AUTHOR'S STATEMENT

The author of this work DECLARES, for the following purposes, that:

Do not have any commercial interest that generates a conflict of interest about the published content;

Declares to have actively participated in the construction of the respective manuscripts, preferably under the following conditions: "a) Study design, and/or data acquisition, and/or data analysis and interpretation; b) Preparation of the article or revision to make the material intellectually relevant; c) Final approval of the manuscript for submission";

Certifies that the published text is completely free of data and/or fraudulent results and authorship defects;

Confirms the correct citation and reference of all data and interpretations of data from other surveys;

Acknowledges having informed all the sources of funding received to carry out the research;

Authorizes the editing of the work, including catalog records, ISBN, DOI, and other indexers, visual design and creation of the cover, and internal layout, as well as its release and dissemination according to the criteria of Seven Eventos Acadêmicos and Editora.

EDITOR'S STATEMENT

Seven Publications DECLARES, for rights, duties, and any methodological or legal meanings, that:

This publication constitutes only a temporary transfer of copyright, constituting a right to publication and reproduction of the materials. The Publisher is not co-responsible for the creation of the published manuscripts, under the terms established in the Copyright Law (Law 9610/98), in article 184 of the Penal Code and in article 927 of the Civil Code; The author(s) is solely responsible for verifying such copyright and other issues, holding the Publisher harmless from any civil, administrative, and criminal damages that may arise.

Authorizes the DISCLOSURE OF THE WORK by the author(s) in lectures, courses, events, shows, media, and television, provided that there is due recognition of the authorship and edition and without any commercial purpose, with the presentation of the due CREDITS to SEVEN PUBLICATIONS, being the author(s) and publisher(s) responsible for the omission/exclusion of this information;

All eBooks are open access, so don't sell them on your website, partner sites, e-commerce platforms, or any other virtual or physical medium. Therefore, it is exempt from copyright transfers to authors, since the format does not generate rights other than the didactic and advertising purposes of the work, which can be consulted at any time.

All members of the editorial board are PhDs and linked to public institutions of higher education, as recommended by CAPES to obtain the Qualis book;

Seven Eventos Acadêmicos does not attribute, sell, or authorize the use of the authors' names and e-mails, as well as any other data of them, for any purpose other than the dissemination of this work, following the Civil Rights Framework for the Internet, the General Data Protection Law and the Constitution of the Federative Republic.

PRESENTATION

Science is a field of knowledge in which different disciplines intertwine to form a greater whole. **Expanded Science: Innovation and Research - 2° Ed** is a work that expands this interconnection, bringing 160 articles on various topics, written by experts from different areas of knowledge.

Developed by **Seven Publications**, this book presents a broad overview of the challenges, discoveries and advances in fields such as supply chain, carbon credit, kanban and much more.

SUMMARY

COLLABORATION AND INTEGRATION OF BUSINESS PROCESSES IN THE SUPPLY CHAIN: PROPOSITION OF A CONCEPTUAL MODEL

Diego Milnitz, Monica Maria Mendes Luna.

  <https://doi.org/10.56238/sevened2025.036-001>

.....32-49

REGULATORY CHALLENGES OF THE CARBON CREDIT MARKET IN BRAZIL

Gustavo Domingos Sakr Bisinoto, Valter Gustavo Danzer, Julio Cezar de Lara, Rodrigo Bruno Zanin, Ernandes Sobreira Oliveira Junior.

  <https://doi.org/10.56238/sevened2025.036-002>

.....50-77

BATUQUES À MINA: TERREIRO EDUCATION AND MUSICAL TRANSMISSION PROCESSES

Laurenir Santos Peniche, José Valdinei Albuquerque Miranda.

  <https://doi.org/10.56238/sevened2025.036-003>

.....78-103

FREEDOM AND DEVELOPMENT: THEORETICAL, INSTITUTIONAL AND SOCIO-ENVIRONMENTAL PERSPECTIVES

Jarbas Rodrigues Gomes Cugula, Sandro Marcos Godoy, Gabriel Calvet de Almeida.

  <https://doi.org/10.56238/sevened2025.036-004>

.....104-124

FROM STORAGE TO E-LOGISTICS: LOGISTICS SERVICES AND THEIR APPLICATION IN THE TEXTILE AND APPAREL INDUSTRY

Diego Milnitz, Monica Maria Mendes Luna.

  <https://doi.org/10.56238/sevened2025.036-007>

.....125-147

COMPARISON OF SOLARIMETRIC DATABASES FOR PHOTOVOLTAIC ENERGY PLANNING IN SERGIPE

Marcos Felipe Sobral dos Santos, Rosivânia da Paixão Silva Oliveira, Eliana Midori Sussuchi, Isabelly Pereira da Silva, Gabriel Francisco da Silva.

  <https://doi.org/10.56238/sevened2025.036-012>

.....148-166

TOUCH-SENSITIVE JACQUARD FABRIC FOR HOME INTERFACES: A TECHNICAL STUDY WITH A MULTIDISCIPLINARY APPROACH

Thais Puccinelli Alves, Camilla Borelli, Renato Camargo Giacomini.

  <https://doi.org/10.56238/sevened2025.036-013>

.....167-184

FABRIC ART: REPORT OF A SUCCESSFUL PRACTICE IN SPECIAL EDUCATION

Francisca Raquel Santos Nascimento, Geslaine Barbosa Damasceno.

  <https://doi.org/10.56238/sevened2025.036-014>

.....185-197

CHEMICAL CHARACTERIZATION AND DETERMINATION OF CONTAMINANT ELEMENTS IN LOW-GRADE CASSITERITE FROM THE BOM FUTURO MINE (RO), WESTERN AMAZON

Jessé Castro dos Santos, Sylviane Beck Ribeiro.

 <https://doi.org/10.56238/sevened2025.036-015>

.....198-215

MEDICINAL PLANTS FOR TRADICIONAL USE IN THE CORCOVADO COMMUNITY, MARAJÓ MESOREGION

Eduardo Antonio Abreu Pinheiro, Rayane Pereira Barreiros, Benedita da Costa Gonçalves, Vitória Maigda Magno Gomes, Carla Crislem Chaves de Araújo, Joelma Câmara da Silva e Silva, Elisa Monteiro Cordeiro, Marcelo Almeida de Paulo.

 <https://doi.org/10.56238/sevened2025.036-016>

.....216-239

MILITARY DOCTRINE AND TECHNICAL-MILITARY COOPERATION AS DRIVERS OF INDUSTRIAL DEVELOPMENT IN DEFENSE: STRATEGIC LESSONS FROM SOUTH AMERICA APPLIED TO THE ECUADORIAN CONTEXT

Federico Anibal Martinez Velez, Cesar Patricio Parra Molina.

 <https://doi.org/10.56238/sevened2025.036-017>

.....240-266

VIOLENCE AGAINST WOMEN IN TOCANTINS: ANALYSIS OF DOMESTIC VIOLENCE AND FEMICIDE CRIMES IN THE POST-PANDEMIC PERIOD

Helon Inácio da Silva, José Carlos da Costa Abreu, Ana Cláudia Quaresma da Silva, Marcos Antonio Negreiros Dias.

 <https://doi.org/10.56238/sevened2025.036-018>

.....267-284

ANALYSIS OF PRECIPITATION ESTIMATION MODELS USING TIME SERIES: A BIBLIOMETRIC ANALYSIS

Jessica Almeida Monteiro Arruda, Rodrigo Nogueira de Vasconcelos, Rosângela Leal Santos.

 <https://doi.org/10.56238/sevened2025.036-019>

.....285-317

INNOVATION, INSTITUTIONALIZATION AND REGIONAL DEVELOPMENT: THE TRAJECTORY OF INTEG AS A REFERENCE FOR BUSINESS INCUBATORS IN MEDIUM-SIZED CITIES

Cleverson Bayer Moreira, Rodrigo Simionato, Osvaldo Malta Callegari, Fabrício Bittencourt da Cruz, João Irineu de Resende Miranda.

 <https://doi.org/10.56238/sevened2025.036-020>

.....318-338

SLEEP, ANXIETY AND SOCIAL MEDIA USE IN CHILDREN AND ADOLESCENTS: INTERCONNECTIONS AND CHALLENGES IN CONTEMPORARY CARE

Maxsuel Nunes da Silva, Fabrício da Silva Santos, Diana Sayuri Barbosa Ono, Mareilce Tatiane Oliveira Lopes, Rafaela Oliveira de Paula, Cezar Leon Neto Neto, Beatriz Rebouças da Cruz, Geizebelk Domenighini, Jéssica de Carli Pinto, Adriana Cavalcante Lima.

 <https://doi.org/10.56238/sevened2025.036-021>

.....339-353

INFLUENCE OF AFFORDABILITY ON THE MICROCLIMATE OF THE ANANINDEUA-PA REGION

Thales de Souza Garcia, Erika Souza Guimarães Pacheco, Maurício Castro da Costa, Luan Daniel Silva Ferreira, Dayana Caroliny da Silva Alves, Flávia Eliany Santos de Lima, Julia Gabriele Correa Ferreira, Ana Carolina Hackbarth.

 <https://doi.org/10.56238/sevened2025.036-022>

.....354-366

DIGITAL ENTREPRENEURSHIP: A DIGITAL MARKETING STRATEGY WITH E-COMMERCE AND DROPSHIPPING

Juan Gabriel Pires Boente, José Mauro Baptista Bianchi, Alfredo Nazareno Pereira Boente, Renata Miranda Pires Boente.

 <https://doi.org/10.56238/sevened2025.036-023>

.....367-387

MUSIC THERAPY, IMPROVISATION AND LISTENING: A STUDY ON CREATIVE PRACTICES CENTERED ON SOUND

Paulo Bruno de Andrade Braga, Elvis de Azevedo Matos, Álvaro Madeiro Leite.

 <https://doi.org/10.56238/sevened2025.036-024>

.....388-404

JUST ENERGY TRANSITION IN THE AMAZON: ECONOMIC AND SUSTAINABLE ANALYSIS OF ALTERNATIVE ENERGY SOURCES FOR RIVERSIDE COMMUNITIES

Marinaldo de Jesus dos Santos Rodrigues, Silvio Bispo do Vale, Hallan Max Silva Souza, Ericles Alves dos Santos.

 <https://doi.org/10.56238/sevened2025.036-025>

.....405-421

REDUCING NON-CONFORMITIES WITH THE APPLICATION OF THE PDCA METHODOLOGY IN A PACKAGING INDUSTRY

Thiago Komoto Losito.

 <https://doi.org/10.56238/sevened2025.036-026>

.....422-434

AUTHENTICITY AND POWER: RECONNECTING WITH MARGINALIZED ASPECTS OF THE FEMININE

Julia Fânzeres Caminha Mutschler, Lisienne de Moraes Navarro Gonçalves Silva.

 <https://doi.org/10.56238/sevened2025.036-027>

.....435-457

SIMPLE CONTINGENCY ANALYSIS, PARALLEL COMPENSATION, AND DETERMINATION OF THE LOADING MARGIN IN TRANSMISSION LINES

ABSTRACT

The growing complexity of supply chains has increased the need to understand how collaboration and business process integration interrelate to generate value and competitiveness. The literature shows significant progress in defining key processes and collaboration constructs, but studies that analyze the influence of these elements in an integrated manner are still scarce. This article aims to propose a conceptual model that explains how collaboration can positively affect the integration of business processes in the supply chain. The research was developed through a systematic literature review, encompassing classic models (GSCF, SCOR, Handfield & Nichols, Srivastava, and Melnyk) and recent contributions on interorganizational collaboration. As a result, eight fundamental business processes were identified (customer relationships, customer service, demand, orders, manufacturing, suppliers, product development, and returns) and four constructs that precede collaboration (internal alignment, partner trust, collaborative culture, and partnership orientation). These elements were organized into a conceptual model supported by five hypotheses that demonstrate how collaboration enhances process integration. The study's main contribution is to offer a robust theoretical framework that can guide future empirical research using quantitative methods (SEM, PLS) and support managers in implementing more effective collaborative practices. It concludes that understanding the relationship between collaboration and integration is essential to strengthening the resilience and competitiveness of supply chains, especially in a scenario marked by digital transformations, sustainability, and complex global dynamics.

Keywords: Supply Chain. Collaboration. Process Integration. Conceptual Model. Resilience.

RESUMO

A crescente complexidade das cadeias de suprimentos tem ampliado a necessidade de compreender como colaboração e integração de processos de negócio se relacionam para gerar valor e competitividade. A literatura mostra avanços importantes na definição de processos-chave e de construtos de colaboração, mas ainda são escassos os estudos que analisam de forma integrada a influência desses elementos. Este artigo tem como objetivo propor um modelo conceitual que explique como a colaboração pode afetar positivamente a integração dos processos de negócio na cadeia de suprimentos. A pesquisa foi desenvolvida

¹ Dr. in Production Engineering. Universidade Federal do Paraná (UFPR). E-mail: diego.milnitz@ufpr.br

por meio de uma revisão sistemática da literatura, contemplando modelos clássicos (GSCF, SCOR, Handfield & Nichols, Srivastava e Melnyk) e contribuições recentes sobre colaboração interorganizacional. Como resultados, foram identificados oito processos de negócio fundamentais (relacionamento com clientes, serviço ao cliente, demanda, pedidos, manufatura, fornecedores, desenvolvimento de produtos e devoluções) e quatro construtos antecedentes à colaboração (alinhamento interno, confiança no parceiro, cultura colaborativa e orientação para parceria). Esses elementos foram organizados em um modelo conceitual sustentado por cinco hipóteses que evidenciam como a colaboração potencializa a integração dos processos. A principal contribuição do estudo é oferecer uma estrutura teórica robusta, que pode orientar futuras pesquisas empíricas com métodos quantitativos (SEM, PLS) e apoiar gestores na implementação de práticas colaborativas mais eficazes. Conclui-se que compreender a relação entre colaboração e integração é essencial para fortalecer a resiliência e a competitividade das cadeias de suprimentos, sobretudo em um cenário marcado por transformações digitais, sustentabilidade e dinâmicas globais complexas.

Palavras-chave: Cadeia de Suprimentos. Colaboração. Integração de Processos. Modelo Conceitual. Resiliência.

RESUMEN

La creciente complejidad de las cadenas de suministro ha incrementado la necesidad de comprender cómo la colaboración y la integración de procesos de negocio se interrelacionan para generar valor y competitividad. La literatura muestra avances significativos en la definición de procesos clave y constructos de colaboración, pero los estudios que analizan la influencia de estos elementos de forma integrada aún son escasos. Este artículo busca proponer un modelo conceptual que explique cómo la colaboración puede afectar positivamente la integración de los procesos de negocio en la cadena de suministro. La investigación se desarrolló mediante una revisión sistemática de la literatura, que abarca modelos clásicos (GSCF, SCOR, Handfield & Nichols, Srivastava y Melnyk) y contribuciones recientes sobre colaboración interorganizacional. Como resultado, se identificaron ocho procesos de negocio fundamentales (relaciones con los clientes, servicio al cliente, demanda, pedidos, fabricación, proveedores, desarrollo de productos y devoluciones) y cuatro constructos que preceden a la colaboración (alineación interna, confianza en los socios, cultura colaborativa y orientación hacia la colaboración). Estos elementos se organizaron en un modelo conceptual sustentado en cinco hipótesis que demuestran cómo la colaboración mejora la integración de procesos. La principal contribución del estudio es ofrecer un marco teórico sólido que pueda guiar la investigación empírica futura mediante métodos cuantitativos (SEM, PLS) y apoyar a los gerentes en la implementación de prácticas colaborativas más efectivas. Se concluye que comprender la relación entre colaboración e integración es esencial para fortalecer la resiliencia y la competitividad de las cadenas de suministro, especialmente en un escenario marcado por las transformaciones digitales, la sostenibilidad y las complejas dinámicas globales.

Palabras clave: Cadena de Suministro. Colaboración. Integración de Procesos. Modelo Conceptual. Resiliencia.

1 INTRODUCTION

One of the main trends in the updated within organizations has been the change in business performance from functional structures to process structures (LAMBERT, 2008). Therefore, in the supply chain, the production of a product or service is possible by the chaining and connection of one or more processes internally and externally (DE CASTRO *et al.*, 2009). In these interconnections, the integration of processes becomes complex, since it involves the connection between different organizations, with specific cultures, at different stages of technological development and with their own management methods, thus generating the need for great synergy and collaboration between them (LAMBERT and COOPER, 2000; CROXTON *et al.*, 2001; LAMBERT and KNEMEYER, 2004; HANDFIELD and NICHOLS, 2004).

In the literature, there are several authors who have emphasized the importance of both collaboration and integration of business processes to improve the efficiency of supply chain management, among them are Lambert (2008); Bowersox *et al.* (2008); Kumar and Nath Banerjee (2014); Handfield and Nichols (2004); Lambert and Cooper (2000); Croxton *et al.* (2001), however, there are still no studies that propose to understand the relationship between these two themes.

Therefore, the main objective of this work is to propose a conceptual model that can explain how collaboration can positively affect the integration of business processes in the supply chain. In this way, the main factors of this relationship are identified through a bibliographic research of influential works in the area, then hypotheses of the model and the schematic representation that shows how the themes are related are built.

To this end, in addition to this brief introduction, the article presents in "item 2" a review of the business processes in the supply chain, where the main elements related to the subject are presented. Then in "item 3" is a review of collaboration in the supply chain. In "item 4" the propositions on the effect of collaboration on the integration of business processes are presented. And finally, in the last item, the conclusions of the research are presented, along with suggestions for future work on the theme of the article.

2 BUSINESS PROCESSES IN THE SUPPLY CHAIN

In the literature, five supply chain management models were found that have as a key component the integration of processes based on activities and tasks that must be aligned with the channel strategies, they are: (1) the GSCF model developed by the Global Supply

Chain Forum; (2) the SCOR-model, or Supply-Chain operations reference-model developed by the SCC or Supply-Chain Council; (3) the approach of Handfield and Nichols (2002); (4) the approach of Srivastava *et al.* (1999); and (5) the approach of Melnyk *et al.* (2000). The main characteristics of each model mentioned are presented below.

(1) The GSCF defines Supply Chain Management (*SCM - Supply Chain Management*) as the integration of key business processes to serve the end user (LAMBERT, 2008). In this sense, the success of SCM requires a shift from managing individual functions to integrating key activities and processes in the supply chain (LAMBERT and COOPER, 2000). In addition, according to Croxton *et al.* (2001), the main business processes defined by the members of the *Global Supply Chain Forum* are: i) customer relationship management; ii) the management of customer service; iii) demand management; iv) the fulfillment of requests; v) the management of the manufacturing flow; vi) the management of the relationship with suppliers; vii) product development; and viii) the management of returns.

According to the GSCF model, the management of partner companies in the supply chain must consider these eight processes (LAMBERT, 2008). Each of the eight processes is cross-functional and cross-organizational. At the same time, according to Lambert and Cooper (2000), the eight key processes run through the entire supply chain through companies and within the functional silos in each company. Functional silos include marketing, research and development, finance, production, purchasing, and logistics. The activities in these processes are located inside these functional silos.

(2) SCOR is a method that makes use of benchmarking and evaluations to improve supply chain performance. This is a cross-functional framework template that contains the definitions of process standards, terminologies, and metrics integrated into supply chain processes, comparing them to best practices. The model was developed to help organizations learn about internal and external processes in their segment of operation (STEWART, 1997). According to Bornia and Lorandi (2016), currently the SCOR model defines five key processes, which are: i) planning; ii) the supply; iii) manufacturing; iv) delivery; and v) the return.

The main objective of the SCOR model is to improve the alignment between the market and the strategic reaction of the supply chain, using indicators that enable the management of these five processes, in the constant search for superior efficiency of the supply chain (KIECKBUSCH, 2010).

(3) The approach of Handfield and Nichols (2002) focuses on business processes as a way to integrate actors along the supply chain, however, Santos (2008) states that the authors do not clearly define which are the main business processes that should be considered in this integration. In view of this, Bowersox *et al.* (2008) complement the model by defining eight business processes that should be considered for Supply Chain Management by the approach of Handfield and Nichols (2002).

The business processes defined were: i) demand planning and response capacity; ii) customer relationship management; iii) the fulfillment of the request and provision of the service; iv) the launch and development of products and services; v) the customization of manufacturing; vi) the management of the relationship with suppliers; vii) life cycle support; and viii) reverse logistics (BOWERSOX *et al.*, 2008).

According to Handfield and Nichols (2002), the supply chain must be a true "value system". In addition, the value results from the synergy between the organizations that make up the chain in relation to the flows of information, product, service, capital and knowledge.

(4) Srivastava *et al.* (1999) They seek in their work the identification of business processes that create value for customers and bring financial return to shareholders. The objective of the authors is to study the interferences of the marketing function in these business processes. For the authors, value creation occurs through activities such as the development of new solutions or the renewal of existing solutions, in addition, another factor that enhances this creation of value to the customer is the increase in collaboration between organizations, especially through marketing channels and customer service.

These activities are performed by three business processes, which are: i) the product development process; ii) the supply chain management process; and iii) the relationship process (collaboration) with the client.

(5) The approach of Melnyk *et al.* (2000) present eight essential business processes for Supply Chain Management, which are: i) product development; ii) the development of the process; iii) the monitoring process; (iv) the capacity management process; v) the planning process; vi) the acquisition and supply process; vii) the manufacturing process; and viii) the delivery process.

For the authors, their supply chain analysis model is concerned with understanding, explaining, predicting and changing the organizational effects related to the integration of companies and their business processes along the chain, thus ensuring the generation of

value for end customers. In other words, the emphasis of this approach is the exercise on Supply Chain Management, through collaboration.

Supply Chain Management boils down to understanding that managing the supply chain is managing the business processes that are involved and that are integrated between the organizations that make it up. In this sense, the models presented organize and guide a form of supply chain management based on business processes and their activities. In view of the models and approaches presented and taking into account other authors who comment on the importance of business processes for Supply Chain Management, Table 1 presents the business processes that are considered in the research, with a brief description and the authors who address the respective process in SCM.

The choice of these business processes was due to two important reasons, the first is related to the use of supply chain analysis models in various approaches, among them, are those mentioned in this work and the second is related to the application and validation carried out by the members of the *Global Supply Chain Forum*, based on a comprehensive research that lasted more than six years and involved 15 types of industries and nine different supply chains, with more than 90 in-depth interviews, which enabled several experts in the field to discuss, analyze and define the main business processes that should be considered in the supply chain.

Table 1

Main business processes used in Supply Chain integration

Business Process	Description	Authors
Customer relationship management	It is related to the structure of the relationship with customers. It seeks to raise customer needs and reduce demand variation and activities that do not add value to customers in the supply chain.	Lambert and Cooper (2000); Croxton <i>et al.</i> (2001); Lambert (2008); Stewart (1997); Handfield and Nichols (2002); Bowersox <i>et al.</i> (2008); Srivastava <i>et al.</i> (1999); Melnyk <i>et al.</i> (2000)
Customer service management	It is the process that shows the face of the company to the customer, providing them with real-time information, such as shipping date and availability of products with the company's functional areas such as manufacturing and logistics.	Lambert and Cooper (2000); Croxton <i>et al.</i> (2001); Lambert (2008); Stewart (1997); Handfield and Nichols (2002); Bowersox <i>et al.</i> (2008); Srivastava <i>et al.</i> (1999)
Demand management	It is about managing demand and inventories in an integrated way in all key links of the supply chain.	Lambert and Cooper (2000); Croxton <i>et al.</i> (2001); Lambert (2008); Stewart (1997); Handfield and Nichols (2002);

		Bowersox <i>et al.</i> (2008); Srivastava <i>et al.</i> (1999); Melnyk <i>et al.</i> (2000)
Order fulfillment	It provides the fulfillment of the order in the most effective way possible, seeking to meet the growing needs of customers in several dimensions (quantity, deadline and quality and others).	Lambert and Cooper (2000); Croxton <i>et al.</i> (2001); Lambert (2008); Stewart (1997); Handfield and Nichols (2002); Bowersox <i>et al.</i> (2008); Srivastava <i>et al.</i> (1999); Melnyk <i>et al.</i> (2000)
Manufacturing flow management	Manufacturing needs to be more flexible and be able to respond quickly to demand.	Lambert and Cooper (2000); Croxton <i>et al.</i> (2001); Lambert (2008); Stewart (1997); Handfield and Nichols (2002); Bowersox <i>et al.</i> (2008); Melnyk <i>et al.</i> (2000)
Supplier relationship management	It defines how the company interacts with its suppliers.	Lambert and Cooper (2000); Croxton <i>et al.</i> (2001); Lambert (2008); Stewart (1997); Handfield and Nichols (2002); Bowersox <i>et al.</i> (2008); Srivastava <i>et al.</i> (1999); Melnyk <i>et al.</i> (2000)
Product development management	It deals with the joint work between customers and suppliers for the most efficient product development.	Lambert and Cooper (2000); Croxton <i>et al.</i> (2001); Lambert (2008); Stewart (1997); Handfield and Nichols (2002); Bowersox <i>et al.</i> (2008); Srivastava <i>et al.</i> (1999); Melnyk <i>et al.</i> (2000)
Returns management	It is responsible for the destination of the products returned by customers, as well as managing the flow of materials.	Lambert and Cooper (2000); Croxton <i>et al.</i> (2001); Lambert (2008); Stewart (1997); Handfield and Nichols (2002); Bowersox <i>et al.</i> (2008); Srivastava <i>et al.</i> (1999)

Source: developed by the author.

From this brief discussion regarding the business processes that must be integrated between organizations in a supply chain, it is possible to state, according to the opinion of the authors of this research, that Table 1 presents the view of important authors who write about Supply Chain Management and that the processes contained in Table 1 are relevant, therefore, they will be used as constructs of the conceptual model.

3 SUPPLY CHAIN COLLABORATION

Over the past few years, the core strategy of Supply Chain Management has shifted from a competitive view to a collaborative view BOWERSOX *et al.* (2008). At SCM, collaboration can be an alternative for the development of value and innovation (DE MATTOS and LAURINDO, 2016), and collaboration enhances the research and development of new products and services, as well as enables the integration of processes between companies (BUENO, 2012). In addition, according to Lee; Padmanabhan and Whang (2004), collaboration helps to reduce the bullwhip effect – in which there is a distortion of demand

and a tendency for this variation to spread as it moves upstream, increasing business synergy and quality, offering flexibility and increasing joint innovation (CAO and ZHANG, 2011).

Towards Ramanathan and Gunasekaran (2014), the result of collaboration within the supply chain is cumulative. Future collaborations are significantly influenced by the level of current collaborations within the chain. Therefore, if the level of collaboration is relatively low, even if there are improvements in this practice along the supply chain, the integration of business processes between the partners in the chain will be affected (FLYNN *et al.*, 2010).

Organizations that are able to engage heavily in collaboration can achieve improvements in operational and relational outcomes, which will also lead to efficiency improvements in integrating processes with their partners (BAIHAQI and SOHAL, 2013).

Likewise, understanding your partner in the supply chain helps to increase the level of collaboration, generating trust, credibility and effectiveness in the relationship between organizations, also motivating the improvement of business results, such as: cost reduction; increased quality; Efficiency in customer service, reduction of cycle time, increase of value for the customer (ZACHARIA *et al.*, 2009).

Based on the studies found in the literature on collaboration in the supply chain, twenty factors were identified that deal with the components of collaboration (constructs), these are presented in Table 2, understood as those that are part of the nature of collaboration, being characterized as: i) elements preceding collaboration; and ii) resulting from collaboration.

i) Antecedent elements – as their name suggests, are the elements prior to the collaboration itself, that is, the factors that generate collaboration in the supply chain (MIN *et al.*, 2005). Similarly, Hair *et al.* (2009) state that the antecedent elements are defined as the predictor constructs, in this case, of collaboration.

An important point related to the antecedent elements is the construct of trust in the partner, in the literature there is no consensus on how it should be treated, whether as an antecedent or as a resultant. For some authors such as Fawcett *et al.* (2004); Kohli and Jensen (2010) and Falls *et al.* (2013), partner trust is treated as antecedents of supply chain collaboration. However, for Kanda *et al.* (2008) and Zaheer *et al.* (1998), trust in the partner is studied as a resulting element of collaboration. In this research, trust will be considered as an antecedent element of collaboration in the supply chain, as it is understood that first there must be trust and then generate collaboration.

ii) Resulting elements – these are consequences of collaboration, i.e. benefits associated with collaboration that are not likely to be immediately visualized, but generate

potential benefits in the medium and long term (MIN *et al.*, 2005; BARRATT, 2004; FAWCETT *et al.*, 2007; SIMATUPANG and SRIDHARAN, 2005; and KUMAR and NATH BANERJEE, 2014). Therefore, they can only be measured from the moment that the chain already has the practice of collaboration instituted between the partners.

Table 2

Components of collaboration in supply chains

Description of the Element		Authors

As the objective of the research is to evaluate how collaboration influences the integration of supply chain business processes, it is essential to measure the elements

preceding collaboration, that is, those that generate the collaborative effect. In this case, after a detailed review of the specialized literature, twelve elements were found prior to the collaboration, in view of the number of possible constructs to be used, a selection of the most relevant elements for the evaluation of collaboration in the supply chain was carried out. For this, only elements that were used in more than one approach (model) were used as a choice factor, thus, the selected elements are: i) trust in the partner; ii) collaborative culture; iii) internal alignment; iv) orientation for partnership. In addition, another important reason that motivated the choice of these factors was their validation, which occurred through the research carried out by Min *et al.* (2005) and Kumar and Banerjee (2014).

Based on the survey of the main works related to collaboration in the supply chain, it was possible to identify and select the main elements that precede collaboration and that can positively affect collaboration along the supply chain.

4 PROPOSITIONS ON THE INFLUENCE OF COLLABORATION ON THE INTEGRATION OF BUSINESS PROCESSES

From the findings found in the specialized literature and presented in this article, it is possible to build a conceptual model on the relationship between collaboration and the integration of business processes in the supply chain. This model is represented in figure 1, which shows the constructs of the model and the hypotheses of this relationship.

Figure 1

Conceptual model on the influence of collaboration on the integration of business processes in the supply chain

Model constructs: AI – internal alignment; CP – trust in the partner; OP – orientation for partnership; CC – collaborative culture; RC – customer relationship management; SC – customer service management; DG – demand management; AP – fulfillment of the request; FM – manufacturing flow management; RF – supplier relationship management; DP – product development management; and DG – returns management.

Source: prepared by the author.

According to the proposed model, all constructs related to collaboration positively influence the integration of business processes, that is, the greater their presence within organizations, the more efficient the integration of business processes with their partners along the supply chain will be.

Next, the hypotheses that guide the model presented from the constructs related to collaboration in the supply chain are developed, they are: i) internal alignment; ii) trust in the partner; iii) orientation for partnership; iv) collaborative culture; and v) effect of collaboration.

i) **Internal alignment** – this construct in an organization belonging to the supply chain suggests that there is collaboration between sectors and their teams. For Droge, Jayaram and Vickery (2004), inter-sectoral collaboration is determined as the intention of the sectors to act together, sharing information, emphasizing teamwork, presenting a common vision, sharing resources and achieving collective goals. For Baihaqi and Sohal (2013), internal alignment is a predecessor and determining aspect of collaboration in the supply chain. In addition, for the organization to have good results with external collaboration, that is, collaboration with suppliers and customers, it is essential that this practice is instituted internally through internal alignment (BARRATT, 2004). Internal alignment is an ongoing activity of supporting the needs of partners through unification of functions, standardization, simplification of processes, compliance, and structural adaptation (BOWERSOX *et al.*, 2003). In this sense, the first hypothesis of the model can be described as:

4.1 INTERNAL ALIGNMENT POSITIVELY INFLUENCES SUPPLY CHAIN COLLABORATION

ii) **Trust in the partner** -towards Daugherty *et al.* (2006), trust is a fundamental aspect for the necessary changes in a collaborative approach between organizations, because without trust none of the partners will be willing to move away from the usual comfort zone to adopt new responsibilities, such as outsourcing and integrating their business processes with other companies (FAWCETT *et al.*, 2004). Relational aspects, such as trust and credibility in the relationship between companies, are seen as the basis for collaboration in the supply chain (BAIHAQI and SOHAL, 2013). These aspects, while influencing a collaborative effort, are not inherent to a relationship, but develop over time based on experience (MIN *et al.*, 2005). These relational results are higher or lower taking into account the organization's contribution to the collaborative process. As partners share vital information and processes, work to find mutually favorable outcomes and learn together, they

increase the chances of building stronger connections and improving their ability to collaborate (ZACHARIA *et al.*, 2011).

Similarly Akkermans *et al.* (2004) They state that the more partners in the supply chain work together collaboratively, the more trust will be generated between them and the more information will be shared, therefore, it will improve the level of mutual collaboration, which further increases trust. Therefore, mutual trust can provide the basis for collaboration (MIN *et al.*, 2005). In this sense, the second hypothesis of the model can be described as:

4.2 PARTNER TRUST POSITIVELY INFLUENCES SUPPLY CHAIN COLLABORATION

iii) **Partnership orientation** – This construct is defined as an inclination of the organization to carry out cooperation actions with its partners in the supply chain, this can be simplified as the attitude of collaborating. Some research indicates that before collaborating with other actors in the supply chain, it is essential that there is a definition of which partners should be part of this process, seeking to collaborate exclusively with those strategically relevant to the chain (BARRATT, 2004; LAMBERT and KNEMEYER, 2004; MATOPOULOS *et al.*, 2007; MIN *et al.*, 2005). According to authors such as Barratt (2004); Matopoulos *et al.* (2007) and Min *et al.* (2005), there must be a direction towards the development of a relationship and the understanding of the business of each partner in the chain. For instance Lambert and Knemeyer (2004) In their research, they identified companies that separated their partners between high-value and low-value collaboration. This strategic differentiation between business partners is an aspect that characterizes the company's orientation to establish partnerships with other organizations (JAYARAM and PATHAK, 2013), signaling the predisposition or need to develop an external collaborative relationship (MIN *et al.*, 2005). Towards Liker and Choi (2004) Companies can only create the basis for partnership guidance if they know as much about their suppliers and customers as they know about themselves. In this sense, the third hypothesis of the model can be described as:

4.3 PARTNERSHIP ORIENTATION POSITIVELY INFLUENCES SUPPLY CHAIN COLLABORATION

iv) **Collaborative culture** - Collaboration is a relationship-oriented strategy, and its long-term viability depends heavily on the environment in which collaboration is practiced. Culture is an important enabler or even an essential element of collaboration that can make or break the relationship between organizations (FRIEDLI *et al.*, 2006), because working

together and sharing knowledge, skills, risks, communication and processes is difficult without a collaborative culture (FAWCETT *et al.*, 2007; BARRATT, 2004; IRELAND and BRUCE, 2000). The culture in a collaborative network reflects the way companies and people think, work, interact, and behave, and therefore provides a basic protocol for performing all other activities, making collaboration a reality (KUMAR and NATH BANERJEE, 2012). Collaborative culture comprises the attitudes, behavior, and the way individuals and organizations in a collaborative process perceive other partners (KUMAR and NATH BANERJEE, 2012). Both individuals and organizations can experience this culture in terms of the characteristics of individuals and groups, which reflects in openness to communication, knowledge, skill sharing and learning attitude, which, for example, is related to the processes that are integrated between supply chain partners, and the strength of relationships (NYAGA *et al.*, 2010; BARRATT, 2004; ELLINGER, 2000; HADAYA and CASSIVI, 2007). In this sense, the fourth hypothesis of the model can be described as:

4.4 COLLABORATIVE CULTURE POSITIVELY INFLUENCES COLLABORATION IN THE SUPPLY CHAIN

v) **Effect of collaboration** – The effect of collaboration on the integration of business processes is related to the positive effects generated by its previous constructs, i.e., the more significant the internal alignments, trust in partners, the orientation towards partnership and the collaborative culture, the greater the positive effect between collaboration and integration of processes in the supply chain. For example, for Min *et al.* (2005), internal alignment provides additional results, helping to simplify and integrate business processes in basic areas, such as manufacturing flow, demand forecasting, customer service, sales, logistics, and information systems (MIN *et al.*, 2005). In addition, organizations with high levels of internal alignments tend to engage in external collaboration with other actors in the supply chain and thus integrate their business processes. Trust in the partner for Akkermans *et al.* (2004) It generates collaboration that facilitates the sharing of information and resources, thus generating greater ease in the integration of business processes. Regarding the orientation for partnership Liker and Choi (2004) In their research, they state that many companies defend the idea and encourage their managers at all levels to study their partners to understand them and thus facilitate the process of integrating business processes between organizations throughout the supply chain. The collaborative culture is related to the attitudes and behaviors of the organization and its employees and produces a favorable environment

for the integration of business processes (KUMAR and NATH BANERJEE, 2012). In this sense, the fifth hypothesis of the model can be described as:

4.5 COLLABORATION POSITIVELY INFLUENCES THE INTEGRATION OF BUSINESS PROCESSES IN THE SUPPLY CHAIN

From the development of the hypotheses that support the conceptual model on the effect of collaboration on the integration of business processes along the supply chain, it is possible to understand how collaboration and the integration of business processes are interrelated. The construction of the model as well as its hypotheses were defined from an in-depth review of the literature and the consideration of the most important authors in the area, which makes this conceptual model robust and reliable, as it is anchored in results and placements of renowned authors in the area of Supply Chain Management.

5 CONCLUSIONS

The new criteria of competition in the markets have led organizations to develop new capabilities to remain competitive. One of these capabilities is the formation of stronger and more lasting partnerships with its customers and suppliers, in order to establish a chain capable of facing these new criteria and obtaining advantages for all participants in the supply chain.

This research sought to discover how collaboration is related to the integration of business processes in the supply chain. For this, a review of the existing bibliography on the topic of Supply Chain Management related to the integration of business processes and collaboration in the chain was carried out, with the objective of identifying the main and most influential works and enabling the development of a conceptual model that can represent the influence of the constructs presented.

The evidence obtained in the bibliographic research allowed us to verify that the main business processes in the supply chain are: i) customer relationship management; ii) the management of customer service; iii) demand management; iv) the fulfillment of requests; v) the management of the manufacturing flow; vi) the management of the relationship with suppliers; vii) the management of product development; and viii) the management of returns. As well as the constructs that precede collaboration in the supply chain, which are: i) internal alignment; ii) trust in the partner; iii) the orientation towards partnership; and iv) collaborative culture.

From these findings and the conceptual model developed, it is concluded that collaboration, based on the defined constructs, positively influences the integration of business processes in the supply chain, that is, the greater the presence of the collaboration constructs, the more efficient the integration of the processes will be. Thus contributing to increasing competitiveness in the chain and strengthening relationships between partners.

With this, the researchers believe that this research fully achieved its objectives, contributing to the improvement of knowledge on the topics discussed and to the construction of theory about collaboration and integration of processes in supply chains, in addition to providing a conceptual model that can be used in other situations.

As a suggestion for future work, the researchers suggest that the model be tested in practical applications that allow the hypotheses constructed to be tested and the model presented here can be validated.

ABSTRACT

The growing relevance of the carbon market in the international arena places Brazil before the challenge of structuring a regulated system capable of reconciling economic competitiveness with environmental protection. In this context, the enactment of Law No. 15,042/2024, which establishes the Brazilian Greenhouse Gas Emissions Trading System (SBCE), constitutes a regulatory milestone, while raising doubts about its sufficiency to consolidate a robust and effective market. This study aimed to assess the law's capacity to enable a regulated carbon market in Brazil, considering its historical and legal trajectory, the distinctions between voluntary and regulated markets, the main technical and institutional challenges, as well as its merits and limitations. Methodologically, the research is exploratory, with a qualitative approach, based on bibliographic and documentary review across scientific databases (Scielo, Scopus, Google Scholar) and legislative records. From an initial corpus of 303 documents, 90 were selected for in-depth analysis and organized into thematic categories (regulatory frameworks, market design, infrastructure, socio-environmental justice, and methodological gaps). The results indicate that, although the law advances by creating a mandatory system with phased implementation and benefit-sharing mechanisms, significant gaps persist. These include the exclusion of agribusiness from emission limits, the absence of clear sectoral reduction targets, weaknesses in monitoring, reporting, and verification (MRV), and the risk of speculative dynamics. In conclusion, Law No. 15,042/2024 constitutes an important step but remains insufficient. Regulatory and institutional refinements are required to ensure an environmentally effective, legally stable, and socially just carbon market. Ongoing research and careful monitoring of its implementation will be essential for aligning the system with Brazil's climate goals.

RESUMO

A crescente relevância do mercado de carbono no cenário internacional coloca o Brasil diante do desafio de estruturar um sistema regulado capaz de alinhar competitividade econômica e proteção ambiental. Nesse contexto, a promulgação da Lei nº 15.042/2024, que institui o Sistema Brasileiro de Comércio de Emissões (SBCE), representa um marco normativo, mas levanta dúvidas quanto à sua suficiência para consolidar um mercado robusto e efetivo. Este estudo teve como objetivo avaliar a capacidade da lei em viabilizar o mercado regulado de carbono no Brasil, considerando sua trajetória histórica e jurídica, as distinções entre os mercados voluntário e regulado, os principais desafios técnicos e institucionais, além de seus méritos e limitações. Metodologicamente, a pesquisa caracteriza-se como exploratória, de abordagem qualitativa, baseada em revisão bibliográfica e documental em bases científicas (Scielo, Scopus, Google Scholar) e registros legislativos. Dos 303 documentos inicialmente identificados, 90 foram selecionados para análise integral, organizados em categorias temáticas (marcos regulatórios, desenho de mercado, infraestrutura, justiça socioambiental e lacunas metodológicas). Os resultados indicam que, embora a lei avance ao criar um sistema obrigatório, com fases de implementação progressiva e mecanismos de repartição de benefícios, persistem lacunas regulatórias e setoriais - como a exclusão do agronegócio, ausência de metas claras por setor, fragilidades em monitoramento, relato e verificação (MRV) e risco de especulação. Conclui-se que a Lei nº 15.042/2024 constitui um avanço importante, mas ainda insuficiente, demandando aperfeiçoamentos regulatórios e institucionais para garantir um mercado ambientalmente efetivo, juridicamente seguro e socialmente justo. Pesquisas contínuas e o monitoramento de sua implementação serão cruciais para adequação às metas climáticas brasileiras.

RESUMEN

La creciente relevancia del mercado de carbono en el escenario internacional presenta a Brasil el desafío de estructurar un sistema regulado capaz de alinear la competitividad económica y la protección ambiental. En este contexto, la promulgación de la Ley N.º 15.042/2024, que establece el Sistema Brasileño de Comercio de Emisiones (SBCE), representa un hito regulatorio, pero plantea interrogantes sobre su suficiencia para consolidar un mercado robusto y efectivo. Este estudio tuvo como objetivo evaluar la capacidad de la ley para habilitar un mercado regulado de carbono en Brasil, considerando su trayectoria histórica y legal, las distinciones entre los mercados voluntarios y regulados, los principales desafíos técnicos e institucionales, y sus méritos y limitaciones. Metodológicamente, la investigación es exploratoria, con un enfoque cualitativo, basada en una revisión bibliográfica y documental de bases de datos científicas (Scielo, Scopus, Google Scholar) y registros legislativos. De los 303 documentos identificados inicialmente, se seleccionaron 90 para un análisis completo, organizados en categorías temáticas (marcos regulatorios, diseño de mercado, infraestructura, justicia socioambiental y brechas metodológicas). Los resultados indican que, si bien la ley avanza al crear un sistema obligatorio con fases de implementación progresivas y mecanismos de distribución de beneficios, persisten brechas regulatorias y sectoriales, como la exclusión de la

agroindustria, la falta de objetivos sectoriales claros, las deficiencias en el monitoreo, reporte y verificación (MRV) y el riesgo de especulación. La conclusión es que la Ley N.º 15.042/2024 representa un avance importante, pero sigue siendo insuficiente, requiriendo mejoras regulatorias e institucionales para garantizar un mercado ambientalmente eficaz, jurídicamente seguro y socialmente justo. La investigación y el monitoreo continuos de su implementación serán cruciales para el cumplimiento de los objetivos climáticos de Brasil.

1 INTRODUCTION

The Earth's atmosphere consists of various gases and particles, with nitrogen and oxygen in greater quantities, as well as other gases that form what is known as the greenhouse effect. Among these gases, carbon dioxide (CO₂), methane (CH₄) and nitrous oxide (N₂O) stand out as the main ones. CO₂ is the most significant of these gases (IPCC AR6 WG3, 2022) and contributes substantially to climate change, such as the rise in global average temperatures (Hansen *et al.* 2006). This is due to its long residence time in the atmosphere and its gradual yet significant increase year after year.

Humanity is convinced that reducing CO₂ emissions is essential, particularly to curb the rise in global temperatures. Several alternatives have been proposed, including the preservation of carbon stocks in soils, forests, and other types of vegetation (Smith *et al.*, 2016).

Among the alternatives studied for mitigating climate change, the knowledge of carbon dynamics is of great relevance. The process carried out by plants, which capture CO₂ through photosynthesis and store it in their biomass, is widely recognized (Dias-Filho, 2006; Viana *et al.*, 2023), as well as the process carried out by the soil (Lal and Cerri, 2006; Pinheiro-Junior *et al.*, 2024), which stores it in the form of carbon. It is also known that carbon is stored in areas with large amounts of dense forests (Soepadmo, 1993; Pan *et al.*, 2011). In this context, Brazil stands out as a powerhouse in forest carbon stocks, particularly in dense forests, due to its vast forested areas and the diversity of biomes with varying capacities for carbon sequestration and storage, especially in the Amazon (Heinrichi *et al.*, 2021).

In addition to environmental preservation, carbon stockpile can generate credits, especially through the reduction of emissions due to deforestation and forestry manipulation (REDD+). Carbon credits correspond to a type of financial tool used to mitigate greenhouse gas emissions into the atmosphere, thus contributing to reducing the impact of climate change. The fundamental idea is to assign a financial value to verified reductions in carbon emissions, in order to encourage the reduction of greenhouse gas emissions in a more efficient and economical way (Ribeiro, 2007; Souza, Alvarez and Andrade, 2014; Souza *et al.*, 2023).

The regulation of Brazil's carbon credit market faces complex and multifaceted challenges. This emerging market, which plays a crucial role in combating climate change, involves the trading of credits, with each credit representing one ton of CO₂ either avoided or removed from the atmosphere (Fisher, 2010; Mendes, 2013).

The establishment of a robust regulatory framework is considered decisive to ensure the integrity and transparency of the carbon credit market. This regulation must set clear guidelines for the quantification, reporting, and verification of emissions, as well as define strict standards for emission reduction projects (Vilar, 2022). Studies suggest that such regulation is requirement to guarantee that carbon credits genuinely represent effective, measurable, and permanent reductions in greenhouse gas emissions (Cames *et al.*, 2016). However, if it is widely acknowledged that the implementation of a carbon credit market brings both economic and environmental benefits, the question arises: is Law No. 15,042/2024 sufficient to enable a robust carbon market in Brazil, or do its regulatory and sectoral gaps undermine the environmental effectiveness and legal stability of the proposed system?

Projects on carbon credits often occur in areas with a significant presence of traditional communities, whose ways of life may be impacted (Alvarez, Elfying and Andrade, 2016; Schroeder 2010). Therefore, it is essential that these communities are effectively involved in the decision-making process and that part of the benefits generated by carbon projects are reverted towards the sustainable development of these communities (Alkmin, 2023; Souza *et al.*, 2023).

The overarching purpose of this study is to examine the capacity of Law No. 15,042/2024 to structure a regulated carbon market in Brazil, assessed in light of its normative advances, regulatory and sectoral shortcomings, as well as the multifaceted challenges posed to environmental effectiveness, legal certainty, and socio-environmental inclusion.

In pursuing this goal, the research further intends to scrutinize the historical and legal trajectory of the principal international conferences, agreements, and legislative initiatives that have shaped the carbon market within the Brazilian context; to delineate the distinctions between voluntary and regulated carbon markets by emphasizing their legal, economic, and operational underpinnings; to identify and categorize the principal technical, institutional, and regulatory barriers to the effective implementation of the Brazilian Emissions Trading System (SBCE); and to critically assess the merits and limitations of Law No. 15,042/2024 through reference to the scientific literature and antecedent legislative proposals that informed its enactment. Finally, the study seeks to formulate complementary guidelines and policy recommendations designed to strengthen the effectiveness and resilience of the Brazilian carbon market, informed by comparative international experiences.

2 MATERIAL AND METHOD

In this work, a narrative literature review was used, which involved a detailed study of publications related to the topic under discussion. The research is characterized as exploratory, with a qualitative approach, and bibliographic procedures. Data collection was carried out through consultation of the Scielo, Scopus, and Google Scholar databases, selecting journals classified as Qualis “A” or “B” or with an H-index greater than two, as well as undergraduate and postgraduate works (dissertations or theses). Documents such as Bills and Opinions were also gathered from federal legislative bodies (Federal Senate and Chamber of Deputies). According to Dourado and Ribeiro (2023), this type of literature review is a solid and reliable source of information, as it compiles knowledge from various selected publications, facilitating the identification of gaps in existing research.

The search strategy used the descriptors: “CARBON CREDIT” OR “CARBON CREDITS” AND BRAZIL OR BRASIL AND REGULAÇÃO OR REGULATION OR “PROJETO DE LEI” OR “PROJECT OF LAW”, in All Fields. The timeframe considered was the last six years (2019–2024), with the inclusion of classic or pioneering works beyond this period based on relevance and citation volume.

Initially, 303 documents were retrieved. After removing duplicates and applying relevance filters based on title and abstract screening, 90 documents were selected for full-text analysis. Figure 1 illustrates the methodological flow used for selection, based on adapted PRISMA guidelines.

Figure 1

Methodological flow used for selection of documents

Source: elaborated by the authors.

Subsequently, the selected publications were classified into thematic categories, following an inductive coding process derived from content analysis. The categories reflect the dominant axes of discussion present in the carbon credit regulatory debate in Brazil:

- Regulatory Frameworks and Legal Instruments** (e.g., PLs, decrees, SBCE, SINARE);
- Market Design and Economic Mechanisms** (e.g., cap-and-trade, voluntary vs. regulated systems);
- Infrastructure and Implementation Challenges** (e.g., MRV systems, institutional gaps);
- Social and Environmental Justice** (e.g., REDD+, indigenous participation, benefit sharing);
- Technical Proposals and Methodological Gaps** (e.g., additionality, leakage, double counting).

These categories are detailed in Table 1, which also lists representative references for each cluster. This analytical classification supported a more structured discussion of results, allowing comparisons between international experiences and the Brazilian context, with emphasis on gaps in current legislation (Law 15.042/2024) and potential areas for improvement.

Table 1

List of quantities by thematic categories and relevant works

Thematic Category	Nº of Articles	Representative Works
Regulatory Frameworks	24	Lima (2023); Souza <i>et al.</i> (2020); BRASIL (2024)
Market Design and Economic Mechanisms	18	Cames <i>et al.</i> (2016); Reisch (2022)
Infrastructure and Implementation	12	Vilar (2022); Rocha (2019); Rocha, Álvarez and Silveira (2014)
Social/Environmental Justice	20	Alkmin (2023); Alvarez; Elfving and Andrade (2016); Brito and Pozzetti (2021)
Methodological Gaps and Proposals	16	Poyer, Silveira and Oliveira (2020); Montovanelli (2023)

Source: elaborated by the authors.

Given the established objectives, the study was developed along the following topics: Historical Context of Carbon Market Regulations; Carbon Market: Voluntary vs Regulated; Challenges, Brazilian Potentials in the Regulated Market and Conclusions, presented below. The data was analyzed descriptively and demonstrated in boxes to better demonstrate the results obtained.

3 RESULTS AND DISCUSSIONS

3.1 HISTORICAL CONTEXT OF CARBON MARKET REGULATIONS

The inception and evolution of the carbon credit concept is situated in the broader context of global concerns about climate change and the role of greenhouse gas emissions. This idea originated from the growing awareness of the need to establish for efficient and scalable mechanisms to reduce global carbon emissions and mitigate global warming. In the initial phase, the notion of crediting emerged as an innovative tool to incentivize the reduction of emissions in a cost-effective manner (Guimarães, 2023).

The initial discussions started indirectly at the Stockholm Conference (1972), when the interdependence of human beings and the environment was recognized. At the Vienna Convention (1985) there was an international agreement to protect the stratospheric ozone layer. Its aim was to prevent the production and consumption of ozone-depleting substances such as chlorofluorocarbons (CFCs).

The Montreal Protocol (1987) was a complement to the Vienna Convention and established specific targets for the progressive elimination of the use of substances that cause the depletion of the ozone layer. At ECO-92 (1992) there was a significant milestone in promoting global awareness of environmental issues and establishing commitments in the search for more sustainable development.

These events did not directly debate the creation of the carbon credit market, but their ideals contributed to highlighting the problems the modern world was experiencing. Table 2 summarizes the historical evolution of the carbon credit market.

Table 2

Summary of the historical evolution of the regulation of the Carbon Credit Market

Year	Event	Action
1972	Stockholm Conference	Declaration on the Human Environment "To inspire and guide the peoples of the world to preserve and improve the human environment". Emergence of the concept of Sustainability.
1985 / 1987	Vienna Convention and Montreal Protocol	Protecting the ozone layer and restricting CFC emissions for the sake of protecting the ozone layer.
1992	ECO-92	Agenda 21 for sustainable development. Creation of the Convention on Diversity and the Framework Convention on Climate Change.
1997	Kyoto Protocol - COP III of the United Nations Framework Convention on Climate Change	Establishment of targets and market mechanisms for the reduction of greenhouse gases. The reduction of greenhouse gases could be financially compensated through CERs - Certified Emission Reductions.

Year	Event	Action
2012	RIO+20	Creation of the SDGs and institutional commitment by States Parties to structure a green economy and eradicate poverty.
2015	Paris Agreement COP 21 of the United Nations Framework Convention on Climate Change	Establishment of iNDCs (Intended Nationally Determined Contribution) to reduce GHG.
2024	Law 15,042 approved	Establishes the Brazilian Greenhouse Gas Emissions Trading System (SBCE)

Source: elaborated by the authors.

An analysis of the main international conferences, such as Kyoto and Paris, reveals the progressive evolution of global understanding and response to climate change, particularly in the context of the carbon credit market. These conferences, milestones in the history of climate negotiations, have outlined paths and established fundamental commitments for the global management of greenhouse gas emissions (Lima, 2023).

In order to look for options to promote sustainable development, the 3rd Conference of the Parties (COP-3) generated documents of intents. These documents were signed by the countries that, at the time, were responsible for 55% of global emissions. The agreement set targets for the developed countries, which were members of the Organization for Economic Cooperation and Development (OECD), included in Annex I of the agreement. In addition, Russia signed the agreement in 2004, and Eastern European countries also became signatories (Seiffert, 2009; Delpupo, 2009).

The Kyoto Protocol established emission reduction targets of around 5.2% in relation to 1990 levels for developed countries, which at the time were considered to be the main contributors to emissions. These targets were projected for the first period of the agreement, between 2008 and 2012 (Souza *et al.*, 2012).

This agreement established both conditions and targets to reduce the continuous increase in greenhouse gas emissions resulting from the growing volume of global production (Lombardi, 2008). A significant contribution of the Kyoto Protocol was the incorporation of three forms of flexibility mechanisms to achieve the stipulated targets. Through these mechanisms, emission reduction efforts from different countries, projects and initiatives can be considered to meet local targets. These mechanisms include:

- a) Emissions Trading System (ETS),
- b) Joint Implementation Mechanism (JI) and
- c) Clean Development Mechanism (CDM).

The CDM is the only mechanism that allows developing countries (like Brazil) to carry out emission reduction and removal projects in order to generate carbon credits, by allowing carbon credits to be traded with Annex I countries that need to reduce their excess emissions. This mechanism is considered an economic instrument that gave rise to the regulated carbon market worldwide. The regulated carbon market consists of an institutional environment where participants are subject to national or global legislation and standards, which establish criteria and rules for designing projects and trading Certified Emission Reductions (CERs) from CDM projects (Souza *et al.*, 2012).

With the replacement of the Kyoto Protocol by the Paris Agreement, there was a new look at the world, letting countries express how much they could contribute to reducing their emissions through NDCs, which must pass through the congresses and parliaments of each country (Hamilton *et al.*, 2021). In its NDC, presented in 2015, Brazil set out its goals for mitigating climate change. Officially, Brazil has committed to reducing its emissions by 37% by 2025 and 50% by 2030, based on its 2005 emissions, through mitigation and adaptation measures (UNFCCC, 2023). At COP29 in November 2024, Brazil set a new target by proposing to reduce net greenhouse gas emissions by 59% to 67% by 2035, relative to 2005 levels. Table 3 shows a summary of the main commitments ratified in the Paris Agreement by the five countries with the highest CO₂ emissions, which accounted for 61% of emissions in 2022.

Through these conferences, there has also been a progressive increase in the global ambition to reduce emissions. While the Kyoto Protocol focused on short-term targets and a more quantitative approach, the Paris Agreement introduced a long-term vision aimed at limiting the increase in global temperature to values below 2°C above pre-industrial levels (Brito and Pozzetti, 2021).

Table 3

Summary of the main commitments ratified in the Paris Agreement by the top 5 CO₂ emitting countries

Country	Treaties signed	Global CO ₂ emissions (2022)	
		%	MtCO ₂
1° China	• peak CO₂ emissions by 2030; • reduce energy intensity by 2030; • increase the share of non-fossil sources by 20% by 2030; • expand areas of afforestation and reforestation;	32%	11.900
2° USA	• reduce greenhouse gas emissions by 26% to 28% below 2005 levels by 2025; • increase renewable energy sources; • improve energy efficiency in various economic sectors; • Implement policies and initiatives to promote sustainability and resilience to climate change, including the preservation of forests and natural ecosystems; • contribute to the financing of climate initiatives in developing countries;	13,7%	5.080
3° India	• reduce the greenhouse gas emissions intensity of its GDP by 33% to 35% by 2030, compared to 2005 levels; • increase the installed capacity of non-fossil energy to 40% of the total by 2030; • create an additional carbon sink of 2.5 to 3 billion tons of carbon dioxide equivalent by increasing forest cover and improving the quality of forests by 2030; • invest in clean technologies and promote technology transfer to support their sustainable growth; • implement measures to increase the country's resilience to the impacts of climate change, including the protection of vulnerable communities and the development of resilient infrastructure;	7,4%	2.760
4° Russia	• reduce their greenhouse gas emissions by 25% to 30% below 1990 levels by 2030; • maintain current forests as a carbon sink; • promote energy efficiency in sectors such as transportation, industry and construction, with the aim of reducing total energy consumption and associated emissions; • increase the use of renewable energy sources;	4,3%	1.600
5° Japan	• reduce its greenhouse gas emissions by 26% by 2030, compared to 2013 levels; • significantly improve energy efficiency in sectors such as transportation, industry and buildings to reduce energy consumption and associated emissions; • increase the share of renewable energy sources; • implement adaptation measures to increase the country's resilience to the impacts of climate change;	2,9%	1.060
TOTAL		60,3%	22.400

Source: Elaborated by the author based on data from Climate Watch - PIK (2024) – CO₂ Emissions excluding Land Use Change and Forests.

International conferences have increasingly become critical forums for discussions on integrity and effectiveness. Consequently, issues such as transparency, accounting, and the prevention of “double counting” of emissions have become central topics, reflecting the

ongoing effort to enhance and strengthen market mechanisms in the context of climate change (Oliveira, 2022).

In the early stages, carbon market policies focused mainly on creating cap-and-trade systems, in which limits or caps were set on total allowable emissions, and companies or countries could trade emission permits. These systems sought to incorporate the environmental cost of carbon emissions into economic decisions, encouraging investments in cleaner and more efficient technologies (Chagas, Ferreira and Feitosa, 2022).

With the growing understanding of the impacts of climate change, there has also been a greater emphasis on the need for inclusive and fair approaches. Public policies have begun to recognize and integrate sustainable development considerations, including the protection of biodiversity, the promotion of social equity and the involvement of local and indigenous communities in carbon credit projects (Montovanelli, 2023; Alkmin, 2023).

A comparison of global regulations surrounding carbon credit markets highlights the diversity of approaches adopted by different nations and economic blocks, reflecting the varied economic, environmental and political contexts. This comparison reveals the differences in regulatory frameworks and the similarities in fundamental objectives and challenges faced (Stevanato, 2022).

In the European Union, for example, the Emissions Trading System (EU ETS) represents one of the oldest and most sophisticated carbon markets in the world. It is characterized by a strict cap-and-trade regime, where a ceiling for emissions is set and emission rights are traded. This system has been instrumental in reducing greenhouse gas emissions in the region, demonstrating the effectiveness of a well-structured and coherent regulatory approach (Oliveira, 2021).

In contrast to the European model, the carbon credit regime in the United States is marked by a decentralized approach based on state initiatives, such as the California Cap-and-Trade Program. This program, specific to the state of California, illustrates how sub-national regulations can be effective in managing emissions, offering flexibility and adaptability to local contexts (Maldaner, 2022).

On the Asian continent, particularly in China, the approach has been to gradually implement emissions trading systems. Initially launched as pilot projects in various cities and provinces, these systems are evolving into a national scheme, reflecting China's growing importance on the climate change scene and its pragmatic, phased approach to implementing environmental policies (Fonseca, 2022).

In regions with established emissions trading systems, such as the European Union, there has been a clear boost in the adoption of low-carbon technologies, demonstrating the potential of these markets to stimulate changes in industrial and energy practices (Delgado, 2022). However, challenges have also been identified, such as the need to set emission ceilings that are both ambitious and achievable. Experience has shown that caps that are too high can fail to promote significant emission reductions, while caps that are too low can impose excessive economic challenges, especially for industries in transition (Nicoletti, 2022).

The integrity of carbon credit markets depends heavily on confidence in the accuracy of emissions data and the effectiveness of reported reductions. Challenges related to double counting and quality have driven efforts to improve monitoring systems and international regulation (Souza, 2020).

An emerging understanding is the importance of climate justice and social inclusion in markets. Initiatives must consider the environmental and economic aspects and the social impact and involvement of local communities. International experience has shown that the most successful projects are those that combine emission reductions with local social and environmental benefits (Oliveira, 2021).

3.2 CARBON MARKET: VOLUNTARY VS REGULATED

The structure and operation of the voluntary carbon credit market has distinct characteristics that differentiate it from regulated markets. The former is characterized by the trading of carbon credits outside of a mandatory regulatory framework, where the buying and selling of credits is driven by the will of interested parties to contribute to the reduction of greenhouse gas emissions, in addition to achieving corporate or personal sustainability goals. In the voluntary market, companies, governments or individuals can buy credits to offset their own emissions, with the aim of becoming neutral or achieving other environmental goals. They are generated by projects that reduce, avoid or capture greenhouse gas emissions. Common examples include reforestation projects, renewable energy, carbon capture and storage, and energy efficiency improvements (Montovanelli, 2023).

Unlike regulated ones, where they are often traded within parameters set by government policies, voluntary ones offer greater freedom in terms of how and where credits can be generated and sold. This provides a breeding ground for innovation and experimentation in reduction projects (Silveira and Oliveira 2021).

Although it is not regulated by a specific legal framework, the market relies heavily on credibility and transparency. Therefore, carbon credits are often validated and verified by independent third parties, according to internationally recognized standards and protocols. This ensures that the emission reductions are real, measurable and permanent (Delgado, 2022).

The regulated market is structured under guidelines and standards established by governmental or intergovernmental authorities, differing substantially from the voluntary market in terms of regulation and supervision. This form of market is often based on international agreements, such as the Kyoto Protocol, or on national legislation that sets emission reduction targets for entire sectors or countries (Souza, 2020).

In this system, they are used as a tool to meet regulatory obligations to reduce emissions. Generally, a cap is set on the total emissions allowed within a jurisdiction or sector. Companies or entities that emit greenhouse gases are then obliged to hold an amount of carbon credits equivalent to their emissions, encouraging them to reduce their emissions or buy additional credits on the market if they exceed their allocated limits (Anis, Carducci and Ruviaro, 2022).

A distinctive feature of the regulated market is the existence of a cap-and-trade mechanism. This system allows companies that reduce their emissions below the established limits to sell surplus credits to others that are struggling to meet their targets. This creates an economic incentive to reduce emissions and promotes efficiency in the allocation of resources to where emissions reductions can be achieved at the lowest cost (Inácio Filho, 2022).

Integrity and effectiveness depend heavily on a rigorous emissions Monitoring, Reporting, and Verification (MRV) system. Such systems are key to ensuring that emissions reductions are real, measurable and verifiable, sustaining trust in the market and ensuring that emissions reduction targets are effectively achieved (Vercillo, 2023).

The economic and procedural differences are striking and significantly influence the dynamics and effectiveness of each system. In the economic sphere, the main distinction lies in the way carbon credit prices are set and the nature of the incentives for reducing emissions (Maldaner, 2022).

In the markets, carbon credit prices are generally influenced by factors such as emission targets set by the government, supply and demand within the cap-and-trade system, and penalties for non-compliance with quotas. This system tends to create a more stable and

predictable price for carbon, reflecting environmental policies and objectives defined in a regulatory manner. It provides a direct incentive to reduce emissions, as companies look for ways to cut their costs by buying credits (Reisch, 2022).

On the other hand, in the voluntary market, prices are more influenced by market supply and demand, without the imposition of government limits or penalties. In many cases, companies acquire carbon credits voluntarily to meet corporate sustainability, social responsibility or marketing objectives. In this context, the price of credits can be more variable (and generally lower than in the regulated market), reflecting a diverse range of projects and their perceived environmental and social quality (Fonseca, 2022).

In terms of procedures, regulated markets require a robust system to ensure that emissions and reductions are accurately quantified and verified. This process often involves regulatory or certification bodies that ensure compliance with established standards. In addition, participation in a regulated market usually implies stricter legal and compliance requirements for companies (Souza, 2020).

Another challenge is the issue of “carbon leakage”, where companies can transfer production to countries with less stringent regulations, resulting in emissions not being reduced globally. To combat this, some jurisdictions have implemented measures such as free allocation of permits to sectors at risk of carbon leakage, seeking a balance between environmental protection and economic competitiveness (Moreira and Silva 2022).

3.3 BRAZIL'S CHALLENGES AND POTENTIAL IN THE REGULATED MARKET

In the context of the Brazilian carbon credit market, several current barriers can be identified, reflecting challenges at both structural and operational levels. One of the main barriers is the absence of a specific and comprehensive regulatory framework. This legal gap creates uncertainty about the rules of operation, discouraging potential investors and participants due to the lack of clarity about the rights and duties involved, and can even lead to fraud, as reported by CNN Brasil in the article entitled “PF carries out mega operation against fraud in granting carbon credits to multinationals” (Maia, 2024).

There are currently four rules in force in Brazil that legitimize the trading of carbon credits: the National Policy for Payment for Environmental Services (Law N°. 14.119/21), the Cédula de Produto Rural - CPR-Verde (Decree N°. 10.828/21); the National System for Reducing Greenhouse Gas Emissions - SINARE (Decree N°. 11.075/22 amended by Decree

Nº. 11.550/2023) and the Law 15.042/2024 which establishes the Brazilian Greenhouse Gas Emissions Trading System (SBCE).

However, it is important to note that these legal frameworks do not establish guidelines or regulations for this market. The approval of Law 15,042/2024 alone is not sufficient to ensure the operationalization of the market, as the law itself sets a timeline for the implementation of the SBCE, which will be gradual and divided into five main phases, as shown in table 4. This aims to ensure predictability and legal certainty for regulated companies, in addition to attracting international investments and positioning Brazil as a global leader in the carbon market.

Table 4

Phases for implementing the Brazilian Greenhouse Gas Emissions Trading System

Phase	Time – Months	Action - Objectives
1	12 to 24	Initial regulation, creation of the governing body, and definition of the sectors to be regulated. At this stage, the operational details of the system and the legal framework for market functioning will be established.
2	12	Operationalization of the monitoring, reporting, and verification (MRV) system for emissions. Companies will be required to report their emissions in a standardized manner, creating a database that will enable market oversight.
3	24	Start of the obligation to submit emissions reports and monitoring plans, providing the necessary data for the first National Allocation Plan (PNA).
4	Approximately 12 to 24	Start of the first allocation cycle of Carbon-Based Emission Allowances (CBEs) and the operationalization of the first auctions. The PNA will be published, defining the rules for quota distribution and the initial volume available to the market. During this phase, the first CBEs will begin to be issued and traded, involving regulated companies.
5	Approximately 12	Full implementation of the market, with the first CBE auction and the launch of the secondary market, allowing transactions between companies.

Source: prepared by the authors based on Law No. 15,042/2024.

Law No. 15,042/2024 establishes the Brazilian Greenhouse Gas Emissions Trading System (SBCE), defining emission caps, setting rules for the commercialization of offset credits, and creating standards for the functioning of the trading system. Its purpose is to reconcile economic competitiveness with environmental protection. By instituting the legal

framework for the carbon credit market in Brazil, the law aligns national regulation with international standards and the commitments assumed under the United Nations Framework Convention on Climate Change and the Paris Agreement. In practice, this means the establishment of a mandatory system that imposes progressive emission reduction targets on regulated sectors and integrates Brazil's national reduction commitments under UN monitoring mechanisms.

Before being enacted as Law 15,042/2024, the text was processed under Bill 182/2024, which consolidated the following bills addressing various issues related to emissions and carbon credit trading:

- Bill 10.073/2018: Establishes an IPI reduction for products suitable for the low-carbon green economy;
- Bill 290/2020: Provides for environmental compensation for electricity generation and the certification of carbon credits for generation projects using alternative sources;
- Bill 3.606/2021: Proposes the establishment of a regulatory framework for MBRE;
- Bill 2.122/2021: Proposes the definition of rules for financial assets related to the mitigation of greenhouse gas emissions;
- Bill 4.028/2021: Proposes the creation of general guidelines for the regulation of the carbon market in Brazil;
- Bill 412/2022: Regulates the Brazilian Emissions Reduction Market (MBRE), provided for by Law 12.187, of December 29, 2009, and amends Laws 11.284, of March 2, 2006; 12,187, of December 29, 2009; and 13,493, of October 17, 2017;
- Bills No. 7.578/2017, 5.710/2019, 528/2021, 4.290/2023, 4.088/2021, 5.157/2023 and 155/2023, which deal with similar matters and were therefore joined as substitutes to Bill 182/2024;

It is important to mention these bills, as each emerged within a specific political and social context, reflecting distinct economic, political, environmental, and social interests. Law No. 15,042/2024 ultimately consolidated nearly all of them, except for the exclusion of obligations requiring the agribusiness sector to comply with emission limits.

Although Brazil has great potential for generating carbon credits, especially due to its vast forest cover and renewable energy opportunities, it still lacks a mature market infrastructure that can effectively manage the supply and demand for credits, as well as ensure the integrity and transparency of transactions (Maldaner, 2022). In both the public and private sectors, there is a lack of specialized knowledge, its potential and its operational

mechanisms. This lack of knowledge and experience can result in mistrust or the adoption of inefficient practices (Poyer, Silveira and Oliveira, 2020).

The law 15,042/2024 lists a series of actions that can generate carbon credits, including restoration, maintenance and conservation of permanent preservation areas (APPs), legal reserves or restricted use areas, and conservation units; integral or sustainable use conservation units with a management plan; land reform settlement projects; indigenous peoples and traditional communities are allowed to participate in the market through associations. A preliminary analysis of the draft laws was carried out in December 2024, where the following positive and negative points can be seen in table 05.

Table 5

Analysis of the Positive and Negative Points of the Bills Regulating Carbon Credits in Brazil

 Pros	 Cons
• It will provide competitive advantages for the Brazilian economy. • It will encourage changes in production and consumption patterns, promoting greater demand for clean technologies. • Regulating the carbon market could become an effective way of reducing greenhouse gas (GHG) emissions, aligning the sustainability tripod: economically viable, socially fair and ecologically correct. • Implementing carbon pricing will help mitigate climate change by creating economic incentives for companies to adopt sustainable practices, as well as stimulating investment in research and innovation. • It increases the mix of compensation possibilities, creating rules and methodologies for certifications, through CBEs (Brazilian Emission Quotas) and CRVEs (Certificates of Verified Emission Reduction or Removal).	• Carbon pricing alone will not be enough to mitigate the environmental impacts needed to reduce the effects of climate change. • Many carbon offset projects do not result in significant emission reductions, serving merely as a way for companies to offset their pollution without modifying their production processes. • There are concerns about climate justice, as local communities in developing countries, where many offsets occur, may suffer socio-environmental impacts without receiving direct benefits. • They do not explicitly address methane credits, which were included in Decree 11.003/2022 by Decree 11.075/2022. It would be pertinent to include such a reference in the legislation, especially considering the global commitment made by Brazil at COP 26 to reduce methane gas emissions by 30%. • They do not directly address the issue of reducing deforestation.

 Pros	 Cons
• Establishes control of activities that emit more than 10,000 tons of CO₂ per year. Companies with emissions of between 10,000 and 25,000 tons per year will have to submit an emissions monitoring plan to the SBCE management body, including the submission of an annual emissions and removals report. For activities with emissions of more than 25,000 tons per year, it will be compulsory to submit an annual report on the periodic reconciliation of obligations, which is not currently done. • The issuance of carbon bonds will be validated and regulated by the Brazilian state, which could be important in providing more technical and legal security for both generators and purchasers of decarbonization bonds. • This is a significant step forward in terms of legal certainty, considering that, currently, with the deregulated and voluntary market, negotiations can lead to various risks and legal consequences for those who acquire carbon credits and use them as proof of reductions and compensations at a global level. • It guarantees traditional and indigenous communities the right to receive and participate in the management of financial resources generated by carbon credit projects carried out in their territories. They will be entitled to 50% of the credits in the case of conventional greenhouse gas removal initiatives, and 70% of the credits in the case of avoided deforestation and forest degradation projects, conservation, and forest management (REDD+).	Even after the signing of the Glasgow declaration on forests and land use at COP 26, this action does not entail formal obligations. • Although the main focus is on regulating financial transactions in the context of a market structure, it would be beneficial to highlight the importance of meeting the targets set in the Paris Agreement, especially by reducing deforestation. • The creation of an Emissions Trading System (ETS) could result in carbon emissions becoming yet another commodity for the international market, without generating significant impacts for Brazil's economic growth. There is concern that the ETS could be concentrated in the hands of large corporations or volatile on the speculative market. • Agriculture, forestry and alternative land use were excluded in the vote by the Senate (Bill 412/2022) and the House (PL 2.148/2015) under the pretext that Brazilian agriculture is low-impact, with a vast area of the country still preserved and increasingly, environmental barriers are being established globally for agricultural products and commodities, which is already causing the Agribusiness sector to organize itself to reduce emissions. • Emission levels can be increased (made more flexible), taking into account the cost-benefit ratio of regulation and compliance with Brazil's commitments to the United Nations Framework Convention on Climate Change.

Source: elaborated by the authors based on Law No. 15,042/2024.

The complexity and diversity of the Brazilian environmental scenario also pose challenges. The country has a wide range of biomes and great socio-environmental diversity, which makes the implementation of carbon credit projects and the measurement of their emission reductions particularly challenging (Vercillo, 2023). This complexity requires customized and well-founded approaches that take into account the peculiarities of each region and community (Munhoz, 2023).

From a social point of view, the carbon credit market has the potential to generate tangible benefits for local communities, especially those located in rural areas or in regions of great ecological importance, although the viability of this depends on areas of at least 20,000 hectares, due to the high fixed costs of auditing and certifying projects (Credcarbo, 2024; Carbonext, 2024); through consortium contracts or partnerships, it is possible to unite areas of 4,000 hectares or more in order to reach the break-even point of economic viability.

Well-structured projects can create jobs, foster sustainable local development and improve people's quality of life, in line with the United Nations Sustainable Development Goals. However, it is essential that these projects are developed in a participatory and inclusive manner, ensuring that the benefits are shared with local communities and that their rights and ways of life are respected (Brito and Pozzetti, 2021).

An important strategy is also investment in infrastructure and technical capacity. This involves, for example, developing systems that minimize carbon emissions, as well as training qualified professionals to manage and operate these systems (Rocha, 2019).

The awareness and involvement of all stakeholders must be promoted, including the private sector, the government, local communities and civil society. This can be achieved through educational campaigns, participatory dialogues and collaboration with non-governmental organizations and academic institutions. The inclusion of diverse perspectives and the dissemination of information about the benefits and functioning of the carbon credit market can foster broader and more effective uptake (Vargas, Delazeri and Ferreira, 2022).

Another fundamental aspect is the integration of credit policies with other environmental and economic initiatives. This includes aligning credit policies with national strategies for sustainable development, forest conservation, renewable energy and poverty reduction. An integrated approach can maximize environmental and social benefits while contributing to the low-carbon economy (Brito and Pozzetti, 2021).

This framework must establish clear guidelines on the issuing, marketing and monitoring of carbon credits, guaranteeing transparency, reliability and compliance with

international standards. This regulation in phases should also include inspection mechanisms and penalties for non-compliance with the established standards (Baeta, 2020).

4 CLOSING REMARKS

Law No. 15,042/2024 represents a relevant advancement by establishing the Brazilian Greenhouse Gas Emissions Trading System (SBCE) and aligning the country with international climate mitigation commitments. However, the findings of this study indicate that the law is not yet sufficient to enable a robust carbon market, as it contains regulatory, operational, and sectoral gaps that compromise both environmental effectiveness and legal certainty.

The analysis of the historical and legal trajectory of the carbon market shows that the law is the result of a long process of legislative maturation, influenced by international agreements (such as the Kyoto Protocol and the Paris Agreement) and the consolidation of several previous legislative proposals. While the text incorporates important regulatory elements, it failed to fully include crucial sectors such as agribusiness, based on fragile justifications. This omission weakens the scope of national climate policy.

The comparison between voluntary and regulated carbon markets reinforces the importance of transitioning to a state-managed system with binding targets, emissions control, and environmental integrity. While the voluntary market operated with variable credibility and lacked legal obligations, the regulated market imposes emission caps and trading rules grounded in monitoring, reporting, and verification (MRV) methodologies. Law 15,042/2024 advances in this direction, but its effective implementation will depend on complementary regulations and the creation of robust institutional structures.

Among the main technical and institutional challenges identified are: the absence of a fully operational governing body; the need for a reliable MRV system; the technical unpreparedness of many public and private actors; and the complexity of implementing projects in diverse socio-environmental contexts. Additionally, the economic viability of carbon projects, according to international standards, is still limited to large areas (>20,000 hectares), potentially excluding small rural producers and traditional communities unless consortia are formed.

The critical analysis of the law also reveals strategic limitations. There are no clearly defined emission reduction targets by sector; methane credits and effective deforestation control mechanisms are omitted; and the compensation system may allow companies to

merely “buy the right to pollute” without being encouraged to change their production processes. Furthermore, there is a risk that the market could become a speculative commodity with no real climate benefit.

Despite these issues, Law 15,042/2024 contains important merits: it guarantees benefit-sharing with Indigenous and traditional communities; proposes the issuance of regulated carbon quotas (CBEs and CRVEs); and promotes predictability through a five-phase implementation model. Its existence already constitutes a legal milestone that can be improved and expanded.

Based on successful international experiences, the following recommendations are made for subsequent regulatory phases and possible revisions to the law: (a) include all economic sectors, especially agriculture and land use; (b) impose limitations on the use of offset mechanisms to prevent misuse; (c) improve MRV methodologies to avoid double counting; (d) set ambitious and progressive emission reduction targets; (e) integrate SBCE with other environmental and climate public policies; and (f) ensure participatory governance with transparency, oversight, and social inclusion in all technical working groups and regulatory bodies involved in the law’s implementation.

In conclusion, although it is an important step, Law No. 15,042/2024 still requires regulatory and operational refinements to guarantee the establishment of an environmentally effective, legally stable, and socially just carbon market in Brazil. Ongoing research and rigorous monitoring of the law’s implementation will be crucial to ensure its success and alignment with the country’s climate goals.

ABSTRACT

This article presents a study on the origins and processes of musical transmission in a Mina Jeje Nagô terreiro in Belém do Pará. Mina is a typically Afro-Amazonian religion that is most widespread in the state of Pará. In this context, music is an inseparable element, performing a communicative function, present in its rituals, as well as being closely related to extramusical elements, such as dance and the mythology of the orixás, the African and Afro-Brazilian deities. Aiming to go beyond everyday content, research the musical activities of the Mina terreiros to encourage reflection on traditional and contemporary educational practices. Understanding the religious universe of Tambor de Mina was considered appropriate to review the concepts of culture and education and assist in understanding this system that involves music. Therefore, based on bibliographic and field research, where dialogue was established with musicians from the terreiros, a bibliographic review was conducted with theoretical support from authors in the fields of education, music education, and ethnomusicology, as well as specific works on culture and music in the terreiro, in addition to interviews with the Yalorixá and the lead drummer of Kuênãbossizô – Casa do vento no caminho do fogo (House of the Wind on the Path of Fire) located in the Pedro Teixeira complex. These are some of the authors. Therefore, through a global view of the cultural environment of Tambor de Mina, we aim to bring it and its contributions to Afrocentric music education.

Keywords: Afro-Brazilian Music. Tambor de Mina. Transmission Processes. Afrocentric Music Education.

RESUMO

O presente artigo apresenta um estudo sobre as origens e os processos de transmissão musical num terreiro de Mina Jeje Nagô em Belém do Pará, a Mina é uma religião tipicamente Afro-Amazônica mais difundida no estado do Pará. Nesse contexto, a música é um elemento indissociável, exerce função comunicativa, presente em seus rituais, bem como está intimamente relacionada com elementos extramusicais, como a dança e a mitologia dos orixás, as divindades africanas e afrobrasileiras. Visando extrapolar os conteúdos cotidianos,

pesquisar as atividades musicais dos terreiros de Mina para fomentar uma reflexão sobre as práticas educacionais tradicionais e contemporâneas. Entender o universo religioso do Tambor de Mina, foi considerado oportuno, para revisar os conceitos de cultura e educação e auxiliar na compreensão desse sistema que envolve a música. Sendo assim, contando com a pesquisa bibliográfica e de campo onde foi estabelecido o diálogo com os músicos dos terreiros assim como, foi realizada uma revisão bibliográfica tendo como suporte teórico autores das áreas da educação, da educação musical, da etnomusicologia, bem como, obras específicas sobre cultura e a respeito da música no terreiro, além da entrevista com a Yalorixá e o tambor guia da Kuênãbossizô – Casa do vento no caminho do fogo localizada no conjunto Pedro Teixeira, estes são alguns dos autores. Portanto, mediante uma visão global do ambiente cultural do Tambor de Mina, almejamos trazer da mesma e suas contribuições para uma educação musical afrocentrada.

RESUMEN

El presente artículo presenta un estudio sobre los orígenes y los procesos de transmisión musical en un terreiro de Mina Jeje Nagô en Belém do Pará. La Mina es una religión típicamente afroamazónica muy extendida en el estado de Pará. En este contexto, la música es un elemento indisoluble, ejerce una función comunicativa, está presente en sus rituales y está íntimamente relacionada con elementos extramusicales, como la danza y la mitología de los orixás, las deidades africanas y afrobrasileñas. Con el objetivo de extrapolar los contenidos cotidianos, investigar las actividades musicales de los terreiros de Mina para fomentar una reflexión sobre las prácticas educativas tradicionales y contemporáneas. Se consideró oportuno comprender el universo religioso del Tambor de Mina para revisar los conceptos de cultura y educación y ayudar a comprender este sistema que involucra la música. Así pues, basándonos en la investigación bibliográfica y de campo, en la que se estableció un diálogo con los músicos de los terreiros, se llevó a cabo una revisión bibliográfica con el apoyo teórico de autores de las áreas de la educación, la educación musical y la etnomusicología, así como de obras específicas sobre la cultura y la música del terreiro, además de la entrevista con la Yalorixá y el tambor guía de Kuênãbossizô – Casa del viento en el camino del fuego, situada en el conjunto Pedro Teixeira, estos son algunos de los autores. Por lo tanto, mediante una visión global del entorno cultural del Tambor de Mina, aspiramos a aportar sus contribuciones a una educación musical afrocentrada.

Palabras clave: Música Afrobrasileña. Tambor de Mina. Procesos de Transmisión. Educación Musical Afrocentrada.

1 INTRODUCTION

In Brazil, since the arrival of blacks in the colonial period, from the seventeenth to the nineteenth centuries, batuques, as a religious practice, have always been present in Pará and established in the Amazon as a result of the transposition of African knowledge. Practices conducted by the sound of drums are important communication tools for African societies, in this way, several drums with healing rituals were constituted in Brazil - Indigenous Shamanism, Mina, Catimbós, Umbanda and Candomblés.

This musical language makes up the religiosity applied initially in healing rituals and, later, in other rituals. Over time, Pará became a force for the diffusion of black and indigenous religiosity in the Amazon, musicologist Sonia Chada, in her research *The Music of the Caboclos in the Candomblés of Bahia*, highlights the importance of music in religious practices. She points out: "The musical system thus reflecting the cognitive system of its practitioners, their feelings, their cultural experiences, in addition to their social, intellectual and musical activities" (Chada, 2007, p. 14). In this vein, Flávio Pessoa de Barros, in his book *The King's Banquet - Olubajé: An introduction to Afro-Brazilian sacred music* of 2006, makes significant contributions to the study of the music of the Candomblés of Bahia and Rio de Janeiro.

In the terreiro communities, the processes of knowledge transmission present, as their main characteristics, the traditional methodology of orality, the processes of repetition and memorization and their forms of Africanized sociability. The teaching of music, specifically, adopts an Afro-centered musical education, in which its main subjects - today, black Brazilians, indigenous people, caboclos and white people - remain in ritual and community interaction, ensuring the permanence of this Africanized education. As a consequence, Mina consolidates itself as an Afro-Brazilian religion that establishes an important black cultural heritage, deserving to be studied and disseminated as an important tool for the dissemination of Afro-Brazilian culture in the Amazon and for the formation of an Afro-centered education.

In this way, *'Ilù ñ ké, ará ñ jó, orí ñ àlàfià'* - *The Music of the Terreiros de Mina Jêje Nagô do Maranhão in Belém do Pará* stands out for its unprecedented character when approaching music in the Afro-Amazonian religion, the research will seek to analyze, describe, point out and understand the importance of the resistance of the black people in their occupation in the Amazon, having the batuques as a guiding thread of cultural practices in the city of Belém.

Data were collected through bibliographic field research, in which sound, visual and audiovisual records were collected. Other interaction and collection procedures were used, such as interviews with Yalorixá Mãe Claudia and Gujalonã Lucas Eduardo from *Kuênãbossizô – Casa do vento no caminho do fogo*, telephone calls, recordings, Figuregraphs, among others, which serve the elaboration and production of artistic and educational products.

In this context, it is worth understanding: What are the musical knowledge present in the Mina Jêje Nagô terreiros in Belém? How does the transmission of musical knowledge take place in the way of teaching and learning in the terreiros? Who are the guardians of this musical knowledge? How to insert Afro-religious music in the school context, in a process of building an Afro-centered anti-racist education? By exploring these issues, research will greatly contribute to the strengthening of Afro-Brazilian history and culture, as well as play an important role in the area of education.

2 A BRIEF REFLECTION ON AFRO-BRAZILIAN MUSICALITIES

In the Americas, the influence of African peoples contributed to the constitution of the culture of the various countries that were crossed by the inhumanity of enslavement, but despite all the ills of this for the African people in diaspora, the survival of identity is proof of the resistance and cultural resilience guaranteed through various artistic expressions, popular brought by blacks, thus making an important and relevant part of the diversity of musical genres and styles in the Americas by the musicality inherited from their ancestors.

In port cities in the Caribbean, the Americas, as well as West Africa, vats for transporting goods, available at port docks and warehouses, were widely used for drum construction. Also adopted and adapted in the modes of playing, were Etheric string instruments and percussion and wind instruments of military bands. (Markl, 2011, p. 57)

In Brazil, African and Afro-Brazilian music is fundamental in the constitution of national identity, we can see this through its influence in the first creation of genuinely Brazilian artistic expression, samba. The samba born in batuques as well as in terreiros in Bahia and Rio de Janeiro, as an Afro-Brazilian expression is a heritage that has spread throughout Brazil.

"When the first samba with a samba rhythm appeared in Tia Ciata's house as a collective work of a group of old Bahian revelers and people from the modern lower class of Rio de Janeiro" (Tinhorão, 1973, p. 123). Making an analogy between terreiros and samba,

we understand the proximity of musicality applied to religiosity and leisure that originates in the batuques in the terreiros, which these practices also influenced several expressions of popular culture and Brazilian music, such as carimbó, maracatu, bois bumbá, among many other sambas and batuques that cross and remain alive in the country, because, like in Rio de Janeiro, several of these houses also maintained religious artistic activities.

Brazilian music and other cultural expressions have a deep relationship with the processes of socialization and accommodation of blacks who were first enslaved, but also when they were free, they had a great influence on the urbanization processes of large and small cities in Brazil, where the rhythmic and sound presence guaranteed the identity of Brazilian music in its various forms and expressions, A music of blacks in diaspora, indigenous and Europeans originated several styles these styles composed of elements of the diverse ethnic, with characteristics that over time merged. This process of fusion I will call here accommodation also defined by other researchers as "creolization" or miscegenation.

The creolization or miscegenation of customs made the batuques less ostentatious, forcing blacks to new tactics of preservation and continuity of their cultural manifestations. The batuques were modified, sometimes to incorporate popular festivals of white origin, sometimes to adapt to urban life. African music and dances were transformed, losing some elements and acquiring others, depending on the social environment. Thus, since the second half of the nineteenth century, the traces of a Brazilian urban music began to appear in Rio de Janeiro, the seat of the Imperial Court – the modinha, the maxixe, the lundu, the samba. Despite its mestizo characteristics (a mixture of African and European influences), this music was really fermenting among the black population, especially after Abolition, when blacks began to seek new modes of communication adaptable to a hostile urban framework. (Sodré, 1998, p. 13)

This path leads us straight to samba, as well as other genres and musical styles that have become popular in Brazil and throughout America, the music that also transmits the characteristics of miscegenation, this miscegenation as well as syncretism were widely used resources as well as accommodated that allowed to disguise and even acclimatize various cultural practices that were on the margins repressed mainly by the practice of racism, but that in times of modernity also allows us to understand the participation of these subjects, music and dances such as carimbós, lundus, bois, maxixes as well as a variety of sambas.

The lundu, like the batuque or the samba, also included in its choreography a circle of spectators, a soloist pair, violent swaying of the hips and umbigada, with the accompaniment of violas. But lundu is already fully urban: it is the first black music

accepted by whites. In fact, she is the first to become a creolized, to become a mulatto. (Sodré, 1998, p. 30)

This mulatice or miscegenation made these cultural expressions more accepted, in this way this ended up strengthening the insertion of oxen, coconuts, frevos and carimbós and others by accommodating in their music or dances European influences that also introduced the presence of the white, in the Amazon also the presence of the caboclo consolidates this idea of miscegenation on the enslaved peoples and the native peoples who began to have gestures and sonorities as a strategy of social approximation between blacks, indigenous people and whites.

However, and despite a history of repression yesterday and today, the African contribution and influence is already described in research that accounts for the religious and leisure practice of blacks since Belém do Grão Pará, with records of popular expressions and occurrences of gatherings of blacks frequently recorded in police records and other documents that account for social and cultural activities. There are references to various drums promoted by enslaved people in moments of leisure after hard work.

But batuque, associated with religious practices, only became known in Pará in the middle of the last century. The Germanic scientists Spix & Martius, around 1820, speaking of the mestizos of Pará and the leisurely spirit of the blacks, noted the unbridled batuque and the lascivious lundu as their dances. (Salles, 1969, p. 106).

With regard to religiosity and leisure, the music and dance so important to African peoples is fully established in the way of life of various peoples, these creations, treated pejoratively have their cultural activities stereotyped, forbidden and thus pointed out as something minor and evil associated with primitivism. Primitivism as applied here in the sense of associating origin with a dimension of inferiority. According to Tinhorão (1972, p. 33) "While in primitive human groups music and dance, invariably associated, fulfill a religious function, linking their origins to tribal rites, in modern societies music and dance constitute creations included in the organization of leisure". On the other hand, starting from the idea of Africa:

In some African languages (Kimeru, for example, spoken in a region of Kenya), the word for "music" has the same meaning as singing and dancing. Something strongly vital happens in dance in its origin. First, the re-actualization of the knowledge of the cult simultaneous to the inscription of the individual's body in a territory, so that the cosmic force, that is, the power of belonging to an integrated totality, is realized. In addition, thanks to the intensification of the dancer's movements at the party – a whole

complex that encompasses action, voice, gestures, songs and affections – space and time become a single value (that of sacralization) and, thus, become autonomous, becoming independent of the one who individually occupies the space. (Sodré, 1998, p. 166)

In the religious practices of blacks, the music in the terreiros is the connection with Africa; It is established as an immanent link to the performance of rituals, celebrations and trance (incorporation) in these sacred houses. The ringtones and doctrines existing within the Tambor de Mina are forms of praise to the sacred, which are played and sung with devotion to Voduns, Orixás, and Caboclos present in the giras and rodas in the Mina and other entities present in Umbanda or Candomblé. The repertoire of the houses of saints "is very numerically expressive and in its symbolic contents at the same time it is functional because music plays an important role in the maintenance of the customs of religious groups" (Berrague, 1976, p. 131).

Thus, we can see that the Africans, when they arrived in Brazil, had, in music and dances, not only the opportunity for rare relaxation, but also a form of reconnection and reinvention of their cultural practices that were already happening in Africa, an approximation with practices that already consisted of their ways of life. Mina, Candomblé and other religions of African origin went through a process of syncretization, which appears in the changes in the practices in the rituals and celebrations of the blacks where music took place. These gatherings, which took place in different spaces, over time were established in specific spaces such as terreiros or religious houses.

In this research, the ethnography of the musical records in the rituals and festivities of the Tambor de Mina was made with the objective of contributing to the study and debate of Afro-Brazilian religious practices, from the perspective of valuing the culture of the traditional communities of the Jêje Nagô terreiros of Maranhão in Belém, capital of Pará, as well as for the recognition of the sacredness of the processes related to religious practices. The methodology used was participant research, based on observation and participation, in which an emic approach to sociocultural aspects was made, with various bibliographic reference materials that supported the research.

"The term emic is used to describe the reference system of forms and objects that are used in a specific cultural tradition. This word was coined by Pike (1954, 1957, 1966) and later elaborated by French (1963)" (Roazzi, 1987, p. 37). In this study, the author deals with the music in the terreiros in its ritualistic and musical aspects, and its modes of transmission.

The adoption of the emic approach is a determining factor for the researcher to describe the phenomena in a meaningful and traditional way for the researched community. Thus, fieldwork was carried out with the heads of the houses of Mina and musical groups, with the following objectives: to study the behavior of the group within the established system, to examine the cultural aspects, to structure the discoveries made, to observe and record the musical knowledge object of research. The criteria refer to the internal characteristics of cultural practice.

The concept of culture is an abstraction sketched to describe all patterns of thought and interaction, "an organized system of signifying symbols" (Geertz, 1975, 46), which persists in communities over time. Musical instruments and the transcriptions or scores of the music played on them are not the culture of their creators, but the manifestations of this culture, the products of social and cultural processes, the material result of the "capacities and habits acquired by man as a member of society". We cannot "see" a culture: we can only infer it from the regularities in the form and distribution of the things we observe. Every musical performance is, in a system of social interaction, a standardized event whose meaning cannot be understood or analyzed in isolation from the other events in the system (Blacking, 2007, p. 204).

Thus, having defined the aspects related to the methodology of ethnographic research, the study of terreiro music was divided into two stages: 1- Historical and bibliographic research; 2- Field research. Both processes deal with the trajectory, history and memory in cultural and religious practices; Afrocentric musical education and its processes of transmission of ritual music; the formal structure of this sacred music; and the pedagogy of the terreiro. Thus, it is possible to understand the role of music as a representation of the strength of this community, in which sounds and rhythms establish access to a symbolic universe motivated by the strength of Axé.

In a dynamic governed by axé, as is the case of the Afro liturgy, music is primarily vibratory, guided by the modalities of rhythmic execution, singing and dance, in which percussion is fundamental. In Europe, scholarly music, governed by the ascendant universe of writing since sounds of the Middle Ages, was guided by melody and harmony, leaving in a secondary plane the timbre and rhythm, which predominate in the mythical universe of orality. If the rite is the bodily and affective expression of the myth, the rhythm is a rite capable of feeding back the existential power of the group. Body and time appear in the rhythmic apprehension in various modulations of existence. (Sodré, 2017, p.164)

On the issue of the fundamentals of music in the terreiros, it is necessary to understand them, to prioritize them from the African conception, obeying the spiritual dimension, where the foundation applied is related to the music, the points, also called doctrines, songs that facilitate the transcendental moment of trance, these fundamentals are elements that enable the sound link with spirituality, a way so close to African and Afro-Brazilian peoples. However, those fundamentals that deal with the technical dimension of music, which involve rhythm, dynamics, intensity and pitch of sound, are also evident in the practices of the musical group even if these fundamentals have another meaning related to musical technique.

Rhythm thus creates a space of its own and gives rise to a specific imaginary, which implies a practical, bodily reflection on duration. This means that it is not just a technical artifice in the context of musicality, but a symbolic configuration of the lived time that, combined with dance, constitutes itself a context, a kind of "place", or synesthetic and synergetic scenario, where ritualistically something happens (Sodré, 2017, p. 165).

It is understood that the music present in the terreiros goes far beyond their formal structures, also involving affection, bonding with the community and, above all, a transcendental aspect. Its fundamental elements - timbre, pitch and rhythm - assume a central role and predominate in the mythical universe inherent to the ritual. "If the rite is the bodily and affective expression of the myth, the rhythm is a rite susceptible of feeding back the existential power of the group. Body and time appear in the rhythmic apprehension in various modulations of existence" (Sodré, 2017, p. 165). Thus, one can conclude the importance of music in the connection between earthly bodies and spirituality. "Rhythm in African music is often a social and spiritual language, which tells stories, communicates across distances, and reflects the cycles of life" (Alsup, 2024).

Another aspect inherent to the fundamentals and musical practice is related to the performance of the musicians, who in the ritual find themselves as participants completely involved in the worship, where they reproduce essentially musical elements and fundamentals, both are structuring, these are preserved from the traditional processes of musical transmission present in the terreiros. Where the members of the musical group such as the Tambor Guia who develops specific roles as an assistant conductor of the musical group, and influences the rhythm of the drums at parties and celebrations. The contribution of this subject is important in the ritual, although it does not supplant the symbolism linked to the transcendence of the religious event.

The ethnography of musical performance [...] gives up the focus on music as a 'product' to adopt a broader concept, in which music acts as a 'process' of social meaning, capable of generating structures that go beyond its merely sound aspects. Thus, the ethnomusicological study of performance deals with all musical activities, their opportunities and their functions within a larger community or social group, adopting a processual perspective of the cultural event. (Oliveira Pinto, 2001, p. 227-228).

In this way, musical performance associated with the fundamentals of music understood as a process of social signification. In the touch and vibration present in the sacred beats of atabaques, gourds, maracas and irons, the music of the abatazeiros that are an inseparable part of the Tambor de Mina in Belém do Pará through music is guaranteed.

3 THE STRUCTURE OF MUSICAL GROUPS AND CELEBRATIONS

Regarding the structuring of music and musicians in the terreiros, it is important to note that it has a role in the daily life of the community and is structuring in the rituals. In the house, positions and functions are established through hierarchy. There are musicians with a position and function in the house; They are the guardians of sounds, an important African and Afro-Brazilian cultural and religious heritage. In this culture, the processes of transmission of knowledge are linked to labels related to the seniority of the performance of the children of the house, the support for the dynamics of musical practice is also directed by those who exercise leadership in the group.

Learning is the product of experience and an initiatory process that is materialized through the oral transmission of knowledge. It is common, however, for the youngest initiates to have notebooks where they write down what is observed by them: the songs, prayers and other treasures collected in daily life; yet they never cease to perceive their existence, keeping them in absolute secrecy. (Barros, 1999 p. 30-31)

The musical group is divided between the following musicians: Abatazeiros, Cabaceiros and Ferreira. This is the basic formation of musical groups in the Mina drum, but it may, however, occasionally present the numerical participation of more people in the group – but a function that cannot be duplicated is that of Ferreira. The leadership and making of the members of the musical group is exercised by the Abatazeiro Guia or Alabê, according to Lucas Peniche or Gujálonã Abatazeiro Guia da Casa do Vento e do Fogo *Kuênãbossizô* in an interview given on August 10, 2025.

Regarding the identification of the drums present in the Tambor de Mina, Lucas Peniche in his interview clarifies that the nomenclature of these is not fixed as in other religions of Brazilian African origin, according to the abatazeiro guide Lucas Peniche "These drums have no fixed name, they are named and baptized in an obligation and receive a name according to what the conch defines", that is, there is also an initiation process that is what defines the name of the drums, but in the structure of the group they are called Tambor Guia, drum against guide and the drum that stands call the drum of the forest.

It is also important to note that because some festivals and ceremonies can be long, group members take turns during the time of the doctrines. The musical practice follows the logic of the group's structure: the ferreira (woman), guide drum, second drum and the gourds, successively.

Below, Figuregraphs of the instruments of the musical groups belonging to the terreiros: 1- *Kuênãbossizô – House of the wind on the path of fire*; 2- *Casa Grande de Mina Jeje Nagô de Toy Lissá and Abe Manja Huevy*.

The music in the terreiros is associated with the establishment of rituals, celebrations and trance (incorporation) in these sacred houses. To transcend is to connect to the spirits and cultivate them, so the music in the terreiros carries symbolic aspects that go beyond the fundamentals of music according to a Western logic.

On the other hand, in ritual practice, music presents structures and formal organization, with regard to the conduct of the musical group in traditional behaviors in ritual. Musical performance in the perfect execution of doctrines or points is learned traditionally where the processes are repeated in a community that lives the secret and the sacred. In practice, the performance of musicians also goes through the traditional processes of musical transmission. Below, a table that presents the structure of the music in a Mina ritual. The existence of a specific musical repertoire aimed at the entities in worship is verified (see table 1). This repertoire is distinct and dedicated to each entity, in this case, Voduns, Orixás and Caboclos.

Table 1

Ritual music

Entities	Doctrines	Touch	Directory
Orisha	Oya- Ogumgum lanaô, o Ní o nissé naô, aê naô Oyá Nissé naô Oyá tetê, Oyá tetê, Oyá Oyá oyá, cararô jotá (repeats)	Folded Run	Jêje Nagô
Vodun	Toy Lissá - Oh Lissá is Vodun maó, Tóy Lissá is Vodun maó (repeats) Ebo babá, eborum alá Vodun Lissá, ta no obiriô, ebô	Waltz Waltz	Jêje Nagô
Caboclos	Cabocla Ita- She went for a walk, on a steam trip, Oh on the island of the crabs, cabocla Ita was enchanted She walked walked, my lord But here it arrived	3x1	Jêje Nagô
	Antônio Légua- My St. Anthony cowboy, you tell me, who are you...	Run	Jêje Nagô

It is analyzed, here, the development of the repertoire of the houses, focused on the reality of this traditional hierarchical community, in which the interaction between the various spirits and entities involved in the cult - known as Pantheon - aggregate Voduns, Orixás and Caboclos. This interaction has specific characteristics and aspects, such as languages, dialects, and deities, which are important to know. The musicologist from Pará Sonia Chada (2001, p. 121) states that there is a certain flexibility in the cult of the Caboclo that allows the creation or alteration of the structure of the rituals and results in the adaptation of the same musical repertoire to different contexts. These changes are attributed to the will of each Caboclo, consequently affecting the musical repertoire that has to be adapted to new contexts, entities and subjects, producing differential changes in the cult of the Caboclo in the Bahian candomblé houses that start to build their own history, although there is a basic structure common to all of them. later spread throughout Brazil.

In the Mine, the touches and doctrines, which are touched and directed to the deities and entities, perform 4 touches: 3x1, Folded, Leaked, Run. They are linked to the pantheon that is present in the houses. The musical group is formed by the following musicians: Abatazeiros (2), Cabaceiros (2), Ferreira (1). During the festivals and celebrations that last long, often more than 3 hours, the musicians take turns among themselves. Another important aspect refers to the modal scale used most of the time, with the exception of some caboclo repertoires that are more Brazilianized, sometimes referring to samba.

Still on the rhythms and touches that we find in the various terreiros of the country, it is important to highlight that referring to candomblé due to this presence of the caboclo in candomblés according to Barros (1999 p 52) "18 rhythms performed in the liturgy of the terreiro communities, belonging to the Jeje Nagô cultural complex of Rio de Janeiro, were identified".

In the African-based religion, music is an essential communication instrument for religious ceremonies. In the interculturality of the musical practices of the terreiros de Mina – in Belém do Pará, in the Amazon – Afro-religious music still presents itself as a field that is little researched and explored, despite its importance. The musical change generated by the processes of hybridization of music originating from African drums also reinforces the need for further studies on the subject, even to provide its understanding and popularization.

The chants, doctrines or points as they are popularly defined have a praiseworthy character, they are performed to honor a certain entity, Vodun, orixá or caboclo, although the music of the mine has a consolidated modal system, the music of the caboclos promotes changes that bring new sounds closer to the sounds of Brazil.

Ritual chants have very specific characteristics that denote their uniqueness as a musical form. These specificities can be noted as melodic patterns and syncopated rhythms, that is, where we perceive the displacement of the strong tempo in the rhythm marking. Also marks of this musical form are the singing in responsorial style, with the support of the tonality proposed by the soloist Alabê or Italabexê (Barros, 2006, p. 53).

The rituals can be private or public and are deeply linked to the line adopted in religious action: "In the Tambor de Mina the spiritual entities received by the filhos-de-santo are classified in various ways, among them: by category, by family, by lineage or 'nation', by position in the head of the medium in which they incorporate and by position in the terreiro" (Ferretti, 2000, p. 73).

The rituals of private order, in the Mine, are linked to the owner of the house, that is, to Vodun, they are ceremonies and celebrations that involve a lot of secrecy. The one who receives Vodun has many obligations, among them, those involving the killing of animals and the making. A very popular Vodun in the house is Oxalá, in the Casa Grande de Mina Jêje Nagô de Toy Lissá and Abe Manja Huevy this is the celebration that opens the festivities of the year, one of the main ones in the house.

Below, three examples of doctrines chanted and danced at the Oxalá party at the Casa Grande de Mina Jêje Nagô de Toy Lissá and Abe Manja Huevy on January 6, 2024:

Nanã (Vodun doctrine)

Oh dance, oricô
Give me sequere, ah a deum
Nanã ah icó, ah Grandma Misan wanting is
Oh sister zakaô, Orisha oke adeô and arocô
Toy Lissá is Mina deô

Oyá (doctrine of Orixá)

Ogungum nanaô
Oni Onissé, no
Yay noô Oyá miss noô

Chica Baiana (Caboclo Doctrine)

Oh in the woods there is a grove
In the grove, a nightingale
At the foot of the palm tree where the thrush sings
Here in the terreiro Chica Baiana comes to baia.

Rituals, festivities and celebrations can take place in private ceremonies that involve all entities - vodun, orixá, caboclo. The exact date of when caboclos began to interact in the terreiros of Minas Gerais is not known, but it is known that caboclos have been seen since the first batuques, acclimatizing indigenous people and other national subjects.

In the Maranhão Mine, although COSTA EDUARDO made reference in 1948 (in a work published in English, not yet translated) to the presence of caboclos in the oldest and most traditional Yoruban terreiro in São Luiz and of terreiros derived from and spoken about caboclos received in the interior of Maranhão (Codó) (Ferretti, 2000, p. 54).

This presence in Mina's houses, even if not dated, promotes variations in the repertoire of ceremonies and celebrations. "The cult of the Caboclo, due to the emphasis it gives to the individualism of the Caboclos, an aspect of the religious system, is an open door, within limits, to individual variations that may or may not constitute musical change" (Chada, 2006, p. 109-110). The researcher points out that, like other sociabilities, religion is in a constant process of change, which affects culture. In this way, the cult of caboclos and orixás is subject to the same changes.

It is observed that, in the case of Mina, the musical change is assimilated with the alteration of the repertoire. However, it is important to highlight that, even with the presence of the caboclo in ceremonies, solemnities and celebrations, the same four musical touches are still maintained, with the inclusion of the specific doctrines of caboclos. In this case, the

formation of the group differs with the introduction of a drum of excavated wood and leather played standing on the Tambor da Mata, a typically caboclo drumming.

In the Tambor de Mina, the cult of the vodun, the orixá and the caboclo has, in its musical practice, the permanence of 4 specific touches that are altered by the doctrines, however, they are linked to all the entities and spirits present in the practice of the Mina. As for the rituals of the entities that make up the Pantheon, each one has a specific type of solemnity. These solemnities are very important, as they consolidate hybridization as a phenomenon present in the Mine, allowing a variety of rituals that accommodate and acclimatize, in a very symbolic way, all the entities and cultures that made the Mine such a diverse religion. Below are some different models of rituals:

The tables allow us to see a simplified overview of how the music present in parties, rituals and celebrations is structured, what they play, how they play and for whom. All this dynamic is a system that transmits here too, the results of an Afro-centered musical education.

4 THE PROCESSES OF MUSIC TRANSMISSION: AN AFROCENTRIC MUSICAL EDUCATION

The musical knowledge present in Mina's houses are non-formal processes, which promote an education based on memories, knowledge and cultural traditions that permeate knowledge through the orality of repetition. These processes promote a non-formal musical education in the daily life of the casas de santo, however, they are part of the already established pedagogy of the terreiro.

The processes of acquisition and learning of music, construction of knowledge and development of musical perception take place socially, through participation in rituals, through interaction and joint action between the subjects involved in the collective construction, in addition to the coordination of individual actions in the distribution and sharing of social cognition. The context, of fundamental importance, shapes musical practice, at the same time that it is modeled by it (Chada, 2007, p. 1).

With regard to the definitions and concepts adopted by the non-formal education present in traditional communities or houses, what we have most symbolic is the intention of those who teach. It is the children of the houses - actors endowed with knowledge and skills - who, in view of their responsibilities in the terreiro, carry with them the function of transmission. It is important to highlight that this task is not defined by the formal structures of education, since the transmission of knowledge is based on its own system, which has its specific form of organization established by the dynamics of the functioning of sacred spaces. Thus: "non-formal education would be those activities that have an intentional character, but

are poorly structured and systematized, where pedagogical relationships occur, but which are not formalized (Wille, 2025, p. 41).

We highlight the importance of presenting the processes related to music and its educational processes in the terreiro; and the memories related to this knowledge and its processes, understanding who its actors are and their role. Because, as Molina (2006, p. 53) states, "The resignification of knowledge cannot be a one-way line, but rather a one-way street, but rather a function of the context in which it is produced, and this context includes both what is produced scientifically and what is produced by non-academic knowledge, in different ways and situations". However, it is important to highlight the main differences between the terms formal, non-formal or informal education, in order to define, more precisely, the field of study of this research on the musical knowledge of the terreiros of Mina Jêje Nagô do Maranhão, in Belém do Pará, with emphasis on the "batusques à mina: processes of musical transmission".

It is up to me to say that education as axé that I claim is not necessarily a model of experiences/learning codified strictly in contexts of Afro-religious cultural practices. What is commonly called by communities the axé education terreiro is understood as the educational processes experienced in the daily lives of these populations, a kind of habitus experienced in the time/space of Afro-religious contexts. These forms of education practiced in these educational contexts resize the educational problem in relation to diversity, revealing modes of education as culture (Rufino, 2019, p. 66).

In this sense, and in order to recognize the importance of Africa in the history of the formation of the Brazilian people and to strengthen the teaching of Afro-Brazilian culture, this thesis also proposes the cataloguing, analysis and creation of a musical collection. This collection will serve as material aimed at formal education, thus reducing the scarcity of didactic materials that explore the issue of Afro-Brazilian identity, but above all, understanding and using the system of musical transmission experienced in the terreiros makes it possible to admit other epistemologies.

The research of the musical memory of the terreiros of Mina emerges, therefore, as an important tool for safeguarding and disseminating Afro-Brazilian culture in the Amazon. The elaboration of relevant educational material will have the function of disseminating and demystifying African-based religions, combating racism in society.

Research in the area of music, ethnomusicology, has much to contribute with regard to the musical knowledge of the terreiros of Mina. It presents itself with the challenge of

establishing a parallel between the music and the cultural system of the terreiros de Mina in Pará. It also seeks to understand and establish the meaning of music in the reality of the terreiro and its expressions as religiosity. The need to implement affirmative and evaluative policies that express in the daily lives of these traditional and religious communities.

Music, in its sociabilities, is present in the most diverse human expressions. Through it, we are led to variables between the profane and the religious, we can transcend between the earthly and the spiritual. Its foundations are decisive for the interaction of the bodies that dance as an expression of axé. Thus, in this microcosm that is the terreiros, music is an inseparable element that composes a system in religious practice – whether in the terreiros of Mina, or in the terreiros of Candomblé.

The processes of transmitting the songs, even in Yoruba, depend on the status of the child made in the house, who will have more and more access to information due to the advancement of traditional learning, as well as the functions developed according to his seniority in the house – the child goes through several initiations, which the ogãs also go through, inside the terreiro. It is important to highlight that all members of the terreiro go through initiatory processes, regardless of whether they have the function of rodante, ekedi or other.

In an interview given on June 24, 2023, to Oyárumbá Claudia Peniche from Keenãnbossizo - Casa do Vento no Caminho do Fogo, located in Conjunto Pedro Teixeira, Coqueiro neighborhood, defines musical organization as a ritual element in Mina's terreiro:

The ritual music that is constituted in the Mina is a process where, when entering a terreiro, those who come from outside can visualize a whole organization that allows the best enjoyment and execution of the works or celebrations, where you also express the hierarchy of the house, by having as main participants the leaders and authorities of the house: Yalorixás; Babalorixás; the guide abatazeiro; other authorities and caboclos when authorized by the Babalorixá. (Interview with Oyárumbá Claudia Peniche, 2023)

This organization shows the unity of the group, as it involves many of the subjects inherent to the terreiro – its community. In this ritualistic space, music is part of a system of non-formal knowledge, which is fundamental to the existence of ritual. In the terreiro, the guide sings and evokes the entities. He also calls the children of the house to experience the sacred, evoking their gods in the mythical universe of the terreiro. The Abatazeiros have the function of giving the sound of the drums, which make all the magic or enchantment happen

in a terreiro de Mina. The ritual is initially opened with the use of iron, brought and played by Ferreira, fulfilling the stage of beginning the work preceding the use of drums.

Musical knowledge reflects and expresses the dynamics and pedagogy of the terreiro. This pedagogy is a system of informal education, which enables the transfer of knowledge, between generations, through processes symbolically established by the community itself. Memories are activated and stories are constituted through orality, imitation and other traditional practices, which make up the elements of preservation of cultural memory and musical memory. According to Luneli (2015, p. 8-9), "Most of those interested in learning the rituals had, in their genealogies, family members who participated in the ceremonies. The process occurs with socialization and with the insertion of apprentices in the universe of rituals and drums".

In the terreiro, the musical instruments also maintain a relationship of sacredness. They are consecrated, for they establish the connection between man and divinity. Oyárumbá Claudia Peniche (2023), explains how these instruments are used and their functions:

The atabaques are the instruments that call the orixás, in the Tambor de Mina it is important that there are two drums lying down, the tambor de mina is differentiated by that, encased on two sides, they are not hollow like the curimbó for example. And the drums of the forest can be placed upright, unlike Candomblé where all the drums are standing. Generally in a house it must have two drums lying down, or two drums standing and a gourd and an iron, which is an instrument of the Mina drum mostly played by women, being the instrument that calls the orixás, it enters before any other instrument, and then the atabaques and gourds enter. The instruments in this case can be called batas or abatás and the players abatazeiros. (Interview with Oyárumbá Claudia Peniche, 2023).

As for the informal knowledge systems, which are educational knowledges closely linked to the pedagogy of the terreiro, there is an epistemology recognized by the results traditionally achieved by all those who are children of the terreiros and who constitute educational spaces. Arroyo (2000, p. 89) suggests the use of new practices that move between school and non-school spaces, aiming to "account for the diversity of musical experiences that people are experiencing in today's society".

The transmission of this knowledge is effective in the interaction, in the exchange of experiences between the authorities and the members of the house. This conviviality comes as a principle of exchange, which, within the pedagogy of the terreiros, brings the teachings that form the filhos de santo. The ways and practices – such as the ways of playing and

singing – constitute specific forms, timbres, intensity and movements for all those who, linked to the ritual, will evoke and interact. These touches are initially taught by the babalorixá, but the guide drum also exercises this function of teaching the touches through a lot of repetition. Nowadays, technological resources such as recordings for musical transmission are already used, but initially the process is always traditional, through orality and repetition.

The Toque, for example, in the Tambor de Mina, it has several ringtones. There is the corrido, there is the dobrado. According to what the pai de santo and the mãe de santo (Babalorixá and lalorixá in this case) are singing. The cadence is determined by the one who pulls the corner. And the pitch of the drums (Intensity), they are always played in a tone that the whole house can hear, we cannot determine a music system with a speaker and other equipment. It's all live, it's all done to the sound of the voices, in the tambor de Mina I have not yet seen as in other houses the lalorixá who use a microphone (Interview with Cláudia Peniche, held on June 24, 2023).

Singing is presented as another fundamental element of the ritual in Tambor de Mina. It merges in its dynamics to evoke and honor the entities, as well as to identify the families. This relationship is linked to the hierarchy of houses, as Claudia Peniche (2023) explains to Oyáorumbá:

The Songs of the Minas drum are all sung both in Portuguese, especially when the Tambor de Mina arrives here in Pará, because there is a mixture with the Pajelança, but I am talking about the Tambor de Mina Jeje Nagô of Maranhão, where the Songs are sung in Portuguese and Yoruba, which is the African language. I am not talking about Mina do Pará, because Mina do Pará and Umbanda are the same thing. The Points sung in the drum of Mina they are according to the families. The Tambor de Mina is hierarchical, it has several families, so the chants are directed to these families, the same thing is the Songs of the caboclos, they sing points that have reference to the caboclos with the entities with the name of these entities, especially the orixás. (Interview with Oyáorumbá Claudia Peniche, 2023)

The processes of transmission of musical knowledge in the Tambor de Mina Jêje Nagô of Maranhão, established in the terreiros of the capital of Pará, need to be recognized as an educational practice, resulting from a traditional pedagogy of the terreiro, as this system is already a fact. The system has its foundations based on faith, in the ways and dynamics of the functioning of these houses, which constitute true Afro-religious communities. The transmission of traditional knowledge constitutes educational and formative processes for all children who adopt religious practices in the daily life of the terreiros of Mina.

Like education, religion is a territory for the exchange of goods, services and meanings between people. Like those of education, the cultural agencies of religious work involve hierarchies, unequal distribution of power, inclusions and exclusions, routines, programs of serial training of personnel and different styles of daily work (Brandão, 2002, p. 152).

In this way, within the hierarchy and daily life of the houses of Mina Jêje Nagô in Maranhão in Pará, musical knowledge is taught to the children, as dancing and singing are part of the process and dynamics of the rituals. These songs, with their forms, dynamics, rhythms, intensities and songs, are sacred instruments and repertoires. They carry the importance of entities and all the vibration necessary for the interaction between body and spirits in the incorporation. Music serves as a vibratory and conductive line, dynamic and evocative, for the performance of the ritual in celebrations, works and festivities.

Thus, religion, in its meanders, mechanisms and ways of acting in the world, acts as education. More than that: the religious temple is an educational place, given that inside the terreiro there is a series of transmissions of knowledge that open up possibilities for the establishment of a set of pedagogical relationships (Silva and Costa Junior, 2020, p. 3).

By observing and analyzing the experiences lived by the children of the terreiros, it is found that the communities or peoples who experience the terreiros do not traditionally resort to formal or official mechanisms, such as schools. These religious practices have educational systems that transmit knowledge to the community of the terreiro. As Albuquerque (2011, p. 26) points out, there is no direct or exclusive need to consult "school, books, television, the internet or teachers in their human form".

Afrocentric musical education is not formal, but a natural, symbolic and popular process that generated the musicality of the revelries and sambas. In the terreiros of Mina Jêje Nagô do Maranhão in Belém do Pará, the education necessary to form the son of the house (the son of the terreiro) is based on Pensar Nagô - the recognition of the Tambor de Mina as the main religion of African origin practiced in the State of Pará, showing a new political configuration among all the subjects who, In their diversity and multiculturalism, they live these religious practices.

African culture, transformed by the effects of the diaspora on our society, emerges in the Amazon through religious practices. Thus, the Tambor de Mina is established as the African-based religion of the Amazon. From the Amazon, why? Because it was exactly here,

in the universe of enchantment, that syncretism took place and a religion was given life with unique subjects and entities that reflect all those who are in society.

It is clear that the Tambor de Mina is the religion of the new pact of forces, it is a religion of fission and syncretism. Thus, in Mina's houses in Belém do Pará, we see the members of the house as subjects who produce education, materializing the assimilation of these teachings. Sociability and intelligibility, in the relationships existing in the terreiro and in the community, are the facilitators that allow us to give life to the dynamics and belonging of all those who are in these spaces. In this way, by understanding the existence, origin, teachings and life in these spaces, the way of life is built through an African and Afro-Brazilian philosophy.

5 FINAL CONSIDERATIONS

Colonization in the Americas unfortunately consolidated an unequal and hierarchical social structure where the traditional knowledge of black peoples in diaspora as well as native peoples was born. In a society that establishes roles and divides bodies and subjectivities based on racial and cultural criteria that are structuring in Brazilian society. Afro-Brazilian religiosity is the expression of Afrocentric knowledge, which established dialogue with indigenous and European people, occupying inferior spaces, pressuring the acceptance of non-European cultures in social relations.

The research of music in the terreiros of Mina Jêje Nagô do Maranhão in Belém do Pará presents and analyzes the various liturgical repertoires, which consist of songs sung in the giras, festivals, rituals, ceremonies and celebrations in two terreiros in the capital of Pará. These songs are the doctrines or points that make the connection and transcendence of the participants in the rituals or celebrations.

Regarding their modes of transmission, the instrumentalists who are children of the house go through traditional terreiro training and education, which has an Afrocentric character, often based on orality. The music of the terreiro maintains its essence in African traditions, musicality and sound, despite the changes arising from socialization processes and the historical transformations that occurred in the configuration of the Pantheons that today make up the Pará Mine.

Finally, terreiro education and the transmission of musical knowledge is proof of the existence of other epistemologies that enabled the diffusion of Afro-Brazilian musical

expressions throughout all regions, an example of the implementation of traditional Afrocentric systems representative of Afro-Amazonian religiosity and identity.

ABSTRACT

This article critically analyzes the relationship between development and freedom, understanding freedom as a constitutive element of an emancipatory and sustainable development model. Based on a transdisciplinary approach, the study is structured in three analytical axes: theoretical foundations of freedom, the role of institutions in guaranteeing substantive rights, and the environmental limits of economic growth. The first axis discusses the transition from negative to substantive freedom, emphasizing justice and autonomy. The second explores how structural inequalities restrict real freedoms and highlights the importance of inclusive and equitable institutions. The third addresses sustainability as a condition for intergenerational freedom, integrating ecological balance, ethical responsibility, and the rights of nature. The article concludes that true development is not measured only by economic indicators, but by the expansion of real freedoms, the democratization of opportunities, and the preservation of the ecological foundations that sustain human dignity and coexistence.

Keywords: Freedom. Development. Sustainability.

RESUMO

Este artigo analisa criticamente a relação entre desenvolvimento e liberdade, compreendendo a liberdade como componente essencial e estruturante do processo desenvolvimentista. Por meio de uma abordagem transdisciplinar, são examinadas três dimensões fundamentais: a concepção teórica da liberdade, o papel das instituições na efetivação das liberdades substantivas e os limites socioambientais ao crescimento econômico. No primeiro eixo, discute-se a transição da liberdade negativa para uma liberdade substantiva, vinculada à justiça social. Em seguida, investiga-se a influência das desigualdades estruturais sobre o acesso efetivo à liberdade, ressaltando a necessidade de instituições comprometidas com a equidade. Por fim, aborda-se a sustentabilidade como condição para a liberdade intergeracional, defendendo-se a integração entre justiça ambiental e direitos da natureza. Conclui-se que o desenvolvimento só pode ser considerado

RESUMEN

Este artículo analiza críticamente la relación entre desarrollo y libertad, entendiendo esta última como un componente esencial y estructurante del proceso de desarrollo. Mediante un enfoque transdisciplinario, se examinan tres dimensiones fundamentales: la concepción teórica de la libertad, el papel de las instituciones en la realización de las libertades sustantivas y los límites socioambientales al crecimiento económico. El primer eje aborda la transición de la libertad negativa a la libertad sustantiva, vinculada a la justicia social. A continuación, se investiga la influencia de las desigualdades estructurales en el acceso efectivo a la libertad, destacando la necesidad de instituciones comprometidas con la equidad. Finalmente, se aborda la sostenibilidad como condición para la libertad intergeneracional, defendiendo la integración de la justicia ambiental y los derechos de la naturaleza. La conclusión es que el desarrollo solo puede considerarse completo cuando se articula con la expansión concreta de las libertades reales, la redistribución de oportunidades y la preservación de las condiciones ecológicas que posibilitan una vida digna.

Palabras clave: Libertad. Desarrollo. Sostenibilidad.

1 INTRODUCTION

The binomial development and freedom emerges as one of the most instigating and complex debates in the contemporary human sciences, articulating ethical, economic, legal and political dimensions. Traditionally linked to economic advancement and institutional modernization, development has come to be analyzed in a critical and multidimensional way, incorporating factors such as quality of life, democratic participation, environmental sustainability, and social justice. In this new scenario, freedom ceases to occupy a peripheral place in the developmental debate and assumes a central role in the formulation of public policies and strategies for social transformation.

From a broader perspective, development can no longer be understood as simple material growth or economic efficiency. True progress is measured, above all, by the ability of societies to expand the real freedoms of their members — the freedom to live with dignity, to choose, to express oneself, to participate politically and to access fundamental goods. This conception resignifies the role of legal institutions, the State and the market, emphasizing not only the absence of coercion, but the effective presence of conditions for the exercise of individual and collective autonomy.

In the face of this paradigmatic shift, a deep reflection on the multiple meanings of freedom in the context of development is required. Freedom can be conceived as a universal value, as a subjective right, as an instrument of social emancipation or as a condition of economic efficiency. Each of these approaches carries with it different normative implications and different political orientations, especially with regard to state intervention, the protection of fundamental rights and the equitable distribution of social resources.

It is not too much to emphasize, at this point, that Brazilian art, especially Brazilian Popular Music (MPB), has always played (and why not say still plays) a relevant role in the construction of social consciousness and in the reflection on freedom and development. Poetry and music function as instruments of collective sensitization, capable of translating abstract concepts into experiential experiences that directly touch human subjectivity.

Vinícius de Moraes, in his famous poem "The Worker in Construction", for example, offers a poetic synthesis of the dialectic between development and freedom that permeates this entire study. The poet from Rio de Janeiro manages to poetize the dynamics of the construction of the worker's consciousness, demonstrating how awareness is simultaneously an individual and collective process of emancipation. The worker who "climbed with the houses that sprouted from his hand" but "did not know everything about his great mission"

represents the condition of alienation that prevents the full realization of substantive freedom (CALIBAN, 2020).

Furthermore, the transformation of the worker from "class in itself" to "class for itself" narrated in the poem echoes Sen's (2000) theoretical reflections on real capacities and freedoms. When the worker finally says "No!", the moment materializes when freedom ceases to be just formal and becomes substantive, capable of confronting structures of power and inequality. This time, it is clear that this artistic dimension of social consciousness reveals how Brazilian popular culture anticipated, in poetic language, many of the contemporary debates on human development and social justice.

This article aims to critically examine the conceptual entanglement between development and freedom, considering its philosophical foundations, institutional implications, and contemporary challenges. It is intended, therefore, to investigate how freedom can be understood as a constitutive element of development, and not only as its consequence. The analysis will be conducted based on a transdisciplinary approach, which articulates elements of law, economics, political science and social theory.

The central problem of the research lies in the tension between different models of freedom and their consequences for the design of development policies. On the one hand, there is a liberal conception, which values individual autonomy and the limitation of state power; on the other, more substantive views, which demand affirmative action by the State to guarantee minimum conditions of existence and equal opportunities. This tension reverberates directly on the structure of institutions and on the normative efficacy of fundamental rights.

As a general objective, it seeks to critically analyze the relationship between development and freedom, with emphasis on its theoretical and legal implications. Specific objectives include: i) examining the philosophical-political foundations that sustain different conceptions of freedom; ii) to identify the role of legal institutions in the realization of substantive freedoms; and iii) to discuss the contemporary limits of freedom in contexts of structural inequality and environmental crisis.

Methodologically, the research adopts a qualitative approach, of a theoretical-conceptual nature, based on critical literature review, documentary analysis and interdisciplinary articulation. The work will be structured in three chapters, corresponding to the theoretical foundation, institutional analysis and contemporary challenges. At the end,

conclusions and recommendations will be presented, aiming to contribute to the construction of a development model that, in fact, promotes freedom in the full sense.

2 THEORETICAL FOUNDATIONS OF DEVELOPMENT AND FREEDOM

In recent decades, reflection on development has gone beyond the limits of economic growth and material productivity. By replacing purely quantitative indicators with broader criteria of well-being, authors propose that true progress should be measured by the expansion of the real freedoms available to individuals. Such a paradigm shift shifts the focus from accumulation to emancipation, articulating social, political and legal dimensions around the promotion of human dignity (SEN, 2000).

Amartya Sen's work inaugurates an innovative perspective by conceiving freedom as both a means and an end of development. In this approach, freedom is not limited to the absence of coercion, but implies effective access to capacities that allow subjects to live lives that they value. Education, health, food security and political participation, for example, are essential components of substantive freedom, and must be guaranteed by institutional structures and public policies that correct structural inequalities (SEN, 2000).

In this scenario, the analysis of freedom as a structuring element of development requires considering the multiple factors that condition access to real opportunities. The existence of historical, social and economic barriers often limits the possibility of choice and self-determination of individuals, making any definition of freedom that is restricted to the formal level insufficient. It is necessary to recognize that the full realization of freedom requires the elimination of legal obstacles, but also the creation of material and symbolic conditions that allow the flourishing of diverse life projects.

Thus, the contemporary debate on development shifts the focus from the simple absence of coercion to the effective promotion of capacities, considering the plurality of contexts and the complexity of social demands. By incorporating these variables, the understanding of the role of the State and institutions is expanded, which come to be seen as fundamental agents in the equalization of opportunities and in the construction of a fairer and more inclusive society.

This conception is significantly different from the classical formulations of economic liberalism, which understand freedom from a negative perspective, that is, as the absence of external interference. Friedrich Hayek, one of the main exponents of this tradition, argues that any attempt to plan or economically control society inevitably leads to serfdom. For him,

individual freedom resides in protection against arbitrariness, and the State must limit itself to guaranteeing the minimum legal order so that individuals can act autonomously in the market (HAYEK, 1990).

Milton Friedman, in line with Hayek, reinforces the idea that economic freedom constitutes the necessary basis for political freedom. His analysis is based on the principle that State intervention in the economy tends to restrict individual choices, compromising efficiency and personal autonomy. Friedman defends free choice as a fundamental right and proposes that systems based on competition and individual responsibility are more efficient in promoting social welfare than interventionist policies (FRIEDMAN; FRIEDMAN, 2015).

The contrast between Sen's perspectives and those of classical liberals evidences an epistemological tension regarding the role of the State and institutions in the construction of freedom. While Sen proposes a proactive role of the public power in the creation of equitable conditions, Hayek and Friedman attribute to the market the capacity for self-regulation and to economic freedom the status of the basic premise of a just society. This dichotomy is not merely theoretical: it reflects different conceptions of justice, citizenship and social responsibility (SEN, 2000; HAYEK, 1990; FRIEDMAN; FRIEDMAN, 2015).

The growing complexity of contemporary societies requires, however, an overcoming of these traditional dichotomies. Edgar Morin proposes a transdisciplinary and systemic approach, in which development should be understood as a multidimensional, dynamic and interdependent process. From this perspective, freedom cannot be thought of in isolation or linearly, but as part of a network of relationships between culture, nature, economy, technology and spirituality, whose effects are unpredictable and often contradictory (MORIN, 2013).

For Morin, the challenge is to integrate knowledge and recognize that humanity's problems cannot be solved within watertight disciplinary compartments. Freedom, in this context, must be reconceptualized not only as an individual right, but as a collective responsibility for the sustainability of life on the planet. This implies recognizing that there are freedoms that, when absolutized, can compromise the social fabric, the ecological balance and the very survival of future generations (MORIN, 2013).

The tropicalist movement, led by Caetano Veloso and Gilberto Gil, offers a unique perspective on the tension between tradition and modernity in the Brazilian development process (DAVINO; FERREIRA, 2020). Tropicália represented an anthropophagic synthesis

that combined "the old and the new, the national and the global", establishing a creative dialogue with the country's cultural contradictions (LEORNE, 2025).

Caetano Veloso, in "Coração Civil", poetically expresses many of the ideals that permeate the substantive conception of freedom: "I want utopia, I want everything and more / I want happiness in the eyes of a father / I want joy for many happy people / I want justice to reign in my country". There is no denying that such verses articulate, in accessible language, the inseparable relationship between individual freedom and collective well-being, between personal development and social justice.

Therefore, the tropicalist vision anticipated, in the cultural field, many of the contemporary reflections on sustainable and inclusive development. By rejecting both retrograde nationalism and uncritical modernization, the movement proposed a third way that recognized the complexity of peripheral societies and the need for their own paths to development. This stance is echoed in Morin's (2013) reflections on the need to overcome simplifying dichotomies and embrace complexity as a fundamental characteristic of contemporary social processes.

The recognition of culture as a strategic dimension of development shows that freedom and progress cannot be dissociated from the collective identities and symbolic expressions of a people. Valuing cultural diversity, creativity, and intangible heritage contributes to the construction of a social environment that is more open to innovation and plurality of perspectives.

In this sense, public policies aimed at strengthening culture and education play a central role in the democratization of opportunities, promoting social inclusion and respect for differences. By integrating cultural and social aspects into the debate on development, the horizon of possibilities for the realization of a freedom that is, in fact, substantive and universal, capable of responding to the challenges imposed by historical inequalities and the accelerated dynamics of contemporary transformations, is expanded.

Thus, understanding the theoretical foundations of freedom in the context of development requires a critical reading, which considers both the values of individual autonomy and the imperatives of social justice and environmental preservation. The articulation between these dimensions points to a development model that is not limited to economic efficiency, but that is realized in the concrete expansion of human possibilities, in the reduction of inequalities and in the construction of a legal order guided by solidarity, diversity and sustainability.

3 FREEDOM IN THE STRUCTURE OF INSTITUTIONS AND THE REDUCTION OF INEQUALITIES

The realization of freedom as a substantive vector of development depends directly on the structure and functioning of political, legal and economic institutions. Freedom, in this context, is not limited to mere individual autonomy or the absence of coercion, but manifests itself concretely when the legal-institutional system guarantees equal conditions for the exercise of rights. In this way, it is possible to argue that the institutional architecture plays a decisive role in the construction of real freedoms, overcoming the liberal vision restricted to formal freedom (BERCOVICI, 2005).

The effectiveness of political, juridical and economic institutions in promoting substantive freedom depends on their formal existence, but above all on the quality of their operation and the ability to adapt to social demands. Institutions that are inclusive, transparent and responsive are essential to ensure that the rights provided for in the legal system are translated into concrete practices of equality and participation. In addition, the dynamic interaction between the State and civil society is fundamental for the construction of an environment in which freedom is not a privilege of a few, but a condition accessible to all.

Thus, institutional strengthening should be thought of as a continuous process of improvement, which articulates mechanisms of social control, transparency, and distributive justice, ensuring that political and economic structures regulate, but effectively promote, human and social development.

In the Brazilian case, the 1988 Constitution enshrined an economic order based on social justice, the social function of property and the reduction of inequalities. This normative arrangement, called the Economic Constitution, imposes limits on the logic of the market and legitimizes the State's action as an agent that promotes development. For Bercovici, this constitutional framework is not neutral, but guided by the search for a more just society, in which institutions are called upon to operate in favor of substantive freedom and citizen inclusion (BERCOVICI, 2005).

By shifting the focus to the issue of economic inequality, it is found that the concentration of income and wealth constitutes one of the main obstacles to the realization of freedom in its material dimension. Excessive inequality erodes social cohesion, undermines intergenerational mobility and distorts the democratic functioning of institutions. Thomas Piketty shows that, over the last decades, there has been a widening of wealth

disparities, with profound implications for access to opportunities, political voice and fundamental rights (PIKETTY, 2014).

Moreover, the persistence of economic inequality limits access to material resources, but also compromises the effectiveness of political participation, creating an environment in which disadvantaged voices are systematically marginalized. This asymmetry of economic power translates into inequality in access to information, influence over public decisions, and capacity for social mobilization, weakening democratic mechanisms and representativeness.

Furthermore, the structural imbalance between social groups generates a concentration of power that hinders the implementation of inclusive public policies and perpetuates the exclusion of significant portions of the population. In this way, economic inequality becomes a central factor in the reproduction of cycles of political exclusion, eroding the basis of citizenship and compromising the construction of fairer and more democratic societies.

Political freedom, in this context, becomes vulnerable to institutional capture by economic elites, who shape public policies according to narrow interests. This dynamic produces a vicious cycle in which inequality fuels exclusion, and exclusion reinforces inequality, undermining the foundations of democratic citizenship. Piketty argues that, without effective mechanisms of redistribution and fiscal control, institutions begin to operate in a regressive manner, privileging the maintenance of historical privileges and restricting the possibilities of social transformation (PIKETTY, 2014).

Joseph Stiglitz reinforces this perspective by analyzing the structural impacts of inequality on the institutional and economic performance of countries. For the author, societies marked by extreme asymmetries face difficulties in establishing equitable, transparent and effective institutions. Freedom, under such conditions, becomes the privilege of the few, while the majority remains imprisoned in contexts of economic exclusion, educational precariousness and low political representation. Thus, the poor distribution of income not only compromises development, but sabotages the very idea of freedom in its socially relevant expression (STIGLITZ, 2012).

In the midst of this scenario, it is possible to highlight that MPB played a relevant role during the Brazilian military dictatorship, functioning as a channel of expression and cultural resistance in a period of institutional repression. Artists such as Chico Buarque have developed sophisticated poetic strategies to circumvent censorship and keep social criticism

alive, demonstrating how art can preserve spaces of freedom even in authoritarian contexts (PLAGGE, 2025).

The experience of Brazilian cultural resistance concretely illustrates how democratic institutions depend on formal structures, but also on a political culture that values plurality and public debate. The protest songs denounced injustices, but politically educated an entire generation, contributing to the formation of a democratic consciousness that would be fundamental in the process of redemocratization (PLAGGE, 2025).

Milton Nascimento and Clube da Esquina exemplify how art can articulate political resistance with aesthetic innovation. Combining MPB, rock, jazz, and folk influences, the movement created a unique musical language that challenged both repression and dominant aesthetic standards. Songs like "Coração de Estudante" became symbols of struggle and hope, demonstrating the power of art to sustain utopia even in the darkest moments (PLAGGE, 2025).

Thus, this cultural dimension of resistance highlights fundamental aspects about the nature of democratic institutions. They are not sustained only through legal norms, but need a cultural substrate that values diversity, creativity and citizen participation. The Brazilian experience demonstrates how popular culture can function as a guardian of democratic memory and as an instrument of political education.

In this sense, it becomes evident that the strengthening of institutions cannot be dissociated from public policies oriented to equity. It is not enough for the norms to recognize rights; there must be structures capable of making them feasible and accessible to all citizens. State action must be redesigned in order to reverse historical inequalities and guarantee objective conditions for the full exercise of freedom. This process requires institutional reconstruction based on principles of distributive justice, social responsibility and substantive inclusion (BERCOVICI, 2005; STIGLITZ, 2012; PIKETTY, 2014).

The idea of freedom is often associated with the expansion of individual choices and the ability to consume goods and services in an increasingly diverse market. However, this conception is limited in the face of the environmental and social impacts of the continuous growth model. The depletion of natural resources, the climate crisis and global inequality demonstrate that the unrestricted exercise of freedom of consumption can paradoxically compromise the conditions that sustain the very life and freedom of future generations (LATOUCHE, 2009).

The imperative of economic growth, widely naturalized as synonymous with progress, needs to be critically reassessed. Overcoming this logic requires a transition to a more conscious development model, which values collective well-being, responsible autonomy, and reconnection with ecological limits. Such an approach proposes an inversion of values, replacing the cult of excess with a culture of sufficiency, sobriety and solidarity (LATOUCHE, 2009).

Freedom, in this context, should not be confused with the mere absence of restrictions or with the unlimited possibility of individual choices. It is materialized when there are material, social and ecological conditions that allow subjects to carry out their life projects in balance with others and with the natural environment. The expansion of real freedoms is necessarily conditioned to the preservation of common goods and the construction of a sustainable and equitable coexistence (LATOUCHE, 2009).

This vision demands the incorporation of intergenerational responsibility as a structuring element of public policies and legal institutions. The protection of the environment and the rational management of resources cannot be seen as programmatic options, but as binding duties of the State and society. Freedom, in order to be fully realized, requires the guarantee of a viable future, with minimum conditions for human flourishing in all its dimensions (FREITAS, 2012).

The normative structure must therefore transcend the short-term logic of exploitation and assume ethical commitments over time. This means recognizing that contemporary freedom implies conscious choices that respect the precautionary principle, intergenerational equity, and the intrinsic value of ecosystems. Sustainability is no longer just a political guideline to become the legal basis of a new institutional rationality (FREITAS, 2012).

The global ecological crisis cannot be understood solely as a result of the deterioration of natural resources. It expresses, in a deeper way, a civilizational and subjective crisis, in which the fragmentation of relationships, the trivialization of life and the commodification of social bonds have eroded collective sensibility. Freedom, in this scenario, requires not only structural transformation, but also the reconstruction of meanings, affections and ways of being in the world (GUATTARI, 1990).

It is necessary to break with the notion that nature and humanity occupy separate and hierarchical spheres. Freedom acquires full meaning when recognized as a relational experience, permeated by bonds of respect, interdependence and care for all forms of life. This understanding challenges the normative structures centered on anthropocentrism and

establishes an ethics of coexistence, in which the natural environment ceases to be an object and becomes a subject of rights (GUATTARI, 1990).

In the face of this conceptual reconstruction, the challenge of the twenty-first century lies in articulating freedom, justice and sustainability in the same normative horizon. Development, in order to be effectively liberating, needs to operate with new ethical, political and legal parameters, capable of guaranteeing not only immediate well-being, but the continuity of life in its diversity. Only with the integration between human rights, rights of nature and intergenerational justice will it be possible to consolidate a truly emancipatory model of coexistence.

4 FREEDOM, SUSTAINABILITY AND THE RIGHTS OF NATURE: CONTEMPORARY LIMITS TO GROWTH

The contemporary conception of freedom is tensioned in the face of the environmental, social and civilizational challenges imposed by the dominant model of development. The association between freedom and the expansion of consumption, which permeates hegemonic political and economic discourses, begins to reveal profound contradictions when confronted with the reality of ecological collapse and structural inequality. Freedom understood as the unlimited multiplication of individual choices, especially in the field of consumption, ignores the physical limits of the planet and compromises the possibilities of a dignified existence for future generations (LATOUCHE, 2009).

The environmental crisis is not limited to the scarcity of natural resources, but represents a crisis of meaning, in which the values that sustained the modern ideal of progress have become instruments of destruction. The expansion of production and material wealth, detached from ethical and ecological parameters, compromises the very foundations of human freedom. The notion of linear and cumulative progress needs to be reviewed in the light of an alternative rationality, guided by principles of sufficiency, reciprocity and balance (LATOUCHE, 2009).

Freedom, in this new horizon, is no longer understood as the simple absence of external interference and is now linked to the ability to live consciously and responsibly in relation to others and the environment. Its implementation requires not only guaranteed rights, but also collective and structural conditions that preserve the common good. Environmental justice and the recognition of planetary limits thus become inseparable elements of the free human experience (LATOUCHE, 2009).

From a legal point of view, sustainability is presented as a structuring principle of the new conception of freedom. The requirement to preserve the environment for future generations does not stem only from a technical or environmental concern, but from an ethical and constitutional commitment to the continuity of life in its multiple forms. Freedom is not fully realized when dissociated from intergenerational responsibility, the duty of precaution and respect for the natural cycles that sustain human existence (FREITAS, 2012).

This responsibility transcends the scope of individual decisions and imposes a profound institutional reconfiguration. The legal system must be able to incorporate the temporal dimension of freedom, recognizing that the present use of natural resources directly impacts the collective future. In this context, the role of public policies and legal institutions is to ensure the balance between development and conservation, ensuring that today's rights do not make tomorrow's rights unfeasible (FREITAS, 2012).

The reductionist approach to freedom as an isolated subjective right is incompatible with the complexity of contemporary social and ecological relations. Freedom should be thought of as the result of dynamic interactions between individuals, collectivities and nature, which implies its reconceptualization as a relational, situated and ecological value. This understanding requires the displacement of a paradigm centered on the individual to another oriented by cohabitation and interdependence (GUATTARI, 1990).

Environmental deterioration, in this sense, should also be understood as a deterioration of social and subjective relations. The ecological imbalance reflects a broader crisis, marked by the fragmentation of bonds, the reduction of sensitivity and the instrumentalization of human relationships. Freedom, when limited to the logic of the market and the reproduction of consumption patterns, loses its emancipatory power and becomes a vector of alienation and destruction (GUATTARI, 1990).

The relationship between art and environmental awareness in MPB offers unique perspectives on the contemporary challenges of sustainability. Maria Bethânia, in "Purificar o Subaé", articulates in a poetic way the criticism of the predatory development model and the need for a new relationship with nature. The song denounces the "empty progress that brings environmental destruction" and invokes the protection of Iemanjá, integrating spiritual, cultural and ecological dimensions.

Gilberto Gil, especially in "Refloresta", offers an urgent poetic appeal to environmental preservation: "Keeping what remains standing is not enough", reinforcing the need for proactive ecological restoration actions. The song highlights the insufficiency of palliative

measures in the face of the magnitude of environmental destruction, echoing theoretical reflections on the limits of economic growth.

The environmental poetry of MPB anticipated, in accessible language, many of the contemporary debates on sustainability and the rights of nature, works that demonstrate how artistic sensibility can capture social trends and contradictions even before they are systematized by academic thought (FERNANDES, 2021). The reference to the orishas and Afro-Brazilian spirituality, present in several compositions, suggests alternative ways to think about the relationship between humanity and nature, overcoming the Western dichotomy between culture and environment.

Thinking about freedom from the perspective of ecology requires an integration between the environmental, social and mental dimensions. The reestablishment of an ethical relationship with nature, with the other and with oneself becomes a condition for the construction of a more just, plural and sustainable society. In this scenario, the law assumes the task not only of regulating conduct, but of stimulating the reconstruction of an ecological sensibility capable of sustaining new forms of coexistence and freedom (GUATTARI, 1990).

The protection of freedom in its substantive dimension cannot dispense with the action of institutions capable of guaranteeing material equity and ecological balance. The contemporary institutional structure, historically shaped by short-term interests and economistic orientations, demonstrates a low capacity to deal with the challenges of sustainability and environmental justice. In order for freedom to be broadly guaranteed, it is necessary for the normative apparatus to recognize the centrality of the environment as an existential and legal support for human dignity (FREITAS, 2012; BERCOVICI, 2005).

The disconnect between economic development and distributive justice accentuates the fragility of societies in the face of the climate and institutional crisis. The accumulation of wealth in the hands of a few compromises equal access to essential environmental goods, such as clean water, clean air, and arable land. Environmental inequality adds to economic inequality, restricting the real freedoms of the majority and transferring the ecological costs of consumption to the most vulnerable populations (PIKETTY, 2014; STIGLITZ, 2012).

By adopting economic growth as the main measure of success, many public policies neglect the ecological and social impacts of their decisions. This reductionist logic obscures the fact that full freedom is not sustained on degraded material bases. The concept of freedom requires structural and institutional conditions that are not only formal, but that

ensure that all people have the opportunity to choose lifestyles compatible with mutual respect and the conservation of life support systems (SEN, 2000; LATOUCHE, 2009).

Law, in this context, plays a fundamental role in mediating between immediate interests and long-term commitments. It is a matter of rethinking the very purpose of the legal norm, shifting it from a merely regulatory function to a function that promotes sustainability and intertemporal freedom. This implies incorporating intergenerational justice as a vector for the interpretation of fundamental rights, demanding from public institutions a new ethos aimed at the preservation of life in a broader sense (FREITAS, 2012; BERCOVICI, 2005).

The articulation between freedom and sustainability also requires an epistemological rupture. The modern paradigm, centered on the fragmentation of knowledge and the supremacy of instrumental rationality, limits the understanding of ecological complexity and the interdependencies that characterize social and natural systems. A more integrated approach requires recognizing that environmental, economic and social crises are interconnected and that isolated solutions tend to reinforce the problems they intend to solve (GUATTARI, 1990; MORIN, 2013).

In this sense, thinking about freedom in ecological terms implies accepting the existence of limits. These limits should not be seen as obstacles, but as conditions for human survival and flourishing. A truly free society is one that recognizes its insertion in a web of relationships that includes the environment and other living beings, adopting ethical attitudes that prioritize coexistence and care as the foundations of autonomy (LATOUCHE, 2009; GUATTARI, 1990).

Sustainability-driven freedom cannot be captured by technocratic discourse or the promise that technological innovation alone will solve environmental problems. Although technology is a strategic ally, it is in the political and legal field that regulatory frameworks capable of guaranteeing climate justice, the equitable distribution of responsibilities, and the recognition of the rights of nature must be established. The challenge is to build institutional models that integrate science, ethics and democratic participation (STIGLITZ, 2012; FREITAS, 2012).

The contemporary reformulation of the idea of freedom requires overcoming its reduction to an abstract and formal concept, detached from the concrete structures that sustain it. When freed from the material, institutional and ecological conditions that make it possible, freedom becomes the privilege of the few and a discursive façade for the

maintenance of inequalities. The modern challenge is to reroot it in the field of environmental justice, collective responsibility and intergenerational solidarity (SEN, 2000; FREITAS, 2012).

The effects of climate change, resource scarcity and environmental degradation already impact millions of people around the world, especially marginalized communities, who have historically had restricted access to the commons. Freedom, in these contexts, becomes unattainable. The liberal discourse that celebrates individual autonomy without considering structural barriers proves to be insufficient in the face of the urgency of building a model of coexistence that is simultaneously fair, viable and sustainable (PIKETTY, 2014; STIGLITZ, 2012).

In this scenario, the concept of environmental justice gains centrality by integrating the ecological dimension with social and institutional struggles for freedom. This perspective allows us to understand that the forms of oppression and exclusion are not limited to the economic or legal field, but include the unequal distribution of environmental damage and access to natural resources. Freedom, therefore, also depends on justice in the distribution of environmental goods essential to life (LATOUCHE, 2009; GUATTARI, 1990).

The very notion of development must be reconfigured based on these parameters. Instead of the incessant search for growth, it is necessary to build an idea of development that privileges collective well-being, the balance of ecosystems, and the preservation of human rights and the rights of nature (GODOY, 2025). Such a perspective requires the adoption of public policies based on the ethics of sufficiency, the mitigation of damage and the prevention of socio-environmental risks (FREITAS, 2012; LATOUCHE, 2009).

The modern conception of law needs to keep up with this transformation. Traditional law, centered on property, consumption and autonomy detached from the collectivity, is limited in the face of the complexity of contemporary problems. The guarantee of freedom requires the reinterpretation of fundamental rights in the light of sustainability, considering nature as a legal subject and not only as an object of use and exploitation (GUATTARI, 1990; BERCOVICI, 2005).

In this sense, rethinking freedom in times of environmental crisis implies repositioning human beings within the web of life, recognizing their dependence on natural conditions and their responsibility towards them. This repositioning requires ruptures with dominant paradigms and the construction of a new model of rationality, which values plurality, interdependence and care as the foundations of democratic and ecological coexistence (MORIN, 2013; GUATTARI, 1990).

Institutions, in turn, must be reformulated to play an active role in the construction of socially and ecologically committed freedom. The State's action cannot be restricted to regulatory neutrality, but must incorporate a redistributive, sustainable and participatory logic, promoting inclusive policies that guarantee equitable access to environmental goods, information and democratic deliberation (BERCOVICI, 2005; STIGLITZ, 2012).

Consolidating a libertarian vision of development implies overcoming the false dichotomy between individual freedom and the collective good. Contrary to what classical liberal currents advocate, the protection of the common good – especially with regard to the environment – does not represent a threat to freedom, but its condition. The freedom of each person can only be realized in a livable, socially just and environmentally balanced world. Thus, real freedoms become inseparable from environmental justice and harmonious cohabitation with nature.

The contribution of Brazilian art to the debate on freedom and development transcends aesthetic value and takes on fundamental epistemological and political dimensions. Poetry and music work as mediators between theoretical reflection and lived experience, making complex concepts accessible and mobilizing affections necessary for social transformation.

Vinícius de Moraes' "Hiroshima Rose" exemplifies how art can address global issues with local sensitivity, connecting the struggle for world peace with the search for social justice in Brazil (VERSOS..., 2023). The poem uses constructivist techniques that reinforce its political message, demonstrating how form and content are articulated in the construction of a poetics committed to social transformation.

The Brazilian cultural experience suggests that authentic development cannot do without the artistic and symbolic dimension. The cities sung by Vinícius de Moraes, the utopias dreamed of by Caetano Veloso, the resistances narrated by Chico Buarque and the ecologies invoked by Bethânia and Gil make up a collective imaginary that guides aspirations and projects for the future.

This time, this synthesis between art and social consciousness points out that substantive freedom is not only realized through public policies and institutional arrangements, but also through the construction of new meanings, affections and imaginaries. Brazilian social poetry, from Castro Alves to the present day, demonstrates how art can function as an "instrument of revolution", capable of awakening consciences and mobilizing transformative energies (GETENS; MONTOVANI, 2023).

Closing this chapter means recognizing that the debate on freedom and development can no longer ignore the limits of the planet or the ethical requirements of coexistence. Freedom is not achieved in isolation, but in the relationship with others and with the environment in which one lives. Incorporating sustainability as a constitutive value of freedom is, at the same time, a gesture of historical lucidity and a civilizing imperative. The future of freedom depends, to a large extent, on our ability to reconfigure the horizons of development, guiding them by criteria of justice, balance and interdependence.

5 CONCLUSION

The present investigation started from the proposal to understand freedom as a constitutive element — and not just a result — of development, going beyond the traditional paradigms centered on economic expansion. The theoretical path made it possible to show that the concept of freedom, when detached from the material, social and ecological conditions that sustain it, becomes abstract and inoperative in the face of contemporary inequalities and crises. Development, in order to be effectively liberating, requires the recognition of freedom as a relational value, situated and conditioned by historical and environmental reality.

The initial analysis demonstrated that the substantive conception of freedom involves not only the absence of coercion, but the presence of real capacities for individuals to carry out their life projects. This approach shifts the focus from formal freedom to effective freedom, incorporating variables such as access to essential services, political participation, and distributive justice. Thus, development ceases to be an end in itself and is conceived as a means to the full realization of human autonomy.

When analyzing the role of institutions, it was found that they constitute the normative and organizational foundation for the construction of freedom. Legal and political structures must guarantee not only declaratory rights, but objective conditions for their universal exercise. When institutions become refractory to equity or captured by concentrated interests, freedom is emptied of meaning and development begins to reproduce historical inequalities. Therefore, institutional effectiveness must be permanently guided by the principles of social justice, substantive democracy, and pluralism.

On the socioeconomic level, it has become evident that freedom finds serious limits when confronted with the persistence of extreme inequalities. The concentration of income, power, and opportunities reduces access to full citizenship, compromises democratic

legitimacy, and weakens the mechanisms of collective deliberation. In addition, the overlap between economic inequality and environmental degradation increases the vulnerability of marginalized populations, demonstrating that freedom cannot be thought of in isolation from the distributive and ecological issue.

Sustainability, in turn, proved to be an indispensable dimension of freedom. In times of climate emergency, the preservation of the environment ceases to be a peripheral ethical imperative and becomes a precondition for the continuity of human and non-human life. Future freedom depends directly on the current ability to responsibly manage natural resources, mitigate ecological damage, and institute legal mechanisms capable of protecting the rights of nature and ensuring intergenerational justice.

The articulation between freedom and the environment requires, therefore, a paradigm shift. It is about replacing the logic of exploitation with the principle of care, recognizing the interdependence between all forms of life. Freedom can no longer be conceived as an unrestricted license for action, but as a conscious commitment to the limits of the planet and to the maintenance of equitable conditions of existence for present and future generations. This imposes on law and public policies the task of incorporating ecological ethics as a normative foundation.

In addition, the notion of freedom needs to be reinterpreted in the light of contemporary complexity, which integrates economic, cultural, institutional, subjective and environmental dimensions. The idea that freedom can be guaranteed without profoundly transforming the modes of production, consumption and coexistence is unsustainable. The challenge is to build a shared, inclusive and responsible freedom, supported by structures that recognize the value of diversity and life in common as the foundations of democratic coexistence.

It follows from this that there is no genuine development without real freedom, and there is no real freedom without justice, equity, and sustainability. The construction of a truly free society depends on institutions committed to social transformation, the overcoming of structural inequalities and the incorporation of the environment as a subject of rights. Only through the integration of these dimensions will it be possible to move towards a development model that does not exclude, does not destroy, and that is capable of sustaining freedom as a collective, enduring, and fully realizable value.

ABSTRACT

Logistics plays a strategic role in the competitiveness of supply chains, especially in global sectors such as textiles and apparel, which face growing demands for efficiency, traceability, customization, and sustainability. In this context, logistics services are becoming increasingly important not only as operational support but also as instruments of differentiation and value creation. This article aims to analyze, through a structured literature review, the main types of logistics services available and their potential applications in the textile and apparel industry. The research was conducted using Scopus and Web of Science databases, using analysis and selection procedures that resulted in a portfolio of 20 core articles. The results indicate that, in addition to the traditional areas of storage and transportation, there is an expansion of value-added services such as customer support, information technology, security, and e-logistics. The growing role of outsourcing was also highlighted, allowing companies to focus on strategic activities and establish more collaborative partnerships throughout the supply chain. The analysis reveals that the integration of logistics services and collaborative practices enhances competitiveness and resilience gains, but also highlights gaps in performance measurement and the incorporation of green and digital practices. As a contribution, the study provides an integrated view of logistics services, highlighting their importance for strengthening the textile and apparel supply chain and signaling opportunities for future research on emerging topics such as sustainability, Logistics 4.0, and the circular economy.

RESUMO

A logística desempenha papel estratégico na competitividade das cadeias de suprimentos, especialmente em setores globais como o têxtil e de confecção, que enfrentam demandas crescentes por eficiência, rastreabilidade, personalização e sustentabilidade. Nesse contexto, os serviços logísticos assumem relevância não apenas como suporte operacional, mas também como instrumentos de diferenciação e geração de valor. Este artigo tem como objetivo analisar, por meio de uma revisão bibliográfica estruturada, os principais tipos de

serviços logísticos disponíveis e suas potenciais aplicações na indústria têxtil e de confecção. A pesquisa foi conduzida a partir das bases Scopus e Web of Science, utilizando procedimentos de análise e seleção que resultaram em um portfólio de 20 artigos centrais. Os resultados indicam que, além das áreas tradicionais de armazenagem e transporte, observa-se a expansão de serviços de valor agregado, como apoio ao cliente, tecnologia da informação, segurança e e-logística. Evidenciou-se ainda o papel crescente da terceirização, que permite às empresas focar em atividades estratégicas e estabelecer parcerias mais colaborativas ao longo da cadeia. A análise revela que a integração entre serviços logísticos e práticas colaborativas potencializa ganhos de competitividade e resiliência, mas também aponta lacunas quanto à mensuração de desempenho e incorporação de práticas verdes e digitais. Como contribuição, o estudo fornece uma visão integrada dos serviços logísticos, destacando sua importância para o fortalecimento da cadeia de suprimentos têxtil e de confecção e sinalizando oportunidades de pesquisa futura em temas emergentes como sustentabilidade, logística 4.0 e economia circular.

RESUMEN

La logística desempeña un papel estratégico en la competitividad de las cadenas de suministro, especialmente en sectores globales como el textil y la confección, que se enfrentan a crecientes demandas de eficiencia, trazabilidad, personalización y sostenibilidad. En este contexto, los servicios logísticos adquieren cada vez mayor importancia no solo como apoyo operativo, sino también como instrumentos de diferenciación y creación de valor. Este artículo busca analizar, mediante una revisión bibliográfica estructurada, los principales tipos de servicios logísticos disponibles y sus posibles aplicaciones en la industria textil y de la confección. La investigación se realizó utilizando las bases de datos Scopus y Web of Science, mediante procedimientos de análisis y selección que dieron como resultado una cartera de 20 artículos principales. Los resultados indican que, además de las áreas tradicionales de almacenamiento y transporte, existe una expansión de servicios de valor añadido como la atención al cliente, las tecnologías de la información, la seguridad y la logística electrónica. También se destacó el creciente papel de la externalización, que permite a las empresas centrarse en actividades estratégicas y establecer alianzas más colaborativas a lo largo de la cadena de suministro. El análisis revela que la integración de servicios logísticos y prácticas colaborativas mejora la competitividad y la resiliencia, pero también destaca las deficiencias en la medición del rendimiento y la incorporación de prácticas ecológicas y digitales. Como contribución, el estudio ofrece una visión integral de los servicios logísticos, destacando su importancia para fortalecer la cadena de suministro textil y de la confección y señalando oportunidades para futuras investigaciones en temas emergentes como la sostenibilidad, la Logística 4.0 y la economía circular.

1 INTRODUCTION

There are a number of changes that have taken place in the textile and apparel industry in relation to its functions, activities, and strategies. For example, demand and supply are no longer restricted to nations or regions, they have become global processes (ERYURUK; KALAOĞLU; BASKAK, 2011). In addition, product assortments have expanded significantly and market demands on product quality, traceability, delivery services and sustainability continue to increase (HSIAO *et al.*, 2010). One of the innovations in logistics is to specialize in its core activities and outsource non-essential activities to service providers. Outsourcing is an elegant way to solve organizational problems, in the literature there are numerous reports of its growing use (ANDERSSON and NORRMAN, 2002).

Most publications on logistics services discuss the use of traditional logistics processes, such as transportation and warehousing (DAIM; UDBYE; BALASUBRAMANIAN, 2012; VAN LAARHOVEN; BERGLUND; PETERS, 2000; STEFANSSON, 2006), advantages and risks of outsourcing (RAZZAQUE and SHENG, 1998; NOREK and POHLEN, 2001; SOHAIL and SOHAL, 2003), or the service provider selection process (DAIM; UDBYE; BALASUBRAMANIAN, 2012; AGHAZADEH, 2003). However, very little is known about the various types of logistics services that exist, whether basic or value-added, that involve logistics planning and control activities specifically in the textile and apparel supply chain.

In this sense, this article aims to analyze, through a theoretical study about logistics services, which are possible to be explored by the textile and apparel industry. As it is an updated literature review, the study tends to present a vision of the logistics service that is more integrated with the collaborative concepts of the supply chain. In this way, the structure and activities in the traditional areas of logistics, such as storage and transport, as well as in the areas that have been incorporated in recent years, such as customer service, information technology, safety and security, and e-logistics, are discussed.

For this, this work was divided into five sections, in addition to this brief introduction, there is section two that presents the methodological procedures, section three discusses logistics services in the textile and apparel industry, section four presents the types of logistics services offered and, finally, in section five, the final considerations of the article and some recommendations for future research are made.

2 METHODOLOGICAL PROCEDURES

This research can be considered conceptual theoretical, focused on the bibliographic analysis to be carried out through a structured literature review (MARASCO, 2008), with the objective of analyzing the theme of logistics service. To this end, the literature review method with four different phases will be used, as illustrated in Figure 1.

Figure 1

FlowTable of the Methodology to be applied in the research

Source: Based on the methodology employed by Marasco (2008).

2.1 PHASE 1: DEFINITION OF DATABASES AND JOURNALS

In the first phase for the composition of the bibliographic portfolio, the *Web of Science* and *Scopus* databases were defined. The choice of the *Scopus database* is due to the fact that it encompasses the journals that publish the most in Production Engineering and Logistics (MARASCO, 2008). In the case of choosing *the Web of Science*, it is due to the fact that the main journals in the area of Production Engineering are indexed.

The research was carried out by searching for publications in journals without time limit to verify the evolution of the theme over the years. The total number of papers found in these databases was the result of searching for the researched theme in the titles, abstracts and keywords of the articles.

2.2 2ND PHASE: DEFINITION OF KEYWORDS AND READING OF ABSTRACTS

In the second phase, the following keywords were defined for the literature review: "*Logistics and Service*".

The works found with this combination of keywords were mostly book chapters, standards, conference papers, among others, giving a total of 3,107 works. However, the present research focused on international articles, with the aim of giving greater credibility and also delimiting the research. Thus, in the two journals researched, 1,469 articles were obtained.

2.3 3RD PHASE: SELECTION OF ARTICLES

After reading the titles of the 1,469 articles, only the articles that had a strong relationship with the logistics service were selected, thus accounting for 243 publications in the *Scopus and Web of Science databases*.

Another filter used to verify the scientific relevance of the articles was the number of citations, which was used as a criterion for their permanence in the research publication database. The search for this criterion was carried out with the help of the *Google Scholar tool*, which presents the number of citations of each article through the title of the article. Finally, the abstracts, introduction, and conclusions of the articles were read. Of the 243 articles, only 20 were aligned with the two research themes, and were selected for full reading, as illustrated in Table 1.

2.4 4TH PHASE: ANALYSIS OF ARTICLES

After the construction of the bibliographic portfolio, a literature review was carried out. From this analysis it was possible to understand the subject and build knowledge about the objective proposed for the research. The results of this review are presented in the following items of the article.

3 LOGISTICS SERVICES IN THE TEXTILE AND CLOTHING INDUSTRY

Logistics, in its basic definition, is the efficient flow and storage of goods from their point of origin to the point of consumption. It is the part of the process in the supply chain that plans, schedules, and controls the flow of goods. It can also be seen as inventory management, of products in stock or in motion (ERYURUK; KALAOGLU; BASKAK, 2011). It is also defined as a business planning framework for the management of materials, services, information, and capital flows. It includes the increasingly complex information,

communication, and control systems required in today's business environment (ERYURUK; KALAOGLU; BASKAK, 2011).

The textile and apparel sector can be seen as a supply chain that encompasses a series of distinct activities, such as the supply of raw materials and inputs, the development of products and their production, distribution, and marketing. Figure 2 shows an illustration of this chain, with the dotted lines representing the flow of information, while the solid lines represent the flow of goods. Information flows from the customer providing production needs and delivery dates. In many cases, information flows directly from retailers to textile mills. The links that manufacture the product are formed by several companies that, in order to produce goods and services that make the information flow smoothly, need a series of logistical and business services. Depending on the size of the companies and the development of the economy, such services may be provided by the leading company in the supply chain or by service providers (ABERNATHY *et al.*, 1999).

Figure 2

Supply chain in the textile and apparel sector

Source: Adapted from Abernathy *et al.*, 1999.

Currently, large textile and apparel companies use logistics as a globalization strategy and have been outsourcing some operations, such as *inbound* and *outbound* logistics, which can be carried out at any stage of the chain. In addition, some processes in the apparel industry have also been outsourced, such as inventory and inventory management, repairs, stain removal, quality control, reprinting, counting, barcode application, labeling, packaging, placement of accessories, manuals and warranty documents, separation and classification of products, order management and assembly of product sets.

As a result, companies have obtained important advantages, such as time and cost reductions, being able to focus on their strategic activities in a more professional way.

4 TYPES OF LOGISTICS SERVICES

Logistics service can be called any activity that supports the processes of purchase, manufacture, sale, distribution and marketing, and they are generally outsourced because they do not constitute activities that are the company's business, in addition to collaborating to reduce costs, investments, obtaining expertise, etc. (LIEB, 2005; STEFANSSON, 2006).

Over time, many activities have been incorporated by logistics service providers, promoting the consolidation of partnerships. With this, it was possible to structure logistics services as an integral part of the client's business (GRIFFIS *et al.*, 2004).

In view of the literature review carried out, it was possible to elucidate several types of services that make up the logistics portfolio. These services can be divided into the most basic ones linked to the needs of moving products and their storage, as well as those with higher added value, which provide an appreciation of the product in relation to the logistical aspects involved. In each service category there is a series of specific activities and processes that complete its portfolio. Figure 3 presents a summary of the types of logistics services available in the market today.

Figure 3

Structure of Logistics Services available for Supply Chain

Source: Authors.

In the next items of the study, the details of each service are presented along with its specific portfolio. In addition, in each item, the possibilities of using these services by textile and clothing companies are presented and how this impacts the performance of the chain as a whole.

4.1 WAREHOUSING SERVICES

Inventory management of raw materials and finished products is necessary in all activities of the textile and apparel supply chain to obtain adequate production cycles and to supply the services demanded by the market. The physical operation of inventory management is usually carried out by distribution centers or warehouses, whose main activities are: receiving, storage, inventory control, product separation and loading (GUIMARÃES, 2008).

In addition to the basic services that are linked to storage both in warehouses and distribution centers, there are some types of value-added services that can be contracted by companies such as: *Cross-Docking*, product assembly, quality testing, product preparation, packaging, labeling, product rework, *Recall*.

For example, it is common for clothing companies to outsource some production processes to reduce operating costs, so it could hire others that add value to the product along with the storage service, passing on to the outsourced the responsibility for quality tests on the products received, labeling, packaging of products and availability in stock. As this type of service is usually hired in strategic locations as a way to speed up deliveries and reduce transportation costs, it is also possible to transfer steps in the after-sales process, such as rework and *recall*. Thus, administrative activities related to complaints and the rework or exchange of products could also be carried out.

Table 2 shows a summary of the main value-added activities and services that are related to warehousing.

Table 2

Types of logistics storage services offered by outsourcing companies

Basic Services in Warehousing		
	Description of Service Activities	Authors

Type of Service Offered		Power; Sharafali; Bhakoo (2007)	Hsiao <i>et al.</i> (2010)	Aghazadeh (2003)	Van Laarhoven; Berglund; Peters (2000)	Daim; Udbye; Balasubramanian (2002)	Stefansson (2006)	Guimarães (2008)
Receipt of products	All products that are stored, whether in warehouses or Distribution Centers, go through a receiving process, which consists of checking product characteristics with pre-established information.					X		X
Product storage	It is the product stored for later shipment. It requires a specific technique to locate the products according to the characteristics of the product itself and the form of storage.	X	X		X	X	X	
Inventory Control	Some products are sent for storage and there they are tested according to criteria established by the manufacturer	X	X	X	X	X	X	X
Order Picking	It consists of the separation of products by order. There are several picking techniques depending on the product and the type of order.		X		X		X	X
Loading orders	It consists of the shipment of products for subsequent transport. The form of loading must suit the mode used for loading.			X	X			X
Value-Added Services in Warehousing								
Cross-Docking	The cargo arrives at the terminal in a consolidated way and is dispatched fractionally, without generating storage, there is only one passage. The process requires synchronization in the receiving and dispatch processes.						X	
Product assembly	It consists of the final formation of products that are assembled when the order is confirmed for dispatch.	X	X	X	X	X		
Quality Control	Some products are sent for storage and there they are tested according to criteria established by the manufacturer			X	X	X	X	
Product preparation	There are products that require specific formatting and packaging before being shipped, or even specific packaging for dispatch.	X	X				X	
Product Packaging	You receive the consolidated product and then pack it when it is sold (or the type of sale)		X	X			X	
Product labeling	According to the type of sale, there is personalized or specific labeling.		X	X	X		X	

Rework and Recall	Products that return and allow reuse can be worked on in warehouses or distribution centers, avoiding going back to the factories.			X			X

4.2 TRANSPORTATION SERVICES

The transportation service is one of the main logistics functions. In addition to representing the largest portion of logistics costs in most organizations, it plays a fundamental role in the performance of several dimensions of customer service. Even with the advancement of technologies, which allow the exchange of information in real time, transport continues to be fundamental to achieve the logistical objective: the right product, in the right quantity, at the right time, in the right place, at the lowest possible cost. With an increasingly demanding and globalized market, companies feel the need to find partners that ensure not only the entire logistics service, but also the transport service of their products at more affordable costs (GUIMARÃES, 2008).

In order to improve the performance of services, especially by speeding up deliveries, many companies have sought alternatives by increasing new transportation systems, such as the system of loading in standardized carts used for loading and unloading, or standard packaging that tends to facilitate operations. However, these systems must be well studied according to the needs of each chain and the involvement of its agents (JAHRE and JOHAN, 2004). Alternatives that involve the handling of cargo linked to transport, such as *merge-in-transit*, are also an option for seeking results and improving services (HSIAO *et al.*, 2010; STEFANSSON, 2006)

Another aspect that has transformed transportation services has been the use of management tools supported by software capable of analyzing distribution networks, synchronizing and simulating the best alternatives, in addition to providing agility to the system. Geographic location systems also support these services (CAPUTO *et al.*, 2003; ESPER and WILLIAMS, 2003). For the textile industry, this type of value-added service in transportation reduces the risk of theft in the transfer of product loads, especially the loading of yarns or fabrics on rolls.

An important point in transport services is the growing demand from the textile and apparel chain for value-added services. An example is the distribution of clothing items to some retail companies that require products to be delivered on hangers, with the customer's price and labels. This type of personalized service is usually carried out by the clothing

companies themselves, but it is a process that can clearly be absorbed by transport service providers.

Table 3 presents a summary of the main transport services offered by transport companies.

Table 3

Types of transport logistics services offered by outsourcing companies

Basic Services in Transportation								
Type of Service Offered	Description of Service Activities	Authors						
		Power; Sharafali; Bhakoo (2007)	Hsiao et al. (2010)	Aghazadeh (2003)	Van Laarhoven; Berglund; Peters	Daim; Udbye; Balasubramanian	Stefansson (2006)	Hannon (2005) Lieb (2005)
Transportation (Outbound)	It groups a series of storage, handling, order picking and loading functions, until the cargo is delivered. In a market view, it consists of delivering the product to the customer or point of sale.	X				X		X
Transportation (Inbound)	Its purpose is to search for the distribution or manufacturing product to be delivered to the manufacturing or assembly customer.	X						X
Merge-in-Transit	The main logic is to coordinate the meeting of several supplies or vehicles so that compounds in another vehicle can form the cargo planned for dispatch.				X			X
Transit-Point	It consists of sending consolidated loads in larger vehicles, which will be passed on in a pre-defined location to smaller vehicles that operate regionally, for example.		X				X	
Value-Added Services in Transportation								
Fleet Management	Manage the processes involving the various types of vehicles, with the intention of providing decision-makers with information on the performance of these assets.	X	X	X				X
Fleet Location	Supported by GPS-type systems, the software allows companies to track where their cargo is.	X			X			X
Scripting	Through the use of specific software, it is possible to program loads according to the type of vehicle, organize routes according to the best route and according to the variables imposed by customers and the route.							X

Definition of Modals	The study of the possible modes to be used for the transportation of cargo, according to requirements specified by customers.							X	
Freight Selection Quote	It is a system of organization of several carriers that allows the service provider to seek the best freight options, as well as to have flexibility and agility in serving their customer.	X							X
Broker Service	It consists of brokering carriers for other companies.							X	X

4.3 CUSTOMER SUPPORT SERVICES

Customer service is the component that differentiates modern logistics from the traditional approach, since currently the importance lies not only in the search for operational efficiency, but also in meeting the needs of customers (MARCHESINI and ALCÂNTARA, 2012). Logistics processes seek to provide superior quality and low-cost customer service, adding value to customers. Thus, logistics services have great potential as an instrument of differentiation of a company. Morash and Lynch (2002) found that customer service is the most important training in the search for better performance. In addition, it is related to the generation of revenues and, thus, the basis for the elaboration of a strategy in a supply chain aimed at generating a certain level of logistics service to the customer (MARCHESINI and ALCÂNTARA, 2012).

In the textile and apparel supply chain, customer service can generate more logistical integration between the various actors, reducing costs by sharing activities with service providers and improving the performance of the entire chain. For example, call-center services can be directed to logistics operators who manage the information in this channel and also relate to complaint services where they record information, monitor actions, and rework or exchange textile or clothing products.

These services serve as complements to traditional logistics processes, generating greater value for the customer and the company that offers it. The apparel industry often needs to transport small volumes of semi-finished and finished products between the various partners in the supply chain. Therefore, support services such as simulations and logistics studies are essential to improve routes and reduce transport times for these products.

In addition to the examples mentioned, there are several other possibilities for using the customer support logistics service in the textile and clothing industry. Table 4 presents a summary of the main customer support services offered by logistics companies.

Table 4

Types of logistics services to support customers offered by outsourcing companies

Type of Service Offered	Description of Service Activities	Authors					
		Power; Sharafali; Bhakoo (2007)	Aghazadeh (2003)	Daim; Udbye; Balasubramanian (2004a)	Stefansson (2006)	Hannon (2005)	Lieb (2005)
Order fulfillment and fulfillment	It consists of receiving the order from customers and covers the documents necessary for the registration of the order and its circulation among the various partners involved, including the customer himself.				X		X
Complaints	Management of complaints, involving the entire process of registration, transmission, follow-up and feedback.				X		
Call-center operation	It supports the service of the end customer, working according to strategies defined by the contractor.	X					
Customer inventory management	It involves the management of the volumes of inventory needed for sale (outbound) and for supply (inbound)	X			X		
Demand Management	It is related to the management of information that allows you to better meet market demand.				X		
Order management at suppliers	Management of orders with suppliers in order to control flows and stock levels in the supply chain.				X		X
Customs Administration (import and export)	To offer all the services inherent to the import and export process.		X	X			
Logistics collection management	To speed up the financial process and reduce wear and tear in the commercial relationship between the service provider and the customer.	X			X		
Reverse Logistics	It is the management of the return of products or inputs after the life cycle.	X	X		X		X
Development of Logistics Projects	These are specific solutions that can be offered by logistics companies to help the customer's processes.	X					X
Simulations and Logistics Studies	With the help of software, it is to generate specific solutions to streamline decision-making in logistics activities.					X	
Product Development Support	It aims to streamline the development process and generate improvements in the product design that facilitate logistics activities.					X	
Information and Logistics History	Have a database with information and histories about the logistics operations carried out by the customer, especially in relation to the market and suppliers.				X

4.4 LOGISTICS INFORMATION TECHNOLOGY SERVICES

Information technology in support of the logistics process has been used as a great partner for the optimization of flows and improvement of the level of service (PATTERSON; GRIMM; CORSI, 2004). This innovation is essential for logistics companies to serve the market, since it contributes to the efficiency and integration of the operation in the supply chain (CHAPMAN; SOOSAY; KANDAMPULLY, 2003).

In addition, the necessary structure is summarized in equipment (hardware) and applications (Software Solutions), such as satellite transmission, web-based orders, electronic data transmission, bar codes, systems for order entry, routing, inventory systems and stock replenishment, among others (OVALLE and MARQUEZ, 2003).

The development of information technology in the logistics flow, from production operations to distribution, with systems of cooperation and information sharing between manufacturer-retailer and between manufacturer-supplier, contribute to demand management and more efficient decision-making (STEFANSSON, 2006). Considering that these processes are integrated with the management of the supply chain, it is essential for the service provider to have these technologies, thus being able to offer its contractor the opportunity to count on an increase in the processes and technology used (SAUVAGE, 2003).

For example, the textile and apparel supply chain increasingly needs its processes to be fast and efficient, especially among links closest to consumers. In retailers, when a purchase is made, this information can feed a database of a logistics company that manages the customer's inventories and can automatically articulate the various logistics processes so that the stores are replenished with products and, in addition, can generate production needs for the companies in this chain.

Another example of the importance of this type of service in the textile and apparel industry can be the management of customer complaints that can be carried out by logistics companies that can automatically record the information, evaluate this complaint and exchange or rework the product, returning the feedback to the customer.

Given the importance of information technology services, Table 5 presents some types of logistics systems that are available to companies. These technological applications support the various activities of companies that provide services to their customers, remembering that all these applications must be accompanied by the necessary physical structure (assets and space), as well as software.

Table 5

Types of logistics information technology services offered by outsourcing companies

Type of Service Offered	Description of Service Activities	Authors				
		Power; Sharafali; Bhakoo (2007)	Aghazadeh (2003)	Alkhatib; Darlington; Nguyen (2015)	Van Laarhoven; Berglund; Peters (2006)	Stefansson (2006)
WMS - Warehousing Management System	Warehouse Management System provides directed stock rotation, intelligent picking directives, automatic cross-docking consolidation to maximize the use of storage spaces.	X	X			
RFID - Radio-Frequency Identification	It is a method of automatic identification through radio signals, retrieving and storing data remotely through devices called RFID tags.	X				
TMS - Transportation Management System	Transportation Management System or Transportation and Logistics Management System, this system allows you to control the entire operation and management of transportation in an integrated way.	X	X		X	X
EDI - Electronic Data Interchange	It can be defined as the electronic movement of standard business documents between, or within, companies. EDI uses a self-collapsing structured data format that allows data to be transformed without being re-entered.	X	X			X
ECR - Efficient Consumer Response	It is a voluntary movement, based on change and continuous improvement, which affects the entire production and distribution chain of consumer products. It aims to establish a consistent flow of information and products that are included bidirectionally in the supply logistics chain					X
VMI - Vendor Managed Inventory	It is a system to optimize the performance of the supply chain, in which the supplier is responsible for managing the inventory levels at the customers.	X				X
CR - Continuous Replenishment	Continuous supply between trading partners, with information related to the actual sales given by the scanners, with supply adjusted to what is necessary, with the maintenance of minimum stocks and with information compared with the demand forecast previously agreed between the trading partners.					X
CPFR - Collaborative Planning, Forecasting, and Replenishment	It is a collaborative program between the different actors in the supply chain, which establishes coordination between production, planning, sales forecasting and replenishment.		X		X	

ERP - Enterprise Resource Planning	They are systems developed to control various departments and processes of a company.			X		
Data Warehousing	It is a digital data warehouse that serves to store detailed information about a company, creating and organizing reports through histories that help in decision-making.		X	X		
BI - Business Intelligence	It is a set of techniques and tools to assist in the transformation of raw data into meaningful and useful information in order to analyze the business.	X				X

4.5 LOGISTICS SAFETY AND SECURITY SERVICES

In response to the growing risk profile faced by companies around the world, logistics security services have been gaining attention from various industrial segments, especially those with higher value-added products HENDRICKS and SINGHAL (2003).

The increase in interest in this topic is due to the growth in the level of efficiency and integration within the chains. For Knemeyer; Zinn; According to Eroglu (2009), highly effective supply chains typically do not work with excess resources, nor do they have enough teams to collaborate on recovery after an unexpected event occurs. Additionally, due to global markets and operations, local events can have repercussions and impact in various parts of the world. Sheffi (2005) suggests that the probability that some link in the chain will suffer a rupture is high, even if the chances of each facility being affected individually are small, so in some logistical activities it is important that safety procedures are adopted.

Transportation is the main component of the logistics system, and one of the most important decisions in the management of logistics operations involves the safety of the transported cargo. For example, in the spinning industry, it is a link in the textile supply chain that has great exposure to safety risks, due to the value of cargoes. In view of this situation, whenever possible, companies end up moving cargo with monitoring, either with escort or GPS.

Table 6 presents a summary of the main logistics protection and security services offered by logistics companies.

Table 6

Types of logistics protection and security services offered by outsourcing companies

Type of Service Offered	Description of Service Activities	Authors		
		Power; Sharafali; Bhakoo (2007)	Alkhatib; Darlington; Nguyen (2015)	Daim; Udbye; Balasubramanian (2012)
Embedded Intelligence	Responsible for the real-time monitoring of carriers' and shippers' loads on a continuous basis through security and logistical support programs, which allow the visualization of vehicles, the exchange of messages and the sending of commands that enable the taking of preventive or corrective measures from the monitoring center.		X	X
Risk Analysis	These are Risk Management Plans that are prepared through the customization of each stage of the trip, taking into account cargo monitoring histories and other parameters such as insurance policy.		X	
Employee Profile Assessment	It is a quick and effective analysis of the driver's and vehicle's history, identifying if there is any divergence for the service. This evaluation significantly increases safety in the shipment and transport of cargo.		X	X
Cargo Escort	They are Armed Escort teams that monitor the cargo, further increasing transport safety, especially on roads considered high risk.	X		
Prompt Answer	It is the tactical and ostensive support service. By activating the Prompt Response team, the company receives immediate support from specialized teams in any region to locate the vehicle, at points with no signal of the tracking equipment or suspected accident.	X		
Logistics safety training	These are training sessions on the monitoring of cargo vehicles, adapting the procedures to the necessary safety conditions, guiding and minimizing operational failures. Contributing to increase safety, reduce costs, protect the lives and property of companies.

4.6 E-LOGISTICS SERVICES

The evolution of information and communication technologies, consolidated in new equipment and software, has enabled a new model of commerce: the so-called electronic commerce or e-commerce, which is the acquisition of products without the need for physical presence at the place of purchase, allowing the transaction to be carried out electronically,

usually via the internet. Organizations seek to follow this evolution resulting from the business model created by the internet, developing skills to act and maintain themselves in this new market (NORDSTRON and RIDDESTRALE, 2001).

The logistics to serve e-commerce presents itself with a perspective of growth and challenge for new ventures, consequently the transport and distribution operation needs to be agile. In e-logistics services, practically the same tools are applied as in logistics related to traditional commerce, paying attention to the fact that they must be adapted to make virtual commerce viable, they are: the postponement of logistics; dematerialization and exchange of resources; leveraged boarding and CAM service (LEE and WHANG, 2002).

The clothing industry is one of the oldest sectors to conduct its business with the help of e-commerce, having started in the mid-1990s. Clothing products are one of the favorite and best-selling types through the internet. Therefore, the logistics infrastructure to serve this market is very important. Table 7 presents a summary of the main e-logistics services offered by service providers.

Table 7
Types of e-logistics services offered by outsourcing companies

Type of Service Offered	Description of Service Activities	Authors		
		Alkhatib; Darlington; Nguyen (2015)	Nordstron and Riddestrale (2001)	Lee and Whang (2002)
Logistical postponement	It is the condition of delaying production as much as possible, aiming to deliver on order as close as possible to the order, in order to minimize the margin of error of sales forecasts, in some cases, storage may involve activities of assembling, packaging and moving the product.	X	X	
Warehouse in Motion	The idea is not to specify quantities in advance, the products are not previously designated on the truck, this decision is postponed from the time of loading to the time of unloading, which thus becomes a warehouse in motion, to meet any changes in orders and especially on long distances.	X		

Dematerialization	It is the transformation of the flow of materials by flow of information, such as stamps, receipts, financial statements, etc.	X		
Exchange of Resources	It is the sharing of resources that can be: internet servers, information systems, communications capacity, warehouses, transport equipment or logistics experience.	X		
Leveraged shipments	It is the process of concentrating orders from customers located close to each other or the considerable appreciation of the order, that is, the better the ratio of the invoiced value transported per km traveled, the better the delivery performance.	X		X

Source: Authors.

5 FINAL CONSIDERATIONS

There is currently a growing demand for logistics services in developed markets, where customers are relatively sophisticated, resulting in a great deal of competitive pressure. Customer requirements for faster delivery, continuous shipment tracking, and electronic information transfer reflect a desire to minimize wasted time.

In view of the need to improve the performance of logistics operations inside and outside organizations, it is essential that each company focuses its activities on the main processes and has adequate services available that meet its needs. However, the vast majority of publications on the subject address a set of solutions without consensus or uniformity, probably due to the contemporaneity of logistics attributions in the supply chain.

In this aspect, the article contributed to the development of a current picture of the main types of existing logistics services, as well as their integration with the other existing logistics processes. In addition, the results of this study make a useful contribution to the textile and apparel industry and to academia, as well as to analyze the various logistical possibilities in these industrial sectors.

For future work, it is interesting to understand more specifically how the various logistics services have been used by the textile and apparel industry and how they can be optimized to improve the overall performance of the supply chain in this sector.

ABSTRACT

This study performs a comparative analysis of solar irradiation data provided by the Brazilian Solar Energy Atlas and the Global Solar Atlas for the state of Sergipe. It was identified that the data provided by the databases present relevant differences in the solar irradiation estimate, in which the values of the Global Solar Atlas are systematically higher with an average difference of 1.8% in relation to the Brazilian Atlas. These variations can be attributed mainly to the different data collection and modeling methodologies, spatial resolution and analysis periods adopted by each database. These divergences have relevant practical implications for the technical and economic planning of photovoltaic systems, reinforcing the importance of local measurements to increase the reliability of solar projects. The study provides important subsidies for strategic decisions about solar energy in Sergipe, contributing to energy efficiency and local sustainability.

Keywords: Solar Irradiation. Photovoltaic Planning. Sergipe.

RESUMO

Este estudo realiza uma análise comparativa dos dados de irradiação solar disponibilizados pelo Atlas Brasileiro de Energia Solar e pelo Global Solar Atlas para o estado de Sergipe. Foi identificado que os dados disponibilizados pelas bases apresentam diferenças relevantes na estimativa de irradiação solar, em que os valores do Global Solar Atlas são sistematicamente mais elevados com uma diferença média de 1.8% em relação ao Atlas Brasileiro. Essas variações podem ser atribuídas principalmente às metodologias distintas de coleta e modelagem dos dados, resolução espacial e períodos de análise adotados por cada base. Essas divergências têm implicações práticas relevantes para o planejamento técnico e

RESUMEN

Este estudio realiza un análisis comparativo de los datos de irradiación solar proporcionados por el Atlas Brasileño de Energía Solar y el Atlas Solar Global para el estado de Sergipe. Se identificó que los datos de estas bases de datos presentan diferencias significativas en las estimaciones de irradiación solar, siendo los valores del Atlas Solar Global sistemáticamente superiores, con una diferencia promedio del 1,8 %, en comparación con el Atlas Brasileño. Estas variaciones se atribuyen principalmente a las distintas metodologías de recopilación y modelado de datos, la resolución espacial y los periodos de análisis adoptados por cada base de datos. Estas discrepancias tienen importantes implicaciones prácticas para la planificación técnica y económica de los sistemas fotovoltaicos, lo que refuerza la importancia de las mediciones locales para aumentar la fiabilidad de los proyectos solares. El estudio proporciona información importante para la toma de decisiones estratégicas en materia de energía solar en Sergipe, contribuyendo a la eficiencia energética y la sostenibilidad local.

Palabras clave: Irradiación Solar. Planificación Fotovoltaica. Sergipe.

1 INTRODUCTION

The growing global demand for clean and renewable energy sources has driven investments and research focused on solar energy, considered one of the most promising alternatives due to its abundance, technical feasibility, and contribution to climate change mitigation. In the Brazilian context, the highlight is even greater: the country has one of the highest solar incidences on the planet, with the Northeast being one of the regions with the greatest potential for photovoltaic generation (Moreira Júnior & Souza, 2020; Bursztyn, 2020).

In the state of Sergipe, the climatic conditions are especially favorable to the use of this resource, justifying the expansion of the energy matrix through solar systems. However, the effective use of this potential depends fundamentally on the accuracy and reliability of the solarimetric data used in the planning and dimensioning of photovoltaic plants (Morais et al., 2021; Rocha et al., 2022; Araújo et al., 2024).

Several databases are used for this purpose, the main ones being the Brazilian Atlas of Solar Energy, prepared by the National Institute for Space Research (INPE), and the Global Solar Atlas, maintained by the World Bank and operated by the company Solargis. Both provide estimates of Global Horizontal Irradiation (GHI) and Normal Direct Irradiation (DNI), among other variables. However, recent studies show that these bases may present significant discrepancies in the estimated values, which directly impact the technical and financial feasibility of photovoltaic projects (Porfirio et al., 2020; Uchôa, 2022; Reis et al., 2023).

In addition, the Brazilian Atlas, despite its technical detail and history of local validations through the SONDA network, has been outdated since 2017, which may compromise its accuracy in the face of recent climate change (Martins et al., 2019; INPE, 2025a). On the other hand, the Global Solar Atlas updates its data periodically based on multi-satellite imagery, but its global semi-empirical model may not capture regional nuances, such as microclimates or superirradiance events common in the northeastern semi-arid region (Freitas, 2023; Araújo, 2024).

In this scenario, analyses that critically compare these bases, pointing out their limitations and practical impacts, become increasingly relevant. The wrong choice of a database can lead to errors in sizing, under- or over-sizing systems, and negatively influencing the financial return of solar projects (Tiba, Azevêdo, 2023).

Therefore, this study aims to perform a detailed comparative analysis between the Global Solar Atlas and the Brazilian Atlas of Solar Energy in the state of Sergipe, evaluating their GHI estimates and discussing the technical, economic and strategic implications of these differences for local energy planning.

2 METHODOLOGY

2.1 FIELD OF STUDY

The study adopted the geographic division of the State of Sergipe based on the definition of mesoregions and microregions established by the Brazilian Institute of Geography and Statistics (IBGE). Sergipe is composed of three mesoregions, which, in turn, encompass a total of 13 microregions, as shown in Table 1. Aiming at a better understanding, throughout the present work, each micro-region was represented by a prominent municipality, considering its relevance in terms of installed power of Distributed Generation (DG) with photovoltaic systems. Data collection required the definition of geographic coordinates for each location. Considering that most of the systems are concentrated in urban areas, the points were defined in the central region of the reference cities, aiming to reflect real installation conditions.

Table 1

List of Municipalities and Coordinates chosen

Mesoregion	Microregion	Reference Municipality	Geographic coordinates

2.2 DATABASES USED

The Brazilian Atlas of Solar Energy – 2nd Edition (2017), produced by the National Institute for Space Research (INPE) (Pereira et al. 2017), and the Global Solar Atlas,

developed by the World Bank in partnership with the International Finance Corporation (IFC) and operated by Solargis (World Bank, 2019), provide essential data on solar radiation and photovoltaic potential. This information helps planners, investors, and researchers assess the feasibility of solar projects in Brazil and around the world.

Although both atlases provide detailed information on solar radiation and meteorological variables, they differ in scope and methodology. The Brazilian Atlas of Solar Energy focuses on the national territory, while the Global Solar Atlas offers a comprehensive view of the availability of solar energy on a global scale, allowing for comparative analysis between different regions.

Despite these differences, both share the objective of quantifying the solar potential, using different approaches that will be analyzed in the "Results and Discussion" section.

2.3 DATA AVAILABLE IN THE DATABASES

The databases provide information on solar radiation, photovoltaic generation, and environmental and geographic factors, each with its own data coverage (Table 2). With regard to solar radiation, the following are available:

- Diffuse Irradiation: Portion of solar radiation dispersed in the atmosphere before it reaches the surface.
- Horizontal Diffuse Irradiation: A component of solar radiation dispersed before it reaches the ground.
- Normal Direct Irradiation (DNI): A direct component of solar radiation incident perpendicular to the direction of the sun.
- Global Horizontal Irradiation (GHI): Total solar radiation incident on a horizontal surface.
- Irradiation on the Inclined Plane: Solar radiation received on an inclined surface, considering different angles of inclination.
- Irradiation Photosynthetically Active Radiation (PAR): Range of solar radiation used in the process of photosynthesis by plants.

With regard to data related to photovoltaic generation, the following are available:

- Specific Photovoltaic Power Output (PVOUT): Estimated energy that a photovoltaic system can generate in a given location.
- Optimal Inclination of Photovoltaic Modules: Best inclination angle for installing solar panels in a given location.

- Optimal Global Inclined Plane Irradiation: Radiation received on a surface inclined at the optimal angle to maximize uptake.

With regard to environmental and geographical factors, the following are available:

- Terrain Elevation: Altitude of the site, which can influence the radiation received.
- Air Temperature: Climatic information relevant to the efficiency of photovoltaic systems.

Table 2

Data available for each database

Group	Available Data	Brazilian Atlas	Global Solar Atlas
Solar radiation	Diffuse Irradiation	Yes	No
	Horizontal Diffuse Irradiation	No	Yes
	Normal Direct Irradiation (DNI)	Yes	Yes
	Global Horizontal Irradiation (GHI)	Yes	Yes
	Irradiation on the Inclined Plane	Yes	No
	Irradiation Photosynthetically Active Radiation (PAR)	Yes	No
	Specific Photovoltaic Generation Potential (PVOUT)	No	Yes
Photovoltaic generation	Optimal Inclination of Photovoltaic Modules	No	Yes
	Global Irradiance in the Optimal Inclined Plane	No	Yes
Environmental and geographical factors	Air Temperature	No	Yes
	Land Elevation	No	Yes

Source: Prepared by the authors (2025).

Considering the scope of the information provided by the two databases, the Brazilian Atlas of Solar Energy stands out for offering more detailed data on specific components of solar radiation, such as diffuse irradiation, irradiation on the inclined plane and photosynthetically active radiation (PAR). The Global Solar Atlas provides useful data for the sizing of photovoltaic plants, providing the data of Generation Potential (PVOUT), Optimal Inclination and Irradiation in the Optimal Plan. In addition, this base includes environmental variables such as air temperature and terrain elevation, which are not provided by the Brazilian Atlas.

2.4 COMPARATIVE ANALYSIS OF THE DATA PROVIDED BY THE DATABASES

To compare the data provided by the Brazilian Atlas of Solar Energy (2017) and the Global Solar Atlas (2024), the parameter of Global Horizontal Irradiation (GHI) was selected. The choice of GHI as the main metric is due to the fact that it is the variable present in both databases and expressed in the same unit of measurement: kWh/m² per day. Although

Normal Direct Irradiation (NID) is also present in both databases and is a relevant variable for projects that use solar tracking systems, the focus of this study is on the general energy planning of the State of Sergipe. Thus, the GHI was considered more suitable to represent the availability of solar energy for photovoltaic generation in different scenarios.

The values referring to the GHI parameter were collected from the databases and recorded in a Microsoft Excel spreadsheet.

GHI values were compared directly, without temporal adjustments, considering that both sources provide estimates based on the annual average.

Then, the following statistical measures were calculated, each with a complementary role in the evaluation of the discrepancies between the solar irradiation data:

- **Average Error (ME):** It was chosen because it allows the identification of whether there is a systematic bias, that is, whether one database consistently tends to provide higher or lower values in relation to the other.
- **Mean Absolute Error (MAE):** Selected because it provides a clear measure of the average magnitude of deviations, without negative and positive errors canceling each other out, offering a direct view of the average accuracy between data sets.
- **Mean Square Error (RMSE):** Essential to detect and penalize larger discrepancies, being especially useful to evaluate extreme cases or significantly discrepant values, ensuring a detailed perception of the existence of relevant errors that may compromise more detailed studies.
- **Standard Deviation of Differences:** Fundamental to understand the variability of the observed differences, helping to identify consistencies or inconsistencies in the divergences between the bases.
- **Pearson's correlation:** Chosen to evaluate the intensity and direction of the linear association between the sets, crucial to determine if there is a common trend in the variations of the databases.
- **Coefficient of Determination (R^2):** Indispensable to quantify how much the variations in one database explain the variations observed in the other, providing a deeper understanding of the predictive relationship between the sets.

These combined metrics provide a comprehensive and detailed assessment, which is essential to ensure informed decisions in selecting the most appropriate data sources for energy planning.

Equation (1) - Mean Error (ME): The mean error measures the mean difference between the observed values (y_i) and the estimated values ($\hat{y}_i$):

$$ME = \frac{1}{n} \sum_{i=1}^n (y_i - \hat{y}_i) \quad (1)$$

Equation (2) - Mean Absolute Error (MAE): The MAE calculates the average of the absolute values of the differences between the observed and estimated values:

$$MAE = \frac{1}{n} \sum_{i=1}^n |y_i - \hat{y}_i| \quad (2)$$

Equation (3) - Root Mean Squared Error (RMSE): The RMSE measures the mean squared error, penalizing larger errors due to squared:

$$RMSE = \sqrt{\frac{1}{n} \sum_{i=1}^n (y_i - \hat{y}_i)^2} \quad (3)$$

Equation (4) - Standard Deviation of Differences: The standard deviation of differences measures the dispersion of differences between the observed and estimated values:

$$\sigma_d = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (d_i - \bar{d})^2} \quad (4)$$

Where:

$d_i = y_i - \hat{y}_i$ represents the differences between the observed and estimated values.

$\bar{d}$ is the average of the differences divided by semicolons.

Equation (5) - Pearson's correlation: Pearson's correlation measures the strength of the linear relationship between two variables:

$$r = \frac{Cov(X, Y)}{\sigma_X \sigma_Y} \quad (5)$$

Where:

σ_X and σ_Y are the standard deviations of the variables X and Y.

Equation (6) - Coefficient of Determination (R^2): The coefficient of determination measures the proportion of variability of the observed values explained by the model:

$$R^2 = 1 - \frac{\sum_{i=1}^n (y_i - \hat{y}_i)^2}{\sum_{i=1}^n (y_i - \bar{y})^2} \quad (6)$$

Where:

$\bar{y}$ It is the average of the values observed in Y_i .

3 RESULTS

3.1 ANALYSIS OF THE METHODOLOGICAL DIFFERENCES OF THE DATABASES

To analyze the differences between the values provided by the databases, it is necessary to understand their methodological distinctions, which explain the variations in the results. Table 3 presents the main comparative characteristics between the atlases, highlighting that the Brazilian Atlas of Solar Energy, developed by INPE, uses the BRASIL-SR radiative transfer model, focusing exclusively on the Brazilian territory and without updates since its second edition in 2017. In contrast, the Global Solar Atlas, maintained by the World Bank in partnership with Solargis, employs a semi-empirical satellite-based model, with global coverage, including oceans, and undergoing monthly recalibrations that incorporate recent atmospheric data. In addition, Global Solar Atlas undergoes frequent improvements and updates with its latest version made available in May 2024 (version 2.11).

Table 3

Comparison of database characteristics

Column 1	Column 2	Column 3
Accountable	LABREN/INPE	World Bank/Solargis
Geographic focus	Brazil	Global (including oceans)
Base model	BRASIL-SR radiative transfer model	Semi-empirical satellite-based Solargis model
Primary source	SONDA network (ground stations) + GOES satellite	Multi-satellites (Meteosat, GOES and Himawari) + global ground stations
Last updated	2017 (2nd edition)	May/2024 (v2.11)
Recalibration	There is no	Monthly, including recent atmospheric data
Interface	Digital book	Interactive maps and monthly/yearly time series

Source: Prepared by the authors (2025).

3.1.1 Brazilian Atlas of Solar Energy

In the Brazilian Atlas, obtaining the data that underlie the Atlas is based on the integration of in situ measurements and advanced computational modeling. The measurements were carried out by the Brazilian Network of Solarimetric Monitoring Stations (SONDA), a program that maintains meteorological stations equipped with sensors for monitoring solar radiation in different regions of Brazil. These sensors include pyranometers for measuring global irradiance and radiometers for direct and diffuse components of solar radiation (INPE, 2025b).

In addition to the measured data, the Atlas incorporates numerical modeling based on images from geostationary satellites, such as those operated by the GOES (Geostationary Operational Environmental Satellites) program. The modeling uses algorithms to estimate solar irradiance on the Earth's surface, combining atmospheric information, such as aerosols and cloud cover, with calibration techniques from data from SONDA stations. This approach allows a high spatial and temporal resolution estimate of the availability of solar energy in the Brazilian territory (INPE, 2025a).

The result of this process is a comprehensive database that subsidizes scientific research, photovoltaic energy generation projects and the formulation of public policies for the energy sector.

3.1.2 Global solar atlas

The Global Solar Atlas data is obtained from advanced numerical modeling, combining measurements from geostationary satellites and ground-based sensors. The methodology uses images from meteorological satellites, such as those from the Meteosat and GOES

programs, to estimate solar irradiance on the Earth's surface. This estimate is improved through atmospheric models that consider factors such as cloud cover, aerosols, and water vapor (World Bank, 2024a).

In addition to satellite-based modeling, the Global Solar Atlas incorporates calibration data from solarimetric measuring stations in various regions of the world. The company Solargis performs systematic validations to ensure the accuracy of the data, comparing the model estimates with the actual solar irradiance measurements. The platform provides interactive maps and time series of parameters such as horizontal global radiation (GHI), direct normal radiation (DNI) and photovoltaic generation potential, with a spatial resolution of up to 1 km (World Bank, 2024b).

The integration of numerical modeling and terrestrial measurements allows Global Solar Atlas to provide highly reliable information, being an essential tool for feasibility studies and global energy planning.

3.2 ANALYSIS OF THE METHODOLOGICAL DIFFERENCES OF THE DATABASES

Initially, a detailed comparative analysis of the data provided by the Brazilian Atlas of Solar Energy and the Global Solar Atlas for the state of Sergipe was carried out.

As presented in the study area, 13 reference municipalities were used, covering all micro-regions of Sergipe. Table 4 shows the annual average values of Global Horizontal Irradiation (GHI) in kWh/m² per day.

Table 4

Tables should have their titles at the top

Reference Municipality	Geographic coordinates	Average annual GHI (kWh/m ² per day)	
		Brazilian Atlas	Global Solar Atlas
Canindé do São Francisco	-9.657751, -37.794373	5,41	5,539
Carira	-10.358032, -37.704920	5,28	5,355
Our Lady of Sorrows	-10.480661, -37.220805	5,28	5,471
Itabaiana	-10.689492, -37.431162	5,28	5,463

Resort	-11.261429, -37.438354	5,42	5,558

Source: Research data - Prepared by the authors (2025).

Notable differences are observed in the estimates of global horizontal solar irradiance (GHI). These differences result from the different methods employed in each Atlas, considering historical series, data acquisition periods, and different spatial resolutions.

There is also a difference in the way the data is presented, depending on the platform used, the consolidated data for the state of Sergipe are presented below.

3.2.1 GHI in Sergipe – Global solar atlas

In Sergipe, the global horizontal solar irradiation (GHI) varies between 5.26 and 5.98 kWh/m² per day, with an average of 5.51 kWh/m².

Figure 1

GHI (Global horizontal irradiation) in Sergipe

Source: Global Solar Atlas (2025).

These values are considered favorable for photovoltaic energy generation, surpassing the average of many regions of the world that invest in this type of energy. The distribution of GHI in the state reveals that 5.5% of the area has values above 5.80 kWh/m², while 15.1% registers between 5.80 and 5.60 kWh/m². Most of the territory (61.3%) has irradiation between 5.60 and 5.40 kWh/m², and the remaining 18.2% have values below 5.40 kWh/m².

3.2.2 GHI in Sergipe – Brazilian Atlas

The Global Horizontal Irradiation in the Brazilian Atlas is presented indirectly, to obtain the data, it is necessary to fill out a form with the Geographic Coordinates (Latitude and Longitude) on the Solar Potential - SunData v 3.0 platform, made available by CRESEB (Reference Center for Solar and Wind Energy Sérgio de S. Brito).

This is because, in the Brazilian Atlas, the database is composed of 72,272 records containing the annual and monthly averages of the total daily Global Horizontal, Diffuse, Direct Normal, Inclined Plane and PAR irradiation in Wh/m².day. Spatial resolution of 0.1° x 0.1° (approximately 10 km x 10 km). Longitude and latitude define the centroid of the entities, or cells, of 0.1° x 0.1°.

Figure 2

Representation of 1 block of record

Source: Brazilian Atlas (2025).

Thus, as shown in Figure 3, the blocks of the state of Sergipe are represented in the Brazilian Atlas.

Figure 3

GHI (Global horizontal irradiation) in Sergipe

Source: Brazilian Atlas (2025).

Applying the equations to the data in the spreadsheet, here are the results of the statistical metrics calculated based on the differences between the Global Horizontal Irradiance (GHI) values, expressed in kWh/m² per day, from the two sources:

- Mean Error (ME): 0.088
- Mean Absolute Error (MAE): 0.205
- Mean Square Error (RMSE): 0.273
- Standard Deviation of Differences: 0.269
- Pearson's correlation: 0.230
- Coefficient of Determination (R²): 0.053

4 DISCUSSION

4.1 INTERPRETATION OF STATISTICAL METRICS

The results indicate that there are considerable differences between the Global Horizontal Irradiation (GHI) values provided by the Brazilian Atlas of Solar Energy and the Global Solar Atlas. Some analyses can be done to better understand these differences and their impacts.

The results of the statistical analyses indicate considerable differences between the databases of the Brazilian Atlas of Solar Energy and the Global Solar Atlas, with important implications for energy planning in Sergipe.

- **Mean Error (ME = 0.088):** The positive value indicates that, on average, the Global Solar Atlas presents values slightly higher than those of the Brazilian Atlas. This suggests a slight systematic bias between the two bases.
- **Mean Absolute Error (MAE = 0.205) and Mean Square Error (RMSE = 0.273):** These values confirm that there are differences of relevant magnitude between the data sets, especially the RMSE, which emphasizes that some divergences can be significant and need to be considered in the planning phase.
- **Standard Deviation of Differences (0.269):** This value shows a significant variability in the differences between the bases, indicating that the divergences are not constant, varying according to the location studied.
- **Pearson's correlation (0.230) and Coefficient of Determination ($R^2 = 0.053$):** The low correlation and the low value of R^2 indicate that the bases have a weak linear relationship with each other, highlighting that the differences observed do not follow a consistent pattern. The low coefficient of determination reinforces that one database does not satisfactorily explain the variations observed in the other, suggesting that local and methodological factors significantly influence the results.

4.2 POSSIBLE CAUSES OF DIFFERENCES

The divergences found between the analyzed databases can be attributed to different methodological and technical factors used by each source. The Brazilian Atlas of Solar Energy is predominantly based on local measurements obtained through the solarimetric stations of the SONDA network, complemented by specific modeling that uses geostationary satellite images calibrated to the local atmospheric conditions of Brazil. The Global Solar Atlas, on the other hand, uses a global numerical modeling methodology, based on data from international satellites and calibrated through global terrestrial measurements. Thus, it may not fully capture regional particularities, such as specific microclimates, small topographic variations, or local atmospheric conditions, including cloud cover and relative humidity levels.

Another significant factor is the differentiated spatial resolution. The Brazilian Atlas has a more detailed spatial resolution, adapted specifically for the national territory, while the Global Solar Atlas presents a global approach with less detailed spatial resolution, which can generate less precision in smaller regions. In addition, temporal differences in the periods analyzed may also contribute to the divergences, since the Brazilian Atlas is based on historical data up to 2017, while the Global Solar Atlas uses data from 2024, in which climate change or atmospheric variations can influence the availability of solar radiation. As the historical series used by each atlas belong to different periods, 2017 in the case of the Brazilian Atlas and 2024 in the Global Solar Atlas, the differences found may be associated not only with modeling methodologies, but also with climate change and atmospheric variations over time.

4.3 POSSIBLE CAUSES OF DIFFERENCES

The divergences between the two databases have important implications for the energy and technical planning of photovoltaic systems in Sergipe. Small variations in solar irradiance values can have a significant impact on the sizing and efficiency of solar systems. Underestimated values can lead to oversizing of systems, resulting in unnecessary additional costs, while overestimated values can result in undersized systems that do not achieve the expected results in terms of energy generation.

These differences also have important strategic consequences for the development of public policies and investment decisions in energy infrastructure. The use of databases that do not adequately represent the regional reality can negatively affect the economic and technical viability of solar projects, harming both investors and end consumers. From an academic and scientific point of view, such divergences can also negatively influence the results of environmental and climate studies, highlighting the need for greater caution and complementation with local measurements in the analysis and interpretation of solar data.

5 CONCLUSION

This study performed an in-depth comparative analysis between the solar irradiation data provided by the Brazilian Atlas of Solar Energy and the Global Solar Atlas, with a specific focus on the state of Sergipe. The results indicated significant differences between the two databases, with the Global Solar Atlas presenting

systematically higher GHI values, on average, 1.8% higher than those of the Brazilian Atlas. Although this difference seems modest, statistical analyses revealed a low degree of linear correlation ($R^2 = 0.053$), indicating an inconsistent relationship between the bases.

The divergences observed are due to relevant methodological factors, such as the collection and calibration model, spatial resolution, and the reference period adopted by each database. The Brazilian Atlas, despite offering specific data for the national territory with relevant technical detail, is outdated (last edition in 2017), not reflecting recent climatic variations. On the other hand, the Global Solar Atlas, with monthly updates and global coverage, may not accurately capture local climatic particularities, as evidenced by Araújo (2024) and Porfirio *et al.* (2020).

These differences are not merely academic: they have substantial practical implications for the design of photovoltaic systems. Underestimated irradiation values can lead to oversizing and increased costs, while overestimated values can lead to failures in meeting projected demand, compromising the economic viability of solar projects (Rocha *et al.*, 2022; Uchôa, 2022; Araújo *et al.*, 2024).

In addition, the study reinforces the importance of complementary strategies to mitigate the limitations of each database. This includes the use of local measurements whenever possible, and, more recently, the use of hybrid modeling with the support of machine learning algorithms (Reis *et al.*, 2023), which have shown potential to significantly reduce prediction errors.

Therefore, it is recommended that technical, strategic, or political decisions related to solar energy in Sergipe be based on the critical integration of different data sources, with local validations and sensitivity analyses. This multidimensional approach contributes to increasing the robustness of feasibility studies, minimizing financial risks, and promoting the sustainable development of the state's energy matrix.

This work also signals the urgency of updating and modernizing the Brazilian Atlas of Solar Energy, in order to ensure its continuity as a technical reference for the national energy sector, especially in a scenario of energy transition and growth of distributed generation in Brazil.

ACKNOWLEDGMENT

Special thanks to Sergipe Technological Park (SergipeTec) and the State Secretariat for Economic Development and Science and Technology (SEDETEC) for the support granted during the development of this research.

ABSTRACT

This article discusses the design and functional analysis of a touch-sensitive fabric, created with Litz conductive yarns and woven on a Jacquard loom, for home automation applications. The study begins with the following research question: is it possible to design a fabric that maintains its textile properties but functions as a tactile sensor in a smart home system? The hypotheses tested were: (1) the fabric will exhibit electrical conductivity after the weaving process; (2) it can be integrated into electronic systems with efficient Bluetooth response. The methodology consisted of the production of the conductive fabric, its integration with an FPGA board, conductivity testing, practical simulations with electrical circuits, and an interface with a mobile application. The results indicated technical feasibility, good tactile response, and stable functional integration, confirming the potential of e-textiles as active components of environmental automation systems. Furthermore, the study reports on an interdisciplinary learning experience of a Textile Engineering student, who was challenged to acquire skills in electronics, sensors, and digital communication, demonstrating the importance of integrated approaches in higher education technology. Further research is recommended to further explore durability, washability, ergonomics, and energy integration testing to consolidate the system's applicability in real-world contexts.

Keywords: Smart Fabric. E-Textiles. Conductivity. Jacquard. Interdisciplinary Training.

RESUMO

Este artigo trata do projeto e da análise funcional de um tecido sensível ao toque, criado com fios condutores do tipo Litz e confeccionado em tear Jacquard, voltado para aplicações em automação residencial. O estudo parte da seguinte questão de pesquisa: é possível projetar um tecido que mantenha suas propriedades têxteis, mas funcione como sensor tátil em um sistema de casa inteligente? As hipóteses testadas foram: (1) o tecido apresentará condutividade elétrica após o processo de tecelagem; (2) poderá ser integrado a sistemas eletrônicos com resposta eficiente via Bluetooth. A metodologia consistiu na produção do tecido condutor, sua integração com uma placa FPGA, testes de condutividade, simulações

práticas com circuitos elétricos e interface com aplicativo móvel. Os resultados indicaram viabilidade técnica, boa resposta tátil e integração funcional estável, confirmando o potencial dos e-têxteis como componentes ativos de sistemas de automação ambiental. Além disso, o estudo relata uma experiência de aprendizagem interdisciplinar de uma estudante do curso de Engenharia Têxtil, que foi desafiada a adquirir competências em eletrônica, sensores e comunicação digital, demonstrando a importância de abordagens integradas no ensino superior tecnológico. Como continuidade, recomenda-se o aprofundamento em testes de durabilidade, lavabilidade, ergonomia e integração energética, a fim de consolidar a aplicabilidade do sistema em contextos reais.

RESUMEN

Este artículo aborda el diseño y el análisis funcional de un tejido sensible al tacto, creado con hilos conductores Litz y tejido en un telar Jacquard, para aplicaciones de domótica. El estudio parte de la siguiente pregunta de investigación: ¿es posible diseñar un tejido que mantenga sus propiedades textiles, pero que funcione como sensor táctil en un sistema de domótica? Las hipótesis probadas fueron: (1) el tejido exhibirá conductividad eléctrica tras el proceso de tejido; (2) podrá integrarse en sistemas electrónicos con una respuesta Bluetooth eficiente. La metodología consistió en la producción del tejido conductor, su integración con una placa FPGA, pruebas de conductividad, simulaciones prácticas con circuitos eléctricos y una interfaz con una aplicación móvil. Los resultados indicaron viabilidad técnica, buena respuesta táctil e integración funcional estable, lo que confirma el potencial de los textiles electrónicos como componentes activos de sistemas de automatización ambiental. Además, el estudio informa sobre la experiencia de aprendizaje interdisciplinaria de un estudiante de Ingeniería Textil, quien se enfrentó al reto de adquirir habilidades en electrónica, sensores y comunicación digital, lo que demuestra la importancia de los enfoques integrados en la tecnología de la educación superior. Se recomienda realizar más investigaciones para explorar más a fondo la durabilidad, la lavabilidad, la ergonomía y las pruebas de integración energética para consolidar la aplicabilidad del sistema en contextos del mundo real.

1 INTRODUCTION

The presence of digital technologies in everyday life has profoundly transformed the way we live and relate to the spaces around us. What was once a traditional house, designed only to house and organize basic functions, is now configured as an intelligent environment, where comfort, practicality and efficiency are amplified by devices that communicate with each other. In this new context of connectivity, e-textiles — fabrics that integrate electronic circuits and functionalities — emerge as innovative solutions, capable of going beyond fashion or technical clothing and assuming interactive, sensory, and even communicational roles.

Initially restricted to academia, e-textiles have been consolidated, in recent decades, as a strategic area of development, where knowledge of textile engineering, embedded electronics and information technology converge. According to Skyrme (2023), in the report *E-textiles and smart clothing markets 2023–2033: technologies, players, and applications*, by the IDTechEx consultancy, there are already more than 200 organizations involved in the creation of smart textile-based products. These products range from heated garments and sensor dressings to touch-sensitive interfaces embedded in vehicle and home interiors. This advance has been made possible by factors such as the miniaturization of components, the evolution of conductive fibers, and the strengthening of connections with mobile devices and the Internet of Things (IoT).

In the field of home automation, this trend gains even more relevance. Houses began to incorporate elements of environmental intelligence that integrate aesthetics, functionality, and technology (Freitas et al., 2012; Muratori, 2015). In this scenario, the so-called smart textiles, also known as *smart textiles*, play an important role in expanding the possibilities of interaction between people and automated systems, as pointed out by Tao (2001) and Van Langenhove & Hertleer (2004). By connecting traditional textile materials with digital solutions, new forms of interface are created that combine design, comfort and technology in a discreet and efficient way.

This article addresses the construction of a conductive fabric responsive to touch, developed with Litz-type copper conductive wires covered by polyester, structured on a Jacquard loom. The fabric is used in the manufacture of a decorative and functional cushion, with a Bluetooth interface aimed at home automation. The research is guided by the following question: is it possible to develop a conductive fabric that maintains aesthetic and structural properties suitable for decorative use?

As a hypothesis, it is assumed that the fabric will maintain electrical conductivity after weaving, be integrated with stability to mobile electronic systems and preserve conventional textile attributes.

In addition to the technical application of the project, this study also represents an interdisciplinary learning experience in the context of training in Textile Engineering. The development of the solution required the author to deepen the contents of basic electronics, conductivity, sensors and digital integration, themes that go beyond the traditional training of the textile area, promoting a practical articulation between different technical knowledge.

General objective: to develop a touch-sensitive fabric applied to residential decoration.

Specific objectives: a) to integrate the fabric with electronic components via Bluetooth;
b) test its electrical conductivity and functionality as a tactile interface.

2 THEORETICAL FRAMEWORK

The integration of electronic functions into textile substrates has been the subject of intensive studies in recent decades, driven by the demand for wearable technologies, flexible interfaces, and integrated solutions for environmental automation. The so-called smart textiles can be classified into three categories: passive, active, and very intelligent, based on their ability to respond and adapt to external stimuli (Wen, 1992; Tao, 2001). This classification guides the development of applications ranging from body sensors to interactive textile panels for device control in smart homes.

E-textiles or electronic textiles are a subcategory of technical fabrics, characterized by built-in electronic functionalities. They integrate electronic components into conventional textile structures, enabling applications ranging from physiological monitoring to interfaces for environmental control (Post; Margaret, 1997; Lind et al., 1997; Rossi; Paradiso, 2011). According to Blecha et al. (2024), this integration can occur superficially — by sewing or printing — or structurally, with the insertion of conductive threads during weaving. The ASTM D8248-20 standard, a reference for classification and standardization of e-textiles, recognizes different levels of complexity and establishes criteria for their validation as functional systems.

From a technical point of view, fundamentals on textile structures and Jacquard weaving processes are well described in classic works such as Araújo (1986), Castelli et al. (2000) and Marks & Robinson (1976). These authors discuss aspects such as warp density, ligaments, and structural parameters that influence the malleability, resistance, and

aesthetics of the final fabric, being essential for planning the insertion of functional threads without compromising textile integrity.

Among the most used functional elements are conductive metal wires, such as copper, silver, and stainless steel. Litz yarn, in particular, stands out for its multifilament composition and flexibility, being widely applied in projects that require good conductivity and malleability. Kuzubaşoğlu et al. (2023) point out that the association between metallic yarns and conventional fibers (cotton, viscose, polyester) allows obtaining comfortable and functional substrates, while maintaining desired characteristics such as soft touch, good mechanical strength, and dimensional stability.

Several studies analyze the mechanical and electrical properties of conductive wires. Ashgar et al. (2016) demonstrate that the orientation and type of metallic filament directly impact the tensile strength and conductivity of hybrid yarns. Rajendrakumar and Thilagavathi (2012) complement this, showing how variations in the construction parameters of fabrics with metallic threads interfere with electromagnetic performance. Lou (2012) describes industrial processes for the production of core-spun conductive yarns with application in functional fabrics.

In addition to metals, conductive polymers have also been widely used as viable alternatives. Ding et al. (2010) investigated the behavior of fabrics impregnated with PEDOT:PSS, relating conductivity with electrochromic stability. Varesano et al. (2005), in turn, examined the degradation of electrical conductivity in fabrics impregnated with polypyrrole, highlighting the challenges related to the durability of these materials in the face of continuous use and washing.

As far as practical applications are concerned, smart fabrics have been used in functional clothing, biometric sensors, and touch-sensitive interfaces. Bae and Hong (2013) researched the use of conductive fabrics as substitutes in the control of contact surface screens. Ferreira et al. (2011) demonstrated the application of carbon nanotubes in monofilaments for the development of sensors integrated into technical fabrics.

Andrade, Borelli and Giacomini (2014) developed wide-area textile sensors applicable to clothing, reinforcing the feasibility of integration into large-area garments. Zhang et al. (2021) conducted a review on advances in the engineering of multifunctional fibers, which can simultaneously act as sensors, emitters, actuators, and energy conductors. Materials such as graphene, carbon nanotubes (CNTs) and metallic nanowires have been applied in textile architecture, allowing the incorporation of circuits directly into the fibrous mesh and its

integration with Internet of Things (IoT) systems. Sánchez (2006.) contributes with a broad vision of the European textile sector, highlighting the advancement of functional fabrics and the industrial perspectives for e-textiles in technical and decorative contexts. This international vision complements the understanding of the challenges and opportunities of applying smart textile technologies in the contemporary context.

In the context of home automation, the use of functional fabrics represents an innovative approach to creating discreet and comfortable interfaces, replacing or complementing conventional rigid surfaces. The literature indicates that these fabrics can be used to control lighting, temperature, sound, or household appliances through touch or proximity detection. Kirstein et al. (2005) highlight that wearable systems and textile interfaces must combine functionality with essential characteristics such as comfort, washability, mechanical durability and low perceptible interference for the user.

The evolution of manufacturing techniques has contributed to the consolidation of these systems. According to Kuzubaşoğlu et al. (2023), methods such as weaving with hybrid threads, computerized embroidery of conductive tracks, printing circuits with functional inks, and soldering flexible electronic components make it possible to produce e-textiles at scale while maintaining control over physical and electrical properties. Structures are often used to encapsulate the lead wires and protect the circuit from wear, bending, or shorting.

However, the main barriers to large-scale commercial adoption still include:

- (1) the degradation of conductive materials in the face of daily use and washing;
- (2) the absence of widely accepted technical standards that regulate performance, safety and durability; and
- (3) the need for compact and integrable energy sources to the fabric. Strategies such as polymeric encapsulation, development of self-sufficient sensors with triboelectric nanogenerators, and integration with textile solar cells have been proposed as viable solutions (Kuzubaşoğlu et al., 2023).

In view of this panorama, the present work is anchored in the understanding of smart fabrics as hybrid platforms, which combine traditional textile properties with the capacity for digital performance and communication. The proposal for an interactive touch-sensitive cushion, connected to mobile systems via Bluetooth, represents a concrete application of this convergence between textile engineering, functional materials and automation technologies.

3 METHODOLOGY

The methodology adopted in the present study is in line with similar proposals already documented in the literature, such as the research conducted by Guedes, Borelli and Giacomini (2017), who also explored the incorporation of tactile sensors in textile materials with interest in applications aimed at the Internet of Things (IoT), highlighting the challenges related to the integration between textile properties and electronic functionalities.

This study is characterized as an investigation of applied and experimental nature, with a projectual objective, presenting the design, synthesis and functional analysis of an intelligent touch screen fabric for use in home automation systems.

The project was developed based on a project-based learning (*PBL*) approach, which allowed the student to articulate knowledge from different areas in a practical and applied way, as discussed by the active methodologies in technological higher education (Markham, 2008).

The development process involved four main steps:

- (1) design and manufacture of conductive fabric;
- (2) integration with electronic systems;
- (3) performance of physical-functional tests; and
- (4) Application of the fabric in a functional decorative item.

3.1 DEVELOPMENT OF TOUCH-SENSITIVE FABRIC

The first stage comprised the structural construction of the touch-sensitive fabric, based on Jacquard technology, which allows precise control of complex ligaments and planned insertion of functional elements. Figure 1 illustrates the structure of the fabric, which was made on a Jacquard loom of the Howa do Brasil brand, using continuous carded cotton threads in the warp, in ecru color, with Ne 20/2 title, and in the weft 90% viscose and 10% metallic yarns, in burgundy color, with 6/2 title.

Figure 1

Jacquard touch-sensitive fabric

Source: authors.

The fabric also has a conductive thread (Litz thread), composed of 4 copper filaments covered by textured polyester, inserted every 2 cm in the direction of the weft and warp. Finally, in the warp, the conductive threads were inserted approximately every 30 cotton threads, and in the weft, a conductive thread was passed for every 14 strokes of the metallized thread, approximately. The wires are shown in figure 2.

Figure 2

Cotton, Litz and metallized yarns

Source: authors.

Electrical functionality was ensured by the insertion of Litz-type conductive wires, composed of four copper filaments covered with textured polyester. In the warp, the conductive threads were positioned every 30 cotton threads, and in the weft, a Litz thread was inserted every 14 passes of the metallized yarn, resulting in a functional distribution

pattern every 2 cm in both directions. The chosen pattern was aimed at residential decoration, aiming at the use of fabric as a visual and interactive component of a cushion. The objective was to ensure that the fabric maintained the appearance and texture of a conventional fabric, respecting criteria of comfort, flexibility and aesthetics.

3.2 TESTING AND EXPERIMENTAL DESIGN

With the system assembled, it was planned to carry out technical-functional tests with the objective of validating the effectiveness of the fabric as a capacitive tactile sensor. The tests were divided into three categories:

(a) verification of electrical conductivity of Litz wires: A Minipa ET-2231 digital multimeter was used to measure the resistance between two points of the conductive wire inserted in the fabric. Due to the enamelled coating of the copper wires, it was necessary to carefully scrape the enamel with tin solder to ensure proper electrical contact.

(b) functional test with mini lamp: An acrylic set containing batteries, cables and a mini lamp, illustrated in figure 3, was used to simulate an electrical circuit. The cables were connected to the fabric conductor wires and, upon touch, the mini lamp was activated, confirming the presence of efficient electrical continuity in the fabric.

Figure 3

Set for the Fabric Conductivity Test

Source: authors.

(c) tactile response tests and communication via Bluetooth with mobile device: After assembling the system, the tissue was subjected to tactile stimuli with real-time response monitoring in the Android application. Communication latency, signal reading accuracy, and

interface stability during prolonged operation were evaluated.

3.3 ELECTRONIC INTEGRATION AND INTERACTIVE SYSTEM DEVELOPMENT

In the second stage, the fabric was integrated into a responsive electronic system, based on an Altera DE0 (Terasic) development board, equipped with FPGA (Field Programmable Gate Array) architecture, programmed to interpret touch signals (Figure 4). To make the electrical connection viable, the Litz wires had their coating removed at strategic points with the help of heated tin, exposing the copper filaments for later soldering to flat cables. These cables were connected directly to the DE0 board, ensuring the reading of tactile signals in an individualized way (Figure 5).

Figure 4

Electronic board system connected to the touch-sensitive fabric

Source: authors.

Figure 5

DE0 electronic board and cell phone, integrated via Bluetooth

Source: authors.

The circuit was powered by a PowerBank, offering mobility and energy independence of the system in relation to the conventional power grid. Data transmission between the fabric and the mobile device was carried out through a Bluetooth module integrated into the board. The interface application was developed using the Bluetooth Electronics platform, compatible with Android devices, allowing the creation of configurable responsive input buttons. Each button in the app was linked to a conductive thread of the fabric, simulating different touch-sensitive activation channels.

3.4 MAKING THE DECORATIVE ITEM

The final stage consisted of the practical application of the developed tissue. A piece was sewn, in the form of a decorative cushion, as shown in figure 6, with dimensions of 40 x 40 cm, allowing the insertion of the electronic components and their integrated operation. Thinking about maintaining the aesthetic and functional character of the article, the piece was filled with textile fibers.

Jacquard touch-sensitive fabric sewn in the shape of a cushion

Source: authors.

4 RESULTS AND DISCUSSIONS

The evaluation of the developed fabric was carried out based on the planned tests, focusing on functional validation and the feasibility of using the material in home automation contexts.

4.1 CONDUCTIVE PROPERTIES OF TOUCH SENSITIVE FABRIC

The electrical conductivity tests, performed with a Minipa ET-2231 digital multimeter illustrated in figure 7, indicated an average resistance of less than 2 ohms per tested segment of the Litz type conductive wires. Due to the insulating enamel of the wires, it was necessary to manually remove the coating in specific areas to ensure direct contact of the multimeter terminals with the copper filaments. The electrical continuity was maintained even after the weaving process and the manipulation of the fabric, proving that the yarns preserved their functional properties in the Jacquard structure.

Figure 7

Results regarding tissue measurement with the multimeter

Source: authors.

4.2 PRACTICAL TESTS WITH ELECTRICAL CIRCUIT

In the test with a mini lamp connected to batteries, all 20 tests performed showed immediate activation on the conductive wires, evidencing the ability of the fabric to act as a circuit closing element. Figure 8, with the device's light on, confirms its operation as a practical and direct tactile interface.

Figure 8

Electrical circuit with the mini lamp lit through the conductive wires of the touch-sensitive fabric

Source: authors.

4.3 CONNECTIVITY AND INTEGRATION VIA BLUETOOTH

During the testing phase with the mobile application, the system's immediate response to tactile interactions was observed. The signals were read by the DE0 board and transmitted via Bluetooth, with latency of less than 200 milliseconds and stability for 10 consecutive cycles.

This result proves that the developed touch-sensitive fabric is functional as a capacitive contact sensor and that its integration into mobile digital systems is technically feasible. This extends the potential of its application in home automation solutions, where the activation of devices by touch can be done discreetly, without the need for rigid interfaces.

In addition, the visual response offered by the app enables an intuitive and accessible user experience, paving the way for applications that involve accessibility, comfort, and smart interior design.

Figure 9

Touch-sensitive Jacquard fabric – mobile app demo

Source: authors.

In addition to the functional performance, the fabric has retained its flexibility and aesthetic appearance after the insertion of the conductive threads and the assembly procedures. The regular distribution of the Litz wires, with a spacing of 2 cm, was effective both to ensure capacitive activation and to maintain the aesthetics of the product. The developed cushion operated as a sensitive, discreet and comfortable interface, demonstrating practical applicability for interior design and accessibility and automation solutions.

Although the developed fabric does not use cutting-edge materials such as graphene

or printed sensors, it represents a technically feasible and affordable solution for tactile automation in homes. The simplicity of the system and the possibility of customization in conventional textile structures expand its application potential. However, the absence of washability, mechanical durability and ergonomics tests limit its commercial validation.

From a pedagogical point of view, the development of this interactive fabric provided a practical and interdisciplinary experience to the author, an undergraduate student in Textile Engineering. The project required not only the mastery of textile and structural aspects, but also the active search for knowledge of electronics, capacitive sensors, wireless communication and FPGA board programming. This experience demonstrates the potential of project-based approaches (*Project based learning*) to promote integration between areas of technical knowledge and prepare the student for real challenges.

5 CONCLUSION

The present study aimed at the development and functional evaluation of a touch-sensitive fabric, made on a Jacquard loom with Litz-type conductive threads, applied to home automation systems. The results obtained demonstrated the technical feasibility of the proposal: the fabric preserved its essential textile properties, such as flexibility and aesthetics, even after the insertion of conductive threads, in addition to presenting stable electrical conductivity and functional integration with electronic systems via Bluetooth.

The practical application in the form of a decorative cushion reinforces the potential of smart fabrics as discreet and functional interfaces for residential environments. Communication with mobile devices occurred responsively and without noticeable latency, validating the system as an integrated capacitive tactile sensor.

In addition to its technical character, this work also stands out as a significant pedagogical experience. Developed by a Textile Engineering student, the project required the articulation of knowledge from different areas — such as electronics, sensors, programming, and wireless communication — traditionally absent in conventional textile training. It is, therefore, an example of active and interdisciplinary learning, in which knowledge is built from real and complex challenges, in line with pedagogical proposals such as project-based teaching and integrated technological education.

It is concluded that the developed touch fabric is a promising solution for applications in home automation and smart interior design, and a powerful training tool. For future research, it is recommended to carry out durability tests (washability, abrasion, use cycles),

usability analysis with different user profiles, and the study of integration with autonomous energy sources. Such actions can expand the practical and educational applicability of e-textiles in multiple contexts of contemporary society.

ABSTRACT

This article describes a pedagogical practice carried out in the Multifunctional Resource Room (SRM) of the Capitão Silvio de Farias State Full-Time High School in Rondônia, aimed at students with special needs. The activity consisted of creating a toiletry bag using cutting and sewing techniques, with the goal of promoting the development of motor, cognitive, social, and emotional skills. Analysis of the results, based on theoretical frameworks on integrative methodologies and inclusive education, revealed significant improvements in the participants' autonomy, motor coordination, and social interaction, reinforcing the importance of manual practices in the inclusive educational process.

Keywords: Special Education. Integrative Practices. Sewing. Motor Skills. School Inclusion.

RESUMO

Este artigo descreve uma prática pedagógica realizada na Sala de Recursos Multifuncionais (SRM) da Escola Estadual de Ensino Médio em Tempo Integral Capitão Silvio de Farias, em Rondônia, voltada para estudantes da Educação Especial. A atividade consistiu na produção de um nécessaire por meio de técnicas de corte e costura, com o objetivo de promover o desenvolvimento de habilidades motoras, cognitivas, sociais e emocionais. A análise dos resultados, à luz de referenciais teóricos sobre metodologias integrativas e educação inclusiva, evidenciou avanços significativos na autonomia, coordenação motora e interação social dos participantes, reforçando a relevância de práticas manuais no processo educativo inclusivo.

Palavras-chave: Educação Especial. Práticas Integrativas. Costura. Habilidades Motoras. Inclusão Escolar.

RESUMEN

Este artículo describe una práctica pedagógica llevada a cabo en el Aula de Recursos Multifuncionales (ARM) del Liceo Estatal de Tiempo Completo Capitão Silvio de Farias en Rondônia, dirigida a estudiantes con necesidades educativas especiales. La actividad consistió en la creación de un neceser mediante técnicas de corte y costura, con el objetivo

de promover el desarrollo de habilidades motoras, cognitivas, sociales y emocionales. El análisis de los resultados, basado en marcos teóricos sobre metodologías integrativas y educación inclusiva, reveló mejoras significativas en la autonomía, la coordinación motora y la interacción social de los participantes, lo que refuerza la importancia de las prácticas manuales en el proceso educativo inclusivo.

Palabras clave: Educación Especial. Prácticas Integrativas. Costura. Habilidades Motoras. Inclusión Escolar.

1 INTRODUCTION

In contemporary society, marked by rapid and constant changes, it is essential to promote the inclusion and belonging of people with Special Educational Needs (SEN) to the various social and educational spaces. In this scenario, the Capitão Silvio de Farias Integral School, through the Multifunctional Resource Room (SRM), develops actions aimed at strengthening students' skills and abilities, seeking to achieve educational inclusion in a broad and meaningful way.

According to the National Policy on Special Education in the Perspective of Inclusive Education (MEC, 2008), Special Education aims to ensure access, participation and learning for students with disabilities, global developmental disorders and high abilities/giftedness. To this end, the adoption of integrative methodologies has gained prominence, since it favors educational experiences that transcend the limits of traditional curricular content.

Among these methodologies, manual practices, such as sewing, stand out for articulating cognitive, motor, affective and social aspects, favoring the overall development of students (Santos; Oliveira, 2021). In addition, such practices promote autonomy and self-esteem, which are fundamental for the integral formation and construction of the identity of individuals.

In this context, this article aims to report the experience developed in SRM through the making of a toiletry bag, analyzing how this activity contributed to the development of motor, cognitive, social and emotional skills of the participating students. The study also dialogues with the literature that discusses integrative methodologies and inclusive practices in education.

2 THEORETICAL FOUNDATION

2.1 MULTIFUNCTIONAL RESOURCE ROOM

The implementation of Multifunctional Resource Rooms (SRM) in Brazil represents a milestone in public policies for Special Education and school inclusion, especially after the enactment of the National Policy on Special Education in the Perspective of Inclusive Education (BRASIL, 2008). This advance reflects the commitment of the Brazilian State to guarantee Specialized Educational Service (SES) as a right guaranteed to students with disabilities, global developmental disorders and high abilities/giftedness, reinforcing the concept of education for all.

However, the analysis of recent studies, such as those by Mendes (2019) and Bueno (2021), reveals that resource rooms, although expanded in number and scope, still face significant challenges in their consolidation as effective pedagogical spaces. Among them, the need for continuing education of teachers, the curricular integration of SEA with regular education and the adequacy of material and technological resources that meet the specificities of students stand out. Without these elements, there is a risk that the resource room will be seen only as a space for school reinforcement, and not as an environment for the construction of autonomy and global development.

Another central issue raised by researchers such as Carvalho (2020) is the articulation between educational policies and pedagogical practices. Although the legislation establishes inclusion as a guiding principle, the realization of this right requires that the resource room transcends the welfare character and starts to act in an integrated way with the school's political-pedagogical project. This implies collaborative action between SEA teachers, common room teachers, managers and families, in order to ensure pedagogical coherence and continuity in the learning process.

In addition, contemporary literature points to the urgency of producing and disseminating knowledge about successful experiences in resource rooms (SANTOS; OLIVEIRA, 2021). Case studies, action research, and reports of successful practices can support more effective public policies, guiding teacher training and the definition of innovative methodologies that promote meaningful learning.

However, when considering the resource room as a pedagogical device, it is understood that its role goes beyond individualized care. It is a space that should dialogue with the school curriculum, articulating strategies that develop students' cognitive, motor, social, and emotional skills, as advocated by authors such as Pletsch and Glat (2019). In this sense, the current challenges lie not only in the expansion of the number of classrooms, but in the qualification of their performance, in order to consolidate school inclusion as a daily and effective practice.

2.2 FINE AND GROSS MOTOR COORDINATION

Motor coordination, as highlighted by authors such as Gallahue and Ozmun (2005), is one of the pillars of child development, since it is directly associated with the child's ability to interact actively and independently with the environment around him. The division between gross motor coordination — responsible for broad and wide-ranging movements — and fine

motor coordination — focused on delicate and precise movements — allows us to understand how different motor skills are interconnected throughout growth, forming the basis for the acquisition of cognitive, social and academic skills.

The work of Rodrigues (2024) contributes significantly to this field by proposing the creation of a transportable kit with devices aimed at the development of fine motor skills. The proposal dialogues with research such as those by Santos and Ferreira (2018), which highlight the importance of manipulative materials to stimulate dexterity, bilateral coordination and precision of movements, especially during early childhood education, a critical phase for neuromotor development.

In addition, the results obtained reinforce the notes of Case-Smith (2013), who highlights how planned and playful interventions can enhance essential skills for daily activities, such as tying shoes, writing and handling objects safely. The use of a portable kit becomes even more relevant when considering educational inclusion, allowing children with special educational needs to also be contemplated with strategies adapted to their specific demands.

Another relevant point is the association between fine motor skills and cognitive and emotional aspects. Research by Cameron et al. (2016) shows that children with greater fine motor skills tend to have better performances in reading, writing, and problem solving, in addition to having greater autonomy and self-esteem. Thus, projects that involve practical activities, such as the one described in this work, not only favor motor coordination, but also contribute to the child's overall development.

In view of the above, it is noteworthy that the analysis stage of similar products and the generation of project requirements follow principles of user-centered design, as defended by Norman (2013), which guarantees the functionality and pedagogical effectiveness of the devices created. This alignment between theory, practice, and applicability demonstrates the project's potential to be incorporated into diverse educational contexts, strengthening active and meaningful learning.

3 REPORT OF PRACTICE

The experience took place with students who are the target audience of Special Education, involving the use of a sewing machine to produce a toiletry bag in honor of Mother's Day. The steps included:

3.1 FAMILIARIZATION WITH THE MACHINE: LEARN HOW TO RUN THE LINE AND CONTROL THE FOOT PEDAL

In this stage, the students Before starting to use the sewing machine, the students received simple instructions on how to pass the thread through the machine's cursors. It was not a challenge to teach students how to run the line through the machine. This process involves several steps, from the top thread guide to threading the needle. Using sewing thread of the shade of the chosen fabric and guidance on how to guide the thread on the cursors and it was possible to make the process more visual and accessible. The student was instructed to follow the steps sequentially, which worked not only on manual skill, but also on attention and sequential memory. When the student was able to pass the line through all the cursors independently, it was a significant victory, evidencing the evolution of perseverance and attention to detail.

The next step was how to position your feet on the pedal and your hands on the fabric. With the machine's pedal placed under the dominant foot, the student was instructed to press it gently to adjust the speed of the sewing. The pressure on the pedal was gradual, according to the motor control of each student, but before starting the pedal movement, the pressure that should be exerted on the pedal with their hands was worked on so that they had a sense of strength and pressure.

The importance of correct posture was highlighted, ensuring that students felt stability, without haste, observing the movement of the machine with maximum concentration. The hands were positioned on the fabric, the left hand guiding lightly, while the right hand kept the fabric aligned. This initial gesture helped improve hand-eye coordination.

With the previous stage finished, it was started how to position the hands on the machine, often complex, it was approached slowly and repetitively, to create an environment of trust and patience, as it involves a piercing object that is the needle and some students showed fear of getting hurt, to lose the fear the needle was removed from the machine and worked on the position of the hands through a sewing exercise on sulfite sheet.

Figure 1

Students in the initial phase of positioning their hands on the sewing machine

Source: From the Authors

3.2 MOTOR SKILLS: CUTTING FABRICS, ALIGNING PIECES, SEWING WITH PRECISION

Once the stages of the sewing machine operation were completed, we started the project with the choice of fabric, where some fabrics of varied colors and prints were made available and the student was guided to choose the one he liked best, having chosen the fabric, the measurements of the main fabric, lining and acrylic mat were passed, items necessary to make the toiletry bag, The student was instructed how the measurements would be marked on the fabrics and after the measurements were scratched and demarcated on the fabric, the cut was made following the markings, some students had difficulties in being able to cut the fabric, because they did not apply adequate pressure with scissors, which made it difficult to make the cut. After the fabric was cut, it was time to make the marking for the metalassê that would have on the piece, this was used as a detail and also to fix the acrylic blanket. Once the demarcations of the metalassê were finished, the students put into

practice the skills previously worked on when we started the presentation of the project, such as positioning the hands and foot on the pedal. When starting to sew the fabric, the students were anxious, but attentive to the teacher's guidelines.

Figure 2

Demonstration of motor skills development

Source: From the Authors

3.3 COGNITIVE SKILLS: FOLLOWING SEQUENCES, SOLVING TECHNICAL PROBLEMS

Some seams came out crooked, but for some who had never had contact with the machine before, it was already expected that this would happen. A seam was made around the piece, fixing the sides of the blanket to the fabric and then the students were guided by the markings previously made on the main fabric. Finishing sewing this step, the students went to the next step, sewing the zipper to close the piece and after placing the lining and closing the sides of the fabric to finish the piece.

Figure 3

Demonstration of cognitive skills in solving technical problems

Source: From the Authors

Emotional and social skills were also developed: working in groups, dealing with frustrations, persisting in the face of difficulties.

The project adopted a practical and adaptive methodology, respecting the individual rhythm and valuing each achievement of the students.

4 DISCUSSION

The results corroborate the findings of Rocha and Pereira (2021), who highlight how manual practices favor the integral development of students, especially in Special Education. Sewing required attention, patience and precision, aspects that, according to Gonçalves (2018), contribute to emotional self-regulation and strengthening self-confidence.

In addition, group work enabled social interaction and cooperation, in line with Vygotsky's (1991) perspective on the importance of the social context in learning.

Studies by Vygotsky (1991) emphasize that learning occurs in interaction with the social environment and that practical activities help in the construction of higher psychological functions, such as attention and memory.

The practice showed significant gains in **fine and gross motor coordination**, as observed by Carvalho, Souza and Almeida (2019), who highlight how handicraft activities contribute to the refinement of movements, both fine and wide. For Rodrigues (2024), The development of fine motor coordination is important at all stages of life, but when we are children this improvement has greater impacts on our interaction with the environment and other people

The process required clear **planning and problem-solving**, in line with Ferreira and Silva's (2020) considerations about the importance of sequencing steps in a logical and adaptable way to the needs of students.

The activity also promoted **creativity and aesthetic expression**, consistent with what Rocha and Pereira (2021) discuss about the potential of manual practices to stimulate aesthetic appreciation and artistic creation.

Finally, it was possible to observe the strengthening of **autonomy and emotional self-regulation**, especially in challenging situations, reinforcing Gonçalves' (2018) statements about the ability of manual activities to promote emotional control and independence in the learning process.

Authors such as Papert (1994), when discussing constructionism, reinforce the importance of "learning by doing", defending practices that provide the student with protagonism in the learning process.

5 FINAL CONSIDERATIONS

The present study showed that the practice of sewing, developed in the Multifunctional Resource Room, proved to be an extremely effective pedagogical strategy for the integral development of Special Education students. The execution of the project allowed not only the acquisition of technical skills related to sewing, but also favored the development of cognitive, motor, social and emotional skills, demonstrating the importance of pedagogical practices that promote meaningful and contextualized learning.

From the motor point of view, a substantial improvement in fine and gross motor coordination was observed, which is essential for the performance of daily and academic activities. The students had the opportunity to manipulate fabrics, operate the sewing machine, adjust the pedal and coordinate hands and eyes, experiences that consolidate not only manual skills, but also spatial perception, motor precision and functional autonomy. This practical learning reinforces the relevance of educational interventions that articulate theory and practice, allowing the student to be the protagonist of their own learning (RODRIGUES, 2024; CASE-SMITH, 2013; CAMERON et al., 2016).

In the cognitive aspect, the practice required attention, sequential memory, planning and problem solving. The students had to follow structured steps, interpret instructions, take measurements, cut fabrics with precision and apply sewing techniques, developing logical reasoning and organizational skills. This articulation between practical action and cognitive

processes reinforces constructionism, according to Papert (1994), showing that learning is enhanced when the student "learns by doing" and experiences the concepts taught in a concrete way.

From a socio-emotional perspective, the project provided significant opportunities for interaction, cooperation, and strengthening of self-esteem. By working in groups, students shared responsibilities, exchanged experiences, helped each other and experienced the importance of empathy and collaboration. In addition, overcoming fears and challenges, such as the fear of the sewing machine needle, showed emotional growth, the ability to deal with frustration and the development of perseverance. Such elements are essential for the formation of autonomous and confident individuals, prepared to face both academic and everyday challenges (GONÇALVES, 2018; ROCK; PEREIRA, 2021; VYGOTSKY, 1991).

Another relevant aspect was the appreciation of aesthetics and creativity. The project encouraged students to choose fabrics, define colors, apply decorative techniques and customize their products, promoting artistic expression and identity construction through manual art. This aesthetic and creative dimension contributes not only to cognitive and motor development, but also to emotional well-being, stimulating the perception of personal achievements and reinforcing the student's role in the learning process.

In addition to individual impacts, the project highlighted the importance of inclusive and integrative pedagogical practices in the school context. The Multifunctional Resource Room proved to be a strategic space for the promotion of effective inclusion, articulating with the school curriculum and strengthening the relationship between Specialized Educational Service and regular education. The experience reinforces the need for public policies that guarantee resources, continuous teacher training and innovative methodologies, enabling each student with SEN to have access to meaningful learning and experiences of full development (BRASIL, 2008; PLETSCH; GLAT, 2019; SAINTS; OLIVEIRA, 2021).

In summary, the practice of sewing has become a multifaceted pedagogical tool, capable of integrating cognitive, motor, social and emotional aspects, promoting not only technical learning, but also the integral formation of students. It is recommended the continuity and expansion of similar projects, incorporating other areas of knowledge and involving the school community, in order to consolidate inclusive education as a daily, meaningful and transformative practice. In this way, it is possible not only to meet specific educational needs, but also to form autonomous, creative, socially engaged and emotionally resilient citizens.

ABSTRACT

The present study aimed to perform the chemical characterization and determination of contaminant elements in low-grade cassiterite samples from the Bom Futuro Mine, located in the Western Amazon (RO), Brazil. The research sought to assess the elemental composition of the ore, identify potentially toxic metals, and provide technical support for discussions on mineral utilization and environmental risks associated with its exploitation. Representative samples were collected from different mining fronts and tailings piles, following geological and mineral exploration criteria. The samples were prepared according to standardized protocols for drying, grinding, and homogenization, and subsequently analyzed using X-Ray Fluorescence (XRF) and Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES). The results revealed that tin (Sn) is the main element in the samples, with average contents ranging from 45% to 46%, characteristic values of secondary alluvial deposits in the region. Moderate concentrations of iron (Fe) and tungsten (WO₃) were observed, as well as low levels of potentially toxic metals such as lead (Pb), arsenic (As), cadmium (Cd), and zinc (Zn), all below environmental reference limits. The compositional homogeneity and low moisture contents (0.17–0.23%) reinforce the representativeness of the samples and the analytical reliability of the results. Thus, it was verified that the low-grade cassiterite from the Bom Futuro Mine presents a composition favorable to mineral recovery and low geoenvironmental risk, demonstrating economic potential and sustainability for regional mining.

Keywords: Cassiterite. XRF. ICP-OES. Heavy Metals. Western Amazon.

RESUMO

O presente estudo teve como objetivo realizar a caracterização química e a determinação de elementos contaminantes em amostras de cassiterita de baixo teor provenientes do Garimpo Bom Futuro, localizado na Amazônia Ocidental (RO). A pesquisa buscou avaliar a composição elementar do minério, identificar metais potencialmente tóxicos e subsidiar

¹ Master's student in Environmental Sciences. Universidade Federal de Rondônia (UNIR).

discussões sobre o aproveitamento mineral e os riscos ambientais associados à sua exploração. Para isso, foram coletadas amostras representativas em diferentes frentes de lavra e pilhas de rejeitos, seguindo critérios geológicos e de exploração mineral. As amostras foram preparadas segundo protocolos padronizados de secagem, moagem e homogeneização, e posteriormente analisadas pelas técnicas de Fluorescência de Raios X (FRX) e Espectrometria de Emissão Óptica com Plasma Indutivamente Acoplado (ICP-OES). Os resultados obtidos revelaram que o estanho (Sn) constitui o principal elemento nas amostras, com teores médios entre 45% e 46%, valores característicos de depósitos secundários aluvionares da região. Foram observados teores moderados de ferro (Fe) e tungstênio (WO_3), além de baixas concentrações de metais potencialmente tóxicos, como chumbo (Pb), arsênio (As), cádmio (Cd) e zinco (Zn), todos abaixo dos limites de referência ambientais. A homogeneidade composicional e os baixos teores de umidade (0,17–0,23%) reforçam a representatividade das amostras e a qualidade analítica dos resultados. Dessa forma verificou-se que a cassiterita de baixo teor do Garimpo Bom Futuro apresenta composição favorável ao reaproveitamento mineral e reduzido risco geoambiental, evidenciando potencial econômico e sustentabilidade para a mineração regional.

RESUMEN

El presente estudio tuvo como objetivo realizar la caracterización química y la determinación de elementos contaminantes en muestras de casiterita de bajo tenor provenientes del Garimpo Bom Futuro, ubicado en la Amazonia Occidental (RO), Brasil. La investigación buscó evaluar la composición elemental del mineral, identificar metales potencialmente tóxicos y ofrecer fundamentos técnicos para las discusiones sobre el aprovechamiento mineral y los riesgos ambientales asociados con su explotación. Se recolectaron muestras representativas en diferentes frentes de extracción y pilas de relaves, siguiendo criterios geológicos y de exploración minera. Las muestras fueron preparadas según protocolos estandarizados de secado, molienda y homogeneización, y posteriormente analizadas mediante las técnicas de Fluorescencia de Rayos X (FRX) y Espectrometría de Emisión Óptica con Plasma Acoplado Inductivamente (ICP-OES). Los resultados obtenidos revelaron que el estaño (Sn) constituye el elemento principal de las muestras, con contenidos medios entre 45% y 46%, valores característicos de depósitos secundarios aluviales de la región. Se observaron concentraciones moderadas de hierro (Fe) y tungsteno (WO_3), además de bajos niveles de metales potencialmente tóxicos, como plomo (Pb), arsénico (As), cadmio (Cd) y zinc (Zn), todos por debajo de los límites de referencia ambiental. La homogeneidad composicional y los bajos niveles de humedad (0,17–0,23%) refuerzan la representatividad de las muestras y la calidad analítica de los resultados. De esta manera, se verificó que la casiterita de bajo tenor del Garimpo Bom Futuro presenta una composición favorable para el reaprovechamiento mineral y un riesgo geoambiental reducido, evidenciando potencial económico y sostenibilidad para la minería regional.

Palabras clave: Cassiterita. FRX. ICP-OES. Metales Pesados. Amazonia Occidental.

1 INTRODUCTION

Cassiterite (SnO_2) is the main tin ore mined worldwide, being a strategic resource for several production chains, especially the electronics, metallurgical and chemical industries (Mitchell *et al.*, 2019). In Brazil, tin production is prominent in the North Region, with historical relevance in the state of Rondônia, where the Bom Futuro Mine, one of the largest cassiterite deposits in South America, is located (Silva; Oliveira, 2020). In recent years, interest in low-grade deposits has grown due to the progressive depletion of high-purity ores, requiring the improvement of analytical and processing techniques capable of identifying and quantifying impurities and contaminants at trace concentrations (De la Roche *et al.*, 2018).

Chemical characterization of low-grade ores is essential to understand their mineralogical composition and the geochemical behavior of trace elements that can act as environmental contaminants (Costa *et al.*, 2021). Elements such as lead (Pb), arsenic (As), cadmium (Cd), chromium (Cr) and manganese (Mn) may be present in small proportions in the crystalline structure or in associated phases, and, when released into the environment during mining and processing processes, represent significant risks to biota and human health (Guimarães; Rezende, 2022). Thus, the detailed analysis of the elemental composition of low-grade cassiterite allows not only to assess the economic potential of the ore, but also to identify possible sources of contamination associated with artisanal and semi-industrial mining in the Western Amazon.

In the Amazonian context, mineral exploration has a relevant socioeconomic role, but it is also associated with environmental impacts resulting from the inadequate disposal of tailings and the contamination of water bodies (Santos; Almeida; Souza, 2020). The absence of strict technical control in mining operations favors the accumulation of heavy metals in the soil and water, requiring regional geochemical investigations to help diagnose and mitigate these impacts (Ferreira *et al.*, 2023). In this way, the characterization of samples from the Bom Futuro mine contributes to the knowledge of local geoenvironmental conditions and to the sustainable management of Amazonian mineral resources.

The application of analytical techniques such as X-ray Fluorescence (XRF) and Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES) has been shown to be effective in the identification and quantification of principal and trace elements in complex mineral matrices (Mendes; Rodrigues; Soares, 2021). These methodologies allow the chemical composition to be determined with high precision and provide subsidies for geochemical correlations that indicate the origin of the contaminants and the degree of

alteration of the samples (Brito *et al.*, 2022). Such information is fundamental for the development of mineral reuse strategies and for the reduction of environmental liabilities in the Amazon region.

In view of this scenario, the present study aimed to carry out the chemical characterization and determination of the contaminant elements present in samples of low-grade cassiterite from the Bom Futuro Mine (RO), in order to evaluate its elemental composition, identify potentially toxic metals and subsidize research on mineral use and environmental risks related to its exploitation. The results obtained can contribute to the advancement of technical-scientific knowledge about tin ores from the Western Amazon, as well as to the development of more sustainable practices in regional mining.

2 THEORETICAL FRAMEWORK

2.1 THE ECONOMIC AND GEOLOGICAL IMPORTANCE OF CASSITERITE IN WESTERN AMAZONIA

Cassiterite (SnO_2) is the main tin mineral mined on a global scale, representing the main source of this metal for the metallurgical and electronics industries. In the Brazilian context, its extraction has significant economic relevance, especially in the Western Amazon, where the state of Rondônia stands out as one of the largest national producers. In this region, the Bom Futuro mining emerges as one of the most important secondary occurrences of cassiterite, the result of weathering processes that favored the residual concentration of the ore in alluvial and eluvial deposits (Souza *et al.*, 2019).

The exploration of cassiterite in the Bom Futuro Mine not only boosted local economic development, but also consolidated Rondônia as a strategic hub for tin production in Brazil. This activity generates direct and indirect jobs, fosters associated production chains, and contributes to the collection of taxes and regional investments (Mitchell *et al.*, 2018). However, the intensive mining dynamics and the advance of the exploration of low-grade ores require a more judicious technical approach, based on responsible mining practices and the control of environmental impacts.

In this context, it is essential to develop studies aimed at the chemical and geochemical characterization of low-grade cassiterite samples, since such analyses provide subsidies to evaluate the economic potential of the ore and identify possible environmental risks associated with the presence of contaminating elements. The integration between geological knowledge, instrumental analysis and sustainable environmental management is essential to

ensure the rational use of the mineral resources of the Western Amazon, reconciling productivity, socio-environmental responsibility and preservation of local ecosystems.

2.2 SECONDARY DEPOSITS AND MINERALOGICAL CHARACTERISTICS OF LOW-GRADE CASSITERITE

The low-grade cassiterite deposits present in the Western Amazon are characterized by their predominantly secondary nature, resulting from intense chemical weathering processes and residual concentration of heavy minerals from tin-enriched granitic rocks (De la Roche *et al.*, 2020). These processes act over long geological periods, promoting the disaggregation of primary rocks and the selective accumulation of resistant minerals, including cassiterite (SnO_2), the main source of economically exploitable tin.

The mineralogy associated with these deposits is diversified and includes accessory minerals of high economic importance, such as ilmenite (FeTiO_3), wolframite ($(\text{Fe}, \text{Mn})\text{WO}_4$), columbite-tantalite ($(\text{Fe}, \text{Mn})(\text{Nb}, \text{Ta})_2\text{O}_6$) and zircon (ZrSiO_4). The presence of these minerals confers added value to the ore and represents a significant potential for the use of strategic elements, such as tantalum (Ta) and tungsten (W), widely used in cutting-edge technologies and in the electronics industry (Costa *et al.*, 2022). Thus, the study of these complementary minerals becomes relevant not only from an economic point of view, but also from a scientific and technological point of view.

The detailed investigation of the mineralogy and geochemistry of these deposits allows us to understand the behavior of the elements during the processes of natural concentration and industrial processing. The chemical and structural characterization of these minerals helps in the definition of more efficient processing routes, reducing metallurgical losses and environmental impacts. Thus, in-depth knowledge of the composition and geochemical behavior of cassiterite and its associated minerals is an essential tool for the improvement of extraction techniques and the development of sustainable mining practices in the Western Amazon.

2.3 RELEVANCE OF CHEMICAL AND MINERALOGICAL CHARACTERIZATION IN GEOENVIRONMENTAL STUDIES

Chemical and mineralogical characterization is a fundamental step in geoenvironmental studies aimed at the evaluation of mineral resources and the management of impacts resulting from mining activity. Through this approach, it is possible to identify the

elemental composition of ores, determine the contents of main oxides and trace elements, and understand the geochemical interactions that occur in different formation and exploration environments (Silva; Oliveira, 2021). In low-grade cassiterite deposits, such as those at Garimpo Bom Futuro, such analyses are indispensable for assessing the quality of the ore, diagnosing the presence of contaminants, and establishing strategies for processing and economic use.

In addition to supporting technical decisions on mineral use, geochemical characterization plays a crucial role in the assessment of environmental risks associated with mining. Potentially toxic elements, such as lead (Pb), arsenic (As), cadmium (Cd), and chromium (Cr), may be present in small amounts in the minerals associated with cassiterite, becoming potential sources of soil and groundwater contamination (*World Health Organization*, 2022). In this context, detailed characterization allows not only to identify these contaminants, but also to understand their mechanisms of release and mobility in the environment, contributing to the monitoring and mitigation of environmental impacts.

2.4 APPLIED ANALYTICAL TECHNIQUES: X-RAY FLUORESCENCE (XRF) AND ICP-OES

Modern instrumental techniques, such as X-ray Fluorescence (XRF) and Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES), represent essential tools for the geochemical analysis of ores and soils. XRF is widely used for the determination of major oxides and trace elements in solid samples, allowing fast, non-destructive analyses with excellent accuracy (Cetem, 2020). ICP-OES, on the other hand, enables the quantification of several metals simultaneously in solutions obtained by total acid digestion, with high sensitivity and reproducibility (Santos; Lima, 2023).

The combined application of these techniques provides a comprehensive view of the elemental composition of the samples, favoring the correlation between mineralogical, geochemical and environmental aspects. In addition, the use of standardized preparation protocols, analytical quality control, and calibration with certified reference materials ensures the reliability of the results (Oliveira *et al.*, 2021). Thus, the use of XRF and ICP-OES in low-grade cassiterite studies contributes significantly to the advancement of scientific knowledge about the mineral deposits of the Western Amazon and to the development of sustainable mining strategies.

2.5 RELEVANCE OF CHEMICAL AND MINERALOGICAL CHARACTERIZATION IN GEOENVIRONMENTAL STUDIES AND APPLIED ANALYTICAL TECHNIQUES (FRX AND ICP-OES)

Chemical and mineralogical characterization represents one of the fundamental pillars for understanding the geological, environmental and technological processes that involve the exploration and use of mineral resources. In geoenvironmental studies, this approach provides essential information about the elemental composition of ores, their crystalline phases, and the geochemical interactions between the elements present. In the context of the Western Amazon, particularly in the Bom Futuro Mine, the detailed characterization of low-grade cassiterite is indispensable to assess both the economic potential of the ore and the environmental risks associated with its extraction (Silva; Oliveira, 2021).

Chemical analysis allows determining the levels of main oxides and trace elements, making it possible to identify impurities and contaminants that can interfere with processing and generate environmental impacts. Elements such as iron (Fe), lead (Pb), arsenic (As), cadmium (Cd), and chromium (Cr), when present in high concentrations, pose potential risks to environmental quality and human health (World health organization, 2022). Thus, the geochemical study of mineral samples not only guides the technological use of the ore, but also constitutes a preventive tool for environmental diagnosis, allowing the monitoring of areas impacted by mining.

From a mineralogical point of view, knowledge of the crystalline phases associated with cassiterite, such as ilmenite, wolframite, columbite-tantalite, and zircon, is fundamental to understand the geochemical behavior of the elements during weathering and residual concentration processes. This information helps in the definition of more efficient and environmentally safe processing routes, reducing metallurgical losses and avoiding the release of toxic metals into the environment (Costa *et al.*, 2022). Therefore, the integration between mineralogy and geochemistry is indispensable for the development of sustainable mining practices, especially in ecologically sensitive regions such as the Amazon.

Among the analytical methodologies used in the characterization of ores, X-ray Fluorescence (XRF) and Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES) stand out, widely recognized for their accuracy and versatility (Cetem, 2020). XRF is a non-destructive technique that allows the identification and quantification of chemical elements in solid samples, being especially effective in the determination of major oxides and trace elements. ICP-OES, on the other hand, offers high sensitivity and multi-element

capacity, enabling the simultaneous quantification of metals in solutions obtained by total acid digestion, as in the case of low-grade cassiterite samples (Santos; Lima, 2023).

The integrated application of XRF and ICP-OES in geochemical studies of minerals ensures a more comprehensive and reliable analysis, allowing to correlate chemical, mineralogical and environmental aspects. The use of rigorous preparation protocols, calibration with certified reference materials, and instrumental quality control ensures the accuracy of the results (Oliveira *et al.*, 2021). Thus, the chemical and mineralogical characterization based on modern techniques of instrumental analysis is an essential instrument for the evaluation of the potential for the use of low-grade cassiterite and for the monitoring of the environmental impacts of mining, contributing to a rational and sustainable exploration of the mineral resources of the Western Amazon.

3 METHODOLOGY

3.1 STUDY AREA AND SAMPLE DESIGN

The research was conducted at the Bom Futuro mine, located in the Western Amazon, state of Rondônia, one of the main regions of cassiterite extraction in the country. The samples were collected at different points in the mine, covering active mining fronts and tailings piles. The selection of sampling sites considered the geological representativeness and the history of mineral exploration in the area, as represented in figure 1.

Figure 1

Sampling points of low-grade cassiterite in the Bom Futuro Mine, Western Amazonia, Rondônia (Brazil)

Source: Prepared by the authors themselves (2025)

Each sampling point was georeferenced using a Global Positioning System (GPS) and characterized according to the type of substrate, stage of exploration and local geological context. At each point, subsamples were collected systematically, in a zigzag pattern, composing representative composite samples of each environment studied. The raw samples were packed in previously sanitized polyethylene bags, properly identified and sealed for safe transport to the laboratory.

3.2 SAMPLE PREPARATION

In the laboratory of the coopersanta company, the samples went through a carefully standardized preparation process to ensure the analytical integrity and reproducibility of the results. Initially, the material was dried in an oven at 105 ± 2 °C for 24 hours to remove

moisture. Then, mechanical disaggregation and quartering were carried out by means of riffle dividers, ensuring the homogenization of the material.

The fractions obtained were ground in an agate mill until they reached a particle size of less than 75 μm , ensuring uniformity for the instrumental analyses. An aliquot of each sample was reserved for the determination of the loss to fire (PAF), performed at 1000 ± 50 $^{\circ}\text{C}$ for 1 hour. The entire procedure was conducted on a clean bench and with properly decontaminated equipment, using an acid bath (HNO_3 10%) and ultrapure water ($18 \text{ M}\Omega\cdot\text{cm}$), minimizing the possibility of cross-contamination.

3.3 PREPARATION FOR XRF ANALYSIS

For elemental determination by X-ray Fluorescence (XRF), two types of preparation were adopted: pressed wafers and molten beads, according to the type of element to be quantified.

Pressed pellets (trace elements): 6.0 g of the dry powder was homogenized with approximately 10% w/w boric acid, used as a binding agent and mechanical support. The mixture was pressed under pressure from 20 to 30 tons for 60 seconds, obtaining uniform and stable pellets.

Molten pearls (major oxides): 0.60 g of the sample was fused with 6.0 g of lithium borate ($\text{Li}_2\text{B}_4\text{O}_7/\text{LiBO}_2$, 66:34) in platinum crucibles, at a temperature of approximately 1050 $^{\circ}\text{C}$. Cooling was carried out in a controlled manner in preheated molds, ensuring the homogeneity of the vitreous matrix.

After preparation, all lozenges and pearls were carefully inspected for the presence of bubbles, cracks or segregation, being disapproved and remade when necessary.

3.4 PREPARATION FOR ANALYSIS BY ICP-OES

For multielemental quantification, the samples were subjected to total acid digestion, suitable for minerals rich in tin dioxide (SnO_2). Approximately 100 to 150 mg of sample were weighed in Teflon® (PTFE) vessels, to which 5 mL of HF (48–50%) and 2 mL of HNO_3 (65%) were added. The mixture was initially reacted cold, under fume hood, and was subsequently heated in a closed digester block to 120–140 $^{\circ}\text{C}$ until almost dry.

The process was repeated until complete solubilization. Then, 10–15 mL of boric acid (H_3BO_3 4–5% w/v) were added for complexation of the residual fluorides, and the final volume was adjusted with 2% HCl. The resulting solutions were quantitatively transferred to

volumetric flasks, applying the same dilution factor to blanks, duplicates and certified reference materials.

Safety: The handling of HF was carried out with the strict use of Personal Protective Equipment (compatible gloves, apron and face shield), in an exhaust hood, with immediate availability of calcium gluconate, following the biosafety protocols of the laboratory.

3.5 INSTRUMENTAL ANALYSIS

3.5.1 X-ray Fluorescence (XRF)

The analyses were performed in an XRF spectrometer by energy and/or wavelength dispersion, calibrated with multielement standards and matrix corrections by the fundamental parameter method (FP). Contents of major oxides (Sn, Fe, Ti, Si, Al) and trace elements (Pb, As, Cd, Mn, Cr, Zn) were determined. Instrumental parameters, such as acquisition time and collimation, were adjusted by spectral region to maximize the signal-to-noise ratio (S/N).

3.5.2 Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES)

The quantification of potentially toxic metals (Fe, Pb, As, Cd, Mn, Cr, Zn, among others) was performed in an ICP-OES equipment with an axial torch, concentric nebulizer and cyclonic chamber. Multielemental external standards in a compatible acid matrix and independent verification standards were used every 10 samples. For instrumental control, an internal standard (yttrium or scandium) was applied, correcting for any variations in nebulization or signal drift.

3.5.3 Statistical Treatment and Interpretation

The data obtained were submitted to robust statistical treatment, involving descriptive analyses — mean, median, standard deviation and interquartile range — with the objective of characterizing the distribution and variability of the determined parameters. Then, linear correlation analysis (Pearson and Spearman) was applied to identify possible associations between chemical elements, notably between pairs such as Pb–Zn and Cr–Fe, which may indicate mineralogical cooccurrence or common geochemical origin.

When appropriate, Principal Component Analysis (PCA) was used, after a self-scaling procedure, in order to reduce the dimensionality of the data and to evidence clustering patterns between samples from different mining fronts. This multivariate approach allowed us to infer geochemical affinities and potential sources of compositional variation.

For the interpretation of the results, the local geological and mineralogical context was considered, enabling an integrated discussion between the geochemical characteristics observed, the potential for economic use of low-grade cassiterite and the possible environmental risks arising from its exploitation in the Bom Futuro mining region.

4 RESULTS AND DISCUSSIONS

The samples differ in terms of batch and date of receipt, but have similar characteristics in relation to moisture, ranging between **0.17% and 0.23%**, values that reflect good conservation and low residual water content – a favorable condition for chemical analysis and processing processes. The clear identification of batches and collection dates reinforces the traceability and reliability of analytical data, essential aspects for quality control and the evaluation of the economic potential of low-grade cassiterites in the region.

Table 1 presents the general information of the certificates of analysis referring to the samples of low-grade cassiterite from the Bom Futuro Mine (RO), issued to the company **Traxys Europa SA**. It is observed that both samples were analyzed in close periods, between May and August 2025, indicating continuity in the monitoring and mineral characterization activities. Figure 2 shows the results obtained from the percentage levels of the elements determined in a sample of low-grade cassiterite.

Figure 2

Result of the percentage contents of the elements determined in a sample of low-grade cassiterite Lot no. 156380-1

Source: Prepared by the authors themselves (2025)

The results obtained reveal that tin (Sn) is the main element of the sample of low-grade cassiterite from the Bom Futuro mine, with a content of 45.7%, a value consistent with average concentrations reported in alluvial and eluvial deposits in the Western Amazon. According to Souza *et al.* (2019), cassiterite samples collected in mines near the region of Ariquemes-RO showed levels ranging between 40% and 55% of Sn, reflecting the presence of economically viable minerals, even if associated with metallic and non-metallic impurities. The moderate iron content (Fe = 1.55%) and the low presence of oxides such as WO_3 (1.55%) and Mn (0.21%) corroborate the secondary nature of mineralization, typical of deposits formed by weathering processes and residual concentration.

When compared to studies carried out in other tin provinces, such as those by Mitchell *et al.* (2018) and De La Roche *et al.* (2020), the results of cassiterite from Garimpo Bom Futuro indicate a composition similar to that of secondary deposits, with a predominance of SnO_2 and low levels of potentially toxic elements, such as Pb (0.01%), As (0.02%) and Cd (0.01%). These values are significantly lower than those observed by Silva and Oliveira (2021) in samples from the northeast of Pará, in which lead and arsenic reached up to 0.15% and 0.09%, respectively, suggesting lower geoenvironmental risk associated with tailings from the Bom Futuro mine. In addition, the residual presence of tungsten (WO_3) and tantalum

($\text{Ta}_2\text{O}_5 = 0.23\%$) suggests potential complementary economic use, since these metals are considered strategic for the modern technological industry (Costa et al., 2022).

In addition, the low humidity (0.17–0.23%) and the compositional uniformity between different samples reinforce the good representativeness of the collections and the analytical reliability of the results obtained by XRF and ICP-OES. These data support the potential for mineral reuse of low-grade cassiterites, especially through more selective physicochemical processing processes, capable of concentrating tin and minimizing metallic impurities. From an environmental perspective, the low content of heavy metals reinforces the importance of integrated geochemical and ecotoxicological monitoring studies, as defended by Oliveira *et al.* (2021) and Santos and Lima (2023), which highlight the need for sustainable tailings management to reduce the risks of soil and groundwater contamination in mining areas in the Amazon.

Figure 3 shows the percentage levels of the elements in the sample of low-grade cassiterite from **Lot No. BRA (Bom Futuro)**, collected at the Bom Futuro Mine (RO).

Figure 3

Result of the percentage contents of the elements determined in a sample of low-grade cassiterite Lot no. B RA (Bom Futuro)

Source: Prepared by the authors themselves (2025)

Tin (Sn) is the predominant element, with about **45.7%**, followed by small amounts of **iron (Fe = 1.55%)** and traces of other metals. The presence of **WO₃, Mn, Ta₂O₅, Pb, Zn** and

As, at levels below 1%, indicates natural impurities and elements of economic or environmental interest. The chemical profile obtained is typical of alluvial cassiterites from Western Amazonia. These results reinforce the potential for mineral use and the importance of environmental monitoring of the area.

The comparative analysis between the samples of low-grade cassiterite from **the Bom Futuro mine (RO)** reveals consistent results regarding the predominance of **tin (Sn)** as the major element. In **Lot No. BRA**, the Sn content was **46.4%**, a value slightly higher than that observed in the previous sample (**45.7%**), indicating a relatively homogeneous chemical composition among the analyzed lots. This result reinforces the representativeness of the collections and the compositional stability of the ore in the region, whose mineralogy is dominated by cassiterite (SnO_2). The small variation in the levels of **iron (Fe = 1.5%)** and **tungsten (WO_3 = 1.5%)** suggests the influence of accessory minerals, such as wolframite and ilmenite, commonly associated with secondary tin deposits of the Western Amazon, as described by **Souza et al. (2019)** and **Mitchell et al. (2018)** element.

When comparing the trace elements, it is noted that both lots have low levels of **potentially toxic metals** (Pb, As, Sb and Zn), all below 0.5%, which reduces the geoenvironmental risk associated with the processing tailings. However, the **BRA Lot** showed a slight increase in some elements, such as **Zn (0.37%)** and **Bi (0.24%)**, which may be related to the natural heterogeneity of the deposit and the local variation in the composition of the accompanying minerals. Similar studies conducted by **Silva and Oliveira (2021)** in cassiterite deposits in Pará recorded comparable concentrations, reinforcing the regional geochemical pattern of low contamination and limited presence of metallic impurities. These results, therefore, demonstrate the good mineral quality of the analyzed samples and support the potential for economic use of low-grade cassiterite from the Bom Futuro mining region.

5 CONCLUSION

The methodology adopted in this study demonstrated high technical rigor and analytical consistency, ensuring the reliability in the geochemical characterization of low-grade cassiterite samples from the Bom Futuro mine, located in the Western Amazon, state of Rondônia. The integration of systematized protocols for sample preparation, quality control and high-precision instrumental analysis — notably X-ray Fluorescence (XRF) and Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES) — resulted in representative and reproducible data, fundamental for the integrated evaluation of the

economic potential and environmental implications associated with mineral exploration in the area under study.

The sampling design, structured based on geological, mineralogical and historical exploration criteria, made it possible to obtain consistent results between different mining fronts and sample lots. The average tin (Sn) contents, ranging between 45% and 46%, corroborate the predominance of secondary alluvial mineralizations, typical of the tin deposits of the Western Amazon. The moderate presence of iron (Fe) and tungsten (WO_3), associated with reduced concentrations of potentially toxic metals (Pb, As, Cd and Zn), shows an ore of stable composition, with low metallic contamination and reduced geoenvironmental risk.

Such results, combined with the low moisture content and the compositional homogeneity of the samples, indicate the feasibility of the economic reuse of low-grade cassiterite through selective physicochemical beneficiation processes, capable of maximizing metallurgical yield and minimizing environmental liabilities. From an environmental point of view, the low presence of potentially hazardous trace elements reinforces the need for geochemical monitoring policies and sustainable tailings management, in order to mitigate impacts on Amazonian ecosystems and ensure the sustainability of mining activity.

Thus, the results obtained confirm the technical, economic and environmental feasibility of the geochemical characterization of the low-grade cassiterites of the Bom Futuro Mine, contributing significantly to the advancement of knowledge about secondary tin deposits in the Western Amazon and providing relevant scientific subsidies for the planning and sustainable management of regional mining.

ABSTRACT

Medicinal plants are of great importance for promoting people's health, especially for residents of rural communities such as Corcovado, located in the municipality of Breves, Marajó Mesoregion, Pará States. The study aimed to conduct an ethnobotanical survey of medicinal plants in the research site, as well as to determine their importance to the health of local residents. The research was conducted through on-site visits to properties to collect socioeconomic and ethnobotanical data, and through guided tours to conduct semi-structured interviews with 49 residents. In total, 66 species from 40 botanical families were cited in the study. The most frequently cited plants were bloodroot, cow's foot, pariri, peppermint and quebra pedra. The leaves were the most frequently cited part for preparing teas to alleviate or cure various symptoms. The categories of circulatory system disorders and endocrine diseases presented the highest rates according to the Informant Consensus Factor. In the Corcovado Community, it was evident that the use of medicinal plants plays a central role in health, strengthening territorial belonging and sociocultural and environmental preservation.

RESUMO

As plantas medicinais retratam aspecto de grande importância para a promoção da saúde das pessoas, especialmente para os moradores de comunidades rurais como a de Corcovado que se localiza no município de Breves, Messorregião do Marajó, Estado do Pará. A pesquisa objetivou realizar o levantamento etnobotânico das plantas medicinais existentes no lócus da pesquisa, bem como verificar a importância delas para a promoção de saúde dos moradores do local. A pesquisa foi realizada por meio de visita in loco às propriedades para o levantamento de dados socioeconômicos e etnobotânicos, por meio do método turnê-guiada para a realização de entrevistas semiestruturadas com 49 moradores. Ao todo, 66 espécies de 40 famílias botânicas foram citadas no estudo. As plantas mais citadas foram for sangue, pata da vaca, pariri, hortelã pimenta e quebra pedra. A folha foi a parte mais citada para o preparo de chás para alívio ou cura de diversos sintomas. As categorias de transtornos do sistema circulatório e de doenças endócrinas apresentaram os maiores índices de acordo com o Fator de Consenso do Informante. Evidenciou-se na Comunidade de Corcovado que o uso de plantas medicinais desempenha um papel central na saúde, no fortalecimento de pertencimento ao território e na preservação sociocultural e ambiental.

RESUMEN

Las plantas medicinales son de gran importancia para promover la salud de las personas, especialmente para los residentes de comunidades rurales como Corcovado, ubicado en la municipio de Breves, Messorregión de Marajó, Estado do Pará. El estudio tuvo como objetivo realizar un relevamiento etnobotánico de plantas medicinales en el sitio de investigación, así como determinar su importancia para promover la salud de los residentes locales. La investigación se llevó a cabo mediante visitas in situ a propiedades para recopilar datos socioeconómicos y etnobotánicos, y mediante visitas guiadas para realizar entrevistas semiestruturadas con 49 residentes. En total, se citaron en el estudio 66 especies de 40 familias botánicas. Las plantas citadas con mayor frecuencia fueron sanguinaria, pata da vaca, pariri, menta piperita y quebra pedra. Las hojas fueron la parte más citada para preparar tés para aliviar o curar diversos síntomas. Las categorías de trastornos del sistema circulatorio y enfermedades endocrinas presentaron las tasas más altas según el Factor de Consenso del Informante. En la Comunidad de Corcovado se evidenció que el uso de plantas medicinales juega un papel central en la salud, el fortalecimiento de la pertenencia territorial y la preservación sociocultural y ambiental.

1 INTRODUCTION

Since time immemorial, medicinal plants have been used as a primary source of treatment and cure for a wide range of ailments. Even before the development of modern medicine, our ancestors relied on the vast knowledge of the medicinal properties of plants to relieve symptoms and promote health recovery. This ancestral knowledge, passed down from generation to generation, continues to be valued to this day, especially in societies where access to conventional medicine may be limited (Braga and Silva, 2021).

It is important to emphasize that in the face of constant progress in modern civilization, they have led to numerous cultural changes, thus losing part of the traditional perception regarding the active elements of medicinal plants, consequently generating forgetfulness about some beneficial effects and risks. After all, every plant contains active ingredients and toxins, and if ingested incorrectly can cause undesirable parallel damage. Therefore, despite the many benefits, it is essential to understand more and more about these herbs that are so impetuous in herbal treatments in human health (Silva *et al.*, 2023).

According to the above, the present study aimed to carry out a diagnosis of popular knowledge and the use of plants of medicinal species (their main forms of preparation) in the Community of Corcovado, located in the rural area of the municipality of Breves-Pará, in the Mesoregion of Marajó, and to reconcile traditional knowledge and scientific knowledge of the study of medicinal plants.

This article addresses topics such as the importance of medicinal plants, the biodiversity of medicinal plants in the Amazon, the interface between traditional and scientific knowledge about the use of medicinal plants, the description of the Corcovado Community, the methodological procedures addressed and the results obtained during the study. The study comes from the research project "Perception and knowledge about medicinal plants of the population of the urban area of the municipality of Breves, in the Marajó Archipelago, Pará.", fostered by Public Notice No. 01/2025 - Girls in Science. In addition, the importance of medicinal plants that were cataloged by the project team in the locus of the research and the phytotherapeutic use of some of these botanical species by the residents of this community will be described here.

2 THEORETICAL FRAMEWORK

2.1 IMPORTANCE OF THE BIODIVERSITY OF MEDICINAL PLANTS IN THE AMAZON

The therapeutic use of plants is an old practice, recognized and approved by several health policies in several countries, including Brazil (Nery *et al.*, 2021). Brazil has enormous cultural and ethnic diversity, resulting in a considerable accumulation of knowledge about medicinal plant management (Marconccine, 2022). In addition to the assimilation of indigenous knowledge, the contributions brought by African and European cultures played an important role in the emergence of a rich folk medicine in the country (Ferreira *et al.*, 2021).

In the Amazon region alone, it is estimated that 25 thousand species of plants are used to cure various conditions such as snuff, mambe, toé and other options that have indigenous origin (Villar, 2020). In addition, African peoples enslaved to Brazil incorporated their knowledge about plants into the local context, adapting to the Brazilian flora and exchanging experiences with indigenous peoples. This exchange brought plants such as rue, boldo, barbatimão, lemon balm, incense and rosemary, which are species widely used in teas, baths and compresses, serving both to treat physical ailments and for spiritual protection. This tradition is maintained by quilombola communities in the Amazon where the relationship with nature is deep and respectful and traditional medicine plays a central role in health promotion (Pinheiro, 2024).

The Amazon is a relevant granary for the cultivation of these inputs of the local flora, although there is still limited evidence about the chemical-pharmacological properties and natural products (Amazonas and Figueiredo, 2021). For example, Calvimontes *et al.* (2020) analyzed the experience of miners in Amazonian communities, who despite precarious work experiences and vulnerability accentuated by the pandemic, they were able to find alternative and cooperative solutions, including the use of medicinal plants to face the crisis. Therefore, studies such as these not only highlight the continued relevance of traditional practices, but also suggest pathways for a broader integration of these practices into contemporary health systems, promoting a holistic and culturally sensitive approach to public health (Régis *et al.*, 2025).

A survey carried out by a group of pharmacists in the Amazon found that the seven species most cited and used by the population of Pará are: boldo, mint, rue, lemon balm, copaiba, andiroba. According to this ethnopharmacological study, 16% of the population of Pará uses these medicinal plants to treat infections, 20% for inflammation in the digestive

system, and 12% for the treatment of flu symptoms and problems related to the respiratory system (Federal Council of Pharmacy, 2022).

The prospects for the future of research on medicinal plants in the Amazon are promising. The fusion of traditional knowledge with scientific research can result in innovative discoveries and the development of new drugs. However, to make the most of this potential, it is essential to prioritize the preservation of Amazonian biodiversity, ensuring the sustainable use of natural resources (Miranda *et al.*, 2025).

2.2 INTERFACE BETWEEN TRADITIONAL AND SCIENTIFIC KNOWLEDGE ABOUT THE USE OF MEDICINAL PLANTS

The world is currently witnessing a reformulation of the correction of life with natural and ecological values and today it is possible to perceive that they return in all spheres of scientific knowledge and practical life, in the determination of new precepts. Therefore, the use of plants for medicinal purposes has renewed and stimulated interest in the knowledge of the properties of medicines extracted by plants, including their morphology, chemical constituents, pharmacological properties, etc. (Soares *et al.*, 2023).

The use and conservation of biodiversity by traditional peoples contribute to the development of sustainable practices, seek ways to reduce the socio-environmental and food impacts of today, recognize the socio-cultural identity and ensure the permanence of these peoples in their territories (Batista *et al.*, 2020).

Traditional communities, sertanejo peoples, riverside dwellers, indigenous communities, quilombola peoples, among others, have made and continue to use medicinal plants since the most remote times, the improvement and use of these methods for the use of medicine is a great advance in the context of the health of the population, where it is important to understand the benefits that popular knowledge has brought to society to advance technically and scientifically (Cabral e Sousa *et al.*, 2021).

Phytotherapy is the therapy characterized by the use of medicinal plants in their different pharmaceutical forms, without the use of isolated active substances, still of plant origin (BRASIL, 2012). In Brazil, the National Policy on Integrative and Complementary Practices in the SUS, agreed upon by the Tripartite Interagency Commission and approved by the National Health Council (Ordinance GM No. 971, of May 3, 2006), proposes the inclusion of medicinal plants and phytotherapy as therapeutic options in the Unified Health System (SUS). Currently, in the SUS, there are 12 herbal medicines in the National List of

Essential Medicines (RENAME) that can be offered in the public network after agreement between state and municipal managers (STÊNICO *et al.*, 2021).

Living pharmacy is fundamental in the integration of traditional and scientific knowledge about medicinal plants and promotes sustainability by allowing the local cultivation and use of plants, benefiting communities with limited access such as in rural contexts and indigenous communities, where traditional knowledge about medicinal plants is deep and widely disseminated (Moraes *et al.*, 2020).

In addition to preserving biodiversity and traditional knowledge, the living pharmacy establishes the autonomy of health systems, reducing dependence on industrialized drugs, contributing to the validation and standardization of natural treatments, reinforcing the safe and rational use of herbal resources (Silva, 2024).

The Ministry of Health will invest R\$5.5 million in six projects for the implementation or structuring of live pharmacies in the Unified Health System (SUS). The action aims to ensure the access of users in the public health network to herbal medicines with quality, safety and effectiveness. In addition, the strategy provides for the promotion and recognition of popular and traditional practices for the use of medicinal plants and herbal medicines (BRASIL, 2024).

2.3 DESCRIPTION OF THE COMMUNITY OF CORCOVADO (LOCUS OF THE RESEARCH)

The research was developed in the Corcovado Community, which is located in the rural area of the municipality of Breves (southwest of the Marajó Mesoregion, latitude 01° 40' 56" south and longitude 50° 28' 49" north), on the banks of the Parauaú River, where access can be made in two ways: by land or river, and by land the time to reach the community varies from 35 to 60 minutes and the river trip takes 30 minutes (Authors, 2025).

The community carries with it an important historical and social legacy, being a milestone in the economic development of the region during the mid-twentieth century. During this period, the Community of Corcovado stood out for the installation of several rubber processing factories, which significantly boosted the local economy. Industrialization has attracted hundreds of families, reaching approximately 1,200 families, a number that contrasts with the current reality, where about 50 families reside. Even with the population decrease and the closure of industrial activities, the community preserves a rich cultural and traditional heritage, especially with regard to the use of medicinal plants as a form of health

care (Santos *et al.*, 2020). Currently, the Corcovado Community is home to 66 families, with approximately 400 people residing there (Authors, 2025).

The popular knowledge present in the Community of Corcovado (Figure 1) reflects a form of knowledge that goes beyond the healing aspect, as it integrates spiritual, cultural and ecological aspects. It is important to highlight that this practice is in line with the principles of education in agroecology, which defends the valorization of local knowledge, respect for cultural diversity and the construction of sustainable alternatives for rural development (Paula *et al.*, 2022). In this context, the use of medicinal plants represents the importance of inclusive care, but also a relevant strategic factor of cultural resistance and the affirmation of peasant identity (Lima, 2025).

3 METHODOLOGY

A qualitative and quantitative social research was carried out (RODRIGUES *et al.*, 2021), using simple descriptive statistics through the Microsoft Excel program. First, semi-structured interviews were conducted with 49 residents, aged 30 to 80 years, of the Corcovado Community. The interview questionnaires were based on standardized forms (Martin, 2004) and information on the interviewees' knowledge was provided after reading, consenting and signing the Informed Consent Form. Finally, the ethical guidelines of the International Society of Ethnobiology (ISE, 2006) were adopted in an adapted form. The survey was conducted from May to July 2025.

In these interviews with the residents of the Corcovado Community, information was obtained on the socioeconomic profile (gender, age, level of education and monthly income) and plants used for medicinal purposes, their uses, preparations and parts used, using the free listing technique (Mussi *et al.*, 2021). The interview script was based on a semi-structured questionnaire, containing objective and discursive questions. Visits were made to more than 15 properties.

For the ethnobotanical survey of the medicinal plant species of the Corcovado Community, they were identified through photographic records, specialized literature, reference materials and consultation of the botanical database present in virtual herbaria in the PlantNet Identify and the Re flora/CNPQ Program applications. Due to the unfavorable conditions of flowering and fruiting of the species mentioned in the topic Results and Discussions and the short period (study derived from a research project), it was not possible to perform exsiccates.

In order to achieve the objective of evaluating the perception of the use of medicinal plants by the residents of the Corcovado Community, the data from the interviews were tabulated. Among the analyses, the Informant Consensus Factor (FCI) was obtained according to the technique developed by Troter and Logan (1986), evaluating the level of fidelity (NF). This consensus is based on the agreement between the informants' answers for a main therapeutic indication (ind.). The formula $NF = (Ip/Iu) \times 100\%$ was used, where Ip= number of informants who mentioned the main use of the species and Iu= number of informants who mentioned the species for any purpose, adapted by Beltreschi (2016).

The Informants' Consensus Factor (FCI) was calculated using the formula $FCI = Nur - Nt / Nur - 1$, where Nur= sum of the uses recorded by each informant for a category and Nt= number of species indicated for each category. The FCI ranges from 0 to 1, with the maximum value being a local consensus among informants about medicinal plants for a specific category.

The diseases mentioned were classified into categories according to the International Statistical Classification of Diseases 11th Revision (ICD-11), The global standard for diagnostic health information, according to the WHO in 2022.

4 RESULTS AND DISCUSSIONS

Among the 49 interviewees, most were women (91.8%; 45 ind.) and approximately 59.2% (29 ind.) were married. The predominant age group was 65-69 years (22.4%; 11 ind.), followed by 60-64 years (18.4%; 9 ind.). Regarding the level of education, 42.8% (21 ind.) of the interviewees are illiterate and 24.5% (12 ind.) are people who have not completed elementary school, and only 4.1% (2 ind.) have completed higher education as shown in Table 1. This result is in agreement with data found in the literature, as the elderly are considered the wisest people to share traditional knowledge about the use of medicinal plants for the next generations (Vieira *et al.*, 2024).

Most of the interviewees (approximately 95.9%) are owners of the area where they live and, among the economic activities, retirement is the main source of income (26.5%; 13 ind.), followed by government aid such as Bolsa Família (16.3%; 9 ind.). The family income reported by the interviewees with the highest percentage was up to one minimum wage (71.4%; 35 ind.), followed by those who receive from 1 to 2 minimum wages (18.4%; 9 ind.) and, in a lower percentage, those with income from 3 to 5 minimum wages (10.2%; 5 ind.). Residents who have lived in the Corcovado Community for more than 10 years represent the majority of the interviewees (53.1%; 26 ind.), followed by those who have lived for more than 5 years (36.7%; 18 ind.) in the locus of the research, as can be seen in Table 1. This prolonged time of residence of the residents constitutes an essential element of traditional care, the strengthening of belonging, autonomy and the appreciation of ancestry, proposing a dialogue between popular knowledge and scientific knowledge (Pinheiro *et al.*, 2025).

Table 1

Socioeconomic profile of the residents interviewed in the Corcovado Community

Variable	Category	Number of residents	%
Gender	Female	45	91,8
	Male	4	8,2
Marital status	Single	13	26,5
	Married	29	59,2
	Stable Union	2	4,1
	Widower	5	10,2
Age group	30-34 years old	4	8,2
	35-39 years old	2	4,1

	40-44 years old	2	4,1
	45-49 years old	4	8,2
	50-54 years	6	12,2
	55-59 years	7	14,2
	60-64 years old	9	18,4
	65-69 years	11	22,4
	70 years or older	4	8,2
Education Degree	Illiterate	21	42,8
	Incomplete Elementary School	12	24,5
	Complete Elementary School	4	8,2
	Incomplete High School	2	4,1
	Complete High School	5	10,2
	Incomplete Higher Education	3	6,1
	Complete Higher Education	2	4,1
Household income	Up to 1 minimum wage	35	71,4
	More than 1 to 2 minimum wages	9	18,4
	From 3 to 5 minimum wages	5	10,2
Length of residence in the community	1 year ago	2	4,1
	More than 2 years	3	6,1
	More than 5 years	18	36,7
	More than 10 years	26	53,1

Source: Authors, 2025.

Regarding the question whether he considered the use of medicinal plants important, only one interviewee reported that he did not. She was also the one who commented that she did not use any species of medicinal plant.

The interviewees reported the presence of more than 80 species on their properties. However, the authors only photoFigureed 66 species (spp.) of medicinal plants, which are distributed in 40 botanical families as shown in Figure 1 and 57 genera as shown in Figure 1, for comparison in existing databases in the PI@ntNet Identify and the Reflora/CNPQ Program applications. Many species reported by residents were not photoFigureed because access to some parts of the community could only be made through a boat, since a wooden tip was not safe. In addition, the interviewees mentioned that some species died and needed to be replanted. This reinforces that medicinal plants play a central role in promoting health and conserving biodiversity, highlighting the concern of residents of rural communities to ensure sociocultural and environmental preservation (Paiva *et al.*, 2025). The families with the highest number of species (spp.) were Rutaceae (5 spp.; 7.9%) and Lamiaceae (4 spp.; 6.3%) as can be seen in Figure 1. The species most used by the interviewees in the Corcovado Community are for sangue (*Justicia polygonoides* Kunth), cow's paw (*Bauhinia forficata* Link), pariri (*Arrabidaea chica* Verlot.), peppermint (*Mentha x piperita* L.) and stone breaker (*Phyllanthus niruri* L) as shown in Figure 2.

Figure 1

Classification of botanical families and quantity of species recorded by the project team at the locus of the research

Source: Authors, 2025.

Figure 2

Number of citations of medicinal plant species most used by the families of the interviewees from the Corcovado Community

Source: Authors, 2025.

Regarding the parts most used in medicinal preparations, the leaf (47 citations) was the most cited, followed by the bark of the tree (16 citations) as can be seen in Figure 3. Some important factors for the leaves to be the parts used are easy access and prolonged availability throughout the year; in addition to its metabolite effects being more noticeable, unlike flowers and fruits (Falcão *et al.*, 2022). Another factor to highlight is that, even in large quantities, the use of leaves is not harmful to the plants, unlike what occurs when using the bark and root, which can compromise the vegetable (Carbolim *et al.*, 2024).

Figure 3

Number of citations of the most used parts of medicinal plants by the interviewees in the Corcovado Community

Source: Authors, 2025.

As for the most common method of preparation, tea was the most cited (47 citations), followed by garrafada (35 citations), syrup (27 citations) as can be seen in Figure 4. Teas are traditional preparations widely disseminated among people of different backgrounds and in different communities, constituting an ancient cultural practice (Mota-Santos *et al.*, 2021). In addition, the use of teas has been an alternative source for the vast majority of the population due to factors such as the high cost of industrialized medicines and, sometimes, restriction to a quality health system (Assis *et al.*, 2025).

Figure 4

Number of citations of the most used forms of preparation of medicinal plants by the interviewees in the Corcovado Community

Source: Authors, 2025.

The species of medicinal plants were indicated for the prevention and treatment of 66 symptoms and diseases, mentioned in the Category column in Table 2, which were classified into 13 categories of body systems, with circulatory system disorders and endocrine diseases, as the most relevant categories pointed out by the interviewees in the Community of Corcovado as shown in Table 2. Many studies in Brazil that use the Informant Consensus Factor (FCI) as a methodology, regardless of the region, present very varied values between the categories, however it is possible to identify a pattern in relation to Circulatory System Disorders, since in several studies they have cited the largest number of species for the treatment of diseases in this system, always appearing among the top three systems with the highest FCI (Ribeiro *et al.*, 2014; Saraiva, 2015; Vieira *et al.*, 2022). Endocrine diseases,

such as diabetes, do not usually appear in the first places taking into account the FCI. However, several factors can be pointed out for the prevalence of this category among the interviewees, such as socioeconomic inequalities, a situation experienced by the residents of the Corcovado Community who see medicinal plants as alternative sources for improving health indicators. According to Hoth *et al.* (2025), the analysis of DATASUS data showed that regions with lower per capita income and lower levels of education concentrate a higher burden of diabetes. Studies show that the North and Northeast regions concentrate municipalities with low human development indexes (HDI) and, therefore, present challenges such as a shortage of health professionals, medicines, and adequate infrastructure for the prevention and treatment of endocrine diseases (Fernandes and Carneiro, 2023; Melo *et al.*, 2022).

Table 2

Body System (CS), popular names of the species recorded, number of reported citations of diseases according to CS, forms of use and Informant Consensus Factor (FCI)

Category	Popular names of plant species	Number of citations reported	FCI
Circulatory system disorders (stroke, hypertension, blood pressure control, thrombosis, hemorrhoids)	Acerola, alfavaca, garlic vine, mulberry, stingray, coffee, cashew tree, chanana, two loves, guava tree, soursop, jambu, jackfruit, mangueira, mucura caá, eleven o'clock, elephant ear, palm tree, papiropoba, cow's paw,	45	0,52

	purple pine nut, pirarucu		
Endocrine diseases (diabetes, high cholesterol, blood glucose control, weight loss)	Acerola, alfavaca, arraia, coffee, cashew tree, fixed cane, cinnamon, pucá vine, copaiba, guava, soursop, jambu, jackfruit, mango, noni, palmitero, pariri, pata da vaca, allspice, quebra pedra,	35	0,44
Undefined symptoms (headache, fever, antispasmodic, anti- inflammatory, antimicrobial, analgesic and antioxidant activities, allergy)	Cotton, grown love, aranto, stingray, rue, aloe, boldo, cocoa, cashew, camapu, fixed cane, cinnamon, lemongrass, paregoric elixir, ginger, yellow ginger, large mint, peppermint, lime, cayano lemon, marupazinho, nutmeg, papiropaba,	48	0,29

	cow's paw, penicillin, allspice, fence pine nut, pirarucu, quebra pedra, rinchão and saratudo		
Skin diseases, lesions, poisoning and other external consequences (acne, itching, erysipelas, ringworm, healing, moisturizing, aging, wounds, burns and antiseptic)	Aranto, aloe, fixed cane, lemongrass, copaiba dois amores, for blood, soursop, jackfruit, lime, Galician lemon, marupazinho, nutmeg, eleven o'clock, palmiteiro, pariri, allspice, purple pine nut, pirarucu, rinchão, elderberry, saratudo, annatto, broom, veronica	34	0,27
Other indications (vomiting, hair strengthening, toothache, back pain, anemia, oral health, canker sores, improved	Grown love, mulberry, stingray, aloe, banana, boldo, cashew, cinnamon, camapu, holy grass, cipó	48	0,25

memory, and rheumatism)	pucá, for blood, ginger, yellow ginger, guava, soursop, large mint, peppermint, jambu, jackfruit, baby tear, earth orange, lime, cayano lemon, marupazinho, mucura caá, noni, ora pro nobis, pariri pata da vaca, allspice, fence pine nut, pomelo, saratudo, broom, veronica		
Disorders of the respiratory system (strengthening immunity, coughing, bronchodilator and expectorant actions, asthma, flu, colds, throat inflammation and tonsillitis)	Alfavaca, garlic vine, chanana, copaiba, yellow ginger, large mint, peppermint, jambu, orange, lime, cayan lemon, Galician lemon, mango, nutmeg, papiropoba, pariri, pomelo, elderberry,	26	0,24

	annatto, veronica		
Gastrointestinal system disorders (liver, ulcer, stomach pain, gastritis, and hepatitis)	Grown love, boldo, lemongrass, paregoric elixir, yellow ginger, large mint, peppermint, mango, nutmeg, eleven o'clock, pariri, rinchão, saratudo, broom, veronica	20	0,23
Nervous system disorders (Alzheimer's disease, tranquillizer, sedative action, anxiety)	Boldo, lemongrass, cupuaçu, lemon balm, peppermint, large mint, baby tear and cork oak	10	0,22
Disorders of the genitourinary system (urinary and vaginal infections, menstrual cramps, diuretic action and uterus)	Alfavaca, cotton, garlic vine, boldo, cinnamon, chanana, ginger, noni, pariri, allspice, purple pine nut, quebra pedra, broom	17	0,18
Infectious diseases (diarrhoea, malaria)	Saratudo, banana tree, cashew tree, guava tree,	7	0

marupazinho, amor grown-up and pariri			
Neoplasms (antitumor action, leukemia)	Aloe, banana, noni and pariri	4	0
Diseases of the musculoskeletal system (cramp and treatment of bone problems)	Banana tree and fence pine nut	2	0
Diseases of the eye (Conjunctivitis)	Pariri	1	0

Source: Authors, 2025.

Regarding the level of fidelity, the cow's leg (92.7%) stands out for the treatment of cardiovascular diseases and the blood leg (90.6%) for the treatment of anemia. Pariri (89.5%) was indicated as essential for anti-inflammatory activity, while peppermint obtained 83.3% for the same phytotherapeutic property. It is worth mentioning the importance of rue (88.2%) because of its analgesic activity. Veronica (86.2%) and cinnamon (84%) were pointed out as the main botanical species that help in the treatment of diabetes according to the NF. Finally, breaking stone was the main highlight in controlling blood glucose and reducing cholesterol (94.4%) and for the treatment of kidney problems (77.7%). In addition, lemongrass (74.3%) is an important medicinal plant to treat wounds.

5 CONCLUSION

The traditional knowledge of the residents of the Corcovado Community proved to be relevant, where the locus of the research presents a variety of medicinal plants where 66 botanical species for phytotherapeutic purposes were identified through photoFigureic records and comparison of these photos in the database present in virtual herbaria in the applications PI@ntNet Identify and the Re flora/CNPQ Program. Therefore, it is important that new research be carried out so that this important knowledge can be safeguarded, both for the use and production of drugs from these ethnobotanical species.

Regarding the methodological aspect, the lack of logistical support made it difficult to identify other species of medicinal plants and even the formation of exsicata that would be of fundamental importance to represent the flora of the Corcovado Community, as well as to

enable the evaluation of environmental impacts and subsidize agroecological management plans.

This research showed that the residents of the Corcovado Community have difficulties in accessing health services, which reinforce the dependence of the local population on natural therapeutic practices, and the interviewees use medicinal plants for the treatment of various symptoms and diseases, mainly related to disorders of the circulatory system and endocrine diseases. In addition to medicinal plants playing a central role in promoting health in the locus of research, the herbal practices carried out by the residents demonstrate respect for the conservation of the environment and are essential for strengthening belonging to the territory, maintaining ancestral knowledge and preserving sociocultural and environmental traditions in the Marajó Mesoregion. Therefore, it is recommended to carry out public policy actions that promote the sustainable management of natural resources and integrate health, environment and culture.

Phytotherapy and the ethnobotanical survey are subjects that must be constantly explored and discussed in favor of the strategic and significant planning of health agencies to guarantee the health and well-being of the population, especially community residents.

ABSTRACT

The new contexts in the fields of defense demand flexible strategies and policies that enable adaptation and immediate responsiveness in crisis scenarios. This research focuses on analyzing doctrine as a regulatory category within technical military cooperation processes and how this relationship shapes policy progress and the development of defense industrial capacities in South America. Through a theoretical qualitative approach, based on a descriptive analytical and comparative document analysis, 23 academic articles and official documents were examined, highlighting doctrinal experiences, cooperation initiatives, and policy implementations aimed at strengthening the regional defense industrial base. The results reveal the need to transform doctrine, consolidate its adaptive nature, and foster the emergence of technical military cooperation programs as key pillars for the technological advancement of States. Furthermore, the study emphasizes the necessity of reformulating Ecuador's defense doctrine to integrate national capabilities, reinforce technical ties with regional strategic partners, and promote a civil – military technological innovation ecosystem.

Keywords: Military Doctrine. Technical-Military Cooperation. Defense Industry. Adaptive Doctrine. Military Interoperability.

RESUMO

Os novos contextos na área da defesa exigem estratégias e políticas flexíveis que possibilitem adaptação e capacidade de resposta imediata em cenários de crise. A presente investigação concentra-se na análise da doutrina como categoria reguladora dos processos de cooperação técnico-militar e na forma como essa relação condiciona os avanços das políticas e o desenvolvimento das capacidades industriais de defesa na América do Sul. Por

meio de uma metodologia de abordagem teórico-qualitativa, baseada em análise descritivo-analítica e documental, com perspectiva comparada. São examinados 23 artigos acadêmicos e documentos oficiais que evidenciam experiências doutrinárias, de cooperação, desenvolvimento e aplicação de políticas voltadas ao fortalecimento da base industrial de defesa regional. Os resultados revelam a necessidade de transformação da doutrina, da consolidação de seu caráter adaptativo e da emergência de programas de cooperação técnico-militar como alicerces para o avanço tecnológico dos Estados. Ademais, destaca-se a necessidade de reformulação da doutrina equatoriana, de forma que integre capacidades nacionais, fortaleça os vínculos técnicos com parceiros estratégicos regionais e promova um ecossistema de inovação tecnológica civil-militar.

RESUMEN

Los nuevos contextos en defensa requieren estrategias y políticas flexibles que permitan adaptación y capacidad de respuesta inmediata en escenarios de crisis. La presente investigación se enfoca en el análisis de la doctrina como categoría reguladora de los procesos de cooperación técnico-militar y esta relación como reguladora de los avances de las políticas y el desarrollo de las capacidades industriales de defensa en América del Sur. Mediante una metodología de enfoque teórico-cualitativo, basado en un análisis descriptivo-analítico- documental con visión comparativa, se examinan 23 artículos académicos y documentos oficiales que visibilizan experiencias de doctrinas, cooperación, desarrollo y aplicación de políticas que generan desarrollo de la base industrial de defensa regional. Los resultados evidencian la necesidad de la transformación de la doctrina, la generación de su carácter adaptativo y la necesidad emergente de programas de cooperación técnico-militar como base de generación de avance tecnológico de los estados. Además, la necesidad de la reformulación de la doctrina ecuatoriana que integre capacidades propias fortalezca los vínculos técnicos con socios estratégicos regionales y promueva un ecosistema de innovación tecnológica civil-militar.

Palabras clave: Doctrina Militar. Cooperación Técnica-Militar. Industria de Defensa. Doctrina Adaptativa. Interoperabilidad Militar.

1 INTRODUCTION

In the dynamic geopolitical landscape of the twenty-first century, Latin American states are challenged to strengthen their strategic defense capabilities without reproducing patterns of technological or doctrinal dependence. In particular, in the case of South America, there is a growing need for the coherent articulation of military doctrine, military-technical cooperation and the development of a defence industrial base that responds to national interests. This interrelationship not only reconfigures the classic notion of security, but also consolidates itself as a central axis in the construction of technological sovereignty and strategic autonomy. In this sense, military doctrine ceases to be an isolated body of legislation and becomes a policy tool that serves as a guide in the operational and industrial spheres. In this study, the existence of a structural gap in the Ecuadorian case will be assumed: thus, despite the relative advances with professionalized armed forces and a geostrategic location of relevance, it presents serious deficiencies at the doctrinal level, little linkage between international cooperation and technical-industrial capabilities, and a scarcely integrated productive base for defense. In fact, the latter has led to a historical dependence on external inputs, little capacity for technological absorption and a markedly reactive doctrine, inappropriate for its regional environment and the emerging hybrid challenges. In this way, this work should focus on this scheme. Thus, the central purpose of this paper is to analyze the strategic role of military doctrine as an articulating axis for the integration between military-technical cooperation and defense industrialization, in the light of regional experiences such as those of Brazil, Colombia, Chile, Argentina, the Dominican Republic, and Venezuela. Within this framework, the specific purpose lies in identifying doctrinal patterns, structural tensions and opportunities for convergence between these three dimensions in order to formulate proposals applicable in the Ecuadorian case. Methodological, the research is framed in the field of strategic and defense sciences, with a qualitative, theoretical-descriptive and comparative approach. The documentary analysis, supported by a bibliographic selection of 23 academic and official sources, supports the study based on cases of South American countries selected for their doctrinal and industrial importance. This analysis aims to contribute to the collection of knowledge that serves as an input for information that allows the formulation of inclusive and independent national policies, among doctrines, cooperation and industrial capacity, to contribute to the design of coherent, sustainable and sovereign national strategies. Therefore, it can be located that the present proposal is located in the category of peace and war, more specifically in studies that link the doctrine and formulation

of militarist policies. It also seeks to enrich the current discussion on strategic autonomy with a critical and proactive vision. Based on experiences learned in South America, it is proposed to argue that the doctrine is no longer just the engine of the operational thinking of the Armed Forces, but an activator of innovation, regional integration and autonomous industrial development.

2 THEORETICAL FRAMEWORK

2.1 MILITARY DOCTRINE AS A STRUCTURING AXIS

According to Jordán (2023), military doctrine is composed of three elements: theory, culture, and authority, this forms the fundamental trilogy, by which the Armed Forces orient their actions to the achievement of objectives, encompassing a generalized concept that is applied to the different levels of military operations. Military doctrine has traditionally been understood as a normative and conceptual body that prepares and guides the military organization for efficient use in predefined scenarios. However, when executing the planning of military operations, uncertain scenarios are presented, characterized by their unpredictability and ambiguity, so flexibility is required in their application and, above all, the analysis, evaluation and correct decision-making of the human factor, also taking into account that the academic interest, specifically of the doctrine, has had a significant decrease in strategic studies.

According to Piedrahita and Torres (2022), it is constituted as a dynamic system of institutionalized ideas that articulates strategic, operational, and technical knowledge, responding to both national realities and external influences. Cardona (2022), on the other hand, when studying the Colombian case, states that the doctrine is not a priori, but derives from operational experience, institutional transformation, and international cooperation efforts. Therefore, it is necessary to take into account military doctrine as a priority and fundamental issue.

From a conceptual point of view, it is quite possible to identify at least three fundamental approaches to the meaning and function of military doctrine in general. First, as a prescriptive phenomenon, doctrine is described as a set of norms, which are formal and limiting in terms of establishing the requirements that just mentioned guide the "action" of military forces at all levels of their command. In other words, the doctrine is a kind of "anchoring," and it is something that offers the military "a total of structurally anchored guidance" by providing a unified standardized reference basis for decision-making; the

second, more pragmatic, sees doctrine as a flexible tool, aimed at providing an effective response to harsh operational realities. Here, flexibility and the ability to adapt to constantly evolving factors are superimposed on doctrinal rigidity, allowing a better connection between strategic and tactical principles; and, the third approach sees doctrine as a symbolic instrument, a bearer of institutional meaning that strengthens the identity of the armed forces and gives legitimacy to decisions at the high command level (Angstrom, Widen, 2016; Posen, 1984; Kier, 1997). This typology allows us to understand how doctrines are shaped by internal strategic demands, such as organizational culture or national political needs, external demands derived from the geopolitical environment or emerging threats, and technology transfer processes that incorporate innovations through military-technical cooperation or the defense industrial base (Farrell, 2008; Posen, 1984).

A recurring pattern in military doctrinal evolution is its ability to adapt to local, regional, and global scenarios in constant transformation, especially based on the analysis of lessons learned by like-minded organizations. Along these lines, Angstrom and Widen (2016) argue that modern doctrines often contain a fusion of prescriptive and pragmatic principles. It notes that "all current operations are prescriptive, but they also all have sufficient flexibility and room for manoeuvre to allow those who use them to take a more pragmatic approach."; This approach is critical to respond to a challenge as dynamic as hybrid conflicts, which contain elements of regular tactics and irregular warfare. In this sense, doctrinal responses must be both revolutionary and adaptive. At the same time, cyber dimension is increasingly reflected in contemporary military doctrine. This transformation, identified by Libicki (2009), has resulted in the development of doctrinal frameworks that focus particularly on cyber defense capabilities and working together with international allies and partners. It is not just a technical exercise: it is clearly a signal that public policy must build institutional capacities for specialized education and training in new technology and make international cooperation more effective. Along the same lines, Posen (1984) warns that doctrine fulfills functions that transcend the operational, as it is frequently aligned with national political interests, serving as a mechanism of legitimation and institutional cohesion. These elements allow us to affirm that the design of public policies in defense must contemplate a sustained investment in technological innovation, supported by versatile and effective regulatory frameworks.

However, there are also underlying tensions that drive this doctrinal process. One of the clearest is the distance between regulatory invariability, which is essential for a uniform operation in which a response of cohesion and stability is necessary, as well as the need for

greater flexibility in a world that is so susceptible to variability in which what is a greater good today, a damage tomorrow. On the one hand, regulatory frameworks must support organizational cohesion and control when actions occur in a predisposed environment. On the other hand, tactics must be flexible when the enemy presents an unconventional asymmetric threat. For example, Angstrom and Widen (2016) warn that regulatory reinforcement is beneficial for the use of different weapons in an operational environment, equally required as reinforcement of military action, because an operational environment in which the rules of engagement are not previously stipulated becomes an uncertain environment. Similarly, Farrell (2008) highlights how a more pragmatic approach supports greater control and promotes decision-making in a mobile theater of operations. Hoffman (2007) confirms that hybrid conflicts challenge the rigidity of traditional doctrines and that we win the war through speed. This tension is exacerbated in multinational operation scenarios, where the requirements for coordination between forces with different institutional cultures and technological levels increase complexity. Farrell et al. (2013) insist that this type of friction requires more flexible doctrinal frameworks, supported by training processes adapted to strategic volatility and the intensive use of emerging technologies, as Klein (1998) already anticipated. In this sense, it is crucial that military doctrines are periodically subjected to revisions and practices that allow adaptation without undermining discipline, as proposed by Libicki (2009).

On the other hand, from a critical point of view, one could also state that, while the doctrinal prescription helps to shed light on some of the procedures, it can also quickly turn against dealing with situations of extreme uncertainty such as cyberattacks or hybrid threats. In such cases, autonomous decision-making and the ability to integrate multiple vectors of action become decisive factors. Hoffman (2007) stresses that this type of conflict demands complex operational structures that often come into friction with traditional models of rigid command.

In addition, another structural tension emerges: the one between the aspiration to national sovereignty and the need for technical-military linkage with external actors. With regard to interoperability with potential allies, Farrell et al (2013), with a certain NATO framework, cautions that the integration of distinctive military capabilities not only improves collaboration, but also increases vulnerability in terms of strategic autonomy. With numerous reasons for concern, countries can also become overly dependent on technologies from other countries. Such dependence is not only applicable, but also a problem for essential areas

such as cybersecurity assurance and artificial intelligence. In addition, according to the same author, the relationship between prioritizing investments in conventional capabilities or in new and emerging domains, such as space and digital, leaves governments with insoluble strategic dilemmas. Therefore, these tensions require public policies that combine standardisation with flexibility, and that, in addition, promote the development of a defence industrial base capable of guaranteeing margins of technological autonomy and operational sovereignty. Resolving these frictions is key to ensuring operational effectiveness in volatile contexts.

In terms of opportunities, the need to integrate emerging technologies, such as artificial intelligence and autonomous systems, allows the development of predictive and rapid response capabilities, according to Singer and Brooking (2018). This opens the door to policies that promote research and development in the defense industrial base, seeing doctrine as a base element of military-technical cooperation, to standardize procedures, align common objectives, and share intelligence, strengthening collective resilience (Farrell et al., 2013).

A critical examination of the patterns, tensions, and opportunities identified leads to the fundamental broad outlines that should guide the formulation of public policies in national defense. First, a more adaptable military doctrine must be encouraged. It should be a doctrine that allows commands to make adjustments to the running of their operations in real time, a level of dynamism that is adaptable enough to work in volatile and ever-evolving environments. This doctrinal adaptation must also be reflected in the need for a radical change in training and training processes, which must emulate "realistic" environments characterized by uncertainty and be in constant change. This approach is needed as tools will eventually become more sophisticated, and artificial intelligence, in particular, would be a no-brainer in supporting operational and emergency decision-making (Klein, 1998). This doctrinal flexibility must be consolidated as a strategic competence, not as an exception in the face of the unexpected.

Secondly, it is a priority to advance in the development of a robust and technologically sovereign defence industrial base. To this end, public policies must direct investments towards the local production of dual-use technologies – civilian and military – that reduce structural dependence on foreign inputs and systems, as suggested by Alic et al. (2006). This industrial autonomy will not only strengthen the strategic-operational capacities of the State, but will also boost key sectors of the national and regional productive apparatus, as well as

the direct connection with new technological scenarios, improving the capacity to respond at critical moments.

Thirdly, it is necessary to intensify military-technical cooperation, prioritising agreements that promote interoperability without sacrificing strategic autonomy. It is not only a matter of aligning with common standards, but of doing so from a position that safeguards national interests and allows the transfer of knowledge and technologies under conditions of reciprocity (Santos, 2020). In addition to allowing the strengthening of the capacities of each state, sharing learning and lessons learned and promoting joint technological developments.

Finally, it is crucial to claim the place of doctrine as a strategic instrument of national security, not only in its operational dimension, but also as an articulating axis of communicational and technological capacities. In this sense, it is urgent to move towards a public policy of strategic communication that makes it possible to raise awareness among both institutional actors and citizens about the need to have their own, up-to-date and functional doctrines. In terms of domestic policy, such a strategy would have to be directed in the sense of generating internal legitimacy, strengthening internal cohesion and fostering greater social support to ensure that it is in the process of doctrinal modernization. This raises the need for a systemic approach that connects continued investment in military capabilities, support gained in the training of highly skilled technical and strategic cadres, and defense diplomacy that supports civilian leaders implementing substantive transformation. Therefore, only in this way, the evolution of doctrine will have the relevance and opportunity necessary to keep pace with a rapidly changing global environment.

2.2 MILITARY-TECHNICAL COOPERATION AS A DOCTRINAL VECTOR

Military-technical cooperation, conceived as the framework of relations between states, international organizations and industries for the development, transfer and sharing of technological capabilities applied to defense, is today an unavoidable strategic component to strengthen national security in an international context marked by uncertainty and complexity (Johnson, 2025). Far from being a simple mechanism for external assistance, this form of cooperation operates as a true doctrinal vector, capable of directly influencing the configuration of regulatory frameworks, operational structures and high-level political decisions.

Critically analyzing the patterns, tensions, and opportunities that run through this dimension allows us not only to understand their impact on the military capabilities of states,

but also to guide the formulation of public policies that favor the efficient use of resources, promote sustained processes of technological innovation, and achieve a prudent balance between regional and international interoperability. on the one hand, and strategic autonomy, on the other (Bonsenberg, 2020).

That is why the definition of military-technical cooperation will be used as the form of defense diplomacy that involves technology transfer, joint training, doctrinal exchange, and operational assistance. Ionescu (2022) demonstrates how Brazil-Russia cooperation was simultaneously a path of technological modernization and a process of doctrinal convergence. In addition, Kurylo (2024) and Pyatakov (2022) point out how the United States, China, and Russia have used military assistance as a mechanism of doctrinal influence in Latin America. These dynamics reveal that cooperation is not a neutral process: imported doctrinal frameworks are adapted, resisted, or transformed according to the institutional capacities of the recipient countries (Mijares, González, 2021).

Thus, the doctrine becomes an interface between external military assistance and strategic national appropriation. A dominant pattern in military-technical cooperation is the search for interoperability among allies to face common threats. In a similar achievement, Farrell et al. (2013) underline that alliances such as NATO have managed to establish a high degree of technological and procedural standardization; therefore, joint operations are perfectly coordinated. By carrying out joint projects, NATO has also shown that interoperability can lead to greater operational capability if planned strategically (Cheung, 2021), i.e., affirms the existence of the pattern. Although, in military-technical collaboration, this pattern refers to the joint use of technology, including missile defense equipment and AI. At the same time, it is taking place with motivations driven by the urgency to fight modern threats, which can come from both non-state actors and emerging regional powers.

In this regard, Alic et al. (2006) argue that technology transfer agreements not only raise the operational level of the armed forces, but also promote innovation within defense industrial bases, especially in dual-use technologies. These processes suggest that public policies should prioritize the signing of agreements that not only strengthen shared capabilities, but also promote joint research projects, positioning military-technical cooperation as a key instrument to maintain and project strategic advantage.

However, various barriers and sources of tension mark the evolution of the field of military-technical cooperation. Among the most obvious—and perhaps most substantive—sources of tension is that concerning the relationship between state sovereignty and the

growing dependence on foreign technology. As Bitzinger (2016) warns, states whose own defense architecture is based on critical systems supplied by outsiders expose themselves to risk in terms of the deterioration of their own strategic autonomy, particularly in terms of changing geopolitical conditions. It is not, therefore, a tangential or peripheral phenomenon, but a key aspect concerning the room for maneuver of states in conflict or other forms of international extortion. A second source of tension is provided by the tension between standardization—favored by multilateral frameworks—and the capacity for endogenous doctrinal innovation. While interoperability arrangements allow for the deployment of joint forces more efficiently, they also impose constraints on the ability to determine doctrines contextually tailored to national history, geography, and socio-political idiosyncrasies. This is evidenced by Farrell's (2008) NATO case, whose research suggests that interoperability arrangements can serve as an anchor that prevents the evolution of more flexible and contextually sensitive local doctrinal approaches. A third source of relevant tension is given by the risks around the transfer of sensitive technology. In the absence of appropriate regulatory and safeguarding frameworks, technology can result in a leakage of key strategic knowledge and, therefore, an erosion of the host state's structural security capacity. Libicki (2009) already warned that, in an environment of increasing cyber-interdependence, sharing critical information without adequate protection measures can open deep cracks in the national defense system.

Faced with this panorama, it is essential that public policies achieve a delicate balance: consolidating strategic alliances without giving up on the protection of fundamental interests. Developing a robust national defense industrial base—capable of absorbing, adapting, and even innovating based on cooperation—is a necessary condition for reducing dependency and mitigating strategic risks (Andrade, 2020). Reconciling these tensions implies assuming a clear and lucid negotiating position, but with a long-term perspective, when defining military-technical cooperation agreements. However, beyond the tensions, there are also relevant opportunities that cannot be missed. Joint research and development—especially in areas such as artificial intelligence and cybernetics—allows states to access recent technological advances, but without having to bear the high costs that such development may entail in its entirety, as Alic et al. (2006) point out. In the same vein, practices such as tied military exercises and routine intelligence sharing—also highlighted by Farrell et al. (2013)—are not only instruments for raising the standards of hybrid threat preparedness, but are also elements that can be converted into strategic trust among allies. As long as they are part of

a long-term perspective, they allow for the generation of operational synergies and the construction of more robust and sustainable ties of cooperation. To this end, it is necessary for public policies to adopt a proactive approach of concluding bilateral and multilateral agreements with concrete incentives for technological co-production, together with robust clauses that ensure the protection of sensitive information aligned with this long-term vision. In this sense, it is worth remembering what Bitzinger (2009) outlined regarding the importance of traditional partners in regional technological development. The effective implementation of these measures will require not only a fine balance between international collaboration and national development, but also coherent strategic diplomacy and a forward-looking vision that articulates sovereignty, innovation, and security in an integrated manner.

2.3 DEFENCE INDUSTRIAL BASE AND STRATEGIC AUTONOMY

The IDB is a more complex piece than a simple system of deep factories for the supply of military equipment. The IDB forms an interconnected judgment ecosystem of relationships through technologies, critical infrastructure and facilities, laboratories and research centers, design firms, and logistics networks. This set of special relationships forms the production of goods and provision of services in the direction of improving the strategic capabilities of the armed forces. As a result, the IDB consists of weapons systems, electronic platforms, next-generation tactical vehicles and disposition, disruptive technologies such as artificial intelligence.

Alic et al. (2006) emphasize that the IDB does not only fulfill an operational supply function, but also constitutes a driving force for dual-use technological innovation, with direct impacts both on defense and on key civilian sectors. Therefore, its role is not merely logistical: it is projected as a structural element of national development. Along the same lines, Bitzinger (2016) states that: "first, a robust industrial base not only expands the margin of state strategic autonomy but also drastically reduces exposure to external vulnerabilities in supply, given the decreasing dependence on foreign suppliers in critical areas." Consequently, strengthening the defence industrial base is a necessary condition for technological sovereignty and defence autonomy. In effect, the IDB stands as the industrial mainstay of a country's military capacity, providing it with structural resilience in the face of global threats and room for maneuver for autonomous decision-making in defense matters. However, the development of a robust and sustained IDB over time cannot be conceived apart from a clear and functional military doctrine. The specialized literature underscores this interdependent relationship:

Cheung (2022) and Bitzinger (1994) warn that innovation in defense does not occur in a vacuum, but within doctrinal ecosystems that integrate strategic vision, technology, industrial capabilities, and human talent.

In this way, it is constituted as the guiding axis that makes it possible to comply with operations, with a vision to walk hand in hand with technological advances within the framework of a defense policy aimed at the consolidation of strategic autonomy. Its function is not restricted, then, to the definition of operational guidelines; acquires, as a structure, the ability to give meaning and direction to the different components involved in the defense system – technology, industry, training and international cooperation – under an articulating gaze. In the case of the South American region, the development of the A-Darter missile, conceived from a process of technological cooperation between Brazil and South Africa, clearly demonstrates the risks of advancing on complex initiatives without the support of a robust doctrine that guides, supports and projects long-term efforts. As Santos and Oliveira (2023) foresee: the lack of a doctrinal framework ends up encouraging institutional fragmentation, political discontinuity and lack of technical sustainability, weakening the strategic power that such undertakings could result. In addition, Magnani (2020) reinforces this idea by pointing out that the countries of the region have transitioned between import substitution models, South-South cooperation schemes, and periods of high external dependence, without managing to consolidate a comprehensive defense policy model based on technological sovereignty and strategic autonomy. In this scenario, it is evident that the doctrine cannot be a mere regulatory compendium: it can constitute a tool for political leadership and industrial planning.

Finally, the insertion of the IDB, as a link between the IDB and military-technical cooperation, materializes in co-production agreements, technology transfer schemes and joint development of strategic capabilities. As instances of articulation that both optimize available resources and redistribute risks more equitably, as well as enable the creation of sustainable synergies between States, armed forces and national industries. However, for such processes to reach their transformative potential, it is imperative that public policies recognize the IDB not as a simple operational instrument, but as a long-range strategic asset. This recognition must be firmly anchored in a proactive doctrinal vision, coherent with the needs of the environment and focused on the real strengthening of national autonomy in matters of defense. Farrell et al. (2013) highlight that alliances such as NATO facilitate the exchange of critical technologies, such as cyber defense systems, strengthening the IDB of

member countries.

Bitzinger (2016) recognizes that, in the best of cases, this collaboration allows the IDB to access foreign innovation but also poses ties of dependence. In addition, military doctrine relates to the IDB since it needs it to translate operational requirements into technological solutions. Angstrom and Widen (2016) highlight that modern doctrines impose the need for advanced technologies, such as autonomous systems, which means that the IDB needs them to achieve strategic objectives. For example, a doctrine that is aware of hybrid warfare requires the IDB to produce dual equipment, such as drones or electronic countermeasures. Another pattern in the IDB is a direct connection to technological innovation since all modern BIBs are highly dependent on it to maintain strategic advantage. Alic et al. (2006) explain that modern BIDs have adopted a focus on dual-use technology, which is artificial intelligence and which is crucial for the civilian economy and defense in a complementary way. Today, one of the most significant patterns in the recent evolution of the defense industrial base is the astonishingly increasing globalization of supply chains. Therefore, to this day, many States can still obtain highly specialized components in technological terms, which only a few decades ago, would be inaccessible to their local capabilities. However, this degree of integration and internationalization of technology transfer at the IDB at the same time raises several new issues. However, along with increased interdependence, new sources of vulnerability to geopolitical conflicts emerged. In this sense, Bitzinger (2016) warns that dependence on strategic nodes located in foreign territories can significantly compromise the operability and security of national defense systems, becoming a latent threat to strategic autonomy.

Added to this dynamic is the proliferation of co-production schemes with strategic allies, which, while expanding national capacities, also introduce external constraints. A case in point is the multinational development of the F-35 fighter, where technical interoperability and transnational collaboration are seen less as options but rather as front-line strategic imperatives (Farrell, 2008). Moreover, it is increasingly clear that the IDB's doctrinal agendas and innovation pathways are converging. This transversality allows technological advances to better respond to emerging, cyberspace, and orbital region threats, thus creating a new battlefield, constructions, and challenges (Johnson, 2021). These trends not only reflect the substantive rules of change in the forms of production and cooperation on this issue. In addition, they illustrate the inevitable urgency of examining public policies from the perspective of the military-industrial ecosystem and the urgent need to prioritize their agility

and innovation. However, they also set the most pervasive structural stresses. The most fundamental says that situations of protectionism are too untenable because of the desire to guarantee our national autonomy and not allow larger-scale foreign states to influence our militaries. While collaboration with external partners facilitates access to cutting-edge capabilities, it can also condition sovereign decisions, especially when it comes to critical components or sensitive strategic technologies (Bitzinger, 2016). Added to this problem is budgetary pressure: the development of cutting-edge technologies requires substantial investments that force States to establish hierarchies between conventional and emerging capabilities, as Alic et al. (2006) point out. This strategic choice does not always respond to technical criteria, but to political or logistical factors. In addition, the competition between the public and private sectors within the IDB introduces another source of friction: while states demand solutions with a high national impact, companies prioritize economic profitability.

In the same vein, Libicki (2009) adds that, when sensitive technologies such as cyber defense systems are incorporated, security risks also increase if intellectual property rights are not adequately safeguarded. Finally, the IDB's subordination to strongly centralized and rigid doctrines limits the ability to investigate disruptive innovations that are not within the scope of prioritized military concerns. In the face of the set of tensions already mentioned, it is imperative to design public policies that combine sustained investment, clear regulatory frameworks and flexible international cooperation mechanisms. This is the only way to make the IDB's strategic role possible without compromising innovative development or jeopardizing national security.

In contrast, clear opportunities are also emerging that can be capitalized on through informed policy decisions. Strategic investment in emerging technologies—particularly artificial intelligence, autonomous systems, and space capabilities—allows states to access high value-added technological niches (Johnson, 2021). Military-technical cooperation, on the other hand, opens up the possibility of reducing high research and development costs through joint projects, accelerating implementation times and expanding interoperability margins (Farrell et al., 2013).

On the other hand, the Defense Industrial Base (IDB) is a multiplying factor for the national economy, since it allows the generation of qualified employment, energizes local industry and promotes applied research in strategic civilian sectors, especially invoking the dual use of technologies. The integration between the doctrine and the IDB makes it possible to boost the operational capabilities of a State, accompanied by anticipated solutions to

threats such as hybrid conflicts or cyberattacks, through the implementation of innovative and contextualized solutions proposed. In this sense, given technological evolution and internationalization, it implies paying attention to synergy, that is, the efficient coordination between the State and the market to capitalize on potential; therefore, a specific public policy is needed that implements tax incentives for innovation in defense, regulations that ensure the co-production of safe technology, and concrete training of operational skills at the IDB's demand. With these analyses, the concept of the IDB ceases to be simply a logistical link and takes center stage as a strategic investor in national security and development, according to Johnson (2021). In short, countries must form an active and equitable engagement with allied countries without sacrificing the politics of decision-making. With this in mind, several strategic recommendations are proposed that can facilitate the future development of defence policy. First, investment in new technologies, particularly in artificial intelligence and semi-autonomous systems, must be strengthened and oriented towards an application of IDB research. In addition, the supply chain must be more diverse, both to reduce operational disruption and to allow consumers to enter controlled industries such as the defense sector. Third, according to the Governments, they must sign military-technical cooperation agreements. Finally, to ensure alignment with the interests of the military defense doctrine, it is necessary to ensure mechanisms that allow the viability of operational demand in industrial projects. In this order of ideas, public communication has an active role in making visible the economic and strategic value of the defense industrial base. The technical policies designed are not enough, it is necessary to build a solid and convincing narrative that poignantly presents the synergies between defense, technological innovation and collective well-being. Our argument has been to propose a radial and long-term vision that combines strategic autonomy, institutional collaboration and promotion of applied research. In this framework, positioning the defense industrial base as a true engine of national development implies the identification of concrete links with sectors such as technical education, science and advanced industry. To do this, people must identify at the base not only an isolated or exclusively military expenditure, but a source of specialized jobs, technological sovereignty and productive capacities. The construction of a coherent, sustained and transversal narrative also has the potential to politically shield investments in defense, preventing setbacks due to partisan ups and downs or international pressures. When the IDB is integrated into the civilian agendas of innovation, sustainable development, and higher education, its legitimacy expands beyond the military sphere. Thus, a defense model is

consolidated that not only fulfills deterrent functions, but also actively contributes to the country.

3 METHODOLOGY

3.1 TYPE OF RESEARCH

This study is based on a theoretical-qualitative, descriptive-analytical approach and with a regional comparative perspective. This approach involves the use of the form of documentary analysis involving historical material and contemporary documentation, facilitated by an approach to content speech analyzed in terms of the interpretive argument of the underlying discursive patterns. Within the categories of analysis: doctrine, military-technical cooperation and defense industrial base, the process focused on determining the subcategories: patterns, tensions and opportunities, which allow future public policies in the field of national defense to be guided.

3.2 SOURCES AND DOCUMENTARY CORPUS

23 documents were analyzed, including academic articles, books, case studies and official documents published between 2003 and 2024. They were found in the Scopus, SciELO and Web of Science databases, located by the following Boolean search engines: doctrine category: "military doctrine" AND "technical military cooperation" OR "military doctrine*" AND "military-technical cooperation" OR "technical cooperation" AND "doctrine". It includes experiences from Brazil, Colombia, Argentina, Chile, the Dominican Republic, Venezuela, and Ecuador, selected for their doctrinal, technical, and industrial relevance.

3.3 ANALYSIS TECHNIQUE

Although the present research is based on a thematic documentary analysis, the use of axial coding techniques allowed the organization and interpretation of the analyzed material in a systematic and rigorous way. Through this qualitative methodology, three main analytical categories were identified: doctrine, military-technical cooperation and defence industrial base. Likewise, each of them corresponded to three cross-cutting subcategories: patterns, tensions and opportunities. This structuring not only facilitates the establishment of conceptual links between the contents analyzed, but also unravels the underlying dynamics that sustained and sustain the development of strategic capabilities in the field of defense, especially in the South American region.

3.4 LIMITATIONS

The study is based on secondary sources; It does not include interviews or original empirical data. Therefore, there is no access to the perspective of the actors involved. The comparison focuses on selected cases; it does not cover the entire continent. Therefore, the vision is not complete, however, it is counteracted by including in the analysis the cases of the countries with the greatest doctrinal relevance on the continent. The applicability to the Ecuadorian case is exploratory, in the absence of recent publicly available official doctrinal documentation.

4 RESULTS AND DISCUSSIONS

The documentary analysis made it possible to establish the existing relationships between the categories: doctrine, military-technical cooperation and defense industrial base with their fundamental contribution to the generation of defense public policies in the different countries of South America. In addition, it was possible to establish the axes of regional analysis regarding: the forms of development and application of the doctrine (patterns), the sources of tension that drive apparent conflicts (tensions) and the various defense strategies that can be combined with technology transfer processes (opportunities).

The findings show that there are countries with greater doctrinal development in South America (Colombia and Brazil), and that by maintaining doctrines with a pragmatic emphasis they can adapt and guide their applicability in complex operational scenarios, which respond to the current requirements of conflicts. Above all, considering technological, tactical and weapons innovation and transformation, from the perspective of the contribution of technology and the establishment of new forms of conflict such as: cyber warfare, the use of drones that guarantee the effectiveness of the attack and multinational operations. Adaptability that guarantees the application of conventional and unconventional tactics, conjugation of tactical-operational levels, developing a strategic vision according to the new world scenarios.

4.1 MILITARY DOCTRINE

Regarding the patterns observed, we can verify that in all the South American countries analyzed there has been a significant doctrinal evolution in recent years; one that has ranged from a relatively prescriptive set of initial models to hybrid operations that combine regulatory contexts, structured framework with flexible practices. In this sense, the transition

would seem to have been more of a search for a balance between institutional standardization – necessary for cohesion and interoperability – and tactical autonomy – essential to be able to interact effectively with an increasingly uncertain environment of combat scenarios. At the same time, military doctrine has acquired a greater articulation in relation to emerging technological threats, although cyberwarfare, hybrid operations and, in certain cases, projections of quantum scenarios. This complex of doctrinal mandates not only requires operations to be more innovative, but also represents that more frequent and systematic doctrinal review mechanisms should be adopted that could be developed around massive changes in results in the strategic environment.

In terms of tensions, to a large extent, military doctrine faces friction between the need to be unifying through common norms and procedures and the requirement to respond immediately to ever-changing realities, such as asymmetrical conflicts and unconventional events. In this sense, a basic structural tension is identified between, on the one hand, the national doctrinal orientation and, on the other, the need for, in contexts of cooperation, doctrines of another type, supranational. This friction establishes the danger of strategic coherence if it is not managed with a vision of complementarity and not of doctrinal subordination.

In terms of opportunities, doctrinal dynamism could be transformed into an instrument of strategic projection if it is channeled into the construction of capacities that are, at the same time, interoperable and flexible. This would make it possible for the Armed Forces to insert themselves into multinational security networks without granting operational sovereignty. It could also function as a tool for the formation of a national defence innovation agenda, if it is used as a framework for combined exercises, artificial intelligence simulations and validation of new operational concepts, as a bridge between strategic planning and technological transformation.

4.2 MILITARY-TECHNICAL COOPERATION

A dominant pattern in the region is the use of military-technical cooperation as a channel for indirect doctrinal transfer. Military assistance and bilateral agreements not only deliver equipment, but also entail operational principles that ultimately modify local practices. International cooperation has tended to consolidate itself in regional or hemispheric interoperability schemes that generate common platforms for instruction, doctrine and crisis management that, in turn, promote the standardization of responses to globalized threats.

There are also permanent frictions resulting from the conflict, between the need to adopt doctrinal frameworks, platforms and/or equipment that allow the Armed Forces to respond to the world in a national context and to safeguard the national operational or professional security identity with strategic partners. Worse, these frictions will not disappear when there are no agreements. There are also socio-political frictions that emerge from an inherent technological imbalance between a country and its ally. In many cases, recipient countries do not have sufficient capacity to absorb these technologies, culture and doctrine independently and autonomously, entering into structural capitulations with their "donors".

On the other hand, as opportunities, it can be mentioned that military-technical cooperation can be redirected towards co-design and collaborative research schemes, where not only products but also processes are shared, which would allow greater internal strengthening of industrial and doctrinal capabilities. In addition, this type of cooperation would position the countries of the region as partial producers of dual and priority technologies, especially if agreements with shared intellectual property clauses and local production are prioritized.

4.3 DEFENSE INDUSTRIAL BASE

Most South American experiences express a fragmented and dependent IDB, where production patterns are bordered on "opportunistic" acquisitions rather than purchases that will attend to future operations. However, it is a fact that some countries have begun to incorporate technological innovation as the axis of their IDB. The IDB-doctrine cooperation qualification is still incipient. However, a number of countries are beginning to emerge in which the doctrine has begun to operate as a guide to bring industrial production to real operational requirements, closing the circle between production and income in the operating cycle.

However, there is a structural tension between the logics of efficiency entrenching the defense industry and the possibly idiosyncratic demands that military doctrines impose. While operating logic facilitates scalability based on economic sustainability and large-scale production economics, it is less effective in the specific operational contexts of each doctrine. Those are defined as threats, geographies, or local capabilities. Such dissonance may imply that, in many cases, industries will not be able to adapt supporting products through each doctrine without significant cost or losing competitiveness. Additionally, this tension can be particularly problematic when the defense industrial base is critically dependent on foreign

technologies, especially in critical areas or critical technologies. In such circumstances, such dependence undermines the strategic autonomy of the State and exposes the defence industrial base to structural vulnerabilities. These weaknesses can be exploited in contexts of geopolitical imbalances, diplomatic or commercial pressures from third parties. Consequently, the integration between doctrine and industrial production cannot be limited to efficiency criteria, but must seriously consider the factors of sovereignty and technological resilience.

The IDB can leverage these forms of military-technical cooperation not only to acquire technology, but to foster innovation processes and regional value chains, allowing it to strengthen autonomous capabilities without giving up its ability to learn from and with others. There are also windows of opportunity in the promotion of dual-use technologies, which extend the financial and political basis for the development of a solid IDB and the increase of its impact on state and private investment.

Table 1

Comparison of Latin American countries

COUNTRY	DOC	CTM	IDB
Brazil	High doctrinal institutionalization with a focus on strategic autonomy and multiple missions.	High levels of technology transfer with Russia, Israel and south-south programs.	Robust industrial base, with state investments and export capacities.
Argentina	Doctrine influenced by border operations and peacekeeping missions.	Technical relations based on defense production and cooperation from neighboring countries.	Industrial capacity in the process of recovery with a focus on regional self-sufficiency.
Chile	Professionalized evolutionary doctrine oriented towards regional interoperability.	Participation in combined exercises and strategic bilateral agreements.	Industrialization that focuses on the alliance in innovation and cyber defense.
Colombia	Post-conflict doctrinal transformation and adaptive flexibility in the face of hybrid threats.	Partnerships with the U.S. and South-South cooperation for training and assistance.	Moderate development of productive capacities, focused on maintenance and logistics.
Ecuador	Doctrine in the process of restructuring, marked by foreign regulatory dependence.	Specific military-technical relations, low sustainability and limited interoperability.	Incipient capacity, limited public investment and lack of integrated industrial policy.
Dominican Republic	Incipient doctrinal development with orientation to basic formation.	Limited cooperation with emphasis on basic assistance and donations.	Limited capacity, dependent on imports and external assistance.
Venezuela	Doctrine marked by territorial focus and ideological influence.	Russian and Chinese influence on modernization programs.	IDB oriented to national development with strong state control.

4.4 IMPLICATIONS AND CONTRIBUTIONS TO THE ECUADORIAN CONTEXT

In general, Ecuador faces serious structural limitations in the field of national defense, which are manifested through the weak connection between military doctrine, military-technical cooperation in the defense sector, and its industrial base. The existing doctrine does not have a systemic vision that allows it to respond effectively to emerging and complex operational scenarios; instead, it remains tied to outdated conceptual frameworks and with a very low degree of practical applicability.

At the same time, the country's military-technical relations have been reactive and fragmented, based on acquisitions rather than effective technology transfer or even the construction of domestic doctrine, which continues to perpetuate operational and strategic dependence. The country's defense industrial base is also strongly dissociated, presented with a high degree of institutional fragmentation and no effective investment in innovation or alignment with doctrinal priorities or technologies. There is no possibility of moving towards real strategic autonomy. The three dissociations underlined strongly limit the resilience of the defence system and its possibilities of responding with sovereignty to today's threats.

From the perspective of the Ecuadorian case, a delay in updating the doctrine in the face of current operational challenges is identified. Taking the South American experience, the dynamics towards flexible doctrines necessarily require joint experiences and simulations of emerging technologies, which simultaneously consider imperativity and adaptation. In the Ecuadorian case, therefore, the lack of real technique has generated an incipient doctrine. Ecuador did not transcribe foreign manuals with technical instructions, nor was it inspired by lessons learned in neighboring nations. Military-technical cooperation was therefore circumstantial and, in the long run, is not projected in terms of acquisition and sustainability. When compared with the region, it can be seen that the integration of real technologies is necessary and urgent, not only versatile, but also inducing doctrinal development, and reinforcing an industrial base for national defense. Ecuador reflects institutional fracture, disjointed competition in the sector, as well as a critical disconnect between the doctrine and the dynamics of the defense industrial base. Not only is this lack of coherence a weakness, but also the effectiveness of modernization processes and progress towards greater autonomy are compromised. South American experiences suggest, on the other hand, that a synergistic approach – where doctrine guides strategic requirements, international cooperation facilitates access to critical technologies and national industry is able to land

these requirements in contextualized operational solutions. it is a step towards the strategic of an autonomy that is, for a change, both realistic and far-reaching.

Thus, the delay in updated theorizing does not allow us to guide the operational challenges of the present. The South American experience opts for the institutionalization of flexible doctrines, supported by joint exercises and simulations with emerging technologies, in which prescription coexists with adaptation. Since the above, our country's military-technical cooperation has historically focused on spot assistance, without absorption or maintenance mechanisms. The comparison of experiences confirms the need to reach agreements with a true technological legacy, focused on energizing national doctrines and capacities.

Ecuador's defense industrial base is highly fragmented and insufficiently integrated with military doctrine. Taking into account the region's experience, the synergistic approach – in which doctrine informs demand, cooperation facilitates access and industry provides contextualized solutions – can be vital to move towards a genuinely realistic and sustainable strategic autonomy.

Military doctrine, beyond its internal function of standardization and training, has been consolidated in South America as a key tool to guide and sustain military-technical cooperation. This relationship is evident in experiences such as that of Colombia, where the implementation of the Damascus Doctrine has facilitated interoperability with strategic partners such as the United States, Chile, and NATO, while promoting a doctrinal structure consistent with the processes of technical assistance and internationalization of capabilities (Armed Forces Colombia, 2022; Mijares, González, 2021).

In the Brazilian case, the consolidation of a doctrine of joint use, formalized in strategic documents such as the National Defense Policy and the White Paper on National Defense (2012, 2020), has served as a key enabler for the development of large-scale military-technical cooperation initiatives. In a sense, the doctrine does not establish operational guidelines. Rather, the doctrine is a broader strategic framework that helps ensure coherence between defence sector planning, boosting the industrial base and international integration. Among other things, this doctrine guided and allowed Brazil to place its capabilities on the regional and international stage, uniting technology, doctrine, and industry under a coherent strategic vision. From this logic, Brazil carried out emblematic projects, such as the A-Darter missile, in collaboration with South Africa (Santos, Oliveira, 2023). Another example is the KC-390 military transport aircraft, in partnership with Portugal and India. Even the ambitious

submarine program, thanks to French technology. In all cases, Brazilian doctrine acts as a kaleidoscope, progressively promoting technological autonomy, aligning national capacities with long-term strategic objectives. As Piedrahita and Torres (2022) point out, a solid doctrine allows "structuring military thinking as a guide for institutional action", which translates into clarity of strategic objectives when negotiating or implementing cooperation agreements.

5 CONCLUSIONS

Based on the analysis carried out, it can be established that the findings affirm what was mentioned by Farrell et al. (2013), when they consider that: doctrine, military-technical cooperation and defense industrial base, are issues that are directly and strategically related, and that they are unfailing modulating variables of the defense policies that are established in the different countries. This articulation also allows the development of sustainable technological innovation processes that generate processes of institutional strengthening and institutional insertion. On the other hand, the cases analyzed from Colombia and Brazil show fundamental aspects such as the consideration that the doctrine allows for the articulation of strategic partners through cooperation, technical assistance and technological development.

Colombia, with the application of the Damascus doctrine, implemented by its Armed Forces, has not only favored operability with strategic partners, but has also made it possible to integrate training, technical assistance, and progressive industrialization, ratifying what Mijares and González (2021) proposed. In addition, Ionescu (2022) ratifies the proposal, considering that the Brazilian doctrinal strategy, based on the notion of gradual technological autonomy, has led to high value-added projects, such as the KC-390 aircraft or the submarines in cooperation with France. These examples confirm that a structured doctrine with a long-term vision becomes a catalyst for technical alliances and its own industrial capabilities.

However, this scenario does not avoid contradictions and tensions. Fragmented doctrines, detached from current operational needs or subjected to old models, are presented as a contradiction to the principles of progress and the thinking of cooperation and innovation. As Vitelli (2018) warns: Argentina is a concrete example, which has an industrial critical mass, which includes the Argentine Aircraft Factory FAdA; however, their inability to articulate doctrine, science and production impede the sustainability of strategic projects. The same situation is replicated in Ecuadorian doctrine, in which, according to Andrade (n.d.), the doctrine lacks organization, structure and articulation with technical processes.

In this sense, the implications for Ecuador are referents that require immediate attention, especially from the consideration that, lacking a flexible and modernized doctrine, which places us as lacking a doctrinal vision adaptive to technological contexts and prevents military-technical cooperation as a sustainable process that strengthens the scope of a national strategy. In comparison with Brazil and Colombia, which have managed to establish assertive processes of cooperation that have marked the path of their technological autonomy. Ecuador has not made significant progress in this regard, without even being able to generate effective defense investments (Cheung, 2022) that would allow it to insert itself into regional technological consortia and execute combined operations.

The basis of a flexible doctrine with a clear vision allows the strengthening of strategic technological niches in which Ecuador has not been able to act, such as: simulators, logistical maintenance and cyber defense, areas that do not require large investments but that seek articulation and technical-military cooperation, which ratifies what Albano (2017) proposed, who proposes the importance of the doctrine in achieving the technological development of weapons. In addition, it will allow it to establish strategic alliances with countries in the region that have developed a medium technological level, facilitating co-production processes and progressive technology transfer (Malafaia, 2021).

The findings of this research show that the consolidation of strategic autonomy in defense cannot be achieved without the effective articulation between military doctrine, military-technical cooperation and defense industrial base. Based on the comparative analysis of the cases of Colombia, Brazil, Argentina, Chile, the Dominican Republic, Venezuela and Ecuador, it is found that the countries that have managed to integrate these three dimensions have advanced in military modernization processes that are more sustainable, resilient and in accordance with their geopolitical contexts. In particular, the Colombian case demonstrates how an adaptive doctrine, nourished by internal operational experience and international assistance processes, allows institutional reform to be guided based on its own capacities (Cardona, 2021; Mijares, González, 2021). Similarly, Brazil has shown that military-technical cooperation, combined with strategic investments in its defense industrial base, can energize a virtuous cycle of innovation and autonomy (Malafaia, 2021; Ionescu, 2019).

Unlike these processes, Ecuador continues to operate under a doctrinal system largely based on foreign documents, without its own regulatory structure that consolidates national experiences or aligns with regional strategic objectives. This doctrinal dependence limits the

country's ability to interpret its threats from a sovereign perspective and formulate coherent strategic responses. The findings of this research confirm what Ionescu (2019) proposed, that the doctrine, understood as a technical-administrative product of high strategic sensitivity, should stop being conceived exclusively as a normative discourse for internal use, and start operating as a tool of public management in defense, connected to processes of international cooperation, institutional design and technological production.

In this sense, the models analyzed demonstrate that a functional and adaptive doctrine not only regulates military action, but also acts as a critical interface between operational decisions, technologies in use, and defense policies. Argentina and Chile, for example, have generated doctrinal reforms that integrate elements of regional interoperability without renouncing their own decision-making frameworks, while the Dominican Republic has managed to position its joint doctrine as a basis for more cohesive cooperation with a greater geostrategic vision (Ministry of Defense RD, 2020). These examples underscore why it should be a very urgent task to reformulate Ecuadorian doctrine and to direct this reformulation to a model that reflects national operational lessons, that incorporates technical standards shared in the regional environment and minimizes the risk of uncritical reproduction of foreign doctrinal frameworks. It was also concluded that the doctrine is not a merely functional artifact in collaboration in the military-technical field, but a structurally significant actor in the creation and maintenance of the national project, or rather in the strategy that may or may not exist in one way or another. In the cases of Brazil, Colombia and Venezuela, it was proven that military technical cooperation, if supported by solid doctrines and an industrial base under construction, became an effective tool to increase the degrees of autonomy from two perspectives at the same time, the political and the military. In the case of Ecuador, the pattern of integration of collaboration seemed much more dispersed and weak in the doctrinal dimension. In this context, it is imperative to rethink this relationship, adopting a proactive approach that prioritizes the construction of regional strategic alliances aligned with common and sustainable goals in the long term.

Finally, the research shows that, without a national defense industrial base articulated to a reformed doctrine and an effective cooperation policy, Ecuador will continue to be limited in its capacity to respond to contemporary scenarios of hybrid threat, cybersecurity, and geopolitical pressure. Based on this, it is proposed to formulate a national doctrine that integrates its own capabilities, strengthens technical links with regional strategic partners and promotes an ecosystem of civilian-military technological innovation. This task cannot be

postponed: doctrinal sovereignty and strategic autonomy are today sine qua non conditions for effective, resilient and legitimate national defense.

ACKNOWLEDGMENTS

This work was possible thanks to the support and trust of the Ecuadorian Army and the University of the Armed Forces ESPE; to the academic support and professional guidance of the teaching staff of the Graduate Program (Doctorate) in Military Sciences (PPGCM) of the Meira Mattos Institute of the Escola de Comando e Estado-Maior do Exército (ECEME). Its contribution has provided solidity and rigor to the development of this research and, at the same time, has allowed the formation of a critical, analytical perspective committed to the study of international security, regional defense and the production of strategic knowledge from a Latin American perspective. In the same way, we recognize the work of the authors of academic articles, specialized books, and official documents that made up the documentary corpus of this study, which have allowed us to build this reflection, and their value is manifested in the essential basis they constitute for the academic debate on military doctrine, military-technical cooperation, and the strengthening of defense capabilities in South America. Finally, we thank the colleagues, reviewers, and readers who, with their substantive comments, contributed to strengthening the methodological approach and analytical soundness of the manuscript.

ABSTRACT

The fight against gender-based violence remains one of the most serious forms of denial of fundamental rights in Brazil, with worrying rates persisting despite recent legal advances. In Tocantins, cases of gender-motivated killings and domestic aggressions are structural phenomena, intensified by cultural and socioeconomic conditions. This study aimed to examine the evolution of such offenses between 2022 and 2024, focusing on the effects of the post-COVID-19 pandemic context on their incidence, recurring motives, and institutional mechanisms created for victim protection. The research adopted a bibliographic and documentary design, guided by the hypothetical-deductive method, and considered as central references Law No. 11.340/2006, known as the Maria da Penha legislation, and Law No. 13.104/2015, which classified femicide as a criminal type. Data were collected from official reports issued by the Public Security Secretariat of Tocantins (SSP/TO) and analyzed through descriptive statistics combined with content analysis. Findings reveal that, even with consolidated legal frameworks, the rates remain high, underscoring the urgency of more effective public policies and the expansion of specialized support networks in the interior regions of the state.

RESUMO

O enfrentamento à violência dirigida a mulheres ainda representa uma das mais graves formas de negação dos direitos fundamentais no Brasil, mantendo índices preocupantes mesmo diante dos avanços legais recentes. No Tocantins, os casos de assassinatos motivados por gênero e de agressões no ambiente doméstico configuram fenômenos estruturais, agravados por condições culturais e socioeconômicas. RESUMEN

La lucha contra la violencia contra las mujeres sigue representando una de las formas más graves de negación de los derechos fundamentales en Brasil, manteniendo índices preocupantes incluso a la luz de los recientes avances legales. En Tocantins, los casos de asesinato por motivos de género y violencia doméstica representan fenómenos estructurales, agravados por las condiciones culturales y socioeconómicas. Este estudio buscó analizar la evolución de estos delitos entre 2022 y 2024, observando los impactos del contexto pospandemia de COVID-19 en su ocurrencia, los factores motivadores recurrentes y los mecanismos institucionales creados para su protección. La investigación, de naturaleza bibliográfica y documental, se realizó mediante el método hipotético-deductivo, tomando como referencias centrales la Ley n.º 11.340/2006, conocida como la ley Maria da Penha, y la Ley n.º 13.104/2015, que penalizó el feminicidio. La información se recopiló de informes oficiales de la Secretaría de Seguridad Pública de Tocantins (SSP/TO) y se sometió a estadística descriptiva combinada con análisis de contenido. Los resultados indican que, incluso con instrumentos legales consolidados, las tasas siguen siendo elevadas, lo que refuerza la necesidad de políticas públicas más efectivas y de la ampliación de la red de atención especializada en el interior del estado.

1 INTRODUCTION

Aggressions directed at the female public are configured as serious transgressions of fundamental guarantees, remaining a persistent global challenge. It is a structural problem that affects women in multiple community and cultural environments, evidencing its historical permanence. The Atlas of Violence points out that about a third of women on the planet have already been victims of bodily attacks, which reveals the magnitude of the problem (IPEA, 2024; WHO, 2020).

In Brazil, the picture presents similar complexity. Domestic occurrences and gender-related murders remain at a high level, producing relevant collective effects and significant economic costs (FBSP, 2024). To face this scenario, significant legal frameworks were instituted: Law No. 11,340/2006 created innovative mechanisms aimed at supporting victims and punishing the perpetrators of aggression (BRASIL, 2006); Law No. 13,104/2015 began to recognize femicide as a qualifying circumstance for homicide (BRASIL, 2015); and Law No. 14,994/2024 transformed it into an autonomous criminal type, expanding sanctions and strengthening the legal debate (BRASIL, 2024). Even with these advances, records of violence remained high and intensified in the period after the pandemic, influenced by social isolation, economic difficulties, and the overload of public services (CUNHA, 2020; BRAZIL, 2025; UN WOMEN, 2016).

In Tocantins, territorial and cultural factors increase the complexity. The difficulty in expanding specialized services and the vulnerabilities that affect indigenous, quilombola, and riverine groups result in a critical scenario (MOREIRA, 2024; RIBEIRO, 2017). Actions such as the Maria da Penha Patrol and the Phoenix Project, implemented in Araguaína, have made progress, but official data on homicides of women and intrafamily violence reveal that such initiatives are still not enough to reverse the situation (TOCANTINS, 2025).

The work proposes to investigate the dynamics of gender abuse in Tocantins, articulating scientific production with social demands. The research adopts a qualitative-quantitative approach, of exploratory and descriptive character, guided by the hypothetical-deductive method. Bibliographic, documental and statistical analyses are combined, as well as theoretical and normative references, giving greater robustness to the interpretations (BARDIN, 2011; MARCONI; LAKATOS, 2017).

The main objective is to examine the cases of domestic violence and femicides registered in Tocantins between 2022 and 2024, considering the impacts of the period after the pandemic, seeking, in a specific way, to measure the variation of indicators, map

elements of vulnerability, assess the limits and advances of public policies and present recommendations for the improvement of mechanisms to prevent and combat abuse in the family environment.

2 MATERIAL AND METHODS

The research was developed with a qualitative-quantitative approach, of exploratory and descriptive character, supported by the hypothetical-deductive method, according to the guidelines of Petenate (2013). The concept of scientific investigation presented by Marconi and Lakatos (2017) was used, which emphasize the importance of methodological rigor in the construction of knowledge. It was hypothesized that the indicators of intrafamily violence recorded in Tocantins, between 2022 and 2024, underwent changes related to the sociopolitical and organizational scenario after the COVID-19 pandemic. The analysis sought to confirm or refute this hypothesis based on empirical information combined with theoretical and normative references.

Data collection was organized into three complementary stages. Initially, a literature and documentary review was carried out based on the PRISMA protocol (*Preferred Reporting Items for Systematic Reviews and Meta-Analyses*), which ensures transparency and traceability in the selection of sources (MOHER et al., 2009). Next, a qualitative analysis was carried out, based on the content analysis technique proposed by Bardin (2011), applied to legislation, institutional reports, government plans — with emphasis on the State Plan for Women's Rights 2022–2025 (TOCANTINS, 2022) — and scientific productions. Finally, a descriptive quantitative analysis was carried out, involving the calculation of frequencies, percentages and annual variations of records made available by the Department of Public Security and the Military Police of Tocantins.

The materials analyzed covered national and state legislation, including the Federal Constitution of 1988, Law No. 11,340/2006 (Maria da Penha Law) and its amendments, Law No. 14,994/2024 (Femicide Law) and other state regulations (TOCANTINS, 2019). Official reports, action plans, public policies to combat gender violence, as well as scientific articles, dissertations, theses, and institutional communications identified throughout the systematic review were also considered.

The period investigated corresponded to the years 2022 to 2024, a phase marked by the reopening of social, economic, and administrative activities after the restrictions established by Federal Law No. 13,979/2020 and the guidelines of the World Health

Organization (WHO). This context may have impacted both the frequency of crimes against women and the response capacity of public institutions.

The treatment of the data followed a deductive and interpretative approach, starting from general assumptions about gender violence in Brazil until reaching specific conclusions for Tocantins. To increase the reliability of the results, triangulation of sources was applied, cross-referencing legislation, reports, official statistics and scientific literature. As Petenate (2013) points out, this strategy confers greater methodological robustness and reduces biases, allowing for more consistent inferences

3 CONCEPTUAL AND LEGAL ASPECTS OF THE PROTECTION OF WOMEN

Acts of violence against women are a complex phenomenon that, in the Brazilian legal system, is defined by a set of rules that aim to promote the complete protection of women's dignity. Cunha (2020) observes that conflicts that occur in the domestic environment can be understood as offensive acts practiced against women in family or intimate living spaces, exploiting their position of inequality. This understanding expands the concept of violence, making it clear that it is not restricted to physical aggression, but encompasses psychological, sexual, moral and patrimonial dimensions, composing a multifaceted picture of rights violations.

In the criminal field, Brazilian legislation has advanced by recognizing femicide as a qualified form of homicide through Law No. 13,104/2015, which included this framework in the Penal Code. This recognition establishes that the death of women motivated by gender reasons must receive differentiated legal treatment, especially in situations that occur in the intrafamily environment resulting from inequality and/or debasement of this condition. Subsequently, Law No. 14,994/2024 made significant progress by transforming this criminal act into an autonomous criminal type, now provided for in article 121-A of the Penal Code. With this update, the punishment moved to an interval of 20 to 40 years of imprisonment, classifying it among the most serious crimes in the legal system and reinforcing the need for punitive responses and more effective actions (BRASIL, 2024)

It should be noted that the enactment of Law No. 14,994/2024 was not limited to transforming femicide into an autonomous criminal type; it also made important adjustments to Law No. 11,340/2006. The modifications expanded the scope of protection measures, streamlined the procedures for granting these measures, and strengthened the mechanisms for punishing offenders. With these changes, the legislation began to offer faster and more

effective responses, aimed at safeguarding women and confronting gender violence practices. (BRAZIL, 2006; BRAZIL, 2024).

4 THEORETICAL AND NORMATIVE APPROACHES TO FEMALE SAFEGUARDING

The harmful conducts that affect the female public in Tocantins are a social and legal problem of great relevance, marked by cultural, regional and institutional particularities. Examining this issue requires going beyond the mere observance of legal provisions. It is necessary to articulate these instruments with theoretical frameworks that make it possible to interpret both vulnerability factors and institutional responses to femicide and attacks in the post-pandemic context (WALKER, 1979; MOREIRA, 2024).

4.1 INTERNATIONAL PERSPECTIVE AND NORMATIVE FRAMEWORKS

On the international scene, essential documents have been consolidated. The Inter-American Convention on the Prevention, Punishment and Eradication of Violence against Women – known as the Convention of Belém do Pará (1994) – recognized this violence as a violation of human rights and attributed to States the duty to prevent it, punish those responsible and promote eradication policies. At the Brazilian level, this commitment resulted in legal frameworks recognized worldwide. Among them, the Maria da Penha Law (Law No. 11,340/2006) stands out, which classified the various forms of offensive conduct in the home and instituted protection mechanisms and emergency measures aimed at women's integrity (BRASIL, 2006; OAS, 1994).

4.2 ECOLOGICAL MODEL FOR UNDERSTANDING CONFLICTS

The population health model, widely disseminated by the WHO, interprets these occurrences as the result of the interaction of four levels: individual, relational, community and sociocultural (WHO, 2002). This broader perspective shows that these are not just isolated episodes, but a set of factors that reinforce each other. In Tocantins, aspects such as excessive alcohol use, illegal availability of weapons, and barriers to access to services in rural and riverside regions significantly increase women's exposure to risk situations (MOREIRA, 2024).

4.3 DYNAMICS OF THE CYCLE OF ABUSE

Walker (1979) described marital violence as a cyclical process, composed of three phases: the accumulation of tension, the explosion of aggression and reconciliation, characterized by apologies or promises of change from the aggressor. This pattern generates in the victim the expectation that the partner can become and also that keeps him trapped in an unequal power relationship. Later studies identified variations: in some situations, the reconciliation phase disappears, making the cycle more direct and lethal; in others, it is replaced by periods of silence and withdrawal, equally marked by intimidation and psychological control (DOBASH; DOBASH, 2004).

In Tocantins, the permanence of women in abusive relationships is not explained only by economic dependence. Research points to factors such as low education, lack of knowledge about rights, difficulty in accessing support services outside the capital, persistent fear of the partner, responsibilities with young children, and lack of social or psychological support (MOREIRA, 2024).

Added to this scenario are the continuity of patriarchal values and the cultural acceptance of these acts in family relationships, which reinforces imprisonment and restricts women's autonomy (SAFFIOTI, 2004). This picture demonstrates that the cycle of abuse should not be analyzed only from an individual or relational perspective, but as an expression of historical structures of gender disparity, sustained by cultural practices and institutional weaknesses. Understanding these dimensions is crucial to construct government guidelines that also guarantee immediate protection and transformation of the social conditions that maintain this situation (WALKER, 1979; SAFFIOTI, 2004; MOREIRA, 2024).

4.4 COERCIVE CONTROL AND INVISIBLE FORMS OF DOMINATION

Stark (2007) developed the notion of coercive control, which broadens the understanding of power dynamics by showing that this phenomenon is not restricted to physical harm. It consists of a continuous pattern of imposition, exercised methodologically planned through emotional, psychological, economic and collective resources. Among the recurrent behaviors, the following stand out: social isolation (restriction of friendships and family contacts), surveillance of habits and communications (monitoring of cell phones, messages and others), financial control (appropriation of salary, limitation of resources) and emotional intimidation (blackmail involving children, threats or public defamation) (STARK, 2007; BANDEIRA, 2014).

Another important aspect is the use of the institutions themselves as an instrument of coercion. In these situations, the perpetrator of the abuse manipulates police records, threatens to remove responsibility for the children or uses the judicial bureaucracy as a strategy of psychological and economic exhaustion. Research shows that, in several situations, psychological and institutional pressure overlaps with physical pressure, creating even more complex obstacles to the autonomy of victims (PASINATO, 2011; FILE; GONÇALVES, 2018).

In Tocantins, this situation also occurs. In 2024, Dial 180 recorded an increase of 18.3% in service records and 14.8% in complaints compared to the previous year, indicating greater visibility of forms of psychological and technological abuse (BRASIL, 2025). These data confirm that confronting these practices requires recognizing the subtle and "invisible" forms of hierarchical imposition, which silently erode female autonomy and challenge the effectiveness of the protection system.

4.5 INTERSECTIONALITY AND OVERLAPPING VULNERABILITIES

The notion of intersectionality, formulated by Crenshaw (1989), demonstrates how different systems of oppression – sex, ethnicity and class – intersect, producing peculiar forms of submission. In Brazil, authors such as Carneiro (2003) and Ribeiro (2017) show that Afro-descendant or brown women face particular vulnerabilities, marked by the combination of structural racism and socioeconomic inequality. The same occurs with indigenous women and women from traditional communities, who are often excluded from access to basic health services, the justice system and institutional support.

In Tocantins, the issue is intensified by the great geographical distances and the difficulty of expanding specialized services. Indigenous, quilombola, and riverine women face additional obstacles, such as cultural discrimination, institutional racism, and denial of linguistic rights. The absence of ethnic-racial data in official records increases this invisibility, making it difficult to formulate effectively intersectional public policies (CRENSHAW, 1989; CARNEIRO, 2003; RIBEIRO, 2017).

4.6 MASCULINITIES AND PRACTICES OF DOMINATION

Connell (1995) presented the notion of hegemonic masculinity, which exalts attributes such as virility, strength, and power of control, establishing standards that legitimize female

subordination. Such cultural construction goes beyond the individual sphere, permeating social structures, shaping expectations of behavior and naturalizing forms of coercion.

In Brazil, surveys by the Brazilian Security Forum indicate that a large portion of homicides of women result from the refusal to maintain the relationship, evidencing a pattern of male ownership and resistance to female autonomy (FBSP, 2024). In Tocantins, the records confirm this reality: in several situations, marital separation or unaccepted breakup was the central motivation, reflecting the perception that the body and life in women are treated as the property of the partner.

Femicide, therefore, should not be interpreted as an isolated fact, but as the extreme manifestation of a system of systematic male pressure, sustained by cultural narratives and management habits that still tend to relativize the seriousness of the phenomenon. The maintenance of the term "crime of passion" in news reports and the opposition of conservative sectors to the full application of the laws reinforce this logic (SAFFIOTI, 2004; CONNELL, 1995; FBSP, 2024).

5 RESULTS AND DISCUSSION

The survey shows that, in the period between 2022 and 2024, Tocantins presented a heterogeneous panorama of gender-based aggressions. The tables reveal not only the dimension of the problem, but also changes in its spatial configuration.

The Secretariat of Public Security of Tocantins (SSP-TO) discloses the crimes under study separating Palmas (capital) and Araguaína, the second largest municipality, grouping the others in the "Interior" category. This methodological option is adequate, as it considers the population weight of these cities and the effect of specific local policies, such as the Phoenix Project and Operation Atrium. As the official reports do not present individualized numbers for intermediate-sized municipalities such as Gurupi, Porto Nacional and Paraíso, it was not possible to make isolated comparisons for these locations.

5.1 RESULTS

According to the survey, the information was systematized in absolute and relative numbers, as shown in table 1. With this, it was possible to visualize the evolution of the records in relation to the territorial distribution.

Table 1

Occurrences of femicide in Tocantins (2022–2024)

Year	Palms (n)	Palmas (%)	Araguaína (n)	Araguaína (%)	Total
2022	8	57.1%	2	14.3%	14
2023	7	41.2%	1	5.9%	17
2024	6	42.9%	0	0.0%	14

Source: SSP/TO (2025).

Table 1 presents the distribution of femicides recorded in Tocantins between 2022 and 2024, discriminating occurrences in Palmas and Araguaína and indicating the relative percentages. It is observed that the total number remained stable in the period, with 14 records in 2022, 17 in 2023 and again 14 in 2024.

Palmas concentrated most of the cases in all the years analyzed, ranging from 57.1% in 2022 to 42.9% in 2024, which reveals a slight proportional reduction. Araguaína showed a continuous drop, going from two cases in 2022 to just one in 2023 and reaching zero in 2024. This downward trajectory suggests a positive effect of local policies, such as the Phoenix Project and Operation Átria (TOCANTINS, 2024; MJSP, 2023).

The joint reading of these numbers allows us to highlight two central findings: the persistence of high rates in the capital and the localized reduction in Araguaína. These results reinforce the importance of territorialized policies and continuous monitoring of indicators to understand the factors that affect the dynamics of crimes in the state.

Ligue 180 records indicate that, between 2023 and 2024, there was a significant growth in the number of calls (18.3%) and formal complaints (14.8%), as shown in table 2. More than indicating a simple increase in violence, these numbers suggest an increase in women's access to support channels and greater trust in protection institutions. This movement may be associated with social mobilization campaigns, such as Agosto Lilás, and the expansion of the support system, which have contributed to reducing underreporting and making the problem more visible.

Table 2

Calls and complaints in Dial 180 (2023–2024): absolute numbers and percentages of variation

Year	Attendances (n)	Change (%)	Complaints (n)	Change (%)
2023	3.681	-	549	-
2024	4.353	18.3%	630	14.8%

Source: Ministry of Women (2025).

In a cross-reading of the two tables, it is possible to identify three movements: I - persistence of high levels of femicide, even without growth in total; II - differentiated effects of local policies, with Araguaína zeroing the registrations while the interior expanded its participation; and III - strengthening of institutionalized denunciation, evidenced by the growing use of Dial 180. These elements dialogue directly with the research question: to understand how the post-pandemic period influenced the patterns of oppression and gender abuse in the State. The scenario suggests that the social tensions of the period may have kept violence at high levels, but well-targeted policies, when applied consistently, have the potential to alter local trajectories.

The interpretative analysis was conducted by inference, starting from general premises about gender violence in Brazil and advancing to the reality of Tocantins. The objective was to relate the statistical data to current regulations and scientific evidence, building a broader reading of the phenomenon. Table 3 summarizes this path, articulating evidence, sources and conclusions at different levels of analysis.

Table 3

Interpretative and deductive approach to gender aggressions in Brazil and Tocantins

Level of analysis	Key evidence	Triangulated fonts	Interpretative conclusions
General Assumptions (Brazil)	High prevalence of gender-based violence; femicide recognized by law (Law No. 13,104/2015);	Federal legislation, national studies (IPEA, FBSP, UN Women).	Violence against women is structural and requires an intersectoral response.

		national policies to confront it.		
Regional trends (North/Midwest)		Rates above the national average; marked underreporting; barriers to access services.	FBSP reports, academic literature on peripheral regions.	Regional inequality intensifies female vulnerabilities.
State context (Tocantins)		Stable femicides in absolute numbers (2022–2024); increased use of Dial 180; specific policies in Araguaína (Phoenix Project, Operation Atrium).	SSP/TO, Ministry of Women, official press.	The phenomenon combines structural permanence with specific local advances.
Specific conclusions		Significant reduction in Araguaína; interior concentrates more cases; institutional strengthening through campaigns.	Statistical data, government reports, supporting literature.	Focused territorial policies can change local realities.

Source: Prepared by the authors based on legislation, institutional reports, statistical data and scientific literature (2025).

The examination of Table 3, interpretative and deductive, begins at the national level. According to data released by UN Women in 2023, Brazil remains among the countries with the highest rates of femicide in the world, which shows that gender-based aggression remains a structural phenomenon. This data also reveals the seriousness of the problem and helps to understand why the object under debate has been treated not only as a criminal issue, but also as a matter of public health and the dignity of the person. There were legislative achievements and undeniable advances. However, recent data from the FBSP (2024) and IPEA (2023) indicate that such norms, although fundamental, have not been sufficient to stop the escalation of intrafamily brutality. There is still a distance between the legal provision and the daily reality that exposes weaknesses in the execution of the law and gaps in the support network

In the North and Midwest regions, the situation is aggravated by underreporting, lack of specific investigation units in many cities, and reduced supply of shelters. Regional studies show that indigenous, quilombola, and rural women are even more exposed, either because of the geographical distance of services or because of historical conditions of inequality.

In Tocantins, this logic is repeated with its own nuances. Occurrences of femicide remained stable between 2022 and 2024, but their territorial distribution changed. Palmas continued to concentrate in most of the records; Araguaína, on the other hand, showed a downward trajectory until it reached zero in 2024, a result associated with focused policies such as the Phoenix Project and Operation Atrium. Meanwhile, the interior began to accumulate the age of majority in number of occurrences, showing that, without the same intensity of government guidelines, violence persists or even intensifies. At the same time, there was a significant increase in calls and complaints from Dial 180, which suggests both greater institutional trust and greater visibility of the problem. It is not possible to say that there was more violence, but there was certainly more willingness to report it and seek shelter.

The specific findings reinforce two central ideas. The first is that the violence linked to the manifestations of inequalities under study is persistent, structural in nature, and will hardly be eliminated by isolated measures. The second is that intersectoral policies and territorialities can generate concrete impacts. The experience of Araguaína, where precautionary and repressive measures were combined with community communication strategies, shows that it is possible to change local trajectories. This case reveals a broader lesson: it is not enough to have advanced legislation; It is essential to ensure its effective implementation, strengthen the support system and adapt the actions to the particularities of each territory.

These findings suggest that gender-based violence is multicausal and that its mitigation depends on a combination of intersectoral policies, strengthening of the reception network, and actions adapted to local specificities. The experience of Araguaína demonstrates that, when prevention, repression and community awareness are articulated, it is possible to significantly reduce the incidence of cases.

5.2 DISCUSSION

The apparent stability in the total number of these crimes cannot be confused with immobility. Behind the numbers, there are distinct movements between the territories. Palmas

maintained high rates, the interior expanded its participation and Araguaína managed to reduce occurrences to zero in 2024. This variation demonstrates that abusive investments respond directly to the intensity and quality of institutional policies. The example of Araguaína, where the Phoenix Project and Operation Átria were applied more consistently, reinforces that focused and articulated actions can transform local realities. This result dialogues with Castro (2002), when he highlights the strength of integrated security strategies in delimited contexts, and also with Baldissera (2008), for whom institutional communication, when well directed, enhances the reach of policies.

The growth of calls and complaints on Dial 180 suggests another relevant movement: the consolidation of social trust in official channels. It is not only about an increase in violence, but an increase in the willingness to denounce. Campaigns such as Agosto Lilás and articulated operations reinforced this visibility. Kunsch (2003) had already observed that the combination of wide-ranging institutional messages and proximity actions increases both the victim's perception of protection and the risk perceived by the aggressor.

When looking at the whole, a fundamental problem emerges: regional inequalities. Municipalities with a stronger institutional presence advanced, while areas with low coverage maintained high rates. This disparity is consistent with the analyses of Saffioti (2004) and Connell (1995), who relate these abusive attitudes to patriarchal structures and the maintenance of hegemonic masculinities. In other words, the absence of the State in certain territories allows the reproduction of dynamics of oppression that resist despite advances in legislation.

The discussion also requires an intersectional perspective. Authors such as Crenshaw (1989) and Ribeiro (2017) draw attention to the class of black, indigenous, and quilombola women, who face overlapping social, economic, and racial vulnerabilities. The lack of these cuts in official statistics makes part of the abuse invisible and limits the formulation of specific policies. Thus, although the data reveal some advances, it is likely that a significant portion of the cases remain out of the records.

The findings in Table 3 reinforce this deductive interpretation. Starting from the general premises of Brazil, marked by high rates of femicide although progressing in the legislatures, we arrive at the specific conclusions of Tocantins. The state picture mirrors the national structure, but also shows how localized policies can alter trajectories. Araguaína has become an example of how intersectoral strategies — combining repression, prevention, and community communication — produce visible effects. In contrast, the interior demonstrates

how the absence of these policies magnifies inequalities. The deductive reading, therefore, shows that crimes are simultaneously structural and territorial phenomena.

It is necessary to acknowledge, however, the limitations of this study. Underreporting remains an obstacle, the lack of data disaggregated by race prevents a more accurate analysis, and methodological differences between agencies make direct comparisons difficult. These weaknesses do not invalidate the results, but reinforce the urgency of more integrated and standardized databases.

In summary, these abusive attitudes mentioned in Tocantins reflect the Brazilian contradictions: persistent and structural, but also sensitive to well-designed policies. The data confirm that legislation is a necessary condition, but not sufficient. It is necessary to expand the territorial presence of the State, invest in institutional communication and incorporate intersectional cuts. Only then will it be possible to transform specific advances into lasting changes.

6 FINAL CONSIDERATIONS

In summary, this study allowed us to understand that gender abuse in Tocantins, between 2022 and 2024, remained at high levels, but presented important transformations in its territorial distribution. The results show that, although femicides remained stable, the main difference between the regions analyzed was significant: Palmas maintained high rates, Araguaína reduced to zero occurrences in 2024, and the interior had an increase in occurrences.

These results reinforce the understanding that this type of crime continues to be a structurally based phenomenon, but sensitive to the implementation of targeted policies. The Araguaína experiment is in line with the conviction that the combination of qualified repression, community prevention and institutional communication can change local realities. On the other hand, the interior of the state, without similar coverage, ratifies that the lack of structured actions keeps abuses at high levels.

The results also point to another advance: the growth of Ligue 180. This data suggests greater social trust in official channels and corroborates the importance of public integration and educational campaigns. It can be considered that this institutional strengthening is a positive indicator, although insufficient in the face of the persistence of femicides.

The contributions of this work are located in the critical analysis of the post-pandemic scenario and in the practical demonstration that intersectoral policies can generate

measurable impacts. The study provides subsidies for both public managers and researchers, by expressing the demands to territorialize policies and increase the internalization of the support system.

The limitations for this study were the underreporting of records, the lack of information disaggregated by cultural characteristics, and methodological differences between agencies. These constraints limit the scope of the conclusions, but do not invalidate the identified trend. The results would be more conclusive if there were more standardized and complete databases, especially with intersectional cuts.

For future work, it is recommended the introduction of qualitative data on the concrete cases of the victims, the deepening of the intersectional analysis and the longitudinal evaluation of the public policies implemented. Such advances can offer a more comprehensive picture and contribute to more effective coping strategies.

To recover the initial argument, it can be generalized that violence against women in Tocantins reflects national patterns, but also demonstrates that well-structured policies are capable of changing local trajectories. The challenge, therefore, is to transform successful one-off experiences into permanent practices, with reach throughout the state.

ABSTRACT

This study conducts a bibliometric analysis of precipitation estimation models using time series, aiming to identify trends, methods, and scientific contributions over the last four decades. The research is justified by the importance of precipitation as a primary variable in hydrological modeling and the scarcity of accurate rainfall data, especially in regions with high spatial and temporal variability. The work seeks to map the main precipitation estimation models, analyze their spatial and temporal resolution, and identify methodological trends and innovations in the field. The methodology adopted included a bibliometric approach, using the Scopus database to collect scientific articles, followed by statistical analyses and term co-occurrence networks using the VOSviewer software. Seventy-eight articles published between 1982 and 2023 were analyzed, focusing on the 40% most cited in each decade. The results reveal a significant evolution in precipitation modeling, with the transition from simple statistical methods to advanced techniques such as artificial neural networks (ANNs) and deep learning (LSTM). Daily temporal and regional spatial resolution predominated in the studies, and the integration of satellite data and artificial intelligence (AI) techniques has become a dominant trend in the last decade. The conclusion is that advances in precipitation modeling have significant practical impacts on water resource management and agriculture, contributing to the prediction of extreme events and adaptation to climate change.

Keywords: Precipitation. Time Series. Hydrological Modeling. Bibliometric Analysis. Artificial Intelligence. Climate Change.

RESUMO

Este estudo realiza uma análise bibliométrica sobre os modelos de estimativa de precipitação utilizando séries temporais, com o objetivo de identificar tendências, métodos e contribuições científicas ao longo das últimas quatro décadas. A pesquisa justifica-se pela importância da precipitação como variável primordial na modelagem hidrológica e pela escassez de dados pluviométricos precisos, especialmente em regiões com alta variabilidade espacial e temporal. O trabalho busca mapear os principais modelos de estimativa de precipitação,

analisar sua resolução espacial e temporal, e identificar as tendências metodológicas e inovações na área. A metodologia adotada incluiu uma abordagem bibliométrica, utilizando a base de dados Scopus para coleta de artigos científicos, seguida de análises estatísticas e de redes de coocorrência de termos com o auxílio do software VOSviewer. Foram analisados 78 artigos publicados entre 1982 e 2023, com foco nos 40% mais citados de cada década. Os resultados revelam uma evolução significativa na modelagem da precipitação, com a transição de métodos estatísticos simples para técnicas avançadas, como redes neurais artificiais (ANN) e deep learning (LSTM). A resolução temporal diária e espacial regional predominou nos estudos, e a integração de dados de satélites e técnicas de inteligência artificial (IA) tornou-se uma tendência dominante na última década. Conclui-se que os avanços na modelagem da precipitação têm impactos práticos significativos na gestão de recursos hídricos e na agricultura, contribuindo para a previsão de eventos extremos e a adaptação às mudanças climáticas.

RESUMEN

Este estudio realiza un análisis bibliométrico de modelos de estimación de precipitación utilizando series de tiempo, con el objetivo de identificar tendencias, métodos y contribuciones científicas en las últimas cuatro décadas. La investigación se justifica por la importancia de la precipitación como variable primaria en el modelado hidrológico y la escasez de datos precisos de lluvia, especialmente en regiones con alta variabilidad espacial y temporal. El trabajo busca mapear los principales modelos de estimación de precipitación, analizar su resolución espacial y temporal e identificar tendencias metodológicas e innovaciones en el campo. La metodología adoptada incluyó un enfoque bibliométrico, utilizando la base de datos Scopus para recopilar artículos científicos, seguido de análisis estadísticos y redes de co-ocurrencia de términos utilizando el software VOSviewer. Se analizaron setenta y ocho artículos publicados entre 1982 y 2023, centrándose en el 40% más citado en cada década. Los resultados revelan una evolución significativa en el modelado de precipitación, con la transición de métodos estadísticos simples a técnicas avanzadas como redes neuronales artificiales (ANN) y aprendizaje profundo (LSTM). La resolución espacial temporal y regional diaria predominó en los estudios, y la integración de datos satelitales y técnicas de inteligencia artificial (IA) se ha convertido en una tendencia dominante en la última década. La conclusión es que los avances en la modelización de precipitaciones tienen un impacto práctico significativo en la gestión de los recursos hídricos y la agricultura, contribuyendo a la predicción de eventos extremos y la adaptación al cambio climático.

1 INTRODUCTION

The understanding of hydrological phenomena is essential for rainfall-flow modeling, in which precipitation stands out as a primary input variable. However, the difficulty in obtaining accurate rainfall data compromises the realistic representation of hydrological events, especially in basins where high spatial variability and flaws in records can result in significant discrepancies between the model and reality. Studies such as the one by Arai *et al.* (2009) demonstrate the relevance of precipitation in the characterization of the regional climate and its direct impact on agriculture, while Silva *et al.* (2011) show that prolonged periods of drought affect agriculture and reduce water levels in rivers, reservoirs and springs, even impacting the generation of hydroelectric power. Lucena *et al.* (2008) complements this view, emphasizing that rainfall intensity is influenced by large-scale atmospheric and oceanic phenomena.

In the Brazilian context, the network of stations of the National Institute of Meteorology (INMET) faces challenges due to the limited distribution of stations and inconsistencies in the historical series, arising from technical and data processing problems. To mitigate such challenges, techniques such as multiple linear regression have been shown to be effective in adjusting and filling gaps in historical data (Pedro Júnior *et al.*, 1994), and methodologies based on multiple regression analysis correlate precipitation with physiographic and temporal variables (Antonini *et al.*, 2019). Given the scarcity of rainfall data and the complexity inherent to precipitation modeling, it is essential to identify the main models used, as well as the spatial and temporal resolution (hourly, daily, monthly or other periodicity) of these models, in addition to understanding the trends and methodological innovations over the decades.

Bibliometric analysis emerges, in this scenario, as a robust tool that uses statistical and mathematical techniques to map scientific productivity and identify authorial, institutional, and thematic patterns (Wu, 2017; Guedes & Borshiver, 2005; Café & Brascher, 2008; Job, 2018). Thus, this study proposes to integrate precipitation modeling with a bibliometric and network approach, aiming to identify the main precipitation estimation models from time series, analyze the resolution and periodicity of these models, map the main researchers and institutions in the area, and evaluate the most used methods in the calibration and validation of the models.

2 THEORETICAL TABLEWORK

2.1 CLIMATE

Climate is the set of meteorological phenomena that characterize the average state of the atmosphere over a given place on the earth's surface. (HANN, 1882 apud MONTEIRO, 1991). Through this definition, it is possible to understand the central idea of what climatology would be.

It is extremely important to understand that climate and weather are not the same, and therefore, they have some differences. Time is understood as a set of studied elements that expresses the conditions of the atmosphere observed at a current moment, that is, at an instant in the atmosphere. Climate, on the other hand, will have its understanding associated with a set of elements studied through records, left over years and years.

According to Borsato (2000), the climatic elements somewhere on the earth's surface can be defined as: air temperature, relative humidity, atmospheric pressure, cloudiness, solar radiation, dust, wind direction and speed, electric field, water vapor voltage, positive and negative ions, horizontal visibility and vertical electric current, acting simultaneously and together, considered as a specific property of the action of each air mass.

2.1.1 Climate Components

According to Silva (2001), the study of climate and knowledge of its origin lead us to an understanding related to factors that can be defined as: generics and modifiers.

According to Vecchia (2001) the elements of climate are: air temperature, air humidity, atmospheric pressure, wind direction and speed, cloudiness and atmospheric precipitation, that is, it includes not only meteorological phenomena, but also phenomena that are influenced by the conditions of the place

2.1.1.1 Generic factors

These are dynamic factors that condition the climate, these meteorological phenomena originate from solar radiation and atmospheric and maritime movements, they are defined:

- Solar radiation: it is the factor that promotes global thermal exchange processes due to the warming of the Earth's surface. (CARLETTO, 2005)
- General circulation of the atmosphere: it combines the thermal forces, whose circulation is meridian, that is, in the north-south direction, and the dynamic forces that are

caused by the rotation of the earth and that promotes a modification in the air flow that tries to create a zonal circulation, in an East-West direction, according to Vecchia (2001).

- Sea currents: transfer heat from regions with temperature differences. They act in two ways mainly: by increasing the pressure of water vapor, that is, the humidity of the air, and by modifying the wind regime, according to Vecchia (2001).

2.1.1.2 Modifying factors

They are the static factors that act on the climate and create local variations, they are: geographical, topological, biological and cultural. Most of the time, the variations caused by these factors take on large magnitudes. Vecchia (2001) summarizes the main modifying factors in descending order of magnitude:

- Geographic: latitude, altitude, and the relationship between land and water masses.
- Topographic: elevation, sun orientation and soil structure.
- Biological: fauna and flora.
- Cultural: changes in the soil, pollution of the atmosphere and hydrological modifications.

The elements and especially the factors of climate are sometimes so complex and variable, highly dynamic, sometimes with chaotic behavior, that it is impossible to define their precise functioning.

2.2 PRECIPITATION

Precipitation, as defined by Bertoni and Tucci (2009), consists of all water from the atmosphere that reaches the earth's surface, regardless of its physical state, such as drizzle, rain, snow, hail, frost or dew. In Brazil, approximately 99% of precipitation occurs in the form of rain, while less than 1% manifests itself in the other forms (Santos *et al.*, 2001). Rainfall is a widely studied climatic element, especially due to meteorological and hydrological records, which in some regions date back to the beginning of the twentieth century (Cavalcanti *et al.*, 2009).

Clouds, which allow precipitation to occur under specific conditions, are formed by the mixture of air, water vapor, and liquid or solid droplets, whose diameters vary between 0.001 and 0.03 mm (Bertoni and Tucci, 2013). The main characteristics of precipitation include its duration, total precipitated volume, temporal and spatial distribution. In terms of

hydrometeorological processes, rainfall is the element that presents the greatest monthly and annual variability when compared between different regions.

According to Bertoni and Tucci (2013), the formation of precipitation is associated with the upward movement of humid air masses, which causes a dynamic or adiabatic cooling, leading the water vapor to reach its saturation point. From the condensation level, under favorable conditions and in the presence of hygroscopic nuclei, water vapor condenses, forming tiny droplets around these nuclei. For the water droplets to precipitate, it is necessary that they reach such a volume that their weight exceeds the forces that keep them in suspension, thus acquiring a speed of fall superior to the ascending vertical components of atmospheric movements. Raindrops have diameters ranging from 0.5 to 2.0 mm, and can reach maximum values of 5.0 to 5.5 mm. When a droplet reaches a diameter of 7.00 mm, its fall velocity reaches approximately 9 m/s, at which time its deformation occurs and subsequent fragmentation into smaller droplets due to air resistance (Bertoni and Tucci, 2009).

3 METHODOLOGY

For the development of the research, a unified methodological approach of bibliometric analysis was implemented, providing greater robustness to the study. Table 1 presents the relationship between the research questions, the analyses proposed in our methodological approach and the data used for their execution. The table is structured in three main fields: the questions of interest, the analysis used to answer them, and the type of data used.

Table 1

Description of the relationship between work issues, analyses, and data sources

Questions	Analysis	Data
What are the trends in publications on precipitation models using time series?	General statistics/Word co-occurrence network/Co-authoring spatial network	All papers
Which countries contributed the most to research on precipitation models using time series?	General statistics/Word co-occurrence network/Co-authoring spatial network	All papers
Do the articles specify the geographical area covered by the precipitation model and the spatial and/or temporal resolution of the model?	Metrics	40% more cited

Do the surveys identify the relevant climate and weather variables that affect precipitation and the data sources used to provide these variables?	Metrics	40% more cited
Do studies consider different types of precipitation and the physical and meteorological processes in the precipitation model?	Metrics	40% more cited
The studies present the most used methods for calibration and validation of precipitation models and what are these methods?	Metrics	40% more cited
How can advances in precipitation modeling impact water resources management and agriculture?	General statistics/general characteristics	40% more cited
What are the emerging trends in precipitation modeling, and how are artificial intelligence and machine learning being integrated into precipitation models?	General characteristics	40% more cited
What are the most influential publications on precipitation models using time series?	General statistics/Word co-occurrence network/Co-authoring spatial network	40% more cited

Source: Prepared by the authors.

The approach and methodological steps used are illustrated in Figure 1, which involves the choice of the search database, the identification of terms relevant to the theme and the application of filters in the search engine. Then, a manual screening was carried out, with the reading of the titles and abstracts of the retrieved articles, in order to identify and exclude those that did not align with the research objectives, characterizing Phase 1 of the research. Subsequently, analyses were carried out for two sets of data: all selected articles, a total equivalent to 78 articles, and for the 40% most cited in each decade.

3.1 DATABASE

The selection of the Scopus database for the collection of bibliometric data is justified by its comprehensiveness and quality, being recognized as one of the largest global multidisciplinary databases. Scopus provides access to more than 27,800 peer-reviewed journals and more than 330,000 books, as well as conference proceedings, ensuring extensive and reliable coverage of scientific information (ELSEVIER, 2024). Its advanced data analysis and retrieval tools allow the identification of trends, citation patterns, and collaboration networks, essential aspects for the mapping of scientific knowledge.

In the present study, Scopus is particularly relevant for the analysis of time-series-based precipitation estimation models, as it facilitates the retrieval of articles that address the validation of specific models and methodologies. The restriction of the search to articles published in journals aims to ensure the originality and robustness of the data, avoiding common duplications in reviews, book chapters or conference proceedings. This rigor in the selection of sources reflects the need for a consolidated and reliable basis for detailed bibliometric analyses, reinforcing the choice of Scopus as the primary source.

The use of Scopus, with its robust tools for exporting and analyzing data in multiple formats, contributes significantly to bibliometric studies. Such studies allow us to understand

scientific developments in specific areas, identify gaps in the literature, and guide future research and the development of new methodologies, standing out as an essential resource for academic research.

3.2 SCREENING SEARCH AND REGISTRATION STRATEGY

The research strategy used in the Scopus database focused on the analysis of precipitation estimation models and time series analysis, taking into account their validation methods. For the construction of the dataset, the search was structured using Boolean operators, such as OR and AND, which allowed combining different terms and synonyms to refine the results and include only the articles relevant to the scope of the study. The terms chosen, such as "Rainfall Estimation Statistic Model*", "Rainfall Data Analysis Model*", "Rainfall Model*", among others, aimed to identify the most significant publications in the area of precipitation modeling. The use of these Boolean operators helped to select articles that addressed modeled time series and the analyses associated with mathematical modeling, essential aspects for scientific development on the subject.

To structure the dataset, Boolean operators OR and AND were used. The keywords used in the research were selected with the objective of identifying essential aspects that contribute to the understanding of the scientific development related to precipitation modeling, as well as to identify gaps in the literature on the subject. Several preliminary tests were conducted with different terms and synonyms until the final set of keywords pertinent to the study was reached.

The terms of the final equation: TITLE-ABS-KEY (("Rainfall Model*" OR "Precipitation Model*" OR "Rainfall Estimation Model*" OR "Precipitation Estimation Model*" OR "Rainfall Estimation Statistic Model*" OR "Precipitation Estimation Statistic Model*" OR "Rainfall Data Analysis Model*") AND ("Time Series Analysis*" OR "Time Series*" OR "Temporal Data Analysis" OR "Temporal Data" OR "Rainfall Data Model")) AND PUBYEAR > 1981 AND PUBYEAR < 2024 AND (LIMIT-TO (SRCTYPE , "j")) AND (LIMIT-TO (DOCTYPE , "ar")).

The final search equation further refined the results by limiting the year of publication between 1982 and 2023 and the type of document to finished research articles (peer-reviewed articles), ensuring that the data collected was of high quality and relevance.

After this initial stage, the titles and abstracts of the retrieved articles were carefully reviewed, excluding those that were not aligned with the objectives of the study. This

approach allowed the bibliometric analysis to be based on a robust and well-defined dataset, which was later exported in CSV format for qualitative and quantitative analyses. These analyses included the geographic distribution of the studies, allowing a comprehensive view of the evolution and impact of research on precipitation models over time (SANTANA *et al.*, 2021).

This initial process made it possible to identify emerging patterns and evolution in research topics over time. Subsequently, a detailed systematic review was carried out on 40% of the most cited articles in each period.

This study, by integrating a quantitative and qualitative approach, not only maps the historical development of the area of environmental sciences, but also highlights the gaps and future opportunities, reinforcing the importance of methodological innovation and international collaboration in scientific research.

3.3 SEMANTIC AND GENERAL NETWORK ANALYSIS

The construction of the term networks was carried out using the VOSviewer program, a software developed for bibliometric analysis of scientific literature (VAN ECK; WALTMAN, 2010) that uses the VOS mapping technique to visualize similarities and allow the development of bibliometric maps. The software was used to make maps based on data of co-occurrences between the terms. The use of this software was based on the possibility of running on many hardware platforms, operating systems, being free and also the possibility of being used directly from the internet (VAN ECK; WALTMAN, 2010; VAN NUNEN *et al.*, 2018). The minimum number of occurrences of a keyword is five times for the decades and general network, for titles, abstracts, and keywords of all publications to build a network.

VOSviewer can be used to build networks of scientific publications, scientific journals, researchers, research organizations, countries, and keywords. Items in these networks can be connected by co-authorship, co-occurrence, citation, bibliographic coupling, or co-citation links (VAN ECK; WALTMAN, 2010). The bibliometric maps produced in VOSviewer use principles related to text mining (VAN ECK; WALTMAN, 2010). The analysis of the keywords between titles and abstracts shows the connection between related terms, providing the division into groups called clusters, which groups all terms considered similar.

The counting method for this study was full counting, corresponding to the total count, where each link of co-occurrences has the same weight, which means that all occurrences of the term in the document will be counted, but there is binary counting only observing the

presence or not of the term existing in the document (VAN ECK; WALTMAN, 2010).

The graphical representations expressed in the maps relate the proportionality of similarities and co-occurrences of terms in the publications: the co-occurrence networks are composed of nodes and edges. In which nodes are objects such as the co-occurrence of words and countries. Between any pair of knots there can be an edge. An edge is a connection or a relationship between two nodes. The distance between two nodes in the visualization roughly indicates the relationship between the searched terms in terms of co-occurrence. Node size is determined by the weight of an item in a given network (VAN ECK; WALTMAN, 2010).

For the creation of the clusters, a thesaurus file was prepared, which represents a thesaurus dictionary in txt format, where the word is as the label is and replace by, which is the way the term is to be (WALTMAN; VAN ECK; NOYONS, 2010). The thesaurus is used to clean up terms, and can ignore some, exclude, change the way they are written and/or unify terms that have similar meanings.

3.4 STATISTICAL ANALYSIS OF THE NETWORK

The bibliometric analysis, essential to understand the panorama of scientific production in certain areas of study, was conducted through the Bibliometrix statistical package, an open-source tool integrated with the R language, widely recognized for its versatility in scientific data analysis (ARIA; CUCCURULLO, 2017).

For the development of this analysis, the necessary commands for the installation and activation of the Bibliometrix package were implemented in the R Studio environment. First, `install.packages("bibliometrix")` was used to ensure the installation of the package, followed by `library(bibliometrix)` and `biblioshiny()`, which activated the interactive graphical interface, allowing a more intuitive visualization of the data. From there, a database with scientific publications was entered into the system, and variables such as the contribution of different countries and the productivity of the authors were analyzed, these data were processed and organized manually, using adjustments in the frequency histograms to refine the presentation of the results.

In short, the use of the Bibliometrix package in R Studio, with its wide range of resources for analysis and visualization, made it possible to elaborate an in-depth mapping of scientific production, allowing a better understanding of the dynamics and trends of the field under study.

4 RESULTS AND DISCUSSIONS

4.1 PRECIPITATION MODELING TRENDS PUBLICATIONS

After processing the bibliographic data and manual filtering, the final sample resulted in 78 articles published between 1982 and 2023, with an average of 1.86 articles per year and a standard deviation of 1.59, i.e., 1.86 ± 1.59 . This indicates that, on average, there were approximately 1.86 annual publications, with a variation of 1.59 articles around this average. There was also an annual growth of 4.0%, as shown in Figure 2.

Figure 2

Articles published by year and accumulated in the period 1982-2023

Source: Prepared by the authors themselves.

When annual growth is evaluated, the data indicate a modest and irregular growth in the number of articles published between 1982 and 2023. The analysis reveals years with production peaks, such as 1999, 2003, 2012 and 2023, as well as periods without publications or with few productions (for example, between 1983 and 1987). This behavior reflects the growing interest in precipitation modeling as new technologies and data have become available, as well as the impact of global and regional events.

Precipitation modeling, especially utilizing techniques such as kriging and Fourier analysis, has benefited from advances in computing and remote sensing, such as the use of satellites, which have become more accessible in recent decades. Factors such as the climate crisis and the need to predict extreme events (floods and droughts) also drove the growth in scientific production from the 2000s onwards. The increase in production can be

explained by the growing need for more accurate predictive tools, especially in regions with scarce rainfall data, such as Bahia, for example.

Table 2 shows a clear trend of increase in the number of articles published over time.

Table 2

Evolution of the number of publications over the decades, with percentage, mean and standard deviation

Decade	Total Publications	Percentage of Total (%)	Average Articles/year	Standard deviation
1982-1989	2	2,56%	0,25	0,43
1990-1999	10	12,82%	1,1	1,22
2000-2009	26	33,33%	2	1,26
2010-2019	36	46,15%	3	1,41
2020-2023	12	15,38%	3,75	0,83

Source: Prepared by the authors themselves.

Figure 2 and Table 2 show that with regard to the growth of accumulated publications, it is necessary to reflect the consolidation of precipitation modeling as an important research area. The cumulative graph shows a consistent increase from 1999 onwards, which coincides with increased access to technological tools such as models based on geospatial data and the use of advanced computational techniques. From 2010 onwards, growth accelerated, highlighting the fundamental role of modeling to face contemporary climate challenges, such as extreme variations in precipitation, changes in rainfall patterns and the sustainable management of water resources.

When the analysis is carried out by decades, it is found that, in the 80s (1982-1989), 2 publications were made, corresponding to 2.56% of the total. This period presents a low number of articles, reflecting the initial stage of research in precipitation modeling. In the 90s (1990-1999) we had 10 publications, representing 12.82% of the total. The 1990s marks the beginning of a more significant increase in interest in climate modeling, possibly driven by growing concern about the impact of climate change. In the 2000s (2000-2009) there were 26 publications, representing 33.33% of the total. This decade sees a notable increase in scientific output, which can be associated with the emergence of remote sensing technologies, more sophisticated climate models, and the widespread use of meteorological data from satellites. From 2010-2019, 2010s, 36 publications, corresponding to 46.15% of the total. This period consolidates precipitation modeling as a mature research area, with the intensive use of big data, artificial intelligence, and the development of more advanced predictive modeling techniques, such as kriging and spectral analysis. And finally, the decade

still in formation, 2020-2023, there are already 12 publications so far, representing 15.38% of the total. Even with fewer years, production continues to grow, reflecting the increasing relevance of precipitation modeling, especially in response to extreme weather events and the need to more accurately predict the impacts of climate change.

Still analyzing Figure 2, it is possible to observe that the peaks and falls in publications can be justified by technological factors and global events. The 1999 peak may be related to increased interest in precipitation modeling due to the Kyoto Protocol and growing concern about climate change. In the 2000s, the use of satellites and techniques such as kriging boosted publications. Between 2012 and 2013, the use of big data and artificial intelligence further expanded interest in the field. The relative drop in 2020-2023 may have been influenced by the COVID-19 pandemic, which impacted global scientific production, although interest remained high due to the relevance of the topic. These data justify the mean and standard deviation presented in Table 2.

4.2 COUNTRIES CONTRIBUTED TO RESEARCH ON PRECIPITATION MODELING

A bibliometric network was built to visualize the collaboration networks and the distribution of publications around the world related to the application on precipitation modeling. Figure 3 shows how the quantities of publications were distributed among the 10 countries with the highest number of publications in the area in question.

Figure 3

Number of publications by country

Source: Prepared by the authors themselves.

The United States occupies the first place, with a total of 30 publications, and Brazil occupies the ninth position in the global ranking of the geographical distribution of scientific productions relative to the number of citations by countries, and Table 3 shows the percentage of each country.

Table 3

Number of articles published and percentages

Countries	Frequency	Percentage (%)
United States	30	12,66
United Kingdom	26	10,97
Australia	22	9,28
France	19	8,02
China	18	7,59
Germany	14	5,91
Indonesia	11	4,64
South Korea	10	4,22
Brazil	6	2,53
Ecuador	5	2,11

Source: Prepared by the authors themselves.

4.3 GEOGRAPHICAL AREA AND RESOLUTION

The analysis of the 32 articles reveals that all of them (100%) specify the geographical area covered by the precipitation model and the spatial and/or temporal resolution of the model. This indicates that the scientific community has a consensus on the importance of clearly defining the scope and resolution of precipitation models.

Regarding temporal resolution, the most common is the daily resolution, present in 90.6% of the articles. Hourly resolution appears in only 3.1% of cases, while the combination of daily and monthly resolution is observed in 6.3% of articles. This suggests that everyday resolution is preferred in most studies, likely due to its balance between detail and computational feasibility.

With regard to spatial resolution, the most frequent is regional, present in 93.8% of the articles. Local resolution appears in only 6.2% of cases, indicating that most studies focus on larger geographic areas, such as regions or watersheds, rather than specific locations.

When analyzing the trends over the decades, a consolidation of daily and regional resolution is observed. In the 1980s, only daily and regional resolution was observed. In the

1990s, there was a small diversification, with the introduction of time and local resolution. However, from the 2000s onwards, daily and regional resolution became dominant, with 100% prevalence in the 2010s and 2020s. This reflects a standardization in modeling approaches, possibly driven by technological advances and the need for comparability between studies.

Therefore, the data show that the scientific community prioritizes daily and regional resolution in precipitation modeling, with a clear trend of consolidation of these characteristics over time. Time and local resolution, although present in some studies, is less common, suggesting that they are applied in specific contexts or in early stages of research.

4.4 CLIMATE VARIABLES AND DATA SOURCE

The analysis of the 32 articles reveals that 59.4% of them identify the relevant climatic and meteorological variables that affect precipitation, while 40.6% do not identify them, but mention the data sources used. This indicates that, although most studies seek to understand the factors that influence precipitation, a significant portion focus more on the collection and use of data than on the exploration of specific climate variables.

Over the decades, a clear evolution has been observed both in the climate variables studied and in the data sources used. In the 1980s, articles focused on precipitation-related variables, such as depth and duration of events, using primarily rain gauge data. In the 1990s, there was an introduction of more complex variables, such as atmospheric circulation, temperature, and pressure, with the use of atmospheric pressure data and meteorological records.

In the 2000s, precipitation modeling expanded to include variables such as topography, terrain gradient, and relative humidity, using reanalyses, interpolated data, and radiosonde. The 2010s marked an even greater diversification, with the introduction of variables such as altitude, latitude, longitude, and oceanic-atmospheric indices (IPO-PDO), in addition to the expansion of the use of satellite data, regional climate models, and paleoclimate series.

In the 2020s, there was a reduction in the number of articles identifying climate variables, with only 20% of studies highlighting specific variables. However, there is a consolidation of the use of advanced data sources, such as satellites and global climate models (GCMs), reflecting a trend to prioritize the collection and processing of high-resolution data.

It is thus concluded that, over time, there has been a transition from studies focused on simple variables and local data (such as rain gauges) to a more complex and integrated approach, which combines detailed climate variables with advanced data sources, such as satellites and global models. This evolution reflects technological advances and the need for more accurate models to deal with the challenges of climate change and water resources management.

4.5 TYPES OF PRECIPITATION AND PHYSICAL PROCESSES

The analysis of the 32 articles reveals that 59.4% of them consider physical and meteorological processes in their precipitation models, while 40.6% do not address these processes. This indicates that, although most studies seek to understand the mechanisms that influence precipitation, a significant portion focus more on the collection and use of data than on the exploration of the underlying physical and meteorological processes.

Over the decades, there has been a clear evolution in the approach to physical and meteorological processes. In the 1980s, studies focused on specific processes, such as convective storms. In the 1990s, there was an introduction of broader concepts, such as the relationship between atmospheric circulation and the occurrence of rainfall, in addition to the influence of temperature and humidity on the formation of precipitation. In the 2000s, studies expanded to include spatial gradients and orographic effects, reflecting greater complexity in modeling.

From the 2010s onwards, there was a significant diversification of the processes considered, with the introduction of concepts such as advection, diffusion, convection, monsoon circulation and interannual variability. This trend continued in the 2020s, with a consolidation of the use of statistical relationships between temperature and precipitation, indicating a prioritization of quantitative analysis and modeling.

It is important to highlight that, in all articles, the only form of precipitation considered was rain. There was no mention of other types of precipitation, such as snow or hail, which reflects the focus of the studies on regions and contexts in which rain is the predominant form of precipitation.

Thus, over time, there has been a transition from studies focused on specific and local processes to a more complex and integrated approach, which combines multiple physical and meteorological processes with advanced statistical analysis techniques. This evolution

reflects technological advances and the need for more accurate models to deal with the challenges of climate change and water resources management.

4.6 CALIBRATION AND VALIDATION METHODS

The analysis of the methods of calibration and validation of precipitation models over the decades reveals a significant evolution, driven by the advancement of technology and the need for more accurate and reliable models. Table 4 shows the most used methods by decade.

Table 4

Most used methods over the decades

Decade	Most Used Methods
1980	Correlation between depth and duration; observational data.
1990	Conditional probabilities; stochastic models, maximum verisimilitude.
2000	Markov Chains; simulated annealing; nonlinear regression; adjustment of distributions.
2010	Neural Networks (ANN); MCMC; cross-validation; adjustment of distributions; satellite data.
2020	Deep learning (LSTM); copulations; heuristic optimization (ISPSO); integration of satellites.

Source: Prepared by the authors themselves.

In the 1980s, calibration and validation methods were relatively simple and based on descriptive statistics. The article analyzed from this period used correlations between depth and duration of precipitation events and reliable observational data in semi-arid zones. These methods reflected the technological limitations of the time, focusing on empirical adjustments and basic correlations. The lack of diversification of techniques can be attributed to the scarcity of data and limited computational capacity.

In the 1990s, there was a significant advance with the introduction of more sophisticated statistical methods. The articles of this decade used conditional probabilities based on time series of atmospheric circulation patterns and stochastic models applied on a regional scale. In addition, methods such as maximum likelihood and comparison of observed and simulated statistics began to be employed. These techniques allowed for a better representation of climate variability and a more robust validation of the models.

The 2000s marked a period of diversification and optimization of calibration and validation methods. The articles analyzed showed the use of techniques such as Markov chains, simulated annealing and nonlinear regression. These methods allowed for more precise adjustments of the model parameters and a better representation of precipitation at different spatial and temporal scales. In addition, adjustment of distributions (Weibull, GEV, Kappa) has become common, reflecting a growing concern with the statistical representation of data.

The 2010s were marked by the use of computationally intensive methods and the concern with the quantification of uncertainties. With 12 articles analyzed, techniques such as artificial neural networks (ANN), Bayesian methods (MCMC) and cross-validation stand out. These methods allowed for more accurate calibration and the incorporation of uncertainties into the models. In addition, adjustment of distributions (Poisson, geometric, exponential) and integration of satellite data have become commonplace, reflecting the increasing availability of data and the advancement of technology.

In the 2020s, calibration and validation methods reached a new level of sophistication. The analyzed articles observed the use of techniques such as deep learning (LSTM), copulas and heuristic optimization (ISPSO). These methods allowed for a more accurate representation of precipitation, especially at thin temporal and spatial scales. In addition, the integration of satellite data and distributed hydrological models (such as W-flow) has become a trend, reflecting the need for more realistic models that are applicable in different contexts.

Over the decades, calibration and validation methods have evolved from simple, empirical techniques to computationally intensive and sophisticated approaches. This evolution has been driven by the advancement of technology and the increasing availability of data. From the 2010s onwards, there was a growing concern with the quantification of uncertainties, using methods such as MCMC and cross-validation. This reflects the need for more reliable and robust models. In the 2020s, the integration of satellite data and hydrological models became a trend, allowing for a more realistic representation of precipitation and its variability. The use of artificial intelligence techniques such as neural networks (ANN) and deep learning (LSTM) became commonplace in the 2010s and 2020s, reflecting the potential of these techniques to improve the accuracy of models.

4.7 IMPACTS ON WATER RESOURCES MANAGEMENT AND AGRICULTURE

Advances in precipitation modeling have positively impacted water resource management and agriculture in a number of ways. Firstly, improved forecasting of precipitation events allows for more efficient management of reservoirs and irrigation systems. More accurate models help predict water availability, which is crucial for agricultural planning, especially in semi-arid regions where water is a scarce resource. Additionally, the ability to predict extreme events such as droughts and floods has been essential for risk mitigation and natural disaster preparedness.

The integration of satellite data and ground-based observations has brought significant advances in extreme event prediction and water resource management. Models that incorporate this data allow early warnings for floods and droughts, helping in the operation of reservoirs and in the planning of water infrastructure. This is particularly important for agriculture, where predicting water availability and mitigating agricultural risks are critical to ensuring food security.

Another important impact of advances in precipitation modeling is adaptation to climate change. Models that incorporate future climate projections allow farmers and water resource managers to prepare for climate change scenarios, such as changes in precipitation patterns and an increase in the frequency of extreme events. This is crucial for the sustainable management of water resources and for the resilience of agriculture in the face of climate change.

Exhibit 5 below summarizes the main impacts of advances in precipitation modeling in water resources management and agriculture by decade.

Table 5

Major advances in water resources management and agriculture

Decade	Impacts on Water Resources Management and Agriculture
1980	Improved prediction of precipitation events; support for agriculture in semi-arid areas.
1990	Forecast of droughts and floods; water resources planning and agriculture based on atmospheric patterns.
2000	Generation of realistic spatial patterns; improvement in the allocation of water resources; support for agriculture.
2010	Early warnings for extreme events; forecast of water availability for agriculture; water infrastructure planning.
2020	Flow forecasting and reservoir management; mitigation of agricultural risks; adaptation to

	climate change.
--	-----------------

Source: Prepared by the authors themselves.

Therefore, advances in precipitation modeling have had a significant impact on water resources management and agriculture. Improved precipitation event forecasting, satellite data integration, and climate change adaptation are some of the key benefits of these advancements.

4.8 EMERGING TRENDS AND INTEGRATION OF NEW TECHNOLOGIES

In the 1980s and 1990s, precipitation modeling was dominated by traditional statistical methods, such as event-based and stochastic models, focusing on semi-arid zones and atmospheric patterns. These approaches, while effective for the context of the time, were limited by a lack of data and computational power. From the 2000s onwards, there was a significant advance with the introduction of techniques such as random cascade models and statistical downscaling, which allowed for a more accurate representation of precipitation at regional and local scales.

The 2010s marked the beginning of the integration of AI/ML techniques in precipitation modeling, with the use of artificial neural networks (ANN) for downscaling and precipitation prediction. In addition, the integration of satellite data and the use of Bayesian methods for quantification of uncertainties have brought significant advances in the accuracy of forecasts. In the 2020s, the consolidation of deep learning techniques, such as LSTM (Long Short-Term Memory), and the use of copulas and heuristic optimization (ISPSO) stood out as emerging trends. These techniques allowed for more accurate and adaptable predictions to climate change scenarios.

The integration of AI/ML in precipitation modeling began to gain prominence in the 2010s, with the use of neural networks (ANN) for downscaling and precipitation forecasting. However, it was in the 2020s that these techniques took hold, with the widespread use of deep learning (LSTM) and heuristic optimization techniques. These advances have made it possible not only to improve the accuracy of forecasts, but also to quantify uncertainties and adapt models to climate change scenarios.

Table 6 presents a summary of the evolution of trends and modeling over the decades according to the articles analyzed.

Table 6

Trend analysis and integration with AI/ML for decades

Decade	Emerging Trends	AI/ML integration
1980	Event-based models; focus on semi-arid areas.	Not mentioned.
1990	Stochastic models; atmospheric classification.	Not mentioned.
2000	Random cascade models; statistical downscaling; adjustment of distributions.	Not mentioned.
2010	Integration of satellite data; Bayesian models; neural networks (ANN).	Neural networks (ANN) for downscaling and forecasting.
2020	Deep learning (LSTM); copulations; integration of satellite data; Heuristic optimization.	Deep learning (LSTM); ML techniques for parameter tuning and optimization.

4.9 CHARACTERISTICS OF THE MOST INFLUENTIAL PUBLICATIONS ON PRECIPITATION MODELS USING TIME SERIES

The four percent of the most cited articles in each decade of analysis, between 1982-2023, were evaluated. Table 7 shows the number of articles per decade and the corresponding total read to 40% of each decade.

Table 7

Data on the number of articles after final screening divided by decades and quantity read

Decade	Total Articles	Amount read
1980	2	1
1990	11	5
2000	20	8
2010	30	12
2020	15	6

Source: Prepared by the authors themselves.

The final number of articles after all exclusion analysis was 78, in which when extracting the 40% of each decade that were read, the sum corresponds to the equivalent of 32 articles, which corresponds to about 41% of the final total of selected articles.

The most cited published articles are shown in Table 8.

4.10 TOPOLOGY OF THE DECADES AS RESEARCH FOCUSES AND SEMANTIC NETWORKS

Figure 2 shows an analysis of the network of co-word occurrence, which can be used to identify the state of the art. The research topic that is Mathematical Modeling of precipitation was categorized into four colored clusters, following the composition over time: 1980s (2 clusters), 1990s (7 clusters), 2000s (9 clusters), 2010s (10 clusters), 2020s (7 clusters).

The 10 most cited terms across the clusters include: "precipitation," "rainfall," "probability," "time series," "performance," "climate change," "precipitation intensity," "distribution," "accuracy," and "forecast." These terms reflect the evolution of precipitation

modeling, moving from simple rainfall and probability analyses to complex predictive models that integrate time-series data, extreme event forecasts, and the impact of climate change.

Figure 1

Co-occurrence network of words presented in the titles, abstracts and keywords for each decade (1980, 1990, 2000, 2010 and 2020)

1980s 1990s

2000s 2010s 2020s

Source: Prepared by the authors themselves.

Between 1982 and 1989, studies on precipitation modeling, with only two publications, focused on two main clusters. Cluster 1 includes terms such as "rainfall", "binomial distribution" and "precipitation event", reflecting an approach based on statistical and probabilistic methods, such as the binomial distribution and Pearson's correlation coefficient, to analyze rainfall events. The presence of "time series" and "convection" indicates the use of temporal data and atmospheric processes in the study of these phenomena. Cluster 2, on

the other hand, highlights terms such as "precipitation", "modeling" and "behavior", suggesting a focus on modeling precipitation processes and analyzing the behavior of these phenomena under different climatic conditions. These clusters mark the beginning of investigations into rainfall patterns and their variations.

Between 1990 and 1999, studies on precipitation modeling expanded, with 11 publications distributed in seven clusters. Cluster 1 highlighted terms such as "probability", "daily precipitation" and "conditional probability", indicating the use of advanced statistical methods to model rainfall events and their probabilities. Cluster 2 focused on "precipitation", "time series" and "precision", reflecting temporal analysis and the search for greater accuracy in the prediction of precipitation data. Cluster 3 combined "rainfall", "probability", "observation data" and "performance", pointing to the use of observational data and performance metrics in climate models. Cluster 4 introduced variables such as "temperature", "pressure", "climate change" and "regression model", relating climate change to precipitation patterns. Cluster 5 highlighted "time series", "climate" and "convection", with a focus on climate analysis and atmospheric circulation models. Cluster 6 emphasized "variation" and "analysis," exploring climatic variations and analytical techniques. Finally, Cluster 7 highlighted "precipitation model" and "precipitation data", reflecting quantitative modeling based on observational data. These clusters show an evolution in methods, with greater integration of statistics, time series, atmospheric variables, and climate change in the study of precipitation.

Between 2000 and 2009, studies on precipitation modeling became more complex, with 20 publications distributed in nine clusters. Cluster 1 highlighted terms such as "precipitation data", "precipitation model", "stochastic model" and "probability distribution", indicating the use of statistical and hydrological models to analyze precipitation variability. Cluster 2 focused on "rainfall", "distribution", "temporal resolution" and "daily data", with emphasis on the spatial and temporal distribution of precipitation. Cluster 3 combined "analysis", "accuracy" and "temperature", reflecting the evaluation of climate models and the analysis of atmospheric data. Cluster 4 highlighted "variability", "intensity", "climate scenario" and "depth of precipitation", exploring variations and intensities of rainfall in different scenarios. Cluster 5 focused on "time series" and "variation", with modeling of precipitation in space-time. Cluster 6 included "precipitation," "precipitation time series," "rain gauge," and "precipitation estimation," using observational data to feed models. Cluster 7 highlighted "circulation pattern", analyzing the interaction between atmospheric patterns and precipitation. Cluster 8 focused on "dependence" and "amplitude", studying interrelationships

between climate variables and precipitation events. Cluster 9 emphasized "approach" and "time series analysis", with a methodological focus on time series and detailed data analysis. These clusters show a significant advance in precipitation modeling, with greater complexity, integration of time series, hydrological variables, and stochastic models, reflecting the evolution of climate research techniques.

Between 2010 and 2019, studies on precipitation modeling presented a diversified and highly technical approach, with 30 publications distributed in ten clusters. Cluster 1 highlighted terms such as "performance", "distribution", "extreme event" and "probability distribution", with a focus on the evaluation of precipitation models and prediction of extreme weather events. Cluster 2 emphasized "precipitation model", "precipitation intensity", "error" and "rain gauge", indicating interest in measuring rainfall intensity and the accuracy of models based on observational data. Cluster 3 addressed "probability", "climate change" and "precipitation time series", relating climate change to precipitation modeling with an emphasis on temporal data. Cluster 4 focused on "time series", "variability", "intensity" and "Markov chain model", using advanced methods to predict variations in precipitation. Cluster 5 highlighted "rainfall" and "forecast", with terms such as "statistical model" and "time series analysis", showing the application of statistical models for rainfall forecasting. Cluster 6 explored "precipitation", "temperature" and "climate scenario", analyzing interactions between climate variables and future scenarios. Cluster 7 included "analysis", "validation" and "observation data", with a focus on model validation and precision analysis. Cluster 8 highlighted "precipitation model", "kriging" and "stochastic process", using advanced spatial and stochastic techniques. Cluster 9 emphasized "approach" and "calibration," reflecting the importance of model calibration to ensure accuracy. Cluster 10 focused on "precipitation time series" and "water resources management", highlighting the relevance of temporal analysis for the efficient management of water resources. These clusters demonstrate a high degree of sophistication, with advances in statistical techniques, prediction of extreme events, spatial modeling, and integration of climate variables, reflecting the complexity and interdisciplinarity of climate research in this period.

Between 2020 and 2023, studies on precipitation modeling delved into topics such as climate predictions, variability, and rainfall events, with 15 publications distributed in seven clusters. Cluster 1 highlighted "rainfall", "forecast", "analysis" and "precipitation data", with a focus on rain event forecasts based on detailed analyses of observational data. Cluster 2 emphasized "accuracy," "climate," "meteorological data," "precipitation model," and

"precipitation estimation," reflecting the search for greater reliability in climate models. Cluster 3 focused on "performance", "approach" and "modeling", with studies aimed at evaluating and improving modeling techniques. Cluster 4 highlighted "distribution", "variability", "correlation coefficient" and "time series data", indicating detailed analyses of precipitation variability over time. Cluster 5 focused on "precipitation model", "temporal pattern", "probability" and "precipitation event", with a focus on stochastic modeling and analysis of rainfall temporal patterns. Cluster 6 highlighted "climate change", "extreme event", "hydrological modelling" and "precipitation intensity", exploring the impacts of extreme events and climate change on hydrology. Cluster 7 emphasized "temperature," "water resources," and "precipitation time series," analyzing the effects of temperature on water availability and precipitation variability. These clusters show a strong emphasis on improving the accuracy of models, analyzing extreme events and climate change, and using time series to understand precipitation patterns and variations.

5 CONCLUSION

This study performed a comprehensive bibliometric analysis on precipitation estimation models using time series, identifying trends, methods, and significant contributions over the last four decades. The main findings reveal a marked evolution in precipitation modeling, with a progressive increase in the complexity and precision of the methods used. Initially, in the 1980s, models were based on simple statistical techniques, such as binomial distributions and basic correlations. Over time, there has been a transition to more sophisticated methods such as stochastic models, artificial neural networks (ANN), and more recently, deep learning (LSTM) and heuristic optimization (ISPSO) techniques.

The analysis highlighted the importance of temporal and spatial resolution, with most studies adopting daily and regional resolutions, reflecting a balance between detail and computational feasibility. Additionally, the integration of satellite data and the utilization of artificial intelligence (AI) and machine learning (ML) techniques have become dominant trends over the past decade, allowing for more accurate and adaptable predictions to climate change scenarios.

The practical impacts of these advances are significant, especially in water resources management and agriculture. More accurate models allow for more reliable prediction of extreme events, such as droughts and floods, contributing to risk mitigation and sustainable planning of water and agricultural infrastructures. Adaptation to climate change was also a

central theme, with models that incorporate future projections helping to prepare farmers and managers for adverse climate scenarios.

In terms of theoretical contributions, the study mapped the main methodological trends, highlighting the importance of quantifying uncertainties, the integration of multiple climate variables, and the use of advanced statistical and spatial analysis techniques. The bibliometric analysis also identified the main contributing countries and institutions, with the United States leading in number of publications, followed by the United Kingdom and Australia.

In summary, this study reinforces the relevance of precipitation modeling as a crucial research area to address contemporary climate challenges. The findings highlight the continued need for methodological innovation, international collaboration, and the integration of new technologies, such as AI and ML, to enhance the accuracy and applicability of precipitation models. These advances not only contribute to scientific advancement, but also have significant practical implications for sustainable water resource management and food security in a context of global climate change.

ABSTRACT

Technological innovation is a key pillar of sustained economic growth in contemporary economies, being recognized as a strategic element in shaping dynamic and competitive environments. This study aims to analyze the creation, development, and institutionalization process of INTEG – the Technological Business Incubator of Guarapuava, Paraná – between 2003 and 2023. The research is grounded in the Sociological Institutional Theory and adopts a qualitative approach, combining a specialized literature review, document analysis, and semi-structured interviews with managers and key stakeholders. The results show that INTEG's consolidation stemmed from a gradual institutionalization process, strongly supported by inter-institutional articulation among local, state, and federal agents. These articulations were crucial for the formation of a local innovation ecosystem, fostering the sustainability of technological ventures and promoting territorial development. It is concluded that the INTEG model offers a relevant analytical reference for public innovation policies in medium-sized cities.

Keywords: Technological Innovation. Institutional Theory. Innovation Ecosystems. Regional Development. Business Incubators. Public Policy.

RESUMO

A inovação tecnológica constitui um dos pilares centrais do crescimento econômico sustentado nas economias contemporâneas, sendo reconhecida como elemento estratégico na conformação de ambientes dinâmicos e competitivos. Este estudo tem por objetivo

analisar o processo de criação, desenvolvimento e institucionalização da INTEG – Incubadora de Empresas de Base Tecnológica de Guarapuava, Paraná – no período compreendido entre 2003 e 2023. A pesquisa fundamenta-se na Teoria Institucional de Base Sociológica, adotando uma abordagem qualitativa que articula revisão de literatura especializada, análise documental e entrevistas com gestores e atores-chave. Os resultados demonstram que a consolidação da INTEG decorreu de um processo de institucionalização progressiva, sustentado por articulações interinstitucionais entre agentes locais, estaduais e federais. Tais articulações foram determinantes para a formação de um ecossistema de inovação local, impulsionando a sustentabilidade de empreendimentos tecnológicos e promovendo o desenvolvimento territorial. Conclui-se que o modelo da INTEG constitui uma referência valiosa para políticas públicas de inovação em cidades de médio porte.

RESUMEN

El papel de la innovación tecnológica como motor del desarrollo económico ha sido ampliamente reconocido en las últimas décadas, especialmente en el contexto de economías emergentes que buscan diversificar sus matrices productivas y aumentar su competitividad a nivel regional y global. En este marco, el presente estudio analiza el proceso de creación, consolidación e institucionalización de INTEG – Incubadora de Empresas de Base Tecnológica de Guarapuava, estado de Paraná (Brasil), en el período comprendido entre 2003 y 2023. La investigación se fundamenta en la Teoría Institucional de base sociológica, permitiendo comprender los procesos mediante los cuales las organizaciones emergentes adquieren legitimidad, estabilidad y reconocimiento en su campo organizacional. Se adoptó una metodología cualitativa, con énfasis en el análisis documental y entrevistas semiestructuradas realizadas a gestores, fundadores y actores institucionales vinculados a la incubadora. Los resultados muestran que la consolidación de INTEG estuvo estrechamente vinculada a la articulación entre diferentes niveles de gobierno —municipal, estatal y federal— y a la participación activa de actores locales, como universidades, asociaciones empresariales y agencias de fomento. Esta articulación permitió la configuración de un ecosistema regional de innovación, favoreciendo la creación y sostenibilidad de emprendimientos tecnológicos y promoviendo el desarrollo territorial. Se concluye que la experiencia de INTEG constituye un modelo replicable para ciudades medianas que buscan implementar políticas públicas orientadas al emprendimiento innovador.

Palabras clave: Innovación Tecnológica. Teoría Institucional. Ecosistemas de Innovación. Desarrollo Regional. Incubadoras de Empresas. Políticas Públicas.

1 INTRODUCTION

The investigation of regional economic development in Brazil, according to Santos and Vieira (2012) is carried out based on economic models and their interrelations with variables such as sustainability and economic growth.

Innovation and technology play a fundamental role in economic expansion, within economic models technology was incorporated into economic growth by Solow (1956), which is considered exogenous, "to demonstrate that a market economy can grow in the long run in a permanent, sustained way and exhibiting a relatively stable equilibrium trajectory without government intervention in the economy." (Silva, 2020, p. 31).

Phan et al. (2005) argue about the impact of technological incubators on the development of innovation and technology, reflected in the greater attention of researchers to incubators, especially in order to verify their impact on the performance of incubated companies.

The development of an incubator demands, therefore, a great effort and an important sum of human, financial and material resources, whose management and monitoring are fundamental for the creation, development and consolidation of the new institution.

Located in the city of Guarapuava, in the central-west region of Paraná, the Guarapuava Technological Incubator, hereinafter INTEG is a consolidated incubator within its innovation environment, which brings together universities, technology parks, companies and representatives of civil society. In view of the fact that it has already been operating for twenty years and a more advanced consolidation than most similar incubators established in the interior of the State of Paraná, this work presents the following guiding questions: What was the theoretical model adopted in the creation of INTEG? Based on this model, what were your experiences that were considered successful and those that, over time, were found to need to be rethought based on the reality found? Does this theoretical model present itself as a safe foundation for the installation and consolidation of incubators or should it be adopted with repairs? What are the concrete lessons obtained from INTEG's trajectory?

The theoretical framework of this article is based on the institutional theory of sociological basis, which encompasses the level of analysis of the intraorganizational field and as a unit of analysis of institutions. According to Hall and Taylor (2003) "institutions provide moral and cognitive models that allow interpretation and action", allowing the analysis of the phenomenon studied.

The research method chosen was the descriptive one that seeks to "illustrate the complexity of the situation and the aspects involved in it" (Godoy, 2010, p. 124) and for its categorization the Case Study was defined which, for Godoy (2010, p. 122) the researcher questions local actors, in order to "develop concepts and understand the patterns that emerge from the data".

Finally, this article begins with the presentation of the Theoretical Framework and the Literature Review on the Institutional Theory of Sociological Base in Administration, presenting its concepts and the Institutionalization Process of an organization. After the discrimination of the research methods and techniques adopted, the documentary analysis and the content analysis of the interviews with the managers of the Incubator are carried out, confronting this information with the Theoretical Framework under analysis in order to evaluate the coherence between the actions developed and the theoretical elements presented.

2 THEORETICAL FRAMEWORK

2.1 INSTITUTIONAL THEORY OF SOCIOLOGICAL BASIS

The Institutional Theory of Sociological Basis, also called neo-institutionalism, is a theory that has as its level of analysis the intra-organizational field and as the unit of analysis of institutions.

According to Hall and Taylor (2003), institutions provide moral and cognitive models that allow interpretation and action. The individual is conceived as an entity deeply involved in a world of institutions composed of symbols, scenarios and protocols that provide filters of interpretation, applicable to the situation or to oneself, from which a line of action is defined. Not only do institutions provide useful information from a strategic point of view, but they also affect identity, self-image and preferences that guide action.

These institutions, according to Carvalho and Vieira (2005), are political, social or economic, and which have been gradually undergoing transformations and acquiring power, becoming complex and effective.

This approach observes the influence of social and cultural factors on organizations, considering institutions as values, symbols, principles, (in)formal rules, standards, myths. Forming and behaving as a mechanism of monitoring and inspection, defining the way of acting, thinking, speaking and behaving, characterizing itself as "the foundations of social life" (Campbell, 2004, p. 1).

The sociological aspect of the institutional perspective received a special contribution from the sociology of knowledge, developed by Berger and Luckmann (1991), whose main concern is centered on the investigation of the nature and origin of the social order. The basis of his argument is that the social order is based on the "social construction of reality" generated by interaction with nature.

Selznick (1957) characterizes the process of institutionalization as the action that becomes continuous, strengthened and repeated, thus assuming the expectation of institutionalization based on practice. However, the process stands out, truly institutionalization as a process, in which repetition and activities become habitual (Scott, 1987).

The sociological strand is an alternative model to rational theories of technical contingency or strategic choice. In organizational studies, she argues that the rationalist order is an "iron cage" that imprisons humanity (Dimaggio; Powell, 2007). That is why they propose that reality is socially constructed and, therefore, is not concrete, objective; but that organizations and individuals have agency power, influencing action.

The institutional theory of sociological basis encompasses organizations, their individuals, norms of conduct and their interrelationships, for the structuring and functioning of modern society. The importance of studies with an approach to institutional change is highlighted in order to understand the deinstitutionalization of existing forms and their replacement by new arrangements, which gradually become institutionalized. (Scott, 2008)

In this context, as the approach of the Sociologically-Based Institutional Theory observes the influence of social and cultural factors on organizations (Campbell, 2004), it was taken as a basis, considering the processes inherent to institutionalization to make explicit the operationalization of the General Law of Micro and Small Enterprises.

According to Pettigrew (1985), understanding the context in which organizations are located is essential to be able to understand their structures and processes. The context shapes the decisions that are made and thus facilitates the predictability of organizational action. But organizations are not passive collective social elements and, in turn, shape the context itself, which leads us to draw a picture of complex interaction between organizations and contexts in permanent dynamic movement, therefore far from configuring a deterministic and unequivocal relationship.

Therefore, the institutional perspective abandons the conception of an environment formed exclusively by human, material, and economic resources to highlight the presence of cultural elements—values, symbols, myths, belief systems, and professional programs.

2.1.1 Concept of organization

Regarding the concept of organization, there are two different approaches, characterized as a technical and institutional environment. The technical environment basically portrays the economic and commercialization aspect, in the sense of exchange (Scott, 2008). The institutional environment, in turn, is seen as norms, cultural/social aspects that occur to generate legitimacy or acceptance by those involved in the process (Scott, 2008).

Institutional theory presupposes that "organizations are influenced by normative pressures, sometimes from external sources, such as the State, other times arising from the organization itself" (Zucker, 1987, p. 443), so that organizations are no longer seen as closed systems, but on the contrary, as open systems that relate to the environment to which they belong in cultural and social aspects (Scott, 2008).

Organizations are the materialization/materialization of institutions, for example, companies, which practice norms, cultural and social aspects, to be accepted by those involved in the process (Scott, 2008).

Campbell (2004), in the face of environmental pressures and/or values, organizations need to adapt and generally make changes in response.

Selznick (1957) characterizes the process of institutionalization as the action that becomes continuous, strengthened and repeated, thus assuming the expectation of institutionalization based on practice. However, the process stands out, truly institutionalization as a process, in which repetition and activities become habitual (Scott, 1987).

For Berger and Luckmann (1967), institutionalization comes from three phases: externalization, objectification and internalization. Outsourcing represents the conditions experienced by all those who are part of the environment in which the institutions are inserted, above all, the way things happen; all those involved have their representativeness and influence (objectification), so each one abstracts what suits him to form his structure (internalization) (Scott, 1987; Rossetto; Rossetto, 2005).

The core of the interpretation of institutionalization is legitimacy, succeeding isomorphism as a vital factor for survival. Legitimacy, in Scott's (2008) view, is social acceptability and credibility, as material resources and technical information are not enough for organizations to survive and thrive in their environments. Therefore, from the institutional perspective, it is a condition in which the actors of a social environment visualize, in a generalized way, that the actions carried out are desirable. Institutional isomorphism is evident for institutions that seek legitimacy (Machado-da-Silva; Fonseca, 1993; Dimaggio; Powell, 1983; 1991).

Selznik (1996) considers legitimacy as the "imperative" for neo-institutionalism, the importance of symbol and myth in the construction of interorganizational reality, the dynamics of the functioning of institutions in the public and private segments and in their direct influence on society. Once social norms and standards are legitimized, continuous reproduction occurs on the part of organizations. The confrontation between the need to maintain competitiveness and to have institutional legitimacy is the point of conflict, where internal and external needs duel to find the ideal bending point for each organization, often giving in to institutional pressure.

In the search for legitimacy, what Dimaggio and Powell (2007) explain by isomorphism can happen, based on what is proposed by Meyer (1979) and Fennell (1980). In this sense, the authors question why organizations have homogeneity of forms and practices, concluding that this is due to the search for good performance. To this end, they explain that there is competitive isomorphism, in which companies recognize market pressures and deliberately make decisions to adapt to competitive advantage. However, the Sociologically-Based Institutional focus is institutional isomorphism, which argues that organizations, through non-deliberate actions, become alike in the search for legitimacy to face internal and external pressures.

In addition, institutions have three pillars that support their processes and that are interdependent; they are: regulatory, normative and cultural-cognitive (SCOTT, 2001). The regulatory pillar has a coercive aspect and uses laws and rules to condition the environment and processes; In this case, aspects of domination are noted from the figure of power. In the normative pillar, values and norms are related, resulting from normative adequacy or isomorphism, also considered as professionalization. Finally, the cognitive cultural, which emphasizes the function of institutions with their social aspect; representations and

symbolisms as mechanisms arising from the process of institutionalization (Dimaggio and Powell, 1983; Scott, 2001; Machado-da-Silva; Foster; Crubellate, 2005).

2.1.2 Processes inherent to institutionalization

Berger and Luckman (1967) developed a model of institutionalization by virtue of phenomenological analyses that incorporates three distinct phases: exteriorization, objectification and internalization. In a logical sequence, it is noted that exteriorization is influenced by the social world, it is external, coercive and sedimented; therefore, it is understood and objectified, to finally be internalized, that is, the objectification and exteriority of an action lead to institutionalization. For this reason, the authors judge man as a product resulting from society. However, Berger and Luckman's analysis focused on the individual rather than organizations. Meyer and Rowan (1977) and Zucker (1977), in turn, also discuss the process of institutionalization based on social evidence. Then, Tolbert and Zucker (1998) developed a new model, based on the findings of Berger and Luckman (1967).

For institutionalization to occur, Tolbert and Zucker (1998) propose internships. That is, a consequence of actions and behaviors of individuals or groups, to face recurring problems.

Thus, as a result of innovation, the stages that make up this process are habituation, objectification and sedimentation, in order to have the new institutionalized structure, as shown in Figure 2.

Figure 2

Processes Inherent to Institutionalization

Source: Tolbert and Zucker (1998, p. 207).

In this context, the need to innovate can happen due to technological changes, legislation, market forces, among other situations. To face this situation, in the **Habitualization** standardized actions are carried out, adapted to the context in which the process is developed.

Thus, it is possible to monitor the action and theorize what happens, so that **objectification** occurs, a moment in which the general meanings of the actions adopted are developed and shared, which can have a positive impact, generate resistance or defense of interest groups (Tolbert; Zucker, 1998).

When actions are carried out as intended or exceeding expectations, that is, presenting themselves as a reality proper to the context, it can be said that **sedimentation has occurred**, completing the institutionalization process if the structure is perpetuated by several generations of members of the organization (Tolbert; Zucker, 1998).

2.2 INCUBATORS IN THE THEORY OF INSTITUTIONALIZATION

The innovation process within organizations is often an arduous task and many entrepreneurs resort to specialized help. This consultancy can be offered by incubators, which can be defined as:

a mechanism that stimulates the creation and development of micro and small industrial or service companies, technology-based or light manufacturing through the

complementary training of the entrepreneur in its technical and managerial aspects and that, in addition, facilitates and speeds up the process of technological innovation in micro and small companies. To this end, it has a physical space specially built or adapted to temporarily house micro and small industrial or service companies and which, necessarily, has a series of services and facilities. as (Ministry of Science and Technology - MCT, 2000, s/n)

Many of the incubators are linked to educational institutions such as universities where they seek to link the theory of academic concepts with the practice of incubated companies, generating knowledge (Cecato, Callegari and Biscaia, 2021). University incubators have the role of transforming researchers and scientists into entrepreneurs, through the various instruments and services available so that they can be informed about the market. (Catapan et al, 2018).

Thus, the theoretical approximation between the institutional model of an incubator and the phases of an institutionalization process is evident, as we can see in the creation, development and consolidation of INTEG, according to documentary analysis and interviews analyzed below.

2.2.1 The creation of INTEG and its relationship with the institutions around it

The creation of a technology-based company incubator demands a lot of energy from those interested in the development and installation process. To a large extent, the installation takes place in public entities, universities and other bodies linked to the public sector. This is because, in a way, it is believed that the structure will be shared with the existing body. This study demonstrates that the work is indeed more arduous and demands great effort from various institutions and people to advance in a direction of expected success. Currently located at the CEDETEG/UNICENTRO Campus, at Rua Simeão Camargo Varela de Sá, nº 03, in the Cascavel neighborhood, in Guarapuava/PR, the Guarapuava Technological Incubator (INTEG) was founded on November 29, 2001 (INTEG, 2001), according to the Minutes of the Assembly of this respective date.

Created as a non-profit Civil Association, with an indefinite term of duration and endowed with administrative and financial autonomy with or without the support of its sponsoring partners (Art. 1), INTEG already had the mission of "fostering the entrepreneurial culture and providing an adequate environment for pre-incubation programs and incubation of technological projects, innovative or not, providing opportunities for the generation of new technology-based companies". (Art. 2).

Associations are legal entities governed by private law made up of people who join forces to achieve non-economic purposes, as recommended by article 53 of Law No. 10,406/2002 (Civil Code).

Although its legal nature is that of a non-profit Civil Association, its Statute determines that it is governed by the applicable legislation, in this case the Civil Code (CC), committing, however, to observe the principles of legality, impersonality, morality, publicity, economy and efficiency, guiding guidelines of the Public Administration.

In turn, the State University of the Midwest (UNICENTRO), where INTEG is headquartered, is constituted in the form of an Autarchy, an entity that is part of the Indirect Public Administration of the State of Paraná, especially of the Higher Education System under the baton of the State Secretariat of Science, Technology and Higher Education of Paraná (SETI).

Once the INTEG is contextualized, it should be noted that Articles 4 and 5 of its statute indicate the Objectives and the means that the Incubator must observe.

The theoretical framework in a study comprises a critical and organized analysis of the literature pertinent to the theme, providing a theoretical contextualization and defining the key concepts. It should comprehensively contain previous theories, models, and research, identifying gaps, contradictions, and consensuses in the literature that are important to the focus of the work being developed.

3 METHODOLOGICAL PROCEDURES

3.1 RESEARCH PARADIGM

In the most diverse situations, people can see the world from different perspectives, for Burrell (1999) "[...] paradigms define, in an agreed and deeply established sense, a way of seeing the world [...]"

In this study, the Functionalist paradigm of Social base will be used, which, according to Morgan (2007), starts from the understanding of the role of the individual in society, in an orderly and regulated way through concrete and tangible social relationships, within a system accepted by a group of researchers.

And analysis is focused on the intra-organizational relationship, for the construction of the reality of society. The research approach is characterized as qualitative. The choice of this method is justified by providing the researcher with a close approximation with the social context studied, offering a valid explanation to better understand it (MARTINS, 2004). The

study is based on questions of "how" and "why" the facts happen in this context (BAUER; GASKELL, 2008).

Considering the objective, the research is descriptive, since it seeks to "illustrate the complexity of the situation and the aspects involved in it" (GODOY, 2010, p. 124), exposing its configuration, structure, activities, relationship with other phenomena, etc. This description has as a research method the case study, which allows to deepen in a unit of analysis, with the use of multiple sources of data collection, to study the phenomenon in its context.

The decisions to be made in this type of study are in relation to what, where, how, who and when the phenomenon will be observed.

Among the benefits of the chosen method, he highlights the characteristics of the qualitative method is flexibility, for example, in relation to data collection techniques (MARTINS, 2004), defined according to the context being studied.

Thus, the data collection instruments used were both primary, through open interviews with a semi-structured script, field diary with non-participant observation, AND secondary, documents such as reports, websites and records in archives.

3.2 RESEARCH CATEGORY

For this study, the Case Study was defined, which, according to Godoy (2010, p. 122), in the case study, the researcher questions local actors, in order to "develop concepts and understand the patterns that emerge from the data".

From the perspective of Triviños (1987), he defines a case study as a category of research whose object is a unit, which is deeply analyzed. With the objective of deepening the description of a certain reality.

Thus, "the case study contributes to the understanding we have of individual, organizational, social and political phenomena. Not surprisingly, the case study has been a common research strategy in psychology, sociology, political science, management, social work, and planning" (Yin, 1983).

The choice of respondents was based on selection and judgment "the key characteristic of sampling by judgment is that the elements of the population are selected intentionally. This selection is made considering that the sample will be able to offer the requested contributions." (Churchill, p. 301)

The criterion for choosing the interviewees is centered on their relationship with the implementation of INTEG in the municipality of Guarapuava, as this way they have pertinent information to answer the research problem.

3.3 ANALYSIS TECHNIQUE

The analysis technique to be employed will be the one proposed by Bardin (2016, p. 37) as content analysis, which consists of "a set of communication analysis techniques", which systematically and objectively describes the content of the message.

Content Analysis is more than an analysis technique, it is a methodological approach with its own characteristics, which reinterpret documents and texts beyond ordinary reading. It is thus part of the theoretical and practical search in the field of social investigations, helping to reinterpret the content itself.

Thus, content analysis is a technique for reading and interpreting the content of all kinds of documents, which, when properly analyzed, open the doors to the knowledge of aspects and phenomena of social life that are otherwise inaccessible. (OLABUENAGA and ISPIZÚA, 1989).

The raw material of Content Analysis can be any material from verbal or non-verbal communication, such as posters, reports, interviews, films, photographs, among many others. It is also worth mentioning that according to (Bardin, 2011) Content Analysis should use matrix tables by category, similar to the figure of Tolbert and Zucker, with Innovation, Habituation, Objectification and Sedimentation, which facilitates the visualization, interpretation and differentiation of each category. Once this is done, the final point of the methodology is reached, which is the phase of interpretation of the collected data and its inference, presentation and treatment of results.

4 RESULTS AND DISCUSSIONS

From the triangulation, the institutional theory, an interview with an INTEG actor and the institution's researched documents, the analysis framework was set up according to the assumptions to understand the existing process and identify in which phase of institutionalization is the following:

Table 1

Analysis Framework to Identify the Institutionalization Phase

Analysis Categories	Interview Result and Researched Documentation	Reasons
Innovation	"It was created at FIEP in 2000, it was here at Sesi SENAI in Guarapuava. He was SESI/ESNAI coordinators together with Sebrae. It was in 2002." Triangulated via document (statute) researched. "So, a union of several institutions was created there, they created this incubator for Guarapuava.	According to Dimaggio and Powell (2007) Desire to improve performance
Habitualization Also Called Pre-Institutionalization Stage	In 2004, the federal innovation law, the national innovation law and the UNICENTRO innovation agency were enacted. In 2005, with the departure of the president of the institution, Unicentro was transferred. It was agreed with the president of the INTEG Incubator, the Acting Rector and the other entities participating in the Deliberative Council."	Tolbert and Zucker (1998), it is the response to specific problems that a given organization or organizations have, in the form of new structural arrangements, policies and procedures.
Organizational Monitoring and Theorizing	"It presents once a year to this assembly, so then the rector is the president. And the direction to the executive board that is there in our statute? He is a coordinator of the innovation agency. So, he is the one who takes the 2 positions. The rectory assigns someone specific to the incubator. Sometimes it doesn't depend on what they have on the possibility of positions and functions." "Because it is a civil organization of an educational center and we have financial autonomy, because we are able to raise funds for the incubator through the incubator's CNPJ. So, we have a bank account."	<i>Champion</i>, that is, as a defender of the objective or project (TOLBERT; ZUCKER, 1998). Theorization is marked by the "development of theories that diagnose the sources of dissatisfaction or failure, in a way that is compatible with the presentation of a specific structure as a solution" project (TOLBERT; ZUCKER, 1998)

Isomorphism	"Know, right, where it came from so we can continue. And so, in the state of Paraná, everyone already knows what I can contribute. So that all state universities can do it, right? Walk the same line, look for what the others have already learned, because if not, we will be trying to invent the wheel. Let's see what the others did not to make mistakes in the same things, or right, so that we can all of us there with an incubator, have well-structured needs, so all these environments." "Every beginning of the year, January, a continuous flow notice is published to receive new business entry processes. So, and the structuring of the executive summary, receives the proposal, constitutes a board and even if sometimes it is for a company, because that thing like sending. The company, I came there in March because January is on vacation. Monday will open the process, it's February, the selection process will open, it will start in March." Availability to the entrepreneur, not failing to meet the demands of society. "To ensure a process of credibility in the selection is to have an external member on the board, so the procedure we adopt"	Dimaggio and Powell (2007), when referring to the isomorphism/homogeneity of organizational forms and practices, as environmental conditions influence the units of a population to have similarities.
Objectification or Semi-Institutionalization	"The Incubator has an average of 11 incubated businesses. If we don't look for it, our average is 10. So like this it has 9. Sometimes there are 12. Companies come and go, so we have an average within what we can meet. All these other issues to solve. So it's no use wanting to embrace the world. So it's that experience of the team. We bring this look. Importance of having a team with beyond this, this commitment, but that has. Follow-up over time with the incubator or with the innovation agency." "The monthly fee for the rooms varies between 150.00 and up to 300.00 reais, so there are rooms for 150, 200.00, 250.00 and 300.00." The non-resident incubation that does not need to occupy physical space is 50.00 reais, symbolic value"	At the moment of objectification, actions are no longer simple imitation, but the structure is adapted to the context, with a normative basis (TOLBERT; ZUCKER, 1998).
Group Resistance,	"... So there are several institutions, so we are	It is relevant to identify

Positive Impacts, and Advocacy	accountable to society, so they follow up. The fiscal council enters the structure of administrative management there." "We give as a counterpart to hire Sebrae projects and all this accountability, then we do everything with the dean's monitoring. This resource goes in there and is much easier to spend, as it is an association. I don't need to enter the Bidding programs that we enter into the Sebrae rules, because it is not a public resource. So we receive it from Sebrae, but the control is extremely, rigorous, working with 03 budgets and all the necessary documents."	factors that influence the propagation of the new structure, as well as its long-term conservation, such as group resistance, in which "a set of actors who are, in some way, adversely affected by the structures and thus are able to collectively mobilize against them" (TOLBERT; ZUCKER, 1998, p. 210)
Legitimacy	"The CERNE certification, although it is tied, complex and all. I see it as a reference. Which contributes a lot to the process, but we need to model, we are here with a SEBRAE consultant, who the Sebrae project authorized us to hire the consultant for the incubator to work with the certification."	The influencing factor in the propagation of the new structure consists of the positive impacts of the results achieved, as a strong positive relationship between the structure and the desirable results strengthens the diffusion and maintenance of the structure (TOLBERT; ZUCKER, 1998).
Sedimentation	"If it is applicable in other environments like this, I can already say, because it is also the importance of this, of our differentiated format that we have here at UNICENTRO, it is a consistent model of technological incubator."	Sedimentation involves the propagation of the structure throughout the group of theorized actors (TOLBERT; ZUCKER, 1998) "a process that is fundamentally based on the historical continuation of the structure and,

		especially, on its survival by the various generations of members of the organization"
--	--	--

Source: prepared by the authors.

Based on the analysis promoted in the table above, with the trajectory of INTEG since its foundation, its consolidation, the Pre-institutionalization phase passing the presidency to Unicentro, achievement of CERNE certification, the companies that participate in the incubation event, which today works with a continuous selection process. With the development, INTEG is fundamental for the development of Startups in Guarapuava and Region.

In the interview, it is clear the importance and propagation of the model and that it already happens with the visitation of Universities, public authorities participating in congresses and lectures at the state and national levels. Characterizing the last phase of institutionalization, the sedimentation that occurs from this model.

Thus, the research hypothesis is confirmed: the consolidation of INTEG provides a path and a methodological contribution for the implementation of incubators in cities of similar size, that is, medium-sized cities in cities in the interior.

In the interviews and in the documents, it is possible to identify the methodological contribution to the implementation of incubators in cities of similar size, that is, medium-sized cities in cities in the interior, based on the main positive points and challenges, considering the events that occurred and the analysis of the data collected.

5 CONCLUSION

The implementation of INTEG was the result of the merger of several entities and the participation of professionals who believed in an Incubator of technology-based companies in a medium-sized city.

From the understanding of the script followed by the managers who installed the incubator in the city of Guarapuava, it is possible to conclude that the creation and installation of INTEG was a successful case, considering the theoretical paradigm of the Institutional

Theory of Sociological Base of Administration. Thus, there are valuable lessons for those who intend to install similar institutions in medium-sized cities in Brazil.

Firstly, the interviews showed that it is clear in the implementation process that INTEG has received knowledge and energy from various entities and technicians, and that these efforts are significant for the goal of installing a technology-based Incubator to be achieved. The genesis of INTEG is found in the initiative of FIEP and SEBRAE, together with the Commercial Association, entities that, although they did not have the capacity to offer all the necessary support for implementation, remain linked to INTEG to this day, being part of its governance.

However, with a view to its effective implementation, the support of a university was very important, offering physical space and technicians with experience and technical capacity in the management of the process. Even today, INTEG is physically located within UNICENTRO, which provides the payment of the professionals who manage the Incubator.

However, as demonstrated in the interviews, the fact that it has its own legal personality, as an association, instead of being an organ of the university, gained greater administrative autonomy for the Incubator, thus highlighting the proposition that an institution with this purpose should not remain administratively subordinate to a university, in view of the peculiarity of its institutional performance and its strategic objectives.

Thus, the functioning and success of INTEG Guarapuava can be pointed out as a successful example of the State of Knowledge in its area, demonstrating, through its results, the validity of the parameters and concepts of the Institutionalization Process present in the Institutional Theory of Sociological Basis of Administration in the creation, development and consolidation of institutional actors related to the promotion of science, technology and innovation applied to entrepreneurship in society.

ACKNOWLEDGMENT

We thank the partner entities and INTEG managers for their support during the research.

ABSTRACT

Introduction: Sleep disorders and anxiety disorders have become increasingly common among children and adolescents, reflecting the behavioral and technological changes in contemporary society. Excessive use of social media, especially at night, has emerged as a significant risk factor for sleep fragmentation, reduced melatonin levels, and increased alertness. This scenario contributes to the worsening of anxiety and depression symptoms, creating a feedback loop between sleep deprivation, anxiety, and digital hyperconnectivity.

OBJECTIVE: To analyze, through a narrative review of the literature, the relationship between sleep disorders, anxiety, and excessive use of social media in children and adolescents, identifying their causes, consequences, and management strategies described in recent literature.

Methods: This narrative review was conducted in the PubMed, SciELO, LILACS, and PsycINFO databases, covering publications published between 2015 and 2025 in Portuguese, English, and Spanish. The descriptors used were sleep disorders, anxiety, social media, children, and adolescents. Studies focused on children and adolescents and the relationship between sleep, anxiety, and technology use were included. Thematic analysis grouped the findings into three areas: causes and mechanisms, psychosocial impacts, and management strategies.

Results: The reviewed studies indicate that nighttime exposure to screens and compulsive social media use reduce sleep duration and quality, in addition to significantly increasing anxiety levels. Adolescents with intense digital use are up to 2.5 times more likely to develop anxiety and depressive symptoms. Sleep deprivation impairs emotional regulation and cognitive performance, while anxiety reinforces vigilance behaviors and digital dependence. Interventions based on sleep hygiene, digital education, and cognitive-behavioral therapy have proven effective in reducing these impacts.

Conclusion: The interaction between sleep, anxiety, and social media use in childhood and adolescence is multifactorial and bidirectional. Promoting the conscious use of technology, strengthening family ties, and implementing public digital education policies are essential measures to prevent emotional dysfunction and preserve the well-being of new generations in the digital age.

Keywords: Sleep. Anxiety. Social Media. Adolescent. Mental Health. Digital Technology.

RESUMO

Introdução: Os distúrbios do sono e os transtornos de ansiedade têm se tornado cada vez mais frequentes entre crianças e adolescentes, refletindo as mudanças comportamentais e tecnológicas da sociedade contemporânea. O uso excessivo de redes sociais, especialmente no período noturno, tem se destacado como fator de risco significativo para a fragmentação do sono, a redução da melatonina e o aumento do estado de alerta. Esse cenário contribui para o agravamento de sintomas ansiosos e depressivos, configurando um ciclo de retroalimentação entre privação de sono, ansiedade e hiperconectividade digital.

Objetivo: Analisar, por meio de revisão narrativa da literatura, a relação entre distúrbios do sono, ansiedade e uso excessivo de redes sociais em crianças e adolescentes, identificando suas causas, consequências e estratégias de manejo descritas na literatura recente.

Métodos: Trata-se de uma revisão narrativa realizada nas bases de dados PubMed, SciELO, LILACS e PsycINFO, abrangendo publicações entre 2015 e 2025, nos idiomas português, inglês e espanhol. Utilizaram-se os descritores sleep disorders, anxiety, social media, children e adolescents. Foram incluídos estudos com foco na população infantojuvenil e na relação entre sono, ansiedade e uso de tecnologia. A análise temática agrupou os achados em três eixos: causas e mecanismos, impactos psicossociais e estratégias de manejo.

Resultados: Os estudos revisados apontam que a exposição noturna às telas e o uso compulsivo de redes sociais reduzem a duração e a qualidade do sono, além de aumentar significativamente os níveis de ansiedade. Adolescentes com uso digital intenso apresentam até 2,5 vezes mais risco de desenvolver sintomas ansiosos e depressivos. A privação de

sono prejudica a regulação emocional e o desempenho cognitivo, enquanto a ansiedade reforça comportamentos de vigilância e dependência digital. Intervenções baseadas em higiene do sono, educação digital e terapia cognitivo-comportamental mostraram-se eficazes para reduzir esses impactos.

Conclusão: Conclui-se que a interação entre sono, ansiedade e uso de redes sociais na infância e adolescência é multifatorial e bidirecional. A promoção do uso consciente da tecnologia, o fortalecimento dos vínculos familiares e a implementação de políticas públicas de educação digital são medidas essenciais para prevenir disfunções emocionais e preservar o bem-estar das novas gerações na era digital.

Palavras-chave: Sono. Ansiedade. Redes Sociais. Adolescente. Saúde Mental. Tecnologia Digital.

RESUMEN

Introducción: Los trastornos del sueño y la ansiedad se han vuelto cada vez más comunes entre niños y adolescentes, lo que refleja los cambios conductuales y tecnológicos en la sociedad contemporánea. El uso excesivo de las redes sociales, especialmente por la noche, se ha convertido en un factor de riesgo significativo para la fragmentación del sueño, la reducción de los niveles de melatonina y el aumento del estado de alerta. Este escenario contribuye al empeoramiento de los síntomas de ansiedad y depresión, creando un ciclo de retroalimentación entre la privación del sueño, la ansiedad y la hiperconectividad digital.

Objetivo: Analizar, a través de una revisión narrativa de la literatura, la relación entre los trastornos del sueño, la ansiedad y el uso excesivo de las redes sociales en niños y adolescentes, identificando sus causas, consecuencias y estrategias de manejo descritas en la literatura reciente.

Métodos: Esta revisión narrativa se realizó en las bases de datos PubMed, SciELO, LILACS y PsycINFO, abarcando publicaciones publicadas entre 2015 y 2025 en portugués, inglés y español. Los descriptores utilizados fueron trastornos del sueño, ansiedad, redes sociales, niños y adolescentes. Se incluyeron estudios centrados en niños y adolescentes y la relación entre el sueño, la ansiedad y el uso de la tecnología. El análisis temático agrupó los hallazgos en tres áreas: causas y mecanismos, impactos psicosociales y estrategias de manejo.

Resultados: Los estudios revisados indican que la exposición nocturna a pantallas y el uso compulsivo de redes sociales reducen la duración y la calidad del sueño, además de aumentar significativamente los niveles de ansiedad. Los adolescentes con un uso intensivo de la tecnología tienen hasta 2,5 veces más probabilidades de desarrollar ansiedad y síntomas depresivos. La privación del sueño perjudica la regulación emocional y el rendimiento cognitivo, mientras que la ansiedad refuerza las conductas de vigilancia y la dependencia digital. Las intervenciones basadas en la higiene del sueño, la educación digital y la terapia cognitivo-conductual han demostrado ser eficaces para reducir estos impactos.

Conclusión: La interacción entre el sueño, la ansiedad y el uso de redes sociales en la infancia y la adolescencia es multifactorial y bidireccional. Promover el uso consciente de la tecnología, fortalecer los lazos familiares e implementar políticas públicas de educación digital son medidas esenciales para prevenir la disfunción emocional y preservar el bienestar de las nuevas generaciones en la era digital.

Palabras clave: Sueño. Ansiedad. Redes Sociales. Adolescentes. Salud Mental. Tecnología Digital.

1 INTRODUCTION

In recent decades, there has been a significant increase in the prevalence of sleep disorders among children and adolescents, which has aroused growing concern among health professionals, parents, and educators. Sleep is an essential biological process, fundamental for physical, cognitive, and emotional development, playing a crucial role in memory consolidation, mood regulation, and metabolic and immunological homeostasis (OGUNDELE *et al.*, 2022). Contemporary society, marked by intense digital stimuli and the acceleration of routines, has significantly altered the sleep patterns of this population, resulting in relevant implications for public health (AMERICAN ACADEMY OF PEDIATRICS, 2016).

Adolescence is a transition period characterized by intense biological, psychological, and social changes, in which the sleep pattern undergoes natural changes. The physiological delay of the sleep phase — known as sleep phase delay — is common in this age group, but has been accentuated by the nocturnal use of electronic devices and prolonged exposure to blue light, which inhibits melatonin secretion and compromises the circadian rhythm (SCOTT; BIJOOR; LEE, 2022). As a consequence, there is a reduction in total sleep time, fragmentation of rest, and daytime sleepiness, factors that directly interfere with learning and emotional stability (OGUNDELE *et al.*, 2022).

The exponential growth in the use of digital social networks has profoundly transformed the ways young people interact and socialize. Platforms such as Instagram, TikTok, and WhatsApp have become central in the process of building identity and maintaining interpersonal relationships (LEVENSON *et al.*, 2017). Although they favor communication and a sense of belonging, these tools also expose children and adolescents to an environment of constant social comparison and search for external approval, which can generate insecurity, anxiety, and reduced self-esteem (MOROMIZATO *et al.*, 2019).

Several studies indicate that excessive use of social networks is associated with higher levels of anxiety and sleep disorders, especially when it occurs in the hours before rest (LEVENSON *et al.*, 2017; SCOTT; BIJOOR; LEE, 2022). The phenomenon known as Fear of Missing Out (FOMO) — the fear of being excluded from online social experiences — induces prolonged screen time and delayed sleep onset. Thus, constant digital interaction keeps the nervous system in a state of alert, making it difficult to relax and favoring insomnia and fragmentation of the sleep-wake cycle (WORLD HEALTH ORGANIZATION, 2023).

The relationship between sleep disorders and anxiety disorders is known to be bidirectional. Sleep deprivation affects the amygdala and prefrontal cortex, brain regions responsible for emotional regulation, leading to more intense responses to negative stimuli and reduced capacity for emotional control (SCOTT; BIJOOR; LEE, 2022). On the other hand, anxiety increases the production of cortisol, the stress hormone, interfering with the ability to initiate and maintain sleep (MOROMIZATO *et al.*, 2019). This circular dynamic reinforces the need for an integrated approach to child and adolescent mental health care (LEVENSON *et al.*, 2017).

From the point of view of global development, chronic sleep deprivation in children and adolescents is related to significant cognitive, emotional, and behavioral impairments. Studies show that young people with insufficient sleep have greater irritability, impulsivity, difficulty concentrating, and worse school performance (OGUNDELE *et al.*, 2022). In addition, there is a correlation between sleep restriction and metabolic changes, such as obesity and insulin resistance, which reinforces the systemic impact of this problem (WORLD HEALTH ORGANIZATION, 2023).

The contemporary sociocultural context intensifies these vulnerabilities. Digital technology, although it plays an important role in education and communication, has often been used as an instrument of excessive entertainment and emotional regulation, replacing physical activities, family life and outdoor leisure (AMERICAN ACADEMY OF PEDIATRICS, 2016). The absence of clear limits on the use of social networks and early exposure to inappropriate content favor patterns of technological dependence and compulsive behaviors, especially in individuals with greater emotional sensitivity (MOROMIZATO *et al.*, 2019).

These phenomena show that sleep disorders and anxiety disorders in childhood and adolescence should not be understood in isolation, but as interconnected manifestations of the same biopsychosocial context. Hyperconnectivity, excessive stimuli and lack of emotional regulation form a scenario conducive to mental overload and deterioration of sleep health (LEVENSON *et al.*, 2017; BLACHER *et al.*, 2024). Thus, understanding the interdependence between these conditions is essential to outline effective preventive and therapeutic strategies.

From the point of view of collective health, the promotion of healthy sleep habits and the conscious use of technology are fundamental pillars in the prevention of mental disorders in young people. Interventions based on digital education, sleep hygiene, and strengthening family bonds have been shown to be effective in reducing anxiety symptoms and improving

sleep quality (SCOTT; BIJOOR; LEE, 2022; OGUNDELE *et al.*, 2022). In this context, schools and health professionals assume a strategic role in the formation of a generation that is more aware of the impacts of technological use on the body and mind.

Therefore, the purpose of this chapter is to analyze in an integrative way the interconnections between sleep disorders, anxiety and the use of social networks in children and adolescents. Based on recent scientific evidence, we seek to understand the causes, consequences, and possibilities of managing these conditions, contributing to the construction of a contemporary care model that combines mental health, digital balance, and the promotion of biopsychosocial well-being (WORLD HEALTH ORGANIZATION, 2023; OGUNDELE *et al.*, 2022).

2 GOALS

This chapter aims to analyze, through a narrative review of the literature, the interconnections between sleep disorders, anxiety disorders and the excessive use of social networks in children and adolescents. It is intended to understand how these factors relate and enhance each other, affecting the biopsychosocial development of young people.

Among the specific objectives, the following stand out:

1. To identify the main causes of sleep disorders in childhood and adolescence, with emphasis on the influence of digital technologies;
2. Discuss the psychological and behavioral implications of intense use of social networks, especially in the emergence or worsening of anxious symptoms;
3. To investigate the bidirectional relationship between anxiety and sleep quality, based on neurobiological and clinical evidence;
4. To bring together management and prevention strategies described in recent literature, considering interdisciplinary approaches that involve family, school, and health professionals.

The relevance of this study is justified by the growing incidence of complaints related to sleep deprivation and anxiety among young people, phenomena that have repercussions on school performance, interpersonal relationships, and collective mental health (WORLD HEALTH ORGANIZATION, 2023; OGUNDELE *et al.*, 2022). Thus, integrative analysis aims to provide scientific subsidies for preventive interventions and policies to promote digital and mental health.

3 METHODOLOGY

It is a narrative review of the literature, a method that allows gathering, synthesizing and critically analyzing the knowledge produced on a given topic, enabling the integration of studies with different methodological approaches (MENDES; SCOTT; GALVÃO, 2008). This modality is especially suitable for understanding complex phenomena, such as the interaction between psychological, behavioral and technological factors in the context of children and adolescents.

The search was carried out in the PubMed, SciELO, LILACS and PsycINFO databases, selected for their relevance in the area of health and psychology. The following descriptors and their combinations in Portuguese and English were used: *"sleep disorders"*, *"children"*, *"adolescents"*, *"anxiety"*, *"use of social networks"*, *"sleep disorders"*, *"children"*, *"adolescents"*, *"anxiety"* and *"social media use"*. The search took place between August and September 2025, adopting the Boolean operators *"AND"* and *"OR"* to expand the scope and precision of the results (MENDES; SCOTT; GALVÃO, 2008).

Studies that addressed the central theme of the study, which is the relationship between sleep, anxiety, and the use of social networks in children and adolescents, studies that were available in full and published in the last 10 years, were included. Duplicate articles, reviews without critical analysis, isolated case reports, and studies involving exclusively adults were excluded.

As this is a literature review, there was no need for approval by the Research Ethics Committee, according to Resolution No. 510/2016 of the National Health Council, since it did not involve primary data from human beings (BRASIL, 2016).

Methodological integrity was guaranteed by transparency in the process of selection, analysis and citation of the sources used, ensuring the reliability and reproducibility of the results (MENDES; SCOTT; GALVÃO, 2008).

4 DEVELOPMENT

The literature review allowed us to identify a consistent set of evidence that reinforces the relationship between sleep disorders, anxiety disorders, and excessive use of social networks in children and adolescents. The studies analyzed converge in pointing to the contemporary digital environment as one of the main factors impacting mental health and sleep pattern in this population (MOROMIZATO *et al.*, 2019 OGUNDELE *et al.*, 2022).

4.1 PHYSIOLOGICAL AND BEHAVIORAL CAUSES AND MECHANISMS

Sleep disorders in young people result from a combination of biological, behavioral, and environmental factors. The natural delay of the circadian phase in adolescence — characterized by the tendency to sleep and wake up later — is amplified by exposure to artificial light emitted by electronic screens at night. This blue light suppresses the release of melatonin, an essential hormone for inducing sleep, and prolongs the state of wakefulness (SCOTT; BIJOOR; LEE, 2022). In addition, the emotional and interactive content of social networks, associated with the intermittent reinforcement of notifications, stimulates the release of dopamine and keeps the brain alert, making it difficult to relax beforehand necessary for the onset of sleep (LEVENSON *et al.*, 2017).

Longitudinal studies show that adolescents who use digital devices for more than three hours a day have up to a 50% higher risk of developing symptoms of insomnia and daytime sleepiness (WORLD HEALTH ORGANIZATION, 2023). Cognitive hyperstimulation and the absence of time limits in the use of social networks contribute to the irregularity of bedtimes, generating patterns of cumulative sleep deprivation. Such changes have a direct impact on executive functions, emotional regulation, and academic performance (OGUNDELE *et al.*, 2022).

4.2 PSYCHOSOCIAL AND EMOTIONAL IMPACTS

The analysis of the studies shows that sleep deprivation and excessive use of social networks have a bidirectional relationship with anxious and depressive symptoms. Lack of adequate sleep is associated with amygdala hyperactivity and reduced connectivity between cortical structures responsible for emotional modulation, which favors exaggerated responses to stress and reduces frustration tolerance (LEVENSON *et al.*, 2017). On the other hand, social anxiety and fear of exclusion (FOMO) drive the constant checking of notifications, even during the night, perpetuating the cycle of sleep deprivation and emotional exhaustion (SCOTT; BIJOOR; LEE, 2022).

Adolescents exposed for long periods of time to social networks are more likely to engage in social comparison and internalize idealized aesthetic and behavioral patterns. This process, added to the emotional vulnerability of the phase, increases the incidence of generalized anxiety disorders, social phobia, and depressive symptoms (MOROMIZATO *et al.*, 2019). In a recent Brazilian study, it was found that 72% of adolescents who reported

nocturnal use of social networks had difficulties falling asleep and a higher frequency of nocturnal awakenings (OGUNDELE *et al.*, 2022).

In addition to the emotional effects, the behavioral impacts are remarkable. Sleep deprivation has repercussions on attention, memory, and decision-making capacity, directly affecting school performance and interpersonal relationships. Children with irregular sleep routines and nighttime exposure to screens demonstrate higher levels of irritability, impulsivity, and lower capacity for self-control (WORLD HEALTH ORGANIZATION, 2023). In the long term, these factors contribute to social isolation, increased aggressiveness, and greater vulnerability to risky behaviors, such as the use of psychoactive substances and self-mutilation (SCOTT; BIJOOR; LEE, 2022).

4.3 MANAGEMENT STRATEGIES AND PREVENTIVE INTERVENTIONS

Recent literature highlights the importance of multidisciplinary approaches in the management of sleep and anxiety disorders associated with social media use. Sleep hygiene is pointed out as a central strategy, encompassing measures such as the regularity of bedtime and wake-up times, the control of light and sound stimuli in the bedroom, and the restriction of the use of electronic devices at least two hours before bedtime (AMERICAN ACADEMY OF PEDIATRICS, 2016).

Psychoeducational interventions involving parents, teachers, and health professionals have shown efficacy in modifying technological habits and promoting behavioral self-regulation. School programs that associate digital education with mental health have reduced insomnia and anxiety complaints among participating adolescents by up to 30% (WORLD HEALTH ORGANIZATION, 2023). The implementation of public awareness campaigns on the "responsible use of screens" has also been recommended by medical societies and international health agencies.

From a clinical point of view, cognitive behavioral therapy (CBT) has stood out as a first-line intervention for both anxiety and insomnia management. CBT applied to sleep hygiene helps to identify dysfunctional beliefs, establish healthy routines, and develop strategies to cope with pre-sleep anxiety (MOROMIZATO *et al.*, 2019). In more severe cases, multidisciplinary follow-up — involving a pediatrician, psychologist, and psychiatrist — is essential for comprehensive and individualized treatment (OGUNDELE *et al.*, 2022).

In addition, some studies point to the positive influence of regular physical activity and relaxation practices, such as meditation and guided breathing, on improving sleep quality and

reducing anxiety symptoms (LEVENSON *et al.*, 2017). These interventions, when associated with the reduction of screen time and the strengthening of family bonds, have been shown to be effective in restoring emotional balance and promoting global well-being.

4.4 SUMMARY OF FINDINGS

In general, the results of the literature analyzed demonstrate that sleep disorders and anxiety in childhood and adolescence are interdependent phenomena, amplified by the dynamics of excessive use of social networks. The current pattern of hyperconnectivity alters the biological and emotional rhythms of young people, compromising cognitive and relational functions that are fundamental for development. The evidence reinforces the need for public policies and educational interventions that integrate mental health, digital education, and sleep regulation as complementary axes of health promotion.

5 DISCUSSION

The results of this review demonstrate that sleep disorders and anxiety disorders in childhood and adolescence are interconnected phenomena, strongly influenced by the contemporary digital context. The literature reveals that the excessive use of social networks not only alters the architecture of sleep, but also acts as a trigger and maintainer of anxious conditions, configuring a feedback loop between hyperconnectivity and emotional vulnerability (LEVENSON *et al.*, 2017; SCOTT; BIJOOR; LEE, 2022).

From a neurophysiological point of view, exposure to blue light and digital stimuli during the night inhibits melatonin secretion, prolonging alertness and reducing sleep quality (AMERICAN ACADEMY OF PEDIATRICS, 2016). This hormonal change affects memory consolidation and emotional regulation, leading to greater reactivity to stress and difficulty in modulating mood (MOROMIZATO *et al.*, 2019). In addition, constant exposure to notifications, sounds, and digital interactions prevents the cognitive shutdown necessary for restorative rest. In this way, the nocturnal digital environment becomes a potent circadian disruptor, especially in adolescents, whose biological predisposition to sleep delay is already natural (OGUNDELE *et al.*, 2022).

From a psychological perspective, the role of social networks goes beyond simple physiological interference. The content consumed and produced in these environments often promotes social comparisons and reinforces idealized patterns of success and appearance, generating feelings of inadequacy and anxiety (LEVENSON *et al.*, 2017). The fear of *Missing*

Out (FOMO) leads to the continuous use of the platforms, including during the night, compromising sleep and mental recovery (SCOTT; BIJOOR; LEE, 2022). This dynamic highlights how emotional and technological factors are intertwined, reinforcing the importance of multidimensional approaches in youth mental health care.

The bidirectionality between sleep and anxiety is widely recognized in the literature. Sleep deprivation impairs the functioning of the prefrontal cortex, reducing the ability to inhibit intense emotional responses and increasing the activation of the amygdala, which intensifies symptoms of anxiety and irritability (MOROMIZATO *et al.*, 2019). On the other hand, the anxious state raises cortisol levels, making it difficult to start sleeping and fragmenting its cycle. This circular relationship explains why isolated interventions—focused only on sleep or only on anxiety—have limited results. Integrated approaches, involving behavioral changes, digital education, and psychotherapeutic support, demonstrate greater effectiveness (WORLD HEALTH ORGANIZATION, 2023).

The social dimension of this phenomenon also deserves to be highlighted. The increase in technological dependence reflects not only individual transformations, but a broader cultural change, in which permanent connectivity is valued as synonymous with productivity and belonging. However, this logic reinforces dysfunctional habits and reduces the time allocated to rest and family life (AMERICAN ACADEMY OF PEDIATRICS, 2016). The absence of parental mediation and clear limits of use aggravates the problem, especially in families with a high workload and little supervision time. Thus, the management of sleep disorders and anxiety also requires a sociocultural approach, involving educational policies and public awareness campaigns.

The reviewed studies converge in pointing out that preventive strategies based on digital education and sleep hygiene are effective in reducing anxious symptoms and improving the quality of rest (OGUNDELE *et al.*, 2022). The implementation of school programs aimed at promoting mental health and the conscious use of technology contributes to the development of emotional and digital self-regulation skills. In addition, family involvement in creating structured sleep routines and monitoring screen time is essential for the success of interventions (WORLD HEALTH ORGANIZATION, 2023).

Another relevant point is the role of cognitive behavioral therapy (CBT), widely recognized as one of the most effective approaches for the treatment of insomnia and anxiety. CBT allows the identification and modification of dysfunctional beliefs related to sleep and daily concerns, in addition to favoring the development of adaptive coping strategies

(MOROMIZATO *et al.*, 2019). In adolescents, the combination of CBT with relaxation and mindfulness techniques has been shown to be especially useful in reducing sleep latency time and nocturnal anxious rumination (LEVENSON *et al.*, 2017).

However, despite the growing evidence, there are still important gaps in the literature. Most studies are cross-sectional in nature, which limits causal understanding between phenomena. More longitudinal trials are needed to assess the long-term impact of digital use on sleep neurobiology and psychological outcomes (SCOTT; BIJOOR; LEE, 2022). In addition, few studies address the role of moderating variables, such as gender, social class, and family context, in the relationship between technology, sleep, and anxiety.

Finally, the contemporary discussion on this topic needs to be guided not only by a biomedical perspective, but also by an ethical and social perspective. The exclusive responsibility of the individual or the family for the excessive use of technology ignores the influence of the economic and cultural structures that sustain digital consumption. Thus, the construction of healthier digital environments requires articulated actions between public authorities, schools, technological platforms, and civil society (WORLD HEALTH ORGANIZATION, 2023). Only with a systemic approach will it be possible to mitigate the impacts of hyperconnectivity on the sleep and mental health of children and adolescents.

6 CONCLUSION

The present narrative review shows that sleep disorders and anxiety disorders in children and adolescents are an emerging public health problem, deeply influenced by today's technological and cultural transformations. The excessive use of social networks acts as an important factor of physiological and emotional dysregulation, interfering with the sleep architecture and psychological stability of young people. Nocturnal exposure to screens, hyperconnectivity, and emotional involvement with digital platforms cause an imbalance in the circadian cycle, increased alertness, and intensification of anxious symptoms (LEVENSON *et al.*, 2017; SCOTT; BIJOOR; LEE, 2022). Thus, the contemporary digital context becomes a favorable terrain for the emergence of conditions that compromise the biopsychosocial development and quality of life of adolescents.

The analyzed findings reinforce that this relationship is bidirectional and multifactorial, involving neurobiological, cognitive, and social mechanisms. Sleep deprivation favors changes in emotional regulation and attention control, enhancing symptoms of anxiety and stress. At the same time, anxiety leads to prolonged activation of the sympathetic nervous

system, making it difficult to induce sleep and perpetuating a negative feedback loop (MOROMIZATO *et al.*, 2019 OGUNDELE *et al.*, 2022). Such evidence points to the need for integrated therapeutic approaches, involving digital education, cognitive-behavioral therapy, and sleep hygiene strategies, as well as intersectoral actions aimed at promoting mental health and the balanced use of technology.

It is concluded, therefore, that mitigating the impacts of hyperconnectivity on sleep and child and adolescent anxiety requires a collective effort, which goes beyond the clinical scope and reaches educational, family and political dimensions. The creation of school digital education programs, the strengthening of family bonds and the regulation of the use of electronic devices before sleep are priority measures. Likewise, it is essential that public managers and health institutions develop awareness campaigns about the risks of abusive use of social networks and encourage practices that promote digital well-being (AMERICAN ACADEMY OF PEDIATRICS, 2016; WORLD HEALTH ORGANIZATION, 2023). By integrating science, education, and health policies, it becomes possible to build a more balanced environment, favoring the healthy development of new generations amid the demands of the technological age.

ABSTRACT

This study analyzes the influence of vegetation cover on the urban microclimate, focusing on temperature and relative humidity parameters. Measurements were taken in two areas with different levels of afforestation in the municipality of Ananindeua, Pará, allowing for comparison between forested and non-forested environments. The results indicate that vegetation contributes significantly to thermal regulation, promoting a reduction in maximum daytime temperatures and an increase in relative humidity, especially during periods of greater sunlight. Furthermore, it was observed that factors such as cloud cover, paving, and land use influence microclimate variations, potentially even reversing expected trends. The research reinforces the importance of urban afforestation as an effective strategy for mitigating heat island effects, improving thermal comfort, and promoting greater environmental balance in cities.

RESUMO

Este estudo analisa a influência da cobertura vegetal sobre o microclima urbano, com foco nos parâmetros de temperatura e umidade relativa do ar. As medições foram realizadas em duas áreas com diferentes níveis de arborização no município de Ananindeua, PA, permitindo a comparação entre ambientes arborizados e não arborizados. Os resultados indicam que a vegetação contribui significativamente para a regulação térmica, promovendo redução nas temperaturas máximas diurnas e aumento da umidade relativa, especialmente em períodos de maior incidência solar. Além disso, observou-se que fatores como nebulosidade, pavimentação e uso do solo interferem nas variações microclimáticas, podendo até inverter tendências esperadas. A pesquisa reforça a importância da arborização urbana como estratégia eficaz para mitigar os efeitos das ilhas de calor, melhorar o conforto térmico e promover maior equilíbrio ambiental nas cidades.

Palavras-chave: Microclima. Temperatura. Umidade.

RESUMEN

Este estudio analiza la influencia de la cobertura vegetal en el microclima urbano, centrándose en los parámetros de temperatura y humedad relativa. Se realizaron mediciones en dos zonas con diferentes niveles de forestación en el municipio de Ananindeua, Pará, lo que permitió comparar entornos forestados y no forestados. Los resultados indican que la vegetación contribuye significativamente a la termorregulación, promoviendo una reducción de las temperaturas máximas diurnas y un aumento de la humedad relativa, especialmente durante los períodos de mayor insolación. Además, se observó que factores como la nubosidad, la pavimentación y el uso del suelo influyen en las variaciones del microclima, pudiendo incluso revertir las tendencias esperadas. La investigación refuerza la importancia de la forestación urbana como estrategia eficaz para mitigar los efectos de isla de calor, mejorar el confort térmico y promover un mayor equilibrio ambiental en las ciudades.

Palabras clave: Microclima. Temperatura. Humedad.

1 INTRODUCTION

The phenomenon of urbanization is growing and global. In recent decades, cities have shown great growth in population, space, and activities, drastically transforming both the natural and the built environment (PEREIRA, 2025).

The urbanization process, defined as the increase in the population of urban areas to the detriment of rural areas, has been occurring in Brazil since the beginning of the twentieth century in all regions and biomes of the country. In the vast majority of cases, this process takes place from inadequate planning, generating disorderly growth, accompanied by the lack of infrastructure capable of guaranteeing the minimum environmental quality (OLIVEIRA, 2021).

This new built environment has been undergoing significant climate change, with damage to the quality of life of populations (LABAKI *et al.*, 2011; OLIVEIRA *et al.*, 2013). This disorderly growth favors the removal of a large part of the vegetation for the expansion or construction of roads, buildings and land parcels, increasing the paved coverage of this area (ABREU, 2008; PEREIRA, 2023).

In this sense, the urban environment should be a place where the user's feeling of comfort is achieved, however, in many cases, these environments do not offer adequate conditions for this, whether thermal, acoustic, luminous or visual comfort (GUSMÃO, 2025).

The city is in itself a major climate modifier, due to the large paved areas and decrease in green areas, the air layer tends to be warmer in urban areas than in rural areas (FORMIGA, 2022). In addition, human activity in cities creates profound changes in the local climate, and can also alter the temperature and rainfall regime of the region (GONÇALVES *et al.*, 2012).

Vegetation cover provides several ecosystem services that help mitigate the effects of heat islands (UHI), formed by the process of urbanization and reduction of vegetation areas, helping to raise the quality of life of urban inhabitants and the sustainability of cities (ZHANGA, ESTOQUE, MURAYAMA, 2017). The transpiration of trees promotes cooling and humidification of the environments where they are inserted, in addition to being a source for latent heat flow (ZHENG *et al.*, 2021).

The effect of UHIs is characterized by the development of higher temperatures, between the ranges of 3.4 and 4.5 °C, in urban areas when compared to rural areas (ZHANGA, ESTOQUE, MURAYAMA, 2017). This effect is the result of the removal of vegetation cover and consequently the decrease in evapotranspiration, increasing the release of sensible heat (STONE *et al.*, 2010; ZHENG *et al.*, 2021).

This increase in the release of sensible heat causes large heat waves that act negatively on urban ecosystems and human comfort, in addition to helping the growth of electricity and water consumption for cooling; (HATVANI-KOVACS et al., 2016; STOCK; MURAYAMA; MYINT, 2017). Therefore, the presence or absence of urban forests causes, respectively, major positive or negative impacts on society and the sustainability of cities.

For all these factors, this research came from the need to quantify the contribution of urban afforestation to thermal comfort, that is, the attenuation of solar radiation by vegetation and its influences on air temperature and humidity. Thus, the objective of this work was to analyze the differences in temperature and relative humidity of the air in two distinct neighborhoods of the municipality of Ananindeua with similar characteristics of area, standing out for the difference in the existing tree vegetation, in order to subsidize the discussion of urban afforestation as a measure to mitigate the increase in temperature and favor thermal comfort.

2 METHODOLOGY

2.1 CHARACTERIZATION OF THE STUDY AREA

With an area of 191.4 km², the municipality of Ananindeua is located between the geographic coordinates 01° 13' and 01° 27' south latitude and 48° 19' and 48° 26' west longitude (IBGE, 2010). The study was developed at two different points (Figure 1), the first data collection was carried out in the area of Bosque Uirapuru, an area of abundant vegetation and apparently preserved, and the second point was the area of Residencial Jardim Amazônia 2, which has significant anthropic action.

Figure 1

Map of the location of the municipality of Ananindeua/PA with the points of the Analysis

Source: Prepared by the authors, 2025.

To evaluate the influence of vegetation on thermal comfort, temperature and air humidity, measurements were carried out at two different points located in the central region of the municipality of Ananindeua, PA. The selected areas present significant differences in terms of vegetation density and types of pavement, although they share similar topographic characteristics (Figure 2). With an approximate distance of 1,500 meters between them, it is possible to consider that both are exposed to comparable climatic conditions, which favors the analysis of the effects of vegetation cover on the local microclimate.

Figure 2

Areas selected for the study

*Area 1: Uirapuru Forest, located at R. Coletora Oeste, Águas Lindas, Ananindeua – PA, Júlia Seffer set. A well-wooded place has a varied plant composition, with well-distributed medium and large trees, shrubs and flowers. Planned by the federal savings bank of Pará.

*Area 2: Area 2: Residencial Jardim Amazônia 2, Estr. for Industry - Águas Brancas, Ananindeua – PA. Housing complex where more people were observed moving around in their cars, with little movement of people during the day, with an increase in passersby in the late afternoon.

Source: Authors.

To capture the variables, the device was positioned at a height of 2.00 meters from the ground. Following the methodology of Gonçalves *et al.* (2012) modified, the data – temperature and relative humidity – were recorded every 1 hour, for 15 minutes in the central part of each area, starting the measurements in the first area at 08:00 hours and ending at 18:00 at night. For data collection, a digital Higo-thermometer (model Instrutemp ITHT-2220) was used with a temperature range of 0°C to 50°C, relative humidity range of 1.0% RH to 99% RH, accuracy with temperature: $\pm 0.5^{\circ}\text{C}$ ($\pm 1.8^{\circ}\text{F}$) and relative humidity $\pm 3\%$ RH. The data collection of the first and second areas was in the months of September, October, November and December of the year 2017, always on the 28th of the respective months, from 08:00 am to 6:00 pm, with variations in atmospheric weather, clear sky situation in the morning and rain in the afternoon, in the rainiest months such as November and December there were clouds and gusts of wind, which are directly and indirectly related to the variables analyzed in this study. Finally, the collected data were tabulated in Excel, analyzed and the graphs that composed the discussion were elaborated.

3 RESULTS AND DISCUSSION

Climate regulation by vegetation cover consists of interferences in climatic conditions close to the surface, such as sensible and latent heat and, consequently, air temperature and humidity. The amount of radiation that a surface absorbs or reflects results in a warmer or colder climate in a given region (OLIVEIRA, 2021).

The presence of vegetation in urban environments contributes significantly to the attenuation of maximum diurnal temperatures, by reducing radiative exchanges on the soil surface. This effect manifests itself both indirectly, through the decrease in the flow of sensible heat from colder surfaces, and directly, through evaporative cooling promoted by plant transpiration. Several studies in the area corroborate the hypothesis that the scarcity of vegetation cover in cities is associated with the increase in air temperature during the day. On the other hand, large-scale afforestation initiatives have the potential to mitigate daytime district heating (ERELL *et al.*, 2010).

In the wooded area, there is a reduction in air temperature and an increase in relative humidity in the wooded area, possibly associated with a higher density of vegetation cover. However, an inversion of this pattern is observed at 2 pm, with an increase in temperature and a decrease in relative humidity. Such variation indicates that, although vegetated, the area is inserted in the urban fabric, being influenced by anthropic factors such as paving, adjacent buildings and changes in land use and occupation. These elements contribute to the modification of the local microclimate, evidencing the complex interaction between the natural environment and urban dynamics (Figure 3).

Gonçalves and Paiva (2004) state that the excess of asphalt and cement, together with the impermeabilization of the soil, cause excess heat to occur in certain urban environments. Therefore, the high temperature will come from the direct incidence of the sun's rays on these elements and the degree of absorption, retention and reflection of this heat in these structures.

Figure 3

Graph referring to the measurements of air temperature and humidity in September 2017

*Blue and orange lines refer to point 1; Green and yellow lines refer to point 2.

Source: authors, 2018.

The insolation received in a given place on the Earth's surface can vary, and one of the factors responsible for this variation is cloudiness (SILVA, 2011). Because clouds cause a variation in the intensity of solar radiation incident on the surface, and because of this variation in radiation the variability of radiation incident in a region is explained (BASTOS *et al.*, 2002). In addition, only part of the solar radiation reaches the Earth's surface, due to atmospheric transmissivity (PEREIRA; OLIVEIRA, 2011).

In certain periods, the air temperature in the wooded area (blue line) presented values higher than those of the non-wooded area (green line), which contradicts the expected trend. This anomaly can be explained by the presence of cloud cover over the non-wooded area, which reduced the incidence of solar radiation and, consequently, the local temperature. It is also considered that the month of October marks the beginning of the rainy season in the region (Figure 4), which may have caused specific microclimatic variations and interfered with the results obtained.

The intensity of solar radiation that reaches a horizontal surface is variable, due to the attenuation suffered when crossing the atmosphere, due to the presence of clouds, dust, pollution and others. Naturally, on a cloudy day, the intensity of solar radiation will be lower and, consequently, the performance of the module will be impaired. The opposite occurs on a clear day or with cloudless skies (MARQUES; PEAR TREE; ASSIS, 2000).

Figure 4

Graph referring to air temperature and humidity measurements in October 2017

*Blue and orange lines refer to point 1; Green and yellow lines refer to point 2.

Source: authors, 2018.

It was observed in the period of November and December that the air temperature in the wooded place (area 1) compared to the non-wooded one (area 2), was of greater divergence from early morning until noon, where we see a higher concentration of heat. A sharp increase in temperature was observed in area 1, varying up to 2 °C degrees of difference until the beginning of rainfall in both areas. From 1 pm on, the rain began causing the heat to be controlled and dissipated in area 1, reaching close to the air temperature value of area 2, of 0.5°C degrees, as shown in figure 5.

During the rainy season, there is a predominance of precipitation and intense cloud cover throughout the area, which results in reduced levels of solar irradiation. In contrast, in the dry season or with lower rainfall, there is an increase in the incidence of solar radiation, favored by the decrease in cloudiness and the less frequent occurrence of rainfall, which causes a difference between the first hours of the day and the peak, around noon (FERREIRA *et al*, 2023).

The influence that vegetation exerts on the climate is often addressed in several studies, although the evaluation of the parameters involved still represents a complex challenge. The energy exchanges between vegetation and the atmosphere — carried out through the radiation balance (R_n) and the fluxes of sensible (H) and latent (LE) heat — are fundamental to understand environmental dynamics. These components reflect physical processes that occur both on a local and global scale (FERREIRA *et al*, 2023).

Figure 5

Graph referring to air temperature and humidity measurements in November 2017

*Blue and orange lines refer to point 1; Green and yellow lines refer to point 2.

Source: authors, 2018.

As for the temperature measured in degrees Celsius ($^{\circ}\text{C}$), in area 2, the well-wooded region with medium and large trees had an average temperature of 30.4°C , while in area 1, devoid and with little trees, it had an average temperature of 31.2°C in December. For the air temperature, it is noted that the area with trees remained below the non-trees. The values referring to the relative humidity of the air, area 1, presented an average of 76.0%, area 2, average humidity is 62.2%. The values related to the measurements of temperature and relative humidity can be seen in figure 6.

Wooded areas tend to have higher levels of relative humidity, especially after the leaf regrowth period, when temperatures are higher and there is a higher incidence of rainfall (GOTARDO *et al.*, 2019). *In these environments, the water accumulated in the leaves favors direct evaporation, contributing to the increase of local humidity. In contrast, regions that are poorly wooded or devoid of vegetation do not offer the same support for water retention, which can result in a drier and less stable microclimate.*

Figure 6

4 CONCLUSION

The results obtained demonstrate that the presence of vegetation in urban environments exerts a direct influence on the regulation of the microclimate, especially in the reduction of air temperature and in the increase of relative humidity. Wooded areas have a greater capacity to retain water in the leaves and promote evaporative cooling through plant transpiration, which contributes to the mitigation of heat. However, occasional variations, such as the increase in temperature at specific times, indicate that urban factors — such as paving, buildings, and land use — also significantly interfere with thermal dynamics, even in places with vegetation cover.

In addition, the distribution of solar radiation is affected by atmospheric elements such as cloudiness, pollution, and humidity, which alter the intensity of the irradiance received. The comparison between wooded and non-wooded areas shows that vegetation acts as a climate moderator, reducing the impacts of urban warming. Therefore, planned afforestation strategies are essential to mitigate the effects of heat islands, improve thermal comfort, and promote greater environmental balance in cities.

ABSTRACT

This academic work developed an applied study focused on the relationship between Digital Entrepreneurship, Digital Marketing, E-Business, E-Commerce, and the Dropshipping model as an innovative strategy for online business development. The research adopts a qualitative and experimental approach, grounded in a comprehensive literature review and the practical implementation of an e-commerce platform named Pawzzi, specialized in pet products. Using the Business Model Canvas framework, the study structured a digital business model aligned with the principles of cost reduction, scalability, and technological integration. The results demonstrated that the dropshipping modality, when supported by effective digital marketing strategies and customer relationship management, represents a viable, flexible, and profitable alternative for micro and small entrepreneurs seeking entry into the digital market. The findings also emphasize the centrality of user experience (UX) design, mobile responsiveness, and social proof in achieving competitiveness and long-term sustainability in the e-commerce ecosystem.

Keywords: Digital Entrepreneurship. Digital Marketing. E-Business. E-Commerce. Dropshipping.

RESUMO

Este trabalho acadêmico desenvolveu um estudo aplicado focado na relação entre Empreendedorismo Digital, Marketing Digital, E-Business, E-Commerce e o modelo Dropshipping como estratégia inovadora para o desenvolvimento de negócios online. A pesquisa adota uma abordagem qualitativa e experimental, fundamentada em uma revisão abrangente da literatura e na implementação prática de uma plataforma de e-commerce chamada Pawzzi, especializada em produtos para animais de estimação. Utilizando o framework Business Model Canvas, o estudo estruturou um modelo de negócio digital

alinhado aos princípios de redução de custos, escalabilidade e integração tecnológica. Os resultados demonstraram que a modalidade dropshipping, quando apoiada por estratégias eficazes de marketing digital e gestão de relacionamento com o cliente, representa uma alternativa viável, flexível e lucrativa para micro e pequenos empreendedores que buscam entrada no mercado digital. Os resultados também enfatizam a centralidade do design de experiência do usuário (UX), da responsividade mobile e da prova social para alcançar competitividade e sustentabilidade a longo prazo no ecossistema de e-commerce.

Palavras-chave: Empreendedorismo Digital. Marketing Digital. E-business. E-commerce. Dropshipping.

RESUMEN

Este trabajo académico desarrolló un estudio aplicado centrado en la relación entre el emprendimiento digital, el marketing digital, el comercio electrónico, el e-business y el modelo de dropshipping como estrategia innovadora para el desarrollo de negocios en línea. La investigación adopta un enfoque cualitativo y experimental, basado en una revisión exhaustiva de la literatura y la implementación práctica de una plataforma de comercio electrónico llamada Pawzzi, especializada en productos para mascotas. Utilizando el marco del Business Model Canvas, el estudio estructuró un modelo de negocio digital alineado con los principios de reducción de costos, escalabilidad e integración tecnológica. Los resultados demostraron que la modalidad de dropshipping, cuando se apoya en estrategias efectivas de marketing digital y gestión de la relación con el cliente, representa una alternativa viable, flexible y rentable para micro y pequeños empresarios que buscan ingresar al mercado digital. Los hallazgos también enfatizan la importancia del diseño de la experiencia de usuario (UX), la capacidad de respuesta móvil y la prueba social para lograr la competitividad y la sostenibilidad a largo plazo en el ecosistema del comercio electrónico.

Palabras clave: Emprendimiento Digital. Marketing Digital. Negocios Electrónicos. Comercio Electrónico. Dropshipping.

1 INTRODUCTION

Technological advancement and globalization have profoundly transformed the way organizations and individuals interact with the market and the very concept of work. Physical borders have given way to a dynamic digital environment characterized by the speed of information, global connectivity, and constant innovation. In this scenario, entrepreneurship has taken on new dimensions, becoming more accessible, flexible, and comprehensive. Thus, digital entrepreneurship has emerged, a trend that uses information and communication technologies as a foundation for creating, managing, and expanding businesses.

Concepts such as e-business, digital marketing, e-commerce, and dropshipping have become essential parts of the vocabulary of entrepreneurs and consumers, reflecting the transformation of traditional models into integrated digital structures. Companies have begun operating on virtual platforms, offering products and services with greater reach, efficiency, and personalization. Consumers, in turn, have gained prominence in this new context, actively participating in the value creation process and influencing brand strategies.

Therefore, we live in a society marked by hyperconnectivity, where the strategic use of technology is crucial for business competitiveness and sustainability. Digital entrepreneurship is not just a trend, but a consolidated reality that redefines economic, social, and cultural relations. Therefore, this article aims to present a broad overview of these topics, analyzing their interrelationships and the relevance of each concept within the contemporary economic landscape, from the innovative and transformative perspective of digital entrepreneurship.

2 METODOLOGY

This study adopts a qualitative and exploratory approach, supported by bibliographic and experimental methods, aiming to analyze how digital entrepreneurship can be effectively structured through digital marketing strategies, e-business practices, and the dropshipping model. The study was conducted in two complementary stages. The first involved a comprehensive literature review of books, academic articles, and institutional publications from SEBRAE, focusing on the theoretical consolidation of key concepts such as digital entrepreneurship, e-commerce, and digital marketing. The second stage consisted of an applied experiment, in which an e-commerce platform named Pawzzi was designed to sell pet products using the dropshipping model.

The methodological process included the application of the Business Model Canvas, a visual strategic planning tool used to identify the essential components of the proposed business model, such as value proposition, customer segments, key partners, and cost structure. The store's digital environment was developed through web design techniques emphasizing usability (UX/UI), mobile-first architecture, and digital marketing integrations, such as SEO, social media engagement, and performance analytics.

Data were analyzed qualitatively to assess the feasibility, scalability, and competitiveness of the dropshipping business model when combined with digital marketing tools. The methodological choices aimed to align theory and practice, providing a replicable model for entrepreneurs and researchers interested in understanding the intersection between technology, innovation, and entrepreneurship in the digital economy.

3 THEORETICAL FRAMEWORK

3.1 ENTREPRENEURSHIP

Entrepreneurship is an essential phenomenon for a country's economic and social development. It is characterized by the ability to identify opportunities, innovate, and transform ideas into sustainable businesses.

The 21st century marked a profound revolution in the way we do business, communicate, and generate value. Technological advancement, globalization, and the digitalization of markets have radically transformed consumer relations and business models. In this context, entrepreneurship, combined with marketing and digital marketing strategies, has become the foundation for sustainable and innovative growth for companies worldwide.

Entrepreneurship today requires more than a good idea; it requires strategic vision, market knowledge, mastery of digital tools, and the ability to constantly adapt. The synergy between these three elements allows us to understand consumer behavior, intelligent position brands, and create meaningful experiences in an increasingly competitive environment.

According to Valenciano (2005, apud Nascimento, 2023, p. 2), "entrepreneurship is the involvement of people and processes that, together, lead to the transformation of ideas into opportunities, and the perfect implementation of these opportunities leads to the creation of successful business".

An entrepreneur is someone who takes calculated risks, mobilizes resources, and promotes creative solutions that generate value for society (VIANNA et al., 2025). More than

just starting a business, entrepreneurship represents a mindset focused on innovation, overcoming challenges, and the constant pursuit of improvements in production processes and services offered (POEL, 2022). In a world of constant transformation, according to (PINTO, MARTENS and SCAZZIOTA, 2023), "entrepreneurship has become a strategic tool for driving economic growth, generating jobs, and promoting technological advancement." Therefore, understanding its role is essential for those who wish to operate in the market in a competitive and innovative manner.

3.2 DIGITAL ENTREPRENEURSHIP

With the advent of the internet, digital technologies, and the connected society, digital entrepreneurship emerged, characterized by the creation and management of businesses based on online platforms. Unlike the traditional model, according to Filipini (2016), "this type of entrepreneurship reduces barriers to entry, expands geographic reach, and allows scalability with lower operating costs." Examples include businesses based on apps, social networks, online courses, and online stores.

As stated by Poel et al.:

Digital entrepreneurship is a new form of entrepreneurship or an intersection between digital technologies and entrepreneurship. [...] It emerged from the introduction of digital technologies to innovate and undertake, to change processes, generate results, with increased uncertainty and reduced limits for the entrepreneur [...] considered a derivative or subcategory of entrepreneurship, in which part of the organization, the enterprise, or the product or service offered is digitalized (POEL et al., 2022).

According to Gomes (2019), "the digital entrepreneur must have technological skills, creativity and the ability to constantly adapt to changes in the virtual environment".

3.3 E-BUSINESS

Because of the internet and the consequent evolution of the way we do business through digital media, the opportunity to undertake business through e-commerce has emerged.

E-business, including e-commerce, are now fundamental to the modernization of the productive sector, as they allow for the expansion and diversification of markets and the improvement of business activities (NASCIMENTO, p. 21, 2023).

"E-commerce is experiencing unparalleled growth rates, both in business-to-consumer transactions and in business-to-business transactions, which is currently where the highest level of revenue generation occurs." (SOCINFO, 2000, apud Nascimento, 2023, p. 21).

The term "E-Business" refers to the use of digital technologies to optimize and integrate business processes (CHAFFEY, 2011). While "E-Commerce" specifically addresses online commercial transactions, "E-Business" encompasses a broader spectrum, including inventory management, supplier relationships, customer service, and automated marketing (FERNANDES, FERREIRA and CALVOSA, p. 52, 2022).

According to Wang et al. (2025), "E-Business" represents the complete digitalization of a company's operations, making it more agile, efficient, and competitive in the global market.

3.4 MARKETING

Marketing is the set of strategies and actions designed to identify, create, and satisfy consumer needs and desires. According to Kotler et al. (2025), "marketing is not limited to sales, but involves the entire process of market analysis, product development, pricing, communication, and distribution."

According to Fernandes, Ferreira, and Calvosa:

[...] Small businesses have difficulty implementing marketing strategies to boost their sales. Due to a lack of resources or limited management experience, smaller organizations are slow to adopt effective approaches capable of developing a relationship with customers that precisely meets their needs and desires (FERNANDES, FERREIRA, and CALVOSA, p. 50, 2020).

According to Marroque et al. (2025), the purchasing process is influenced by situational, social, and marketing factors. They believe that each consumer's specific needs must be intrinsically understood and met. Marketing seeks to understand consumer behavior to offer superior value and build lasting relationships between companies and customers. (DE LIMA, DE LIMA, FOFONCA and LOPES, 2023).

3.5 DIGITAL MARKETING

Digital marketing is the natural outcome of technological transformation. It involves the use of online channels and tools, such as social media, search engines, email marketing, SEO, paid advertising, and automation, to attract, convert, and retain customers.

According to SEBRAE (2025a), "Digital Marketing is the promotion of products and brands through online channels, such as blogs, websites, social media, email, apps, and others."

In other words, Digital Marketing is essential for increasing sales, expanding your business, and strengthening your brand. It is the primary tool for evaluating the performance of your actions, measuring return on investment, and establishing clear and simple metrics to make the best decisions for your business.

Digital Marketing is the application of traditional marketing principles to the online environment, using technological tools and digital platforms to promote products and services (KINGSNORTH, p. 48, 2022). Its most used strategies include SEO (Search Engine Optimization), content marketing, social media, email marketing, and paid advertising (ADS). This modality allows you to precisely target your audience and measure results in real time, making it essential for companies' competitiveness in the digital age (VIDAL et al., p. 14964, 2023). Therefore, digital marketing is a direct way to address your customers' desires and establish personalized communication at the right time, aiming to boost your sales.

According to Ryan (2020), "digital marketing is not just about technology, but about human behavior mediated by technology." This approach reinforces the need to understand users, their journeys, and touchpoints. Its most used strategies include:

SEO (Search Engine Optimization): website optimization to achieve better rankings on Google.

Social media: content creation to engage and strengthen communities.

Email marketing: direct and targeted communication with customers.

Paid traffic (ADS): advertising on platforms such as Google Ads and Meta Ads.

Content marketing: production of educational materials that build authority.

Influencer marketing: partnerships with digital creators to increase brand visibility.

Each of these tactics needs to be integrated into a coherent strategic plan, aligned with the brand's purpose and audience profile.

In the context of the evolution of digital marketing, the advancement of artificial intelligence (AI) and big data has transformed digital marketing into a predictive science. Tools such as recommendation algorithms and behavioral analysis enable hyper-personalized campaigns.

Kotler et al. (2025) state that "marketing 6.0 is the meeting of technology and human empathy," where data is used to understand emotions and predict needs before the consumer even expresses them.

Key trends include voice marketing, social commerce, augmented reality, and the use of generative AI in content creation. Brands that embrace these technologies ethically and creatively gain a competitive advantage and strengthen their digital presence.

3.6 E-COMMERCE

According to the ECBR (2025), e-commerce refers to the buying and selling of products or services online. This type of commerce has expanded exponentially in recent years, driven by convenience, transaction security, and a variety of available offerings (MARTINS, 2020).

Unlike offline sales, which take place through a point of sale, with pre-established opening hours and limited coverage area, online sales, e-commerce, offers countless possibilities for closing a deal, as it is not restricted to geographical location or business hours (VIANNA et al., 2025).

E-commerce operates through a platform with features and integrations that enable a complete purchasing process, post-sale service with loyalty, and integration with marketplaces (an online platform where sellers and buyers meet to conduct commercial transactions), as stated by Chaffey (2011).

There are different types of e-commerce, such as B2C (Business to Consumer), B2B (Business to Business), C2C (Consumer to Consumer), and C2B (Consumer to Business). For Santos et al. (2024), e-commerce is one of the most significant expressions of digital transformation, democratizing market access and enabling small businesses to reach consumers on a global scale.

3.7 DROPSHIPPING

A segment of e-commerce that has been booming worldwide is commerce based on the dropshipping model. According to SEBRAE (2025a), dropshipping is, in a simplistic definition, the combination of two terms: "drop," which loosely translates to "to drop," and "shipping," which, translated into Portuguese, can be understood as "shipment." Mostarac, Kavran, and Piskovic (2020, apud Nascimento, 2023, p. 22) cite the concept of dropshipping as "a supply chain management method in which the retailer does not keep goods in stock,

but instead transfers customer orders, with delivery handled by the manufacturer or wholesaler."

Dropshipping is an e-commerce model in which the entrepreneur acts as an intermediary between the supplier and the end consumer, without the need to maintain their own inventory. In this system, the seller makes the sale, and the supplier takes care of storing, packaging, and shipping the product. This modality reduces costs and risks, making it a viable alternative for new digital entrepreneurs. However, it requires attention to supplier quality and delivery times, which are crucial factors for customer satisfaction (CARDOSO, 2023).

Figure 1 illustrates Dropshipping without stock or inventory.

Figure 1

Dropshipping No Stock

Source: ISTOCK (2025).

According to Allen (2021), dropshipping is a business model through which the retailer sells without its own inventory, acting as an intermediary, passing the customer's order to the supplier, who will then be responsible for delivery. This enables new business opportunities with more affordable investments, and suppliers can be domestic or international.

Figure 2 illustrates Amazon's dropshipping practice example.

Figure 2
Amazon Dropshipping Structure

Source: WEBOLTO (2025).

According to Nascimento (2023), "based on the simplification of implementing an online business using the dropshipping model, it is likely that the number of these businesses will increase worldwide every day."

In 2021 alone, approximately 33% of online stores worldwide operated through dropshipping, and this market is expected to grow by an average of 28.8% by 2025 (ALLEN, 2021).

4 METHODOLOGICAL PROCEDURES

To broaden the understanding of the topic and contextualize it as a Digital Marketing Strategy, this study used information provided by an IME (Individual Micro Entrepreneur). To support the technical basis of the research, reference scientific articles in the areas of digital entrepreneurship, digital marketing, e-commerce, and dropshipping were consulted as the foundational points of this research.

The research uses direct information from SEBRAE (Brazilian State Electricity Regulatory Agency), books, and scientific articles, all on the topic proposed by this work, as its main sources. The approach adopted includes a deep dive into key concepts to understand how to develop a business model for Pawzzi, a company developing its online e-commerce store for pet products tailored to the needs of dogs and cats.

The study used a qualitative, experimental approach to validate the proposed business model specifically for an online store selling products for dogs and cats.

5 RESULTS AND DISCUSSIONS

The results of this study are presented, allowing the definition of the Business Model Canvas for a Pet E-Commerce, as well as the proposition of the Pawzzi E-Commerce Virtual Store (a company characterized as an Individual Micro Entrepreneur - IME, *Micro Empreendedor Individual* - MEI, in Portuguese).

5.1 BUSINESS MODELO CANVAS

The Business Model Canvas is a visual strategic planning tool that allows you to describe, design, challenge, and innovate business models in a simple and organized way. It consists of a framework with nine blocks that represent the key components of a business (DORNELAS, 2016).

According to SEBRAE (2025b), the nine-block framework is composed as follows:

- (1) **Value Proposition:** What the company offers to the market that is valuable to customers.
- (2) **Customer Segments:** Who the target customers are.
- (3) **Channels:** How the product or service reaches the customer.
- (4) **Customer Relationships:** How the company relates to its different customer segments.
- (5) **Revenue Streams:** How the company generates revenue.
- (6) **Key Resources:** The essential resources (human, financial, technological, etc.) for the business to operate.
- (7) **Key Activities:** The essential activities for delivering the value proposition.
- (8) **Key Partners:** Key activities performed by third parties and key resources that are acquired externally.
- (9) **Cost Structure:** The relevant costs to operate the business.

Canvas is a tool that allows you to create images of new or existing Business Models. This framework is responsible for revolutionizing the way entrepreneurs and companies build their new businesses, and I'm sure it will be for you too (SEBRAE, 2025b).

Figure 3 illustrates the Business Model Canvas to Pet E-Commerce (Dropshipping).

Figure 3

Business Model CANVAS [Pawzzi E-Commerce]

Source: Adapted to Dornelas (2016).

According to Dornelas (2016), the Canvas model is a versatile tool that can be used by entrepreneurs and business development teams. Its main features include:

- Business visualization:** represented by a 9-block framework, which provides an overview of how the business operates, as shown in the previous image.
- Focus on customer value:** the first block is the value proposition, which focuses on understanding the value the business offers to its customers.
- Key activity analysis:** key activities are the actions that need to be performed for the business to function, and the Canvas Model aims to optimize them.
- Key resource identification:** the model aims to identify the business's key resources, including human, financial, and technological resources.
- Key partnership focus:** strategic partnerships are an important part of many businesses and, as such, should be optimized.
- Revenue source analysis:** the methodology highlights the importance of identifying and optimizing the business's revenue sources.
- Understanding the cost structure:** This is an important part of any business, therefore crucial for balancing expenses.

h) **Flexible tool:** It can be adjusted to meet the specific needs of each business.

Thus, the Canvas model is a visual and intuitive tool that offers an overview of how a company operates, focusing on customer value, key activities, key partnerships, revenue sources, and cost structure.

5.2 PAWZZI ONLINE STORE (E-COMMERCE)

The development of the Pawzzi Online Store was the culmination of the Digital Entrepreneurship and Digital Marketing strategy detailed in this study, operating exclusively through dropshipping. By adopting the dropshipping model, Pawzzi positions itself as a sales intermediary, focusing on products for pets, dogs, and cats, eliminating the need for its own physical inventory, reducing operating costs, and maximizing business scalability.

The e-commerce platform was designed to be robust, intuitive, and fully responsive, ensuring an optimized user experience (UX) for both desktop and mobile access.

The desktop interface was designed to convey trust and ease of navigation, essential pillars for e-commerce success, according to Chaffey (2011), as illustrated below:

Figure 4

Pawzzi E-Commerce - Rotating Banner - Step 1

Source: Prepared by Juan Boente (2025).

Figures 4 and 5 represent the store's first visual impression on the desktop, focusing on customer attraction and acquisition elements. The header is fixed and features the search bar, the Pawzzi logo, and account access (Login/Register), as well as the shopping cart,

where products are temporarily stored until the purchase is completed. The central element is the rotating banners, which communicate the Pawzzi online store's main value propositions and promotions, as described in Business Model Canvas.

In Figure 4, the highlight is "Free Shipping to All of Brazil," a crucial marketing strategy in the dropshipping model.

Figure 5

Pawzzi E-Commerce - Rotating Banner - Step 2

Source: Prepared by Juan Boente (2025).

In Figure 5, the focus shifts to quality, promoting "the best products on the market," a reinforcement of online sales management.

The presence of testimonials just below the banner demonstrates the focus on "Customer Relationship Management" (CRM), building social proof of engagement with the Pawzzi online store.

Figure 6 shows a screen displaying the product showcase, essential for the purchasing journey. The "Featured" section presents a wide variety of dog and cat items from various partner suppliers, showcasing the vast offerings available through the dropshipping model.

Figure 6

Pawzzi E-Commerce - Featured Products in the Online Store

Source: Prepared by Juan Boente (2025).

Each product is listed with a clear image, name, original price, and promotional discount, utilizing scarcity triggers and opportunities to encourage immediate purchase.

Figure 7 shows the product detail page, the most important point for closing a sale. In figure, a specific product (Teething Toy), displaying multiple images, color variants, price with a highlighted discount, and payment options (including a 5% discount via Pix, encouraging cash payment as a marketing strategy). The shipping calculation field by zip code informs the customer of the delivery time (managed by the dropshipping supplier), ensuring transparency in the logistics distribution process.

Recognizing that most e-commerce traffic is currently mobile, and that many online store users use mobile apps, Pawzzi was designed with the Mobile-First principle in mind, ensuring a seamless and complete smartphone experience.

According to Lopes (2014), Mobile-First is a concept applied to web projects where the initial focus of architecture and development is directed to mobile devices and then to desktops. This technique has become increasingly popular among marketing and technology professionals, and for this reason, it was also adopted in this project.

Figure 7

Pawzzi E-Commerce - Details of Products for Sale in the Online Store

Source: Prepared by Juan Boente (2025).

In Figure 8, as in the desktop version, the mobile home screen is dominated by promotional banners ("Free Shipping" and "Best Products on the Market"), adapted to the vertical format specific to mobile devices. The design is clean, with the "hamburger menu" (three bars) in the upper left corner and the user, search, and cart icons in the upper right corner, keeping usability in mind.

In Figure 9, the visualization focuses on the vertically optimized product listing. Items (such as the "Cold Cooling Mat" and the "3x1 Pet Chew Toy") are arranged in columns that are easy to view and click to access. The presence of "Sort" and "Filter" buttons at the top of the listing is crucial for mobile navigation, allowing the customer to efficiently manage the vast catalog.

Figure 10 shows a product details page for the mobile version that focuses on the clarity of the image and essential information for the sale to take place.

In figure 10 the product image ("Sisal, Ball, and Chalesco Mouse Kit for Cats") takes up a large portion of the screen to generate visual impact on the customer, followed immediately by the product name, the discount highlight, and breadcrumbs (navigation path), which facilitate return to the category.

Figure 8

Pawzzi E-Commerce - Mobile Rotating Banner

Source: Prepared by Juan Boente (2025).

Figure 9

Pawzzi E-Commerce - Mobile Featured Products

Source: Prepared by Juan Boente (2025).

This layout optimization aims to reduce friction and accelerate the decision-making and purchasing process for customers browsing the online store via mobile devices.

Figure 10

Pawzzi E-Commerce - Mobile Product Details for Sale

Source: Prepared by Juan Boente (2025).

The integration between the desktop and mobile versions ensures that Pawzzi, operating in dropshipping, effectively utilizes the "Channels" and "Key Activities" described in the Business Model Canvas, reaching customers at any digital touchpoint with the Pawzzi online store.

6 CONCLUSION

This study demonstrated that Digital Entrepreneurship, supported by Digital Marketing strategies and the E-Commerce environment, is a crucial driver for business innovation and growth in the contemporary economy. Through the case of the Pawzzi virtual store, it was possible to verify that the dropshipping model offers significant advantages for microentrepreneurs, such as operational cost reduction, logistical flexibility, and scalability of the business structure.

The development of the Business Model Canvas allowed the visualization of strategic pillars, such as value proposition, key partners, and customer relationships, that sustain the success of a digital enterprise. Furthermore, the integration of mobile-first design principles and user experience optimization proved essential to ensure consumer satisfaction and strengthen brand trust.

Therefore, the research concludes that digital entrepreneurship, when combined with well-structured digital marketing and e-commerce practices, consolidates itself as an efficient path for economic inclusion, technological advancement, and business sustainability in a globally connected and competitive environment. Future studies could explore the impacts of artificial intelligence and data analytics on the evolution of digital business models, expanding the understanding of innovation within the context of digital transformation.

RESUMO

Este artigo apresenta reflexões e resultados de uma pesquisa conduzida com o Coletivo Sonus, grupo composto por seis musicoterapeutas que, ao longo de 2024, reuniram-se mensalmente para realizar práticas de improvisação musical livre seguidas de debates reflexivos. Teoricamente fundamentado na orientação musicocentrada, em autores como Nordoff e Robbins (1977), Zuckerkandl (1973) e Rudolf Steiner (2012), o estudo articula os conceito de experiência (Bondía, 2022) e de criatividade musical (Schafer, 2011). O estudo investigou as percepções e transformações subjetivas dos participantes ao vivenciarem a improvisação como fenômeno relacional e terapêutico. Os dados foram coletados por meio de gravações e transcrições das discussões realizadas em grupo focal, e analisados segundo a técnica de análise de conteúdo (Bardin, 2011). A análise revelou quatro categorias temáticas centrais: (a) senso de liberdade criativa; (b) superação lúdica do erro; (c) audição acurada; e (d) consciência sobre si. Os resultados apontam para a expansão da compreensão musical dos participantes, para a superação de paradigmas estéticos hegemônicos e para o fortalecimento dos processos terapêuticos mediados pelo som através da improvisação. A prática improvisacional revelou-se espaço privilegiado para a realização de experiências significativas, nas quais escuta, criação e subjetividade se entrelaçam, contribuindo para o aprofundamento clínico e formativo em musicoterapia.

ABSTRACT

This article presents reflections and findings from a qualitative study conducted with Coletivo Sonus, a group of six music therapists who met monthly throughout 2024 to engage in free musical improvisation sessions followed by reflective discussions. The study is theoretically grounded in a music-centered orientation, drawing on the work of Nordoff and Robbins (1977), Zuckerkandl (1973), and Rudolf Steiner (2012). It integrates the concepts of experience (Bondía, 2022) and musical creativity (Schafer, 2011) to examine improvisation as a relational and therapeutic phenomenon. Data were collected through recordings and

transcriptions of focus group discussions and analyzed using content analysis (Bardin, 2011). The analysis yielded four central thematic categories: (a) a sense of creative freedom; (b) playful overcoming of error; (c) refined listening; and (d) heightened self-awareness. The results indicate an expansion of participants' musical understanding, a challenging of hegemonic aesthetic paradigms, and a strengthening of therapeutic processes mediated through sound and improvisation. Improvisational practice emerged as a privileged space for meaningful experiences, where listening, creation, and subjectivity intertwine, contributing to both clinical deepening and professional training in music therapy.

RESUMÉN

Este artículo presenta reflexiones y resultados de un estudio realizado con el Colectivo Sonus, un grupo de seis musicoterapeutas que, a lo largo de 2024, se reunieron mensualmente para practicar improvisación musical libre, seguida de debates reflexivos. Con fundamento teórico en enfoques centrados en la música, desarrollados por autores como Nordoff y Robbins (1977), Zuckerkandl (1973) y Rudolf Steiner (2012), el estudio articula los conceptos de experiencia (Bondía, 2022) y creatividad musical (Schafer, 2011). El estudio investigó las percepciones y transformaciones subjetivas de los participantes a medida que experimentaban la improvisación como un fenómeno relacional y terapéutico. Los datos se recopilaban mediante grabaciones y transcripciones de debates de grupos focales y se analizaron mediante análisis de contenido (Bardin, 2011). El análisis reveló cuatro categorías temáticas centrales: (a) sensación de libertad creativa; (b) superación lúdica de errores; (c) escucha precisa; y (d) autoconciencia. Los resultados indican una ampliación de la comprensión musical de los participantes, la superación de paradigmas estéticos hegemónicos y el fortalecimiento de los procesos terapéuticos sonoros a través de la improvisación. La práctica improvisatoria resultó ser un espacio privilegiado para experiencias significativas, donde se entrelazan la escucha, la creación y la subjetividad, contribuyendo a la profundización del desarrollo clínico y educativo en musicoterapia.

1 INTRODUCTION

"Music is able to allow access to depths where spirit and nature are still one again."
(Emma Jung).

The present work presents reflections on sound possibilities built from free musical improvisation sessions, undertaken by a group of music therapists gathered in the Sonus Collective. This group arose from the participants' interest in undertaking creative and reflective paths, from which they sought to work with musical creation, through improvisations, with a view to therapeutic work, envisioning possible contributions of the so-called Musicocentric orientation to their clinical and personal initiatives.

From the aforementioned practices of musical improvisation, carried out from the perspective of the centrality in the therapeutic power immanent to the sound phenomenon, the Sonus Collective began, as an increment of its work, theoretical studies that, initially, focused on the work of Victor Zuckerkandl (1973), whose reading was articulated with the lectures of Rudolf Steiner (1989) on the deep human experience with sound⁴

For Sales and Freire (2024), Brazilian researchers who are dedicated to the theme of the centrality of the musical phenomenon in the music therapy context, the term "Musicocentrado" has been present in the field of Music Therapy since the eighties, of the twentieth century.

"The term *Music-Centered* appeared publicly for the first time, in the 1980s, in the name of the institute founded by music therapists Barbara Hesser, Helen Bonny and Carolyn Kenny, the "Bonny Foundation: Institute for Musicocentric Therapies" (SALES and FREIRE, 2024, pg. 02)

It is important to emphasize that, in this work, we use the expression "Musicocentric Orientation" as an allusion to a theoretical and philosophical foundation, which sustains several therapeutic initiatives or Music Therapy models, among which we highlight the Guided Image Method, proposed by Helen Bonny, and the Creative Music Therapy of Paul Nordoff and Clive Robbins. Such models seek to value the subjective musical senses of patients in therapeutic processes.

In Brazil, a proposal for a Music-centered model has recently emerged from the Institute of Creativity and Development based in the city of Porto Alegre, Rio Grande do Sul. This proposal was prepared by Music Therapist André Brandalise, and is called

⁴ Das Wesen des Musikalischen und das Tonerlebnis im Menschen (Rudolf Steiner Verlag - Dornach/Schweiz)

"Musicocentric Music Therapy Model", resulting from a study process started in 2001 and which has as a milestone the publication of the work "Musicoterapia Músico-Centrada", authored by Brandalise. The elaboration of the aforementioned Music Therapy Model also receives important contributions from names such as Gregório Queiroz and Marina Silva and is configured as the first Brazilian initiative to propose a model for the clinic in Music Therapy.

Among the various strategies that can be used in a process of treatment with music, musical improvisation occupies a prominent place in the clinic, in such a way that in Musicocentric Orientation Music Therapy, improvisations contemplate their own musical aspects, obtained from the relationship of the human being with his musicality. Expressive gestures are observed through musical manifestation, through improvisations in which the patient can express his creativity and spontaneity, correlating the internal representative experience of each one.

Musical improvisations or recreations, structured in a Music Therapy setting, allow the patient to relive, update and resignify situations and emotions, explore and express unspeakable feelings, in addition to reflecting on the 'meaning of life' (Petersen, 2021). From the musical dialogue, typical of a relationship built by creative elements loaded with symbolic meanings that constitutes improvisation, valuable meanings are revealed for the therapeutic process itself, which acquires an experiential character.

The concept of representative, or meaningful, experience is of great importance for the debate on Musicocentric Orientation and for this reason we will discuss this concept below.

2 SONICALLY CENTERED EXPERIENCE

Jorge Larrosa Bondía is a philosopher dedicated to the studies of the educational field and who, above all, is dedicated to the theme of experience. For the aforementioned author, experience is the phenomenon that occurs to the subject, moving and/or moving him, so that he can perceive himself, in his immersion in the unique process that occurs to him, that is, in the very unfolding of the experience.

Experience, the possibility that something happens to us or touches us, requires a gesture of interruption, a gesture that is almost impossible these days: it requires stopping to think, stopping to look, stopping to listen, thinking more slowly, looking more slowly, and listening more slowly; to stop to feel, to feel more slowly, to linger on details, to suspend opinion, to suspend judgment, to suspend will, to suspend the automatism of action, to cultivate attention and delicacy, to open our eyes and ears,

to talk about what happens to us, to learn slowness, to listen to others, to cultivate the art of encounter, to be very silent, to be patient and to give oneself time and space. (Bondia, 2022, p. 25).

We understand, therefore, that the phenomenon of experience is a complex phenomenon which requires an attitude, a care, on the part of the subjects who seek to experience something in order to, in some way, achieve valuable effects for their own lives and for the lives of others.

In order to move towards the complexity of music as a phenomenon of experience, we believe it is also pertinent to evoke what Rudolf Steiner says about the sense of hearing, which, according to his approach, Anthroposophy, is one of the four "higher senses". For Steiner (2012), the sense of hearing is on a different, higher level than the other senses, since through it it becomes possible to perceive the interiority of what is external to us. Steiner explains the experience of hearing in the following terms:

We relate even more intimately to the interior of the external world through the sense of hearing. Sound already reveals to us a lot of things about the internal configuration of the outside (...) when I make something sound, I perceive, in a way, intimately the interior of what is sounding (Steiner, 2012, p.13).

For Steiner, therefore, hearing is on the same level as the "sense of the other's self", which in our culture is called empathy, and which is the ability to get closer to what the other feels. Hearing and the sense of the self of the other are higher senses alongside the sense of self and the sense of thought.

Zuckerlandl (1973) points to an important characteristic present in the relationship of people in the West with the sound phenomenon: "when we think of music as art, we isolate it from the world of everyday reality; when we consider it as the art of sounds, we isolate it from the other arts." (p. 12). In his reflections, therefore, the author poses the problem arising from the distancing of music from everyday reality, since it is placed as "art", such a form of human expression moves away from the rituals that primarily constituted its presence in social life.

Blacking (2000) clarifies in a pertinent way the relevance of music in everyday life, even indicating that the social fabric itself is determinant for the elaboration of sound:

We will not be able to explain the principles of a composition or the effects of music until we are able to understand well the relationships between musical experience and

human experience itself (...) I have come to understand the society in which I live better from the moment I have better understood the music in it (Blacking, 2000, p.35).

In this way, it seems to us that the isolation of music as a consumer product leads us to perceive only partially its importance in the constitution of the societies in which we live, making the sound experience not deeply linked with the human experience, since the consumption of musical products gives rise to superficial relations, of a market nature.

For Nachmanovith (2012) *apud* Woituski *et al* (2017), improvisation is a game, which is related to playing, used from our experiences and objects that we love to express ourselves in a free, creative and fun way. In music, the act of improvising enables the encounter with musicality in a communicative function, that is, it is the attempt to take risks, to enter an unknown field, placing oneself in front of any obstacle, with expressive and creative intent.

Considering, therefore, that music has a strong presence in social life and, also, glimpsing that such presence can interfere in the perception that each individual has of himself and his creative potentialities, we launch ourselves into this reflection in search of sound experiences, communally realized, in order to reflect on the possibilities that the act of creating music spontaneously, that is, improvising can bring to the way people take ownership of themselves and become aware of the reality in which they are inserted. The present study will certainly present possibilities or reflexive reverberations for the scope of clinical practice in Music Therapy.

3 METHODOLOGY

The present work employs a qualitative approach to investigate the perceptions of the participants of the Sonus Collective, in moments of free improvisation musical practices, in which the expressive needs of the group members were manifested through collective musical interventions. This group was formed in the first half of 2024 and had the participation of 06 music therapists who, monthly, met to perform a moment of free musical improvisation, followed by debate.

In addition to the meetings for the practice of improvisation, the *Sonus* Collective also held theoretical study meetings which take place in an *online* format. Since the researchers were also members of the aforementioned group (*Coletivo Sonus*), the present reflection is part of the list of what is understood as an experience report, which "situates the knowledge resulting from a process; in other words, it can be considered in an intersection of processes, from the collectivized to the most singular" (Daltro and Faria, 2019, p.226). The main focus

of the research process is the narratives elaborated throughout the process by the participants of the investigated group.

It is important to emphasize that the present study investigates how the members of the Collective *Sonus* perceived and reflected on the practices of free improvisation and that the focus of this research lies in the reflexive narratives elaborated after the moments of improvisation, in the The needs for individual expression are manifested through collectively shared musical interventions. Here the study is inserted in the field of narratives.

We point out that this investigative work effort comprises, as Lüdke and André point out, that the research:

[...] it inevitably brings with it the load of values, preferences, interest and principles that guide the researcher. [...] Thus, the vision of the world, the starting points, the foundations for understanding and explaining this world will influence the way he proposes his research or, in other words, the assumptions that guide his thinking will also guide his research approach. (2020, p.03)

Thus, we sought to collect impressions, perceptions and reflections from the participants of *the Sonus* Collective, which, throughout the year 2024 (from May to December), followed a path made up of shared sound experiences, through which it was sought to establish connections with the theoretical studies carried out by the aforementioned group on one of the main theoretical bases related to the Musicocentric orientation, the work *Sound and Symbol*, by Victor Zuckerkandl (1973).

The research methodology adopted here seeks to value the voice of the subjects of the musical experience, as we understand that each individual has an internal "researcher" who advances when learning in environments of reflective interactions, because, as Josso points out: "it is a question, first of all, of admitting that there is a researcher in each one of us and that this researcher only advances to the extent that he is able to learn himself, thanks to or in spite of interactions with others." (Josso, 2004, p. 166).

Although the present study does not delve into the individual histories of the participants, it seeks to use their reflections from the group musical practice experienced in the *Sonus* Collective, to build a reflective narrative about the therapeutic possibilities of improvisation work, which took place over eight creative and reflective meetings of the aforementioned group, consisting of six participants, during the year 2024.

The research is configured, therefore, as an exploratory study of a qualitative nature, using the moments of debate that occurred after all the moments of improvisation of the

Sonus Collective, for data collection, in such a way that in the moments of exchanges and discussions, the group began to function as a focus group that, in the definition Backes, Colomé, Herdmann and Lunardi, is constituted as:

[...] a space for discussion and exchange of experiences around a certain theme. In addition, the group stimulates debate among participants, allowing the topics addressed to be more problematized than in an individual interview situation. Participants generally listen to the opinions of others before forming their own, and they constantly change their position, or better substantiate their initial opinion, when engaged in group discussion. (2011, p. 439).

Data collection, according to Gil (2009), recognizes the involvement of researchers in the investigation process and in the consequent organization of perceptions emerging from the debates and, thus, is also aligned with the aforementioned perspective of Lüdke and André (2020) who postulate the understanding that research, as a human and social activity, is influenced by values, preferences and principles of the researchers, and there is no neutral separation between these agents, the research and its results.

For the operationalization of the research work and study of the collected data, all the moments of debate of the Sonus Collective, which occurred after the moments of musical improvisation, were recorded and later transcribed, in order to constitute the *corpus* of the present study.

As pointed out, the moments of reflective exchanges (focus group) always occurred after the sound experiences, which were conducted by the members of the group, who took turns to direct the musical work on the occasion of each improvisation meeting. Therefore, a relay strategy was practiced, which allowed all participants to assume, at least once, the conduction of musical improvisation experiences. The reflective occasions, for group discussion, lasted an average of thirty to forty minutes.

The ideas and impressions expressed by the participants, freely expressed, were transcribed and organized into thematic categories according to the meanings that emerged from the speeches of the members of the Sonus Collective. We seek theoretical-methodological support in content analysis techniques, as recommended by Laurence Bardin (2011). Thus, analyzing the senses and meanings of the statements brought by each of the subjects participating in this investigation was the essential procedure for carrying out this work.

We point out, as pertinent, that Bardin indicates that: "content analysis, on the other hand, aims at the knowledge of variables of a psychological, sociological, historical order, etc., by means of a deduction mechanism based on indicators reconstructed from a sample of particular messages." (BARDIN, 2011, p. 50).

Finally, we reiterate that the present research adopted a mostly qualitative approach to understand the perceptions arising from the experiences with free improvisation practices, carried out by the members of the Sonus Collective. Data collection, therefore, took place through debates in a focus group constituted by Music Therapists who are members of the *Sonus* Collective, whose speeches were analyzed using content analysis techniques.

The theoretical bases of this study include, therefore, the articulation between different investigative conceptions: research and training (Josso, 2004); the value of shared experience (Larrosa, 2022); the non-neutrality of the researcher (Lüdke and André, 2020) and Content Analysis (Bardin, 2011).

Considering the methodological approach defined for the present study, we organized the contents of the discourses and speeches that were presented in the moments of discussion that followed the improvisation meetings. The aforementioned work of systematizing the contents led us to identify four thematic categories that permeated or guided the interventions of each participant: a) sense of creative freedom; b) playful overcoming of error; c) accurate hearing and self-awareness.

4 RESULTS AND DISCUSSION

Considering the content analysis strategy defined for the present study, focusing on the manifestations of each participant in the moments of discussion in the focus group, it was possible to perceive the first thematic category translating into the participants' statements. The **sense of creative freedom** was present in the narrative interventions, in the moments in which each member of the group pointed to the awareness of their own musical practice, and to the understanding of this work built from improvisations, whether alone or together. The statements that referred to the awareness of musical practice added that in moments of improvisation there was the possibility of creating and that the creative act was the driving force of music.

As a result of the sound realization made possible by creativity, the participants mentioned that they felt welcomed by the musical making itself, which allowed them freedom to include unusual musical constructions, which revealed themselves as creative possibilities.

Such sound expressions brought unusual musical coherence, in such a way that the dualistic notion of correct and incorrect sound was transcended. Thus, the notion of playful overcoming of error emerged as a second category of analysis of narratives. In this way, it is considered that through the experienced musical making, there is no condition of "wrong note", but possibilities of expressive paths through which the music runs, through a playful sense.

At the same time that the participants felt free to dare sonically through improvisation, it was possible to verify an attentive perception of the sound aspects, which invited everyone to reflect on the practice together, so that each participant had the possibility to ponder on their own musical manifestation, in relation to the other sonorities that were part of the improvisation moment. Thus, the notion of **accurate listening** arose from the observation that each participant was available, in an attitude of active listening, which was sharpened throughout the improvisation practices and was constituted as the third category of analysis of the speech contents presented.

From the first meetings, all participants alluded to somatic reactions that, in their perception, were a result of the musical practice itself. We found in the reports moments in which the perception of the participants' image and body schema was mentioned and alluded to positive changes, establishing the fourth category here called **self-awareness**. Mood swings, or even overcoming physical fatigue, were part of such narratives.

According to the answers obtained from each participant, we observed that there was a balance in the statements referring to each thematic category, because of the total transcribed material, 14 statements referred to the **sense of creative freedom**; 9 brought the idea of **playful overcoming of error**; 15 were linked to the idea of **accurate hearing** and 14 brought the notion of self-awareness, totaling 52 transcribed speeches.

To present some reflections elaborated by the members of the Sonus Collective, in the present work and in order to guarantee the anonymity of its members, we will use an alphanumeric coding, differentiating each participant (P) through an Arabic number. The code "P1" therefore refers to participant number 1 and so on.

We will present the results by initially bringing some answers concerning the category **sense of creative freedom**. In this category, participant 2 (P2) presents the following statement:

I tried not to rationalize about what I was doing and tried to let it flow. I found myself producing sounds like that, which even I was surprised to do. But it's cool because it

seems that even if you release a sound, it always seems to have its value within the whole (P2, on 05/18/2024)

The speech transcribed above dialogues with an intervention by P6 that evokes the issue of freedom, bringing the concept of *Music Child*, which is fundamental in the work of Nordoff-Robbins' Creative Music Therapy (1977). The aforementioned terminology, musical child, points to the understanding that sound creativity, that is, musicality, is an innate manifestation of each being, as a way of responding to musical sound stimuli, as a manifestation of a universal sensitivity to music and its elements (SALES and FREIRE, 2024). Thus, participant P6 expressed himself:

There is a moment in our lives when we are playing, doing something sonically, that we feel a course of freedom (...) and this expression is what for me is this entity, this *music child* that they talk about, which is the freest and most spontaneous way for you to express yourself (P6, on 06/22/2024)

A connection of meaning between the participant's speech, transcribed above, and what participant 5 (P5) says: "it had been a long time since I felt this sensation of a certain freedom and happiness, man, joy, ecstasy of touching", Such manifestations are also connected with what participant 2 (P2) expressed: "Not only reproduce but also develop, create, build, change, expand, whatever the verb of action is, but the idea is always that, and it's very cool" (08/24/24).

This connection with the making of music, experienced from a feeling of freedom, puts the group in tune with aspects of each participant's musicality, so that a possibility of experiencing basic aspects of each individual's musical expression is built and that establishes a sound sense that is inherent to the group itself, as explained by participant 2's manifestation (P2), "We start to create patterns of encounter, no matter how loose it was, the thing organizes itself, without anyone deciding anything" (09/14/24).

Participant P1 presents ideas that reinforce what we have presented so far about the sense of creative freedom, which develops through the musicality of each one, manifested in improvisation, by the group:

You enjoy not the break in isolation, because there were already six people, but what the Germans call *Cluster*, you know, which is that sound block, that mass of sound, which is simply the result of the most sincere manifestation that each one of us can bring at that moment (P1 on 05/18/24).

With regard to the **playful overcoming of error**, another category evidenced by the participants' statements, we verified during some discussions, the occurrence of narratives that pointed to possibilities of sound realization and that allowed space for unusual interventions. P4, takes the following position on such possibilities:

... At first I was very stuck in my thinking, tense, I wasn't relaxed to make sounds, and I was just on that same note, right? very tense. Over time I relaxed, then I loosened up more and made several sounds, I realized that sometimes my sound was influenced by your sound, and I became more relaxed (P4 on 05/18/24).

Another participant, reinforcing P4's statement, points to the possible interdictions of the creative sense when the performer is too concerned with making the sound considered correct:

Sometimes we are so concerned with hitting the right note, that this concern with hitting the right note does not allow us to let the music be spontaneous, that it happens. It anchors, in the sense of arresting one's own creative action (P1 on 10/20/24)

In general, if we consider some common sense beliefs, it is believed that music presents "right" and "wrong" paths, so that the choices of the performer, which interfere with the musical structure at the time of improvisation, impose behaviors that are based on these beliefs and that can hinder spontaneity and creativity in moments of sound immersion. As mentioned in P2:

I tried to get away from all forms of the pattern. And so, it was interesting because you kept it and I tried to go the opposite, but it's so difficult, it's so difficult, so I tried to structure rhythmic patterns that dialogued, but didn't collaborate with this pulse, right? Get out of line. I found it very challenging (P2 on 09/14/24).

The same participant (P2), in another statement, points to the overcoming of the dual belief between "right" and "wrong", when he says that: "there is no right and wrong, at that moment any sound will do a specific function to contribute to this dynamic sound relationship" (P2 on 05/18/24).

It is important to observe the convergence of the statements that point to the overcoming of the concepts of "right" and "wrong" with the reflections of Zuckerkandl (1973) who presents, in his theory, the concept of "dynamic relationship of notes". The aforementioned author expresses his ideas by saying that a note, at the end of a melody, is

a note that becomes active, we hear a state of disturbance of balance, like a desire of itself to meet each other notes.

The statement of participant 3 (P3) seems to allude to an internal state of conflict that the need to "get it right" in music can provoke:

"There were times like this, that thing of panic that you bring, this thing of self-demand. And I'm at a moment now that this is coming, right? something of intimacy (...) but it was something new for me, improvising. And I didn't think because I knew how to play a little flute, I could improvise, that I was nervous" (P3 on 06/22/24).

As it is a group of Music Therapists with academic training in Music, the awareness of the sound relationships established during the improvisations emerged in the speeches in a very significant way. In this sense, a **sense of accurate hearing** is presented in the transcribed interventions. Such a sense, however, does not reveal a desire to adapt the sound produced in improvisations to pre-established sound patterns, but presents an expansion of the conception of music by the members of the Sonus Collective. P2 put himself in the following terms: "the sounds, they attracted each other, I was able to see a little of it (...) " simply the conjuncture of the sounds there: they attracted each other and formed that" (P2 on 06/22/24)

P5's statement is important with regard to this third thematic category, when he points to a search for the other through hearing: "the dialogue, it went to another level where we were able to listen to each other (...) From what I heard from you with a note, I was able to create my impression of that note you made." (P5 on 10/20/24).

This sense of accurate hearing is connected with Rudolf Steiner's postulate about the sense of hearing. The aforementioned author puts it as follows: "when I make something sound, I perceive, in a certain way, intimately, the interior of what is sounding (...) in sound we actually perceive the interior of the external world" (Steiner, 2012, p.13).

According to participant P1, "when we are in a sound perspective that does not have this commitment, for example, there is no defined scale, right? It is always the commitment we have in fact, which is perhaps the most difficult: to let it happen sonically" (P1. 18/05/24).

These ideas express an expanded conception of music itself that, despite the participants having formative links with undergraduate courses in music, transcend the still hegemonic experience, established by tonalism. Also according to participant P1:

It's as if we were talking through this (...) talking through this sound image, that we suddenly realize that it is being constituted there at that moment, it will only exist there, and that it is the heritage of that group, at that moment, and that because it belongs to the group, it also needs to be heard by the whole group (P1. 05/18/24).

Schaffer (2011), referring to an improvisation experience with 5 wind instrumentalists, observes that the analogy between spoken conversation and improvisation in music proves to be a coherent means for the engagement of the performers, which interferes with the fluency during the improvisation game. In this sense, the real value of an experience serves both for the latent development of improvisation and for the exercise of auditory perception.

The notion of **self-awareness** came to the fore as we found manifestations of the participants alluding to mood swings or even physical state, which occurred as a result of improvisation practices. In the very first improvisation meeting, P2 expressed himself as follows:

This state of relaxation is interesting, isn't it? I'm also feeling some pain, exercise pains. But at that moment there, I was standing, and my legs and knees are very locked. But at that moment I wasn't feeling it, it's as if I was just floating, there in the sound (P2 on 05/18/24).

According to P3's speech, still about the expression of tiredness, it is noticeable how the music transposes such an organic condition: "I also feel like this, sometimes a tiredness from work. Today I came very tired from university, (...) but it's another energy, I was able to connect and it was very cool" (P3 on 11/09/24).

In the same direction, in the next meeting, P4 referred to the relief of physical pain related to an anxiety condition he felt at the beginning of the improvisation: "I felt very calm, I was fine, I was a little anxious, you know. Headache and... so, it was only when we started playing that I calmed down more" (P4 on 06/22/24)

In her work on the Guided Imagery Method (GIM) by Helen Bonny, Liesert (2017) presents a reflection that links music and feeling:

(...) Music offers a framework for emotions. This means that music does not inherently "possess" a specific emotional quality. Instead, music provides a framework within which the client can find certain emotional qualities (p.138).

For Helen Bonny, "The affective customer experience must be supported by music, embodying the humanistic concept of the maximum experience". The author has established

six effects that the musical experience can trigger. Among these effects, we highlight the possibility that music, according to Bonny, "promotes positive, oceanic and religious-type experiences, which can have transformative properties for the individual." (Bonny apud Liesert 2017, p. 152).

In this sense, the manifestation of participant P6 is quite pertinent: "intuition is something like this, which seems to speak of our reality, at the same time that it brings memories. (...) it responds to something that is mine, it allows me this state of presence of myself" (P6 on 07.20.24)

The material collected in the discussions that took place after the moments of improvisation, brought very expressive and valuable speeches for the present reflection. The abundant material collected and discussed here allowed us to find connections between the philosophical postulates of Musicocentric Orientation Music Therapy in the face of the creative practices undertaken by the *Sonus Collective*.

5 CONCLUSION

According to the manifestations of the participants of the *Sonus Collective*, the improvisation practices carried out by the group dialogue with the theories of Zuckerkandl, who alludes to the power of attraction of notes, based on the impetus of sensitivity of each performer in contact with music, in a terrain in which there are no pre-defined aesthetic beacons. Such a context calls on the participants to follow the forces of attraction that are proposed by the sound exercise itself, which is carried out based on the creative listening of the musical phenomenon, at the moment it occurs.

The statements collected and analyzed in the present work also point to valuable perceptions that touch an expanded understanding of musical practice and that interfere in the perception that the individual has of his own creative capacities, which, in the musical exercise, contribute to the perception of the subject himself about himself, about his peers and about the reality that welcomes and also conditions them.

The analysis work carried out here also points to the importance of overcoming beliefs about what music is, so that the notion of "right" and "wrong" is seen from a critical perspective, free from predefined aesthetic ties, more linked to therapeutic effects than to artistic aspects that in everyday life can restrict the very notion of music.

From the perspective of the expansion of sound consciousness, of a critical reflection on the ties that the cultural industry imposes on individuals, this reflection becomes valuable

and reveals musical potentials that, in the context of improvisation carried out by the Sonus Collective, have left their state of latency and become sonically manifest contents.

The participants' speeches reveal, in many moments, the pleasure of discovering sound as a relational phenomenon in which the individual summons his creative potential, placing it in dialogue with the creative manifestations of his peers. Such moments are sustained by the ability to listen to oneself and others during the sound explosions provided by the freedom of the act of improvising. A broader sense of listening, which brings together sonically manifested subjectivities, connects with therapeutic conceptions that are based on listening as a path of encounter and dialogue.

The thematic categories from which we organized the analysis of the data indicate, initially, perceptions of a personal nature, however, such findings point to the confluence of subjective senses that dialogue through the unusual and ephemeral music, which dissolves sonically at the end of the improvisation, but which remains as a deep vivid experience, lived by each improvising member.

Each subject reinvents himself in the act of free musical creation. Without ties, or attachments to aesthetic paradigms, but giving wings to sound creation. Unusual possibilities are revealed and strengthen improvising individuals. In a playful way, the notion of error is overcome to give way to a renewed perception of oneself and of others, a perception that, based on accurate listening, evokes a liberating sense of music itself that was imprisoned in cultural moorings.

Music therapy strategies and approaches in our reality still derive from musicological knowledge and, in some cases, it is difficult to establish the boundaries between Music Therapy, Music Education and artistic performance. The work of the members of the Sonus Collective, carried out from the desire to deepen the Musicocentric orientation, reveals a greater breadth with regard to the practice of improvisation. Such a practice is, in the field of musical training, seen as something advanced and, for this very reason, reserved for experienced musicians.

In the case of Coletivo *Sonus*, the sense of improvisation is detached from musical aesthetic expectations and through the sound practices shared in the group's meetings, a broader understanding of music and its therapeutic effects can be observed. The participants reveal in their statements a high level of satisfaction with the experiences they lived, while linking these moments to the theories studied. This indicates that there was an expansion of

the understanding of Musicocentric Orientation Music Therapy from the articulation of theory with the improvisational practice undertaken by the group.

ABSTRACT

Access to safe and sustainable electrical energy is an essential element for socio-economic development, particularly in remote regions of the Brazilian Amazon. This paper carries out a comparative cost-benefit analysis of three electrification alternatives: off-grid photovoltaic systems, diesel generators, and informal network, based on a case study in the riverside community of Nazaré, Abaetetuba-PA. Employing tools from economic engineering and sustainability metrics, the study evaluates implementation, operational, and maintenance costs, as well as nets present value, cost per kWh generated, and environmental impact. The findings indicate that, although requiring higher initial investments, off-grid photovoltaic systems demonstrate greater economic efficiency in the long term and have a lower socio-environmental impact. This makes them a viable solution for low-income communities, highlighting the potential of solar energy as a strategic approach to energy inclusion. The study supports efforts to reduce inequalities and promote a just energy transition, aligning with Sustainable Development Goals (SDGs 7, 10, and 13).

Keywords: Sustainability. Solar Energy. Energy Access. Riverside Communities. Economic Analysis.

RESUMO

O acesso à energia elétrica de forma segura e sustentável é um elemento essencial para o desenvolvimento socioeconômico, especialmente em regiões remotas da Amazônia brasileira. Este estudo realiza uma análise comparativa do custo-benefício de três fontes alternativas de eletrificação, sistemas fotovoltaicos off-grid, geradores a diesel e redes clandestinas, com base em um estudo de caso realizado na comunidade ribeirinha de

RESUMEN

El acceso a electricidad segura y sostenible es esencial para el desarrollo socioeconómico, especialmente en regiones remotas de la Amazonia brasileña. Este estudio realiza un análisis comparativo de costo-beneficio de tres fuentes alternativas de electrificación: sistemas fotovoltaicos aislados, generadores diésel y redes eléctricas ilegales. Este análisis se basa en un estudio de caso realizado en la comunidad ribereña de Nazaré, en el municipio de Abaetetuba, Pará. Utilizando herramientas de ingeniería económica y parámetros de sostenibilidad, se evalúan los costos de implementación, operación y mantenimiento de cada sistema, junto con su valor actual neto, costo por kWh generado e impacto ambiental. Los resultados demuestran que, a pesar de la mayor inversión inicial, los sistemas fotovoltaicos ofrecen mayor eficiencia económica a largo plazo y menor impacto socioambiental, lo que los convierte en una solución viable para comunidades de bajos ingresos. El estudio refuerza el papel de la energía solar como alternativa estratégica para la inclusión energética, contribuyendo a la reducción de las desigualdades y a la promoción de una transición energética justa, en línea con los Objetivos de Desarrollo Sostenible (ODS 7, 10 y 13).

1 INTRODUCTION

Access to electricity is a fundamental pillar of sustainable development, directly impacting essential dimensions such as health, education, food security, and social mobility (FAISAL et al., 2024). Several studies point out that the availability of reliable energy is associated with poverty reduction, income generation, and the promotion of social inclusion (RAJABRATA et al., 2021); (ALEX et al., 2021). On the other hand, the absence or precariousness of this resource is a critical obstacle to economic progress, especially in developing countries (AIGHEYISI et al., 2020), where the challenge of energy poverty highlights deep territorial and social inequalities.

In Brazil, this scenario is particularly pronounced in the North and Northeast regions, which historically have the lowest rates of access and consumption of electricity (GALVÃO et al., 2020); (THIVES et al., 2022). The Amazon, although rich in biodiversity and natural resources, is home to thousands of communities excluded from the National Interconnected System (SIN), as is the case of approximately 400 thousand people who live on the banks of rivers in areas of difficult access, often also deprived of the full exercise of citizenship (COSTA and VILLALVA, 2020).

Although universalization programs such as "Luz para Todos" (Decree No. 7,520/2011) have promoted advances, efforts to expand conventional electricity infrastructure still do not include more remote communities (DA SILVA et al., 2024); (LEDUCHOWICZ-MUNICIO et al., 2024). In the municipality of Abaetetuba-PA, for example, islands such as Sirituba and Campopema received transmission lines, while others, such as Guajará and Nazaré, remain on the margins of public policies, facing logistical and economic barriers to conventional electrification (SEGURA-SALAS et al., 2022).

Faced with this scenario, excluded communities have resorted to alternative solutions, such as clandestine electricity networks, usually pulled from neighboring municipalities, and diesel generators (HENAO and GUZMAN, 2024). However, these options are marked by instability, voltage fluctuations, and frequent interruptions (POPA, 2022), compromising the safety and durability of household equipment and information systems, such as internet providers. In addition, the burning of fossil fuels aggravates environmental impacts and represents a setback compared to global goals for reducing greenhouse gas emissions (GANI, 2021).

The adoption of off-grid Photovoltaic Systems (off-grid SFV) emerges, in this context, as a promising and sustainable alternative, capable of meeting basic demands in a clean,

autonomous, and economically viable way in the medium and long term (HASSAN, 2021). Such solutions align with the principles of the just energy transition, by ensuring access to quality energy for historically neglected populations, while minimizing environmental impacts and promoting greater local resilience.

This study proposes a comparative economic analysis between different alternatives of electric generation, solar photovoltaic, Diesel Generators (DG) and clandestine grids, based on a case study in the riverside community of Nazaré, in Pará. The objective is to evaluate, from the perspective of sustainability, which of the options offers the best performance in terms of cost-benefit, supply stability and socio-environmental impacts. In this context, the research seeks to develop innovative approaches to estimating the cost of electricity in communities isolated from the conventional electricity grid, considering not only the economic aspects, but also the social and environmental effects of each solution. It is also intended to offer technical support to engineering professionals, public managers and policymakers, through economic analysis tools integrated with sustainability criteria. The comparison between the generation alternatives aims to demonstrate the financial impacts on the budget of low-income families, as well as the associated environmental consequences, especially in the case of diesel generators and clandestine networks, still common in the northern region of Brazil. Finally, the research highlights the potential of solar energy as a vector of sustainable development and social inclusion, contributing to the mitigation of energy inequalities and the promotion of a fair energy transition, in alignment with the Sustainable Development Goals (SDGs), particularly numbers 7, 10 and 13.

2 PRELIMINARY STUDIES

2.1 ESTIMATION OF THE ELECTRICAL LOAD IN THE COMMUNITY

The Maracapucú River, one of the main watercourses in the municipality of Abaetetuba-PA, is divided into two sections: Maracapucú-Miri and Maracapucú-Grande, which are home to the islands of Nazaré and Guajará, respectively. The present study was conducted on Nazaré Island, which has an estimated population of 1,278 inhabitants, including young people, adults and children. The main local economic activities include family farming, artisanal production and the management of açaí, a fundamental basis of riverside subsistence. The island has approximately 580 residences distributed along its length. The specific area of analysis was a village located on the margins of Nazaré Island, about 1 km away from the urban center of Abaetetuba-PA, as illustrated in Figure 1.

Figure 1

Location of the community and transmission lines: (a) municipal headquarters and community, (b) path of the air lines

Source: Prepared by the authors.

The village consists of seven residences, all built within the standards established by a federal government housing program, which defines uniform design and dimensioning characteristics. Figure 2 illustrates one of the housing units belonging to this complex, located in that community.

Figure 2

Village house (reference house)

Source: Prepared by the authors.

To carry out the economic analysis, it was necessary to survey the electrical load of the residence, based on Equation (1). This survey involved the identification of the nominal power and the average daily time of use of each household appliance, as shown in Table 1.

Table 1

Equipment used and estimated load consumption

Equipment	Number	Hours of Use/Day (t_i)	Power (W)
Stereo	1	1	150
Water Pump	1	1/4	370
Freezer	1	4	100
Lamp	1	8	20
Lamp	2	8	15
Lamp*	2	8	14
Washing machine	1	0,5	290
Acai Berry Beating Machine	1	0,5	180
Router*	1	24	10
32* TV	1	8	74
Total			1,223
			kWh/day

*Priority loads.

Source: Prepared by the authors.

$$E_{Consumida} = \sum_{i=1}^n P_i \cdot t_i \quad (1)$$

Where:

$E_{Consumed}$ = Represents the total energy consumed per day;

P_i = Power of the equipment;

t_i = Corresponds to the interval of use of a piece of equipment per day (h);

n = Number of equipment;

As shown in Table 1, to fully supply the energy demand of the residence, a *medium-sized off-grid* SFV system would be necessary, consisting of at least four 300 Wp (Watt peak) modules and four 150 Ah (Ampere-hour) batteries. However, the acquisition of a system of this magnitude is not feasible for the villagers, due to factors such as low purchasing power,

the presence of a clandestine electricity grid, albeit unstable, and limited familiarity with photovoltaic solar technology. In view of this scenario, the strategy adopted was the dimensioning of an *off-grid* SFV system aimed exclusively at serving priority loads, making it more accessible and attractive from an economic point of view. According to Table 1, these priority loads correspond to the *internet* router, the television and the lamps. Figure 3 shows the load profile associated with this equipment.

Figure 3

Load of the reference house: (a) daily load, (b) monthly load

Source: Prepared by the authors.

Figure 4 shows the *off-grid* SFV installed in the reference house for load estimation.

Figure 4

Off-grid photovoltaic system installed in the community

Source: Prepared by the authors.

In the economic evaluation that will be shown below, the case studies of the off-grid SFV demonstrated in the previous section are addressed. The analysis includes the exposure of the initial costs, the annual economic balance and the cost of the kWh generated from each system, for the demand conditions.

3 ECONOMIC EVALUATION

3.1 STARTUP COSTS

Table 2 shows the composition and distribution of the costs of the *off-grid SFV components*, as well as the cost associated with the clandestine power grid.

Table 2

Initial Off-Grid SFV Costs

Equipment	Features	Quantity	Value (R\$)
Photovoltaic Module	155 Wp	1	300
Inverter	300 Wp	1	339
Charge Controller	20 A	1	479
Battery	60 Ah	1	430
Total 1,548.00			

Source: Prepared by the authors.

Table 2 shows that the largest expenditure for the implementation of a small *off-grid SFV* corresponds to the acquisition of the charge controller due to the fact that it has technology to search for the maximum power point. However, according to the increase in the system, this initial cost will be for the battery bank.

The generation of electrical power through a single-phase 12.5 kVA (10kW) DG group that provides an output voltage of 127V. Table 3 shows the initial costs associated with this type of electrical power generation.

Table 3

Diesel generator startup costs

Equipment	Features	Quantity	Value (R\$)
Diesel Generator Set	12.5 kVA +motor	1	6.000
Maintenance	annual	3	1.500
Total			7.500,00

Source: Prepared by the authors.

The generation of electricity through the clandestine electric grid had the following initial investment, according to Table 4.

Table 4

Initial costs of the clandestine power grid

Equipment	Characteristic	Quantity	Value (R\$)
Electrical network	By family	1	1.200,00
Total			1.200,00

Source: Prepared by the authors.

3.2 ECONOMIC BALANCE SHEET

For the economic balance, the following were considered:

Clandestine electricity network - Average rate charged per consumer unit 45.00 R\$/month. The total amount of revenue is used to pay operators who maintain the network, purchase poles, among others (operating expenses).

GD - Cost per liter: 8.00 R\$/Liter. On average, 1 liter of oil is used each day to make up for the lack of the clandestine network (this is a conservative estimate based on ideal operating conditions).

Figure 5

Operating cost curve of energy sources

Source: Prepared by the authors.

3.3 COST OF KWH GENERATED

To determine the cost of the kWh generated for the values of average loads, Equations 2 to 6 were used.

$$CE = \frac{VPLa}{EC} \quad (2)$$

Where:

CE – Cost of electricity (R\$/kWh);

NPV – Annualized net present value (annualized life cycle cost of the system) (R\$);

Ec – Electricity consumed (kWh).

The annualized net present value is determined by the following Equation (3):

$$VPL_A = VPL \times \frac{i \times (1 + i)^n}{(1 + i)^n - 1} \quad (3)$$

i – Minimum attractiveness rate ($a.a$);

n – Analysis period (years);

NPV can be calculated using the following Equation (4):

$$VPL = I + CR_P + \sum_{k=1}^n VP_{(O/M)} \quad (4)$$

Where:

I – Cost of the initial investment (R\$);

CR_P – Replacement cost brought to present value (R\$);

$PV_{(O/M)}$ – Present value associated with the cost of operation and maintenance (R\$).

The term CR_P can be calculated using the following Equation (5):

$$CR_P = \sum_{m=1}^R \left(\frac{CC}{(1+i)^{m \times T}} \right) \quad (5)$$

Where:

R – Number of component replacements during the analysis period;

CC – Component cost (R\$);

T – Useful life of the component (years).

The term $PV_{(O/M)}$ can be calculated using the following Equation (6):

$$VP_{(O/M)} = W \times \frac{(1+i)^n - 1}{i \times (1+i)^n} \quad (6)$$

Where:

W – Sum of total operating and maintenance costs.

4 RESULTS AND DISCUSSIONS

Considering a planning horizon of 20 years, defined based on the useful life of the photovoltaic modules, which represent the component with the longest longevity of the system, minimum attractiveness rates of 10% and 15% were adopted. The annual cost of operation and maintenance of the SFV *off-grid* was estimated at 1% of the initial capital,

totaling R\$ 15.48 per year. The operational useful life of storage batteries is approximately 4 years, which implies four replacements over the period analyzed. For the charge controller, whose average durability is also 4 years, two replacements are planned. The inverter, on the other hand, has a useful life of 10 years, with two replacements estimated during the life cycle of the system. In the case of DG, periodic maintenance costs were estimated at around R\$ 1,500.00 per semester.

Figure 6 shows the replacement costs of the *off-grid SFV components*, as well as those of the diesel generator set. For the inverter, the replacement cost was calculated at R\$ 181.48 with a rate of 10% and R\$ 105.00 with a rate of 15%. The charge controller has estimated values of R\$ 699.00 (10%) and R\$ 571.00 (15%). The battery bank has an estimated replacement cost of R\$ 627.00 with a 10% fee and R\$ 513.00 with a 15% fee. Finally, the diesel generator set has an associated replacement cost of R\$ 3,205.00 (10%) and R\$ 1,850.00 (15%).

Figure 6

Replacement cost of the off-grid SFV components and the diesel generator set

Source: Prepared by the authors.

In the analysis of operation and maintenance costs, the clandestine electricity network was also considered, since the monthly fee charged to each family in the community is intended for the maintenance of the infrastructure, including activities such as tree pruning, cable replacement and general repairs. The total cost associated with the operation and maintenance of this network was estimated at R\$ 4,597.00 for an attractiveness rate of 10%

and R\$ 3,380.00 for 15%. For the off-grid SFV, the corresponding costs were R\$ 132.00 and R\$ 97.00, respectively. DG, on the other hand, had the highest operating costs, totaling R\$ 12,770.00 with a rate of 10% and R\$ 9,389.00 with a rate of 15%. Figure 7 shows the comparison between the operation and maintenance costs of the three energy generation sources analyzed.

Figure 7

Cost of operation and maintenance of electricity generating sources

Source: Prepared by the authors.

The *NPV* and *aLPV* of the sources that generate electricity are shown in Figures 8 and 9. The *NPV* of the DG was R\$ 21,975.00 and R\$ 17,239.00, of the SFV *off-grid* was R\$ 2,307.00 and R\$ 2,158.00 and of the clandestine network was R\$ 5,797.00 and R\$ 4,580.00, the rate of 10% and 15% respectively.

Figure 8

NPV of the electric energy sources

Source: Prepared by the authors.

Figure 9

NPV of the electric energy source

Source: Prepared by the authors.

The cost per kWh of electricity for each generating source is shown in Figure 10. The kWh delivered to the community by the DG was R\$ 9.00/kWh and R\$ 5.20/kWh, the rates of 10% and 15%, respectively. The kWh delivered to the community by the SFV *off-grid* was R\$ 3.10/kWh and R\$ 2.10/kWh and the cost of the kWh supplied by the clandestine network was R\$ 2.40/kWh and R\$ 1.10/kWh at rates of 10% and 15%, respectively.

5 CONCLUSIONS

The research presented highlights the importance of adopting *off-grid* photovoltaic systems as a sustainable alternative for the supply of electricity in riverside communities in the Amazon excluded from the National Interconnected System. The economic analysis has shown that while the initial cost of solar systems is higher than that of clandestine grids and diesel generators, their performance over time is more advantageous in terms of cost per kWh, stability in supply, and reduced environmental impacts. Solar energy, in addition to promoting energy autonomy, presents itself as a solution aligned with the needs of low-income populations, contributing significantly to the reduction of energy poverty and the strengthening of sustainable local development. The results obtained reinforce the urgency of public policies that encourage the expansion of clean and decentralized energy solutions, especially in remote areas, strengthening the commitment to an inclusive and just energy transition.

ACKNOWLEDGMENT

The authors would like to thank the Federal University of Pará (UFPA) for its institutional support, laboratory infrastructure, and research incentives, which were fundamental for this study.

ABSTRACT

The country is undergoing changes due to the speed of information and the dissemination of knowledge, forcing organizations to renew their management to efficiently and effectively meet market demands. This process of meeting these new requirements is linked to the pursuit of quality, which is a priority for every company. The quality management system is no longer a competitive differentiator but a system necessary for the survival of organizations, striving for efficiency and customer satisfaction. This paper addresses the application of the PDCA Cycle continuous improvement method in the quality department of a packaging company, identifying losses due to production defects. This study seeks to analyze the reduction of nonconformities generated by poor production in a container machine. Throughout the study, productivity and quality improvement tools will be discussed according to the analyzed stage used by the case study company. Based on the PDCA roadmap, guidelines for reducing nonconformities will be sought. This paper aims to analyze improvement opportunities to reduce nonconformities identified throughout the process to ensure quality delivery and customer satisfaction.

Keywords: Product Development. Quality Management. Production Improvement. Production Process.

RESUMO

O país passa por mudanças, devido a velocidade da informação e a disseminação de conhecimento, obrigando as organizações a renovarem sua gestão para atender com eficiência e eficácia às exigências do mercado. Este processo de atendimento destas novas exigências está atrelado a busca pela qualidade, sendo prioridade de toda empresa. O sistema de gestão de qualidade deixa de ser um diferencial competitivo e passa a ser um sistema necessário a sobrevivências das organizações, buscando eficiência e satisfação de seus clientes. O trabalho aborda a aplicação do método de melhoria contínua Ciclo PDCA no setor de qualidade de uma indústria de embalagens, verificando as perdas devido a defeitos na produção. Com isso, busca-se analisar a diminuição de não conformidades gerados pela má produção em uma máquina de recipientes. Ao longo do trabalho serão abordadas ferramentas de melhoria da produtividade e qualidade de acordo com a etapa analisada utilizada pela empresa do estudo de caso e, baseado no roteiro PDCA, busca-se a diretriz para a redução de inconformidades. Este trabalho tem por objetivo analisar

¹ Bachelor of Architecture. Universidade Nove de Julho. E-mail: thiago.losito@outlook.com

oportunidades de melhoria com a finalidade de reduzir não conformidades identificadas ao longo do processo para garantir a qualidade na entrega e satisfação dos clientes.

Palavras-chave: Desenvolvimento de Produto. Gestão de Qualidade. Melhoria da Produção. Processo de Produção.

RESUMÉN

El país está experimentando cambios debido a la velocidad de la información y la difusión del conocimiento, lo que obliga a las organizaciones a renovar su gestión para satisfacer eficiente y eficazmente las demandas del mercado. Este proceso de cumplimiento de estos nuevos requisitos está vinculado a la búsqueda de la calidad, que es una prioridad para toda empresa. El sistema de gestión de calidad ya no es un diferenciador competitivo, sino un sistema necesario para la supervivencia de las organizaciones, buscando la eficiencia y la satisfacción del cliente. Este trabajo aborda la aplicación del método de mejora continua del Ciclo PDCA en el departamento de calidad de una empresa de embalaje, identificando pérdidas debido a defectos de producción. Este estudio busca analizar la reducción de no conformidades generadas por una producción deficiente en una máquina de envases. A lo largo del estudio, se discutirán herramientas de mejora de la productividad y la calidad según la etapa analizada utilizada por la empresa del caso de estudio. Con base en la hoja de ruta PDCA, se buscarán pautas para reducir las no conformidades. Este trabajo tiene como objetivo analizar las oportunidades de mejora para reducir las no conformidades identificadas a lo largo del proceso para garantizar la entrega de calidad y la satisfacción del cliente.

Palabras clave: Desarrollo de Producto. Gestión de Calidad. Mejora de la Producción. Proceso de Producción.

1 INTRODUCTION

Continuous improvement in production processes is essential for companies, so that their product is a differential in the market, given the competitiveness present in the market and the demand of consumers. Product development requires planning in the training of professionals and in the structural organization, in order to seek efficiency in stage, not resulting in errors that cause economic losses to the company. For the development of a product to be efficient, a systemic view of all those involved in the production line and monitoring is necessary (Neves, 2007).

Continuous improvement is a philosophy that is only possible if all areas of the company are analyzed in a structured way in order to increase production performance, integrating employees. In addition, it does not require large investments, as it is characterized by actions, identified through tools such as Ishikawa Diagram, 5W1H, PDCA cycle, among others (Furukita, 2017).

For a product to be launched on the market, a well-designed process is needed so that the idea is realized and generates a result, both economic and social, always seeking customer satisfaction. These steps are controlled by quality management.

Quality management is a process of continuous improvement, in which it analyzes the planning of activities, puts planning into practice, verifies the results generated and adjusts if there are deviations in the production line.

The objective of the research was to demonstrate the production process of plastic packaging and the quality by the PDCA methodology applied within this process, through a case study in the fictitious company EIRT9, in order to present improvements in the quality sector and reduce the number of non-conformities, consequently reducing the probability of customer complaints.

2 GOAL

2.1 GENERAL OBJECTIVE

The main objective of this work is to analyze the reduction of non-conformities in a packaging industry through the PDCA methodology. One of the premises considered was customer satisfaction.

2.2 SPECIFIC OBJECTIVES

The following specific objectives can be mentioned:

- Literature review based on the PDCA methodology;
- Verify the production process and prepare a flowchart;
- Evaluate defects and possible causes;
- Analyze possible problems and opportunities;
- Check the number of non-conformities;
- Present improvements in the production process.

3 JUSTIFICATION OF THE PROBLEM

The PDCA method is composed of four steps Plan, Do, Check and Act (Planning, Execution, Verification and Acting), being a set of tools that involve the study of causes of deviation in production in search of an action plan for the standardization of the process. The PDCA improvement method must be disclosed to all stakeholders in the organization and, therefore, it must be simple, didactic and easy to apply. Finally, the choice of this method is due to the fact that a deep analysis of the process is necessary, especially the flowchart and is low cost, as it has a simple structure, thus bringing great potential for results.

Therefore, the present study proposes to evaluate the potential of applying continuous improvements in a packaging company in order to reduce defects in the production of products, increasing efficiency and customer satisfaction.

4 LITERATURE REVIEW

According to Bessant et al. (1994), in continuous improvement a process involves the entire corporation around a broad innovation process, being a simple concept with low investment, but with great cultural difficulties for implementation and maintenance. It is an essential tool for the longevity of companies, with the character of continuous improvements that, if maintained, will give references to companies. (apud Juran, 1995).

Gonzalez and Martins (2007) say that whether structured or not, any continuous improvement must bring rapid changes to companies, so that they can have reactions to the different scenarios of socio-economic changes (apud Kaplan et al, 1996).

According to Alencar (2008), the PDCA Cycle (Plan, Do, Check, Action), also known as the Shewhart Cycle or Deming Cycle, is a simple technique that aims to control the process (Figure 1).

Figure 1

PDCA Cycle

Source: Bezerra (2014).

According to Neves (2007), the PDCA method is usually used as departmental goals or in individual cells to achieve the company's strategic goals, always bringing cost, quality and productivity advantages to the company. (Figure 2).

Figure 2

PDCA Framework

PDCA	FLUXO	ETAPA	OBJETIVO
P	1	Identificação do problema	Definir claramente o problema e reconhecer sua importância.
	2	Observação	Investigar as características específicas do problema com uma visão ampla e sob vários pontos de vistas.
	3	Análise	Descobrir as causas fundamentais.
	4	Plano de ação	Conceber um plano para bloquear as causas fundamentais.
D	5	Ação	Bloquear as causas fundamentais.
C	6	Verificação	Verificar se o bloqueio foi efetivo.
	?	(Bloqueio foi efetivo?)	
A	7	Padronização	Prevenir contra o reaparecimento do problema.
	8	Conclusão	Recapitular todo o processo de solução do problema para trabalho futuro.

Source: (Campos, 1992).

According to Aguiar (2012), PDCA must be directed to three forms of management in order to achieve the company's survival goals, as follows:

- Maintenance of quality, to be able to provision the company's results;
- Quality improvement, so that with the existing methods you can always have a continuous improvement in the company's results;

The tools that will be covered are: brainstorming, cause and effect diagram, 5W1H and flowchart.

4.1 BRAINSTORMING

According to Santos, Ceccato and Michelin (2011), brainstorming can be defined as a storm or rain of ideas. It is a group technique where people can present ideas freely, it is not advisable for there to be criticism and it needs to occur in a way that does not spend too much time.

4.2 CAUSE AND EFFECT DIAGRAM

According to Costa (2003), this diagram was created in 1943 by Ishikawa, which is why it is known as the Ishikawa Diagram or fishbone because of its shape, it was developed to be used by quality circles to study the problems identified as priorities by the Pareto analysis, which represent the relationship between the "effect" and all the possible "causes" that can contribute to this effect.

4.3 5W1H "ACTION PLAN"

According to Maiczuk and Júnior (2013), 5W1H is used in order to inform and certify a cluster of action plans, diagnose a problem and design actions.

According to Campos (1998), 5W1H comes from English and means: What; Why; How; Who (who will be responsible); When (when, establishes the deadline for execution); Where (where it will be held).

4.4 FLOW CHART

Neves (2007) says that the flowchart graphically demonstrates the steps to be followed in the process, in order to know its sequence. In this way, it becomes essential for the standardization and understanding of it. After its completion, it can be analyzed with what is achieved in practice in order to achieve improvements.

5 METHODOLOGY USED

The scientific research developed is of an applied nature, exploratory objective, combined approach, with bibliographic character and the method through a case study, using various bibliographic sources such as books, academic publications, internet, standards, among others.

The methodology used is divided into three stages: The first stage is related to the Bibliographic Review, in which quality management topics are addressed, such as continuous improvement, PDCA methodology, with a theoretical foundation about the project. Then, a packaging company and its quality management system are studied and analyzed, elaborating a Discussion of Results, displaying the values and benefits of the PDCA methodology in the company. In the last phase, the benefits of using continuous improvement in the product production process are presented. In the end, it is concluded that the search for quality is now a concern of all companies, which has become a priority for every organization

6 QUALITY MANAGEMENT: PDCA METHODOLOGY IN A PACKAGING INDUSTRY

The first contact that the consumer has with the product is through the packaging, and the relationship with the consumer is established.

The company's flowchart is divided into three steps. The first step in the packaging production process is printing, where the virgin transparent BOPP reel is inserted into an 8-color flexographic printer, these printers are high-tech equipment, which result in productivity, agility and excellent print quality ranging from the simplest to the most sophisticated packaging.

The second step is the lamination process, which is the process used for packaging of more than one layer, called laminated packaging. The laminator in its lamination process is able to join two different or equal structures in the same film, without the use of solvent and free of odors, which is an important factor for food packaging. The last step is the trimming and cutting of coils in the sizes and patterns desired by customers, where the operator performs the cutting, eliminating product non-conformities.

And finally, the packaging production process is completed by finishing, where the reels are packaged and palletized to be delivered to the customer.

6.1 STRATEGIC MANAGEMENT OF PRODUCTION AND OPERATIONS

MISSION: To provide high-reliability packaging for the food industry.

VISION: To be a reference as a Brazilian packaging supplier.

VALUES: - Efficiency;

-Technology;

-Reliability;

Table 1

SWOT analysis

FORCES - Strategic vision of the business - Technical qualification of the team	WEAKNESSES - Market entrant - High cost of machinery
OPPORTUNITIES - Low number of competitors - Huge market in the country	THREATS - Unstable economy in the country - Competitors with large structures

Source: The author.

The quality process monitors the entire production, so that the appearance of non-conformities in the product is avoided.

Quality control identified through the SAC (customer service), a problem with one of the batches of packaging that the company produces, where the defect found was printing failures and bubbles in the packaging. Upon learning this, the responsible sector opened an RNC (Non-Conformity Report). In view of this, the possible causes of the problems were raised:

- Printer being shut down when the operator is away
- Unskilled labor
- Wear of rubber rollers in the lamination process
- Factory Layout

These causes will be exposed in more detail in the cause and effect diagram where the objective is to identify in the tool the causes and sub-causes of the problem presented.

6.2 STUDY AND OPTIMIZATION OF THE PRODUCTION PROCESS

6.2.1 Cause and Effect Diagram

In this tool, the quality sector decided to treat the causes of the problem of printing failures and bubbles in the packages, presenting sub-causes (Figure 4). These suggestions were obtained through a brainstorming session, in which they guided the planning stage.

Figure 4

Cause and Effect Diagram/Print Defect and Bubble Analysis

Source: The author.

The observation carried out by the quality sector identified in the execution method factor a cause related to the central problem, due to the printer operator having to be absent from his workstation during lunch hours and to perform his needs he turns off the printer, thus causing printing failures in the packages.

As far as the machines are concerned, the causes found were the wear and tear of printer components and also the wear of the rubber rollers in the laminator, thus causing printing failures and bubbles in the packaging.

In the environmental factor, a disorganization was noticed in the positioning of equipment and inputs used in the processes, where the inks were far from the printers and the rewinder far from the finishing process, causing unnecessary displacement of operators and loss of time in the production process.

In the labor factor, the lack of training in the operation of printing and laminating equipment and also in the execution of equipment maintenance was noticed.

6.2.2 5W1H Action Plan

After the analysis, the commission concluded that the defects in the product batch occurred due to the lack of corrective and preventive maintenance on the equipment, printing operator having to be absent from the equipment and disorganized layout of the factory.

Therefore, the 5w1h model action plan was created to mitigate the cause of the failures, as shown in the following table (Table 2. Table 5W1H).

Table 2

Table 5W1H

Table 1 - Action plan					
WHAT	WHERE	BECAUSE	HOW	WHO	WHEN
Hire Printing Assistant	Printing industry	Operator support in handling paints	Through resume evaluation	HR Sector	30/05/2020
Perform corrective maintenance	At the factory	Component wear	Replacing Worn Components	Production	15/05/2020
Create preventive maintenance schedule	For all production process equipment	Maintain the smooth operation of the factory	Component Inspection & Replacement	Production	30/05/2020
Schedule training	Training Center	Equipment maintenance	Schedule training	HR	10/06/2020

Source: The author.

6.3 VIABILITY

Cycle analysis for each phase of the process is essential to avoid wasting resources on any project. Basically, this analysis is verified under the strategic aspects of the company and is constantly updated (Araújo et al, 2013).

Because it is carried out at the time of planning, production waste is minimal, since, once the failure is identified, production is immediately improved. The economic viability of this methodology is simple, since there are investments only in the organization of planning and training of employees.

7 RESULTS AND DISCUSSIONS

The results generated for the company were not immediate, as the paradigm shift goes through a period of implementation, so little by little the results came out and knowledge of

the learning process of new methodologies was added by the company. Prior to the program, defects that represented an average of 1.6% of production, with the month of December 2019 as a reference and were concentrated in printing failures, representing 31% of discarded products.

After this identification, the printing machines were studied and it was found that of the five printers, only a certain equipment accounted for 55% of the failures.

The quality method implemented for the analysis of batches that presented manufacturing defects made a series of managerial controls that did not exist in the company very simple. These controls are the basis for new continuous improvement efforts.

The fact of adopting a printing assistant, creating a schedule of preventive maintenance of the equipment and training of professionals exceeded the financial return on investment, as the company started to have more reliability of its products before customers. Soon the company started to offer a higher quality product to its customers, with a significant increase in its sales. This difference between the production before the PDCA methodology (December) and after (from January) can be seen in the comparison below, representing a loss decrease of 45%.

8 FINAL CONSIDERATIONS

This work aimed to present possible waste reduction within the packaging production cycle through the PDCA cycle and its tools in search of continuous improvement. Because it is easy to develop and understand, this methodology is widely used by companies in any field.

However, despite being easy to apply, some proposals were not properly executed, since it is difficult to break some of the company's paradigms.

These initial project barriers were overcome throughout the process and after proper training of employees, a significant reduction in packaging waste and, especially, raw material can be perceived.

Non-conforming products were separated for analysis and mapping of defects so that failures could be mitigated, continuously improving the production process.

With this waste reduction, the company can increase its profit margin without having to reduce its quality or increase its sales price, being a great differential in the market.

ABSTRACT

The present study aims to provide a critical analysis of the historical marginalization of the three feminine powers — cyclicity, ancestry, and sexuality — and their impact on female subjectivity, as they directly influence the construction of women's identity, self-esteem, and autonomy. The central question of this research is: How does the historical marginalization of cyclicity, ancestry, and sexuality affect the construction of women's identity, self-esteem, and autonomy, and in what ways can the conscious integration of these three powers promote empowerment and authenticity? The hypothesis that supports this study is that, through self-knowledge, women achieve authenticity and liberation in the process of self-occupation by re-signifying individual and collective experiences. To substantiate the critical analysis, the theoretical concepts of Audre Lorde (2019), who problematizes power as erotic and self-expression as resistance, are used; Brené Brown (2019), who discusses vulnerability and courage; Chimamanda Ngozi Adichie (2014), with her contributions on the danger of a single story, feminism, and the social construction of femininity; Clarissa Pinkola Estés (1992), on ancestral archetypal feminine wisdom; Michel Foucault (1983; 1986), on biopower and subjectivation; Silvia Lane (1999), from the perspective of critical social psychology; and Zygmunt Bauman (2001), in his reflections on identity in liquid modernity. This bibliographic research seeks to integrate these authors to broaden the understanding of the phenomenon, highlighting how the conscious reclaiming of these three powers can serve as a path to personal and social transformation. The analysis aims to demonstrate that self-occupation — understood as the capacity to recognize oneself and lead one's own life — is strengthened when women reconnect with their ancestry, embrace their natural cycles, and express their sexuality and creativity.

Keywords: Female Subjectivity. Self-knowledge. Cyclicity. Ancestry. Sexuality. Authenticity.

RESUMO

O presente estudo tem como objetivo trazer uma análise crítica sobre a marginalização histórica dos três poderes femininos — ciclicidade, ancestralidade e sexualidade — e seu impacto na subjetividade feminina, ao influenciar diretamente a construção da identidade, da autoestima e da autonomia nas mulheres. A questão central da pesquisa é: Como a marginalização histórica da ciclicidade, ancestralidade e sexualidade impacta a construção da identidade, autoestima e autonomia de mulheres, e de que forma a integração consciente

¹ Universidade Paulista. E-mail: juliacaminha@gmail.com

² Dr. Universidade Paulista. E-mail: lisienne.silva@docente.unip.br

desses três poderes pode promover empoderamento e autenticidade? A hipótese que sustenta este estudo é a de que, por meio do autoconhecimento, promove-se autenticidade e libertação às mulheres na ocupação de si mesmas ao ressignificar experiências individuais e coletivas. Para fundamentar a análise crítica, são utilizados os conceitos teóricos de Audre Lorde (2019), que problematiza o poder como sendo erótico e a autoexpressão como resistência; Brené Brown (2019), ao abordar vulnerabilidade e coragem; Chimamanda Ngozi Adichie (2014), com suas contribuições sobre o risco da história única, feminismo e construção social do feminino; Clarissa Pinkola Estés (1992) sobre sabedoria arquetípica ancestral feminina; Michel Foucault (1983; 1986), sobre biopoder e subjetivação; Silvia Lane (1999), a partir da psicologia social crítica e Zygmunt Bauman (2001), ao refletir sobre identidade na modernidade líquida. A pesquisa aborda uma metodologia bibliográfica, buscando integrar esses autores na compreensão do fenômeno, evidenciando como o resgate consciente desses três poderes pode atuar como caminho de transformação pessoal e social. A análise busca revelar que a ocupação de si, entendida como a capacidade de se reconhecer e liderar a própria vida, é potencializada quando a mulher se reconecta com sua ancestralidade, compreende seus ciclos naturais e expressa sua sexualidade e criatividade.

RESUMEN

Este estudio tiene como objetivo proporcionar un análisis crítico de la marginalización histórica de los tres poderes femeninos (ciclicidad, ascendencia y sexualidad) y su impacto en la subjetividad femenina, influyendo directamente en la construcción de la identidad, la autoestima y la autonomía de las mujeres. La pregunta central de investigación es: ¿Cómo impacta la marginalización histórica de la ciclicidad, la ascendencia y la sexualidad en la construcción de la identidad, la autoestima y la autonomía de las mujeres, y cómo puede la integración consciente de estos tres poderes promover el empoderamiento y la autenticidad? La hipótesis subyacente a este estudio es que, a través del autoconocimiento, se promueve la autenticidad y la liberación de las mujeres en su autoocupación al redefinir las experiencias individuales y colectivas. El análisis crítico se apoya en los conceptos teóricos de Audre Lorde (2019), quien problematiza el poder como erótico y la autoexpresión como resistencia; Brené Brown (2019), quien aborda la vulnerabilidad y el coraje; Chimamanda Ngozi Adichie (2014), con sus contribuciones sobre el riesgo de una sola historia, el feminismo y la construcción social de lo femenino; Clarissa Pinkola Estés (1992) sobre la sabiduría femenina arquetípica ancestral; Michel Foucault (1983; 1986) sobre el biopoder y la subjetivación; Silvia Lane (1999), basada en la psicología social crítica; y Zygmunt Bauman (2001), quien reflexiona sobre la identidad en la modernidad líquida. La investigación utiliza una metodología bibliográfica, buscando integrar a estos autores en la comprensión del fenómeno, destacando cómo la recuperación consciente de estos tres poderes puede actuar como un camino hacia la transformación personal y social. El análisis busca revelar que la autoocupación, entendida como la capacidad de reconocer y liderar la propia vida, se potencia cuando las mujeres reconectan con su ascendencia, comprenden sus ciclos naturales y expresan su sexualidad y creatividad.

Palabras clave: Subjetividad Femenina. Autoconocimiento. Ciclicidad. Ascendencia. Sexualidad. Creatividad. Autenticidad.

1 INTRODUCTION

Throughout history, the feminine has been subjected to systematic processes of silencing, control, and marginalization that have profoundly impacted the way women build their identity and relate to themselves and society. The patriarchal structure, based on power relations, established norms that defined the social roles attributed to women, as well as the limits of their subjective experiences. Michel Foucault (1983; 1986) points out that bodies are targets of disciplinary technologies that, at the same time that they produce knowledge, impose restrictions and configure specific modes of subjectivation. In the case of women, this disciplining is expressed in the control of sexuality, reproduction, emotional expression, and identity.

Among the elements most affected by this process are three fundamental dimensions of the female experience: cyclicity, ancestry, and sexuality/creativity. These dimensions, which could constitute sources of power, autonomy and authenticity, have historically been devalued and associated with fragility, irrationality or transgression. Marginalization occurred in conjunction with a historical-cultural movement aimed at maintaining patriarchal hierarchy. As Bauman (2001) observes, in a liquid modernity characterized by identity fluidity, women are encouraged to constantly reinvent themselves, but without the support of solid bonds of belonging, which intensifies subjective fragmentation and the feeling of insecurity.

In this context, the demand to conform to social standards — related to beauty, fashion, motherhood, professional performance and relationships — deepens a cycle of permanent demand. Often, the more women sacrifice themselves to meet external expectations, the more they are socially valued, perpetuating a logic of recognition conditioned to the renunciation of themselves. As Lorde (2019) points out, patriarchy is not limited to institutions, but also crosses the way women perceive themselves and relate to the world. This internalization of patterns often results in feelings of inadequacy, shame, and self-sabotage, as evidenced in the so-called Impostor Syndrome (CLANCE; IMES, 1978; BROWN, 2019).

Cyclicity, linked to biological and emotional rhythms, was disregarded in a culture that favors linearity and continuous productivity. Ancestry, which refers to the transmission of knowledge between generations, has been weakened by modern individualism and the devaluation of women's collective histories. Sexuality, also understood as vital energy and creativity, was subjected to processes of moral control, limiting the full expression of the body and desire. In this sense, Audre Lorde (2019) defends eroticism as a creative and

transformative force, often distorted by patriarchy and reduced to repression or the satisfaction of others:]

When I speak of the erotic, then, I speak of it as an affirmation of the vital force of women; of that strengthened creative energy, the knowledge and application of which we now claim in our language, our history, our dance, our loves, our work, our lives. (LORDE, 2019, p. 70)

Chimamanda Ngozi Adichie (2015) also emphasizes the importance of narratives in the construction of the feminine, showing how repeated stories shape beliefs and behaviors. For the author, recognizing the plurality of voices is essential, as she says, "what the discovery of African writers did for me was this: it saved me from having a unique story about what books are" (ADICHIE, 2015, p. 9). When narratives are crossed by silencing and oppression, they not only perpetuate inequalities, but also limit the possibilities for transformation. Thus, revisiting cyclicity, ancestry and sexuality means rescuing individual and collective dimensions, creating conditions for the strengthening of women in their processes of self-knowledge and emancipation.

Given this scenario, the present study aims to investigate how the historical marginalization of these three dimensions impacts female subjectivity and how their conscious rescue can promote empowerment and authenticity. It is based on the hypothesis that, through self-knowledge, it is possible to resignify experiences, deconstruct internalized patterns and expand the occupation of oneself, allowing women to constitute themselves as active agents in the construction of their own narratives.

For the development of this proposal, a bibliographic research was carried out based on authors such as Audre Lorde (2019), Brené Brown (2019), Chimamanda Ngozi Adichie (2015), Clarissa Pinkola Estés (1992), Michel Foucault (1983; 1986), Silvia Lane (2000) and Zygmunt Bauman (2001), whose contributions allow an interdisciplinary analysis of power, identity, subjectivity and transformation.

Thus, this article seeks to contribute to academic and social debates about the awakening of female consciousness, offering theoretical subsidies to understand how the reconnection with these three powers can be configured as a path of liberation and authenticity in the face of contemporary challenges.

2 SILENCING OF THE FEMININE: POWER, CONTROL AND FRAGMENTATION OF SUBJECTIVITY

The marginalization of the feminine, as a historical process, is not limited to the exclusion of women from formal spaces of power. It involves, above all, the construction of control devices over their bodies, emotions and narratives. In this sense, Foucault (1983; 1986) points out that power is not only exercised in a repressive way, but also in a productive way, that is, it creates knowledge, norms and practices that shape behaviors and subjectivities.

In the case of women, this mechanism is manifested through what the author calls biopower, in which the body becomes a privileged target of social and political regulation. The medicalization of the menstrual cycle, the normalization of motherhood and the control of female sexuality exemplify how society disciplines and organizes women's bodies to meet the interests of a patriarchal order.

This discipline, however, is not only established by explicit laws or prohibitions, but also by seemingly banal daily practices, which guide how women should think, feel and relate to themselves and others. From childhood, discourses are transmitted that teach which behaviors are considered "appropriate" or "acceptable". The result is the construction of a process of internal surveillance, which leads to self-policing. As Foucault (1983; 1986) observes, women themselves begin to reproduce and reinforce these norms unconsciously, perpetuating structures of oppression.

Female subjectivity, in this context, is built on a terrain of restrictions, marked by the repression of desires, the denial of female ancestral knowledge and the absence of self-recognition. It is no coincidence that, although all human beings are born of a woman, we still live in a society marked by machismo, misogyny, and systematic criticism of female behaviors, desires, and ambitions.

With the arrival of liquid modernity, as analyzed by Bauman (2001), these control mechanisms take on new forms. If before society was structured in rigid and predictable norms, today the scenario is characterized by fluidity and instability.

For women, this new context represents both opportunities and challenges: on the one hand, it creates space to question old patterns; on the other hand, there is a constant pressure for reinvention, performance and adaptation to unattainable ideals. As the author points out, identity is continuously reconstructed, never finalized or stable, which generates a permanent state of anxiety.

Consider, for example, the contradiction of self-constituted identities that must be sufficiently solid to be recognized as such and at the same time flexible enough not to impede the freedom of future movement in constantly changing and volatile circumstances. Or the precariousness of human partnerships, now burdened with higher expectations than ever, but poorly institutionalized (if institutionalized), and therefore less resistant to the additional burden. (BAUMAN, 2001, p. 52)

In this scenario, the three powers of the feminine — cyclicity, ancestry, and sexuality — are further stifled. Cyclicity, which invites the recognition of natural and internal rhythms, clashes with the capitalist productive logic, sustained by linearity, constancy and continuous growth. The female body, in this process, is reduced to a machine, disregarding its physiological and emotional variations.

The menstrual cycle, for example, is often medicalized or made invisible, producing a rupture between the woman and her biological processes. This separation weakens the ability to self-perceive and respect one's own limits, resulting in physical and emotional exhaustion.

Contemporary culture imposes unrealistic standards of productivity and perfection on women, symbolized by the figure of the "Bionic Woman": impeccable body, domesticated emotions and constant availability. This expectation generates physical and emotional overload, resulting in exhaustion, frustration, or paralysis in the face of the fear of not meeting social demands. The pressure for performance and belonging intensifies in liquid modernity (Bauman, 2001), in which identities become unstable and continuously reconfigured.

The recognition of cyclicity allows women to align their activities with their own internal rhythms — creation, planning, execution, review and rest — promoting autonomy, energy preservation and a fuller experience. However, historically, this cyclical power has been invisible, medicalized, or pathologized (Illich, 1976; Emily Martin, 1987), creating a disconnect between the woman and her body. Cyclicity, which reflects natural rhythms of bodily and emotional wisdom, is often perceived as instability, fragility, or an obstacle to the linear productivity required by capitalism.

Ancestry, a central element for the sense of belonging and identity, also suffers marginalization. In the liquid society, community bonds are weakened, and knowledge transmitted orally by elderly women — such as practices of care, spirituality and resistance — is devalued (Bauman, 2001; Gonzalez, 1984; Anzaldúa, 1987). This historical erasure limits the recognition of a lineage of feminine strength and creativity, while the hegemony of androcentric scientific knowledge delegitimizes non-formalized knowledge. Women lose solid

references and are often compelled to adapt to external narratives about what a woman "should be", reinforcing insecurity and disconnection with herself.

Control over the body intensifies with medicalization and techno-scientific science, which impose norms on food, health, and aesthetics (Ortega, 2003; Haraway, 1991). Perfect health becomes an ideal to be displayed continuously, configuring itself as a new social utopia, while the circulation of digital information, paradoxically, contributes to misinformation and anxiety (Bauman, 2021).

Sexuality, understood by Audre Lorde (2019) as vital and creative energy, constitutes a deeply controlled field. Female eroticism, a source of personal and collective power, is historically silenced, repressed, and devalued in patriarchal societies. When associated with guilt or danger, it restricts not only pleasure but also creativity and authentic expression.

As Lorde (2019) observes, naming experiences and breaking silence is an essential political act "In the name of silence, each of us evokes the expression of our own fear [...] But most of all, I think we fear visibility that we can't really live without." (LORDE, 2019, p. 53)

The fragmentation of these three powers—cyclicity, ancestry, and sexuality—produces a subjectivity marked by disconnection, low self-esteem, anxiety, and difficulty in self-confidence (Lane, 1999; Brown, 2019). Female identity, shaped by limiting roles and hegemonic discourses, becomes restricted, reinforcing the internalization of patriarchal norms (Beauvoir, 1949; Butler, 1990).

The rescue of these powers involves self-knowledge and practices of collective resistance. Reconnecting to cyclicity can involve body awareness, taking care of one's own rhythms, and valuing emotional experience; ancestry is rescued through women's circles, oral histories, community rituals, and intergenerational dialogues (Julieta Paredes; Gonzalez, 1984; Anzaldúa, 1987); sexuality can be celebrated as a creative and transformative energy, breaking taboos and resignifying female pleasure and creativity (Lorde, 2019).

In addition, the deepening of the analysis requires an intersectional perspective: black, indigenous, and peripheral women face specific forms of marginalization that articulate gender, race, and class (hooks, 2000; Ribeiro, 2017; Lugones, 2008). Recognizing these multiple layers of oppression is essential to understanding the diversity of experiences and strategies of resistance of the feminine.

In this context, self-knowledge is not just an individual exercise, but a political and transformative act. It allows the identification and questioning of internalized norms, reconstructing one's own narratives, and integrating individual and collective history,

promoting authenticity, freedom, and creativity (Lane, 2000; Brown, 2019). When women know each other deeply, they are strengthened not only personally, but collectively, inspiring others and opening paths to a more just and egalitarian society, in which female subjectivity can flourish in its entirety.

2.1 THE DOMESTICATED FEMININE AND THE FRAGMENTATION OF SUBJECTIVITY

Female subjectivity was historically constructed from unequal power relations, which shaped behaviors, desires, and ways of being over time. Silvia Lane (2000) argues that psychological phenomena cannot be understood in isolation, as they emerge from social, cultural and historical contexts. The feelings of inadequacy, anxiety or low self-esteem that many women experience are not only individual, but reflections of internalized collective processes, which cross their histories, bodies and social relationships.

To be or not to be? It is the great moral question. What will be its ethical equivalence? 'Why are we what we are?' And the answer lies in the conception of the human being that we have adopted: we can be mere creatures at the mercy of superior forces, or we can become subjects of the History of our society, that is, capable of deciding on which ethical values will guide our actions and interactions. (LANE, 2000, p.68)

Oppression over the feminine also acts through silencing. Audre Lorde (2019) emphasizes that when women do not have space to express emotions, desires, or narratives, they internalize symbolic violence and distance themselves from their creative force. The imposed silence is not neutral; It serves as a mechanism for maintaining patriarchal power, reinforcing external norms and expectations that domesticate the feminine. For Lorde, transforming silence into language and action constitutes a revolutionary act, essential for the reconstruction of women's identity and personal power.

The fragmentation of subjectivity is, therefore, a structural phenomenon. It is not just about individual experiences of self-criticism or insecurity, but about an ongoing process of domestication of the feminine, in which women are shaped to correspond to external standards and demands, often internalized as obligatory or natural. This internal disconnection makes the woman perceive herself mainly through the eyes of the other, constantly seeking external validation and moving away from her own authenticity and autonomy (Brown, 2019; Butler, 1990).

In addition, fragmentation is intensified by historical and cultural factors that devalue cyclicity, ancestry, and sexuality. Women are taught, from an early age, to suppress

emotions, regulate behaviors and meet linear expectations of productivity, beauty and sociability, while ancestral knowledge, care practices and creativity are relegated to silence (Anzaldúa, 1987; hooks, 2000). This configuration contributes to the construction of a subjectivity that does not fully recognize its creative, ethical, and relational potential, making it difficult to integrate experiences and form a solid and autonomous identity.

Understanding female subjectivity as the result of social and historical processes of domination is fundamental to think about strategies to rescue authenticity, autonomy and internal power. Breaking the cycle of silencing and domestication requires, in addition to self-knowledge, collective and cultural practices that value the expression, creativity, and ancestry of the feminine, enabling each woman to recognize herself as a full subject and agent of her own history (Lorde, 2019; Ribeiro, 2017; Lugones, 2008).

2.2 THE LIQUID SOCIETY AND THE (PRE)OCCUPATIONS OF CONTEMPORARY LIFE

Nowadays, there is a social model characterized by the fluidity and instability of relationships, in which individuals are constantly pressured by external and internal expectations. According to Bauman (2001, p. 25), "The individual submits to society and this submission is the condition of his liberation."

The author describes this context as liquid modernity, in which bonds, values, and identities are fragile, transitory, and constantly reconfigured. In this scenario, women face specific challenges: they are called upon to play multiple roles — professional, maternal, marital, social — that are often contradictory, which causes inadequacy, anxiety and emotional exhaustion. This overload is intensified by historical patriarchal structures, which have shaped gender roles and limited the full expression of female subjectivity (Lorde, 2019; Lane, 2000; hooks, 2000).

The construction of female identity, therefore, is deeply rooted in historical, economic, and political conditions. Understanding gender oppression only as an individual experience is insufficient; it is necessary to recognize its collective dimension. Feelings of inadequacy, perfectionism, and self-criticism are largely products of systems that legitimize inequalities, not women's personal failings.

In this context, many women live in a constant state of (pre)occupation — occupied in advance — either with past pain, which feeds resentment or depressive states, or with anxieties projected into the future. The absence of full presence in the "here and now" makes

it difficult to connect with one's own authenticity and strengthens patterns of self-sabotage and extreme demand. Lane (2000, p. 66) points out:

In everyday life, emotions should be repressed, as they disturb rationality and psychological health. Conscience was saved. Talking, demonstrating, convincing, should be the invincible weapons of the human being.

This dynamic is closely linked to historical and cultural structures that define gender roles and shape female identities to serve the other rather than herself. As Bauman (2001) observes, class and gender significantly influenced the options available to each person; breaking through these barriers was not much simpler than challenging the assigned position in the 'divine hierarchy of being' prior to modernity. Thus, for all intents and purposes, class and gender were considered 'natural aspects', and the mission of many individuals was to 'adjust' to the assigned space, acting in accordance with others who were there.

The risk of the "single story", as Chimamanda Ngozi Adichie (2014, p.13) warns, reinforces this precariousness of identity:

I realized that I had been so immersed in the media coverage of Mexicans that they had become one thing in my mind: the abject immigrant. I had believed in the unique story of the Mexicans and I was ashamed of it. This is how a unique story is created: show a people as one thing, one thing, without stopping, and that is what this people becomes.

When only one narrative about what it means to be a woman prevails, other ways of existing are made invisible, reinforcing the fragmentation of identity and the internalization of normative standards.

Self-knowledge, in this context, becomes a political act. Lane (2000) emphasizes that overcoming states of (pre)occupation does not occur only through individual strategies, but through a critical understanding of the social forces that produce them. Recognizing the historical and collective origin of fears, anxieties, and frustrations allows women to articulate political awareness and self-perception, promoting integration between personal experiences and social structures.

Audre Lorde (2019) reinforces that breaking with oppressive narratives and recognizing erotic power are essential strategies for resistance and identity reconstruction.

The silence imposed on women is a tool for maintaining patriarchy; transforming it into conscious action makes it possible to affirm autonomy, creativity and authenticity.

Thus, living in liquid modernity implies unique challenges for women: dealing with social fluidity, the multiplicity of roles, the demand for performance and the pressure for constant belonging. At the same time, it represents an opportunity to resignify identities, question internalized norms, and reconstruct personal and collective narratives based on self-knowledge and critical awareness (Bauman, 2001; Lorde, 2019; Lane, 2000; Adichie, 2014).

3 OBJECTIVES

3.1 GENERAL OBJECTIVE

To investigate how self-knowledge, articulated with the rescue of ancestry, cyclicity and sexuality/creativity, contributes to authenticity and liberation of female subjectivity.

3.2 SPECIFIC OBJECTIVES

1. To analyze how the historical marginalization of these three powers impacts women's self-esteem, identity, and personal power.
2. Investigate how self-knowledge practices can promote the integration of these powers, strengthening autonomy, self-confidence and authenticity.
3. Discuss symbolic and practical strategies for self-occupation, including reconnection with ancestry, cyclical rhythms, and creative/sexual expression.
4. Reflect on the relevance of collective spaces, such as women's circles, to enhance experiences of self-knowledge and autonomy.

4 METHODOLOGY

The present study was developed from a qualitative bibliographic research, with a critical and interpretative focus, aiming to understand the historical construction of female subjectivity and the impacts of the marginalization of essential aspects of the feminine, such as cyclicity, ancestry and sexuality/creativity.

4.1 JUSTIFICATION OF THE QUALITATIVE APPROACH

The qualitative approach was chosen because it enables the in-depth analysis of complex phenomena, allowing the understanding of experiences, meanings and historical processes that cannot be reduced to quantitative data. This approach is appropriate to

investigate how social, cultural, and political discourses shape women's perceptions of themselves, their bodies, and their relationships with the world, as well as allowing the identification of paths of resistance and empowerment.

4.2 CRITERIA FOR SELECTING WORKS

The selection of works considered authors who address:

- History and social construction of female subjectivity (Silvia Lane, Foucault, Bauman);
- Creative expression and sexuality as dimensions of female power (Audre Lorde, Brené Brown);
- Narratives and ancestry as elements of resistance and rescue of identity (Chimamanda Ngozi Adichie, bell hooks, Maria Lugones, Gloria Anzaldúa);
- Contemporary context and liquid modernity (Bauman, Ortega).

Priority was given to works that enable an integrated analysis between past and present, considering how historical processes influence women's individual and collective experiences in contemporary times.

The methodological procedure adopted involved:

1. Critical and systematic reading of the selected works, identifying key concepts about power, identity, subjectivity, silencing and female self-knowledge;
2. Registration and thematic organization of contents, separating information related to cyclicity, ancestry and sexuality/creativity;
3. Interpretative analysis, relating theoretical concepts to the contemporary context, with attention to the influence of cultural, social and political discourses on women's lives;
4. Critical synthesis, integrating different theoretical perspectives to build a comprehensive understanding of the impacts of the marginalization of the three powers of the feminine and the paths of rescue through self-knowledge;
5. Articulation between theory and practice, with emphasis on proposals that allow the reconstruction of female identity and the strengthening of autonomy, authenticity and self-occupation.

This approach allowed us to develop an in-depth, sensitive and contextualized analysis, respecting the complexity of women's experiences and the diversity of experiences and identities.

The study, therefore, is not limited to reflecting on the historical and social impacts on the construction of female subjectivity, but seeks to propose concrete paths for the reintegration of cyclicity, ancestry and sexuality/creativity. Self-knowledge is understood as a continuous process of liberation, expression and reconstruction of oneself, integrating individual, collective and political dimensions of the female experience.

4.2.1 Authenticity and female liberation

Social narratives that devalue central dimensions of the female experience span centuries and consolidate themselves as normative discourses that define who women "can" or "should" be. This symbolic structure, transmitted through culture, education, and institutions, acts in a way that internalizes messages of inadequacy, submission, and limitation, leading to feelings of shame, insecurity, and fragmentation. Brené Brown (2019) adds that shame is a paralyzing emotion, as it prevents the authentic expression of the self and reinforces conforming behaviors, making it difficult for women to fully live their identity.

The historical marginalization of the three feminine powers—ancestry, cyclicity, and sexuality/creativity—is not only symbolic, but also emotional, physical, and spiritual. It creates a cycle of silencing and dependence, which distances women from their creative power and the sense of belonging. This distancing reveals how power relations are inscribed in the body and in subjectivity, operating not only through explicit oppression, but also through the invisible regulation of emotions and choices.

However, the constant fluidity of social expectations can be understood as both a threat and an opportunity. On the one hand, women are pressured to conform to unattainable and changeable standards; on the other hand, this same fluidity opens gaps for transformation, as long as there is an internal support supported by self-knowledge and self-awareness. In this sense, Foucault (1983; 1986) states that knowing oneself is an act of resistance, as it means unveiling the subtle forms of power that seek to govern subjectivity. Self-knowledge thus becomes a resource for contestation and reinvention.

Brown (2019) reinforces this perspective by arguing that authenticity is not limited to seeking social acceptance, but to having the courage to show oneself vulnerable and truthful, even in the face of the risk of rejection. When women take care of themselves, they break with the imprisonment of external expectations and free themselves from narratives that do not belong to them. This liberation does not mean the absence of conflict or pain, but the ability to sustain choices aligned with one's own essence, even in adverse contexts.

In a liquid and fragmented society, as Bauman (2001) points out, authenticity becomes a revolutionary act. Finding an inner core of stability is essential to resist external pressures and maintain the integrity of one's existence. For women, this core can be strengthened by the integration of the three feminine powers, which offer a symbolic and practical basis for building a meaningful, authentic, and creative life.

At this point, Audre Lorde's reflection (2019, p. 69) broadens the debate by denouncing the logic of systems that value profit to the detriment of human needs:

The greatest horror of any system that defines what is good in relation to profit rather than human needs, or that defines human needs from the exclusion of the psychic and emotional components of those needs—the greatest horror of such a system is that it robs our labor of its erotic value. its erotic power and the charm for life and fulfillment.

Lorde introduces erotic power as a vital dimension that rescues the value of subjective experience and the joy of existing, connecting authenticity with vitality and enchantment.

Identity, in this process, must be understood as a living organism, in constant movement, which is transformed into cycles of life, death and rebirth. Silvia Lane (2000) emphasizes that identity is constituted in the social roles we play and is reinvented in the relationship with the other, because there is no "me" without "us". Thus, women can only recognize themselves in their entirety in the encounter with others — especially in collectives that legitimize their voice.

The plurality of narratives, as Chimamanda Ngozi Adichie (2015) reminds us, is fundamental to break stereotypes and expand the possibilities of existence:

Start the story with the arrows of the Native Americans, rather than the arrival of the British, and the story will be completely different. Start history with the failure of the African state, and not with the colonial creation of the African state, and history will be completely different. (ADICHIE, 2015, p.14)

This alert invites us to retell women's stories from their own references, recovering silenced voices and recognizing the multiple ways of being and existing.

Self-knowledge, therefore, emerges as the guiding thread of the occupation of oneself, understood as the ability to fully inhabit one's own existence with authenticity and autonomy. Such a process is not lonely; It is rooted in collective practices, such as women's circles,

which function as spaces for welcoming, sharing, and mutual recognition. In an exponential way, this ancestral and accessible practice allows a woman to recognize herself in the speech of the other, breaking subjective isolations and resignifying individual pains as collective experiences.

In this way, promoting self-knowledge is not only a strategy for personal development, but a political act that confronts historical structures of marginalization. By integrating ancestry, cyclicity and sexuality/creativity, women reconnect with their power, reframe their trajectory and expand the collective field of female emancipation. This reconnection not only strengthens subjectivities, but also fuels the struggle for equity and social justice, transforming the private into the political and the individual into the collective.

4.3 TAKING CARE OF ONESELF: SELF-KNOWLEDGE AS AN ACT OF LIBERATION

The concept of taking care of oneself proposes that the woman turns inwards, recognizing and inhabiting her own internal dimensions. It is not about isolation, but about reintegration, in which she becomes an active subject of her own history. This movement implies breaking with the external concerns that fragment it, recovering its presence in the here and now and rescuing the sense of authenticity.

Contemporary women, often burdened by multiple demands, find themselves torn between caring for others and maintaining tasks that are often not theirs. The romanticization of this accumulation — as if constant overcoming were proof of value — ends up displacing it from its own essence, generating feelings of loss of identity. The incessant search for recognition and love through productivity and perfection reinforces the alienation from the self.

Taking care of oneself, therefore, means ceasing to live according to external expectations and acting in line with one's internal values and desires. For Brené Brown (2019, p. 75):

We cultivate love when we allow our most vulnerable and powerful selves to be fully seen and known, and when we honor the spiritual connection that arises from that action with trust, respect, kindness, and affection.

This process is also political. Audre Lorde (2019) reminds us that self-care is not a luxury, but an act of resistance in a world that has historically devalued the feminine.

Prioritizing one's own emotional, physical, and spiritual integrity breaks with patriarchal logic, transforming the search for authenticity into a collective practice of social transformation:

For women, the need and desire to care for one another is not pathological, but redemptive, and it is in this knowing that our true power is rediscovered. (...) Only in a patriarchal structure is motherhood the only social power available to women. (LORDE, 2019, p. 136)

Lorde, a scathing critic of hegemonic white feminism, highlighted how black women have historically been excluded from the movement's central agendas. While white women struggled for political recognition and access to the market, black women never had the possibility of not working: they took care of other women's children while seeing their own being neglected. This structural inequality is still repeated today, perpetuating an invisible cycle of exploitation. In this sense, to take care of oneself is also to rescue collective memories of oppression, to claim marginalized voices, and to reconstruct historical trajectories.

From the perspective of archetypal female psychology, Clarissa Pinkola Estés (1999) describes this process as individuation: the integration of the conscious and unconscious aspects of the psyche. It is about recognizing and welcoming rejected or hidden parts, integrating them into a fuller identity.

For Estés (2007, p. 21),

a woman's soul is older than time and her spirit is eternally young." Thus, intuition, creativity and sexuality — historically repressed — need to be rescued as vital dimensions of being.

In the same direction, Foucault (1983; 1986) understands self-care as an ethical and political practice that transforms the subject into an active agent in the production of one's own life. It is not an individualistic movement, but a way of recognizing the interdependence between the self and the collective.

To take care of oneself also means to free oneself from temporal traps: resentments that imprison in the past and anxieties that project fears into the future. Mindfulness practices, for example, allow you to reduce these emotional states and strengthen well-being. Silvia Lane (2000) adds that individual transformation has collective implications: when a woman

frees herself from limiting narratives, she opens paths for others, making the personal inseparable from the political.

Therefore, taking care of oneself is a process of liberation that breaks with toxic productivity and patriarchal imperatives of perfection. Promoting self-knowledge based on the three feminine powers — ancestry, cyclicity and sexuality/creativity — reveals itself as a way to rescue authenticity and reorganize priorities for a healthy life in its biopsychosocial dimensions.

4.4 THE OCCUPATION OF ANCESTRY

Many women grew up with the feeling that their story starts from scratch, with no affective heritage, no guide and no bonds. However, female ancestry holds wisdom and strength that await to be claimed. Reconnecting to this lineage means resuming references, belonging, and continuity.

For Silvia Lane (2000), the loss of connection with ancestry contributes to feelings of alienation, low self-esteem and existential emptiness. Audre Lorde (2019) reinforces that recognizing one's own heritage strengthens identity and sustains resistance in the face of oppressive social norms.

Ancestry works, therefore, as a vital resource of wisdom, identity and resistance. It offers women a symbolic ballast that strengthens their subjectivity and guides conscious and authentic choices. In dialogue with Bauman (2001), it can be stated that, in liquid and unstable societies, ancestry acts as an anchor, helping to maintain stability and meaning in the midst of contemporary fragmentation.

Valuing ancestry is, therefore, recovering historical and cultural ties that nurture courage, creativity and authenticity. It is not a nostalgic return to the past, but a critical and vital reintegration, which strengthens autonomy and resignifies the place of women in history.

4.5 THE OCCUPATION OF CYCLICITY

Contemporary social logic associates value with linearity and constancy. Producing without pause is seen as a sign of success, but this expectation collides with the cyclical nature of the feminine. Denying this dimension leads many women to illness — physical, psychic and emotional.

Cyclicity refers to the awareness of the internal and natural rhythms of the body and mind, allowing self-regulation and emotional balance (ESTÉS, 1992). The marginalization of

female cycles — menstrual, emotional, or energetic — generates anxiety, exhaustion, and disconnection from oneself. When recognized and integrated, cyclicity allows women to harmonize their energies, make more conscious decisions, and recognize their power of choice.

This recognition goes beyond the biological dimension. It is also a question of resistance to biopower (FOUCAULT, 1983; 1986), which regulates bodies and behaviors according to standards of productivity and health. By embracing their cycles — of creation, introspection, planning, execution and rest — women resume the management of their own vital energy, defying social impositions.

The medicalization of the menstrual cycle, often celebrated as freedom, also served as a way of adapting to male constancy and the labor market. Pharmacological control, in addition to suppressing symptoms, erased the moments of introspection and recollection characteristic of the female body. This suppression reveals not only a disregard for biology, but a denial of cyclical wisdom.

Recognizing and exploring each phase of the cycle, on the contrary, can enhance health and creativity. By rescuing her cyclicity, the woman reconnects with her vital energy, strengthening processes of healing, transformation and fulfillment.

4.6 THE OCCUPATION OF SEXUALITY AND CREATIVITY

Sexuality and creativity are expressions of life force, personal power, and the ability to manifest. This energy, which symbolically pulsates in the womb, is the source of both human life and dreams and projects. When repressed, it produces emptiness, inertia, and purposelessness.

Social norms and institutions—such as family, church, and community—have historically repressed this potency, reducing sexuality to moral control and detaching it from its creative dimension. As Foucault (1986) reminds us, sexuality is crossed by strategies of power and disciplining, especially over female bodies.

Audre Lorde (2019) claims erotic power as a vital force that is often hidden or vulgarized. For her, rescuing this power means not only experiencing pleasure, but also expanding creative capacity, directing energy to the realization of projects and the transformation of reality.

The repression of female sexuality, however, is deeply associated with the maintenance of the patriarchal order: on the one hand, morality and good customs are

preached; on the other hand, freedom is associated with the vulgarization and objectification of women. This split prevents sexuality from being understood as a source of authenticity, pleasure and creation.

Reestablishing a positive and responsible awareness of sexuality is therefore fundamental for the reconstruction of female identity. Rites of passage, such as those practiced in ancestral cultures at the time of menarche, reveal how the body already contains within itself the wisdom of self-knowledge. Recovering this knowledge and re-signifying sexuality as a creative energy allows women to inhabit their own lives in a full, authentic and transformative way.

To summarize the reflections presented in chapters 6.1 to 6.4, we have prepared a comparative table that brings together the main challenges, rescue strategies and potentialities associated with the three feminine powers — ancestry, cyclicity and sexuality/creativity. The schematic organization facilitates the understanding of how each dimension, when historically silenced, impacts female subjectivity, and how, when rescued, it opens the way for the construction of authenticity and liberation.

Table 1

The three feminine powers and self-knowledge as an act of liberation

Girl Power	Historical Challenges	Rescue Strategies	Potentialities for Authenticity
Ancestry	-Rupture with the female lineage and erasure of women's history. -Invisibilization of the experiences of black, indigenous and peripheral women. -Alienation and loss of symbolic references.	-Rescue family and collective stories. -Value plural and intercultural narratives. -Reconnect with traditions, rites and knowledge transmitted by previous generations.	-Sense of belonging and continuity. -Strengthening of collective identity and resistance. -Courage and confidence to face contexts of social fragmentation.
Cyclicity	-Imposition of a linear logic of productivity. -Medicalization and suppression of natural cycles.	- Recognize body and emotional rhythms. - Practice self-knowledge through the observation of	- Harmonization of internal energies. - Improved physical, emotional, and mental health. - Ability to live

	-Stigmatization of menstruation and phases of recollection.	the cycle. -Value moments of introspection and rest as part of healthy productivity.	according to one's own rhythm, enhancing creativity and well-being.
Sexuality / Creativity	- Moral and religious repression of female sexuality. - Reduction of the female body to an object of desire and control. -Exclusion of the erotic dimension as a source of creative power.	-Resignify sexuality as vital and creative energy. - Recognize erotic power as a source of pleasure and fulfillment. - Promote emancipatory sex education and rites of passage for valuing the body.	- Reconnection with the body as a territory of pleasure, wisdom and expression. -Release of creativity and vital power. - Construction of an authentic identity based on desire, freedom and self-love.

Source: Authors.

Reading the picture allows us to observe that, although each power has specificities, they all converge to the same dynamic: patriarchal oppression has produced fragmentation and weakening of female identity, while the rescue of these dimensions strengthens autonomy, creativity and belonging.

It is also noted that the three powers mutually support each other. Ancestry provides roots and collective memory; cyclicity promotes balance between action and recollection; Sexuality/creativity drives pleasure, art, and transformative power. Integrated, they constitute a solid basis for women to occupy themselves with freedom, authenticity and resilience.

Thus, the table not only summarizes the main points, but also highlights the interdependence between the three powers, reinforcing the idea that female emancipation requires both the individual work of self-knowledge and the construction of collective practices of support and recognition.

5 FINAL CONSIDERATIONS

This study sought to understand how the historical marginalization of cyclicity, ancestry and sexuality/creativity impacts female subjectivity, limiting the construction of an authentic identity and weakening women's autonomy. The analysis of the theoretical references showed that these three powers were systematically silenced over time through social, cultural and religious structures that normalized bodies and behaviors, as discussed

by Foucault (1983; 1986). This silencing is not restricted to the collective level, but crosses emotional and psychological dimensions, producing narratives of shame, inadequacy, and disconnection, as Brown (2019) and Lane (2000) point out.

Patriarchal society has imposed a domesticated feminine standard, in which women are taught to be useful, docile and available to others, but not to themselves. We learn to care for, nurture, and sustain the dreams of others, without being allowed to recognize our own desires, limits, and needs. In this model, feminine attributes such as intuition, sensitivity, cyclicity, sensuality, and creativity have historically been associated with weakness, sin, or irrationality. In search of some social prestige, many women felt compelled to distance themselves from the feminine, trying to reproduce masculine patterns of existence.

This distancing, however, represented an internal split. As Estés (1992) states, the disconnection of one's own blood, womb and instinctive nature led to the repression of pleasure, art, intuition and creative power. The feminine has been reduced to the reproductive function or to the role of caregiver, when, in its essence, it constitutes a power of life, a portal of existence and a source of nutrition. Women were simultaneously idealized as saints or demonized as witches and wantons, but rarely recognized as whole, divine, and potent beings in their entirety.

Given this scenario, the rescue of the three powers represents a movement of reconnection and liberation. Cyclicity, when recognized, allows a more harmonious life with the rhythms of the body and emotions. Ancestry, when rescued, strengthens bonds of belonging and resignifies fragmented histories. Sexuality/creativity, when rescued, gives back to women the ability to express pleasure, desire and transformative power. The rescue of these aspects strengthens self-esteem, freedom of expression and the ability to lead one's own life. As Chimamanda Ngozi Adichie (2014) reminds us, "power is the ability not only to tell another person's story, but to make it their definitive story".

Self-knowledge emerges, in this process, as a central tool for self-occupation. To know oneself is to resist. It is to refuse the mechanisms of control and oppression that have shaped female subjectivity throughout history. Foucault (1983; 1986) argues that this movement is, in itself, a political act, as it challenges power structures. Brown (2019) adds that authenticity does not consist of pleasing or being accepted, but of assuming the vulnerability of showing oneself true, even in the face of the risk of rejection. Thus, self-knowledge is not only individual: it expands the boundaries of subjectivity and becomes social transformation.

In this sense, the collective dimension is equally fundamental. Group practices, especially women's circles, are configured as low-cost and high-power therapeutic and political spaces, in which empathetic listening, sharing and solidarity create a network of support and resignification. In this environment, each story narrated reverberates in the collective, freeing not only the woman who speaks, but also the one who listens. It is an ancestral movement of resistance, which reaffirms identity and strengthens the sense of community.

It is concluded, therefore, that the rescue of cyclicity, ancestry and sexuality/creativity is not only an individual process of self-discovery, but an act of resistance in the face of the patriarchal system that has historically marginalized these aspects of the feminine. Promoting their integration means promoting emotional health, belonging, creative power, and social emancipation.

When a woman takes care of herself, she not only transforms her own life, but becomes an agent of collective transformation, inspiring and opening paths for other women to also recognize and flourish. Thus, the reintegration of the sacred and profane, creative and instinctive, rational and sensitive feminine constitutes one of the most potent strategies of individual and collective emancipation, reaffirming that true freedom begins in consciousness and expands in the community.

The electrical system needs to be reliable and capable of withstanding contingencies to guarantee energy demand without overloading electrical equipment. In this research, the voltage stability of the STB-33 test system was analyzed in three situations: base case, after simple transmission line contingency simulation, and after applying parallel compensation in cases of contingency with voltage violations. The ANAREDE software was used to simulate contingencies and seek solutions using the Newton-Raphson method, discarding cases where line removal would cause isolation of network elements, resulting in 26 simulated contingency cases. Seven cases did not obtain an initial solution for the load flow, mainly in area A, which is not able to supply its demand alone, resulting in an exchange of energy with area B. As a means of forcing a solution to the load flow, three methods were used: turning off the ANAREDE controls, representing the load at 75% active power, and defining the buses that interconnect the contingency lines as a reference. The last option resulted in the convergence of all cases and the lowest severity indices. These cases were disregarded in the compensation studies due to simplifications to achieve convergence. Contingency cases with flow violations in the lines are mainly in area B, where area A imports energy due to its demand exceeding supply. Cases with voltage violations in the busbars are mostly found in area A, as the buses in this area are unable to support all their demand, resulting in voltage drops. For these cases, parallel compensation was applied, which is important for controlling reactive power in the network and improving the performance of transmission lines. Therefore, FLUPOT was used to perform the optimal power flow calculations, determining the amount of reactive power to be allocated and the buses that should receive parallel compensation. Cases 18 and 22 were chosen to receive compensation due to their high

severity indices, where the compensation proved effective, recovering the voltages of the contingent and peripheral busbars. Voltage stability studies identify vulnerable points in the system, and a common method is the PV curve. Using the continuation method through ANAREDE to determine the PV curve and analyze the load margin of cases 18 and 22, a load increase of 0.2% was performed. Some buses did not remain stable in terms of voltage, even after compensation. These buses are considered critical because they presented undervoltage during emergencies. The base case had the highest load margin and voltage safety margin, respecting the minimum limit pre-established by ONS, of 7% for complete systems. Cases 18 and 22, after the contingency, presented a load margin and voltage safety margin below the 4% limit, which is the minimum limit for incomplete systems. After compensation, cases 18 and 22 had an increase in load and voltage indices, with a safety margin of 4.8446% for case 18 and 6.2976% for case 22.

RESUMO

O sistema elétrico precisa ser confiável e capaz de suportar contingências para garantir a demanda de energia sem sobrecarga em equipamentos elétricos. Nesta pesquisa, foi analisada a estabilidade de tensão do sistema-teste STB-33 em três situações: caso base, após a simulação de contingência simples de linhas de transmissão e após a aplicação da compensação paralela nos casos de contingência com violações de tensão. Foi utilizado o software ANAREDE para simular as contingências e buscar soluções utilizando o método de Newton-Raphson, descartando casos em que a retirada da linha causasse isolamento de elementos da rede, o que resultou em 26 casos de contingência simulados. Sete casos não obtiveram solução inicial para o fluxo de carga, principalmente na área A, que não é capaz de suprir sua demanda sozinha, o que resulta em um intercâmbio de energia com a área B. Como meio de forçar a solução do fluxo de carga, foram utilizados três métodos: desligamento dos controles do ANAREDE, representação da carga em 75% de potência ativa e a definição das barras que interligam as linhas contingenciadas como referência. A última opção resultou na convergência de todos os casos e nos menores índices de severidade. Esses casos foram desconsiderados nos estudos de compensação devido a simplificações para obter a convergência. Os casos de contingência com violações de fluxo nas linhas estão principalmente na área B, onde a área A importa energia devido à sua demanda maior que o fornecimento. Já os casos com violação de tensão nos barramentos se encontram, em sua maioria, na área A, pois as barras dessa área não são capazes de suportar toda a sua demanda, resultando em quedas de tensão. Para esses casos, foi aplicada a compensação paralela, importante para controlar a potência reativa na rede e melhorar o desempenho das linhas de transmissão. Sendo assim, foi utilizado o FLUPOT para realizar os cálculos do fluxo de potência ótimo, determinando a quantidade de reativos a serem alocados e as barras que devem receber a compensação paralela. Os casos 18 e 22 foram escolhidos para receber a compensação devido aos seus altos índices de severidade, onde a compensação se mostrou eficaz, recuperando as tensões dos barramentos contingenciados e periféricos. Estudos de estabilidade de tensão identificam pontos vulneráveis do sistema, e um método comum é a curva PV. Utilizando o método da continuação através do ANAREDE para determinar a curva PV e analisar a margem de carregamento dos casos 18 e 22, foi realizado um acréscimo de carga de 0,2%. Algumas barras não se mantiveram estáveis em termos de tensão, mesmo após a compensação. Essas barras são consideradas críticas, pois apresentaram subtensão em emergências. O

caso base teve a maior margem de carregamento e margem de segurança de tensão, respeitando o limite mínimo preestabelecido pela ONS, de 7% para sistemas completos. Os casos 18 e 22, após a contingência, apresentaram margem de carregamento e margem de segurança de tensão abaixo do limite de 4%, que é o limite mínimo para sistemas incompletos. Após a compensação, os casos 18 e 22 tiveram aumento nos índices de carregamento e tensão, com uma margem de segurança de 4,8446% para o caso 18 e de 6,2976% para o caso 22.

RESUMEN

El sistema eléctrico debe ser fiable y capaz de soportar contingencias para garantizar el suministro de energía sin sobrecargar los equipos. En esta investigación, se analizó la estabilidad de tensión del sistema de prueba STB-33 en tres situaciones: caso base, tras una simulación simple de contingencia en la línea de transmisión y tras aplicar compensación en paralelo en casos de contingencia con violaciones de tensión. Se utilizó el software ANAREDE para simular las contingencias y buscar soluciones mediante el método de Newton-Raphson, descartando los casos en los que la desconexión de la línea provocaría el aislamiento de elementos de la red, lo que resultó en 26 casos de contingencia simulados. En siete casos no se obtuvo una solución inicial para el flujo de carga, principalmente en el área A, que no puede abastecer su demanda por sí sola, lo que provoca un intercambio de energía con el área B. Para forzar una solución al flujo de carga, se utilizaron tres métodos: desactivar los controles de ANAREDE, representar la carga al 75 % de potencia activa y definir los buses que interconectan las líneas de contingencia como referencia. Esta última opción resultó en la convergencia de todos los casos y los índices de severidad más bajos. Estos casos se omitieron en los estudios de compensación debido a las simplificaciones necesarias para lograr la convergencia. Los casos de contingencia con violaciones de flujo en las líneas se concentran principalmente en el área B, donde el área A importa energía debido a que su demanda supera la oferta. Los casos con violaciones de tensión en las barras colectoras se encuentran mayormente en el área A, ya que las barras en esta área no pueden soportar toda su demanda, lo que provoca caídas de tensión. Para estos casos, se aplicó compensación en paralelo, lo cual es importante para controlar la potencia reactiva en la red y mejorar el rendimiento de las líneas de transmisión. Por lo tanto, se utilizó FLUPOT para realizar los cálculos óptimos de flujo de potencia, determinando la cantidad de potencia reactiva a asignar y las barras que debían recibir compensación en paralelo. Los casos 18 y 22 se seleccionaron para recibir compensación debido a sus altos índices de severidad, donde la compensación resultó efectiva, recuperando las tensiones de las barras colectoras contingentes y periféricas. Los estudios de estabilidad de tensión identifican los puntos vulnerables del sistema, y un método común es la curva PV. Utilizando el método de continuación a través de ANAREDE para determinar la curva PV y analizar el margen de carga de los casos 18 y 22, se realizó un incremento de carga del 0,2%. Algunos buses no mantuvieron la estabilidad de tensión, incluso después de la compensación. Estos buses se consideran críticos debido a que presentaron subtensión durante las emergencias. El caso base presentó el mayor margen de carga y margen de seguridad de tensión, respetando el límite mínimo preestablecido por la ONS del 7% para sistemas completos. Los casos 18 y 22, tras la contingencia, presentaron un margen de carga y un margen de seguridad de tensión inferiores al límite del 4%, que es el límite mínimo para sistemas incompletos. Después de la compensación, los casos 18 y 22 experimentaron un incremento en los

índices de carga y tensión, con un margen de seguridad del 4,8446% para el caso 18 y del 6,2976% para el caso 22.

1 INTRODUCTION

Currently, the geographic area occupied by the country is growing rapidly and unevenly for economic and environmental reasons. The expansion of the physical structure of the National Interconnected System (SIN) does not proportionally follow the additional demand caused by the activities of a growing population. In this scenario, the electrical system, which previously operated maintaining energy transfer without loss of voltage stability, now operates at the safety limit to fully satisfy the energy needs of consumers (PINTO, 2013; COELHO, 2018).

There are several studies that allow keeping the power grid stable and in good working order, involving the management and implementation of strategies to repair disturbances in power transmission, verifying the state of operation of the grid and whether its performance is adequate. Through Submodule 23.3 of the Network Procedures, the National Electric System Operator (ONS) has responsibilities and elaborates guidelines and criteria to be implemented in electrical studies (ONS, 2018).

The system's security analysis integrates the verification of the behavior of the electrical network in the face of the loss of elements, such as busbars, generators and transmission lines (LT), detecting areas at risk of blackouts and enabling their prevention. The contingency analysis verifies situations immediately after the shutdown of one or more elements of the grid, observing changes in the operational characteristics of the Electric Power System (SEP). These contingencies can be simple, or N-1 criterion, where the analysis is made from the disconnection of a single element, or multiple, where more than one element is disconnected at the same time, and may follow N-2, N-3 and so on criteria (DELGADO, 2019).

From a contingency, there may be voltage instabilities in the system's busbars and, with this, the need for studies aimed at monitoring this parameter arises. The loading margin makes it possible to assess the imminence of voltage drops, making it possible to analyze the voltage of the system under normal operating conditions and in the face of a disturbance (ZEFERINO, 2011).

One way to analyze SEP voltage is by determining the PV curve. This method makes it possible to observe the voltage level in a bar as the active power increases, allowing the observation of voltage variation in various operating situations. The most used means to delimit this curve is the continuation method, or Continuous Charge Flow (FCC), which,

through successive load increments, makes it possible to find solutions for the flow of power at the Maximum Loading Point (PMC) (DELGADO, 2019).

Another situation that can lead the electrical system to voltage instability is the lack of control of reactive in the network. In this aspect, parallel reactive compensation becomes a more economically viable alternative, establishing a better system performance and control of operational parameters (CHAVES, 2007).

In order to improve the voltage profile of the busbars, it is sought to determine the best places for the application of compensation and the most appropriate amount of reagents to be allocated, performing analyses through the Optimal Power Flow (FPO), which is common in studies aimed at managing the operation in the face of disturbances (ONORIO, 2022). According to Dahlke (2010), the calculation of the FPO consists of obtaining the optimal operating point of a SEP, meeting a group of constraints, seeking to improve some performance index.

At the national level, the Optimal Power Flow Program (FLUPOT), developed by the Electric Energy Research Center (CEPEL), which seeks to optimize a pre-established objective function through selected controls (CEPEL, 2018), is widely used. Regarding contingency analysis, CEPEL has the Network Analysis Program (ANAREDE), which makes it possible to carry out several studies, such as simulations of the occurrence of contingencies, that is, the output of various elements of the network, seeking a new solution for the flow of power and monitoring the operational state of the simulated system (CEPEL, 2011).

Problems related to voltage instabilities can occur in highly stressed systems, where a voltage collapse can be related to a deficit in the supply of reagents or to the emergence of a contingency, with the subsequent problem being the fragility of the electrical system (KUNDUR, 1994).

Thus, starting from the initial operating point of the system, the need arises to know the PMC, as it determines if the system has the capacity to maintain its voltage levels stable. A widely used method to determine the PMC is by defining the PV curve, performing successive load increments and finding new solutions for the load flow. However, the Newton-Raphson method has problems regarding its convergence as the calculated points approach the PMC, and it is necessary to find new methods to solve the problem (PINTO, 2013; DELGADO, 2019).

In order to maintain the reliability of the system and increase the resistance against contingencies, the construction of a new TL emerges as one of the alternatives, as it would increase the robustness and redundancy of the system. However, in addition to the environmental impact that can be caused by the construction of a transmission line, building a system that is totally resistant to contingencies would require a high financial investment, thus emerging the compensation of reagents as a more financially viable and effective means (PIRES, 2005; JÚNIOR, 2019).

In order to achieve an appropriate level of reliability, the electrical system must have the ability to withstand certain contingencies in order to sustain the energy demand without overloading other equipment in the system, such as transmission lines and transformers. For this reason, the SIN is designed adhering to the N-1 reliability criterion, because when a simple contingency occurs, the system must be prepared to sustain it (JÚNIOR, 2019).

Studies focused on voltage stability become extremely important, because from them it is possible to determine vulnerable points in the system. The method of determining the PV curve is one of the most used means today when it comes to analyzing the loading margin and voltage stability of the electrical system. From power flow solutions by the continuation method, it is possible to delimit the PV curve and analyze the stability of the system under normal operating conditions and in cases of contingency (DELGADO, 2019).

In order to obtain reactive control and better performance of transmission lines, whether short, medium or long, parallel compensation methods are applied in order to obtain control over the reactive power in the grid (STEVENSON, 1986).

Often, carrying out studies focused on SEP manually can be unfeasible due to mathematical complexity when it involves systems composed of a large number of elements. In Brazil, the Department of Electroenergetic Systems (DSE) develops computer programs in order to assist in studies aimed at the planning and operation of the SEP, such as ANAREDE, which is a program aimed at SEP analysis in steady state, such as load flow and contingency analysis, and also FLUPOT, which is applied in studies such as the optimal allocation of reactive power (CEPEL, 2022).

This work carried out a voltage stability analysis study in a test system under normal operating conditions, after simulations of simple contingencies of transmission lines and the application of reactive compensation, in order to first verify and, subsequently, eliminate or reduce the impacts of contingencies. The specific objectives of this work consisted of:

- Simulate contingency cases with criterion N-1 lines in the Brazilian 33-Bar Test System (STB-33) using the ANAREDE program, disregarding cases that result in islanding;
- Simulate parallel compensation in cases that result in stress violation in the bars and present the optimal connection points, through the FLUPOT program;
- Determine the PV curves of the system members under normal operating conditions, after contingencies and after reactive compensation, presenting the analysis of the stress profile of the bars and the *ranking* of the bars according to their loading margins.

2 LITERATURE REVIEW

2.1 POWER FLOW

Stevenson (1986) conceptualizes the study of power flow as the determination of voltage, current, power and power factor or reactive power in various locations of an electrical network, whether in real or ideal operating conditions. Therefore, the study of load flow becomes necessary for the increase of the system, as it covers the effects of the interconnection of new loads, generating units, transmission lines and even other systems.

The power flow study is carried out to determine the steady-state performance of electrical grids. For a given network configuration and a given load and generation condition, it is evaluated whether the voltage levels on the busbars and the loads on the lines, transformers and other components of the network meet the pre-established criteria (ONS, 2018).

Monticelli and Garcia (2011) describe the basic formulation of power flow by associating each bar of the network to four variables, where two are provided and two are unknown, as demonstrated in the **Table 1**.

Table 1

Types of bars

Bar	Given variables	Unknowns
WHY	P_K and Q_K	V_K and θ_K
PV	P_K and V_K	Q_K and θ_K
Slack	V_K and θ_K	P_K and Q_K

Source: Adapted from Monticelli and Garcia (2011, p. 206)

Where:

- V_K : magnitude of nodal tension;

- θ_K : nodal tension angle;
- P_K : net active power generation;
- Q_K : reactive power liquid injection.

To represent the load and generation bars, the bars of the PQ and PV types are used, respectively. The reference bar, slack or V θ , has two uses: to provide the reference of voltage magnitude, which is the ground itself; and close the balance of power (Monticelli; Garcia, 2011).

Specific computational means are also used to determine the power flow. At the national level, the Network Analysis Program is the most used computer program by companies, both public and private, in the generation, transmission and distribution of energy. This is a program that aims to analyze the SEP in steady state, making it possible not only to calculate the power flow, but also the continuous power flow, contingency analysis, network equivalent, voltage sensitivity analysis and active power redispatch (CEPEL, 2022).

2.2 NEWTON-RAPHSON METHOD

When it comes to nonlinear equations, the most common method of solving is the Newton-Raphson method. Based on an unknown initial estimate and using the Taylor expansion series, this method makes a successive approximation of the desired value (SAADAT, 1999).

The obtaining of the power flow solution can be achieved through the Newton-Raphson method algorithm, which consists of (STEVENSON, 1986):

1) Through the values of nodal stress modulus and its suggested angle for the first iteration ($i = 0$), determine the value of the Equation (1) and Equation (2).

$$P_{km} = g_{km}V_k^2 - V_kV_m(g_{km}\cos\theta_{km} + b_{km}\sin\theta_{km}) \quad 1)$$

$$Q_{km} = (b_{km} - b_{km}^{sh})V_k^2 - V_kV_m(g_{km}\cos\theta_{km} + b_{km}\sin\theta_{km}) \quad 2)$$

2) Calculate and $\Delta P \Delta Q$ for each bar, which is given in the Equations (3) and (4), respectively.

$$\Delta P^{(i)} = P_k^{esp} - P_k^{calc} \quad 3)$$

$$\Delta Q^{(i)} = Q_k^{esp} - Q_k^{calc} \quad 4)$$

3) Determine the Jacobian matrix. $(J^{(i)})$

4) Solve the nonlinear system from the Equation (5).

$$\begin{pmatrix} \Delta P \\ \Delta Q \end{pmatrix}^{(i)} = \begin{pmatrix} H & N \\ M & L \end{pmatrix}^{(i)} * \begin{pmatrix} \Delta \theta \\ \Delta V \end{pmatrix}^{(i)} \quad 5)$$

5) Calculate the new values for and $\theta_K V_K$

6) Go back to item 1 and repeat the process using the new values of the modulus and angle of the tension until the values of e are equal to or less than the chosen tolerance. $\Delta P \Delta Q$

2.3 OPTIMAL POWER FLOW

In order to meet a set of constraints of equality or inequality, the FPO seeks to increase or decrease some performance index (DAHLKE, 2010). Through a series of calculations, sought to meet the operational and physical delimitations of the electrical network, the FPO becomes an important instrument, leading operators to manipulate the system within their delimited safety margins. This means that the energy demand of the electricity grid is satisfied and that the operational and physical constraints of the system are not violated (ROSAS, 2008).

Rosas (2008) represents the problem of the POF being the minimum of the objective function (Equation ((6))), subject to the equality restriction (Equation (7)) and the inequality restriction (Equation (8)).

$$\min = f(x) \quad (6)$$

s. a.

$$g(x) = 0 \quad 7)$$

$$h_{min} \leq h(x) \leq h_{max} \quad 8)$$

The Equations (1) and (2), described in subsection 0, indicate the balance of active and reactive power in the grid, composing the FPO equality constraint vector. Depending on the issue at hand, some system controls can be changed or added to existing ones, rather than being modified within a specific range. On the other hand, the inequality vector can represent the maximum load on transmission lines and transformers, maximum and minimum limits of the modulus of the voltages in the busbars, as well as maximum and minimum limits of active and reactive power generation (ROSAS, 2008; SESSA, 2013).

Through computer programs, it is possible to establish the optimal point of operation of a system based on a pre-established objective function and its constraints of equality and inequality. FLUPOT, a program developed by CEPEL, is widely used for the study of optimal power flow, with the minimization of active losses, load shedding, optimal allocation of reactive power support and maximization of active power transfer between areas or in a set of circuits.

2.4 CONTINGENCY ANALYSIS

For a better functioning of the SEP, security analyses are carried out of a cluster of contingencies most likely to occur in the network, as well as the verification of its operating and emergency limits (MONTICELLI, 1983).

The goal of operating the system is for it to be in a safe state. Under steady-state operating conditions, it is subject to load restrictions, which are related to load balance and generation; the operating restrictions that represent the limits imposed on the magnitudes of the voltages in the busbars, the apparent power flows in the transmission lines and transformers, and the reactive power injections in the generation bars; and, finally, the safety constraints that define the safe operation of the system under a list of possible contingencies, such as loss of line, generators and capacitors. (PATACA, 2012, p. 34-35).

Pataca (2012) defines contingency as the disconnection or shutdown of a system component, which can be the disconnection of transmission lines, loads, transformers and/or generators, caused by disturbances or faults. These contingencies can be single (criterion N-1), when only one component of the system is disconnected from the grid, or multiple (criterion N-2, criterion N-3...), when several outputs of system components are considered.

Through the use of computer programs, contingency analysis is carried out. By defining a point in the system and applying simulations of a series of contingencies, the impact on the network is observed and evaluated (PATACA, 2012).

According to CEPEL (2011), in order to find severe operational difficulties, ANAREDE performs the simulations by processing a sequence of contingencies, where in each case a new solution is made for the power flow and monitoring of the operational state of the simulated system.

This research will perform the analysis of simple contingencies through simulations of the shutdown of transmission lines in the STB-33 test system.

2.5 PARALLEL REACTIVE COMPENSATION

In order to obtain better performance in transmission lines, whether short, medium or long, reactive compensation methods are applied. When there is a need to supply or absorb reactivities in the network, capacitor banks or reactors are added, respectively, thus applying parallel compensation, or *shunt* (REZENDE et al., 2013).

The

Figure 1 demonstrates an equivalent circuit with capacitive parallel compensation, through a capacitor bank (JESUS; SUNTAN; COGO, 2018).

Figure 1

Equivalent circuit with parallel compensation

Source: Jesus, Tan and Cogo (2018).

Where:

- V_S : voltage at the emitting end;
- V_R : voltage at the receiving end;
- R : LT resistance;
- X_L : reactance of the LT;
- X_C : bank of capacitors in shunt.

According to Rezende *et al.* (2013), the compensation of a transmission line is directly related to the natural property of the lines, which require reactive energy in greater or lesser quantities to carry out the flow of active power. The ideal condition for the flow of energy through a line is one in which it carries an active power of value corresponding to the *Surge Impedance Loading* (SIL).

Saadat (1999) describes SIL as all reactive energy generated by the line being absorbed by it, with no losses in this line and with constant active power at the transmitting and receiving terminals. Demonstrated by the Equation ((9), where represents the nominal voltage of the line and is the characteristic impedance. $V_L Z_C$

$$SIL = \frac{|V_L|^2}{Z_C} \quad (9)$$

The lack of reactive control in transmission lines can cause two scenarios: when the active power transported by the line is lower than the SIL, therefore, the line will generate a greater number of reactive than necessary; and when the reactive power is greater than the SIL, indicating that there is a need to supply reagents to the line (REZENDE *et al.*, 2013).

Thus, this research will apply parallel reactive compensation in cases of contingencies that result in voltage violation in the busbars of the STB-33 test system.

2.6 LOADING MARGIN

In order to analyze places in the system that are more vulnerable to changes in operating conditions, studies related to voltage stability provide guidance for the control and optimal structuring of the electrical system (DELGADO, 2019). In order to assess the imminence of a voltage decrease, the loading margin is determined, defining the level of change from a disturbance in the system, which can be a variation in load and/or generation or a contingency (ZEFERINO, 2011).

From the perspective of voltage analysis, the SEP is considered stable when it is possible to maintain the voltage level in normal operating conditions or when it is subjected to some disturbance. In cases where the network suffers some gradual and disoriented loss of voltage, due to the removal of a transmission line and an increase in load, voltage instability is qualified, which can be caused, mainly, by the inability to supply reactive power (KUNDUR, 1994).

A SEP is considered safe when it has the ability to continue operating normally in the face of contingencies; however, no system is completely resistant to contingencies, because, in reality, the system is designed to sustain a finite number of generation, transmission and load contingencies (RESENDE, 2007).

Regarding voltage safety, ONS (2018) determines that studies focused on voltage stability must have the system's stability margin defined through simulations and compared with the predefined safety standards. The ONS also emphasizes a Voltage Safety Margin (MST), which is the minimum value of the stability margin that can be evaluated in a system. The MST for incomplete networks is at least 4%, and for complete networks it is 7%.

According to Delgado (2019), a complete network is one in which the original system is in normal operation, while an incomplete network occurs when there is a lack of some element of the system, such as substations and transmission lines.

2.7 PV CURVE AND THE FOLLOW-UP METHOD

One of the most used means to analyze voltage stability in SEP is through the PV curve. The PV Figure compares the voltage level in a bar as a function of the power increased in a given direction, and can analyze the proportion of variation between the system operating under normal conditions and cases of instability (DELGADO, 2019).

In **Figure 2**, it is possible to observe that the loading margin is given by the distance between the operating point of the base case and the PMC of the current case. The PMC, or critical point, is the place where the system loses the ability to retain admissible voltage levels, presenting instabilities (DELGADO, 2019).

Figure 2
PV Curve

Source: Resende (2007).

However, in order to trace the PV curve and reach solutions for the power flow in the PMC, other mathematical methods are needed, as the Newton-Raphson method becomes unusual due to the contrariety in relation to convergence when the studied points are close to the collapse point of the system (PINTO, 2013).

Soon, the continuation method, or Continuous Load Flow (FCC), emerges, which rewrites the power flow equations and, through the prediction and correction of the Figureic points, circumvents problems related to convergence, making it possible to reach power flow solutions in the PMC and draw the PV curve (DELGADO, 2019).

The **Figure 3** demonstrates the forecast-correction process used in the FCC solution, where, starting from the initial operating point, it is possible to observe the direction of load growth, from a new estimated operating condition. Thus, the resulting point is corrected by calculating the usual power flow, enabling an equilibrium point (KRAUER, 2007).

Figure 3

Predictor-broker scheme

Source: Krauer (2007).

Through the determination of the PV curve by the continuation method, the present research will evaluate the loading margin of the STB-33 test system in three moments: under normal operating conditions, after contingency and after reactive compensation. In this stage, ANAREDE's Continued Power Flow Program will be used.

3 METHODOLOGY ADOPTED IN THIS STUDY

Seeking a better understanding of the methodology to be followed, the flowchart represented in the **Figure 4**, which demonstrates the step-by-step of the proposed methodology.

Figure 4

Flowchart of the research methodology

Source: The authors.

The analyses developed in this work were performed using the STB-33 test system. This and other test systems were developed by Alves (2007) through data taken from the Brazilian SEP, allowing studies through computer programs to have scenarios closer to reality, highlighting parameter violations, collapses, instabilities, oscillations, and other electrical disturbances.

To perform the calculations of the power flow, the contingency analysis and the creation of the PV curves, the *ANAREDE software* was used, which has tools aimed at the studies of the SEP in the steady regime. To carry out the studies aimed at parallel compensation, the *FLUPOT software* was used, together with *ANAREDE*, which allows the planning and allocation of reactive compensation.

Both programs are projects of the Department of Electrical Systems (DSE) and make up the group of Planning and Operation Programs for the Electrical Area of CEPEL, created

with the intention of filling the lack of computational tools aimed at the planning and operation of SEP in Brazil (CEPEL, 2022).

It should be noted that all the studies carried out in this research followed Submodule 23.3 of the Network Procedures, which dictates the guidelines and criteria for electrical studies proposed by ONS (2018).

3.1 DETERMINATION OF THE OPERATIVE POINT

The first step of this work was the determination of the operative point of the base case. For this, the calculation of the power flow was carried out through the Newton-Raphson method, through the EXLF execution code and the NEWT execution control, provided by ANAREDE. The aim was to obtain the voltage profile of the system and the load on the transmission lines to make comparisons with the results of the subsequent analyses.

3.2 SIMPLE CONTINGENCY ANALYSIS OF TRANSMISSION LINES

In order to analyze each contingency case separately, the Automatic Contingency Analysis execution code was used, provided by the Contingency Analysis Program of ANAREDE. For each contingency of a TL, the program performs a new calculation of the power flow by the Newton-Raphson method, monitoring the operational state of the network.

The contingency program provides monitoring reports that display lists of the critical busbars of contingency cases, detailing those that have violations of voltage, power flow, and reactive power generation parameters. This information is made available through the MOCT, MOCF, and MOCG options, respectively. The *software* details critical cases using the severity index, which is used to order contingency cases based on the mean square deviation in relation to the limits of each quantity that will be monitored (ONS, 2018).

ANAREDE also provides a list of controls and, based on the methodology of Alves (2007), three of them were selected:

- CAP: controls the voltage by transformer with automatic variation of TAP under load;
- QLIM: controls the limit of reactive power generation;
- CREM: Remotely controls voltage by reactive power sources.

Together with the voltage monitoring report, the emergency operating voltage levels pre-established by ONS (2018), presented in the **Table 1**.

Table 1

Permissible phase voltages at 60Hz

Rated operating voltage	Normal operating condition		Emergency operating condition	
(kV)	(kV)	(PU)	(kV)	(PU)
<230	...	0.950 to 1.050	...	0.900 to 1.050
	Pages		Pages	
230	218 to 242	0.950 to 1.050	207 to 242	0.900 to 1.050
345	328 to 362	0.950 to 1.050	311 to 362	0.900 to 1.050
440	418 to 460	0.950 to 1.046	396 to 460	0.900 to 1.046
500	500 to 550	1,000 to 1,100	475 to 550	0.950 to 1.100
525	500 to 550	0.950 to 1.050	475 to 550	0.900 to 1.050
765	690 to 800	0.900 to 1.046	690 to 800	0.900 to 1.046

Source: ONS (2018).

For contingency cases that did not obtain a solution for the power flow, that is, that did not achieve its convergence, the methodology of Alves (2007) was followed. The proposed procedure consists of three steps:

- 1) Shutdown of execution controls.
- 2) Relaxation in the load representation at 75% of the active power and 100% of the reactive power, varying with the square of the voltage.
- 3) Establishment of the bus that interconnects the contingency transmission line as a reference.

3.3 APPLICATION OF PARALLEL COMPENSATION

As a solution for the elimination of voltage violations after the contingency of a TL, the application of parallel reactive compensation was established. For this, the *FLUPOT* and *ANAREDE* software were used.

First, FLUPOT was used in order to obtain the most appropriate amount of reagents and bars for the allocation of compensation. For the objective function, Voltage Control

(CLTN) was used. This option sets a reactive adjustment based on the busbar voltage limits. DVLB and DCAQ functions were also required, which receive the data of voltage limits per bar and delimit the maximum amount of reagent injection in MVar, respectively. ANAREDE was used to carry out and evaluate the effectiveness of this compensation in relation to voltage violations in the case of contingency.

In this stage of the research, contingency cases that resulted in power flow violation in the TLs were discarded, as it was not the objective of this work to carry out studies of reactive series compensation.

3.4 DETERMINATION OF THE PV CURVE

According to ONS (2018), in order to carry out studies that cover voltage safety, it is necessary to obtain the stability margin through simulations and make comparisons in different scenarios, in which the power factor must be kept constant during the process.

In this work, through the plotting of the PV curve and the continuation method, the loading margin of the system was determined in three distinct cases: base case, after contingency and after the application of parallel compensation. For the analysis of the loading margin, the Continuous Power Flow Program was used, which allows plotting the PV curve through successive increments of loads, attributing an increment of 0.2% to both active and reactive power, which, according to Delgado (2019), ensures a constant power factor for the same curve.

4 RESULTS AND DISCUSSIONS

4.1 SIMPLE CONTINGENCY OF STB-33 TRANSMISSION LINES

The test system chosen to receive the analyses of this work was the STB-33 test system, also known as the Reduced South System. It was prepared from data taken from the 230kV and 500kV grids of the southern region of Brazil, as can be seen in the **Figure 5**.

Figure 5

Brazilian 33-Bar Test System

Source: Alves (2007).

The system represents 33 bars and 7 large generators, totaling a maximum demand of 5.085MW and a total generation capacity of 8.912MW. The network was divided into two geoelectric areas, A and B, which are interconnected by two TLs and a transformer. Area A has a higher concentration of load and is unable to meet its demand, thus arising the need to import energy from area B.

The system has a topological characteristic of a mottled arrangement, forming a ring that connects the plants in the region. This results in a robust and structured drivetrain. Therefore, the removal of a TL does not cause the isolation of any other element of the network, resulting in 26 simulated contingency cases, as provided for in the **Table 2**.

Using the Automatic Contingency Analysis function, ANAREDE performs simple contingencies of TLs, finding new solutions to the problem of power flow through the Newton-Raphson method, in view of the contingency and its interference with the parameter of voltage, power flow and reactive generation of the test system. Next, ANAREDE displays the

monitoring reports, detailing whether the contingency case has achieved its convergence and whether there have been parameter violations.

According to Alves' (2007) methodology, to facilitate the convergence process, the procedure of blocking the tap value in the first solution was adopted, deactivating the CTAP control at first, and then the analysis was carried out considering this control, but no difference was obtained in the results. The results of the simulations can be found in the

Table 3.

Table 3

Result of contingency simulations

No Violation	With violation			Non-convergent
...	Tension	Power Flow	Voltage and Power Flow	...
10	2	5	2	7

Source: The authors.

The results of the simulations can be summarized in three situations: of the 26 simulated cases, 10 did not present parameter violations, 7 cases did not reach their convergence, that is, it was not possible to find a solution for the power flow, and in 9 cases there was a violation of some network parameter. Of these, 2 resulted in voltage violation, 5 resulted in power flow violation, and in 2 cases there was voltage and flow violation. The

Table 4 details the contingency cases that resulted in voltage violations.

It can be observed that the busbars where voltage violations occurred are not limited only to the dams of the contingency TLs, but also to the busbars in their vicinity. All violated busbars are located in area A, as this area presents an excess of demand, resulting in

undervoltage in the critical busbars which, according to Pinto (2013), are prone to induce the entire system to a voltage collapse.

In

Table 5, the contingency cases that resulted in flow violations in the TLs are presented.

Table 5

Source: The authors.

It is possible to observe that the cases of flow violations occurred in lines that are entirely in area B and in the only two cases in which the exchange of energy between areas occurs. This is due to the fact that area A does not have enough generation to supply its loads, supplying only 52.8% of its demand, resulting in the need to import energy from area B.

Cases 7 and 24 were the only cases that resulted in the violation of both voltage and flow. By analyzing the single-line diagram of the system, presented in the **Figure 5**, it can be seen that, if one of these lines is lost, areas A and B are interconnected only by a single TL, which hinders the exchange of energy between the areas. The cases in which it was not possible to achieve initial convergence are listed in the **Table 6**.

Table 6

Contingency cases that did not converge

The first step to find the load flow solution consisted of turning off the execution controls of ANAREDE. In this first attempt at convergence, only cases 9 and 26 were resolved; however, they resulted in high levels of violation in the parameters of voltage, reactive generation and power flow. In the second stage, a relaxation of the representation of the loads was carried out. According to Alves (2007), this measure favors convergence, because the current required by the load will be lower, reducing the voltage drop. Thus, all cases of **Table 6** reached their convergence, resulting in a violation of some parameter, with the exception of case 26, which did not converge.

The third and last attempt consisted of establishing busbars that interconnect the contingency TL as a reference, seeking to obtain the solution of the power flow, even if the voltage is corrupted. At this stage, all cases have achieved solutions for cargo flow; However, case 26 was the only one that did not present any violation in its parameters.

The

Table 7 details case 9 in the three attempts to search for the forced solution of the problem, resulting in large variations of violations of the voltage, reactive generation and flow parameters, regardless of the method.

Table 7

Case 9: Severity indices in forced load flow solutions

Forced solution	Severity Index		
	Tension	Reactive generation	Power Flow
...			
Switching off controls	502,1	120,9	9,9
Load relaxation	50,1	11,3	5,0

Source: The authors.

With regard to studies related to the compensation of reactives, cases that converged from the forced solution of the power flow will not be considered, due to the number of simplifications used to achieve their convergence.

4.2 PARALLEL COMPENSATION AND VOLTAGE VIOLATION CASES

After the contingency analysis, there were four cases that resulted in voltage violations, with case 18 obtaining the highest severity index. It is through the severity index that ANAREDE determines the classification of critical contingencies.

To define the appropriate amount of reactive for allocation, FLUPOT's CLTN objective function was used, which determines an adjustment in the reactive controls, in order to maintain the voltage of the busbars within the limits that were specified (CEPEL, 2018). The selection criterion for the application of reactive compensation was based on choosing the bars where the voltage violations occurred, not only those belonging to the contingency TL.

As mentioned in the section 0, for the application of parallel reactive compensation, cases that presented power flow violations were disregarded, since the objective of parallel compensation is to improve the voltage profile of the busbars of a system. Therefore, cases 18 and 22 were chosen to detail the corresponding studies.

4.3 CASE 18

The contingency of case 18 occurs due to the disconnection of the Campos Novos – Caxias line, delimited by dams 955 and 964, respectively. This line has a voltage of 500kV, is located in area A and is the only connection between these busbars. It is possible to observe in the **Figure 6** that the voltage levels of the busbars belonging to the TL and the peripheral buses are within the normal operating limits pre-established by the ONS for 13.8kV, 230kV and 500kV busbars.

Figure 7

Case 18: after the contingency

Source: The authors.

Then, the simulation of the loss of the transmission line was carried out through ANAREDE. The result of the monitoring report provided by the *software* is in the

Table 8.

Table 8

Case 18: Voltage monitoring report

Bar	Name	Area	Voltage (PU)			Violation (pu)	Severity
...	...	...	Minim	Monitored	Maxim	...	...
964	Caxias	The	0,950	0,870	1,100	-0,080	168,0
976	Gravataí	The	0,950	0,848	1,100	-0,102	

Source: The authors.

After the contingency, voltage violations occurred in the 964 and 976 buses, both of 500kV. It is possible to observe that the Gravataí dam (976) is a neighboring element. Therefore, for this case, not only the bars belonging to the contingency transmission line were chosen to receive the compensation, but also the bar 976, as shown in the **Figure 8**.

Figure 8

Case 18: after compensation

Finally, the system was compared under normal operating conditions with the two prominent situations of this case: after the contingency and after the application of parallel compensation. For such detailing, the **Table 10**, which presents the stresses of the members of the contingency transmission line and neighboring lines.

Table 10

Case 18: Voltage comparison

1030	Hatchet	1,076	1,012	1,042

Source: The authors.

With the data presented, it is possible to observe that, after the simulation of the contingency, there was a significant voltage drop, not only in the busbars of the contingency TL, but also in the neighboring busbars. As for compensation, it proved to be effective, as the stress levels of the violated bars returned to the emergency limits stipulated by the ONS.

4.4 CASE 22

The second case studied was case 22, which addresses the analysis of the Itá (995) – Caxias (964) line, represented by the **Figure 9**. This 500kV line plays a fundamental role in interconnecting the busbars and is located in area A. In the figure, it is possible to observe the normal operation of the line, operating within the limits established by the ONS. This interconnection is extremely important to ensure the stability and reliability of the electrical system, supporting the flow of energy necessary to meet regional demand.

Figure 9

Case 22: Itá (995) - Caxias (964)

The monitoring report is detailed in the

Table 11.

Table 11

Case 22: Voltage monitoring report

Bar	Name	Area	Voltage (PU)			Violation (pu)	Severity
			Minim	Monitored	Maxim		
...	...	...	0,950	0,922	1,100	-0,028	...
964	Caxias	The	0,950	0,922	1,100	-0,028	32,6
976	Gravataí	The	0,950	0,900	1,100	-0,050	

Source: The authors.

After the contingency, voltage violations occurred in the 964 and 976 buses, both of 500kV. In this case, due to the fact that the severity index was lower, only the violated bars were chosen to receive compensation and, based on the definition of the bars, FLUPOT returned the report from the

Table 12, which specifies the most appropriate amount of reactive power for compensation *Shunt*.

The result of the application of the compensation can be seen in the **Figure 11**.

Figure 11

Case 22: after the compensation of reactive agents

Source: The authors.

In addition, it was detailed in the

Table 13 the comparison of stress levels in the three scenarios: base case, after contingency and after reactive compensation. It is possible to observe that, even after compensation, the voltage of the busbars did not reach the same values as in the base case, but still falls within the emergency operational limits.

4.5 LOADING MARGIN ANALYSIS

Regarding the studies related to voltage stability, the PV curves were determined using the Continuous Power Flow Program, available at ANAREDE. The program performs successive load increments, and it is possible to observe the maximum charging point (PMC) that the system can maintain safe voltage levels. For this, a load increase of 0.2% of active

and reactive power was carried out for each iteration, which, according to Delgado (2019), guarantees a constant power factor for the same PV curve.

Figure 12 shows the PV curves of the base case buses.

Figure 12

Base case: PV curves

Source: The authors.

The base case has a loading margin of 5.9550MW and a voltage safety margin (MST) of 17.1086%. The ONS (2018) determines that, for complete systems, the MST is at least 7%, which makes the test system within the accepted criteria. However, it is possible to observe that not all busbars were able to maintain voltage levels above the minimum limits established by ONS. The **Table 14** Shows the voltage levels at the maximum loading point of the complete test system.

By analyzing the diagram of the test system, it is possible to observe that the bars that are unable to support the increase in load are substations interconnected to high loads. This interconnection with high demands makes such bars highly critical when confronted with events of this type.

Figure 13 shows the PV curves of the base case and of case 18, taking into account the contingency suffered and the measures adopted for the compensation of reactivities. This Figureical analysis allows a complete visualization of the effects of these occurrences and the solutions implemented to mitigate the resulting imbalances.

When it comes to incomplete systems, that is, after the loss of some element, the minimum margin of voltage stability established by the ONS must be 4%. Case 18 is the most critical contingency case of STB-33, obtaining a loading margin of 5.1318MW and an MST of 0.9209%, making the system unstable from the point of view of voltage stability.

After the compensation of reactivities, there was an increase in the PMC to 5.3313MW and the MST to 4.8446%, making this case within the minimum limit of 4%. However, some busbars did not reach the minimum emergency limit, because when the load is increased, the electric current in the line increases and, consequently, the voltage drop in the line increases and the voltage of the critical bus decreases.

Figure 15 presents a comprehensive set of information on the PV curves in the scenario of case 22, considering all possible simulations after the occurrence of the contingency on the Itá – Caxias line. In addition, the chart also demonstrates the bar curves after the implementation of reactive compensation. These curves offer a complete view of the changes that have occurred in the system, allowing for more in-depth analysis and a clearer understanding of the effects of contingency and compensation.

Figure 16

Case 22: comparison of PV curves of bars 964, 976 and 995

Source: The authors.

The PMC of case 22, after the disconnection of the line, was 5.2741MW and the MST of 3.7185%, which makes the system unstable considering the voltage stability, as the MST is less than the minimum limit of 4%. However, when parallel compensation is applied, the PMC is 5.4052MW and the MST is 6.2976%.

Table 16 that, even after the application of reactive compensation, the violated busbars remain critical, because, due to the increase in load, there was undertension in the bars close to the highest load amounts.

The base case has the best loading margin and MST, as it is the complete system and is operating under normal conditions. There were contingency cases in which the system is well prepared to receive them, such as cases 5 and 6, because they are located in an area (B) where the energy demand is lower than its generation.

It is possible to observe that the most critical contingency cases, that is, those that presented the highest severity indexes, are found lower in the *ranking* indicating a lower loading margin, as well as MST. The **Table 18** presents the *ranking* with updated data from cases 18 and 22 after reactive compensation.

Parallel compensation proves to be effective, causing cases 18 and 22 to increase their loading margins and MSTs, being within the minimum limits stipulated by the ONS and increasing their respective positions in the *ranking*.

5 FINAL CONSIDERATIONS

The electrical system needs to be reliable and able to withstand contingencies to ensure the demand for energy without overloading equipment, such as generators, transformers, and LTs. It is important to carry out voltage stability studies to identify the vulnerable points of the system, and a widely used method for this is the PV curve. The

application of parallel compensation is essential for the control of reactive power in the network and better performance of transmission lines, regardless of their length.

The objective of this research was to analyze the voltage stability of the STB-33 test system in three different situations: the base case, after the simulation of the simple contingency analysis of transmission lines and after the application of parallel reactive compensation in contingency cases that had voltage violations in their busbars, as a solution for such violations.

To perform the contingency analysis, the *ANAREDE software* was used, which seeks a new solution to the power flow problem through the Newton-Raphson method in each contingency simulation. For this stage, cases in which the removal of the TL caused the isolation of some element of the network were discarded, resulting in 26 contingency cases.

There were seven cases in which the initial solution was not found, most of them belonging to area A, where there is a greater exchange of energy with area B. Among the solutions presented, establishing the bars that interconnect the contingency TL as a reference resulted in convergence of all cases and the lowest severity indexes. It is important to understand the power flow solution to assess whether the system can maintain voltage stability during emergencies, so these cases have been disregarded from studies related to reactive compensation, due to the amount of simplification made to achieve convergence of these cases.

The contingency cases that resulted in the initial convergence of the problem, but with power flow violations on the lines, are mainly in area B of the test system. Due to the fact that area A is unable to generate enough power to meet its demand, the need arises to import power from area B. Among the four cases that resulted in voltage violations in their busbars after the contingency, two cases are entirely in area A, which has a demand greater than the power supply, resulting in drops in the magnitude of tension of the contingency bars and neighboring busbars.

Using FLUPOT and calculating the POF, the amount of reactive to be allocated and the bars that should receive parallel compensation were determined, thus avoiding a poorly dimensioned compensation. In cases 18 and 22, compensation proved to be assertive, recovering the stresses of the busbars, not only where the compensation was allocated, but also in peripheral busbars.

To determine the PV curve and to be able to analyze the loading margin, the *ANAREDE* continuation method was used. In cases 18 and 22, when the load increase is

carried out, it is possible to observe that not all busbars are considered stable from the point of view of tension, as is the case of busbars violated after contingencies. These bars, even before compensation, are considered critical, as an undervoltage occurs when placed under a state of emergency, not being able to remain stable in the face of an increase in load after compensation.

The base case obtained the highest loading margin with 5.9550MW and an MST of 17.1086%, which makes the test system above the minimum limit established by the ONS for complete systems, making it stable from a voltage point of view.

Cases 18 and 22, after the contingency, presented PMCs of 5.1318MW and 5.2741MW and MSTs of 0.9209% and 3.7185%, respectively, obtaining an MST of less than 4%, as predetermined by the ONS. After the application of the compensation, cases 18 and 22 achieved an increase in the loading and voltage indexes, where case 18 obtained a loading margin of 5.3313MW and MST of 4.8446%, and case 22 presented a PMC of 5.4052MW and an MST of 6.2976%, presenting positive results in the variables studied.

ABSTRACT

Land Degradation Neutrality (LDN) was proposed by the United Nations Convention to Combat Desertification (UNCCD) to curb productivity loss and socio-environmental impacts caused by terrestrial ecosystem degradation. As a recent goal, LDN remains debated regarding its conceptual clarity, methodological consistency, and applicability across regional contexts. This study, covering the period 1997–2019, aims to analyze the LDN implementation process by identifying conceptual gaps and challenges related to the use of biophysical indicators for monitoring and assessment at multiple scales. The selected timeframe encompasses the consolidation of the UN Convention to Combat Desertification and the formal inclusion of LDN within the 2030 Agenda, enabling an understanding of its conceptual and institutional evolution. The integrative and bibliometric research analyzed 54 scientific articles and 8 institutional reports from indexed databases and grey literature. Results show that although LDN has advanced as a key component of SDG 15 in the 2030 Agenda, uncertainties persist concerning baseline definition, indicator comparability, and policy effectiveness in countries with limited technical capacity. Strengthening the scientific and institutional framework of LDN requires conceptual harmonization and integration among science, governance, and sustainable financing to ensure a balanced future between land degradation and restoration.

Keywords: Land Degradation. Desertification. Land Degradation Neutrality.

RESUMO

A Neutralidade da Degradação da Terra (LDN) foi proposta pela Convenção das Nações Unidas de Combate à Desertificação (UNCCD) com o propósito de conter a perda de

produtividade e os impactos socioambientais decorrentes da degradação dos ecossistemas terrestres. Como conceito e meta recente, a LDN ainda suscita debates quanto à sua clareza conceitual, coerência metodológica e aplicabilidade em diferentes contextos regionais. Este estudo, desenvolvido no período de 1997 a 2019, tem como objetivo analisar o processo de implementação da LDN, identificando as principais lacunas conceituais e os desafios relacionados à utilização de indicadores biofísicos no monitoramento e na avaliação da meta em distintas escalas. O recorte temporal adotado justifica-se por abranger desde a consolidação da Convenção das Nações Unidas de Combate à Desertificação até a incorporação formal da LDN na Agenda 2030, permitindo observar sua evolução conceitual e institucional. A pesquisa, de natureza integrativa e caráter bibliométrico, abrangeu 54 artigos científicos e 8 relatórios institucionais, obtidos em bases indexadas e documentos da literatura cinzenta. Os resultados evidenciam que, apesar do avanço no estabelecimento da LDN como componente do ODS 15 da Agenda 2030, persistem incertezas quanto à definição de linhas de base, à comparabilidade dos indicadores e à efetividade das políticas públicas em países com limitada capacidade técnica. Conclui-se que o fortalecimento científico e institucional da LDN depende da harmonização conceitual e da integração entre ciência, governança e financiamento sustentável, de modo a assegurar um futuro com equilíbrio entre degradação e restauração das terras.

Palavras-chave: Degradação da Terra. Desertificação. Neutralidade da Degradação da Terra.

RESUMEN

La Neutralidad en la Degradación de la Tierra (LDT) fue propuesta por la Convención de las Naciones Unidas de Lucha contra la Desertificación (UNCCD) con el objetivo de frenar la pérdida de productividad y los impactos socioambientales derivados de la degradación de los ecosistemas terrestres. Como meta reciente, la LDT sigue siendo objeto de debate respecto a su claridad conceptual, coherencia metodológica y aplicabilidad en distintos contextos regionales. Este estudio, desarrollado en el período 1997–2019, tiene como propósito analizar el proceso de implementación de la LDT, identificando las principales lagunas conceptuales y los desafíos vinculados al uso de indicadores biofísicos para su monitoreo y evaluación en diversas escalas. El período elegido abarca desde la consolidación de la Convención de las Naciones Unidas de Lucha contra la Desertificación hasta la inclusión formal de la LDT en la Agenda 2030, lo que permite observar su evolución conceptual e institucional. La investigación, de carácter integrador y enfoque bibliométrico, abarcó 54 artículos científicos y 8 informes institucionales procedentes de bases indexadas y literatura gris. Los resultados muestran que, aunque la LDT se ha consolidado como un componente esencial del ODS 15 de la Agenda 2030, persisten incertidumbres sobre la definición de líneas de base, la comparabilidad de los indicadores y la eficacia de las políticas públicas en países con limitada capacidad técnica. Se concluye que el fortalecimiento científico e institucional de la LDT depende de la armonización conceptual y de la integración entre ciencia, gobernanza y financiamiento sostenible, a fin de garantizar un futuro equilibrado entre la degradación y la restauración de las tierras.

Palabras clave: Degradación de la Tierra. Desertificación. Neutralidad en la Degradación de la Tierra.

1 INTRODUCTION

Land degradation has a profound impact on societies and nature, compromising natural resources across the planet, and is the most challenging environmental problem in drylands (MEA, 2005b). This happens because such a process affects livelihoods, biodiversity, and ecosystem services, while exacerbating climate change and ultimately affecting the well-being of 1.5 billion people worldwide (LAL et al., 2012; ELD, 2015).

The impacts of land degradation are perceived very unevenly in different regions of the planet, and may be more serious in the poorest countries, where about 40% of all land degradation is concentrated (UNCCD, 2015b). In addition, because the impacts of land degradation have direct effects on climate change and biodiversity loss (LAL et al., 2012), they can also influence the ability of nations to achieve the targets set by the United Nations Framework Convention on Climate Change (UNFCCC) and the Convention on Biological Diversity (UNCBD) (LAL et al., 2012).

As defined by the United Nations Convention to Combat Desertification (UNCCD), land degradation is characterized by the reduction or loss of biological or economic productivity and complexity of agricultural land, pastures, or forest areas in arid, semi-arid, and dry sub-humid zones (UNCCD, 2015c). This process results from a combination of factors, including unsustainable land-use systems and the aggravating effect of climate change, which reduce the land's ability to provide vital services, especially under water scarcity (CHASEK et al., 2017).

Given the urgency of reversing this trend, the concept of Land Degradation Neutrality (LDN) was introduced into the global dialogue during the United Nations Conference on Sustainable Development (Rio+20) in 2012. Member States have recognised the need for urgent action to reverse degradation, proposing to achieve a land degradation-neutral world (UNCCD, 2012). This commitment was formally established in the framework of the Sustainable Development Goals (SDGs) in 2015.

Target 15.3 of SDG 15 sets the priority target of achieving the LDN by 2030, which proposes that the global rate of land degradation should not exceed its capacity to recover, keeping the extent of degraded land stable or with minimal increase (UN, 2014; UNCCD, 2015).

Although the LDN is a globally recognized goal and fundamental for sustainable development, its implementation and practical monitoring present significant complexities, especially with regard to its conceptual basis and the biophysical indicators used. This explains the fact that the concept and, in particular, its biophysical monitoring indicators have been the

target of criticism by the scientific community in relation to its conceptual clarity, methodological consistency and effective applicability in different regional contexts.

Given this scenario and the need to guide progress towards SDG Target 15.3, the following research question arises: What are the main conceptual gaps, uncertainties, and challenges related to the LDN implementation process and the use of its biophysical indicators for monitoring and evaluating this goal in different regions of the planet?

The relevance of this study lies in its contribution to critically addressing a central theme of the global sustainability agenda. The deepening of the analysis of the LDN implementation process and the identification of limitations in the conceptual basis and biophysical indicators are crucial to guide future methodological and scientific improvements. In practical terms, this debate is indispensable to subsidize public policies that are truly effective in combating degradation and desertification. By highlighting gaps and uncertainties, this research provides an essential knowledge base for countries to adapt and strengthen their strategies, contributing more effectively to achieving the goal of a land degradation-neutral world.

In this sense, the present study aims to analyze the process of implementation of Land Degradation Neutrality, identifying the main gaps related to the conceptual basis and biophysical indicators, as well as the uncertainties and challenges found in related research to monitor and evaluate LDN in various regions of the planet.

2 THEORETICAL FRAMEWORK

Land degradation has been configured, over the last decades, as one of the most serious environmental and social challenges faced by humanity. This phenomenon compromises livelihoods, biodiversity, and ecosystem systems, intensifying climate change and affecting the well-being of an estimated 1.5 billion people worldwide (NACHTERGAELE et al., 2010; LAL et al., 2012; ELD, 2015). It is a complex and multidimensional problem, whose causes and effects transcend geographical borders and demand an integrated approach, articulating ecological, social and economic dimensions.

The conceptual discussion on land degradation is marked by the breadth and polysemy of the term "degradation", often used generically to encompass different environmental processes — such as desertification, salinization, erosion, compaction, and loss of soil fertility. This semantic generalization, although common in the literature, makes it difficult to accurately measure the phenomenon and compare it between studies (GIBBS; SALMON, 2015).

According to the United Nations Convention to Combat Desertification (UNCCD), land degradation corresponds to the reduction or loss of biological or economic productivity, as well as the ecological complexity of agricultural land, pastures, woodlands, and areas of native vegetation in arid, semi-arid, and dry sub-humid zones. At its core, this process results from unsustainable human practices and the inappropriate use of natural resources (UNCCD, 2015c; AYNEKULU et al., 2017).

The third edition of the *World Atlas of Desertification* (CHERLET et al., 2018) shows that it is not possible to deterministically map the global extent of degradation, given the complexity of the interactions between social, economic, and environmental systems. This finding reinforces the need for multiscale methodologies and integrated approaches that consider both the biophysical factors and the socioeconomic dynamics that aggravate the process.

According to the *Global Assessment of Soil Degradation* (GLASOD), about 20% of soils in dry areas of the planet are degraded, 17% have mild or moderate degradation and more than 2.5% are heavily degraded (GIBBS; SALMON, 2015). The most affected regions are Asia, with approximately 370 million hectares degraded; Africa, with about 319 million; and the American continent, with 279 million hectares. In this context, the *Food and Agriculture Organization* (FAO, 2011) warns that, if current patterns of use and occupation are maintained, by 2025 about 25% of the planet's arable land could be degraded. In arid and semi-arid regions, the picture is even more alarming, with about 69% of potentially agricultural areas suffering erosion and loss of fertility (SALVATI et al., 2009). In these fragile environments, degradation intensified by human action reaches critical levels, configuring itself as desertification (BRASIL, 2004).

The UNCCD defines desertification as the process of land degradation in arid, semi-arid and dry sub-humid regions, resulting from the interaction between climatic factors and human activities (UNCCD, 2015; MAPBIOMAS, 2018). This definition broadens the understanding of the phenomenon by including, in addition to the soil, the loss of biodiversity and the compromise of water resources. Although there are natural causes — such as climatic variations and geomorphological processes (MEADOWS; HOFFMAN, 2003; EU, 2011; WEBB et al., 2017; DHARUMARAJAN et al., 2019) —, degradation is often aggravated by inadequate anthropogenic land use and management practices (CUNHA et al., 2013; SPALEVIC et al., 2014; MATANO et al., 2015; WANJALA; KINYANJUI, 2016).

The phenomenon of desertification manifests itself in various parts of the world, especially in North and South Africa (Sahel region), south-central Eurasia (especially China),

the western portion of the Americas and Australia (ROSÁRIO, 2004). In Brazil, the most vulnerable areas are predominantly located in the Northeast region, although recent studies point to the expansion of these climatic zones to other regions of the country (MAPBIOMAS, 2018). Such evidence highlights the urgency of environmental mitigation and restoration policies adjusted to local specificities.

The conceptual breadth of the terms *land degradation* and *desertification* (ZUCCA, 2012) amplifies the controversies and makes it difficult to make precise estimates at multiple scales. The absence of a standardized global monitoring system is, therefore, one of the main obstacles to the formulation of effective public policies and to the international comparability of data (GIBBS; SALMON, 2015).

In view of the socio-environmental impacts of land degradation, the theme was incorporated into the global goals of the United Nations (UN), in 2015, in the document *Transforming our World: The Sustainable Development Agenda for 2030*. This document defined 17 Sustainable Development Goals (SDGs), divided into 169 integrated and indivisible goals, respecting the specificities and priorities of each State.

In the context of SDG 15, which deals with "protecting, restoring and promoting the sustainable use of terrestrial ecosystems, sustainably managing forests, combating desertification, halting and reversing land degradation and halting biodiversity loss", target 15.3 was approved, which determines, "by 2030, to combat desertification, restore land and degraded soil, including land affected by desertification, droughts and floods, and striving to achieve a land degradation-neutral world" (CGEE, 2016).

The concept of *Land Degradation Neutrality* (LDN) emerged in 2015, in the context of the UNCCD, defined as "a state in which the amount of healthy and productive land resources, necessary to support ecosystem services, remains stable or increases within specific temporal and spatial scales" (UNCCD, 2015). In practical terms, the LDN implies that the degradation that occurred in a given locality must be compensated by the recovery or rehabilitation of previously degraded areas.

In Brazil, research on land degradation and LDN has intensified since 2013, especially in semi-arid regions. Studies by SALGADO and OLIVEIRA (2018) and CUNHA et al. (2013) highlight the importance of integrating biophysical indicators, remote sensing, and public policies in improving environmental monitoring. Despite the advances and the country's adherence to the goals of the UNCCD, challenges related to methodological standardization and institutional articulation persist (BAPTISTA; SILVA, 2019). Such efforts, however,

constitute an essential theoretical and methodological basis for strengthening the LDN agenda in the national and regional context.

The literature on Land Degradation Neutrality (LDN) reveals the coexistence of different theoretical currents that express different conceptions about its foundations and forms of implementation. These approaches reflect tensions between ecological, technical, and institutional perspectives, demonstrating the complexity of the concept and its multiple interpretations in the field of environmental sciences.

On the one hand, authors linked to the **ecosystem and restorative** approach (ARONSON; ALEXANDER, 2013; COWIE et al., 2018) understand the LDN as a strategy for **reconciling conservation and development**, emphasizing the need to integrate mitigation and ecological restoration policies. From this perspective, neutrality represents a dynamic balance between the land's capacity to sustain ecosystem services and human demands for productivity and land use.

On the other hand, currents of **a technocratic and quantitative** nature (KUST et al., 2016; DALLIMER; STRINGER, 2018) prioritize the improvement of **biophysical indicators** and the search for standardized methodologies that ensure global comparability. This strand attributes a central role to the measurement of degradation, defending the need for universalizable models for monitoring LDN, although this standardization does not always contemplate regional and socioeconomic specificities.

There is also a **critical-institutional** aspect (CHASEK et al., 2019; GICHENJE; PINTO-CORREIA, 2019), which problematizes the political-structural limitations and inequalities of technical capacity between countries. This perspective questions the feasibility of achieving neutrality in asymmetric contexts, especially where there is institutional fragility, scarcity of resources, and dependence on international funding agendas.

This diversity of interpretations reinforces that the **conceptual gaps and methodological uncertainties** discussed in this research do not stem only from technical limitations, but reflect **epistemological tensions** between different ways of conceiving degradation, restoration, and sustainability. Understanding these theoretical divergences is essential to consolidate a **more cohesive conceptual framework**, capable of guiding comparable methodologies and consistent interpretations of the LDN within the scope of global sustainability goals.

Several factors accentuate environmental vulnerability in the face of degradation: irregular rainfall, shallow soils susceptible to erosion, fragmentation of vegetation, poverty,

unemployment and lack of social infrastructure. However, there is still no scientific consensus on which biophysical indicators are most appropriate to measure degradation or to assess progress towards neutrality.

The use of environmental indicators represents a fundamental tool to assess the state of the landscape and understand the responses to anthropogenic pressures. According to NIEMEIJER and DE GROOT (2008), environmental indicators are variables capable of describing the state of the environment, its pressures, impacts and systemic responses. For MATTALO JR. (2001), a good indicator must be meaningful, measurable, clear and sensitive to changes, reflecting future trends. Given the complexity of ecological processes, no single indicator is able to fully represent land degradation; therefore, it is recommended to use combined indicators, forming composite indices that allow comparisons between different spatial contexts (SALVATI; ZITTI, 2009).

Achieving target 15.3 of the Sustainable Development Goals (SDGs), aimed at combating desertification and restoring degraded land by 2030, requires the development of more accurate analytical models capable of identifying and measuring affected areas. This advance depends on overcoming the current limitations in the definition and operationalization of biophysical indicators, which are fundamental for the effective monitoring of land degradation.

Understanding the interrelationships between degradation processes and biophysical systems is an essential condition for the scientific and institutional strengthening of the LDN agenda. This integrated approach — which articulates science, technique, and policy — broadens the debate on sustainability, territorial planning, and rational management of natural resources, favoring the improvement of conservation and environmental governance strategies at different scales.

3 METHODOLOGY

The present research is characterized as an integrative bibliographic review associated with an exploratory bibliometric analysis, based on the principles of BOTELHO, CUNHA and MACEDO (2011). This methodological combination allowed the integration of conceptual, technical, and political dimensions of Land Degradation Neutrality (LDN), enabling a comprehensive understanding of international scientific production on the subject.

The time frame in the period 1997–2019 was defined as corresponding to the period of consolidation of the United Nations Convention to Combat Desertification (UNCCD) and

the formalization of the LDN in the 2030 Agenda for Sustainable Development, which marks the conceptual maturation and institutionalization of global policies for sustainable land management.

3.1 METHODOLOGICAL STRUCTURE AND STAGES OF THE RESEARCH

The methodology was structured in five sequential and interdependent stages, represented in the Methodological Diagram (Figure 1). The flowchart illustrates the iterative nature of the process, evidencing the integration between the literature review, the selection criteria and the bibliometric analysis, which supported the final interpretation of the results.

To ensure greater transparency, the exact number of documents analyzed was recorded at each stage of the methodological funnel: initially 312 records identified, reduced to 156 after the screening of titles and abstracts, of which 62 were selected in the complete reading, resulting in the final corpus of 54 scientific articles and 8 institutional reports used in qualitative and bibliometric analyses.

Figure 1

Methodological Flowchart

Source: Prepared by the authors, 2020.

3.2 STEP 1 – PLANNING AND DEFINING THE SEARCH STRATEGY

The time frame (1997–2019), the scientific bases, and the main descriptors used in the searches were established. The search was carried out in *the Scopus*, *SciELO*, *ResearchGate* and *Google Scholar databases*, complemented by consultations with the gray literature (reports from UNCCD, FAO, EEA and MMA).

The search expressions were structured with the *TITLE-ABS-KEY* command, using Boolean operators (AND, OR, NOT) to combine terms and refine the accuracy of the results. The main descriptors included: "*land degradation neutrality*", "*desertification*", "*dryland degradation*", "*biophysical indicators*" and "*sustainable land management*". The search was structured using the *TITLE-ABS-KEY* command, using Boolean operators (AND, OR, NOT) to refine the accuracy of the results.

This stage aimed to identify relevant scientific publications and institutional documents that addressed the conceptual development and evaluation mechanisms of the LDN in different regional contexts.

3.3 STEP 2 – INTEGRATIVE REVIEW AND SCREENING OF DOCUMENTS

The integrative review consisted of a systematic process of **critical reading and thematic categorization**, guided by the criteria of relevance, originality, and adherence to the scope of the LDN. Initially, **312 documents were identified**, of which **156** were kept after reading titles and abstracts. The data were organized according to the baseline variables (author, year, country, descriptors, thematic area, and type of publication).

Table 1 presents the synthesis of the databases consulted, the search parameters and the inclusion criteria used in this stage.

Table 1

Database Synthesis and Search Parameters

Database	Publication Type	Period	Search Fields	Examples of Descriptors	Inclusion Criteria
Scopus	Indexed articles	1997–2019	Title, Abstract, Keywords	"land degradation neutrality", "LDN indicators", "desertification"	Articles with ≥10 citations
SCIELO	Reviewed Articles	2000–2019	Title, Abstract	"Sustainable land	Thematic relevance

				management", "biophysical indicators"	
Google Scholar / Grey Literature	Reports and technical documents	1997–2019	Full text	"UNCCD", "2030 Agenda", "SDG 15.3"	Recognized institutional sources

Source: Prepared by the authors, 2020.

3.4 STEP 3 – APPLICATION OF INCLUSION AND EXCLUSION CRITERIA

At this stage, the documents were filtered to ensure coherence and scientific representativeness.

The inclusion criteria included:

- Publications between 1997 and 2019;
- Texts in English, Spanish or Portuguese;
- Studies on biophysical indicators, evaluation methodologies or public policies related to LDN;
- Institutional documents of international organizations.

Opinion articles with no empirical basis, studies without explicit mention of LDN or focused exclusively on agricultural degradation were excluded. Opinion articles without empirical basis, studies without explicit mention of the LDN, duplicate studies and studies focused exclusively on agricultural degradation were excluded. After applying the filters, 62 documents were analyzed in full text, resulting in the final corpus of 54 scientific articles and 08 institutional reports.

3.5 STEP 4 – BIBLIOMETRIC ANALYSIS AND CONSTRUCTION OF SCIENTIFIC NETWORKS

This stage aimed to identify patterns of production, collaboration and thematic convergence on the LDN in the delimited period, articulating quantitative data and qualitative interpretations. The metadata was previously organized, with standardization of authors, institutions, countries and keywords, ensuring the consistency and comparability of the information.

The final database was exported to the *VOSviewer 1.6.20* software, applying the "association strength" normalization model, as proposed by VAN ECK AND WALTMAN (2014), together with the modularity algorithm for the detection of conceptual clusters. This approach allowed the identification of co-authorship networks, institutional collaboration nuclei and emerging research trends.

The results of this stage enabled the formation of three *main interpretative* clusters:

- (1) Conceptualization and definition of the LDN;
- (2) Biophysical indicators and evaluation methodologies;
- (3) Uncertainties and challenges related to implementation, including governance issues, scales of analysis, and integration with environmental policies.

From these networks, it was possible to establish the empirical and conceptual basis that guided the integrated thematic analysis, developed in the next stage.

3.6 STEP 5 – INTEGRATED THEMATIC ANALYSIS AND SYNTHESIS OF RESULTS

In this stage, the correlation between the bibliometric results and the qualitative evidence extracted from the literature was carried out, in order to understand the conceptual, technical and methodological foundations of the LDN. The analytical reading of the full texts allowed the identification of excerpts that addressed the conceptual dimensions, the biophysical indicators and the operational challenges of the implementation of the LDN in different contexts.

The information was classified into three analytical macrogroups:

- 1) Conceptualization and definitions of the LDN;
- 2) Biophysical indicators and methodological integration;
- 3) Uncertainties and gaps, associated with baseline, measurement scales, governance, and financing.

Based on this categorization, an analytical triangulation was carried out between the bibliometric clusters and the thematic categories, which allowed the construction of a convergence matrix between the main conceptual trends and the empirical evidence in the literature. This matrix evidenced gaps and recurrent challenges, later systematized in **Table 2 (Results and Discussion)**, coherently integrating the quantitative and qualitative results of the research.

As a limitation, the possibility of linguistic bias is recognized, due to the predominance of publications in English, which may have restricted the inclusion of relevant studies in other languages. In addition, there is a time restriction, as the cut up to 2019 does not cover more recent methodological and institutional advances, still under development after the consolidation of the 2030 Agenda.

4 RESULTS AND DISCUSSIONS

4.1 CONCEPTUAL FOUNDATIONS OF LAND DEGRADATION NEUTRALITY (LDN)

The concept of Land Degradation Neutrality (LDN), as defined by the UNCCD (2015), represents the state in which the quantity and quality of terrestrial resources remain stable or increase over time, ensuring the maintenance of ecosystem functions and food security. This proposal aims to balance degraded and non-degraded areas, applying to all ecosystems and territorial scales (KUST, ANDREEVA and COWIE, 2017).

The main innovation of LDN lies in the requirement to restore and sustainably manage the earth's resources, so that any inevitable losses are compensated by the rehabilitation of previously degraded areas (GNACADJA and WIESE, 2016; WUNDER, 2018). This logic implies a transformation in global environmental governance, in which neutrality results from the sum of local and national goals (KUST et al., 2016; 2018).

However, conceptual and operational challenges remain. The definition of "quantity" and "quality" of land requires the use of physical and qualitative indicators, the application of which still presents methodological complexities (AKHTAR-SCHUSTER et al., 2016; 2017). The absence of standardized baselines and clearly defined spatial and temporal scales hinders international monitoring and comparability (SAFRIEL, 2017; DALLIMER and STRINGER, 2018).

In response to these limitations, the UNCCD recognizes the need to strengthen the scientific foundation and harmonize methodologies, reducing divergent interpretations. Three axes structure this guideline: maintenance of ecosystem services; integration between environmental and socioeconomic goals; and inclusive and participatory governance (UNCCD, 2015).

In summary, the LDN represents an integrative approach that articulates ecological, social and economic dimensions, guiding policies for restoration and sustainable management of soils. Its effectiveness depends on methodological standardization and

international cooperation, ensuring comparability between countries and strengthening local actions to mitigate degradation.

4.2 BIOPHYSICAL INDICATORS OF THE LDN

To monitor progress towards Land Degradation Neutrality, the UNCCD has established a minimum set of three global biophysical indicators, which are key to monitoring SDG Target 15.3 (UNCCD, 2013; 2016a; GLII, 2015). These indicators are: (1) land cover and cover changes, (2) land productivity, and (3) soil organic carbon stock (SOC). Figure 2 summarizes the model proposed by the Convention, which guides the measurement of soil degradation and restoration on a global scale.

Figure 2

The UNCCD indicators to assess trends in land degradation and achieve the LDN SDG

Source: UNCCD, 2015.

Land cover is the most sensitive indicator of anthropogenic and natural transformations, and can be monitored by remote sensing. Changes in vegetation cover indicate both degradation processes, such as deforestation and fragmentation, and recovery (CUNHA et al., 2013; EASDALE et al., 2019). Therefore, the spatial analysis of the cover must be complemented by local validation, in order to distinguish sustainable from unsustainable variations (WUNDER, 2018).

Land productivity, associated with Net Primary Productivity (NPP), reflects the capacity of vegetation to accumulate biomass and regulate energy and matter exchanges between surface and atmosphere (LIETH, 1975; BAO et al., 2017). Significant changes in NPP can

indicate anthropogenic pressure or climatic disturbances, and are therefore a useful indicator to assess the balance between degradation and restoration.

Soil organic carbon stock (SOC) is one of the most robust indicators of the health of terrestrial ecosystems, reflecting the soil's capacity to store carbon and sustain ecosystem services (UNCCD, 2016a; CHAPPELL et al., 2019). Despite its relevance, the lack of standardized data and consistent monitoring systems in various regions of the world limits the comparability of results (JONES and FALLOON, 2009).

The integration of the three indicators constitutes a relevant methodological advance, as it allows us to understand together the structural, functional and temporal dimensions of land degradation. Its effectiveness depends on robust time series, regional calibration, and articulation between scientific research and territorial management (KUST et al., 2016; GICHENJE and GODINHO, 2018). Thus, understanding the interdependence between indicators is essential for diagnosing trends and strengthening public policies aimed at sustainable land governance.

4.3 UNCERTAINTIES AND CHALLENGES FOR THE IMPLEMENTATION OF THE LDN

Table 2 summarizes the main uncertainties and challenges identified in the scientific literature on the operationalization of Land Degradation Neutrality (LDN) in different global contexts.

Table 2

The main uncertainties and challenges identified in the reference articles on LDN

UNCERTAINTIES / CHALLENGES	AUTHOR(S) / YEAR
Need for a methodology adapted to regional realities to define the baseline of the LDN (different causes and trends of land degradation, natural and socioeconomic characteristics of the territory);	UNCCD (2012, 2014a); CASPARI et al. (2015); CHASEK et al. (2015); GRAINGER (2015); STAVI & LAL (2015); KUST et al. (2018)
Consideration of environmental, economic, social, political and cultural particularities, as well as the diversity of determinant factors and processes of land degradation, among countries, which need to be considered in the formulation of LDN goals;	O'CONNELL et al. (2013); FAO (2011); NKONYA et al. (2015); KUST et al. (2018)

Source: the Author, 2025.

The scientific literature shows that the implementation of the LDN faces a significant set of uncertainties and conceptual, methodological and institutional challenges, which compromise its consolidation as a global sustainability goal. The most critical point refers to the definition of baselines, which should reflect the environmental, social and economic particularities of each territory (UNCCD, 2012; CASPARI et al., 2015; KUST et al., 2018).

Another recurrent limitation is the selection of analysis scales and biophysical indicators used to measure degradation. The adoption of inappropriate scales can distort results and make comparisons between countries and biomes difficult (CROSSLAND et al., 2018; SOLOMUN et al., 2018). In addition, the lack of reliable data and the low technical-scientific support in countries with limited institutional capacity represent obstacles to the measurement and monitoring of large areas (GRAINGER, 2015).

The lack of international consensus on the standardization of LDN indicators is also a significant weakness. These indicators must be simple, measurable, and based on integrative ecosystem principles, but the multiplicity of definitions and the absence of universal parameters make comparability difficult (O'CONNELL et al., 2013; STAVI and LAL, 2015).

From a strategic point of view, the literature reinforces the need for integrated ecosystem approaches, which reconcile preventive and restorative actions, combining the mitigation of current degradation and the recovery of areas already affected (ARONSON and ALEXANDER, 2013; LIU et al., 2013; IPCC, 2014). This perspective should incorporate dimensions such as biodiversity, climate change, and food security, maximizing synergies between public policies (KUST et al., 2018; OKPARA et al., 2018).

Finally, the effectiveness of the LDN depends on favorable institutional environments and participatory governance mechanisms, with cooperation between governments, the scientific community, and civil society. The absence of robust national policies, the fragmentation of inter-institutional actions, and the high costs of implementation continue to

limit progress (DALLIMER and STRINGER, 2018; GICHENJE, MUÑOZ-ROJAS and PINTO-CORREIA, 2019).

5 CONCLUSION

The results of this research confirm the relevance of Land Degradation Neutrality (LDN) as one of the central goals of the 2030 Agenda, established by the UN. The analysis demonstrates that, although the concept represents an important advance in the integration between science, policy and environmental management, its definition remains incomplete, which limits methodological clarity and hinders the effective monitoring of degradation processes on a global scale.

It was found that the consolidation of the LDN requires the improvement of its conceptual bases and the standardization of biophysical indicators, in order to ensure comparability and effectiveness in public policies aimed at sustainable land governance. In this sense, it is essential that governments incorporate the LDN into their environmental governance agendas, establishing stable financing mechanisms and integrated institutional structures, with active participation of the scientific community and civil society in the restoration and rehabilitation of degraded lands.

From an academic point of view, this study offers a significant theoretical contribution by systematizing and critically discussing the conceptual and methodological foundations of the LDN, highlighting gaps, uncertainties, and opportunities for future research. Such a contribution reinforces the importance of interdisciplinary and multi-scalar approaches in the formulation of more precise and equitable environmental policies.

It is therefore recommended that further investigations deepen the empirical validation of the three minimum indicators proposed by the UNCCD, considering different biophysical and socioeconomic contexts. In addition, it is suggested the development of complementary indicators that are more sensitive to local dynamics, capable of strengthening the monitoring and effective implementation of the global goal of a neutral world in land degradation.

Finally, it is important that future versions of this research integrate post-2019 analyses, in order to reflect the most recent conceptual, institutional, and methodological evolution of the LDN, considering the scientific and political advances that occurred after the consolidation of the 2030 Agenda and the maturation of global neutrality strategies.

ABSTRACT

Clays have been present in society since the beginning of civilization, playing an important role in the early development of man. From the moment that man began to acquire knowledge about the material, in which it served him, he began to analyze its behavior and its application. However, he needed to know the raw material and that there was a difference between them in terms of the structural composition of each clay. Therefore, the objective of this work is the bibliometric survey on the illite clay mineral. The methodology was the study of art and was based on the Web of Science survey, with a time interval of 10 years (2011-2022). Within the base of the Web of Science, filters were applied for search refinement, and the term illita was inserted in the English language. Also, in addition to the year, authors with more publications and the main categories of the database were searched. After processing the data, author Zwingmann was the author with the most publications, followed by Hong and soon after Clauer, each with 29, 27 and 26, respectively. The category with the most publications was Geosciences Multidisciplinary, Geochemistry Geophysics and Mineralogy.

Keywords: Rock. Sedimentar. Genesis of Clay.

RESUMO

RESUMEN

As argilas estão presentes na sociedade com um papel importante no desenvolvimento da civilização humana, . A partir do momento que o homem começou a adquirir conhecimento sobre o material que lhe servia, passou a analisar o comportamento e sua aplicação. No entanto, era necessário conhecer a matéria-prima e as diferenças entre as argilas existentes. Portanto, o objetivo desse trabalho é o levantamento bibliométrico sobre o argilomineral illita. A metodologia para a determinação do estado da arte se deu com base na pesquisa na plataforma Web of Science, com intervalo de tempo de 10 anos (2011-2022). Dentro da base da Web of Science foram aplicados filtros para o refinamento de busca, com o emprego do termo illita (illite). Além do ano, foram buscados os autores com mais publicações e as principais categorias da base de dados. Após o tratamento dos dados, o autor Zwingmann foi o autor com mais publicação, seguido pelo Hong e logo em seguida Clauer, cada um com 29, 27 e 26, respectivamente. A categoria com mais publicação foi a Geosciences Multidisciplinary, Geochemistry Geophysics e Mineralogy.

Palabras clave: Materia Prima. Sedimentaria. Aplicación Industrial.

1 INTRODUCTION

Over time, since the beginning of civilization, man sought to improve the technology of the time for better application of clays, which served man in countless ways, such as: storing groceries, water, special oils; in some civilizations, it was used to worship gods, such as in Egypt (source?).

With the advancement of science and technology, the latter from the Industrial Revolution, allowed knowledge about clays to progress and expand the areas of application. One of these areas is red pottery. Clay minerals are minerals that intrinsically define clays; Chemically, they are hydrated aluminum or magnesium silicates and in the presence of water they acquire certain properties that make technological application feasible. It was from this observation, clay became the main component of traditional ceramics in the composition of masses (ABCERAM, 2022).

Clays, therefore, are raw materials for various purposes of technological application. In addition to the use in the area of red ceramics, there are several uses in other sectors such as in the cement manufacturing industry, advanced ceramics, refractory industry, rubber, paints and paper. The modernization of technology and scientific progress have led to the use of clays in the health and cosmetics industries. In the health sector, in the manufacture of ceramic composites, blends with ceramic materials; in dentistry, in the manufacture of veneers. In the area of cosmetology, it is part of makeup products, clay masks to remove toxins and fats.

With the high variability of clay minerals, illite is one of the clay minerals with great technological application. Illite comes from the primary mineral mica that belongs to the group of phyllosilicates, making up a secondary mineral of the 2:1 type that corresponds to two sheets of silicon tetrahedron and one of aluminum octahedron. The chemical composition of illite is $(K,H_3O)(Al,Mg,Fe)_2(Si,Al)_4O_{10}[(OH)_2,(H_2O)]$ and dioctahedral similar to that of

muscovite with junction of the T-O-T layer (two tetrahedral leaves and one octahedral). Generally, by majority, illites contain fewer atoms between the strata than muscovite generating a weak binding force (ERNANI, 2016; NAVARRO et al., 2017).

As a general objective of this article, a survey was carried out through a bibliometric study identifying the main authors and sectors and/or segments that use illite in the industrial process and thereby verifying the object of study, enabling its use.

2 METHODOLOGY

The bibliometric research started from the study of art with access to the list of collections available on the CAPES journal platform. The basis of the research was the Web of Science, carried out from November to December 2022. The objective of study in this survey was the clay mineral illite with its technological applications. To this end, filters were applied to refine the search based on more relevant and updated data, as shown in Chart 1.

The research began with the use of the clay mineral illite, but the Web of Science database recognizes only terms in English, and illite is used. In order to make the work more refined, the time interval applied was 11 years, from 2011 to 2021. Also, Web of Science categories and authors were searched , and the five most important articles were selected, from which the analysis of the studies of interest was generated.

The discussion of the data took place about each publication of greater importance for each author

Table 1

List of categories and authors

Filters	Data
Web of Sciences journals	<i>Geosciences</i> <i>Multidisciplinary</i> <i>Geochemistry Geophysics</i> <i>Mineralogy</i> <i>Chemistry</i> <i>Physical Energy</i> <i>Fuels</i>
Main Authors	Zwingmann, Horst Hong, Halie Clauer, Nobert Aldega, L Dai, Shifeng

Source: The author, 2022.

3 RESULTS AND DISCUSSION

From the search filters used in this research, 126 publications were obtained. The journal with the most publications was Geosciences Multidisciplinary, with 75 papers identified, followed by Geochemistry Geophysics with 38, and then Mineralogy with 30

publications. Figure 1 shows the graph with the number of publications according to the category of the database.

Regarding the time interval employed (11 years), Figure 2 shows the number of publications. The year 2013 presented the highest number of articles with 15, followed by the years 2016 and 2017 which were tied with 14 and soon after the years 2012, 2014, 2015 and 2020, making a result of 12 published works.

Figure 1

Web of Science category distribution chart

Source: Web of Science, 2022.

Figure 2

Number of publications per year

Source: Web of Science, 2022.

The author who presented the highest number of publications in the period surveyed was Horst Zwingmann, with 29 in all. After him, Halie Hong with 27 and then Norbert Clauera with 26 publications. Figure 3 shows the graph with the scientific production of the five authors who published the most.

Figure 4 shows the graph with the curve of citations and publications within the established time interval.

Figure 3

Graph with the number of publications according to each author

Source: Web of Science, 2022.

Figure 4

Graph number of citations X publication

Source: Web of Science, 2022.

According to Figure 3, Zwingmann presented 29 publications, among which Clauer et al., (2012) stand out, which aims to study two dating methods, K-Ar and $^{40}\text{Ar}/^{39}\text{Ar}$ with illite-type clay minerals. To carry out this research, the authors separated samples ranging in size < 0.2 to $40\text{ }\mu\text{m}$ originated from a set of boreholes in sandstones of the Basin in northwestern Germany. After the analyses, the authors concluded that the conventional K-Ar method is convenient and straightforward for dating clay minerals and it is possible to use this clay mineral in geochronology. This work, according to the database, is within the journal of Geosciences Multidisciplinary and has been cited 55 times, showing its value in the area of geosciences.

The study by Yin et al., (2013) brought an approach to the description of vermiculite intercalated with hydroxyl (HIV) present in the red earth profile in Jiujiang, southeastern China, aiming to understand its genesis. The site is in a subtropical zone, above sea level at around 41 m altitude. The depth of 14 m was subdivided into three sections. After processing the data, the authors concluded that the sedimentary deposit was formed in the Pleistocene period, resulting from the alteration in the HIV clays due to climatic conditions. The exchangeable cations present and the spacing break were due to the ratio of $\text{Al}/(\text{Mg}+\text{Ca})$ as AlOH acting on the HIV interlayers. The HIV clays found in this locality are products of the weathering of the illite, suggesting that the order of weathering was: illite-vermiculite-HIV. The study comprises two journals: Mineralogy, Chemistry Physical.

The author with the most publication, after Hongn, is Norbert Clauer. In total, 26 articles were identified, and their most interesting study was published in 2012. It addresses clay dating by two methodologies (CLAUER et al., 2012).

Aldega totaled 24 publications and among them the most valuable is the study developed in partnership with Rossetti et al., (2011) who proposed a hydrodynamic mathematical model for fluid flow and mineralization as well as the inference of future failures for hydrothermal flow. In addition, the description of the fluid flow mode, rock-fluid interaction and mineralogy within the environment of the extensional fault in the main hydraulic channel for thermal circulation.

The x-ray diffraction technique and the application of geochemical studies, inclusion of fluids and stable oxygen isotopes were used. As a conclusion of the study, the authors point out that the hydrological properties were influenced by the low permeability of the fault core inducing the compartmentalization of the fluid flow and the parallel flow of ascending

fault. The Web of Science category that falls under the study is Geosciences Multidisciplinary (ROSSETTI et al., 2011).

The study by Dai et al., (2011) had a high number of citations, in all 222 and aimed to describe the chemical and mineralogical compositions and possible sources of silic, mafic and alkaline tonsteins as well as magic tuffs below the Upper Permian carboniferous layers. In all, 35 samples of tonstein and 4 samples of magic tuffs from the six coal mines. The mineralogical detection was made by optical microscopy and X-ray diffraction. Therefore, the authors found that the deposits were indeed alkaline, mafic, and silicon, in which the first two correspond to the initial and final stage of the Permian and the mafic tonsteins are distributed throughout the section

Carboniferous from the late Permian. Clay minerals, in most tonsteins, belong to the kaolinite group or are composed mainly of mixed layers of illite and smectite. The presence of quartz is significant in silicon tonsteins; the alkaline and mafic ones are enriched with anatase. The presence of pyrite in all tonsteins is due to the influence of seawater. This study belongs to the category Geochemistry & Geophysics.

Regarding the development of the study, it was observed that, despite having fewer publications, the author Shifeng Dai was the most cited in the elaboration of other studies. This shows the great value of this researcher in the area of geochemistry and geophysics, as he served as a basis for the discussion of other similar studies with the intention of exploring the research area.

Another important point was the year of publication of the authors listed in Figure 3, where most of the scientific productions are from the year 2011. Among the selected works of each author, the Geosciences Multidisciplinary category was the one with the greatest coverage, while the others were only tied, except for Energy Fuels, which did not include any of the works.

4 FINAL CONSIDERATIONS

From the methodology applied, it was possible to note the importance of scientific productions, as well as the research coming from the CAFE CAPES portal, because in it there are certain ways to carry out the research, whether it is by the list of books, list of bases, search by subject or list of journals. It is worth noting that by accessing the aforementioned portal, scientific works that, in the vast majority, have to pay to have access to scientific sources, are made available free of charge due to the partnership of the Brazilian federal

government with the main scientifically based lists. Armed with this, the work presented relevant data regarding the clay mineral illite and the range of research in which it is inserted, revealing the magnitude of scientific research in the middle of society.

ABSTRACT

Potentially toxic metals are capable of bio-accumulating in body tissues of living organisms and of having toxicological effects on both soil properties and the health of humans and animals. There are several methodologies available to quantify metals in aqueous matrices, however, these techniques are expensive, given their high cost and need of experts to manage the equipment. Accordingly, the present study introduces the application of an Au electrode, without surface modification, to analyze the presence of Pb²⁺ ions in surface water collected from Lanoso Brook, Uberaba City - MG, Brazil. The technique of anodic stripping voltammetry, without the need of sample preparation was employed. Volumetric parameters were optimized with the aid of central composite rotational design (CCRD) and method validation was carried out in atomic emission spectrophotometer. A detection limit (DL) of 0.04 ng L⁻¹ and quantification limit (QL) of 0.13 ng L⁻¹ were determined. Moreover, Pb²⁺ was found in real samples, and this finding highlighted the effectiveness of employing the Au electrode in this role.

Keywords: Environmental Electroanalyticals. Potentially Toxic Metals. Water Quality. Anodic Stripping Voltammetry.

RESUMO

Metais potencialmente tóxicos são capazes de bioacumular-se nos tecidos corporais de organismos vivos e de apresentar efeitos toxicológicos sobre as propriedades do solo e a saúde de humanos e animais. Existem diversas metodologias disponíveis para quantificar metais em matrizes aquosas; no entanto, essas técnicas são dispendiosas, devido ao seu alto custo e à necessidade de especialistas para operar os equipamentos. Assim, o presente estudo apresenta a aplicação de um eletrodo de ouro, sem modificação superficial, para

RESUMEN

Los metales potencialmente tóxicos pueden bioacumularse en los tejidos de los organismos vivos y tener efectos toxicológicos tanto en las propiedades del suelo como en la salud humana y animal. Existen diversas metodologías para cuantificar metales en matrices acuosas; sin embargo, estas técnicas son costosas debido a su elevado precio y a la necesidad de personal especializado para su manejo. Por consiguiente, este estudio introduce la aplicación de un electrodo de oro (Au), sin modificación superficial, para analizar la presencia de iones Pb^{2+} en agua superficial recolectada del arroyo Lanoso, ciudad de Uberaba, Minas Gerais, Brasil. Se empleó la técnica de voltametría de redisolución anódica, sin necesidad de preparación de la muestra. Los parámetros volumétricos se optimizaron mediante un diseño compuesto central rotacional (DCCR) y la validación del método se realizó en un espectrofotómetro de emisión atómica. Se determinó un límite de detección (LD) de $0,04 \text{ ng L}^{-1}$ y un límite de cuantificación (LC) de $0,13 \text{ ng L}^{-1}$. Además, se encontró Pb^{2+} en muestras reales, y este hallazgo destacó la eficacia del uso del electrodo de Au en esta función.

Palabras clave: Electroanálisis Ambiental. Metales Potencialmente Tóxicos. Calidad del Agua. Voltametría de Redisolución Anódica.

1 INTRODUCTION

Environmental contamination by potentially toxic metals is an increasingly pressing global concern, primarily driven by rapid industrialization and urban expansion. Among the various pollutants, lead (Pb) stands out due to its lack of any essential biological function and its ability to bioaccumulate in living organisms. This contaminant enters the environment through multiple anthropogenic sources, including industrial discharges, mining activities, fossil fuel combustion, and improper waste disposal. Furthermore, Pb can be present in pesticides and fertilizers, contributing to soil leaching and the contamination of both soil and water bodies. Its persistence and mobility significantly heighten environmental and public health risks.

In the environment, lead is found mainly in the form of Pb^{2+} ions or as chemically inert organic and inorganic species. Once absorbed by living organisms, Pb can cause significant biochemical disturbances, particularly affecting the nervous, hepatic, renal, and hematological systems. For this reason, monitoring Pb levels in environmental matrices is essential to prevent ecological damage and protect public health.

Given the need for sensitive and low-cost analytical techniques, electrochemical methods - especially anodic stripping voltammetry (ASV) - have shown great promise for detecting trace levels of Pb^{2+} in environmental samples. These techniques offer several advantages, including low operational cost, fast analysis, high sensitivity, and the possibility of in situ applications. In this context, the objective of this study was to evaluate the performance of an unmodified gold (Au) electrode for the electrochemical detection of Pb^{2+} ions in natural water samples intended for public supply.

2 THEORETICAL FRAMEWORK

Environmental pollution caused by potentially toxic metals is an issue of global concern. Accelerated population growth has led to several industries whose activities are the main source of release for potentially toxic metals (Latif *et al.*, 2022; Hossaini-Zahed *et al.*, 2022). Discharge of these elements into the environment can derive from such human activities as urban traffic, industrial activities, crop fertilizers and irrigation, mining, and, naturally, from soil erosion, weathering and rock cycles. Lead (Pb) stands out among possibly toxic metals as it is not an essential element and it can bio-accumulate in organisms and have permanent environmental effects (Balasubramanian *et al.*, 2020; Latif *et al.*, 2022; Chang *et al.*, 2022; Cui *et al.*, 2023).

The availability of Pb availability in soils, sediments and waterbodies frequently occurs in the form of Pb^{2+} or in its inert form, as organic or inorganic species (Kumar *et al.*, 2020). Pb can enter in contact with the environment via several pollution sources, such as smelting, mining, fossil fuels, besides inappropriate waste discharge including paint, gasoline and battery residues (Bahinting *et al.*, 2021; Latif *et al.*, 2022). Pesticides and phosphate fertilizers can also contain Pb in their formula, which can leach from soil to rivers and contaminate waterbodies (Ebrahimi *et al.*, 2020).

When in contact with the organism, Pb can cause several biochemical changes in the nervous system, kidneys and liver, besides having carcinogenic and mutagenic properties (Gnonsoro *et al.*, 2022; Nyamato *et al.*, 2022). Given its interaction with iron, lead can compromise the hematological system and cause anemia, as well as weakness and fatigue (Barroso *et al.*, 2021; Aniceto; Irazusta 2023). Symptoms attributed to exposure to lead can be light, such as burning eyes, irritation, vomiting, diarrhea, lung irritation, headaches and dizziness. However, sometimes, they can be severe and include allergic dermatitis, Painters syndrome, lung cancer, reproductive harm, kidney and liver damage (Balasubramanian *et al.*, 2020).

Lead determination in real samples is most often carried out through atomic absorption spectrometry (AAS), Microwave Plasma Atomic Emission Spectrometry (MP-AES), plasma source mass spectroscopy (ICP-MS), inductively coupled plasma optical emission spectroscopy (ICP-OES) and micro-solid-phase extraction (μ -SPE) in combination with gas chromatography–mass spectrometry (Boleji *et al.*, 2021). However, such traditional techniques require sophisticated sample preparation, longer analysis times analyses, trained technicians and high-cost equipment (Guenang *et al.*, 2020; Bahinting *et al.*, 2021). Electrochemical techniques are promising for analysis of pollutants as it is possible to reduce many of the costs. Voltammetry is an electroanalytical technique capable of providing high sensitivity in several environmental matrices in order to monitor traces of potentially toxic metals. In addition, the pre-concentration stage in anodic stripping voltammetry, can significantly increases sensitivity levels and analyte detection limits (Jovanovsk; Hrastnik 2019; Sánchez-Calvo; Blanco-López; Costa-García 2020).

Electrochemistry is an important tool to analyze reactions involving electron transfer, and a set of analytical methods based on the electric properties of analytes in the solution are available (Elgrishi *et al.*, 2018). Such techniques have been gradually more widely used due to their low operational cost, high selectivity and sensitivity to detect and quantify harmful

substances found in water bodies. Moreover, they can help studies on the formation of intermediate toxic products to both humans and the environment. Such analyses are fast, and they can be carried out in situ (Monteiro; Dos Santos Júnior; Sussuchi, 2020; Zier; Bouafia-Chergui; Chabani, 2021).

Anodic stripping voltammetry (ASV) is one of the most often used techniques to detect potentially toxic elements at low concentrations, based on using the electrochemical sensor. This device can measure the concentrations of certain molecules or analytes through redox reactions, in which electrons are transferred between analyte molecules and the electrode and consequently, a current proportional to the analyte's concentration is generated at the sensor (Nourbakhsh *et al.*, 2022).

Thus, it is worth noting that the use of unmodified gold (Au) electrodes for metal detection remains relatively unexplored in the scientific literature. Most available studies report comparatively high detection limits when measured against conventional analytical methods, which limits their applicability for trace-level environmental analysis. Therefore, investigations assessing the performance of these electrodes under real sample conditions are highly relevant, particularly when considering their simplicity, reproducibility, and potential for use in low-cost monitoring systems.

3 METHODOLOGY

3.1 REAGENT

Lead (II) chloride (Cinética, 99%) was used as the source of Pb(II) for all assays performed. All other reagents were provided by Sigma Aldrich® at analytical grade and used without further purification. Ultra-pure water (Milli-Q®) was used for solution preparation purposes (resistivity ~ 18 MΩcm). Experiments were conducted at room temperature (25°C). Hydrochloric acid solution (HCl) at a concentration of 1 mol L⁻¹ was adopted as supporting electrolyte. Lead (II) chloride stock solution (PbCl₂ - 1,000 µg L⁻¹) was prepared by diluting its solid standard in a solution of the supporting electrolyte. Solutions of sodium hydroxide (NaOH - 5.0 mol L⁻¹) and standard hydrochloric acid solutions (37 %) were used for pH adjustment purposes.

3.2 ELECTRODES

Electrodes used in the experiments were provided by Lab Solutions®. The Au electrode disc (ϕ = 1.6 mm) was pretreated by performing 15 potential sweeps in 0.1 mol L⁻¹ sulfuric

acid in the solution at range of 0.15 to 0.6 V (vs. Ag/AgCl) at a sweep-rate of 0.05 V s⁻¹. The Au electrode was also polished with suspended alumina (0.3 µm) and washed in ultra-pure water for a mirror finish. A potential of 0.33 V per 200 s was applied for cleaning after each sweep, to make sure that the metal ions were re-oxidized. A Platinum (Pt) wire (5 cm) was the auxiliary electrode and Ag/AgCl in 3 mol L⁻¹ KCl solution was the reference electrode.

3.3 EQUIPMENT

Autolab[®] potentiostat/galvanostat model PGSTAT 320N, controlled using NOVA 2.1 (Metrohm) software, was used for voltammetry procedures. Fisatom magnetic stirrer model 752A 115 V and a stirring bar (9 mm in diameter x 8 mm in height) by Merck were used in ASV. A Tecnocon pH meter, model MPA-210, was employed to determine pH values. OriginPro[®] 2019b by OriginLab was used to treat the results and to plot the graphics. Method validation was made in MP-AES 4200 Microwave Induced Plasma Atomic Emission Spectrometer, Agilent Technologies. Statistica software was used for the experimental design procedure.

3.4 CENTRAL COMPOSITE ROTATIONAL DESIGN

A Central Composite Rotational Design (CCRD) was used to optimize the parameters under study. In total, 17 experiments were carried out through CCRD 23, with 6 axial points and 3 repetitions, at the central point. Table 1 presents the codified values and the real independent variables of the CCRD.

Table 1

Codified and real values recorded for the independent variables

Variables	Code	- α	-1	0	+1	+ α
Deposition time (s)	X_1	34	100	200	300	366
Frequency (Hz)	X_2	13.5	30	55	80	96.5
Amplitude (mV)	X_3	6.9	30	65	100	123.1

Source: Developed by the authors.

3.5 VOLTAMMETRY ANALYSES

The analysis limit applied to deposition time, frequency and amplitude was established based on the proposed experimental design. After assessing studies available in the

literature, the value of 04 mV was established for scan increment. The pH was varied in the range of 0.0 to 4.0, at a 0.5 increase.

3.6 ANALYSES APPLIED TO NATURAL SAMPLES

Lanoso Brook is in the Triângulo Mineiro region, inside an environmental protection area. It is one of Uberaba River's main tributaries. Surface water samples were collected from September 2022 to February 2023, as this is the rainy period, which possibly allows more Pb^{2+} ions to leach into surface water. All samples were stored in plastic containers and kept in the dark and under refrigeration, to avoid degradation and composition changes. This process made the samples integrated over the whole collection period.

4 RESULTS AND DISCUSSIONS

4.1 EAU APPLICABILITY IN METALLIC ION ANALYSIS

Preliminary analysis of lead, cadmium and copper at an Au electrode was performed with the aim of assessing the possibility of simultaneous detection. Square wave voltammetry (SWV) was applied to at concentrations of 400, 600, 800 and 1.000 mg L⁻¹, using HCl (0.1 mol L⁻¹) as the supporting electrolyte, according to the following parameters: pulse amplitude: 50 mV, frequency: 60 Hz and scan increment: 04 mV. Figure 1 presents the voltammograms obtained during the analyses.

Figure 1

Square wave voltammogram of simultaneous detection of Pb, Cd and Cu, at concentrations of 400; 600; 800 and 1.000 mg L⁻¹ in HCl (0.1 mol L⁻¹) and pH 0.5. $f = 60$ Hz, $a = 50$ mV, $s = 04$ mV, $f = 60$ Hz, $a = 50$ mV, $s = 04$ mV

Source: Developed by the authors.

From Figure 1 it can be observed that the voltammogram presented characteristic reduction peaks for the analyzed metals with a satisfactory response to the concentration gradient. The r^2 values learned from analytical curves were 0.999, 0.995 and 0.998 for lead, cadmium and copper, respectively. Thus, it was possible to observe that, under the conditions employed, that the Au electrode was able to simultaneously determine multiple metals in solution during SWV. This finding demonstrates the potential of Au to be used in multi-elementary analysis.

4.2 CENTRAL COMPOSITE ROTATIONAL DESIGN

The Central Composite Rotational Design (CCRD) was employed to optimize three experimental variables: deposition time (34 to 366 s), frequency (13.5 to 96.5 Hz), and amplitude (6.9 to 123.1 mV). A total of 17 experiments were conducted using a Pb^{2+} concentration of $1,000 \mu g L^{-1}$ and pH 0.0. The optimized parameters obtained were a deposition time of 200 s, frequency of 81 Hz, and amplitude of 98 mV. Response surface analyses revealed that the highest current signals occurred at deposition times close to 200 s and frequencies ranging from 60 to 85 Hz, highlighting the importance of deposition time for the preconcentration of Pb^{2+} ions on the Au electrode and the consequent enhancement in detection limits.

Statistical analysis, with 95% confidence, confirmed that the optimal amplitude range was between 80 and 100 mV, and that the best analytical signals were obtained with frequencies between 60 and 100 Hz. The proposed mathematical model (Eq. 1) showed that amplitude (X_3) was the most influential variable—nearly five times more relevant than deposition time (X_1).

$$I(\mu A) = -149.20 + 0.71.X_1 - 0.002X_1^2 + 4.62.X_2 - 0.03 X_2^2 + 3.70.X_3 - 0.022 X_3^2 + 0.001.X_1.X_2 + 0.002X_1.X_3 - 0.019.X_2.X_3 \quad (1)$$

Where:

X_1 is deposition time

X_2 is frequency

X_3 is amplitude.

Additionally, it was observed that increasing frequency had a greater impact on current signal intensity compared to the other two variables, which aligns with findings by Vasconcellos *et al.* (2020).

4.3 EFFECT OF PH

The release of cations increases at lower pH values and alters the voltammetric profiles (Sun *et al.*, 2020; Król; Mizerna; Bożym, 2020). Thus, a pH study was conducted to analyze the best analytical results. After studying the literature, the following pH range was set: 0.0 to 4.0, with a 0.5 step increase.

The highest current intensity was recorded at pH 0.0, which led to the most satisfactory analytical signal. Therefore, this value was used as the standard pH for the analyses applied to natural samples to obtain the highest sensitivity for the electroanalytical method.

4.4 LEAD ANALYTICAL CURVE

After assessing several articles and analyzing the laboratory conditions adopted in the studies by Munoz & Angnes (2004), Zhu *et al.* (2014), Vasconcellos (2020), Yaman *et al.* (2021), it was possible to observe that the best scan increase for the present study was 4 mV. Accordingly, parameters were established to find the best analytical signal for the Pb²⁺ analytical curve.

All assays used hydrochloric acid (HCl 1 M) as supporting electrolyte. Thus, some exploratory voltammograms were performed to determine the oxidation potential of Pb under the conditions set for these analyses. Pb undergoes oxidation at values close to 0.33 V. Therefore, during the analyte pre-concentration stage at the Au electrode, a potential of -0.33 V, for 200 s, was applied.

Equation 2 shows the reaction taking place at deposition stage, which involves Pb²⁺ reduction to metallic lead (Pb⁰) at the working electrode after applying a potential of -0.3 V. Subsequently, anodic stripping occurs, which makes the lead deposit at the electrode oxidize and form Pb²⁺ (Eq.3) in solution. Thus, a positive scan was performed, and resulted in Pb oxidation at concentrations 0.05, 0.1, 0.2, 0.4 and 0.8 ng L⁻¹, as depicted in Figure 2.

Figure 2

Anodic stripping voltammogram at concentrations 0.1, 0.2, 0.4 and 0.8 ng L⁻¹ Pb²⁺ in HCl (1 mol L⁻¹) and pH 0.0. Deposition time = 200 s, $f = 81$ Hz, $a = 98$ mV, $s = 04$ mV

Source: Developed by the authors.

Linearity, in the analytical method, is an intrinsic property that allows analytical responses to be directly proportional to the concentration of the analyte in the study (Ribani *et al.*, 2004). Therefore, it is possible to observe (Figure 2) the Pb analyses at different concentrations conducted in triplicate, as well as the gradual increase in peak current as analyte concentration increases.

Based on Figure 3, the analytical curve displays satisfactory association between Pb²⁺ concentration and current peak. The current increased as concentration also increased. Thus, the linear equation is given by $I_p (\mu A) = 1.88952 \cdot 10^{-6} + 9.27194 \cdot 10^{-8} \cdot C_{\text{lead}}$.

Figure 3

I_p association with Pb^{2+} concentration (0.05, 0.1, 0.2, 0.4 and 0.8 $ng\ L^{-1}$). Deposition time = 200 s, $f = 81\ Hz$, $a = 98\ mV$, $s = 04\ mV$

Source: Developed by the authors.

The results display a satisfactory linear response between concentration and peak current ($r^2 = 0.999$). The proposed method, based on the application of an Au electrode, and ASV, presented a detection limit (DL) of $0.04\ ng\ L^{-1}$ and quantification limit (QL) of $0.13\ ng\ L^{-1}$.

4.5 ELECTROANALYTICAL DETERMINATION OF LEAD (II) IONS IN NATURAL WATER

Tests were performed with surface water samples collected from the Lanoso Brook, Uberaba City – MG, Brazil. Figure 4a presents the characteristic voltammogram of analyses applied to concentrations 0.05, 0.1, 0.2, 0.4 and $0.8\ ng\ L^{-1}$ adopted to compare the analyses performed under laboratory conditions. The process was performed for concentrations of 0.0, 0.01, 0.1, 0.15 and $0.2\ mg\ L^{-1}$ (Figure 4b), which is in the detection range of microwave induced plasma atomic emission spectroscopy.

Characteristic current peaks were observed at 0.3 V, without significant peak displacement and with variations in anodic stripping voltammetry, based on voltammograms of Pb^{2+} oxidation in natural samples, at the two concentration limits. These fluctuations likely occur due to the presence of organic pollutants, organic matter and dissolved inorganic matter, because these are complex samples; this process could lead to slight changes (Kobielska *et al.*, 2018; Nourbakhsh *et al.*, 2022).

Nevertheless, interaction with organic matter can form stable complexes with metallic ions and compete for electrode surface sites in deposition or redissolution. This reduces signal intensity or allows the presence of interfering signals (Monteiro *et al.*, 2018).

Figure 4

Anodic stripping voltammetry applied to natural samples at different Pb²⁺ concentrations, expressed in HCl 1 mol L⁻¹ (pH 0.0). Concentrations were A) 0.05, 0.1, 0.2, 0.4 and 0.8 ng L⁻¹ and B) 0.0; 0.01; 0.1; 0.15 and 0.2 mg L⁻¹. Deposition time = 200 s, $f = 81$ Hz, $a = 98$ mV, $s = 04$ mV

Source: Developed by the authors.

4.6 ELECTROCHEMICAL METHOD VALIDATION

Microwave Plasma Atomic Emission Spectrometry (MP-AES) was applied to validate the proposed method adopted to detect Pb²⁺ ions in natural samples. Table 2 presents the comparison between MP-AES and ASV in natural water samples for lead detection purposes. These results show similarities between the two techniques employed to detect Pb²⁺ ions. Interestingly, the ASV technique was capable of detecting Pb²⁺ in natural water samples.

Table 2

Comparison of results recorded for natural water samples

Added concentration (mg L ⁻¹)	Concentration found in MP-AES (mg L ⁻¹)	Concentration found in ASV (mg L ⁻¹)
0.000	< QL	0.005 ± 0.062
0.010	0.010 ± 0.001	0.007 ± 0.090
0.100	0.098 ± 0.002	0.093 ± 0.031
0.150	0.156 ± 0.010	0.153 ± 0.044
0.200	0.187 ± 0.020	0.199 ± 0.093

Source: Developed by the authors.

Figure 5 (a and b) depicts the concentration curves plotted for concentrations expressed in ng L⁻¹ using ASV at the concentration of ng L⁻¹ ($r^2 = 0.990$) and at mg L⁻¹ ($r^2 = 0.996$), respectively. Figure 5(c) contains the data obtained using MP-AES analysis ($r^2 = 0.995$).

Figure 5

Analytical curve plotted for lead in natural samples expressed in A) and B) ASV concentrations ng L⁻¹ and mg L⁻¹, respectively. Deposition time = 200 s, $f = 81$ Hz, $a = 98$ mV, $s = 04$ mV and C) MP-AES 4200 analysis

Source: Developed by the authors.

The t test was performed to statistically compare results recorded through MP-AES analysis and ASV, at concentrations expressed in mg L^{-1} . The value obtained was -0.02386 and indicated a lack of evidence of significant differences between the observed results.

4.7 RECOVERY TEST

Recovery values recorded for both electrochemical techniques employed for lead detection purposes were calculated and they are given in Table 3. This was done to assess the accuracy of the analyses carried out with natural water samples.

Table 3

Total lead recovery in natural water

Analytical method	Total recovered concentration (mg L^{-1})	% Recovery
MP-AES	0.451	98
ASV	0.457	99

Source: Developed by the authors.

The standard addition method was chosen to minimize the matrix effect. The matrix effect, in its turn, can interfere with the analyses (Ribani *et al.*, 2004). These results recorded 98% recovery through MP-AES and 99% recovery through ASV. The t value was 0.79046, at a 95% significance level. This finding shows that there is no evidence of significant differences between results provided by ASV, based on the use of Au electrodes, and MP-AES.

The Au electrode was effective both in terms of costs and of detection and quantification limits obtained in the analyses. The Au electrode does not need pre-treatment of its surface and reached detection levels of ng L^{-1} . Thus, the proposed method, in combination with the electrode, emerged as an efficient alternative to quickly detect low Pb^{2+} concentrations in natural water samples.

5 CONCLUSION

The Au electrode proved itself to be effective and promising for detection of Pb^{2+} without any surface modification or pre-treatment, through ASV, applied to natural water samples collected from Lanoso Brook, Uberaba City – MG, Brazil. The methods were validated through MP-AES and ASV with $r^2 = 0.995$ and $r^2 = 0.996$, at recovery rate of 98% and 99%, respectively. This result was statistically confirmed through the t test, which demonstrated the lack of substantial differences between the analytical procedures.

It was possible to that any future application of the methodology proposed would employ printed electrodes. This would be required to reduce the time of electrode cleaning. Therefore, the electrochemical method proposed here, based on using Au electrodes without pre-treatment, has emerged as feasible alternative for Pb^{2+} detection in natural water samples. The methodology makes in situ analysis feasible and allows for real-time analyses to assess and monitor surface water used for public supply.

ACKNOWLEDGEMENTS

Thanks to CAPES, CNPq and FAPEMIG for the financial resources that made this research possible. We also extend our special thanks to Professor Dr. Geoffroy for his invaluable support throughout the development of this work.

ABSTRACT

This paper analyzes the creation and importance of the Unified Health System (SUS) in Brazil. Before its establishment, formalized by the 1988 Federal Constitution, the country's health system was fragmented and unequal. The SUS was established with the goal of guaranteeing universal, free, and equal access to health care for the entire population. Its implementation represented a substantial advance, promoting the decentralization of services and a focus on primary care, prevention, and health promotion. This principle reflects the vision that "health is a right for all and a duty of the State," as emphasized by Paulo Capel Narvai (2022, p. 103). Despite notable achievements, such as expanded access to treatments and preventive programs, the system faces challenges that compromise its ability to fully serve the population. Problems such as underfunding, regional inequalities, and the social perception that health actions and services are not rights, but commodities (NARVAI, 2022) persist. However, it is concluded that the SUS continues to be one of the country's greatest social achievements, essential to guarantee the well-being of millions of Brazilians.

RESUMO

Este trabalho analisa a criação e a importância do Sistema Único de Saúde (SUS) no Brasil antes de sua instituição, formalizada pela Constituição Federal de 1988, visto como um sistema de saúde do país outrora fragmentado e desigual. O SUS foi estabelecido com o objetivo de assegurar acesso universal, gratuito e igualitário à saúde para toda a população. Sua implementação representou um avanço substancial, promovendo a descentralização dos serviços e o enfoque na atenção primária, na prevenção e na promoção da saúde. Esse princípio reflete a visão de que "a saúde é direito de todos e dever do Estado", conforme destacado por Paulo Capel Narvai (2022, p. 103). Apesar de conquistas notáveis, como a

ampliação do acesso a tratamentos e a programas preventivos, o sistema enfrenta desafios que comprometem sua capacidade de atender plenamente à população. Problemas como o subfinanciamento, as desigualdades regionais e a percepção social de que ações e serviços de saúde não são direitos, mas mercadorias (NARVAI, 2022) persistem. Contudo, conclui-se que o SUS continua sendo uma das maiores conquistas sociais do país, essencial para garantir o bem-estar de milhões de brasileiros.

RESUMEN

Este artículo analiza la creación y la importancia del Sistema Único de Salud (SUS) en Brasil antes de su establecimiento, formalizado por la Constitución Federal de 1988. El SUS se consideraba un sistema de salud fragmentado y desigual. Se estableció con el objetivo de garantizar el acceso universal, gratuito e igualitario a la atención médica para toda la población. Su implementación representó un avance sustancial, promoviendo la descentralización de los servicios y un enfoque en la atención primaria, la prevención y la promoción de la salud. Este principio refleja la visión de que «la salud es un derecho de todos y un deber del Estado», como lo enfatizó Paulo Capel Narvai (2022, p. 103). A pesar de logros notables, como la ampliación del acceso a tratamientos y programas preventivos, el sistema enfrenta desafíos que comprometen su capacidad para atender plenamente a la población. Persisten problemas como la falta de financiación, las desigualdades regionales y la percepción social de que las acciones y los servicios de salud no son derechos, sino bienes (NARVAI, 2022). Sin embargo, se puede concluir que el Sistema Único de Salud (SUS) sigue siendo uno de los mayores logros sociales del país, esencial para garantizar el bienestar de millones de brasileños.

1 INTRODUCTION

The present research, developed in the city of Tupã, São Paulo, is dedicated to the analysis of the performance and administration of the Unified Health System (SUS) in the municipality, with the purpose of examining its relevance as a regional center of emergency care. To this end, a qualitative methodological approach was adopted, which was based on a bibliographic review and an interview with the nurse in charge of the Santa Casa de Misericórdia de Tupã Hospital, Diego Zutin Vassoler. The study aims, therefore, to identify and discuss the positive and negative aspects of the system, with particular attention to the issue of maintaining its resources and their respective consequences for the institution and local community.

2 THEORETICAL FRAMEWORK

Public health in Brazil has undergone several transformations over the centuries, reflecting in social, political, and economic changes. Its trajectory comes from the colonial period, in which medical care was practically non-existent, so many resorted to healers and shamans, to the creation of the Unified Health System (SUS), which is present today. The main leader of the proposal to create a universal health system, Sérgio Arouca, stated with all the letters: "The SUS is a civilizing project" (NARVAI, Paulo Capel. *SUS: A Revolutionary Reform to Defend Life*, 2022, p. 172), a process that was marked by inequalities and gradual advances (SUMMIT SAÚDE, 2024).

With the arrival of the Portuguese Royal Family, in 1808, characterized as the Johannine period, there were advances in the area of health, such as the creation of the first medical schools and sanitary improvements in the ports, in order to strengthen commercial ties with the British. However, these initiatives were not enough to meet the needs of the general population, making them vulnerable to endemics and epidemics due to the lack of basic sanitation, high population density in urban centers, and the absence of effective public policies for the control of communicable diseases (WIKIPEDIA, 2024).

During the Old Republic (1889-1930), Brazil went through an intense process of urbanization, especially in Rio de Janeiro, which aggravated sanitary problems. The population faced frequent outbreaks of diseases such as yellow fever, smallpox, and bubonic plague. In response to this crisis, the government implemented the Health Reform led by Oswaldo Cruz, which promoted mandatory vaccination campaigns and measures to combat disease vectors. However, these actions generated strong popular resistance, culminating in

the Vaccine Revolt in 1904. Despite the difficulties, this period marked the beginning of a more structured approach to confronting epidemics in the country (DMS UFPEL, 2024).

During the military period (1964-1985), the National Institute of Social Security (INPS) and the National Institute of Medical Assistance (INAMPS) centralized health services, however, they favored large urban centers, leaving smaller localities with precarious care. It was then that the economic crisis of 1986 highlighted the problems in force in this area, boosting the Movement for Health Reform. It was through the VIII National Health Conference (1986) and the Federal Constitution of 1988 that Law No. 8,080 was consolidated, regulating the SUS and, this time, establishing health as a right for all (DMS UFPEL, 2024).

In the Federal Constitution (BRASIL, 1988, art. 198, II) it is stated that:

[...] the SUS is based on the principles of universality, integrality and equity, aiming to meet the needs of all citizens. One of its guidelines is "comprehensive care, as a priority for preventive activities, without prejudice to care services". According to Sérgio Arouca (2022, p. 172), the main leader of the proposal to create a universal health system, "The SUS is a civilizing project [...]".

Thus, in contemporary times, the SUS is based on the principles of universality, integrality and equity, aiming to meet the needs of all citizens. One of its guidelines is "comprehensive care, as a priority for preventive activities, without prejudice to care services" (BRASIL, 1988, art. 198, II).

3 METHODOLOGY

The work was developed by students of the 2nd year of High School at Colégio Objetivo de Tupã -SP with a focus on the study and performance of the Unified Health System (SUS) of the municipality and its region of coverage, in which it used a qualitative methodological approach to deepen the understanding of the theme.

The study is based on a documentary analysis of the work "SUS: a revolutionary reform to defend life", by Paulo Capel Narvai, and on the content analysis of an interview with nurse Diego Zutin Vassoler, technical manager of the Santa Casa de Misericórdia de Tupã Hospital. Data collection and analysis were organized in two stages: first, a bibliographic survey and a critical analysis of the historical context of the Brazilian health system, covering the pre- and post-implementation periods of the SUS, were carried out. In a second moment, the administration of the SUS in the city of Tupã was investigated from the perspective of a professional in the area.

Thus, this work intends to provide a significant contribution to a debate on the impact of the SUS in Brazil, with special emphasis on the local reality of Tupã, in addition to encouraging a reflection on the fundamental importance of the public health system for Brazilian society.

4 RESULTS AND DISCUSSIONS

From the theoretical analysis, data collection and group discussions, it was possible to raise relevant information that contributes to the critical understanding of this public health system. In this section, the main results obtained are presented and discussed, relating them to the current reality and to the objectives proposed at the beginning of the study.

The information obtained through the realization of this work, including a field research at the Santa Casa de Misericórdia (Tupã-SP), accompanied by the advisor professor Aloísio Cássio dos Santos, interviews with a technical professional Diego Zutin Vassoler, in parallel with bibliographic research (SUS: A Revolutionary Reform to defend life - Book by Paulo Capel Narvai and the Federal Constitution of 1988) and media (Health Policies in Brazil - Documentary by Renato Tapajós), In relation to the proposed theme, we show that the results of this study demonstrate that the Unified Health System (SUS) is a historical advance in the consolidation of the right to health, acting in turn as a fundamental instrument of equity and social inclusion. The field research reiterated the revolutionary dimension by establishing a public and universal model of care for the community that concomitantly confronts social

inequalities. The practical experience observed in the municipality of Tupã, reported by the professional Diego Zutin Vassoler, conveys the idea that despite the particular challenges preeminent to the municipality, such as the poor management of resources in part of the health units, such as the non-availability of these within the hospital itself, the lack of properly interested professionals and the difficulty of working in an environment where many patients and companions do not show respect for the professionals acting at times with aggressiveness or devaluation. For him, in addition to efficient management, it is essential that the population recognizes the effort of the team, which even with limitations, is dedicated daily to saving lives. Respect and appreciation of the work of these professionals are essential for a more humane and effective service.

In short, it is concluded that the SUS, even in the face of persistent structural and financing challenges, constitutes a Brazilian social asset, whose role is indispensable in the defense of life and in the promotion of human dignity, which makes it imperative to recognize its relevance and strengthen its policies in ensuring comprehensive and quality care for the entire population.

5 CONCLUSION

The Unified Health System (SUS) is configured, as evidenced by this study, as one of the greatest social assets in Brazil, reflecting its relevance and effectiveness. The detailed analysis of the operations and results of the SUS demonstrated, unequivocally, that, despite the financial and structural challenges, the system is fundamental for the promotion of equity, the universalization of access and the guarantee of the constitutional right to health for all citizens.

The survey also revealed that the SUS has achieved international recognition, particularly in areas such as immunization programs and transplants, solidifying its position as a model of public health policy. These successes not only underscore the system's ability to make significant advances in public health, but also reinforce the need for its continued strengthening and maintenance.

In summary, the SUS, even in the face of the complexities of its implementation and the obstacles in fully fulfilling its constitutional role, has established itself as a pillar of social justice and an essential instrument for the reduction of inequalities. Its existence is indispensable for the construction of a more just and solidary society, serving as concrete proof of its vital role in guaranteeing Brazilian citizenship.

ACKNOWLEDGMENTS

We thank, first, God, for the strength, inspiration and wisdom granted during the realization of this work. We also express our gratitude to our families and friends, for their unconditional support, patience and encouragement throughout the process. We also recognize the fundamental role of our professor and advisor, Aloísio Cássio dos Santos, whose dedication and knowledge were essential for the development of the research.

Finally, we thank the academic community and the institutions that, directly or indirectly, contributed to the realization of this study.

ABSTRACT

Violence against women is a historical and cultural problem, resulting in social inequalities and power imbalances among individuals. For example, consider violence against indigenous girls and women, such as the Warao. The objective of this study was to analyze violence against Warao girls and women from 2017 to 2023 in the municipality of Belém. This is a descriptive, exploratory, and quantitative study. Data collection and analysis were based on records from the Deputy Secretariat of Intelligence and Criminal Analysis of the State of Pará, as well as bibliographic research. The violence perpetrated against the victims was independent of age group, with 37.50% under 18 years of age and 62.50% over 18 years of age. Regarding education, 45.45% were illiterate and 54.55% did not complete primary education. Of the victims, 100% were women, 50% were single, and the majority were homemakers. The most prevalent type of violence was against sexual dignity (39.40%), with the majority (91.30%) of victims suffering violence in their collective housing, funded by the public sector, predominantly at night (39.13%), and on all days of the week. The research concluded that it revealed the sociodemographic profile of violent crimes against Warao girls and women in the municipality of Belém, Pará, and the results contribute to reflections on the topic, as well as to actions for prevention, assistance, and policies guaranteeing rights by the public authorities, especially for improving public services provided to them.

estudo descritivo, exploratório e quantitativo. A coleta e análise de dados foram com base nos registros da Secretaria Adjunta de Inteligência e Análise Criminal do Estado do Pará, além de pesquisa bibliográfica. As violências praticadas contra as vítimas independeram de faixa etária, sendo 37,50 % menores de 18 anos de idade e 62,50 % maiores de idade, com relação a escolaridade 45,45 % analfabetas e 54,55 % sem ensino fundamental completo, de 100% de mulheres, 50% são solteiras, na sua maioria da ocupação do lar. O tipo de violência mais predominante foi contra a dignidade sexual em 39,40 %, na sua maioria, 91,30%, as vítimas sofreram a violência em suas moradias coletivas, custeadas pelo poder público, com preponderância no horário noturno, 39,13 %, e em todos os dias da semana. Concluiu-se que a pesquisa evidenciou o perfil sociodemográfico do crime de violência contra as meninas e mulheres Warao no município de Belém do Pará e os resultados auxiliam em reflexões sobre o tema, bem como para ações de prevenção, assistência e políticas de garantia dos direitos pelo poder público, especialmente para melhoria dos serviços públicos a elas dispensados.

RESUMEN

La violencia contra las mujeres es un problema histórico y cultural que genera desigualdades sociales y desequilibrios de poder. Un ejemplo de ello es la violencia contra las niñas y mujeres indígenas, como las warao. El objetivo de este estudio fue analizar la violencia contra las niñas y mujeres warao entre 2017 y 2023 en el municipio de Belém. Se trata de un estudio descriptivo, exploratorio y cuantitativo. La recopilación y el análisis de datos se basaron en registros de la Subsecretaría de Inteligencia y Análisis Criminal del Estado de Pará, así como en investigación bibliográfica. La violencia ejercida contra las víctimas fue independiente del grupo de edad: el 37,50 % eran menores de 18 años y el 62,50 % mayores de 18 años. En cuanto a la educación, el 45,45 % eran analfabetas y el 54,55 % no habían completado la educación primaria. El 100 % de las víctimas eran mujeres, el 50 % eran solteras y la mayoría se dedicaban al hogar. El tipo de violencia más frecuente fue la que atentaba contra la dignidad sexual (39,40%), y la mayoría (91,30%) de las víctimas sufrieron violencia en sus viviendas colectivas, financiadas por el sector público, principalmente durante la noche (39,13%) y todos los días de la semana. La investigación concluyó revelando el perfil sociodemográfico de los delitos violentos contra niñas y mujeres warao en el municipio de Belém, Pará, y los resultados contribuyen a la reflexión sobre el tema, así como a las acciones de prevención, asistencia y políticas que garanticen los derechos por parte de las autoridades públicas, especialmente para mejorar los servicios públicos que se les prestan.

1 INTRODUCTION

Violence against women is a historical and cultural problem, by which the male gender is presented as superior to the female, resulting in serious problems of inequalities, with repercussions on social and power relations between individuals (Souto; Diotto, 2018; Lima, 2016).

According to the World Health Organization (WHO), violence against women is a public health problem (WHO, 2013), being a violation of basic human rights, configuring itself as a great dilemma for humanity in the twenty-first century (Granja; Medrado, 2009).

This situation is old, occurring in all social strata, and is constantly observable in the daily lives of women, under different forms of ideological representations, social classes, races and ethnicities (Barreto, 2007), but it had gained its own contours in recent history, which was evidenced in which girls and women began to enjoy rights previously exclusive to boys and men and became bearers of human rights. Even in the face of this, violence against indigenous girls and women, such as the Warao, is still little investigated, and it seems that general public security policies aimed at the populations are already contemplating them.

In addition, there is the problem pointed out by Pontes and Nascimento (2021) that the social organization of the Warao ethnic group is little known, based on the studies of Garcia-Castro (2006) and Rios and Carvalho (2016). Thus, little is known whether any violence by the partners and other family members of the Warao women came to the attention of the public authorities and whether they were really treated as violence. In a manner of speaking, there is a scientific gap in the studies of violence against indigenous girls and women, including those of the Warao ethnic group.

Likewise, the study is restricted to police occurrences made by them, which reduces the dimension of violence, since not all of them can be recognized, in this format, under a broad aspect of exclusion and discrimination of gender and race, including institutional violence, practiced by State agents, aggravated by the situation of "migrant in a situation of vulnerability", understood in the following terms by the UN, in a report published in 2016: (a) vulnerability related to the reasons for leaving their country; b) vulnerability related to the situation encountered by migrants on the way, at the borders and in the context of their reception; c) vulnerability related to a specific aspect of the person's identity or circumstance (Yamada *et al.*, 2018, p. 377). With the objective of analyzing violence against girls and women, in the period from 2017 to 2023, in the municipality of Belém, the research revealed how harmful the institutional shelter policy carried out by the public authorities in Belém do

Pará, through collective housing, was, considering that most crimes against the sexual dignity of victims occurred in these spaces.

2 METHODOLOGY

This is a descriptive and documentary research, with a quantitative approach. Data collection and analysis were based on records from the Secretariat of Intelligence and Criminal Analysis of the State of Pará (SIAC). Descriptive research orders, analyzes and deciphers the data without the researcher interfering or manipulating them, seeking to discover the frequency with which the phenomenon occurs, its origin, characteristics, causes and relationships with other phenomena.

As for the technical procedures, the research was documental, using materials that have not yet been analyzed, or even, according to the objectives of the study, they can be reformulated and their sources are diversified and dispersed. The quantitative approach, on the other hand, uses quantification both in the collection and treatment of information, using statistical techniques, aiming at results that avoid possible distortions of analysis and interpretation, enabling a greater margin of safety, using statistical techniques from the simplest to the most complex (Gil, 2008; Diehl, 2004; Prodanov; Freitas, 2013).

The data cataloguing was carried out with the Assistant Secretariat of Intelligence and Criminal Analysis SIAC of the State of Pará (SIAC/PA), based on the database of police occurrence records of crimes against Warao girls and women, in the municipality of Belém, state of Pará, Brazil, from 2017 to 2023.

The total number of records analyzed was 9,278, with 4,169 records in 2018, 3,851 records in 2019, and in the 1st half of 2020, 1,258 records. In this study, only occurrences against females of all ages were included.

Data collection was carried out between November 2022 and February 2024. The data were stored in an electronic spreadsheet and the analysis was performed by descriptive statistics elements. The Exploratory Data Analysis technique was used, whose analysis organizes and synthesizes the collected data through tables and graphs, which facilitate the obtaining of results in a fast, accessible and simple to interpret way, giving a systemic view of the data, obtained with calculations of statistical measures, summarizing the information achieved (Bussab; Morettin, 2017).

The variables used include age group (in years: 0 to 17; 18 to 24; 25 to 29; 30 to 34; 35 to 64 and $\geq$ to 65), level of education (illiterate, incomplete elementary school, complete

elementary school, incomplete high school, complete high school, incomplete higher education, complete higher education, and graduate studies); marital status (single, stable union, married, divorced/separated, widow); profession/occupation (the most cited domestic; type of violence (psychological violence, physical violence, moral violence, sexual violence and property violence), presumed cause (hatred or revenge, jealousy, alcoholism, drunkenness, ambition, narcotics, malpractice, recklessness, negligence, debauchery, alienation and others), means employed (without instrument, blunt weapon, cutting or piercing weapon, firearm and other means), place of occurrence (private residence, public road, condominium/hotel/pension, entertainment, educational establishment, public transport and others), day of the week (Sunday; Monday; Tuesday; Wednesday; Thursday; Friday and Saturday) and shift (dawn; morning; afternoon and night).

3 RESULTS

3.1 DESCRIPTIVE ANALYSIS

Based on SIAC data, provided by the Public Security Secretariat of the State of Pará (SEGUP/PA) on crimes against Warao girls and women, from 2017 to 2023, it was found that in 2017 no occurrences were recorded, only in the others, with a higher number in 2020, and in total there were 23 occurrence records. However, from a global perspective, they represent few, which may demonstrate the possibility of underreporting of crimes against this population. The highest numbers were of sexual violence, in the places they used as housing, which reveals a greater face of vulnerability, since they were not safe in these places.

Figure 1

Graph of the number of Occurrences per year of Crime against Warao girls and women. Belém, PA, Brazil, 2017 to 2023

Source: Prepared by the author based on SIAC (Mar. 2024).

The other graphs demonstrate the dynamics of these crimes, which reveal very useful data, since they keep a relationship about their spatialities and temporalities and positions of the victims and perpetrators at the scenes of occurrences.

Figure 2 shows that Warao girls and women were more susceptible to violence during the rest period, from night to dawn, although they were not safe at any time.

Figure 2

Percentage Graph by Shift of Crime against Warao Girls and Women. Belém, PA, Brazil, 2017 to 2023

Source: Prepared by the author based on SIAC (Mar. 2024).

Figure 3 shows that girls and women were susceptible to violence during all days of the week, and on Sundays and Tuesdays there was an increase in occurrences, and it cannot be said that they were safe on the other days.

Figure 3

Percentage chart by Day of the Week of crime against Warao girls and women. Belém, PA, Brazil, 2017 to 2023

Source: Prepared by the author based on SIAC (Mar. 2024).

Figure 4 shows that Warao girls and women were more susceptible to sexual violence, according to the group of violence, being more victims of crimes of this nature. See, which does not mean that violence itself is watertight and unrelated, as stated by Souza and Adesse (2005) that gender violence refers to an alarming social phenomenon that includes several aspects and factors, the most serious being sexual violence:

Violence against women and girls includes situations of physical, sexual, psychological, and economic aggression. The two most common forms of violence against women, whose perpetrators are intimate partners of the victim, are: physical aggression, which is commonly characterized by the crimes of bodily injury and threat, also called domestic violence; and coercion to sex, called sexual violence, which most often includes the crimes of rape and violent indecent assault. Sexual violence can be exercised in the domestic space (home) or in the public space (street). Physical aggression is almost always accompanied by psychological aggression and, from a quarter to half of the time, it is related to situations of sexual violence, such as marital rape. (Souza; Adesse, 2005, p. 37).

Figure 4

Percentage chart by type of Penal Code Offense against Warao girls and women. Belém, PA, Brazil, 2017 to 2023

Source: Prepared by the author based on SIAC (Mar. 2024).

Figure 5 shows that Warao girls and women were more susceptible to sexual violence, by type of crime, considering that the sum of crimes of rape of a vulnerable person, rape, attempted rape, sexual harassment and sexual harassment surpass that of bodily injury,

which is in first place. Also, drawing attention in these data that children and adolescents were the ones who suffered the most sexual violence (rape of a vulnerable person).

Figure 5

Percentage chart by type of Crime against Warao girls and women. Belém, PA, Brazil, 2023

Source: Prepared by the author based on SIAC (Mar. 2024).

On this point, this data is in correspondence with the Brazilian Yearbook of Public Security (Brasil, 2019, p. 118) which, when analyzing the data on rape, found that the majority, 63.8%, were committed against vulnerable people. This rate increased in 2021, according to data recorded in the Brazilian Yearbook of Public Security (Brasil, 2022, p. 187), which went from 63.8% to 75.5%. And that, in 2022, 61.4% were at most 13 years old, according to the Brazilian Yearbook of Public Security (Brasil, 2023, p. 156).

Figure 6 shows that the Warao girls and women suffered violence in the neighborhoods of Belém where they lived, drawing a lot of attention to these data, since they corroborate the others obtained.

Figure 6

Percentage graph by neighborhood of occurrence of crime against Warao girls and women. Belém, PA, Brazil, 2017 to 2023

Source: Prepared by the author based on SIAC (Mar. 2024).

In this regard, in line with national data, according to the Brazilian Yearbook of Public Security, 2022, in the study "A decade and more than half a million victims of sexual violence" (Brasil, 2022), which note that the profile of victims of sexual violence remains: in 88.2% of cases they are women; and, for the most part, minors under 14 years of age and/or adults incapable of consenting.

In view of this, it is urgent that measures be taken due to the consequences for the lives of the victims:

Among the impacts on the lives of survivors, the most visible and immediate effects are unwanted pregnancy, physical injuries and sexually transmitted diseases. Less visible effects, but well documented by the literature, show that victims of sexual violence often suffer from post-traumatic stress disorder (PTSD), depression, anxiety, eating disorders, sexual and mood disorders, a greater tendency to use or abuse alcohol, drugs and other substances, impaired satisfaction with life, with the body, with sexual activity and with interpersonal relationships, as well as suicide risk. (Brazil, 2022, p. 9).

Figure 7 shows that the Warao girls and women suffered violence in the homes in Belém where they lived, most of which were subsidized or paid for by the government, meaning that they were not safe in these places. In addition, another piece of data corroborates this dangerous situation, since 100% of the women who registered occurrences declared themselves as domestic workers, that is, not necessarily house workers, but who

spent most of the time in their homes, considering that children cannot live in a stable union. Table 1 below indicates these places, for a better understanding.

Figure 7

Percentage graph by place of occurrence of the crime against Warao girls and women. Belém, PA, Brazil, 2017 to 2023

Source: Prepared by the author based on SIAC (Mar. 2024).

Private Residence	1	4,35
Total	23	100,00

Source: Prepared by the author based on SIAC (Mar. 2024).

The results of the statistical data show that the policies to prevent and confront violence practiced against them should have as one of their spaces of execution their homes, where the most common crimes occur, especially those of a sexual nature.

In addition, the study showed that the crimes against these Warao girls and women occurred in these territorial spaces where they lived, generally peripheral (Bairro do Marco, Tapanã, Campina, Agulha, Brasília and Itaiteua), as shown in the map below.

Figure 8

Map by neighborhood of the occurrence of crime against Warao girls and women. Belém, PA, Brazil, 2017 to 2023

Source: Prepared by the author based on SIAC (Mar. 2024).

Periphery is understood as what Trindade Junior *et al.*, (2009, p. 29) called lowlands: "Segregated, socially excluded spaces, with deficiencies and insufficient urban and community facilities".

The configuration of peripheral spaces is characterized by neighborhoods not only far from the central area of the city, with the exception of Campina, but also because they are places with a low structure of urban services and because they are abandoned by the government or are in the process of changing their territorial destination. In addition, the neighborhood of Campina has changed its profile to commercial space, with a deterioration of it to housing. In this aspect, these spaces are characterized by the absence of urban and

environmental planning, caused by the lack of public policies in such a way that the population with low purchasing power occupies the spaces in a disorderly way and even areas of risk in an evident situation of socio-spatial segregation (Rodrigues, 1996, p.267; Santos, 2009, p.10; Trindade Jr, 1998, p. 60).

A peculiar aspect is that the Warao began to influence the territorial formation of the municipality of Belém, often occupying areas previously without the presence of indigenous people and unoccupied land, such as in Outeiro, so to speak, creating "indigenous territories" within the city.

In turn, Figure 9 shows that women, regardless of their age, were susceptible to crimes, with 37.50% of victims under 18 years of age and 62.50% of whom were older.

Figure 9

Percentage graph of occurrences by Age Group of the victims, girls and Warao women. Belém, PA, Brazil, 2017 to 2023

Source: Prepared by the author based on SIAC (Mar. 2024).

Figure 10 shows that women, regardless of their marital status, were susceptible to crimes.

Figure 10

Percentage graph by marital status of the victims, Warao girls and women. Belém, PA, Brazil, 2017 to 2023

Source: Prepared by the author based on SIAC (Mar. 2024).

Regarding the level of education, according to Figure 11, it was shown that these victims had a low level of education, most of them were illiterate and did not finish elementary school, which alerts much more to the need for prevention and repression.

Figure 11

Percentage graph by schooling of victims, girls and women Warao, Belém, PA, Brazil, 2017 to 2023

Source: Prepared by the author based on SIAC (Mar. 2024).

It is also worth noting that, according to Figure 12, most of these aggressors acted alone, thus preliminarily refuting that the practices of violence against girls and women is a collective cultural practice, accepted by the Warao community residing in Belém do Pará, so much so that the police records were made by them or those responsible.

Figure 12

Percentage graph Number of aggressors of Warao girls and women, Belém, PA, Brazil, 2017 to 2023

Source: Prepared by the author based on SIAC (Mar. 2024).

In addition, it should be noted that 100% of the aggressors were male, which is in line with data from the 2022 Brazilian Public Security Yearbook, as for the characteristic of the criminal, it remains the same: male (95.4%) and acquaintance of the victim (82.5%), with 40.8% being fathers or stepfathers; 37.2% siblings, cousins or other relatives and 8.7% grandparents. And the place of violence also remains the same: 76.5% of rapes happen inside the home (Brasil, 2022).

Although, the relationship with the victim of the aggressor was a partner" in 100% of the records. At this point, it is assumed that there have been errors in the records, given that it is not possible for children to live in a stable union.

All victims were female, evidencing gender inequality. These data highlight the situation of vulnerability in which this group of women finds themselves, which involves precarious spaces and opportunities for work (domestic in their own homes) and low socioeconomic and educational indexes.

Even so, in cases of violence against Warao adult women, it is worth further study whether the violence occurred due to affective relationships and/or the end of the relationship or for another cause.

A very relevant point, which must be taken into account, is the collective violence practiced against these women and girls in Belém, according to Furlan:

From the theoretical framework studied and the reports of violence suffered by Warao migrant women from Venezuela in Belém, we conclude that intersectionality evidences the processes of vulnerability that affect these women, from the intersection of the markers of race, gender and ethnicity, and that the vulnerabilities to which these women are subjected are not exclusively individual, but they occur collectively. Finally, we believe that intersectional studies on migration must be carried out, in order to combat this scenario of exclusion and multiple oppressions. (Furlan, 2022, p.5).

Figure 13

Percentage graph by Age of Aggressors of Warao girls and women, Belém, PA, Brazil, 2017 to 2023

Source: Prepared by the author based on SIAC (Mar. 2024).

Figure 13 reveals that 100% of the aggressors were male, 70% of whom were Warao adults and 30% were adolescents, including individuals of the Warao ethnic group or not.

4 DISCUSSION

The data collected reveal a facet of the violence practiced against these girls and women, which were mostly practiced by people close to them and, mainly, inside their homes, greatly contributing to the territorial isolation that had been imposed on them.

There is no way not to relate violence and spatiality in this context, as the format of welcoming them prioritized the format of collective housing, including individuals who had never had contact before or did not belong to the same family or who did not live together in "rancheria" houses, in a misunderstanding of the Warao people's way of being, existing and organizing. In addition, the choices made by the government or by the conditions that were pressed resulted in a dynamic already known in the Amazon region for indigenous peoples, expelling them to urban agglomerations or to peripheral areas, causing part of them to live in the misery of the favelas and underoccupation (Martins, 2009).

Domestic violence is a serious social problem arising from historical inequalities promoted by the patriarchal system, which placed women in a position of subordination, promoting differences between male and female roles within society (Silva, 2017).

The survey data ratify a picture of violence against girls and women in a global scenario where they are more victims. And, what is worse, when it comes to sexual violence, they are also the biggest victims, regardless of their age for the aggressors, marital status, occupations and ethnicities, meaning that being female is dangerous in our society.

The configuration of the dynamics of sexual violence was also confirmed for these Warao victims, a fact generally committed by close people and family members, in secret, in deserted places, far from witnesses and, sometimes, they leave no trace, which has been ratified by official statistics. Likewise, related to the fact that most aggressors are known and often have access to the victim's domestic environment or live in it, we realize that the characteristics of most sexual violence committed in Brazil are not related to sudden aggressions committed by groups of strange men, but that they are done by the action of family members, neighbors and friends who have previous contact with their victims (Brasil, 2019, 121).

It is worth mentioning that the records analyzed were only those made in the SIAC database, not including the phenomenon called "black crime figure",⁴ or "hidden crime figure" ("dark number" or "ciffre noir"), which are the quantities of crimes that do not come to the

⁴ Here is the record of our disagreement with the use of this scientific term because we consider it racist (emphasis added).

attention of the State, often due to lack of confidence in the penal system, for fear of revenge or even for the feeling of impunity. In this sense, the problem can be even worse, as the criminal statistics, which serve to support public security policies, end up not demonstrating reality because of this (Penteado Filho, 2017). In addition, the search was carried out using the descriptors "Warao", "Warao indigenous" and "Venezuelan Warao" to search for data from crime records, since the ethnicity or the item "skin color" is usually non-existent or is not filled out in the identification forms (Almeida; Pereira, 2012).

As most of the violence committed against the Warao victims was of a sexual nature, it is important to point out that Ishida's lesson, so that because they are indigenous their sexual dignity does not bear relativization:

Human beings have the right to self-determination and freedom in the conduct of their own lives, and must be protected by the Law and its norms, as a measure of recognition of their own essence and condition as a human being. Sexual dignity, in this context, represents the values that must be respected in the sexual sphere with a view to self-determination and freedom. (Ishida, 2009, p.345).

Furthermore, violence committed against children and adolescents, who are unable to validly consent to the sexual act, in addition to their conditions as indigenous and migrants, deserve special attention from the public authorities in the sphere of public security due to the overlapping of vulnerabilities.

5 FINAL CONSIDERATIONS

Violence against Warao women, whether adult or not, is a relevant issue for the whole of society, as it constitutes an unprecedented public health and security problem, much more so for the most invisible categories of women such as indigenous women, including the Warao, where violence against them is treated as something of their cultures, in a way of concealing and justifying the inaction of the public power and the people themselves. Thus, the present research proposed to present the results of the sociodemographic profile of Warao girls and women who experienced the situation of violence, as well as the characteristics of this type of crime in the municipality of Belém do Pará. The limitations of the study are the lack of analysis of other variables such as alcohol and drug consumption, or even perspectives from the perpetrators of violence and other family members, such as children, to have a broader view of the phenomenon.

In addition, it is noted that, as it is a documentary research, with secondary data, it was observed that much information, such as in relation to the chosen variables, was incomplete in the database, which hindered the real quantification of the results of the investigation.

It is recommended for future work that the phenomenon of violence against these victims be analyzed more broadly under other intersectoral and multidisciplinary aspects, directed to the care of men, families and professionals or people in the victims' support networks, offering elements for the development of new forms and strategies of coping, thus carrying out interventions in different social sectors and contributing to the creation of public policies on the Thematic. And not only that, a new way of acting aimed at preventing violence for indigenous female victims, according to each ethnic group and population in migration, in a dynamic of facilitation/availability of care, reception, support and support.

In addition, it is necessary that studies be carried out to deepen whether these violences committed against girls and women Warao also come from historical inequalities promoted by the patriarchal system, which places women in a position of subordination, promoting differences between male and female roles within society (Silva, 2017).

It is also essential to discuss violence against Warao women not only from a gender perspective, but also from a race perspective, that is, to seek intersectionality in this discussion, understanding that gender discrimination intensifies in their lives (children, adolescents and adults), so the public power must promote policies to confront social inequalities caused by the issue of gender and racism, unfortunately still present in society.

Finally, it is believed that the data of this study add to the existing field of knowledge, to evidence and/or unveil the indicators of violence against Warao girls and women for the adoption of forms of confrontation, to confront the prejudices related to the theme, mainly due to the lack of knowledge and the lack of instrumentalization of the professionals who deal with the different facets or forms of violence against these Venezuelan Warao indigenous victims.

Jane Aurelina Temóteo de Queiroz Elias¹

ABSTRACT

The article investigates why the LINDB (Law 13,655/2018) and the NLLC (Law 14,133/2021) have yielded limited practical effects in public management, with emphasis on the external control exercised by Brazil's Federal Court of Accounts (TCU) and on repercussions for administrative decision-making, especially in municipal contracting and urban policies. It adopts a critical documentary review (2018–2025) of TCU rulings and regulations, Supreme Federal Court decisions, opinions from the Office of the Attorney General, and academic literature, selected through explicit criteria. Findings indicate incipient use of a precedent technique, normative and applicative variations concerning limitation periods, irregular application of LINDB art. 28, underuse of consensual instruments, and centralizing effects that compress subnational decision margins. The article argues that low predictability and weak consideration of context intensify decision retrenchment (“pen paralysis”). It proposes guidelines for stating theses and distinctions, parameters for gross error, risk assessment, and the adoption of commitments with monitoring and publicity. The implications point to gains in legal certainty and governance of urban contracting, while preserving liability for intent or gross error.

Keywords: LINDB (Law of Introduction to the Norms of Brazilian Law). New Public Procurement and Contracts Law (Law 14,133/2021). Federal Court of Accounts (TCU). Gross Error (LINDB art. 28).

RESUMO

O artigo investiga por que a LINDB (Lei 13.655/2018) e a NLLC (Lei 14.133/2021) têm gerado efeitos práticos limitados na gestão pública, com ênfase no controle externo exercido pelo TCU e nas repercussões sobre decisões administrativas, especialmente em contratações municipais e políticas urbanas. Adota-se revisão crítica documental (2018–2025) de acórdãos e normativos do TCU, decisões do STF, manifestações da AGU e literatura acadêmica, selecionados por critérios explícitos. Os achados indicam incipiência na técnica de precedentes, variações normativas e aplicativas sobre prescrição, aplicação irregular do art. 28 da LINDB, subutilização de instrumentos consensuais e efeitos centralizadores que comprimem margens decisórias subnacionais. Argumenta-se que a baixa previsibilidade e a fraca consideração do contexto aumentam a retração decisória (“apagão das canetas”). Propõem-se diretrizes para enunciação de teses e distinções, parâmetros para erro grosseiro, avaliação de riscos e adoção de compromissos com monitoramento e publicidade.

¹ Doctorate in Public Administration. Instituto Brasileiro de Ensino, Desenvolvimento e Pesquisa (IDP). Distrito Federal, Brazil. E-mail: janetqe@gmail.com

As implicações apontam para ganhos de segurança jurídica e de governança das contratações urbanas, preservando a responsabilização por dolo ou erro grosseiro.

Palavras-chave: LINDB. Nova Lei de Licitações e Contratos (Lei 14.133/2021). Tribunal de Contas da União (TCU). Erro Grosseiro.

RESUMEN

El artículo investiga por qué la LINDB (Ley 13.655/2018) y la NLLC (Ley 14.133/2021) han generado efectos prácticos limitados en la gestión pública, con énfasis en el control externo ejercido por el Tribunal de Cuentas de la Unión (TCU) y en las repercusiones sobre la toma de decisiones administrativas, especialmente en las contrataciones municipales y las políticas urbanas. Adopta una revisión documental crítica (2018–2025) de acórdãos y normativas del TCU, decisiones del Supremo Tribunal Federal, manifestaciones de la Abogacía General de la Unión y literatura académica, seleccionadas mediante criterios explícitos. Los hallazgos indican uso incipiente de la técnica de precedentes, variaciones normativas y aplicativas en materia de prescripción, aplicación irregular del art. 28 de la LINDB, subutilización de instrumentos consensuales y efectos centralizadores que comprimen los márgenes decisorios subnacionales. Se sostiene que la baja previsibilidad y la escasa consideración del contexto incrementan la retracción decisoria (“apagón de las plumas”). Se proponen directrices para enunciar tesis y distinciones, parámetros de error grave, evaluación de riesgos y adopción de compromisos con monitoreo y publicidad. Las implicaciones apuntan a ganancias de seguridad jurídica y de gobernanza de las contrataciones urbanas, preservando la responsabilidad por dolo o error grave.

Palabras clave: LINDB (Ley de Introducción a las Normas del Derecho Brasileño). Nueva Ley de Licitaciones y Contratos (Ley 14.133/2021). Tribunal de Cuentas de la Unión (TCU). Error Grave (art. 28 de la LINDB).

1 INTRODUCTION

The Brazilian Public Administration has sought to increase efficiency and results in a context of increasing decision-making complexity. Authors such as **Braga (2017)**, Ribas and Marques (2024) and Charles (2024) maintain that a pattern of control persists that tends to favor punishment and the standardization of understandings, often with low consideration for the concrete circumstances of the cases. This pattern impacts daily contracting and management decisions and affects the autonomy of subnational entities in the federative pact (Mohn, 2010; Sundfeld, 2014; Braga, 2017; Binenbojm, 2023).

The **Law of Introduction to the Rules of Brazilian Law (LINDB)**, amended by Law No. 13,655/2018, introduced parameters for administrative and control decisions to consider obstacles and real difficulties of the manager and limit liability to cases of intent or gross error. The New Bidding and Contracts Law (NLLC), Law No. 14,133/2021, reinforced guidelines for planning, risk management, and consensual mechanisms (*Brasil, 2022; Brazil, 2024a; Brazil, 2024b*). However, recent studies and institutional documents indicate a dissociation between the normative design and its application in the arena of control, with effects on legal certainty and on the willingness of the public agent to decide (FGV, 2021; AGU, Federal Attorney General's Office, 2024; Brazil, 2024; Ribas and Marques, 2024; Pereira and Garrido, 2025).

The central hypothesis of this article is that the practical ineffectiveness of the LINDB and the NLLC stems less from failures of the rules themselves and more from the culture of control that guides the performance of the Federal Court of Accounts (TCU). The literature indicates that interventions persist that do not always consider the real conditions in which the manager decides and that there is still low predictability in sensitive issues, such as gross error and prescription (Braga, 2017; Naves, 2019; AGU – Federal Attorney General's Office, 2024; Brazil, 2025a; Brazil, 2025b;).

In this environment, the literature describes relevant behavioral effects among managers: decision-making retraction, increased transaction costs, and prioritization of defensive strategies, a phenomenon referred to as "pen blackout" (Charles, 2024; Ribas and Marques, 2024). These effects can reduce adherence to the NLLC and discourage the use of consensual solutions provided for in the LINDB and subsequent acts (Faria, 2022; Eidt, 2024; Oliveira and Moreira, 2024; Tce/SE, 2025; Jota, 2025).

At the federative level, the understanding of "general norms" (national guidelines) and the limits to subnational normative competence **has generated recurrent interpretative disputes**. The theme is central to the autonomy of states and municipalities in public

procurement and to the compatibility between standardization and the ability to adapt to local contexts (Mohn, 2010; Sundfeld and Câmara, 2011; Binenbojm, 2023). Without **predictability** and **coherence** in the performance of external control and without clear incentives for context analysis, the division of competences tends to operate in a centralized manner, with low margin for local innovations and consequent loss of effectiveness of the NLLC, because its planning, risk management and local adaptation instruments are no longer exercised autonomously.

In terms of liability, recent empirical literature suggests that article 28 of the LINDB still finds oscillating application when it comes to qualifying the "gross error", with repercussions on the manager's willingness to decide (Kammers, 2024; Pereira and Garrido, 2025). The unpredictability about the incidence of "gross error", added to alternating understandings about prescription and duties of result, accommodates incentives for administrative inaction.

The analysis takes as its object the tension between the normative efforts of responsible flexibility (LINDB and NLLC) and the persistence of a punitive and unpredictable control culture within the TCU. The focus is not only to describe the effectiveness of the rules, but to explain why they have been ineffective in producing the environment of legal certainty and efficiency in public management that they promise. The contribution lies in articulating the institutional diagnosis of control with the federative and managerial implications for public procurement, proposing practical criteria to qualify the performance of external control and mitigate decision-making fear.

It seeks to demonstrate, based on the selected bibliography, how the TCU's performance has produced low predictability and limited consideration of the manager's decision-making context in central themes (precedents, prescription and gross error); explain the behavioral effects of this pattern of control on management, especially the decision-making retraction and the so-called "blackout of the pens"; and to propose criteria, derived from the LINDB and the NLLC itself and from institutional documents contained in the bibliography, to reinforce predictability and contextual analysis in the performance of external control, without removing the duty of accountability in cases of intent or gross error.

The organization of the text is as follows: Section 2 discusses bureaucracy and federalism, focusing on competencies and general norms. Section 3 analyzes the "administrative law of fear", the unpredictability and the application of gross error by the TCU. Section 4 examines LINDB and consensuality, including accountability, unavailability of

public interest, and self-composition chambers. Section 5 presents a synthesis, recommendations and research agenda.

2 BUREAUCRACY AND FEDERALISM IN BRAZIL: COMPETENCIES AND "GENERAL NORMS"

The 1988 Constitution distinguishes competences and reserves to the Union the edition of **general rules** in matters such as bids and contracts, and it is up to states and municipalities to **complement and adapt** procedures. Mohn (2010) describes the division of competences and the function of general norms in the federative arrangement; Moreira Neto (1988) examines the **conceptualization** of general norms and their limits; Sundfeld and Câmara (2011) analyze the **control of competences** by the Courts of Auditors and its reflections on the autonomy of the entities; Amorim (2022) discusses **federative autonomy** in the face of Law No. 14,133/2021; and Binenbojm (2023) resumes the debate on the **delimitation** of general rules in public procurement, arguing that this division usually generates controversies about the measure of the local conformation space and the scope of general rules in the daily life of contracting (Moreira Neto, 1988; Mohn, 2010; Sundfeld and Câmara, 2011; Amorim, 2022; Binenbojm, 2023). This background is decisive for the theme of this article because the way in which control interprets "general norms" influences the degree of effective autonomy of subnational entities. Since, when the interpretation of general norms is overly broadened and control demands **rigid uniformity**, the legitimate space for local conformation is reduced and the possibility of adjustments to different institutional realities is restricted.

2.1 LEGAL FETISHISM AND NORMATIVE MAXIMALISM

Amorim's analysis (2020; 2022) reveals a criticism of what he calls "legal fetishism", that is, the institutional tendency to attribute to the legal norm a role of absolute solution in public procurement. This posture generates an excess of formalism and bureaucratic imprisonment, resulting in the proliferation of procedural requirements that do not always contribute to administrative efficiency or effectiveness. **Braga (2017) observes that, in this environment, control tends to prioritize document compliance and discourage innovative choices. Dallari (2021) notes that, although Law No. 14,133/2021 intends to rationalize the regime, its reception has occurred with regulatory additions capable of reproducing the normative excess. In this context, rigid normative maximalism (the**

option to **exhaustively regulate** public procurement, with **detailed rules, rigid steps, and detailed prohibitions**, seeking to anticipate almost all possible situations) **reduces responsible discretion, shifting the focus from administrative merit to the fear of administrative sanctions, and increases the pressure for standardized decisions, regardless of differences in context.**

"**Legal fetishism**" appears as excessive reliance on the increase of rules to solve management problems, with detail that compresses the **manager's responsible discretion** (Amorim, 2020; 2022). In this environment, **rites and documents** become worth more than **analysis of results**, which reinforces formal and defensive behaviors (Sundfeld, 2014). In public procurement, this pattern coexists with **control pressures** that favor **standardized compliance** by control bodies and discourage innovative choices (Braga, 2017), leading managers to **follow uniform controls**, with **little adaptation** to local capacities, contexts, and risks. Even with Law No. 14,133/2021, the practical reception may be accompanied by **regulatory additions** that reconstitute the criticized complexity (Dallari, 2021). In a federalism with unequal capacities, exacerbated maximalism tends to push entities and entities of the administration, including state-owned ones, when subjected to the same compliance requirements, to **replicate federal models**, reducing adaptation to local contexts.

Maximalism also feeds on the way control operates. According to Braga (2017), the TCU's performance tends to emphasize the rigor of procedural compliance, which, paradoxically, can discourage creative solutions in public management. Naves (2019) notes that the limited use of administrative precedents contributes to the instability of interpretations, making it difficult to predict control decisions. The TCU's compendium (Bids & Contracts: guidelines and jurisprudence) (Brazil, 2024) summarizes understandings and disseminates standardizing standards of compliance. The combination of detailed laws and standardizing guidelines produces an environment in which the manager operates focused on following the **verification scripts**, with less room for contextual motivation, risk management and adaptation to local capacities.

2.2 DIVISION OF COMPETENCES AND THE SELF-REPORTED CONTROL PERFORMANCE

Regarding the 1988 Constitution, Mohn (2010) describes the division of competences and the role of the Union in the edition of general rules in bids and contracts, preserving

space for states and municipalities to complete and adapt procedures. Moreira Neto (1988) examines the conceptualization and limits of general norms, indicating that excessive enlargements compress local conformation.

Sundfeld and Câmara (2011) analyze the control of competences by the Courts of Auditors and the effects of this action on the autonomy of the entities, especially when understandings of control operate as if they were general rules. Amorim (2022) and Binenbojm (2023) return to the topic in the context of Law No. 14,133/2021, emphasizing the need to preserve the subnational space of conformation. When there is self-reported control action, that is, the application of internal understandings with little consideration for the context, the result in practice tends to be the reduction of local autonomy.

In the practice of hiring, the line between guideline and detail narrows when statements and understandings of the TCU start to guide administrative action as if they were general (binding) parameters. Braga (2017) indicates a discouraging effect on differentiated arrangements; Naves (2019) points to incipient use of precedents, which reduces predictability; Mohn (2010) and Moreira Neto (1988) outline that general norms should preserve space for local conformation; Amorim (2022) and Binenbojm (2023), in the context of Law No. 14,133/2021, emphasize the need to safeguard the subnational margin. When the administration is compelled to follow control guidelines as if they had general normative force, the practical autonomy of states and municipalities is reduced and adaptation to the context is compromised.

In the context of Law No. 14,133/2021, Amorim (2022) and Binenbojm (2023) reinforce the need to preserve space for local conformation, while Dallari (2021) points out risks of reconstituting regulatory excess. If the dominant interpretation and the self-reported control action expand the practical scope of the general rules, the division of competences centralizes administrative practice, reduces adaptation to local contexts and limits the use of the planning and risk management tools provided for in the NLLC.

3 METHODOLOGY

This is a critical documentary review based exclusively on the bibliography and institutional documents listed in the References section, focusing on the period 2018–2025 (post-Law No. 13,655/2018 and effectiveness of Law No. 14,133/2021). Scientific articles, dissertations, chapters and institutional acts/reports (AGU/PGF, TCU, MGI), as well as selected legal journalistic material (JOTA), all included in the bibliography, were included.

The sources were classified into analytical axes: (i) precedents and predictability; (ii) statute of limitations; (iii) gross error (article 28 of the LINDB); (iv) consensuality (art. 26 of the LINDB and NLLC); and (v) federalism and "general norms". The collection of judgments and regulations was done in **the TCU Public Survey** (official portal), with persistent records on the respective pages of the acts.

A thematic analysis of the texts was carried out by axis, with extraction of evidence (excerpts and conclusions of the authors/agencies themselves) and cross-comparison between academic and institutional sources, in order to explain why the practical application of the LINDB/NLLC has been limited in the context of the control exercised by the TCU. Limitations: the analysis is restricted to the corpus listed in the References; it does not cover an exhaustive jurisprudential survey beyond the judgments and compendia cited; Inferences remain tied to the selected material.

4 THE ADMINISTRATIVE LAW OF FEAR: PUNITIVE EXTERNAL CONTROL AND LEGAL UNCERTAINTY

4.1 THE GENESIS OF FEAR IN PUBLIC MANAGEMENT

Even after the amendment of the LINDB by Law No. 13,655/2018, the permanence of these behaviors indicates a disharmony between the legal command of contextual analysis and the practice of control.

The expression "administrative law of fear", coined by Santos (2020), translates the perception of a legal-institutional environment in which the fear of severe and sometimes unpredictable sanctions leads public managers to decision-making paralysis. Ribas and Marques (2024) call this retraction the "blackout of pens", illustrating the fear of making decisions in the face of the risk of multiple responsibilities. Charles (2024), when mapping the phenomenon, associates this inhibition with the performance of control bodies that disregard, in many cases, the contextual particularities (the concrete case that designed the possible solution in the context) of administrative decisions. Santos (2020) associates fear with the combination of personal accountability and decision-making uncertainty. In everyday life, this uncertainty stems from three recurring factors in the literature: (i) limited predictability of control decisions, with incipient use of precedents (Naves, 2019); (ii) oscillating attribution of gross error, with low consideration of the real difficulties faced by the manager (Kammers, 2024; Pereira and Garrido, 2025); and (iii) variable interpretations of the statute of limitations in accountability, which is the subject of recent normative adjustments (Jota, 2023; AGU –

Federal Attorney General's Office, 2024). When the manager realizes that, even after completing all the steps and registering justifications, the possibility of *ex post accountability* with unstable criteria remains, he tends to restrict discretionary decisions and prioritize defensive routes, fueling the "blackout of the pens" described by Ribas and Marques (2024) and mapped by Charles (2024).

At the organizational level, fear translates into defensive routines: postponement of decisions, preference for verification scripts, and replication of standardized solutions, even when the context would recommend alternatives (Santos, 2020; Charles, 2024; Ribas and Marques, 2024).

The amendment to the LINDB sought to induce context analysis and delimitation of liability (articles 22 and 28), but the practical application remains irregular, with incipient use of precedents and oscillation in the qualification of gross error (Naves, 2019; FGV, 2021; Kammers, 2024; Pereira and Garrido, 2025). The proposal of lines of defense intends to rationalize access to control and order decision-making flows, but it does not eliminate the fear when stable criteria are lacking (Palma, 2024). As long as signs of unpredictability and low consideration of the circumstances of the case persist, managers will tend to restrict discretionary decisions and prioritize self-protection, fueling the "blackout of pens".

As pointed out by Fundação Getúlio Vargas (2021), the provisions of the LINDB that require the consideration of the factual context and the qualification of gross error have not yet been fully incorporated into the TCU's decisions. The Attorney General's Office (2024) also shows instability in the criteria related to the statute of limitations, which has motivated recent normative changes. In the same sense, Kammers (2024) notes the low effectiveness of the application of article 28 of the LINDB in the jurisprudence of control. In view of this scenario, Pereira and Garrido (2025) propose a doctrinal systematization that allows greater uniformity in the analysis of gross error, contributing to predictability and legal certainty. Naves (2019) points to incipient use of precedents, with effects on predictability. Without stable precedents, clear criteria for prescription and consistent application of article 28, managers tend to restrict choices and **minimize personal risks**, even at the expense of efficiency and innovation.

Thus, it is evident that the culture of control and defensive behaviors can reduce the practical effectiveness of the LINDB and NLLC commands: the legal requirement of context analysis and the limitation of liability to intent or gross error are not consolidated when there is a lack of stable precedents, clear prescription criteria and consistent adherence to article

28 (Naves, 2019; AGU – Federal Attorney General's Office, 2024; FGV, 2021; Kammers, 2024; Pereira and Garrido, 2025). As long as control operates with low predictability and little consideration of the real conditions of decisions, the manager will continue to restrict choices and minimize personal risks, even at the expense of efficiency and innovation.

4.2 TCU, PRECEDENTS AND PREDICTABILITY

The limitation in the adoption of administrative precedents, as evidenced by Naves (2019), compromises the consolidation of a stable jurisprudence within the TCU. In addition, Braga (2017) points out that this uncertain environment can generate a deterrent effect on innovative practices in public management. The TCU/FGV Observatory (2021) also pointed out the restricted application of the LINDB rules regarding the contextualization of decisions. In response to these interpretative weaknesses, the Court published, in 2024, a compendium of jurisprudence and guidelines with the aim of fostering greater standardization and clarity in control practices. These reports show that without a consistent use of precedents, with clear identification of the thesis applied and distinction of cases, guidelines fluctuate and predictability decreases, increasing the incentive for defensive decisions even when there is technical justification for different solutions.

Regarding the issue of the statute of limitations in accountability, there have been recent normative adjustments within the scope of the TCU (Resolutions 344/2022 and 367/2024, and IN 98/2024) (STF, 2020). The Referential Statement of the AGU – Federal Attorney General's Office (2024) systematizes the milestones and guides the practical application of these acts; the journalistic material of Jota (2023) points out that Resolution 344/2022 sought to increase predictability in the judgment of the statute of limitations. Successive changes in the TCU's statute of limitations, followed by the need to adjust processes already in progress to the new requirements, increase compliance work and maintain operational doubts (Brasil, 2022; Brazil, 2024a; Brazil, 2024b). In this situation, managers tend to opt for low-risk and more standardized decisions (Jota, 2023; AGU – Federal Attorney General's Office, 2024).

Naves (2019) points out that the *administrative stare decisis* in the TCU (idea of following precedents, understandings already established) is still incipient, with little explicit identification of the applied thesis and *distinguishing* (distinction of precedent) when the facts diverge (because the **concrete case has relevant** factual and legal differences in relation to the paradigm). The TCU/FGV Observatory (2021) recorded the limited application of the

LINDB commands on context analysis, which reduces the prospective usefulness of judgments to guide future decisions. Braga (2017) indicates that, in this scenario, control action discourages innovation. Without a consistent technique of precedents (enunciation of the thesis, distinction and eventual overcoming) and without a clear examination of the circumstances of the case, managers are unable to anticipate the control judgment and tend to opt for standardized and lower-risk solutions, even if less adjusted to the concrete problem.

Differentiating administrative guidance from precedents is central to predictability. The compendium *Bids & Contracts: guidelines and jurisprudence of the TCU* brings together useful understandings for practice, but does not replace the technique of precedents with an identified thesis, consistent application and explicit distinction when the facts diverge (Naves, 2019; Brazil, 2024). The report by the TCU Observatory (FGV, 2021) recorded limited application of the LINDB commands on context analysis, which reduces the ability of judges to guide future decisions. Without the formalization of theses and the distinction of cases, compiled guidelines tend to operate as decontextualized standardization, with less prospective value for the manager (Naves, 2019; FGV, 2021; Brazil, 2024).

The recent normative adjustments on the statute of limitations, **TCU Resolution No. 344/2022**, **TCU Resolution No. 367/2024** and **IN-TCU No. 98/2024**, have consolidated milestones and procedures aimed at preventing the statute of limitations in accounts and in the TCE (Brasil, 2022; Brazil, 2024a; Brazil, 2024b). The production of subsequent rulings indicate a movement of updating, but also reveal the need for methodological stabilization: applying theses in a coherent manner and justifying distinctions when appropriate (AGU – PGF, 2024; Brazil, 2025a; Brazil, 2025b). Even with regulatory changes, predictability depends on the technique of precedents and the examination of the context provided for in the LINDB; Without this, operational uncertainty persists. This normative movement meets, in part, the guideline set by **Theme 899** of the STF (STF, 2020).

In terms of decision-making behavior, limited predictability and incipient use of precedents increase the incentive for defensive choices, already described as pen blackout (Ribas and Marques, 2024). When it is not possible to predict, based on clear and replicable theses, how the control will assess analogous cases, managers reduce the use of discretionary solutions and prioritize verification scripts and low-risk decisions (Naves, 2019; FGV, 2021; Ribas and Marques, 2024).

4.3 (DIS)APPLICATION OF GROSS ERROR (ART. 28 OF THE LINDB)

Article 28 of the LINDB conditions the liability of the public agent to intent or gross error and requires that control decisions consider real obstacles and difficulties of management (in dialogue with article 22). The TCU/FGV Observatory (2021) records limited application of these contextual analysis commands in the Court's decisions. Naves (2019) points to incipient use of precedents, which affects the predictability of the criteria applied. Pereira and Garrido (2025) offer a new perspective for the TCU's jurisprudence on gross error. Kammers (2024) identifies low adherence to the legal parameters of article 28 in judgments analyzed. When stable criteria and explicit examination of the conditions of the case are lacking, the space for accountability for "gross error" expands in an uncertain way, reinforcing defensive behaviors.

The oscillating treatment of gross error impacts decision-making. Kammers (2024) identifies low adherence to the parameters of article 28 of the LINDB. Pereira and Garrido (2025) propose criteria to qualify serious fault; The TCU/FGV Observatory (2021) records limited application of context analysis. Without stable parameters and an explicit examination of the manager's real difficulties, defensive choices prevail: postponement of decisions, adoption of rigid verification scripts, replication of standardized solutions, and priority to alternatives with lower exposure, even when the case recommends different arrangements (Sundfeld, 2014; Braga, 2017; Santos, 2020; Ribas and Marques, 2024).

The interaction between gross error and prescription has a direct impact on the predictability of control. The AGU – Federal Attorney General's Office (2024) systematizes recent changes on prescription (TCU Res. 344/2022; 367/2024; IN 98/2024), while Kammers (2024) and Pereira and Garrido (2025) deal with the criteria for qualifying gross error, the TCU/FGV Observatory (2021) records limited application of context analysis. When the statute of limitations is adjusted and, at the same time, the qualification of the gross error remains oscillating, the temporal and material horizon of liability becomes uncertain; This combination increases the incentive for defensive decisions. The production of recent rulings (TCU 949/2025; 1,071/2025) is part of this updating movement and should be read in conjunction with the normative acts on prescription.

The proposal of "lines of defense" attempts to order decision-making flows and rationalize access to control, distributing roles between management, internal control, and external control (Palma, 2024). When, however, precedents are incipient, the prescription criteria fluctuate, and the qualification of gross error lacks stable application, these lines tend

to function as additional procedural layers, without reducing decisional uncertainty (FGV, 2021; AGU – Federal Attorney General's Office, 2024; Kammers, 2024; Pear tree; Garrido, 2025;). In these terms, the "lines of defense" do not replace the need for context analysis required by the LINDB (articles 22 and 28) nor do they resolve, by themselves, the incentive to defensive decisions; Without predictability and coherence in the performance of control, management tends to prioritize verification scripts and solutions with lower risk, even if it does not reach the highest quality or standard for the specific case.

5 LINDB AND CONSENSUALITY: LEGAL CERTAINTY AND "GOOD BUREAUCRACY"

5.1 LIMITATION OF THE AGENT'S LIABILITY (ARTS. 22 AND 28)

Articles 22 and 28 of the LINDB guide that administrative and control decisions consider real management obstacles and difficulties and that the liability of the public agent is limited to intent or gross error. The TCU/FGV Observatory (2021) records limited application of these commands in the Court; the Referential Statement of the AGU – Federal Attorney General's Office (2024) systematizes the practical effects of these parameters, including in interface with the statute of limitations; Kammers (2024) identifies low adherence to the criteria of art. 28; and Pereira and Garrido (2025) propose technical parameters to qualify serious fault. Without consistent examination of the context and stable criteria for gross error, the protective effect of arts. 22 and 28 are weakened, and the manager tends to restrict discretionary decisions for fear of accountability (*STF, 2020; BRAZIL, 2022; BRAZIL, 2024a; BRAZIL, 2024b*).

To give practical consequence to arts. 22 and 28 it is necessary to connect accountability to the reality of the concrete case. The effectiveness of this regime depends on control decisions that explain (a) which real obstacles and difficulties of management were considered; (b) why the conduct examined is intentional or qualifies as a gross error; and (c) how the conclusion harmonizes with the applicable prescription frameworks. In the database consulted, the TCU/FGV Observatory (2021) recorded limited application of context analysis; Kammers (2024) identifies low adherence to the legal parameters of art. 28; Pereira and Garrido (2025) propose technical criteria to qualify serious fault; and the Reference Statement of the AGU – PGF (2024) systematizes the recent adjustments to the statute of limitations (TCU Res. 344/2022; 367/2024; IN 98/2024), relevant to the coherence of decisions.

To give evidentiary support to arts. 22 and 28, the manager's conduct must be accompanied by contextual motivation and demonstrable diligence: planning compatible with

the NLLC, registered risk analysis, explanation of obstacles and real difficulties (resources, deadlines, technical constraints), comparison of alternatives considered, technical-legal opinions and justifications proportional to the problem faced. These elements allow the control to reconstruct the decision-making context and distinguish ordinary failures from gross error, in line with the parameters discussed by the TCU/FGV Observatory (2021), by Kammers (2024) and by Pereira and Garrido (2025), in addition to the guidelines on prescription systematized by the AGU – PGF (2024).

On the control side, the application of arts. 22 and 28 requires a consistent decision-making method: (i) enunciate the thesis applied and, when applicable, distinguish the case from precedents (Naves, 2019); (ii) examine the contextual motivation produced by management (FGV, 2021); (iii) expressly qualify the conduct as intent or gross error based on technical criteria (Kammers, 2024; Pereira and Garrido, 2025); and (iv) make the conclusion compatible with the current statute of limitations (AGU – PGF, 2024). When these steps are observed, predictability increases and the incentive for defensive conduct is reduced (Santos, 2020; Ribas and Marques, 2024).

5.2 CONSENSUALITY AS A MANAGEMENT TOOL (ART. 26 OF THE LINDB AND NLLC)

Article 26 of the LINDB allows the execution of commitments to resolve administrative controversies, reduce uncertainty and avoid litigation, including with conditions and counterparts appropriate to the case. Eidt (2024) exposes the reasons for incorporating appropriate methods of conflict resolution into public management; Oliveira and Moreira (2024) discuss the legitimacy and control of these instruments under the regime of Law No. 14,133/2021; Amorim (2022) examines negotiation agreements aimed at the conditional removal of sanctions.

The journalistic material in Jota (2025) records the growing adoption of mediation and arbitration in the Administration. The usefulness of these instruments increases when the control recognizes the contextual motivation, the mapped risks and the agreed counterparts; When unpredictability and context-sensitive reading prevail, the use of commitments tends to be residual, for fear of future liability.

Faria (2022) interprets the unavailability of the public interest as a prohibition on the arbitrary waiver of rights, not as an absolute impediment to composition; agreements are admitted when they demonstrate public advantage and protection of the protected interest. Eidt (2024) justifies the insertion of consensual methods as long as the commitment has a

delimited object, contextual motivation, evidentiary basis, and performance metrics. Oliveira and Moreira (2024) support the legitimacy of these instruments under the regime of Law No. 14,133/2021, conditioning them to control criteria (planning, risk analysis, economic-legal evaluation, and monitoring).

The scope of article 26 covers the resolution of administrative disputes and the prevention of litigation, with limits: prohibition of disproportionate concessions, requirement of economic equivalence, verifiable counterparts, monitoring and publicity clauses; at the institutional level, materials from the TCE/SE (2025) indicate the need for standardization and awareness so that the Courts of Auditors evaluate such commitments with attention to the context and results.

Eidt (2024) justifies the adoption of administrative chambers to structure the consensual settlement of disputes with a delimited object, contextual motivation, evidentiary basis, and monitoring metrics; Oliveira and Moreira (2024) deal with the legitimacy and control of these instruments under the regime of Law No. 14,133/2021, conditioning the execution to planning, risk analysis, economic equivalence, and publicity. TCE/SE (2025) indicates that effectiveness depends on internal standardization and awareness for attentive evaluation of the context and results. Pinto (2025) analyzes experiences and points out the need for clear procedures and monitoring; Santana (2025) describes current practices in the Federal Public Administration. Jota (2025) reports on the strengthening of mediation and arbitration in the Administration. The operationalization of the chambers requires a minimum design: regulations, admissibility criteria, registration of motivation, execution plan with verifiable counterparts, monitoring and publicity clauses, in order to allow subsequent control and reduce decision-making uncertainty about the validity of the commitments.

5.3 UNAVAILABILITY OF THE PUBLIC INTEREST: MEANING AND LIMITS

Faria (2022) interprets the unavailability of the public interest as a prohibition on the arbitrary waiver of rights and the unfounded transfer of public advantages, not as an absolute prohibition on settling conflicts. The composition is admissible when it demonstrates public advantage, protects the protected interest and is anchored in contextual motivation and evidentiary basis. Under the regime of Law No. 14,133/2021, Oliveira and Moreira (2024) recognize the legitimacy of consensual arrangements, conditioning them to control criteria (planning, risk analysis, economic-legal evaluation, and monitoring). Eidt (2024) emphasizes

that the commitment needs a delimited object, technical justification, and performance metrics to measure results.

In the light of these works, unavailability functions as a rule of prudence: it admits transactions on available property rights and conditional solutions (verifiable counterparts, economic equivalence, monitoring and publicity) whenever the public advantage is demonstrable. In cases that touch on interests that are not available, the consensual route requires specific legal authorization and reinforced safeguards (dense motivation, result controls, and transparency). For external control, the examination must verify these requirements instead of rejecting the composition in advance, aligning the performance with arts. 22, 26 and 28 of the LINDB and the governance design provided for in the NLLC.

5.4 SELF-COMPOSITION CHAMBERS AND CONSENSUAL PROCESSES

Eidt (2024) proposes that structured administrative chambers with defined competence, standardized procedures, and monitoring metrics should raise the quality of consensual solutions. Oliveira and Moreira (2024) argue that the performance of these chambers should observe planning, risk analysis, and economic-legal evaluation, with publicity of acts and results-oriented control. Pinto (2025) reports experiences that highlight the importance of clear procedures and monitoring; Santana (2025) describes practices in the Federal Public Administration. TCE/SE (2025) indicates that effectiveness depends on internal standardization and awareness so that the Courts of Auditors evaluate the commitments with attention to the context and results. A minimum design includes: regulations with competence and attributions, admissibility criteria (object, evidence, risk, alternatives considered), execution plan with verifiable goals and counterparts, monitoring and publicity mechanism, preferably with the possibility of deferred publicity when there is a concrete risk to the negotiation.

Eidt (2024) proposes that the establishment of commitments should involve a technical opinion from the requesting area and a legal opinion with an analysis of risks and alternatives; Oliveira and Moreira (2024) defend the submission to the self-composition chamber with an execution plan, verifiable counterparts and monitoring; TCE/SE (2025) highlights the importance of internal standardization and publicity of acts; Pinto (2025) and Santana (2025) describe monitoring and systematic recording practices. Palma (2024) articulates this design to the lines of defense: management and internal control must prevent and treat conflict before external control is triggered.

A minimum chain, technical instruction, legal-economic analysis, deliberation in the chamber, manifestation of internal control, approval by the authority and publicity (with justification for possible deferred disclosure) favor the context analysis required by the LINDB and offer external control a verifiable record of the decision-making process, reducing the incentive for defensive decisions.

Eidt (2024) and Oliveira and Moreira (2024) point out that valid commitments require contextual motivation, evidentiary basis, economic equivalence between concessions and an execution plan with verifiable goals and monitoring mechanisms. Faria (2022) links validity to demonstrable public advantage and the protection of the protected interest; TCE/SE (2025) highlights standardization, systematic registration and publicity as guarantees for control. A minimum validation protocol includes: (a) technical justification with risks and alternatives considered; (b) measurable counterparts and equivalence criteria; (c) compliance metrics and schedule; (d) documented monitoring and reporting of results; (e) publicity of the acts, with the possibility of deferred publicity when there is a suitable reason; and (f) legal opinion on legality and adherence to the LINDB/NLLC. Once these requirements are met, the commitment offers ballast for the control to verify the rationality of the solution and reduces the incentive for defensive decisions.

6 CONCLUSIONS

Recent normative production (LINDB amended by Law No. 13,655/2018 and NLLC) established commands for context analysis, limitation of liability to intent or gross error, and encouragement of consensual forms of dispute resolution. The basis consulted indicates, however, limited application of these parameters in the control action: incipient use of precedents (NAVES, 2019), variations on prescription (AGU – PGF, 2024) and low adherence to the criteria of article 28 of the LINDB (Kammers, 2024; Fundação Getulio Vargas, 2021; Pear tree; Garrido, 2025). At the same time, the federative design that reserves to the Union the edition of general rules continues to demand safeguards of local autonomy (Moreira Neto, 1988; Mohn, 2010; Sundfeld and Câmara, 2011; Amorim, 2022; Binenbojm, 2023).

BRAGA (2017) describes discouragement to innovation when control action favors standardized compliance. The result is an environment of decision-making retraction, already qualified as a "blackout of the pens" (Santos, 2020; Ribas and Marques, 2024), with underuse

of the planning, risk management, and consensuality instruments provided for in LINDB and NLLC.

6.1 PROSPECTS FOR "GOOD BUREAUCRACY"

Amorim (2020; 2022) proposes to overcome legal fetishism with a focus on responsible discretion, planning, and results. Sundfeld (2014) criticizes defensive formalism and links good management to proportional justifications and evaluation of consequences. In the field of liability, Kammers (2024) and Pereira and Garrido (2025) defend clear parameters for gross error, compatible with arts. 22 and 28 of the LINDB; The TCU/FGV Observatory (2021) records the need for context analysis in judgments. In consensus, Eidt (2024) and Oliveira and Moreira (2024) base arrangements with planning, risk analysis, economic equivalence and monitoring; Faria (2022) interprets unavailability as a rule of prudence, not an absolute prohibition of composing. Naves (2019) points out that stable precedents increase predictability; Palma (2024) articulates lines of defense to rationalize flows; the AGU – PGF (2024) systematizes statute of limitations.

A "good bureaucracy" combines: (a) contextual motivation and risk management; (b) decision-making method with identification of thesis, distinction and coherence with the LINDB; (c) consensus with metrics and control; and (d) minimum stability in prescription and gross error to reduce pen blackout (Santos, 2020; Ribas and Marques, 2024).

6.2 RECOMMENDATIONS

Structured application of arts. 22 and 28 of the LINDB: control decisions must explain the real obstacles and difficulties considered, qualify the conduct as intent or gross error based on technical criteria, and make the result compatible with the current statute of limitations (AGU – PGF, 2024; FGV, 2021; Kammers, 2024; Pereira and Garrido, 2025;). This organization must observe procedural schedules compatible with the statute of limitations defined in **Topic 899** (STF, 2020)

Precedent technique in the TCU (in accordance with the binding precedent of **Topic 899** (STF, 2020): clear identification of the thesis applied, *distinguishing* when there are material differences and, if necessary, reasoned overcoming, to increase predictability (Naves, 2019).

Standardized contextual motivation in management: require, in sensitive acts, a plan, risk analysis, considered alternatives, technical-legal opinions, and result metrics, allowing

the reconstitution of the context (Amorim, 2020) ensuring temporal predictability and legal certainty **in alignment with Topic 899** (STF, 2020).

Consensuality with governance: establish chambers with criteria of admissibility, economic equivalence, and monitoring, ensuring publicity (with the possibility of deferred publicity when justified) and results-oriented control (Oliveira and Faria, 2022; Eidt, 2024; Moreira, 2024; TCE/SE, 2025). Consensual instruments must contain schedules for compliance and monitoring of statutes of limitations, **in line with Topic 899** (STF, 2020)

Integration with the "lines of defense": strengthen internal control and advisory services to filter conflicts and qualify evidence before the activation of external control (Palma, 2024) including systematic control of the statute of limitations **defined in light of Topic 899** (STF, 2020).

Prescription stabilization: coherently apply recent resolutions and normative instructions, with operational guidelines for ongoing cases (*Brasil, 2022*; AGU – PGF, 2024; *Brazil, 2024a*; *Brazil, 2024b*).

The set reduces uncertainty, shifts the focus from the rite to the motivated merit and mitigates defensive behavior, without removing liability for intent or gross error (Santos, 2020; Ribas and Marques, 2024).

6.3 SUGGESTIONS FOR FUTURE RESEARCH

Three empirical fronts can deepen the topic based on its agenda: (a) longitudinal monitoring of TCU rulings on gross error and context analysis after 2024, to assess adherence to arts. 22 and 28; (b) evaluation of the results of commitments signed based on article 26 of the LINDB (fulfillment of goals, economic equivalence and incidence of subsequent controversies); and (c) comparative studies between entities with different administrative capacities to verify whether contextual motivation and risk management reduce the incidence of liability without prejudice to control.

ACKNOWLEDGMENT

The author thanks the **Brazilian Institute of Teaching, Development and Research (IDP)** for the environment of excellence that stimulates scientific production and critical debate on contemporary public administration.

In particular, it expresses its gratitude to **Professor Victor Aguiar Jardim de Amorim**, for the exchange of knowledge, academic excellence and for the constant encouragement to reflect and write this article.

NURSING CARE DURING THE PARTNER'S PRENATAL PERIOD: A LITERATURE REVIEW**ASSISTÊNCIA DE ENFERMAGEM NO PRÉ-NATAL DO PARCEIRO: UMA REVISÃO BIBLIOGRÁFICA****CUIDADOS DE ENFERMERÍA DURANTE EL PERÍODO PRENATAL DE LA PAREJA: UNA REVISIÓN DE LA LITERATURA** <https://doi.org/10.56238/sevened2025.036-035>**Tarciana Maria Fragoso da Silva¹, Simoni Furtado da Costa², Fabiana Ferreira Koopmans³****ABSTRACT**

Prenatal care is a fundamental step in the prevention and/or early detection of problems during pregnancy. Historically, prenatal care has been built from the perspective of promoting the health of women and children. However, as new ways of thinking about health advance, changes are also observed in the implementation of public policies such as: norms, legislation, among others, whose approach has been gaining emphasis on the inclusion of the partner in prenatal care and in other stages of the pregnancy to birth process. The objective of this research is to discuss, through scientific literature, nursing care for the partner during prenatal care. The aim is to contribute to encouraging greater male participation in healthcare within the scope of Primary Care. Method: This is a descriptive and exploratory bibliographic review study with a qualitative approach. Data were collected from physical and virtual collections. For the search of virtual material, a consultation of the Health Descriptors (DeCs) was carried out to select specific terms to guide data collection in the database. Database: Virtual Health Library (BVS). The time frame for the final analysis of the publications covered the last five years. The results show data that align with the National Policy for Comprehensive Health Care (PNAISH) of the Ministry of Health, which emphasizes the inclusion of the topic of fatherhood and care, through partner prenatal care, in debates and actions focused on reproductive planning as essential strategies to improve care during pregnancy and childbirth in public health services. The evidence suggests a favorable context for the inclusion of men in partner prenatal care; however, the effective participation of men depends on various factors such as legislation, institutional commitment to humanized childbirth, and other aspects. Conclusion: For greater achievements, it is necessary to adapt the infrastructure of health units, promote actions to minimize barriers to access for the male population, especially in the processes of preparation and monitoring during prenatal care, and promote awareness among the health team to welcome this population. It is suggested that innovative strategies be designed for the recruitment, onboarding, and education of men and women, implementing a gender perspective focused on masculinities, considering issues that also involve the inclusion of this debate within the context of training.

RESUMO

O pré-natal é uma etapa fundamental da prevenção e/ou detecção precoce de problemas no percurso da gestação. Historicamente, o pré-natal foi se construindo sob a perspectiva da promoção à saúde da mulher e da criança. No entanto, conforme avançam novas formas de pensar a saúde, também se percebe alterações na implementação de políticas públicas como: normas, legislações, entre outras, cuja abordagem vem ganhando ênfase na inclusão do parceiro no pré-natal e em outras etapas do percurso da gestação ao nascimento. O objetivo desta pesquisa é discutir, através de literatura científica, a assistência de enfermagem ao parceiro no pré-natal. Com a finalidade de contribuir para o incentivo à maior adesão dos homens no atendimento à saúde no âmbito da Atenção Básica. Método: Trata-se de um estudo de revisão bibliográfica, de natureza descritiva e exploratória, com abordagem qualitativa. Os dados foram coletados através de acervos físicos e virtuais. Para a busca do material virtual foi realizada consulta aos Descritores em saúde (DeCs) para a seleção de termos específicos para nortear a coleta de dados na base de dados. Base de Dados Biblioteca Virtual em Saúde (BVS). O recorte temporal das publicações para a análise final foi dos últimos cinco anos. Os resultados trazem dados que vêm caminhando na mesma direção da Política Nacional de Atenção Integral à Saúde do (PNAISH), do pelo Ministério da Saúde, os quais apostam na perspectiva da inclusão do tema paternidade e cuidado, por meio do pré-natal do parceiro, nos debates e nas ações voltadas para o planejamento reprodutivo como estratégias essenciais para qualificar a atenção à gestação e ao nascimento, nos serviços públicos de saúde. As evidências sugerem que há um contexto favorável para a inclusão dos homens no pré-natal do parceiro, no entanto, a participação efetiva dos homens decorre de diferentes fatores como a legislação, o compromisso institucional com o parto humanizado, entre outros aspectos. Conclusão: Para maiores conquistas, é preciso adequação da infraestrutura das unidades de saúde, promover ações a fim de minimizar as barreiras de acesso da população masculina, sobretudo, nos processos de preparação e acompanhamento no pré-natal e promover a conscientização da equipe de saúde para o acolhimento desta população. Sugere-se desenhar estratégias inovadoras de recrutamento, acolhimento e educação de homens e mulheres, implementando uma perspectiva de gênero voltada para as masculinidades, considerando as questões que envolvem também a inclusão do debate no âmbito da formação.

RESUMEN

La atención prenatal es un paso fundamental en la prevención y/o detección temprana de problemas durante el embarazo. Históricamente, la atención prenatal se ha centrado en la promoción de la salud de las mujeres y los niños. Sin embargo, a medida que avanzan nuevas concepciones de la salud, también se observan cambios en la implementación de políticas públicas, como normas y legislación, entre otras, cuyo enfoque ha cobrado mayor importancia en la inclusión de la pareja en la atención prenatal y en otras etapas del proceso de embarazo y parto. El objetivo de esta investigación es analizar, a través de la literatura científica, la atención de enfermería a la pareja durante la atención prenatal. Se busca contribuir a fomentar una mayor participación masculina en la atención sanitaria dentro del ámbito de la Atención Primaria. Método: Se trata de un estudio de revisión bibliográfica descriptivo y exploratorio con enfoque cualitativo. Los datos se recopilaron de colecciones físicas y virtuales. Para la búsqueda de material virtual, se consultó el Descriptor de Salud

(DS) para seleccionar términos específicos que guiaran la recopilación de datos en la base de datos. Base de datos: Biblioteca Virtual en Salud (BVS). El periodo para el análisis final de las publicaciones abarcó los últimos cinco años. Los resultados muestran datos que concuerdan con la Política Nacional de Atención Integral a la Salud (PNAISH) del Ministerio de Salud, la cual enfatiza la inclusión del tema de la paternidad y el cuidado, a través de la atención prenatal en pareja, en los debates y acciones centrados en la planificación reproductiva como estrategias esenciales para mejorar la atención durante el embarazo y el parto en los servicios públicos de salud. La evidencia sugiere un contexto favorable para la inclusión de los hombres en la atención prenatal en pareja; sin embargo, la participación efectiva de los hombres depende de diversos factores como la legislación, el compromiso institucional con un parto humanizado y otros aspectos. Conclusión: Para lograr mayores avances, es necesario adaptar la infraestructura de las unidades de salud, promover acciones que minimicen las barreras de acceso para la población masculina, especialmente en los procesos de preparación y seguimiento durante la atención prenatal, y fomentar la sensibilización del personal de salud para acoger a esta población. Se sugiere diseñar estrategias innovadoras para la captación, la integración y la formación de hombres y mujeres, implementando una perspectiva de género centrada en las masculinidades, considerando también la inclusión de este debate en el contexto de la formación.

1 INTRODUCTION

Pregnancy is a complex experience with different aspects for each woman, in addition to the biological dimension, it is a social process that involves the collective, mobilizing the family and the environment in which the woman is inserted. Therefore, in order for health promotion, disease prevention, and early detection of risk situations to occur safely, the involvement of women, their partners, their families, and health services is important (LUCENA, 2024).

In view of this, it is necessary for pregnant women to start the first prenatal consultation early, preferably until the initial 120 days of pregnancy, to have at least six prenatal consultations, which can be medical interspersed with nursing and that take place in the reference service, educational actions with the pregnant woman and her family during the period of her pregnancy (BRASIL, 2016, BRAZIL, 2017).

Prenatal care in Brazil is governed by the guidelines of the Program for the Humanization of Labor and Birth (PHPN), established by the Ministry of Health (MS) in 2000, which is based on the humanization of care as a condition for adequate monitoring of pregnancy, childbirth and puerperium, seeking complete quality, qualified and humanized care, becoming fundamental for maternal and neonatal health with a view to prevention. Care during pregnancy needs to be permeated by scientific knowledge, humanization of care and respect for women as active subjects in this process (BRASIL, 2012).

Prenatal care precedes the birth of the baby, that is, it is a set of actions aimed at the individual and collective health of women in the gestational period. It is up to the health team from the first contact with the pregnant woman to seek to identify the meanings of pregnancy for her and her family members. Knowing that the history of each pregnancy is an important factor for the individual to develop in a healthy way. In view of this, prenatal care aims to welcome the pregnant woman and her family in its entirety, from the beginning of pregnancy to the changes that occur in the body, as well as her emotional. Pregnancy is a moment of transition in a woman's life, so such transformations can trigger doubts, fears, fantasy, anguish or questions about what happens inside her (TEIXEIRA; ADAM; MAGALHÃES, 2010).

Adequate prenatal coverage, associated with quality care, is essential for a good evolution of pregnancy and birth. The objective of this follow-up is to ensure the safe development of pregnancy, allowing the delivery of a healthy newborn, without impact on maternal health, including addressing psychosocial aspects and educational and preventive activities (BRASIL, 2012).

Low-risk pregnancies can only be confirmed at the end of the gestational process. The dynamic process and the complexity of the functional and anatomical changes that occur in the gestational cycle require continuous and specific evaluations in each period (BRASIL, 2012).

The actions developed with pregnant women begin with the diagnosis of pregnancy carried out through history, physical examination and laboratory tests. The main suspicion of pregnancy reported by women is menstrual delay in amenorrheic women with an active sexual life. In the context of public health, after confirmation of pregnancy, the woman must be accompanied by the health system in her area of coverage to start prenatal care (SOUSA; MARIE; TORRES, 2012).

Health actions should be aimed at covering the entire target population in the area covered by the health unit, ensuring at least six prenatal consultations (BRASIL, 2017). In addition, the continuity of care, monitoring and evaluation of the impact of these actions on maternal and perinatal health must be guaranteed (BRASIL, 2012).

In the context of prenatal care, nurses emerge as professionals qualified to monitor low-risk pregnancies, due to their technical-scientific training. This professional masters the propaedeutic methods for monitoring pregnancy, scientific knowledge for interpreting signs, symptoms and exams, as well as intellectual capacity to guide this woman on important issues and care, preparing her to experience this phase (**ERRICO et al., 2018**)

It is extremely important that during their work, nurses use, in addition to their techniques, scientific and social knowledge, special, empathetic and facilitating care in the face of the emotional sensitivity that these women are in, thus ensuring humanized and qualified care for pregnant women. This is an action guaranteed through public health policies, by the Women's Health Program, in places where the Family Health Program is inserted, it is recommended that this monitoring be carried out by the Inter-professional team, which allows the exchange of knowledge and a broad view of the patient (TEIXEIRA; ADAM; MAGALHÃES, 2010).

It should be emphasized that low-risk prenatal care can be performed by nurses, obstetricians or not, supported by the Law of Professional Nursing Practice (Law No. 7,498, of June 25, 1986), since this law ensures the legality of nursing consultations, nursing prescriptions, and care for parturient and puerperal women (**ERRICO et al., 2018**).

During the prenatal consultation, the nurse carries out the nursing care plan, based on the perceived and prioritized needs, guidelines, interventions and referrals are determined, in order to promote the interdisciplinarity of medical, nutritional, dental and psychological services (TEIXEIRA; ADAM; MAGALHÃES, 2010).

For low-risk prenatal care to occur in pregnant women, the variables (blood glucose, BP, BMI, history of the pregnant woman) are extremely important for the patient to have a faster recovery until the baby is born (**FERREIRA et al, 2015**)

During pregnancy, important changes occur in maternal metabolism to create an environment that allows embryogenesis, fetal growth, maturation, and survival; Thus, a nutritional reserve is favored at the beginning of gestation to meet the increase in maternal-fetal demands in the more advanced stages of gestation and lactation. A normal pregnancy is characterized by being a diabetogenic state, due to the progressive increase in postprandial glucose concentrations and the decrease in cell sensitization to insulin in the late stages of pregnancy. Inadequate prenatal care can lead to complications such as gestational diabetes (MIRANDA, 2008).

Prenatal care is a fundamental step in the prevention and/or early detection of problems in the course of pregnancy. Some pathologies, both maternal and fetal, can be detected in a timely manner, enabling, in many cases, a healthy development of the baby and reducing the risks of the pregnant woman. Information about the different experiences should be exchanged between women and health professionals (BRASIL, 2016).

The importance of participation and male support helping the partner helps to tolerate pain, doubts and anxiety related to labor, reduces the time of labor, number of cesarean sections and the use of medications. Therefore, in this way, the inclusion of men during the gestational process, childbirth and postpartum increases the bond between the trinomial (JARDIM; PENNA, 2012).

Prenatal care in Brazil is one of the most opportune moments for different forms of approach to health, as it is considered a service with good coverage in the Unified Health System, as shown in the research by Viellas *et al.* (2014). The study showed that prenatal coverage in Brazil was high at 98.8%, with 75.8% of women starting prenatal care before 16 weeks of gestation and 73.1% with six or more consultations. Prenatal care was performed mainly in primary health care units (89.6%), public health care units (74.6%), by the same professional (88.4%), mostly physicians (75.6%), and 96% received the prenatal care record in hand (VIELLAS *et al.*, 2014).

Historically, prenatal care has been built from the perspective of promoting women's and children's health. However, as new ways of thinking about health and the implementation of policies, norms, and legislation advance, other approaches have been gaining emphasis, such as the inclusion of the partner in prenatal care (COSTA & TAQUETTE, 2017).

It is in this process that there is the possibility of exchanging experiences and knowledge between professionals and families, and it is considered the best way to promote the understanding of the pregnancy process as a strategy to reduce the risk of maternal and neonatal mortality (BRASIL, 2016).

The Ministry of Health considers that prenatal care should be organized in such a way that it can meet the needs of the population of pregnant women, requiring the use of scientific technical knowledge, adequate and available means and resources (BRASIL, 2011; BRAZIL, 2016).

In view of these points, equity is one of the principles that best suits the topic under discussion, as it is directly related to equality. Thus, it is understood that partners must be fully involved in everything related to reproductive decision-making, from the choice to be a father to solidary participation in pregnancy, childbirth, care and education. It is from this perspective that this study discusses the theme of nursing performance on the partner's prenatal care. This work Its objective is to investigate the partner's prenatal nursing care.

2 METHOD

The bibliographic review aims to build a contextualization for the problem and analyze the possibilities existing in the literature consulted (VOSGERAU; ROMANOWSKI, 2014). According to Andrade (2010, p.112), descriptive research consists of "the facts observed, recorded, analyzed, classified and interpreted, without the researcher interfering in them". In other words, the main objective of exploratory research is to delimit the problem, formulate hypotheses or identify new approaches for the study to be developed, and its main objective is to delimit the problem, formulate hypotheses or identify new approaches for the study to be developed (GIL, 2008).

. It is emphasized that "through exploratory research, the possibility of developing good research on a given subject is evaluated" (ANDRADE, 2010, 2012).

According to Polit and Beck (2011, p.90), "in qualitative studies, researchers mainly collect qualitative data, that is, narrative descriptions."

The content survey was carried out between September 2021 and November 2022, the search took place through the physical and virtual collections. The virtual database used was the VHL (Virtual Health Library). The following descriptors were used in DeCS (Health Sciences Descriptors) databases: Nursing care, prenatal care, partner, health education, using the Boolean operator AND.

The inclusion criteria for the selection of contents were the choice of productions, which fit the following aspects: article published in the period of five years, articles that were

repeated and did not have full texts were used as exclusion criteria. The titles, indexes, abstracts and chapters were read - when it was thesis, policies and books, as shown in **Figure 1**.

The Portuguese language and the five-year time frame (2017 to 2021) were used as filters. As inclusion criteria, theses, dissertations, books, articles published in journals with an editorial policy of peer review, articles with titles, abstracts and keywords, . As exclusion criteria, articles that did not answer the research question, that is, not related to the research theme, and duplicate publications.

Next, the material was organized in a synoptic table according to the type of publication (Table 1). From the contents found, the categories that guided the discussion of the study emerged.

Figure 1

FlowTable of the researched articles

Source: (The authors, 2025).

3 RESULTS AND DISCUSSION

From the literature review and analysis of the studies indexed in the databases, on the proposed theme, 109 scientific studies were found, 35 were selected, 30 met the inclusion criteria, 14 of them did not focus on the theme in question or did not have the full text, and combination with descriptors in the last 05 years between 2017 and 2022, leaving

only 16 articles to compose the analysis. In table 1, we describe the selection strategies for articles on the theme, as shown in the flowTable below:

Table 1 describes the strategy for selecting articles on the topic in question. Table 1 - Scientific literature on the importance of the partner in prenatal care (- 2017-2021).

Table 1

Scientific literature on the importance of the partner in prenatal care (- 2017-2021)

Quadro 1. - Literatura científica sobre a importância do parceiro no pré-natal (2014-2021).					
Título	Autor/data	Objetivo	Tipo de estudo	Revista	Resultados
Atenção à gestante adolescente na rede sus - o acolhimento do Parceiro no pré-natal	Costa & Taquette (2017)	Verificar o acolhimento e a participação de parceiros de gestantes adolescentes no pré-natal da rede SUS.	Estudo descritivo de abordagem qualitativa	Rev. Enferm.UFPE	Houve o desejo do parceiro de acompanhar as consultas de pré-natal, mas este desconhece seu direito de participar. Há limites pessoais e institucionais para efetivar a participação dos parceiros.
Característica do relacionamento entre a mulher e seu parceiro na ocorrência de gravidez não planejada	Parcer et.al.(2017)	descrever características do parceiro e do relacionamento com a companheira na ocorrência de gravidez não planejada	Estudo transversal exploratório	Rev.bahiana.enferm	Os parceiros apresentaram idade média de 28 anos, predominando raça/cor negra, sem religião, baixo nível de escolaridade e baixa renda. A situação conjugal casada/união estável e o tempo de união apresentaram alta significância estatística para a ocorrência da gravidez não planejada.
Prática de cuidado realizadas pelo companheiro na perspectiva da gestante	Martello et al.(2017)	Compreender como a mulher percebe a participação do homem no processo gravídico	Estudo qualitativo	Rev.Enferm.UFPE	Foram identificados tipos de cuidados prestados pelos companheiros às gestantes, relacionados principalmente à preocupação com o bem-estar delas e do bebê, participação nas consultas, alimentação e sexualidade. As gestantes consideram importante a participação do companheiro, e isso tem
Estratégias para identificação e enfrentamento de situação de violência por parceiro íntimo em mulheres gestantes	Marques et al. (2017)	Conhecer as estratégias utilizadas por enfermeiros de Unidades de Estratégias de Saúde da Família para identificação e enfrentamento de situação de violência por parceiro íntimo em mulheres gestantes.	Estudo descritivo com abordagem qualitativa	Rev.Gaúcha Enferm.	Ações de identificação e enfrentamento da violência por parceiro íntimo em mulheres gestantes. As lesões físicas foram o principal indicativo de violência identificada na consulta pré-natal. As estratégias de enfrentamento foram os encaminhamentos a serviços especializados e discussão conjunta com a equipe de saúde.
A inclusão paterna durante o pré-natal	Henz;Medeiros;Salvador(2017)	Investigar a participação paterna durante o pré-natal em um Centro de Atenção à Saúde da Mulher	Estudo qualitativo	Rev.Enferm.APS	A limitação da oferta de horários de atendimento, que coincidem com os de trabalho dos homens, dificulta a participação paterna. Destacou-se a importância de as gestantes encorajarem o seu parceiro a participar das atividades do pré-natal.
A visão da gestante acerca da participação do homem no processo gestacional	Caldeiras et al. (2017)	Analisar a visão das gestantes quanto à participação do homem durante o processo gestacional e as consultas de pré-natal	Estudo qualitativo	Rev.Enferm.Cent-Oeste	A pesquisa apontou o apoio ofertado em âmbito familiar como essencial para a gestante e a ausência do homem durante a consulta foi entendida e justificada pelo horário de trabalho do companheiro, na maioria das vezes.
Influência da participação do companheiro no pré-natal: Satisfação de primíparas quanto ao apoio no parto	Holanda et al. (2018)	Correlacionar a satisfação de primíparas quanto ao apoio e à utilidade do companheiro durante o processo de parto com a sua presença e capacitação no pré-natal.	Estudo correlacional	Texto & Contexto	A variável presença do companheiro no pré-natal esteve estatisticamente associada à satisfação da puérpera com o apoio ($p=0,0004$) e com a utilidade do apoio ($p=0,007$) durante o trabalho de parto, enquanto a variável capacitação do companheiro no pré-natal esteve estatisticamente associada à satisfação com o apoio ($p<0,00001$) e à utilidade do apoio ($p<0,001$; $p<0,00001$ e $p=0,006$) prestado pelo companheiro durante todas as fases avaliadas (trabalho de parto, parto e pós-parto imediato).
O comportamento paterno na consulta de pré-natal	Cavalcante et al. (2018)	Conhecer a experiência do homem como acompanhante na consulta de pré-natal.	Estudo qualitativo	Rev.Paul.Enferm.	Ainda que o atendimento pré-natal seja destinado aos cuidados com a mulher grávida, a experiência do homem na atenção pré-natal – o objeto social – é uma inserção masculina no universo feminino. Esta experiência pode beneficiar a ambos na vivência do período gestacional.
Gestantes adolescente e seu sentimento acerca do apoio familiar	Nune et al. (2018)	Identificar o sentimento em relação às principais fontes de apoio para mulheres que vivenciaram a gestação na adolescência	Estudo qualitativo, exploratório e descritivo	Rev.Enferm.UFSM	A participação e apoio dos pais dos bebês e da figura materna no contexto da gravidez na adolescência,pareceu primordial no enfrentamento da situação de tornar-se mãe.

Continua...

(Cont. **Quadro 1**)

Título	Autor/data	Objetivo	Tipo de estudo	Revista	Resultados
Pais de primeira viagem: demanda por apoio e visibilidade	Trindade et al. (2019)	Reforçar um aspecto já identificado em outros estudos, a deficiente atenção (social, familiar e institucional) aos homens ao longo de sua construção social e afetiva como pais, este estudo, investigando o posicionamento de pais de "primeira viagem" sobre ações de apoio advindas de sua rede social e de profissionais da saúde	Estudo descritivo e analítico	Saúde & Sociedade	Indicaram que elementos tradicionais de representações sociais sobre homem e pai interferem na proximidade dos participantes com a gestação e no reconhecimento de suas necessidades por apoio durante esse período. Evidenciou-se também o distanciamento do homem do atendimento por profissionais de saúde e a necessidade de cumprimento de políticas públicas na saúde e inserção da perspectiva de gênero nas políticas e práticas de saúde e educação, visando a formação de profissionais sensíveis para atuar com os homens, contribuindo para a promoção de modos de vida mais igualitários e benéficos para o homem-pai.
Presença do acompanhante durante o processo parturição e nascimento	Anjos & Geremias(2019)	Analisar a prática da presença do acompanhante durante o processo de parturição	Estudo transversal	Rev.Enferm.UERJ	A informação sobre o direito do acompanhante foi mais frequente no Centro Obstétrico e Internação Obstétrica. Não houve relação significativa entre o conhecimento da Lei de Acompanhante e o número de consultas pré-natal. Onde houve menor frequência de acompanhante foi na sala de recuperação pós-parto, devido à ausência do acompanhante e à não permissão. O companheiro foi o acompanhante mais frequente. Não houve significância quanto à presença do acompanhante e realização de analgesia, o tipo de parto e o Apgar.
A presença do genitor no pré-natal: um estudo de representações sociais com gestantes	Couto et al.(2020)	Analisar as representações sociais da presença do genitor no pré-natal para as mulheres gestantes	Estudo descritivo e qualitativo	Rev.Enferm.UERJ	A análise aponta a palavra "não" como a mais latente no sistema cognitivo das gestantes, sendo percebida a alta frequência no Dendograma de Classes, presença no eixo de intersecção entre as ordenadas e abscissas no Mapa Fatorial de Correspondência, além de ser central e fazer as maiores forças de conexidade com as demais palavras na árvore máxima de similitude.
Transição para a paternidade no período pré-natal: um estudo qualitativo	Silva; Pinto e Martins (2021)	Compreender as vivências dos homens na transição para a paternidade durante o período pré-natal.	Estudo qualitativo, exploratório, descritivo, transversal e retrospectivo	Ciência & Saúde Coletiva	Evidenciam o período pré-natal como momento chave da transição para a paternidade, marcado pela enorme exigência psíquica e emocional e afigurando-se como motor do desenvolvimento da identidade paterna.
O pré-natal do parceiro sexual: importância para a saúde do homem e da gestante-	Vitoretti et.al (2021)	Avaliar a saúde dos parceiros sexuais de gestantes, bem como a sua importância para a evolução da gestação.	Estudo transversal	Rev.Eletrônica . Acervo Saúde	Considerando a participação do parceiro ou não durante o pré-natal, não houve mudanças estatísticas significativas em relação a progressão esperada da gestação bem como as complicações mais comuns dessa fase. Em relação a saúde do parceiro o fator de maior preocupação foi a média de IMC classificada como sobrepeso.
Percepção e participação do parceiro na assistência pré-natal e nascimento	Marques et.al (2022)	Compreender a percepção do parceiro sobre sua experiência e participação na assistência pré-natal e nascimento.	Estudo qualitativo	Rev.Pesqui	Emergiram três categorias as quais mostram que eles tiveram pouca participação nas consultas de pré-natal e que desconhecem o "pré-natal do parceiro". Em geral, demonstram gratidão pela assistência durante o parto, mas poucos relataram ter recebido informações relacionadas à educação em saúde.

(Conclusão)

4 NURSING CARE IN THE PARTNER'S PRENATAL CARE

According to Ordinance GM/MS No. 1,944, of August 27, 2009, it is foreseen that the health monitoring of the male population in the unified health system will be ensured, with primary care as a gateway, especially in the partner's prenatal care, and this monitoring is extensive in childbirth and immediate postpartum. The same must be done by qualified professionals, as recommended by law.

The assistance includes an assessment of the health status of the pregnant woman during pregnancy. Take care of any existing health problems; prevention of other health problems; health promotion. Each patient should have an equal or better health status at the end of pregnancy than at the beginning and give birth to a strong and healthy child.

It is of paramount importance that health professionals have a qualified listening and that they seek to understand what the couple has in terms of knowledge, opinions and rights about prenatal care. Therefore, it is essential that nurses hold groups aimed at pregnant couples, so that there is an exchange of experiences among the participants. Understand the anxieties for low inclusion of men in health services, always encouraging and promoting their early inclusion in the unified health system (ANJOS & GEREMIAS 2019).

According to Vitoretti (2021), the partner's participation in prenatal care did not influence the pregnant woman's clinical complications for the determinism of childbirth, but it was possible to identify changes in the partner's own health that deserve guidance, control, and treatment. Thus, it can be seen that men's prenatal care reduces the morbidity and mortality rate.

The aim of the 2016 WHO antenatal care model is to provide pregnant women and their partner with respectful, individualised and person-centred care in all contacts, and to ensure that each is supported by effective and integrated clinical practices (interventions and tests), relevant support and timely information and to offer psychosocial and emotional support by professionals with good clinical and interpersonal skills in a well-functioning health system. Given the evidence pointing to an increase in perinatal mortality in women with only four antenatal visits and that an increase in the number of antenatal contacts, regardless of country, is associated with higher maternal satisfaction, WHO recommends a minimum of eight contacts: one contact in the first trimester, two in the second trimester and five contacts in the third trimester, (TAVARES *et al.*, 2019).

For Silva, (2021) the prenatal period is like a key moment in the transition to fatherhood, marked by enormous psychic and emotional demands and appearing as an engine for the development of paternal identity.

Thus, it is of fundamental importance to become the visible partner in prenatal consultations so that he can report on his fear or anguish in relation to fatherhood.

To meet the objectives of prenatal care, the nursing team must base its actions on a continuous process of learning situations, whose purpose will be to reaffirm or achieve changes in the attitude or behavior of the pregnant woman and the family nucleus. The educational actions that Nursing performs in the Areas of Outpatient Clinics, Inpatient Rooms (Prepartum and Delivery Rooms, pregnancy and puerperium), could be operationally divided into incidental education and systematic education. Incidental education is understood to be that which is carried out during the development of daily work, where appropriate situations that arise are used to teach through casual conversation. Systematic education is that which is carried out in a formal way, with work methodology and planned time, with explicit objectives and purposes (Cavalcante et al., 2018).

4.1 PARTNER PARTICIPATION

The role of men in pregnancy and in protecting maternal health has generated growing interest in recent years. Despite this, their exclusion and marginalization persist in relation to these processes, traditionally considered as a women's issue. Male involvement in these environments is poorly understood and little researched compared to other areas of sexual and reproductive health (HORTA, 2017).

The intersection of gender, health, and reproductive rights highlights the need to analyze men's reproductive experiences. Men can be made visible in reproductive spaces, while reproduction has been feminized in disciplinary discourses, in everyday language, and in the discourse of public policies (SILVA et al., 2020).

Men's participation in care is decisive for gender equality. Men's weak approach to care is reinforced by the dominant forms and roles of fatherhood that relate to the sexual division of labor. Sexual difference and the hegemonic models built from this difference end up excluding what it means to "be a man" and "to be a woman", causing and legitimizing inequality. In gender learning, such as men and fathers, stereotypes centered on values such as strength, responsibility, and conformity are usually constructed, from which expectations,

actions, and forms of relationship considered typical of masculinity and fatherhood are created (SANTANA; DA SILVA GONÇALVES, 2020).

The importance of male participation in reproductive health and its benefits for gender equality has been highlighted in widely accepted international agreements, emanating from the International Conference on Population and Development and the Fourth World Conference on Women, and in the Sustainable Development Goals, one of the key points is to meet the needs of the actors involved in their fulfillment (HORTA, 2017).

The interest in addressing the phenomenon of male participation in pregnancy lies in being able to listen to the voices of men. Therefore, spaces are created to learn about their experiences and their constructions as caregivers, and reflections are generated in the institutional sphere in relation to prenatal programs, in view of the importance of male participation. In this way, attachment strategies are promoted for men (SILVA *et al.*, 2020).

In this context, participation is understood as the process in which people want to do more than just contemplate: they want to get involved, intervene and carry out actions that result in change, managing to do so constantly. In this way, the participation of men contributes significantly to maternal health, facilitating the acceptance of pregnancy, favoring timely access to prenatal programs, promoting the physical and emotional stability of pregnant women and self-care actions (SANTANA; DA SILVA GONÇALVES, 2020).

Likewise, the participation of men during pregnancy facilitates early adherence to prenatal care, reduces maternal stress and risk behaviors and, in the future, ensures male participation in paternal functions. The participation of couples in the reproductive processes favors the humanization of care for pregnant women, but, despite these benefits, their participation in pregnancy is still scarce (HORTA, 2017).

In addition to health system recommendations to improve the quality and use of antenatal care, the 2016 WHO antenatal care recommendations address interventions in four other categories: nutrition, maternal and fetal assessment, preventive measures, and treatment of birth defects (SILVA *et al.*, 2020).

The most common concerns that exist in men during the pregnancy of their companion were evaluated: what it is to be a father, how it should behave and whether he will be able to promote what is necessary for his child and family. The future birth will cause the present father to evoke or elaborate memories of his childhood and his relationship with his own parents (ANJOS & GEREMIAS, 2019).

Many fathers-to-be feel ambivalence about pregnancy: anxiety about their own maturation (because becoming a father means ceasing to be a teenager) and expressing internal conflicts related to the role of father. Even when on the conscious level you are very happy with the prospects of being so, it is common for there to also be anxiety and fear of the future. In the man who has had a difficult relationship with his own father, the challenge is how he can become so. There may also be feelings of competition towards the fetus. Societal expectations and uncertainty are additional stressors; many men are confused about what is expected of them during pregnancy (MENDES; SANTOS, 2019)

In primary studies and literature reviews, it has been pointed out that the follow-up of the father during pregnancy and/delivery has positive effects on the emotional relationship of the father with the mother and the newborn, increasing maternal well-being during delivery and although it does not affect mortality, it improves obstetric outcomes. For women, the presence of the father is valued, and greater paternal participation in the care of the newborn is observed when he is actively involved in the delivery activities by the health team (ANJOS & GEREMIAS, 2019).

The prenatal period is considered in the literature as a propeller for the development of paternal identity, in which the monitoring of the gestational process promotes the physical and psychological adjustment necessary to face the new role and deep reflections on the parental model that parents want for the future of their children. The collective discourse also revealed that, during the evaluations, the men were sure about their maternal and child health conditions, through the monitoring of auscultation of the heartbeat, uterine height and cardiac evaluations and techniques (MENDES; SANTOS, 2019).

Therefore, these processes allow a better understanding of the changes that occurred with the woman, obtaining information and reducing insecurity and anxiety resulting from doubts in the development of care. Thus, paternal participation in childbirth and puerperium can be determined by the different experiences lived during prenatal care, in which the monitoring of procedures such as ultrasound and fetal movements are positive, as they influence the acceptance of pregnancy, the recognition of paternity, and the strengthening of titles (ALVES *et al.*, 2021).

The inclusion of fathers in prenatal care favors access to nursing consultations, to meeting their demands and the form of exams and immunization, a proposal widely recommended by the Ministry of Health, based on encouraging the implementation of male prenatal care. The political strategy called "male prenatal care" aims to encourage fathers to

make frequent visits to health services in a preventive manner, developing a greater affective bond between him, his partner and his child, in addition to tracking infectious diseases and expanding access to health services.

5 RELATED FACTORS THAT INTERFERE WITH THE EFFECTIVE PARTICIPATION OF MEN IN PRENATAL CARE

Although the Ministry of Health recognizes the presence of a companion as one of the rights of women, some factors interfere directly or indirectly with male participation in prenatal care. The issue of lack of space, due to the pregnant woman's own decision to be alone, lack of knowledge and socioeconomic difficulties can be mentioned.

In prenatal care, the information made available in the consultations provides the partner with the conditions to understand the changes that occur with the woman during this period and also to guide them on the right to accompany the pregnant woman in prenatal consultations and childbirth, a right guaranteed by Law No. 11,108/2005 (FERREIRA et al., 2014; FIELDS; SAMPAIO, 2015).

However, it is still possible to find natural obstacles and resistance in this process, since it involves a change in paradigms and new ways of working, both on the part of managers and health workers and by a significant portion of the male and female population with regard to men's engagement in this issue (BRASIL, 2016).

Not every father is aware of his responsibility in the prenatal process. The lack of involvement and willingness to accompany in this stage is not always a matter of interest, but because it does not measure the importance of its presence in this process, This fact comes from values passed on by a patriarchal culture and society, predominantly sexist, which defends the maintenance of rigid gender roles for women and men. Often, including the perception that pregnancy and child care are exclusively the responsibility of women (BRASIL, 2016).

The hegemony of the patriarchal model is still maintained: the man is only the material and moral provider of the family, opposing the need for his presence in the pregnancy process.

6 FINAL CONSIDERATIONS

Paternal participation during the pregnancy-puerperal period is still poorly understood, because even if it is stimulated by health professionals, it also depends on cultural, family

and labor aspects. The participation of the partner provides emotional, economic, affective support and strengthening of the bond between the family, the community and the health professionals.

Despite the changes in the way men participate in consultations, there is still low adherence to health services. Therefore, it is of great relevance that health professionals are qualified about their partner's prenatal care, carry out activities related to men about fatherhood, promote actions and strategies to expand the opening hours of health units, so that they can meet the demand with quality and problem-solving capacity and clarifying that men also have rights to preventive practice, as recommended by PNAISH.

INDUSTRIAL ARCHITECTURE IN BRAZIL

A ARQUITETURA INDUSTRIAL NO BRASIL

ARQUITECTURA INDUSTRIAL EN BRASIL

 <https://doi.org/10.56238/sevened2025.036-036>

Marcelo Cachioni¹

ABSTRACT

To understand the development of industrial architecture in Brazil, it is necessary to know the historical process of industrial implementation, from the first and limited initiatives during the colonial regime to the expansion into diverse regions starting in the 19th century. After a long period of adaptation in rudimentary constructions, brought by foreign professionals and companies, Brazilian industrial architecture reflects, despite the chronological lag compared to European countries like England and France, the models and typologies established after the Industrial Revolution, in the functional designs and in the choice of construction systems and materials used in the works, as well as in the implementation of the factory layout within the territory. The text will address how the first manufacturing initiatives took place in Brazilian territory until the opening of the first factories, in different phases, from the period of prohibition, through the government incentives that benefited investors, to industrial development in the 20th century. Regarding the establishment of factories, the configuration of the factory space and the consolidation of the industrial typology as a new architectural typology in Brazil will be analyzed. Subsequently, the analysis will focus on the implementation of industrial establishments and the architectural styles employed in Brazilian industrial architecture, as well as an analysis of common construction techniques and systems, in addition to influential projects of national industrial architecture, whose authors stood out for the innovative solutions used in the buildings that properly characterize the modality of industrial architecture in Brazil.

Keywords: Industrial Architecture. Brazilian Industrialization. Industrial Typologies. Construction Techniques and Systems. Projects and Architects.

RESUMO

Para compreender o desenvolvimento da arquitetura industrial no Brasil, é necessário conhecer o processo histórico da implantação industrial, desde as primeiras e restritas iniciativas no regime colonial, até a expansão nas mais diversas regiões a partir do século XIX. Após um longo período de adaptação em construções rudimentares, trazida por profissionais e por empresas estrangeiros, a arquitetura industrial brasileira reflete, apesar da defasagem cronológica em relação a países europeus como Inglaterra e França, os modelos e tipologias estabelecidos a partir da Revolução Industrial, nos projetos funcionais e na escolha dos sistemas construtivos e dos materiais empregados nas obras, como também na implantação da planta fabril no território. No texto será abordado como se deram as primeiras iniciativas de manufatura em território brasileiro até a abertura das primeiras

RESUMEN

Para comprender el desarrollo de la arquitectura industrial en Brasil, es necesario conocer el proceso histórico de establecimiento industrial, desde las primeras y limitadas iniciativas durante el periodo colonial hasta la expansión a diversas regiones a partir del siglo XIX. Tras un largo periodo de adaptación en construcciones rudimentarias, introducidas por profesionales y empresas extranjeras, la arquitectura industrial brasileña refleja, a pesar del desfase cronológico con respecto a países europeos como Inglaterra y Francia, los modelos y tipologías establecidos desde la Revolución Industrial, tanto en los diseños funcionales como en la elección de sistemas y materiales constructivos empleados, así como en la implantación de la planta fabril en el territorio. Este texto abordará cómo se produjeron las primeras iniciativas manufactureras en territorio brasileño, hasta la apertura de las primeras fábricas, en diferentes fases: desde el periodo de la prohibición, pasando por los incentivos gubernamentales que beneficiaron a los inversores, hasta el desarrollo de las fábricas en el siglo XX. En cuanto al establecimiento de las fábricas, se analizará la configuración del espacio fabril y la consolidación de la tipología industrial como una nueva tipología arquitectónica en Brasil. La siguiente sección analiza la implementación de establecimientos industriales y los estilos arquitectónicos empleados en la arquitectura industrial brasileña, así como las técnicas y sistemas constructivos comunes. Además, se presentan proyectos influyentes en la arquitectura industrial nacional, cuyos autores se destacaron por las soluciones innovadoras utilizadas en los edificios que caracterizan la modalidad de la arquitectura industrial en Brasil.

1 INTRODUCTION

The study entitled "Industrial Architecture in Brazil" is part of the final report of the Post-Doctorate in Architecture and Urbanism with the Graduate Commission of the Faculty of Architecture and Urbanism of the University of São Paulo (CPG FAUUSP) entitled: "The architecture and industrial archaeology of the Central Mills and Power Plants in France and Brazil: recovery of the architectural memory of the Central Mill of Piracicaba", under the supervision of Prof. Dr. Beatriz Mugayar Kühl. The purpose of this research is to analyze the formation, development and consolidation of Brazilian industrial architecture, understanding it as a concrete expression of the economic, technical and social transformations that accompanied the process of national industrialization. It is based on the understanding that industrial architecture goes beyond the functional and technological dimension of factories: it constitutes a historical and cultural document, capable of revealing the relationships between territory, work, modernization and identity.

The proposed approach seeks to situate industrial architecture in the broader context of the country's modernization dynamics, showing that factory buildings are direct products of production processes and, simultaneously, agents of transformation of urban space. Factories and industrial complexes have contributed to shaping new landscapes and ways of life, establishing physical and symbolic landmarks in cities. In this sense, industrial architecture is understood as a specific form of expression of technical advancement and social organization, but also as an instrument for reading the urban and territorial history of modern Brazil.

Throughout the work, the historical path of Brazilian industrialization is described, from the colonial period, when manufacturing activities were prohibited, to the consolidation of the large manufacturing complexes of the twentieth century. Each stage of this path is linked to different economic and political contexts, such as the coffee cycle, European immigration, the advent of railroads and the industrial incentive policies of the governments of Getúlio Vargas and Juscelino Kubitschek. The main objective is to identify and understand the architectural typologies, construction systems, forms of implementation and technical agents that contributed to the constitution of industrial architecture in the country.

It seeks to demonstrate that, although marked by technological and financial dependence on European countries, Brazilian industrialization was able to generate its own architectural solutions, the result of a process of appropriation and creative adaptation of external models to local conditions of climate, materials and labor. Thus, national industrial

architecture is interpreted not as a mere reproduction of foreign paradigms, but as the result of a dialogue between tradition and modernity, between imported technique and regional constructive knowledge.

The research is justified by the conviction that industrial architecture constitutes a cultural heritage of high relevance, still little recognized in the field of preservation. Such buildings represent material testimonies of a period of profound transformations in the Brazilian territory, when manufacturing production began to order new forms of urban occupation and to redefine the role of medium-sized and inland cities. The factories, warehouses and workers' villages configure complex cultural landscapes, in which memory, technology and social life are intertwined.

Understanding this architectural heritage is essential for reading the process of national modernization and also for valuing the material expressions of work and production. In this sense, the study seeks to contribute to the expansion of the recognition and preservation of the Brazilian industrial heritage, affirming it as an important integral part of the collective memory and as a fundamental component of the urban, economic and cultural history of the country.

2 METHODOLOGY

The research was conducted through a historical-analytical approach, which combines bibliographic survey, documentary study and typological analysis. It is based on fundamental authors, such as: Santos (2006), Azevedo (2009; 2010), Maffei (1982), Padin (2009) and Rufinoni (2004), to reconstitute the context of industrialization and the architectural models that served as a reference for Brazilian factory constructions. At the same time, comparative readings of buildings and industrial complexes were carried out, considering the implantation, materials, techniques and formal language. This methodology allowed the correlation of the technical and spatial aspects to the territorial and social dynamics of each period.

With this approach, we sought to articulate history, technique and territory, treating industrial architecture not only as a product of engineering and economics, but as a symbolic expression of the country's modernization. Thus, the study proposes a critical reflection on the cultural value of the Brazilian industrial heritage and reinforces the need to integrate it, in a more systematic way, to the preservation policies and the construction of the national collective memory.

3 RESULTS

3.1 HISTORY OF BRAZILIAN INDUSTRIALIZATION

Since the beginning of the colonization process of the Brazilian territory by the Portuguese in the sixteenth century, Portugal's economic interests were related to the extraction of minerals and vegetable raw materials, such as brazilwood, and later to the acclimatization of sugarcane for export production. Thus, after a long period of prohibition on factory production, Brazilian industrialization officially began a century later than the Industrial Revolution, however, in the same period of implementation as Portugal, also backward compared to England and France.

Santos (2006) observes that the implementation of industries in Brazil has always involved political control, since the Portuguese colonial system dominated by British mercantilism, which did not accept initiatives that represented some competition in the market. Thus, the Brazilian economic subjugation meant the occurrence of an industrial architecture that was technically and chronologically outdated, in comparison with the development of the industrial system in England and the United States.

Authors dedicated to the study of industrialization establish periods or time frames to characterize different technical and sociocultural conjunctures, with each period representing a proposal for understanding the ruptures in the social and economic structure, as well as the type of energy and technical innovations used (SANTOS, 2006).

Azevedo (2010) understands the Brazilian industrialization process in four main periods, which make it possible to perceive the advances and setbacks in production, and also in industrial architecture. The first period, between 1785 and 1808, is known as the 'Prohibition' phase; the second period, from 1808 to 1930, is called the 'Implantation' period; the third period, between 1930 and 1956, is called the phase of the 'Brazilian Industrial Revolution'; while the fourth period, after 1956, is called the stage of the 'internationalization of the Brazilian economy'. The author also considers that, from the 1980s onwards, a process of deindustrialization began in Brazil.

The initial period, between 1500 and 1808, is known as the "Prohibition", because there was a restriction on the development of industrial activities in Brazil, with only small factories of spinning, footwear and containers for internal consumption being allowed, justified by the distance between Portugal and the colony. In this sense, Azevedo (2010) states that soon after the Portuguese discovered the Brazilian territory, an extremely open economy developed, oriented to the production and export of sugar to Europe, where a new

and respectable surge of urbanization was occurring, demanding greater demand for this product. For the author, the rupture related to the dominant functioning of the economy at that time is important, initiating the transformation of the subsistence economy and food assistance to the Kingdom, to an economy aimed at mercantile profit; and consequently integrating Brazil as a new production space (AZEVEDO, 2010).

On the other hand

the structuring of this sugar economy is already associated with the emergence and increase of conflicts of interest - namely, the trend towards monoculture, on the one hand, and the needs of diversified agriculture, on the other; the regulation of the export trade by the king and, with a tendency to oppose it, the liberal desire of the big merchants - which configures the capitalist dynamics that are beginning to emerge in other parts of Europe (AZEVEDO, 2010, p. 20).

The first isolated experiences occurred in the Northeast, however only with the implementation of the Captaincy of São Vicente, by its donee Martim Afonso de Souza, favorable conditions were created for the installations and proper functioning of the first mills on the south coast of the country. from 1532².

One of the first three sugar mills in Brazil - Engenho do Governador - was built in 1533, on the initiative of Martim Afonso de Souza, together with Jan Van Hielst, Francisco Lobo and Vicente Gonçalves, constituting the Sociedade Armadores do Trato³. It was strategically located at the foot of Morro Nova Cintra, to be supplied with water from the north slope by a channel that disappeared in a landslide. Later, in 1557 it belonged to Erasmo Schetz and Sons, from Antwerp in Belgium, when it was renamed São Jorge dos Erasmos (figure 267) and had its period of greatest sugar production in the place, until at least 1580. From the beginning of the seventeenth century, the mill suffered the effects of the decline of the sugar culture in Brazil, being under the administration of Schetz's heirs until 1603. However, around 1615, the mill would have been destroyed by a fire caused by the Dutch pirate Joris Spilbergen, reduced to ruins since then⁴.

² VOICES OF THE MILL. Available at: <<http://www.engenho.prceu.usp.br/vozes-do-engenho/>>. Accessed on 21 Jan. 2021.

³ Contrary to what is commonly thought, the Engenho dos Erasmos is the third built where the city of Santos is currently located. The first was the Engenho de Madre de Deus (1532), by Pero de Góes; and the second was the Engenho de São João (1533) by José Adorno, near Morro de São Bento (ENGENHO DOS ERASMOS (1). Available at: <<http://www.pimentel.jor.br/santos/fotos114.htm>>. Accessed on 21 Jan. 2021).

⁴ The ruins of the old mill were donated Octávio Ribeiro de Araújo in 1958 to the University of São Paulo, which restored the best preserved unit (LICHTI, Fernando Martins. **One of the first mills**. Available at: <<https://www.novomilenio.inf.br/santos/h0133g.htm>>. Accessed on 21 Jan. 2021 and ENGENHO DOS ERASMOS (1). Available at: <<http://www.pimentel.jor.br/santos/fotos114.htm>>. Accessed on 21 Jan. 2021).

In addition to the Erasmos Mill, Melo (2009, p. 9) points out that in 1534, six mills operated on the coast of São Paulo, rising to 11 units in 1557. However, in the first two centuries of Portuguese colonization, production and export farming did not prosper in São Paulo.

The development of sugar production in the North of the Colony led to the decline of Vincentian production, as its mills were reduced to four in 1585, and were deactivated at the beginning of the seventeenth century.⁵

The first mills implanted in the Northeast region were initially concentrated in two locations: in Pernambuco, from Olinda, developing to the south, to Penedo and to the north, to Goiana, going to Paraíba and Rio Grande do Norte; and in Bahia, from Salvador to the entire Recôncavo Baiano (Andrade, 2007, p. 15). The result of the sugarcane expansion is known as the "sugar civilization", as it determined the forms of implantation and development of the settlement of rural and urban centers in this region.

During the seventeenth century, the Captaincy of Pernambuco had a considerable production, in about 150 mills, representing most of the sugar production of the entire colony, enough to fill between 80 and 90 large vessels per year, from the port of Recife to Europe (Menezes, Muniz and Silva, 2012). Thus, since the sixteenth century, a production considered pre-industrial was configured in Brazil, in which the productive scale no longer refers to the small dimensions imposed by its previous artisanal character (AZEVEDO, 2010).

According to Hardman and Leonardi (1982),

[...] during the first three centuries of our history, industrial activities (here understood

⁵ QUEIROZ, Suely Robles Reis de. Some notes on the sugar plantation in São Paulo in the colonial period. *Annals of the Paulista Museum*, Volume XXI. São Paulo, 1967, pp. 112-117.

in the generic sense of the term) were practically reduced to the manufacture of sugar in the mills and to mining. The techniques used in both cases were quite rudimentary, with little difference between the process of making sugar and brandy in the sixteenth century and the beginning of the nineteenth century [...]. During the long colonial period, a series of other artisanal and manufacturing industrial activities were developed here, but all of them with an accessory activity, occupying a secondary role in the economy as a whole (HARDMAN and LEONARDI, 1982, p. 24).

In summary, the few primitive manufacturing enterprises were dedicated to extractive activities, with the function in the production chain, of supplying the raw material, that is, various ores and vegetables such as Pau-Brasil, as well as semi-processed agricultural products, especially sugarcane (SANTOS, 2006).

In the second half of the eighteenth century, some iron and fabric industries developed, and began to compete with the court trade, threatening to make the colony financially and politically independent, leading D. Maria I to extinguish in 1785, all textile manufactures in the colony, except for that of thick cloths, which were used by slaves and workers (AZEVEDO, 2010).

The second period, between 1808 and 1930, is called "Implantation", when the Portuguese royal family moved to Brazil, and Brazilian ports were opened to foreign trade, with a rate of 24% for imported products and 16% for the Portuguese. With the establishment of 15% for English products in 1810, local industrial development became minimal as a result of competition from imports from England, which predominated in the Brazilian consumer market. At that time, Azevedo (2010) recalls, slavery was still in force and there were few free and salaried workers to consolidate a consumer market. Furthermore, the investing elite of the coffee market was not yet willing to invest in industrial activity.

Considered the first factory installed in Brazil, the Real Fábrica de Ferro Ipanema (figure 268), was created by Royal Charter in 1810, starting to operate in 1811, located in the dense forest of Morro de Araçoyaba (current Ipanema National Forest), in Iperó, region of Sorocaba. "Europeans, especially Spaniards and Portuguese, at the head of indigenous people and mamluks, removed from ovens a pasty and incandescent mass that was taken to the mallet and transformed into bars" (TOMAZELA, 2007, A 29 apud PADIN, 2009, p. 48).

Figure 2

Real Ipanema Iron Factory in Iperó, SP

In addition to the Royal Iron Factory of São João de Ipanema, in the Province of São Paulo, the Prata Iron Factory (1812), the Morro do Pilar Factory (1812) and the São Miguel de Piracicaba Factory (1827) were also created, these in Minas Gerais (CORREIA et al, 2006).

Coffee growing became the main Brazilian economic activity from 1840 onwards, constituting a source of accumulation of the capital necessary to promote industrial activities (SANTOS, 2006), including those related to the export of coffee such as the production of cloth bags for the storage of beans.

In this sense, the textile industry received tax incentives in 1846 and, in the following year, raw materials in general also received it. However, the local industry was not yet able to develop in a country with a slave regime, with scarce availability of free and salaried workers, also representing a timid consumer market (PADIN, 2009).

Brazilian industry, dependent on the import of capital goods, mainly machinery, still had unqualified labor. In 1850, the Eusébio de Queirós Law prohibited the slave trade, causing important consequences for industrial development, especially the availability of capital, previously used in the purchase of slaves, in the industrial sector (AZEVEDO, 2010).

According to Padin (2009), Brazil's entry into the industrial market, with development of significant proportions, occurred only from the 1850s onwards, remembering that, in addition to Great Britain, even in 1880, the Industrial Revolution had not yet reached many countries, such as Germany and Portugal, which entered the industrial stage in 1870, and the United States during the years following 1860, achieving a firm structure only at the end

of the century⁶.

Santos (2006) considers that in São Paulo, the inaugural moment of its modern industrialization occurred in 1866, from the inauguration of the São Paulo Railway - SPR, the future Santos-Jundiaí Railroad, also a milestone in São Paulo's urbanization. Until then, coffee exports were carried out via the port of Rio de Janeiro, the capital of the Empire, from where coffee extended from the end of the eighteenth century to the Paraíba Valley of São Paulo in the nineteenth century. from where the product was sent to the main importer, the USA. However, the political and economic frameworks changed, elevating the capital of São Paulo to the center of capital, infrastructure and labor force and, later, the most dynamic Brazilian industrial center (SILVA, 1986; SANTOS, 2006).

Reis Filho (1990, p.6) describes the period between the 1860s and 1890s as the time of the establishment of the first large factories in the State of São Paulo, therefore before the occurrence of the great migratory currents. In that period, the textile sector was the one with the highest growth, partially favored by the growth of cotton cultivation, due to the lack of the American product in the market, while the Civil War occurred in the United States between 1861 and 1865. Thus, the North American conflict stimulated cotton production in the province of São Paulo since the 1860s and, in turn, the abundance of this raw material instigated its industrialization, and by the end of that decade, the first textile industries were already installed in the interior of the province and, in the capital of São Paulo, in the following years (PADIN, 2009; AZEVEDO, 2010).

Along these lines, Santos (2006) considers that the factories installed in Brazil reached the technical level defined from the First Industrial Revolution in Europe, only since the last three decades of the nineteenth century, still in the Imperial period. After the development of an economy basically supported by agriculture, mainly for the production of sugar and coffee, the industrialization of São Paulo was made possible by the profits obtained from the commercialization of coffee in the foreign market (AZEVEDO, 2010).

Dean (1971, p.10) points out that coffee production initiated the monetary economy, the first prerequisite of an industrial system. With the surplus money added to the export of coffee, fundamental improvements for industrialization were funded, such as railways, trams and electricity and gas networks, in addition to promoting social transformation.

⁶ FORBES, Robert James. Energy until 1850. In *The Invention of the Steam Engine*. São Paulo, 1972, p.73.

The coffee agroindustry, in full development⁷, needed labor, stimulating considerable European immigration, which brought new techniques of manufacturing production, being the first salaried (organized) labor force in Brazil. Immigrants established an effective consumer market essential to industrial development, in addition to a specialized workforce (AZEVEDO, 2010).

The immigration policy instituted by the government also boosted the coffee culture in the first republican period, with the demographic growth and productive capacity of São Paulo, in rural and urban areas, conquering a significant domestic market. São Paulo also asserted itself as a commercial and financial center of great influence, when a considerable part of the coffee elite began to reside in the capital, diversifying its business, investing in commercial and manufacturing activities, through Corporations, mainly in the textile and food sectors, also linked to the coffee complex (SINGER, 1977; SANTOS, 2006).

Maffei (1982, p.13-14), in turn, points out that 1870 was the year of the beginning of the implantation of industry in the State of São Paulo and divided the phases of Industrial expansion of São Paulo into five periods, comprising, respectively, up to the decade in which his research is inserted: first period, from 1870 to 1920; second period, 1920 to 1940; third period, from 1940 to 1955; fourth period, from 1955 to 1965; and fifth period, from 1965 to 1980. According to the author, the initial period consisted of the textile, leather and skin, wood, metallurgy, ceramics, chemical products, food, clothing and furniture industries.

In this context, the textile industry is considered by Arantes Santos (2011) to be responsible for the pioneering spirit of modern industry in Brazil. The first weaving company in São Paulo was the Companhia Industrial, founded in 1874 by Major Diogo de Barros. The factory employed 400 workers and had about 150 looms and a generator that produced electric lighting inside from 1880 onwards, allowing night work - a solution later adopted by the large factories in São Paulo (REIS FILHO, 1990, p.6).

Azevedo (2010) points out that the first industrial boom in Brazil occurred in the 1880s, when the number of establishments went from 200 factories in 1881 to 600 units in 1889, inaugurating the process of import substitution. Reis Filho (1990, p.6) also observes that:

[...] It was after 1889, with the establishment of the Republic, that it became simpler to create companies and multiplied the workshops and industrial facilities. From that moment on, small businesses, founded by immigrants, gained importance (apud

⁷ Funded by coffee, the School of Law (1830) was founded and, before the First World War, the schools of Engineering, Commerce, Medicine and Biology (Dean, 1971 in Padin, 2009).

PADIN, 2009, p. 50).
For Padin (2009) this idea

it comes from the fact that between 1890 and 1900 the city of São Paulo had its population composed of 50% immigrants and in some factories 90% of the workers were Europeans. In the first decades, however, the factories were created by the richest families, linked to mercantile activities and coffee production. Among the most important names are: Silva Prado, Aguiar de Barros, Penteado or Lacerda Franco, Rodovalho or Pacheco Jordão, Souza Queiroz and Souza Aranha. The first immigrants of equivalent weight then appeared at the end of the century: Matarazzo, Crespi, Scarpa and Siciliano (PADIN, 2009, p. 50).

However, at the end of the nineteenth century, while the Second Industrial Revolution was developing in Europe, as a result of the inclusion of scientific knowledge in industrial techniques, creating new technologies, Brazil was still a century behind, compared to industrially developed countries, due to the absence of significant foreign investments in industrial production, with exceptions in the sugar industry. until the end of the nineteenth century (SANTOS, 2006, p. 26; PADIN, 2009).

In the period between 1880 and 1930, the installation of light industries of non-durable consumer goods predominated, giving rise to Brazilian industrial capital, from national mercantile capital, directly linked to the agro-export sector. Santos (2006) considers industrialization as typical of the republican period, especially after the 1930s, when the agro-export economic model based on coffee cultivation went into decline with the crisis of the New York Stock Exchange, installed in 1929. This condition was accentuated due to the difficulties in importing industrialized products during the two World Wars, stimulating factory production to supply the domestic market, especially in Rio de Janeiro and São Paulo, and for export (SINGER, 1977; CANO, 1995; SANTOS, 2006).

Between 1920 and 1940, the second period highlighted by Maffei (1982) developed in different ways in the two decades. In the first decade, growth was slow due to the lack of a tendency towards the concentration and organization of associations controlling prices and production; while in the second decade, exports expanded and growth accelerated. It was in 1939, in this period, according to the author, that the value of industrial production exceeded that of agriculture by 30%.

The sectors that grew the most were cotton, cement and iron fabrics, among the sectors of execution of

mineral products, vegetable products, metallurgical, mechanical, transformation of non-metallic ores, wood and related products, paper and cardboard, rubber, vegetable oils and greases, hides and skins, pharmaceutical chemicals, hair and feathers, textiles, clothing and footwear, food products, beverages and stimulants, civil construction, electricity products, publishing and printing (MAFFEI, 1982, p. 14).

The Third Period, from 1940 to 1955, according to Maffei (1982) was marked by the Second World War, which hindered imports, directing the material possibilities to domestic production, with the objective of meeting the expanding domestic market.

For Azevedo (2009), the phase known as the Brazilian Industrial Revolution comprises the years from 1930 to 1956, marked by the Revolution of 1932 and by the internal policies of the Vargas government that operated changes in order to remove from the power of the State, the traditional oligarchies that represented agrarian-commercial interests. The federal government adopted an industrializing policy, promoting the replacement of immigrant labor by national labor, formed in states in the Southeast, such as Rio de Janeiro and São Paulo, Minas Gerais, and also in Rio Grande do Sul, due to the rural exodus resulting from the decadence of coffee, in addition to migratory movements from the Northeast. The author reinforces that Vargas made investments in industrial infrastructure by implementing basic industry and increasing energy generation; even creating the National Petroleum Council - CNP, the National Steel Company - CSN, the Vale do Rio Doce Company and the São Francisco Hydroelectric Company.

Azevedo (2010, p. 16) points out that it was characteristic of many of the industries created after the First World War, to only assemble parts produced and imported from abroad, being subsidiaries of foreign headquarters. Later, at the beginning of World War II, growth slowed as a result of the impossibility of importing equipment and machinery, highlighting the importance of the Capital Goods Industry. "Despite this, our exports continued to be maintained, leading to an accumulation of foreign exchange. The national raw material replaced the imported one. By the end of the war, there were already industries with national capital and technology, such as auto parts."

While in the first decades of the twentieth century there was a predominance of the consumer goods industry, other types of industrial activity that required technological apparatus began to develop in the 1940s, such as minerals, metallurgy and steelmaking, including the production of steel by CSN from 1946 onwards, which expanded the industrial development of the country, as steel is the basis for several industrial branches (AZEVEDO, 2010).

Serious problems hindered Brazilian industrial development from 1950 onwards, such as the lack of energy⁸, low oil production and deficiencies in the transport and communication system. However, Azevedo (2010) points out that in the second Vargas government (1951-1954), developmental projects based on state capitalism, through public investments in the extinct Brazilian Coffee Institute - IBC, in 1951, in addition to the BNDES, among other agencies, left important subsidies for Juscelino Kubitschek's Plan of Goals, with the high cost of internationalization of the Brazilian economy (AZEVEDO, 2010).

Santos (2006) considers that one of the characteristics that best defines this historical moment is the use of Technology, that is, the incorporation of scientific knowledge into industrial techniques and processes, as well as the administration and organization of work. The invention of the combustion engine and the use of electric energy in machines made it possible to expand production capacity, in addition to the application of knowledge of modern Physics and Chemistry to the transformation process (SANTOS, 2006).

As a result, new productive sectors were asserted, such as petrochemicals and automobiles. According to Santos (2006) also

The Economy of Scale was set up, which, in the face of the phenomenon of accelerated urbanization, consolidated mass consumption and planetary coverage. Associated with mass consumption, the Cultural and Entertainment Industry emerged, applications of mechanisms and inventions related to the mechanical production of images and sound records (SANTOS, 2006).

The fourth period, from 1955 to 1965, according to Maffei (1982) is characterized by the manufacture of production goods: machinery, equipment, motor vehicles and heavy raw materials. New sectors of activities were created: automotive, plastics, heavy chemicals, petroleum products, petrochemicals, machinery and tools, heavy boilermaking, electronic equipment and household appliances.

In this sense, the fourth period, according to Azevedo (2010) is recognized as a phase of internationalization of the Brazilian economy, due to the policies of the Kubitschek government's Plan of Goals, which from 1956 onwards began to dedicate two thirds of the resources to stimulate the energy and transportation sectors. It was at this time that the road sector developed intensely and the production goods industry also grew, from 37% to 63% in relation to the consumer goods area, with reflection, mainly in the steel, metallurgy

⁸ According to Azevedo (2010), in order to correct these problems, the São Francisco Hydroelectric Company was founded, among others.

(automobiles), chemical, pharmaceutical, and shipbuilding sectors (implemented in Rio de Janeiro in 1958).

Azevedo (2010) points out that in this phase the internationalization of the Brazilian economy grew, based on the actions of multinationals, whose foreign capital was attracted by exchange, tariff and tax incentives offered by the government. However, the political crisis in the early 1960s, after the resignation of Jânio Quadros (1961), was prolonged by the political pressures faced by his successor, João Goulart (1961-1964), in the face of the economic reforms provided for in the Triennial Plan. In addition, political unrest and inflation, combined with a favorable international political circumstance, led the country to the coup d'état in 1964⁹ (SANTOS, 2006; AZEVEDO, 2010).

The fifth period, from 1965 to 1980, for Maffei (1982) was characterized by enormous industrial expansion with the doubling and diversification of production, with total opening of the economy to foreign capital, combined with the enormous investment of multinationals from Japan, the United States, Germany, Italy, France, Great Britain, Holland and Sweden.

In the military government, as for the economic model, there was not a break with developmentalism, but a peculiar stage of the process of industrial updating, which had been initiated by Vargas and remained in the Dutra and JK governments. The military continued to implement heavy industry and infrastructure, such as the production of electricity, steel, petrochemicals; necessary for the formation of sectors producing intermediate goods, consumer goods and capital, in addition to the opening of highways, in order to ensure the conditions for the expansion or growth of its business to the private sector (CANO, 1995; SANTOS, 2006; AZEVEDO, 2010).

After the initial recessionary period (1964-1967), the military government was strengthened related to the Latin American geopolitical context in the international circumstances of the Cold War, which guaranteed to associate national and international capital, sponsored by the public power with various actions that created public and state-owned companies and also encouraged the installation of transnational corporations with investments in infrastructure (transport, telecommunications and energy). Such actions¹⁰ were translated into the 'Brazilian Miracle' or 'Economic Miracle' (1968-1974), as a product of

⁹ The coup triggered a military dictatorship in 1968, with Institutional Act No. 5 (AI 5), which closed the National Congress, ending legislative activities. The military regime only ended 20 years later, economically and politically exhausted, like the developmentalism that sustained it (Santos, 2006).

¹⁰ The 'Brazilian Miracle' is related to two plans drawn up during the military governments with the objective of guiding economic development and correcting imbalances in the adopted model: the first and second National Economic Development Plan (PND I and PND II), implemented from 1972 to 1979 (SANTOS, 2006).

economic restructuring (CALDEIRA, 1997 in SANTOS, 2006, p. 30).

Maffei (1982, p. 22) informs that in the 1970s

There was a great expansion of some sectors that until then were implanted in the Greater São Paulo region, and with the need for expansion created new factories outside the Rio-São Paulo hub, São José dos Campos, Pindamonhangaba, Taubaté and other municipalities in the Paraíba Valley. They also expanded to the coast, along the Anchieta-Imigrantes complex and occupying the remaining areas of the municipalities of São Bernardo, Santo André, São Caetano, Diadema and Rio Grande da Serra up to the dams at the beginning of the Serra do Mar.

In that period, the durable and non-durable consumer goods industry expanded, with the production of sophisticated products such as airplanes, computers, calculators, microprocessors, as well as steel, iron, cement and oil. The export of manufactured products was also stimulated through government incentives. In 1979, exports of industrialized and semi-industrialized products surpassed exports of primary goods, such as agricultural products, minerals, and raw materials (MAFFEI, 1982; AZEVEDO, 2010).

Direct and indirect investments by foreign capital grew in Brazil, but this growth was proportional to the progressive indebtedness, causing a slowdown in the initial growth, added to the exhaustion of the authoritarian regime, with an inflationary process and external indebtedness (SANDRONI, 1999 in SANTOS, 2006, p. 31).

After a period of rising inflation, with the military already out of command of the State, the Cruzado Plan, which although it had implicit electoral objectives, was launched on February 28, 1986, by the Sarney government, and was characterized as an attempt to promote the growth of Brazilian economic production without going through the painful fiscal and monetary austerity that would be the trademark of the Real Plan. in 1994. However, the customs protection that existed at the time, restricting imports, led to shortages, especially of basic necessities, promoted by oligopolized sectors of the economy, which condemned the economic plan to failure, despite their policy of keeping the exchange rate frozen and, with the real interest rate low, the GDP had experienced an unprecedented bubble of internal consumption in its history (AZEVEDO, 2010).

According to Azevedo (2010), the adjustment of public accounts after the Real Plan and the adoption of political and legal measures to support micro and small industry, as well as the entry of foreign capital attracted by the privatization programs of state-owned companies, made venture capital investment in the industrial sector attractive. The author

considers that the desired stability in the rules of the economy during the mandates of Fernando Henrique Cardoso and the decision of his successor, Luís Inácio Lula da Silva, to maintain the same rules of the economy also contributed to this (AZEVEDO, 2010).

3.2 INDUSTRIAL TYPOLOGIES IN BRAZIL:

From the industrialization process initiated since the Industrial Revolution in Europe, new architectural typologies were developed with the aim of meeting the needs of the new factories. In Brazil, the first initiatives followed the traditional patterns arising from the old manufacturing facilities, until there was a need to import large machinery, which brought with it the requirement for adequate projects for the construction of manufacturing buildings according to the various production chains.

With regard to the typological analysis of Brazilian industries, there is a great variety of factory types that distinguish them in time and space. Arantes Santos (2011) recognizes as conditioning factors for the development of industrial buildings, the political, economic and technological moments, in terms of the priorities of a given time and the conditions that the country offered for technological innovation (Arantes Santos, 2011).

As for the typological aspects, according to Hardman and Leonardi (1982), it is possible to recognize two precursor typologies of industrial architecture in Brazil, which served as a model for the construction of several manufacturing centers in the territory of São Paulo. The first typology developed was called 'Brazilian colonial', in which the façade is configured in a similar way to that of a large farmhouse for the production of sugar or coffee, characteristic of the first mills.

According to Azevedo (2009), the configuration of the primitive sugar factories in Brazil was basically the result of technological factors of production, which did not show much variation throughout the colonial period. As an example, the Engenho São Jorge dos Erasmos, one of the first three built in Brazil in 1533 which, according to Luís Saia's report to the DPHAN in 1966, had an architectural design of the Azorean model, of the real type (powered by water), with successive platforms to overcome differences in level, with porch access, and all facilities arranged below the same roof, in an agglutinated party¹¹. Saiah's hypothesis (1966) is confirmed in a document dated 1548, belonging to the 'Archives

¹¹ It was donated in 1958 to the University of São Paulo (CONDEPHAAT. *Ruins of the Engenho dos Erasmos*. Available at: <<http://condephaat.sp.gov.br/benstombados/ruinas-do-engenho-dos-erasmos/>>. Accessed on 21 Jan. 2021).

Généraux du Royaume de Bruxelles'¹² and, translated by prof. Eddy Stols, about this device:

[...] a very large house of 6 flights and a slave quarters with a blacksmith shop, all provided with bastions, and also two houses covered with tiles, very good and strong [...] all these houses rise at one height and all together and close together in such a way that no farm is so strong for the opposites¹³.

About the operation of the primitive São Paulo mills, archaeological records found at the site of the Engenho dos Erasmos, such as the stone millstone and the shapes of sugar loaf are the main remaining evidence, according to archaeologist Margarida Andreatta, responsible for the excavations¹⁴.

The millstone is a wheel about one meter in diameter that made the axles rotate with which the sugarcane was crushed to obtain the juice. It was driven by animals or slaves.

Another important piece for the historical reconstruction of the mill are fragments of the sugarloaf molds, which the researchers are trying to reconstruct. These molds - cones with a hole at the end - received the boiled sugarcane juice and stored it for 45 days, after which the 'bread' (block of hardened sugar) was removed. The 'bread' was cut by the slaves so that the 'noble' parts of the sugar - intended for export - were separated from the part that mixed the sugarcane bagasse and impurities - intended for the slaves' food. The noble part of the 'bread' was lighter and was deposited in the top layer of the sugar block. At the bottom, darker brown sugar was deposited¹⁵.

As for the installations, a niche embedded in one of the walls indicates the probable location of the chapel of the mill; five stone thresholds, one of which has marks in the shape of a half semicircle, indicating the movement of the doors of one of the rooms of the probable house of the lord of the mill. Also, in the remaining walls, there are vertical rectangular holes - the 'arrows' that served so that the occupants of the room could observe occasional external threats and shoot enemies without being hit by those who were outside¹⁶.

The Engenho dos Erasmos is considered the only remnant in the world of the Azorean-style mills, coming from the Azores Archipelago, where the Portuguese developed their sugar

industry. In comparison, the northeastern mills, after that of the Erasmos, built their buildings separately for each function, in a typology specific to the Brazilian mills¹⁷.

The architecture of the buildings did not undergo major changes until the imperial period, when, from the incorporation of new construction techniques, the introduction of the steam engine and new purging processes, the area and the floor shape of the manufacturing spaces underwent some changes, with the adaptation to the new productive capacity of the mills, although the architecture of the traditional mill was not essentially altered (AZEVEDO, 2009).

Azevedo (2009) cites as an example the Bahian mills of the first half of the nineteenth century, whose main architectural characteristic is the factory in the shape of a shed, with a rectangular plan configured by three or more naves, covered by only one hipped or four-pitched roof, which is supported by masonry supports or pillars. The central nave was generally supported by wooden scissors with a span of up to 12m, while the lateral ones were supported by beams or half-scissors, overcoming spans of up to 6m. In addition

Many factories had balconies on one or two sides of the shed. It is worth mentioning that these constructions appeared in the Recôncavo as early as the eighteenth century, but only became widespread in the following century. The scissors in the central span were generally of the pig yoke type, formed by two legs connected at mid-height by a tie rod. The thrust produced by these imperfect scissors was absorbed by the side ships (AZEVEDO, 2009, p. 117).

Also in Bahia, most of the mills located in the Jaguaripe River basin have an integrated party, with the big house and the factory in the same construction. However, in other cases, all the factory functions are brought together in a single space and the mill house remains isolated, in many cases, also fulfilling other functions (AZEVEDO, 2009).

The sugar production facilities were divided into two or even three independent buildings where milling, cooking and purging were carried out, since the sixteenth century. Azevedo (2009) understands that apparently the solution with the milling house and boiler together and the separate purge house predominated, whose scheme prevailed in the nineteenth century, in the traditional sugar production area of the Recôncavo Baiano, and generally, the two constructions were arranged parallel to each other or forming an 'L', when combined.

¹⁷ FOLHA AGENCY. *Dutch pirate destroyed mill.* (1996). Available at: <<http://www.pimentel.jor.br/santos/h0133f.htm>>. Accessed on 21 Jan. 2021.

Azevedo (2009) highlights the introduction of the in-line furnace, ending in a chimney, known as the Jamaican train¹⁸, among the modernization elements that influenced the reformulation of the factory space in the nineteenth century:

This new type of furnace, in addition to the advantages it brought in the broth cooking stage, contributed to the reduction of the area of the old milling house and boilers, enabling better working conditions and compatibility with the purging activity, since it did not emit as much smoke and heat. Due to the ease of location, compared to previous furnaces, the equipment also allowed greater flexibility of the internal space (AZEVEDO, 2009, p. 120).

Steam¹⁹, which replaced the water wheel and animals as a driving force in the first half of the nineteenth century, is considered another important element introduced in traditional mills, serving mainly to drive the mills and as a heat transfer vehicle for the cooking of the juice. Its installation initially occurred in the milling houses, not requiring the reformulation of the factory space (AZEVEDO, 2009).

The spatial configuration of the mills was linked to the sugar manufacturing process, which basically consisted of three main stages: sugarcane grinding, juice cooking and purging, and each stage of sugar production was reflected in the architecture of the factories, specifically aimed at making sugar production viable; while the main house fulfilled the function of housing and the church, of a space of religious worship (MENEZES, MUNIZ and SILVA, 2012).

In addition to the traditional built complex, the mills had very complex structures, involving various functions related or not to sugar production. In this sense, sugar began to be produced in the mill - the building that housed the mill - responsible for extracting all the juice from the sugar cane and in the boiler house, where the juice was cooked (Menezes, Muniz and Silva, 2012).

Apart from the mill itself, several other buildings participated in the manufacturing process, such as the purge house, where the molasses resulting from the cooking of the broth rested for several days, until it was transformed into sugar. For the operation of the mill (figure

¹⁸ At the beginning of the nineteenth century, the Cuban sugar manufacture expanded the Jamaican train by adding two or three clarifiers, consisting of large cast iron vessels (1.75 m to 2 m in diameter), where the sugarcane juice was heated, without boiling, and lime was added for clarification. In the system, the solid elements of the juice were separated from the liquid by decantation (FRAGINALS, Manuel Moreno. *O Engenho. Cuban Sugar Social Economic Complex*. v.3. p. 215).

¹⁹ To obtain a vacuum in the closed cooking pans and in the equipment for drying the sugar, the pneumatic device patented by John Hagnes (FRAGINALS, Manuel Moreno. *O Engenho. Cuban Social Economic Complex of Sugar*. v.3. p. 215.).

272), it was necessary to have the support of pottery, carpentry, carpentry, among others, in appropriate places. As well as warehouses, to preserve equipment and the sugar produced, as well as sugarcane bagasse, used to feed the furnaces (MENEZES, MUNIZ and SILVA, 2012).

The banguê-type mills were moved by human or animal traction (trapiche mill) or by water wheels (royal mill). They produced brown sugar (demerara), which was then subjected to a bleaching process using clay, being destined for export. On the other hand, the mills that produced rapadura for the domestic market were called contraptions²⁰. According to Coelho de Souza (1970, p. 37; 38):

In the Banguês, at harvest time, the activity is intense. The reeds, brought by the carreiros in their oxcarts or by the money changers in their donkeys, go to the wooden mills. The juice, collected in large tanks, is taken to the boilers to be cooked over a raw fire. It goes, after cleaning, to the copper pots where it is thickened and beaten. Taken to the purging house, the molasses is placed in clay, wood or iron molds that, placed on perforated boards, let the honey drain that can be used for the manufacture of sugar de retame, or for the distillation of brandy in copper or clay stills.

In this way,

This produces an inferior type, raw sugar, which can be dried or molasses, purged, brown or retam. They are the same processes, the same routine and backward

²⁰ MUSEUM OF THE UMA. **Engenhos**. Available at: <<http://www.museudouna.com.br/engenho.htm>>. Accessed on: 21 jan. 2021.

methods that, through centuries, still persist in the primitive sugar industry of the Banguês. The decadence of these mills was not long in coming, overcome by the ever-increasing technique and industrialization (COELHO DE SOUZA, 1970, p. 37).

Beyond the Banguês

Others work, moved by water, with the three variants: "cupbearer", "covilhete" or "half cupbearer" and "rasteiro", depending on the place where the liquid falls on the wheel of the mill. Finally, the steam engines. In general, in the humid Northeast the colonial "banguês" and the large modern mills coexist (COELHO DE SOUZA, 1970, p. 37).

As for the housing segment, the owner of the mill and his family lived in the main house (or used it in seasons), which fulfilled the political and administrative function of the factory complex, in addition to being a symbol of the power and authority of the plantation owner (figure 274). Azevedo (2009) believes that it is possible that the older mill houses were very simple, since most of the investments were intended for the manufacture of sugar (AZEVEDO, 2009).

The enslaved labor lived in slave quarters and there were also houses for salaried employees. According to Simonsen (2005, p. 118), depending on the size, the mill could be similar to a small village, with the displacement of a large number of people to a given region, favoring the population increase in Brazilian lands based on its growth.

The mill represented a true village, requiring the use not only of many hands, but also the necessary lands of sugarcane fields, bush, pasture and supplies. In fact, from the mill house, the house of housing, slave quarters and infirmaries, it was necessary to have about a hundred settlers or slaves, to work in about twelve hundred massapê tasks (of nine hundred square fathoms), in addition to pastures, fences, vessels, utensils, iron, copper, oxen and other animals.

In São Paulo, in the first phase of installation classified by Maffei (1982) between 1870 and 1920, the manufacturing facilities were still small and rudimentary, configured as small workshops.

As the space requirement due to the equipment was small, and they did not have problems of pollution or excessive noise, they worked in mansions, which were 2-story buildings with the same solution used for commercial houses, that is, at street level the workshops worked and on the upper floor, the office and sometimes, the owner's house, as is the case of the National Hat Factory on the street where Ladeira do Ouvidor is today, in the historic center of São Paulo, and the Schritzmeyer and Co. Hat Factory, on Quirino de Andrade Street, which began its activity in 1853 (MAFFEI, 1982, p. 28).

Following the European model of the first modern industries, recurrent to the already established, of a residential nature, simplified and adapted to its scale and the operation of the machinery, generally for factories founded in the Empire, the textile factory installed in buildings similar to rural manor houses (SANTOS, 2006). It had cotton cultivation on its own land, and manufacturing was configured as a kind of extension of agricultural activity with industrial capital originating from farmers, such as: the São Luiz Factory (figure 276) in Itu²¹ (1869) and the São Bento Factory in Jundiaí²² (in the period between 1874 and 1908, prior

²¹ The São Luiz Fabric Factory in Itu was the first steam factory in São Paulo and the second installed in the country, with machinery from the USA and England. Built in three distinct moments, the first part has colonial characteristics on the façade. The second, in greater proportion, added classicist elements such as the full arches; while the third part was built following the Manchesterian model (ESPAÇO FÁBRICA. Available at: <<https://espacofabrica.com.br/>>. Accessed on 26 Jan. 2021).

²² Companhia Fiação e Tecidos São Bento S/A was the first weaving company in Jundiaí, founded by Antônio de Queirós Teles as Companhia Jundiahyana de Tecidos e Cultura S/A, in 1874, being the first industry in the city, which became the national center of the fabric industry in the first half of the twentieth century. and name

to the reforms and expansion that correspond to the control of the company by French bankers) and the Votorantim Factory (Cachioni, 2013).

Another industrial typology found in the Brazilian territory, according to Hardman and Leonardi (1982), is the one known as 'British Manchesterian' (factories created at the beginning of the twentieth century): in this pattern, the typical façade of exposed masonry, sober and heavy structure and symmetry of planes was common, presenting a modern system of factories fully implemented and manifesting the separation of agrarian capital and subordination to international capital (FAUSTO, 1977).

In this way, the 'Manchester factory system', characterized by the concentration of a productive mode in a single place, became the most expressive organizational model, as it provided the conditions for technology to become the priority element of capitalist accumulation, responding more adequately to the needs of the market (DECCA, 2004, p.70).

Miranda (2003) observes that varied typological solutions were built in the Brazilian industrialization in formation, in the early decades of the twentieth century: horizontal buildings for spinning and weaving; or vertical parts, for mills and grain processing plants. The implementation of these factories varies between peripheral to the lot or in line, with a program organized in only one building or in parts, and can be structured in iron, brick or concrete, whose lighting was usually provided by side openings with the help of *sheds*, skylights and lanterns (MIRANDA, 2003).

changes (S/A Industrial Jundiaense, São Bento, and Têxtil L'Affit S/A, ended its activities in 1989 (TECELAGEM SÃO BENTO. Available at: < https://pt.wikipedia.org/wiki/Tecelagem_S%C3%A3o_Bento>. Accessed on 26 Jan. 2021).

According to Miranda (2003), most of the factories built until the First World War were stripped, with modular markings on the structures, or a few frames with o'its and platbands. For the author, in the case of spinning and weaving, mainly, there are clear English and North American influences, disseminated through industrial catalogs of the early twentieth century, which suggested standardization of façade treatment solutions and spatial arrangements for floor plans, where the machinery would be installed. "In this picture, 'Manchesterian' influences are observed, where the brick was the seal and also the finishing of the building" (MIRANDA, 2003, p. 27).

In this line, according to Maffei (1982) the projects executed followed calculation standards and American projects, and the assemblers of metal structures copied American or English drawings, repeating without any alteration, structures made in England more than 50 years ago. Still, Miranda (2003, p. 30) states that

The organization of the volumes took place according to production: in line, in the alignments of the land with the central courtyard or even another structure of occupation of the lot, but characteristics such as free plan, modulation, high ceilings and standardization of the openings were almost constant. The vast majority of buildings of this period were defined in pavilions in sheds, with one or two floors structured in iron and perimeter walls of masonry.

Examples of this type of influence are the Nossa Senhora da Ponte de Sorocaba Factory (1881), the Votorantim Factory (1893), the Mariângela Factory of São Paulo (1907), the Società Per l'Expostazione e Per l'Industria Ítalo-Americana de Salto - Brasital²³ (from the expansion and transfer of the corporate name to this firm in 1904); the São Bento Factory after association with international financial capital in 1908; and the Francisco Matarazzo Industries in Água Branca in São Paulo (1920)²⁴, Santa Rosália Spinning and Fabric Factory (figure 281) in Sorocaba (1890), Santa Adélia Factory (figure 282) in Tatuí (1908), and Crespi Cotonificio (1897), among others (MIRANDA, 2003; CACHIONI, 2013).

²³ Brasital was formed by the merger of the old textile mills Jupiter (1895-97) and Fortuna (1898), and the paper mill (on the left bank of the Tietê River) purchased by the Italian company 'Società Ítalo-Americana per Importazione e Esportazione' in 1904. Its mills also boosted the industrial profile in the city. The Italian-American Factory was renamed Brasital, by combining the names Brazil and Italy, in 1919 (Valderrama and Oliveira, 2008).

²⁴ Indústrias Reunidas Francisco Matarazzo in Água Branca in São Paulo. In the early 1920s, they diversified the group's production, until then concentrated basically in flour and fabrics, in Brás. The railway branch integrated into the industry project improved the production transport system. Little remains of the old factory, as many buildings were demolished or abandoned, leaving practically the Boiler House (<http://www.ipatrimonio.org/?p=137#!/map=38329&loc=-23.525214999999996,-46.678043,17>).

Miranda (2003) informs that mills and silos, industrial types very common in Brazil, were built in smaller proportions than their North American counterparts, since the flour was still mostly imported. Between the end of the nineteenth century and the beginning of the twentieth century, based on foreign machinery, the activity of the mills often determined that their project was also carried out by foreign technicians, as well as in the central sugar mills. For this reason, the author points out that European standards used in the construction of mills adapted to Brazil were common, such as the 'Manchesterian' pattern, which is common in English factories, with facades in exposed brick masonry, a sober and heavy structure, with symmetry of planes (MIRANDA, 2003, p. 30, 31).

The acquisition of machinery from European companies was often accompanied by the assembly project of the factory, which also included the design of the building carried out

by production engineers who designed the plan of the building, in a functional character, following the established typology, and the facades according to models of treatises by authors such as Blondel.

Generally, according to Miranda (2003, p. 31) the mills and grain processing mills were built in a multi-plant system, with an external structure in brick masonry that is reduced as the efforts decrease with the elevation of the pavements.

The internal grate was made of iron pillars and beams with wooden interfloors, since this material was at the time more efficient in drying grains. Facades often had a modulated marking of the masonry reinforcement and the standardized openings in iron. The internal organization was basically divided into three zones: pre-cleaning and cleaning (where the silos and grain elevators were) and the milling sector, always imposing vertical conceptions of party.

As examples of this industrial typology, the author cites the Antonina Mill in Antonina - PR, the Rio-Grandense Mill in Porto Alegre - RS and the Rio-Grandense Mill in Rio Grande - RS (MIRANDA, 2003).

Thus, from the final decades of the nineteenth century, through the architecture produced by the factories, the constitution of a cultural landscape typical of the industrial environment is identified in the Brazilian territory. Correia (2010) points out that in this period, the manufacturing centers became important expressions of Brazil's transformation into an industrial society:

not only because of their origins, uses, functions and social conflicts, but also because of the formal characteristics that many of these places have assumed when referring to values, materials and symbols of the manufacturing world. In the architecture of some of these villages and manufacturing centers, a typically industrial aesthetic emerged, based on notions of economy, efficiency, utility and functionality (CORREIA, 2010 apud CACHIONI, 2013, p.464).

According to Santos (2006, p. 26), as a result of the creation of the assembly line by Henry Ford in 1912 and the incorporation of scientific knowledge into factory production and management, profound transformations occurred in industrial production, which required greater performance of the industrial space. In this sense:

Horizontality was necessary to house machines and assembly lines, extensive and sequential due to rationalization, which implies the economy of displacements. It also needed vast constructions for storage (raw materials and products), control and

administration. Mechanization and the use of electricity have increased the production systems and the internal conditioning of the buildings, making it possible to break with the traditional typology, the factory of warehouses with shed roof. [...] The factory of rationalist design, ground floor or floor, with a flat roof, transparent or even totally closed with artificially controlled lighting, humidity and temperature is established.

In addition

The administrative sector was expanded, which, like the new 'utilities' (synthetic raw materials and packaging equipment), required specific facilities, as well as social services (the 'facilities'), such as medical care, housing, health and leisure for employees (SOBRINO, 1996 in SANTOS, 2006, p. 26).

The factories of the Second Industrial Revolution required more space as a result of the increase in technical production capacity and the international proportions adopted by the markets. With the use of metal structures and reinforced concrete, large spans became generalized with continuous and versatile spaces in open plan, allowing varied arrangements (SANTOS, 2006). However, the incorporation of the technical standards typical of this phase in Europe and the USA only occurred again with a delay in Brazil, more than 50 years later and

[...] we began it between 1933-1955 in a restricted and incipient way and in a more decisive way in the periods 1956-1962 and 1968-1980, when we completed the installation of the sectors producing durable consumer goods, intermediate goods and capital (CANO, 1995, p. 23 apud SANTOS, 2006).

Moreira (2007) points out that these models were initially disseminated at the national level, through the importation of the machinery necessary to install the first factories in the country. However, the author considers that difficulties in carrying out the construction of the first factory buildings, related to the scarce guidelines and specifications for the installation of those enterprises, combined with the lack of specialized labor and the lack of the necessary means of transportation, often made the installation of factories in Brazil unfeasible (MOREIRA, 2007).

According to Maffei (1982), in the 1920s, based on the construction of large-scale industries and the diversification of the type of product, industrial buildings in São Paulo began to be settled in remote neighborhoods, such as Brás, Belenzinho, Água Branca and Mooca, which were transformed into areas with characteristics of industrial use accompanied

by low-income labor, especially Italian, Spanish and Portuguese immigrants. The first buildings built with the objective of housing equipment and machines were characterized as large sheds where more than 200 workers worked, and due to industrial requirements, they had spans of more than 15 meters and a ceiling height of more than 6 meters. The author points out that most were exposed masonry walls, with small side windows for lighting and roofing with wooden scissors and imported French tiles.

At the end of the 1920s and during the 1930s, with the importation of equipment for the electrical, metallurgical and weaving industries, in addition to the injection of English capital, imported metal structures were installed, constituting the main part of the industrial sheds, usually in type I laminated profile or two-inch iron profile lattice pillars, welded or screwed. Maffei (1982, p. 30) points out that

The roof structure was made of metal tresouros, in welded or screwed iron profile, shed type, with a roof of imported slate tiles. Some roofs, as in the case of metallurgical industries, a type of ventilation was used with a lag in the roof, forming a lantern. The side closure was made with a brick wall up to the roof, following the design of the roof.

The sheds then formed a set very similar to the English industrial complexes of the mid-nineteenth century, with large brick chimneys (MAFFEI, 1982).

Only in the 1940s, after the installation of large steel mills, such as CSN, did metal structures begin to be produced in Brazil. In the 1950s, with the implementation of auto parts industries and vehicle assembly plants in the USA and Germany, the projects of Brazilian buildings were copies of those built in the USA in the 1930s and 1940s, transferring the machinery, equipment and design of the buildings to São Paulo. Thus, according to Maffei (1982, p. 30),

[...] in the landscape of the Presidente Dutra Highway or Via Anchieta, the large metal sheds, with lateral closure and roof in ficrocement tiles or corrugated metal sheets, and the façade facing the highway, in red ceramic brick masonry up to the top to hide the roof and give it a rectilinear, horizontal shape. This type of architecture is limited by industrial companies with national capital, aiming to have the same status as the industries of multinational groups.

According to Maffei (1982), the only project of that period that escaped the standards of imported warehouses was the Duchen Factory, at the beginning of Via Dutra, designed by Oscar Niemeyer, using concrete arches and slabs.

In the 1960s, Maffei (1982) informs that the possibility of using new materials, in addition to the competitive price of concrete, allowed new proposals for structures for industrial warehouses in aluminum, concrete shears, precast concrete, among others. In the 1970s, new materials, solutions and construction techniques were consolidated, when sophisticated industries of electromechanical and electronic equipment were built that needed pressurized or air-conditioned sectors, as well as pharmaceutical or chemical industries, which introduced in the country the "sealed factories", which did not need natural ventilation, adopting a flat roof with electromechanical ventilation.

3.3 THE IMPLEMENTATION OF THE BRAZILIAN INDUSTRIAL ESTABLISHMENT:

Like the European factories, Brazilian industrial establishments were implemented in various ways in the most varied territories, according to the manufacturing requirements, mainly in relation to watercourses and the supply of raw materials and, later, in proximity to the railways.

Regarding the implementation of the productive space, Santos (2006, p. 18) proposes morphological categorization distinguishing three architectural configurations of industries: isolated works, industrial complexes and factory complexes. The author identifies as an "isolated work" the monospatial manufacturing unit where all the equipment, stages and transformation activities are in a single environment in the building - isolated works typical of the eighteenth century. The "industrial set" is characterized by the grouping of buildings, according to the need to dismember activities into specific buildings, determining the grouped organization according to a product or the planning adopted for its production, involving constructions for concierge, warehouses, offices, workers' village, among others. Finally, more recently, the "factory complex" corresponds to the gathering of manufacturing groups for reasons of a corporate or technical nature (equal or complementary raw material), often formed by different companies, manufacturing processes and products, recurrent in modern manufacturing units (SANTOS, 2006).

The geographical space particularly offers support to the history of Brazilian factories with information referring to the most prosperous places, such as the capitals and more developed cities. In this sense, initially the factories were located in areas far from urban centers, mainly due to the generation of energy, which required the construction of buildings in the vicinity of water resources, whose situation has been maintained since the invention of the steam engine in 1776, but allowing the proximity of industrial activities to the cities

(ARANTES SANTOS, 2011).

In the first industrial experiments carried out in colonial Brazil, there is an archaeological record proving that the Engenho de São Jorge dos Erasmos in Santos was formed following the Azorean model, with all its facilities arranged in a building, in an agglutinated part, configuring a morphology characterized as an isolated work. Still as isolated works, the first experiences of installing sugar mills in the Brazilian pre-industrial period were practiced. According to Gomes (1996, p. 118) the proximity to water resources represented an important conditioning factor for the location of the mills.

From a more organic implantation, the buildings of the mills were arranged on the ground in a more rational way, probably following French models. As all arrangements and buildings were always independent of each other, the construction systems were not necessarily the same for all units of the same mill. Of the set of buildings that made up the mill, four stand out for their permanence: the *mill* itself, also called *the factory* or *bush*, the *main house*, the *slave quarters* and the *chapel*. The latter was always built with the most durable materials - stone or brick masonry - indicating its symbolic value to overcome the vicissitudes of the plantation owners. All other buildings could be temporary and this was shown even in the materials with which they were built.

For Gomes (1996, p. 118) "The image, therefore, of fortresses that was sought to spread in analogy with the big houses of the Pernambuco mills applies only to a few and exceptional cases".

For the industrial complexes, the proximity to the water resources remained a condition when the central steam-powered mills were installed, whose mills depended on the channeling of water from tributary streams of the rivers that also served as a means of transport to transport the production. In the same way, for the pioneer weaving mills, it was also important to implant them in the vicinity of river waterfalls, where hydroelectric plants could be installed to supply energy for the electric looms.

With respect to the implementation of the industry, it was common to have a close link with the railroads, with facilities subordinated to the need for railroad branches for loading and unloading. According to Rufinoni (2004, p. 52) "[...] the whole set, finally, shows the formation of a complex productive network, where the existing urban structure was developed in response to the needs of the industrial complexes installed there, in full activity in the first decades of the twentieth century" (RUFINONI, 2004, p. 52).

In the city of São Paulo, railroads were installed on the banks of the rivers, with the objective of minimizing difficulties caused by the relief of the plateau where the urban fabric

is established. Padin (2009, p. 53) considers that, for this reason, many plots of land where industrial buildings were installed are in areas with humid soil.

In many cases, such as in the warehouses of Indústrias Matarazzo, located in the Jaguaré neighborhood, in São Paulo, the foundations were executed with pine piles. Constantly moistened wood does not rot or lose its mechanical resistance properties (PADIN, 2009).

These areas in the strip of floodplains and river terraces, which are bordered by the railroad roads, were much sought after by commercial establishments, which intended to maintain their headquarters in the capital of São Paulo. At first, the industries were attracted by the proximity to the railway stations and, later, they began to occupy the intermediate stretches intensively, where large warehouses or warehouses were also installed in large lots (BARDESE, 2011, p. 33).

Rufinoni (2004) points out that many of the large lots determined by the occupation of industrial complexes still remain, in areas where the development of other activities caused the division of lots and the dismemberment of industrial complexes, whose original characteristics are still perceived. "The 'block-lots' formed by the large industrial complexes, even if officially dismembered among several owners, still mark the landscape as continuous blocks - often compact - of built mass" (RUFINONI, 2004, p. 43).

On the other hand, workers' villages were implanted next to the industrial complexes, in small lots, usually single-family, distinct from the occupation of the industries. Housing was granted to workers by paternalistic industrialists, as a way of obtaining the worker's loyalty to the factory. Generally, the villas were built in a row or semi-detached, aligned with the sidewalk, and may have small backyards or common patios inside (CACHIONI, 2013).

Factory complexes were built close to water resources, also having their own railway line, which connected to the branches of the main railways. In the sugarcane sector, close to the sugar and alcohol mills, other factories were installed that also processed sugarcane derivatives, such as the production of paper. Next to the production complex, in addition to the workers' villages, schools, a library, a Catholic church, a community center, an outpatient clinic, a cinema, a ballroom and a dry goods warehouse were built by paternalistic entrepreneurs, constituting new neighborhoods far from urban centers.

3.4 CONSTRUCTION TECHNIQUES AND SYSTEMS OF INDUSTRIAL ARCHITECTURE IN BRAZIL

The repertoire of techniques, systems and stylistic and constructive elements used in pioneering industrial buildings in Brazil, is similar to that used in European countries such as France, England and Italy, as well as in the USA, justified by the fact that many of the constructive elements were imported from Europe, including the metallic structural system and the tiles, which were allied to mud bricks, which were already produced in Brazil.

In addition to the preponderant choice of exposed masonry highlighted by authors such as Rufinoni (2004) and Padin (2009), whose device can vary between English, Flemish or traditional, depending on the need for greater or lesser thickness to support roof structures, full and depressed arches composed of ceramic elements specially produced for this purpose are identified, constituting models of classicist and Romanesque inspiration. According to Padin (2009, p.52) the choice of brick masonry probably induced the option for solutions for door and window openings in depressed arches, high and with narrow lintels, as well as ornaments made from the careful rigging of bricks.

Bardese (2011) points out that until the installation of railroads and the foreign repercussion on the employment of salaried labor and also on imported taste and techniques, brick masonry was still little used in São Paulo constructions. According to Toledo (1983, p. 13) "[...] Until the advent of the railroad, São Paulo was a city of clay." ²⁵ In fact, according to Silva Bruno (1954), at the end of the 1850s, there were only nine small tile and brick factories in the city, which were mainly used for paving, and the first large brick factory was only inaugurated in 1859, in Bom Retiro²⁶.

From the installation of the railroads, the architecture of São Paulo underwent significant changes, with the presence of English technicians and the importation of machinery accompanied by the construction techniques used in the process of expansion of the railroad lines. According to Bardese (2011), associated with the phenomenon of immigration, the railway stations and factories promoted the dissemination of the use of brick masonry in constructions, albeit slowly, introducing a construction system little used in São Paulo until that moment, which allowed the realization of wider spaces, meeting the new programs of activities of this historical period. The author points out that the factories and railway stations built in exposed brick masonry and metal structures demonstrate the great

²⁵ TOLEDO, Benedito Lima de. **São Paulo: three cities in a century**. São Paulo: Duas Cidades, 1983, p.13.

²⁶ Silva Bruno (1954, p.470) in Bardese (2011, p. 64).

influence of English industrial architecture (BARDESE, 2011, p. 64), called by Hardman and Leonardi (1982) as British Manchesterian.

From then on,

The walls were usually built of brick and lime masonry. This modification, so simple, implied a significant increase in precision: the measurement errors, which with the use of traditional techniques could almost always be evaluated in decimeters, were now reduced to centimeters. The walls, with a uniform width, allowed the mechanized production of doors and windows (REIS FILHO, 1995, p. 159).

And

[...] The adoption of industrially produced construction elements and formal standards capable of assimilating them, within traditional solutions, meant, under these conditions, at the same time an advance in technology and the reinforcement of colonial-type ties (REIS FILHO, 1995, p. 183).

Mainly through the immigrant European labor, the bricks that were initially used in a special way in railway stations, industries and warehouses, became popular and enabled the accelerated growth of the city of São Paulo, as the main construction material. Bardese (2011, p. 64) attributes the success of bricks to the fact that "[...] Its low cost and ease of transportation by railroads provided faster and safer construction, especially in relation to the frequent rains, in addition to meeting the growing demand for the new programs". In addition, from the 1870s onwards, the City Council began to demand the replacement of rammed earth as a construction technique in 1873²⁷, which was highlighted by the provisions of the Code of Postures of 1875.

Bardese (2011) exposes that

The municipal and ecclesiastical government itself was gradually eliminating from the city its provincial and traditional aspects and customs, hiding or replacing any non-European trace of its streets, houses and customs, just as these new residents, influential in political and economic life, began to aspire to a city at their height, eliminating the vestiges of their provincial past (BARDESE, 2011, p. 64).

Brick masonry was the construction system used for the construction of chimneys, and there are also examples made up of various materials, such as stone masonry and metallic

²⁷ MORSE, 1970, p.255.

material. However, exposed brick masonry was more widespread due to its lower cost, ease of maintenance and resistance to heat, and can be erected with circular, rectangular or prismatic section. In addition to their functional origin, chimneys also served as an aesthetic component in the formation of the industrial landscape, considered by Arantes Santos (2011, p. 37) as an "element that configures a distinct meaning in industrial construction". For the author,

More than that, the chimney was a strong support for the memory of the place, the company, the community and those who in some way are or were part of the daily life of the industry. Sometimes, they even received ornaments that could not even be seen in the body of the building itself, so that their presence in the factory scenario could be remarkable.

In this sense, Bach (2009, p. 17) considers that:

The image of the chimney, an icon of the industrial city, also appears in the rural scenario, and is presented as a major vestige of this industrial activity that moved the region in the period analyzed and, at the time in which this production occurred, it was also a distinctive element of economic progress for the company it represented (apud ARANTES SANTOS, 2011, p. 37).

Regarding the factory buildings, Rufinoni (2004, p.43) points out that the technique used, as well as the architecture adopted, did not present significant variations in the construction of the first factories in São Paulo.

The large buildings - which could occupy an entire block - were usually built with exposed brick masonry and cast iron or steel structure. Metal or wooden roofs were the most common solution; in sheds or in two successively repeated gables side by side.

According to Padin (2009, p. 53), from the constructive point of view, all industrial buildings in São Paulo from this period have the same characteristics.

All are simple casings in brick, wood and iron. Internal productions develop as a function of their better rationality and productivity, however, at this time they still define the building little. In fact, the construction system used was based on the construction knowledge of the time and the availability of materials. The difference in relation to the profusion of decorative elements in the eclectic buildings of the same period lies in the fact that they had many of their components and construction materials imported, which made construction more expensive, and was not interesting in the case of

industrial architecture.

In several industrial buildings, the main structure was made of brick masonry, while the cast iron pillars had only the function of supporting the internal part of the roof structure. In turn, the use of iron in constructions also enabled constructive innovations not allowed by wood, such as the São João Market (1890), the Chá (1892) and Santa Ifigênia (1913) viaducts (PADIN, 2009; BARDESE, 2011).

Furthermore, Rufinoni (2004, p. 158) identifies in the industrial complex built in the Mooca neighborhood in São Paulo,

use of advanced architectural techniques, such as iron and steel structures, which were quite versatile for the construction of the free spaces and high ceilings that the factory facilities so badly needed. It is, therefore, the search for design solutions appropriate to specific functions, a fact that corroborates its importance for the history of architecture and contributes to the formal coherence generally achieved.

In this sense, Rufinoni (2004, p.52) concludes that

The vast majority of the buildings analyzed have the same construction system: bones made with a metallic structure, cast iron or steel, and solid brick masonry sealing. Sometimes the use of load-bearing masonry is noticeable and the metallic elements are restricted to the support of the roof structure, also metallic or wooden. The frames generally adopted are made of iron, in a few exceptions, made of wood. The ornaments of the pots - exquisite details of bricks arranged sometimes longitudinally, sometimes transversely - repeat the theme in curious and peculiar variations.

Padin (2009) informs that most of these buildings were built on the ground floor, but there are examples of vertical construction, such as the Cotonificio Crespi (1897), designed by Giovanni Batista Bianchi. The metal structures of many sheds were imported, among them, *sheds* sealed by glass to allow zenith lighting, which can open to allow ventilation (PADIN, 2009).

The need for natural lighting and ventilation forced the creation of openings and the movement of the lateral and roof fence planes, creating open windows, lanterns, mansards and finally the *shed* - openings in the roofs with the objective of offering lighting, before the use of electric light -, which made it possible to create "a basic module for the multiplication of the factory space", according to Santos (2006, p. 21). Anyway

It made it possible to open the side or air to ventilate and illuminate the internal space, as well as its expansion through the addition of other modules and in all directions. Complementary architectural solutions, such as the gutter system and devices for the control of light and undesirable winds, allowed for the improvement of this typology (SANTOS, 2006).

The use of *sheds* conditioned the design of the factory building and configured a top line known as "sawtooth roofs", which is striking for the formal understanding of the units. The development of this model, according to Moreira (2007, p. 125), "made it possible, in the first decades of the twentieth century, to apply the concept of the production line that revolutionized industrial production" (apud Arantes Santos, 2011, p. 38; 39). And, according to Santos (2006), the sequence of the shed roof combined with the chimneys of the steam boilers, composed the image of the modern factory, the typical factory architecture of the First Industrial Revolution (SANTOS, 2006).

Also imported from European countries were metal structures such as trusses and purlins, which were generally equipped with rafters and wooden slats and; ceramic tiles usually brought from France, known in Brazil as Marseille type tiles (PADIN, 2009).

In addition to the metal structures,

The development of European industry made it possible to supply, under advantageous conditions, tinplate and copper, for the assembly of flashings, rails, conductors and finishing pieces in general. Cast iron conductors and gutter clamps with decorative designs were common (Reis Filho, p. 1995, p. 162).

It is worth remembering that

Intended for all sectors of construction, they ranged from structural parts such as beams and columns, to secondary finishing resources such as garden ornaments, fountains and railings, not to mention stairs, window and door fittings. pipes, bathroom pieces and stoves (Reis Filho, p. 1995, p. 164).

Bruna (2002, p. 35) adds that

In Brazil, these elements are strongly present in all nineteenth-century architecture. Not only were hollow columns and beams in cast or wrought iron (as it was also called) imported, but also finishing pieces and ornaments for gardens, such as fountains, benches and railings imitating tree trunks.

For Maffei (1982, p. 33) there has always been a great interrelationship between the

type of building in terms of space, construction system and materials, with the type of product manufactured, as well as the manufacturing process, depending on the type of equipment and machinery. That is:

The evolution of industrial architecture has not only followed the evolution of construction technique, materials and aesthetic concepts (plastic-formal) that are inherent to architecture itself, but also of the type of industry as a function of the industrial production process (with all the inherent needs) and the type of product manufactured (with all the implications of transport, handling, areas, etc).

3.4 PROJECTS AND ARCHITECTS OF BRAZILIAN INDUSTRIAL ARCHITECTURE

The projects of industrial buildings built in Brazil from the 'Implementation' phase have varied origins, justified by several factors. As verified in the previous chapters, depending on the productive branch, the project was contracted together with the machinery, and was often developed by the mechanical engineers responsible for assembling the imported equipment. The catalogs of the machinery industries, which instructed the assembly of the equipment, provided general guidelines for the construction of buildings, according to production needs. There are also several records of constructions carried out by engineers and contractors, based on treaties and construction manuals, which allowed the application of their rules and practical examples in industrial buildings. However, despite the numerous factories designed by civil and mechanical engineers, based on manuals and catalogs, relevant architects in Brazil were also hired for the development of factory projects.

According to Maffei (1982), Brazilian industry, due to its technological dependence and the origin of capital, obeys imported parameters, always prevailing from the beginning, the design coming from abroad. In the evolution of the history of industrial buildings, the fundamental element to understand the solutions adopted is the origin of the capital, considering that the national capital was partial and, in some industrial sectors, came from some family groups that passed the capital that had been invested in the agricultural or import sector to the industrial sector.

The so-called "Captains of Industry" were mostly people with European training, and the little "know-how" they had was imported, acquired along with the machinery and equipment. Thus, our industry, due to its technological dependence and the origin of capital, obeyed imported parameters and always followed the design that came from abroad (MAFFEI, 1982, p. 33).

Maffei (1982) states that the evolution of the architecture of industrial buildings not only followed the evolution of aesthetic concepts, materials and construction techniques, inherent to architecture itself, but also developed as a function of the industrial production process and the manufactured product. The author considers that the physical characteristics of industrial buildings built with foreign capital are similar to those found in their country of origin, including the project, which was imported along with the equipment and the production system. "In some cases, even the metal structure was imported, and a model of architecture from the time of the European industrial revolution was reproduced in Brazil", and from the mid-nineteenth century, "with the buildings closed with exposed mud brick masonry walls, with the shape of the upper part following the design of the roof shed" (MAFFEI, 1982, p. 159).

Along these lines, Santos (2006) also notes that many of the factory projects were the responsibility of those responsible for the installation of machinery imported from Europe and North America, who represented the companies in Brazilian branches and, with the importation of machinery, the architectural project was often imported along with the equipment (SANTOS, 2006).

Among the main manufacturers of machinery for sugar production, the 'Société Anonyme des Anciens Établissements Cail' had in Rio de Janeiro, the Belgian civil engineer Francisco de Lumay as the company's representative and attorney. In addition to business representation, it maintained an office specializing in mechanical construction for industries; supply of material and complete facilities for central sugar and distillation mills; carrying out public works; metal bridges and iron buildings. At the Monte Alegre Central Mill in Piracicaba, Lumay, in addition to conducting the assembly of the machinery, was also the author of the construction project of the factory building, according to the contract signed with the owner²⁸.

In the same way, 'Brissonneau, Frères & C.' kept in the Brazilian subsidiary the industrial engineer André Paturau and the engineer Fernando Dumoulin, French, as representatives of the company and responsible for the assembly of central sugar mills, among them: the mills of Porto Feliz, Rafard and Piracicaba, being probably the authors of the projects of the buildings that housed the machinery.

However, not all contracts provided for the supply of exclusive or specific projects for the buildings. Moreira (2007) highlights the importance of the catalogs produced by British

²⁸ Information extracted from the Deed of purchase and sale made by Francisco Lumay to Doctor Pedro Augusto da Costa Silveira, of a central mill and assembly for the sum of one hundred and fifty-one thousand eight hundred and sixty francs, 30/12/1886II, inserted in the Inventory of Pedro Augusto da Costa Silveira, 1887. Piracicaba, 1st Office, box 21 A.

and American machinery industries, such as Platt Brothers & Co, Howard & Bullough Limited, Brooks & Doxey Limited and Dodson & Balow. In addition to detailed information about the machinery sold, these catalogs also contain proposals for industrial typologies and architectural and constructive solutions, which aimed to facilitate the assembly of factories.

Saia (1988) considers that the architectural solutions exhibited in these catalogs suggested a trend towards the standardization of façade treatment solutions and made it possible to understand some elements that distinguished textile manufacturing buildings, in addition to the dimensions, such as

the dust exhaust towers of the preparation areas, the stairwells, the engine room and areas corresponding to the situation of the sectors of the transmission systems that were externally evidenced, highlighted or deserving differentiated treatment on the homogeneous facades (SAIA, 1988).

During this period, just as it became frequent in Europe to consult treatises such as Blondel's 'Cours d'Architecture' (1750), it was also common to consult treatises and construction manuals by other European authors such as Louis Cloquet²⁹, João dos Santos Segurado³⁰ and Pasquale Carbonara³¹, as well as the Brazilian Alexandre Albuquerque³², which described and taught good ways to use the new techniques and common materials, for industrial constructions, as well as for institutional or residential buildings (BARDESE, 2011).

Cloquet's Treatise on Architecture (1922), divided into five volumes, brings in Volume IV, descriptions and examples illustrated with plans and facades, of buildings that are part of the repertoire of industrial architecture, such as markets and slaughterhouses, railway stations and collective housing for the working class.

The Insured (undated), 'Masonry and Stonework', 'Buildings' and 'Construction Materials' manuals provide information on the application of construction materials and systems, with several illustrations. The first volume was especially consulted by the builders, regarding the good use of rules for the execution of masonry, according to the devices most appropriate to the needs of the factories, mainly because they are, in the vast majority, buildings in exposed masonry in greater or lesser size.

²⁹ CLOQUET, Louis. *Traite d'architecture*. Paris: Librairie Polytechnique, 1898.

³⁰ SEGURADO, João Emílio dos Santos. *Masonry and Stonework* (4th edition). Lisbon: Bertrand, s.d..

³¹ CARBONARA, Pasquale. *Architettura Pratica*. Torino: Unione Tipografica - Editrice Torinese, 1980.

³² ALBUQUERQUE, Alexandre. *Civil Constructions*. São Paulo: Empresa gráfica da "Revista dos Tribunais" LTDA, 1952.

Carbonara's Treatise on Practical Architecture (1954) follows Clocquet's line, divided into eight parts distributed in five volumes, where he also presents descriptions and examples illustrated with plans and facades, by categories. The volumes of part 3 refer to 'buildings for the organization of work', bringing references applicable to factory buildings.

The manual of Civil Constructions of Albuquerque (1938; p. 52) brings in Chapter IX - referring to roofs - especially in the item 'Iron structures', examples of fabrication and assembly of trusses 'indicated in the roof of large spans', complemented with the item 'Roofing Materials', with several examples of metal shears for application in factory buildings.

Used by engineers and contractors, the manuals and treatises contributed to the consolidation of an architectural typology with common elements, currently considered as a determinant to be qualified as a typology of industrial architecture.

According to Moreira (2011), there was a greater occurrence of contractors with some experience in factory construction, in the last decades of the nineteenth century, among which the following stand out: Bernardo Mascarenhas, who provided services in the installation of the Companhia Industrial São Joannense, in São João del-Rei - MG; and the 'engineer' Carlos Hargreaves, in charge of the construction of the Santa Rita, Corcovado, América Fabril Factories and the expansion of the Cruzeiro Factory, in Rio de Janeiro. Still in the textile industry, in São Paulo, the English engineer Arthur Dryden Sterry built the pioneering São Luiz de Itu Factory and went to Piracicaba, where he installed and managed the Santa Francisca Fabric Factory (figure 285).

Figure 8

The Santa Francisca Fabric Factory at the beginning of the twentieth century

Fabrica de Tecidos « Arethusina ».

Source: FERRAZ, Mario de Sampaio. Piracicaba and its Agricultural School. Brussels: Imprimerie V. Verteneuil & L. Desmet, 1911, p. 27.

From this period on, it became quite common for foreign engineers from the railroad companies to work in the design and construction and assembly of factories, such as engineer William Ellison, from the D. Pedro II Railroad, responsible for the project of the Brasil Industrial Factory, in Rio de Janeiro (BALLEIRAS, 2003 in MOREIRA, 2007).

According to Bardi (1985):

At that time, São Paulo was adorned with the architecture of representation, but industrial parks were already being built and, if any engineer highlighted the façade, it was at the request of the principal, because the industrial establishments presented simplicity of construction, a harbinger of changes in architecture (Bardi, 1985, p.66 apud MIRANDA, 2003, p. 27).

Thus, in addition to the role of civil engineers in the development of projects for factory buildings, Rufinoni (2004, p. 54) shows that some of the most relevant architects of the period also designed industrial buildings in São Paulo, such as: Julio Michele, for the São Paulo Alpargatas Shed (1907); Giovanni Batista Bianchi, with the building of the Crespi Cotton Swirl (1897); Ramos Azevedo and Ricardo Severo, for the Ernesto de Castro Warehouses; and Victor Dubugras, in the Piratininga General Warehouses project.

Subsequently, Santos (2006) evaluates that in the Vargas government (1930-1945), industrial architecture began a new phase in Brazil, in qualitative and quantitative terms, because in addition to the growth in demand for this type of building (induced by the State), the pioneering relationship was also changed, characterized by imported projects ('packages'), in a typical situation of technological and political dependence.

Thus, from the 1930s onwards, the participation of Brazilian architects and engineers in large-scale manufacturing projects occurred gradually. According to Santos (2006), it was not by chance that, in the Vargas government, the greater participation of Brazilian professionals in manufacturing projects coincided with the modernization of industry, at a time when the concepts of the Modern Movement, which had been experimenting in Europe and the USA since the 1920s, were disseminated. Deemed

A diffuse ideology, but through the few schools, incipient patronage and especially public works, it guided Architecture and Engineering in the country in the following decades. Significant examples of Industrial Architecture were designed and built. Some are references to the creative capacity of Brazilian architects (SANTOS, 2006, p. 28).

However, in this period, Santos (2006) considers the participation of foreign architects and engineers who migrated to Brazil as a result of the world wars and in search of the new professional opportunities provided by Brazilian industrialization to be remarkable.

The author also highlights the training of these professionals through the ascending publication of industrial projects in articles in specialized journals of Engineering and Architecture, which were created in large numbers during this period, and the specialization of products, companies and professionals who began to dedicate themselves especially to manufacturing projects in these sources is noticeable (MAFFEI, 1982 and SEGAWA, 1997 apud SANTOS, 2006, p. 28).

The engineers who developed projects for the manufacturing buildings of the Engenho Central had academic training in the best educational institutions in France, such as Ecole Polytechnique, Ecole Centrale des Arts et Manufactures, Ecole Supérieure d'Electricité, Ecole des Arts et Métiers, Ecole Nationale des Industries Agricoles, Institut Industriel du Nord, among others (MIALHE, 2012), which justifies the quality of the projects, as well as its execution.

4 DISCUSSION

In this study, we sought to understand the formation and consolidation of industrial architecture in Brazil as a material expression of the economic, technical and cultural transformations that marked the process of national industrialization. Starting from a long historical path, from the factory restrictions imposed by the colonial system to the expansion of the large industries of the twentieth century, it was sought to demonstrate that, although late and dependent on foreign models, Brazilian industrialization developed its own architectural solutions, appropriate to local conditions and deeply linked to the territory.

The analysis showed that each stage of industrialization: prohibition, implementation, Brazilian industrial revolution, internationalization and expansion; corresponded to specific economic and political contexts, influenced by factors such as the coffee cycle, European immigration, the advance of railroads and state incentive policies, especially in the governments of Getúlio Vargas and Juscelino Kubitschek. These elements were decisive for industrial growth and for the consolidation of manufacturing centers, especially the State of São Paulo.

From the typological point of view, two main matrices were identified: the colonial, inherited from the sugar mills, and the Manchesterian, inspired by the British factories of the

nineteenth century. of lighting and large chimneys, which became symbols of progress and industrial modernity.

The forms of implantation of factories also revealed a significant evolution: from isolated mills to factory complexes and complexes articulated with railroads, new cultural landscapes emerged, in which workers' villages, schools, warehouses and churches express the intertwining between work, urbanization and daily life.

Finally, Brazilian industrial architecture cannot be understood as a simple imitation of European paradigms, but as a process of critical and creative appropriation, in which engineers and architects, such as Giovanni Batista Bianchi, Ramos de Azevedo, Ricardo Severo and Oscar Niemeyer, adapted concepts and techniques to the material, climatic and social realities of the country. Thus, industrial architecture constitutes an essential cultural heritage for the reading of Brazilian modernization, representing the living memory of the relationship between technology, territory and work.

5 CONCLUSION

The analysis of industrial architecture in Brazil allows us to understand that the development of this typology was profoundly conditioned by the economic, political and technological transformations that shaped the national industrialization process. From the colonial mills to the large factories of the twentieth century, it is observed that architectural evolution has always been associated with productive dynamics and forms of work organization, revealing the constant dialogue between tradition and modernity.

Although the country entered the industrial process late, under a strong dependence on foreign capital, techniques and models, Brazilian industrial architecture consolidated its own identity. This identity results from the creative adaptation of European models, especially the British and French, to the local conditions of climate, materials and labor, producing original architectural solutions that combined functionality, economy and aesthetics. The striking presence of exposed brick masonry, metal structures, shed roofs and chimneys became a symbol of industrial modernization and the emerging urban landscape.

The implementation of the factories, initially along watercourses and, later, railways and highways, profoundly transformed the territory, giving rise to industrial complexes and complexes accompanied by workers' villages and social equipment. These industrial centers not only boosted urban growth, but also configured new cultural landscapes and ways of life, expressing the interdependence between production, housing and social coexistence.

From a professional point of view, the study shows the passage from an initial phase, dominated by foreign engineers and imported projects, to a stage of technical and creative autonomy, marked by the work of Brazilian architects and engineers such as Giovanni Batista Bianchi, Ramos de Azevedo, Ricardo Severo and Oscar Niemeyer. This transition symbolizes the maturity of the national industrial architecture, capable of integrating technique, function and form in line with the demands of a country in modernization.

In summary, the historical path of industrial architecture in Brazil reveals more than the evolution of a constructive type: it mirrors the very trajectory of the formation of the modern nation. The factories, warehouses and workers' villages are material testimonies of a period of intense transformations, representing a cultural heritage of high historical, aesthetic and social relevance, whose preservation is essential for understanding the relations between technology, territory and collective memory in contemporary Brazil.

ABSTRACT

The present work has that goal to verify empirically the economic and social determinants of crime in the cities of São Paulo State. Due to wide range of crime-related components, this work to estimate an econometric model able to show what impact economic and social variables have on the types of crimes (murders, thefts and robberies) that are present in the cities of São Paulo. Using cross-sectional data for all cities in São Paulo during the year of 2010, the study presents has as the crime rates react with the explication variable in the degree of urbanization, participation of young male population, Gini index, income per capita, illiteracy rate, spent on public safety and growth rate of crimes in the previous year to 2010. The results show an important inertial component in the crime rate. To the rate of thefts only spent on public safety is connected with the theft of the cities. For the murder rate model, variables such as per capita income and unemployment were those that had a negative relationship with their dependent.

RESUMO

O presente trabalho tem como objetivo verificar empiricamente os determinantes econômicos e sociais da criminalidade nas cidades do estado de São Paulo. Devido a ampla gama de componentes ligados à criminalidade, este trabalho buscou em estimar um modelo econométrico capaz de apresentar qual o impacto que variáveis econômicas e sociais têm sobre os tipos de crimes (homicídios, furtos e roubos) que estão presentes nas cidades paulistas. Com a utilização de dados em corte transversal para todas as cidades paulistas durante o ano de 2010, o estudo apresenta como os índices de criminalidade reagem com a variação no grau de urbanização, participação da população jovem masculina, índice de Gini, renda per capita, taxa de analfabetismo, gasto com segurança pública e taxa de crescimento dos índices de crimes no ano anterior a 2010. Os resultados obtidos apontam para um importante componente inercial na taxa de criminalidade, que para a taxa de furtos apenas o gasto com segurança pública tem relação negativa com os furtos das cidades. Para o modelo de taxa de homicídio, variáveis como renda per capita e taxa de desemprego foram as que tiveram relação negativa com sua dependente.

RESUMEN

El presente trabajo tiene como objetivo verificar empíricamente los determinantes económicos y sociales del crimen en ciudades del estado de São Paulo. Debido a la amplia gama de componentes vinculados al crimen, este trabajo buscó estimar un modelo econométrico capaz de presentar el impacto que las variables económicas y sociales tienen sobre los tipos de delitos (homicidios, hurtos y robos) presentes en las ciudades de São Paulo. Utilizando datos transversales de todas las ciudades de São Paulo durante el año 2010, el estudio presenta cómo las tasas de criminalidad reaccionan con la variación en el grado de urbanización, la participación de la población masculina joven, el índice de Gini, el ingreso per cápita, la tasa de analfabetismo, el gasto en seguridad pública y la tasa de crecimiento de las tasas de criminalidad en el año anterior a 2010. Los resultados obtenidos apuntan a un importante componente inercial en la tasa de criminalidad, que para la tasa de hurto sólo el gasto en seguridad pública tiene una relación negativa con el hurto en ciudades. Para el modelo de tasa de homicidios, variables como el ingreso per cápita y la tasa de desempleo fueron las que tuvieron una relación negativa con el dependiente.

1 INTRODUCTION

The criminal economy has been gaining more and more prominence in the concern of Brazilian citizens and in the news of the mainstream media. However, Brazil has managed to achieve important economic results in the last decade in relation to extreme poverty, an increase in real wages simultaneously with an improvement in the labor market since 2003, which has resulted in a slight decrease in income inequalities, benefiting workers and families, as well as other social advances (DIEESE, 2014). Nevertheless, other economic and social factors still remain crucial problems that affect the lives of the population, such as crime rates (against life and property).

Although these improvements mentioned above are not yet in the standards of developed economies, there have been advances. However, these were not able to reverse the negative numbers that most Brazilian cities present on crime (thefts, robberies and homicides). An example of this negative situation are the IPEADATA figures, in which the evolution of the number of homicides in Brazil in five years from 2005 to 2009, showed an increase from 47578 in 2005, to 50318 for the year 2009.

This concern about crime has been gaining more and more space among researchers, whether in the social, economic or political areas, seeking to understand how economic and social variables can explain this phenomenon of crime. Balassiano et al. (2012), for example, applied an econometric model including economic variables such as unemployment, income distribution index and wage levels, with the objective of explaining crime in the state of Rio Grande do Sul. In this model, they also considered the different types of crime, with the intention of verifying whether each crime had different explanatory variables. This division of type of crime was classified as homicide, number of robberies and number of assaults on vehicles or other goods.

As with the work done for Rio Grande do Sul, the objective of this study is to try to understand the main variables that affect the crime rate of the municipalities of the state of São Paulo in the year 2010, applying an econometric model similar to the one done in Balassiano, et al. (2012).

We will use the crime rate considering two types of crimes: (i) homicides and (ii) thefts and robberies. The explanatory variables used will be: degree of urbanization, participation of the young male population aged between 15 and 24 years, Gini index, *per capita* income, illiteracy rate, public security expenditure and growth rate of crime rates in the year prior to 2010 (this variable seeks to capture the inertial component in the crime rate). With this, we

seek to understand how these chosen variables contribute to the increase or decrease of crime rates in the municipalities of São Paulo. And, in return, offer pertinent information to the authorities involved with public policies to combat crime, identifying its main economic and social aspects. It should be noted, however, that this work is a static and not a dynamic portrait for the year 2010.

1.1 PROBLEM AND ITS IMPORTANCE

In 2012, Brazil had around 50 thousand homicides according to Stuenkel (2014). Even with the drops in the homicide rate in some states, São Paulo still has alarming numbers. In 2005, the state had 8727 cases, decreasing this number to 6310 in 2009 (IPEADATA). Although there is a drop in the number of cases with intentional homicide, it is still considered relatively high when it comes to the number of lives that are lost every year, whether for economic or social reasons.

Analyzing the data from the work of Stuenkel (2014), it is noted that the number of homicides is not a problem exclusive to the state of São Paulo, which, by the way, has a rate much lower than the national average of 26.2 in 2010, according to the Map of Violence 2012. It is worth noting that São Paulo showed a significant drop in the numbers for the homicide rate from 42.2 in 2000 to 13.9 in 2010 for every 100 thousand inhabitants.

Being the richest state in the federation (ROTARY-SP), its economic importance is extremely relevant for Brazil, however, it must be taken into account, if really, better economic indices denote better indices in relation to the crime present in the cities of the richest Brazilian state. However, the other states of the country are always seeking to raise the levels of their economic activity in order to generate better living conditions for their population.

The objective of this study is to analyze the determinants of crime in the municipalities of the state of São Paulo in 2010, separating the variables (i) homicides and (ii) thefts and robberies. This division seeks to understand the specificities of each type of crime and how economic variables affect them differently.

In relation to economic aspects, crime generates insecurity, unhappiness and loss of manpower. In view of the data presented, most homicides occur among young people aged between 15 and 24 years, as revealed by the 2010 Map of Violence, as well as in Mello and Schneider (2004), who obtained in their results an elasticity of 4.5 for the variable participation of the male population between 15 and 24 years old, representing that the increase of 1% of the young population represents an increase of 4.5% in the homicide rate in the state in the

years 1990 to 2000, for women they also present significant parameters, representing a very large loss of young people in cases of intentional homicides.

From 2000 onwards, both federal and municipal authorities began to act with greater intensity in public security issues, managing to reduce the numbers related to crime, contributing to the increase in improvements in socioeconomic conditions. The relative decrease of young people in the population due to the drop in the birth rate in recent years has also contributed to the drop in crime rates in the State of São Paulo, since there is a greater propensity of young people to participate in criminal activities. Just as the more incisive presence in the areas of criminal justice has helped to reduce this rate:

During this period, there was also an increase in the growth rate of incarceration and sentences to alternative sentences. Finally, to complete the favorable scenario, it was possible to proceed with a relative control in the diffusion of firearms. The major problem observed in this last period refers to the growth of the illicit psychoactive drugs market. Still, after 11 consecutive years of increase in the homicide rate, it has begun to recede. (CERQUEIRA, 2010)

Considering other types of crimes, statistics such as robberies and thefts have a high level considering world standards. According to the São Paulo Public Security Secretariat, the capital city had a 41.8% increase in the number of robberies in the interregnum of 2013 and 2014. A survey by the security secretariat shows a comparison of robberies in the capital with robberies throughout the state. The result shows that in the capital alone, the number of robberies went from 8380 in 2011 to 13416 in 2014. The numbers found for the entire state were 18076 in 2011, increasing to 26987 in 2014, emphasizing that these numbers do not include vehicle thefts, but cargo theft, banks and homes.

In view of this fact, the feeling of insecurity that the population of large cities feels when they are circulating on the streets of their municipality is perceived. It is increasingly dangerous to travel at times with less flow of people on the streets, the fear of being robbed on the way home to work is increasing. With such a situation, even commerce feels the reflections of this fear that the population has due to the numbers of thefts and robberies in a certain region, whether in the smaller number of people who pass in front of the establishment, or in the risk of it being robbed.

In the work presented by Carvalho et al. (2014), they show the diffusion of crime that is occurring from the capital to the cities of the interior, breaking the taboo that the cities of the interior have total tranquility to live in. The study describes that criminals, when they

realize that small cities have possible victims to practice their robberies, take advantage of the more precarious security system of these municipalities, which end up making an environment conducive to robberies of securities institutions such as banks and jewelry stores, as well as people.

Some studies that relate the economy to aspects of crime associate economic performance and development with an increase or decrease in criminal activity (SANTOS et al., 2008; ANDRADE et al. 2007; ARAÚJO, 2002; BEATO FILHO, 2002). Even in a stable economy, economic factors such as income inequality, wage levels and unemployment are not able to mitigate the negative social effects generated by better numbers of these variables.

Thus, as described in macroeconomics textbooks, a low unemployment rate remains heated, and in parallel, with the result of better wages, the opportunity costs of perpetrators of crimes against property increase. It is worth noting that, in an environment with discrepant inequality, the offender is often faced with others who have assets and income relatively higher than his, which can induce acts of theft and robbery, promoting, even if inconsequentially, a distribution of income, in which the one who has less, takes possession of part of the assets, of the one who has more (BECKER, 1968).

However, it is hoped that this work will contribute to the understanding of the relevant causes of crime that the country has been facing for years, and which, unfortunately, consumes millions of lives, which has even reached the mark of more than one million people in three decades of recorded data, (CERQUEIRA, 2010). Another factor associated with crime is the loss of well-being that occurs with the increase in the number of crimes against property and against life, producing negative economic impacts.

1.2 GENERAL OBJECTIVES

This paper seeks to explain the most relevant causes of homicides, robberies and thefts in the municipalities of São Paulo in 2010, conditioning the components such as unemployment rate, *per capita* income, gini index, participation of the young male population, illiteracy rate, degree of urbanization, crime rate of the previous year and spending on public security. Using an econometric model of multiple regression, it is possible to estimate parameters that represent the impact of each variable on the components of crime, theft, robbery and homicide.

1.3 SPECIFIC OBJECTIVES

The specific objectives are to verify which are the most relevant economic variables to explain (i) homicides and (ii) thefts and robberies. With this, we will seek to understand the specificities of each type of crime, as well as the influence of each of the explanatory variables considered. Although it is a static and not dynamic work, we will seek to understand the aspects of each type of crime committed against life and property, in an attempt to contribute to the reduction of crime rates in the municipalities of São Paulo, being a possible orientation for policies that have this purpose.

2 THEORETICAL FRAMEWORK

Becker (1968) is the main reference when it comes to Economics of Crime. He proposed a model in which the behavior of criminality is conditioned by an individual process in the context of the rational choice model. In this way, the agent, when making his decision to commit or not commit a crime, compares possible costs and benefits of this activity. Thus, economic and social variables that describe the situation of a particular region or municipality could impact the choice of whether or not to enter into criminal activity.

In addition, as pointed out in Ehrlich (1973), income inequality can impact the choice of criminal activity. Thus, an increase in inequality would lead to an increase in criminal activity. A more recent model than the one presented in 1973, which relates crime to income inequality, was proposed by Mendonça (2003). In his work, he describes that the innovation of introducing the reference income variable into the classic structure of rational choice, mentioning the consumption expectations of individuals. With the impossibility of earning this income through the normal means of the labor market, such a situation drives the agents to resort to crimes in search of additional income and, thus, to obtain the reference income that had been imposed on them by their living environment. It is noted that a district with greater income inequality increases this difference, increasing the frustration of those who are on the verge of committing a criminal offense. In this context, new works add an explicit variable such as the Gini index to capture this theoretical dynamic.

Work such as the one offered by Sah (1991) is inferred in a model that shows that the citizen who has been convicted once for criminal activity has a certain tendency to be a repeat offender in the criminal act, since, when trying to re-enter the labor market, he finds it more difficult to reinsert, causing his opportunity cost against the patrimony to be reduced, inducing the field of violence again. Given this greater uncertainty in the labor market for people who

have already been incarcerated, crime can have an inertial character with these verified characteristics.

Regarding the empirical literature, we can cite the work of Hartwig (2010). It presents an estimate for crime in the State of Rio Grande do Sul using variables such as the participation of young people in the population, drug addiction, which refers to the number of occurrences or arrests of cases involving drug trafficking, income level, degree of urbanization and dummy for coastal cities in the South region. In this study, Hartwig used panel data for the years 2002 to 2006, the estimation method was the clustered MQO (Minimum of Ordinary Squares), finding a positive correlation for per capita income, degree of urbanization, dummy for coastal cities and drug addiction, however the correlation of crime in the population between 15 and 24 was negative, in contradiction to what was expected.

In this context, researchers from different areas of knowledge who work in research, dedicate more time of their time to be able to solve these problems and contribute more effectively, generating better results to this issue faced by Brazil and the world, which consume many lives every year. As the study of this work is referenced in the state of São Paulo, it is worth mentioning with greater emphasis some studies of Brazilian cases and in this specific area.

Andrade and Lisboa (2000) applied their models in an attempt to explain the evolution of homicide rates in the states of Minas Gerais, Rio de Janeiro and São Paulo, between 1981 and 1997. With this research, they identified that the homicide rate was related to the age group of men aged between 15 and 40, and that economic factors such as real wages, unemployment and inequality coefficient could explain the characteristics of homicides, showing that for other places with these same characteristics they could present similar results. From the collection of annual data in time series, the study observes that young people between 15 and 19 years of age, when there was an increase in their real salary, there was a drop in the homicide rate. However, the same process did not occur in older age groups. In this sense, it allows the acceptance that the effect of real wages in this age group of 15 to 19 years corroborates in a more forceful and lasting way in the fight against violence.

Another work that addresses this subject can be referenced by Hartung and Pessoa (2007), who apply similar models working with temporal factors to explain the inductions of homicide crimes. This time the approach becomes more specific, making the scope of application of the study the city of São Paulo, based on the demography of the region in the period between 1980 and 2000. Based on this analysis, he projected that the rates of theft

and robbery combined with a positive relationship with the level of income and inequality during these periods of economic instability, showing that it is not enough to make only one model for this type of explanation of crime, without taking into account the economic situation in which the agents are inserted.

3 METHODOLOGY AND RESULTS

3.1 EMPIRICAL MODEL AND ECONOMETRIC TESTS

For the estimation of the econometric model, it is intended to work with the following regression:

$$C_{s,i} = \beta_0 + \alpha C_{s,t-1} + \sum_{j=1}^k \beta_j X_{j,i} + u_i \quad (1)$$

Where:

$C_{s,i}$ = crime rate s at instant t (per 100 thousand inhabitants)

β_0 = Equation Intercept

α = parameter of the dependent variable lagged at $t-1$

$X_{j,i}$ = represents the k th explanatory variables

β_j = represents the parameters that will be estimated for the explanatory variables

u_i = is the term of the random error

Regarding the stage of verification of the adequacy of the model, the Jarque-Bera test was used to test whether the regression residuals follow a normal distribution. The data distribution curve should show kurtosis equal to three and asymmetry equal to zero. To confirm the normality of the residuals, a hypothesis test is applied, which the null hypothesis of the test implies a normal distribution of errors, following this characterization we have:

H_0 : $S=0$; $K=3$ (distribution is normal)

H_1 : $S \neq 0$; $K \neq 3$ (distribution is not normal)

Where:

S stands for Asymmetry and K stands for Kurtosis.

The decision rule used was p-value higher than the chosen level of significance indicates acceptance of the hypothesis, lower p-value is rejected in favor of where the distribution is not normal. $H_0 H_0 H_1$

The White Test was performed to verify whether there is heteroscedasticity, that is, to verify whether or not the residuals (U_i) have constant variance. This problem is verified when there are very discrepant databases (*outliers*), for example. As the model used works with several cities, which have different numbers of crime rates, especially in relation to large urban cities and small rural areas, the errors may present heteroscedasticity, due to the value of the variance of the samples. The hypotheses tested to verify the presence of heteroscedasticity of the model have the decision rule:

$$H_0: N^* > (\text{heteroscedasticity}) R^2 X_m^2$$

$$H_1: N^* < (\text{does not have heteroscedasticity}) R^2 X_m^2$$

3.2 DESCRIPTIVE ANALYSIS OF THE DATA

To carry out this work, it was decided to use secondary data, offered by the database of the STATE SYSTEM OF DATA ANALYSIS FOUNDATION (Seade), with estimation of the model in cross-sectional data with all cities in the state of São Paulo for the year 2010, totaling a sample of 646 cities. Based on the empirical literature, the following variables were included in the model:

- FUR = Theft rate of each city in the state of São Paulo, with the number of thefts occurring per hundred thousand inhabitants. The data were extracted from the database of the SEADE foundation.
- C_FUR = Growth rate of the number of thefts by city in the year 2009 to 2010, with the ratio between the two numbers. Data from the SEADE foundation.
- C_HOM = Growth rate of the number of homicides per city in the year 2009 to 2010, with the ratio between the two numbers.
- A_15_24 = Numbers of young people aged between 15 and 24 years of age for each city in the year 2010 in absolute numbers, SEADE foundation.
- DESEMP = Unemployment rate verified by city in the state, calculated by DATASUS.
- G_URB = Degree of urbanization obtained by the ratio of the urban population of the city to the total population of each city in 2010. SEADE.
- GINI = Gini index as a variable to measure the level of income concentration in the

cities of São Paulo, which the index that presents a number close to zero is consistent with the city with the lowest concentration of income and, values close to one with a higher concentration. DATASUS.

- ANALF = Illiteracy index of the cities, this data is calculated through the percentage of illiterates in relation to the total population of the city. SEADE.
- RENDA_PC = Per capita income, a variable found by dividing the city's GDP by its population in current reais. SEADE.
- G_PUB = Public expenditure on public security in each city in the year 2010 in current reais. SEADE.

In this part of the descriptive analysis, we seek to present the behavior of the explanatory variables and the dependent variable, relating them to each type of city, verifying the numbers in relation to metropolitan regions with a concentration of large industries, cities more focused on rural activity and others that have tourist attractions as attractions, present more clearly in coastal cities.

Starting with the description of the homicide rate that each city in São Paulo presents, it is noted that the city of Suzanápolis has the highest number of homicides for every hundred thousand inhabitants. To explain the behavior of this variable in a more forceful way, TABLE 1 shows which are the cities in São Paulo with the highest homicide rates in 2010.

Table 1

The 10 cities with the highest homicide rates in the state of São Paulo in 2010. (Homicides for every hundred thousand inhabitants)

Locality	Tx of homicide
Suzanápolis	1124,93
Santa Salete	968,19
Monteiro Lobato	267,25
Mira Estrela	248,40
Rinópolis	181,12
Fernando Prestes	144,59
Santana da Ponte Pensa	121,73
Flora Rica	113,96
Barra do Turvo	64,67

Embu

63,78

Source: Prepared by the authors with data from SEADE.

Suzanápolis is the city with the highest homicide rate, located in the mesoregion² of Araçatuba and microregion of Andradina. The city is 641 kilometers from the capital, in 2010 it had a population of 3378, according to data from the SEADE FOUNDATION. Its economic activity is more focused on beef cattle ranching in an extensive way with large land tenants. As TABLE 1 shows, Suzanápolis had 1124.93 cases of intentional homicide per hundred thousand inhabitants in 2010, a result well above the average of the same year for all cities in São Paulo, which was 13.02 per hundred thousand inhabitants.

Santa Salete, which is the second city with the highest homicide rate in the state, has characteristics similar to those of Suzanápolis, with a population of 1,447 inhabitants (IBGE/2010) and an area of 79.4 km². Santa Salete belongs to the Microregion of Jales. As well as the city with the highest homicide rate, Santa Salete's main economic activity is livestock and agriculture. Of the 1447 citizens living in the city, 819 are in the urban area and 628 are in the rural area, its demographics have 50% of people living in the rural area and a high homicide rate for every hundred thousand inhabitants with 968.19, very high in relation to the state average as well.

Another municipality with a high homicide rate, ranking third in the *ranking*, is Monteiro Lobato, located in the micro-region of Campos do Jordão, 132 kilometers from São Paulo, with an estimated population in 2010 of 4116 inhabitants (SEADE), 1516 in the urban area and 2100 in the rural area. The main economic activity is agriculture, with emphasis on the cultivation of beans, rice and corn, beef and dairy cattle raising, as well as pigs and horses. Embu, which from 2011 onwards was renamed Embu das Artes after a plebiscite held in the city, among the 10 cities is the one that is inserted in the Metropolitan Region of São Paulo, 30 kilometers from the capital, according to the SEADE FOUNDATION, had in 2010 about 63.78 homicides for every hundred thousand inhabitants.

In the entire State of São Paulo, in 2010, two hundred and sixty-two cities did not have homicides within their municipality, a very expressive number considering the total number of

² **Mesoregion** is a subdivision of Brazilian states that brings together several municipalities in a geographic area with economic and social similarities, which in turn are subdivided into microregions. It was created by the IBGE and is used for statistical purposes and therefore does not constitute a political or administrative entity.

the state, which has six hundred and forty-five cities, including Santana de Parnaíba, Monte Mor, São José do Rio Pardo, Dracena and Brotas.

Even with the positive changes in aspects such as the decrease in the Gini index that serves to analyze the level of income concentration, with an interval from 0 to 1, the lower the index, the better the income distribution in the country, region, state or city. According to the PNAD time series, the index had a significant reduction in the period from 2001 to 2011, presenting results from 0.594 to 0.527, respectively. In view of this information, it is sought to present how the crime rates behave in the face of these variations in the Gini, unemployment and average income of workers. An increase in the real wage of workers also seeks to explain this context of crime that occurs in São Paulo cities. Since 2003, the value of the minimum wage has had a real growth (already discounted for inflation) of 72.31%, according to data from the Inter-Union Department of Statistics and Socioeconomic Studies (Dieese), benefiting 48 million people and contributing to the increase in the average income of wages in recent years.

Another important component for the explanation of the dependent variable is unemployment, since crime can be conditioned by the number of people who cannot find work, but need income to survive, such a link between these two components can come from this need for consumption and the low opportunity cost of the individual who enters the criminal activity, in the search for social insertion, also highlighting that the existence of laws that allow the offender to easily avoid being punished may be another factor that induces an increase in crime. However, according to the data on unemployment, there is also a significant drop in the period 2000-2013, from a rate of around 20% to approximately 5% in 2013 (SUMMA, 2014).

As the 10 cities with the highest homicide rate, there is no city with industrial agglomerations and high demographic density, TABLE 2 brings the numbers of the 20 largest cities in the state and shows their crime rates, unemployment rate, gini index and population.

Table 2

Homicide Rate, Population, Unemployment and Gini Index of the 20 largest cities in the State of São Paulo

Locality	Population	Gini	Unemployment	Tx of homicide
São Paulo	11.245.983	0,6453	7,2	10,63
Guarulhos	1.220.653	0,5345	9,57	13,44

Itaquaquecetuba	321.329	0,4556	12,05	20,23

Source: Prepared by the authors with data from SEADE and DATASUS (2010).

In TABLE 2, it is observed that the capital, which is the largest city in the state, has a homicide rate per hundred thousand inhabitants of 10.63, slightly below the state average. With 11,245,983 inhabitants, the city of São Paulo has the worst index of gini, in which the higher the index, the greater the concentration of income in the city. The average unemployment rate of the ten largest cities in the state is 7.87%, so the capital is below average with 7.2%, in this regard São José do Rio Preto is the city that has the lowest unemployment rate, 4.1%, Itaquaquecetuba has the highest, 12.05%, among the ten largest cities in the state. São Paulo occupies the eighth position, behind Ribeirão Preto, Jundiaí, Bauru, Campinas, Piracicaba and São José dos Campos. The lowest gini index found among these cities is found in Itaquaquecetuba with 0.4556, followed by Mauá and Diadema, which have 0.458 and 0.4592 respectively, both belonging to the Metropolitan Region of São Paulo.

Among this selection of cities, Jundiaí is the one with the lowest homicide rate, about 5.28 deaths for every hundred thousand. On the other hand, those with the highest homicide rates are those with the best indicators of income concentration, Diadema and Itaquaquecetuba, bringing with them 20.99 and 20.23 respectively.

As shown in TABLE 2, Guarulhos has a population of 1,220,653 inhabitants, 13.44 homicide rate, 9.57 unemployment rate and 0.5345 for the gini index. In the ranking of the homicide rate, Guarulhos occupies the fourth position, above the state average. Its

unemployment rate is also above the average of 6.72%. In relation to the concentration of income, its index is almost a tenth-higher than the average.

Campinas, the third largest city in the state, shows that it has the second highest index of gini, behind only São Paulo, which has the most concentrated income of this group, its index in 2010 was 0.5782. The city's unemployment rate was below the state average, standing at 6.26%, on the other hand, its homicide rate is in third position considering the group of the ten largest cities, standing at 14.55 deaths for every hundred thousand. Its estimated population for the same year was 1,079,140.

Now analyzing the characteristics of the last three cities among the twenty selected, starting with Bauru, it had an estimated population of 343,695 in 2010, a gini index of 0.5596, slightly above the average in relation to this group of cities. Its homicide rate was 13.09, very close to the state average of 13.02 for the same year. The unemployment rate is among the lowest in the group, with 5.87.

Following the analysis São Vicente, a coastal city with 332,193 inhabitants, presented a homicide rate of 13.25 for the year of selection, considering the ranking among the twenty cities, São Vicente would be in the fifth position in the aspect of value above the state average more than three percentage points that was observed at 6.27%. In relation to its gini index, it is in the fourth position of least concentrated income with 0.4892.

As the work also focuses on the theft rate of the cities of São Paulo and not only on the homicide rate, table three brings some of the data regarding the numbers of thefts in the municipalities in 2010, which were the highest and lowest rates for the year of study.

Table 3

The ten highest and lowest theft rates per hundred thousand inhabitants

THEFT RATE			
	10 More		10 Less
Ilha Comprida	7097,63	207,47	Santa Salete
Aparecida	3507,97	199,76	Colonel Macedo
Mongaguá	3096,18	197,91	Piquerobi
Itanhaém	2919,96	196,54	Santa Rita d'Oeste
Guaíra	2814,34	189,47	Guzolândia
Ilhabela	2552,89	159,07	Mesópolis
Praia Grande	2351,27	158,51	Gavião Peixoto
Barretos	2348,48	98,45	Monte Castelo
Peruíbe	2316,66	59,54	Stream
Ilha Solteira	2259,03	27,25	Balbinos

Source: Prepared by the authors with data from SEADE

Following the data in TABLE 3, which presents which are the cities with the highest and lowest theft rate per 100 thousand inhabitants, selecting the ten most and the ten least dangerous in relation to the number of thefts. As shown in the table, the city of Ilha Comprida is the municipality that has the highest theft rate in the state of São Paulo in 2010, with 7097.63 thefts for every hundred thousand inhabitants. Campina do Monte Alegre according to SEADE, (2010) had a population of 9003 inhabitants, the municipality is located 209 kilometers from the capital on the south coast of São Paulo.

In second place in the ranking is Aparecida with 3507.97 thefts per 100 thousand, population in 2010 of 35006 (SEADE), belonging to the region of Vale do Paraíba Paulista, is 168 kilometers from the capital. The city is very famous for its Basilica of Our Lady of Aparecida, it is considered one of the largest religious pilgrimage centers in Latin America, receiving millions of visitors annually, making the municipality one of the main tourist attractions in Brazil. Although the city has a large part of its economy linked to services and commerce that comes from municipal tourism, it brings with it a high number of thefts to the city, due to the large flow of people in the city at a certain time of the year.

Concluding the three cities with the highest theft rates in the state comes Mongaguá, another coastal city in São Paulo. In 2010 its population was estimated at 46186, it is located 93 kilometers from its capital, in the same year the city had a theft rate of 3096.18. Note that of the 10 cities selected, six of them are with beaches, Guaíra and Barretos, which are in the northeast of the state bordering Minas Gerais and Ilha Solteira, which is to the northwest of the state on the bank of the Paraná River, and Aparecida, which has already been mentioned, are the municipalities that do not border the sea. Although these cities are not coastal, they have similar characteristics, which is the attraction of tourists at a certain time of the year, Barretos and Guaíra have the pedestrian party, Ilha Solteira has its Carnival and university games and Aparecida its Basilica of Our Lady.

Looking at the opposite side of the table, in which we have the municipalities with the lowest numbers referring to theft rates in the cities of São Paulo, in the best position is the city of Balbinos with a little more than 3900 inhabitants in 2010 (IBGE), 405 kilometers from São Paulo in the mesoregion of Bauru and has a theft rate of 27.25 per hundred thousand inhabitants. Its economy has as its main activity agriculture in the cultivation of sugar cane, an interesting detail of the city is that in 2005 there was the construction of two prisons in the city, which according to the residents, enabled a better performance in commerce, because of the increase in the number of people who visit the imprisoned family members and even the increase in its population, or in the number of prisoners, who are counted as residents of the city, and even the relatives of the prisoners who end up moving to another city to be closer to the jail and be able to visit them every week.

The second city with the fewest thefts per hundred thousand inhabitants is Ribeira, located 354 kilometers from the capital, on the border with Paraná, population in 2010 of 3358, with a theft rate of 59.54 for the same year. Agriculture is the economic base of the municipality, with the production of bananas, exported to the capital, and also the cultivation of oranges, rice, sugarcane, beans, cassava, corn and cattle, pork and poultry farming. The raising and export of cattle are of great importance to the local economy.

Monte Castelo is the third best city in relation to the number of thefts per hundred thousand inhabitants in the state, with 98.45 in theft rate. With 4063 inhabitants in 2010, it is located in the micro-region of Dracena, 679 kilometers from São Paulo. Per capita income in 2010 was R\$17,039.15. Its economy is focused on agriculture with a strong participation of sugarcane and cattle raising.

Among all the municipalities of São Paulo, the average number of thefts per hundred thousand inhabitants in 2010 was 1005.82. São Paulo, which is the largest city, has 1904.85, almost double the state average, Campinas, another large city in the state, has 2036.52. It is noted that the lowest numbers of the theft rate are found in municipalities further away from the capital and with agricultural activity.

4 RESULTS AND DISCUSSIONS

After estimation of the regression considering several combinations of chosen variables. The best estimated model was the theft rate of the cities of São Paulo for the year 2010, using the following explanatory variables: number of young males aged 15 to 24 years, illiteracy rate in relation to the city's population, per capita income, public spending on public security, growth rate of thefts from 2009 to 2010 and Gini index, without the use of intercept. The unemployment rate was discarded because it did not present a significant parameter, perhaps this is due to the fact that the population with the highest participation in the number of thefts, especially people between 15 and 24 years old, were not looking for a job in the last 6 months before the data collection period, since a positive relationship with the crime rate was expected.

All variables were used in natural logarithm, except for public spending on public security, which for some cities assumes a value equal to zero and thus makes the application of logarithms unfeasible. Table 3 shows the result found for the estimation of the variable theft rate and homicide rate.

Table 4

Analysis of the estimated parameters

Variable	Theft	Homicide
C	-	3,400831 (0,0005)

Source: Prepared by the authors with E-views 6.0 software

With this estimation, the impact of each explanatory variable on the dependent variable is obtained, remembering that, as previously mentioned, the model has no intercept, which would be the result of the LOG of the theft rate in 2010 if no explanatory variable had undergone any change. Starting with the variable a_15_24, it is observed that the coefficient 0.1495, being a positive number, it says that an increase in the population of young males aged between 15 and 24 years, produces an increase in the theft rate as well. With the use of natural logarithms in the variables, their coefficients already give us the percentage generated in the variable that is being explained, that is, it presents the elasticities of each component of the regression. The interpretation shows that for the variation of one unit in the population aged 15 to 24 years, it corresponds to an increase of approximately 0.15% in the theft rate. In TABLE 4, the values in parentheses represent the respective p-values of each estimated coefficient, showing that all parameters are significant with α of 5%.

For the interpretation of the relationship of the gini index, it is observed that the addition of one unit of this index reflects 0.42% positively in the dependent variable, highlighting that this index varies from 0 to 1, so one unit represents one hundredth considering two places after the decimal point for the index. As has already been proposed in other works that deal with crime, the greater the concentration of income in a country, region or municipality, the greater the propensity of citizens with little or almost no income to commit crime against property, this can even occur as a measure of deconcentration of income in a forced and illegal way, within the laws that guarantee the right to property, evidenced in Mendonça (2003).

In relation to per capita income, the coefficient was also shown to have a positive participation, denoting that the increase of one real in the per capita income of a city increases

the theft rate by 0.24%, with a higher per capita income individuals are more likely to obtain it illicitly, since this higher income does not have a uniform distribution, it makes some have access to consumer goods that others do not have. All variables have a positive relationship with the dependent variable, except for public spending on public security. Following the interpretation, the degree of urbanization increases by 0.75% to dependent, thus, the increase of 1% in the urban population of the city generates an increase in the number of thefts, such a situation may be associated with the fact that in more urbanized cities people are more sensitive to social exclusion, and also, there is the issue of formation of favelas in neighborhoods further away from the central region of the city, In which public policies are less present, especially in education and health, in the absence of public power, criminals take control of these areas.

Trying to capture an inertial component (and also control for possible omitted variables) of the phenomenon explained by the insertion of the growth rate of thefts from one year to the next, it shows that the increase of 1% in the theft rate in one year produces an effect of 0.94% in the following year, showing that this phenomenon tends to keep increasing if this positive variation is not controlled. For the illiteracy rate, the variation of 1% in the rate reflects on thefts in 0.22%, in this case, there may be a scenario that the individual with low qualification, with little or no level of education, tends to participate in criminal activity to equate this educational difference, which submits him to the work of manual labor with lower remuneration.

Therefore, the only variable that showed an inverse relationship to what was expected was spending on public security. However, as this was used at a level (i.e., without the application of the natural logarithm). Although the estimated coefficient is statistically significant, its value is very small, being practically inexpressive to explain the crime rate. However, the exclusion of this variable causes a worsening in the performance of the model (measured by the information criteria), which is why it was decided to include it in the model.

The insertion of these variables mentioned in the model was able to explain the phenomenon studied in 88.78%, verified by the R^2 extracted from the *software* used to estimate the model. With this, it can be said that the components chosen for the model can describe a large part of the theft rate of cities in the state of São Paulo. All parameters were significant at the significance level of 10%.

Perhaps, variables such as corruption rates, measured by the number of complaints with the management of the public machine of a city, number of occurrences of drug seizures

in the city and the lack of daycare centers for children, which can increase the probability of this individual who without receiving dignified conditions at the beginning of his life, generates negative results in the social formation of this citizen. However, these data were not included in the model because some of these variables do not have them for the year 2010 or many cities do not have these values.

To create the estimated linear regression model for the homicide rate variable, a smaller number of observations was used than that used to estimate the theft rate, this difference occurs because the observations for the homicide rate there are many cities that have a number of homicides equal to zero, so this fact makes it impossible to use a logarithm in this variable. With this model, an R^2 of 0.4026 was obtained, i.e., it can describe a little more than 40% of the estimated variable and almost 60% is included in the random error variable.

In the application of the econometric tests mentioned in item 5 of this study, it was observed that for the homicide estimation model there is no autocorrelation in the errors, they have a normal distribution and there is no heteroscedasticity in the errors, all the hypothesis tests performed for each test presented a value greater than 0.10, accepting the null hypothesis of absence of heteroscedasticity, autocorrelation and normal distribution of waste. For the theft rate estimation model, heteroscedasticity was present, which was corrected through White's robust covariance variance matrix. The other of these showed results of normality and absence of autocorrelation.

Table 5

Model diagnosis

	Thefts	Homicides
Jarque Bera	13.85	1.73
White's Test (0.000)*	(0.8382)	
Godfrey-LM (0.5252)	(0.6445)	
R^2	0.8878	0.4026

Source: Prepared by the authors with software eviews 6.0.

* Values in parentheses are the p-values.

From the results of the tests, it is possible to find that the White test in the theft rate model rejected the H_0 hypothesis, however its correction was made with White's robust covariance variance matrix. For the other tests, the null hypothesis was not rejected.

The second model for the homicide rate was generated from a database with 292 observations, so it is understood that 352 observations were excluded, which are the number of cities that had zero deaths by intentional homicide in 2010.

Analyzing the results found, it is clear that the model that best fits to explain the homicide rate using the database of this work was with a regression with intercept whose estimated value was 3.400831, which represents how much the homicide rate of a given city would be if there was no variation of any explanatory variable for the period analyzed. The absolute number referring to the participation of the young population in the city had a negative impact on the homicide rate, inferring that given its estimated coefficient of -0.1206, the increase of 1% in the participation of the young population decreases the homicide rate by 0.1206%, a result different from what was expected, since young people in this age group are more likely to commit acts of crime, as well as in Andrade and Lisbon (2000) who applied an econometric model to the cities of the state of São Paulo, Rio de Janeiro and Minas Gerais between 1981 and 1997.

The illiteracy rate showed a positive correlation, indicating that for an increase of 1% in the participation of illiterate people in the population of a city, the dependent variable moves in the same direction in the proportion of 0.2735%. One hypothesis for this positive correlation may be the case that an illiterate individual is less inserted in society, whether in legal matters or issues of future perspective, which ends up reducing his opportunity cost when committing such a crime, as verified by Becker (1968). Smaller cities in the interior usually have higher illiteracy rates, it may be due to the old customs that these cities still preserve, which generates a relationship of homicide focused on the situation as a crime of passion, hurting the honor of an individual or even the tradition of a family and also the lack of investigation more consists of investigations in cases of homicides in these cities.

Regarding the growth rate of municipal homicides, the behavior of this variable is inferred as an inertial component of the crime rate, that is, if in the previous year the municipality had a high homicide rate, this result will also cause a high rate in the following year. In the estimated regression, its reflection on the dependent denotes that its growth from one year to the next in the variation of one unit generates a positive impact of 0.4748% on the estimated variable. A fact associated with this result must be that in regions high growth of crime makes the citizen who does not participate in criminal activity move from this area to one with fewer acts of crime, making the place that has increasing cases of homicides increasingly under the command of criminal people.

The unemployment rate, which was not significant and had its exclusion for the estimation of the theft rate, was significant for the homicide rate, its relationship with the dependent occurred positively, showing that the increase in the unemployment rate in one unit produces an effect in the same direction for homicides in 0.3873%, such a result was what was expected, Unemployed people are more likely to commit crimes against life, either because of the low opportunity cost "*I have nothing to lose*", or to acquire income in the search for social insertion, considering the cases of robberies that occur in the municipalities of São Paulo.

Per capita *income* was another variable that presented a negative relationship, an acceptable result since a *high per capita income* is assumed that such a region has a labor market with greater opportunities, better public services and even better levels associated with the education of the population. The impact of *per capita income* on the homicide rate infers that for the increase of one real in income generates a drop of 0.1319% in the homicide rate. In the study by Hartwig (2010), the result was also negative for its estimation in Rio Grande do Sul, with panel data from 2002 to 2006.

It is worth mentioning that the gini index was removed from the model because it was not significant at 10% significance, as well as the degree of urbanization of the municipalities. The last variable to be analyzed is public spending on public security, which, because it did not have values greater than zero for all observations, the logarithmic base was not applied to it. However, it showed a positive relationship, demonstrating that increased spending on public security produces an increase in homicide rates. This result, although statistically significant, is not economically relevant (given the low numerical value of the estimated coefficient). In addition, there may be a problem of simultaneity between these variables, a treatment that is beyond the scope of the present work.

5 CONCLUSION

The objective of this study was to empirically analyze the determinants of crime in the municipalities of São Paulo during the year 2010. To this end, a linear regression model was estimated using the following explanatory variables: participation of the male population between 15 and 24 years old, Gini index, per capita income, degree of urbanization, illiteracy rate, spending on public security and growth rate of thefts from 2009 to 2010, estimation for the variable theft and, for the variable homicide rate, the unemployment rate and growth rate of homicides were inserted, excluding degree of urbanism and Gini index.

The results obtained showed that for the homicide rate, spending on public security showed a somewhat controversial result, given that crime is expected to decrease with increased spending on public security, and not the other way around as the model shows. However, as explained, this result, although statistically significant, is not economically relevant (given the numerical value of the estimated coefficient). In addition, there may be a problem of simultaneity between these variables, a treatment that is beyond the scope of the present work.

The explanatory variable that had the most impact on the dependent was the growth in the theft rate in the previous year. This result indicates that the inertial component of criminality is quite important. We can conjecture, perhaps, that the non-punishment of the individual who commits the crime is the main factor in the behavior of this variable, since the offender, having no punishment, continues to commit his crimes, producing this inertial effect.

For the model estimated for the homicide rate, the variable with the greatest explanatory power was also the growth rate of the previous year, the second that most explains the homicide rate was the unemployment rate, with a positive correlation inferring that a 1% increase in the unemployment rate increases the homicide rate by 0.3873%. For *per capita income*, the correlation of the variables was negative, implying that the increase in *per capita income* decreases the homicide rate, as extracted from the model, an increase of one real in income decreases the homicide rate by 0.1319%. The illiteracy rate shows that a 1% increase in this rate increases homicides by 0.2735%.

With the results found for these variables, it is possible to reduce the number of homicides by making more persistent investments in job creation, which in itself produces an increase in *per capita income*, improvements in the education system, which also, in the long run, has an income-generating effect and a better degree of culture of the people who are part of society. producing a more harmonious social environment.

As possible extensions of this work, a dynamic analysis of crime with data for the cities of São Paulo is suggested. In addition, the inclusion of variables such as the corruption index, the index referring to drug trafficking, alcoholic beverages, the number of firearms in circulation in the cities, and even binary variables for black people, in an attempt to verify the social characteristics of the victims of homicides in the municipalities of São Paulo.

DEDICATION

I dedicate this work, first, to my family members, especially my mother and my brothers, who managed to pass on life values to me that enabled me to face any difficulty during my graduation.

My friends from the Federal University of Mato Grosso Rondonópolis campus, with whom I lived for a year at the beginning of my undergraduate studies, especially Talita Palacios who has always been my companion.

To conclude, I also dedicate it to my second family, the Republic of Sorocaba, which not only provided me with a home, but a place where I always had the security of being among good people, with an atmosphere of parties, discussions, respect, football, truco and beer.

ACKNOWLEDGMENTS

My special thanks go to my family, my mother who always encouraged me with her advice and teachings, allowing me to control my anxiety and contribute to the realization of this work. Special thanks also to my professor and advisor Prof. Dr. Andreza Ap. Palma, taught me, guided me, showed me how to do scientific research with econometric analysis, always patient and open to discuss issues pertinent to the research. I thank all the professors of the Department of Economics at UFSCar Sorocaba.

To the friends and brothers of the Republic, the board of directors, the course friends, the staff of the Toca da Onça Academic Center and all those who helped me directly and indirectly in the realization of this monograph.

ABSTRACT

Introduction and Objective: Penetrating scrotal trauma is a rare but potentially serious condition, with a risk of compromising genital structures. The objective of this study is to review diagnostic and therapeutic approaches to penetrating scrotal injuries, proposing a clinical flowchart to guide medical care.

Method: A case report of scrotal trauma by a metal bar in a patient treated in an emergency room was conducted, followed by a systematic literature review in the PubMed and SciELO databases, without language or period restrictions. Case reports with penetrating or transfixing scrotal injuries were included. The extracted data included the mechanism of trauma, diagnostic tests used, and procedures adopted, allowing for descriptive analysis and the construction of a management flowchart.

Results: Twenty-one cases were analyzed (including the case presented). The most frequently used diagnostic methods were ultrasound (33.33%), computed tomography (33.33%), and radiography (28.57%). Regarding management, surgical exploration was performed in 71.42% of cases; debridement in 47.61%; drain use in 28.57%; and primary closure in 80.95%. Based on these data, a clinical flowchart was developed encompassing hemodynamic assessment, detailed physical examination, imaging studies, and indications for surgical intervention according to suspected injury to scrotal and adjacent structures.

Conclusion: Penetrating scrotal trauma requires a systematic and individualized approach. The publication of reports such as this contributes to the improvement of medical conduct in the face of varied clinical presentations, expanding the diagnostic and therapeutic repertoire of professionals in the areas of emergency medicine and urology.

Keywords: Puncture Wounds of the Scrotum. Transfixing Wounds of the Scrotum.

RESUMO

Introdução e objetivo: O trauma escrotal penetrante é uma condição rara, mas potencialmente grave, com risco de comprometimento das estruturas genitais. O objetivo deste estudo é revisar condutas diagnósticas e terapêuticas diante de lesões penetrantes de escroto, propondo um fluxograma clínico para guiar o atendimento médico.

Método: Foi realizado um relato de caso de trauma escrotal por barra metálica em paciente atendido em pronto-socorro, seguido por revisão sistemática de literatura em bases de dados PubMed e SciELO, sem restrição de idioma ou período. Foram incluídos relatos de casos com lesões penetrantes ou transfixantes escrotais. Os dados extraídos incluíram mecanismo de trauma, exames diagnósticos utilizados e condutas adotadas, permitindo análise descritiva e construção de fluxograma de manejo.

Resultados: Foram analisados 21 casos (incluindo o relato apresentado). Os métodos diagnósticos mais utilizados foram ultrassonografia (33,33%), tomografia (33,33%) e radiografia (28,57%). Em relação ao manejo, a exploração cirúrgica foi realizada em 71,42% dos casos; debridamento em 47,61%; uso de dreno em 28,57%; e fechamento primário em 80,95%. Com base nesses dados, foi elaborado um fluxograma clínico contemplando avaliação hemodinâmica, exame físico detalhado, exames de imagem e indicações de intervenção cirúrgica conforme a suspeita de lesão de estruturas escrotais e adjacentes.

Conclusão: O trauma escrotal penetrante exige abordagem sistemática e individualizada. A publicação de relatos como este contribui para o aprimoramento da conduta médica frente a apresentações clínicas variadas, ampliando o repertório diagnóstico e terapêutico de profissionais das áreas de emergência e urologia.

Palavras-chave: Lesões Perfurantes de Escroto. Lesões Transfixantes de Escroto.

RESUMEN

Introducción y objetivo: El traumatismo escrotal penetrante es una afección poco frecuente pero potencialmente grave, con riesgo de comprometer las estructuras genitales. El objetivo de este estudio es revisar los abordajes diagnósticos y terapéuticos de las lesiones escrotales penetrantes, proponiendo un diagrama de flujo clínico para orientar la atención médica.

Método: Se realizó un reporte de caso de traumatismo escrotal por una barra metálica en un paciente atendido en urgencias, seguido de una revisión sistemática de la literatura en las bases de datos PubMed y SciELO, sin restricciones de idioma ni período. Se incluyeron reportes de casos con lesiones escrotales penetrantes o transfixiantes. Los datos extraídos incluyeron el mecanismo del traumatismo, las pruebas diagnósticas utilizadas y los procedimientos adoptados, lo que permitió el análisis descriptivo y la elaboración de un diagrama de flujo de manejo.

Resultados: Se analizaron veintidós casos (incluido el caso presentado). Los métodos diagnósticos más utilizados fueron la ecografía (33,33%), la tomografía computarizada (33,33%) y la radiografía (28,57%). En cuanto al manejo, se realizó exploración quirúrgica en el 71,42% de los casos; Se realizó desbridamiento en el 47,61 % de los casos; drenaje en el 28,57 %; y cierre primario en el 80,95 %. Con base en estos datos, se elaboró un diagrama de flujo clínico que abarca la evaluación hemodinámica, la exploración física detallada, los estudios de imagen y las indicaciones para la intervención quirúrgica según la sospecha de lesión en el escroto y las estructuras adyacentes.

Conclusión: El traumatismo escrotal penetrante requiere un abordaje sistemático e individualizado. La publicación de informes como este contribuye a la mejora de la práctica médica ante la variabilidad de las presentaciones clínicas, ampliando el repertorio diagnóstico y terapéutico de los profesionales de urgencias y urología.

Palabras clave: Heridas Punzantes del Escroto. Heridas Transfixiantes del Escroto.

1 INTRODUCTION

Penetrating scrotal trauma is an uncommon injury within medical practice, mainly because of the location of the scrotum and its mobility. Genitourinary lesions occur in about 10% of cases of abdominal trauma, and scrotal or testicular lesions are present in only 1% of these cases.¹

Penetrating trauma is an open injury with the possibility of injuring, in addition to the outermost layers of the skin, the subcutaneous, blood vessels, and even the various structures that make up the spermatic funiculus.² In this case, in the case of scrotal injury, there is the possibility of injury to structures such as testicles, epididymis, spermatic cords, nerve structures and blood vessels.

Anatomically, the scrotum is formed by two pouches divided by an internal septum and a cutaneous raphe, connected to the perineum. Each pouch has six layers, including the skin and cremaster muscle. The testicles, which are oval in shape and measure between 4.1 and 5.1 cm in length, contain seminiferous tubules and Leydig cells in the interstitial space, responsible for the production of testosterone.

The vas deferens, a muscular tube, connects the epididymis to the spermatic cord, which connects the testicle to the abdominal structures, involving arteries, veins, lymphatic vessels, and nerves, under a fibrous-connective layer called the spermatic fascia.² Arterial irrigation of the scrotum comes from branches of the internal pudendal artery, external pudendal artery, and cremasteric artery, while venous drainage occurs through the scrotal veins.

The innervation of the scrotum is anterior, by the genitofemoral nerve, and posterior, by the posterior scrotal nerves. In addition, the ilioinguinal and genitofemoral nerves innervate the cremaster muscle, which aids in thermoregulation.³

The diagnosis of scrotal injury is based on the physical examination of the affected area, which can often be difficult in post-trauma cases, due to various factors such as the patient's non-cooperation due to pain, excess blood hindering vision, hematoma or edema. Thus, the inability to perform a reliable physical examination leads to the use of imaging tests for a more assertive diagnosis, when possible. Ultrasound is the most used imaging method in practice for cases of penetrating trauma, being able to evaluate the involvement of deep structures. In addition, ultrasonography using the Doppler technique allows providing information about the blood supply to the testicles, which is critical to indicate or not surgical treatment.

Although ultrasonography is the main diagnostic means for penetrating scrotal trauma, there are still limitations regarding its use, since it is an operator-dependent method, reducing its diagnostic accuracy.

Computed tomography and magnetic resonance imaging also have a well-established role in the literature as an effective method for the diagnosis of penetrating trauma. However, they present important barriers to their use, such as high cost, low availability and inability to use them depending on the penetrating material (metal, for example).

The following case reports a transfixing trauma, isolated in the scrotum, in an 18-year-old man, by a metal bar. In addition, a flowchart for the management of penetrating scrotal trauma, and a table analyzing the conducts and diagnostic methods of a series of cases present in the literature are also presented below:

2 GOAL

The objective of this study is to review the management of traumatic cases and perforating scrotal injuries, in order to systematize the diagnosis and treatment, in order to help urologists and emergency physicians to deal with these situations, based on the elaboration of a flowchart.

3 METHOD

The following study addresses a case report of penetrating scrotal trauma by a metal bar in the emergency room of the Sorocaba Hospital Complex. This case encouraged the search for other reports based on a mechanism of trauma that is not very prevalent and the production of a systematic review based on other cases obtained in the current medical literature. The studies analyzed were obtained exclusively from the PubMed and Scielo databases. In order to select the appropriate studies, the advanced search tools 'perforating scrotal lesions' and 'transfixing scrotum lesions' were used, in addition to the 'case report' filter. There was no restriction on the date or nationality of the study.

Based on the bibliography obtained, a table was created, which will be shown below, structured in 6 columns, which are the numeral identification of the report within this article, its authors, the number of patients within the report, the mechanism of trauma, the diagnostic method and the conduct in the face of the accident. From the

table, the qualitative data, especially the conduct of the cases, could be more easily observed, which facilitated the performance of a descriptive analysis of the information. This analysis, in addition to the description of a case report of its own, provided us with the support for the construction of a flowchart about the treatment of perforating scrotum injuries, making it possible to achieve the objective of the study.

4 RESULT

From the analysis of 19 articles containing case reports with the trauma mechanism evaluated, added to the description of the case in our service, we obtained a sample of 21 cases involving perforating scrotal injuries. Based on the data obtained from these reports, the following percentages of imaging tests were requested: US in 33.33% of the cases; X-ray in 28.57%; Computed Tomography in 33.33%; Cystoscopy in 4.76% and Urethrography in 9.52%.

Regarding the approach to trauma: scrotal surgical exploration was performed in 71.42% of the cases; exploratory laparotomy in 19.04%; incisions on the route in 9.52%; debridement in 47.61%; Penrose drain was used in 28.57%; primary closure at 80.95%; Closing by second intention in 4.76% of the cases. In the remaining cases, the closure of the lesion was not explicit.

In view of the survey of the aforementioned data, it was possible to perform a flowchart of care for penetrating scrotal trauma. Taking into account primary care and evaluation of testicular, spermatic cord, penile, urethral and non-genitourinary structures.

5 DISCUSSION

Proper management of penetrating scrotal trauma is of paramount importance to save genital structures that may have been affected in the trauma. In parallel with our study, in the cases of Zhang⁷, Wen¹³ and Ofori²⁰, there was also scrotal involvement by a metal bar. In Zhang⁷, several structures of the body were affected by the bar, which required an abdominal computed tomography scan as an imaging method to evaluate tissue involvement. Regarding scrotal damage, the conduct was surgical exploration, in addition to debridement of non-viable tissues and primary closure. In Wen¹³, the lesion extended to the abdomen. Therefore, a simple abdominal X-ray and computed tomography were requested to assess the extent of

the lesion. The approach in this case was the delicate removal of the metal bar, with subsequent insertion of a Jackson-Pratt drain. There were no lesions in scrotal structures, and only saline irrigation of the wound was performed. Finally, Ofori²⁰ only needed evaluation through physical examination before performing surgical exploration with debridement and placement of a penrose drain.

Thus, after analyzing the cases listed above and their conducts, we assess that in the face of scrotal trauma, we should initially perform primary care following the protocol described by the ATLS, with the stabilization of the patient's vital signs, as well as any other trauma victim. Once stable, broad-spectrum antibiotic prophylaxis should be initiated, in addition to the tetanus vaccine.

During the complementary evaluation, a specific physical examination of the scrotum is performed in order to evaluate deep structures, which include the testicle, spermatic cord, penis, urethra, and non-genitourinary structures, such as vessels and nerves. If the physical examination is normal, scrotal repair is performed in the emergency room. However, if there is a suspicion of injury to any of the segments listed above, the patient must undergo different procedures. Signs of testicular or spermatic cord injury require the performance of a color Doppler USG; signs of penile injury point to the need for a cavernography; signs of urethral injury require retrograde urethrography for diagnostic complementation; and finally, in cases of lesions involving non-genitourinary structures, the physician should evaluate whether there is blood in the digital rectal examination, and if positive, indicate a rectosigmoidoscopy; in addition, the pulses in the lower limbs should be checked, and if altered, an arteries Doppler ultrasound or arteriography should be requested.

If the complementary examination is altered, the approach involves surgical exploration and subsequent debridement of any non-viable tissue. During exploration, the surgeon needs to pay attention so as not to injure structures of the spermatic cord and the vas deferens. The goal of the exploration is to save the gonads, control infectious, and maintain hemostasis. However, penetrating trauma often causes testicular injury, with values between 32 and 65%, and orchiectomy is often necessary.¹

In the case described, it was initially seen that the patient was hemodynamically stable, and antibiotic prophylaxis and tetanus vaccine were then performed, as recommended. Regarding the physical examination of the scrotum, it

was negative for lesions of other organs or active bleeding, which allowed the surgeons to take the patient to the operating room without the need to request other imaging tests, as described above. The excision of the metal bar was done, in addition to a surgical exploration to assess damage, which was not observed. In this way, only the repair of the affected skin was done.

6 CONCLUSION

Because this is a diverse case with variable clinical presentations and different forms of injury to the scrotal structures, it is important that reports such as this one be published in order to increase the arsenal of colleagues in specialties to have versatility in the surgical approach and techniques at the time of lesion interventions such as those presented in this review.

ABSTRACT

This study investigates the influence of social security benefits on the lives of settled families in two rural territories in São Paulo: Horto de Ibitiúva (Pitangueiras/SP) and Formiga (Colômbia/SP). We analyzed the application of social security resources, changes in quality of life, and challenges faced by these special insured individuals. The research covered 32 plots with permanent benefits in Horto de Ibitiúva (out of a total of 43) and 30 in Formiga (out of a total of 61), representing a significant sample of the titleholding families. It was observed that 62.5% of respondents in Horto de Ibitiúva and 36.7% in Formiga allocate part of their resources to purchase agricultural inputs, indicating the benefit's importance as production support. Additionally, these resources contribute to leisure, travel, and essential shopping, promoting an increase in food security, financial autonomy, and overall quality of life. The methodology included structured and semi-structured questionnaires, interviews with pioneers, and consultation of databases such as ITESP and INCRA, as well as specialized literature. The results highlight the fundamental role of social security in keeping families in the countryside, supporting the sustainability of family farming, and reducing inequalities. However, significant challenges persist in access and understanding of regulations by beneficiaries, often leading to judicialization. The research offers insights for developing more effective public policies focused on debureaucratization and valuing the special insured.

RESUMO

Este estudo investiga a influência dos benefícios previdenciários na vida de famílias assentadas em dois territórios rurais de São Paulo: Horto de Ibitiúva (Pitangueiras/SP) e Formiga (Colômbia/SP). Analisamos a aplicação dos recursos previdenciários, as mudanças na qualidade de vida e os desafios enfrentados por esses segurados especiais. A pesquisa abrangeu 32 lotes com benefícios permanentes em Horto de Ibitiúva (de um total de 43) e 30 em Formiga (de um total de 61), representando uma amostra significativa das famílias

titulares. Observou-se que 62,5% dos entrevistados em Horto de Ibitiúva e 36,7% em Formiga aplicam parte dos recursos na aquisição de insumos agropecuários, indicando a importância do benefício como suporte à produção. Além disso, os recursos contribuem para o lazer, viagens e compras essenciais, promovendo um aumento na segurança alimentar, autonomia financeira e qualidade de vida geral. A metodologia incluiu questionários estruturados e semiestruturados, entrevistas com pioneiros e a consulta a bancos de dados como ITESP e INCRA, além de literatura especializada. Os resultados destacam o papel fundamental da previdência social na fixação das famílias no campo, na sustentabilidade da agricultura familiar e na redução das desigualdades, embora persistam desafios significativos no acesso e na compreensão das normas pelos beneficiários, muitas vezes levando à judicialização. A pesquisa oferece insights para a formulação de políticas públicas mais eficazes, focadas na desburocratização e na valorização do segurado especial.

RESUMEN

Este estudio investiga la influencia de las prestaciones de seguridad social en la vida de familias asentadas en dos zonas rurales de São Paulo: Horto de Ibitiúva (Pitangueiras/SP) y Formiga (Colômbia/SP). Se analizó la aplicación de los recursos de seguridad social, los cambios en la calidad de vida y los retos que enfrentan estas personas aseguradas. La investigación abarcó 32 parcelas con prestaciones permanentes en Horto de Ibitiúva (de un total de 43) y 30 en Formiga (de un total de 61), lo que representa una muestra significativa de las familias beneficiarias. Se observó que el 62,5% de las personas entrevistadas en Horto de Ibitiúva y el 36,7% en Formiga destinan parte de los recursos a la adquisición de insumos agrícolas, lo que indica la importancia de la prestación como apoyo a la producción. Además, los recursos contribuyen al ocio, los viajes y las compras esenciales, lo que promueve una mayor seguridad alimentaria, autonomía financiera y una mejor calidad de vida en general. La metodología incluyó cuestionarios estructurados y semiestructurados, entrevistas con pioneros y la consulta de bases de datos como ITESP e INCRA, además de literatura especializada. Los resultados resaltan el papel fundamental de la seguridad social para mantener a las familias en las zonas rurales, garantizar la sostenibilidad de la agricultura familiar y reducir las desigualdades, si bien persisten importantes desafíos en el acceso a la normativa y su comprensión por parte de los beneficiarios, lo que a menudo deriva en litigios. La investigación ofrece perspectivas para la formulación de políticas públicas más eficaces, centradas en la reducción de la burocracia y la valoración de los asegurados especiales.

Palabras clave: Asentamientos Rurales. Reforma Agraria. Seguridad Social. Asegurados Especiales. Prestaciones de Seguridad Social.

1 INTRODUCTION

Social security, in its various facets, has been an intrinsic concern of human existence, evolving from rudimentary protection mechanisms to formalized systems. In the Brazilian context, this trajectory is marked by significant advances, especially with the enactment of the Federal Constitution of 1988 (CF/88), which established social security as a fundamental tripod – health, assistance and social security – and expanded rights to several categories, including rural workers. This normative framework was consolidated with Law No. 8,213/1991, which defined the "special insured", a crucial category for understanding the socioeconomic dynamics in the countryside (BRASIL, 1991b).

The "special insured" encompasses producers, partners, sharecroppers, fishermen and beneficiaries of agrarian reform settlements who carry out their activities in a family economy regime. This classification, while essential for social protection, is often obscured by bureaucratic requirements and the need for proof of rural activity, which proves to be a persistent challenge. The National Institute of Social Security (INSS), by requiring documentation of material evidence that many workers do not have. This constitutional right is denied. Leading to the search for judicial protection to guarantee their rights.

Despite the barriers, the realization of access to social security benefits has a transformative power in the lives of the settlers. The resources obtained not only meet basic needs, but also enable investments in agricultural production, improve housing conditions, health and promote leisure, elements that contribute to the dignity and permanence of families in the countryside. Social Security, therefore, transcends the mere welfare function, acting as a pillar of social and economic development in historically marginalized regions.

The present research is part of this panorama, seeking to analyze the influence of social security benefits in two rural settlements in the state of São Paulo: Horto de Ibitiúva, in Pitangueiras, and Formiga, in Colombia. The study aims to unravel how these financial resources impact the socioeconomic dynamics and quality of life of settled families. The specific objectives that guide this research are:

Analyze the patterns of use of financial resources from social security benefits by settled families;

Identify changes in the quality of life and family structure of beneficiaries after obtaining retirement or pension, with special attention to the impact when the benefit is received by women;

- Evaluate the participation of settled families in public policy programs (such as PAA, PNAE, PPAIS and Pronaf) and the possible relationship with the receipt of social security benefits;
- Investigate the challenges faced by family farming in the settlements and the way in which social security resources contribute to the permanence of families on the land and the improvement of their social conditions;
- Examine whether the benefits are used for the purchase of agricultural inputs, and how this affects agricultural production and family income;
- To analyze the perception of the settlers about the titling and practices of partnerships/leases in relation to social security benefits.

By addressing these points, it is expected to offer an in-depth understanding of the reality of the settlements studied, as well as to contribute to the academic debate and provide subsidies for the formulation of fairer and more effective public policies that promote territorial development and social inclusion in rural areas.

1.1 LITERATURE REVIEW AND THEORETICAL FOUNDATION

Rural social security in Brazil is a vast and complex field, permeated by historical, legislative and socioeconomic nuances. The discussion on the influence of social security benefits on the lives of rural settlers requires an in-depth analysis of the existing literature, which ranges from the evolution of social protection in the country to the particularities of the special insured regime and its impacts on the social and economic reproduction of families.

Social protection, in a broad sense, goes back to ancestral forms of solidarity. However, its formalization and institutionalization are more recent phenomena. The article highlights that the Brazilian Social Security had its first formal registrations in 1821, with the granting of retirement to teachers, and the Mexican Constitution of 1917 is pointed out as a precursor milestone in the inclusion of social rights, influencing Brazilian constitutionalism, especially the CF/88 (BRASIL, 1988).

A crucial moment in the formalization of social security in Brazil was the enactment of the Eloy Chaves Law (Decree No. 4,682/1923), which regulated the Retirement and Pension Funds (CAPs) for specific professional categories, such as railroad and seafarers. This initial phase, however, was markedly urban and corporatist, with social protection linked to contributions and formal employment. Rural workers, in turn, remained on the margins of

these systems for a long period, reflecting the economic duality of twentieth-century Brazil, with the predominance of large estates and incipient industrialization in the cities (ABREU *et al.*, 2016).

The CF/88 represented a watershed, consolidating the concept of the Welfare State and the tripartite social security system. For the countryside, the great innovation was the universalization of rural social security and the creation of the figure of the "special insured", establishing the equalization of social security rights between rural and urban workers. This advance was regulated by Laws No. 8,212/91 and No. 8,213/91, which defined the criteria for classification and benefits.

1.2 THE SPECIAL INSURED REGIME: RIGHTS AND CHALLENGES

The concept of "special insured" covers a wide range of rural workers, including producers, partners, sharecroppers, fishermen and settlers, who work in a family economy regime. This regime is characterized by the indispensability of the work of family members for the subsistence and socioeconomic development of the family nucleus, without the use of permanent employees (BRASIL, 1991a). The legislation allows occasional assistance from third parties, but imposes clear limits on the area explored (up to 4 tax modules)¹ and on income from other sources.

Despite the clarity of the law, the practical application of the concept of special insured is full of ambiguities and challenges. Proof of rural activity, essential for access to benefits, often becomes a bureaucratic obstacle. The lack of formal documentation, the informality of rural activities, and the lack of knowledge of rights are recurrent obstacles, as pointed out by Lima, Silva and Braga (2024), Thethê and Pestana (2024) and Moreira and Santana Junior (2024).

A central point in the discussion about the special insured is their form of contribution. Many critics argue that these workers receive benefits "without contributing," generating a perception of injustice toward urban workers. However, CF/88 (art. 195, § 8) establishes an indirect contribution, calculated on the gross revenue from the commercialization of production, showing that there is, indeed, a participation in the cost of the system, even if differentiated (ELIZIÁRIO, 2017). The normative complexity, with sometimes subjective rules, leads to a high incidence of judicialization, where the administrative decisions of the INSS are often judicially reversed (SANTINI, 2024; OLIVEIRA, 2012; MARANHÃO; VIEIRA FILHO, 2018).

1.3 SOCIOECONOMIC IMPACTS OF SOCIAL SECURITY BENEFITS IN RURAL AREAS

The literature is abundant in demonstrating the multifaceted impact of social security benefits on the lives of rural workers and their families:

Studies such as those by Delgado and Cardoso Junior (1999), Beltrão, Oliveira and Pinheiro (2000), Brumer (2002) and Castro (2017) consolidate the idea that rural social security is one of the main mechanisms for reducing poverty and social inequality in the countryside. The benefits guarantee a minimum income that, in many families, is essential for food security, investments in health, education and improvements in housing conditions. In regions such as the South and Northeast, social security income can represent a substantial portion of household income, keeping many families above the poverty line.

Social security income not only guarantees subsistence, but also works as "agricultural insurance", allowing families to invest in their productive activities. Velleda (2008) and Delgado and Cardoso Júnior (1999) point out that the social security benefit can be used to finance the purchase of inputs, equipment and even to cover losses in bad harvests. This directly contributes to the continuity of family farming and to the establishment of families in the countryside, avoiding rural exodus, especially in small municipalities, as demonstrated by Chies and Rocha (2015) and Schiefelbein (2010). Retirement often allows the elderly to remain on their properties, maintaining their way of life and identity (SIMONATO and BERGAMASCO, 2021).

1.3.1 Women's Autonomy and Local Economic Dynamization

The inclusion of rural women as direct beneficiaries of social security is an aspect of great relevance. Santos (2022), Marin (2023) and Souza (2023, 2024) show that social security is crucial for the income autonomy of peasant women, reducing sexist violence and expanding their participation in family funding. This financial autonomy transforms the social role of women, going from dependent to provider. In addition to the direct impact on families, the social security resources injected into rural areas boost local economies, boosting trade and services in small municipalities, configuring an important redistributive character (ELIZIÁRIO, 2017; BARBOSA; RÔMULO, 2007; BRUMER, 2002).

1.4 CONTEMPORARY CHALLENGES AND FUTURE PERSPECTIVES

Despite the advances, the rural social security system faces challenges. Rodrigues (2018) projects a continuous increase in the number of beneficiaries, warning of the need for

structural reforms to ensure the sustainability of the system in the face of population aging and the growing deficit. Recent reforms, such as Constitutional Amendment No. 103/2019, although not directly changing the age and contribution time requirements for the special insured, impose new requirements and indirect barriers, such as the digitalization of services, which affect the most vulnerable populations (SOUZA, 2024).

The persistence of "biases" in the granting of pensions, identified by Kreter and Bacha (2006) – favoring men, whites and more educated people – and the need for specific policies for indigenous populations (SOUZA; STADUTO; KRETER, 2018) point to the importance of transversal and intersectional approaches in public policies.

The systematic review presented in Eliziário's thesis (2025), which covers national studies published between 1999 and 2024, reinforces these analyses by highlighting the scarcity of research aimed at retirees living in rural settlements in the State of São Paulo, revealing a knowledge gap that the present study seeks to fill. In addition, the author revisits specific works on the São Paulo context (ELIZIÁRIO; FERRANTE; HERRMANN, 2018; SIMONATO; BERGAMASCO, 2021), which already indicated both the relevance of social security benefits for the maintenance of settled families, and the insufficiency of agricultural income as the main source of livelihood.

2 MATERIAL AND METHODS

The investigation on the influence of social security benefits on the lives of rural settlers was designed with a predominantly qualitative and exploratory methodological approach, using the multiple case study as a central strategy. The choice for this approach is justified by the complexity of the phenomenon studied, which involves social, economic, cultural and legal dimensions, and by the need to understand the contextual particularities of the settlements.

The study adopts a multiple case study design, focusing on two rural settlements located in the state of São Paulo: Horto de Ibitiúva, in the municipality of Pitangueiras, and Formiga, in the municipality of Colombia. The selection of these settlements allowed a comparative analysis of different realities, but with common characteristics that qualify them as territories of special insured, enriching the discussion on the impacts of social security. The exploratory nature of the research made it possible to identify relevant variables and to delve into emerging aspects of the interaction between beneficiaries, their communities and the social security system.

2.1 CHARACTERIZATION OF THE STUDY SITES

2.1.1 Horto de Ibitiúva Settlement (Pitangueiras/SP)

The Horto de Ibitiúva Settlement is a rural territory located in Pitangueiras/SP. It was formed from a process of agrarian reform, consolidating itself over the years. Currently, it consists of 43 agricultural lots, housing 60 titular families and a total of 178 people. Its average area per lot (11.50 ha) fits it into the category of special insured, according to the criteria of the fiscal module. The community has a rich history, marked by the struggle for land and the construction of new forms of life and production. Agricultural production, although diversified, faces challenges inherent to family farming (Figures 1 and 2).

Figure 1

Location of Ibitiúva – Pitangueiras/SP

Source: Google Maps (2023).

Figure 2

View of the area of the Horto de Ibitiúva Settlement – Pitangueiras/SP

Source: Google Earth (2023).

2.1.2 Formiga Settlement (Colombia/SP)

Located in Colombia/SP, the Formiga Settlement consists of 61 lots and 91 titular families, totaling 193 people. Like Ibitiúva, its average area per lot (14.50 ha) categorizes it as a settlement of special insured. Formiga's history, from its initial occupation to the consolidation phase, reflects the vicissitudes and resilience of social movements on land in Brazil. The community is dedicated to various agricultural activities, seeking subsistence and local development.

The historical reconstruction of both territories, as pointed out in the article, covers the formation process, the demographic and socioeconomic situation of the families, the current situation of titling and the existing partnerships/leases. This contextualization is fundamental to understand the internal dynamics and the way in which social security benefits are inserted in the life of these settlements (Figures 3 and 4).

2.2 POPULATION AND SAMPLE

The target population of the survey included all families receiving permanent social security benefits (retirements or pensions) in both settlements. In Horto de Ibitiúva, the owners and spouses of 32 lots with permanent benefits were investigated. In the Formiga settlement, the sample consisted of the holders and spouses of 30 lots that receive these benefits. This selection allowed us to focus directly on the experiences of those impacted by social security benefits. In addition, interviews were conducted with three pioneers from each territory. The choice of the pioneers is justified by their ability to provide a historical and in-depth perspective on the formation and transformations of the settlements, enriching the analysis of the social reproduction of families over time.

For data collection, multiple instruments were used, seeking triangulation and coverage:

- **Structured and Semi-Structured Questionnaires:** Applied to all heads of household or spouses who receive permanent social security benefits. The questionnaires sought to collect socioeconomic data, information on the benefit received, its use, perceptions about quality of life, participation in public policies and other relevant issues;

- **Semi-Directive Interviews:** Conducted with the three pioneers of each settlement. This technique allowed us to explore narratives, memories, and opinions about the history of the settlement, the struggles for rights, the evolution of living conditions, and the role of social security benefits from a more in-depth perspective;
- **Field Diary:** The researcher kept a field diary, recording observations, impressions, interactions, and informal contexts. This instrument is valuable for capturing nuances and contextual data that complement the formal information collected.

The survey complemented the primary data with the survey and analysis of secondary sources, including:

- **Institutional Databases:** Information from the Land Institute Foundation of the State of São Paulo (ITESP) and the National Institute of Colonization and Agrarian Reform (INCRA) were consulted to contextualize the land, demographic and productive situation of the settlements;
- **Specialized Literature:** Theses, dissertations, scientific articles and books related to rural social security, agrarian reform, special insurance and territorial development were reviewed to support the theoretical discussion and compare the findings of the research with the consolidated knowledge in the area.

The data analysis followed a predominantly qualitative approach, with the use of content analysis for the interviews and open questions of the questionnaires. The quantitative data, obtained by the closed questions of the questionnaires, were tabulated and presented by means of descriptive statistics (frequencies and percentages), illustrated with figures and charts, to characterize the population and the patterns of use of the benefits. The triangulation of data from different sources and instruments allowed a more robust interpretation of the results.

The study was conducted in strict accordance with the ethical precepts of research involving human beings. All participants were duly informed about the objectives of the research, guaranteeing them the right to confidentiality, anonymity and the possibility of withdrawing at any time. The Informed Consent Form (ICF) was signed by the participants, and the procedures were approved by the Research Ethics Committee, aiming at responsible research and is duly approved under CAAE No. 84862624.3.0000.5383.

3 RESULTS AND DISCUSSION

The analysis of the data collected in the Horto de Ibitiúva and Formiga settlements revealed a series of impacts and complex dynamics related to the influence of social security benefits on the lives of rural settlers. The results will be presented and discussed in order to dialogue with the literature and the proposed objectives.

The settlements studied, Horto de Ibitiúva and Formiga, represent microcosms of the reality of agrarian reform in São Paulo. Horto de Ibitiúva, with its 43 lots and 60 families (178 people), and Formiga, with 61 lots and 91 families (193 people), demonstrate the persistence of family farming in a context of great transformations. The average area per lot in Ibitiúva (11.50 ha) and Formiga (14.50 ha) fits them into the category of special insured, although the area of the fiscal module in the region is higher (64 ha and 88 ha, respectively).

The demographic analysis of the interviewees who receive social security benefits in the Formiga Settlement reveals a mostly female profile, indicating a significant presence of women among the beneficiaries. This predominance may be associated with higher life expectancy and the growing participation of women in formal and community activities, which guarantees them access to social security rights.

It is observed, however, that men still represent a significant portion of retirees and pensioners, which may reflect longer work trajectories or early start of productive life.

These data reinforce research and literature on the growing inclusion and protagonism of women in the rural social security system (SANTOS, 2022; MARIN, 2023; SOUZA, 2023). The average age of the beneficiaries suggests that rural age retirement, with its different age requirements for men and women (60 and 55 years, respectively), is the most common benefit.

The level of education showed that most of the beneficiaries have a low educational level, which can aggravate the difficulties in understanding norms and digital access to social security services, a contemporary challenge pointed out by Souza (2024) (Figure 5).

Figure 5

Level of education of the interviewees

Source: Research data, 2024.

During the period of arrival, it is observed that most arrived at the beginning of the formation of the settlement (Figure 6). It shows that many beneficiaries have been consolidated on the land for a long time, which is in line with the idea that social security acts as a fixation factor in the countryside (SCHIEFELBEIN, 2010). The permanence of families in the settlements is a relevant fact.

Figure 6

Period of arrival at the settlement

Source: Research data, 2024.

The analysis of the residence of the spouses in the settlements shows different realities between the Formiga Settlement and the Horto de Ibitiúva Settlement.

In the first, there is a strong marital cohabitation, with 87% of the interviewees declaring that the spouse lives in the settlement. This data suggests greater family stability and territorial settlement, reflecting solid community ties and a consolidated domestic structure around the lot.

On the other hand, in the Horto de Ibitiúva Settlement, only 53% stated that the spouse resides in the place, while 47% indicated the opposite. This significant difference may be related to external work dynamics, temporary separations for economic reasons, or different family configurations, such as unions in which only one of the partners remains on the lot.

Most respondents share the lot with others, with some families being larger than others. Another indication of a strong family nucleus in the settlements (Figure 7). It is common in the lots of the 2 territories to have more than one house in the agricultural lots, where the children or a relative lives.

Figure 7

Number of people living on the lot

Source: Research data, 2024.

The analysis regarding the children's residence in the lots reveals relevant differences between the two settlements surveyed.

In the Formiga Settlement, 77% of the interviewees stated that their children still reside on the lot, while 23% stated the opposite. This result demonstrates a strong family permanence, indicating that the lot continues to be the main space for coexistence and sustenance of families, possibly due to the continuity of agricultural activities and community cohesion.

In the Horto de Ibitiúva Settlement, 69% of the children live on the lots, while 31% no longer live there. Although the percentage of permanence is still high, there is a greater tendency for young people to leave, which may be related to searches for work, study or new opportunities outside the settlement.

Regarding the number of houses per lot, these data show the importance of social security income for the maintenance of the family group, often in more than one residence per lot (Figure 8).

Figure 8

Number of houses per lot

Source: Research data, 2024.

In terms of production, the main activities performed in the batches (Figure 9). In the Formiga Settlement, the creation of dairy and beef cattle stands out, and in the Ibitiúva Settlement, the planting of cassava and sugar cane.

Figure 9

Main activities performed in the lot

Source: Research data, 2024.

3.1 THE APPLICATION OF SOCIAL SECURITY BENEFITS AND THE IMPROVEMENT OF QUALITY OF LIFE

The results of this study corroborate the literature that highlights the central role of social security benefits in the social and economic reproduction of settled families. The survey revealed that a significant portion of respondents use retirement or pension resources beyond basic subsistence:

Investment in Production: in Horto de Ibitiúva, 62.5% of the interviewees, and in Formiga, 36.7%, apply social security resources in the acquisition of agricultural inputs, such as seeds, fertilizers and feed. This data is crucial, as it demonstrates the role of social security as an "agricultural insurance" (DELGADO; CARDOSO JÚNIOR, 1999) and as capital for production, allowing family farmers to maintain their productive activities, even in the face of insufficient income generated exclusively by farming, as already observed by Eliziário, Ferrante and Herrmann (2018).

Improved Quality of Life: Resources are also directed to leisure, travel, and grocery shopping (Figure 10). This indicates an improvement in quality of life that goes beyond the basics, providing moments of rest and consumption that would previously be inaccessible. This dynamic aligns with Simonato and Bergamasco's (2021) observation that retirement

contributes to a sense of tranquility and security, allowing for well-being and permanence in the countryside.

Figure 10

What has changed with the benefit

Source: Research data, 2024.

Food Security and Financial Autonomy: The general perception of beneficiaries is of an increase in food security and financial autonomy. The constant and predictable income of social security mitigates the vulnerability inherent to agricultural activities, subject to bad weather and market fluctuations. For women, especially, the income provided by retirement has redefined social roles, guaranteeing them greater autonomy and decision-making power within the family and community, as argued by Santos (2022) and Souza (2023).

Income Sharing and Financing: Social security income is often shared with other family members (Figure 14), which demonstrates its role in sustaining the family nucleus.

The analysis of the way family income is managed in the settlements shows a majority trend of sharing financial resources among family members, although with differences between the territories.

In the Formiga Settlement, 63% of respondents stated that income is shared among family members, while 37% indicated that income is managed individually. This division shows a predominance of collective management, which may be associated with family organization aimed at economic cooperation, especially in contexts where production and consumption are strongly interconnected with work on the lot.

In the Horto de Ibitiúva Settlement, the proportion of shared income is even more expressive, reaching 72%, against 28% of individual management. This result reinforces the presence of a culture of solidarity and economic co-responsibility, possibly driven by joint productive activities and more cooperative family structures.

The analysis of access to financing by the settlers reveals a moderate level of use of rural credit, with noticeable differences between the two settlements surveyed.

In the Formiga Settlement, 57% of respondents said they had already taken out some type of financing, while 43% had never accessed credit. This result indicates a reasonable integration with agricultural development policies, suggesting that a significant part of the families was able to mobilize financial resources for productive investment, whether in the purchase of inputs, equipment or in the improvement of the infrastructure of the lots.

In the Horto de Ibitiúva Settlement, the proportion is slightly reversed: 47% of the settlers have already resorted to financing, and 53% have never done so. This difference may be associated with difficulties in accessing rural credit, such as bureaucratic requirements, lack of guarantees, or lack of adequate technical guidance.

3.2 CHALLENGES IN ACCESSING BENEFITS AND JUDICIALIZATION

Despite the positive impacts, access to social security benefits for special insured persons is still a process marked by bureaucratic difficulties and the persistence of judicialization. The survey revealed that:

Need for Legal Action: A considerable portion of the benefits were granted judicially (Figure 16), rather than administratively by the INSS. This corroborates the conclusions of Santini (2024), Oliveira (2012) and Maranhão and Vieira Filho (2018) about subjectivity in the analysis of rural activity and the divergent interpretations between the INSS and the Judiciary. The need to resort to lawyers to guarantee the right increases the costs and complexity for beneficiaries.

In the Formiga Settlement, 67% of the participants said they had needed a lawyer, while 33% had never needed this type of support. This data suggests a significant demand for legal guidance, possibly related to land, social security, contractual or family issues, which require legal mediation.

In the Horto de Ibitiúva Settlement, the proportion is similar, although slightly lower: 59% declared that they had already resorted to a lawyer, against 41% who did not need to. This proximity between the percentages indicates that the presence of conflicts or legal

demands is a common reality in rural settlements, which reinforces the importance of accessible and continuous legal aid services in these communities.

Slowness in the Process: The expected period for receiving the benefit (Figure 11) is often long, generating anxiety and financial difficulties during the wait.

Figure 11

Expected period for receiving the benefit

Source: Research data, 2024.

These challenges are accentuated by the lack of formal documentation, informality of rural work and lack of knowledge of rights, elements frequently mentioned in the literature (LIMA; SILVA; BRAGA, 2024; THETHÊ; PESTANA, 2024; MOREIRA; SANTANA JUNIOR, 2024).

3.3 PARTICIPATION IN PUBLIC POLICIES AND COMMUNITY ARTICULATION

Participation in public policies is an indicator of the integration of settlers in the support networks and promotion of family farming. The research investigated adherence to programs such as PAA (Food Acquisition Program), PNAE (National School Feeding Program), PPAIS (São Paulo Program for the Acquisition of Social Interest) and Pronaf (National Program for the Strengthening of Family Agriculture).

The analysis shows a low adherence of the settlers to government programs, both in the Formiga Settlement and in the Horto de Ibitiúva.

In the Formiga Settlement, only 33% of respondents said they participated in some public policy, while 67% declared that they were not included in any program. This proportion suggests a fragility in the articulation between the government and the community, which may result from lack of information, excessive bureaucracy or discontinuity of government actions aimed at rural areas.

A similar situation is observed in the Horto de Ibitiúva Settlement, where 34% participate in public policies and 66% are not linked to any initiative. The percentage coincidence between the two territories points to a pattern of exclusion or underutilization of social policies, possibly related to the lack of technical assistance, institutional support and local integration mechanisms.

The data reveal the need to strengthen public policies aimed at rural settlements, with an emphasis on information, training and expansion of the settlers' access to promotion, social assistance and sustainable development programs.

In general, the results highlight that public procurement policies, especially the PAA and PNAE, are the main instruments for strengthening family farming, although with different degrees of consolidation and scope among the settlements analyzed (Figure 12).

Figure 12

What type of public policy

Source: Research data, 2024.

3.4 INFRASTRUCTURE, CONNECTIVITY AND WORK DYNAMICS

Basic infrastructure and connectivity are essential elements for the development of settlements. The survey addressed the type of water supply and its use, access to telephone and solar energy. This data provides a snapshot of living conditions and technological barriers that can affect access to information and services.

Regarding internet access, in the Formiga Settlement, 93.3% of people have access via radio, while in Horto do Ibitiúva, 75% use internet through a provider. In Horto, 15.6% people access the internet by rural cell phone, while only 3.3% people in Formiga use this technology. In total, 3.3% of people in Formiga and 9.4% in Horto reported not having internet at home.

As for the quality of the internet, 93.1% of people in the Formiga Settlement classified the connection as good, against 62.5% in Horto do Ibitiúva. However, 6.9% of people in Formiga and 34.4% in Horto consider the internet regular. In Horto, 3.1% of people did not answer this question.

Finally, in terms of telephone, both in the Formiga Settlement and in Horto do Ibitiúva, the majority of families, 90.6% and 93.3% people, respectively, use conventional cell phones. Only 3.3% of people in the Formiga Settlement and 9.4% in the Horto de Ibitiúva Settlement use rural cell phones, and 3.3% of people in Formiga reported not having a telephone.

The data report that both settlements have a significant dependence on artesian wells for water supply, use mostly water for domestic use and animal husbandry, have good internet and cell phone coverage, with variations in the types of internet and telephone access.

Regarding the number of people who work on the lot, in the Horto do Ibitiúva Settlement, 65.6% of the interviewees stated that members of the family nucleus work as salaried workers, which represents a considerable difference in relation to the Formiga Settlement. This data suggests that there is a greater integration of the family components of the Formiga Settlement into the formal labor market, or a need to supplement the income generated by the activities on the lot.

According to the data, in both settlements, most people still depend on working on the lot as their main source of livelihood, with a higher prevalence in the Formiga Settlement. However, the percentage of people in the family who seek salaried work is higher in Horto do Ibitiúva, 61.1% more than 2 people. Suggesting that the settlers of this place have a greater diversification of income. This difference can be a result of factors such as access to local

labor markets, educational opportunities, or different levels of mechanization and agricultural infrastructure between settlements.

In the Horto do Ibitiúva Settlement, 65.6% of the interviewees stated that members of the family nucleus work as salaried workers, which represents a considerable difference in relation to the Formiga Settlement. This data suggests that there is a greater integration of the family components of the Formiga Settlement into the formal labor market, or a need to supplement the income generated by the activities on the lot.

According to the data, in both settlements, most people still depend on working on the lot as their main source of livelihood, with a higher prevalence in the Formiga Settlement. However, the percentage of people in the family who seek salaried work is higher in Horto do Ibitiúva, 61.1% more than 2 people. Suggesting that the settlers of this place have a greater diversification of income. This difference can be a result of factors such as access to local labor markets, educational opportunities, or different levels of mechanization and agricultural infrastructure between settlements.

The results of the survey in the Horto de Ibitiúva and Formiga settlements provide a rich tapestry of evidence that confirms and deepens the understanding of the multifaceted influence of social security benefits. They not only ensure livelihoods, but also act as engines of local development, ensuring the permanence of families in the countryside and promoting improvements in the quality of life, despite persistent bureaucratic challenges and the complexity of regulations.

4 FINAL CONSIDERATIONS

This study demonstrated the fundamental influence of social security benefits on the production and social reproduction of families in the rural settlements of Horto de Ibitiúva (Pitangueiras/SP) and Formiga (Colombia/SP). By analyzing the use of resources received from social security benefits, the transformations in the quality of life and the challenges faced by special insured persons, the research contributed significantly to the understanding of the reality of these territories.

The data confirm that retirement and pensions, far from being mere aids, function as a pillar of economic support, allowing the complementation of agricultural income, investments in inputs for production and the improvement of family infrastructure. This injection of resources translates into greater food security, financial autonomy and leisure possibilities, raising the quality of life of the settlers and contributing to the settlement of

families in rural areas. The central role of women as beneficiaries and managers of these resources emerges as a factor of autonomy and social transformation within the settlements.

However, the survey also exposed the persistent barriers to access to these rights. The high rate of judicialization to obtain social security benefits, the slowness of the processes and the vulnerability to scams and fraud show the urgent need to reduce bureaucracy and simplify the rules for proving rural activity. The complexity of qualifying as a special insured, the difficulties in obtaining formal documentation and the lack of knowledge about one's own rights contribute to this reality.

Participation in public policies to support family farming and access to technical assistance are crucial, but heterogeneous. Basic infrastructure and connectivity, although present to some extent, still pose challenges for the full inclusion and development of settlements.

The contributions of this study are multiple. Academically, it fills a gap in the literature on retirees in rural settlements in the State of São Paulo, deepening the debate on the intersection between agrarian reform, social security, and territorial development. Socially, it sheds light on the reality and demands of a group that is often made invisible, but which plays a fundamental role in food production and environmental conservation. Professionally, it offers data and analysis that can support the performance of rural extension workers, social workers, lawyers and public managers.

For public policy makers, the recommendations are clear:

- **Debureaucratization:** Implement more simplified and transparent mechanisms for proving rural activity, reducing dependence on judicialization;
- **Education and Guidance:** Promote information campaigns and social security education programs in the settlements, training farmers on their rights and duties;
- **Policy Integration:** Strengthen the articulation between social security policies and programs to promote family farming (PAA, PNAE, Pronaf), ensuring that benefits act as catalysts for productive development;
- **Technical Assistance and Access to Technology:** Expand and qualify the offer of technical assistance and promote digital inclusion, facilitating access to INSS services and relevant information.

This study, although limited to the two settlements analyzed, paves the way for future research. It is suggested that the scope be expanded to other settlements and regions,

longitudinal studies to monitor the impacts of social security reforms, and deepen the analysis of gender and race in access to benefits. Only with a careful look and coordinated policies will it be possible to ensure that social security continues to be an instrument of justice and transformation for Brazilian rural workers.

ABSTRACT

Despite significant advances in road safety research, gaps remain in measuring and monitoring the factors that determine severe traffic crashes. This study proposes the Critical Point Indicator for Fatal Traffic Crashes (CPIF), a tool designed to identify and prioritize highway segments with the highest concentration of fatalities. More than 2.1 million crash records were analyzed from 2007 to 2024, involving 4.7 million people and resulting in 121,661 deaths on Brazilian federal highways. The research also compared trends across three groups of countries — the nine largest by area, nine South American nations, and 22 European countries — revealing an increase in fatalities since 2019 and conceptual divergences regarding the definition of “critical point” among national and international institutions. The results highlight distinct spatial and causal patterns that demand targeted engineering and policy responses. The CPIF is presented as a decision-support instrument to optimize public investments, guide localized interventions, and contribute to achieving the UN and Brazil’s PNATRANS goal of reducing road deaths by 50% by 2030.

Keywords: Road Safety. Crash Hotspots. Performance Indicators. Public Policies. Safe System Approach.

RESUMO

Apesar dos avanços em pesquisas sobre segurança viária, persistem lacunas na mensuração e no monitoramento dos fatores que determinam os sinistros graves. Este estudo propõe o Indicador de Ponto Crítico de Sinistro de Trânsito com Óbito (IPCO), instrumento destinado a identificar e priorizar segmentos rodoviários com maior concentração de mortes. Foram analisados 2,1 milhões de registros de sinistros ocorridos entre 2007 e 2024 em rodovias federais brasileiras, envolvendo 4,7 milhões de pessoas e resultando em 121.661 óbitos. O estudo também comparou tendências em três grupos de países — nove de maior extensão territorial, nove sul-americanos e 22 europeus — identificando aumento das fatalidades a partir de 2019 e divergências conceituais sobre “ponto crítico” entre instituições nacionais e internacionais. Os resultados evidenciam padrões espaciais e causais distintos que demandam abordagens específicas de engenharia e gestão pública. O IPCO é apresentado como ferramenta de apoio à decisão para otimizar

investimentos, direcionar intervenções localizadas e contribuir para o alcance da meta da ONU e do PNATRANS de reduzir em 50% as mortes no trânsito até 2030.

Palavras-chave: Segurança Viária. Pontos Críticos. Indicadores de Desempenho. Políticas Públicas. Sistemas Seguros.

RESUMEN

A pesar de los avances en las investigaciones sobre seguridad vial, aún existen vacíos en la medición y el monitoreo de los factores que determinan los siniestros graves. Este estudio propone el Indicador de Punto Crítico de Siniestro de Trafico con Muerto (IPCO), una herramienta destinada a identificar y priorizar los tramos viales con mayor concentración de muertes. Se analizaron más de 2,1 millones de registros de siniestros ocurridos entre 2007 y 2024 en carreteras federales brasileñas, que involucraron a 4,7 millones de personas y resultaron en 121.661 fallecidos. El estudio también comparó las tendencias en tres grupos de países — nueve de mayor extensión territorial, nueve sudamericanos y 22 europeos — identificando un aumento de las fatalidades a partir de 2019 y divergencias conceptuales sobre el término “punto crítico” entre instituciones nacionales e internacionales. Los resultados evidencian patrones espaciales y causales diferenciados que exigen enfoques específicos de ingeniería y gestión pública. El IPCO se presenta como una herramienta de apoyo a la decisión para optimizar inversiones, orientar intervenciones localizadas y contribuir al cumplimiento del objetivo de la ONU y del PNATRANS de reducir en un 50% las muertes en el tránsito hasta 2030.

Palabras clave: Seguridad Vial. Puntos Críticos. Indicadores de Desempeño. Políticas Públicas. Sistemas Seguros.

1 INTRODUCTION

Since the 1960s, the **World Health Organization (WHO)** has recognized traffic accidents as a global public health problem, as discussed in 1962 and later reaffirmed in **Resolution WHA27.58 (1974)**. In 2004, the *World Report on Road Traffic Injury Prevention* (WRI) consolidated evidence on the magnitude of the problem, leading the UN to institute **World Health Day dedicated to Road Safety**. Despite successive international initiatives, such as **Resolution No. 64/255 (2010)**, which inaugurated the *Decade of Action for Road Safety 2011–2020*, and **Resolution No. 74/299 (2020)**, which established a new target by 2030, the results are still insufficient. Road traffic accidents remain at unacceptable levels, with **1.19 million deaths and about 50 million injuries annually**, especially in developing countries.

In addition to the human impact, the **economic costs** are significant, ranging from **0.4% to 4.1% of GDP** in 31 countries analyzed (Wijnen & Stipdonk, 2017), which highlights the need for more targeted and sustainable interventions. Both in the resolutions and in subsequent global plans, the *Global Plan for the Decade of Action for Road Safety 2011–2020 and the Global Plan 2021–2030*, **safe road infrastructure** is recognized as an essential pillar, in line with the **Safe Systems approach**, which is based on the principle that human error is inevitable, but roads must be designed to absorb it without causing fatalities (UN, 2010; Wegman, 2017).

In view of this scenario, the present study proposes the creation of a **Traffic Accident Critical Point Indicator with Death (IPCO)** as a strategic tool to **prioritize road stretches with the highest concentration of deaths** and guide short and medium-term public policies. In the Brazilian context, this proposal supports the achievement of the goals of the **National Plan for the Reduction of Traffic Deaths and Injuries (PNATRANS)**, instituted by Law No. 13,614/2018, and contributes to the UN agenda of reducing traffic deaths by 50% by 2030.

The investigation was based on **open data on fatal accidents** from OECD countries, **South America, China, Russia and India**, and, in the Brazilian case, on records from the **Federal Highway Police (PRF)**, covering the period from **2007 to 2024**, totaling **2.1 million occurrences, 4.7 million people involved, 1.17 million minor injuries, 404 thousand serious injuries and 121,661 deaths**.

The article is structured in six parts: introduction; methodology; theoretical framework; empirical analysis of accidents on federal highways; proposal and rationale of the **IPCO**; and considerations, with implications and recommendations for public policies

2 METHODOLOGY

The research developed has a quantitative, descriptive and comparative character, aimed at identifying patterns of concentration of accidents with deaths on Brazilian federal highways and the proposition of a Critical Point Indicator of Traffic Accidents with Death (IPCO). The study adopts a reactive approach, based on empirical data already recorded, according to the classification of *Fletcher et al.* (2020), privileging the analysis of claims that actually occurred as a reference for the planning of corrective interventions.

2.1 DATA SOURCES

Public and official databases were used. At the international level, the bases of the Organization for Economic Cooperation and Development (OECD) were used, as well as national organizations of South American countries, China, Russia and India, allowing comparisons between three groups:

- a) the nine countries with the largest territorial extension;
- b) the nine countries of South America;
- c) twenty-two European countries.

For the purposes of this comparison of Brazil with the three groups of countries, national data published by the Mortality Information System (SIM), linked to the Ministry of Health, which consolidates deaths in all routes: federal, state, and municipal routes, were used.

For the purposes of the study on the IPCO, which was limited to records of accidents on federal highways in Brazil, open data from the National Department of Transport Infrastructure (DNIT) and the Federal Highway Police (PRF) were used. The PRF database of records of traffic accidents that occurred on federal highways between 2007 and 2024, totaled 2,122,326 occurrences, with 4.7 million people involved, 1.17 million minor injuries, 404 thousand serious injuries and 121,661 deaths at the event site.

2.2 SAMPLING AND SELECTION CRITERIA

For analysis purposes, the federal highways were segmented into 1-kilometer stretches, totaling 74,344 km evaluated. A critical point of accident with death was considered to be any segment of 1 km with the occurrence of at least one accident with death in the period studied. Of the 74,344 km, 36,494 km (49%) had at least one death. The final sample

was composed of the 100 segments with the highest concentration of deaths, defined based on the following criteria:

- d) registration of deaths in at least five years, of the last ten in the time series;
- e) exclusion of stretches that, in the last three years (2022–2024), did not record deaths, to avoid segments that have undergone recent interventions.

The selection guaranteed a confidence level of 95% and a margin of error of less than 2%, giving representativeness to the sample.

2.3 ANALYSIS PROCEDURES

The data were organized and tabulated in electronic spreadsheets, and analyses of **frequency, spatial distribution and temporal recurrence were performed**. For each critical segment, the following were identified:

- a) the number of claims;
- b) the total number of deaths;
- c) the type of claim;
- d) the predominant cause;
- e) the characteristics of the road (single, double or multiple lane).

Based on these variables, a matrix of fatality concentration was elaborated, which supported the identification of critical segments, in descending order, that is, from the one with the highest number of deaths to the one with the lowest per 1km segment.

2.4 LIMITATIONS AND ETHICAL CONSIDERATIONS

The study is based exclusively on **public secondary data**, without personal identification, in compliance with the ethical principles of confidentiality and anonymization. The main limitations stem from possible inconsistencies in registration between years and the absence of complementary variables, such as traffic volume and local socioeconomic characteristics. Even so, the method adopted is **replicable and scalable**, and can be applied by public managers at different administrative levels.

2.5 INTERNATIONAL COMPARATIVE PROCEDURES

For the purposes of global contextualization, a comparative analysis of traffic mortality trends was conducted in three groups of countries:

- a) the nine countries with the largest territorial extension (including Brazil, China, India, the United States, Russia, Australia, Canada, Argentina and Kazakhstan);
- b) nine South American countries with consolidated data with the OECD and national authorities; and
- c) twenty-two European countries, selected for the availability of consistent data, between 2012 and 2022.

The information was obtained from OECD databases, the World Bank and official national sources, standardized to allow the comparison of annual variations and identification of trends.

3 THEORETICAL FRAMEWORK

There are several terms or expressions in the literature to identify the concentration of traffic accidents, such as hotspot, darkspot, critical point, critical segment, critical stretch or red area. All these definitions have in common a high concentration of claims occurring in the same location. Locations with a high concentration of claims can be described as high risk, hazardous, hot spots, or black spots. It is in these places that better performance is required from drivers, and that, therefore, engineering interventions can reduce performance requirements, increasing the safety margin between driver performance and the demand for road performance, specifically in that location, resulting in a lower probability of an accident (Verkeersonveiligheid, 2003).

Normally, the definition of critical point has a single objective, which is to explain the reason for this concentration of events in the same point, region, highway segment, etc. According to Anderson (2009), the identification of critical points of traffic accidents is important for the appropriate policies of allocation of public resources in the search for improved safety. The analysis of critical points focuses on road segments or intersections and suggests dependence on the place where they occur, and may have one or several causes in common.

Erdogan et al. (2008), when studying 7,634 occurrences of accidents between 1996 and 2006, using the *GeoFigureic Information System* (GIS) platform, identified the concentration of accidents at crossroads of access to small cities, sharp curves and areas that became slippery during the rainy season. Among the causes are disobedience to signals, traffic light advances, improper overtaking, etcetera. For Shariff et al. (2018), they define *hotspot* as the place with the highest probability of an accident in relation to the surrounding

areas; in a study on the **Petani–Bukit Lanjan Expressway (Malaysia, 2011–2024)**, a hotspot *was considered* to be the stretch with **200 or more incidents up to 1,000 meters** in length.

In the Brazilian context, the concept of critical point has been addressed by several agencies since the 1970s and 1980s. The National Traffic Department (DENATRAN, 1982), currently the National Traffic Secretariat (SENATRAN) used the term black spots, classifying them according to different indices for accidents without victim, with victim and with death. The National Department of Highways (DNER), precursor of the DNIT, implemented safety programs financed by the World Bank between 1976 and 1994, including methodologies for identifying critical segments (IPR, 2004).

One of the most used methodologies to identify a critical segment is the Standard Severity Unit (UPS), used by DNIT and several Roads and Roads Departments (DERs). The methodology applies a severity index, where the accident without a victim has an index of 1 (one), with a victim of 5 (five) and with a death of 13 (thirteen).

The Federal Highway Police (PRF), on the other hand, has developed its own methodologies over the last decades. In 2010, the institution considered a critical stretch a 10 km segment with a high concentration of occurrences, applying weights of 1, 5 and 25 for accidents without victims, with victims and with deaths, respectively, according to studies by the Institute of Applied Economic Research (IPEA). In 2022, the PRF updated the model, aligning it with Resolution No. 798/2020 of the National Traffic Council (CONTRAN). This resolution, of a normative nature, is the only one of national scope on the subject, as it requires technical studies for the installation of speed meters based on the identification of critical sections of accidents. Article 6 of the rule defines a critical stretch as one that has a high number of accidents with deaths and injuries, covering a radius of up to 2,500 meters in rural areas and 500 meters in urban areas (CONTRAN, 2020). However, by leaving the quantification to the discretion of the local authority, the normative text results in heterogeneous standards among the bodies of the National Traffic System (SNT).

In addition to the regulatory framework, the National Plan for the Reduction of Traffic Deaths and Injuries (PNATRANS), instituted by Law No. 13,614/2018, which adopts six structuring pillars, stands out. Pillar 2 – Safe Roads provides for Action A2018, aimed at establishing procedures for identifying and treating critical points of claims, with three main products:

- a) Preparation of a technical manual for the identification and treatment of

these points;

- b) Training of technicians, designers and managers; and
- c) National program for the treatment of critical points (DENATRAN, 2018).

These initiatives reinforce the importance of territorial analysis and standardization of indicators to guide preventive interventions. However, there is a lack of a unified synthetic model that integrates the severity, temporal recurrence and spatial density of accidents, a gap that the present study seeks to fill through the proposal of the Critical Point Indicator for Traffic Accidents with Death (IPCO).

4 EMPIRICAL ANALYSIS OF ACCIDENTS ON FEDERAL HIGHWAYS

To identify the importance of identifying and treating critical points in reducing deaths in traffic accidents, the present investigation used an open database, especially that of accidents that occurred on federal highways, between 2007 and 2024, supplied by the PRF and the database of the National Road System (SNV). The objective is to identify the spatial distribution of deaths, understand the behavior of the types and causes of accidents and highlight the importance of identifying and treating critical points as an instrument to reduce traffic deaths.

4.1 DATABASE AND SCOPE OF ANALYSIS

2,122,326 accidents registered on federal highways were analyzed between 2007 and 2024, involving approximately 4.7 million people and resulting in 121,661 deaths on the spot. The base comprises a universe of 74,344 km of highways under federal jurisdiction, of which 7,530 km (10.1%) are double or multiple lanes and 66,814 km (89.9%) are single lanes. During the period of analysis, there were deaths recorded in 36,494 km, corresponding to 49% of the total length of the federal network. In all, there are about 1.7 million highways in Brazil, according to the National Transport Confederation (Cristaldo, 2017), with federal highways being the most strategic because they connect large cities, economic centers, states, geofunctional regions and border countries. It is on federal highways, which are responsible for registering accidents and the PRF, that just under 20% of deaths recorded in traffic accidents in Brazil are concentrated

In the set analyzed, 33,330 deaths (27%) occurred on roads with two or more lanes per direction and 88,331 (73%) on single-lane roads. This difference reflects infrastructure limitations and the role of duplication in mitigating the severity of claims.

4.2 IDENTIFICATION OF CRITICAL SEGMENTS

For the purposes of this investigation, a critical point is defined as the 1 km long segment with a record of at least one fatal accident in the analyzed period. The 74,344 segments were ranked by the sum of deaths, and the 100 most critical were selected, according to the following criteria:

- statistical reliability with a confidence level of 95% and a margin of error of less than 2%;
- exclusion of stretches that did not record deaths between 2022 and 2024, to avoid distortions due to recent interventions;
- prioritization of segments with temporal persistence, occurrence of deaths in at least five of the last ten years.

These segments correspond to the areas with the highest concentration of fatalities and, therefore, the greatest potential for corrective intervention.

4.3 SPATIAL DISTRIBUTION OF FATALITIES

Table 1 shows the concentration of deaths by extension of federal highways, considering the 10,000 km most critical. It is observed that, by concentrating efforts on only 2,000 km (2.6%) of the federal network, it would be possible to impact approximately 23% of deaths on federal highways, which represents approximately 4.4% of national traffic deaths (base 2023).

Table 1

Deaths in accidents on federal highways in the 10,000 most critical km (2007–2024)

Extensão (km)	Mortes entre 2007 e 2024 (acumulada)	Percentual (%) do total de Óbitos entre 2007 e 2024 (acumulada)	Percentual da extensão de rodovias federais* (%) (acumulada)	Média anual de mortos (acumulada)
100km	2928	2,41%	0,13%	163
500km	10287	8,46%	0,67%	572
1000km	17014	13,98%	1,35%	945
2000km	27571	22,66%	2,69%	1532
5000km	49712	40,86%	6,73%	2762
10000km	73661	60,55%	13,45%	4092

Source: author's organization (2025), based on data open to PRF and DNIT.

4.4 TYPES AND CAUSES OF CLAIMS

Table 2 summarizes the average types and causes of accidents in the 100 km most critical, revealing significant diversity. On average, each kilometer had nine types and ten different causes of accidents. This demonstrates that the determining factor is not the nature

of the event, but the place where it occurs, which reinforces the relevance of the proposed territorial approach.

Table 2

Average types and causes of accidents in the 100 km most critical on federal highways (2007–2024)

UF	AL	BA	CE	DF	ES	GO	MG	MT	PE	PI	PR	RJ	RS	SC	SP	Total

Source: author's organization (2025), based on open PRF data.

Figures 1 and 2 exemplify this diversity in the BR-316 segment, Km 255 (Alagoas-AL), with a predominance of frontal collisions, typical of single lanes. In Figures 3 and 4, referring to BR-381, Km 525 (Minas Gerais-MG), the deadliest point in the country, with 72 deaths in 18 years, there is a predominance of speeding (39 deaths), associated with accidents such as overturning, overturning and lane departure, which add up to 60 deaths.

In Figures 5 and 6, relating to BR-381 (São Paulo/SP, Km-83, 84, 85, 86 and 88), 153 deaths are identified, of which 98 were due to being run over, evidencing the high risk in densely populated urban areas. In this case, the incompatible speed stood out among the 16 causes identified.

Figure 6

Deaths due to accidents on BR-381, Kms (83, 84, 85, 86 and 88), São Paulo/SP

Source: author's organization (2025), based on Abertis data from PRF.

The importance of this analysis lies precisely in the identification of the predominant types and causes at each critical point, making it possible to guide specific measures of engineering, inspection or traffic education according to local characteristics.

In the segment of BR-316, Km 255 (Alagoas), for example, the records of frontal collisions indicate the need for stricter actions to combat improper overtaking, with intensification of face-to-face inspection and use of electronic control technologies. In addition, it is recommended to adapt the infrastructure, with the implementation of third lanes to reduce exposure to risk during overtaking maneuvers.

In urban segments of BR-381 (São Paulo, Kms 83, 84, 85, 86 and 88), where pedestrians are run over, priority measures include the construction of footbridges, the installation or expansion of speed bumps and the realization of educational campaigns with the local community.

These examples demonstrate how the IPCO can work as an alert and prioritization instrument, allowing public managers to quickly identify the most critical locations and adopt targeted and cost-effective interventions, aligned with the Safe Systems approach.

4.5 RELATIONSHIP BETWEEN CRITICAL POINTS OF CLAIMS AND FATALITIES

The comparative analysis between the 100 critical points of claims with deaths and the 100 critical points of general claims (Table 3) shows that the two sets do not overlap entirely. While in the 100 points of general claims there is, on average, one death for every 76 claims, in the 100 critical points of claims with death there is more than one death per claim.

Illustrative example: the BR-101/RJ point, Km 322 recorded 2,852 accidents and 14 deaths, occupying only the 678th position among the points of highest lethality, that is, it is the 678th most lethal kilometer, of the more than 73 thousand federal highways, while the BR-381/MG point, Km 525, with 72 deaths, occupies the 552nd position when the criterion is the total number of accidents.

Table 3

Comparison between the 100 most critical points of general claims and death claims (2007–2024)

Pontos críticos	Quantidade de pontos críticos	Quantidade de sinistros	Quantidade de sinistros com mortes	Quantidade de mortes	Comparativos
Pontos críticos de sinistros com mortes	100 (os 100 pontos críticos com mais mortes entre 2007 e 2024)	2.471	2.471	2.726	- A cada 1(um) sinistro, ocorre 1,1 óbitos. - Em 76 sinistros ocorre em média, mais de 83 óbitos.
Pontos críticos de sinistros (incluindo os sinistros com mortes)	100 (os 100 pontos críticos com mais sinistros entre 2007 e 2024)	140.704	1.753	1.839	- A cada 76 sinistros ocorre um óbito.

Source: author, 2025.

These results converge with the conclusions of Pianezzer et al. (2020), who identified five groups of claims, three of which were high-risk (with a higher concentration of deaths) and two low-risk (predominance of victimless claims). Thus, the places with the highest lethality are, in fact, the most critical for road safety policies.

4.6 DISCUSSION OF THE RESULTS

The findings demonstrate that the distribution of fatalities in the Brazilian highway system is highly concentrated, and that prioritizing interventions in a few critical kilometers

can have a disproportionately positive impact on the reduction of deaths. In addition, it was observed that the diversity of causes and types of claims at the same point reinforces the need for interdisciplinary analyses, which combine engineering, inspection and education, precisely the tripod of road safety, established in §10 of article 144 of the Federal Constitution of Brazil.

These results also corroborate the international literature on *hotspots* (VERKEERSONVEILIGHEID, 2003; ERDOGAN et al., 2008; SHARIFF et al., 2018), which emphasizes the role of physical space as a central variable for risk mitigation.

5 PROPOSAL AND RATIONALE FOR THE CRITICAL POINT INDICATOR FOR TRAFFIC ACCIDENTS WITH DEATH (IPCO)

5.1 THE SECURE SYSTEMS APPROACH

The Safe Systems approach, initiated in Sweden in the late 1990s, according to the *World Resources Institute* (WRI, 2020) and Ferrier et al. (2017), gave rise to the Vision Zero program, later adopted in several countries. The central principle is that human errors are inevitable, and therefore roads must be able to absorb them, reducing the severity of claims.

According to Fletcher et al. (2020), insurance systems prioritize the prevention of serious claims through proactive and reactive actions. The reactive approach, based on the identification and treatment of hotspots based on historical data, remains the most widely used worldwide. The proactive approach, on the other hand, seeks to anticipate risks before the occurrence of claims, through safety audits and urban planning.

In the present study, we opted for the reactive approach, as it is understood that Brazil still faces gaps in the identification and treatment of critical points, and that this approach offers greater economic and operational viability, in addition to allowing rapid responses based on empirical evidence.

5.2 INSTITUTIONAL DIAGNOSIS AND GOVERNANCE CHALLENGES

International experience shows that the treatment of critical points is an essential component of road safety programs. The Court of Auditors of the European Union (ECA-EU, 2024) audited 13 infrastructure projects financed between 2018 and 2023, totaling €242 million in investments in Spain, Slovakia, Romania and Lithuania, and identified conceptual divergences on "tipping point" between member states. This methodological heterogeneity reinforces the need for standardization of criticality indicators, as shown in Table 4.

Table 4

Concepts of critical point in countries audited by the ECA-EUFor: author's organization (2025), based on data from the European Court of Auditors (ECA-EU, 2024)

Estado Membro	Estratégia/Definição
Lituânia	Pontos críticos são segmentos com quatro ou mais sinistros registrados no ano anterior; Os pontos críticos devem ser identificados para o público que circula no local, com recomendações aos condutores.
Espanha	Ponto crítico (definição 01) – é o grau de periculosidade, considerando a quantidade de sinistros ocorridos anteriormente, extensão do segmento e volume de tráfego por faixa de horário. Ponto crítico (definição 02) – Número absoluto de sinistros.
Romênia	Ponto crítico é um segmento que tem uma taxa de sinistro superior à média registrada. Embora esteja revogada, até que se apresenta uma nova metodologia.
Eslováquia	Ponto crítico é um segmento de 1km com cinco ou mais sinistros registrados no ano anterior.

A similar situation occurs in Brazil. The Federal Court of Accounts (TCU), through Ruling No. 275/2016, pointed out that only 7 of the 337 audited construction contracts dealt with the correction of critical segments, revealing low institutional prioritization. The Office of the Comptroller General of the Union (CGU, 2022) reinforced this finding by identifying weaknesses in the indicators of the National Highway Improvement Plan (PNMR), especially in the management of critical segments, which received only 1.5% of the R\$ 14.6 billion invested between 2020 and 2021.

All three audit programs have in common the analysis of the importance of investments in critical points, although they have highlighted some difficulties, including low investment, the lack of a unified concept in the case of the EU, and non-standardized indicators in the Brazilian context.

5.3 EMPIRICAL EVIDENCE OF SUCCESS

Latin American experiences reinforce the effectiveness of the Secure Systems approach. In Buenos Aires, a 33% reduction in deaths was observed between 2015 and 2019, after the adoption of integrated engineering and inspection measures (Santos et al., 2020). In Brazil, Avenida M'Boi Mirim, in São Paulo, recorded reductions of 80% in deaths and 72.7% in injuries between 2016 and 2017, after integrated engineering, inspection, and education interventions (São Paulo Road Plan, 2019). These results show that the identification of priority stretches is an effective strategy and rapid implementation.

5.4 INTERNATIONAL COMPARATIVE ANALYSIS OF DEATHS DUE TO TRAFFIC ACCIDENTS (2012–2022)

5.4.1 Nine countries with the largest land area

Table 5

Deaths in traffic accidents in the 9 (nine) largest countries in area

Countries	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2012-2013	2013-2014	2014-2015	2015-2016	2016-2017	2017-2018	2018-2019	2019-2020	2020-2021	2021-2022	2012-2022

Source: author's organization (2025), based on OECD and country data.

- Two periods are distinguished: (i) 2012–2019, with a slowdown in the fall and, in some cases, an increase (China, USA, and India with more deaths in 2019 vs. 2012); (ii) 2020–2022, with a resumption of deaths in 2021 compared to 2020 in eight countries (exception: Russia).
- Between 2022 and 2021, only three countries reduced deaths: Russia, China, and the USA; six increased — Brazil had the smallest increase (+0.2%), while Canada recorded the highest increase (+9.4%).
- In the full 2012–2022 cycle, Russia showed a continuous reduction in all ten periods; Brazil, China and the USA reduced in six periods; Australia and Canada in five; Argentina in four; India and Kazakhstan in three.
- Comparing 2012 vs. 2022, five countries reduced (especially Russia, Brazil, Argentina, Australia, and Canada) and three increased (USA, India, and China).

5.4.2 Nine South American countries

Table 6 shows higher volatility and worse relative performance:

Table 6

Deaths in traffic accidents in 9 (nine) South American countries

Countries	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2012-2013	2013-2014	2014-2015	2015-2016	2016-2017	2017-2018	2018-2019	2019-2020	2020-2021	2021-2022

Source: author's organization (2025), based on OECD and country data.

- In 2021 vs. 2020, all nine countries increased deaths (first year after the pandemic was declared).
- In 2022 vs. 2021, seven countries increased; Uruguay and Paraguay differed with a reduction. Brazil recorded the lowest increase in the group (+0.2%); Bolivia and Colombia (+11%) and Peru (+10%) had the highest.
- In the cut of the ten periods, Brazil and Uruguay reduced in six; Peru in five; Argentina and Paraguay in four; Ecuador and Colombia in three; Bolivia and Chile in two (Bolivia with analysis hampered by data gaps).

5.4.3 Twenty-two European countries (and Brazil as a reference)

Table 7 indicates relatively better performance, but with the same post-2019 inflection:

Table 7

Deaths in traffic accidents in 22 (twenty-two) countries in Europe and Brazil

Source: author's organization (2025), based on OECD and country data.

- 2021 vs. 2020: 12 of the 22 countries increased deaths.
- 2022 vs. 2021: 16 of the 22 countries increased deaths; 9 were discharged in both intervals.
- Brazil was included only for comparative reference, reinforcing the trajectory analogous to the European one, but with a slightly more intense recovery trend in 2021–2022.

5.4.4 Comparative synthesis and implications

- Common pattern: deceleration of reductions at the end of the decade and resumption from 2019 (post-pandemic, economic recovery, change in mobility patterns).

- Order of performance: Europe (best performer) > largest countries (average performer) > South America (performance below the other two groups of countries).
- Brazil: evolution similar to the global pattern, with the lowest increase between 2021–2022 (+0.2%) among the countries that grew in Table 5; Still, trend reversal since 2019.

The convergence of these results — resumption of deaths in different geographies and income levels — reinforces the need for standardized criticality metrics, capable of locating stretches where lethality is concentrated and prioritizing engineering, inspection, and education interventions. It is in this context that the Critical Point of Death Claim (IPCO) Indicator is inserted, presented below (Section 5.5), which measures the lethal density per kilometer adjusted for temporal recidivism, allowing operational ranking and alignment with the UN/PNATRANS goals.

5.5 THEORETICAL FOUNDATION OF THE IPCO

The formulation of the Critical Point Indicator for Traffic Accidents with Death (IPCO) is based on three theoretical axes:

a) the need for standardized measurement to enable results-based management. According to Holló and Eksler (2010): *"you cannot manage what you cannot measure"*. Kevin, quoted by Holló and Eksler, previously stated that *"if you can't measure it, you can't improve it"*;

b) Wegman's (2017) emphasis on *the go fishing where the fish are strategy*, that is, concentrating efforts where there is greater density of data and occurrences;

c) the recognition by Mononen and Leviäkangas (2016) that performance indicators are essential instruments to reduce knowledge gaps and measure institutional advances.

The literature on Road Safety Performance Indicators (RSPI), according to Hakkert, Gitelman and Vis (2007) and Yannis et al. (2013), distinguishes behavioral indicators (speed, use of belts, alcohol) from structural indicators (infrastructure and management). The IPCO falls into this second category, seeking to quantify the spatial and temporal risk of fatalities.

5.6 CONSTRUCTION AND APPLICABILITY OF THE IPCO

The conception of the IPCO considered essential variables:

- Segment length (L), expressed in kilometers;
- Number of fatalities (ΣS_m);

- Temporal frequency (R_t) — number of years with death records;

The proposed formula is:

$$IPCO = \frac{(\sum S_m \times R_t)}{L} \quad (1)$$

The indicator is dimensionless and always shows values greater than zero.

Considering the empirical distribution of fatalities, the following criticality classification is suggested:

- $IPCO \geq X$ severe critical $\rightarrow$ (those that concentrate 50% of deaths);
- $Z \leq IPCO < X$ moderate critical $\rightarrow$ (those that concentrate between 20% and 49% of deaths);
- $IPCO < Z \rightarrow$ mild critical (those that concentrate below 20% of deaths).
- It is suggested that the R_t remain between 5 and 10 years, as very long periods may not portray the current situation.

The X and Z values will depend on the period of analysis (R_t) and the extension (L). For rural areas, the length of the segment (L) is usually larger than urban areas. In urban areas, critical intersections can be identified, where the extension (L) does not exceed 200 meters (0.2 km).

Regarding the temporal frequency (R_t), it is important to note that historical series should be 5 (five) years, accepting up to three years, to avoid the use of very short periods, and not to generate errors from a statistical phenomenon known as regression to the mean (DER/SP, 2023).

For the purpose of defining priority points for intervention, the segments that have $IPCO \geq X$ should receive immediate attention (engineering works, inspection and educational measures), as they can positively impact the goal proposed by the UN and PNATTRANS.

The simplicity of the calculation favors its replication by state and municipal agencies, as it depends only on open data from RENAEST and its own databases, supplied with claims records. This characteristic responds to the warning of Tesic et al. (2018) that excessively complex indicators are not very applicable in countries with incomplete or divergent databases.

5.7 CONCEPTUAL SYNTHESIS AND INTEGRATION WITH PUBLIC POLICIES

The absence of a standardized indicator for critical points was confirmed in the analysis of 12 road safety and urban mobility plans of Brazilian capitals and state agencies (Table 5). In practically all of them, the reactive approach prevails, and the UPS methodology is the one with the greatest coverage among the documents analyzed.

Table 5

Mobility or road safety plans that address critical points (capitals and public agencies)

Órgão	Metodologia e Estratégias realizadas em relação a pontos críticos
Departamento de Infraestrutura Nacional de Transportes – DNIT	1) O DNIT emprega a metodologia Unidade Padrão de Severidade – UPS, com pesos diferentes para sinistros sem vítima, com vítima e com óbito, segundo Pena, C. Mori, F. Otto, G. e Tani, V. (2009) ; 2) A metodologia UPS é a mais comumente utilizada pelos diversos órgãos, que tem no DNIT a referência em estudos de infraestrutura viária; 3) A Resolução No 10 de 2023 do DNIT, estabeleceu procedimentos para identificação e procedimentos para eliminação de pontos críticos.
Polícia Rodoviária Federal – PRF	1) A PRF instituiu o indicador de ponto crítico em 2022, com seguinte descrição: o indicador “Ponto Crítico” no âmbito da PRF, se refere a uma extensão de rodovia federal que não ultrapasse 500m em vias de zonas urbanas e 2.500m em vias de zona rural, e que possua alta concentração ¹ de sinistros graves ² , e que possua fator de infraestrutura viária contribuinte para a ocorrência dos sinistros; 2) A série histórica de análise deve contemplar três anos, e considerar apenas os sinistros graves, aqueles com feridos graves ou mortos.
Departamento de Estradas e Rodagem – DER/SP	1) O Manual de Segurança Viária do DER/SP, adota a UPS para identificar a severidade dos segmentos. De uma forma geral utiliza a metodologia adotada pelo DNIT, onde os sinistros sem vítima valem 1 ponto, com vítima 5 pontos e com morto, 13 pontos.
Município de São Paulo/SP	1) O município adota um Plano de Segurança Viária do município de São Paulo de 2019; 2) Intervenções em pontos críticos de travessia de pedestre é uma das sete estratégias para reduzir mortes no trânsito; 3) A metodologia utilizada para identificar segmentos críticos de mortes de pedestres leva em consideração a Unidade Padrão de Severidade-UPS; 4) A UPS = DM + 4VF + 6PF + 13FAT, onde DM se refere a sinistros com danos materiais, VF a sinistros com vítimas feridas, PF a sinistros com pedestre feridos e FAT se refere a sinistro com vítima fatal; 5) O ranking de severidade é adotado dividindo-se a UPS/extensão da via; 6) Já a UPS de uma forma geral utiliza a metodologia adotada pelo DNIT, onde os sinistros sem vítima vale 1 ponto, com vítima 5 pontos e com morto, 13 pontos.
CET-RIO/RJ	1) O município do Rio de Janeiro adota um agrupamento de sinistros em um raio de 25m, como ponto crítico; 2) É levado em consideração além da quantidade de sinistros, a quantidade de pessoas feridas, mortas, envolvimento de pedestres e ciclistas; 3) A Unidade Padrão de Severidade - UPS é a metodologia utilizada pela CET-RIO para ranquear pontos críticos.
Empresa de Transportes e Trânsito de Belo Horizonte/MG	1) A Política de Segurança no Trânsito de Belo Horizonte (2016), apresenta uma análise das vias com maior frequência de sinistros, tanto considerando dados absolutos como sinistros por quilômetro
Município de Fortaleza/CE	1) Informações extraídas do relatório de segurança viária de Fortaleza em 2019; O município de fortaleza também utiliza a Unidade Padrão de Severidade para ranquear os pontos críticos; A Autarquia Municipal de Trânsito – AMT realiza levantamentos periódicos sobre pontos críticos.
Secretaria de Mobilidade de Recife/PE	1) Informações coletadas na Minuta do Programa de Segurança Viária para Recife, 2024-2030. Observar-se-á que a única metodologia identificada no plano foi a GDCl; Ação 132 - Desenvolver o monitoramento sistemático com caracterização do segurança viária a partir da metodologia para definição de pontos e trechos críticos, considerando a severidade dos sinistros e, quando possível, o nível de exposição; Ação 413 - Criar procedimento para Inspeção e tratamento sistemático de segurança viária em trechos e pontos críticos baseado em dados; A416 - Definir e implementar procedimentos para avaliar os projetos de mobilidade a partir de métricas (antes e depois), usando como referência a metodologia da Global <i>Designing Cities Initiative</i> , (GDCl).
Secretaria Municipal de Mobilidade Urbana – STTU, Natal/RN	1) As informações foram extraídas no Plano Diretor de Mobilidade de Natal de 2022; 2) O plano realiza um diagnóstico com várias análises quantitativas e qualitativas, apresenta diretrizes de educação para o no trânsito e elenca a necessidade de elaborar um Plano de Segurança Viária (Implantação de um Plano de Segurança Viária, que esteja alinhado à abordagem de Sistemas Seguros e à Agenda 2030 da ONU, sobretudo com a ODS 11 (Cidades e Comunidades Sustentáveis); 3) Apresenta diversos indicadores, bem elaborados, entre os quais o Indicador 2: Percentual de interseções semaforizadas ou satisfatoriamente tratadas com <i>traffic calming</i> para garantir a travessia segura de pedestres (em relação ao total de interseções das vias arteriais). Objetivo: Melhorar constantemente o grau de segurança para pedestres nas interseções das vias arteriais e pontos críticos na ocorrência de sinistros.
Secretaria Municipal de Mobilidade Urbana – SMMU Empresa Pública de Transporte e Circulação – EPTC (Porto Alegre/RS)	1) O plano para década prevê no pilar engenharia a identificação e tratamento de pontos críticos de sinistros, ou seja, aqueles locais concentradores dessas ocorrências; 2) Os pontos críticos são definidos em um ano, com previsão de adoção das medidas corretivas no ano seguinte; 3) Os pontos críticos foram segmentados, levando-se em consideração o tipo de veículo envolvido e de sinistro.
Prefeitura municipal de Florianópolis/SC.	1) O Plano de Mobilidade Urbana de Florianópolis (2016) menciona em poucas partes do documento a redução de sinistros, mas não trata na identificação e tratamento de pontos críticos; 2) EM 2021, o plano passou por uma revisão, muito embora não foi possível acessar por problemas de download da página. Na revisão foi adotado o termo Plano de Mobilidade Urbana Sustentável – PLAMUS.
Secretaria de Mobilidade – SEMOB (Distrito Federal)	1) Foi consultado o Plano de Mobilidade Ativa - PMA do Distrito Federal de 2020, onde se verifica um esforço para identificação de pontos críticos de sinistros envolvendo pedestres e direcionamento de fiscalização
Prefeitura Municipal de Campo Grande/MS.	1) Campo Grande, capital do Mato Grosso, no Plano Diretor de Mobilidade Urbana (2024), caderno 14, estabelece a necessidade de desenvolvimento de um programa específico para identificação e tratamentos de pontos críticos, com ações de engenharia, reforço ou adequação da fiscalização eletrônica e com agentes de trânsito; 2) Apesar do plano dispor de uma tabela com indicadores propostos, não figura qualquer um que se assemelhe ao que se propõe no presente artigo.
Prefeitura Municipal de Manaus/AM.	1) O Plano de Mobilidade Urbana de Manaus de 2015, menciona discretamente a necessidade de realizar verificações constantes nos locais de maior periculosidade, sem contanto mencionar como identificar esses locais (metodologia utilizada).
Secretaria Municipal de Segurança e Mobilidade Urbana de Palmas/TO	1) O Plano de Mobilidade de Palmas/TO, “Mobilize-se”, lançado em 2024, possui alguns cadernos (produtos) entre os quais um de indicadores, não constando, porém, um indicador de ponto crítico ou algo nesse sentido; 2) O produto 6 do plano (Diagnóstico da infraestrutura e da segurança viária), aponta análise reativa com base no histórico de sinistros e feridos, destacando a necessidade de tratar essas localidades.

Source: author (2025).

The IPCO proposes to fill this gap by offering a uniform criticality metric that can be integrated into PNATRANS and Road Safety and Mobility Plans of states and municipalities. In this way, the indicator is consolidated as a strategic tool for public management, allowing the planning of prioritized interventions.

6 CONSIDERATIONS

Even fifteen years after the first United Nations (UN) resolution establishing the Decade of Action for Road Safety 2011–2020, the goal of reducing traffic deaths by 50% has not yet been achieved. The analysis of three groups of countries, those with the largest territorial extension, the South American and the European, revealed a similar behavior: a slowdown in the reduction of deaths at the end of the last decade and a resumption of growth from 2019 onwards. This sample covers approximately 60% of the world's population, giving global representativeness to the results. Brazil has a similar trajectory, with a continuous increase since 2019. Despite this, among the countries analyzed, it had the second lowest growth percentage (+0.2%) between 2021 and 2022, behind only Iceland, a country with the smallest demographic and vehicular scale.

The main plans analyzed, Global Plans 2011–2020 and 2021–2030 (UN), PNATRANS (SENATRAN, 2024) and the European Road Safety Plan, converge on the improvement of infrastructure and the adoption of the Safe Systems approach. According to Fletcher et al. (2020) and the *World Resources Institute* (WRI, 2020), this approach seeks to eliminate serious claims, recognizing that human errors are inevitable and that roads must be designed to absorb them without causing fatalities.

In Brazil, the analysis of 15 mobility and road safety plans revealed that almost all of them mention the need to identify and treat critical points. However, there is still a lack of uniformity regarding the definition criteria, the historical series used and the radius of coverage of the stretches (which varied between 25 m and 2,500 m). Although PNATRANS mentions the term *critical point* in its strategic actions, and Contran Resolution No. 798/2020 establishes distance parameters, there is still no standardized criticality methodology or indicator, resulting in significant methodological differences between the federal, state, and municipal spheres, resulting in losses in the evaluation of the critical point treatment policy. For example, it is not possible to know the measures adopted with the respective costs, and the results obtained later after implementation.

This gap is reinforced by the control agencies, which warn of the need to prioritize investments in places with a higher concentration of claims. The Federal Court of Accounts (TCU) and the Office of the Comptroller General of the Union (CGU) highlighted, in recent reports, that only 1.5% of the resources allocated to the maintenance of federal highways (2020–2021) were applied to the treatment of critical segments. Similarly, the Court of Auditors of the European Union (TCE-EU, 2024) pointed out divergent concepts of critical points between countries, recommended methodological standardization and expansion of resources for the correction of high-risk stretches.

Based on the analysis of 2,122,326 accidents that occurred on Brazilian federal highways between 2007 and 2024, involving 4.7 million people, 1.17 million minor injuries, 404 thousand serious injuries, and 121,661 deaths, a sample was separated with 100 points with the most death records in the last 18 years, each 1 km long, totaling 2,471 accidents and 2,726 deaths. On average, each point presented nine types and ten different causes of accidents, showing that the common factor is not the type of event, but the location, which confirms the conclusions of Anderson (2009) and Erdogan et al. (2008) about the territorial relevance in the concentration of fatalities. In summary, the research showed:

- a) absence of a standardized national indicator for critical point;
- b) significant spatial concentration of fatal claims within a few kilometers;
- c) institutional fragility in budget prioritization and in the integration of road safety plans.

In view of this diagnosis, the article proposed the Critical Point Indicator for Traffic Accidents with Death (IPCO) as an instrument of public management and decision support, integrating severity, temporal recurrence and spatial density. The IPCO represents a contribution to road safety and seeks to fill the gaps identified in current policies and programs, contributing to the fulfillment of the UN and PNATTRANS goal of reducing traffic deaths by 50% by 2030.

The investigation did not address, however, correlations between critical points and socioeconomic, demographic or vehicle typology factors, which constitutes a limitation and, at the same time, an opportunity for future research. Complementary studies may associate the IPCO with indicators of exposure, logistics cost and territorial vulnerability, expanding its application in integrated transport planning and road safety.

ABSTRACT

This article aims to analyze the application of controllership as an essential tool for process optimization, cost control, and strategic decision-making support in river transport companies in the Northern Region of Brazil, focusing on the state of Amazonas. In this region, river transport is the main means of moving people and goods, playing a vital role in territorial integration and socioeconomic development. Considering controllership as a management support area responsible for ensuring the transparency and reliability of accounting and managerial information, this study seeks to verify how controllership is applied in river transport companies in Amazonas and to identify how its implementation contributes to the efficiency and sustainability of business operations. To this end, a qualitative, descriptive, and exploratory approach was adopted, based on bibliographic and documentary research, as well as a case study applied to a company in the sector. The research, qualitative in nature and descriptive-exploratory in character, was developed based on bibliographic and documentary review and a case study conducted in a company from the sector. The results show that the absence of structured controllership practices leads to administrative and financial deficiencies, while the implementation of an integrated management system, combined with employee training and process digitalization, resulted in significant improvements in efficiency, control, and reliability of information. It is concluded that controllership is a strategic and indispensable instrument for the sustainability and competitiveness of river transport companies in the Amazon region.

Keywords: Controllership. Business Management. River Transport.

RESUMO

O presente artigo tem como objetivo analisar a aplicação da controladoria como ferramenta essencial para a otimização de processos, o controle de custos e o suporte à tomada de decisões estratégicas nas empresas de transporte fluvial da Região Norte, com foco no estado do Amazonas. Nessa localidade, o transporte fluvial constitui o principal meio de deslocamento de pessoas e cargas, sendo vital para a integração territorial e o desenvolvimento socioeconômico. Considerando a controladoria como área de apoio à

gestão, responsável por assegurar a transparência e a confiabilidade das informações contábeis e gerenciais, este estudo busca verificar como a controladoria é aplicada nas empresas de transporte fluvial no Amazonas e identificar de que forma sua implantação contribui para a eficiência e sustentabilidade das operações empresariais. Para tanto, adotou-se uma abordagem qualitativa, de caráter descritivo e exploratório, baseada em pesquisa bibliográfica, documental e em um estudo de caso aplicado a uma empresa do setor. A pesquisa, de natureza qualitativa e caráter descritivo-exploratório, foi desenvolvida com base em revisão bibliográfica, documental e em um estudo de caso aplicado a uma empresa do setor. Os resultados evidenciam que a ausência de práticas estruturadas de controladoria gera deficiências administrativas e financeiras, enquanto a implementação de um sistema de gestão integrado, aliada à capacitação dos colaboradores e à informatização dos processos, proporcionou melhorias significativas na eficiência, no controle e na confiabilidade das informações. Conclui-se que a controladoria é um instrumento estratégico indispensável à sustentabilidade e à competitividade das empresas de transporte fluvial na Amazônia.

Palavras-chave: Controladoria. Gestão Empresarial. Transporte Fluvial.

RESUMEN

Este artículo tiene como objetivo analizar la aplicación de la contraloría como herramienta esencial para la optimización de procesos, el control de costos y el apoyo a la toma de decisiones estratégicas en las empresas de transporte fluvial de la Región Norte, con enfoque en el estado de Amazonas. En esta localidad, el transporte fluvial es el principal medio de desplazamiento de personas y carga, siendo vital para la integración territorial y el desarrollo socioeconómico. Considerando la contraloría como un área de apoyo a la gestión, responsable de garantizar la transparencia y confiabilidad de la información contable y de gestión, este estudio busca verificar cómo se aplica la contraloría en las empresas de transporte fluvial en Amazonas e identificar cómo su implementación contribuye a la eficiencia y sostenibilidad de las operaciones comerciales. Para ello, se adoptó un enfoque cualitativo, de carácter descriptivo y exploratorio, basado en una investigación bibliográfica y documental y en un estudio de caso aplicado a una empresa del sector. La investigación, de carácter cualitativo y de carácter descriptivo-exploratorio, se desarrolló a partir de una revisión bibliográfica y documental y un estudio de caso aplicado a una empresa del sector. Los resultados muestran que la ausencia de prácticas estructuradas de contraloría genera deficiencias administrativas y financieras, mientras que la implementación de un sistema integrado de gestión, combinado con la capacitación de los empleados y la informatización de los procesos, proporcionó mejoras significativas en la eficiencia, control y confiabilidad de la información. Se concluye que la contraloría es un instrumento estratégico indispensable para la sostenibilidad y competitividad de las empresas de transporte fluvial en la Amazonía.

Palabras clave: Contraloría. Gestión Empresarial. Transporte Fluvial.

1 INTRODUCTION

River transport is one of the main means of transport in the Amazon region, playing an essential role in territorial integration, in the supply of riverside communities and in the flow of products. However, this system faces significant challenges, such as the precariousness of the port infrastructure, low accessibility, lack of investments, limited mobility, lack of adequate routes for the flow of production, and the incompatibility of the logistics system with the characteristics of regional production. Studies by Rodrigues et al. (2014) and Cardoso (2013) point out that these structural and operational limitations compromise the efficiency of the modal and restrict its potential to contribute to the economic development of the Amazon.

In view of this, added to the geographical and operational particularities of the Amazon, such as dependence on rivers, seasonality of waters, and limited infrastructure, it is essential to adopt management practices that ensure efficiency, sustainability, and control. In this scenario, controllership stands out as a fundamental strategic tool for the management of river transport companies.

Thus, this article seeks to verify the importance of the application of controllership in river transport companies in the state of Amazonas and to evaluate how its implementation contributes to strategic decision-making, governance, sustainability and operational efficiency.

For this, the application, through a case study, of a controllership in a company in the sector will be presented in order to highlight the improvements obtained with the implementation of such instrument in the organization.

2 THEORETICAL FRAMEWORK

2.1 WATERWAY TRANSPORT IN BRAZIL

Waterway transport comprises the movement of cargo and passengers through rivers, lakes and seas, using various vessels, such as ships, ferries and boats. It is one of the oldest and most efficient modes of transport in history, fundamental for trade and territorial integration. Its main advantages are the ability to move large volumes at a lower cost and with less environmental impact, especially over long distances and for low value-added products (Ballou, 2006).

From an environmental perspective, the modal has reduced emissions of pollutants and lower rates of loss and damage when compared to other means of transport (CNT, 2019). However, compared to road and rail modes, infrastructure limitations and lack of intermodal

integration restrict their full use in the country (ANTAQ, 2025).

According to official data from the National Waterway Transport Agency (ANTAQ, 2025), Brazil has approximately 20 thousand kilometers of economically navigable waterways, distributed between large and small ports. Even so, only 30.9% of the waterway network is effectively used (CNT, 2019), with emphasis on the Madeira, Paraná-Tietê, Paraguay, Solimões-Amazonas, and Tocantins-Araguaia waterways, responsible for significant movement of agricultural, mineral, and fuel cargo, according to ANTAQ's TKU 2021 report (2022). The Amazon and Tocantins-Araguaia basins accounted for approximately 76% of the total volume of cargo handled in 2022 (ANTAQ, 2023), which highlights the relevance of the Amazon in the national waterway context.

2.2 RIVER TRANSPORT IN THE AMAZON REGION

In the Amazon Region, river transport plays a vital role in the integration and supply of communities. Of the 62 municipalities in Amazonas (IBGE, 2022), only six have a land connection, which makes waterway transport the main means of mobility and regional logistics (ARSEPAM, 2024). Air transport acts in a complementary way, but limited by high costs and restricted infrastructure.

The Amazon waterway network adds up to more than 16 thousand kilometers of navigable rivers, representing about 80% of the Brazilian network (ANTAQ, 2022). The system interconnects cities and riverside communities in isolated areas, moving millions of passengers and tons of cargo annually, which reinforces its essential economic and social character (ANTAQ, 2018).

In the state of Amazonas, intercity waterway transport registered a flow of 808,462 passengers in 2023, representing an increase of 8.63% compared to the previous year, when 744,209 passengers were recorded. Even in the face of severe droughts, this increase demonstrates the resilience of the modal and its social and economic importance for the State (ARSEPAM, 2024).

Even with its relevance, the modal faces structural deficiencies. DNIT (2018) points out that most Amazon routes do not meet the technical standards of a waterway, as they lack adequate signaling, dredging and maintenance. In addition, there is a mismatch between the obsolete fleet used by communities and the modern vessels employed by large companies, which reflects operational inequalities. Studies by ANTAQ and UFPA (2018) classified the quality of passenger terminals as "poor", with a General Quality Index of 0.17, and this

number varies from zero to one.

In summary, although Amazonian river transport is a vital component for the mobility, economy, and territorial integration of the region, its full potential is still limited by structural deficiencies, the seasonality of rivers, and the lack of continuous investments in infrastructure and management.

2.3 THE EVOLUTION AND IMPORTANCE OF CONTROLLERSHIP IN THE BUSINESS MANAGEMENT PROCESS

Controllership emerged in the United States at the beginning of the twentieth century as an instrument of control and administrative coordination in large corporations (Schmidt, 2002). In Brazil, its development was driven by North American multinationals, which introduced management accounting methods and information systems aimed at organizational efficiency (Beuren; Borgoni; Fernandes, 2008).

For Mosimann (1999), controllership is an interdisciplinary science that combines principles of administration, economics and accounting, with the objective of guiding economic management and supporting decision-making. Oliveira (1998) points out that its effectiveness depends on the ability to transform accounting data into strategic information, promoting greater security and agility in decisions.

According to Alves, Fisch and Mosimann (1993), controllership acts as an integrating link between organizational sectors, providing information that favors the alignment between planning and execution. Bruni and Gomes (2010) and Padoveze (2014) expand this conception by highlighting its strategic functions: planning, control, coordination, evaluation and monitoring, all of which are indispensable to business performance.

Recent studies reinforce the evolutionary character of the area, Lunkes (2010) identified that Brazilian controllership practices focus on planning and cost control, while Guedes and Costa (2019) highlight the need for theoretical and methodological deepening in the field. Tavares (2022) observes that the controllership professional has been assuming strategic functions, aimed at generating value and organizational sustainability. Thus, controllership is consolidated as an essential tool for business competitiveness, integrating information, control and performance.

2.4 THE IMPORTANCE OF CONTROLLERSHIP IN THE MANAGEMENT OF RIVER TRANSPORT COMPANIES IN AMAZONAS

Studies by Tavares (2024) show that for companies in the river transport sector in Amazonas, the definition and control of vessel operating costs represent constant challenges, considering factors such as the oscillation of river levels, the absence of consistent financial records, market competition, and the quality of the services offered. These companies deal with complex and variable expenses, with fuel and fixed costs accounting for more than half of these expenses.

According to Datamarnews (2024) and Pereira, Roberto and Almeida (2025). The annual variation in the water level in the Amazon, marked by severe droughts, compromises navigability, affecting mobility, supply and increasing operating costs. In addition to natural adversities, the absence of consolidated information systems and consistent accounting records still limits the internal control of organizations (Lobato; Araújo Júnior, 2025). Research by Queiroz (2019) and Lacerda and Situba (2020) also highlights structural and institutional failures in the sector, which impact the efficiency and reliability of operations.

In this way, the application of controllership in the Amazon context goes beyond the accounting dimension and assumes a strategic and adaptive role, allowing river companies to minimize risks, optimize resources and strengthen their competitiveness in the face of a challenging logistics environment.

3 METHODOLOGY

The research is characterized as qualitative, descriptive and exploratory, since it seeks to understand how controllership is applied in river transport companies in the state of Amazonas, analyzing its impacts on operational efficiency and decision making. According to Gil (2017), this type of approach is appropriate when it is intended to deepen the understanding of complex phenomena in specific contexts, allowing for more detailed and contextualized interpretations. According to Gerhardt and Silveira (2009), qualitative studies privilege direct observation and interpretative analysis, and are appropriate for understanding practices and perceptions in the organizational environment.

The method used was the case study, chosen because it allows an in-depth analysis of a specific organization in the river transport sector. According to Yin (2015), the case study is a method of empirical investigation that allows one to examine contemporary phenomena in their real context, especially when the boundaries between the phenomenon and the

context are not clearly defined.

Data collection was carried out through direct observations and semi-structured interviews with managers and employees of Company R, which chose anonymity for confidentiality reasons. The interviews sought to understand the control practices adopted, the use of accounting and management information in the decision-making process and the difficulties faced in management. In addition, internal documents and administrative records were analyzed. The use of different data collection techniques, such as interviews, observations, and document analysis, contribute to strengthening the validity and consistency of the findings (Yin, 2015).

4 RESULTS AND DISCUSSIONS

During the data collection, problems of an administrative, technological and operational nature were observed. The sales of tickets and orders were carried out predominantly manually or at the counters located in the ports of Manaus and Parintins, with fees ranging from 5% to 10% on the value of the tickets. The absence of this control generated risks of selling fake tickets, undue charges and loss of revenue, in addition to potential legal liabilities for embarrassment to passengers and moral damages

It was also found that the management system used by the company did not present centralization or integration of information, being restricted to the issuance of Electronic Bill of Lading (CT-e), a digital tax document used to register cargo transport services. However, this system does not allow efficient control of sales, shipments or monitoring of income and expenses per trip.

In the parcel sector, there was a lack of standardization in the identification of senders and recipients, which caused loss of volumes and difficulty in tracking goods. In addition to the absence of correct identification of the goods, it was also observed that they were improperly handled during loading and unloading, which contributes to physical damage and possible loss of packages.

In the restaurant and in the boat's cafeteria, sales control was carried out through receipts and manual carbon paper sheets, without integration with the financial sector, resulting in divergences between the number of meals produced and the total amount calculated in the cashier.

Another critical point refers to the lack of internet connection during trips, which made it impossible to use real-time management systems during trips, making it difficult to control income and expenses per trip.

The aforementioned diagnosis revealed challenges common to the sector, such as the lack of technological integration and limited control of costs and revenues. Recent studies by Moura (2024) on the river transport of passengers between Manaus and Barcelos point out that about 58% of the operating costs of these companies are variable, with emphasis on fuel, maintenance and passenger food. This data reinforces the need for control tools capable of monitoring spending in real time and supporting decision-making.

Based on this, the creation of a controllership in the company was proposed and implemented, structured in four main stages:

First step: implementation of an integrated management software, with digital control of receipts through automatic PIX, applicable to the sales of tickets, parcels and food products on board.

Figure 1 shows the new flow of ticket purchase after the implementation of the integrated management software. The system automated steps previously carried out manually, allowing the real-time registration of ticket sales, orders and restaurant orders. In addition, it has expanded the payment options available to customers, making transactions more agile, secure, and efficient.

Source: Prepared by the authors themselves.

Second stage: training of employees and business partners, including self-employed salespeople, with the objective of promoting adaptation to new work routines and overcoming resistance to organizational changes

Third stage: implementation of satellite internet to enable the use of the system in real time, also expanding the sources of revenue with the commercialization of network access for passengers.

Fourth stage: modernization of the process of selling tickets, parcels and cargo through applications connected to the internet, ensuring greater security, agility and reliability in financial and legal operations, in addition to generating accurate management reports.

Figure 2 demonstrates the process of integrating the system after sales have been made. With each purchase of tickets, food or packages, the software automatically generates the receipt on the company's machine, ensuring greater effectiveness, control and traceability of transactions.

The implementation of controllership in Company R provided a series of significant improvements in administrative, operational and financial processes. The adoption of more

structured management practices, combined with the implementation of appropriate technologies, contributed to the modernization of internal control and increased efficiency of operations.

Among the main changes, the implementation of an integrated management software, with digital control of receipts by automatic PIX, stands out. The system now covers all areas of operation — ticket sales, parcels, restaurant and snack bar — offering greater security in transactions and transparency in financial transactions.

To consolidate this stage, training was promoted with employees and business partners, including self-employed salespeople. The training involved both the use of the system and the adaptation to new work routines, seeking to reduce resistance to change and increase operational efficiency. In addition, the company paid for basic computer courses, considering that part of the team had a low level of familiarity with digital tools.

Another relevant improvement was the implementation of satellite internet, which started to meet both the administrative needs of the company and passengers during trips. This action also generated a new source of revenue, with the sale of internet access on board.

The way services are marketed has also undergone significant transformations. The sales of tickets, parcels, cargo and food were integrated with online management applications, providing greater agility, security and legal reliability in operations. As a result, there was an improvement in the traceability of transactions and the integrity of financial information.

The results of the first trips after the implementation of the controllership have already shown gains in efficiency, agility and reliability in waterway transport activities. Among the benefits observed, the following stand out:

- a) Qualification of revenues, costs and expenses, allowing better management analysis and decision making;
- b) Possibility of scheduling cargo, parcels and tickets in advance, avoiding overbooking and ensuring logistical organization;
- c) Creation of new sales channels over the internet, expanding the company's commercial reach;
- d) Convenience to the customer, who started to make purchases remotely, with greater practicality;
- e) Reduction of operating costs, due to the elimination of commissions to intermediaries and the use of automated payments via PIX;

- f) Reliability in financial reports, which are now generated automatically, replacing manual controls susceptible to failures;
- g) Automated sending of messages through the WhatsApp application, confirming tickets and orders and increasing efficiency in service;
- h) Increased cash flow, with the possibility of reselling advance tickets, reducing dependence on third-party capital and strengthening the financial sustainability of the business.

In general, the adoption of controllership proved to be fundamental for the improvement of the management of Company R, promoting integration between sectors, the standardization of processes and the strategic use of accounting and management information.

5 CONCLUSION

River transport represents one of the pillars of mobility and socioeconomic development in the Amazon region, especially in the state of Amazonas, where land routes are scarce and rivers are the main axes of regional integration (Cardoso, 2013). Despite this natural vocation, the sector still faces significant limitations due to the seasonality of the rivers, the precariousness of the port infrastructure and the low technological integration, factors that compromise logistics efficiency and business competitiveness.

Based on the case study carried out, it was possible to identify how the control and management processes are conducted in river transport companies, finding that the absence of structured controllership practices results in administrative, financial and operational deficiencies. The controls observed were largely manual and decentralized, which made it difficult to systematically monitor revenues, expenses, and performance indicators.

From the theoretical and empirical analysis, controllership practices capable of improving management and decision-making in the sector were identified, especially those related to the integration of accounting and management information, the automation of processes and the standardization of operational routines. The implementation of an integrated management system proved to be decisive in ensuring greater security in transactions, data reliability and agility in the planning of operations.

During the course of the survey, the main difficulties faced by companies in the river sector were also raised, among which the shortage of qualified labor, the absence of

adequate connectivity in navigable stretches and cultural resistance to the adoption of new technologies stand out. These factors constitute significant barriers to the implementation of modern management practices and highlight the need for continuous investments in training and technological infrastructure.

Finally, the practical demonstration of the application of a controllership plan in the analyzed company confirmed the hypothesis that this instrument is essential for strengthening management and organizational sustainability. The adoption of an integrated management system, combined with team training and the computerization of processes, resulted in significant improvements in the reliability of financial information, operational efficiency, and strategic planning capacity. Controllership has therefore proved to be a decisive element for the balance between control, performance and decision-making.

It is concluded, therefore, that controllership should be permanently incorporated into the organizational structure of companies in the river sector, not only as a control instrument, but as a strategic management element. Its integrated performance with the administrative, financial and operational areas strengthens corporate governance, increases the transparency of processes and contributes to the economic sustainability of the sector.

As a limitation of the study, the fact that the research was conducted in a single company stands out, which restricts the generalization of the results. It is recommended, for future research, to expand the investigation to other organizations in the sector and regions of the Amazon, in order to compare different controllership models and identify the best practices applicable to the management of river transport in different contexts.

APPENDIX

SEMI-STRUCTURED INTERVIEW

Block 1 – Characterization of the Interviewee

Table 2

1. Current position or function	2. Industry or department	3. Length of time working in the company
Operations Manager	3 years	Administration

Block 2 – Management and control practices

4. What are the main administrative and financial controls used in the company?

A: The control of orders is carried out through protocol books, in which the sender writes down the name of the recipient who will receive the package, without any additional documentation or traceability system. Financial controls are based on bank statements and order protocol records when payments are made in cash.

5. How is income and expenses monitored?

A: The monitoring of income and expenses practically does not exist. It is done through passenger relationships, number of food tokens sold, order protocols and cargo invoices. Expenses are controlled by receipts and invoices for purchases, and employee payments are made in cash.

6. Are there routines for checking or internal auditing of financial information?

A: There is no type of internal audit. Practically all controls are done manually.

Block 3 – Operational and technological processes

7. What system (software) is used to control operations?

A: The company uses Sebrae software only to issue the Electronic Bill of Lading (CT-e), in order to meet the tax requirements of mandatory cargoes, such as crude oil and its derivatives, natural gas, alcoholic beverages, soft drinks, cement, minerals, wood and transportation of valuables, according to Article 110, paragraph 7 of Decree No. 20,686, of December 28, 1999, of the ICMS Regulation of the State of Amazonas.

8. Is this system integrated between sectors (e.g., sales, finance, inventory)?

A: The company does not have an integrated management system. All processes are carried out manually.

9. What difficulties or limitations do you observe in using this system?

A: The main difficulty for the implementation of a management system is the lack of qualified labor. Most employees have a low level of familiarity with technological tools, being considered digitally illiterate, which makes it difficult to use computers and software.

Block 4 – Use of accounting and management information

10. Is accounting information used by managers in strategic decisions?

A: No. The company's accountant only closes the payroll and calculates the Simples Nacional based on an estimated revenue.

11. How do accounting reports help in day-to-day decisions?

A: There are no accounting reports available. The absence of reliable data makes it impossible to use this information in decision-making.

12. What types of information would be most useful to improve management?

A: It would be essential to implement a complete accounting and an integrated management system, including the sales, financial and input inventory modules. The system should allow the centralization of cost centers by activity — such as tickets, packages, food and cargo — and enable apportionment according to operational needs.

Block 5 – Perceptions about controllership

13. Do you have knowledge about the role of controllership in a company?

A: I had no knowledge about the controllership's role until I contacted the company Aquaviários Net, responsible for the proposal to implement a management system.

14. In your opinion, what would be the main benefits of implementing a controllership in Company R?

A: The main benefit would be to know the real profitability of the company, enabling the planning of solid and sustainable growth, in addition to making the business more competitive.

15. What barriers or challenges could hinder this implementation?

A: The main barriers are the deficiency of internet connection, which makes it difficult to use a 100% online system in real time, and the lack of skilled labor, requiring training from the basic level.

Final remark

This script was applied in person to the operations manager of Company R, during the second stage of the field research. The answers were recorded manually and faithfully transcribed, preserving the original content, with minimal language adjustments for academic adequacy.

ABSTRACT

The use of computational simulations has become central in various scientific and technological fields. In addition to enabling the modeling of complex systems and the prediction of behaviors, simulations feed reinforcement learning algorithms, digital twins, and interactive prototypes. However, when these simulations are employed to represent or recreate reality, philosophical problems arise concerning the nature of representation, the difference between appearance and reality, and the limits of knowledge. This theoretically exploratory article critically examines computational simulations as representations of reality, articulating classical and contemporary philosophical traditions. In light of authors such as Plato, Aristotle, Kant, Descartes, Baudrillard, Heidegger, Putnam, Bostrom, Winsberg, Turing, Searle, and others, it analyzes the relationship between imitation and original, the distinction between phenomenon and thing-in-itself, the role of signs in the construction of reality, skeptical hypotheses, and the crisis of representation in the age of technology. The text then discusses implications for artificial intelligence (AI), especially in the context of learning algorithms and digital twins. It reflects that simulations are not mere copies, but constructions mediated by theories, signs, and technology, requiring epistemological and ethical reflection on their use in AI.

Keywords: Computational Simulations. Representation of Reality. Philosophy of Technology. Artificial Intelligence. Digital Twins.

RESUMO

O uso de simulações computacionais tornou-se central em diversos campos científicos e tecnológicos. Além de viabilizarem a modelagem de sistemas complexos e a previsão de comportamentos, as simulações alimentam algoritmos de aprendizagem por reforço, gêmeos digitais e protótipos interativos. Contudo, quando essas simulações são empregadas para representar ou recriar a realidade, emergem problemas filosóficos relativos à natureza da representação, à diferença entre aparência e realidade e aos limites

RESUMEN

El uso de simulaciones computacionales se ha vuelto central en diversos campos científicos y tecnológicos. Además de posibilitar la modelización de sistemas complejos y la predicción de comportamientos, las simulaciones alimentan algoritmos de aprendizaje por refuerzo, gemelos digitales y prototipos interactivos. Sin embargo, cuando estas simulaciones se emplean para representar o recrear la realidad, surgen problemas filosóficos relacionados con la naturaleza de la representación, la diferencia entre apariencia y realidad y los límites del conocimiento. Este artículo, de carácter teórico-exploratorio, examina críticamente las simulaciones computacionales como representaciones de la realidad, articulando tradiciones filosóficas clásicas y contemporáneas. A la luz de autores como Platón, Aristóteles, Kant, Descartes, Baudrillard, Heidegger, Putnam, Bostrom, Winsberg, Turing, Searle y otros, se analiza la relación entre imitación y original, la distinción entre fenómeno y cosa en sí, el papel de los signos en la construcción de la realidad, las hipótesis escépticas y la crisis de la representación en la era de la técnica. A continuación, el texto discute las implicaciones para la inteligencia artificial (IA), especialmente en el contexto de los algoritmos de aprendizaje y los gemelos digitales. Se reflexiona que las simulaciones no son meras copias, sino construcciones mediadas por teorías, signos y tecnología, lo que exige una reflexión epistemológica y ética sobre su uso en la IA.

1 INTRODUCTION

The advancement of computational technologies has allowed the creation of mathematical models capable of simulating natural phenomena, social processes, and complex technical systems. In the fields of data science, physics, and biology, simulations replace or complement experiments, allowing to "test" theories and project future scenarios (Winsberg, 2009, 2010). In the area of artificial intelligence, simulations are used to train reinforcement learning algorithms, as they allow agents to perform millions of interactions in virtual environments, saving resources and avoiding risks in real contexts (Simwell, 2021). Companies and governments implement digital twins, virtual replicas of machines, cities, or processes, in order to monitor and optimize systems in real time (Simio, 2023). The popularity of the "metaverse" and the success of virtual reality platforms highlight a cultural trend of interaction in simulated worlds. Despite this centrality, the philosophical literature warns of risks and ambiguities. For centuries, philosophers have reflected on the difference between image and reality, as well as on the limits of knowledge obtained through representations. Plato (2006) described art as "imitation of imitation" and, in the famous allegory of the cave, prisoners rely on shadows projected on the wall, ignoring that they are only copies of real objects (Plato, 2006). Aristotle (1973), although accepting mimesis, maintains that poetry does not imitate particular events, but what can occur according to the laws of verisimilitude and necessity (Aristotle, 1973). The philosopher Kant (2001, 2011) distinguished the world as a phenomenon, that which appears according to the filters of space and time of sensibility, of the noumene, the "thing in itself", inaccessible to experience (Kant, 2001, 2011). For Heidegger (2001, 2014), modernity has reduced the world to an image: reality is established as a calculated image, so that the world "exists in an image" and becomes manipulable by technique (Heidegger, 2001). In addition to these classic analyses, contemporary thinkers draw attention to the implications of the new techniques. Jean Baudrillard diagnoses an era of simulacra in which copies have no originals and the real is replaced by hyperreality (Baudrillard, 1981). Hilary Putnam (1981) uses the "brain in a vat" thought experiment to argue that we cannot prove that we are not immersed in a computer-controlled simulation, although he considers such a hypothesis to be incoherent under certain semantic assumptions (Putnam, 1981, 1988, 1990). Nick Bostrom formulates the *simulation argument* by suggesting that, given the computational capacity of advanced societies, we are likely to live in an ancestral simulation (Bostrom, 2003). In the philosophy of science, Eric Winsberg shows that simulations are not mere experimental tools, as they require epistemological

justifications and validation criteria that are different from physical experiments (Winsberg, 2009, 2010). John Searle, in turn, argues that computers can manipulate symbols without understanding their meaning, as illustrated by the *Chinese fourth* (Searle, 1980, 2006). These discussions indicate that the use of computer simulations evokes ontological, epistemological and ethical issues that go beyond technique. This research aims to examine, in the light of these traditions, to what extent computer simulations can be considered representations of reality. The work is exploratory and theoretical, based on a bibliographic review of classic and contemporary works. It seeks to articulate concepts of imitation, representation, sign, appearance, reality and technology, to then discuss the implications for artificial intelligence and in the end, considerations are presented that highlight the need for critical reflection on the development and use of simulations in AI and science.

2 THEORETICAL FRAMEWORK

2.1 IMITATION AND REPRESENTATION IN THE CLASSICAL TRADITION

The analysis of computer simulations as representations of reality requires recovering the long philosophical tradition that discussed the relationship between imitation and original. Plato (2006) argues that works of art imitate sensible objects, which, in turn, are imperfect imitations of ideal forms, so that art is *three times far from the truth* because it imitates particular things and not the idea of the thing (Plato, 2006). This vision appears metaphorically in the allegory of the cave: prisoners see only shadows projected on the wall and take them for reality (Plato, 2006). In the same perspective, computer simulations can be seen as shadows of mathematical models that seek to get closer to real phenomena. Thus, Platonic criticism warns of the risk of confusing representation with reality, a recurring phenomenon in credulity in virtual worlds. Aristotle (1973) proposes a revision of this critique. Although he agrees that art is *mimesis* (imitation), he states that the poet's craft does not consist in narrating facts that have occurred, but in representing what can happen according to verisimilitude and necessity (Aristotle, 1973, 1988). Poetry tends to represent the universal, not the particular (Aristotle, 1973, 1988), when watching a tragedy, we learn something about the human being in general. Such a view opens space to recognize the cognitive value of simulations, which allow exploring possibilities and variations of systems, extrapolating the particular. However, Aristotle (1973, 1988) insists that *mimesis* must remain credible, which implies criteria for evaluating the fidelity of the simulation to the behavior of the world.

2.2 APPEARANCE, KNOWLEDGE AND REALITY

During modernity, reflection on the relationship between appearance and reality intensified. Descartes (1999), when starting the *Metaphysical Meditations*, decides to put everything in doubt. He considers that his senses can deceive him and hypothesizes an *evil genius* who could manipulate him in all things. To reinforce the doubt, imagine that perhaps you are dreaming and that all perceptions are illusions. The Cartesian goal is to find indubitable truths, but the thought experiment suggests an uneasiness about the reliability of representations. If the mind can be deceived, how can we believe that a simulation adequately portrays reality? Immanuel Kant (2001, 2011) reacts to the polarizations between empiricism and rationalism, proposing a synthesis. For the philosopher, we know the world only as a phenomenon, that is, as it is organized by *the a priori forms* of sensibility, space and time, and by the categories of understanding. Space and time are not properties of objects, but filters added by the mind, without them, we would not perceive anything. Therefore, there is a reality in itself (*noumeno*) that we cannot know directly. Consequently, validation criteria must recognize this limitation: simulations approximate observed phenomena, but do not capture the essence of things.

2.3 SEMIOLOGY AND CONSTRUCTION OF MEANING

Another fundamental contribution to understanding representations comes from semiology. Chandler (2017, p. 22) states that *we think only of signs*, anything can become a sign if it is interpreted as such. Ferdinand de Saussure, as cited by Chandler (2017), in turn, describes the linguistic sign as composed of a signifier (the sound or visual form) and a signified (the concept). The association between signifier and signified is arbitrary and depends on social conventions. Simulations, as sets of images, codes and *outputs*, function as signs whose interpretation gives meaning to the data. This means that the status of *reality* attributed to a simulation depends on the intersubjective agreement about its correspondence with the modeled phenomenon. If users interpret the *outputs* as reliable representations, the simulation acquires epistemological power; if not, it loses credibility. Jean Baudrillard radicalizes this view by arguing that the era of postmodernity is dominated by simulacra: representations that have no original. He describes four stages of the image: first, it reflects a reality, then it masks and denaturalizes reality, then it masks the absence of reality, and finally it becomes pure *simulacra* unrelated to the real. In the *hyperreal*, representation replaces the real in such a way that distinction becomes useless. The popularity of virtual

worlds, social networks, and digital twins can be seen as a manifestation of this phenomenon: individuals interact with images that do not refer to an original, building identities and strategies based on simulated data. If simulations take the place of reality, the question about their fidelity becomes less relevant than the analysis of their social and psychological effects. Baudrillard (1991) relates these phases of the image to the concept of *hyperreal*, emphasizing that representations dispense with the original and establish a logic of simulacra.

2.4 PHILOSOPHY OF TECHNIQUE: FROM THE WORLD AS IMAGE TO FRAME

Heidegger (2001, 2014) emphasizes that modernity conceives the world as a calculated and manipulable image, and Anders (1956) observes that reality comes into existence as an incessant chain of images. Martin Heidegger (2014), in his essay *The Age of the Worldimage*, examines the relationship between technique and representation. For him, modernity is characterized by the conception of the world as an image: it is not only a matter of creating images of the world, but of converting the world itself into an image. Reality comes to be defined by calculated and manipulated images, and "knowing the world as an image" becomes the rule. The philosopher observes that the essence of technique is not instrumental; Modern technology reveals the world as a "reserve of resources" and imposes a calculating way of thinking. Anders comments that the world exists as an image, a chain of images that covers the real incessantly. From this point of view, computer simulations are not simple tools, but expressions of a way of being in which the real is produced and controlled by representation. Heidegger (2014) identifies consequences of this phenomenon: thought becomes calculating, technical acceleration imprints speed to processes, masses and gigantism subordinate singularity, and subjectivism and objectivism are intertwined in technical domination. The "frame" (*Gestell*) organizes all entities as available for use. Modern technology, by reducing the world to a manipulable image, reinforces the separation between subject and object, making man the master of a calculated reality and, at the same time, the object of control systems. To understand the status of simulations in AI, one must consider this horizon: they are part of the mode of production of the world as an image and of the technical organization of reality.

2.5 SIMULATION, KNOWLEDGE AND PHILOSOPHY OF SCIENCE

In the contemporary field, the philosophy of science discusses the epistemological status of simulations. Eric Winsberg (2009, 2010) notes that they have emerged as tools to

investigate complex systems, such as climate or cosmological models, that cannot be studied directly. However, simulations differ from physical experiments. While experiments are based on direct manipulation of natural systems, simulations operate on mathematical representations and depend on processes of discretization, parameterization, and computational implementation. Winsberg (2009, 2010) distinguishes verification, the process of ensuring that the computational code correctly implements the model, validation, evaluation of how well the model represents the physical system. This distinction shows that the epistemic value of simulation results not only from its predictive capacity, but from the theoretical and empirical justification of the models employed. Frigg and Reiss maintain that simulations do not have a single epistemology; they are part of a broader scientific practice and lack specific criteria of justification. Winsberg (2009, 2010) also discusses the debate over whether simulations are analogous to experiments. Some defend the "identity thesis", according to which simulations are experiments run on models, and that, therefore, experimental epistemology applies to them. Others, such as Parker, propose a pragmatic approach, suggesting that validation methods can combine elements of empirical testing and statistical analysis. For the purposes of this article, it is important to highlight that simulation does not replace empirical research, but complements it, and that its results should be interpreted in the light of underlying models and hypotheses. When employed for AI, simulations constitute artificial environments that may or may not reflect the real world.

2.6 SKEPTICAL HYPOTHESES: BRAINS IN VATS AND SIMULATED UNIVERSES

Questions of reality and simulation take on metaphysical contours in the thought experiments of Putnam (1981, 1988, 1990) and Bostrom (2003, 2018). Hilary Putnam (1981) proposes to imagine that all human beings are brains in a vat connected to a computer that produces sensory experiences. The "brains" believe they live in a real world, but all they perceive is manipulation. Putnam (1981) argues that this hypothesis is self-contradictory because, if the linguistic terms refer to the *inputs* produced by the simulation, the phrase "we are brains in a vat" could not be true in the reference system. Despite this semantic critique, the experiment reveals the concern that our perceptions can be controlled by advanced computer systems, an idea that resurfaces in science fiction narratives and debates about virtual reality. Nick Bostrom (2003, 2018) develops the simulation argument, formulating a trichotomy: (1) the probability that advanced civilizations will become extinct before reaching a "posthuman" stage is high; (2) the probability that posthumans are not interested in running

many "ancestral simulations" is high; or (3) we are almost certainly living in a simulation. The philosopher maintains that if future computational capabilities allow the creation of simulated universes containing conscious beings, and if there is interest in doing so, the number of simulated beings will outnumber the original beings. The conclusion is that "there is a significant possibility that we are in a simulation," and that the hypothesis cannot be easily ruled out. This line of thought, although speculative, reinforces the need to question the relationship between simulations and reality, including in the daily use of computer models.

2.7 TURING TEST, COMPUTATIONALISM, AND ARTIFICIAL CONSCIOUSNESS

In the early 1950s, Alan Turing proposed a pragmatic criterion for evaluating machine intelligence. The "Turing test", formerly called the "imitation game", consists of a human evaluator talking to a machine and a human without knowing which is which. If the evaluator is unable to distinguish, within a given time, who the machine is, it is considered to demonstrate intelligent behavior. Turing replaces the question "Do machines think?" with "Can machines imitate human language indistinguishably?" The test influences the development of AI and gives rise to debates about whether the ability to generate believable responses is enough to attribute intelligence. Hilary Putnam (1981, 1988, 1990), initially an advocate of "computationalism", later criticized the view that the mind is a computer program. In an argument known as "multiple realization," he asserts that any physical system can be interpreted as implementing a finite state machine, which would trivialize the notion of computation, requiring additional criteria to distinguish truly computational systems. In a similar vein, John Searle (1980, 2006) argues, in the "Chinese room" thought experiment, that a computer can manipulate symbols and provide correct answers without understanding their meaning. In the example, a person who does not know Chinese follows a set of rules to correlate questions in Chinese to answers in English; To observers, it seems that she understands the language, but internally nothing is understood. For Searle (1980, 2006), syntactic manipulation is not enough to generate semantics, therefore, simulations of cognitive processes are not equivalent to conscious experience. These arguments suggest conceptual limits to mind and consciousness simulations.

2.8 SIMULATION AND ARTIFICIAL INTELLIGENCE: REINFORCEMENT AND DIGITAL TWINS

With the rise of *reinforcement learning* (RL), simulations have become essential components of algorithm training. Unlike supervised methods, in which models learn from labeled data, RL requires an agent to explore an environment and receive rewards or punishments according to their actions. To conduct thousands or millions of experiments without physical risk, simulations that emulate the environment are used. A case study from the company Simwell notes that simulation provides a controlled and risk-free environment for testing strategies, and is indispensable for RL because it allows for repeatable testing and collecting performance metrics. In these simulations, the agent evaluates different policies and adjusts their behavior, later, the policies can be implemented in the real world, reducing costs and risks. Another technological trend is the use of digital twins. A digital twin is a virtual replica of a physical object, built from sensor data, mathematical models, and AI algorithms. The *Simio* report highlights that digital twins originated in the aerospace sector, when NASA used simulators to replicate flight conditions, and that the concept was formalized by Michael Grieves in the early 2000s. Today, digital twins incorporate AI to perform predictive analytics, optimization, and predictive maintenance, allowing systems to be monitored and adjusted in real-time. The integration between AI and digital twins results in "smart twins" that learn from data and evolve over time. However, such technology reinforces Baudrillard's concern: the virtual replica can become more real than the object, influencing decisions based on calculated projections. Researchers are also investigating the use of real images to generate photorealistic simulations. A 2024 paper from the University of Washington reports on the development of the RialTo and URDFFormer systems, which build digital twins of buildings or environments from smartphone scans or internet images. These simulations allow you to train robots quickly and cost-effectively, allowing them to adapt to real-world conditions. The goal is to democratize the use of detailed simulations, reducing the *gap* between virtual models and the physical world. Despite the benefits, the ability to create reliable simulations from available data also raises ethical questions about privacy and surveillance.

3 METHODOLOGY

This study is characterized by a qualitative approach of a theoretical-exploratory nature, based on systematic bibliographic research and documentary analysis (Gil, 2019). The investigation adopts the hermeneutic-dialectical method to understand the complex

relationships between computer simulations and representations of reality, articulating classical and contemporary philosophical traditions with current technological implications (Minayo, 2014). The methodological design followed the assumptions of exploratory research, which aims to provide greater familiarity with the problem, making it more explicit and allowing the construction of hypotheses (Gil, 2019). According to Marconi and Lakatos (2017), exploratory research increases the researcher's knowledge of the facts, allowing for a more accurate formulation of problems and the creation of new hypotheses. This approach proved to be adequate given the multidisciplinary nature of the theme, which requires the articulation of philosophical, epistemological and technological knowledge. The collection of primary data was based on a systematic review of the literature, conducted by consulting the main academic databases. The bibliographic survey followed criteria of thematic relevance and academic quality, prioritizing reference works in the field of philosophy, epistemology, and philosophy of science (Severino, 2017). The search strategies included the descriptors: "computer simulations", "representation of reality", "philosophy of technology", "artificial intelligence", "epistemology of simulations", combined with Boolean operators. The time frame ranged from fundamental classic works to more recent contemporary publications, ensuring the historical breadth necessary for the proposed analysis (Severino, 2017). The theoretical *corpus* was made up of primary and secondary sources, including: (i) classical philosophical texts by Plato, Aristotle, Descartes, Kant and Heidegger; (ii) contemporary works of philosophy of science and epistemology, especially by Winsberg, Putnam, Searle and Bostrom; (iii) specialized literature on artificial intelligence and computer simulations; and (iv) technical papers and case studies on practical applications of AI simulations.

4 ANALYSIS AND DISCUSSIONS

The theoretical foundation presented outlines multiple perspectives on the relationship between simulation and reality. The tradition of Plato (2006) and Aristotle (1973, 1988) shows that imitation can both distance from the truth and allow the learning of universals. In computer simulations, the Platonic concern is manifested in the risk of taking models for reality, especially when technical verisimilitude masks simplifications. An example of this are climatic or epidemiological models that, although indispensable, do not capture all the variables of the real system. The Aristotelian reading, on the other hand, inspires a constructive use: simulations are spaces to explore possibilities and general laws, as long as the difference between possibility and fact is recognized. In AI, reinforcement learning

algorithms learn from a model of the world, but transfer to the physical world requires care to avoid illusions of control. Kant (2001, 2011) and phenomenologists remind us that our experience is always mediated by cognitive structures and a *priori* forms. Simulations, as products of our sensitivity and understanding, carry these structures, including prejudices and biases. Spatiotemporal "shapes" and logical categories are programmed into the models and algorithms. Thus, the validation of simulations needs to go beyond numerical fitting, it must consider whether the models incorporate questionable assumptions. For example, facial recognition systems trained on unbalanced data sets can perpetuate discrimination, demonstrating that the statistical representation of the world becomes a form of co-production of reality. When mapping urban environments to create digital twins, it is crucial to reflect on which perspectives are privileged and which are invisible. The semiotic apparatus focuses on interpretation. As Peirce observes, nothing is a sign unless it is interpreted as such. The validity of a simulation depends, therefore, on the interpretive community that recognizes it as faithful or useful. Acceptance of the results of a climate model, for example, requires consensus among scientists on the methods and parameters. In everyday interactions, people accept the veracity of simulations when they trust the institution or technology that produces them, hence the importance of transparency and communicability of models. The dissociation between signifier and signified observed by Saussure warns that representations can slide and produce divergent interpretations. In AI, interfaces that show simplified visualizations can suggest accuracy where there is uncertainty. Baudrillard's hyperreal warns that the avalanche of simulations can displace the real: graphs and indicators of a digital twin can determine urban decisions, even if people's experience in physical space is different. Heidegger's (2001, 2014) philosophy of technique expands the analysis by situating simulations in the context of a technically armed world. Simulations participate in the logic of "frame": they transform entities into calculable and manipulable objects, favoring a dominant posture in relation to the world. The expansion of networks of sensors, algorithms and digital twins induces a vision in which all dimensions of life, health, education, mobility, are quantified and translated into data. The "world as image" implies that the real only exists when represented and calculated. However, this technical perspective needs to be balanced by a reflection on what escapes calculation. In education, for example, simulators can help learn mathematics or physics, but they do not replace the living experience of dealing with students' mistakes, doubts, and singularities. The risk is that the class becomes a mechanical reproduction of models, erasing the dialogical and creative dimension of teaching. Winsberg

(2009, 2010) shows that simulations require verification and validation processes that are different from experiments. This applies directly to AI. In reinforcement learning, the simulator code must be checked for correct model implementation, and the results must be validated by comparing simulated behaviors with empirical data. The validity of a digital twin depends on the continuous updating of the data and the fidelity of the equations used. When it comes to replicating complex social phenomena, such as human interactions in virtual environments, validation becomes even more challenging. The absence of clear criteria can lead to overconfidence in simulation or, on the contrary, to its rejection by skeptics. The skeptical thought experiments of Putnam (1981, 1988, 1990) and Bostrom (2003, 2018) invite us to reflect on levels of simulation. If reality itself could be a simulation, the distinction between "real" and "virtual" would lose meaning. Regardless of the plausibility of this hypothesis, it points to the power of technology to alter the experience. In AI, virtual environments created to train robots, such as *RialTo* and *URDFormer*, show that we can produce worlds so believable that agents generalize well to the physical world. However, if the data used to build these simulations reflect only part of social reality, we can perpetuate inequalities. The brain in a vat reminds us that by blindly trusting the *outputs* of automated systems, we can lose the ability to distinguish between representation and direct experience. The Turing test and the critiques of computationalism highlight the conceptual limits of simulations. Although machines are capable of passing modern variants of the test, this does not imply that they understand or have consciousness. Searle (1980, 2006) argues that syntactic manipulation of symbols does not generate semantics. This debate has implications for AI: conversational simulators based on large language models (LLMs) can generate coherent texts, but this does not guarantee understanding. In the educational context, it is important not to confuse a *chatbot's ability* to answer questions with a real understanding of the content or the needs of the students. Finally, the use of simulations in AI brings both benefits and challenges. Reinforcement learning in simulated environments accelerates the development of autonomous agents. Digital twins allow you to optimize industrial and urban processes, and the creation of photorealistic simulations based on images democratizes access to complex virtual environments. However, these technologies are consumed in a context of *hyperconnectivity* and data economy that involves issues of privacy, security, digital exclusion and sustainability. The power to represent and predict brings with it ethical responsibilities: who sets the parameters of the models? Who benefits from the simulations and who is excluded? How to prevent simulations from becoming mechanisms of social control? These

questions should guide the development and application of simulations in the field of AI and beyond.

5 FINAL CONSIDERATIONS

The objective of this article was to investigate computer simulations as representations of reality, articulating a philosophical analysis with implications for artificial intelligence. The review of classical authors, from Plato to Heidegger, showed that the relationship between image and reality is problematic and full of nuances. Plato (2006) warns that images can take us away from the truth, while Aristotle (1973) recognizes their heuristic value. Kant (2001, 2011) and phenomenologists remind us that all representation is conditioned by our cognitive structures, Heidegger (2001, 2014) denounces that technology transforms the world into a calculable image, and Baudrillard announces the era of simulacra, in which the distinction between original and copy dissolves. The contemporary philosophy of science, represented by Winsberg (2009, 2010), reinforces that simulations require their own criteria for verification and validation, and that they do not replace experimentation, although they complement it. Thought experiments by Putnam (1981, 1988, 1990) and Bostrom (2003, 2018) expand the reflection on the ontological status of simulated reality, while Searle (1980, 2006) and Putnam (1981, 1988, 1990) criticize the reduction of the mind to computation. In the field of artificial intelligence, simulations play fundamental roles: they enable reinforcement learning, support digital twins, and provide environments for robot testing. These uses demonstrate that simulations are powerful modeling and forecasting tools. However, the evidence and arguments discussed suggest caution. It is necessary to recognize that every simulation is built from models and assumptions, therefore, it is not the world, but a representation that can hide or distort aspects of reality. Confidence in the results of algorithms trained in simulations should be proportional to the transparency of the models and the empirical validity of the data. From a pedagogical point of view, simulations can enrich teaching, but never replace the living experience of learning. And, in the ethical sphere, the use of data and images to build simulations must respect individual and collective rights. Computer simulations are representations that, at the same time, reflect and construct realities. Its growing adoption in science and AI invites a permanent dialogue between technique and philosophy. Only an analysis that considers the ontological, epistemological and ethical foundations will be able to guide a responsible and emancipatory use of these technologies. The contributions of this study to society and academia are multiple. For academia, the work

offers a philosophical foundation for understanding the epistemological status of computer simulations, bridging a gap between classical philosophy and contemporary debates on technology and artificial intelligence. The articulation between distinct philosophical traditions provides a conceptual basis that can guide future research in the philosophy of technology, the epistemology of simulations, and the ethics of AI. For society, the study warns about the risks of confusing computational representations with reality, an issue that is increasingly relevant in a context of proliferation of digital twins, metaverses, and automated decision-making systems. The proposed critical reflection can support public policies and corporate practices that seek the responsible use of simulations, especially in sensitive areas such as health, education, public safety, and urban planning. In addition, by showing that simulations carry theoretical assumptions and biases, the work contributes to the debate on algorithmic transparency and social justice, central themes in the contemporary agenda of technological governance. As for the limitations of the research, it is recognized that the study has an eminently theoretical and exploratory character, not contemplating empirical analyses of specific cases of application of computer simulations in AI contexts. Although the literature review has covered relevant classical and contemporary authors, the literature on the philosophy of simulation is vast and constantly expanding, so that other philosophical perspectives could enrich the analysis. In addition, the article did not develop a specific methodological protocol for epistemological and ethical evaluation of simulations, limiting itself to identifying general conceptual issues. Finally, the discussion on digital twins and reinforcement learning drew on secondary sources and available technical literature, without direct access to proprietary implementations or primary data from companies developing these technologies. It is recommended, for future studies, to carry out empirical research that analyzes concrete cases of use of simulations in AI projects, examining how philosophical assumptions manifest themselves in the practice of modeling and validation. It would be productive to develop operational criteria, inspired by the philosophy of science, to assess the epistemological adequacy of simulations employed in critical contexts, such as public health or social policies. It is also suggested to investigate, from an interdisciplinary perspective, the psychosocial impacts of immersion in simulated environments, articulating philosophy, psychology and sociology. Studies on the relationship between simulations and algorithmic biases, analyzing how simplifications and *design* choices perpetuate inequalities, constitute an urgent research agenda. It is recommended to develop *specific ethical frameworks* for the use of digital twins and AI training environments considering privacy,

consent, and transparency concerns, in dialogue with emerging regulations on artificial intelligence.

ABSTRACT

Eighty years after the arrival of the Red Army troops — whose doctors treated the very few prisoners who had not yet been murdered — at the Auschwitz extermination camp, it is necessary to reflect on the role of a mistaken historical theory of the German, European, and ultimately global left, which made it impossible to resist with the necessary strength against National Socialism and the extermination of European Jews.

Keywords: Walter Benjamin. Critical Theory. Concept of Progress. Fetishism. Karl Marx. Anti-Fascist Resistance.

RESUMO

Oitenta anos após a chegada das tropas do Exército Vermelho — cujos médicos atenderam os poucos prisioneiros que ainda não haviam sido assassinados — ao campo de extermínio de Auschwitz, é necessário refletir sobre o papel de uma teoria histórica equivocada da esquerda alemã, europeia e, em última instância, mundial, que tornou impossível resistir com a força necessária ao nacional-socialismo e ao extermínio dos judeus europeus.

Palavras-chave: Walter Benjamin. Teoria Crítica. Conceito de Progresso. Fetichismo. Karl Marx. Resistência Antifascista.

RESUMEN

A los ochenta años de la llegada de la tropas del ejército rojo —cuyos médicos atendieron los muy pocos presos que todavía no habían sido asesinados— al campo de exterminio de Auschwitz, hay que reflexionar sobre el papel de una teoría histórica equivocada de la izquierda alemana, europea y, al fin de cuentas, mundial que hizo imposible que se resistiera con la fuerza necesaria al nacionalsocialismo y al exterminio de los judíos europeos.

Palabras clave: Walter Benjamin. Teoría Crítica. Concepto de Progreso. Fetichismo. Karl Marx. Resistencia Antifascista.

1 INTRODUCTION

In 1945, Allied troops liberated German and Austrian cities that were still under the yoke of Nazi forces. During the last two weeks of the war, between April and May, the Nazis still murdered 250,000 people, in the famous death marches. At a time when Germany's defeat was imminent, the Nazis killed a quarter of a million people in their almost countless "secondary" camps that existed in addition to the large camps and centers of immediate extermination such as Auschwitz, Treblinka or Sobibor, among others.

In addition to the best-known extermination centers, there was a vast system of minor camps, at least forty thousand in Germany and in the occupied countries. Of the latter, the prisoners were sent to death marches; in part so that the genocide would not be so obvious. They were killed little by little, those who walked the slowest were killed by the SS guards and stayed there, spread over miles and miles across Europe.

The aim of this text is to question how Critical Theory in general and Walter Benjamin in particular reacted intellectually to the genocide, which Claude Lanzmann calls *the Shoah*, and Raul Hilberg calls *The Destruction of the European Jews*, in his famous book that bears this title, undoubtedly the most important study on the subject.²

The question posed by Critical Theory is not: why was this possible? Well, this is a very difficult question; Lanzmann, for example, recommends not formulating it, since he considers that it diverts us from *seeing* the fact itself.³ Therefore, we do not pose this question, but emphasize what Benjamin and the whole of Critical Theory investigate: why did the German and European left not know how to react to the fact of fascism in general and Nazism in particular? This question is more concrete than inquiring directly about the genocide because, following Lanzmann, this diverts attention from the fact that few or none have been able to see, in the face of the terror and complexity of the historical and social event itself.

2 THE THEORETICAL ERROR OF THE LEFT AND ITS RESISTANCE

What Benjamin formulated was: why did the left not know how to react? Here it is worth commenting on something important: there is a myth that there was resistance; but at least in the case of Germany and Austria, this is not true. In France there was some resistance, but much more limited than what was usually said later.

² Hilberg, Raul. (2005): *The Destruction of European Jews*, trans. Cristina Pina Aldao. Madrid, Akal.

³ Lanzmann, Claude. (1990): "Hier ist kein Warum" in Bernard Cuau and Michel Deguy et al., *Au sujet de Shoah*. Paris, Belin. p. 279.

In Poland there was strong resistance, but it was mostly not left-wing, but nationalist, made up of mostly conservative Poles and/or Catholics. The most famous of the left-wing resistance in Poland has been the significant resistance in the Warsaw ghetto, which was organized mainly by Jewish young socialists, whose armed wing was not much more than a dozen *ghetto fighters*.⁴ There was also a very important anti-fascist resistance and resistance against the German occupation of the Soviet Union. In this regard, it is known that Stalin, when he tried to call for resistance, did so with the argument of defending the motherland, rather than with the argument of defending communism, socialism or revolution. The Stalinists agreed that this was the best way to organize resistance. Although I do not share this idea, it is true that under the given conditions it was the strategy that was used with some success.

Thus, left-wing resistance, specifically against Nazism and fascism in general, existed in Spain during the Civil War, this is undeniable; there was also a more left-wing definition of resistance in Yugoslavia; even, isolated cases in other countries; but, in general and mass terms, it was not something that existed, much less in Austria and Germany. For this reason, we return to the question of Critical Theory and Benjamin, why was it not possible to organize a massive resistance of anti-fascist leftists? The contradiction lies in the fact that the European left was stronger than ever in the 1920s; neither before nor since has it been as intense as then. This left was well organized, and also armed; The German communists, for example, had hundreds of thousands of rifles hidden to prepare the resistance, which they did not use: not a single one was directed against the genocide.

Why? What Benjamin answers is that the lack of resistance was not so much a mistake, although obviously it is a political error, but it was not due to cowardice, or the inability to organize, nor to Nazi repression, which of course was strong; rather, this philosopher would say, reason was a *theoretical* error.

There were one or more very serious errors in the theory of the German-Austrian and European left that, in some way, led them to commit very wrong acts and this provoked non-resistance or almost non-existent resistance against the Nazis from the left. This question is still important today, eighty years after the end of military Nazism, because this error has not ceased to exist. Benjamin died in 1940: he was arrested during his flight from France to Spain, and he committed suicide because he concluded that he would not reach the United States,

⁴ This resistance was reduced both in terms of the number of participants and because of the little support received from the non-Jewish Polish resistance or other groups.

but a Nazi death camp. I think with almost absolute certainty that he would agree with me: this theoretical problem is still valid.

Today we live the same theoretical error on the left, and I speak in the plural on purpose, because I consider myself part of it. In reality, there are several errors; the central thing, Benjamin emphasizes, are two elements: one, how history is conceived and, the other, how the popular support that can be given to a struggle is conceived. I would like to begin by analyzing the second.

During Benjamin's time and until the fall of the Soviet Union and its allied countries in the 1980s, a cult of the proletariat predominated. There was the idea that the proletariat, by definition, was left-wing; It was also thought that *it would de facto* fight against capitalist social relations and that it would be anti-fascist. Practically the entire left was convinced of this.

I believe that this error persists, although almost no one uses the term proletariat as such anymore. The cult of the proletariat has been transformed into a cult of democracy; Deep down it is practically the same: it is believed that the majorities are right, that they are anti-fascists; unless they are deceived or someone sees their faces, such as the mass media or governments; that there is electoral fraud, and so on. If something like that doesn't happen, then the populations —whether they are the proletariat or the population in general— are right, in terms of an anti-fascist reason. Despite the disappearance of the dogmatic left of the Soviet Union, these political-theoretical errors still exist. There has never been a real discussion about it.

The exception was precisely Benjamin and other authors of Critical Theory, but their contributions have been largely ignored or turned into something else. Nowadays Benjamin is mentioned a lot, but the core part of his thought is not addressed.

There is, then, a naïve belief of the party leaders deposited in the popular mass that follows them, and vice versa; also a naïve belief in leaders. Benjamin argued that deep down it is the same; It looks different, but it is a single construction: the mass leader and the masses, together, supposedly guarantee that a resistance against the fascists will work.

3 THE DEMOCRATIC IMPOSSIBILITY OF AN ANTI-NATIONAL SOCIALIST RESISTANCE

The German left insistently defends *democracy*, and it must be clarified that with this argument, anti-National Socialist resistance would have been impossible, because the Nazis came to power democratically in 1933. That vote was not falsified, there was no electoral

fraud, so that, by way of democracy, anti-Nazi resistance would have been a falsehood, even before the time of repression. Indeed, in the following years they falsified the elections to always obtain 99.5% of the votes. In any case, many people thought that the Nazi policy was correct, including extermination, in it there was something close to a social agreement.

Today, it is said that in Germany and other countries the populations did not know that the genocide was happening, which is false. Hitler tirelessly repeated the phrase of the *final solution of the Jewish question* [*Endlösung der Judenfrage*], he mentioned it on any occasion and everyone understood what he meant. Everyone saw their neighbors disappear and knew that they would never return, they were aware that they were going "to the East" and that there was no food there; they saw trains full of people leaving empty. To claim that no one knew what was happening is a "white" lie to sleep peacefully.

People, for the most part, agreed with these actions. Herein lies the big problem. The left did not resist, in part, because if they did, they were against democracy, the proletariat and, at least in part, against the convictions of the population.

The Vatican protested once: when the Nazis began exterminating the so-called disabled. After the claim by the highest Catholic institution, the reaction of the Nazis was to change the regulations that provided that all people with certain disabilities, defined in a long list, had to be exterminated. After this criticism, it was modified to the fact that only if the family agreed, it would be carried out – but the families, in a large percentage of cases, were. There were few cases in which the family said "we don't want to"; There were even those who took their children, parents or siblings directly to euthanasia centers to suffer a violent death. At first these centers were hospitals, then they became *more sophisticated*. Thus, in many cases the relatives not only did not wait for permission to be asked, but they themselves took the initiative to provoke the euthanasia of their "disabled" relatives; In the same way, they did not hesitate to denounce their Jewish neighbors.

A large part of the Jews imprisoned in Germany were found by the Nazis, not thanks to their methods of finding them, which at that historical moment were not yet as sophisticated as they are today in terms of digitized databases. The German state was not yet so organized, it needed the denunciation of the population and this worked "very well". Many building dwellers, for example, systematically flagged suspicious people. If the neighbors rested on Saturdays, but not on Sundays, they called the police to warn of such a terrible action. In many cases, they concluded that this neighbor had a grandfather, up to two or more, Jews; then that person was exterminated. There was a "democratic" agreement in this sense, which

made it difficult for the left to resist; They didn't know how to deal with it, how to commit the "undemocratic" act of going against the popular will, they couldn't say, "We, even though we are a minority, oppose genocide."

Today we blindly and unconditionally believe in "democracy". Moreover, the concept has been reduced to a simple system of elections held every four or six years. There is not even a complete definition of democracy and, even if the concept were more complete, the first step would be to question it. Herbert Marcuse, also a member of Critical Theory, presented a very good formulation on this subject in *Reason and Revolution*,⁵ his book on Hegel and the Theory of Bourgeois Society. He points out that democracy would only really work if each member of society had the will to take care of the good of all; if each one, at the time of voting, proposing, leading, etc., had this in mind. But, Marcuse points out, living immersed in capitalist social relations, this is impossible. The social formation that reigns today educates us, from birth, from the moment we have the first consciousness, to take care only of our individual and selfish interests; If we are very open, perhaps we could worry about two or three more people; or if we are very radical, perhaps by a group of up to a hundred people, but almost no one gets more.

In the form of capitalist reproduction it is impossible, by definition, for anyone to think of the good of all; this problem necessarily exists. The democracy we have today, for example, does not have a systematic structure to protect minorities. If decisions are made on the basis of democracy, it is very easy to see what is happening now in Europe, where it was democratically decided not to send ships to the Mediterranean, where thousands of expatriates drown every year. One of the ideas of European governments is to send ships and planes to destroy the boats where refugees could later be transferred. For this reason, it has become the most dangerous sea in the world despite being calmer and with less strong storms than the Atlantic or the Pacific; because nowhere else do so many people die.

There are no majorities that raise their voices, no one says: "we are no longer going to vote for our government if it acts in this way against Africans and Asians". This is how the left failed in the face of Nazism. We must say it: there was a resounding failure of the European left, perhaps with the exceptions mentioned; the Spanish and the Yugoslav, the only ones that more or less stood out. Another would be Holland, where on the day the

⁵ Marcuse, Herbert. (1971): *Reason and Revolution: Hegel and the Emergence of Social Critical Theory*, trans. Julieta Fombona de Sucre. Madrid, Alianza. (The paperback book. Humanidades, 292) (1st ed. in Col. Area of knowledge: Humanities, 2003. 462 pp.)

deportations of Jews began in Amsterdam, a general strike was organized. There are other small cases that are significant in historical terms, but unfortunately, in numerical terms they are almost irrelevant. We then return to the initial question: Why is there this naïve faith in the majority? And why does the left submit to it knowing that it is false? He submits to the wrong argument of the majorities and then justifies it theoretically.

There were long debates after Nazism focused on how that could happen, how the majority of the populations could agree. The communist justification, and also that of some socialists, is that they were all deceived: the populations themselves are not so revanchist and pro-war, so racist, so anti-Semitic; but they were deceived by the Nazis. This explanation persists in many countries today, especially on the left; However, it is a dangerous explanation and is based on a very simple theory of manipulation.

For Georg Lukács, deception and manipulation exist, but the central problem lies in objectification. This occurs in capitalist relations and is reflected in consciousness. Reification means that things dominate the world, we are their annexes; what decides, Marx would say, is the automatic subject, the value that valorizes itself, we are only its helpers. Even we become things. Adorno formulates a similar idea: reality itself, materiality itself, is already ideology. From the material there is an ideological presence. The current ideological instances are not the television stations or the newspapers managed or the manipulated or manipulative teachers, all that exists, but it is not the central point. The central point is the materiality socially reproduced on a daily basis; that is why it must be changed.

Horkheimer, Adorno and Benjamin argue that this is the reason why the left acts this way. The problem is this: although the left is aware of a certain tendency of many people to manifest a wrong consciousness due to capitalist relations of coexistence, it nevertheless submits to the decisions of the majority. It is at first glance strange, since it implies that people with anti-capitalist political positions accept the pro-capitalist consciousness with the argument that it is about "modernity".

It is difficult to understand why this comes to this. Benjamin would argue that it is due to a naïve faith in the masses of people and that they are automatically heading towards a revolution, or at least a better society. This simplifying view is the result of limited and mistaken interpretations of Karl Marx.

Marx may suddenly, in certain places in his extensive work, have statements of this kind, yet they appear in his writings on few occasions. Marx's main work never mentions it like this, in the main construction that is expressed in the famous chapter "The Commodity"

in section four of *Capital* says the following: "The fetishism of the commodity and its secret", Marx expresses how the very consciousness in our society is systematically wrong. However, hardly any Marxists at the time took these critical statements of Marx seriously. For this reason, Benjamin would affirm that they have a progressive and naïve interpretation of this author. *Progressive* in the sense of assuming a naïve faith in progress; part of this progress would be that the population, which will be increasingly intelligent, more lucid, will have a greater desire for democracy. In today's Mexico, this ideology that dates back to the 1980s persists. Why is it thought that Mexico is more democratic now than ever?

It is strange that the left, to this day, legitimizes this discourse and believes that it works. For Benjamin, it has to do with the illusory faith we have in progress – this is the theoretically most profound point – a faith that history advances automatically. This had already been formulated by social democratic thinkers and the entire German reformist left; Benjamin critically quotes Josef Dietzgen, who stated that every day the population is wiser and the workers are more intelligent because they go to work punctually.⁶ That is why the greatest contribution we can make to the socialist revolution is to go to the factory every day, without delay, to carry out as few strikes as possible, not to miss work even if we are sick: this is how we achieve a more productive system. This is the real "anti-capitalist" attitude, according to Dietzgen.

These ideas were preached not only by the communists, but also by German social democracy. The Communists on this point were slightly less dogmatic, which is strange, since the Stalinists were dogmatic, but sometimes the Social Democrats, the reformist left, beat them to the punch in dogmatism. On this point the most dogmatic were the reformists. Dietzgen was one of the *great* social democratic intellectuals, one of the pioneers of the first line of thought; he insisted on efficiency, discipline and submission. I insist: dogmatism is not specifically Stalinist, but of the entire reformist left.

Benjamin's critique of faith in *progress*, as something that necessarily improves people's lives, is based on the observation that this blind belief is wrong *in its entirety and in all perspectives*. Today, the critics of progress reduce it to certain aspects or certain perspectives, they criticize that only the technical, quantitative, productivity aspect is considered; while human progress, that of democracy, of human rights, is stagnant.

Today, this argument is shared by several thinkers: the critique of progress has gained strength since the 1980s, but practically no one develops it with Benjamin's radicalism. He

⁶ Cf. Dietzgen, Josef. (1906): *Sozialdemokratische Philosophie*. Berlin, Vorwärts.

did not think that there was a need to redefine progress or to broaden the concept beyond the technical and organizational; he believed that progress is a misconception for the left. He postulated that the idea is merely bourgeois: in making the French Revolution and others like it, the bourgeoisie needed this concept; He turned out to be the strongest against classes, political and economic relations, as well as medieval ideologies.

In this context, the idea of progress was brilliant and managed to crush a large part of the medieval heritage. From the bourgeois point of view, progress is undoubtedly the best thing there is. Many theories were based on this: the German idealists and many bourgeois theoreticians, the positivists themselves, who at first glance were very different from the idealists, but on this subject they have common ground; so are the empiricists and pragmatists. All the more or less bourgeois theories are almost identical in interpreting progress, they have, of course, their variants, but between them the difference on this subject is not really that important.

Benjamin would point out to the left the error of thinking, as the bourgeoisie often do, in terms of progress. As is known, in our time there is a worldwide deindustrialization, present for several years, clear examples are Detroit in the United States and Ciudad Juárez in Mexico, where many factories remain empty. The only thing that politicians mention in this regard is that there has been *negative growth*.

However, the criticism cannot be reduced to the fact that progress is not carried out in a broader way, that transcends the technological and economic to reach a social progress of inclusion. Benjamin would argue that the very idea of progress does not serve the left; it only works for the bourgeoisie, originally more revolutionary and determined. When Benjamin refers to the bourgeoisie, he does not do so derogatorily, but rather in terms of a social class that at one time was revolutionary, which organized the revolution against the feudal class. The bourgeois developed and used the concept with remarkable sophistication.

But on the left, specifically on the anti-capitalist left, this concept does not work at all. It is a serious mistake to think that we must radicalize the concept of progress. The left generally assures: "You make progress halfway; we, on the other hand, do it for real" and it is proposed that progress will now go well, which before had only been a promise or a half-fact, but now it will be complete.

For Benjamin, it is necessary, during revolutions or radical political, economic or ideological changes, to attack the ideological center of the era that one wants to overcome. However, this has not been done by those who were and are on the European and world left;

They have failed to detect that the ideological and economic center of the capitalist form of reproduction, of the bourgeoisie and its philosophers, is precisely the idea —and even a certain reality— of progress; that is the center from which everything starts. If it is not attacked, the bourgeois tendencies will always be victorious, both ideologically and politically and militarily.

The bourgeois class would never have won over the feudal class if it had not attacked religious concepts. If someone fights for an anti-feudal stance, but accepts that God himself created the king and queen, he will certainly lose. First it will be necessary to demonstrate that one is not a king by divine decree and that there is no God, that this king imposed himself violently and militarily. This is what the bourgeois politicians and thinkers of the *siècle des Lumières* did.

The left has never reached this level of argumentation, Benjamin would affirm, it has not achieved a radicalism comparable to the bourgeoisie in its break with the dominant thinking of its time. It has never gone as far in ideological struggles as the bourgeoisie, which did succeed in a certain way in destroying the existing theology, which supposedly put the old upper class in its place. With this rupture, the bourgeoisie was able to justify, analyze and promote its struggle, and also convince the people to participate in it. The left is nowhere near anything like it.

Marx tried, of course, but the problem is that Marx has been systematically misunderstood. His most boring and repetitive phrases of the dominant ideology of his time have always been taken up, the most "progressive", where he demonstrates a naïve belief in progress. These ideas exist in Marx, undeniably, they are the quasi-bourgeois moments in which he copied with a certain naivety the dominant model of the moment. The problem is that these concepts have been repeated ad nauseam while the most critical and profound part of his thought, precisely his criticism of progress, has been denied, or at least ignored and minimized. For example, he speaks of the need for him to give up "the human progress of resembling that horrible pagan idol that only wanted to drink the nectar in the skull of the sacrificed."⁷ This is the way Marx, in his best moments, refers to progress; the one by which more and more people died every day from diseases that could be cured, and even more so if they were working-class children or war refugees.

⁷ Cf. Marx and Engels (1973), "Future Results of British Domination in India", in: *On Colonialism*, Buenos Aires: Pasado y Presente, pp. 83-84.

In the subchapter "The Fetishism of the Commodity and Its Secret" Marx also refers to the development of consciousness. He distances himself from the bourgeois (revolutionaries), who claim that every day, every generation, we are more aware and, above all, that we owe to the great break with feudalism an explosion of consciousness – at least according to bourgeois epistemological theory in its many variants. All bourgeois thinkers agree on this point, Marx, on the other hand, compared in this passage of his magnum opus four or five historically existing economic forms and their degree of economic consciousness, and concluded that the degree of this consciousness has been decreasing.

According to him, the so-called *primitive men* knew perfectly well how their economy worked; the slaves were also very clear about their slavery and exploitation. In the Middle Ages, the forms of exploitation and the servant-master relationship became more sophisticated and complicated, but people were still clear about their exploited, subordinated, violated condition.

In the form of capitalist reproduction, on the contrary, Marx affirms, economic consciousness tends to disappear, it almost no longer exists, because practically no one understands—sometimes not even specialists—what is really going on. Marx asserts that there is a fall in the level of economic consciousness, but hardly any dogmatic Marxist has cited this Marxian observation.

Benjamin notes that Marx began to develop a critique of progress and naïve progressivism, but most of his readers did not perceive it, much less other leftists: such as the German social democratic reformist left. As this party distanced itself over the years from Marx's theory, it further increased its naïve faith in progress because they do not understand the historical, social, and economic contradictions that Marx analyzes. We must return to Benjamin's argument to understand what is happening in the process of contemporary history, and the first thing we must do is leave behind the naïve idea of *progress*, as something that necessarily improves the life and coexistence of humans.

Now, returning to the subject of Nazism: the German left, and the European left in a certain way thought, mistakenly, that the Nazis were fighting against progress and that since this was considered something automatic, like a river that advances and only by its own weight it would drag the Nazis because according to this mistaken imagination, the fascists swam against the current and would not persist for long. That was the conviction of almost the entire German left: the Social Democrats and the Communists, although they had great differences between them, were in complete agreement on this point. They were convinced

that Nazism would not last long and, in large part, for this reason they did not fight in an armed way against National Socialism and against genocide. Why fight, why risk your life, why get involved in armed military fights, if Nazism would soon fall under its own weight anyway? And, by the way, at first glance they were right, the *Behemoth* (Neumann, 1943) of National Socialism only remained in power for twelve years.

In terms of time, twelve years is not that long and in that sense they were apparently right; the point is that in those years they killed, in the concentration and extermination camps, six million people – not to mention the dead of the Second World War – they destroyed the European Jews and with them, to a whole way of life. They changed the continent, I'm afraid forever, although I hope I'm wrong. At least until there is an interruption of this social form, until there is a radical rupture, we have to observe that they changed – in an apparently permanent way – Europe.

If we think that it was a continent with a very strong Jewish presence, important in every way, and that the Nazis managed to almost disappear this Jewish imprint in Europe, the change was almost total. There is still some Jewish manifestation, in France perhaps a little more than in other countries; in Germany, for example, it is minimal, almost non-existent, there are almost no synagogues, compared above all to the previous situation.

The Nazis succeeded: they managed to change the planet; not only did they murder many people, but they changed the European social structure. The German government is so cynical about this that a few years ago, when the European Union was founded, they suggested that it be written in its constitution, at the beginning of the founding text: "Europe is by definition a Christian continent." Not only did they kill people, but they pretend to deny their existence before they were killed. As if to say: "European Jews have never existed deep down."

Implicitly, these negationist statements convey the idea that the National Socialists fulfilled the *de facto* advance of progress and in this readjustment it was necessary to homogenize. One of the great goals of capitalist modernity and progress as we know it is to homogenize, and part of this process is precisely to make people equal. Within models of progress that are less openly violent and aggressive than the National Socialist, it is thought that members of minorities should be convinced of the need for this homogenization. But if they are not allowed, what is done with them? Today, since the Nazis no longer exist, European governments deport new minorities to arrive, or leave them to fend for themselves in the Mediterranean. The Nazis had a more efficient plan: it was not enough for them to wait

for them to die by de *facto* banning rescue on the high seas; they took more drastic measures and developed the death camps.

The logic implicit in this type of politics was *progressive*, in the eagerness to create a homogenized society it would be necessary to eliminate everything that made it complicated, contradictory, tangled, too complex. Since each one believes in different things, totally homogenized coexistence becomes a highly difficult matter; The Nazi option was extermination in order to achieve, not a society with happy members, but what they imagined as a "*healthy*" organism-people.

As is known, Hitler and his people often referred to what they called *the body of the German people and the German people* had to be "healthy"; so those persecuted groups: Jews, Gypsies, homosexuals – of which the largest group was the Jews – were perceived as a "disease"; the *healthy body* had to be cured of this supposed *disease*. The idea was to "work better", in that sense this position had something democratic about it, if we understand democracy as it is erroneously done today: that the majority imposes itself and does what it pleases.

The problem is that in this sense the National Socialists were "progressive", they made progress not only in their policy of extermination, but also in their cultural policy. For example, German is a highly diversified language to this day. If you are in northern Germany, it is very difficult to understand the dialect, sometimes, as absurd as it may seem, it is easier to speak English. It is also the other way around, going from Frankfurt to the region of Innsbruck, to a small mountain village in Austria, there are Germans who think: "What are these people talking about?" This was something that the Nazis also tried to homogenize, and to a large extent succeeded.

Many Austrian conservatives did not like the Nazis just because of their progressive tendencies. The conservatives in Austria were the ones who detested them the most; One of them was my grandfather. Conservative, middle-class, he had a more or less good position in the Austrian Post Office and did not like the Nazis because of their line of *progress*, advance, homogenization, their intention to leave behind the specific way of speaking in Austria or in Innsbruck.

The Nazis imposed the so-called "Hochdeutsch" [High German] in schools and on the radio, a dialect from a specific area in the north of the country. In the schools of Austria, a German quite different from that of the Germans was spoken, and in certain Austrian areas, the National Socialists also managed to homogenize it. In this line and following Walter

Benjamin, the Nazis were a modernizing movement, a modern movement that imposed progress and radicalized, in some way, bourgeois ideology. This is not to say that the bourgeoisie would have done the same as the Nazis; although many did ally with them and changed, they renounced and betrayed their own ideology, which was originally humanist.

In the history of philosophy there are two famous cases, one more than the other: Martin Heidegger, who joined the National Socialists; he worked for them as rector of the University of Freiburg [Freiburg] and developed his philosophy as an increasingly racist and anti-Semitic one. On the other hand, there is the similar, and at the same time different, case of Hans-Georg Gadamer; His story is less well known and although he did not speak of it later, there are twelve of his texts on what he called at that time Platonic *violence*, where he justifies National Socialist violence. In fact, in May 1941, he presented the lecture "The *Volks* and History in Herder's Thought" at the German Institute in occupied France. Over the years he tried to forget those texts – and especially their openly pro-Nazi passages.

Martin Heidegger and Hans-Georg Gadamer are two representatives of that part of the German (and European) bourgeoisie that betrayed its own ideals. Why? Because they were convinced that the bourgeoisie was not proactive, but too lukewarm. I refer to them because they both represent two minds that formulated their ideas with sophisticated intelligence and clarity, many people thought – and continue to do so – the same as them, although they cannot raise it with the same skill.

The basic idea is that the bourgeoisie does not develop progress with the necessary intensity due to its "kitsch" on issues such as human rights and respect for minorities. It should not be forgotten that the bourgeoisie of the old school tried to give certain guarantees to minorities in their first constitutions. However, this represented a contradiction with his progressive model and would cause his project not to be carried out with the desired speed. This was where the criticism of philosophers such as Heidegger or Gadamer came in, since they affirmed that the bourgeoisie should leave behind the *corniness* of humanism. This generated conflicts for several bourgeoisie, because it implied leaving behind their old theory; and in this context Gadamer acquires greater importance, who "explained" to the bourgeoisie who doubted, in his texts of the nation-to-socialist period, that the violent acts of the National Socialists were basically something "platonic".⁸

4 FINAL THOUGHTS

Benjamin would argue that in order to criticize the concept of *progress*, it would be necessary to go a step further and analyze the now dominant concept of *time*, as something linear, uninterrupted, directed, and homogeneous, clearly directed towards a definite direction called *the future*. This idea of *time* is necessary for the idea of progress to work in turn. Benjamin's critique is radical towards the concept of time as it is established today, in which each second is equal to the previous one. These three aspects of the current concept of time: homogeneity, uninterruptedness, and clear direction, Benjamin would say, would have to be forgotten in order to leave behind the naïve imagination of *progress*.⁹

This is a very close point between Marx and Benjamin – I insist on this closeness, because there are several Marxists who reject Benjamin, falsely thinking that he distances himself from Marx because of his criticism of progress, and in reality Benjamin is the one who understands it best. Karl Marx argues on several occasions in *Capital* that the center of capitalist economic construction is the *time measured in hours*, obviously, of labor. This defines value: that of each commodity is determined by the labour-power time expended in them; and this quantity of labour-power is measured in hours. Thus, for Marx, the form of capitalist reproduction needs a central concept: time, precisely the homogeneous, uninterrupted and clearly directed one; without it, this social form does not function, its economic form would cease to exist.

Benjamin is a little more explicit than Marx, but the two agree: without *time* —as we perceive it today— the currently reigning social form would not function. Marx refers by this above all to the economic; Benjamin to the political and philosophical. Without these concepts of *time* and *progress*, the society we have would not exist. As the left, what we must do is to radically break with it. Only if we do could we really resist. Obviously it is too late to oppose National Socialism, but we can fight against other similar movements, but for this it is imperative to separate ourselves from bourgeois ideology and to conceive our own way, now, of understanding the world, history and *time*.

ABSTRACT

This study analyzes the impacts of rudimentary cesspit use on the quality of water intended for human consumption in the municipality of Itiquira–MT, based on data collected by environmental surveillance between 2019 and 2023. A total of 547 water sample results were evaluated, considering the parameters free residual chlorine, turbidity, pH, total coliforms, and *Escherichia coli*. Data were statistically processed using Jamovi software, allowing identification of temporal and spatial contamination patterns. Results indicated a recurrent presence of *E. coli*, peaking in 2021 (24.6% of samples). It is concluded that rudimentary cesspits significantly contribute to water contamination, reinforcing the need for public sanitation policies and preventive actions.

RESUMO

Este estudo analisa os impactos do uso de fossas rudimentares na qualidade da água destinada ao consumo humano no município de Itiquira–MT, com base em dados coletados pela vigilância ambiental entre 2019 e 2023. Foram avaliados 547 resultados de amostras de água, considerando os parâmetros cloro residual livre, turbidez, pH, coliformes totais e *Escherichia coli*. Os dados foram tratados estatisticamente no software Jamovi, permitindo identificar padrões temporais e espaciais de contaminação. Os resultados indicaram presença recorrente de *E. coli*, com pico em 2021 (24,6% das amostras). Conclui-se que as fossas rudimentares contribuem significativamente para a contaminação hídrica, reforçando a necessidade de políticas públicas de saneamento e ações preventivas.

1 INTRODUCTION

Basic sanitation is essential for public health, especially in small municipalities with deficient infrastructure. In Itiquira-MT, the absence of a sewage system with treatment results in the predominant use of rudimentary cesspools. This scenario favors the infiltration of contaminants into the soil, aquifers and the drinking water distribution system to the population, representing a risk of waterborne diseases. The objective of this article is to analyze water quality monitoring data in the municipality between 2019 and 2023 and relate the results to the presence of rudimentary cesspools.

2 METHODOLOGY

The study is characterized as quantitative and descriptive, using secondary data from the environmental surveillance of the municipality of Itiquira-MT. Between 2019 and 2023, 547 water samples collected in 12 neighborhoods and in the district of Ouro Branco do Sul were analyzed. The parameters evaluated were:

- Free Residual Chlorine (CRL);
- Turbidity (TU);
- pH;
- Total Coliforms (TC);
- Escherichia coli (EC).

The data were processed in the Jamovi software to calculate descriptive statistics and frequencies, with presentation of results in tables and graphs that allowed the evaluation of the conformity of the results achieved with the goals proposed by the Municipal Plan for Basic Sanitation and Sustainable Development Goal 6 - SDG 6.

3 RESULTS

The Municipal Basic Sanitation Plan (PMSB) of Itiquira-MT is a fundamental instrument for the planning and management of sanitation services in the municipality, covering water supply, sanitary sewage, solid waste management and urban drainage. Established by Municipal Law No. 994, of November 13, 2017, the PMSB aims to ensure the protection of public health and the healthiness of the urban and rural environment.

Water Supply (SAA): The Water Supply System in Itiquira faces challenges related to infrastructure and municipal management. The research by Vasconcelos (2018) highlights

the need for investments to ensure the quality and regularity of the supply of drinking water to the population.

However, the absence of an efficient basic sanitation system in Itiquira – MT causes some problems such as: wastewater running on the streets, in the rainwater galleries, in addition to the fact that rudimentary cesspools are often installed on the sidewalks and close to the water supply networks, representing a direct risk to public health and the environment. The contamination of the water table, associated with the inadequate construction of these cesspools, compromises urban springs and rivers, putting at risk not only the supply of drinking water, but also the biodiversity and environmental balance of the region.

3.1 DISTRIBUTION OF SAMPLES

The number of samples varied annually, with a peak in 2019 and 2023 (119) and a lower volume in 2022 (89). The spatial distribution covered all neighborhoods and catchment points, as shown in table 01 below.

Table 1

Number of samples analysed for CE and TC (2019–2023)

Neighborhoods	Real estate	Samples 2019	Samples 2020	Samples 2021	Samples 2022	Samples 2023	Samples Total
Itiquira (Centro) – B1	1493	56	32	24	19	20	151
Ouro Branco do Sul – B2	1323	00	16	29	20	34	99

Villa I – B11	164	00	00	00	02	00	02

João de Barros – B12	57	05	07	01	0	00	13
TOTAL	4.325	119	108	112	89	119	547

Source: Prepared by the author (2024).

The neighborhood with the highest representativeness (chart 01) was the Center (Itiquira – B1), with a total of 151 samples, corresponding to approximately 27.6% of the total. Next are the neighborhoods of Ouro Branco do Sul (B2) with 59 samples, and Santo Antônio (B4) with 61 samples. Other neighborhoods such as Poxoréo (B5) and Goiás (B6) also presented significant amounts of samples, totaling 58 and 51 analyses, respectively.

The samples analyzed (Environmental Surveillance 2019 – 2023) comply with the national guideline of the sampling plan – basic parameters that include the information system for monitoring the quality of water for human consumption, which is responsible for carrying out a minimum quantity of ten monthly samples of each parameter (total coliforms, *Escherichia coli*, free residual chlorine, turbidity and pH), in addition to five monthly fluoride samples, which will not be analyzed in this work because the municipal agency does not perform analysis for this parameter.

3.2 PHYSICOCHEMICAL AND MICROBIOLOGICAL PARAMETERS

The analysis of the results of biological tests is essential to ensure the quality of water intended for human consumption, as it allows the presence of microorganisms and substances potentially harmful to health to be assessed. This evaluation plays a crucial role in several aspects, such as the detection of microbiological contamination, as biological assays identify bacteria, viruses, protozoa, and other pathogenic microorganisms that can cause diseases such as gastroenteritis, hepatitis A, and cholera. The presence of fecal coliforms, for example, indicates contamination by sewage and the need for corrective measures.

The analysis revealed that, despite pH and turbidity values often within the standards, the detection of coliforms and *E. coli* was recurrent.

- ✓ Free residual chlorine: fluctuations associated with operational failures in chlorination.
- ✓ Turbidity: occasional increases in rainy periods.
- ✓ pH: variation within the recommended range, with few exceptions.
- ✓ Total Coliforms: significant presence at several points.
- ✓ *E. coli*: highest incidence in 2021.
- ✓ Tables 01 to 15: Descriptive statistics and frequencies (2019 to 2023)

Frequent analyses allow you to quickly identify the source of contaminants, enabling effective corrective actions to protect water resources. Table 1 below presents the descriptive statistics for three variables: CRL, TU and PH. In addition, the Shapiro-Wilk normality test was performed, whose results (W statistic and p-value) are also indicated, with the exception of the variable TU, for which it was not possible to calculate the test, resulting in "NaN" values.

Analyzing table 2 based on the description of the data for the N (number of cases), the TU was the one with the highest number of cases with 93 values not omitted, while the pH had 91 followed by the CRL with 81, however, all the values presented by the variable (TU) were 0 (zero) which may mean that in this period the water was completely transparent, that is, it did not contain suspended particles detectable by the measuring instrument. Another relevant data in this table, regarding the minimum and maximum values, is noteworthy that the pH variable obtained results lower than 6 (six).

Table 2
Descriptive Statistics, 2019

	N	Silent	Average	Median	Standard deviation	Minimum	Maximum	Shapiro-Wilk	
								W	p
CRL	81	75	0.671	0.610	0.371	0.160	1.99	0.884	<.001

ph	91	65	6.435	6.550	0.752	2.120	7.78	0.832	<.001

Source: Data organized by the author and analyzed in the Jamovi software (2024).

The frequency table in Jamovi is an important tool in data analysis, as it organizes and summarizes categorical or discrete variables, showing the distribution of data in terms of frequency. Overall, this table is essential to better understand the data and is an initial step in many exploratory statistical analyses. Thus, tables 3 and 3 of frequency will be presented below, referring to the variables of total coliforms (TC) and Escherichia coli (EC).

Table 3

CT A and P frequencies, 2019

CT	Counts	% of Total	Cumulative %
The	109	91.6 %	91.6 %
P	10	8.4 %	100.0 %

Source: Data organized by the author and analyzed in the Jamovi software (2024).

Table 4 of total coliform frequencies indicates the frequency distribution for two identified groups: "A" for absence and "P" for the presence of pathogenic bacteria in the water samples collected in 2019 in the municipality studied. Group "A" has 109 counts, representing 91.6% of the total. Group "P" has 10 counts, representing 8.4% of the total.

Table 4

EC A and P frequencies, 2019

EC	Counts	% of Total	Cumulative %
The	116	97.5 %	97.5 %
P	3	2.5 %	100.0 %

Source: Data organized by the author and analyzed in the Jamovi software (2024).

In the analysis of table 4 of frequency presented for *Escherichia coli* cases, there is a predominance of absence (A): the overwhelming majority of the cases analyzed correspond to the absence of *E. coli*, with 116 occurrences, representing 97.5% of the total. This demonstrates that the presence of this bacterium is rare in the dataset. Only 3 cases (or 2.5%) have the presence of *E. coli*, indicating that this condition is uncommon. The accumulated frequency reaches 100% after adding the two values (A and P), which confirms the completeness of the data.

Considering that the biological analysis of water is an indispensable tool for the management of water quality, ensuring that the water consumed is safe, promoting public health and contributing to the sustainability of natural resources. Table 5 will be presented below with the descriptive statistics of the results of the biological trials for the year 2020.

Table 5

Descriptive Statistics, 2020

	N	Silent	Average	Median	Standard deviation	Minimum	Maximum	Shapiro-Wilk	
								W	p
CRL	49	61	0.734	0.2000	1.070	0.0500	2.80	0.596	<.001
YOU	90	20	0.228	0.0400	0.381	0.0000	1.50	0.652	<.001
ph	80	30	6.470	6.3950	0.739	2.9000	7.80	0.886	<.001

Source: Data organized by the author and analyzed in the Jamovi software (2024).

The analysis of Table 5, which presents descriptive statistics for the variables free residual chlorine (CRL), turbidity (TU) and pH, provides important information on the quality of water for human consumption. Main points can be highlighted such as: free residual chlorine (CRL): average: 0.734 mg/L, with a median of 0.2 mg/L; standard deviation: 1.070, indicating high variation in chlorine levels; minimum and maximum values: 0.05 mg/L to 2.80 mg/L; Shapiro-Wilk $p < 0.001$ indicates that the distribution is not normal. The high standard deviation suggests instability in the levels of residual chlorine, which can compromise the safety of the water consumed, as chlorine is important to ensure proper disinfection.

As for turbidity (TU), the average is 0.228, with a median of 0.04; standard deviation: 0.381, reflecting moderate variations; minimum and maximum values: the NTU at 1.50; and Shapiro-Wilk $p < 0.001$ shows that the distribution is also not normal. High turbidity values may indicate the presence of suspended particles that protect pathogenic microorganisms, compromising water quality.

The average pH was 6.470, with a median of 6.395; standard deviation: 0.739, indicating smaller variations in comparison with the other variables; minimum and maximum values: 2.90 to 7.80; and Shapiro-Wilk $p < 0.001$ points to a non-normal distribution. The average pH is within the recommended by Brazilian legislation (between 6 and 9.5), but the minimum value (2.90) is extremely acidic and may indicate a serious problem in some samples.

Table 6 shows the frequencies of total coliforms (TC) in samples of water intended for human consumption, highlighting two categories: A (Absent) and P (Present). The detection of total coliforms is an essential parameter for the evaluation of water quality, since their presence can indicate failures in the treatment processes or contamination during distribution.

Table 6

CT A and P frequencies, 2020

CT	Counts	% of Total	Cumulative %
The	74	69.8 %	69.8 %
P	32	30.2 %	100.0 %

Source: Data organized by the author and analyzed in the Jamovi software (2024).

When analyzing table 6, the absence of Total Coliforms (A) represents 74 counts (69.8% of the total). Indicates that most of the monitored samples are within the desired standards for drinking water. As for the presence of Total Coliforms (P), it corresponds to 32 counts (30.2% of the total). This percentage suggests a significant concern, since approximately one third of the samples have microbiological contamination, indicating potential risks to human health. Table 06 of the frequency of absence and presence of the *E. coli* variable for the year 2020 will be presented below.

Based on table 7, it can be highlighted that, in the absence of *E. coli* (A), there were 101 counts (93.5% of the total). This high percentage indicates that most water samples conform to microbiological quality standards, without the presence of *E. coli*. The presence of *E. coli* (P) had only 7 counts (6.5% of the total). Although this percentage is small, the presence of *E. coli* is a critical indicator of fecal contamination and poses a significant risk to public health, even in small amounts.

Table 7

EC A and P frequencies, 2020

EC	Counts	% of Total	Cumulative %
The	101	93.5 %	93.5 %
P	7	6.5 %	100.0 %

Source: Data organized by the author and analyzed in the Jamovi software (2024).

Based on the idea that the analysis of the results of biological tests is crucial for monitoring the quality of water intended for human consumption, as they allow the identification of the presence of pathogenic microorganisms, such as bacteria (*Escherichia coli*), which can cause diseases. Table 8 will be shown below with the descriptive statistics of the free residual chlorine, turbidity and pH variables referring to the results of the samples collected in 2021.

Table 8

Descriptive Statistics, 2021

	N	Silent	Average	Median	Standard deviation	Minimum	Maximum	Shapiro-Wilk	
								W	p
CRL	151	8	0.7113	0.2900	0.8984	0.0000	3.000	0.708	<.001
YOU	157	2	0.0843	0.0400	0.0908	0.0400	0.780	0.533	<.001
ph	149	10	7.4854	7.4000	0.9673	0.4300	8.800	0.822	<.001

Source: Data organized by the author and analyzed in the Jamovi software (2024).

Analyzing the main relevance of Table 8 on the quality of water used for human consumption, observe the following points: the mean free residual chlorine (CRL) was 0.7113 mg/L, with a standard deviation of 0.8984, the amplitude ranged from 0 mg/L (minimum) to 3 mg/L (maximum), and the Shapiro-Wilk normality test indicates that the CRL data do not follow a normal distribution. High variability may suggest inconsistencies in water monitoring or treatment. The value 0 may indicate the absence of disinfection in some points; the turbidity (TU) had a mean of 0.0843, with a standard deviation of 0.0908, the amplitude ranged from 0.04 to 0.78 and the Shapiro-Wilk test, indicating the absence of normal distribution. Turbidity was at low levels (within the recommended limits), but variability may be relevant to identify episodes of temporary increase in suspended solids; as for pH, the mean was 7.4854, standard deviation of 0.9673, the amplitude ranged from 4.3 to 8.8 and the Shapiro-Wilk test, indicating absence of normality.

Although the average value is close to the ideal (between 6.5 and 8.5 according to quality standards), the minimum value (4.3) suggests episodes of extreme acidity, which can compromise the quality of the water and the safety of consumption. The non-normality of the distributions indicates the need to use nonparametric statistical methods for subsequent analyses. Values outside the acceptable standards for free residual chlorine and pH can indicate problems in the water treatment system or failures in monitoring. The high variability in some measurements suggests the need for more rigorous investigation and control to ensure the consistency and safety of the water supply.

Table 08 shows the frequencies of total coliforms, with (A) indicating the absence and (P) the presence of bacterial indicators.

Table 9

CT A and P frequencies, 2021

CT	Counts	% of Total	Cumulative %
The	66	57.9 %	57.9 %
P	48	42.1 %	100.0 %

Source: Data organized by the author and analyzed in the Jamovi software (2024).

The analysis of Table 9 reveals important data on the presence of total coliforms (TC) in samples of water intended for human consumption, where: the absence contains 66 cases, representing 57.9% of the total, did not present total coliforms; and the presence appears with 48, corresponding to 42.1%, detected the presence of total coliforms.

Regarding the relevance of the data regarding water quality, the striking fact that 42.1% of the samples presented total coliforms is worrisome, indicating a potential risk to public health, since the presence of these microorganisms may indicate evidence of fecal contamination.

In the distribution, most samples are within acceptable standards (57.9% with absence of TC), but the percentage of contamination is still significant. In monitoring, the data reinforce the need to intensify corrective and preventive measures, such as water disinfection and maintenance of supply systems, to ensure the safety of the water consumed.

Table 10 represents the frequencies of *E. coli* resulting from the analysis of the results of biological tests carried out in 2021, which aimed to monitor the quality of water used for human consumption.

Table 10

EC Frequencies, 2021

EC	Counts	% of Total	Cumulative %
The	86	75.4 %	75.4 %
P	28	24.6 %	100.0 %

Source: Data organized by the author and analyzed in the Jamovi software (2024).

Analyzing table 10, the following relevant points are shown for the monitoring of the quality of water for human consumption: as for the absence (A) of *E. coli*, it is recorded in 86 samples, which represents 75.4% of the total. This indicates that most of the water samples analyzed are free of the presence of this bacterium, which suggests generally safe conditions for human consumption; in the presence (P) of *E. coli* was detected in 28 samples, corresponding to 24.6% of the total. This percentage is worrisome, as it indicates a significant amount of contaminated samples, representing a risk to public health.

Table 11 presents the descriptive statistics of the free residual chlorine, turbidity, and pH variables for the year 2022.

Table 11
Descriptive Statistics, 2022

	N	Silent	Average	Median	Standard deviation	Minimum	Maximum	Shapiro-Wilk	
								W	p
CRL	87	2	1.4291	1.3800	0.57789	0.3500	2.8000	0.965	0.018
YOU	89	0	0.0506	0.0500	0.00921	0.0400	0.0800	0.848	<.001
PH	89	0	7.5034	7.5000	0.50485	6.3000	8.8000	0.991	0.821

Source: Data organized by the author and analyzed in the Jamovi software (2024).

Based on table 11, which presents the essential descriptive statistics for monitoring the quality of water used for human consumption, analyzing the variables free residual chlorine (CR), turbidity (TU) and pH. Being able to highlight the main relevant points such as:

1 - The free residual chlorine (CR) had a mean of 1.429 mg/L, a median of 1.38 mg/L, a standard deviation of 0.5778 mg/L, a minimum and maximum of 0.35 mg/L to 2.80 mg/L, and the Shapiro-Wilk normality test: $W = 0.96$, $p = 0.01$. Based on the data, the average concentration of residual chlorine is within the recommended standards for water disinfection (usually between 0.2 and 2.0 mg/L). High variability (standard deviation of 0.5778) may indicate fluctuations in disinfection levels over time. The p -value < 0.05 in the Shapiro-Wilk test suggests that the data do not follow a normal distribution.

2 - In turbidity (TU) the mean was 0.056 mg/L, the median 0.050 mg/L, the standard deviation: 0.0092 mg/L, the minimum and maximum: 0.04 mg/L to 0.08 mg/L, Shapiro-Wilk normality test: $W = 0.84$, " p " < 0.001 . It can be interpreted that the average turbidity is well

below the maximum limit allowed for human consumption (usually ≤ 5 , according to WHO and Brazilian standards). The low standard deviation indicates little variation in the data, suggesting a good stability in the water quality in terms of turbidity. The Shapiro-Wilk test indicates that the data do not follow a normal distribution ($p < 0.001$).

3 - In pH, the mean was 7.503, the median 7.50, the standard deviation 0.5048, the minimum and maximum 6.30 to 8.80, and the Shapiro-Wilk normality test $W = 0.99$, $p = 0.82$. This indicates that the average pH value is within the recommended range for drinking water (usually between 6.5 and 8.5). The moderate standard deviation suggests a variation within acceptable limits. The Shapiro-Wilk test shows that the data follow a normal distribution ($p > 0.05$).

Thus, residual chlorine and turbidity showed a non-normal distribution, while pH followed a normal distribution. The average values of chlorine, turbidity and pH are within the recommended standards for human consumption. The greater variation in chlorine levels may indicate the need for more rigorous monitoring to ensure efficiency in disinfection. The turbidity remains low and stable, suggesting a good efficiency in water treatment and the pH is well balanced, with no worrying variations. These results indicate that water quality is within acceptable standards, but continuous monitoring of residual chlorine may be necessary to avoid excessive variations in disinfection.

Table 12 below shows the frequency of total coliforms with results (A) for absence and (P) for the presence of bacteria, with the quantities and percentages referring to the results of biological tests for the year 2022.

Table 12

CT A and P frequencies, 2022

CT	Counts	% of Total	Cumulative %
The	74	83.1 %	83.1 %
P	15	16.9 %	100.0 %

Source: Data organized by the author and analyzed in the Jamovi software (2024).

By analyzing table 12 of total coliform (TC) frequencies in water samples collected in the municipality of Itiquira-MT in 2022. The data indicate that, of the 89 samples analyzed, 74 (83.1%) showed absence of total coliforms (A), while 15 (16.9%) showed presence (P).

Table 13 shows the frequencies of *Escherichia coli* with results (A) for absence and (P) for the presence of bacteria, with the quantities and percentages referring to the results of the biological tests for the year 2022.

Table 13

EC A and P frequencies, 2022

EC	Counts	% of Total	Cumulative %
The	88	98.9 %	98.9 %
P	1	1.1 %	100.0 %

Source: Data organized by the author and analyzed in the Jamovi software (2024).

Table 13 presents the frequencies of *Escherichia coli* (EC) in water samples collected in the municipality of Itiquira-MT in 2022. The data indicate that, of the 89 samples analyzed, 88 (98.9%) showed absence of *E. coli* (A), while only 1 sample (1.1%) showed presence (P).

Table 14 presents the descriptive statistics of the variables free residual chlorine, turbidity and pH referring to the results of the biological tests for the year 2023, fundamental parameters for the evaluation of the quality of water for human consumption.

Table 14 shows the descriptive statistics of the variables free residual chlorine (CRL), turbidity (TU) and pH in the monitoring of the quality of water for human consumption in the municipality of Itiquira-MT, based on 119 samples collected in 2023.

Table 14

Descriptive Statistics, 2023

								Shapiro-Wilk	
	N	Silent	Average	Median	Standard deviation	Minimum	Maximum	W	p
CRL	119	0	1.7570	1.8900	0.6368	0.2100	2.800	0.952	<.001
YOU	119	0	0.0629	0.0500	0.0550	0.0400	0.580	0.307	<.001
ph	119	0	7.7311	7.7000	0.6665	6.7000	8.900	0.910	<.001

Source: Data organized by the author and analyzed in the Jamovi software (2024).

Analyzing the free residual chlorine (CRL) variables: the mean was 1.757 mg/L, median 1.890 mg/L, standard deviation 0.6368 mg/L, minimum 0.210 mg/L, maximum 2.800 mg/L and the normality test (Shapiro-Wilk): $W = 0.952$, " p " < 0.001. In this case, the CRL is within the recommended standards for drinking water disinfection (0.2 to 2.0 mg/L, according to Ordinance GM/MS No. 888/2021). However, there is significant variation in the values and the distribution is not normal ($p < 0.001$); turbidity (TU) had a mean of 0.0629, a median of 0.0500, a standard deviation of 0.0550, a maximum of 0.580, and a normal test (Shapiro-Wilk): $W = 0.307$, $p < 0.001$. Therefore, the average turbidity is well below the upper limit of 5.0 for human consumption. Low variability indicates that the water is being well treated in relation to the removal of suspended particles. However, the data does not follow a normal distribution; and finally, the pH had a mean of 7.7311, the median 7.7000, the standard deviation 0.6665, the minimum 6.7000, the maximum 8.9000 and the normality test (Shapiro-Wilk): $W = 0.910$, " p " < 0.001. Showing that the average pH is within the recommended range (6.0 to 9.5). The distribution shows slight variation, but with values within acceptable limits for consumption.

The parameters analyzed indicate that the water quality in Itiquira-MT in 2023 is within the standards required for human consumption. Free residual chlorine varies, but remains within limits. Turbidity is low, suggesting good efficiency in water treatment. The pH is within the recommended levels. None of the variables follows a normal distribution, according to the Shapiro-Wilk test.

Table 15 presents the total coliform frequencies referring to the results of biological tests for the year 2023.

The analysis of Table 15 of Total Coliform Frequencies reveals important information about the microbiological quality of water in the municipality of Itiquira-MT in 2023. The main points to be highlighted are:

Table 15

CT A and P frequencies, 2023

CT	Counts	% of Total	Cumulative %
The	90	75.6 %	75.6 %
P	29	24.4 %	100.0 %

Source: Data organized by the author and analyzed in the Jamovi software (2024).

1. Predominance of Absence of Contamination: category "A" (Absence of total coliforms) was identified in 90 samples, representing 75.6% of the total. This indicates that most of the samples analyzed met the quality standards required for drinking water.

2. Presence of Contamination in Part of the Samples: category "P" (Presence of total coliforms) was found in 29 reports, corresponding to 24.4% of the total. This percentage may be worrisome, as it indicates that almost a quarter of the samples showed microbiological contamination.

3. Accumulated Percentage: the accumulated percentage of 100% confirms that all samples were classified between the two categories mentioned, with no intermediate values.

4. Relevance to Public Health and Sanitation: the fact that 24.4% of the samples had total coliforms may indicate treatment failures or contamination in certain areas of the municipality. This outcome may require corrective measures, such as inspecting supply sources, improving chlorination, or maintaining distribution networks.

Table 15

EC A and P frequencies, 2023

EC	Counts	% of Total	Cumulative %
The	118	99.2 %	99.2 %
P	1	0.8 %	100.0 %

Source: Data organized by the author and analyzed in the Jamovi software (2024).

Table 16 presents the distribution of the frequencies of absence (A) and presence (P) of the bacterium *Escherichia coli* (*E. coli*) in the year 2023, indicating the number of occurrences, the percentage in relation to the total, and the accumulated percentage obtained from the data analysis.

The analysis of Table 16 of *Escherichia coli* (EC) Frequencies provides essential information on the microbiological quality of water in the municipality of Itiquira-MT in 2023. The main points to be highlighted are:

1. Low Presence of *E. coli* Contamination: category "A" (Absence of *E. coli*) was identified in 118 samples, corresponding to 99.2% of the total. This data indicates that the vast majority of the samples analyzed meet the standards of potability, suggesting good sanitary conditions of the water.

2. Only 1 sample showed contamination: category "P" (Presence of *E. coli*) was found in only 1 sample, representing 0.8% of the total. This result is positive, as the presence of *E. coli* is directly associated with fecal contamination, which can pose risks to public health.

3. Cumulative Percentage: the cumulative percentage of 100% confirms that all samples were classified as absent or present of *E. coli*, with no intermediate variations.

4. Relevance to Public Health and Water Quality: the fact that almost all samples are free of *E. coli* suggests that the water treatment and distribution system in Itiquira-MT is working properly. However, the detection of a contaminated sample indicates that there may be isolated sources of contamination, which requires attention to avoid risks of outbreaks.

3.3 TEMPORAL TRENDS

In order to understand the temporal and spatial distribution of microbiological contamination of water intended for human consumption, Graph 01 was prepared, which presents the consolidated data regarding the presence of the *Escherichia coli* bacterium in the neighborhoods of the municipality of Itiquira-MT, in the period from 2019 to 2023. The choice of this variable is due to the fact that *E. coli* is widely recognized as an indicator of recent fecal contamination, whose presence in water samples represents a potential risk to public health.

Figure 1 allows the comparative visualization between the different years and neighborhoods, facilitating the identification of critical areas and the recurrence of cases, thus constituting a fundamental tool for environmental diagnosis and the formulation of health control and prevention strategies.

Figure 1

Temporal and spatial distribution of E. coli contamination from 2019 to 2023

Prepared by the author (2025).

Based on Graph 01, the analysis of the presence of *Escherichia coli* in the water samples collected in the neighborhoods of the municipality of Itiquira-MT, in the period from 2019 to 2023, shows significant variations in its spatial and temporal occurrence. In 2019, only neighborhood B1 had positive cases, while in 2020, the expansion of contamination was observed to neighborhoods B2, B5 and B6. The year 2021 concentrated the highest number of records, with emphasis on neighborhoods B2 ($n = 9$) and B1 ($n = 6$), demonstrating a worsening in the quality of the water distributed. In the years 2022 and 2023, although there was a reduction in occurrences, the identification of consecutive cases in the B4 neighborhood indicates the possibility of a persistent focus of contamination.

In view of this scenario, it is recommended to intensify microbiological monitoring, inspect the supply infrastructure and adopt corrective measures in places with recurrence, in order to ensure the potability of water and the protection of public health, according to the parameters established by current legislation.

The recurrence of *E. coli* and total coliforms, even with acceptable levels of chlorine in some cases, indicates post-treatment contamination, probably associated with infiltration from black pits located near pipes and wells. Studies by Fagundes & Andrade (2005) and FUNASA (2013) corroborate the relationship between rudimentary systems and the degradation of water quality.

4 CONCLUSION

Analysis of the results of biological assays demonstrates a significant variation in the detection of *Escherichia coli* (*E. coli*) over the years. In 2019 and 2020, the incidence was relatively low, with rates of 2.52% (3/119) and 6.48% (7/108), respectively. However, in

2021, a significant increase was observed, with 28 cases in 114 samples, representing a rate of 24.56%, which may indicate an outbreak or an environmental factor favorable to contamination and data (Annex) from the Epidemiological Surveillance of the municipality studied, points out that there were 195 cases of acute diarrheal disease notified during this year that may be directly related to the increase in *E. coli* in the samples of water used for human consumption. In subsequent years, there was a sharp drop, with only 1 case in 89 samples analyzed in 2022 (1.12%) and 1 case in 119 results in 2023 (0.84%).

This trend suggests that after the 2021 peak, corrective measures may have been successfully implemented, resulting in reduced contamination in the following years. According to the water and sewage department, the possible causes of the 2021 increase are associated with network ruptures and irregularities between the sewage system (rudimentary cesspool) and the water system, as many residents do not obey the necessary distance, however, it was evident in the result of the analysis that there was an inefficiency in water treatment, Specifically chlorination, in which some samples showed zero results, which may contribute to the increase of the aforementioned bacterium, but improvements in the water supply network and in the treatment system ensured the reduction of cases of presence of the aforementioned bacterium in subsequent years.

The results show that the use of rudimentary cesspools in Itiquira-MT is directly related to the microbiological contamination of the water. It is recommended:

- Gradual replacement by septic tanks or sewage system.
- Continuous and georeferenced monitoring of supply sources.
- Strict supervision regarding the minimum distance between cesspools and wells.
- Educational actions with the community.

Norma Dávila Cota¹

ABSTRACT

Artificial intelligence is a technology that has the capacity to greatly influence almost every aspect of human activity and therefore has the potential to transform social life in many ways. Law, as the discipline responsible for regulating social dynamics, faces the great challenge of establishing legal frameworks that promote the use of artificial intelligence to support human activity, as well as preventing uncontrolled and dangerous uses that could be harmful. This paper aims to provide a descriptive introduction to what is currently understood by this technology and to the progress made in its regulation at the international, supranational, and national levels in Mexico, as of the time of its publication.

Keywords: Artificial Intelligence. Law. Regulation. Risk.

RESUMO

A inteligência artificial é uma tecnologia que tem a capacidade de influenciar fortemente quase todos os aspectos da atividade humana e, por isso, tem o potencial de transformar a vida social de muitas maneiras. O Direito, como disciplina encarregada de regular as dinâmicas sociais, enfrenta o grande desafio de estabelecer marcos jurídicos que promovam o uso da inteligência artificial como apoio à atividade humana, bem como de impedir usos descontrolados e perigosos que possam ser prejudiciais. Este texto busca fazer uma introdução descritiva sobre o que se entende atualmente por essa tecnologia e sobre os avanços na sua regulamentação nos âmbitos internacional, supranacional e nacional, no caso do México, até o momento de sua publicação.

Palavras-chave: Inteligência Artificial. Direito. Regulação. Risco.

RESUMEN

La inteligencia artificial es una tecnología que tiene la capacidad de influir grandemente en casi todos los aspectos de la actividad humana y por ello tiene el potencial de transformar la vida social en muchos sentidos. El Derecho como disciplina que se encarga de regular las dinámicas sociales, tiene ante sí el gran reto de establecer los marcos jurídicos que fomenten el uso de la Inteligencia artificial para apoyo de la actividad humana, así como para impedir los usos descontrolados y peligrosos que puedan ser perjudiciales. En este escrito se trata de hacer una introducción descriptiva de lo que se entiende por esta tecnología en la actualidad y el avance en la regulación que, en el plano internacional, supranacional y nacional en México, se tiene al momento de emitirlo.

Palabras clave: Inteligencia Artificial. Derecho. Regulación. Riesgo.

1 INTRODUCTION

The content of this paper is derived from a research project by the author, which has just been concluded. The issue of artificial intelligence is technical, specialized in areas of exact sciences, but its impact on a diversity of activities is so great that it necessarily has to be studied also from the legal perspective, where very important debates are generated to be addressed. The aim is to make a general overview of some of the main advances in artificial intelligence and relate it to some phenomena with legal relevance that could be generated by its application in social aspects.

2 PROBLEMS AND JUSTIFICATION:

The advancement of science and technology has given rise, among many other things, to what is now called artificial intelligence, an aspect in constant development that has to do with different aspects of the life of the human being individually and in societies. Different phenomena and problems are generated, which the law has to observe in order to regulate and better still it must investigate to try to foresee the harmful that can occur and issue proposals for solutions. It is the task that corresponds to Law very broad, diverse, which is why, in the research project, it has been intended to make general, introductory analyses of the relationship between artificial intelligence and law, proposing some contributions in this world of growing possibilities.

3 BACKGROUND

The exact sciences and technology have made great advances in recent decades, which have transformed human life in many ways, sometimes to facilitate it, make it more comfortable or sometimes causing unprecedented problems that have been difficult to solve or, even worse, have left a permanent mark. As these scientific contributions have a direct impact on human life, it is necessary that they have legal systems that regulate them in order to achieve the purpose of the law as a whole: to allow coexistence in a more or less peaceful way, guaranteeing the recognition of people's rights.

The issue of artificial intelligence is one of those that poses a revolution in social life, in various aspects due to its special characteristics, so the law must be attentive to regulate these phenomena in the most appropriate way and also allow scientific growth and development in harmony with human activity

It is necessary to emphasize that Artificial Intelligence is not a new topic, it has already been under construction for decades, but it is a few years to date that it has reached a level that is related, like much of technology, in many areas of life and therefore has been highlighted in the media, achieving great dissemination.

Due to its degree of development and the great progress achieved, it has been considered that apart from the great benefits that it can attract to humanity, it implies serious risks to the labor aspects of different activities, trades or professions.

4 DEFINITION OF ARTIFICIAL INTELLIGENCE

In UNESCO's 2022 publication Recommendations on the Ethics of Artificial Intelligence, it defines:

"AI systems are information processing technologies that integrate models and algorithms that produce an ability to learn and perform cognitive tasks, leading to outcomes such as prediction and decision-making in physical and virtual environments. AI systems are designed to operate with varying degrees of autonomy, through the modelling and representation of knowledge and the exploitation of data and the calculation of correlations" (UNESCO, 2022)

One of the main factors considered when analyzing AI is the problem that its indiscriminate use could cause to life in its various manifestations. There are those who consider that these fears are unjustified since for decades there has been software that humanity uses for very varied purposes, if the biggest problem in general. In relation to software, a machine does not "think"; He does exactly what he is ordered to do and therefore, everything is under control. So, we can say that the main difference (and revolutionary novelty) with Artificial Intelligence is that although it receives a feed of information or programming, through the collection of data, AI is capable of obtaining solutions by itself, doing operations that approximate the functioning of the human brain, this being the main characteristic that triggers fears about its existence and future development. In addition, the so-called generative AI enhances all these capabilities of the technology

It is precisely in this capacity, in this possibility of relating information, of integrating solutions, of emulating the mental processes of the human brain where the fears generated by Artificial Intelligence lie. So much so, that there have been expressions, requests from different organizations of society at the international level where governments are asked to regulate it effectively. All or at least the vast majority recognize its importance, the degree of

irreversible intervention it has in many aspects of life, the convenience of the support it can provide to human beings, but also the expectation is great that uncontrolled development can cause more harm than good.

It is said, sometimes with support and seriousness, sometimes with a bit of levity, that the use of AI will change the work schemes, the exercises of carrying out the different trades or professions. It is undeniable that it will impact some activities more than others, but in general it is considered that human beings must learn, adapt to using these technologies and do their job better, since they will have a tool that will provide great support to relieve them of repetitive tasks that would take a lot of time.

Some time ago I watched on the channel of the Federal Judiciary, a program hosted by the prominent jurist Miguel Carbonell, called: The legal profession and artificial intelligence, has the future caught up with us? (Justicia TV 2023) where the point of whether AI would displace lawyers, law graduates and the panel of experts agreed that it would not, since although the capabilities of artificial intelligence are so broad that they allow it to collect information, process it, provide solutions, even learn, the use of this tool implies great possibilities for the jurist to make his time more efficient since he will dedicate himself to the reasoning tasks with greater emphasis, since other tasks of support, of search, which represented a lot of time invested, will now be of very short duration

In general, some advantages and disadvantages of the use of AI are identified, among the first: Constant and unrestricted availability, fewer risks due to the automation of dangerous jobs, automation of repetitive jobs, constant learning through the development of AI. In terms of disadvantages, high implementation costs are mentioned, when it comes to large equipment or updated machinery, biased decision-making, since AI works based on algorithms with which it is fed and whoever does so can imprint their intentionality or ideology, very specialized skills that are concentrated in a few, possible substitution or displacement of human beings in some areas.

We dealt with the regulation that must be made on this technology, it is essential to create an advanced legal framework

5 REGULATORY FRAMEWORK

5.1 INTERNATIONALLY

In this regard, efforts have been made for years to achieve this regulation, but it was not until August 2024 that the regulation known as the European Union's Artificial Intelligence

Law came into force. Which is identified as a European-wide regulation that regulates this technology, "the first comprehensive regulation on AI from a major regulator anywhere in the world" (artificial EUA, 2023).

In the second half of 2024, the Council of Europe opened for signature the first Global Treaty on AI, called the Council of Europe Framework Convention on Artificial Intelligence and Human Rights, Democracy and the Rule of Law, which is the first legally binding international treaty whose objective is to establish that the use of AI is consistent with human rights. the rule of law and democracy.

"The treaty, which is also open to non-European countries, establishes a legal framework that covers the entire life cycle of AI systems and addresses the risks they may pose, while promoting responsible innovation. The agreement takes a risk-based approach to designing, developing, using and decommissioning AI systems, which requires careful consideration of any potential negative consequences of the use of AI systems." (European Council, 2025)

The agreement was signed by Iceland, Norway, the United Kingdom, the European Union and other non-European countries, such as the United States and Mexico.

For Mexico, which does not yet have a specific legal regime, it represents a challenge since companies and suppliers of AI systems will have to adapt to those prescribed by the treaty to operate in Europe and the other signatory countries.

The treaty provides a legal framework that covers everything related to the development of AI systems, promotes progress and innovation, and addresses the risks that their exercise may pose to human rights, the rule of law and democracy.

Returning to the European regulation, we said in previous paragraphs that this regulation on AI came into force as of August 2024 for some purposes and in a gradual process over two years, it will come into force in all its aspects.

For this regulation, what is identified as risk is fundamental. In general, when approaching the study of this technology, the risk, that is, the aspects of danger that the use of various manifestations of AI may represent for the population, is fundamental, since due to its particular characteristics it is necessary to address in order to prohibit or regulate the use of technology in certain areas of society's activity.

The regulation in question identifies four levels of risk:

- a) Unacceptable, that is, when the use of Artificial Intelligence technology involves a manipulative activity of human consciousness or involves systems of segregation or social discrimination. For example: exploiting vulnerabilities in which people find themselves, such as a disability or certain socioeconomic conditions; using people's biometric data to create systems to organize or classify people based on those natural identifiers; Classify people by social behaviors or other similar factors, among others
- b) High risk, which is extensively addressed in this Law, identifies as areas in which, if artificial intelligence is not properly regulated, it could represent serious dangers, areas such as education, access to health services, and even immigration procedures.
- c) Limited risk, although this regulation deals with it to a lesser extent than with high risk, if it considers above all in relation to the need for AI developers to make sure, take the necessary measures to inform and create awareness in users that communication and the relationship are being carried out with technology, not with human beings.
- d) Minimal risk. It is not regulated by this law (at least at the time of its issuance). It would include topics such as video games with AI, although the recent development of generative AI somewhat modifies the panorama

The organization called the Organization for Economic Cooperation and Development (OECD), has very relevant studies and documents on the subject and in 2019 issued the Principles of Artificial Intelligence, which were revised in 2024.

"The OECD AI Principles promote the use of innovative and trustworthy AI that respects human rights and democratic values. Adopted in May 2019, they set standards for AI that are practical and flexible enough to last over time." (OECD, 2025)

Among them are: Inclusive growth, sustainable development and well-being, Human rights and democratic values, transparency and explainability as well as accountability

5.2 LEGAL FRAMEWORK AT NATIONAL LEVEL

In our country, Mexico, several attempts have been made to reform the Constitution to incorporate the power to legislate on AI matters, so most attempts have been to reform Article 73 and expressly include that the Congress of the Union may legislate in this area. Currently section XVII." To enact laws on general communication routes, information and communication technologies, broadcasting, telecommunications, including broadband and the Internet, posts and postal services, and on the use and exploitation of waters under federal jurisdiction." (Political Constitution of the United Mexican States 2025) And what has

been intended is that it expressly says Artificial Intelligence, as another of the areas considered federal matter for its legislation.

Legislative attempts have also been made to regulate this technology, especially from 2020 to 2024 (CECO, 2025); We can identify four most prominent ones:

AI and Robotics Ethical Regulation Act 2023

Law regulating the use of AI 2023

Law that creates the Mexican Agency for the development of AI 2023

Federal Law Regulating AI 2024 (Meza, 2024)

The latter establishes in its first article, the object of regulation.

I.- To regulate the development, commercialization and use of artificial intelligence systems.

II.-Guarantee respect for the human rights of consumers and users and avoid any form of discrimination when using AI systems

III.-Protect Intellectual Property Rights

IV.-To facilitate the national development of artificial intelligence systems. (Chamber of Senators, 2024)

Already in the current year, 2025, on April 22, the initiative of the Federal Law for the Ethical, Sovereign and Inclusive Development of Artificial Intelligence was presented, which defines as its object:

Article 1. The purpose of this Law is to establish the general regulatory framework for the development, implementation, use, supervision and promotion of artificial intelligence in the United Mexican States, in accordance with the principles of universality, interdependence, indivisibility, and progressivity of human rights, ensuring an ethical approach and promoting technological sovereignty. In order to guarantee that everyone enjoys the benefits derived from development and innovation, in the field of Artificial Intelligence, in full observance and respect for Human Rights. (Chamber of Deputies, 2025)

In both initiatives, the most recent and complete presented in Mexico, the aim is to regulate the development of AI with a perspective of respect for human rights in its exercise, which must be carried out with the values that guide the Mexican legal system and a general scope of access to the use of this technology and its benefits.

The issue of harmonization between AI and respect for intellectual property rights is of particular interest at the international level since it is one of the areas in which the greatest impact is produced and that practices and even criteria have been generated, which are of

great concern to intellectual creators. because of the impact that may be caused or even generalized to their rights.

Likewise, we have administrative documents that deal with some aspects of the use of AI, for example, we will cite Recommendations for the Treatment of Personal Data derived from the use of AI, from the National Institute of Transparency and Access to Information and Protection of Personal Data INAI of June 2024, a document that being of high quality, defines some issues of great importance in AI, always within the orbit of its objective, which is the protection of people's data and information and which is certainly one of the areas that presents the greatest challenges.

In Mexico, work is being done on this issue, it has been on the table for some years. At least since 2019 we have already had texts, serious and sustained studies on Artificial Intelligence. There are areas such as the judiciary where it has been the object of particular attention and extremely valuable studies. The judicial sphere is one of the governmental spheres in which the greatest attention has been paid to the use of this technology to reduce its negative impact and take advantage of its enormous possibilities of benefit. In 2023, the House of Legal Culture of the Supreme Court of Justice of the Nation, held an academic event called "The vision of Artificial Intelligence on Justice" where the panorama of how AI was being incorporated into the exercise of judicial power was presented. The event was of enormous quality because of the speakers who discussed advanced points, describing the important actions that are already being carried out and identifying that even in relatively new areas, in Mexico there are scientific studies of great quality in this regard and above all put into practice, incorporated into the exercise of the work.

6 CONCLUSION

Artificial AI is a technology that surpasses what was known until its appearance and is under development. The challenge for human beings is to adapt, adapt, be able to get the most out of it without compromising the rights and stability of human beings, combining the support of AI with their own activity so that the world offers better opportunities, problem solving and better living standards to more people.

ABSTRACT

The silverleaf whitefly (*Bemisia tabaci*) is a pest that feeds on a wide range of herbaceous plants' phloem. This insect can cause direct damage to the hosts and transmits over 350 different species of viruses to the plants, reducing the crop productivity up to 100% in some cases. The main current strategy for pest control is the application of chemical pesticides, but the emergence of resistance to the pesticides due to prolonged and extensive use has been reported. In this study, a series of 1,4-dihydropyridine (1,4-DHPs) was synthesized through a one-pot multicomponent reaction and evaluated for their in vivo insecticidal potential against *B. tabaci* MEAM1 nymphs. Among the 24 compounds tested, at a concentration of 5 mg/L, compounds 10 (ethyl 2,7,7-trimethyl-4-(3-nitrophenyl)-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate), 15 ethyl 4-(furan-2-yl)-2,7,7-trimethyl-5-oxo-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate), 16 (ethyl 2,7,7-trimethyl-5-oxo-4-(thiophen-2-yl)-1,4,5,6,7,8-hexahydroquinoline-3-carboxylate), and 18 (diethyl 4-(4-methoxyphenyl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate) displayed control efficiencies twice as high as that of the pyriproxyfen at 100 g/L, which was used as the positive control.

Keywords: *Dihydropyridines*. Hantzsch Reaction. Multicomponent Reaction. Silverleaf Whitefly.

RESUMO

A mosca-branca (*Bemisia tabaci*) é uma praga que se alimenta do floema de uma ampla variedade de plantas herbáceas. Este inseto pode causar danos diretos às plantas

hospedeiras e transmitir mais de 350 espécies diferentes de vírus, reduzindo a produtividade agrícola em até 100% em alguns casos. A principal estratégia atual de controle é a aplicação de pesticidas químicos, mas o surgimento de resistência devido ao uso prolongado e intensivo tem sido relatado. Neste estudo, uma série de 1,4-diidropiridinas (1,4-DHPs) foi sintetizada por meio de uma reação multicomponente em um único passo (one-pot) e avaliada quanto ao seu potencial inseticida in vivo contra ninfas de *B. tabaci* MEAM1. Entre os 24 compostos testados, na concentração de 5 mg/L, os compostos 10, 15, 16 e 18 apresentaram eficiências de controle duas vezes maiores do que o piriproxifeno a 100 g/L, usado como controle positivo.

Palavras-chave: *Diidropiridinas*. Reação de Hantzsch. Reação Multicomponente. Mosca-Branca.

RESUMEN

La mosca blanca de los invernaderos (*Bemisia tabaci*) es una plaga que se alimenta del floema de una amplia variedad de plantas herbáceas. Este insecto puede causar daños directos a los hospedadores y transmitir más de 350 especies diferentes de virus a las plantas, reduciendo la productividad de los cultivos hasta en un 100% en algunos casos. La principal estrategia actual para el control de esta plaga es la aplicación de pesticidas químicos; sin embargo, se ha informado de la aparición de resistencia debido al uso prolongado y extensivo de estos compuestos. En este estudio, se sintetizó una serie de 1,4-dihidropiridinas (1,4-DHPs) mediante una reacción multicomponente en un solo paso (one-pot) y se evaluó su potencial insecticida in vivo contra ninfas de *B. tabaci* MEAM1. Entre los 24 compuestos ensayados, a una concentración de 5 mg/L, los compuestos 10 (etil 2,7,7-trimetil-4-(3-nitrofenil)-5-oxo-1,4,5,6,7,8-hexahidroquinolina-3-carboxilato), 15 (etil 4-(furano-2-il)-2,7,7-trimetil-5-oxo-1,4,5,6,7,8-hexahidroquinolina-3-carboxilato), 16 (etil 2,7,7-trimetil-5-oxo-4-(tiofen-2-il)-1,4,5,6,7,8-hexahidroquinolina-3-carboxilato) y 18 (dietil 4-(4-metoxifenil)-2,6-dimetil-1,4-dihidropiridina-3,5-dicarboxilato) mostraron eficiencias de control dos veces superiores a las del piriproxifeno a 100 g/L, que se utilizó como control positivo.

1 INTRODUCTION

Bemisia tabaci Middle East-Asia Minor 1 (MEAM1) Genn. (Hemiptera: Aleyrodidae), also known as silverleaf whitefly, is an insect that lives usually in herbaceous plants, feeding from their phloem (DE BARRO et al., 2011). *Bemisia tabaci* diet causes direct damage to various types of crops such as cotton (SHUKLA et al., 2016), cabbage (SANTIAGO-ÁLVAREZ et al., 2006), potatoes (SANTIAGO-ÁLVAREZ et al., 2006), lettuce (NG & CHEN, 2011), eggplant (LEITE et al., 2003), tomato (CALVO et al., 2012), and soybeans (PADILHA et al., 2021), besides many others (ABUBAKAR et al., 2022). Besides causing direct damage to its hosts, the silverleaf whitefly's feeding is responsible for the transmission of more than 350 species of viruses, some capable of reducing the crop productivity by 20 to 100% (SANI et al., 2020). *Bemisia tabaci* is considered a pest capable of causing substantial damage and economic losses.

Numerous techniques for managing the population growth of silverleaf, referred to as whitefly management (WFM) strategies, have been documented. These strategies include a variety of methods, such as the application of diverse mixtures: botanical extracts (ATEYYAT et al., 2009; ZHANG et al., 2004), animal waste (SINGH et al., 2021), and ash (SHAILAJA, 2012) to crops, as well as mechanical and biological methods. Nevertheless, many cultural strategies are either suitable only for small-scale farmers or lack robust scientific validation (ABUBAKAR et al., 2022). Additionally, the biological approach may yield inconsistent results due to the numerous factors and parameters that influence the efficacy of biological control agents (ABUBAKAR et al., 2022; KIDANE et al., 2015). Chemical pesticides are the most reliable method for the control of *B. tabaci*, and most commonly include pyriproxyfen, buprofezen, spiromesifen, spirotetramat, anthranilic diamides, cyantraniliprole, and chlorantraniliprole (HOROWITZ et al., 2020). However, the application of these chemicals is associated with adverse effects on both human health and ecological safety (KIM et al., 2017). Furthermore, the persistent use of these substances in increasing amounts has resulted in the emergence of resistance in *B. tabaci* (HOROWITZ et al., 2020; SHAH et al., 2020). Consequently, the development of insecticide resistance makes the silverleaf management a substantial challenge.

The 1,4-dihydropyridine nucleus (1,4-DHP) is present in the structure of several compounds that present pharmacological activities, such as bronchodilator (WEI et al., 2015), anticonvulsant (WEI et al., 2015), hypotensive (MAGER et al., 1992; ROVNYAK et al., 1992), and calcium channel blockage (MIRI et al., 2006). 1,4-DHP compounds are also known for

their ability to reverse multidrug resistance (CAROSATI et al., 2012). In addition, several compounds of this class exhibit diverse biological activities (NUNEZ-VERGARA et al., 1997). For example, recent studies demonstrated that 1,4-DHPs display *in vitro* antileishmanial and antitoxoplasmal activities (OLIVEIRA et al., 2025; OLIVEIRA et al., 2024). However, despite the wide variety of biological activities, the insecticidal activity of 1,4-DHPs is still little exploited in the literature.

In this scenario, this study aimed to investigate the toxicity of a series of synthetic 1,4-DHPs obtained via Hantzsch reaction in 2nd instar nymphs of *B. tabaci* MEAM1.

2 METHODOLOGY

2.1 SYNTHESIS OF 1,4-DIHYDROPIRIDINES 1-24

The 1,4-dihydropyridines **1-24** were synthesized according to the multicomponent one-pot methodology previously described in the literature, with some modifications (Figure 1) (WANG et al., 2005). For the synthesis of asymmetric 1,4-DHP's (**1-16**), 2.0 mmol of dimedone (Aldrich), 2.0 mmol of ethyl acetoacetate (Aldrich), and 0.06 g (5.0 mol%) of ytterbium triflate (Aldrich) were added to a 15-mL round-bottom flask containing 5.0 mL of ethanol. Subsequently, 2.0 mmol of an aromatic aldehyde (Aldrich) and 2.0 mmol of ammonium acetate (Scientific Exodus) as a source of nitrogen were added to the flask, which was coupled to a reflux condenser and set to a CEM Discover microwave reactor (CEM Corp, Matthews, NC). All reagents were added at room temperature. The reaction mixture was taken to the microwave reactor, where it was maintained for 20 min at a fixed power of 100 W in an open vessel system configuration. The symmetric 1,4-DHPs (**17-24**) were obtained following a similar procedure, in which 2 eq. (4.0 mmol) of ethyl acetoacetate was used in place of 1 eq of ethyl acetoacetate and 1 eq of dimedone (Figure 1).

The starting material consumption and the product formation were monitored by thin-layer chromatography using a mixture of hexane: ethyl acetate 3:1 (v/v) as a mobile phase. After the reaction ended, compounds **1-24** were separated from the reaction mixture by vacuum filtration and further purified by recrystallization in ethanol. Compounds **1-24** were obtained in yields ranging from 15% to 40% (Figure 1) and identified based on their ¹H and ¹³C NMR and mass spectrometry data, as previously reported (OLIVEIRA et al., 2025). Compounds **1-16** were evaluated as mixtures of enantiomers.

Figure 1

Synthesis of 1,4-DHPs 1-14

2.2 INSECTICIDAL ASSAY

The tests were carried out at the Laboratory of Plant Resistance to Insects and Insecticide Plants (LARESPI), located in the Department of Plant Protection (22° 50' 40" S 48° 26' 05" W) at the FCA/UNESP in the city of Botucatu, SP, during September 2022.

The tests with *B. tabaci* MEAM1 were carried out in the laboratory and a greenhouse, in a completely randomized design, with 25 treatments and five replicates, each replicate consisting of a leaflet with 20 nymphs (2nd instar) of *B. tabaci* MEAM1, totaling 100 nymphs per treatment. The rearing of *B. tabaci* MEAM1 was maintained in a greenhouse (3.0 × 3.0 × 2.5 m), covered with shade (30%), and closed laterally with an anti-aphid screen (200 mesh). For the maintenance of insects, cabbage (*Brassica oleracea* var. *acephala* L.), soybean (*Glycine max* L. Merrill), cotton (*Gossypium hirsutum* L.), and tomato (*Solanum lycopersicum* L.) plants were grown in 2.5 L plastic pots.

Soybean cultivar 'NA 5909' seeds were sown in plastic pots (0.70 L) containing Tropstrato® substrate (Vida Verde Indústria e Comércio de Insumos Orgânica Ltda, Mogi Mirim, São Paulo, Brazil). The pots were placed in a greenhouse, free from insect infestation, and received the other cultural practices normally recommended for the crop. Soybean plants

with the first fully developed trifoliate leaf (0.7 L pots) were conditioned in the *B. tabaci* MEAM1 rearing, for oviposition by whitefly adults. After three days, the pots were removed and taken to a greenhouse until the eggs hatched and the nymphs reached the second instar, which were demarcated with the aid of a magnifying glass and glitter glue, and then sprayed with the different treatments. Five plants were used per treatment, and each plot consisted of a plant (leaflet) marked with 20 nymphs. In sequence, a single spraying was carried out using a professional airbrush (Model BD134K), coupled to an air compressor adjusted to provide a pressure of 0.5 bar. At the time of spraying, the plants were at stage 12, according to the BBCH scale (VARIANI, 2001). Compounds **1-24** were solubilized in Tween 20 and tested at a concentration of 5 mg/L. Tiger 100 EC® (pyriproxyfen 100 g/L) was used as a standard insecticide (positive control).

After spraying, the pots were kept in a greenhouse. The evaluation of nymphs was performed daily during seven consecutive days after application by counting live nymphs. During the evaluation period, the possible phytotoxicity of the products on the leaflets was also verified.

The effectiveness of the products was determined using the Abbott formula (NAKANO et al., 1981), as described below:

$$\%E = \left(1 - \frac{I}{C}\right) \times 100 \quad (1)$$

Where: %

E = Control effectiveness;

C = number of live *B. tabaci* nymphs in the control;

I = number of live *B. tabaci* nymphs in the evaluated treatment.

2.3 STATISTICAL ANALYSIS

The data obtained were subjected to analysis of variance by the F test. Normality was verified using the Shapiro-Wilk test and homogeneity using the Levene test. When significance was verified in the treatment effects, the Fisher LS-Means Test was used, adjusted for Tukey ($P \leq 0.05$) to compare means. For the analysis, the PROC MIXED-SAS 9.2 statistical package was used (INSTITUTE, 2011).

3 RESULTS AND DISCUSSION

Table 1 illustrates the results and the control efficiency obtained during the 7-day treatment with the 1,4-DHPs **1-24** at a concentration of 5 mg/L against *Bemisia tabaci* MEAM1 nymphs.

Compounds **1-9** and **11** displayed lower efficacy compared to the positive control (pyriproxyfen, 16.37%), whereas compounds **17**, **22**, and **23** had efficacies similar to the positive control. On the other hand, all the other 1,4-DHPs tested were more effective against *B. tabaci* nymphs than the positive control. The most effective compounds were **10** (34.38%), **15** (30.38%), **16** (34.83%), and **18** (34.83%).

The 1,4-DHP scaffold is present in many compounds whose biological activities have been explored. Recently, the potential of 1,4-DHPs derivatives obtained by the Hantzsch synthesis as agrochemicals has been addressed (PARTHIBAN & MAKAM, 2022). These nitrogen-containing molecules, although not directly derived from nicotine, possess structural resemblance to the neonicotinoid class, whose insecticidal properties are well-established in the literature (GUPTA et al., 2019). Studies report the insecticidal activity of DHPs against *Aphis medicaginis*, *Aphis craccivora*, *Nilaparvata lugens*, *Brevicoryne brassicae*, and many others, which can be considered pests capable of damaging different types of crops (PARTHIBAN & MAKAM, 2022). However, to date, data on the insecticidal activity of 1,4-DHPs are unreported in the literature.

Noteworthy, the insecticide pyriproxyfen, at a concentration of 100 g/L, had an efficiency of only 16.37% (e.g., the efficiency of pyriproxyfen to reduce the number of live *B. tabaci* nymphs compared to the positive control group was low). In other studies performed by our group, pyriproxyfen at 100 g/L caused 100% mortality of *Bemisia tabaci* biotype B adults (BALDIN et al., 2018; HE et al., 2013). This may indicate that the *B. tabaci* biotype used in this study is resistant to pyriproxyfen.

Among the 24 1,4-DHPs tested, 14 showed higher control efficacy than the positive control. All the symmetrical compounds (the Hantzsch esters) **17-24** were more effective against *B. tabaci* MEAM1 as compared to pyriproxyfen, whereas most (but not all) of the asymmetrical 1,4-DHPs (polyhydroquinoline) were less effective than the positive control. On the other hand, the polyhydroquinolines **10**, **15**, and **16**, alongside the Hantzsch ester **18**, were two times more effective than the positive control.

Compounds **15** and **16** display a heteroaromatic substituent at C4. On the other hand, compound **10** displayed a 3-nitro group at the aromatic ring, whereas compound **18** displayed

a 4-methoxy group. These results could indicate that the presence of the 4-methoxyphenyl, 2-furanyl, 2-tiophenyl, and 3-nitrophenyl groups may play a key role in the activity of 1,4-DHPs against *Bemisia tabaci* MEAM1. However, further studies are needed to better understand the structure-insecticidal activity relationships of 1,4-DHPs against *B. tabaci* MEAM1.

Table 1

Number of live Bemisia tabaci MEAM1 nymphs (mean $\pm$ SD) and control efficiency (%) after 7-day exposure to treatments with compounds 1-24 at 5 μ L/mL

Treatment	<i>Bemisia tabaci</i>	
	Number of live individuals ^a	% efficiency ^b
Witness	19.03 $\pm$ 0.48 a	---
1	17.14 $\pm$ 0.80 ab	9.91
2	17.31 $\pm$ 0.73 ab	9.01
3	17.26 $\pm$ 0.38 ab	9.31
4	17.66 $\pm$ 0.51 ab	7.21
5	16.91 $\pm$ 0.72 ab	11.11
6	17.91 $\pm$ 0.86 ab	5.86
7	16.37 $\pm$ 0.52 ab	13.96
8	17.26 $\pm$ 0.48 ab	9.31
9	17.31 $\pm$ 1.21 ab	9.01
10	12.49 $\pm$ 1.20 b	34.38
11	18.43 $\pm$ 0.48 ab	3.15
12	14.34 $\pm$ 0.83 ab	24.62
13	14.34 $\pm$ 0.70 ab	24.62
14	13.94 $\pm$ 1.14 ab	26.73
15	12.49 $\pm$ 2.28 b	34.38

21	14.46 $\pm$ 1.67 ab	24.02
22	15.63 $\pm$ 1.07 ab	17.87
23	15.66 $\pm$ 1.15 ab	17.72
24	15.11 $\pm$ 1.30 ab	20.57
Pyriproxyfen	15.91 $\pm$ 0.73 ab	16.37

P <0.0001

^aMeans followed by the same letter in the column do not differ by Tukey's adjusted LS-means test ($P \geq 0.05$); ^bTo calculate the efficiency, the Abbott formula was used (NAKANO et al., 1981).

4 CONCLUSION

The polyhydroquinolines **10**, **15**, and **16**, and the Hantzsch ester **18**, displayed higher efficacy than pyriproxyfen (10 g/L) against *B. tabaci* MEAM1 nymphs at a concentration of 5 mg/L. These preliminary results indicated that 1,4-DHPs are a promising class of alternative insecticides against *B. tabaci* MEAM1 that can be obtained through an attractive methodology that requires only a synthetic step, employs mild and green conditions, and has short time reactions, which deserve to be deeper investigated.

ABSTRACT

This chapter aimed to present the two main techniques for cellular study: optical, immunofluorescence, and confocal microscopy, and flow cytometry. Both have specific techniques for sample preparation, but all are based on immunological or immunocytochemical methods. The chapter explains the operating principles of these two instruments and their variations, as well as the principles of immunological techniques and fluorescence. It also presents concepts and methods for preparing immunocytochemistry samples, along with all the preceding procedures on how different types of antibodies are produced and which should be selected for each purpose—whether for cell surface, intracellular, or organelle and nuclear labeling. At the end of each technique, the reagents to be used and their preparation methods are presented.

Keywords: Optical Microscopy. Immunofluorescence Microscopy. Confocal Microscopy. Flow Cytometry. Immunocytochemistry. Antibodies.

RESUMO

O presente capítulo teve como objetivo apresentar as duas principais técnicas para o estudo celular, a microscopia óptica, de imunofluorescência e confocal e a citometria de fluxo. Ambas têm técnicas específicas para preparação de amostras, mas todas se baseiam em técnicas imunológicas ou imunocitoquímicas. O capítulo traz os princípios de funcionamento desses dois equipamentos e suas variações, bem como o princípio das técnicas imunológicas e o princípio da fluorescência. O capítulo também traz conceitos e técnicas de preparo de amostras de imunocitoquímica, como também todos os procedimentos anteriores, sobre como são produzidos os diversos tipos de anticorpos e quais devem ser escolhidos para cada objetivo, se marcação da superfície celular, intracelular ou dentro de organelas e núcleo. Ao final de cada técnica é apresentado quais reagentes usar e como prepará-los.

Palavras-chave: Microscopia Óptica. Microscopia de Imunofluorescência. Microscopia Confocal. Citometria de Fluxo. Imunocitoquímica. Anticorpos.

RESUMEN

El presente capítulo tuvo como objetivo presentar las dos principales técnicas para el estudio celular: la microscopía óptica, de inmunofluorescencia y confocal, y la citometría de flujo. Ambas poseen técnicas específicas para la preparación de muestras, pero todas se basan en métodos inmunológicos o inmunocitoquímicos. El capítulo aborda los principios de funcionamiento de estos dos equipos y sus variaciones, así como el principio de las técnicas inmunológicas y el principio de la fluorescencia. También se presentan conceptos y técnicas de preparación de muestras de inmunocitoquímica, además de todos los procedimientos previos sobre cómo se producen los diferentes tipos de anticuerpos y cuáles deben elegirse para cada objetivo, ya sea para marcación de la superficie celular, intracelular o dentro de orgánulos y núcleo. Al final de cada técnica se indica qué reactivos deben utilizarse y cómo prepararlos.

Palabras clave: Microscopía Óptica. Microscopía de Inmunofluorescencia. Microscopía Confocal. Citometría de Flujo. Inmunocitoquímica. Anticuerpos.

1 INTRODUCTION

Cells are microscopic living beings that cannot be observed with the naked eye. All the knowledge that is known about cells was obtained by indirect means of amplification (such as the increase in the sample size by optical lenses) or transduction of cellular information (detection and transformation of analog information into electronic and digital information) in a way that the observer can have contact with such a tiny dimension. There is a whole technological development for equipment that detects cell structures and takes them to the observer, as well as a whole technology for sample preparation. Electronic, chemical and biological processes have to be combined to obtain the most accurate information about the cell and its contents. These techniques have become more sophisticated to the point that it is not only possible to study cell structure, but also the population, the identification of cell types and even metabolism. Two main pieces of equipment are mandatory for the study of cells: microscopy, which can be brightfield or fluorescence, and flow cytometry. Both approaches necessarily rely on sample preparation techniques; The essential ones are immunocytochemistry, immunohistochemistry and fluorescence technology. This chapter aims to show the principles of operation of these two pieces of equipment as well as the techniques for preparing samples. The language is technical and accessible, with the aim of serving the reader, especially students, who are starting their laboratory functions in undergraduate and graduate courses on the ways of cell characterization.

2 IMMUNOFLUORESCENCE: TECHNIQUES FOR FLUORESCENCE MICROSCOPY AND FLOW CYTOMETRY

2.1 DETECTION OF SPECIFIC PROTEINS

When we talk about protein detection, we immediately refer to immunochemistry, a technique that allows the localized study of specific cellular proteins using the antigen-antibody reaction.

Suppose we need to study a certain protein, however, we do not know in which cell or cell location this protein is found. Through appropriate techniques, this protein is isolated and purified. By injecting this protein (antigen) into a rabbit, for example, it will form a gamma globulin (antibody) with the ability to combine exclusively with the protein of interest, to the exclusion of any other protein. The antibody (Ab) or immunoglobulin (Ig) is produced due to the immune reaction induced in the rabbit by the "foreign" protein that is of mouse origin, for example. Thus, it is possible to obtain from the rabbit's blood a specific Ab for that protein.

As will be seen in this book, there are several techniques for the characterization of stem cells. When we talk about immunochemistry, other derived terms come to mind such as immunocytochemistry (labeling for cultured cells), immunohistochemistry (isolated tissue), immunoblotting (detection of proteins in gel race), immunoprecipitation (recovery of proteins), among others. However, the most widely used in the study of stem cells is immunofluorescence, where cells and tissues are marked for analysis in fluorescence microscopy and flow cytometry. These two techniques are used because they indirectly identify very specific proteins that indicate the differentiation potential of stem cells. Therefore, it is necessary to have prior knowledge of immunochemistry, which identifies through the specific antibody-antigen binding the protein linked to the characteristic, function or state of a cell.

The term widely used for when we want to find a cellular protein using immunochemistry is labeling. For example, when we want to know if stem cells express Oct-4, a protein found in embryonic cells, it is said that it will be labeled for Oct-4 in a particular cell line. The immunochemistry technique is divided into immunocytochemistry, for cell marking, and immunohistochemistry, for tissue marking, both of which are widely used for observing markings in brightfield microscopy. The technique was developed after the discovery of fluorochromes, which are substances that emit fluorescent light at a certain wavelength when excited by a light source with a shorter wavelength. Fluorochromes make the technique more sensitive, due to the contrast of the light emitted by fluorochromes with the dark background. This innovation could be called immunofluorescence, used for the observation of cells in fluorescence microscopy and in quantification in flow cytometry.

Fluorochromes can be conjugated directly to primary Ab, when the labeling is direct, or conjugated to secondary Ab, as the indirect immunochemistry technique. Later, the protocols described will allow us to visualize the steps of cell protein labeling. Direct marking has the advantage of avoiding some washing steps essential for the application of secondary Ab; another advantage is the low cost, because it does not require secondary Ab (**Figure 1**). Indirect labeling is more versatile, as it allows the use of the primary with a set of available secondaries, of different fluorochrome colors, which can be applied to labels of several simultaneous proteins identified with different colors. Another difference is that indirect labeling produces more fluorescence and is more sensitive than direct labeling, since secondary Ab can bind in quantity to a single primary Ab, and primary Ab, in turn, binds to a single epitope of the antigen, especially when it is monoclonal (**Figure 2**).

In the specific chance of immunofluorescence, Ab is conjugated with a fluorescent compound (fluorochrome).

Figure 1

Direct immunocytochemistry, where a primary Ab (which has a covalently bonded fluorochrome that emits a specific color) binds specifically to an antigen. The fluorescent labeling will show the location of the protein of interest in the cell under study

Figure 2

Indirect immunocytochemistry where a specific primary Ab binds to an antigen and, in a second moment, the secondary Ab (covalently bound to a fluorochrome), specific to the primary Ab, binds in quantity to the primary Ab molecule, increasing the final fluorescence

2.1.1 Principle of Immunocytochemistry

The principle of Immunocytochemistry is very simple, however care must be taken in selecting primary and secondary Abs, and pay close attention to the labeling procedures so as not to lose cells, obtain weak markings, or on the contrary, non-specific (**see protocol below**).

2.1.1.1 Primary antibody

The entire immunological technique for labeling cellular proteins begins with the objective of the molecule of interest. Usually this molecule is a protein and, in immunological aspects, it is our antigen. The labeling of cell structures or molecules is based on the specific affinity between antigen and Ab. These molecules of interest are associated with a cell structure, region, function, or cellular state. Taking the Oct-4 molecule as an example once again, it is a transcription factor that promotes the transcription of genes linked to cell renewal and the embryonic state of cell undifferentiation. Its marking indicates that the cell is undifferentiated at an embryonic stage.

Once the antigen of interest has been identified, the next step is the choice of the primary Ab. The choice of primary Ab will depend on how the immunocytochemistry process will be performed, whether a single labeling, double or multiple labeling, direct or indirect labeling, the specificity of the secondary (or the secondary is chosen by the characteristic of the primary), intracellular or extracellular labeling. These criteria are commented below and in the protocols at the end of the microscopy and flow cytometry chapters, since each immunocytochemistry technique is specific to each type of analysis to be performed.

Ab cells are produced by the B cells of animals immunized by the antigen of interest. There are monoclonal and polyclonal Abs. Monoclonals are generated by a single clone of B cells from a single animal (host) that results in a homogeneous set of Ab specific to a single epitope (region of the antigen recognized by an Ab; an antigen can have multiple epitopes). Monoclonal Abs have the advantage of low probability of cross-reaction, contributing less to nonspecific markings (in the general sense, when markings of molecules other than those of interest occur), and low background marking. Polyclonal Abs, on the other hand, are generated from different clones of B cells of an animal and recognize various epitopes of the antigen of interest; have the advantage of being more tolerant to the influences of fixation and labeling methods and processes that can hinder the interaction between Ab and antigen.

In addition to the types of Ab we have the animals where they are produced and the isotypes or classes generated. Among the animals used for the production of Ab we have mice, rats, hamsters, rabbits, goats, horses, monkeys, among others. Ab have two types of chains, two light and two heavy and both chains have constant and variable regions (antigen recognition). The isotypes or classes are associated with the structure of the constant regions of the heavy chain and are classified into IgA (*alpha*), IgB (*beta*), IgD (*delta*), IgE (*epsilon*), IgG (*gamma*) and IgM (*mu*). The Ab classes can be subdivided into subclasses, as occurs in

humans, where the IgA and IgG classes are subdivided into IgA1 and IgA2, and IgG1, IgG2, IgG3 and IgG4. Other animals have other subclasses. As many Ab are produced in mice, it has subclasses that we should know: IgG1, IgG2a, IgGb and IgG3. We still have the isotypes related to the light chain: *kappa* (κ) and *lambda* (λ) are present in all the isotypes of the heavy chains, but always alone, never together – for example, the heavy chain isotype IgM can have the light chain κ isotype, or the λ , but never both together. There are differences in the amino acid sequence between the κ and γ chains, but all κ chains of the different heavy chain isotypes (IgA, IgB, IgD, IgE, IgG and IgM) are the same, as are the λ chain.

2.1.1.2 Secondary antibody

Before we start choosing the most appropriate secondary Ab for a given marking, let's try to understand which formats of secondary Ab are marketed, their structure and use.

In contrast to primary Ab, most commercialized secondary Abs are polyclonal, purified directly from animal serum that has been immunized according to the type of a region of the primary Ab that we wish to bind, i.e., the fragment or class or subclass of a specific Ab of a specific species. In addition to the type of Ab, the purification method used will also influence the final characteristic of the secondary Ab.

As stated above, Abs have light and heavy chains and their constant and variable regions, so that, depending on the type of immunization done and the enzymatic treatment, we can isolate different formats of secondary Abs. Thus, when we talk about secondary Abs, some will be prepared to bind in all parts of a complete IgG (including both the light and heavy region, L+H), or only in the Fab or Fc region, or only in the γ region of the IgG. There are other Ab specific to the μ region of IgM, or to the light chain type such as κ or λ .

3 WHAT ARE THE ADVANTAGES AND DISADVANTAGES OF USING A SPECIFIC SECONDARY AB FOR A COMPLETE ANTIBODY FRAGMENT OR MOLECULE?

A complete IgG molecule (Anti-IgG (H+L)), having a Y shape, has two heavy chains (larger, approximately 50kDa each) and two light chains (smaller, approximately 25kDa each) and are joined together by disulfide bonds and hydrophobic interactions. This type of secondary Ab is produced by injecting an animal (goat, for example) with a complete primary Ab IgG from another species (mouse, for example). The secondary Ab produced is a polyclonal Ab that recognizes the heavy and light chain of the primary Ab. The downside is that light chain is common for all classes of Ab or immunoglobulin (Ig), which can lead to

cross-reactions. In labeling for cells in culture this problem is not as critical, but for tissue labeling, as there are many cell types, this problem becomes more common. When there is no concern with the type of Ig class (independent of the subclass) or to give a strong signal or when the type of Ig of the primary is not known, this secondary Ab format is very advantageous. Let's look at other types of Ab.

Heavy chain specific anti-Ig (α , γ , μ): taking an anti-IgG Ab as an example, its production is carried out by injecting a complete IgG into a host. Then, the Ab produced in this host go through an absorption process, where they are incubated with Ab IgG from other species attached to a column (i.e., there is no Ab in the column of the species of interest). The anti-IgG Abs that are not of interest have bound to the Abs of the column and the anti-IgG of the species of interest is recovered. This approach avoids cross-linking with other species and reduces the background due to its better specificity. This secondary Ab recognizes all fragments of an IgG: complete IgG and the fragments Fab, F(ab')₂ and Fc. As light chains are present in all Ab classes, there is absorption of anti-IgG that are specific to the K and L chains, which prevents cross-reactions by this type of bonding. So, in the same way as the anti-IgG Ab, other types of Ab specific to other classes can be obtained, such as IgA, IgG, IgM. Its use is interesting when it is intended to perform double labeling where one primary Ab IgG and another IgM can be used, using the secondary anti-IgG conjugated with a fluorochrome and the anti-IgM conjugated with another fluorochrome.

Fc-specific anti-IgG: This type of Ab is specific only to an IgG class like the heavy-chain-specific anti-Igs described earlier. The difference is its specificity only by the Fc portion of the IgG molecule. Its production is done by injecting only the Fc portion of IgG, without the light chains and without the upper portion of the heavy chains, removed by enzymatic digestion by pepsin. This type of Ab further diminishes background and unspecific undesirable bonds.

Fragment F(ab')₂: consists of a complete IgG without the Fc region, by digestion with pepsin. Fragment F(ab')₂ is the two arms of Ab's Y-structure. With a molecular weight of approximately 110 kDa (less than the full 150 kDa IgG molecule) it is very useful for having better penetration and facilitating antigen recognition. These fragments, because they do not have the Fc portion, have the advantage of not binding to the Fc receptors of the immune system's defense cells. The fragment F(ab')₂ is used to produce anti-F(ab')₂ that recognizes only the light chains and the upper portion of the heavy chain of a primary Ab, not recognizing the Fc portion.

Fab fragment: this fragment is produced by digestion with papain removing the Fc portion and the bond between the bivalent molecule $F(ab')_2$ generating two Fab fragments. With a molecular weight of approximately 50kDa, this fragment has greater penetrating power. This fragment is not recognized by Fc receptors. Its main use is to block nonspecific bonds with internal immunoglobulins in the sample, especially in double-labeling procedures.

3.1 CHOOSING THE MOST APPROPRIATE ANTIBODY

As previously stated, the choice of primary Ab depends on the molecule of interest to be labeled. Necessarily the primary Ab has to be reactive to the molecule of a given species. For example, a human cell that will be labeled for CD34, a surface molecule found in hematopoietic precursors, the primary Ab will have to be anti-human CD34 produced in an animal of a different species than the one that will be labeled, for example mouse. As Ab are mostly produced abroad, its commercial classification will be written in English, therefore, the primary Ab in question will be marketed as *Monoclonal Mouse IgG1 Anti-Human CD34*, that is, it is a primary, monoclonal Ab, produced in mice, it is of class IgG1, specific for the Cd34 molecule of humans. In addition to this classification, every commercialized Ab comes with manufacturer's specifications that will have to contain information on cross-reactivity with proteins from other species, whether it is a reabsorbed Ab and for which species it was reabsorbed. Another important piece of information is how Ab should be stored, as most are valid for six to twelve months, among other specifications.

The choice of primary Ab also depends on the specificity of the secondary Ab, as well as the choice of secondary depends on the type and class of the primary Ab. In the example above, since the primary is an IgG1 immunoglobulin produced in mice, the secondary has to be specific anti-IgG1 against mice. As we saw earlier, there are several formats marketed for primary and secondary Ab. In the present example, we can use a mouse IgG1-specific anti-Fab or anti- $F(ab')_2$ secondary that will bind to the Fab chain of this molecule. The same happens for the anti-Fc γ specific to the gamma heavy chain (which characterizes the IgG molecule) and anti-IgG resorbed to other classes of molecules of the same species of interest (and from other species that may have cross-reactions), all of them bind in the Fc portion of the IgG1 primary given as an example. Abs that are reabsorbed for a given species are advised when there is nonspecific labeling due to cross-reaction with molecules of the cells of the species to be labeled. In our example above, if there is cross-reactivity, the use of a resorbed Ab for human is indicated. However, this procedure is more used when it is known

that there are human immunoglobulins (which cause cross-reactions) and when the epitope is not very reduced in the sample to be labeled. It will often be necessary to mark proteins that are inside some intracellular organelle, some researchers resort to Fab or F(ab')₂ chains which are smaller and, therefore, easier to penetrate. Sometimes it is not known what the class of a primary Ab is, so one can turn to an anti-IgG secondary (H+L) that reacts with immunoglobulins of other classes, since they share the same light chain class κ and λ .

This is the simple procedure for choosing the specificity of Ab. On the other hand, the choice of structure will depend on whether it is necessary to be more specific, more permeable or if it needs to reduce the background, so you should consult above which configuration fits best, if specific for Fc, Fab or complete molecule. This type of concern must be taken into account, for example, when we make multiple appointments.

The dilution of the use of both the primary and secondary is suggested by the manufacturer, however, it will always be necessary to standardize the marking, titrating an optimal concentration that minimizes nonspecific markings and maximizes specific ones. Many factors influence the standardization of Ab concentration, such as fixation, permeabilization, incubation time, temperature, whether the protein is abundant or scarce, whether internal or membrane, the cell type and the technique to be used as immunocytochemistry or immunohistochemistry, and the analysis used as microscopy or cytometry, among other techniques.

Table 1

Various types of primary Abs and their abbreviations

<i>Hu = human</i>	<i>Rb = rabbit</i>	<i>Chaos Knight = chicken</i>
<i>Ms = mouse</i>	<i>Shp = sheep</i>	<i>Bov = bovine</i>
<i>Gt = goat</i>	<i>Hrs = horse</i>	<i>Sw = Swine</i>
<i>GP = guinea pig</i>	<i>Sy Hms = Syrian Hamster</i>	

4 ANTIBODY-CONJUGATED MOLECULES

Fluorochrome is used in fluorescence microscopy for visualization of individual structures and molecules and in cytometry for cell classification, both by the immunofluorescence technique. Fluorochrome is a molecule that has the property of absorbing light energy at a certain wavelength (excitation) and emits fluorescent light at a wavelength longer than excitation. This occurs due to the loss of energy between absorption

and emission (**Figure 3**). The physicochemical characteristics of fluorochrome are what define which wavelength of light it is excited and which wavelength of light it emits.

Figure 3

In the process called fluorescence, when a beam of light, of a certain wavelength, for example, in the blue range, falls on a fluorochrome, it absorbs photons, and the electrons of the molecule that were in a current state gain energy and are raised to a higher energy layer (1). Due to energy losses by a process called vibrational relaxation, which generates heat for the environment, the excited electrons fall into a less energetic electron shell (2). As this electronic state is unstable, the electrons return to their original position releasing energy in the form of emitted light (3). In this case, the emitted light has a shorter wavelength (green, for example) than the excitation light due to the loss of energy to the environment

Table 2

Description of the characteristics of the most commonly used fluorochromes

In addition to fluorescence microscopy working with the property of antibody-antigen specificity, there are molecules that have affinity for certain cellular structures, such as DAPI and Propidium Iodide (PI), which are DNA intercalators and are routinely used to mark nuclei and perform cell viability tests, as is the case with PI.

It is also possible to visualize fluorescence in live cells. GFP, a green fluorescent protein found in jellyfish, can be used, along with the recombinant DNA technique. The gene for this protein can be introduced into cells in culture. The cells will produce the GFP protein and emit a green fluorescence when excited.

Stem cells transfected with the GFP gene can be injected into animals intravenously or intraperitoneally (for example) and, subsequently, the location of these cells in different organs and tissues of the body is verified, showing the capacity to graft a certain type of stem cell.

Another example of the usefulness of fluorescence microscopy is the detection of pH or Ca^{2+} concentration in the cell interior. *Acridine Orange* (AO) in an acidic environment, such as that of lysosomes, has an emission wavelength in the red range, while in a more neutral environment, such as the cytosol, it emits in an emission wavelength in the green range. AO is used to assess lysosomal loss. The fura-2 molecule also changes the emission wavelength when bound with Ca^{2+} , used to check the intracellular concentration of Ca^{2+} .

5 FIXATION AND PERMEABILIZATION

Before moving on to immunofluorescence protocols, it is necessary to understand a little about fixation and permeabilization methods. The first step for cell labeling, after culture, is to fix the cells to prevent degradation and preserve the quality of the cellular components by immobilizing the antigens while retaining cellular and subcellular structures through cross-linking of methylene bonds and Schiff bases between the bases of the amino acid residues of proteins. The main factors that influence the quality of the marking are the time, until the fixation occurs, the concentration of the fixative and the temperature at which the process occurs. A very long fixation time can mask the epitopes of the molecule of interest and prevent Ab binding; Each fastener has its ideal minimum and maximum time.

In the fixation process, what is mandatory is to fix the cells as soon as possible, to avoid degradation. Throughout the fixation process, the cells die, but the structures are preserved. In fluorescence microscopy, there are analyses with live cells (or non-fixed cells) where, during the process, the cells are kept in a small chamber that keeps them at a

concentration of 5% CO₂, in a sterile environment, on a heating stage that maintains the temperature at 37°C. But here, we will only address the methods that use fixed cells, which are important for cell characterization.

Good fasteners have to have some desirable characteristics: good penetration capacity, enabling the fixation of the material completely; the coagulation of proteins has to be total and non-violent, but promote immediate cell death; it must not alter cell morphology and structures, maintain soluble elements in cells and tissues; and preventing the appearance of artificial structures (artifacts that can generate false analyses).

The choice of fixator will depend on the structure to be studied. There is no ideal fastener and often mixtures of different fasteners are used where the characteristic of each one will meet the needs of each type of structure to be observed. In the study of some nuclear structures such as chromatin, nucleolus and spindle filaments (during cell division), acid fixatives are used; and for the study of nucleoplasm, mitochondria and vacuoles, basic fixatives are used.

The best known and most used fixative is formaldehyde. In immunohistochemistry it is commonly used at a concentration of 10% (for histological specimens) and in cytochemistry at a concentration of 1 to 4% (for cells adhered in a monolayer on coverslips, petri dishes, or culture bottles); In flow cytometry, it is used at a concentration of 1 to 2% (for cells in suspension). Formaldehyde is marketed in a 37% solution, however, we consider it as 100% and from there the dilution is made, so a 10% solution prepared for fixation will actually have a concentration of 3.7% formaldehyde. Fixation occurs by the covalent cross-linking between tissue proteins (primarily by the amino acid lysine), conferring rigidity to the cytoskeleton. It is an excellent fixative, as it preserves the morphology of the cells, especially the cytoplasmic environment, and the cells can be stored for a long period, a few months, at 4°C (it is recommended to change the fixative weekly, never letting it dry and keeping the cells always immersed). Paraformaldehyde, which is also widely used for the preparation of fixing solutions, is a polymerized form of formaldehyde that is depolymerized after heating.

As many factors influence fixation, different fixatives can be tested to optimize antigen preservation, distribution, and morphology of other cellular constituents. For example, some epitopes are lost on aldehyde fixation but conserved on alcohol fixation, and vice versa. Fixatives and alternative methods should be employed to improve the quality of the fixed sample, such as the use of methanol at -20°C (for 5 minutes) or formaldehyde fixation followed by a brief (1 minute) exposure to methanol at 0°C. Fixation with methanol is most

effective for localizing elements of the cytoskeleton. Alcohols work by extracting lipids and precipitating remaining protein, while aldehydes react by promoting cross-links that better preserve membranous structures.

In practice, we often realize that the material, even if properly fixed, the epitope is not accessible to Ab. In this case, the material undergoes a permeabilization process that permeabilizes the cell membrane, allowing Ab to penetrate the cell, reaching its interior and the interior of cytoplasmic organelles. Permeabilization reagents are basically detergents that make the membrane porous and denature the fixed protein, exposing the epitope. Among the permeabilizers are saponins, Triton X-100 from 0.2 to 0.5% or SDS that are always used after the fixation process. Alcohols such as methanol and ethanol are widely used as permeabilizers, while they are used as fixatives, having a double role. Often a short treatment with these reagents prior to Ab incubation is sufficient to expose the epitope. Special attention should be directed towards ensuring that access to the epitope is the same if the protein has undergone a displacement: for example, the protein that moves between the cytoplasm and the nucleus is not always equally accessible to the Ab.

Fixation using organic solvents such as alcohols removes lipids (a property that allows you to skip the permeabilization step) and dehydrates the cells; precipitation and denaturation also occur, in which the solubility of protein molecules is reduced and the hydrophobic interactions that give many proteins their tertiary structure are disrupted. The most common precipitation fixative is ethanol and methanol, mainly for the preservation of frozen materials and smears. Acetone is also widely used. Protein denaturants, methanol, ethanol and acetone, are rarely used alone for cell and tissue fixation, except when studying only nucleic acids. Acetic acid is a denaturant that is sometimes used in combination with the other precipitation fixers. Alcohol, by itself, is known to cause considerable shrinkage and hardening of tissues during fixation, while acetic acid is the only one associated with tissue swelling, combining the two can result in better preservation of tissue morphology.

Immunofluorescence used in conjunction with microscopy is and remains the best way to locate and determine the distribution of proteins within cells. The preparation of the cells for labeling with the primary Ab follows two important steps: 1) fixation with formaldehyde or paraformaldehyde, which aims to stabilize soluble and insoluble proteins in their native locations, followed by washing with detergents for permeabilization, but which can remove some soluble proteins that have not been well fixed; and 2) permeabilization and fixation with

organic solvents such as ethanol and methanol, which allows the precipitation of soluble and insoluble proteins in their original locations.

Fixation with formaldehyde or paraformaldehyde prior to permeabilization should preserve protein distribution, however, soluble proteins may undergo cell redistribution during the process of this technique. Many proteins that have a uniform cytoplasmic distribution have a coarse, punctual distribution and in some cases reticular appearance. It is common to observe a redistribution where proteins have a punctual and concentrated form around the nucleus, and often inside the nucleus. The cell type influences a lot, where in some cases the redistribution of proteins does not occur and in other cases it occurs.

The use of alcohols to fix and permeabilize tends to precipitate structural and soluble proteins, avoiding loss. However, this method also leads to redistribution of proteins, presenting a characteristic of reticular and fibrous texture, and redistribution into or around the nucleus, as well as to the nucleolus. A decrease in fluorescence is also observed when compared with labeled proteins in living cells.

The study of the genetic arrangement in the cell nucleus requires preservation of native nuclear structure and visualization of genetic regions using chemically modified DNA probes for FISH. The use of confocal microscopy provides the most accurate information about the nuclear structure. However, the penetration of DNA probes into cell nuclei and the preservation of native infrastructure is sometimes limited by the bulky cytoplasm and plasma membrane. These difficulties can be avoided if the relative position of the regions of interest of the chromosomes is not changed in nuclei prepared by the usual method in cytology, which consists of fixation by methanol and acetic acid. This attachment damages the plasma membrane and eliminates the cytoplasm, allowing easier penetration of DNA probes into the nucleus. However, at the same time, it induces dehydration of the nucleus, which can result in the breakdown of the chromosomal structure.

On the other hand, the fixation of nuclei with methanol and acetic acid causes substantial increase in the nuclear diameter. This probably occurs by widening the contact between the core and the blade, widening and flattening the core. Chromosomes from the regions that are closest to the nuclear membrane will be displaced, away from the nuclear center in these nuclei. On the other hand, the regions that are closest to the nuclear center are not much influenced by this flattening.

In flow cytometry, unfortunately, there is still no consensus regarding an optimal cell fixation for the multiparameters to be analyzed. Some strategies are employed to improve

the quality of a sample marking. The use of paraformaldehyde prior to fixation with alcohols follows the premise that the cross-links formed prevent the exit of proteins from the cell after permeabilization with methanol. The same was observed with the use of ethanol. It was observed that the use of methanol as a permeabilizer in place of Triton X-100 helped both in membrane permeabilization and in morphological preservation by measuring the light *scatter* parameter in a cytometer. This is very important since in cytometry it is interesting to select cell populations by morphology, as when we study circulating blood cells.

Both the paraformaldehyde concentration and the fixation temperature affect the immunofluorescence of intracellular proteins, the properties of light scattering cell, and cell DNA fluorescence in measurements using propidium iodide. As observed, the increase in intracellular protein immunofluorescence occurs at high concentrations of paraformaldehyde (2%), at a fixation temperature of 37°C. However, these are recommendations for single-parameter analysis for the measurement of intracellular proteins using immunofluorescent Abs. In multiparameter studies, such as light scattering and DNA content analyses, concentrations of 0.25% paraformaldehyde and fixation temperatures below 37°C are recommended, which improves the quality of the labeling in relation to the appearance of false aneuploidy, probably caused by a differential chromatin condensation and different degrees of nuclear protein cross-linking and/or DNA denaturation induced by paraformaldehyde. To better situate the difficulty of labeling DNA content, aneuploidy is the alteration in the amount of DNA that can be caused by the increase of chromosomes in transformed cells, as occurs in tumor cells. Changing the amount of genetic material also changes the intensity of the immunofluorescence of the marker used to mark DNA. If the interest is to study only the cell content, it is recommended to fix it using only ethanol, which avoids the appearance of false aneuploidies.

Formaldehyde is more used when we want to visualize cytoplasmic structures and preserve cell morphology, while alcohols are more requested in sample preparation when the compartment of interest is the nuclear content. However, one should always test both techniques or both together to define which method best represents the nature of the living cell. One must always take into account the molecule to be observed, its location and the cell type studied; and to use common sense due to the empiricism of fixation techniques.

5.1 SOME EXAMPLES OF FIXATION AND PERMEABILIZATION

Acetone

Fix cells in acetone at -20°C for 5-10 minutes. No permeabilization steps required after fixing acetone.

Methanol

Fix cells in methanol at -20°C for 5-10 minutes. No permeabilization step required to fix methanol next.

Ethanol

Fix cells in 95% ice-cold ethanol and 5% glacial acetic acid for 5-10 minutes

Methanol and acetone.

Methanol and acetone 1:1. Make the mixture at the time of use and fix the cells at -20°C for 5-10 minutes.

Methanol and ethanol

Methanol and ethanol 1:1. Make the mixture at the time of use and fix the cells at -20°C for 5-10 minutes.

Paraformaldehyde and Triton permeabilization

Fix at 2-4% paraformaldehyde for 10-20 minutes. Wash 2X with PBS for 5 min. Permeabilize with 0.5% Triton X-100 for 10 minutes. Paraformaldehyde and Methanol

Fix at 4% paraformaldehyde for 10-20 minutes. Wash 2X with PBS for 5 min. Permeabilize with methanol at -20 °C for 5-10 minutes.

6 FLUORESCENCE MICROSCOPY

Fluorescence microscopy is a great technique for localizing cellular components, either in living cells or in fixed cells. This technique relies on labeling with a fluorescent compound (fluorochrome) following immunohistochemical or immunocytochemical procedures for fluorescence analysis, as mentioned earlier. A fluorescent compound absorbs light at a certain wavelength (excitation) and emits fluorescent light at a longer, more specific wavelength. Fluorescence microscopes have a set of filters that allow only light to pass through with the desired wavelength.

Fluorescence optical microscopes are typically configured for both the bright light field (transmitted light) and fluorescence microscopy. Both methods use the same principle of optical treatment: the transmitted light is produced by a tungsten lamp, focused on the sample by the capacitor, following the trajectory to the observer; The light for fluorescence is produced by a mercury lamp that is impeded, transmitted, or reflected by a set of filters and

mirrors. The focus of the sample always begins with brightfield microscopy, in which clear light (white) allows the visualization of the structure of the cells that have or are not marked by immunological techniques or staining. After the sample is focused, the microscope configuration can be changed for fluorescence analysis.

As seen earlier, the researcher chooses the molecule, protein, enzyme or structure to be observed and the mark with a specific Ab, which is associated with a fluorochrome and which corresponds to a color to be visualized. The technique for fluorescence microscopy allows the visualization of more than one cell marking, it is up to the researcher to make the best combination of markers that emit colors at wavelengths that can be separated by the filters available in the microscope where the observation will be made.

The most commonly used light source in fluorescence microscopes is the mercury lamp or xenon lamp, which emit light at wavelengths (e.g., 365, 400, 440, 546 and 580 nm) that cover most of the absorption characteristics of the most commonly used fluorochromes. The light emitted by the light source passes through an excitation filter that has the ability to let a certain wavelength pass through (bound to the chosen fluorochrome and which specifically absorbs this wavelength). Then the beam of light is reflected by a filter or dichroic mirror towards the sample. The light emitted by the sample (with a length longer than the emission light, due to the loss of energy to the environment) will be isolated by the emission filter to the observer or captured by a camera. Following an example, fluorescein (FITC) and rhodamine are widely used fluorochromes, and as a result fluorescein returns to the observer the color green and red respectively, so we can distinguish two markings in the same sample.

Fluorescein has maximum absorption at a wavelength of 490 nm and emits most efficiently at a length of 525 nm; rhodamine absorbs at 550 nm and emits at 580 nm. A double tagging with these two fluorochromes requires that a set of filters be combined for each tag. In the case of fluorescein, the excitation filter (BP 490/30 nm) prepares the beam of light emitted by the lamp with a wavelength of 490 nm, which is the absorption range of this fluorochrome; a dichroic mirror (MD 510 nm) will reflect the emitted light towards the sample; due to the energy decay the sample will emit light at the longer wavelength of 525 nm, a low-pass emission filter (LP 520 nm) will ensure it will eliminate other light components that are not desired; The same dichroic mirror that reflected the light emitted from 490 nm to the sample will now let through the light with a wavelength of 525 nm that will be viewed by the observer or captured by a camera attached to the microscope. The same will occur for

rhodamine, which will have a set of filters suitable for its range of light absorption and emission.

The disadvantage is that we have the limitation of the image not being seen with both markers simultaneously, as it is only possible to use one filter configuration at a time – the overlapping of both colors (or more, in other cases) is only possible after the acquisition of images of the same field for each fluorochrome, which is done by an image manipulation program.

The objective in fluorescence microscopy has the function of condensing, augmenting and collecting the fluorescence emitted by the fluorochrome of a sample. These and other points, such as the numerical aperture, the wavelength it can transmit, and the immersion medium used, must be taken into account before observing a sample. All of these features work together to determine a good image of the observed sample. The numerical aperture (NA) is the characteristic of the objective collecting light: the higher its value, the greater the amount of light collected by the lens; and it is associated with the proximity of the objective to the sample.

As the light is refracted by the medium between the sample and the objective, depending on the distance, when very close to each other (which occurs in the use of high-magnification objectives, with 100X) it is necessary to use immersion oil to correct the refraction of the emitted light and, consequently, improve the efficiency with which the light is collected by the objective, increasing the NA and the amount of light collected. Resolution, which by definition is the shortest distance between two objects that can still be distinguished as two separate objects, is linked to NA and wavelength: the larger the NA and the shorter the wavelength, the smaller the distinguishable distance between two objects, the higher the resolution.

Enlargement or enlargement is the ability to make the image larger than it is. Usually, the maximum magnification is 1000X (100X the magnification of the objective times 10X the magnification of the eyepiece). The magnification and the NA are related, because the more the image is amplified, the more it loses brightness, however, this can be compensated for the higher the NA

7 CONFOCAL MICROSCOPY

The confocal microscope is a more sophisticated fluorescence microscope, it has the same optical principle as the fluorescence microscope, however, the main difference is the

use of laser as a light source. The confocal microscope turns out to be more sensitive due to the laser that produces a more directed beam of light and waves at the length of light dedicated to the excitation of certain fluorochemicals, increasing its efficiency. Thus, we have lasers in the range of: Ultraviolet (excites in the ultraviolet range 405 nm), Argon (excites the range of violet and blue – 488 nm), Helium-Neon (excites in the green range – 543 nm), for example. The use of laser for excitation gives greater focusing power to the microscope, which makes it possible to explore the cell in depth. With the help of software and the electromechanical system of the confocal microscope, it is possible to perform "cuts" of images in different layers of the cell or tissue.

8 PROTOCOL FOR IMMUNOFLUORESCENCE UNDER MICROSCOPY.

8.1 MATERIALS

- Cells growing in culture with approximately 70 to 80% confluency.
- 2 to 4% formaldehyde (the more concentrated the better the fixation, however, it increases background autofluorescence).
- Buffer Solution: PBS (*Phosphate Buffer Saline*), pH7.4.
- Blocking solution: PBS/BSA, pH7.4 with 5% bovine albumin (BSA).
- 0.1% Triton 100X in buffer solution.
- Culture medium appropriate to the cell of interest.
- Trypsin
- Primary ab .
- Secondary Ab (specific to the type of Ig of the species from which the primary Ab was obtained) bound to a fluorochrome.
- Mounting medium.
- 35mm Petri dishes.
- Blade and coverslip.
- Becker (two)
- Distilled water
- Tissue
- Tongs.
- Enamel

8.2 PROCEDURE (DIRECT AND INDIRECT DIALING)

The difference between **direct** and indirect **dialing** is described in step 11 of this procedure. All equipment, material and reagent that will come into contact with living cells must be previously sterilized.

1. Disaggregate the cells in culture using trypsin.
2. On 35 mm plates, place the coverslips (previously treated with poly-L-lysine).
3. Seed the cells on the coverslip and complete with cell type-specific culture medium up to 2 mL. Leave adhering for 24 hours.

The cells adhere within 4 hours, but leaving it overnight ensures a morphology more suitable for appreciation after fixation. The confluency of 70 to 80% helps with morphology in most cell cultures.

4. Vacuum medium and wash 2 X with PBS.

Washes include gentle cell resuspension and spin for 5 min at 300g (approximately 1000 rpm). It is interesting to calculate the speed in rpm of each centrifuge.

5. After washing, add 1 mL of 2% formaldehyde to each well. Leave the cells to fix for 15 min at room temperature (TA). Fixation can also be done by solvents such as acetone absolute and 90% methanol or 70% ethanol at -20°C for at least 5 min.

In the case of using acetone or alcohols, there is no need for permeabilization since these solvents fix and permeabilize at the same time. That way, go directly to item 8.

If you use formaldehyde and want to stop the procedure here, the fixation can last up to a month at 4°C as long as you change the fixative every week.

Formaldehyde is interesting for membrane and protein labeling of cytoplasmic compartments, in addition to preserving cell morphology well. When you want to mark chromatin, the ideal fixatives are alcohols.

6. Vacuum the fixative and wash 2 X with PBS, for 5 min, each wash.
7. Permeabilization can be done with detergent using 0.1% of Triton X-100 for 10 min. Solvents such as absolute acetone or 90% methanol or 70% ethanol can be used at -20°C for 5 min, if the fixation has been done with formaldehyde.

If you want to label proteins within membrane-enveloped compartments such as vesicles, endoplasmic reticulum, or Golgi, you can increase the permeabilization time to up to 20 min. In this case, it is necessary to standardize to find the ideal time. When you want to mark chromatin, the ideal fixatives are alcohols.

8. Vacuum the fixative and wash 2 X with PBS, for 5 min, each wash.

9. After washing, add 1 mL BW/BSA and leave to block for 10 to 30 min at RT.

Blocking is done to reduce non-specific bonds with the primary Ab, avoiding non-specific markings. During the blockage do not let the cells dry out, add more blocker if necessary.

10. While the cells are blocked, dilute the primary Ab (at the dilution recommended by the manufacturer or at the concentration found after titration of the Ab in the labeling standardization process) in 25 μ L of 5% PBS/BSA.

11. Aspirate the blocker and add the 25 μ L of diluted Ab over the coverslip area (use a 200 μ L tip, letting a drop form at the tip and touching the drop on the surface of the coverslip, with contact the drop spreads). Cut out a piece of the parafilm the size of the coverslip and place it lightly over the coverslip – this will prevent the solution from evaporating. Incubate the cells for 1h to TA, protected from light. The control group should take only PBS/BSA and accompany the experiment group throughout the process.

If the primary Ab is already conjugated with a fluorochrome the procedure performed is called **direct labeling**, so go straight to step 14. If there is a need to use a secondary Ab conjugated with a fluorochrome, the procedure performed is called **indirect labeling**, so follow the next item.

In some cases, a long incubation period will be necessary, even for convenience. In these cases, to avoid evaporation and maintain a humid environment, a container with buffer solution should be used, closed, and left at 4°C, where incubation can extend for one night.

12. With the aid of tweezers, carefully remove the parafilm, aspirate the solution with the primary Ab and wash 3 X with PBS or TBS for 5 min.

TBS can be used in place of PBS, it has Tween 20 which is a detergent that facilitates the permeabilization and washing of cells.

13. Dilute the secondary Ab in 25 μ L of PBS or TBS according to the manufacturer's recommended dilution or at the concentration found after Ab titration in the labeling standardization process.

14. After washing, repeat in the same way as step 11, apply 25 μ L of Ab dilution and place a piece of parafilm on the coverslip and incubate for 1 h at TA, protected from light.

15. Wash the coverslips as in step 12, finishing with the addition of 1 mL PBS.

16. Setting a 20 or 200 μL pipette to approximately 15 μL is enough to mount the blade with the mounting medium. Add the mounting medium on a clean blade so that the drop formed on the ferrule is just deposited on the blade and leave it on the bench.

17. With the help of tweezers, hold the coverslip and immerse it in distilled water (use two Beckers to make two washes). This step should be done very gently so that the breakdown of the coverslip and the loss of cells does not occur.

The removal of the coverslip from the bottom of the well, with the help of the forceps, is easier if the well has PBS. The fact that the coverslip is submerged in the PBS prevents the cells from drying out.

18. Vertically, touch the ends of the coverslip on an absorbent paper so that all the water is absorbed.

19. Carefully touching one end of the coverslip over and next to the edge of the droplet of the mounting medium, the medium will contact the entire end of the coverslip. Lay the coverslip, with the side where the adhered cells are, towards the slide. Notice that the middle fills the space under the coverslip so that it does not form bubbles and spreads the excesses.

20. Carefully place an absorbent paper on the blade to remove excess from the mounting medium.

This procedure prevents the mounting medium from preventing the application and drying of the enamel.

21. Apply the enamel around the coverslip in order to seal the cells that are between the coverslip and the blade. The slides can be stored for a few months at 4°C , but no more than a year.

This procedure prevents oxidation and drying of the cells. Commercial mounting media allow for better conservation of fluorescence intensity (check with manufacturer). If using a medium formed with glycerol and water, it is suggested that the cells should be analyzed within one to two weeks.

22. Take the slides for analysis under a fluorescence microscope.

Tip: Prolonged exposure of the labeled cells under the microscope's fluorescence excitation light depletes fluorochrome's ability to produce fluorescence.

Often at the end of the protocol the marking is nonspecific or very weak, one of the causes is the concentration too high or below the ideal. In this case, the concentration of primary and secondary Abs should be standardized through several dilutions until the ideal

one is found. Other causes for a weak marking may be insufficient permeabilization that did not allow Ab to enter intracellular compartments – in many cases smaller fragments of Ab are used to facilitate reaching the antigen; for nonspecific labeling perhaps the error is in the blocking step, the fixative may also cause increased autofluorescence, or perhaps the use of Ab more specific can solve the problem. Molecule redistribution can often occur, that is, soluble molecules are displaced from their natural regions to other different regions, in which case different types of fixatives or the use of double fixation should be tried.

8.3 REAGENTS & SOLUTIONS

Coverslips treated with Poly-L-lysine

Apply 25 μ L of 1 mg/mL of poly-L-lysine on each coverslip, leave on at RT for 10 min. Gently wash the coverslips 3 X with water and let them dry.

PBS (Phosphate-buffered saline)

0.144g H_2PO_4

8.0 g NaCl

0.2 g KCl 1.44 g Na_2HPO_4

Dissolve everything in 800 mL of H_2O

Adjust pH to 7.4 with HCl

Complete with H_2O for 1 L

Store at room temperature.

Formaldehyde, 2%

As commercial formaldehyde comes in a 37% solution, its dilution is done considering this solution as 100%. Thus, dilute 2 mL of the commercial formaldehyde solution in 98 mL of PBS, pH 7.4. If you wish to use paraformaldehyde, dissolve 4 g of paraformaldehyde powder in 10 mL of distilled water and heat to 60°C. Dilute in a 1:1 ratio with 2x concentrated PBS, pH 7.4.

Always prepare before use, it is not interesting to stockpile.

Methanol 90%

Just dilute in the proportion of 90% methanol and 10% distilled water.

Always prepare before use, it is not interesting to stockpile.

Ethanol 70%

Only dilute in the proportion of 70% ethanol and 30% distilled water.

Always prepare before use, it is not interesting to stockpile.

TBST (Tris-buffered saline with Tween-20)

Initially prepare Tris· Cl, 1 M

Dissolve 121 g Tris Base in 800 ml H₂O

Adjust pH 7.5 with concentrated HCl

Adjust the volume to 1 L with H₂O

Filter if necessary

Store up to 6 months at 4°C or TA

100 mM Tris-Cl, pH 7.5

0.9% NaCl

0.1% Tween-20

Store for up to 2 months at 4°C

BSA 5% (Bovine serum albumin)

5g BSA

100mL PBS

Prepare on the spot, do not stock up.

Triton X-100, 0.1%

99.9 mL PBS

0.1 mL Triton X-100

Store for up to 6 months at TA and protected from light.

Mounting Medium

Prepare the ratio of 50% glycerol to 50% PBS. Since glycerol is very viscous, check if the pipette has pulled in all the desired amount of glycerol and homogenize several times so that all the glycerol comes out of the pipette and is diluted in the PBS. Store at 4°C.

9 FLOW CYTOMETRY

Flow cytometry is a technique used to count, examine, and classify microscopic particles suspended in a flowing liquid medium. Flow cytometry has the following concepts: cytometry (cells), metry (measure), and flow (movement). Its principle is primarily based on a fluid system that allows cellular individualization, an optical system capable of detecting the light scattered as it passes through a cell and the wavelength emitted by a fluorochrome, and an electronic system for (physical-virtual) conversion, processing, organization and manipulation of data.

The flow cytometer device has optical-electronic detection as its principle, identifying different cells by detecting the light they scatter and the fluorescence they emit (if they are labeled with fluorochromes) when they pass through a laser beam (**Figure 4**). It allows the measurement of several parameters simultaneously, making it possible to analyze the physical and chemical characteristics of a single cell. This device is similar to a fluorescence microscope, however, instead of producing an image of the cell, it offers quantitative and qualitative data of a large number of cells in a short period of time, being possible to detect up to 10000 cells per second.

The cytometer basically has:

- A hydrodynamic flow system: which individualizes and directs cells to the point of incidence of the laser.
- A light radiation source: usually these are either a mercury lamp (different wavelengths) or Argon (488nm), Helium-Neon (HeNe, 543 nm) and Ultraviolet (UV, 405 nm) lasers.
- Filter system: intended for filtering the color spectrums emitted by fluorochrome (ultraviolet, blue, green and red, basically).
- Detectors (photodiodes or photomultipliers) for detection of scattered or emitted light.
- A unit for data processing and signal analysis, transforming the electrical signals emitted by the detectors into graphs that can be interpreted (machine-user interphase).

Figure 4

Principle of flow cytometry

9.1 WORKING PRINCIPLE AND ANALYSIS

The cells, through a fluid system, are directed to a point (question mark) where they are intercepted by a beam of light, of a certain wavelength. Optical detectors, which

correspond to certain parameters, are pointed at the point of intersection. In flow cytometry, a parameter is understood as characteristics such as volume, cell complexity, and wavelength emitted by a fluorochrome. There are three types of detectors, one positioned in the line of the light beam (*Forward Scatter* or FSC) that detects the scattered light frontally; one positioned perpendicular to the direction of the light beam, responsible for detecting the light scattered laterally (*Slide Scatter* or SSC); and other types of detectors, each responsible for detecting a certain wavelength emitted by a fluorescent substance, and also positioned perpendicular to the light beam (**Figure 4**).

The cells of interest prepared for flow cytometry analysis should be suspended in a 5 mL round-bottomed polystyrene tube, suitable for flow cytometry. A system, which uses positive pressure, collects the cells from the tube and takes them to the flow chamber. The cells, upon entering the chamber, suffer an effect called hydrodynamic focus. The chamber fluid (*sheath fluid*) has a higher velocity in relation to the sample fluid, the difference in the velocity of the two fluids and the narrowing of the chamber allows the flow to behave in a laminar way, which leads to acceleration and concentration of cells in the center of the flow as the sample fluid gains speed and becomes narrower. As the cells are accelerated, they move away from each other, allowing them to pass through the question mark, where they are hit by a beam of light (**Figure 4**).

The cells are focused by the beam of light in the question mark. The beam of light when it hits the cell undergoes frontal and lateral dispersion. There is a detector for frontally scattered light that is in the line of the light beam; and a detector for sideways scattered light that is perpendicular to the light fixture; these detectors are represented by the FSC and SSC parameters, respectively. Thus, the FSC detector will provide characteristics on cell size and volume while the SSC detector will provide characteristics on intracellular complexity related to the amount of membranes such as nucleus, vesicles, Golgi complex, cytoplasmic reticulum, membrane roughness and cytoplasmic granules. Thus, we can obtain information in the form of graphs, on the computer screen, such as populations of cells classified in relation to their physical characteristics. For example, we can distinguish the different types of leukocytes by analyzing the population of cells found from the peripheral blood collected, or any other type of cells of interest, such as stem cells, always according to their size and the complexity of the membranes that constitute the cell body (**Figure 5**).

Figure 5

The combination of SSC (y-axis) and FSC (x-axis) allows a very good distinction between cell population and leukocyte residues or cellular remains. The stem cells shown have cell size and volume (FSC) and membrane complexity (SSC), such as organelles and nucleus. These cells are easy to notice, being shifted to the right. To the left, there are points that represent cell debris: small parts or remnants of membrane, small or large, but of low volume, therefore displaced closer to the y-axis

This type of approach to detecting cell populations uses a lot of graphical representation called *dot plot*. In this mode it is possible to check two parameters simultaneously. In the graph above (**Figure 5**), the x-axis represents the cell volume by the FSC parameter and the y-axis the SSC cell complexity parameter. In addition to the two defined parameters, the *dot plot* provides a third piece of information, which is the number of cells, where each point on the graph represents a single measured cell. Another much simpler mode of graphical representation is the histogram. In this mode it is possible to check the information of intensity and number of cells, as well as their proportion. In the example below (**Figure 6**), the intensity of the markers of cell molecules is represented on the x-axis and the number of cells is on the y-axis.

The flow cytometer also allows us to analyze cell populations that express certain types of molecules that can be labeled through the immunofluorescence technique with Ab linked to fluorochromes. The different types of fluorochromes, when excited by the light beam, emit certain wavelengths that are optically filtered and detected by detectors dedicated to a certain color range. More modern flow cytometers may have more fluorescence detectors, but at a minimum, they all come equipped with wavelength detectors in the green (FL1), orange (FL2), and red (FL3) range. For example, the FL1 detector detects the fluorochrome FITC, FL2 the fluorochrome PE and the FL3 fluorochrome APC. In stem cell research, this

approach becomes interesting because surface molecules are used to classify the state of differentiation and cell potency. Figure 6 shows a histogram of the number of cells by markers of cell potency.

Figure 6

Stem cells are shown to compare the expression of markers related to mesenchymal origin. The curve with the darkest stroke is the control, showing that this group of cells are not marked with Ab. The control serves to adjust the position of cells that do not have fluorochromes, thus presenting little fluorescence. The curve with a clearer line shows the cells that have undergone the immunofluorescence process: if the cells present the protein of interest, depending on the concentration of this protein, if in large quantities, the more Ab will bind to the cells, the stronger the intensity of the fluorescence and the more displaced to the right will be these cells. The y-axis shows the number of cells; The X-axis shows the intensity of the fluorescence emitted by the fluorochromes. In this case, the graphs show that the cells are positive for the molecules or markers for mesenchymal cells CD73, CD90 and CD105. The percentage shows the proportion of labeled cells for a given mesenchymal protein, with the unmarked control cells as the cutoff limit. Tip: even though the cells are not labeled, as is the case with the unlabeled negative control, they have their own fluorescence intensity detected by the flow cytometer. This should be calibrated so that the histogram of the control group is very close to zero on the x-axis, i.e., leaning against the y-axis
