowledge about Africa, Literature and Social Sciences contemporaneously. As part of a broader research project that aimed to reflect on the spheres of knowledge production about and for Africa, sewn together in a partnership between universities in Brazil and Germany³ (Barros, 2020), in this text we return to the issue of the international constraints on the circulation of individuals, ideas, and symbolic goods in the international space, trying to outline the contours of a fertile field of studies on student careers, African researchers, intellectuals and literati from the mid-twentieth century onwards.

At its starting point, the guiding question of the research was to understand how the international trajectories of African students, writers, and researchers contributed to shaping contemporary patterns of knowledge production about Africa and the African diasporas in the fields of literature and social sciences. In our perspective, this way of formulating the question would allow us to articulate three distinct and interdependent levels of analysis, combining the circulation of individuals, works and epistemological models. In other words, these modalities of international circulation would dynamize both the literary repertoires and the schemes of interpretation and production of knowledge about Africa, in a framework marked by linguistic, epistemological and institutional hierarchies.

For the present text, however, we intend to offer a more descriptive and reflective record of this ongoing research, striving to build useful tools for researchers and students who wish to venture into the study of a field as broad and challenging as the one that permeates the categories and uses of the international, transnational, globalization and/or globalization (Sapiro, 2021); Africa and African diasporas (Sansone, 2002; Silvério et al., 2020; Gueye, 2006; Zeleza, 2020) and, finally, of the specific forms of internationality in the field of Social Sciences (Gingras, 2002; Siméant, 2015). The focus here is therefore on the forms of articulation between these different axes of problems.

³ Briefly, the aforementioned project, *Producing knowledge about and for Africa in Germany and Brazil*, focused mainly on the careers of Anglophone and Francophone scholars from West Africa and African scholars from countries that have Portuguese as their official language. In the end, the project was interested in addressing the perspectives and motivations of African students and scholars about their priority destinations and exchanges and how this would have contributed to their later professional careers and the construction of African knowledge societies. In the alternative, the interest was also focused on professionals who had passed through Brazil, encompassing both those who returned and those who chose to remain in the national territory (Barros, 2020).

In the perspective adopted in this study, the exploration of the modes of circulation and the trajectories of individuals allows us to reflect in a very refined way on the theme of cultural mediation in asymmetrical conditions, bringing together the problems concerning the circulation of literary goods, epistemological models and which, in the end, refers to the circulation of agents beyond the geographical and institutional boundaries within which we traditionally think of the forms of consecration and literary, intellectual and scientific recognition. All the analytical efforts undertaken here to explore an investigative agenda derive from this attempt to delineate an analytical framework that allows circumscribing this terrain of inquiry, evidencing both its tensions and its potentialities, and indicating paths for future research that deal with African intellectual mobilities as central operators in the global production of knowledge.

Objectively, the text is structured in three axes of discussion considered interdependent. In the first, we raise some of the theoretical challenges implied in the study of the production of knowledge from/in Africa, literature and the social sciences when thinking about the weight of structures of domination over scientific, literary and artistic representations. Next, we return to this issue of the conditioning factors of the international circulation of symbolic goods from the seminal perspective of Pierre Bourdieu (Sapiro; Pacoutet, 2015) exploring a research on the processes of fabrication of the literary consecration of writers and works from sub-Saharan Africa in the French linguistic area (Ducournau, 2017). In the third part, we present some suggestive propositions from the research coordinated by Monique de Saint Martin, Grazia Scarfò Ghellab and Kamal Mellakh (2015) on the experience of African graduates in the USSR and in the countries of the Soviet bloc from the second half of the twentieth century onwards. internationally notable for their inseparably scientific, literary, and political investments (for an inspiring study, see: Ducournau, 2013; Zeleza, 2013).

2 THE CONSTRUCTION OF THE OBJECT AND SOME THEORETICAL CHALLENGES

In fact, the choice to analyze the experiences and trajectories of individuals from African countries, in the context in question, was not fortuitous. In addition to the research we have carried out on leading groups and international circulation (Neris, Seidl, 2015a; Neris, Seidl, 2015b; Neris, Seidl, 2015b; Neris, 2023) or on Nation, memory, and cultural policies in Africa (Barros, 2020; 2021), the historical context concomitant with the Cold War and the Afro-Asian decolonization process – roughly speaking, corresponding to the second half of

the twentieth century (Hobsbawn, 2015) – offers particularly interesting territory for this study, for several reasons.

Starting with the change in international migration patterns, previously dominated by population movements from colonized countries towards colonizing countries (South/North) and the explosion of the universalization of higher education in Africa, especially from 1945 onwards, with dynamics and trajectories that vary according to the country (Zezeza, 2016). Throughout the second half of the twentieth century, as Paul Tiyambe Zezeza (2020) demonstrates, African population migration grew in a higher percentage than any other region on the planet, even tending towards a diversification of destinations with a gradual and consistent increase in displacements on the South/South axis. In fact, this change in patterns has something to say, including about the ways of institutionalizing higher education in Africa and about the training of its leading groups (Niane, 1992; Garcia Jr., 2004).

Equally important was the remarkable expansion of African studies centers, institutes and programs through the molding of an institutional architecture, research and publications (institutes, centers, journals, periodicals) that produced a large number of works (impossible to be inventoried), which do not allow themselves to be crossed by the hierarchies and asymmetries characteristic of the production of knowledge in the international division of intellectual space (Zezeza, 2020). In Brazil, for example, this interest dates back at least to the 1950s, with the creation of the Center for African and Oriental Studies (CEAO) at the Federal University of Bahia, the Center for African Studies (CEA) at the University of São Paulo, which later contributed to the expansion and contemporary consolidation of this field of study in the national academic space (Sansone, 2002; Zamparoni, 2007). As complex, contradictory, processual and/or interdisciplinary as the shaping of African studies may have been, the fact is that these have been structured simultaneously at the national and transnational, local and global levels (Zezeza, 2006), while at the same time taking on different meanings in Africa and in the West (Hountondji, 2010).

We are, however, only at the tip of the iceberg of a current, relevant and decisive debate for the production of knowledge in Africa itself, with a series of epistemological implications and challenges. In fact, it is important to consider that the production of knowledge about Africa on the continent itself is permeated by a power structure that shapes the circuits of intellectual production, validation, circulation and consumption between languages and national contexts that occupy unequal positions (Falola, 2007; Hountondji, 2010; Yanka, 2016).

It is no coincidence that Paul Zeleza criticizes, for example, the way in which in the academic factories of North America and Western Europe African Studies "have historically been imprisoned by languages, epistemologies and discourses that are external to Africa, reducing this continent to no more than a laboratory for testing the supposedly universal models, theories and paradigms" (Zeleza, 2007). Paulin J. Hountondji questions, in turn, whether what we call African studies – which encompasses a diverse framework of disciplines in the Social Sciences (History, anthropology, sociology, economics, political science) – can legitimately be called African, especially when it is not "sourced from Africa or produced by Africans" (Hountondji, 2010). If, for Hountondji, the institutional field of knowledge production in Africa has not been able to formulate original problems, that is, "original sets of problems based on a solid appropriation of the international intellectual legacy and deeply rooted in the African experience" (Hountondji, 2010, p. 128), this does not necessarily mean that there should be a break with the tradition of Western knowledge. In a perspective that seems to us similar to that of the Ghanaian Kwame Anthony Appiah (1997), who studied the formations of African philosophers in the Western tradition, it is understood here that the construction of African knowledge must follow an essentially comparative and critical path, and cannot entirely dispense with the Western philosophical formation itself.

If these conditioning factors of cross-cultural transfers fall strongly on the domain of the social sciences and humanities, they impose themselves even more clearly in the universe of literary production, strongly linked to language and the cultural construction of national identities, even having repercussions on subfields of studies such as comparative literature or comparative studies (Fazzini, 2023). In this sense, Luca Fazzini's (2023) statement is correct that, when one thinks about the place in Africa in *world-literature*, one can see the hegemony/predominance of a restricted corpus of works, authors, and genres (notably the novel), belonging, above all, to the English and French linguistic universe (the Portuguese language occupying a clearly marginal position) and that obtaining global projection and recognition in the Euro-American academic and publishing circuits, they place themselves at the top of the hierarchy of legitimate scientific-literary objects.

The problem becomes even more complex, in fact, when it is conceived that the very definition of African literature(s) permeates/encompasses textualities that are completely marginalized in relation to transnational linguistic areas (English, French, Spanish, German, Portuguese, Arabic), forming, in practice, distinct and split circuits of production and circulation (Gnocchi, 2004). Sometimes excluded, sometimes confined, weakened and/or

dominated, African literatures then tend to depend heavily on the recognition of international bodies and mediators (with which they become an export product), consequently excluding a wide universe of languages, authors and forms of popular, oral, sometimes anonymous, languages and forms of knowledge produced by Africans and which generally do not enter the order of knowledge (Mudimbe, 2013) and in the canon and in the international literary market (in this regard, see: Fyfe; Krishnan, 2022, Hodapp; 2020)

Although with specificities, the production of knowledge about Africa, literature and social sciences presents similarities when taken from the conditioning factors of these asymmetric transnational cultural exchanges. In fact, it is always useful to remember that the schemes of perception and interpretation of colonial and postcolonial realities have always been fed and have been fed by enterprises of domination that permeate scientific, literary and artistic representations (Ducournau, 2010; Sapiro et al., 2015).

3 THE INTERNATIONAL CIRCULATION OF CULTURAL GOODS: CALIBRATING THE CONSTRUCTION OF LEVELS OF ANALYSIS

As we highlighted in a previous text on the translation of literary works, the contributions of Pierre Bourdieu (2002) and a series of authors inspired by his theoretical perspective are fundamental to the design of global research in the Social Sciences (Siméant, 2015). In a short text entitled "*The social conditions of the international circulation of ideas*", delivered on the occasion of a conference at the University of Freiburg in 1989, Pierre Bourdieu then questioned whether there was a spontaneously international intellectual life, when examining the circulation of intellectual works and the examples of import and export between France and Germany. For Bourdieu, in addition to intellectual life being "the place of nationalisms and imperialisms, preconceived ideas, very elementary summary representations", etc., in practice, "international exchanges are subjected to a certain number of structural factors that generate colossal misunderstandings" (Bourdieu, 2002, p. 6). Understanding some of the social mechanisms that operate in this process and that would represent an obstacle to the development of "a European program of scientific research regarding European scientific relations" (Bourdieu, 2002, p. 5) was the objective of this communication, whose main elements can be summarized below (Neris, Neris, 2016):

- For Pierre Bourdieu, the fact that texts do not circulate with their context, that is, that they do not import the field of production with and against which they were produced, means that, when they are introduced in a different field of production, they are

subjected to a reinterpretation as a function of the structure of the field of reception. As the meaning and function of a work in its field of origin are recurrently ignored, the meaning acquired by this or that work is determined to a large extent by the field of arrival;

- This resignification is operated by a series of social mechanisms, such as: selection operations (what is translated? what is published? who translates? who publishes?); marking and labeling operations carried out by publishers, authors, disciplines, etc.; and the operations of reading, through which categories of appreciation and problems that are the product of a different field of production are applied to the works.
- By reconstructing the finishing field, it is possible to better understand the effects of the games to which the translated authors and works are subjected. These involve everything from the reinforcement of dominant positions to ways of strengthening dominated positions, always involving a variety of combinations. It is through the reconstitution of these positions, for example, that it becomes possible to apprehend the affinities linked to identity (or homology) that favor the translation of authors with whom there is a convergence of interests, styles, parties and intellectual projects. "Thinkers of great elasticity are, in this sense, a full plate for these strategic uses", emphasized Pierre Bourdieu (2002, p. 9). In the same way, the characterization of distinct intellectual and social contexts allows us to understand how "fictitious oppositions between similar things and false similarities between different things" are sometimes constituted (Bourdieu, 2002, p. 10).
- In addition, this selection is accompanied by forms of annexation and marking through which certain readings and interpretations of the texts are consecrated, specific issues and problems are highlighted, sometimes residual for the author, while the interpretative authority of the translator and the commentator is consecrated. This labeling also involves the typographic structure of the work, the cover images, the distribution of the text with its emphases, succession of prefaces, etc., through which a series of transformations or even deformations of the original message are also operated.

This is, without a doubt, one of the few texts in which Pierre Bourdieu addresses more directly an object that is linked to the spaces of international power. There is no doubt, in fact, about the fact that the very use of the notion of field to address transnational and international

objects has been motivating debates about the conditions of importation, appropriation and redefinition of the concept (Sapiro, 2019). This was also one of the main theoretical questions faced by several authors who composed the work *Les champs littéraires africains* (2001) - a collection of texts organized by Romuald Fonkoua and Pierre Halen, with the collaboration of Katharina Städtler. In addition to the theoretical framework and the conditions of theoretical appropriation, researchers must also be aware of the variety of notions and the implications that the notions of circulation, transfers, exchanges, networks, connections, miscegenation, hybridizations, etc., carry for the object of study itself. In addition to not seeming appropriate to consider them as mere synonyms, it is appropriate to specify the definition of the terms, their uses, and limits (Sapiro, 2021), including here the understanding of the chosen metaphorical register (Lahire, 2006).

Although with reservations, the problem of the circulation of cultural goods internationally raises a series of levels and questions of analysis that deserve to be highlighted (Sapiro; Pacouret, 2015). Yes, because when it comes to studying international or transnational dynamics, it becomes clear that there is a need to define the unit of observation that is usually based on socially recognized and identifiable entities - cultures, societies, communities, nations, states, regimes (Sapiro, 2012).

Equally important, according to Sapiro and Pacouret (2015), is the choice of levels of analysis: at the macro level, attention should be paid to the structural asymmetries in international relations according to the position in the geopolitical, economic, and cultural power relations between countries (central, semi-peripheral, peripheral); at *the meso level* It is necessary to re-inscribe the analysis in the structure of national markets and the fields of cultural production of origin and reception (editorial, artistic, musical, cinematographic, literary, among others) and at the *micro level* arouses interest precisely the strategies and individual or institutional motivations of production, use and appropriation and mediation of imported cultural goods. It is important to emphasize, moreover, that "the center-periphery scheme" constitutes a powerful tool to describe the phenomena of asymmetry in the linguistic exchanges in question (Casanova, 2002)

Once the particular category of cultural asset has been selected - in this case, literature or scientific production in the social sciences - the corpus (author, school and/or genre) has been defined, it is necessary to identify the forms of materialization, the modes of production of publications and the symbolic capital linked to the prestige of both the authors, the mediators or importers. A decisive step is, therefore, to circumscribe this circulation between

spaces and cultures according to the place of publication of origin and the place of reception, and this choice may fall both on larger units such as countries, as well as on more particular cities and contexts (Sapiro; Pacouret, 2015). The use of international catalogs, as well as national publishers, compendiums, anthologies and bibliographic databases can be particularly useful in the attempt to map this circulation. No less important is the very definition of the linguistic area (nationality, geographical origin) which also produces not inconsiderable effects on the conditions of circulation of the works⁴.

The unequal distribution of this capital orders the literary linguistic field according to an opposition between the literary languages dominated by one part – languages that have recently been "nationalized" (i.e., made national languages relatively late), endowed with little literary capital, little international recognition, a small number of translators (national and international) or poorly known and remaining for a long time invisible in the great literary centers (such as Chinese and Japanese) – and on the other hand, the dominant languages, which, due to their specific prestige, their antiquity, and the number of texts declared universal written in their languages are endowed with an important volume of literary capital (Casanova, 2002, p. 9).

Some important studies can be mentioned as salutary examples of the use of these theoretical perspectives, especially works that deal with the material circulation of symbolic goods, with particular attention to the center-periphery relations between France and the countries of the African continent. The chosen approach is also opportune, since the international trend of valuing writers from the cultural peripheries in the literary, publishing, book salons, schools/or universities gained strength mainly after the 1980s (Sapiro, 2020).

In this sense, it is worth highlighting especially the work of Claire Ducournau, who was directly interested in the material and symbolic mechanisms that guaranteed the access and recognition of authors linked to the African continent, whose careers were marked and shaped by the institutions of French literary life (Ducournau, 2017). In line with the research program proposed by Pierre Bourdieu, Ducournau makes efforts to understand the logic of the work of writing, of publishing and seeing oneself recognized in a literary scene, in view of the structural constraints that condition the production and reception, the internal and external analyses of the works. Thus, through a prosopographical research with 151 writers from the

⁴ In addition to the theoretical issues, it would also be necessary to add here that the study of processes, institutions and actors that move on the international scene also requires from researchers not only the mastery of distinctive social and linguistic skills, but also the availability of resources to carry out empirical work in costly and sometimes adverse conditions. which is a not inconsiderable challenge in a professional and academic area such as ours that recruits mainly graduates from the lower classes and with less chance of having the required economic and linguistic capital (in this regard, see: Siméant, 2015).

French-speaking part of Sub-Saharan Africa who had gained recognition in the post-independence context, she was able to demonstrate how the creation of a "legitimate African literature" or even the emblem "African literary classic" was manufactured in France from two transnational waves: the first, in the 1980s, demarcated by the entry of Leopold Sédar Senghor into the French Academy and, later, in the 1990s, which depended heavily on some intermediaries for it to be recognized as properly literary. In addition to great intellectual figures, such as André Gide and Jean Paul Sartre, literary magazines (the recompositions of the publishing world, as a whole), then contributed to the molding of a kind of legitimate profile of the African writer, with all the implications on how and why some authors are published and others are not.

To a large extent, the outline of these processes converges with the generational dynamics of the black diaspora of African intellectuals in France studied by Abdoulaye Gueye (2001; 2006). Strongly influenced by the more general migratory movements and political dynamics in the African and French contexts, these *Les Intellectuels africains en France* are understood as belonging to different generations in Gueye's reading: the first generation, whose entry would have occurred between the 1950s and 1970s, would be very marked by the transitions of political regime, by the pioneering in the realization of higher studies in independent structures in Africa and massively influenced by Marxism, when not directly engaged in the Federation of Students of Black Africa in France (FEANF), created in the 1950s. Socialized under colonization, these individuals tended to build their identities and engagements around an autonomous Africa, elaborating different repertoires of justification for returning to the newly independent countries, in which they placed their hopes of participating in national construction (notably by engaging in political and/or diplomatic positions).

In a different way in relation to the previous generation, subsequent generations, in addition to having less insertion in the conventional instances of politics, attenuate their political discourses in the same proportion as they invest in other domains (economic, cultural, scientific). Born in the post-independence period and progressively distanced from the African continent, to which they no longer directed their expectations of return or to the reconstruction of Africa, the new generations began to present motivations more directed to concrete and clearly defined objectives, such as punctual sending of resources or materials to the countries of origin (Gueye, 2001). It is precisely among these generational strata that reach adulthood in the 1980s that the first literary productions of part of the literati studied by

Ducournau (2017, p. 299) are found, who, despite their greater concrete distance from the African territory, maintain an ambiguous relationship with an Africa conceived as an entity, discursive and referential in his "works produced outside the continent". In fact, despite the structural differences observed, perhaps this more recent experience of African students who activated different strategies of family reproduction - such as the constitution, for example, of diasporic families, which were dispersed across different countries and continents and in various professional domains - constitutes the manifestation of the acquisition of what Angela Xavier de Brito called the *habitus of migrant*⁵ (Brito, 2010).

In fact, a decisive part of the works of literature published between the 1960s and 2010 in the area in question are concentrated in a restricted number of countries, with a notorious preponderance of France, followed by Cameroon, Zaire/DRC, Senegal, etc. (Ducournau, 2017). Throughout this process, in fact, there was a notorious change in the genres preponderant in the scale of literary values, progressively passing from poetry, until then dominant in African literature, to the novel, which would better adjust to the logic of the market and to the expectations (including university ones) in relation to African literary productions in France. In a very similar way, this issue of the importance of external mediation also appears forcefully in Wend Griswold (2000) who used Nigerian novels to explore the impact of production systems on the content of the literary work. Through his work, it has been evidenced, for example, that British publishers are more likely to publish Nigerian novels if the themes concern the traditional, peasant, rural universe, even if a significant part of Nigerian novelists write books that address urban social problems.

4 STUDENT MOBILITIES IN THE GLOBAL SOUTH: NOTES FROM THE EXPERIENCES OF AFRICAN STUDENTS IN THE FORMER SOVIET BLOC

On this topic, as already pointed out, we shift the focus to a fertile field of study that has explored the redefinition of forms of academic mobility, appearing, alongside the traditional South/North displacements, a series of other multipolar and even invisible

⁵ "This last notion takes into account some of the aspects covered by the concept of *habitus*, as it is summarized by J.C. Kaufmann (2001): the *habitus of migrant* is a second nature, which is constructed through the succession of experiences lived during the processes of spatial mobility, during which people who move acquire new mental schemes and new moral and bodily dispositions. Or even, an implicit intelligence, situated between reflexivity, memory and the unconscious, buried in the most intimate of beings, which is sedimented in individuals and serves, in turn, as an instrument for the transmission of cultural acquisitions. But the *habitus of the migrant* also includes aspects described by the Bourdieusian concept of *habitus*, to the extent that, by dint of being repeated, these dispositions acquire a certain stability, become more or less socially structured - and, therefore, structuring" (Brito, 2010, P. 433)

migrations of students from countries on the African continent (Leclerc-Olive et Hily 2016; Saint Martin et al., 2015). The attempt to retain some lessons from the exploration of the experiences of African students who arrive in the former Soviet bloc is what motivates the project. We then selected the work coordinated by Monique de Saint Martin, Grazia Scarfo-Ghellab et Kamal Mellah (2015), which raises, from our perspective, important questions about the new mobilities between countries of the South, particularly those in Africa⁶. From our perspective, the exploration of the unprecedented experiences faced by students, activists and trainees who settled in a geographical, political, cultural and linguistic context as distinct as that of the USSR allows us to suggest, with great richness, an instigating agenda of research on the expectations, implications and biographical consequences of the international migrations of African graduates who return or settle outside the continent.

In *Étudier à l'Est* (Saint Martin et al., 2015) the authors attempted to combine three fundamental levels of analysis. First, some of the researchers try to outline the political, social and institutional frameworks within which cooperation agreements and government policies from State to State were operated. In this context, two major events that mark the Soviet rapprochement with African states stand out: in 1957, the Sixth World Festival of Youth and Students organized in the socialist bloc and which brought together representatives from 131 countries with 600 African participants; in addition, the foundation in Moscow of the University of the Friendship of the Peoples, which in 1961 was renamed Patrice Lumumba University, intended primarily for students from Asia, Africa and Latin America (Yengo; Saint Martin, 2017). On the second level, the book addresses the experiences, narratives, hopes and contradictions experienced by former African students, notably the first to confront this experience. The last part focuses on the contrasting experiences of the migratory path, but mainly with the conditions and itineraries of return, demarcating the effects and variable profitability of the passage through different worlds.

It is also worth highlighting the suggestive methodological strategies, based on in-depth interviews and the use of a corpus of very diverse sources, such as archives of the Russian Federation, Unesco, embassies of African countries, as well as literary testimonies written by former African students, such as the novel by the Guyanese Jan Carew, entitled *Moscow n'est pas ma Mecque* or *Tavarich Gay*, written by Souleyanta Ndiaye (Saint Martin

⁶ Although they were increased from the 1960s onwards, with the creation of several establishments in Eastern Europe aimed at welcoming African students, it should be noted that their contacts with the communist world were older (Yengo; Saint Martin, 2017).

et al., 2015). In this way, the authors were able to explore various facets of the Soviet experience, such as the weight of the discovery of otherness, the challenges of adapting and learning the language, hopes and disappointments, daily vicissitudes and undesirable events, relationships of complicity, friendship, but also surveillance and control, etc. The diversity of memories of former African students then refers to the very complexity of experiences and trajectory, combining convergent dynamics at the same time as singularities.

As is well known, while the international migrations of students were characterized until the 1950s by the omnipresence of currents going notably from colonized countries towards colonizing countries, from the mid-1950s onwards new mobilities emerged, such as that of students from African and Asian countries, recently independent, destined for socialist countries. This process is undoubtedly linked to the increasingly central place acquired by the international in the legitimization schemes of the ruling groups on the global stage (for an excellent reconstitution of this debate in Brazil, see: Seild, 2013). In the case of Africa, this increase in international student mobility has shifted northward (Gérard, 2008; Niane, 1992), as traditionally occurred, but with a strong increase in the south-south axis and within the continent itself, as has already been evidenced in several recent studies (Geisser, 2000; Mazzella, 2009; Tati, 2014).

It should also be emphasized that a significant part of these migrations are still part of the framework of cooperation agreements, which depend heavily on government policies and the strategies of the new African states in an international space divided into blocs. Concomitantly with the Afro-Asian decolonization movement, there was the progressive opening, carried out by the Union of Soviet Republics (USSR) and different socialist countries, of institutions, programs and incentives for the massive and systematic collection of Maghreb and sub-Saharan students (Saint Martin et al, 2015). The reasons for this opening, however, do not stem simply from an expansionist policy of the USSR in relation to the third world, but also from the demand of African countries that did not yet have universities and had an urgent need to train new elites (Gheorghiu, 2012).

The case of Portugal's former colonies can be taken as an illustrative example of this, since, with the end of Salazarism in 1984 and the massive departure of metropolitans and their descendants, the leaders of liberation movements in Angola, Mozambique and Guinea-Bissau had to "appeal to the offer of intellectual and political skills at an international level", with which a series of posts were opened for Brazilian exiles (Garcia Júnior, 2004, p. 249). Occupying first-level positions in public universities or even in the educational system of

countries such as Angola and Mozambique, these Brazilians then participated in the process of diversifying the forms of international cooperation with effects not yet fully understood (Garcia Júnior, 2004). Be that as it may, in parallel with the massive return of Brazilians in the context of progressive liberalization of the Brazilian public space, there was an increase in Russian, Bulgarian and German cooperation from the German Democratic Republic (GDR) in the Portuguese-speaking space of Africa.

Thus, through the creation of Soviet Houses of Science and Culture, Soviet Cultural Centers, the organization of libraries full of Soviet publications in other languages, or even the demand for the incorporation of Marxism-Leninism in the education systems of the countries economically and politically supported by the USSR, broad Soviet hegemony was consolidated in the space in question. All of this allows us to understand more clearly how African mobilities towards Eastern Europe have been increased on the continent, and are certainly "among the most important institutionalized student mobilities in the history of higher education and executive training" (Saint Martin et al, 2015; Katsakioris, 2015).

The data compiled by Katsakioris (2007) corroborate this centrality acquired by the Soviet Union as the main destination (from 611 between 1959-1960, the number of African students only increased to more than fifteen thousand in 1980 and reached about 30 thousand on the eve of the fall of the Berlin Wall), followed at a distance by Romania and the GDR. The available statistics regarding these student flows are full of gaps, however, requiring several precautions from researchers. When researching African students in Romania and the GDR, Mihaï Dinu Gheorghiu highlighted the state of disorganization of the archives, the geographical dispersion of the actors and the difficult communication between Europe and Africa as a powerful discourager for carrying out studies such as the one under discussion (Gheorghiu et al, 2015).

In any case, the compulsory research allows us to outline some of the striking traits of these African students, mostly men, recruited for studies in Eastern Europe. Although these should be selected from among the children of workers or peasants, according to Soviet guidelines, in practice, as Katsakioris, Demintseva and Mazov (2015) have found, the selection on the African side was carried out arbitrarily, without exactly meeting the criterion of modest social origin, which allowed students from middle social sectors to enter, of the elites and even of the offspring of the aristocracies of their countries of origin. In some situations, such as that of Minabe Diarra, of the Communist Party of Mali – who defended her thesis in 1972 at the Institute of Ethnography and Anthropology of the USSR Academy of

Sciences – these students did not even have a secondary education (Siim-Moskovitina, Dobronravin; 2015). Almost all of these students were supported by scholarships, either those provided by their home states or by Soviet political, social, or cultural organizations.

Although they were divided into different areas, including literature, philosophy, cinema, most of these students focused on training in engineering, medicine, pharmacy, agronomy, among others (Saint Martin et al, 2015). Generally, the disciplines in the field of Social Sciences were the object of optional teaching in universities – when they were not subsumed under the teaching of Marxist-Leninist philosophy – with only a small minority of foreigners who specialized in these disciplines. It is not surprising that few studies have been concentrated on the intellectual and/or political trajectories of elites of the humanities among the works gathered in the work (Kouvouama, Bowao; 2015). Be that as it may, it is precisely in the domain of the social sciences that the Soviet ideological influence was most clearly outlined, based on a methodological and theoretical basis necessarily informed by Marxist-Leninist ideology. Anna Siim-Moskovitina and Nikolay Dobronravin (2015) thus show part of the demands that were imposed on the production of theses and thesis summaries sustained in Leningrad or Moscow:

In these disciplines, Marxist-Leninist ideology was the formal basis of methodology. All students were required to quote Lenin, Marx, Engels, and the Soviet leaders of the time (from Khrushchev to Gorbachev) in their writings and speeches. This was even more true if they were preparing for a PhD in history or anthropology. When African doctoral students described and analyzed their own cultures and societies, all the phenomena described were interpreted within the framework of historical materialism. They had to severely criticize the "bourgeois and pro-capitalist" approaches of the West in the social sciences, as well as the reality of traditional societies (caste, arranged marriages, polygamy, etc.) and their "old-fashioned" and "archaic" way of life that "delays" the development of individuals.

When it comes to African Studies, Anna Siim-Moskovitina and Nikolay Dobronravin (2015) also note that these were poorly developed until the 1960s. An example of this, the Institute of African Studies, founded in 1959 and dependent on the Russian Academy of Sciences, began its first publications only in 1973, extending until 1990. This process of institutionalization, by the way, was contemporaneous with the increase in interest in the USSR in French, Portuguese, and English-speaking African literature among the more general and specialized Soviet public (Nikiforova, 2000). This is a process of African-Soviet rapprochement that arouses interest not only in relation to the patterns and conditions of

student circulation, but also opens up an agenda of research on the growing number of art and film festivals, the creation of conferences of African and Asian writers and the reception of African artists and intellectuals by the USSR (In this regard, see: Blum et al., 2021).

Finally, it should be noted that the experiences of return are varied and the very conditions of using the diploma as an asset depended strongly on the political dynamics of each African State of origin. It is necessary to guard against the view that the rate of return on stays abroad consequently generated given conditions for social ascension on return. Thus, for example, while the degrees obtained by students from countries that opted for the path of socialism (Benin, Congo, Mali, Angola, etc.) served as tickets for quick access to public and prominent functions, in countries still strongly linked to colonial metropolises, such as Morocco or Ivory Coast, the diplomas acquired in the socialist bloc were often declassified and labeled as mediocre in the face of the excellence of the studies carried out in the bloc capitalist. The exploration of the diversity of return itineraries of these students and the problematic cases of recognition of the diploma obtained in the USSR, requiring a series of reconversions or professional reorientations, reveal that the value of the diploma was not at all mechanical and univocal (Saint Martin et al, 2015). The example of Bulgaria and the varying effects of international mobility in the field of social sciences and humanities can be taken as particularly suggestive.

5 THE CIRCULATION OF AFRICAN WORKS, GRADUATES AND TEACHERS: SOME PROVISIONAL CONCLUSIONS

At the end of the text, the reader may rightly ask himself: what is the common point in the empirical and theoretical considerations made so far about the production of knowledge about Africa, Literature and Social Sciences. At first glance, it may not seem like much, but the scientific curiosity outlined here in relation to the conditioning factors of the production of knowledge, the circulation of cultural goods and literary productions to/from/for Africa has led us to highlight precisely the experiences of migration, travel and displacement of concrete individuals that end up playing a fundamental role in the reconfigurations of the imaginary and sensibilities in relation to the continent. Valid for the African literary scene (in this regard, see: Mazauric; Sow, 2013), the importance of these mobilities is also decisive when it comes to thinking about the academic space itself and the circulation of research models, knowledge, and practices (Niane, 2011) in an increasingly complex, diverse, and competitive structure of the global market for scientific skills (Dia, Ngwe, 2018).

Obviously, the selection of student or teacher mobility is aligned with the very intention of reflecting on the epistemological conditioning factors of knowledge production in Africa and by Africans (Hountondji, 2010), also opening space to reflect on the contribution of researchers from the continent to research in the humanities and social sciences in Africa (Gueye, 2011). But these reflections are equally useful when one thinks, for example, of the trend identified by Paul Zeleza (2006) in departments of Euro-American literature in which, under the influence of the dominant versions of postcolonial theory, at the same time that generous niches have been opened in multicultural studies programs for African writers, there is a tendency to canonize a literary production based on the West or on themes set in it, filtered by the stereotyped focus on transnational and migrant subjectivities and textualities. In fact, much remains to be done in order to objectify the relations of domination that permeate the schemes of interpretation of colonial and postcolonial realities in literature, the arts and the social sciences (Sapiro; Ducournau, 2010),

Despite the existence of peculiarities/singularities in the conditioning factors of the circulation of scientific and literary works (Sapiro, 2012), there are many dimensions of international circulation and the experiences of various individuals that raise convergent problems at various points. In any case, what we want to emphasize is that the exploration of African migrations, of African diasporas, which articulate ancient and innovative dynamics, archaic or contemporary forms - it would be necessary to recall with Zeleza (2020, p. 921) the existence of differences and similarities between the "trans-Indian oceanic diasporas, the trans-Mediterranean diasporas and the transatlantic diasporas" - offers unique opportunities to apprehend the reconfiguration of the imaginary, of sensibilities and, certainly, of the modes of production of knowledge as well as of the goods and works of culture. What we sketch here were the outlines of the construction of a dynamic object, which continues to challenge researchers.

ABSTRACT

The persistence of traditional practices in Physics teaching, characterized by excessive mathematical formalism and a content-transmission-centered approach, still hinders students' construction of meaning in secondary education. In the case of Newton's Laws, such an approach tends to privilege the mechanical application of formulas to the detriment of conceptual understanding and the problematization of phenomena. This article aims to discuss theoretical and didactic foundations for teaching Newton's Laws and to present an inquiry-based proposal aligned with the Brazilian National Common Curricular Base (BNCC), aimed at overcoming such formalism. This is a theoretical-bibliographic study grounded in constructivist frameworks and contributions from inquiry-based science education, articulating assumptions of the Science, Technology, Society and Environment (STSE) approach, elements from the History and Philosophy of Science (HPS), and the use of Digital Information and Communication Technologies (DICT). The proposal is structured around the investigation of contextualized problem situations that mobilize prior knowledge, teacher mediation for the formulation of students' hypotheses, and the conceptual systematization of the three laws of motion. As potential outcomes, this proposal fosters an inquiry-based approach that promotes the construction of meaning regarding the relationships among force, mass, and motion, expanding evidence-based argumentation and strengthening students' scientific autonomy. It is concluded that this teaching proposal contributes to overcoming formalism in the teaching of Newton's Laws, requiring pedagogical intentionality, formative assessment, and teacher education consistent with current curricular guidelines.

RESUMO

A persistência de práticas tradicionais no ensino de Física, marcadas pelo formalismo matemático excessivo e pela centralidade na transmissão de conteúdos, ainda dificulta a construção de significados pelos estudantes no Ensino Médio. No caso das Leis de Newton, tal abordagem tende a privilegiar a aplicação mecânica de fórmulas em detrimento da compreensão conceitual e da problematização dos fenômenos. Este artigo tem como objetivo discutir fundamentos teóricos e didáticos para o ensino das Leis de Newton e apresentar uma proposta investigativa alinhada à Base Nacional Comum Curricular (BNCC), voltada à superação desse formalismo. Trata-se de um estudo de natureza teórico-bibliográfica, fundamentado em referenciais construtivistas e em contribuições do ensino por investigação, articulando pressupostos da abordagem Ciência, Tecnologia, Sociedade e Ambiente (CTSA), elementos da História e Filosofia da Ciência (HFC) e o uso de Tecnologias Digitais da Informação e Comunicação (TDICs). A proposta organiza-se a partir da investigação de situações-problema contextualizadas que mobilizam conhecimentos prévios, mediação docente para a formulação de hipóteses discentes e sistematização conceitual das três leis do movimento. Essa proposta possibilita, como possíveis resultados, uma abordagem investigativa que favorece a construção de significados das relações entre força, massa e movimento, ampliando a argumentação baseada em evidências e fortalecendo a autonomia científica dos estudantes. Conclui-se que essa proposta de ensino contribui para a superação do formalismo no ensino das Leis de Newton, exigindo para tanto, intencionalidade pedagógica, avaliação formativa e formação docente consistente com as diretrizes curriculares vigentes.

RESUMEN

La persistencia de prácticas tradicionales en la enseñanza de la Física, caracterizadas por un excesivo formalismo matemático y por la centralidad en la transmisión de contenidos, aún dificulta la construcción de significados por parte de los estudiantes en la educación secundaria. En el caso de las Leyes de Newton, dicho enfoque tiende a privilegiar la aplicación mecánica de fórmulas en detrimento de la comprensión conceptual y la problematización de los fenómenos. Este artículo tiene como objetivo discutir fundamentos teóricos y didáticos para la enseñanza de las Leyes de Newton y presentar una propuesta investigativa alineada con la Base Nacional Común Curricular (BNCC) de Brasil, orientada a la superación de dicho formalismo. Se trata de un estudio de naturaleza teórico-bibliográfica, fundamentado en referentes constructivistas y en aportes de la enseñanza por indagación, articulando presupuestos del enfoque Ciencia, Tecnología, Sociedad y Ambiente (CTSA), elementos de la Historia y Filosofía de la Ciencia (HFC) y el uso de Tecnologías Digitales de la Información y la Comunicación (TDIC). La propuesta se organiza a partir de la investigación de situaciones-problema contextualizadas que movilizan conocimientos previos, la mediación docente para la formulación de hipótesis por parte de los estudiantes y la sistematización conceptual de las tres leyes del movimiento. Como posibles resultados, esta propuesta favorece un enfoque investigativo que promueve la construcción de significados en las relaciones entre fuerza, masa y movimiento, ampliando la argumentación

basada en evidencias y fortaleciendo la autonomía científica del estudiantado. Se concluye que esta propuesta de enseñanza contribuye a la superación del formalismo en la enseñanza de las Leyes de Newton, exigiendo intencionalidad pedagógica, evaluación formativa y formación docente coherente con las directrices curriculares vigentes.

1 INTRODUCTION

School education, throughout its institutionalization process, began to reflect the sociocultural contexts in which it is inserted. However, it still preserves traditional practices centered on the mechanical and decontextualized transmission of contents, characterized by low student participation and little appreciation of prior knowledge (Vygotsky, 1987; Durkheim, 1922). This model, criticized by Rubem Alves (2010) for limiting students' creativity and engagement, is described by Freire (1968) as banking education, marked by vertical pedagogical relations, absence of dialogue and weakening of problematization as a formative principle.

In the field of Physics Teaching, such characteristics are often manifested in the excessive emphasis on mathematical formalism and in the centrality of algorithmic resolution of exercises, to the detriment of conceptual understanding and the construction of meanings. Research in the area has defended methodologies aligned with contemporary demands, valuing active participation, investigation and the development of critical thinking (Nardi, 2001; Moran, 2000).

This change in perspective dialogues with the growing need to promote learning that transcends the mere application of formulas and favors the interpretation of everyday natural and technological phenomena. From a normative point of view, the Law of Guidelines and Bases of National Education (LDB) and the National Common Curriculum Base (BNCC) guide an education focused on the integral development of students, emphasizing contextualized, inclusive practices based on evidence-based argumentation (Brasil, 1996; 2018).

In the field of Natural Sciences, the BNCC highlights the investigation of phenomena, the understanding of the relationships between Science, Technology, Society and Environment (CTSA) and the construction of competencies that articulate conceptual knowledge and citizen action.

In this scenario, the teaching of Newton's Laws in High School assumes a structuring role in the organization of Mechanics, as it makes it possible to understand forces, movements and interactions present in everyday situations and in technological applications. However, when approached predominantly under formalist logic, this content tends to be reduced to the mechanical application of mathematical relations, making it difficult to understand the concepts that underlie such relations.

Overcoming this limitation implies recognizing the student as an active subject of the

learning process and promoting practices that favor problematization and the construction of meanings.

In view of this scenario, this article starts from the following research question: Which didactic paths can contribute to overcoming formalism and decontextualized traditional practices in the teaching of Newton's Laws in High School, favoring the construction of meanings by students?

In line with this issue, the objective of this article is to discuss theoretical and didactic foundations for the teaching of Newton's Laws in High School and to present a proposal for didactic organization oriented to overcoming formalism and promoting conceptual learning.

From this outline, the article is organized in the presentation of the theoretical foundations that support the proposal, in the description of its principles and structuring stages and in the discussion of its implications for the conceptual learning of Newton's Laws in High School.

2 THEORETICAL FRAMEWORK

2.1 CONSTRUCTIVISM AND CONSTRUCTION OF MEANINGS IN THE TEACHING OF PHYSICS

The criticism of transmissive approaches in the teaching of Science is supported by the constructivist bases that understand learning as an active process of construction of meanings. Ausubel (1985) argues that learning becomes meaningful when new information is related in a substantive and non-arbitrary way to the student's previous knowledge. Such a perspective shifts the focus from memorization to cognitive organization and conceptual anchoring.

Vygotsky (1987) expands this understanding by highlighting the role of social mediation and language in the formation of scientific concepts, situating the Zone of Proximal Development (ZPD) as a privileged space for cognitive advancement. Learning, in this horizon, does not occur in isolation, but through guided interaction, in which the teacher assumes a decisive role in the organization of situations that enable the progressive internalization of concepts.

Piaget (1998), in turn, contributes by emphasizing the processes of assimilation and accommodation, understanding cognitive development as a continuous movement of imbalance and rebalancing. Cognitive conflict, in this context, constitutes a structuring element of the construction of knowledge. Learning Physics, therefore, is not reduced to the

reproduction of mathematical procedures, but involves conceptual reorganization and establishment of relationships between different representations and experiences.

This understanding dialogues with contemporary curricular guidelines that defend the integral formation of the student and the articulation between scientific knowledge and application contexts (Brasil, 2018). The construction of meanings, in this sense, becomes a structuring axis for the teaching of classical contents of Mechanics, such as Newton's Laws, often reduced to algorithmic application.

2.2 TEACHING BY INVESTIGATION AND PROBLEM SITUATIONS

In the context of Physics teaching, teaching by investigation is pointed out as a consistent alternative to practices focused on exposure and mechanical resolution of exercises. Gil-Pérez (1993) and Cachapuz (2005) defend didactic models based on problem-situations that mobilize previous knowledge, stimulate mediation for the formulation of hypotheses and lead to the progressive systematization of scientific knowledge.

The problem-situation is not configured as a mere applied exercise, but as a structured context that provokes questions, makes alternative conceptions explicit and creates conditions for its conceptual reconstruction. In this process, teacher mediation is essential to articulate the hypotheses formulated by the students to the consolidated scientific models, avoiding both authoritarian imposition and the absence of epistemological direction.

This approach can integrate, through dialogic, elements of the History and Philosophy of Science (HFC), evidencing the historical and provisional nature of scientific models, as well as articulate relationships between STSA. The insertion of Digital Information and Communication Technologies (DICTs) expands possibilities of visualization, simulation and analysis of phenomena, as long as it is guided by clear pedagogical objectives.

By shifting the focus from memorization to investigation, teaching by inquiry favors the development of evidence-based argumentation and intellectual autonomy, aspects consistent with the competencies provided for in the BNCC for the Natural Sciences (Brasil, 2018).

2.3 FORMATIVE ASSESSMENT AND PEDAGOGICAL MEDIATION

Consistent with the investigative perspective, the evaluation assumes a formative and procedural character, overcoming the exclusive emphasis on the verification of final results. Campos and Nigro (1999) argue that evaluation should be integrated into the teaching process, allowing the monitoring of the students' conceptual evolution and guiding more

precise pedagogical interventions.

Pozo (2009) expands this understanding by proposing multidimensional and continuous assessments, such as qualitative records, concept maps and contextualized activities, capable of evidencing advances, difficulties and cognitive strategies mobilized by the students. Evaluating, in this horizon, implies understanding how the student thinks and how he reorganizes his ideas in the face of new conceptual challenges.

Such an approach becomes particularly relevant in the teaching of Newton's Laws, content that often reveals persistent Aristotelian alternative conceptions related to force, motion, and interaction. Pedagogical mediation, articulated with formative evaluative strategies, contributes to making these obstacles explicit and to promoting their conceptual overcoming.

2.4 DIDACTIC TRANSPOSITION AND IMPLICATIONS FOR THE TEACHING OF NEWTON'S LAWS

Didactic transposition, understood as a process of reorganization of scientific knowledge into school knowledge (Delizoicov; Angotti; Pernambuco, 2002), is a central dimension in the discussion about the teaching of Newton's Laws. The challenge lies not only in simplifying content, but in selecting, reorganizing and contextualizing concepts in a way that preserves their scientific coherence and explanatory power.

In the case of Mechanics, the risk of formalism is manifested when laws are presented exclusively as mathematical relations, detached from their conceptual foundations and their conditions of validity. Prioritizing conceptual understanding implies making explicit that Newton's Laws apply to macroscopic systems in inertial frames (non-accelerated frames) and that outside these limits, these laws require other theoretical formulations, such as Relativity and Quantum Mechanics. This explanation favors a more consistent view of the nature of scientific models.

Materials produced by the Group for the Reelaboration of Physics Teaching (GREF, 1993) and the National Book and Didactic Material Program (PNLD) 2024 exemplify didactic reorganization efforts aligned with curricular guidelines, by integrating everyday situations, CTSA relationships, HFC elements, TDICs, conceptual problematization and investigative teaching. These initiatives reinforce the need to overcome the centrality of algorithmic manipulation and to promote inclusive practices that consider different rhythms and modes of learning.

In this sense, the framework presented here supports the defense of a teaching of Newton's Laws oriented to the construction of meanings, to intentional mediation and to the investigation and problematization of phenomena in line with the current curricular guidelines and with critical scientific training.

3 METHODOLOGY

This article is characterized as a theoretical-bibliographic research, with a qualitative approach and propositional character. Bibliographic research, as defined by Gil (2010), is developed from material already prepared, especially books, scientific articles and official documents, enabling the critical and systematic analysis of concepts and categories pertinent to the problem investigated. In this sense, the study organizes and interprets contributions from the field of Physics Teaching and Science Teaching, articulating them to the elaboration of a didactic proposal aimed at the teaching of Newton's Laws in High School.

The qualitative approach is based on the understanding of processes, meanings and theoretical constructions, prioritizing interpretation and conceptual analysis to the detriment of data quantification (Lüdke; André, 2013). Bogdan and Biklen (1994) point out that qualitative research is concerned with understanding the phenomenon in its context, seeking to interpret meanings attributed to practices and concepts. Although the present study does not involve the collection of empirical data, it shares this orientation by critically analyzing theoretical references and their implications for the didactic organization.

The methodological path was structured in two complementary movements. The first consisted of the selection and analysis of literature related to the axes that support the investigated problem: constructivist contributions to meaningful learning; fundamentals of teaching by inquiry; formative evaluation and pedagogical mediation; didactic transposition; and national curriculum guidelines, with emphasis on the National Common Curriculum Base. The analysis sought to identify theoretical convergences, conceptual tensions and gaps related to the formalistic treatment of Newton's Laws in High School.

The second movement focused on the systematization of a proposal for didactic organization based on the analyzed references. The proposal was structured based on contextualized problem situations, mobilization of previous knowledge, mediation in the formulation of hypotheses and subsequent conceptual systematization of the three laws of motion. Possibilities of articulation with CTSA relations, HFC elements, use of TDICs and formative assessment strategies integrated into the teaching process were also considered.

As this is a theoretical and purposeful study, there was no empirical application in a school context or participation of research subjects, dispensing with ethical procedures related to research with human beings. As a limitation, it is noteworthy that the proposal presented was not submitted, within the scope of this article, to empirical validation in the classroom, configuring itself as a theoretically grounded didactic organization and open to further investigation in future investigations.

4 RESULTS AND DISCUSSIONS

The analysis of the theoretical references mobilized throughout this study allowed us to organize a didactic proposal for the teaching of Newton's Laws in High School based on three articulating axes: mobilization of previous knowledge, problematization through contextualized situations and conceptual systematization mediated by the teacher. As it is a theoretical-bibliographic and propositional study, the results presented here refer to the systematization of this didactic organization and the discussion of its pedagogical implications in the light of the literature in the area.

4.1 ORGANIZATION OF THE DIDACTIC PROPOSAL

The didactic proposal is organized in sequential and articulated stages, designed to favor the conceptual reconstruction of Newton's Laws from contextualized problem-situations. Each stage involves three fundamental moments: survey of previous knowledge, problematization in groups and teacher mediation oriented to conceptual systematization.

The starting point consists of mapping the students' initial conceptions about movement, force and interaction. This survey can be carried out through a brief diagnostic pre-test, open-ended questions projected in class, or guided reading of a short text that explores intuitive notions about why objects move or stop. The objective is not to evaluate performance, but to make explicit previous ideas often associated with the conception that movement requires continuous strength to maintain itself.

4.1.1 Newton's First Law: Inertia and Frames of Reference

To introduce the First Law, the following problem-situation is proposed: what happens to standing passengers when a bus starts or brakes abruptly? Before any formalization, students are organized into small groups and are invited to discuss and record explanatory hypotheses. It is common to emerge interpretations based on the idea that the body "is thrown

backwards" or "pushed forward" by a mysterious force associated with the movement of the vehicle.

At this point, the teacher assumes the role of mediator, asking the groups to explain their justifications and confront arguments. The collective discussion shows that, when the bus accelerates, the passenger's body tends to maintain the previous state of rest, going backwards; when he brakes, he tends to maintain the state of movement, going forward. From this confrontation of ideas, the principle of inertia is introduced, explaining that a body remains at rest or in uniform rectilinear motion (MRU) if the net force on it is zero.

As a historical and epistemological expansion (HFC), it is suggested the guided reading of excerpts from *Galileo's (1999) Dialogues on the two greatest systems of the world*, in which experiments with inclined planes and the notion of conservation of motion in the absence of resistance are discussed. The analysis of these excerpts makes it possible to highlight the rupture with Aristotelian physics, which associated movement with the continuous action of a force, conceptually preparing the ground for the Newtonian formulation of the principle of inertia. This moment contributes to the students' understanding that scientific concepts result from historical processes of debate and overcoming previous models.

After the discussion, conceptual systematization is carried out: inertia is presented as a property related to the mass of the body, understood as a measure of resistance to the variation of the state of motion (GREF, 1993). Situations such as the use of seat belts, airbags and the movement of satellites in orbit are analyzed to consolidate the understanding of the principle in different contexts, such as the analysis of CTSA relationships. At this point, the limits of validity of Newton's Laws are also explained, highlighting that they apply to macroscopic systems, in inertial frames and at speeds much lower than the speed of light.

4.1.2 Newton's Second Law: Relationship between force, mass and acceleration

To address the Second Law, the investigative logic is resumed. The proposed new problem-situation involves two identical supermarket carts, but one empty and the other loaded with bottles of water, both initially at rest. The question is: what is needed to set them in motion? In which of them is it more difficult to move it, applied to the same force? What happens if we apply the same force to both?

Students discuss in groups and record their hypotheses. They often recognize that the loaded cart requires "more effort," but they do not always articulate this perception with the

quantitative notion of mass as a measure of inertia. Teacher mediation leads to the analysis that the variation of movement depends on the net force applied and the mass of the body, and it is also up to the teacher to relate this situation to the conceptual elements discussed in the First Law (inertia and mass) (GREF, 1993).

Formalization occurs gradually. It is based on the idea that the net force is associated with the variation of movement over time (acceleration). In High School, for constant mass, this relationship is expressed by:

$$F_r = m \cdot a \quad (1)$$

It is explained that:

represents the net force (N), mass (kg), and acceleration (m/s²). The focus is not only on calculation, but on interpretation: all acceleration results from the action of a net force and, for the same force, bodies of greater mass have less acceleration. F_r, m, a

To consolidate this understanding, a contextualized example is analyzed: a 1200 kg car that travels at 20 m/s and suffers a braking force of 6000 N. The application of equation (1) leads to a (de)acceleration of -5 m/s^2 . The physical meaning of the result is discussed: the velocity decreases by 5 m/s every second while the force acts (hence the negative sign). This moment is decisive to prevent the equation from being perceived as a mere algorithmic tool, emphasizing its explanatory power. Later, having explained the third law, one can return to this example and detail it by discussing Newton's three laws in this same situation.

Situations involving acceleration and braking of vehicles, sports practices or displacement of loads expand the analysis and favor the articulation of this law in contexts such as the analysis of CTSA relations.

4.1.3 Newton's Third Law: Interactions and pairs of forces

The Third Law is introduced from a problem-situation involving an athlete kicking a suspended sandbag. The question is: if the athlete applies force to the bag and puts it in motion, why does he feel pain on impact and is "pushed back"? Group discussion allows for the explicit of alternative conceptions, such as the idea that only the object "receives" the force.

Teacher mediation leads to the understanding that forces are interactions between bodies. By exerting force on the sac (, the athlete simultaneously receives a force of the same intensity and direction (, but in the opposite direction (hence the negative sign). This relationship can be expressed by: $\vec{F}_{AS})\vec{F}_{SA})$

$$\vec{F}_{AS} = -\vec{F}_{SA} \quad (2)$$

Examples such as rocket propulsion, jumping, and vessel displacement reinforce the interactional character of the forces and broaden conceptual understanding in different contexts, such as the analysis of CTSA relationships.

To deepen the study of Newton's Laws, it is also possible to problematize whether the First Law constitutes a particular case of the Second. Although relation $\vec{F}_R = m\vec{a}$ (1) suggests that the absence of acceleration implies a net force of zero, this interpretation is conceptually insufficient. The Second Law expresses a classical deterministic model that describes everyday macroscopic phenomena, but does not exhaust the foundations of Newtonian mechanics nor does it apply to relativistic or quantum domains (Nussenzweig, 1997).

It is inferred, therefore, that Newton's First Law is not a particular case of the Second. Its essential function, although it is compatible with the condition of $a = 0 \text{ m/s}^2$, implied in $F_r = 0 \text{ N}$, is to establish the existence of inertial frames, a necessary condition for the validity of Newton's three Laws and of the entire formalism of classical mechanics.

4.1.4 Integration of digital resources and formative assessment

Throughout all stages, it is recommended to use interactive simulations, such as those provided by Physics Education Technology (PhET), to explore vectors of force, balance and motion. Simulations should be accompanied by guiding questions that require qualitative interpretation before mathematical formalization.

The evaluation occurs in a procedural way, through written records of hypotheses, debates, collective syntheses and resolution of contextualized problems. This monitoring allows the teacher to identify conceptual advances and persistent difficulties, adjusting pedagogical interventions.

4.2 DISCUSSION OF THE RESULTS IN THE LIGHT OF THE LITERATURE

The systematized didactic organization shows convergence with the constructivist bases discussed in the theoretical framework. The mobilization of previous knowledge and the confrontation of hypotheses dialogue with the perspective of meaningful learning, as new information is anchored in existing cognitive structures. Cognitive conflict, triggered by problem situations, favors conceptual reorganization, as pointed out by classic studies in the area.

The centrality of teacher mediation proves to be a decisive element to avoid both formalistic imposition and the absence of conceptual rigor. By articulating student hypotheses to consolidated scientific models, the professor preserves the epistemological coherence of the content, without reducing the student to a mere executor of algorithmic procedures.

The results of the systematization indicate that the investigative approach contributes to shift the focus from the calculation to the physical interpretation of the relationships between force, mass and motion. By integrating everyday situations, limits of validity of laws and discussion of inertial references, the understanding of the nature of scientific models is expanded, overcoming simplifying views often present in textbooks.

The articulation with CTSA relations and with digital resources strengthens the contextualization and expands the formative reach of the content, in line with the competencies provided for the Natural Sciences. In addition, the incorporation of formative assessment throughout the process allows for the monitoring of the conceptual evolution of the students, favoring more precise pedagogical interventions.

In general, the results discussed indicate that the overcoming of formalism in the teaching of Newton's Laws does not depend on the elimination of mathematics, but on its reintegration into a process of construction of meanings. When inserted in an investigative, mediated and contextualized path, laws cease to be formulas to be applied mechanically and constitute explanatory instruments to understand phenomena of the physical world.

Thus, the proposal presented reaffirms that the teaching of Newton's Laws, guided by problematization, intentional mediation and formative evaluation, can consistently contribute to the critical scientific education of high school students, in line with the current curricular guidelines and with the contemporary demands of Physics Teaching.

5 CONCLUSION

This article aimed to discuss theoretical and didactic foundations for the teaching of Newton's Laws in High School and to present a proposal for didactic organization oriented to overcoming formalism and promoting conceptual learning.

In response to the research question, it is argued that the overcoming of traditional decontextualized practices and excessive mathematical formalism passes through didactic paths that replace the student at the center of the learning process, articulating prior knowledge, problematization and intentional teacher mediation, in order to transform the laws of motion into explanatory instruments to interpret real situations and not just formulas to be applied mechanically.

The results of this study, of a theoretical-bibliographic and propositional nature, consist of the systematization of a didactic proposal anchored in contextualized problem situations for Newton's First, Second and Third Law, with explicit stages of diagnostic survey, group discussion, formulation of hypotheses, confrontation of ideas and conceptual systematization.

The incorporation of CTSA relations, elements of HFC, as well as the guided use of DICTs, expands the possibilities of visualization and argumentation, preserving conceptual rigor. It is a viable proposal for application in High School, as it is based on everyday situations, accessible didactic resources and strategies that can be integrated into the teacher's regular planning, without requiring complex structural changes in the curriculum.

From a formative point of view, the proposal reinforces that the teaching of Newton's Laws gains consistency when supported by formative and procedural evaluation, capable of making persistent alternative conceptions visible and guiding pedagogical interventions along the way. In line with the BNCC and the current curricular guidelines, the organization presented contributes to a Physics Teaching more aligned with contemporary demands, by favoring evidence-based argumentation, critical reading of everyday phenomena and a more rigorous understanding of the modeling character of physical laws.

As a limitation, as it is a theoretical and purposeful study, the proposal was not applied empirically in the scope of this article. Future investigations, through intervention research or case studies, may analyze its implementation in different school contexts, examining its effects on conceptual learning and on the overcoming of alternative conceptions. Even so, it is argued that the didactic reorganization presented offers consistent foundations to face the formalism in the teaching of Newton's Laws, strengthening a more critical and meaningful scientific education in High School.

ACKNOWLEDGMENTS

The authors would like to thank the State University of Rio Grande do Norte (UERN) and the Federal Rural University of the Semi-Arid (UFERSA), institutions to which the authors are linked as civil servants, for their institutional support to the development of this research. Finally, they acknowledge the National Council for Scientific and Technological Development (CNPq) for granting a doctoral scholarship to the first author and the CNPq Knowledge Dissemination Support Scholarship - Level 1C, for the second and fourth authors.
