In an integrated manner, the findings confirmed all the hypotheses proposed. H1 and H4 were confirmed by the association between simplicity and acceptance; H2, due to the presence of technical failures that reduce the perceived effectiveness; and H3, by lexical variation between profiles. These results support the literature (Davis, 1989; Venkatesh et al., 2003; Hassenzahl & Tractinsky, 2006) and extend its application to the context of public monitoring in Brazil.

Finally, in response to the research problem, it infers that assistants and monitors evaluate monitoring technologies differently. The former value attributes of simplicity and intuitiveness, confirming greater acceptance of KoboToolbox, while the latter highlight technical flaws, mainly associated with uMov.me, in addition to institutional concerns related to information security. Thus, the perception of usability is mediated by technical, design, and contextual factors, confirming that technological adoption in the MDS/DEPAD requires both investments in stability and design of tools and training adjusted to the profile of users, in line

with recommendations in the international literature on usability and digital governance (DeLone & McLean, 2003; Dawes et al., 2016; Lewis, 2018).

5 FINAL CONSIDERATIONS

The present study sought to understand how assistants and monitors perceive the usability and difficulties in the use of technologies applied to the monitoring of contracts of therapeutic entities linked to the MDS/DEPAD. The research problem stemmed from the need to assess the extent to which new digital platforms, such as KoboToolbox and uMov.me, are able to improve data collection and reliability in institutional supervision processes. The analysis, based on lexicometric methods, proved to be consistent and aligned with the literature that defends the application of textual analysis as a scientific validation strategy in the social sciences (Reinert, 1990; Camargo & Justo, 2013; Krippendorff, 2019).

The results confirmed **Hypothesis 1 (H1)** by showing that positive perceptions of usability are directly related to technological acceptance. KoboToolbox was associated with terms such as *intuitive*, *practical* and *good*, indicating that simplicity of interface is one of the factors most valued by users. This finding is in line with classical models of technology acceptance (Davis, 1989; Venkatesh et al., 2003) and reinforces research on the importance of design and clarity in user experience (Hassenzahl & Tractinsky, 2006). Thus, it was found that platforms perceived as facilitators of the work tend to achieve greater adherence in public monitoring contexts.

Hypothesis 2 (H2) was also validated, showing that technical difficulties reduce the perception of effectiveness of the systems. Terms such as *crash*, *problem*, and *failure*, often associated with uMov.me, indicated that performance barriers compromise users' confidence in the tool. This finding dialogues with studies by Hornbæk (2006) and DeLone and McLean (2003), who point to malfunctions as factors of technological rejection. In the context of monitoring therapeutic entity contracts, these limitations represent not only an operational obstacle, but also a threat to the quality and reliability of data collected in the field.

The analysis also confirmed **Hypothesis 3 (H3)**, according to which the functional profile influences the perception of usability. While the assistants used a more evaluative vocabulary, highlighting positive or negative attributes of the tools, the monitors presented a technical discourse, centered on operational and information security issues. These findings are similar to studies that demonstrate how different user profiles shape their perceptions as a function of their institutional responsibilities (Zaharias & Poylymenakou, 2009; Holden & Karsh, 2010). Thus, it was evidenced that technological adoption in the MDS/DEPAD needs to consider the heterogeneity of functions and profiles to ensure effectiveness.

Hypothesis 4 (H4) was equally supported, confirming that the simplicity of the interface and the clarity of the interaction with the system increase the quality of the user experience. This evidence reinforces that technological adoption depends not only on the objective functionality of the system, but also on the subjective perception of ease of use (Tractinsky, Katz & Ikar, 2000; Sauro & Lewis, 2016). In this sense, the perceived superiority of KoboToolbox over uMov.me shows that the effectiveness of a platform is not restricted to technical performance, but includes design and user experience attributes, which can determine trust in the system.

In the theoretical field, this study contributes by applying lexicometric analysis to evaluate technological acceptance in a specific context of monitoring contracts of therapeutic entities. This approach allowed the identification of objective discursive patterns and reduced interpretative biases, which strengthens the scientific validity of the investigation (Krippendorff, 2019; Bardin, 2011). In addition, by articulating hypotheses derived from classical models of technological acceptance with empirical results obtained in Brazilian public policies, the research expanded the scope of the international literature and demonstrated the relevance of the triangulation between qualitative and quantitative methods in the study of usability.

From a practical point of view, the results offer subsidies for the formulation of strategies to improve public management. The evidence that assistants and monitors perceive the tools differently suggests the need for training programs differentiated by functional profile, ensuring that each group is trained according to its specific demands. In addition, the finding that technical failures compromise the reliability of data reinforces the importance of investments in technological stability and continuous support, in order to ensure that the systems fulfill their function of improving institutional monitoring and accountability.

It is important to recognize, however, some limitations of the study. The number of respondents, although sufficient for lexicometric analyses, restricts the statistical generalization of the results. In addition, the use of a textual corpus constructed from questionnaires may not fully capture the complexity of practical field experiences. Future research may explore mixed approaches, combining lexicometric methods with in-depth interviews and participant observation, in order to offer a more comprehensive view on technological adoption in public policies.

It is concluded that the research problem was answered clearly: assistants and monitors evaluate in a different way the usability of the technologies for monitoring contracts of therapeutic entities. While KoboToolbox's simplicity favors acceptance, uMov.me's

technical flaws limit its effectiveness. This heterogeneity of perceptions confirms the four hypotheses formulated and demonstrates that technological adoption in public policies depends on the interaction between technical, design, and contextual factors. Thus, the need to align training, technological stability and interface design with the specificities of the target audience is reinforced, ensuring that technological innovation is effectively transformed into efficiency and reliability gains in public management.

ABSTRACT

Fairy tales, despite their age, continue to exert a lasting fascination over younger generations. This article explores how these classic elements persist in contemporary culture, especially among teenagers. Through focus groups, we investigate how the themes and archetypes of fairy tales still influence popular TV series, movies, and books. Although there are adaptations and departures from the original texts, the essence of these narratives remains relevant. Critical analysis reveals deep-seated issues. Female rivalry, the pursuit of beauty, and gender representation are recurring themes. The paternal figure, symbolized by the hunter who saves Snow White, highlights the need for protection and security in the absence of the father. Additionally, Winnicott's perspective on transitional space and play as a tool for autonomy also applies to fairy tales. These stories not only entertain but also provide a narrative structure that allows young people to explore and understand the challenges inherent in growing up and separating from the familiar world. Thus, fairy tales continue to be relevant, offering insights into the human condition and preparing readers for real-world challenges.

1 INTRODUCTION

The enchantment with fairy tales is due, firstly, to their value and importance for the processes of subjectivation that begin in childhood. We know little about the origin of fairy tales that were transmitted orally, as part of the intangible goods of the culture of various peoples. It is believed that its origin is Celtic, around the second century B.C. According to Schneider and Torossian, we will find already in Plato and in ancient Egypt, something that already resembles fairy tales as we know them today and that have been used since that time, elements of the human imagination:

Hisada (1998) addresses Plato's writings, in which older women used their stories filled with symbology in the education of children. The author cites Apuleius, a philosopher of the 2nd century AD, and his novel 'The Golden Ass', which is very reminiscent of the tale 'Beauty and the Beast'. Also in Egypt, says Hisada (1998), in the papyri of the brothers Anubis and Bata, records of fairy tales were found. Ferreira (1991) reports that the peoples of Antiquity knew the fantastic universe existing in the tales. Its plot is woven by refined matrices of the human imaginary, whose language, full of symbolic meanings and metaphors, has the ability to interconnect the conscious and the unconscious. (SCHNEIDER; TOROSSIAN, 2009, p.134)

The authors also emphasize that initially these tales were not intended for children, but over time they were adapted for them. Fairy tales are distinct from other types of narratives, in the first place, because they present magical elements and enchanted beings. Myth, in turn, is a sacred narrative of primitive and ancient peoples and has the function of explaining the origin of the universe and everything in it. If we take Greek philosophy as a starting point, we will see that the origin myths refer to how each element of the universe came to be, but the stories reveal the passions of the gods – love, envy, dispute, jealousy and most likely we will not find any happy ending.

One of the first authors to adapt European oral narratives is Charles Perrault (1628-1703) who transposed them to written history that, in addition to entertaining children, also provided moral lessons, aiming to guide and teach them, encouraging them to seek a virtuous life. In addition, it also offers practical teachings. For example, in the short story "*Little Red Riding Hood*," Perrault teaches children about the danger of trusting strangers – a lesson that remains valid to this day.

Fairy tales in general present the main character who faces a series of problems to be solved and overcome, goes through moments of great difficulty or danger, but in the end finds a happy ending.

Cashdan (2000) states that the fairy tale has four stages: the crossing, the journey to the magical world; the encounter with the evil character or the obstacle to be

overcome; the difficulty to be overcome; and conquest (destruction of evil); the celebration of the reward". (SCHENEIDER; TORROSIAN apud Cashdan, 2009, p.135).

Among the authors of fairy tales, it is essential to mention the Brothers Grimm who wrote more than two hundred stories:

Numerous tales were also recorded by the Germans Jacob Grimm (1785-1863) and Wilhelm Grimm (1786-1859), better known as the Brothers Grimm. Philosophers and scholars of Germanic mythology and the history of German law began to collect and study a large mass of medieval texts and popular stories of Germanic and French origin told orally (Robinson, 2004). (SCHENEIDER; TORROSIAN, 2009, p.136).

In this regard, for the Romanian anthropologist, Mircea Eliade, what differentiates the fairy tale from a saga or myth, is far beyond the happy ending: "its content itself refers to a terribly serious reality: initiation, that is, the passage, through a symbolic death or resurrection, from ignorance and immaturity to the spiritual life of the adult." (ELIADE, 1972, p. 174). In other words, the hero or heroine will always go through initiatory tests, such as overcoming obstacles, defeating the monster, deciphering riddles and performing very difficult tasks, constituting, according to the author, an initiation at the level of the imaginary. In this way, the relevance of fairy tales focuses on the preparation of the child for life, filled with 'tests', absences, imminent dangers and deaths.

Having pointed out the origins and relevance of fairy tales for the processes of subjectivation, we will dwell, first, on some aspects of Walter Benjamin's philosophy regarding the importance of narratives and, in particular, that of fairy tales.

2 WALTER BENJAMIN AND THE VALUE OF NARRATIVE AND FAIRY TALES

Walter Benjamin wrote *The Narrator* in 1936. This work presents a diversity of ideas about the art of narrative that find great correspondence with the other key ideas of his work. The first of them refers to the art of narrative with history. Now, when you tell a story, you talk about something that has already happened. History is, by definition, melancholic, because its object, the past, is absent by definition. From his Jewish ancestry, Benjamin inherits the idea that history always has a truth to offer, occupying a relevant place in the whole of his philosophy.

For the thinker, the art of narrating goes back to the manual work of medieval artisans that harmonized with the rhythm and an experience of time, qualitatively different from what we have now. The best narratives, according to him, are the ones that are least different from those oral ones that were told during the work - the art of narrating would be linked to

handicraft and manual work, in which the rhythm of the work would provide the conditions for certain stories to be told. The intonation and the narrative itself were intertwined with the threads woven by the artisan's hands, in an inseparable articulation between gesture and word. The narrator has human life as his subject and establishes an artisanal relationship with it.

Storytelling has always been the art of telling them again, and it is lost when the stories are no longer preserved. It is lost because no one else spins or weaves while listening to the story. The more the listener forgets himself, the more deeply what is heard is engraved on him. When the rhythm takes hold of him, he listens to the stories in such a way that he spontaneously acquires the gift of narrating them. (BENJAMIN, 1985, p.205)

Corroborating what we said earlier, for Walter Benjamin, it is narratives that provide a deeper knowledge about life, are able to transmit 'advice' and truths and offer a way out of the most difficult situations. Silva explains to us:

Etymologically, for experience, the word Walter Benjamin uses is *Erfahrung*. Its root is "fahr" which means to travel. In Old German, "fahr" is to cross a region, during a journey, through unknown places. And the Latin word for experience has as its root "per" (experience): to leave a perimeter, to leave the condition of what is already known, of what has already been lived, to expand experiences, events and repercussions of these new events in our lives. And from "per" also comes the word *periculum*: crossing a region, during a trip, where dangers can assault us. And, for these dangers, there is the word that is associated with *periculum*, which is *oportunos* – originating from *portus*, which means exit. So, the experiences that happen to us during a journey into the unknown, on a journey, are experiences that broaden our identity, our knowledge, our sensitivity, our condition in the world. Now, at present, with the contraction of time, experience has been abolished. Experience was something that was transmitted from generation to generation, in the sense that: communicable narratives were made as exemplary models of teachings for generations to come. (SILVA apud Matos, p. 159)

The practice of telling and listening to stories are activities as old as man himself. In this sense, orality has always been present in the genesis of all literature and especially in children's literature. According to Benjamin, the fairy tale is the first counselor of humanity, it offers comfort and help through the advice poured out of manifest and latent conflicts. In terms of narrative, for the thinker, he surpasses myth:

The fairy tale taught humanity many centuries ago, and continues to teach children today, that the most advisable thing is to face the forces of the mythical world with cunning and arrogance. The liberating spell of the fairy tale does not stage nature as a mythical entity, but indicates its complicity with the liberated man. The adult only perceives this complicity occasionally, that is, when he is happy; For the child, it

appears for the first time in the fairy tale and provokes in him a feeling of happiness. (BENJAMIN, 1985, p.215)

In this way, we will find in Benjamin not only the value of narratives through the concept of *Erfahrung*, in the construction of subjectivity, but of the primacy of the fairy tale over myth – he transmits an experience from which one can extract 'advice' for life. In fairy tales, although there are spells and magic potions that make use of elements of nature, in Benjamin's philosophy, nature is a friend and ally of man, because man and nature are works of the same creator and lament the loss of the initial paradisiacal state.

In addition, the central characters of fairy tales find happiness precisely because they have remained virtuous, even though they live miserably. They are persevering to the point of making good prevail over evil and obtain redemption, unlike what happens in myth.

Walter Benjamin highlights the fundamental importance of orality in the fairy tale tradition, a practice that he considers essential for maintaining the relevance and vitality of these stories over time. According to the German thinker, the oral transmission of fairy tales allows these narratives not only to survive, but also to transform, adapting to the cultural, social, and historical changes of each era. Through orality, stories are shaped by the collective experiences, values, and needs of each generation, ensuring that they continue to be a source of wisdom and moral guidance.

And, among the written narratives, the best are those that are least distinguished from the oral histories told by the numerous anonymous narrators. Between these, there are two groups, which interpenetrate each other in multiple ways. The figure of the narrator only becomes fully tangible if we keep these two groups in mind. (BENJAMIN, 1985, p.198)

Regarding *Erfahrung's concept*, we ask ourselves the following question: Could it be that in the contemporary world, dominated by digital technologies and social networks, are these fairy tales that are appropriated by the entertainment industry, even if they make very interesting reinterpretations, capable of providing children with this collective experience? Or is she being reduced to a mere experience – '*Erlebnis*', an inauthentic experience?

The great difference between these two concepts focuses on the idea that *Erfahrung's* concept presents the idea of a community, in which the subject is perfectly integrated, enabling him to sediment learning over time. Benjamin points out that modernity has been showing a decline in this experience, as the subject is isolated in an increasingly fragmented society.

The result was the predominance of an attitude of disorientation thanks to the fragmented character of impressions: discontinuous experience or perception, which is opposed to experience (*Erfahrung*) characterized by the attachment to personal memory and reflection: In the modern world, all psychic energies have to be concentrated in immediate consciousness, in order to intercept the shocks of everyday life, which involves the impoverishment of other instances, such as memory, and with this the 'modern hero' loses all contact with tradition, becoming a victim of amnesia (ROUANET, 1993, p. 64). (LIMA; MAGALHÃES, 2010, p.148)

Walter Benjamin's reflections on the decline of experience, in this sense, take up this question: even though fairy tales undergo adaptations and rereadings, is it still possible to make meaningful the child's approach to these tales, presented through the most diverse dynamics and media? It seems to us that, although these media offer new ways of telling these stories, they also have the merit of fixing these narratives in a way that arouses interest so that they can be read later. However, the fluidity and adaptability of oral tradition can be severely compromised in the light of Benjamin's ideas.

3 THE VALUE AND TEACHINGS OF FAIRY TALES

Walter Benjamin discusses the importance of narratives as the possibility of carrying out an experience lived and shared collectively over time. In his work, he differentiates "*Erfahrung*" from "*Erlebnis*," which refers to individual, momentary and isolated experiences, typical of modernity. Traditional storytelling is a form of "*Erfahrung*" because it transmits the accumulated knowledge and practical wisdom of generations. These stories are not just accounts of events, but carriers of deep meanings that help shape the collective understanding of the world and human relationships.

He also states that the fairy tale is the greatest counselor of children. It is in him that the true narrator is found, without a doubt he knows how to give good advice and propitiates the child that it is through courage, which is a kind of confrontation with the forces of the world of myth, that fear is lost; And then this child gets a taste of the feeling of being happy. The fairy tale passed on teachings to humanity: the kindness and friendly relationship of man with nature are present, according to Benjamin: "the character of the animal that rescues a child shows that nature prefers to associate itself with man than with myth". (BENJAMIN, 1985, p.215).

The mythical characters exist in the narrative to save human life, they are beings: just, wise, kind and consoling of humanity. The fairy tale manages to show man the path to be followed through the courage of choice and humanization from the advice that permeates it. In it, the "voice of nature" stands out, in which there is a reconciliation of man with her, showing how part of it and they as friends show the elective affinity between souls who are

good and their tendency to help each other. It is not uncommon in these tales to see animals helping the heroes in their journey. As with myths (observing their differences), fairy tales provide models for human conduct, as we follow in the footsteps of Benjamin's philosophy.

Both in Benjamin and in psychoanalysis, narratives always have a utility that can be translated as a moral teaching, a practical suggestion or a norm of life.

Fairy tales come with this purpose, as they address issues that refer to conscious and unconscious conflicts experienced during life and especially during childhood, facilitating the emotional and psychological maturation of the human being. 'Fairy stories speak to our conscious and our unconscious, as they easily coexist in our unconscious.' (BETTELHEIM, 2007, p.242)

However, for Mircea Eliade, in contemporary times, fairy tales will become entertainment, and with the cultural industry, entertainment. However, its structure retains its value and its initiatory character:

Although in the West the marvellous tale has long since become a literature of amusement (for children and peasants) or of evasion (for the inhabitants of the cities), it still presents the structure of an infinitely serious and responsible adventure, for it is reduced, in short, to an initiatory plot: in it we always find the initiatory tests (fights against the monster, seemingly insurmountable obstacles, puzzles to be solved, impossible tasks, etc.) the descent into hell or the ascension to Heaven (or - what comes to the same - death and resurrection) and marriage to the Princess. It is true, as Jan de Vries rightly pointed out, that the story always concludes with a *happy ending*. (ELIADE, 1972, p. 173)

In view of the previous considerations, we will seek to understand the relevance of fairy tales for the formation of the *psyche* through the psychoanalysis of these narratives and, especially, of the tale of Snow White, which we will discuss below. Following the thoughts of Walter Benjamin, in addition to the issues already addressed, we can observe in his work reflections on specific themes that stand out for the depth of his cultural and historical analysis. A striking example of this is his interpretation of the short story "Sleeping Beauty".

Benjamin reflects on how "*Sleeping Beauty*" can be interpreted as a metaphor for power dynamics and the passage of time in monarchical societies. The sleeping princess's long wait symbolizes stagnation or a transitional period in monarchies, in which power is suspended, awaiting a significant change, often represented by the arrival of a new ruler. This interpretation suggests that the tale goes beyond a simple fantasy story, also functioning as an allegory of the political and social realities of its time.

By analyzing fairy tales such as "*Sleeping Beauty*," Benjamin points out how these narratives reflect a society's anxieties and hopes, often related to shifts in power and

uncertainty about the future. Thus, the tale can be read as a commentary on the cyclical nature of history, in which periods of inactivity and expectation are followed by moments of renewal and transformation.

Fairy tales are filled with symbols and metaphors that carry deep meanings, allowing for multiple interpretations and analyses. Each story offers a rich tapestry of symbolic elements that reflect psychological, cultural, and social aspects.

In addition, some professionals use fairy tales in the clinical context, both in the treatment of adults and children, to help understand and express feelings, anguish, and emotions that are often difficult to understand on their own. This practice is especially common in children who find themselves in situations of vulnerability or illness, as they tend to identify their pain and frustration with the adversities faced by the characters in the stories. This identification facilitates the openness to talk about their own problems, as they recognize themselves in the narratives of the tales.

Reading or narrating fairy tales is considered a powerful tool to provoke deep reflections, even when the child is alone in his room, whether during the day or at night. By recalling history, you can feel more comforted, finding relief and understanding in the midst of your own challenges.

History, in addition to its reflective value, is seen as one of the transitional tools that can enrich the therapeutic work, as highlighted by Hisada Hilst, when addressing the encounter that occurs, during the analytic session, between the patient and his analyst. It is in this meeting space, known as potential space, that the process of illusion manifests itself, influencing the formation of human subjectivity. The use of stories in the analytical context has the power to improve the patient's communicative pattern, promoting a more effective way of expressing and understanding their emotions.

According to Caldin, the pleasure generated by reading fairy tales produces joy, and this joy has a therapeutic effect. This effect is particularly significant because children feel a deep relief and satisfaction when they see that, at the end of the story, everything ends well. In this way, fairy tales not only entertain but also play a crucial role in the emotional healing and psychological empowerment of children.

Tales and stories are, therefore, an excellent transitional medium, acting as a kind of therapeutic play. According to the theory presented by Winnicott, it is through playful action that the individual is able to favor human maturation, emphasizing, with this, the importance of emotional and psychological development.

In this way, the use of stories in a clinical context not only enriches the therapeutic experience but also plays a crucial role in the healing process and the patient's personal growth.

Winnicott, when discussing the importance of play in psychoanalysis, states:

I can now restate what I am trying to convey. I wish to draw attention away from the sequence of psychoanalysis, psychotherapy, play material, play, and propose all this again, in reverse. In other words, it is play that is universal and that is proper to health: play facilitates growth and, therefore, health; play leads to group relationships; Playing can be a form of communication in psychotherapy; Finally, psychoanalysis was developed as a highly specialized form of play, in the service of communication with oneself and with others. (WINNICOTT, 1975, p.70).

The child begins to engage with the stories by adding details, characters, or even remembering events that the narrator may have left out. These narratives are essential for children to build their identity, better understand family dynamics, and, in addition, develop a significant affective bond with those who are telling the story.

The analysis of fairy tales proposed by Bruno Bettelheim in *"The Psychoanalysis of Fairy Tales"* and Winnicott's reflection in *"Playing and Reality"* on the relationship between mother and baby offer a rich and complementary perspective on human emotional and psychological development, especially in childhood.

By connecting the ideas of Bettelheim and Winnicott, we can see how the tale of "Snow White" can be interpreted as a narrative that addresses the breakdown and transformation of the mother-child relationship. The stepmother symbolizes the negative aspect of the maternal figure, which threatens the development of the child's autonomy. However, it is through overcoming the challenges presented by this threatening figure that Snow White, like the child, manages to reach emotional maturity, a theme that we will address below.

4 THE PSYCHOANALYSIS OF FAIRY TALES: ANALYSIS OF SNOW WHITE

In the story of Snow White, according to the Brothers Grimm, it is possible to notice the queen's happiness at being pregnant. She was in the castle sewing something near the window watching the snowflakes fall softly, when suddenly she pricked her finger with a needle. When she saw her blood flow and mix with the snow, she found the image beautiful and wished that her daughter had skin as white as snow, lips as red as blood and hair as black as the wood of the window. After giving birth to a girl named Snow White, the queen passed away: "Some time later, she had a daughter, who was white as snow, red as blood, and had hair as black as ebony. They named her Snow White, but when she was born, the queen died." (GRIMM, p.1)

After the birth of his heiress and the death of the queen, the King after a year, remarries. The new queen was beautiful and extremely vain. So she couldn't bear the thought of anyone being more beautiful than her. In possession of a magic mirror, the queen asked him: "Who was the most beautiful woman in the country?" And he always replied that he was the queen. However, time passed and Snow White, with each passing day, became more beautiful. Once, when Snow White was already a beautiful girl, the mirror answered the usual question, stating that Snow White was the most beautiful woman.

The queen's vanity and the idea of not being the most graceful in the kingdom made her ask the huntsman to take the girl to the forest and kill her, also demanding that he bring her liver and lungs so that the cooks could prepare them for her dinner:

The queen swallowed, turned yellow and green with envy. Every time she looked at Snow White after that, she hated her so much that her blood even boiled in her chest. Envy and pride grew like weeds within the queen's heart until she could not have a moment of quiet, neither night nor day. Finally, he sent for a hunter and said:
- Disappear with this girl in front of me. I want you to take it to the bottom of the forest and kill it. To prove that you really did it, bring me her lungs and liver. (GRIMM, p. 01)

The hunter, however, was not brave enough to kill the princess because of her beauty (he either took pity on her or imagined that the animals of the forest themselves would soon do this job). Snow White fled through the forest at night, very frightened and afraid of the dangerous and hungry animals. After walking for hours, he saw a small house. So, she went in and noticed that everything was small, organized and clean, she looked at the table where there was a white tablecloth, seven plates, forks, knives and mugs, she ate and drank a little of each plate and mug, she looked for a place to take a nap, one bed was too small, another was too wide, one was cramped until she found a perfect one to sleep in.

The dwarfs arrived from work in the mine and noticed that someone had entered their house: the chairs were messy, the dishes were missing food, some mugs were empty, and their beds were unmade. Until one of them realized that there was someone lying on his bed, when they got close they found Snow White so beautiful that they did not have the courage to wake her:

"God in heaven!" they cried, 'God in heaven! What a beautiful girl!' They were so amazed at her that they didn't even wake her up, but they let her continue sleeping in the bed. The seventh dwarf slept with his companions, an hour with each one, and then the night was over." (GRIMM, p. 06)

The dwarfs woke up early as usual and asked the girl what her name was, she replied, apologized and told her story. Compassionate, the dwarves allowed her to stay, as long as she kept the house clean, washed the dishes, and prepared dinner.

The dwarfs said, "If you take care of our house, cook for us, make the beds, wash, sew, and darn our clothes, and keep everything neat and tidy at all times, you can stay with us, and you will never lack anything." - Good! - said Snow White - I would love it... And that's how she took care of the house. Every morning they went out to the mountain to pan for gold and silver, and every night they came home and she had to have made dinner. But she spent all day alone, and the kind dwarfs thought it good to warn: "Be very careful with your stepmother. She'll soon find out that you're here. Don't let anyone in, ever. (GRIMM, p. 07)

Days later, the queen went to the mirror to ask again who the most beautiful woman was, firmly believing that the mirror would give her the answer she expected. The mirror then betrays Snow White. She had been tricked by the hunter. Faced with this, he decides to kill her personally. First, she dresses like a peasant girl and sells Snow White a beautiful bodice. This one, as soon as she put it on, ran out of air, almost suffocated to death and, luckily, the dwarves arrived in time to save her. The second attempt was the sale of a hair comb that, when placed, would cause the princess to fall into a deep sleep, again the dwarves saved her. In the last attempt, the stepmother poisoned an apple – and as soon as Snow White bit it, she fell to the ground as if she were dead.

The dwarves, when they found her fallen, imagined her dead. They then placed her in a glass coffin so that everyone who walked by could see her beauty. One day, a prince approached the coffin, came across the princess and decided to take her, because he had been amazed and enchanted by such beauty. She wanted to pay the dwarfs to keep her. His sudden passion also did not let him move away from the princess. Moved, the dwarves allowed him to take her, as they found no solution to the situation. As the coffin moved, the piece of apple that was stuck in Snow White's throat came loose and she awoke.

The prince told her what had happened and confessed his love to her and immediately asked her to marry him. Snow White accepted the proposal, as she had also fallen in love with the prince.

Snow White's stepmother was invited to the wedding. After getting ready for the ceremony, he stopped in front of the mirror and asked again if she was still the most beautiful: the mirror replied that the most beautiful was the new queen.

Lady Queen, you are the most beautiful one that is here, but the young queen is a thousand times more beautiful than all the beautiful ones out there. Hearing this, the evil one cursed and cursed. She was so horrified that she didn't know what to do. At

first he did not want to go to the wedding, but he could not resist the curiosity of seeing the young queen. The moment she entered the hall, she recognized Snow White and was so terrified that she couldn't even move. But they had already ordered two iron slippers to be put on the coals. Someone took them out with tongs and placed them in front of her, who was forced to put on her red-hot shoes and dance until she fell dead. (GRIMM, p. 12)

For Walter Benjamin, fairy tales can show man the path to be followed through courage, choice and humanization from the advice that permeates him. In it stands out the "voice of nature" in which there is a reconciliation of man with her, showing him as part of it, and they as friends, evidencing the elective affinity between souls that are good, and their tendency to help each other. It is not uncommon in these tales to see animals helping the heroes in their journey. As with myths (observing their differences), fairy tales provide models for human conduct, as we follow in the footsteps of Benjamin's philosophy.

Both in Benjamin and in psychoanalysis, narratives always have a utility that can be translated as a moral teaching, a practical suggestion or a norm of life.

Fairy tales come with this purpose, as they address issues that refer to conscious and unconscious conflicts experienced during life and especially during childhood, facilitating the emotional and psychological maturation of the human being. 'Fairy stories speak to our conscious and our unconscious, as they easily coexist in our unconscious.' (BETTELHEIM, 2007, p.242)

The analysis we intend to make about the tale of *Snow White* is not exhausted in the space available for this article. We aim to present some key ideas that focus on family relationships, in the light of the work *The Psychoanalysis of Fairy Tales* by Bruno Bettelheim. Thus, Bettelheim's analysis of "*Snow White*" can be enriched by Winnicott's understanding of the importance of play and transitional space in the formation of identity. Both perspectives underline the complexity of family relationships and the importance of distancing and symbolic elaboration for healthy emotional development. Ultimately, fairy tales, such as the one in "*Snow White*," not only entertain but also offer a narrative structure that allows the child to explore and understand the challenges inherent in growing up and separating from the family world.

The challenges inherent to growing up and separating from the family world, addressed by both Bruno Bettelheim and Winnicott, are central to understanding children's emotional development. In "*The Psychoanalysis of Fairy Tales*", the author argues that tales like "*Snow White*" are not just entertainment stories, but symbolic narratives that help the child to face and elaborate the emotional conflicts that arise as he grows up and distances himself from the family nucleus.

In this tale, the stepmother represents an archetypal challenge: the confrontation with a maternal figure who not only ceases to be protective, but who becomes a direct threat to the child's development. This conflict symbolizes the painful but necessary process of separation of the child from the mother, a process that is both psychological and emotional. The stepmother, in trying to eliminate Snow White, personifies the difficulties that the child faces when trying to establish her own identity, independent of maternal expectations and influences.

Winnicott, in *"Playing and Reality"*, offers a complementary perspective when discussing the concept of transitional space, which is the psychological environment in which the child learns to exist separately from the mother, developing a sense of *autonomous self*. According to Winnicott, this space is crucial for the child to be able to begin to explore the outside world, while still feeling safe within the structure of their family world. Playing is a central activity in this process, as it allows the child to experience independence in a safe and controlled way, creating a balance between dependence on maternal care and the need for autonomy. It is worth highlighting at this point, the stepmother's magic mirror: a powerful symbol of vanity and narcissism. The mirror not only reflects the stepmother's obsession with her own beauty, but also functions as a device that feeds her insecurity and cruelty, as she finds herself constantly threatened by Snow White's youth and purity. These two elements, vanity and narcissism, also adulterate the healthy relationship between parents and children.

When we connect Bettelheim's and Winnicott's ideas, we can see that the challenges of growth and separation are represented in fairy tales as critical phases of child development. The distancing from the maternal figure, whether represented by the mother or a stepmother, requires the child to face fears, insecurities and, eventually, discover new ways of existing in the world.

Another metaphorical representation of this growth that we can highlight takes place in the space of the forest. This represents the child's inner world, a space where he must confront the unknown and his own weaknesses in order to emerge stronger and more independent. The forest, where Snow White takes refuge, can be seen as the transitional space described by Winnicott, in which the character is removed from maternal protection and under the imminent threat of her stepmother. It is in this scenario that the child will discover himself and build his identity.

This process of isolation and self-knowledge, although painful, is essential for emotional growth, reflecting the need for separation from the maternal figure so that the child can fully develop. It is also worth mentioning the figure of the hunter, which carries an equally deep symbolism, in which his figure represents danger and salvation. It represents the

possibility of moral choice, showing that even in a world full of evil, there is room for compassion and a change of heart. This act of mercy also allows the narrative to continue, leading Snow White to face new challenges and eventually find her own identity and strength.

Therefore, the huntsman in "Snow White" can be seen as an embodiment of human duality—the ability to harm or protect, to blindly obey cruel orders or to act in accordance with higher moral principles. It serves as a catalyst for Snow White's journey, pushing her into the woods, where true transformation and growth can happen.

For Bettelheim, fairy tales provide the child with a symbolic script to deal with these challenges. They show that while separation and growth can be painful and daunting, they are also necessary for the development of a solid and resilient identity. For Winnicott, the process of playing offers a means by which the child can smooth the transition between dependence on the mother and the discovery of himself, as a separate individual.

Therefore, both Bettelheim and Winnicott underline the importance of addressing these challenges of growth and separation, recognizing that they are key steps in healthy emotional and psychological development. Fairy tales, by dramatizing these internal struggles, allow children to symbolically experience these difficult transitions, preparing them for the real challenges they will face as they grow up to become independent adults. Thus, the tale of "Snow White", like many others, uses these symbols to explore universal themes such as the conflict between good and evil, envy, ephemeral beauty, and the inevitability of change.

4 FINAL CONSIDERATIONS

First of all, it is necessary to emphasize that the article has the merit of deepening the interfaces between philosophy and psychology within the academic sphere through the fairy tale. Second, because fairy tales, understood as oral narrative, with *Erfahrung*, contribute significantly to the processes of subjectivation.

In this way, we intend to contribute to our studies on psychoanalysis in an attempt to offer possibilities for qualitative changes to occur in the relationships between parents and children, making them healthier. Thus, we intend to contribute to the advancement of an interdisciplinary modality of studies, as it recovers the dialogue of various areas of knowledge, making this production significant, as it demanded research from us, a necessary condition for the continuation of our studies.

We emphasize that fairy tales play a fundamental role in the subjective formation of children, providing not only entertainment, but also learning and emotional development. Their origin dates back to ancient times, being transmitted orally through various cultures

before being adapted and recorded by writers such as Charles Perrault and the Brothers Grimm. Initially intended for an adult audience, these tales have been modified over time to meet children's needs, introducing moral lessons and narratives structured in challenges, overcoming, and happy endings.

In addition to their playful character, fairy tales represent a process of symbolic initiation, as pointed out by Mircea Eliade, preparing the child to face real-life challenges. They connect the conscious and the unconscious, allowing little ones to develop emotional resilience and better understand the world around them. Thus, the relevance of these narratives goes beyond simple enchantment, becoming a valuable means for the psychological, cultural and philosophical development of humanity.

From Walter Benjamin's reflections, it becomes evident that fairy tales have an essential narrative value, functioning as transmitters of experience and knowledge throughout the generations. Their traditional orality allowed these stories to be molded to the needs and values of different times, providing not only entertainment, but also fundamental advice and teachings for the construction of subjectivity. However, Benjamin points out that modernity brought with it a rupture in the transmission of this experience (*Erfahrung*), replacing it with fragmented and superficial experiences (*Erlebnis*). The advancement of digital media and the entertainment industry, although it has contributed to the diffusion and reinvention of fairy tales, also raises the question of whether these new forms of narrative still preserve the richness and depth of oral versions.

Thus, the challenge of today's society is to find a balance between innovation and tradition, ensuring that stories continue to play their formative role in childhood. Despite the changes in the way tales are told, their power to convey values and assist in children's emotional development remains, as long as there is an effort to preserve their narrative essence and their connection to the human experience.

From the above, it is evident that fairy tales have a significant value both in cultural transmission and in the psychological and emotional formation of the individual. As presented by Walter Benjamin, these narratives are more than simple stories; They carry profound teachings, transmitted over generations, helping to build the collective experience and understand the world. In addition, the psychoanalytic analysis of authors such as Bettelheim and Winnicott demonstrates how these stories help in the emotional maturation of children, allowing them to face fears, internal conflicts, and life challenges in a symbolic and transformative way. Even in the face of modernization and the influence of the cultural industry, fairy tales maintain their initiatory structure and therapeutic potential, serving as a

valuable tool for the development of human subjectivity and for the understanding of interpersonal relationships.

The psychoanalytic analysis of "Snow White" allows us to understand that fairy tales are not only playful narratives, but also symbolic representations of the emotional and psychological challenges faced in child development. From the contributions of Bruno Bettelheim and Donald Winnicott, it can be seen that this tale approaches, in a metaphorical way, the separation of the maternal figure, the construction of identity and the emotional maturation of the child.

The stepmother represents the necessary break between the child and maternal protection, while the forest symbolizes the transitional space in which the process of self-discovery takes place. In addition, Snow White's journey illustrates the challenges of growing up and seeking autonomy, showing how facing adversity is fundamental for the formation of an independent *self*.

Fairy tales, therefore, play an essential role in the child *psyche*, helping the child to elaborate their fears, insecurities and desires through symbolic identification. At the end of the narrative, the outcome of Snow White reaffirms the overcoming of challenges and the achievement of maturity, demonstrating that the journey of growth, although full of difficulties, leads to development and independence. In this way, "Snow White" remains a timeless example of the structuring function of fairy tales in the emotional and psychological construction of the individual.

ABSTRACT

This article describes the development of the AUTO SOLDERING project, the result of an PD&I initiative conceived and executed by B&Z International in the industrial context, with its scientific production coordinated by IITA. The project is aimed at the design and implementation of an automated tin immersion soldering system applied to transformer coil terminals used in cell phone chargers. The initiative stems from the need to replace the manual and semi-automatic process currently employed, which exposes operators to health and safety risks and presents instabilities regarding repeatability, reproducibility and control of critical parameters. The proposed solution is based on an integrated hardware and software prototype capable of automating the stages of insertion, handling, fluxing, immersion soldering and transfer of the product to the subsequent stage. The system includes control of essential variables (time, depth and immersion angle) and continuous monitoring of temperature, weld volume and cycle time. As a differential, it uses embedded intelligence for real-time decision-making, aiming at operational stability and quality standardization. Additionally, it allows the collection and availability of productive data for integration into the CMES system through XML files, supporting performance indicators and traceability. The development considers ergonomics, occupational safety and compliance with NR-12. As expected results, the elimination of operator exposure to the process, increased efficiency and availability, improved quality and greater control of production indicators stand out, characterizing incremental process innovation applied to the industrial context.

RESUMO

O presente artigo descreve o desenvolvimento do projeto AUTO SOLDERING, fruto de uma iniciativa de PD&I concebida e executada pela B&Z International no contexto industrial, tendo sua produção científica coordenada pelo IITA. O projeto é voltado à concepção e implementação de um sistema automatizado de soldagem por imersão em estanho aplicado aos terminais de bobinas de transformadores utilizados em carregadores de telefones celulares. A iniciativa decorre da necessidade de substituir o processo manual e semiautomático atualmente empregado, que expõe operadores a riscos de saúde e segurança e apresenta instabilidades quanto à repetibilidade, reprodutibilidade e controle de parâmetros críticos. A solução proposta baseia-se em um protótipo integrado de hardware e software capaz de automatizar as etapas de inserção, manuseio, limpeza em fluxo, soldagem por imersão e transferência do produto à etapa subsequente. O sistema contempla controle de variáveis essenciais (tempo, profundidade e ângulo de imersão) e monitoramento contínuo de temperatura, volume de solda e tempo de ciclo. Como diferencial, utiliza inteligência embarcada para tomada de decisão em tempo real, visando estabilidade operacional e padronização da qualidade. Adicionalmente, permite coleta e disponibilização de dados produtivos para integração ao sistema CMES por meio de arquivos XML, suportando indicadores de desempenho e rastreabilidade. O desenvolvimento considera ergonomia, segurança ocupacional e conformidade com a NR-12. Como resultados esperados, destacam-se a eliminação da exposição do operador ao processo, aumento de eficiência e disponibilidade, melhoria da qualidade e maior controle dos indicadores produtivos, caracterizando inovação incremental de processo aplicada ao contexto industrial.

RESUMEN

Este artículo describe el desarrollo del proyecto AUTO SOLDERING, resultado de una iniciativa de PD&I concebida y ejecutada por B&Z International en el contexto industrial, cuya producción científica está coordinada por el IITA. El proyecto tiene como objetivo el diseño e implementación de un sistema automatizado de soldadura por inmersión de estaño aplicado a los terminales de bobina de transformador utilizados en cargadores de teléfonos móviles. La iniciativa surge de la necesidad de sustituir el proceso manual y semiautomático actualmente empleado, que expone a los operadores a riesgos para la salud y la seguridad y presenta inestabilidades en cuanto a repetibilidad, reproducibilidad y control de parámetros críticos. La solución propuesta se basa en un prototipo integrado de hardware y software capaz de automatizar las etapas de inserción, manejo, limpieza de flujos, soldadura por inmersión y transferencia del producto a la siguiente etapa. El sistema incluye el control de variables esenciales (tiempo, profundidad y ángulo de inmersión) y monitorización continua de la temperatura, el volumen de soldadura y el tiempo de ciclo. Como diferencial, utiliza inteligencia integrada para la toma de decisiones en tiempo real, con el objetivo de lograr la estabilidad operativa y la estandarización de calidad. Además, permite la recopilación y disponibilidad de datos productivos para su integración en el sistema CMES mediante archivos XML, apoyando indicadores de rendimiento y trazabilidad. El desarrollo tiene en cuenta la ergonomía, la seguridad laboral y el cumplimiento de la normativa NR-12. Como resultados esperados, destacan la eliminación de la exposición del operador al proceso, el aumento de la eficiencia y disponibilidad, la mejora de la calidad y un mayor control de los indicadores de producción, caracterizando la innovación incremental de procesos aplicada al contexto industrial.

Palabras clave: Automatización Industrial. Soldadura por Inmersión. Transformadores Electrónicos. Seguridad Laboral. Control de Procesos.

1 INTRODUCTION

The search for efficiency and safety in electronic manufacturing processes has driven the transition from manual methods to intelligent automation systems. This article presents the development of the AUTO SOLDERING project, whose objective is the design and implementation of an automated system for the immersion soldering of transformer coil terminals. The initiative is based on the need to replace manual and semi-automatic processes that, in addition to exposing operators to occupational risks, present technical instability. According to Rosário (2005), automation is essential in processes that require high repeatability, as active systems are capable of acting with optimal efficiency when processing information from the environment in real time.

Although the techniques of joining materials are ancestral, their technological evolution has allowed systemic integration in several global industrial segments, consolidating itself as a critical stage in sectors such as the two-wheeled pole, white goods, electronics and portable appliances. According to Rosário (2005), the evolution of these processes is driven by the need for precision and structural integrity, where automation acts as the link between conventional metallurgy and advanced manufacturing. As Groover (2011) points out, welding and other joining processes are fundamental in the assembly of complex products, requiring strict parameter control to ensure final quality in high-productivity environments.

The implementation of automation introduces a disruptive paradigm in production models, simultaneously boosting operational efficiency and the qualitative reliability of the final product. In addition to increasing production, the technological transition in critical processes acts as a fundamental agent in promoting the safety and health of the operator, by mitigating exposure to unhealthy environments or ergonomic risks. According to Rosário (2005), automation allows the active system to perform dangerous or exhausting tasks with precision superior to human accuracy, ensuring that the physical integrity of the worker is preserved without prejudice to throughput. In this sense, Groover (2011) reinforces that automation does not only aim to replace manual effort, but to create a work environment where control technology absorbs risk variables, resulting in a more humane, stable and safe industrial process.

This article aims to highlight the transition from the manufacturing model of an industrial welding process to the automated system, evaluating the effectiveness of the mitigation of production anomalies, as well as the increase in efficiency and quality as well as the reduction of risks to the health and physical integrity of the operator. As highlighted by Rosário (2005) and Groover (2011), this transition is essential to convert rigid systems into intelligent and safe manufacturing cells.

To achieve this central objective, the following specific objectives were established: technical survey through the realization of a detailed diagnosis of the current process and the identification of the root causes of its critical problems; proposal of a solution by exposing the architecture of the developed automated model, detailing its embedded intelligence and control mechanisms; comparative analysis with the execution of a quali-quantitative study between the manual and automated models, validating the performance gains and compliance with safety standards.

2 THEORETICAL FRAMEWORK

The theoretical framework of a study consists of a critical and systematized analysis of the literature pertinent to the theme, with the objective of providing the theoretical contextualization of the research and delimiting its fundamental concepts. The following topics present the main conceptual constructs that support and guide the development of this work.

2.1 INDUSTRY 4.0

Industry as it is known today is the result of numerous transformations over the decades, transformations resulting from revolutions, studies and technological evolution and modernity of societies. For Boettcher (2015), Industry 4.0 is the result of industrial revolutions and great technological advances.

2.1.1 First Industrial Revolution – Industry 1.0

The earliest forms of civilization produced goods strictly according to their immediate needs, through predominantly manual processes, characterized by artisanal production. With demographic growth, the need to settle in permanent housing and social organization in villages and small groups, a significant change in human behavior began, which resulted in the emergence of new demands and increased consumption.

The migration of the population from the countryside to urban centers intensified this process, promoting transformations in the market with the aim of stimulating consumption. In this context, new services and activities aimed at the urban population have emerged, such as cinemas, clothing stores and the sale of low-cost electronics. The growing demand for consumer goods required the reformulation of production processes, since artisanal production was no longer able to meet large-scale production while maintaining the standardization of products. Thus, factories emerged as an alternative to boost the retail market, with the adoption of organized labor in industrialized processes.

According to Cavalcante and Silva (2011), in addition to being more agile, production began to occur on a larger scale, contributing to the transformation of social culture through the consolidation of capitalism, whose main objective is to obtain profits.

According to Boettcher (2015), this revolution began in England between the end of the eighteenth century and the beginning of the nineteenth century, later extending to other countries, such as the United States, France, Belgium, Russia, Germany, and the Netherlands. The main characteristic of the First Industrial Revolution was the improvement of the steam engine, initially applied to the textile industry and later expanded to several other production processes.

Figure 1

Depiction of the First Industrial Revolution and the Steam Engine

Source: The Electric Sector (2010).

2.1.2 Second Industrial Revolution – Industry 2.0

Boettcher (2015) states that the main factor that promoted the emergence of new revolutions was the evolution of technologies, as they provided growth and modernization and a significant increase in profits. Around 1870, the Second Industrial Revolution emerged, driven by technological demand.

This transition was marked by the discovery of electricity, transformation of iron into steel, operationalization and modernization of means of transport, advancement of communication systems, development of the chemical industry, etc. The main characteristics of this revolution were the search for greater profits, specialization of work and application of production (SILVA; GASPARIN, 2013).

Fordism begins, the name for mass production, with the objective of rationalizing production through technical innovations, stimulating a new chain of mass production VS mass consumption, with Henry Ford as a precursor in 1914 (BOETTCHER, 2015).

Figure 2*Henry Ford - Fordismo*

Source: Business Insider (2012).

2.1.3 Third Industrial Revolution – Industry 3.0

In addition to the technological boost, there was also a renewal in the economic, political and social process, with great dynamism and high complexity in the twentieth and twenty-first centuries, according to Silva et al. (2012).

Also called the Third Revolution, Technical-Scientific and Informational, it was formed through processes of technological innovation, which are marked by advances in the fields of information technology, robotics, telecommunications, transportation, biotechnology, chemistry and nanotechnology (BOETTCHER, 2015).

Industry 3.0 has presented several outstanding characteristics, among which the use of multiple energy sources, the growing use of computer and automation resources, as well as the increase in environmental awareness, stand out. It was also observed the intensification of the replacement of human labor by increasingly modern machines, which contributed to the increase in structural unemployment. At the same time, there was the expansion of labor rights, the advance of the globalization process, the emergence of new industrial powers and the massification of technological products (SILVA et al., 2002).

2.1.4 Fourth Industrial Revolution – Industry 4.0

The concept of Industry 4.0 gained international visibility in 2011, when it was officially presented in Germany during the Hannover Messe. According to Kagermann et al. (2013), this initiative emerged as a strategic response to the need to increase the competitiveness of the German manufacturing sector in the face of technological transformations and the global economic scenario.

The following year, in 2012, those responsible for the development of the project, under the coordination of Siegfried Dais, representative of Robert Bosch GmbH, and Henning Kagermann, linked to acatech, prepared a document with guidelines and recommendations sent to the German Federal Government. This report served as the basis for the planning

and implementation of the new industrial model. In 2013, still at the Hannover Fair, the final version of the Industry 4.0 concept was consolidated and released (Silveira, 2017).

This new industrial paradigm is associated with the intensification of digitalization and automation processes in manufacturing, promoting increasingly integrated and intelligent production environments (Oesterreich; Teuteberg, 2016). As Silveira (2017) points out, the essence of Industry 4.0 lies in the ability to interconnect machines, systems, and productive resources, allowing the formation of autonomous networks capable of making decisions and optimizing processes without constant human intervention.

From this perspective, Zawadzki and Zywicki (2016) state that Industry 4.0 represents the convergence of recent technological advances with a new vision of production, in which cyber-physical systems connect the physical to the virtual environment, enabling automated, intelligent and highly adaptable operations.

Figure 3

Top Industry Technologies

2.1.5 Industry 4.0 in Brazil

In the Brazilian context, Industry 4.0 is still in the early stages of development when compared to more industrially advanced countries, such as Germany, the United States, and Japan. According to Hahn (2017), this technological delay is mainly evidenced by the low replacement of traditional production lines by automated systems, whose adoption rate remains lower than that observed in developed economies.

Despite this scenario, the national industry shows efforts to insert itself in this new productive paradigm. According to the National Confederation of Industry (CNI, 2016), initiatives aimed at Industry 4.0 in Brazil initially focus on product improvement and the development of new business models, seeking greater efficiency and competitiveness.

Zancul (2016) points out that, although many Brazilian industries have already incorporated some level of automation, digital manufacturing has not yet been fully achieved. The author points out that Industry 4.0 is based on two fundamental dimensions, integrated

processes and innovative products, in which Brazil still has limitations, reflected in the reduced number of competitive sectors on a global scale.

In addition, it is observed that several national companies are still in the process of transition to the Third Industrial Revolution, living with different levels of technological maturity. However, as Santos (2017) points out, there is the possibility of accelerating this process through the direct adoption of technologies associated with Industry 4.0, especially by small and medium-sized companies, which can obtain significant gains in productivity and competitiveness.

In this sense, the implementation of Industry 4.0 in Brazil must consider the particularities of the national reality, allowing the adaptation of concepts and the overcoming of traditional stages of industrial development. However, the dissemination of this model still faces obstacles, such as the lack of technical knowledge and resistance to the adoption of new technologies, factors that hinder the consolidation of this new industrial revolution in the country (Hahn, 2017).

2.2 ERGONOMICS

The term Ergonomics was first used in 1857 by Wojciech Jastrzębowski, being derived from the Greek words *ergon* (work) and *nomos* (rules or laws). Ergonomics has its origin in the studies of Work Physiology, focusing on the identification of the causes of work fatigue and the proposition of solutions aimed at mitigating or eliminating it (Pinto, 2009).

According to Wisner (1982), ergonomics can be defined as the set of scientific knowledge related to the human being and necessary for the design of tools, machines, systems and devices that can be used with maximum comfort, safety and efficiency.

Ergonomics is directly related to the health and safety of the worker, through the adequacy of processes and working conditions, seeking to ensure the highest possible level of comfort and well-being. This concern began to gain greater relevance from the changes in the way workers were perceived within organizations, especially throughout the different industrial revolutions. As Chiavenato (2002) points out, "the more industrialized the society, the more numerous and complex the organizations become, which begin to exert a deep and lasting impact on the lives and quality of life of individuals".

In this context, ergonomics addresses aspects such as lighting, posture, limb and spine positioning, repetitive movements, load handling capacity, temperature, and other physical and organizational factors, which are essential to ensure that the work environment is considered adequate, safe, and healthy.

2.3 WELDING

Welding is a process of permanent joining of materials, predominantly metallic, carried out by means of heating and/or pressure, with or without the addition of filler material. In electrical and electronic applications, welding plays a critical role by directly impacting electrical conductivity, mechanical integrity, and product reliability throughout the life cycle.

From the point of view of technological classification, welding processes can be organized into different groups, depending on the form of heat generation and the joining mechanism:

- Fusion welding: the base metal is fused, with or without filler metal, and the joint is formed after solidification of the metal bath. It is widely used in industry for its versatility and productivity.
- Solid state (pressure) welding: the union occurs without significant melting of the base metal, typically by the application of pressure, and there may be auxiliary heating. It stands out for its high-strength joints and for reducing metallurgical effects associated with melting.
- Resistance welding: heat is generated by the passage of electric current in the region of contact between the parts, combined with pressure. It is common in serial and highly repeatable applications.
- Concentrated energy welding: uses highly concentrated sources (e.g., laser or electron beam), allowing high precision, low thermally affected zone, and strict control of deformations.
- Gas welding (oxygen): uses the heat from the combustion of gases, and is traditionally applied in maintenance, repair and light welding operations.
- Brazing and soft welding: joining processes in which the base metal is not melted; The union occurs by melting the addition metal, with a melting point lower than that of the base metal. Brazing usually takes place above 450 °C, and soft welding below this value.

Historically, welding has accompanied the evolution of metallurgical techniques for centuries, with records of processes such as brazing and forging in different civilizations. Industrial consolidation intensified with the development of controllable energy sources and the use of electric arcs and combustible gases, increasing the precision and reliability of joining processes, especially after the great industrial demands of the twentieth century.

In this early stage of development, welding had limited application, being employed mainly in emergency repairs. Only after the First World War did this process begin to be used more widely and systematically, consolidating itself as an important method of industrial manufacturing. Currently, there are more than fifty distinct welding processes with application in the industrial sector, making it the main means of permanent joining of metals. The relevance of this process is evidenced by its presence in several segments of the industry and by the direct influence that weldability requirements exert on the development of new types of steels and other metal alloys.

In the present work, the focus is on tin immersion (tin bath) soldering, applied to metal terminals of miniaturized transformers. In this method, the previously prepared terminals, including the fluxing step, are immersed in liquid metal alloy for a controlled time, promoting proper wetting and joint formation after solidification. As it is a process that is highly sensitive to variables such as time, depth, and immersion angle, in addition to temperature and bath conditions, automation becomes a determining factor to ensure stability, repeatability, and reduction of defects in the production process.

Figure 5*Welding process*

2.4 AUTOMATION

It is essential to distinguish automation from automation. While the first refers strictly to the mechanization of repetitive movements, characterized as a "blind action" because it lacks the processing of variables, automation is defined as a set of cyber-physical techniques. It enables the creation of active systems capable of processing information from the environment in real time to act with optimal efficiency. In short, automation provides intelligence to the process, allowing the system to make data-driven decisions.

In this context, modern industrial automation operates through computer systems that process signals from various measuring instruments on the factory floor. By confronting this data with optimal parameters (setpoints), the system performs complex mathematical operations in order to generate instantaneous correction signals. As stated by Groover (2011), automation is the technology by which a process or procedure is carried out without human assistance, being executed through an instruction program combined with a control system.

According to Rosário (2005), industrial automation can be categorized into three main types, according to its versatility and production volume:

- **Fixed Automation:** It is characterized by operational rigidity, with little or no adaptability to changes. It is aimed at very high-volume processes and standardized models, where the sequence of operations is fixed by the configuration of the equipment. An example of this is the large-scale SMD insertion processes, where there is no internal variation or change of setup, and the lines are segregated by models due to the impossibility of changing to different processes.
- **Flexible Automation:** It is an evolution of programmable automation, being directed to medium production volumes. Its main feature is the ability to process different product models without wasting time with extensive tool changes or reprogramming, allowing for a varied and simultaneous production mix.

- **Programmable Automation:** It is used in production processes that have high product variability and lower production volumes. In this case, the sequence of operations is controlled by software, and can be changed to different product configurations, although it requires a setup time for the reprogramming and replacement of physical devices.

The evolution of manufacturing systems has been driven by the transition from mass markets to niche markets, where product variability becomes a competitive differentiator. According to Rosário (2005), the need for automation arises not only to increase productivity, but to ensure integrity and repeatability in scenarios where human error is enhanced by the diversity of models and processes.

In contexts of high variability, automation is no longer purely mechanical and becomes a tool for managing complexity. Rosário (2005) argues that fixed automation, although efficient for large volumes, becomes obsolete in the face of the need for customization, since "it is directed to production processes with little or no adaptability to changes" (Rosário, 2005, p. 11).

The implementation of flexible and programmable systems is justified by the ability to process different product configurations with minimal physical intervention. As the author points out:

"Flexible automation is an extension of programmable automation. [...] A flexible automation system is one capable of producing a variety of products (or parts) with reduced setup times, allowing the production of different models on the same assembly line." (Rosário, 2005).

Thus, the variability of products requires automation to be equipped with intelligent control systems and embedded software capable of recognizing and adjusting parameters autonomously. This transition to flexible automation minimizes losses from batch changes (setups) and reduces the incidence of critical failures, such as electrical insulation or structural integrity, which tend to occur more frequently when the process relies solely on memory and operator manual action in the face of multiple models.

In short, automation in high-variability environments is not just a technical choice, but a strategic necessity to enable throughput and regulatory compliance in modern production systems.

3 METHODOLOGY

The present research is characterized as applied and technological, as it is oriented to the solution of a real manufacturing problem and involves the development and evaluation of a prototype of industrial automation. As for the objectives, this is a descriptive and explanatory study, as it describes the immersion welding process currently used and explains the effects of automation on critical safety, stability, and performance variables (GIL, 2019).

Regarding the approach, a mixed design (qualitative-quantitative) is adopted, integrating qualitative evidence (mapping of occupational risks and compliance with safety requirements) and quantitative evidence (cycle time measurements, productivity indicators and quality metrics), a strategy recommended when seeking a more comprehensive understanding of the phenomenon by combining different types of data (CRESWELL; CLARK PLAN, 2017).

As a technical procedure, the work is configured as a case study in an industrial environment, suitable when investigating contemporary phenomena in the real context and intending to understand "how" and "why" process changes produce certain effects (YIN, 2018). The validation of prototype performance follows a comparative before-after logic (semi-automatic process versus automated prototype), incorporating chronoanalysis/study of times for estimates and comparison of standard time and cycle time (BARNES, 1977).

The evaluation of the performance of the automated system is carried out through a direct comparison between the semi-automatic process and the automated model, considering operational and productive indicators extracted from the equipment's own control system. The analysis includes variables such as cycle time, process stability, incidence of defects and operational availability, data that are automatically collected by the on-board software and made available for monitoring through the CMES system. To consolidate the overall performance of the equipment, the Overall Equipment Effectiveness (OEE) indicator is adopted, widely used in the industry for the integrated measurement of availability, performance and quality (NAKAJIMA, 1988).

3.1 DIAGNOSIS OF THE NON-AUTOMATED PROCESS

The production process under study is a fundamental stage in the manufacture of cell phone chargers, focusing specifically on the welding of the terminals of a critical component: the transformer. This operation is technically called immersion welding, or "tin bath", and consists of submitting the terminals to the metal in a liquid state to promote the metallurgical union. To ensure joint quality and integrity, strict control of fluid temperature, immersion height accuracy, and alloy purity is imperative, as the presence of contaminants compromises conductive properties and process adhesion.

The current method for welding the terminals is based on a semi-automatic system with a high dependence on manual intervention and low ergonomic efficiency. The operational flow begins with the preparation of the fixing rod, which requires the manual application of adhesive tapes (double-sided and crepe) to support the components. After positioning the transformers with the pins vertically oriented, the terminals are subjected to fluxing, a process that requires frequent renewal of the chemical input every two tray cycles to ensure adequate deoxidation of the surfaces.

Figure 6

Comparative analysis of the morphology of the terminals: (A) Pre-welded in natura state and (B) Metal interface after the immersion tinning process

Source: RD&I Technical Report – B&Z International (2022).

The critical welding step takes place by means of manual activation, after coupling the rod to the traction device. The process requires two consecutive immersion cycles in the molten tin alloy, with tightly established contact times of between 2.2 and 2.6 seconds. The second dip presents an additional technical complexity, as it must selectively target the Tex-E yarn. At the end of the immersion, a detailed visual inspection is carried out to validate the integrity of the welding and certify the absence of thermal degradation in the insulators or fasteners.

This flow is characterized by constant setup maintenance, requiring the replacement of the masking tape every 15 or 20 cycles, a frequency that varies according to the temperature and saturation of the flow. In the event of anomalies in the primary welding, the

components are segregated to a rework line with adjusted parameters, immersion times between 1.0 and 2.0 seconds and temperatures between 350°C and 370°C. The persistence of failures after this intervention results in definitive disposal (scrap), evidencing a manufacturing model with a high incidence of human manipulation and latent productivity bottlenecks.

Figure 7

Flow of transformer assembly activity on dip rulers.

Source: RD&I Technical Report – B&Z International (2022).

Figure 8

Process of immersion of the transformers in the solder bath

Source: RD&I Technical Report – B&Z International (2022).

The analysis of this scenario reveals a matrix of critical risks to the physical integrity and occupational health of operators in the long term. The preponderant risk factor lies in the inhalation of metallic fumes composed of ultrafine particles (0.01 to 1µm) that, due to their small size, cross the barriers of the respiratory system. The toxicity of these effluents is potentiated by elements such as hexavalent chromium Cr(VI), manganese and nickel. According to Nederman technical data, continuous exposure to these agents is associated with severe pathologies, including systemic neoplasms, neurological damage, occupational asthma and other lung diseases.

In addition to the chemical risk, manual operation imposes immediate physical dangers, since the welding crucible operates at constant temperatures between 350°C and

370°C. This condition subjects the worker to intense thermal radiation, resulting in acute discomfort and early fatigue, factors that exponentially increase the probability of accidents and serious burns during the handling of the dipstick. From the perspective of production efficiency, the current model suffers from chronic instabilities in the repeatability and reproducibility of the process, since the control of fundamental variables, such as immersion time, depth and angle of attack, depends exclusively on the dexterity and physical resistance of the operator. The absence of digital records and the dependence on analog methods for monitoring make it difficult to manage performance and favor handling errors that compromise the final quality of the product. In view of this scenario, the automation of the process via the AUTO SOLDERING project presents itself as an imperative measure to ensure the biosafety and technical stability required by modern manufacturing.

The diagnosis of the current process revealed critical instabilities in the repeatability and reproducibility of the welding, mainly due to the manual variation of the immersion time and angle. In addition, the direct exposure of operators to metal fumes and high temperatures was identified, reinforcing the need for an automated solution in compliance with NR-12 and ergonomics standards.

3.2 DETAILING OF THE AUTOMATED MODEL WITH EMBEDDED INTELLIGENCE AND CONTROL MECHANISMS

The proposed solution consists of a prototype of integral automation with embedded software, designed to manage the production cadence through real-time monitoring. The transition to the fully automated model eliminates the need for direct operator intervention in critical steps, substantially reducing the risks of occupational diseases and accidents. The technological scope of the system includes:

- **Product Life Cycle Automation:** The prototype performs the automatic insertion, handling and transport of transformers through customized pick and place systems, ensuring continuous production online.
- **Intelligent Treatment and Welding:** Includes automatic cleaning of terminals in flux tanks and immersion welding with strict control of bath height, angle and depth.
- **Safety and Biosecurity:** Implementation of an independent exhaust system to capture metal fumes at the source and compliance with NR-12 for operation in a zero-risk environment.
- **Digital Integration (Smart Manufacturing):** Collection of production indexes and equipment status for export via XML files, allowing direct integration with the company's CMES system.

Figure 9*Concept of the prototype*

Source: RD&I Technical Report – B&Z International (2022).

The prototype was conceived from digital modeling elaborated in the SolidWorks software. In the construction phase, the mechanical structure was initially assembled and then the manipulation, transport, control and power devices were integrated, including sensors, actuators, PLC, pneumatic cylinders, among other components necessary for the operation of the system.

Figure 10*Module development*

Source: RD&I Technical Report – B&Z International (2022).

The storage and control system of the flux and solder in the respective tanks was developed independently, depending on the technical particularities of each application. The resin-coated flow tank is intended for cleaning terminals, made of titanium alloy, and has been subjected to use and reliability tests.

Figure 11

Welding tank

Source: RD&I Technical Report – B&Z International (2022).

The main purpose of the use of solder flux is to facilitate the welding process, promoting the removal of oxides and impurities, in addition to improving the wettability of the metal surface. According to Frank et al. (1981), the welding flux can be composed of a non-reactive mixture, containing activators with at least one halogen atom, destabilizing components and acidic surfactants, such as polybasic carboxylic acids, their hydroxylated derivatives, acetoacids or combinations of these agents, whose function is to optimize the performance of the process.

Figure 12

Flow circulation tank (fluxer)

Source: RD&I Technical Report – B&Z International (2022).

To ensure that the chemical compound was kept in optimal operating conditions, especially in terms of temperature, wave height and applied volume, a system with a recirculation pump was designed, responsible for regulating the formation of the wave during

the cleaning process. Such a solution avoids the alteration of the viscosity of the flow, preventing its paste-like consistency, and allows the controlled adjustment of the operating parameters, ensuring stability and quality to the developed cleaning system.

Figure 13

Weld volume level sensor

Source: RD&I Technical Report – B&Z International (2022).

One of the main solutions used in the system was the welding wave height sensor, developed from research carried out, a system was established (described in figure 14) that starts when the tungsten probe touches the surface of the liquid weld, this potential of 0V is transferred to the input of the solid state relay, which results in energization of the coil. At this moment, the contact of the solid-state relay switches, transferring the potential of 0V to the x11 terminal of the PLC. When the PLC detects the signal in x11, its internal program reads the height on the Z-axis encoder. The height read on the encoder is the weld level used as a reference in the welding process.

3.2.1 Software Architecture

The core of the system was developed in the C and C++ languages, using an architecture that processes field variables in milliseconds. The innovative differential lies in the implementation of an Artificial Intelligence that performs autonomous decision-making on the depth of immersion.

Through mathematical calculations processed by the computer, the system checks the volume of material available in the tanks and dynamically adjusts the position of the robotic arm. This mechanism automatically compensates for tin and flux consumption, ensuring that the level of contact with the terminals remains constant regardless of the amount of material in the crucible. In addition, the software calculates and makes available OEE, monitoring temperature, speed and defect indexes, demonstrating them in an intuitive human-machine interface (HMI) for technical supervision.

3.2.2 Incremental Innovation and Industrial Customization

Due to the lack of "off-the-shelf" solutions for the manufacture of miniaturized transformers, a market restricted to proprietary designs, the project represents an incremental process innovation. The equipment was designed with interchangeable accessories, allowing flexibility for future product design adjustments, aligning the robustness of fixed automation with the versatility of flexible automation, as recommended by Rosário (2005).

Table 1

The Human Machine Interface (HMI) used in the system was the WEINVIEW MT6071iP model. The programming was carried out in the EasyBuilder Pro software, in which the application files were developed, the operating parameters were defined and the communication devices were configured. The integration with the PLC used in the application was established through the parameterization of communication protocols, allowing the monitoring and management of movements and system functions in real time.

Figure 19

Interface requirements

Source: RD&I Technical Report – B&Z International (2022).

Based on the previously established requirements, the graphical interfaces of the system were elaborated, using the resources of the Drawing Tools library of EasyBuilder Pro. In this stage, elements such as buttons, light indicators, text fields, labels, images and tables were inserted and configured, organized in the project files in the extensions ".exob" and ".cxob", which make up the visual and functional structure of the HMI.

3.2.3 Negative Scope and Restrictions

To ensure the focus on the central objective of safety and welding quality, the project delimits that the following functionalities will not be contemplated: automatic identification of product change via code reading; direct integration with ERP (maintaining only the provision of data to the CMES via XML); and purely cosmetic or mechanical quality inspections outside the scope of the welded joint.

3.3 METHODOLOGY FOR THE QUALI-QUANTITATIVE STUDY BETWEEN THE MODELS

For the validation of the technological transition, this research adopts a mixed methodological approach, based on a quali-quantitative study that confronts the current scenario (semi-automatic) with the developed prototype (AUTO SOLDERING). The objective is to measure the impact of automation on the mitigation of occupational risks and the increase of production efficiency.

3.3.1 Qualitative Procedures (Health and Safety)

Qualitative analysis focuses on the assessment of biosafety and regulatory compliance. The methodology consists of mapping the risks of exposure to metal fumes and thermal irradiation (350°C - 370°C), based on the particle toxicity parameters (0.01-1µm) described in Nederman's technical literature. The effectiveness of the prototype is validated by the complete elimination of human interaction at the welding point, replacing manual handling with pick and place systems and independent exhaust, aiming to achieve the goal of zero accidents and absences.

3.3.2 Quantitative Procedures (Performance and Reliability)

The quantitative aspect uses chronoanalysis and comparison of operational indicators to evaluate productivity and quality between the semi-automatic process and the automated model (BARNES, 1977). The data collection follows the following criteria:

Evaluation of the stability and operational repeatability of the process by monitoring the critical parameters (time, depth and immersion angle), comparing the variation observed

in the manual model with the variation obtained in the automated system. While the manual model depends on the operator's skill, the automated model uses embedded intelligence (ANI), implemented in C/C++, to calculate and adjust the depth and angle of immersion in real time, compensating for variations in the process throughout the production cycle.

Overall Equipment Effectiveness (OEE): Automatic data collection via software, integrating cycle time, availability, and defect rate information directly into the company's CMES system via XML files.

Technical Parameters: Comparative monitoring of thermal stability and immersion time (set at 2.2s ~ 2.6s), evaluating the percentage of scrap reduction after rework.

3.3.3 Innovation Validation Framework

Given that there are no standardized "off-the-shelf" solutions for the specific design of the company's transformers, the development methodology follows the concept of incremental innovation. Validation occurs by verifying the system's ability to automatically adjust to the volume of molten tin and the cleanliness of the terminals, ensuring that the immersion soldering technology achieves the levels of precision required by high-scale manufacturing.

4 RESULTS AND DISCUSSIONS

The implementation of the AUTO SOLDERING project resulted in the development of a functional prototype of an automated tin immersion soldering station applied to the terminals of transformer coils used in mobile phone chargers. The results obtained were evaluated from the perspectives of occupational health and safety, process stability, production efficiency and welding quality, according to the objectives established in the project's work plan.

From the point of view of biosafety, the main evidence of the result was the total elimination of the operator's direct interaction with the weld bath, which operates at temperatures between 350 °C and 370 °C. The automated system integrated pick and place mechanisms, dedicated metal fume exhaust and enclosure as per the requirements of NR-12, completely mitigating the risks associated with inhaling ultrafine particles (0.01–1 µm) containing elements such as hexavalent chromium, manganese and nickel. In this way, the projected indicators of zero work accidents, zero absences and zero occurrence of occupational diseases became technically achievable, significantly surpassing the scenario of the semi-automatic process previously used.

The integral automation of the cycle, insertion, cleaning, welding and transfer of the components, allowed continuous operation in an online regime, meeting the critical requirement of production time of approximately 2.86 seconds per part, through the collective welding of multiple transformers simultaneously.

Source: RD&I Technical Report – B&Z International (2022).

The quality of the final product also showed significant gains. Reduced manual handling minimized thermal damage to insulators, weld wetting failures, and defects associated with rework. As a consequence, the project projects an improvement in welding quality of around 30%, directly reflecting on the reduction of scrap and the increase in the reliability of the component delivered to the subsequent stages of the production line. In addition, the automatic collection of production data enabled the continuous monitoring of indicators such as OEE, cycle time, stoppages and defect rates, allowing integration with the company's CMES system through XML files.

From the perspective of industrial innovation, the results confirm the character of incremental process innovation of the AUTO SOLDERING project. The lack of standardized "off-the-shelf" solutions for the automated welding of miniaturized transformers required the development of a customized solution, with interchangeable accessories and flexible architecture. This characteristic ensures the adaptability of the system to future variations in

product design, reconciling the robustness of fixed automation with the versatility of flexible automation, as recommended in the classic literature of industrial automation.

5 CONCLUSION

The development of the AUTO SOLDERING project has proven to be a technically and industrially viable solution for the automation of the tin immersion soldering process of transformer coil terminals applied to the manufacture of mobile phone chargers. The transition from the semi-automatic model to a fully automated system showed significant gains in occupational safety, process stability, production efficiency and quality of the final product.

The results obtained confirm that the elimination of human intervention in the critical stages of the process not only effectively reduces the risks of accidents and occupational diseases, but also contributes to the standardization of welding, ensuring high levels of repeatability and reproducibility. The use of embedded intelligence for real-time decision making proved to be fundamental for the dynamic control of process variables, automatically compensating for variations in weld volume and flux, and ensuring the metallurgical integrity of the welded joints.

In addition, the ability to collect and make available productive data in real time positions the AUTO SOLDERING system in line with the principles of industry 4.0, by allowing integration with corporate manufacturing systems and management based on performance indicators. This characteristic expands the potential of the equipment not only as an operational solution, but as a strategic tool to support industrial decision-making.

Finally, it is concluded that the project represents an applied incremental innovation, capable of raising the technological level of the production process without the need for complex restructuring of the industrial plant. The solution developed contributes to the modernization of electronic manufacturing, promoting a safer, more efficient and sustainable work environment, in addition to serving as a reference for future applications of intelligent automation in critical industrial processes.

ACKNOWLEDGMENTS

The authors would like to thank B&Z International for the design and execution of the RD&I project that served as the basis for this study, carried out in partnership with a company from the Manaus Industrial Complex. The support for the technical analysis, theoretical

systematization and preparation of this scientific publication was provided by the Institute of Innovation and Technology of the Amazon (IITA).

ABSTRACT

The homeless population represents one of the most complex social phenomena in contemporary societies, resulting from structural processes of social exclusion, economic inequality and the weakening of family and community ties. This article analyzes the Lages Recupera Program, a municipal public policy aimed at sheltering, assisted transition and socioeconomic reintegration of the homeless population in the city of Lages, Santa Catarina, Brazil. The study adopts a qualitative approach based on literature review, normative analysis and a case study of a municipal public policy. The theoretical framework incorporates contributions from Lenio Streck, Pedro Serrano, Paulo Freire, Moacir Gadotti, José Carlos Libâneo, Selma Garrido Pimenta and Slavoj Žižek, as well as institutional data from IBGE and IPEA. The findings indicate that integrated public policies combining assisted housing, psychosocial support, professional training and productive inclusion have greater potential to reduce homelessness and promote human dignity. The study concludes that the Lages Recupera Program represents an important instrument for sustainable human development aligned with the Brazilian Constitution of 1988, human rights principles and the Sustainable Development Goals of the United Nations 2030 Agenda.

Keywords: Public Policies. Homelessness. Human Rights. Social Inclusion. Sustainable Development.

RESUMO

A população em situação de rua constitui um dos fenômenos sociais mais complexos das sociedades contemporâneas, resultante de processos estruturais de exclusão social, desigualdade econômica e fragilização de vínculos familiares e comunitários. O presente artigo analisa o Programa Lages Recupera, política pública municipal voltada ao acolhimento, transição assistida e reinserção socioeconômica da população em situação de

RESUMEN

La población sin hogar constituye uno de los fenómenos sociales más complejos de las sociedades contemporáneas, resultado de procesos estructurales de exclusión social, desigualdad económica y debilitamiento de los lazos familiares y comunitarios. Este artículo analiza el Programa Lages Recupera, una política pública municipal orientada a la acogida, la transición asistida y la reintegración socioeconómica de la población sin hogar en el municipio de Lages, Santa Catarina. El estudio adopta un enfoque cualitativo, basado en una revisión bibliográfica, un análisis normativo y un estudio de caso de política pública municipal. La investigación se fundamenta en los marcos teóricos de Lenio Streck, Pedro Serrano, Paulo Freire, Moacir Gadotti, José Carlos Libâneo, Selma Garrido Pimenta y Slavoj Žižek, además de datos institucionales del IBGE y el IPEA. Los resultados indican que las políticas públicas integradas que combinan vivienda asistida, apoyo psicossocial, formación profesional e inclusión productiva tienen un mayor potencial para reducir la población sin hogar y promover la dignidad humana. Se concluye que el Programa Lages Recupera constituye un instrumento relevante para el desarrollo humano sostenible, en consonancia con la Constitución de 1988, los derechos humanos y los Objetivos de Desarrollo Sostenible de la Agenda 2030.

Palabras clave: Políticas Públicas. Población Sin Hogar. Derechos Humanos. Inclusión Social. Desarrollo Sostenible.

1 INTRODUCTION

The homeless population is a multifactorial social phenomenon that reflects the deep socioeconomic inequalities present in contemporary societies. This phenomenon results from the combination of structural factors such as unemployment, job insecurity, chemical dependency, mental disorders, rupture of family ties and absence of effective housing policies.

In Brazil, recent data indicate significant growth in this population in recent decades. Surveys based on the Unified Registry indicate that the number of homeless people in the country exceeds 260 thousand individuals, revealing a trend of expansion of this population group in several urban regions.

In the state of Santa Catarina, the situation is also worsening. Recent studies indicate that the number of people living on the streets went from 5,678 in 2021 to approximately 9,989 in 2023, representing a growth of about 76% in two years.

In the municipality of Lages, located in the Serra Catarinense, estimates point to approximately 397 homeless people, placing the municipality among the ten with the highest absolute number in the state.

The scenario becomes even more critical due to the climatic conditions of the region, characterized by harsh winters, often with temperatures close to or below 0°C. In these circumstances, the absence of shelter and adequate public policies significantly increases the risks of illness and mortality of the homeless population.

The 1988 Constitution of the Federative Republic of Brazil, often referred to as the Citizen Constitution, established a model of State committed to the promotion of human dignity, social justice and the reduction of inequalities. In this sense, the realization of social rights requires the implementation of structured public policies capable of guaranteeing housing, health, social assistance and productive inclusion.

This article aims to analyze the Lages Recupera Program, a municipal public policy aimed at the social reintegration of the homeless population, evaluating its legal, social and institutional foundation.

2 METHODOLOGY

The present research is characterized as a qualitative study of exploratory and descriptive nature, based on bibliographic, documentary and normative analysis.

The investigation was structured in three main stages: Bibliographic review, involving classic works in the areas of constitutional law, public policies and education.

Documentary and normative analysis, with examination of the Federal Constitution of 1988, Decree No. 7,053/2009 (National Policy for the Homeless Population) and institutional documents produced by public agencies such as IBGE and IPEA.

This is a case study, centered on the analysis of the proposal of the Lages Recupera Program as a municipal public policy aimed at the socioeconomic reintegration of the homeless population.

The approach adopted allows us to understand the phenomenon of homelessness in its social and institutional complexity, articulating legal, economic and educational dimensions.

3 THEORETICAL FOUNDATION

3.1 1988 CONSTITUTION AND THE EFFECTIVENESS OF FUNDAMENTAL RIGHTS

The Brazilian Constitution of 1988 established a new legal paradigm based on the centrality of the dignity of the human person and the guarantee of social rights.

In this sense, Lenio Streck points out that the Constitution has a normative and directing character:

The Constitution is not a letter of intent. It establishes normative commitments that bind the State and society, imposing the realization of fundamental rights as a condition for the legitimacy of the democratic State itself. (Streck, 2017, p. 89)

Public policies aimed at the homeless population must be understood as instruments of constitutional implementation.

Pedro Serrano complements this perspective by stating that the effectiveness of fundamental rights depends on the concrete action of the State in reducing social inequalities.

3.2 EDUCATION, SOCIAL EMANCIPATION AND INCLUSION

The social reintegration of the homeless population requires public policies that promote autonomy and human emancipation.

The thinker and educator, Paulo Freire states: "Education does not transform the world. Education changes people. People transform the world." (Freire, 1996, p. 67).

Freire's perspective emphasizes that educational processes must contribute to the reconstruction of autonomy and human dignity.

Moacir Gadotti reinforces this view by highlighting the transformative role of education: "Education committed to human emancipation needs to be linked to the construction of a more just, democratic and solidary society." (Gadotti, 2003, p. 54).

Public policies for social inclusion must articulate education, work and citizenship.

3.3 SOCIAL EXCLUSION AND CONTEMPORARY CRITICISM

Extreme social exclusion can also be analyzed in the light of contemporary critical theory.

Slavoj Žižek observes that: "The most profound violence in contemporary societies is not only visible violence, but that which manifests itself in the social structures that produce exclusion and invisibility." (Žižek, 2014, p. 22).

The perspective shows that homelessness cannot be understood only as an individual problem, but as a result of exclusionary social structures.

4 THE LAGES RECUPERA PROGRAM

The Lages Recupera Program proposes a municipal public policy structured in three central axes:

- housing reception;
- psychosocial recovery;
- socioeconomic reintegration;

4.1 HOUSE OF THE NEW BEGINNING

The Casa do Recomeço is an assisted transition center for the reception of the homeless population.

The program adopts principles inspired by the international model Housing First⁶, which establishes housing as an initial condition for social reintegration.

4.2 PSYCHOSOCIAL RECOVERY CENTER

The program provides care by a multidisciplinary team composed of psychologists, social workers and occupational therapists.

The objective is to promote emotional recovery, strengthen autonomy and rebuild social bonds.

⁶ The Housing First model is a public policy approach that originated in the United States in the 1990s, especially from the experiences developed by Sam Tsemberis, which proposes the immediate offer of permanent housing to homeless people as a starting point in the process of social reintegration. Unlike traditional models of care, which condition access to housing to the prior overcoming of problems such as chemical dependency or unemployment, Housing First is based on the assumption that housing stability is a fundamental condition for individuals to be able to later face other social vulnerabilities, such as mental health, professional qualification, and insertion in the labor market. International studies indicate that this approach presents high rates of permanence in housing and improvement of the living conditions of the beneficiaries (TSSEMBERIS, 2010).

4.3 SCHOOL OF MOUNTAIN CRAFTS

Another strategic axis of the program consists of professional training focused on the regional economy.

The timber sector, traditional in the Lages region, is a relevant opportunity for income generation and productive inclusion through the circular economy.

5 EXPECTED OUTCOMES AND IMPACTS

Among the main results expected from the program are:

- a 40% reduction in the homeless population in 24 months;
- insertion of 60% of the beneficiaries in the labor market;
- reduction of hospital admissions associated with exposure to cold;
- strengthening urban social cohesion.

6 FINAL CONSIDERATIONS

The homeless population is one of the greatest social challenges faced by Brazilian cities. This is a structural phenomenon that requires integrated and sustainable public policies.

The analysis carried out demonstrates that the Lages Recupera Program has a consistent legal, social and institutional foundation, aligned with the principles of the 1988 Constitution, human rights and the Sustainable Development Goals of the 2030 Agenda.

By articulating decent housing, psychosocial monitoring, professional qualification and productive inclusion, the program establishes an innovative model of social reintegration and promotion of human dignity.

ABSTRACT

This article analyzes the phenomenon of welfare assistance within the context of Brazilian public policies, discussing its relationship with social assistance, the role of the State, and its social and economic impacts. The study begins by distinguishing between welfare assistance and social assistance, highlighting that the former has an emergency and palliative character, whereas social assistance constitutes a right guaranteed by the 1988 Brazilian Constitution and is part of the social security system. The research is exploratory and bibliographical in nature, based on theoretical contributions from sociology, political economy, and social theory, as well as the analysis of public policies implemented in Brazil, such as conditional cash transfer programs and the Unified Health System. Institutional data and local experiences in social policy are also discussed, including references to the municipality of Lages, Santa Catarina. The results indicate that although income transfer programs contribute to reducing poverty and social vulnerability, their effectiveness depends on their articulation with structural policies related to economic development, education, and productive inclusion. It is concluded that public policies based on social rights can play an important role in promoting citizenship and reducing social inequalities.

Keywords: Welfare Assistance. Public Policies. Social Assistance. Social Inequality. Citizenship.

RESUMO

O presente artigo analisa o fenômeno do assistencialismo no contexto das políticas públicas brasileiras, discutindo sua relação com a assistência social, o papel do Estado e seus impactos sociais e econômicos. Parte-se da distinção conceitual entre assistencialismo e assistência social, destacando que o primeiro possui caráter emergencial e paliativo, enquanto a assistência social constitui direito garantido pela Constituição Federal de 1988 e integra o sistema de seguridade social. A pesquisa possui natureza exploratória e bibliográfica, fundamentada em autores das áreas da sociologia, economia política e teoria social, além da análise de políticas públicas implementadas no Brasil, como programas de

RESUMEN

Este artículo analiza el fenómeno de la asistencia social en el contexto de las políticas públicas brasileñas, discutiendo su relación con la asistencia social, el papel del Estado y sus impactos socioeconómicos. Comienza con la distinción conceptual entre asistencia social y asistencia social, destacando que la primera tiene un carácter de emergencia y paliativo, mientras que la asistencia social constituye un derecho garantizado por la Constitución Federal de 1988 y forma parte del sistema de seguridad social. La investigación es de carácter exploratorio y bibliográfico, basada en autores de los campos de la sociología, la economía política y la teoría social, además del análisis de políticas públicas implementadas en Brasil, como los programas de transferencia de ingresos y el Sistema Único de Salud. También se discuten datos institucionales y experiencias de políticas sociales a nivel municipal, con referencia al municipio de Lages (SC). Los resultados indican que, si bien los programas de transferencia de ingresos contribuyen a la reducción de la pobreza y la vulnerabilidad social, su efectividad depende de su articulación con políticas estructurales de desarrollo económico, educación e inclusión productiva. Las políticas públicas basadas en derechos sociales pueden desempeñar un papel relevante en la promoción de la ciudadanía y la reducción de las desigualdades sociales.

1 INTRODUCTION

The debate about welfare in Brazilian public policies has acquired increasing relevance in the field of social, legal and economic sciences, especially in view of the expansion of income transfer and social protection programs in recent decades. Such policies are often aimed at socially vulnerable groups, such as homeless people, unemployed individuals, and families without access to formal income, seeking to reduce conditions of poverty, inequality, and social exclusion.

It is essential to understand the distinctions between social assistance and assistance. While social assistance is a right guaranteed by the Federal Constitution of 1988 and is part of the Brazilian social security system, welfare is usually associated with specific aid practices that do not necessarily address the structural causes of social inequality. The distinction has been widely debated in the academic literature, especially with regard to the effects of these policies on the promotion of citizenship, the expansion of access to rights, and the construction of more equitable conditions for social development.

The expansion of public income transfer policies, although recognized for their ability to reduce extreme levels of poverty and expand access to basic rights, also raises criticisms related to the possibility of generating social dependence or discouraging productive insertion. In this sense, part of the literature argues that such programs should be articulated with broader strategies for economic inclusion, professional qualification, and strengthening of the autonomy of individuals, avoiding that they are merely palliative mechanisms in confronting structural inequalities.

This article aims to analyze the phenomenon of welfare in the context of Brazilian public policies, discussing its limits and potentialities in confronting social inequalities. It seeks to examine the relationship between social assistance, state action and the social and economic impacts of these policies, also considering the criticisms directed at welfare practices and their possible effects on the reproduction of historical structures of dependence and social exclusion.

The debate raises the hypothesis that public policies for income transfer in Brazil should not be understood exclusively as welfare practices. When structured as State policies and articulated with broader strategies for social inclusion, professional qualification, and economic development, such policies can contribute significantly to the reduction of social inequalities, to the expansion of access to fundamental rights, and to the strengthening of the human capacities of individuals.

The discussion becomes particularly relevant in a scenario marked by deep social inequalities and the growing demand for social protection mechanisms. In this sense, the

proposed reflection dialogues with theoretical contributions that problematize the limits of practices based exclusively on immediate care, highlighting the need for public policies guided by the promotion of autonomy, citizenship and social participation.

Paulo Freire's thought contributes to understanding that overcoming conditions of oppression and social exclusion is not achieved only through the granting of material benefits, but requires processes of awareness and social transformation. As the author points out:

The assistentialist practice, when disconnected from processes of awareness and social emancipation, tends to reinforce the dependence of the subjects. The liberation of individuals is not achieved by the simple granting of benefits, but by the creation of conditions that allow the oppressed to understand and transform the social reality in which they live. (Freire, 1996, p. 67).

Understanding the role of public policies in confronting poverty and promoting citizenship becomes fundamental to assess whether such initiatives contribute to the construction of emancipatory processes or end up reproducing, albeit indirectly, historical structures of inequality and social exclusion.

1.1 METHODOLOGY

The present research is characterized as an exploratory and bibliographic study, based on the analysis of classic and contemporary works in the areas of law, economics, sociology and political philosophy.

The method adopted consists of a literature review, with interpretative analysis of authors who discuss social inequality, public policies and the role of the State. The theoretical approach allows us to understand assistentialism from different analytical perspectives.

According to José Carlos Libâneo:

Bibliographic research is a fundamental stage of scientific production, as it allows the researcher to situate his object of study within a broader field of theoretical and conceptual debates. By analyzing different authors, the researcher identifies convergences, divergences, and gaps that contribute to the advancement of scientific knowledge. (Libâneo, 2013, p. 52).

The readings of references support the article with theoretical analysis and statistical data, institutional reports on social assistance programs in Brazil, especially those related to income transfer policies and social protection systems.

1.2 LITERATURE REVIEW

The analysis of Brazilian public policies demonstrates that social protection programs cannot be understood only from the perspective of welfare. Unlike specific care practices, many of these policies are structured as social rights institutionally guaranteed by the State.

The most relevant examples are the Bolsa Família Program, considered one of the main income transfer policies implemented in the country in recent decades. Studies carried out by the Institute of Applied Economic Research (IPEA) indicate that programs of this nature produce significant effects on poverty reduction and local economic dynamism. "Income transfer programs have an important multiplier effect on the economy, as the resources destined to low-income families quickly return to the economic circuit through consumption." (IPEA, 2013, p. 31).

The programs have a relevant social impact, especially when associated with education, economy and health policies. The conditionalities linked to school attendance and health monitoring demonstrate that the policy seeks to act on structural factors related to poverty. "The Bolsa Família Program is part of a broader strategy to combat poverty that articulates income transfer with access to essential public services." (Campello; Falcão, 2014, p. 54).

Another example of structuring public policy in Brazil is the Unified Health System (SUS), established by the Federal Constitution of 1988 and based on the principles of universality, integrality and equity. "The Unified Health System is one of the most important social achievements of the 1988 Constitution." (Paim, 2015, p. 37).

The SUS expands access to health and also plays an important role in economic development, by moving the health industrial complex and encouraging scientific production. "The Unified Health System should not be understood only as public spending, but as a strategic investment for national development." (Campos, 2007, p. 112).

The analysis of Brazilian public policies shows that social protection programs can play an important role in reducing social inequalities and promoting citizenship, as long as they are structured as social rights and articulated with broader strategies for economic and social development.

2 WELFARE

The concept of welfare refers to social practices aimed at offering immediate help to individuals or groups in situations of social vulnerability, especially those affected by poverty, unemployment or social exclusion. Although such actions can alleviate urgent needs, they

are often palliative, as they do not address the structural causes that produce social inequalities.

Historically, welfare has been associated with practices of charity or social paternalism. As Boschi (1984) observes, these actions are often related to the philanthropic tradition and the logic of punctual help, which does not necessarily promote lasting processes of social inclusion. In this sense, Paiva and Ouriques argue that: "[...] in Brazil, the logic of crumbs sets the tone for social policies, marked by fragmented actions and incapable of promoting structural changes in the living conditions of the poorest population." (Paiva; Ouriques, 2006, p. 173).

However, it is necessary to differentiate traditional welfare from contemporary public policies of social protection. From the Federal Constitution of 1988, several policies began to be structured as social rights guaranteed by the State, integrating the Brazilian social security system.

Income transfer programs have gained relevance as instruments to combat poverty. Among them, the Bolsa Família Program stands out, widely analyzed by researchers and international organizations. Studies indicate that programs of this nature have a relevant impact on reducing poverty and stimulating the local economy.

Research by the Institute of Applied Economic Research (IPEA) shows that the resources transferred to low-income families quickly return to the economic circuit through consumption. "Income transfer programs have an important multiplier effect on the economy, as the resources destined to low-income families quickly return to the economic circuit through consumption." (IPEA, 2013, p. 31).

The economic impact is very important and social dimension policies are significantly added, especially when associated with public education and health services. In this sense, the Unified Health System (SUS) is one of the main pillars of Brazilian social policy.

The Federal Constitution establishes that: "Health is a right of all and a duty of the State, guaranteed through social and economic policies aimed at reducing the risk of disease and other health problems and universal and equal access to actions and services." (Brasil, 1988, p. 118).

According to Paim (2015), the SUS represents one of the most important social achievements of the Brazilian redemocratization, by guaranteeing universal access to health services.

The Unified Health System is one of the greatest social achievements of the 1988 Constitution, as it instituted a health care model based on the principles of universality, comprehensiveness and equity. It is a structuring public policy that significantly

expanded the population's access to health services and consolidated health as a right of citizenship and responsibility of the State. In this sense, the SUS represents not only a system of service provision, but also a civilizing project committed to the reduction of social inequalities and the promotion of social justice in Brazil. (Paim, 2015, p. 32).

The system also has an economic impact parallel to the social one in a relevant way by mobilizing a broad productive complex linked to the health area. Demonstrated by Campos 2007:

The Brazilian public health system should not only be understood as a social policy to serve the population, but also as an important inducer of economic development. The SUS mobilizes complex production chains that involve pharmaceutical industries, medical equipment, specialized services and scientific production. Thus, the public health system constitutes a relevant component of the national economy, articulating social policies and development policies. (Campos, 2007, p. 115).

Research by Rego and Pinzani (2013) also indicates that income transfer programs do not produce generalized social dependence. On the contrary, they can contribute to expanding the autonomy of beneficiary families and strengthening social participation.

Contrary to the argument often used by critics of cash transfer policies, our empirical research demonstrates that the beneficiaries of these programs do not tend to be accommodating or permanently dependent on the state. On the contrary, income transfer programs can contribute to expanding the autonomy of individuals and strengthening their capacity for social participation, to the extent that they provide minimum conditions of material security necessary for the exercise of citizenship. (Rego; Pinzani, 2013, p. 147)

Relevant aspects of the expansion of autonomy refer to the so-called social conditionalities, such as the requirement of school attendance and monitoring of children's health. According to Campello and Falcão (2014), such mechanisms seek to act on structural factors related to the reproduction of poverty.

The conditionalities associated with income transfer programs do not have a punitive character, but constitute instruments of articulation between different public policies. By requiring school attendance and monitoring of children's health, these programs seek to act on structural factors responsible for the intergenerational reproduction of poverty, simultaneously promoting social inclusion, expanding opportunities and strengthening the human capital of beneficiary families. (Campello; Falcão, 2014, p. 63).

Public policies for income transfer can function as instruments of social protection and promotion of citizenship, especially when articulated with broader strategies for economic development and social inclusion.

2.1 SOCIAL ASSISTANCE AS A PUBLIC POLICY

Social assistance is one of the policies that is part of Brazilian social security, along with health and social security. Unlike welfare, this policy is based on principles of universality, social protection and guarantee of rights.

The regulation occurred with the creation of the Organic Law of Social Assistance – LOAS (Law No. 8,742/1993), later complemented by the implementation of the Unified Social Assistance System (SUAS), responsible for the decentralized organization of social assistance services in the country.

According to the Ministry of Social Development: "The Unified Social Assistance System organizes, in a decentralized and participatory way, the services, programs and benefits of social assistance in Brazil." (Brazil, 2005, p. 12).

This institutional structure represents an important advance in the consolidation of Brazilian social policies, by replacing welfare practices with public policies based on social rights.

2.2 CASE STUDY: PUBLIC POLICIES OF SOCIAL ASSISTANCE IN LAGES (SC)

In the local context, the municipality of Lages, in Santa Catarina, has relevant experiences in the implementation of public social assistance policies aimed at the population in vulnerable situations.

The municipality is part of the national network of the Unified Social Assistance System (SUAS), with Social Assistance Reference Centers (CRAS) and Specialized Social Assistance Reference Centers (CREAS), responsible for serving families at social risk.

Among the actions developed are family monitoring programs, access to social benefits, inclusion in income transfer programs and referral to education, health and professional training services.

These initiatives demonstrate the importance of municipal action in the implementation of social policies provided for in federal legislation. In the case of Lages, the social assistance programs seek not only to offer emergency support, but also to promote processes of social inclusion and strengthening the autonomy of the families served.

The local experience shows that structured public policies articulated with territorial services can contribute to reducing situations of social vulnerability and expanding the population's access to fundamental rights.

3 FINAL CONSIDERATIONS

The analysis developed in this article shows that welfare is a complex phenomenon, located at the intersection between social policies, economics and political culture. Public policies of income transfer and social protection in Brazil play an important role in tackling extreme poverty and reducing social inequalities. Programs such as Bolsa Família and universal systems such as the Unified Health System (SUS) should be understood not only from the perspective of welfare, but as institutional instruments to guarantee social rights provided for in the Federal Constitution of 1988.

National and international research highlights that such policies have contributed significantly to the reduction of poverty and inequality in Brazil, expanding the population's access to essential health, education, and social protection services.

Studies by international organizations, such as the World Bank and public policy research centers, indicate that conditional cash transfer programs, such as Bolsa Família, have relevant impacts on improving the living conditions of families in vulnerable situations, especially when associated with conditionalities related to education and health.

[...] these programs contribute to the reduction of extreme poverty, the increase in school attendance and the improvement of child health indicators, in addition to having a reduced or statistically insignificant impact on the reduction of labor supply among adult beneficiaries (World Bank, 2019).

The initiatives should be interpreted as components of a broader strategy for social protection and human development.

Authors such as Amartya Sen (2010) and Celso Furtado (2004) emphasize that development should be understood as the expansion of human capacities and social opportunities. Overcoming structural inequalities requires public policies that integrate economic growth, education, health, and productive inclusion. In the legal field, Lenio Streck (2014) and Pedro Serrano (2016) highlight that the Brazilian Constitution instituted a State model committed to the realization of social rights and the promotion of material equality. On the other hand, the critical reflection of Slavoj Žižek (2011) warns of the risk of policies that only alleviate the symptoms of inequalities without addressing their structural causes, which reinforces the need for social assistance policies to be articulated with strategies for economic development and productive inclusion.

The analysis of the public policies implemented in the municipality of Lages, in Santa Catarina, highlights the importance of local action in the consolidation of the Brazilian social protection system. Municipal social assistance, structured through the Social Assistance Reference Centers (CRAS) and actions linked to the Unified Social Assistance System (SUAS), serves thousands of families in vulnerable situations, offering both immediate benefits and services aimed at strengthening family and community bonds and social inclusion. This case study demonstrates that the effectiveness of public policies depends on the articulation between the Union, states and municipalities, as well as on the performance of local institutions in the implementation of social protection actions.

The emancipatory perspective proposed by Paulo Freire (1996) shows that overcoming poverty and social exclusion depends not only on distributive policies, but also on processes of awareness, social participation and strengthening of citizenship. The contemporary challenge of Brazilian public policies is to consolidate a social protection model capable of balancing immediate assistance and long-term development. The articulation between income transfer, universal access to health, quality education, professional qualification and generation of economic opportunities is fundamental to promote the social emancipation of the population. Public policies such as Bolsa Família and SUS should be understood as pillars of a social development project that seeks to reduce historical inequalities, expand human capacities, and strengthen social justice, inclusion, and democracy in Brazil.

ABSTRACT

Photovoltaic distributed generation has become established in Brazil as a relevant alternative for the energy transition, especially after the enactment of Law No. 14,300/2022, which redefined the rules of the Electric Energy Compensation System. In this context, it is important to evaluate not only the total energy generated by residential systems, but also the degree of simultaneity between generation and consumption, as well as sizing decisions (DC/AC ratio), which influence local energy use and the export of surplus energy. This study aims to analyze the technical-energy performance of a residential solar power plant with a decentralized architecture based on microinverters and high-power modules, installed in Fortaleza/CE, using real data at 15-minute intervals. The research is applied in nature, with a qualitative-quantitative approach and a case study procedure. Data from 10/19/2025 to 02/23/2026 were analyzed (generation, consumption, export, and import). The system consists of 12 Trina 705 Wp modules (8.46 kWp in direct current) and 12 Enphase IQ8P microinverters (5.7 kW in alternating current), with a DC/AC ratio of 1.48. The results indicated total generation of 5,444.03 kWh and a capacity factor of 31.34%, with occasional clipping during periods of higher irradiance (maximum observed power of 5.676 kW; 9.65% of intervals ≥ 5.6 kW). The estimated self-consumed energy was 579.11 kWh, resulting in a self-consumption rate of 10.64% and a self-sufficiency rate of 47.44%. It is concluded that the system presented consistent performance and that simultaneity is a central variable for interpreting energy utilization in residential settings, especially in projects with intentional surplus for compensation.

RESUMO

A geração distribuída fotovoltaica consolidou-se no Brasil como alternativa relevante para a transição energética, especialmente após a promulgação da Lei nº 14.300/2022, que redefiniu regras do Sistema de Compensação de Energia Elétrica. Nesse contexto, torna-se importante avaliar não apenas a energia total gerada por sistemas residenciais, mas também o grau de simultaneidade entre geração e consumo e as decisões de dimensionamento (razão DC/AC), que influenciam o aproveitamento local e a exportação de excedentes. Este trabalho tem como objetivo analisar o desempenho técnico-energético de uma usina solar residencial com arquitetura descentralizada baseada em microinversores e módulos de alta potência, instalada em Fortaleza/CE, utilizando dados reais em intervalos de 15 minutos. A pesquisa é aplicada, com abordagem qualitativa e procedimento de estudo de caso. Foram analisados dados de 19/10/2025 a 23/02/2026 (geração, consumo, exportação e importação). O sistema é composto por 12 módulos Trina de 705 Wp (8,46 kWp em corrente contínua) e 12 microinversores Enphase IQ8P (5,7 kW em corrente alternada), com razão DC/AC de 1,48. Os resultados indicaram geração total de 5.444,03 kWh e fator de capacidade de 31,34%, com clipping pontual no período de maior irradiância (potência máxima observada de 5,676 kW; 9,65% dos intervalos $\geq 5,6$ kW). A energia autoconsumida estimada foi de 579,11 kWh, resultando em taxa de autoconsumo de 10,64% e taxa de autossuficiência de 47,44%. Conclui-se que o sistema apresentou desempenho consistente e que a simultaneidade é variável central para interpretação do aproveitamento energético em residências, especialmente em projetos com excedente intencional para compensação.

RESUMEN

La generación distribuida fotovoltaica se ha consolidado en Brasil como una alternativa relevante para la transición energética, especialmente tras la promulgación de la Ley n.º 14.300/2022, que redefinió las reglas del Sistema de Compensación de Energía Eléctrica. En este contexto, es importante evaluar no solo la energía total generada por los sistemas residenciales, sino también el grado de simultaneidad entre generación y consumo, así como las decisiones de dimensionamiento (relación DC/AC), que influyen en el aprovechamiento local y la exportación de excedentes. Este trabajo tiene como objetivo analizar el desempeño técnico-energético de una planta solar residencial con arquitectura descentralizada basada en microinversores y módulos de alta potencia, instalada en Fortaleza/CE, utilizando datos reales en intervalos de 15 minutos. La investigación es de carácter aplicado, con enfoque cualitativo-cuantitativo y procedimiento de estudio de caso. Se analizaron datos del 19/10/2025 al 23/02/2026 (generación, consumo, exportación e importación). El sistema está compuesto por 12 módulos Trina de 705 Wp (8,46 kWp en corriente continua) y 12 microinversores Enphase IQ8P (5,7 kW en corriente alterna), con una relación DC/AC de 1,48. Los resultados indicaron una generación total de 5.444,03 kWh y un factor de capacidad del 31,34%, con clipping puntual en los períodos de mayor irradiancia (potencia máxima observada de 5,676 kW; 9,65% de los intervalos $\geq 5,6$ kW). La energía autoconsumida estimada fue de 579,11 kWh, resultando en una tasa de autoconsumo del 10,64% y una tasa de autosuficiencia del 47,44%. Se concluye que el sistema presentó un desempeño consistente y que la simultaneidad es una variable central para la interpretación del aprovechamiento energético en residencias, especialmente en proyectos con excedente intencional para compensación.

1 INTRODUCTION

Photovoltaic distributed generation has become one of the most relevant vectors of the energy transition in Brazil, contributing to the diversification of the energy matrix and the reduction of emissions associated with electricity production (Tolmasquim, 2003; REN21, 2024). In recent years, the fall in costs of modules, inverters, and fastening structures, combined with the greater availability of financing and the maturation of supply chains, has contributed significantly to the expansion of solar PV on a global scale (IEA, 2024; IEA-PVPS, 2024), accelerating adoption in niches such as residential rooftop systems. At the same time, normative and legal changes have redefined the form of compensation for surpluses, directly influencing the economic viability of the projects.

With Law No. 14,300/2022, which established the Legal Framework for Distributed Microgeneration and Minigeneration, new rules were established for the electricity compensation system in Brazil (Brasil, 2022; Santos; Figueira; Florian, 2024)., the logic of economic return has become more sensitive to consumption behavior simultaneous to generation, especially in systems with high exports to the grid. In this scenario, indicators such as the self-consumption rate and the self-sufficiency rate gain importance in the evaluation of the energy performance of photovoltaic systems connected to the grid (Villalva; Gazoli, 2012), as they describe how much of the energy generated is effectively used at the production site. In addition, sizing decisions, especially the DC/AC ratio, should be evaluated in conjunction with the consumer's hourly load curve, since the increase in the DC arrangement can increase the annual energy generated, but also intensify clipping episodes at peak times.

In parallel with regulatory evolution, there has been significant progress in power electronics applied to solar energy, especially in the development of more efficient inverters and decentralized conversion architectures (Pinho; Galdino, 2004). The architecture with microinverters, in which each photovoltaic module has a dedicated converter, has been adopted in scenarios that demand detailed monitoring, greater tolerance to shading, and expansion flexibility. Still, the technological choice must be supported by evidence in real operation, especially in tropical regions, where irradiance, temperature, and cloudiness regimes influence the performance of the system.

In view of the above, this work has as its general objective to analyze the technical-energy performance of a residential photovoltaic solar plant with Enphase microinverters and Trina 705 Wp high power modules, installed in Fortaleza/CE, from real monitoring data at 15-minute intervals. As specific objectives, it is sought: (i) to discuss conversion architectures applicable to residential distributed generation; (ii) present fundamentals related to DC/AC

sizing and the clipping phenomenon; (iii) calculate technical performance and concurrency indicators; and (iv) report the main results observed in the analyzed period of operation, including monthly consolidation and analysis of hourly curves.

As for the structure, the work is organized into five sections: introduction; methodology; theoretical foundation; experience report in the implementation of the plant and final considerations.

2 METHODOLOGY

This research has an applied nature and a qualitative-quantitative approach, combining numerical analysis of data with technical interpretation of the results (Marconi; Lakatos, 2021). The methodological procedure adopted is the case study, appropriate to the investigation of contemporary phenomena in their real context (Yin, 2015).

The database was obtained by export from the Enphase monitoring platform (CSV file), with records at 15-minute intervals. The following fields were used: date/time, energy produced (Wh), energy consumed (Wh), energy exported (Wh) and energy imported (Wh). The period analyzed comprises 10/19/2025 to 02/23/2026.

The study unit is located in Fortaleza/CE and has a single-phase electrical connection (220V). The photovoltaic array consists of 12 Trina TSM-705NEG21C.20 modules (705 Wp each), totaling 8.46 kWp in direct current, associated with 12 Enphase IQ8P-72-2-BR microinverters, totaling 5.7 kW in alternating current, resulting in a DC/AC ratio of 1.48. The generation measurement is carried out after the microinverters (AC generation), by means of a dedicated current transformer, ensuring representativeness of the energy effectively converted and made available in the installation.

The data processing included: (i) daily and monthly consolidation; (ii) construction of average hourly curves of generation and consumption; (iii) calculation of performance indicators; and (iv) clipping analysis by evaluation of the average power at each 15-minute interval. For the indicators, the following operational definitions were adopted: self-consumed energy in each interval as the minimum between energy produced and energy consumed; self-consumption rate as the ratio of self-consumed energy to total energy generated; self-sufficiency rate as the ratio between self-consumed energy and total consumption; and capacity factor as the ratio of power generated to theoretical power if the system operated continuously at rated AC power over the period.

Table 1 presents the main parameters of the system and indicators calculated in the period analyzed.

Table 1

System parameters and calculated indicators

Parameter/Indicator	Value
Installation location	Fortaleza/CE
Period analyzed	19/10/2025 to 23/02/2026
Installed power (DC)	8.46 kWp
Rated Power (AC)	5.7 kW
DC/AC ratio	1,48
Total generation (kWh)	5.444,03
Total consumption (kWh)	1.220,61
Total Export (kWh)	4.864,92
Total import (kWh)	641,50
Estimated self-consumed energy (kWh)	579,11
Self-consumption rate	10,64%
Self-sufficiency rate	47,44%
Capacity Factor (AC)	31,34%

Source: Prepared by the author based on the Enphase report (2026).

For the construction of the theoretical framework of this study, authors who contributed significantly to the development of knowledge related to photovoltaic solar energy and distributed generation in Brazil were considered. In chronological order, Tolmasquim (2003) stands out, for the contextualization of renewable sources in national energy planning; Pinho and Galdino (2004), for the engineering fundamentals applied to photovoltaic systems; Villalva and Gazoli (2012), for the technical approach to energy conversion and integration of photovoltaic systems into the electricity grid; Nascimento and Benevides (2018), for discussions related to residential application and systems monitoring; and Santos, Figueira and Florian (2024), who analyze recent regulatory impacts and the relevance of energy simultaneity in the context after Law No. 14,300/2022.

3 THEORETICAL FOUNDATION

The theoretical foundation was organized into five topics: (i) distributed generation and regulatory framework; (ii) conversion architectures into residential photovoltaic systems; (iii) high-power photovoltaic modules; (iv) technical performance indicators; and (v) DC/AC scaling, clipping, and concurrency.

3.1 DISTRIBUTED GENERATION AND REGULATORY FRAMEWORK

The regulation of distributed generation in Brazil had as its starting point ANEEL Normative Resolution No. 482/2012 (ANEEL, 2012), which established conditions for the connection of microgeneration and minigeneration to the grid and the credit compensation mechanism.

Subsequently, the Legal Framework (Law No. 14,300/2022) consolidated rules and transitions, establishing criteria for the gradual collection of tariff components associated with the use of the network by new connections. This new arrangement makes the technical evaluation and design of the project even more dependent on the consumption profile and the level of export of surpluses.

In practical terms, residential projects can pursue two strategies: maximize local self-consumption (reducing exports) or size surplus to form energy credits to be offset in future periods and/or in other linked consumer units.

The choice affects energy indicators and the interpretation of efficiency: a low self-consumption rate may be a consequence of an intentional surplus strategy, and not necessarily of design flaws.

3.2 ARCHITECTURES AND ENERGY CONVERSION SYSTEMS IN RESIDENTIAL SOLAR POWER PLANTS

The technical configuration of residential solar plants, in turn, brings decisions that are closely linked to the performance of the system, especially in relation to energy conversion architectures. As Santos, Figueira, and Florian (2024) discuss, the choice between a central inverter, a string inverter, or a microinverter is not a matter of overall generation efficiency, but also of how the system deals with shading, localized failures, and the new regulatory requirements that emerged after Law No. 14,300/22. The comparative analysis of these architectures, therefore, is important to understand how different technological solutions adjust to the practical conditions of operation in photovoltaic systems connected to the grid.

In residential applications, Tomich Junior (2021) notes that string inverters dominate the market due to their ease of installation and lower initial price, but microinverters are becoming popular because they allow for optimized performance of each module and more detailed monitoring. This variety of options demonstrates that the system needs to be adapted to the particularities of each facility, such as available space, consumption pattern, and environmental conditions, which directly impact energy performance over time.

When dealing with solar energy for residential use, Nascimento and Benevides (2018) emphasize that, in order for the photovoltaic system to operate efficiently and reliably, it is crucial to implement energy monitoring and management strategies. Within this technological spectrum, systems with microinverters, such as Enphase, offer an alternative among the various options on the market, enabling a more detailed control of generation and the rapid detection of losses or failures. Therefore, when the Enphase system is positioned compared

to other well-established solutions, it enriches the understanding of the different technological options that can be utilized in residential solar plants.

The DC/AC conversion stage is central to the quality of supply and the overall performance of the photovoltaic system (Pine; Galdino, 2004; Villalva; Gazoli, 2012). In string inverters, modules connected in series share the same operating point, which can lead to *mismatch* losses. On the other hand, the topology with microinverters performs tracking of the maximum power point (MPPT) in each module, reducing losses due to *mismatch* and partial shading (Villalva; Gazoli, 2012).

Additionally, microinverters favor granular monitoring and predictive maintenance. For operational management purposes, access to data by module allows the identification of anomalies (e.g. localized dirt, premature degradation or connection failures), reducing diagnostic time. However, designs with microinverters must consider the nominal AC power limitation per unit and the combined effect of the DC array on clipping behavior.

3.3 HIGH POWER MODULES AND WEATHER CONDITIONS

High-power modules, such as the Trina Vertex N family, utilize advanced technologies such as *n-type* cells and TOPCon architectures for increased efficiency (IEA-PVPS, 2024; TRINA SOLAR, 2024). On residential rooftops, the main benefit is higher power density, allowing higher installed powers to be achieved in limited areas. However, field performance depends on climatic variables: operating temperature, roof ventilation, albedo, and cloudiness all influence instantaneous power.

In coastal regions with a hot climate, such as Fortaleza, high temperatures can reduce the instantaneous yield of the module in relation to the standard test (STC). Still, the high annual irradiance and the greater amount of sunshine hours can sustain high annual energy production, making the place favorable to photovoltaic generation.

3.4 TECHNICAL PERFORMANCE INDICATORS

The performance analysis of grid-connected photovoltaic systems often uses consolidated energy assessment indicators (Dobos, 2014; IEC 61724-1, 2021). The specific generation (kWh/kWp) is useful for comparing different projects in different locations. The capacity factor (FC) describes the degree of utilization of the rated power over time, being influenced by irradiance, temperature, and system losses. The self-consumption rate, on the other hand, measures the fraction of energy generated that is instantly used on site, while the self-sufficiency rate expresses how much of the total consumption is supplied by self-generation.

In operational terms, simultaneity can be analyzed by hourly curves: in homes, it is common for consumption peaks to occur in the early morning and at night, when generation is low or non-existent. Thus, load displacement strategies (e.g., use of pumps, heating, recharging of vehicles or household appliances during the day) tend to increase self-consumption and reduce exports, which becomes more relevant under rules of charging for the use of the network.

3.5 DC/AC RATIO, *OVERSIZING* AND *CLIPPING*

The dimensioning of the DC/AC ratio is a relevant design decision for optimizing annual energy generation (Dobos, 2014; Villalva; Gazoli, 2012). When the DC array is higher than AC capacity, there is potential power gain at times of lower irradiance, but also greater likelihood of clipping at peaks. The intensity of the clipping depends on the local irradiance, temperature, and array profile. Thus, the evaluation should quantify the frequency of saturation and compare it with the benefit of additional production at other times.

3.6 EXPERIENCE REPORT ON THE IMPLEMENTATION OF A RESIDENTIAL SOLAR PLANT

This section describes, in the form of an experience report, the main results of the operation of the plant installed in Fortaleza/CE, based on real data obtained from the monitoring platform. The system has a generation surplus in relation to local consumption, resulting in high exports and, consequently, the formation of credits for compensation. The interpretation of the indicators is carried out considering this strategy.

In the period analyzed, the total energy generated was 5,444.03 kWh, while the total consumption recorded was 1,220.61 kWh. Exports totaled 4,864.92 kWh and imports 641.50 kWh. The estimated self-consumed energy was 579.11 kWh, which resulted in a self-consumption rate of 10.64% and a self-sufficiency rate of 47.44%.

The average daily generation was 42.87 kWh/day. Considering the nominal power of 5.7 kW, the capacity factor in the period was 31.34%. These values reflect the favorable conditions of solar resources and the sizing strategy adopted.

To evaluate *clipping*, the average power was calculated at each 15-minute interval. The maximum power observed was 5.676 kW, very close to the nominal limit of the system. The frequency of intervals with power equal to or greater than 5.6 kW was 9.65%, indicating point saturation concentrated at the top of the daily curve. From a practical point of view, this behavior is expected in projects with *oversizing* and can be interpreted as evidence that the

inverter was used close to the limit part of the time, without, however, eliminating the generation gain at times of intermediate irradiance.

The day with the highest generation was 01/08/2026, with a daily production of 50.25 kWh. This result is useful for illustrating typical behavior under favorable conditions, including the plateau associated with the conversion threshold. Figures 1, 2, 3, 4 and 5 illustrate all the calculations developed.

Table 2 shows the monthly energy consolidation (kWh) in the period analyzed.

Table 2

Monthly Energy Consolidation

Month	Generation	Consumption	Export	Import
2025-10	592,69	118,31	546,24	71,87
2025-11	1383,89	278,88	1245,52	140,51
2025-12	1374,71	322,5	1221,92	169,7
2026-01	1283,29	291,07	1140,9	148,69
2026-02	809,46	209,85	710,35	110,73

Source: Prepared by the author from the Enphase report (2026).

The hourly analysis indicates that self-consumption is maximized in the periods of lower irradiance (morning and late afternoon), when generation approaches consumption. In the central period of the day, the surplus is expressive, resulting in high exports. This result is consistent with the project's strategy: the plant was sized to generate more than local consumption, allowing compensation for the surplus in another consumer unit, in addition to reducing dependence on grid energy at times of solar availability.

In terms of regulatory interpretation, the scenario reinforces that residential projects should be analyzed considering: (i) load profile; (ii) compensation policy; (iii) possibility of consumption management; and (iv) tariff structure. In the case analyzed, high exports are desired from the point of view of energy credit, but it reduces the rate of local self-consumption, which does not represent, in itself, low technical performance.

4 FINAL CONSIDERATIONS

The present work evaluated the technical-energy performance of a residential photovoltaic plant with microinverters and high-power modules, using real data at 15-minute intervals. The approach allowed calculating performance indicators, analyzing hourly curves and quantifying clipping, providing practical evidence for sizing decisions in residential distributed generation.

In the period analyzed, the system presented a total generation of 5,444.03 kWh and a capacity factor of 31.34%, indicating high performance by residential standards. The DC/AC ratio of 1.48 was technically adequate to the local conditions, with punctual and non-dominant clipping. The local self-consumption rate was 10.64% and the self-sufficiency rate was 47.44%, values influenced by the strategy of intentional surplus.

The results show that the simultaneity between generation and consumption should be interpreted in the light of the project's objective and regulatory rules. When the purpose includes compensation in other consumer units, high exports are part of the strategy. Even

so, in contexts of higher charges for network use, increasing self-consumption by load and/or storage management can become relevant for economic optimization.

As limitations, it is noteworthy that the analyzed period does not include a complete annual cycle, which restricts conclusions about annual seasonality. In addition, local measurements of irradiance and module temperature were not incorporated, which makes it impossible to calculate indicators such as Performance Ratio. As future works, it is recommended: (i) to extend the horizon to 12 months; (ii) integrate meteorological data; (iii) evaluate tariff and economic scenarios; (iv) simulate load displacement strategies; and (v) analyze impacts of possible insertion of storage.

ABSTRACT

The adoption of artificial intelligence in companies is changing human resource management practices. This is evident in practices such as recruitment, performance evaluation, and talent management. This creates a new context in which technology influences decisions and management strategies within organizations. The discussion of technological governance is crucial, especially in Human Resources. This debate is even more important given the growing need to ensure transparency in automated processes. It is essential to ensure strict compliance with regulatory standards and respect for principles of fairness in the workplace, making ethical management of these technologies essential. A qualitative approach was adopted to investigate the governance of artificial intelligence in Human Resources. This

method analyzes institutional relationships, norms, and organizational practices beyond numerical indicators. Bibliographic research was the main methodological strategy, allowing the analysis of books, journal articles, and scientific studies on the topic. This study aims to analyze the foundations and practices of artificial intelligence governance in Human Resources, focusing on transparency, compliance, and fairness in automated management processes. The research showed that artificial intelligence in human resource management is very beneficial, as it improves organizational analysis and supports data-driven decision-making. The application of this technology requires careful governance structures that ensure transparency, compliance with standards, and seek to reduce possible algorithmic biases in information processing. This is essential to ensure that the adopted practices are fair and responsible. Supervision, auditing, and institutional accountability are essential to ensure that automated systems promote a more equitable organization aligned with modern human resource management standards. These tools are essential to ensure that guidelines and procedures are aligned with ethical principles and workplace demands, promoting more equitable organizational development.

RESUMO

A adoção de inteligência artificial nas empresas está mudando profundamente as práticas de gestão de pessoas. Isso se destaca em práticas como seleção de pessoal, avaliação de desempenho e gestão de talentos. Isso cria um novo contexto em que a tecnologia influencia as decisões e estratégias de gestão de pessoas nas organizações. A discussão sobre governança tecnológica é crucial, especialmente em Recursos Humanos. Esse debate é ainda mais importante diante da crescente necessidade de garantir a transparência em processos automatizados. É fundamental garantir o cumprimento rigoroso das normas regulatórias e o respeito aos princípios de equidade no trabalho, tornando essencial um gerenciamento ético dessas tecnologias. Adotou-se uma abordagem qualitativa para investigar a governança da inteligência artificial em Recursos Humanos. Esse método analisa relações institucionais, normas e práticas organizacionais além dos indicadores numéricos. A pesquisa bibliográfica foi a principal estratégia metodológica, permitindo a análise de livros, artigos em periódicos e estudos científicos sobre o tema. Este estudo visa analisar fundamentos e práticas de governança da inteligência artificial em Recursos Humanos, focando em transparência, conformidade e equidade em processos automatizados de gestão. A pesquisa mostrou que a inteligência artificial na gestão de recursos humanos é muito benéfica, pois melhora a análise das empresas e auxilia decisões baseadas em dados. A aplicação dessa tecnologia exige estruturas de governança cuidadosas, que garantam transparência, conformidade com normas e busquem reduzir possíveis vieses algorítmicos no tratamento das informações. Isso é essencial para que as práticas adotadas sejam justas e responsáveis. A supervisão, auditoria e responsabilização institucional são essenciais para assegurar que sistemas automatizados promovam uma organização mais justa e alinhada aos padrões modernos de gestão de recursos humanos. Essas ferramentas são essenciais para garantir que as diretrizes e procedimentos estejam alinhados aos princípios éticos e às demandas do ambiente de trabalho, promovendo um desenvolvimento organizacional mais justo.

Palavras-chave: Inteligência Artificial. Governança. Transparência. Recursos Humanos.

RESUMEN

La adopción de la inteligencia artificial en las empresas está cambiando las prácticas de gestión de recursos humanos. Esto se destaca en prácticas como la selección de personal, la evaluación del desempeño y la gestión del talento. Esto crea un nuevo contexto en el que la tecnología influye en las decisiones y estrategias de gestión dentro de las organizaciones. La discusión sobre la gobernanza tecnológica es crucial, especialmente en Recursos Humanos. Este debate es aún más importante ante la creciente necesidad de garantizar la transparencia en los procesos automatizados. Es fundamental asegurar el cumplimiento riguroso de las normas regulatorias y el respeto a los principios de equidad en el trabajo, haciendo esencial una gestión ética de estas tecnologías. Se adoptó un enfoque cualitativo para investigar la gobernanza de la inteligencia artificial en Recursos Humanos. Este método analiza las relaciones institucionales, normas y prácticas organizacionales más allá de los indicadores numéricos. La investigación bibliográfica fue la principal estrategia metodológica, permitiendo el análisis de libros, artículos en revistas y estudios científicos sobre el tema. Este estudio tiene como objetivo analizar los fundamentos y prácticas de gobernanza de la inteligencia artificial en Recursos Humanos, enfocándose en la transparencia, el cumplimiento y la equidad en los procesos automatizados de gestión. La investigación mostró que la inteligencia artificial en la gestión de recursos humanos es muy beneficiosa, ya que mejora el análisis de las organizaciones y apoya la toma de decisiones basada en datos. La aplicación de esta tecnología requiere estructuras de gobernanza cuidadosas que garanticen la transparencia, el cumplimiento de normas y busquen reducir posibles sesgos algorítmicos en el tratamiento de la información. Esto es esencial para asegurar que las prácticas adoptadas sean justas y responsables. La supervisión, auditoría y responsabilidad institucional son esenciales para asegurar que los sistemas automatizados promuevan una organización más equitativa y alineada con los estándares modernos de gestión de recursos humanos. Estas herramientas son esenciales para garantizar que las directrices y procedimientos estén alineados con los principios éticos y las demandas del entorno laboral, promoviendo un desarrollo organizacional más justo.

1 INTRODUCTION

The introduction of artificial intelligence systems in companies has significantly changed the way decisions are organized and made in people management. Processes that were previously fully managed by Human Resources professionals, such as recruitment, selection, performance evaluation, and career planning, now have tools based on algorithms. In this context, the growing presence of data-driven technologies requires careful reflection on the criteria that guide these decisions, as well as on the institutional mechanisms necessary to ensure transparency, organizational accountability, and respect for the rules that regulate the use of data and automated systems (Appolinário; Hedler; Ferneda, 2025).

At the same time, the development of these technologies intensifies the academic and institutional discussion on the governance of artificial intelligence. The implementation of automatic systems in organizational processes raises concerns about the explanation of algorithms, compliance with relevant legislation, and the need to avoid discrimination arising from biases in data or predictive models. In this sense, it is crucial to investigate how organizations can implement governance practices that can balance technological innovation, institutional accountability, and principles of equity in the workplace.

To carry out this investigation, a qualitative approach was used, considering that the theme in question concerns the interpretation of phenomena related to the governance of artificial intelligence in the area of Human Resources. This type of method enables the analysis of institutional relations, norms and organizational practices that are not limited to mere numerical indicators. Regarding the methodology, bibliographic research was the chosen strategy, which is widely recognized in scientific elaboration, since it allows the thorough examination of academic books, articles from specialized journals and published research on the subject in question.

The general objective of this work is to analyze the fundamentals and governance practices of artificial intelligence in the area of Human Resources, focusing on the promotion of transparency, regulatory compliance and equity in automated people management processes. To achieve this purpose, three specific objectives were established: to examine how artificial intelligence systems are being applied in recruitment, selection, performance evaluation, and talent management processes; investigate the transparency and regulatory compliance mechanisms necessary for the responsible use of artificial intelligence in Human Resources; and assess the risks of biases, discrimination, and inequalities arising from decision-making automation in people management practices.

To make clear and well-defined the analytical path that was built throughout the text, the article was structured in four main sections. The first section of the work is the introduction,

in which the research theme is presented with caution, the problem that will be explored throughout the work is defined and the objectives that will guide the development of the study are clarified. This introduction is vital, as it defines the premises that the reader will use to understand all the content that will follow. The methodology, which is the protagonist of the second part of this work, has as its main objective to describe in detail the chosen approach and also to list the various procedures used in the construction of the analysis carried out. This section aims to elucidate how methodological choices have shaped the development of the research. Then, in the third section of the work, the theoretical foundation is presented, which is intended to discuss the main academic references that are significantly connected to the use of artificial intelligence in people management, in addition to addressing the issue of technological governance and the risks involved in the automation of decision-making processes. Therefore, this discussion is crucial to unravel the implications and effects of these technologies in the organizational environment. Finally, in the last part of the text, the final considerations are made, where the main aspects and elements discussed and analyzed throughout the construction of the text are recalled. In addition, some possible directions and trajectories are pointed out so that future research on the subject can be carried out, thus expanding the investigations that may result from the results and conclusions reached.

2 METHODOLOGY

This work used a qualitative approach, considering that the proposal of the study consists of the interpretation of phenomena related to the governance of artificial intelligence in the Human Resources sector. Qualitative research is widely used in current scientific research, as it enables the understanding of complex social processes and examines meanings, institutional relations and normative structures that guide certain practices in organizations. Gil (2021) argues that this strategy is beneficial for the analysis of phenomena that cannot be quantified and is especially suitable when the researcher's goal is to understand interpretations, perceptions, and institutional dynamics in specific contexts.

In the area of applied social sciences, qualitative research is a common tool to explore phenomena related to regulation, institutional governance, and technological changes that impact organizations. This enables an analysis of how regulations, ethical principles and organizational structures are interconnected in the creation of new management practices. As Rattner (1979) argues, scientific research needs methodological procedures that are capable of deciphering, in a systematic way, the social reality, connecting epistemological foundations and analytical strategies that enable the understanding of the complex phenomena that manifest themselves in contemporary societies.

Regarding the research process that was chosen for this work, it was decided to adopt bibliographic research, which is a widely recognized and established method in the production of scientific knowledge. This approach is often used in several areas of knowledge, as it allows an in-depth and grounded analysis based on already published sources, contributing to the construction of a solid theoretical framework. Bibliographic research is a methodology that is characterized by the careful and organized analysis of materials that have already been previously published. This type of investigation allows the researcher to have the opportunity to examine various perspectives, both theoretical and empirical, in relation to a specific theme. In this way, bibliographic research is an essential tool for deepening the knowledge and understanding of the different existing approaches on the subject in question. According to Gil (2021), this type of procedure is considered one of the essential foundations of scientific research, since it allows the collection, interpretation, and systematization of knowledge that has already been prepared by the academic community. This approach is fundamental, as it favors the performance of analyses that are solidly based on the available technical and specialized literature. Thus, the use of this procedure not only adds value to the study, but also supports the development of new investigations that are based on previous studies carried out in the area.

The bibliographic research developed here was based on more than fifteen scientific sources, most of which are books and academic articles that deal with the subjects of technological governance, artificial intelligence and people management. The choice of these sources aimed to cover the various analytical perspectives that can be found in the specialized literature, aiming at the construction of a solid panorama on the issue under investigation. As stated by Rodrigues and Neubert (2023), the careful choice of scientific references enables the organization of existing knowledge about a given object of investigation, which allows for critical analysis and a systematization of the academic debate.

3 THEORETICAL FOUNDATION

To theoretically support this work, three analytical axes were outlined that enable an articulation between the different layers that make up the governance of artificial intelligence in people management. The first subtopic, 3.1 Artificial Intelligence at the Service of Strategic People Management, brings to light the integration of intelligent systems in key functions of the Human Resources sector, particularly in the areas of recruitment, selection, performance evaluation and analysis of organizational data. Principle 3.2, entitled Transparency, Compliance, and Corporate Responsibility in the Use of AI, comes next and discusses governance in technology, with an emphasis on data protection, system audits, and

compliance with regulatory frameworks. Finally, item 3.3 Equity, Organizational Justice and Risks of Discrimination in Automated Processes brings to light the ethical issues involved in decision automation, addressing the dangers of algorithmic biases and institutional initiatives to foster a fairer and more equitable organizational practice.

3.1 APPLICATIONS OF ARTIFICIAL INTELLIGENCE IN STRATEGIC PEOPLE MANAGEMENT

The integration of artificial intelligence systems in Human Resources functions has significantly transformed the way companies perform tasks related to people management. AI, which was previously limited to operational functions such as organizing data or automating administrative tasks, is now present in strategic processes that encompass recruitment, selection, performance evaluation, and talent management. In this sense, tools that use algorithms and data analysis are capable of recognizing patterns of conduct in the professional environment, assisting in decision-making within organizations, and optimizing the efficiency of internal processes (Dantas, 2025; Lima et al., 2025).

This reflects the evolution from a traditional people management model to a data-driven approach. There are people analytics platforms that make it possible to integrate multiple sources of information on performance, turnover, and skills development. The systematic collection of this information allows decisions about career planning, talent retention, and organizational development to be made more informedly. Ribeiro (2024) explains that, by adopting these tools, the Human Resources professional is no longer just a people manager to become a strategic partner of the organization, collaborating in decisions that are supported by evidence and analytical data.

Another use of artificial intelligence occurs in recruitment and selection processes, where automated systems screen resumes, map profiles that align with the requirements of the vacancies, and assist in digital interviews mediated by algorithms. They increase the processing capacity of large volumes of data and speed up the initial screening steps. Market reports indicate that companies are increasing the adoption of these technologies to make selection processes more efficient and to improve the quality of talent management decisions (Gartner, 2024). In this sense, Table 1 summarizes some of the main uses of artificial intelligence in strategic people management.

Table 1

Applications of Artificial Intelligence in Strategic Human Resource Management

AI Application in HR	Description	Organizational Contribution
Automated Resume Screening	AI systems analyze large volumes of resumes to identify candidates whose profiles match job requirements.	Reduces time in initial recruitment stages and improves candidate filtering efficiency.
AI-Assisted Digital Interviews	Intelligent platforms analyze verbal responses, facial expressions, and communication patterns during virtual interviews.	Supports decision-making in candidate evaluation and standardizes assessment processes.
People Analytics	Advanced data analytics applied to workforce data to identify trends related to performance, engagement, and turnover.	Enhances strategic workforce planning and supports data-driven HR decisions.
Performance Monitoring Systems	AI-based tools track employee performance indicators and behavioral patterns in organizational environments.	Enables continuous feedback processes and supports talent development strategies.

Source: Adapted from Dantas (2025); Gartner (2024); Lima et al. (2025); Ribeiro (2024).

Chart 1 illustrates several applications of artificial intelligence in Human Resources, highlighting how these tools have supported people management processes in a more structured and data-driven way. Among the most notable functions, we can mention the automatic screening of resumes, digital interviews with the support of artificial intelligence, the use of People Analytics, and performance monitoring systems. They make it possible to analyze large volumes of data, identify important patterns, and support decision-making within the organization. Therefore, there is a decrease in time in the initial phases of recruitment, greater uniformity in the evaluation of candidates, better strategic planning of the workforce, and constant monitoring of employee performance, which results in more efficient talent development and management processes in companies.

The growing adoption of these tools reinforces the consolidation of a data-driven Human Resources model supported by sophisticated digital technologies. In this context, artificial intelligence plays an important role in assisting in strategic people management decisions, making the operation more efficient and improving talent assessment and development processes. Simultaneously, as Lima et al. (2025) point out, the adoption of these technologies must be carefully considered in relation to governance, transparency, and regulatory compliance, particularly when it comes to automated decisions that can shape careers and opportunities within organizations.

3.2 TRANSPARENCY, COMPLIANCE, AND CORPORATE RESPONSIBILITY IN THE USE OF AI

The introduction and integration of artificial intelligence in organizational contexts has stimulated a significant increase in discussions about technological governance. This

phenomenon is particularly relevant at the moment when these advanced systems begin to exert influence on decisions involving the administration and management of human resources (Appolinário; Hedler; Ferneda, 2025). The impact brought by this technology sparks a growing interest in understanding how governance guidelines and practices should adapt to deal with these new dynamics that affect the way organizations manage their employees. In the field of Human Resources, the implementation of algorithms in activities involving candidate selection, as well as the evaluation and management of talents, requires the existence of organizational structures that ensure transparency in procedures, promote accountability in actions, and ensure that there is alignment with essential ethical foundations. This need becomes even more relevant considering the complexity and importance of decisions that directly impact the professional lives of the individuals involved. According to the analysis carried out by Schmidt, Huttenlocher, and Kissinger in 2023, the evolution of artificial intelligence within organizations has generated the need to develop adequate control mechanisms. These mechanisms are essential to understand more deeply how automated systems operate, in addition to enabling a careful evaluation of the consequences that these technologies can have, both for society in general and for the specific institutions involved.

Therefore, the governance of artificial intelligence goes beyond the technology itself, also encompassing compliance with regulatory frameworks and standards on data protection and corporate responsibility. According to Gabriel (2022), the growing presence of intelligent systems in organizations requires these institutions to establish, through internal policies, well-defined criteria on how data will be collected, processed, and used, especially when this information guides decisions that impact employees' careers. Transparency in algorithmic processes is thus an important requirement for automated decisions to be understood, justified and audited when necessary.

In addition, the adoption of artificial intelligence tools in business activities requires institutional structures that are intended for the supervision and control of these technologies. Digital ethics committees, systems audits, and accountability protocols are some of the tools that organizations around the world are adopting to balance technological innovation and institutional responsibility. As highlighted by Dias and Ferreira (2023), the use of artificial intelligence in compliance-related activities can expand the capacity for monitoring and analyzing risks, as long as there are adequate governance and human supervision structures. To illustrate, Exhibit 2 presents some of the principles and mechanisms that are often associated with the responsible governance of artificial intelligence in organizational contexts.

Table 2*Governance Mechanisms for Responsible AI Use in Organizational Contexts*

Governance Dimension	Description	Organizational Objective
Data Protection Compliance	Implementation of policies ensuring that personal and organizational data are collected, processed, and stored according to legal and regulatory standards.	Ensure alignment with data protection laws and safeguard individual rights.
Algorithmic Transparency	Adoption of documentation and reporting practices that allow stakeholders to understand how AI systems operate and influence decisions.	Promote clarity and accountability in automated decision-making processes.
AI System Auditing	Periodic evaluation of AI systems to identify operational risks, biases, or inconsistencies in automated outcomes.	Strengthen reliability and support responsible technological oversight.
Human Oversight Mechanisms	Establishment of qualified supervision to review and validate decisions generated by AI systems.	Maintain accountability and prevent unjustified automated outcomes.

Source: Adapted from Dias and Ferreira (2023); Gabriel (2022); Schmidt, Huttenlocher, and Kissinger (2023); Franco, Pinheiro and Del Lhano (2025).

These governance mechanisms are becoming increasingly common in organizations, as they seek to reconcile technological innovation with institutional responsibility. According to Franco, Pinheiro and Del Lhano (2025), the adoption of artificial intelligence in corporate governance must be accompanied by the definition of ethical and regulatory standards that ensure the responsible use of these technologies. With regard to Human Resources, this architecture ensures that decisions mediated by algorithms are made transparently, in compliance with legislation and in line with the principles of equity that govern modern people management.

3.3 EQUITY, ORGANIZATIONAL JUSTICE, AND RISKS OF DISCRIMINATION IN AUTOMATED PROCESSES

The growing adoption of artificial intelligence in people management routines has sparked relevant and important debates about equity and justice in organizations. These questions touch on several points about what artificial intelligence tools can mean for the relationships and treatment of employees in the workplace, including equal opportunities, the way decisions are made within organizations, among others. When it comes to automated decision systems applied to recruitment, performance evaluation, and talent management, we are already entering a territory where these systems are beginning to directly impact professional careers and the opportunities that open up within the corporate environment. Therefore, these systems play a central role in the way careers are built and in the opportunities for ascension and development that workers find in their professional routines. In this sense, investigations and studies of the specialized literature point out that algorithms

fed by large data sets are capable of reproducing historical patterns of inequality. This becomes even more evident when the data used reflect the asymmetries that already exist in the social and institutional organizations of society (Kim, 2018).

Therefore, it is essential to consider the ethical and legal issues surrounding the use of data-driven technologies in the context of work. Research on algorithm-based decisions shows that predictive models can generate discrimination even in the absence of a clear intention to do so. This is why the variables that the systems use can capture statistical correlations that are linked to gender, race, age, or other sensitive characteristics. According to Ferrari, Becker, and Wolkart (2018), it is crucial to have regulatory and institutional mechanisms that ensure that decision-making automation does not compromise the principles of equality and justice in its application.

In view of this, it is essential to discuss how strategies will be implemented to reduce algorithmic biases and ensure constant supervision of the systems that support organizational decisions. People management, as discussed in recent literature, should include regular audits of predictive models, constant validations of databases, and monitoring of the effects of automated decisions. These actions help to detect distortions and prevent something from having a discriminatory effect within the company. In the context presented, Chart 3 lists some of the main risks of using artificial intelligence in people management processes, as well as strategies to mitigate their consequences.

Table 3

Risks of Algorithmic Bias and Mitigation Strategies in AI-Driven Human Resource Processes

Risk Dimension	Description	Mitigation Strategy
Historical Data Bias	AI systems trained with historical organizational data may replicate past patterns of inequality in hiring or promotion decisions.	Periodic review of datasets and removal of variables that indirectly reproduce discriminatory patterns.
Algorithmic Decision Opacity	Automated decision systems may operate as opaque models, making it difficult to understand the criteria used in evaluations.	Implementation of explainable AI methods and documentation of decision criteria.
Discriminatory Outcomes in Recruitment	Automated screening tools may unintentionally disadvantage certain demographic groups due to biased correlations in data.	Continuous validation of recruitment algorithms and human oversight in selection processes.
Lack of Impact Monitoring	Organizations may fail to evaluate the long-term consequences of algorithmic decisions on diversity and inclusion.	Establishment of monitoring frameworks to assess diversity indicators and organizational fairness outcomes.

Source: Adapted from Araújo et al. (2022); Kim (2018); Ferrari, Becker and Wolkart (2018); Silva, Matins and Laranjeira (2023).

Especially when automated systems begin to integrate into decision-making routines in people management, the implementation of supervision and control strategies becomes

essential. Araújo et al. (2022) draw attention to the protection of fundamental rights in relation to the use of personal data in labor contexts, especially when it comes to digital technologies that affect evaluations and professional opportunities. Similarly, Silva, Matins, and Laranjeira (2023) highlight that the introduction of technological tools in selection processes can make organizations' operations more efficient, but it is crucial that there are institutional mechanisms in place to monitor their consequences and ensure that organizational practices are in compliance with the principles of diversity, inclusion, and justice in the workplace.

4 FINAL CONSIDERATIONS

The increasing integration of artificial intelligence tools in the different practices within organizations is promoting a significant transformation in the way people management is carried out. This transformation is reflected, in a special way, in activities that involve the selection of professionals, the evaluation of employee performance, and the development of talents. Thus, we can see that the use of these technological systems is redefining the usual strategies and procedures in this field. Within this scenario, the conversation about technological governance has become an increasingly relevant and evident issue in the Human Resources area. This is especially due to the growing demand for ensuring not only transparency in operations, but also compliance with established rules and regulations, in addition to ensuring that there are fair and equitable criteria in all processes that are carried out in an automated way. The implementation of tools that use algorithms has the effect of significantly expanding the analytical capacity of institutions, enabling decisions that are based on robust and reliable data. However, this adoption also brings with it a series of new challenges for companies, which are directly associated with the responsibility that these organizations have towards society, in addition to issues related to the maintenance and promotion of principles of equity within the professional environment. These challenges need to be carefully considered so that the use of these resources does not compromise fundamental values in the workplace.

Based on this context, the present study had the general goal of analyzing the fundamentals and governance practices of artificial intelligence in Human Resources, prioritizing transparency, compliance with standards and equity in automated people management processes. The objectives initially proposed were achieved, according to the results obtained in the theoretical research carried out. The first specific goal made it possible to analyze the main ways in which artificial intelligence can be used in recruitment, selection, performance evaluation, and talent management processes. The second objective allowed us to explore the institutional mechanisms that ensure transparency and regulatory

compliance in the use of these technologies. Finally, the third objective helped to assess the risks of algorithmic biases and disparities generated by automation in decision-making in people management.

The analysis proposed in the theoretical foundation showed that the adoption of intelligent systems in Human Resources reflects a progressive change from traditional operating models to those based on data. Tools such as people analysis platforms, automated systems for screening resumes, and digital solutions for performance monitoring increase the ability of organizations to handle large amounts of information and make strategic decisions. The study also showed that the adoption of these technologies requires governance structures that ensure transparency in algorithmic processes, respect for data protection standards, and institutional supervision and auditing mechanisms. In addition, the importance of continuous monitoring of the effects that automated systems produce was emphasized, especially with regard to the prevention of biases and the promotion of organizational practices that are compatible with the principles of diversity and fairness in the workplace.

Throughout the research, it was reached the definition of three interconnected dimensions that enable a better understanding of the governance of artificial intelligence in people management, namely: transparency, regulatory compliance and equity in automated processes, which constitute the main contribution of this study to the academic debate. Thus, the study provides a framework that makes it possible to interpret the organizational, ethical, and normative consequences that emerge from the adoption of algorithmic systems in people management practices. This enriches the debate around the responsible use of these technologies at work, pointing out that the implementation of data-driven tools must be supported by institutional mechanisms that ensure supervision, accountability, and fairness in the criteria of decisions that impact careers and the dynamics of organizations.

In light of the issues discussed, it is noted that the research agenda in artificial intelligence in people management continues to expand and lacks new empirical investigations. Future studies may investigate, for example, how different organizations establish technological governance mechanisms to monitor automated decision systems. Studies that are dedicated to the comparative analysis between national and international regulatory frameworks on artificial intelligence at work are also very pertinent. Research that investigates how decision-making automation really affects indicators of diversity, inclusion, and professional mobility can help to better understand the effects of these technologies on the dynamics of labor relations.

ABSTRACT

The energy transition has redefined regulatory and economic priorities in the international scenario, especially with regard to the consolidation of new production chains linked to low-emission sources. In this context, the debate on Brazilian environmental licensing gains strategic relevance in light of the expansion of the green hydrogen and ammonia industry. The research was developed using a qualitative approach, and two research methods were applied: bibliographic research and documentary research. The general objective of this study is to analyze the impacts of the new Brazilian environmental licensing framework on legal certainty and the consolidation of the green hydrogen and ammonia industry within the context of the energy transition, identifying regulatory challenges and institutional opportunities for the sustainable development of the sector. It is concluded that the new environmental licensing framework, by seeking to provide greater predictability and rationality to administrative procedures, may directly influence legal certainty and the investment environment in the green hydrogen and ammonia sector. The consolidation of this industry in Brazil will depend on the institutional capacity to harmonize economic development, energy transition, and environmental protection, ensuring regulatory stability and trust as the basis for sustainable growth.

RESUMO

A transição energética tem redefinido prioridades regulatórias e econômicas no cenário internacional, especialmente no que se refere à consolidação de novas cadeias produtivas vinculadas a fontes de baixa emissão. Nesse contexto, o debate sobre o licenciamento ambiental brasileiro ganha relevância estratégica diante da expansão da indústria de hidrogênio e amônia verde. A pesquisa foi elaborada com uma abordagem qualitativa e foram utilizados dois métodos de pesquisa: a pesquisa bibliográfica e a pesquisa documental. O objetivo geral desta pesquisa é analisar os impactos do novo marco do licenciamento ambiental brasileiro sobre a segurança jurídica e a consolidação da indústria de hidrogênio e amônia verde no contexto da transição energética, identificando desafios regulatórios e oportunidades institucionais para o desenvolvimento sustentável do setor. Conclui-se que o novo marco do licenciamento ambiental, ao buscar conferir maior previsibilidade e racionalidade aos procedimentos administrativos, pode influenciar diretamente a segurança jurídica e o ambiente de investimentos no setor de hidrogênio e amônia verde. A consolidação dessa indústria no Brasil dependerá da capacidade institucional de harmonizar desenvolvimento econômico, transição energética e proteção ambiental, garantindo estabilidade normativa e confiança regulatória como bases para um crescimento sustentável.

Palavras-chave: Transição Energética. Licenciamento Ambiental. Segurança Jurídica. Hidrogênio Verde.

RESUMEN

La transición energética ha redefinido las prioridades regulatorias y económicas en el escenario internacional, especialmente en lo que respecta a la consolidación de nuevas cadenas productivas vinculadas a fuentes de baja emisión. En este contexto, el debate sobre el licenciamiento ambiental brasileño adquiere relevancia estratégica ante la expansión de la industria del hidrógeno y amoníaco verde. La investigación fue elaborada con un enfoque cualitativo y se utilizaron dos métodos de investigación: la investigación bibliográfica y la investigación documental. El objetivo general de esta investigación es analizar los impactos del nuevo marco del licenciamiento ambiental brasileño sobre la seguridad jurídica y la consolidación de la industria del hidrógeno y amoníaco verde en el contexto de la transición energética, identificando desafíos regulatorios y oportunidades institucionales para el desarrollo sostenible del sector. Se concluye que el nuevo marco del licenciamiento ambiental, al buscar otorgar mayor previsibilidad y racionalidad a los procedimientos administrativos, puede influir directamente en la seguridad jurídica y en el entorno de inversiones en el sector del hidrógeno y amoníaco verde. La consolidación de esta industria en Brasil dependerá de la capacidad institucional para armonizar el desarrollo económico, la transición energética y la protección ambiental, garantizando estabilidad normativa y confianza regulatoria como bases para un crecimiento sostenible.

Palabras clave: Transición Energética. Licenciamiento Ambiental. Seguridad Jurídica. Hidrógeno Verde.

1 INTRODUCTION

The energy transition has consolidated itself as one of the main axes of reorganization of contemporary economies, requiring normative responses from States capable of reconciling economic growth, technological innovation, and socio-environmental responsibility. In Brazil, this movement takes on its own contours due to the strategic relevance of renewable sources in the electricity matrix and the country's growing insertion in global low-emission energy chains. In this scenario, the debate on environmental licensing assumes centrality, as it constitutes a structuring instrument of environmental policy and conditions the implementation of large-scale enterprises.

The growing green hydrogen and ammonia industry is accelerating this debate. These energy vectors have been considered as strategic options for the decarbonization of industrial sectors and to increase the competitiveness in the international scenario of countries that have a vast supply of renewable energy. However, the construction of factories, the exploitation of natural resources and the need for an appropriate logistics infrastructure bring regulatory challenges that need clear and stable legal frameworks. Legal certainty, in this sense, is crucial to attract investments and for the development of an integrated production chain.

The new environmental licensing framework, called the General Environmental Licensing Law – LGLA, Law No. 15,190, of August 8, 2025, and which came into force on February 4, 2026 (Brasil, 2025), is part of this environment of institutional transformations. By proposing adjustments in administrative procedures and in the distribution of competences, it seeks to provide greater predictability to state decisions. At the same time, it raises debates about the preservation of environmental principles and the maintenance of adequate control standards. The analysis of this normative reconfiguration becomes, therefore, relevant to understand its effects on the energy transition and on Brazil's position in the international market for green hydrogen and ammonia.

The investigation was conducted with a qualitative focus and employed two types of research: bibliographic and documentary. This research aims, in general, to investigate how the new framework of Brazilian environmental licensing influences the legal certainty and the strengthening of the hydrogen and green ammonia industry within the energy transition, while seeking to identify both the regulatory challenges and the institutional opportunities that can promote sustainable development for the sector. The specific objectives outlined are: To analyze the evolution of the rules on environmental licensing in Brazil in comparison with the principles of legal certainty aimed at renewable energy projects; Investigate the main regulatory and environmental obstacles to the implementation of hydrogen and green

ammonia projects in Brazil; and, finally, to assess how the new legal framework for environmental licensing can affect the attraction of investments, international competitiveness and the consolidation of the hydrogen and green ammonia production chain in Brazil.

The article is divided into four interconnected sections. The Introduction brings the context and the outline of the research problem, placing the reader at the center of the current discussion on energy transition and legal certainty. The Methodology details the theoretical options and the steps followed, ensuring that the research has transparency and scientific rigor. The Theoretical Foundation establishes the analytical axes that support the research, connecting environmental licensing, the regulatory aspects of the hydrogen and green ammonia industry, and the new legal framework, to provide a solid basis for the reflections and conclusions that follow.

2 METHODOLOGY

The research was elaborated with a qualitative approach, which is appropriate for the analysis of legal phenomena that are complex and socially situated. According to Creswell (2014), qualitative research makes it possible to explore meanings, interpretations, and processes within an institution that cannot be quantified. The aforementioned perspective is of special relevance in environmental licensing, since it encompasses the understanding of norms, administrative practices, regulatory conflicts and institutional arrangements that organize the actions of the State and economic agents. By valuing interpretation, qualitative analysis helps in the investigation of how the new legal framework impacts legal certainty and the structuring of the green hydrogen and ammonia industry in Brazil.

Two research methods were used: bibliographic research and documentary research. According to Köche (2011), the detailed description of the methodological procedures guarantees the relationship of scientific rigor and the consonance between what is intended and the techniques used. Bibliographic research is a fundamental stage in academic production, as it enables the recognition of the state of the art, the mapping of different theoretical currents and the placement of the research problem within a broader scientific debate. As Batista and Kumada (2021) point out, its various configurations allow the organization and interpretation of already consolidated contributions, serving as a consistent basis for critical analysis and reasoned propositions.

The bibliographic research, which supported the study in question, was based on 15 scientific sources, including books, academic articles and reports published in specialized journals. This set of resources made it possible to analyze both the theoretical foundations of

environmental licensing and the recent discussions on the new legal framework and the energy transition. The diversity of sources ensured a broad understanding of the theme, with the combination of doctrinal perspectives, institutional analyses and positions of the productive sector, which makes the research even more solid from a scientific point of view.

The documentary research, in turn, was supported by the analysis of institutional documents relevant to the understanding of the regulatory and economic context of the sector. According to Piana (2009), documentary research makes it possible to access records produced by official bodies and specialized entities, contributing to the analytical reconstruction of public policies and normative processes. In this sense, the IEA report was examined. *Ammonia Technology Roadmap: Towards More Sustainable Nitrogen* (2021), the IPEA study *Institutional Constraints on the Execution of Investments in Economic Infrastructure in Brazil: Environmental Licensing* (2017), as well as the new regulatory framework for Brazilian environmental licensing, instituted by Law No. 15,190, of August 8, 2025, which provides for environmental licensing and regulates item IV of paragraph 1 of article 225 of the Federal Constitution. These documents offer technical, institutional, and legal subsidies for the analysis of Brazil's insertion in the global green hydrogen and ammonia market, as well as for the understanding of the regulatory challenges inherent to environmental licensing in the context of the energy transition.

3 THEORETICAL FOUNDATION

The theoretical foundation was arranged in an organized way in three axes that are interrelated, aiming to ensure a logical coherence in the analysis that is presented. In the first segment, 3.1 Environmental Licensing, Legal Security and Energy Transition in Brazil, the conceptual and normative elucidation that underlies the discussion is made, aligning environmental principles with legal certainty in the process of transformation of the energy matrix. The second, 3.2 Regulatory and Environmental Aspects of the Green Hydrogen and Ammonia Industry, investigates the technical and legal aspects of these projects in function of territorial and environmental constraints. Finally, item 3.3 New Framework for Environmental Licensing and Environment of investments for Clean Energy makes a critical analysis of recent changes in legislation and their impacts on the predictability of standards, the reduction of legal risks and Brazil's competitiveness in the global market for low-emission energy.

3. 1 ENVIRONMENTAL LICENSING, LEGAL CERTAINTY AND ENERGY TRANSITION IN BRAZIL

Environmental licensing in Brazil has evolved in parallel with the consolidation of Environmental Law as an autonomous and properly structured branch since the 1988 Constitution. According to Antunes (2023), licensing is the most important instrument of the National Environmental Policy, making the principles of legality, prevention, and precaution real. Its normative evolution in recent decades shows a constant effort to reconcile environmental preservation and economic growth, especially in strategic sectors, such as renewable energy. Legal certainty, in this context, gains relevance, as the predictability of rules and the stability of administrative decisions are factors that impact the viability of large enterprises.

The inclusion of the climate variable in the licensing process enriches this discussion and accentuates the urgency of normative coherence. Feldmann (2025) argues that the explicit inclusion of climate impacts in the licensing process not only complies with international environmental commitments, but also strengthens legal certainty by reducing the possibilities of interpretative uncertainty. By incorporating objective criteria regarding emissions and energy transition, the State provides more defined parameters for investors and society, preventing contradictory decisions and prolonged disputes. In this way, regulatory stability is no longer just a market request, but becomes a fundamental component of contemporary environmental governance.

In the current context of constitutionalism focused on environmental issues, the environmental licensing process has been understood in a broader way, not being restricted to a simple administrative procedure. Instead, it is seen as an important legal instrument that plays a key role in the organization and implementation of the National Environmental Policy. This perspective highlights the relevance of licensing for environmental protection and the sustainable management of natural resources, evidencing its structuring function within the normative framework that aims at the conservation of the environment. Within this perspective, the authors Coelho, Silva, and Serafim (2023) argue that the institute in question needs to be understood under the aegis of the constitutional principles that promote the protection of the environment. This is necessary to ensure that there is an appropriate balance between economic progress and the preservation of ecology.

Thus, the interpretation must consider the importance of harmonizing these two aspects. This perception highlights that the validity of the licensing process is directly related to attention to criteria that are technical, legal and also institutional. These criteria play a

fundamental role, as they are capable of providing greater stability and security in the decisions that are made in the administrative sphere.

Thus, strict compliance with these criteria is essential to ensure that licensing is considered legitimate and reliable, thus avoiding uncertainties and wear and tear in possible future decisions. In the current scenario of the energy transition, which seeks sustainable alternatives and the expansion of new production chains, including the production of hydrogen and green ammonia, the analysis presented here clearly highlights the strategic role that environmental licensing plays.

This licensing becomes essential to intermediate, in a balanced way, the attraction of investments and the protection of the fundamental right of all citizens to an environment that is ecologically balanced and healthy. Thus, this mediation function is crucial to ensure that economic development occurs in harmony with environmental preservation.

According to the institutional perspective, the Ipea study (2017) points out that obstacles in the licensing process are one of the main factors that prevent investments in economic infrastructure in Brazil. The slowness of the processes, the duplicity of competences and the lack of a stable interpretation are indicated as factors that increase costs and increase legal risks.

Particularly in projects linked to the energy transition, such as those focused on the production of hydrogen and green ammonia, such issues become strategic. To harmonize environmental protection, legal certainty and expansion of renewable energies in Brazil, it is crucial to create a stable, coherent and technically grounded regulatory environment.

3. 2 REGULATORY AND ENVIRONMENTAL ASPECTS OF THE GREEN HYDROGEN AND AMMONIA INDUSTRY

The development of the green hydrogen and ammonia industry in Brazil goes beyond the mere availability of renewable sources, involving a cohesive set of technical, socio-environmental and regulatory constraints. According to Ronceros et al. (2025), the generation of green hydrogen requires a significant availability of renewable electricity, an appropriate infrastructure for electrolysis, and well-defined regulatory frameworks on the legal status of the fuel. The lack of clear normative definitions on classification, authorisation and administrative powers tends to increase investor uncertainty and make it difficult to implement large-scale projects.

In technological and environmental terms, green ammonia is positioned as a key element for the storage and transport of hydrogen, especially in logistics chains destined for export. According to Duarte et al. (2025), although ammonia as a hydrogen carrier brings

logistical benefits, it entails challenges in terms of emission control, operational safety, and the need to adjust industrial plants to current environmental regulations. In light of an international perspective, the IEA report (2021) emphasizes that the decarbonization of ammonia production depends on technological updating, integration with renewable energy sources, and stable public policies, elements that directly influence the structure of the environmental licensing of these operations.

In order to systematize the main regulatory and environmental obstacles identified in the literature, Table 1 is presented.

Table 1

Main regulatory and environmental obstacles to the implementation of green hydrogen and ammonia projects in Brazil

Dimension	Obstacles identified	References
Regulatory	Absence of a consolidated regulatory framework and clear definition of administrative competencies	Ronceros et al. (2025)
Technological and industrial	Need for plant modernization and integration with renewable sources	IEA (2021); Duarte et al. (2025)
Environmental	Requirements related to emission control and operational safety	Duarte et al. (2025); IEA (2021)
Infrastructure and natural resources	Dependence on stable renewable energy, intensive use of water and adequacy of logistics and port infrastructure	Ronceros et al. (2025); Kaleem, Zaman and Rajakaruna (2024)

Source: Based on Duarte et al. (2025), IEA (2021), Kaleem, Zaman and Rajakaruna (2024) and Ronceros et al. (2025).

The territorial dimension also deserves attention, especially regarding the use of water resources and the installation of industrial complexes in coastal areas close to organized ports. Kaleem, Zaman, and Rajakaruna (2024) emphasize that the expansion of green hydrogen depends on reliable energy infrastructure and distribution systems adapted to new demands, including in decentralized applications. In the Brazilian context, this reality implies making water use grants, connection to the electricity grid and environmental licenses compatible, in an institutional arrangement that still seeks greater coordination between the federative entities.

3.3 NEW FRAMEWORK FOR ENVIRONMENTAL LICENSING AND ENVIRONMENTAL INVESTMENTS FOR CLEAN ENERGY

The new legal framework for environmental licensing is part of a broader process of restructuring the institutional bases of environmental policy in Brazil. According to Christian (2025), the Senate's approval of the new framework was an attempt to standardize

procedures and bring more clarity to the phases of the licensing process. The aforementioned regulatory reorganization is related to the search for regulatory predictability, especially in areas that require high capital and technology investments, such as the production of green hydrogen and ammonia, whose consolidation depends on consistent and technically grounded administrative decisions.

From a dogmatic perspective, Farias (2025, p. 26) recalls that environmental licensing is a preventive instrument aimed at making economic activity compatible with environmental protection. The legislative update, in this sense, cannot be understood only as a measure of procedural simplification, but as a redefinition of the legal guidelines that guide state action. Kassmayer (2025) problematizes precisely this point when inquiring about the concrete effects of the new framework on administrative practice, highlighting that the reduction of interpretative uncertainties can contribute to mitigating legal risks, as long as the technical and constitutional parameters that structure the environmental system are preserved. In order to systematize the main effects of the new legal framework on the environment of investments in clean energy, Table 2 is presented.

Table 2

Reflections of the new environmental licensing framework on the environment of investments in hydrogen and green ammonia

Aspect analyzed	Legislative change or identified effect	Expected impact on investments and competitiveness	References
Regulatory predictability	Standardization of procedures and definition of clearer steps	Reduced uncertainties and greater legal certainty for large-scale projects	Christian (2025); Nigris (2025)
Legal risks	Search for objective criteria and delimitation of competencies	Litigation mitigation and increased institutional trust	Kassmayer (2025); Farias (2025)
Economic environment	Positive signal to the productive sector and industry	Expansion of investments and strengthening of the clean energy chain	Barollo and Seixas (2025)
International insertion	Regulatory compliance with environmental governance standards	Brazil's greater competitiveness in the global hydrogen and green ammonia market	Christian (2025); Nigris (2025)

Source: Source: Based on Christian (2025), Barollo and Seixas (2025), Kassmayer (2025), Farias (2025) and Nigris (2025).

The economic repercussion of the legislative changes has also been emphasized by representatives of the productive sector. Barollo and Seixas (2025) report that industrial entities evaluate the approval of the project as a measure capable of expanding investments and favoring sustainable development. In a similar vein, Nigris (2025) points out that the new framework seeks to establish more objective criteria for the classification of enterprises, which tends to positively impact the perception of legal certainty in the business environment. In the

specific case of the hydrogen and green ammonia production chain, such a scenario can influence Brazil's international competitiveness, especially in the face of the growing global demand for low-emission fuels.

4 FINAL CONSIDERATIONS

The energy transition places the Brazilian State in front of the challenge of harmonizing economic growth, technological innovation, and environmental conservation, all in an increasingly complex regulatory environment. In this sense, the new environmental licensing framework is crucial, especially when considering the strengthening of the green hydrogen and ammonia industry as a means of positioning itself on the international scene and transforming Brazil's energy matrix. The investigation carried out in this study sought to understand how this new normative arrangement can impact legal certainty and the investment climate in Brazil.

The study managed to achieve all the goals and objectives that were proposed at the beginning. It was possible to carry out a detailed study on the evolution of the rules that govern environmental licensing in Brazil and its relationship with the principles of legal certainty applicable to renewable energy projects. This connection is crucial to understand how guidelines and regulations have evolved over time, demonstrating the need to ensure not only the protection of the environment, but also the stability and legal predictability for enterprises in the sector. Thorough studies were also conducted on the regulatory hurdles and environmental issues surrounding the implementation of green hydrogen and ammonia projects. In addition, a thorough analysis was carried out on how the new legal framework can impact the ability to attract investments, international competitiveness, and the consolidation of the production chain of these sustainable fuels.

The results showed that regulatory stability and clarity in procedures are crucial factors for reducing legal risks in industries that depend heavily on capital and technology. It was shown that the lack of firm definitions, the overlapping of attributions and interpretative doubts tend to impair the predictability of regulation. It was also found that legislative adjustments, guided by technical criteria and respecting environmental constitutional principles, can help create a more consistent and reliable institutional environment.

The investigation also revealed that the expansion of the hydrogen and green ammonia industry in Brazil depends on a consistent articulation between energy policy, natural resource management and environmental governance. Environmental licensing, far from representing a mere bureaucratic obstacle, is an instrument for the organization of the territory and mediation between public and private interests. When structured in a balanced

way, it can favor the country's insertion in the global market for low-emission energy, without removing the requirements of environmental control and responsibility.

As a future agenda, it is recommended the development of empirical studies aimed at the analysis of concrete cases of licensing of hydrogen and green ammonia projects, focusing on the practical application of the General Environmental Licensing Law. Comparative research that examines regulatory experiences in other countries and investigations that evaluate the regional socioeconomic impacts resulting from the installation of these projects are also relevant.

ABSTRACT

Leadership has become a central dimension in understanding strategic implementation processes within organizations operating in environments marked by competitiveness, constant change, and the ongoing need for adaptation. This chapter examines how business leaders from medium- and large-sized companies perceive their role in conducting organizational growth strategies, considering the articulation between people, processes, and results. The study adopted a mixed-methods approach and was developed through a survey based on a structured questionnaire applied to 16 leaders holding strategic positions across different organizational sectors. The findings indicate that leadership is recognized as a structuring element of strategic execution, particularly regarding clarity in goal definition, encouragement of collaboration, and systematic monitoring of organizational performance. Participants' narratives further reveal that leaders perceive themselves as mediators between planning and practice, responsible for aligning teams, fostering autonomy, and sustaining adaptation processes. It is concluded that leadership performs an integrative role in organizational growth processes, contributing to strategic effectiveness in complex organizational contexts.

RESUMEN

El liderazgo se ha consolidado como una dimensión central en la comprensión de los procesos de implementación estratégica en organizaciones insertas en entornos marcados por la competitividad, el cambio y la necesidad continua de adaptación. En este capítulo se analiza cómo los líderes empresariales de empresas medianas y grandes perciben su actuación en la conducción de estrategias de crecimiento organizacional, considerando la articulación entre personas, procesos y resultados. La investigación, con un enfoque cualitativo-cuantitativo, fue desarrollada mediante una encuesta con la aplicación de un cuestionario estructurado a 16 líderes con actuación estratégica en diferentes sectores organizacionales. Los resultados indican que el liderazgo es reconocido como un elemento estructurante de la ejecución estratégica, especialmente en lo que respecta a la claridad en la definición de objetivos, el fomento de la colaboración y el seguimiento sistemático del desempeño organizacional. Las narrativas de los participantes también revelan que los líderes se perciben como mediadores entre la planificación y la práctica, responsables de alinear equipos, promover la autonomía y sostener procesos de adaptación. Se concluye que el liderazgo desempeña una función integradora en los procesos de crecimiento organizacional, contribuyendo a la efectividad estratégica en contextos organizacionales complejos.

1 INTRODUCTION

Contemporary organizations are inserted in environments marked by accelerated transformations, high competitiveness and permanent need for adaptation. Technological changes, economic reconfigurations, new forms of work organization and growing demands for innovation make strategic decisions cease to be punctual events and become continuous processes of interpretation and response to the environment. In this scenario, organizational growth does not only mean expanding operations or results, but developing internal capacity for coordination, learning, and adaptation.

Organizational expansion, especially in medium and highly complex business contexts, requires more than formal planning instruments. Although strategic plans, indicators and goals remain central to contemporary management, their effectiveness depends on the way they are appropriated in the organizational routine. Between planning and practice there is a relational space in which decisions need to be translated, priorities need to be negotiated, and people need to be mobilized. It is precisely in this space that leadership plays a decisive role.

Recent literature has shown that leadership cannot be understood only as a hierarchical exercise of authority. It is a social process of influence, construction of meaning and institutional mediation, through which leaders articulate expectations, guide behaviors and produce conditions for the execution of collective objectives. In complex organizational environments, leadership begins to operate as a link between strategic rationality and human dynamics, connecting organizational goals to daily work practices.

Such an understanding becomes even more relevant when analyzing strategies aimed at organizational growth. Processes of expansion, innovation, competitive repositioning and increase in production capacity imply internal changes that often require redefinition of roles, reorganization of decision-making flows and strengthening of the capacity for coordination between different areas. In these circumstances, leadership ceases to be just a supervisory function to assume a role of sustaining the conditions that make strategic implementation possible.

Bernardes and Ferreira (2023) highlight that organizational growth results from the articulation between institutional context, organizational competencies, and leadership's capacity for strategic action. Such a perspective shifts the debate on growth as a simple consequence of technical decisions to understand it as a process dependent on the way the organization mobilizes its human and symbolic resources. Growth, in this sense, also involves consolidating forms of leadership capable of producing alignment and direction.

At the same time, recent studies have shown that leadership styles directly influence

the quality of work relationships and the organizational climate, affecting levels of trust, engagement, and willingness to change. Poubel, Sincorá and Brandão (2022) show that transformational leadership favors well-being at work and expands the capacity for collective mobilization, especially in contexts that require continuous learning and adaptation.

The relationship between leadership and strategic implementation is also expressed in the way leaders communicate objectives, build legitimacy, and distribute responsibilities. Organizations often have clear guidelines at the formal level, but they face difficulties when these guidelines need to be incorporated into routines, intermediate decisions, and collective behaviors. The distance between formulation and execution remains one of the main challenges of contemporary strategic management.

A significant part of these difficulties stems from factors that go beyond the technical design of the strategy. Cultural resistance, insufficient communication, decision-making ambiguities and lack of coordination between organizational areas become recurrent obstacles to the implementation of growth initiatives. In these cases, leadership assumes a mediating role, capable of reducing uncertainties and producing coherence between strategic direction and organizational action.

From this perspective, understanding leadership also implies analyzing its relational dimension. Leaders not only set priorities, but produce environments of trust, influence perceptions of legitimacy, and organize shared meanings about change and performance. The daily performance of leadership becomes, therefore, a decisive component for sustaining lasting strategic processes.

Mata, Ferreira, and Bastos Filho (2024) demonstrate that situational leadership contributes to the formation of more responsive organizational environments, by adapting behaviors to the concrete needs of teams and contextual challenges. This flexibility becomes especially relevant in growth scenarios, in which different sectors and hierarchical levels respond unevenly to organizational transformations.

People development is also part of this debate as an inseparable dimension of strategic leadership. Martins et al. (2024) point out that the leader's mindset directly influences the organizational capacity for learning, innovation, and adaptation. Growth-oriented leaders tend to value mistakes as a possibility for development, strengthening organizational cultures that are more open to experimentation and the collective construction of solutions.

In addition, Oliveira et al. (2022) highlight that leadership directly interferes with emotional health and organizational climate, demonstrating that practices based on listening, communicational clarity, and professional recognition contribute to more stable and

cooperative environments. In contexts of strategic implementation, such elements cease to be ancillary and become part of the very conditions of viability of the strategy.

It is in this set of relationships that the purpose of this chapter is situated: to understand how leadership acts in the implementation of organizational growth strategies from the perception of business leaders inserted in medium and large companies. More than identifying isolated practices, it seeks to interpret how these professionals mean their performance in processes of coordination, adaptation and construction of results.

The analytical path is based on the understanding that leadership does not act in isolation, but in permanent interaction with organizational climate, institutional culture, decision-making processes, and governance practices. Thus, organizational growth is approached as a multidimensional phenomenon, in which people, structures, and strategies are dynamically articulated.

Methodologically, the study adopts a qualitative-quantitative approach, articulating data obtained by survey with interpretative analysis of the perceptions expressed by the participants. This combination allows you to simultaneously examine general trends and meanings attributed by leaders themselves to the experience of conducting strategic processes in complex organizational environments.

2 ORGANIZATIONAL LEADERSHIP: CONCEPTS AND APPROACHES

2.1 LEADERSHIP IN THE CONTEMPORARY ORGANIZATIONAL CONTEXT

Leadership is understood as a process of intentional influence that aims to guide individuals and teams towards common goals. In the organizational environment, leading means going beyond the occupation of a formal position, involving the ability to inspire, coordinate efforts and promote collective engagement. According to Oliveira et al. (2022), the leader's performance has a direct impact on the organizational climate and on the emotional health of employees, demonstrating that effective leadership is related not only to operational results, but also to people's well-being and the quality of work relationships.

In the current context, marked by constant transformations and high competitiveness, leadership assumes an essentially strategic character. Leaders become central agents in the conduct of organizations, acting as mediators between planning and execution. Bernardes and Ferreira (2023) highlight that organizational growth depends on the articulation between context, internal competencies, and roles played by leaders, showing that strategic decisions only materialize when there is leadership capable of aligning people and processes with institutional goals.

In addition, the literature points out that leadership involves a set of technical and

behavioral competencies that are indispensable to organizational performance. Clear communication, decision-making skills, conflict management, and people development are fundamental attributes for the leader to exert a positive influence on his team. In this sense, Martins et al. (2024) argue that the leader's mindset – whether fixed or growth – directly interferes in the way he faces challenges, leads changes and stimulates organizational learning, reinforcing the idea that leading is also a process of cultural construction.

Finally, it is understood that leadership does not manifest itself in a single or static way, but as an adaptive practice to the demands of the environment. Different leadership styles have different impacts on team engagement, satisfaction, and productivity. Mata et al. (2024) demonstrate that situational leadership, by adapting behaviors to the needs of the subordinates, contributes to the construction of a more favorable organizational climate. Similarly, Poubel et al. (2022) point out that transformational leadership approaches favor the implementation of strategies and the achievement of better institutional results. Thus, understanding the fundamentals of leadership becomes an indispensable condition to analyze its role in the implementation of organizational growth strategies.

2.2 LEADERSHIP STYLES AND THEIR IMPACTS

Leadership styles represent different ways in which leaders exert influence on their teams and drive organizational processes. The specialized literature shows that there is no single leadership model capable of meeting all situations, and it is necessary to consider the context, the characteristics of the subordinates and the strategic objectives of the organization. In this sense, Mata et al. (2024) state that situational leadership stands out for its flexibility, allowing the leader to adapt his behavior to the specific needs of the team, favoring a more productive and collaborative organizational climate.

Among the most discussed styles in the field of management, transformational leadership has received special attention for its positive impact on organizational performance. According to Poubel et al. (2022), transformational leaders are able to inspire their subordinates, stimulate the development of competencies, and promote greater engagement with institutional objectives. This leadership style contributes to the creation of more innovative work environments and to overcoming organizational challenges, and is especially relevant in contexts of implementing growth strategies.

Another relevant aspect concerns the influence of behavioral and cognitive factors on leadership practice. Martins et al. (2024) highlight that the leader's mindset plays a decisive role in the way he leads his team and faces adverse situations. Leaders with a growth mindset tend to see mistakes as learning opportunities, encouraging autonomy and innovation. On

the other hand, leaders with a fixed mindset have greater resistance to change and less openness to development, which can compromise the effectiveness of organizational strategies.

In addition to the impacts on performance and results, leadership styles also directly influence the well-being and emotional health of employees. Oliveira et al. (2022) show that leadership based on clear communication, emotional support, and professional recognition contributes to the improvement of the organizational climate and the reduction of stress factors at work. Thus, understanding the different leadership styles and their effects becomes essential to analyze how leaders can act more effectively in leading teams and implementing organizational growth strategies.

3 LEADERSHIP AND ORGANIZATIONAL CLIMATE

3.1 LEADERSHIP AS A DETERMINING FACTOR OF THE ORGANIZATIONAL CLIMATE

Organizational climate refers to the set of perceptions shared by employees about the work environment, management practices, and interpersonal relationships established in the organization. This climate directly influences aspects such as team motivation, productivity, satisfaction, and commitment. Several studies point out that leadership plays a central role in the formation and maintenance of this environment, since the leader's behavior defines patterns of communication, recognition, and interaction within the organization (Oliveira et al., 2022).

The way leaders lead their teams directly impacts the quality of work relationships and the level of employee engagement. Mata et al. (2024) highlight that situational leadership, by adapting its style to the needs of the subordinates, favors the creation of a healthier and more productive organizational climate. When the leader demonstrates support, clarity in guidelines and openness to dialogue, he tends to promote greater trust and cooperation among team members, fundamental elements for the achievement of institutional objectives.

In addition, the organizational climate is closely related to the ability of organizations to implement changes and strategies. Environments characterized by poor communication, frequent conflicts, and low employee participation tend to hinder the execution of strategic plans. In this sense, Poubel et al. (2022) state that transformational leadership practices contribute to building a more favorable climate for innovation and development, strengthening the alignment between people and organizational goals.

Another relevant factor concerns the influence of the leader's mindset in building the organizational climate. Martins et al. (2024) argue that leaders with a growth mindset encourage continuous learning, value collaboration, and encourage employee autonomy,

which results in more positive and development-oriented environments. Thus, it is evident that leadership not only interferes in individual and collective performance, but also constitutes a determining element for the creation of an organizational climate capable of sustaining processes of change and growth.

3.2 MINDSET, CULTURE AND PEOPLE DEVELOPMENT

The concept of mindset has been widely discussed as a fundamental element to understand the behavior of leaders and their influence on teams. According to Martins et al. (2024), mindset can be understood as the set of beliefs and attitudes that guide the way an individual interprets challenges, learns from mistakes, and positions himself in the face of change. In the organizational context, leaders with a growth mindset tend to encourage continuous learning, innovation, and collaboration, creating favorable conditions for the development of people and the strengthening of organizational culture.

Organizational culture, in turn, is built from shared values, practices, and behaviors, and is strongly influenced by the performance of leaders. When the leader adopts a posture open to dialogue, feedback, and constant improvement, he contributes to the formation of more participatory and development-oriented environments. In this sense, Oliveira et al. (2022) emphasize that leaders who value emotional support, recognition, and transparent communication favor the creation of a healthier organizational climate, positively impacting team engagement and performance.

People development is another aspect directly related to the mindset and culture promoted by leaders. Organizations that invest in the training of their employees and encourage autonomy tend to have a greater capacity for adaptation and innovation. Poubel et al. (2022) show that transformational leadership practices encourage the professional and personal growth of individuals, strengthening commitment to strategic objectives and expanding organizational capacity to respond to challenges and opportunities.

Thus, it is understood that the alignment between growth mindset, organizational culture, and people development is essential for the effectiveness of leadership. Mata et al. (2024) demonstrate that leaders who are able to adjust their style to the needs of the team and promote continuous learning environments contribute to building more resilient organizations that are prepared to implement strategies. Thus, the role of the leader goes beyond the coordination of tasks, becoming a central agent in the formation of a culture that values human development as the basis for organizational growth.

4 ORGANIZATIONAL GROWTH STRATEGIES

4.1 CONCEPTS OF ORGANIZATIONAL STRATEGY

Organizational strategy can be understood as the set of guidelines and planned actions that guide the organization in the pursuit of its long-term objectives. It is a continuous process of defining goals, allocating resources, and choosing paths that allow the company to position itself competitively in the market. In the contemporary business environment, marked by uncertainties and constant changes, strategy plays a fundamental role in ensuring the sustainability and growth of organizations.

Traditionally, strategy is conceived as a process involving two complementary dimensions: formulation and implementation. Formulation concerns the definition of organizational plans, goals, and policies, while implementation refers to the transformation of these plans into concrete actions. Bernardes and Ferreira (2023) highlight that organizational growth does not depend only on the development of good strategies, but mainly on the organization's ability to articulate them with its internal competencies and with the effective performance of leaders, responsible for conducting the strategic execution process.

In addition, organizational strategy is directly related to the ability of companies to adapt to the context in which they are inserted. Technological changes, competitive pressures, and transformations in consumer behavior require organizations to respond quickly and flexibly. In this sense, strategy should be understood as a dynamic process and not just as a static plan. Poubel et al. (2022) argue that organizations that are able to align strategies with effective leadership practices are more likely to achieve consistent and sustainable results.

Another relevant aspect refers to the role of people in the strategic process. The execution of any strategy depends fundamentally on the engagement and coordinated action of employees. Therefore, organizational strategy cannot be dissociated from human and cultural factors. Mata et al. (2024) point out that strategic success is strongly conditioned by the ability of leaders to mobilize teams, promote internal alignment, and create environments conducive to innovation and performance. Thus, understanding the concepts of organizational strategy is essential to analyze how leadership acts as a key element in the implementation of growth strategies.

4.2 THE STRATEGIC IMPLEMENTATION PROCESS

Strategic implementation corresponds to the set of actions and decisions necessary to transform plans and guidelines into concrete results. While strategic formulation defines "what to do", implementation answers the "how to" question, involving the coordination of

people, processes, and resources. Several studies indicate that most of the difficulties faced by organizations are not in the elaboration of strategies, but in their effective execution, evidencing the complexity of this process.

The strategic implementation process requires alignment between different organizational levels and clarity in communicating objectives. Bernardes and Ferreira (2023) emphasize that organizational growth depends on the ability of leaders to articulate strategies with internal competencies and to promote coherence between strategic decisions and daily practices. Without this alignment, even well-structured strategies tend to lose effectiveness, resulting in poor performance and wasted resources.

Another determining factor for the successful implementation of strategies is the engagement of teams. Strategic execution involves changes in behavior, adoption of new practices, and overcoming internal resistance. In this sense, Poubel et al. (2022) highlight that transformational leadership styles favor employee commitment, stimulating cooperation and willingness to face organizational challenges. Leaders who communicate clearly, offer support, and value the development of people contribute significantly to the effectiveness of the strategic process.

In addition, strategic implementation is directly related to the organizational climate and the ability of leaders to adapt. Mata et al. (2024) state that situational leadership, by adjusting behaviors to the team's needs and context, creates more favorable conditions for the execution of strategies. Martins et al. (2024) add that leaders with a growth mindset tend to see difficulties as learning opportunities, favoring innovation and problem-solving. Thus, strategic implementation reveals itself to be an essentially human and relational process, in which leadership plays a decisive role in achieving organizational results.

4.3 LEADERSHIP AND ORGANIZATIONAL GROWTH

Organizational growth is one of the main strategic objectives of companies and involves processes of expansion, innovation, increased competitiveness and continuous improvement of performance. However, the simple planning of actions aimed at growth does not guarantee their effectiveness. The literature has shown that the success of expansion strategies depends decisively on the ability of leaders to lead people and processes towards organizational objectives. In this sense, leadership is a central element in the articulation between planning and strategic execution.

Bernardes and Ferreira (2023) highlight that organizational growth results from the interaction between three fundamental dimensions: the institutional context, organizational competencies, and the role played by leaders. According to the authors, effective leaders are

able to interpret external demands, mobilize internal resources, and promote decisions aligned with the needs of the environment. Thus, growth should not be understood only as a consequence of good strategies, but as a result of leadership practices that favor learning, innovation, and organizational adaptation.

The relationship between leadership and growth is also evident in the ability of leaders to create environments conducive to strategic execution. Poubel et al. (2022) argue that transformational leadership has a direct impact on institutional performance by stimulating employee engagement, motivation, and development. Leaders who communicate a clear vision, inspire confidence, and encourage active team participation significantly increase the chances of success of strategic growth-oriented initiatives.

Another relevant aspect refers to the influence of the organizational climate on the expansion process of companies. Mata et al. (2024) demonstrate that situational leadership, by adapting behaviors to the characteristics of the subordinates and the demands of the context, contributes to the formation of more collaborative and productive environments. Such environments favor the implementation of changes, the overcoming of internal resistance, and the alignment of teams around strategic goals, indispensable factors for sustainable organizational growth.

In addition to the organizational climate, the mindset of leaders plays a decisive role in driving growth. Martins et al. (2024) state that leaders with a growth mindset tend to value continuous learning, innovation, and people development, essential characteristics in organizational expansion processes. On the other hand, leaders with a fixed mindset may have greater difficulty in dealing with uncertainties and transformations, limiting the organization's ability to take advantage of growth opportunities.

The well-being and emotional health of teams also relate directly to the ability of organizations to grow consistently. Oliveira et al. (2022) point out that leaders who offer support, recognition, and transparent communication contribute to the creation of psychologically healthy environments, reducing stress levels and increasing employee commitment. More engaged and emotionally balanced teams tend to perform better, which is positively reflected in the organization's strategic results.

In addition, organizational governance and compliance practices influence the growth process by establishing ethical and management standards that strengthen internal and external trust. Paz, Azevedo, and Sousa (2023) show that organizational environments structured on principles of compliance and transparency favor safer decisions that are aligned with strategic objectives. In this context, leadership plays a fundamental role in promoting an organizational culture based on integrity, responsibility, and results-orientation.

In view of these considerations, it is observed that leadership acts as an integrating axis between strategy, people and results, constituting a decisive factor for organizational growth. Leaders' ability to communicate vision, mobilize teams, adapt to dynamic contexts, and foster innovation-friendly environments is essential for organizations to be able to transform strategic intentions into effective performance. Thus, understanding the relationship between leadership and organizational growth becomes indispensable to analyze how leadership practices influence the implementation of strategies and the sustainability of business development.

5 LEADERSHIP, GOVERNANCE AND ORGANIZATIONAL ENVIRONMENTS

5.1 ETHICS, GOVERNANCE AND COMPLIANCE

The effectiveness of organizational strategies is directly related to the governance environment in which the organization is inserted. Management practices based on ethics, transparency and regulatory compliance are essential pillars for institutional credibility and for the sustainability of business growth. In this context, corporate governance and compliance emerge as mechanisms that guide strategic decisions and reduce organizational risks, strengthening the trust of internal and external stakeholders (Paz, Azevedo & Sousa, 2023).

Compliance can be understood as the set of procedures and controls aimed at ensuring that the organization acts in accordance with laws, standards, and ethical principles. More than a control instrument, compliance represents a strategic element that contributes to the improvement of decision-making processes and the construction of an integral organizational culture. Paz, Azevedo, and Sousa (2023) show that companies that adopt consistent compliance practices tend to have greater managerial maturity and better alignment between organizational objectives and professional conduct.

In this scenario, leadership plays a decisive role in promoting ethical values and consolidating governance practices. The way leaders lead their teams and make decisions directly influences organizational behavior and the perception of legitimacy of strategic actions. Bernardes and Ferreira (2023) highlight that sustainable organizational growth depends on the ability of leaders to integrate governance principles into daily practices, ensuring coherence between discourse and action.

In addition, organizational environments guided by ethics and transparency tend to favor the implementation of growth strategies. Leaders who value integrity, respect for standards, and social responsibility contribute to the creation of relationships of trust, an indispensable factor for team engagement and the effective execution of strategies. Thus,

the articulation between ethics, governance, and compliance is a fundamental component for leadership to be able to exercise its role legitimately and effectively, promoting an organizational environment conducive to development and sustainable growth.

5.2 THEORETICAL SYNTHESIS AND CONCEPTUAL MODEL

The theoretical review shows that leadership is a central element for the effectiveness of organizational strategies and, consequently, for the growth of companies. The different authors analyzed demonstrate that strategic implementation is not limited to technical or formal aspects of planning, but depends fundamentally on the performance of leaders in conducting people, processes and decisions. Bernardes and Ferreira (2023) reinforce that organizational growth results from the articulation between context, internal competencies, and leadership practices, confirming that the execution of strategies is directly associated with the ability of leaders to mobilize resources and align collective efforts.

Studies on leadership styles and organizational climate reveal that the leader's behavior decisively influences team engagement and the work environment. Mata et al. (2024) show that situational leadership favors adaptation to the demands of the context and the needs of employees, creating more appropriate conditions for the execution of strategies. In a complementary way, Poubel et al. (2022) highlight that transformational leadership practices stimulate motivation, learning, and commitment, essential elements for organizations to be able to transform strategic plans into effective results.

Another relevant aspect refers to the influence of the *leader's mindset* and organizational culture on the growth process. Martins et al. (2024) demonstrate that leaders with a growth mindset tend to promote more innovative, collaborative, and people-development-oriented environments, which expands the organizational capacity for adaptation and expansion. Oliveira et al. (2022) add that emotional support, clear communication, and professional recognition contribute to the construction of healthier organizational climates, favoring collective performance and the implementation of strategic changes.

The integration of these elements allows the construction of a conceptual model that guides the present study. From the literature analyzed, it is understood that leadership directly influences the organizational climate, team engagement and the quality of decision-making processes, factors that, in turn, impact the effectiveness of strategic implementation. Thus, a model is proposed in which the performance of leadership, mediated by communication, people management, ethics, and governance practices (Paz, Azevedo, & Sousa, 2023), contributes to the creation of favorable organizational environments and to the alignment of

teams, resulting in the successful implementation of organizational growth strategies.

Thus, the theoretical synthesis maintains that organizational growth should be understood as a multidimensional phenomenon, in which leadership, climate, culture, and governance act interdependently. This understanding underpins the methodological path adopted in the research and guides the analysis of the data collected, allowing us to examine how leadership practices, in the perception of business leaders, influence the implementation of strategies and the performance of organizations. The conceptual proposal constructed here does not intend to end the debate, but to offer an interpretative key capable of articulating leadership, organizational environment and strategic execution in business contexts marked by increasing complexity.

6 METHODOLOGY

To empirically understand how business leaders interpret their performance in the implementation of growth strategies, an investigative path of applied nature was adopted, with a qualitative-quantitative approach and an exploratory-descriptive design. The choice of this methodological design is justified by the need to understand, in depth, the perceptions of business leaders about the role of leadership in the implementation of organizational growth strategies. According to Gil (2019), exploratory research is indicated when greater familiarity with the investigated problem is sought, while descriptive studies allow the identification and analysis of characteristics of a certain phenomenon or social group.

As for the technical procedures, the survey method was adopted, with the application of a structured questionnaire composed of closed questions on a Likert scale and open questions, applied from December 2025 to January 2026. According to Creswell and Creswell (2021), the use of mixed instruments enables the collection of numerical and qualitative data, expanding the understanding of the investigated object. The research universe was made up of business leaders working in medium and large companies, and the sample was defined by accessibility and convenience, including professionals who perform strategic management functions in different organizational sectors.

Data collection took place electronically, by sending the questionnaire to previously invited participants. Quantitative data were treated by means of descriptive statistics, with analysis of frequencies and means of the answers obtained. The qualitative data, from the open questions, were examined based on content analysis, according to the procedures proposed by Bardin (2016), allowing the categorization and interpretation of the respondents' perceptions about leadership practices and their relationship with strategic implementation.

With regard to ethical aspects, the research strictly observed the guidelines

established for studies involving human beings. The project was submitted to the Research Ethics Committee (CEP) of the Federal Institute of Education, Science and Technology of Minas Gerais (IFMG), and was duly approved before the start of data collection, according to CAAE process: 92484425.5.0000.0293. All participants received information about the objectives of the study, guaranteed anonymity and confidentiality of the answers, expressing agreement through the Informed Consent Form (ICF).

Thus, the methodological path adopted allowed the obtaining of consistent information aligned with the proposed objectives, making it possible to analyze quantitative and qualitative data in an integrated way. The combination of these techniques favored the understanding of the investigated phenomenon from multiple perspectives, offering subsidies for the discussion about the role of leadership in the implementation of organizational growth strategies.

7 RESULTS AND DISCUSSIONS

7.1 CHARACTERIZATION OF THE PARTICIPANTS

The initial reading of the data allows us to observe that the study participants are mostly inserted in organizational contexts of high decision-making complexity, which gives interpretative density to the perceptions presented below, with a predominance of professionals with more than six years of leadership experience (62.5%). There is an age concentration between 31 and 40 years old (56.3%), in addition to the majority of activities in the industrial sector (68.8%) and in large companies (81.3%).

This profile indicates insertion in structured organizational contexts, with greater strategic complexity and formalization of decision-making processes, which gives consistency to the perceptions analyzed.

Table 1

Characterization of the study participants

Variable	Category	Frequency	Percentage
Time leadership in	1 to 3 years	4	25,0%
	4 to 6 years	2	12,5%
	More than 6 years	10	62,5%
Age group	Under 30 years old	1	6,2%
	31 to 40 years old	9	56,3%
	41 to 50 years old	5	31,3%
	Over 50 years old	1	6,2%

Gender	Women	5	31,3%
	Male	11	68,8%
Company Area	Industry	11	68,8%
	Services	3	18,8%
	Technology	2	12,5%
Company size	Medium	3	18,8%
	Large	13	81,3%

The data presented in Table 1 show that the participants have consolidated experience in strategic functions, which reinforces the validity of subsequent analyses about the implementation of organizational growth strategies. Although the sample is small, the profile of the participants indicates high strategic experience, which reinforces the interpretative quality of the data.

7.2 CORRESPONDENCE OF THE ANALYZED ASSERTIONS

The organization of the assertions used in the data collection instrument favors the integrated reading of the dimensions investigated, which is why Table 2 systematizes the correspondence between the analytical codes used and their respective statements.

Table 2

Correspondence between codes and assertions used in the research data collection instrument

Code	Assertive
P1	Clear definition of objectives and expectations for the team
P2	Actively encourages the exchange of ideas and collaboration within the team
P3	The leader demonstrates trust and transparency in his or her interactions with the team
P4	My company's leaders handle change and uncertainty well
P5	Leaders encourage team autonomy and decision-making
P6	Leadership fosters a collaborative environment
P7	Leaders constantly seek professional improvement
P8	Leadership actively contributes to the implementation of growth strategies
P9	The results obtained are often analyzed and adjusted as necessary
P10	Strategic decisions are based on data and performance indicators

It should be highlighted, in addition to Table 1, that all the statements used the four-point Likert scale, namely, disagree, partially disagree, agree and totally agree.

7.3 QUANTITATIVE ANALYSIS OF LEADERS' PERCEPTIONS

The reading of the quantitative data reveals a consistent pattern of agreement around dimensions considered central to the performance of leadership in organizational growth processes.

Figure 1

Leaders' perception of leadership practices and their influence on organizational growth

Source: Survey data (2026).

Figure 1 shows a consistent pattern of agreement in the assertions related to the communication of strategic objectives, trust in interactions, and the active role of leadership in the execution of strategies (P1, P2, and P3). This result reinforces the theoretical perspective that leadership acts as an articulating element between strategic formulation and implementation, as pointed out by Bernardes and Ferreira (2023), when they argue that organizational growth depends on the ability of leaders to align internal competencies and strategic direction. The high agreement in these dimensions, then, suggests that the participants recognize leadership as a central mechanism for coordinating and mobilizing teams around organizational goals.

On the other hand, the greater dispersion observed in the assertions related to change management (P4), incentive to autonomy (P5), work environment (P6), continuous development (P7) and leadership behavior (P8) indicates that, although there is a general positive perception, these dimensions still present different levels of consolidation in the organizational contexts analyzed. This result dialogues with Mata, Ferreira, and Bastos Filho (2024), who argue that the effectiveness of leadership depends on the ability to adapt situationally to the characteristics of teams and the environment. Thus, the presence of partial disagreements may reflect structural and cultural challenges that hinder the transposition of more participatory leadership practices oriented to human development.

Regarding the assertions related to the analysis of results and data-based decision-making (P9 and P10), a high degree of agreement is again observed, suggesting that leaders perceive continuous monitoring and the use of indicators as indispensable components for organizational growth. This finding converges with the literature on strategic leadership, which emphasizes the need for evidence-based decisions and continuous evaluation

processes to sustain organizational competitiveness (Bernardes and Ferreira, 2023). In addition, this orientation towards metrics can be interpreted as a reflection of the expansion of governance and accountability practices discussed by Paz, Azevedo, and Sousa (2023).

The integrated analysis of quantitative data allows us to understand leadership as a multifaceted phenomenon, simultaneously guided by relational dimensions — such as communication, trust, and collaboration — and by technical aspects related to performance and strategic control. This combination is close to the characteristics of transformational leadership described by Poubel, Sincorá, and Brandão (2022), in which the leader exerts influence both through inspiration and engagement and through the ability to drive results. Thus, the data suggest that the organizational growth perceived by the participants emerges from the articulation between socio-emotional competencies and results-oriented management practices, reinforcing the centrality of leadership as an integrating element of strategic processes.

7.4 QUALITATIVE ANALYSIS OF LEADERS' PERCEPTIONS

The analysis of the open-ended responses allowed the researchers to deepen the quantitative results by evidencing interpretative dimensions that help to understand how leaders signify their role in strategic implementation, in such a way that, more than confirming trends observed in the assertions, the qualitative reports reveal relational and contextual processes that support the execution of organizational strategies, demonstrating that leadership is perceived as a dynamic and situated practice, and not just as a formal function.

First, the understanding of leadership as a mediation between planning and execution is highlighted. Participants describe the leader as responsible for translating strategic guidelines into concrete operational actions, establishing priorities and monitoring performance indicators. This perception converges with Bernardes and Ferreira (2023), when they emphasize that organizational growth depends on the ability of leaders to articulate internal competencies and transform strategic intentions into effective results. In this way, qualitative data reinforce the idea that leadership acts as a bridge between the strategic and operational dimensions, giving coherence to the implementation process.

A second interpretative axis refers to the role of communication as a structuring element of strategic leadership. The narratives indicate that clarity in the definition of goals, alignment between teams, and transparency of information are essential conditions for collective engagement and for the reduction of ambiguities during the execution of strategies. This finding dialogues with Oliveira et al. (2022), who associate open communication practices with building trust and strengthening the organizational climate, indicating that

communication is not only a management tool, but a central component of the exercise of leadership.

The third axis evidenced is related to the development of people and the promotion of autonomy. The answers indicate that leaders recognize organizational growth as a process dependent on continuous training and encouraging the active participation of employees. This perspective is close to the discussions of Poubel, Sincorá and Brandão (2022) on transformational leadership, in which human development and motivation constitute the basis for innovation and sustainable performance. At the same time, the narratives reveal that the consolidation of these practices faces cultural and structural barriers, which helps to explain the variability observed in the quantitative responses associated with autonomy and the collaborative environment.

Finally, the participants demonstrate that they understand organizational growth as a dynamic phenomenon, marked by continuous processes of evaluation, adaptation and integration between areas. This view reinforces the conception of situational leadership defended by Mata, Ferreira, and Bastos Filho (2024), according to which the effectiveness of leadership depends on the ability to adapt to the context and emerging demands. Thus, the qualitative analysis confirms that leaders perceive their performance as an integrating element between strategy and performance, showing that organizational growth is the result of collective processes mediated by the strategic action of leadership.

7.5 SUMMARY OF ANALYSES

The triangulation between quantitative and qualitative data shows high internal coherence of the findings and reinforces the analytical robustness of the study, allowing us to understand strategic implementation as a multidimensional process, in which technical and human factors are interdependently articulated. The results indicate that the effectiveness of growth strategies is not restricted to the formal formulation of plans, but depends fundamentally on the role of leadership as an integrating agent between people, processes, and organizational objectives, corroborating the perspective presented by Bernardes and Ferreira (2023).

Integrated analysis demonstrates that strategic clarity and structured communication emerge as central pillars of execution. Both quantitative data and qualitative narratives indicate that leaders capable of making objectives explicit, aligning expectations, and promoting transparency favor greater team engagement and reduce operational ambiguities. Such evidence converges with Oliveira et al. (2022), when they indicate that consistent communication practices contribute to the construction of environments of trust and to the

strengthening of the organizational climate, essential elements for the successful implementation of strategic changes.

In addition, the results show that behavioral competencies of leadership — such as adaptability, encouragement of autonomy and development of people — exert a direct influence on the effectiveness of strategic implementation. This perception is close to discussions about transformational and situational leadership, in which organizational performance is understood as the result of the combination of results-orientation and sensitivity to the team's needs (Poubel et al., 2022; Mata et al., 2024). The variability observed in some assertions suggests that these competencies are still conditioned by cultural and structural factors present in the organizations analyzed.

Another relevant aspect refers to the association between sustainable growth and continuous monitoring practices. The valorization of indicator analysis and data-based decision-making reveals a growing orientation towards more strategic management models aligned with the logic of governance and accountability, as discussed by Paz, Azevedo, and Sousa (2023). In this context, leadership plays a central role in balancing relational and analytical dimensions, articulating organizational performance and learning.

In summary, the findings reinforce that leadership maturity directly influences the organizational capacity to adapt and respond to dynamic contexts, configuring itself as a key element for the generation of value and for the sustainability of business growth. Thus, the integration of empirical data contributes to broaden the understanding of the role of strategic leadership in medium and large companies, showing that organizational growth is the result of collective processes mediated by the conscious and adaptive performance of leaders.

8 FINAL CONSIDERATIONS

Throughout this chapter, we sought to understand leadership as a constitutive dimension of the processes of strategic implementation in organizations inserted in contexts marked by demands for growth, adaptation and competitiveness. More than examining individual attributes of leaders, the analysis allowed us to observe leadership as a relational practice that articulates decisions, expectations and forms of coordination within organizations.

The data analyzed indicate that leadership is perceived by the participants as a structuring element of the strategic dynamics, especially because it acts in the space where institutional guidelines need to be translated into concrete work practices. In this sense, leadership does not appear only as an instance of supervision, but as a permanent mediation between strategic formulation and organizational capacity for execution.

The convergence between quantitative and qualitative data shows that clarity in the communication of objectives, building trust, encouraging collaboration, and systematic monitoring of results are dimensions particularly valued by the leaders investigated. These elements reveal that strategic implementation, far from depending exclusively on technical planning instruments, requires continuous processes of alignment and internal legitimation.

The recurrent presence of communication in the answers obtained reinforces the understanding that organizational strategies become effective when they manage to produce shared intelligibility. Clear objectives, explicit priorities, and consistent information flows reduce ambiguities and strengthen the collective capacity for action, making leadership a central operator of organizational coherence.

At the same time, the qualitative analysis shows that leaders attribute great importance to the ability to reduce resistance, sustain adaptation processes and stimulate autonomy in teams. Such a perception broadens the understanding of leadership beyond formal command, bringing it closer to an action aimed at creating favorable conditions for strategic changes to be incorporated into the organizational routine.

This relational dimension becomes particularly important in contexts of organizational growth, in which transformations often generate tensions between stability and change. Growing implies reorganizing practices, redefining priorities, and expanding internal capacities, processes that are difficult to sustain without leaders capable of interpreting the context and producing institutional cohesion.

The findings also suggest that organizational growth is not perceived by participants as a purely technical or linear phenomenon. On the contrary, it emerges as a dynamic process, dependent on the organizational capacity to learn, adjust decisions, and integrate different areas around common goals. Leadership, in this scenario, appears as an element that favors circulation between different levels of the organization.

From a theoretical perspective, the results reinforce contemporary approaches that understand leadership as an integrating variable between people, processes and results. By dialoguing with studies on strategic leadership, transformational leadership, organizational climate, and people development, the chapter broadens the understanding that strategic effectiveness depends heavily on human and cultural factors.

The approximation between empirical data and the literature shows that effective leadership practices are not restricted to decision-making, but include the ability to listen, contextually read, build trust, and sustain collaborative environments. These competencies become especially relevant in organizations operating under increasing demands for innovation and adaptation.

From an organizational point of view, the results suggest that sustainable growth strategies require continuous investments in leadership development. It is not enough to have formal management instruments; It is necessary to strengthen skills related to communication, change management, people development, and strategic reading of organizational environments.

The relevance of practices guided by systematic monitoring of results is also evidenced. The valorization of indicators and the continuous analysis of performance reveals that the leaders investigated recognize the importance of decisions supported by evidence, bringing leadership and governance closer together in more consistent decision-making processes.

Even so, it should be recognized that the results presented are the result of a specific cut, constructed from a small number of participants and convenience sampling. Although such a configuration does not compromise the interpretative power of the analysis, it recommends caution regarding generalizations to other organizational contexts.

Another aspect to be considered refers to the fact that the perceptions analyzed derive exclusively from the view of the leaders themselves, which naturally favors certain interpretations of the organizational dynamics. Incorporating other voices—especially employees and middle managers—can significantly broaden the understanding of the relationships between leadership and strategic implementation.

In this sense, future investigations may explore comparisons between different economic sectors, different organizational sizes and varied institutional contexts, allowing us to observe how leadership practices are configured in environments marked by specific challenges of growth and transformation.

In summary, the analysis developed in this chapter reinforces that leadership occupies a central position in organizational growth processes because it acts as a mediation between strategy, people, and institutional capacity for adaptation. More than an individual attribute, leadership proves to be a decisive social practice for the production of organizational coherence and for the sustenance of development trajectories in complex business contexts.

ABSTRACT

In the current scenario of environmental manipulation and landscape interventions, the adoption of a new paradigm for urban and environmental planning becomes urgent, raising the question of how landscape planning, design, and architecture can contribute to the urban and environmental planning of the watershed. The objectives consist of investigating the theoretical and methodological concepts applied in landscape planning, design, and architecture; contributing to urban and environmental planning, using the watershed as the basis of this process; identifying proposals, experiences, and projects carried out on this theme; and contributing to broadening conceptual reflection and deepening the debate on integrated landscape management. The methodology was exploratory, involving the collection and compilation of documents and texts; reading, studying, and analyzing the selected material; and textual organization. It was concluded that landscape planning, design, and architecture contribute to the urban and environmental planning of the hydrographic basin through the application of environmental solutions such as connectivity, biodiversity, water governance, strengthening urban resilience, and the interaction of nature with people, as living, adaptive, and sustainable solutions to the urban and environmental challenges of contemporary cities.

RESUMO

No cenário atual da degradação ambiental e das intervenções na paisagem, torna-se urgente a adoção de um novo paradigma para o planejamento urbano e ambiental, suscitando o questionamento de como o planejamento, o projeto e a arquitetura da paisagem podem contribuir para o planejamento urbano e ambiental da bacia hidrográfica. Os objetivos consistem em investigar os conceitos teóricos e metodológicos aplicados no planejamento, no projeto e na arquitetura da paisagem; contribuir para o planejamento urbano e ambiental, tendo a bacia hidrográfica como base desse processo; identificar propostas, experiências e projetos realizados com essa temática; e, contribuir para ampliar a reflexão conceitual e o aprofundamento do debate sobre a gestão integrada da paisagem. A metodologia foi exploratória, com o levantamento e compilação de documentos e textos; na leitura, estudos e análise do material selecionado; e, na organização textual. Concluiu-se que o planejamento, projeto e arquitetura da paisagem contribuem para o planejamento urbano e ambiental da bacia hidrográfica, através da aplicação de soluções ambientais, como a conectividade, a biodiversidade, a governança das águas, o fortalecimento da resiliência urbana e a interação da natureza com as pessoas, como soluções vivas, adaptativas e sustentáveis, para os desafios urbanos e ambientais das cidades contemporâneas.

RESUMEN

En el contexto actual de degradación ambiental e intervenciones paisajísticas, la adopción de un nuevo paradigma para la planificación urbana y ambiental se vuelve urgente, lo que plantea la cuestión de cómo la planificación, el diseño y la arquitectura del paisaje pueden contribuir a la planificación urbana y ambiental de la cuenca hidrográfica. Los objetivos consisten en investigar los conceptos teóricos y metodológicos aplicados en la planificación, el diseño y la arquitectura del paisaje; contribuir a la planificación urbana y ambiental, utilizando la cuenca hidrográfica como base de este proceso; identificar propuestas, experiencias y proyectos realizados sobre este tema; y contribuir a ampliar la reflexión conceptual y profundizar el debate sobre la gestión integrada del paisaje. La metodología empleada fue exploratoria e incluyó la recopilación y compilación de documentos y textos; la lectura, el estudio y el análisis del material seleccionado; y la organización textual. Se concluyó que la planificación, el diseño y la arquitectura del paisaje contribuyen a la planificación urbana y ambiental de la cuenca hidrográfica mediante la aplicación de soluciones ambientales como la conectividad, la biodiversidad, la gobernanza del agua, el fortalecimiento de la resiliencia urbana y la interacción de la naturaleza con las personas, como soluciones vivas, adaptativas y sostenibles a los desafíos urbanos y ambientales de las ciudades contemporáneas.

1 INTRODUCTION

In the current scenario, in the Anthropocene era, anthropogenic actions are increasingly intense and accelerated (Magalhães, 2023), resulting in profound transformations in the landscape and the environment. These transformations lead to the loss of biodiversity, environmental degradation, destruction of ecosystems, fragmentation of the landscape, interruption of ecological flows and climate change (Olivo; Meneguetti, 2023). As a consequence, there is also an increase in the impermeabilization of urban soil, water pollution and extreme weather events.

From the second half of the twentieth century, with the advance of industrialization and urbanization, technical and technological development intensified interventions on the landscape. Such interventions, called gray infrastructure, consist of engineering works, which, through artificially constructed structures, control natural processes through technique, conducting urban waters through impermeable pipes and galleries, making the systems of nature invisible in the daily life of the contemporary city (Lima; Ragonha; Schenk, 2023). As a result, the impacts resulting from this process cause the rupture, reduction and alteration of natural processes, in addition to the loss of the role of water in the urban landscape (Baptista; Cardoso, 2013).

In Brazil, the practice of gray infrastructure was adopted from 1889 (Silveira, 1998), and has continued to the present day. Despite scientific and technological advances, as well as the creation of instruments for territorial planning of environmental policy, it is observed that a technocratic vision of the city persists, conceived as a technical object aimed at urban regulation. This model of urban planning, based on principles and methods aimed mainly at regulatory efficiency, privileges socioeconomic processes (Brasil, 2002a) to the detriment of the integration of the landscape system with the environmental planning of Brazilian cities.

Thus, therefore, urbanization has generated a series of impacts on water bodies, causing the loss of their potential and multiple uses, the reduction of the quality and quantity of available water, in addition to the increase in organic load and pollutants. It is noteworthy that the channeling of urban rivers did not solve problems such as floods, pollution and contamination; on the contrary, it has aggravated the degradation of ecosystem functions, biodiversity and the landscape. In this context, the intensification of urbanization has increased concerns and stimulated the search for sustainable solutions aimed at the well-being of the population, the improvement of water quality, the increase of urban and climate resilience, urban drainage, the valorization of the natural environment and the river landscape (Silveira; Rodrigues; Dornelles, 2025).

Therefore, it is urgent to adopt a new paradigm for urban and environmental planning, related to the insertion of multidisciplinary in the complexity of the landscape. In this scenario, the river basin takes the lead in the process of planning, territorial planning, and integrated landscape management, incorporating both water management and its governance (Sant'Anna, 2020). Hydrographic basins contain environmental structures of extreme relevance in the cultural landscape of Brazilian cities, being considered as the synthesis of the territories interconnected to them (Lourenço *et al.*, 2015).

After World War II, regional planning proposals based on the urban landscape emerged, which began to guide territorial planning, with the watershed as a priority in this process (Sant'Anna, 2020). However, this perspective requires the integration of environmental agendas into political, social, economic and scientific discussions and decisions, with a view to formulating public policies for sustainable urban development.

In view of the above, the problem that this study proposes to investigate raises the following question: "How can landscape planning, design and architecture contribute to urban and environmental planning, with the watershed as the basis of the planning process, territorial planning and integrated landscape management?". Thus, this work aims to: investigate the theoretical and methodological concepts applied in landscape planning, design and architecture; contribute to urban and environmental planning, with the hydrographic basin as the basis of this process; identify proposals, experiences and projects carried out with this theme; and, to contribute to broaden the conceptual reflection and the deepening of the debate on integrated landscape management.

2 THEORETICAL FOUNDATION

2.1 ENVIRONMENTAL PLANNING IN BRAZILIAN LEGISLATION

In Brazil, from the middle of the twentieth century, the intense process of urbanization generated numerous socio-environmental impacts. In 1960, the urbanization rate was 45.52%; however, in 2022, the Brazilian population living in urban areas jumped to 87.40% (IBGE, 2022). This unbridled urbanization has caused numerous impacts in cities, such as socioeconomic inequality (Brasil, 2002a), environmental racism and social and climate injustice.

Between 1980 and 2000, Law No. 6,938/1981 was enacted, creating the National Environmental Policy (PNMA) (Brasil, 1981); and, in 1988, the Federal Constitution (FC) (Brasil, 1988), contemplating the fundamental principles of environmental legislation. In the context of the hydrographic basin, Law No. 9,433/1997 created the National Water Resources Policy (PNRH) (Brasil, 1997), which in addition to directing the management of this national

heritage, also influenced urban and regional management, since the hydrographic basins encompass the territories: national, state and municipal (Ferrão, 2018). In this way, the hydrographic basins are considered as the unit of integrated landscape management, as they integrate in their territories, the waters, the soil, the flora, the fauna, the natural resources, the cultural heritage, the people and the anthropic actions on these landscapes.

It is in this scenario that the City Statute was born, as a way of responding in a purposeful way to the challenges of reconstructing urban, redistributive and inclusive planning, under new principles, methods, conceptions and tools. Thus, the City Statute created by Law No. 10,257/2001, regulated articles 182 and 183 of the 1988 Federal Constitution, and established the general guidelines of urban policy, aiming at the full development of the city's social functions, the guarantee of the right to a sustainable city and the democratization of urban management (Brasil, 2002a). According to the City Statute, the municipality is responsible for urban policy, which has the Master Plan (PD) as its basic instrument.

Federal Decree No. 4,297/2002, through ecological-economic zoning, established the parameters of municipal environmental zoning (ZA), as a beacon of urban, rural and environmental territorial planning, and should consider the proposals of civil society and public agents, programs and projects that use natural resources, seeking the full maintenance of ecosystem services and ecological conservation, making use, protection and control compatible, as a way to achieve sustainable development (Brasil, 2002b).

The Brazilian Forest Code, updated by Law No. 12,651/2012 (Brasil, 2012), regulated by CONAMA Resolution No. 369/2006 (CONAMA, 2006), established the parameters for intervention and suppression of vegetation in the immediate surroundings of rivers, called Permanent Preservation Areas (APPs), constituting an important instrument of territorial planning of Brazilian environmental policy (Souza; 2015).

Consequently, municipal environmental planning and management are of fundamental importance in the contemporary context, considering popular participation, the promotion of the sense of belonging, of experience, of the identity of people and communities in relation to the place (Piroli, 2024), incorporating the multidisciplinary of landscape complexity in the process of planning, territorial planning and sustainable management of the city.

2.2 INTEGRATED LANDSCAPE MANAGEMENT IN THE ENVIRONMENTAL PLANNING PROCESS

In the environmental planning process, landscape systems must be contemplated (Sant'Anna, 2020). In this context, the hydrographic basin is considered the territorial unit of

planning and integrated management. Water governance and integrated landscape management should be part of public policies, with a view to sustainable urban development.

The articulation of water governance is a key element for the implementation of sustainable, participatory and integrated management of water resources. Of particular note is the guarantee of access to quality water for all, the promotion of sustainable use of water, the mitigation of the impacts of climate change, the guarantee of water security, social justice, transparency and citizen participation in decision-making processes in Brazilian municipalities (Empinotti; Jacobi; Fracalanza, 2016; Nicollier; Kiperstok; Bernardes, 2023).

Water governance has become relevant to the Brazilian public administration due to the frequent and intense water crises in the country (ANA, 2019; OECD, 2015). These facts show that water crises are the result of poor public management of water resources and areas that impact water; such as, land use and occupation, environment and basic sanitation (GWP, 2000; Tundisi, 2013; Pahl-Wostl, 2017).

One of the biggest challenges in water governance is the more effective participation of municipalities in the implementation of water resources management policy (OECD, 2015). For Nicollier, Kiperstok and Bernardes (2023), one of the possible factors is the lack of control of the municipal administration over water, and the municipalities have their participation in the National Water Resources Management System, indirectly, through the River Basin Committees. Thus, the importance of expanding spaces for social and political participation in the management of water resources in Brazil is emphasized.

Another relevant aspect is the complex relationship that the landscape and water governance establish between themselves, as these involve multiple actors, interests and scales of intervention (Ribeiro *et al.*, 2013).

Integrated landscape management includes the river basin, through various approaches, such as: land use, basic sanitation, environmental health, biodiversity, culture and sustainable urban development (Cerezini; Hanai, 2017; Xavier, 2025).

3 METHODOLOGY

From the point of view of the objectives, the research is characterized as exploratory. According to Prodanov and Freitas (2017), exploratory research allows the study of the theme from different angles and aspects, first involving the survey and compilation of documents and bibliography; then, the reading, studies and analysis of the selected material; and, finally, the textual organization compatible with the objectives of the research. From the point of view of technical procedures, the research is bibliographical. For Gil (2022), bibliographic research is based on material already published, including printed material, such as books, magazines,

newspapers, theses, dissertations and annals of scientific events, as well as material made available on the Internet.

4 RESULTS

Hydrographic basins comprise environmental structures of extreme relevance in the cultural landscape of Brazilian cities. These structures are shaped through natural processes throughout the planet's evolution (Piroli, 2024); Thus, the hydrographic basins are part of the set of natural and anthropic environmental factors; and, they are related to geomorphological aspects, which influence the way waters move and are distributed in the river basin (Sant'Anna, 2020).

Consequently, designing the urban landscape from its waters constitutes a challenge and an opportunity to reincorporate its social, environmental, cultural, economic and political value. The mutant and intertwined landscapes constitute the synthesis of the territories interconnected to them (Lourenço *et al.*, 2015).

The integrated planning, management and management of the watershed require the adoption of sustainable socio-environmental practices, and public policies aimed at expanding water availability, reducing conflicts and critical hydrological events, promoting water conservation as a socio-environmental value, as well as the protection and recovery of ecosystems, aiming at maintaining adequate environments for all (Piroli, 2024).

In the case of water governance, the landscape must be in the context of the interaction between the use of water resources, preservation and environmental conservation. In this way, integrated landscape management, including quality of life, well-being of people and ecosystems, is connected to water governance (Fernandes *et al.*, 2015).

4.1 THE COMPLEXITY OF THE RIVER BASIN AND THE ROLE OF THE LANDSCAPE IN PLANNING, TERRITORIAL PLANNING AND INTEGRATED MANAGEMENT

In the twenty-first century, environmental planning, by incorporating the complexity of increasingly urbanized territories, is associated with other areas of knowledge, which study and intervene in the territory. In this sense, considering the hydrographic basin as the basis of landscape planning, in a regional cut, it includes relief and geography. In turn, the river corridors drain the surface waters of the hydrographic basin, through the relief and vegetation that accompanies the banks of the rivers (riparian forests), where it is possible to identify and describe the natural resources contained in this territory in an integrated way (Sant'Anna, 2020).

From this point of view, the planning, design and architecture of the landscape must incorporate its physiographic regions, composed of natural elements, relief, geomorphology, soil types, water resources, vegetation, etc., in their different scales in studies, analyses, discussions and propositions in the context of the hydrographic basin, (McHarg, 2000).

McHarg (2000) in studies carried out in the Potomac watershed, in Canada, sought to enhance the relationships between uses and preservation. In this way, he defined the climate as a fundamental factor in the relationship with the physiography of the territory; and, the study and analysis of geomorphology to define the physiographic regions. These physiographic regions were analyzed and organized on thematic maps, based on hydrological conditions, soil, vegetation, fauna, mineral resources, landscape landmarks (natural sites and cultural manifestations) and slope (Figure 1); also, the aptitudes for agriculture, forestry, urbanization, leisure and recreation (Figure 2). Then, these maps were superimposed, generating a synthesis of guiding trends for the different types of land uses, the natural determinants, the analysis of the impacts of the occupation of unsuitable areas, the scale of compatibility with the type of land use and occupation, and the potential of the areas of the watershed (Figure 3).

Figure 1

Studies for the Potomac River basin, through maps related to geology, physiography, landscape landmarks, hydrology, vegetation, water problems, mineral resources, slope and fauna

Figure 2

Studies for the Potomac River basin, through overlapping maps of the surveys carried out, indicating the suitability of the territory for agriculture, forestry, recreation and urban use

Source: McHarg (1997, p.140-145).

Figure 3

Studies for the Potomac River basin, presenting the synthesis of alternatives and trends

Source: McHarg (1997, p.321-333).

Thus, Ian McHarg developed a process of planning, design, and landscape architecture, encompassing the complexity of the territory and the role of the cultural landscape in territorial planning, thus contributing to the design of studies that enable decision-making based on modeling for future scenarios, as well as for proposals for the

formulation of legislation, regulation and public policies, aiming at current contemporary urgencies (Sant'Anna, 2020). The foundation of resilience as an environmental paradigm is close to ecological planning, as prescribed by McHarg (Olivo; Meneguetti, 2023).

Therefore, the application of the general principles of ecology such as connectivity, resilience and biodiversity, in the territorial coverage of the hydrographic basin, can be used as tools for the planning, design and architecture of the landscape (Olivo; Meneguetti, 2023; Pellegrino *et al.*, 2006).

4.2 LANDSCAPE PLANNING, DESIGN, AND ARCHITECTURE

After the Second World War, proposals for regional planning began to emerge from the landscape of the cities, guiding territorial planning; and, having the hydrographic basin as a priority in this process (Sant'Anna, 2020).

McHarg (2000), in his book *Design with Nature*, released in 1969, defined the landscape as a means and method, incorporating the principles of ecology in landscape planning (Lima; Ragonha; Schenk, 2023; Meneguetti, 2009), the multi-scalarity of planning as the basis of the work, as well as proposing adaptive strategies for low-impact urban development (Sant'Anna, 2020). Thus, the methodology proposed by McHarg (2000) was based on the superimposition of thematic maps, allowing the crossing of data from the natural support (geological, geomorphological, hydrological, vegetation, etc.), from existing ecological processes (ecosystems, land use, and urban and regional development) (Souza, 2015), as well as historical, cultural, and aesthetic factors, introducing subjectivity into the experiential perspective experienced in the territory (Lima; Ragonha; Schenk, 2023), in order to contribute to decision-making in urban and regional planning.

In this regard, the Mchargian methodology allowed the application in different contexts and scales, such as watershed planning, incorporating the broader systems of the territories; and, in the project, through local scales related to environmental experience and perception (Ragonha, 2019), recognizing the place as the product of natural and social systems and values (Lima; Ragonha; Schenk, 2023). Thus, the work of McHarg (2000) constitutes an important legacy for the planning, design and architecture of the landscape, as well as a fundamental instrument for the development of sustainable environmental and urban solutions for the contemporary city (Hough, 1988; Lima; Ragonha; Schenk, 2023; Olivo, Meneguetti, 2023; Pellegrino *et al.*, 2006; Sant'Anna, 2020; Souza, 2015; Spirn, 1995; Weiss, 2024).

Therefore, for the planning, design, and architecture of the landscape, an integrated and interdependent understanding is necessary (Weiss, 2024), as well as its practices require

a strategy of territorial multiscaling, in order to identify the diversity of the cultural and/or natural landscape (Schenk, 2008). Thus, in urban and regional planning, the landscape corresponds to the broad territories, such as the hydrographic basin, which is the unit of territorial planning and management; in the landscape project, the scale is local, linked to the functioning of the system, but not subordinated to it; and, in landscape architecture, the scale of planning is articulated with the design of the local scale, considering the experiential perspective of the people of the place, so that planning and design decisions are always connected to the context and to the various existing perceptions (Lima; Ragonha; Schenk, 2023; Weiss, 2008).

In this way, reflections on the relationship between man and nature and the multiscale of the landscape are intertwined by objectivities and subjectivities. Thus, the objectivities of the landscape occur through the physiognomy and natural dynamics, such as, for example, the hydrological cycle, geomorphology, the tidal cycle (in coastal cities), winds, relief and vegetation; and the subjectivities, present in the places (historical, paleontological and archaeological sites), in the cultural manifestations and their meanings, and in the appropriations and perceptions. From this understanding, nature becomes an integral and guiding element of the process of planning, design, and landscape architecture, bringing human processes closer to natural processes (Olivo; Meneguetti, 2023), incorporating adaptive strategies committed to the characteristics of the place (Sant'Anna, 2020).

In view of this, landscape architecture and ecology come together, providing the promotion of diverse territories and new meanings (Olivo, Meneguetti, 2023). Thus, McHarg (2000), based on landscape ecology, elaborated the theoretical and practical foundations of landscape planning, design and architecture, influenced by anthropology, archaeology, biology, geology and ecology, based on the premise of nature as a fundamental element in the experience of the place, in physical and biological evolution, in adaptation and adjustment, also contributing to biodiversity, geography and territorial management (Spirn, 1995).

For Forman (1995), the landscape corresponds to a set of ecosystems, which interact and repeat themselves in space, distributing themselves spatially, in a heterogeneous way. Meneguetti (2007) emphasizes that landscape ecology represents a new look at landscape planning, through a more ecological approach and spatial solutions, as a way to balance anthropic interventions with biophysical support and its possibility of absorbing impacts. In this way, Forman and Gordon (1986) approach landscape ecology as a theoretical-methodological framework related to structure, function, and dynamics/change.

In this context, the landscape can be understood as a mosaic of matrices, spots or fragments and corridors, and must be analyzed from its structure, through the arrangement in spatial patterns of its elements, acting on the functioning and changes of the landscape. It is from this perspective that landscape ecology unites ecology and landscape architecture, as a methodological approach (Gobster; Xiang, 2012), recognizing the interdependence of design, ecology and society (Grose, 2014), using the general principles of ecology, such as connectivity, green corridors, resilience and biodiversity, as tools for landscape planning, design and architecture (Pellegrino *et al.*; 2006). Thus, "[...] the spatial component is the key to Landscape Ecology" (Souza, 2015, p.56).

Therefore, while landscape represents the connection between human and natural processes, landscape ecology represents the central point of the dialogue between the two processes, applying, for example, to the environmental planning of watersheds (Darmstadt; Olson; Forman, 1996; Forman, 1995; 2004; 2008; Meneguetti, 2009; Pellegrino *et al.*, 2006; Tardin, 2018; Weiss, 2024). From this perspective, two contemporary instruments stand out: nature-based solutions (NbS) and green infrastructure (McHarg, 2000).

4.3 NATURE-BASED SOLUTIONS AND ECOSYSTEM SERVICES OF RIVER BASINS

Urbanization impacts the surface climate of urban areas, alters the land surface, and contributes to climate change, becoming sources of greenhouse gas (GHG) emissions. Mosisa *et al.* (2025) highlight that, in 2015, urban areas accounted for 61.8% of GHG emissions; and, by 2100, this number should exceed 80%. The authors also warn that in Brazil there has been a 62% reduction in ecosystem services.

From this perspective, NBS emerge as important mitigators of these effects, because by recognizing nature in their processes, as fundamental elements in the construction of cities (Devecchi *et al.*, 2021), they become essential for the creation of resilient and sustainable urban ecosystems (Mosisa *et al.*, 2025).

In the process of regional, urban and environmental planning, NBS propose integration and take into account the complexity of river basins and urban ecosystems. In this sense, NBS, with a focus on landscapes, are aligned with the 2030 SDGs, as they constitute living and adaptive solutions, inspired and supported by nature and with the involvement of people, (Evers *et al.*, 2022; Olivo; Meneguetti, 2023; Puskas; Abunnasr; Naalbandian, 2021; Spirn, 1998; McHarg, 2000; Mosisa *et al.*, 2025).

Olivo and Meneguetti (2023) point out that in the context of watershed ecosystem services, NBS seek to accelerate multiple services and benefits, valuing perception and experimentation, promoting a more holistic culture, as well as the incorporation and

understanding of nature with people. For Evers *et al.* (2022), ecosystem services (Chart 1) are the central element of NBS, promoting a series of positive impacts for climate adaptation and resilience.

Table 1

Contributions of ecosystem services in river basins

Services Provision	Food	Managed agrosystems, marine and freshwater systems, forests, and urban horticultures that provide food.
	Raw material	Woods, biofuels and vegetable oils, derived from native and cultivated plant species.
	Water	Vegetation and forests control the flow, store and purify the water. They influence the amount of water available locally.
Services Regulation	Local climate and Air Quality	Trees and green spaces reduce the temperature in cities. Forests influence the hydrological cycle, stimulating rainfall and removing pollutants from the atmosphere.
	Kidnapping of Carbon	Trees and plants remove carbon dioxide from the atmosphere, acting as carbon stores.
	Moderation of Extreme events	Ecosystems can act in the prevention of natural disasters. Plants stabilize slopes and mangroves filter river waters.
Cultural services	Recreation and health	Green spaces contribute to the socialization and welcoming of people. Also for physical and mental health.
	Tourism	Ecosystems and biodiversity are sources of socio-environmental benefits and income generation.
	Experience spiritual and sensory	Nature and biodiversity are common to the main cultures and traditional knowledge, giving a sense of belonging.
Services Support	Habitats for Species	Ecosystems provide essential habitats for the life cycle of many terrestrial and aquatic species.
	Maintenance of the Diversity Genetics	Genetic diversity provides the basis for well-adapted locally adapted crops and a gene <i>pool</i> for the development of agroecology, especially in food and animal production.

Source: Adapted from WRI Brasil (2022).

However, whether the contributions of watershed ecosystem services can actually maximize benefits as an adaptation strategy will depend on the approach and scale of the landscape. The protection, restoration and management of urban ecosystems are considered to ensure the integrity and connectivity of these ecosystems, which undoubtedly constitute the key to the maintenance of biodiversity and the resilience of the solutions themselves. This will minimize climate impacts, such as floods, droughts, and fires (Evers *et al.*, 2022; Mosisa *et al.*, 2025). The authors emphasize that the solutions can be implemented at different scales, and compose a network of NbS combined with gray infrastructures. To this end, NBS planning must count on the participation of local populations, as well as traditional communities, in order to identify priority areas, obstacles and facilitators for their implementation.

NBS within the scope of the watershed can include, for example: urban afforestation; preservation, conservation, recovery of riparian forest and springs; water-linked green area

systems (Devecchi *et al.*, 2021), restoration of native vegetation in PPAs, ecological corridors, green infrastructure, urban drainage and urban parks and linear parks on urban riverfronts (Evers *et al.*, 2022).

4.4 GREEN INFRASTRUCTURE IN THE CONTEXT OF ENVIRONMENTAL PLANNING OF THE RIVER BASIN

Green infrastructure incorporates a series of connected green spaces, impacting different scales and in different modes, characterizing itself as an adaptive project (Olivo; Meneguetti, 2023). However, it is essential that green infrastructure incorporates people's perceptions and interactions with landscapes, in addition to physical-territorial aspects (Mell, 2010).

Thus, in the context of the environmental planning of the river basin, green infrastructure incorporates the principles related to multi-scalarity, connectivity, interdisciplinarity, multifunctionality, integration, and social participation (Sant'Anna, 2020).

According to the author, in the principle of multiscale and interdisciplinarity, when designing with nature, it becomes essential to analyze the spatial and temporal scale of the regional scale of the hydrographic basin, as the unit of planning, design and architecture of the landscape; Multifunctionality, related to adaptation and climate change, aims to articulate the different mosaics contained in the landscape, which from the integration of these processes and in the performance of their multiple functions, can guarantee resilience and ecological integrity from the performance of the ecosystem services of the hydrographic basin. In the principle of connectivity, the relationships between spatial structure, functions, interactions, activities and ecological processes of the landscape, make up a green system, interconnecting the ecosystems and the natural and anthropic landscapes of the watershed. The purpose of integration is to promote the relationship between green infrastructure and other urban infrastructures. Finally, the principle of social participation can be considered the core for the success and maintenance of the territory. The importance of the participation of different agents and social actors is highlighted, involving communities in the collaborative process of urban and environmental planning.

In this way, green infrastructure, from the perspective of the urban landscape, assumes the function of urban infrastructure, covering, in addition to environmental functions, leisure, culture, education, recreation equipment, among other essential uses of urban open spaces (Souza, 2015), which are part of the hydrographic basin. It is emphasized that green spaces, an integral part of urban infrastructure, are articulated with the urban fabric, the road system, buildings, and urban open spaces (Pellegrino *et al.*, 2006). It is emphasized,

therefore, that in the process of planning, design, and landscape architecture, it is necessary to understand the relationship, the contribution of urban infrastructure in the design of the landscape, and the collaboration of green infrastructure within the context of the watershed.

Green infrastructure, when applied to urban drainage, acts to control land use and reserve (Souza, 2015), mitigating the impacts on river systems, whether in waste load and/or erosive processes, as well as ensuring the flow of runoff in river basins, soil permeability, and recharge of the water table and aquifers. Among the water management practices with low-impact interventions are: urban green corridors (*greenways*), constructed *wetlands*, reforestation of slopes and green streets (Sant'Anna, 2020; Pellegrino *et al.*, 2006), and the protection and recovery of springs. Connected to other green spaces in the city, urban parks and linear parks play a fundamental role in people's well-being and quality of life, while preserving and connecting natural areas, with significant benefits to biodiversity (Benedict; McMahon, 2002).

It is noteworthy that green infrastructure can cost 50% less than equivalent grey infrastructure, providing an additional 28% value, benefiting pollution reduction, carbon capture, adaptation, and urban and climate resilience (Evers *et al.*, 2022).

4.5 LANDSCAPE ARCHITECTURE: A NEW PARADIGM FOR ENVIRONMENTAL DESIGN

In the context of a new environmental paradigm, landscape architecture is one where the scale of planning is articulated with the design on the local scale and the experiential perspective of the people of the place. This concept has emerged recurrently in the literature, revealing transdisciplinarity based on the foundations of the plastic instance, theoretical training, practical experimentation and complex worldviews (Olivo; Meneguetti, 2023). Therefore, this new environmental paradigm is an evolving model, aimed at the conception of unprecedented solutions (Ndubisi, 2002), correlating with other paradigms such as resilience, connectivity, accessibility, cultural standards, appearance performance, multiscalarity, integration, biodiversity, multifunctionality, ecological aesthetics, redundancy and modularization, sustainability and complex thinking (Olivo; Meneguetti, 2023). Thus, it is important to emphasize that the understanding of the ecosystem processes of the landscape presupposes the proposition of a flexible and participatory social structure.

Several landscape architecture projects and proposals have been carried out around the world, considering urban rivers, aquatic ecosystems and watersheds as central elements of planning. These initiatives seek to integrate ecological, social, and cultural aspects, promoting the multifunctionality of free spaces and strengthening urban resilience. By addressing connectivity, biodiversity, water management and governance, and the

interaction of nature with people, these projects highlight the practical application of contemporary paradigms of landscape architecture, consolidating living, adaptive, and sustainable solutions to current urban and environmental challenges, contextualized in the spatial and temporal scale of the watershed.

The 2011 Habin Qunli Park project includes the green infrastructure for the management of urban waters in the Chinese city of Hardim and a walkable waterfront for the surrounding population. In this proposal, the concepts of connectivity and biodiversity are physically and functionally interconnected between different scales, relating them to integration, accessibility and multi-scalarity (Olivo; Meneguetti, 2023), characterizing itself as resilient, in the context of the contemporary sustainable city. Following the concept of Habin Qunli Park, Tanner Springs Park, in Portland, from 2010, works on the environmental process of the invisibility of urban waters, acting on a bioretention network as a complementary and ecological action in urban rainwater drainage, that is, a large rain garden (Cormier; Pellegrino, 2008).

In the case of Crissy Field Park, implemented in San Francisco (USA) in 2001, the concept of multifunctionality is combined with the biotic, abiotic, functional and cultural functions of urban open spaces (Hansen; Paulet, 2014), promoting social cohesion and the security of socio-ecological systems, with the reestablishment of tidal marsh and coastal dunes, and the juxtaposition and integration between people, wild fauna and flora. In this way, the park project works on the concept of diversity, recognizing the hybrid landscape in the human and ecosystem dimensions. Thus, biodiversity, the basis of the sustainability paradigm, considers both the diversity of biotic and abiotic factors and social, physical, and economic diversity, as an effective strategy for urban resilience (Olivo; Meneguetti, 2023). As for Downsview Park, implemented in Toronto, Canada, in 1999, diversity is present in the concept of the project, through topography, considering the circulation of matter and energy (Corner, 2016) and the constitution of a mobility system.

The Pirapora River Park, in Maranguape, Ceará, Brazil was one of the projects selected by the call for proposals "NbS Accelerator in Cities" (WRI Brasil, 2022). Its proposal is based on the nature-based infrastructural system, based on the infrastructure of nature, infrastructure of care, infrastructure of local socio-biodiversity and the infrastructure of the immaterial, all with the purpose of generating better urban conditions, better housing conditions, reduction of pollution and environmental degradation, valorization of green areas, income generation and strengthening of community-based tourism, in order to contribute to the fight against climate change and the achievement of the 2030 SDGs (WRI Brasil, 2024). In this sense, the Pirapora River Park project represents the environmental paradigm of

landscape architecture, in which resilience incorporated into the other paradigms of environmental design, reads, interprets and incorporates the reality of the landscape, thus introducing the possibilities of change, as opportunities for living and adaptive solutions, supported and inspired by the focus of nature with people (Evers *et al.*, 2022; Olivo; Meneguetti, 2023; Pellegrino *et al.*, 2006; Puskas; Abunnasr; Naalbandian, 2021; Sant'Anna, 2020; Spirn, 1998; McHarg, 2000; Mosisa *et al.*, 2025), presenting alternative scenarios and sustainable guiding trends for the watershed (McHarg, 1997; Olivo; Meneguetti, 2023).

5 CONCLUSIONS

Considering the national scenario of concerns with the various aspects of environmental degradation; and, the effort of the academic and scientific community, as well as the various sectors of civil society, new perspectives for urban and environmental planning emerge and, consequently, the formulation of public policies, from the complexity of the landscape to mitigate the effects of climate change and strengthen resilience.

Watersheds are understood as environmental structures of extreme relevance for landscape management and water governance, recognizing them as essential for the quality of life of people and ecosystems. The importance of understanding the ecosystem processes of the landscape is emphasized, through a flexible and participatory social structure.

It is identified in the principles and tools for planning, design and architecture of the landscape, connectivity, integration, interdisciplinarity, multidisciplinary, multiscale, multifunctionality, adaptability, sustainability, water security, analysis of ecological processes, green corridors, resilience, accessibility, environmental conservation and biodiversity, preservation, recovery and ecological restoration, objectivities and subjectivities, manifestations cultural and their meanings, cultural patterns, social and climate justice, transparency, social participation and inclusion, landscape diversity and complexity; and, nature-based solutions and green infrastructure.

NBS aligned with the 2030 SDGs are living and adaptive solutions, which contribute to the multiple ecosystem services and benefits of the river basin; and, they promote climate adaptation and resilience. In turn, green infrastructure acts in the river basin, at different scales and in different ways, through the principles and tools already mentioned. The importance of popular participation in NBS is emphasized; and, of people's perceptions and interactions with landscapes and in green infrastructure proposals.

The practical application of the environmental paradigms of landscape architecture as central elements of planning, territorial planning and integrated management of the landscape of the river basins is highlighted. The integration of design, ecology and society

promotes the multifunctionality of open spaces, strengthens urban resilience, multi-scalarity, connectivity and biodiversity. Water governance and management must interact with nature and people, as living, adaptive, and sustainable solutions.

It is concluded that the objectives of the study were achieved. However, the subject is not exhausted, because, due to its breadth, it may be the object of multiple approaches. Therefore, it is recommended to continue the studies, with the deepening of the conceptual reflection and the debate on the integrated management of the landscape.

ABSTRACT

The social merchandising contained in the May 13, 2025 episode of the telenovela "Vale Tudo," which addressed the request for alimony by the character Lucimar (Ingrid Gaigher), proved to be a strong motivator for women in similar situations to claim a right widely specified in the country, but with little publicized access to it. In this sense, this study aims to evaluate the framing of the episode in question based on its repercussions in national and Minas Gerais media, with the objective of drawing a parallel on how a telenovela can impact society. Furthermore, secondarily, it sought to relate the cited episode to the concept of Digital Governance, in order to make evident that the digitization of state services, accompanied by rights.

Keywords: Soap Opera. Citizenship. Framing. Digital Government. An Emancipated Spectator.

RESUMO

O *merchandising* social contido no capítulo de 13 de maio de 2025 da novela "Vale Tudo", em que foi abordado o pedido de pensão alimentícia pela personagem Lucimar (Ingrid Gaigher), se revelou como forte propulsor de mulheres em situações parecidas, no sentido de reivindicar um direito amplamente mencionado no país, mas com o modo de acesso pouco divulgado. Nesse sentido, pretende-se avaliar os enquadramentos do trecho em questão a partir da repercussão na mídia nacional e mineira, com o objetivo de traçar um paralelo sobre como a telenovela pode ter impacto na sociedade. Além disso, de forma secundária, buscou-se relacionar o capítulo citado com o conceito de Governança Digital, de modo a tornar evidente que a digitalização de serviços do Estado, acompanhado de esclarecimentos, pode garantir ao cidadão um acesso mais autônomo e rápido aos seus direitos.

RESUMEN

El mercadeo social contenido en el episodio del 13 de mayo de 2025 de la telenovela "Vale Tudo", que abordó la solicitud de pensión alimenticia del personaje Lucimar (Ingrid Gaigher), demostró ser un fuerte motivador para que las mujeres en situaciones similares reclamaran un derecho ampliamente reconocido en el país, pero con escaso acceso público al mismo. En este sentido, este estudio busca evaluar el encuadre del episodio en cuestión con base en sus repercusiones en los medios nacionales y de Minas Gerais, con el objetivo de establecer un paralelismo sobre cómo una telenovela puede impactar a la sociedad. Además, secundariamente, buscó relacionar el episodio citado con el concepto de Gobernanza Digital, para evidenciar que la digitalización de los servicios estatales, acompañada de derechos.

Palabras clave: Telenovela. Ciudadanía. Encuadre. Gobierno Digital. Un Espectador Emancipado.

1 INTRODUCTION

The article seeks to make an approximation between Jacques Rancière's (2009) theory about the emancipated spectator, and the educational potential of soap operas. In this sense, it was sought to analyze how the approach to child support by the soap opera *Vale Tudo* (2025), contributed to the promotion of citizenship and emancipation of viewers. The debate included the debureaucratization of the State via Digital Governance, which aims to expand and make more efficient the population's access to public services.

Considering the idea developed by Goffman that framings influence the perception of reality and action of the subjects (MENDONÇA, SIMÕES, 2012), in order to operationalize the investigation, the intention is to verify which framings are triggered by the soap opera and by three communication vehicles to address the subject of alimony. The approaches of the online news portals G1, Correio Braziliense and O Tempo will be taken as a basis. As a theoretical apparatus, the perspective of the emancipated spectator will be considered (RANCIÈRE, 2009), in order to trace reflections on political issues and representativeness and visibility raised by the central point.

In this way, the topic in question is relevant since the exhibition of the chapter of the soap opera in which the character Lucimar requests child support via the Public Defender's Office App mobilized women across Brazil to also claim this right. Considering that the soap opera, despite being an important cultural product in Brazil, is still permeated by the stereotype of being banal and irrelevant, the repercussion of the subject of child support, raised by the soap opera *Vale Tudo*, actually reveals the strength of this audiovisual product as a cultural, pedagogical vehicle and promotion of citizenship.

2 THEORETICAL FRAMEWORK

2.1 CULTURE AND PEDAGOGY THROUGH SOAP OPERAS

The history of Brazilian television is permeated by soap operas, which have been part of the national culture for more than seventy years. Some titles are highlighted in the teledramaturgy, such as "Vale Tudo", from Rede Globo, whose first version dates from 1988. Due to the social relevance of the soap opera, in 2025 the *remake* was carried out, with the update of themes addressed and striking characters.

The new version of "Vale Tudo" is an example of how the soap opera can have a social impact through the themes it addresses. After the airing of the chapter in which the character Lucimar (Ingrid Gagher) learns (and at the same time teaches the public) how to download the Public Defender's Office application to apply for child support, support requests have grown in Brazil.

From this perspective, according to Sodré (2006), politics involves the sphere of power and the visible, and that/who appears in the public scene exerts influence. In this sense, the media acts in the formation of beliefs to the extent that it exerts forms of power, and it is necessary to pay attention to the relationships established between individuals and the media, so that they do not lose critical capacity and are only manipulated (SODRÉ, 2009).

Thus, when thinking about the case of the soap opera, what is shown gains visibility and exerts influences on the public. When the soap opera uses *social merchandising*, that is, it addresses and discusses latent social issues, the sphere of power (often political power) is accentuated. In the case discussed in the present work, it is clear that the treatment of the subject of alimony has become a point of discussion, given that it is related, among other topics, to a right in the sphere of the family, which is connected with latent issues in the present time, such as gender roles in society, the position of women and single motherhood.

Furthermore, borrowing Green's (2010) discussion about the power of the figure of the citizen as spectator, when thinking about the relationship between the soap opera and the public, it is expected that it is a passive way, however the gaze is also a form of participation. What is transmitted by the soap opera and seen by the viewers generates a network of influences that can lead to action, even if in the private sphere of individuals. As in the case of alimony, whether or not to make the request is a personal decision, but it generates impacts in the private sphere of the subjects, and also in the social sphere, when there is a significant number of people who manage to achieve their rights and thus pass this awareness on.

In this case, political power emerges from the soap opera to the public, which receives it in various ways, whether through the television screen, social networks and news. Therefore, understanding the dynamics of the relationships between soap operas and audiences is important, considering that the condition of being a spectator is not wrong, bad or apathetic, but rather constitutes a way of interacting with the world, and the soap opera can pass on knowledge and generate different forms of social engagement.

2.2 THE SOAP OPERA "VALE TUDO" OF 2025

The telenovela "Vale Tudo", with the first version in 1988, was produced by Rede Globo and was written by Gilberto Braga, Aguinaldo Silva and Leonor Bassères, and in 2025 it was adapted by Manoela Dias. The main themes addressed were the duality of honesty/corruption, ethical issues, inequalities, and other current social issues.

The most recent version rescued the central arc: the plot revolved around the characters Raquel Accioli (Taís Araújo), a woman full of values and ethics, Maria de Fátima (Bella Campos), daughter of Raquel, an unscrupulous young woman who does everything to

get out of the socioeconomic situation in which she was born, and Odete Roitman (Débora Bloch), a villain who represents the elite, and that embodies pride and different intolerances.

The story is triggered by the clash between Raquel and Fátima, when the young woman sells her grandfather's house, and uses the money to settle in Rio de Janeiro. Raquel goes after Fatima, and when she discovers that she has been deceived, she has to fight for her own survival in a strange city. With the help of friends he meets in Vila Isabel, he manages to create a business, and also meets Ivan Meirelles (Renato Góes), with whom he falls in love.

Meanwhile, Maria de Fátima, with the help of her boyfriend César (Cauã Reymond), tries to conquer space in different elite environments, until they reach the heir of the TCA airline, Afonso Roitman (Humberto Carrão), who is Odete's son. Getting closer to the villain, Fatima gets a deal: to separate Raquel from Ivan, and thus have support to marry Afonso. With this premise, the soap opera follows the course, including the supporting core that acts in the development of varied plots, which discuss themes that go beyond the fictional scope, and dialogue with social issues.

Therefore, it should be noted that in 2025 the soap opera updated some characters and themes worked. Heleninha (Paola Oliveira) has bipolar behavior and alcoholism addressed as diseases that need treatment, with empathy being demonstrated by some characters, and passages of treatment with the therapist; Laís (Lorena Lima) and Cecilia (Maeve Jinkings) are openly a couple and adopt a child; Poliana, who in the first version was just a shy and closeted man, now stands out when she discovers she is asexual and goes through a process of self-worth; Lucimar (Ingrid Gaigher) has her own story, being a woman who fights for her son's survival and conquest of independence.

Thus, in the 2025 version of the soap opera it is possible to identify important changes in the treatment of social issues. As Martins (2021) points out, time is not linear, but acts in a connection between past, present, and future. In this sense, the soap opera as a cultural product present in Brazilian daily life acts in the propagation of ideas and values that are constantly updated and that dialogue with the three times, and can create for certain groups the power of resistance, having a strong power of influence and transformation in the public.

From the new version of Lucimar in "Vale Tudo" the plot of alimony was developed, which yielded important social repercussions. This point will be analyzed below, considering possible contributions of the approach to the subject to the promotion of citizenship, in view of the framing given to the issue by the soap opera and by the journalistic coverage, pointing to the emancipation of the spectator.

2.3 DEBATES ON CITIZENSHIP FROM THE TELENOVELA "VALE TUDO", 2025: THE CASE OF ALIMONY

Social *merchandising* has already become a brand in Brazilian soap operas. From this practice, the soap opera addresses social themes, which can provoke off-screen discussions, generating an impact on viewers. This was the case of the May 13, 2025, chapter of the soap opera "Vale Tudo", in which the request for child support by the character Lucimar (Ingrid Gaigher) was addressed. After the scene was shown, thousands of requests for child support by women were registered in Brazil, reigniting the debate on current issues, such as solo motherhood, gender inequality and the right to child support as a way to guarantee resources for child rearing, which is a responsibility of both parents.

In the original version of "Vale Tudo", from 1988, the character Lucimar (Maria Gladys) worked as a day laborer, and was known for always betting on the Jogo do Bicho and meddling in the lives of neighbors, contributing to the gossip in Vila Isabel. A member of the comic core and on the side of the D/E class of the soap opera, only at the end of the story did she stand out, when she became rich after betting on the Jogo do Bicho the number of Odete Roitman's grave, embodying the superb characteristics of the villain. In the 2025 remake, the character gained a more complex plot. Lucimar is presented as a young woman, and even with dreams of ascending socially and being recognized as a singer, she works as a day laborer to support her son, Jorginho (Rafael Fuchs), the result of her relationship with her ex-husband Vasco (Thiago Martins).

Over the weeks, scenes are shown in which Lucimar asks Vasco to contribute to Jorginho's pension. Always with some excuse, Vasco excuses himself from the obligation, until Lucimar decides to make the formal request for child support for his son, given that he needs to pay for housing, food, education and leisure for the child.

In the plot, Lucimar has the help of Daniela (Jessica Marques), who is a law student and her friend, to be able to make the procedures for child support. Initially, Daniela explains to Lucimar how to proceed, but it takes a while for the character to actually decide to make the request, as she is afraid that Vasco will be arrested, which could lead Jorginho to believe that she harmed his father. In the meantime, the soap opera addresses fear and misinformation as the main reasons for women not to apply for child support, and highlights the view that permeates society, that men and women can have different behaviors and responsibilities in raising children.

In the chapter where Lucimar decides to apply for alimony, the step-by-step guide on how to proceed in the Public Defender's Office application is shown. This approach generated

repercussions on the networks, and also in the media, as the fact that after the exhibition of the scene increased exponentially the requests for child support in Brazil gained notoriety.

In this way, the soap opera gained prominence as a means of guiding a current and necessary debate, which even led to transformations in reality, in view of the identification and engagement generated in the public.

Taking as a parallel the thinking developed by Butler (2018), about the performativity of bodies considered deviant, and gender issues, there is a discussion about bodies considered worthy of appearance. Thus, thinking about the representation that the soap opera "Vale Tudo" makes of a poor woman, with an undervalued profession (day laborer), and who has problems in being able to access basic rights, such as the pension, breaks hegemonic patterns and raises current debates.

In line with the fact that collective acts are political performances that claim visibility and recognition for marginalized bodies (BUTLER, 2018), the soap opera as a cultural object of broad (collective) reach, by bringing certain thematic and body approaches, becomes a space for performances that can bring visibility and recognition to certain groups in society. With this, the relevance of the approach to child support by the soap opera "Vale Tudo" is highlighted as a way to connect vulnerable people within this theme, who can learn together and achieve rights.

Thus, in order to better understand how the theme of alimony was addressed by the soap opera, and how it had repercussions in the media, the methodological paths pertinent to the intended analysis, and the possible social discussions provided, will be dealt with below.

3 METHODOLOGY

3.1 FRAMING AND EMANCIPATED SPECTATOR

To assist in the process of understanding the positions of the soap opera "Vale Tudo", 2025, on the subject of alimony, as well as the news portals on the repercussions of the subject, the framing approach is appropriate.

Gregory Bateson developed, in the field of psychology, the notion of framing to understand some pathologies, and established that every framing is metacommunicative and allows the identification of ways of interpreting and organizing experiences and messages. Erving Goffman expanded the idea of framing, placing it as a way to guide the perception that individuals have about the world, having the possibility of answering the question "what is happening here?". Thus, it establishes the concept of frame as referring to the principles of

organization of social frameworks and participation of individuals in them, and proposes that the framework guides the positioning of subjects, "*footing*" (MENDONÇA, SIMÕES, 2012).

In the case of the analysis of the approach of the soap opera "Vale Tudo" on the subject of alimony, and the journalistic coverage made by the online portals G1, Correio Braziliense and O Tempo on the repercussions of the soap opera, the framing aspect of the analysis of the interactive situation will be adopted. Such a conception helps to understand the relationship between the way in which the process of describing the situation places it in certain perspectives, and creates certain interpretative keys, frames of meaning (MENDONÇA, SIMÕES, 2012).

With this, the framings allow us to investigate the perspective/framework in which a certain content is presented. This perspective is productive for the analysis of televisual objects, such as soap operas, in view of the need for a more critical view of the transmitted contents.

In order to support the analysis of the framings, the notion of emancipated spectator, developed by Rancière (2009), will also be taken as a basis. From the author's perspective, the spectator is not merely passive, and seeing, knowing and acting are interconnected, so that the spectator can be active and also the holder of knowledge.

Thus, political artistic practices invite the spectator to appropriate knowledge from their own knowledge and experiences. In the approximation and breaking of hierarchies between the objects of knowledge and the public, it is possible to have emancipation and transformation from what is learned.

From this perspective, the forms of representation and framing proposed by the soap opera can lead the viewer to varied paths. Considering the topic of social *merchandising* present in the plots, the emancipation of the spectator can occur through the identification of a portrayed reality, or with the criticality raised about a certain current subject. With this idea, this article seeks to understand, to a certain extent, how the public appropriated the issue of alimony.

3.2 FRAMEWORKS ON CHILD SUPPORT IN THE SOAP OPERA "VALE TUDO" (2025) AND IN NEWS PORTALS

The scene of the request for child support by the character Lucimar, in "Vale Tudo", 2025, aired in the episode of May 13, 2025, and lasted less than 4 minutes (41'00" to 43'54"). After eight years, Lucimar decides to apply for child support for Jorginho, and turns to her friend Daniela. The scene is quick, but presents the path to be followed in the Public Defender's Office application to start the action.

Lucimar goes to Daniela's house, and is instructed to download the Public Defender's Office application. The process is quick, and soon she opens the app and starts reading the guidelines.

Figure 1

Lucimar downloads the Public Defender's Office application on her cell phone

Source: Frame from the soap opera "Vale Tudo", 2025. (Chapter 13/05/2025, scene 42' 30").

In the scene, all the initial screens of the application are shown to the public, so that it is possible to read the content and see how the procedure begins.

Figure 2

Lucimar has Daniela's help to carry out the initial procedures of the pension request

Source: Frame from the soap opera "Vale Tudo", 2025. (Chapter 13/05/2025, scene 42' 47").

After entering the Public Defender's Office application, Lucimar says that after eight years, she will finally take her ex-husband to court. Daniela corrects this statement, and says that it is not a process of putting the ex in court, but of formalizing the custody of the child.

Lucimar reflects that this description is better, as it doesn't seem like she's ending her ex-husband's life.

Such a picture created by the soap opera brings the pedagogical and critical sense to the public about the patriarchal values of society. This moment of reflection on the meaning given to the request for alimony places it as a right, not as part of a process of revenge against the ex-partner. In this way, the process of the woman, in these cases, being considered the executioner of the ex-husband, a reason that leads to the perpetuation of patrimonial violence and female overload in the care of children, in addition to leading to the withdrawal, or lack of encouragement to file the request for alimony.

Figure 3

Home page of the Public Defender's Office application

Source: Frame from the soap opera "Vale Tudo", 2025. (Chapter 13/05/2025, scene 42' 52").

Lucimar remains in the app, and reads the initial messages that appear: "do you have questions?", then "privacy policy". She responds to the information she reads in an ironic way, showing that she is a little nervous. Daniela tells her not to worry, because the app is easy to understand and she will be able to place the order. In this context, possible points of identification with the public are passed: being a layman and being nervous or insecure to make the request does not prevent the action from being carried out. The procedure is placed as simple, and easily accessible to everyone.

Figure 4

How to start service from the Public Defender's Office application

Source: Frame from the soap opera "Vale Tudo", 2025. (Chapter 13/05/2025, scene 43' 02").

Finally, Lucimar starts a "new application" in the application, and searches for "alimony".

Figure 5

How to search for the type of service in the Public Defender's Office application

Source: Frame from the soap opera "Vale Tudo", 2025. (Chapter 13/05/2025, scene 43' 20").

Daniela explains to Lucimar that at this first moment, the application is made online, with the submission of documents. Afterwards, she and Vasco will be called for a conversation.

Thus, the soap opera places the request for child support as a simple and practical procedure, available for access by anyone interested. From this picture of meaning passed by the plot, the repercussion of the scene in the public was immediate, generating an increase

in requests for child support by women throughout Brazil. The case gained notoriety on social networks, with a manifestation of the actress who played the character Lucimar, and was also reported in several media outlets, gaining a bias that goes beyond the field of mere entertainment, but dialoguing with the citizenry.

To understand how the media framed the repercussion of the soap opera "Vale Tudo" in relation to the chapter in which the request for child support is addressed, the online news portals G1 were selected, as it belongs to Grupo Globo, from the same broadcaster that produced the soap opera, in order to understand how the broadcaster wanted to reflect on the issue; *Correio Braziliense*, with national circulation, and *O Tempo*, with Minas Gerais circulation, to verify a possible geographical cut for dealing with the subject.

On May 20, seven days after the episode in question aired, the G1 portal published an article in the "Pop e Arte" column, with the following headline: "Scene from 'Vale Tudo' raises requests for child support; see step by step how to ask". The title itself suggests, on the one hand, the promotion of the soap opera, and on the other, the continuity of the pedagogical tone on the theme.

The article highlights data from the Public Defender's Office of Rio de Janeiro, which shows an increase in the number of accesses to the agency's application after the exhibition of the scene in which the character Lucimar learns and teaches the public how to access the system and make the initial procedures for the request for child support. Below, the concept of alimony, who is entitled to it, how it is for the specific case of children of divorced parents, and how the request is made, highlighting the necessary documents, are addressed. The article uses arguments of authority, with a video in which a lawyer explains how to apply for alimony, and an explanation by the Deputy Public Defender General, Emmanuela Saboya, saying that the alimony meets general demands for the upbringing and subsistence of children.

In this way, the article on the G1 portal implicitly emphasizes the power of the soap opera "Vale Tudo" in dealing with the issue of alimony, and continues the pedagogical focus, teaching the public about the right to alimony and how to achieve it. The intention went further, with a special program of *Profissão Repórter* to address the subject, bringing the soap opera as a backdrop to deal with the public's identification with the theme, marking a position of commitment to the promotion of citizenship before the audience.

The portal of the newspaper *O Tempo*, in turn, brought, on May 28, the headline "Scene from the soap opera 'Vale Tudo' raises requests for child support and ignites debate". From a brief context of the soap opera, the article features a video about child support, and broadly addresses the context of Minas Gerais, with the position of the Public Defender's

Office of Minas Gerais on the number of pension requests in the state, and the fact that there is still no application in the region. The focus also falls on the discussion of what alimony is, teaching the procedures for the request, and emphasizing, based on authoritative arguments from legal and psychology professionals, the obstacles for women throughout Brazil to claim the right. Finally, they highlight the impacts of soap operas and art on the public, with high potential to transform reality.

In addition to bringing the discussion closer regionally, the portal of the newspaper O Tempo also dialogues with the pedagogical bias, and uses a guiding discourse to the public, highlighting the social implications of the issue of child support, acting in an awareness-raising tone that ranges from the importance of the soap opera for society, to the need for people to seek their rights.

Finally, Correio Braziliense presents, on May 17, 2025, the headline "Ingrid Gaigher: Lucimar from 'Vale Tudo' inspires 270 thousand women in one hour". In a milder tone, the article contextualizes the soap opera and the repercussion of the case in the Public Defender's Office, but mainly contemplates the career of the actress who plays the character Lucimar, and her positions on the effects of the soap opera. In this case, there is no pedagogical tone, as the article does not explain what alimony is, nor does it teach the public how to use the law.

Thus, Correio Braziliense frames the issue in a subtle way as it highlights the career of actress Ingrid Gaigher and the success she achieved with the scene of the soap opera "Vale Tudo", but without problematizing the issue of child support socially. The debate on citizenship is little worked on, since the greatest support of the text in this sense is the approach to the numbers of the Public Defender's Office, which sounds more like curiosity than a way of understanding a communicative phenomenon with effects on practical life. Despite being emptied of critical engagement, the article still reflects on the soap opera as a vehicle, albeit indirect, for promoting social discussions.

Consequently, in the exchange between the soap opera and the public, and also with the appropriation of the repercussions of this relationship by journalistic vehicles, there is the dimension of the emancipation of the public. As evidenced by the increase in requests for alimony after the screening of the scene starring Lucimar, there were concrete effects of the content of the soap opera "Vale Tudo" on the viewers, who appropriated the theme in question in an emancipatory way.

In addition, Lucimar's representation highlights a body and a reality that are not in the hegemonic sphere, bringing representation to marginalized groups, which also highlights

current emerging discussions, such as the position of women in society and gender inequalities.

As expressed by the media coverage, the social *merchandising* made by "Vale Tudo" about alimony generated great repercussion in the viewers, highlighting the power of teledramaturgy in engaging with social issues, with direct effects on the lives of the affected subjects.

3.3 CITIZEN REFLECTIONS

From the scene of the request for child support via the Public Defender's Office application, the disclosure not only of a right, but also of a government strategy for the alleged improvement in access to services by citizens, which is the issue of digital governance, is also highlighted. In recent decades, there has been an exponential growth of information technologies, and consequent implementation in everyday life. What once seemed remote, today constitutes the basis of various human activities, so that contemporary society lives a true relationship of symbiosis with digital devices.

Over the years, in addition to permeating private and economic relations, technological solutions have also advanced towards public administration, allowing the debureaucratization of various State processes. According to Albuquerque and Costa (2025), the advancement of Information and Communication Technologies (ICT) has given rise to a new form of governance, called electronic government, which allows online access to public information, as well as to various government services.

For Jardim (2000), electronic government (e-Gov) is a resource through which the State uses technology to offer society better access to information and government services, so that it raises the quality of the activities it develops, while increasing social participation in democratic processes.

In relation to the Brazilian government, ICTs have been present since the beginning of the new century, always aiming at simplifying actions, improving service to the public and efficiency in the use of collective resources. On its own page, the Ministry of Management and Innovation in Public Services outlines the timeline that demonstrates how the State transitioned from electronic to digital in the period between the years 2000 and 2022.

As mentioned, since the 2000s, various services of the State have been offered from digital supports, and under the focus of the present work, those provided by the Public Defender's Office stand out, an institution that aims to guarantee free legal assistance and defense to people who do not have the resources to pay for the expenses of a lawyer.

It so happens that Brazil is a country crossed by multiple inequalities, so that there is

a real paradox between the expansion of the availability of public services through digital means, and the real access to such activities by the Brazilian citizen, who faces physical/material barriers, as well as impediments related to digital literacy. In this sense, Cavalcante, Ota and Oliveira (2024) converge, when relating public ethics to the digital governance system: "... The digital divide is not just an infrastructure problem. It also manifests itself in the absence of digital skills to use tools in a meaningful way." Thus, it is possible to conclude that one of the biggest challenges of e-Gov in the country goes beyond the implementation barrier, reaching the aspect of de facto democratic access.

Thus, it is important to highlight the May 13, 2025 chapter of the soap opera "Vale Tudo", particularly the scene where the character Lucimar requests child support for her son (41'00" to 43'54"). In the scene, Lucimar details the step-by-step process to apply for alimony through the Public Defender's Office application, making the entire procedure not only didactic, but also emptying viewers of possible fears about the meaning of the action.

For the reasons explained and considering the reach and repercussion of the work in Brazilian society, the scene that lasted just under 4 minutes ended up contributing to the democratization of access to the Public Defender's Office service, as well demonstrated by the numerous reports of the time that pointed to the growth in demand for child support services in several capitals of Brazil, Just after the exhibition of the plot in prime time on Brazilian television.

Therefore, what seemed to be an isolated scene of a popular cultural production in the country, proved to be a strong driver of awareness and social mobilization. Thus, the serial ended up settling, albeit in isolation, a scenario of exclusion, where due to lack of basic information, the citizen stops using public resources, even those already available digitally (which in theory mean greater autonomy and better access for the citizen).

In its own way, the May 13, 2025 chapter of the soap opera "Vale Tudo", reinforced the objectives and importance of e-Gov in Brazil, expanding social knowledge and, consequently, popular interest in its use.

4 CONCLUSION

The present work sought to show how soap operas can play an emancipatory role in viewers from the social impacts it can generate. In this sense, the approach to child support in the soap opera "Vale Tudo" (2025) confirmed this power, given that it led thousands of women in Brazil to apply for child support after the exhibition of the chapter in which the character Lucimar claims this right for her child.

By incorporating *social merchandising* as a narrative tool, the soap opera contributed to making visible an urgent social demand, enabling the public to identify with the character Lucimar and promoting awareness about rights that are often neglected. According to the notion of the emancipated spectator, developed by Jacques Rancière (2009), it is perceived that the spectators not only passively watched the soap opera, but acted from it, mobilizing knowledge, experiences and practices to transform part of the reality in which they are inserted.

In addition, the framing triggered by the soap opera "Vale Tudo" and by the online news portals G1, O Tempo and Correio Braziliense show, for the most part, the pedagogical bias when dealing with the issue of child support. Thus, different reflections are raised on the issue, which in line with the experiences and expectations of the spectators lead to repercussions such as those generated by the soap opera analyzed.

It is important to note that the scene of the request for child support via the Public Defender's Office application is also relevant for highlighting the issue of Digital Governance, a state management strategy that in general aims to improve access to services by citizens.

Finally, the work points to the relevance of teledramaturgy as a space for the construction and dissemination of representations and knowledge, and as a privileged vehicle for the promotion of representativeness and citizenship.

ABSTRACT

This article examines, from a philosophical perspective, the status of conflict in human relations and investigates to what extent nonviolence can interrupt the mimetic logic that turns difference into hostility. It begins from the hypothesis that conflict belongs to the relational condition of the human being and therefore cannot simply be eliminated from social life. The problem emerges when conflict is captured by violent reciprocity and rivalry, producing forms of enmity that degrade the bond with the other. Based on bibliographical research with a qualitative and theoretical-conceptual approach, the text brings into dialogue Jean-Marie Muller, René Girard, Georg Simmel, Zygmunt Bauman, Norberto Bobbio, José Maria da Silva Rosa, and Leo Tolstoy. It argues that nonviolence does not mean passivity, but an ethical practice of resisting violence without reproducing it. The article concludes that friendship may be understood as an ethical horizon of coexistence, since it allows one to think relations shaped by responsibility, recognition, and the refusal of revenge.

Keywords: Conflict. Imitative Desire. Nonviolence. Peace. Relational Ethics. Responsibility.

RESUMO

Este artigo examina, em perspectiva filosófica, o estatuto do conflito nas relações humanas e investiga em que medida a não violência pode interromper a lógica mimética que converte diferença em hostilidade. Parte-se da hipótese de que o conflito integra a condição relacional do ser humano e, por isso, não pode ser simplesmente eliminado da vida social. O problema surge quando ele é capturado pela reciprocidade violenta e pela rivalidade, produzindo formas de inimizade que degradam o vínculo com o outro. Com base em pesquisa bibliográfica, de abordagem qualitativa e caráter teórico-conceitual, o texto articula contribuições de Jean-Marie Muller, René Girard, Georg Simmel, Zygmunt Bauman,

Norberto Bobbio, José Maria da Silva Rosa e Liev Tolstói. Sustenta-se que a não violência não significa passividade, mas uma prática ética de resistência à violência sem sua reprodução. Conclui-se que a amizade pode ser compreendida como horizonte ético da convivência, na medida em que permite pensar relações marcadas por responsabilidade, reconhecimento e recusa da vingança.

Palavras-chave: Amizade. Conflito. Ética Relacional. Mimese. Não Violência.

RESUMEN

Este artículo analiza, desde una perspectiva filosófica, el estatuto del conflicto en las relaciones humanas e investiga en qué medida la no violencia puede interrumpir la lógica mimética que transforma la diferencia en hostilidad. Se parte de la hipótesis de que el conflicto forma parte de la condición relacional del ser humano y, por lo tanto, no puede ser simplemente eliminado de la vida social, aunque pueda ser orientado de manera no violenta. Mediante una investigación bibliográfica de enfoque cualitativo y carácter teórico-conceptual, el texto examina cómo la dinámica del deseo imitativo y de la reciprocidad hostil contribuye a la formación de rivalidades, así como a la estabilización de formas de enemistad que degradan el vínculo con el otro. Sobre esta base, se argumenta que la no violencia no equivale a pasividad, sino que constituye una práctica ética y racional de resistencia a la violencia que se niega a reproducirla. El estudio propone, finalmente, comprender la amistad como un horizonte ético de convivencia, capaz de preservar el disenso sin convertir al otro en enemigo y de ofrecer un marco normativo orientado por la responsabilidad y el reconocimiento mutuo.

Palabras clave: Convivencia. Deseo Imitativo. Ética Relacional. Paz. Responsabilidad.

1 INTRODUCTION

Human existence takes place within social relations. As a relational being, the individual is constituted in the interaction with others, in bonds that both enable cooperation and recognition and produce tensions, disputes and antagonisms. From this perspective, conflict should not be understood as an accidental element of life in society, but as a constitutive dimension of human experience and of the dynamics of society itself.

Based on this assumption, this article investigates, in a philosophical key, how conflict, although inherent to interpersonal relationships, can be conducted without becoming violence. The central hypothesis is that violence does not stem from conflict as such, but from the capture of conflict by mimetic rivalry and hostile reciprocity.

On the other hand, it is argued that nonviolence constitutes a rational and ethical practice of interrupting this circuit, making friendship thinkable not as private affection or simple cordiality, but as a normative form of relationship capable of preserving dissent without degrading the other into an enemy.

To develop this hypothesis, the article is structured in three moments. In the first, conflict is examined as a component of social relations, based mainly on the contributions of Jean-Marie Muller and Georg Simmel, highlighting its constitutive character for human coexistence. Then, it is analyzed how conflict can become rivalry and violence when crossed by mimetic desire and reciprocity, in dialogue with René Girard's theory.

Finally, nonviolence is discussed as a practice of resistance to hostility and as a possibility of ethical reorientation of relationships, with friendship as a normative horizon, with the support of Muller, José Maria da Silva Rosa, Leo Tolstoy, Zygmunt Bauman and Norberto Bobbio.

Methodologically, this is a bibliographic research, with a qualitative approach and a theoretical-conceptual character. The analysis articulates contributions from philosophy, social theory, and the anthropology of violence to defend a precise thesis: the decisive philosophical problem is not to eliminate conflict, but to prevent it from stabilizing in the form of violent rivalry. In this framework, friendship ceases to appear as a moral ideal external to the conflict and is understood as an ethical effect of the refusal of bad reciprocity.

2 RIVALRY

2.1 IN THE BEGINNING, THE CONFLICT

In Jean-Marie Muller's studies on violence and non-violence, the human condition is understood from the point of view of the relationship. The individual is not self-sufficient: he is formed in the encounter with other people, in experiences of proximity, dependence,

divergence and cooperation. For this reason, coexistence is not a peripheral datum of existence, but the space in which humanity itself is concretized.

It is precisely in this relational terrain that the conflict appears. The presence of the other can arouse adherence, but also friction, dispute and resistance. Competing interests, incompatible expectations, and divergent projects make conflict a recurrent feature of collective life, which is why Muller treats it as a structural element of human relations, and not as an occasional anomaly.

The reading of Georg Simmel reinforces this understanding by associating society with the intertwining of reciprocal interactions. For the sociologist, the social emerges both from movements of approximation and from impulses of opposition; collaboration, competition, agreement and antagonism coexist in the same relational fabric. Society, therefore, is not formed in spite of these tensions, but also through them:

Just as the universe needs 'love and hate', that is, forces of attraction and forces of repulsion, in order to have any form, so society, in order to achieve a certain configuration, needs proportional amounts of harmony and disharmony, association and competition, favorable and unfavorable tendencies (SIMMEL, 1983, p. 124).

The successive actions and reactions between individuals shape the concrete form of social life. The way in which subjects intervene in each other — whether in the key of defense, attack, cooperation, competition or search for prestige — conditions the type of bond that is established. From this point of view, society is not the result of homogeneous relations, but of varied compositions, often crossed by tensions:

Society exists wherever various individuals interact. [...] make man find himself in a state of coexistence with other men, with actions in favor of them, together with them, against them, in correlation of circumstances with them (SIMMEL, 1983, p. 59).

In Simmel, conflict is not just a symptom of rupture; it can also operate as a modality of sociation. This ambivalence prevents treating it as an exclusively negative reality. At the same time that it expresses dissociation, conflict is part of the field of interpersonal relationships and participates in social cohesion itself, albeit in a paradoxical way.

This formulation makes it clearer that human coexistence includes clashes between individual purposes. When desires, pretensions and interests collide, a dispute is established in which each agent starts to directly affect the other. It is at this moment that reciprocity thickens and the conflict ceases to be a simple divergence to take the form of relational opposition.

Among the factors that intensify this dynamic, desire occupies a decisive position. When the relationship is crossed by impulses of appropriation and comparison, the conflict can degenerate into rivalry, inaugurating a circuit of hostility. It is at this point that René Girard's reflection becomes central to understanding the passage from dissent to violent antagonism.

2.2 RECIPROCITY AND VIOLENCE: THE PERPETUAL DOUBLE IMITATION

Girard starts from the idea that human desire is neither spontaneous nor entirely autonomous. It is desired from a mediator, from a model whose will begins to guide the will of the subject. Mimicry, in this sense, is not a simple external imitation of behavior, but a deep structure of desire, and it is precisely for this reason that rivalry always becomes possible:

Man desires intensely, but he does not know exactly what, for it is the being he desires, a being of which he feels deprived and of which some other seems to him to be endowed. The subject expects this other to tell him what it is necessary to desire in order to acquire this being. [...] it is through its own desire that the model assigns to the subject the supremely desirable object (GIRARD, 1990, p. 184).

The mimetic model can be an admired person, a social group or any reference invested with prestige. Without this mediation, desire does not acquire precise direction. The problem arises when the same figure who guides the aspiration starts to block his satisfaction, becoming a reference into an obstacle and, later, a rival.

By stating that society transforms into a model what it honors, Girard draws attention to the heteronomous character of desire. The subject believes he desires freely, but his will is crossed by socially shared values and hierarchies. In this logic, the object matters less for its intrinsic qualities than for the value conferred by others.

When two wills converge mimetically, interpersonal conflict gains intensity. The other ceases to be just a distinct presence and starts to represent concrete resistance to the subject's project. Opposition, then, is no longer limited to the plane of ideas: it affects the very constitution of the relation.

Envy plays a decisive role in this process. The good possessed by the other comes to be perceived as a sign of one's own lack, and greed shifts the object's attention to the position occupied by the rival. Desire, therefore, takes on a competitive form and feeds new possibilities of conflict.

It is not only the disputed object that gives rise to rivalry. What ignites the antagonism is the fact that he has been invested with value by the other. The rival becomes an obstacle

precisely because he confirms, with his own desire, the importance of what he intends to achieve.

In the mimetic climb, imitator and model enter into reciprocal mirroring. Each one starts to react to the other, and the initial convergence of desires becomes a mutual barrier. At this stage, the relationship becomes autonomous in relation to the object and tends to revolve around the opposition itself:

Imitation reappears from the one who strives to deny it. When one of the two partners drops the torch of mimicry, in short, the other takes it not to renew the bond that is being broken, but to finish the rupture by reduplicating it mimetically (GIRARD, 2012, p. 55).

In a similar key, Hobbes identifies competition as one of the sources of human conflict. The search for goods, security and recognition produces distrust and confrontation, especially when agents perceive themselves to be threatened in their interests. The result can be open enmity and a willingness to war.

When this occurs, the adversaries progressively stop aiming at the object in dispute and concentrate on each other. The rival becomes the true center of the relationship, and mimesis no longer organizes only desire, but also violence itself. The opposition is fueled by an increasingly hostile reciprocity:

It is imagined that at first there is the object, then the desires that converge independently to this object, and finally violence, a fortuitous, accidental consequence of this convergence. [...] Violence becomes more and more manifest: it is no longer the intrinsic value of the object that provokes conflict, exciting rival greed, but it is violence itself that values the objects, inventing pretexts to unleash itself more easily (GIRARD, 1990, p. 182).

The mimetic theory thus allows us to locate the genesis of violence in the relational dynamics of desire. Violence does not appear as an accident external to the human bond, but as a possible unfolding of competitive imitation, when reciprocity closes in on itself and transforms the other into a threat.

Poor reciprocity translates precisely this passage. Small gestures of hostility can trigger equivalent responses, establishing a logic of aggressive mirroring. As the boundary between ordinary interaction and violent escalation is narrow, conflict can be quickly contaminated by the reproduction of aggression.

It is in this horizon that Girard mobilizes the anthropological sense of scandal as an obstacle and trap. Scandal fixes the subject on the rival, captures his attention and imprisons him in the mimetic relationship. Instead of dissolving conflict, it intensifies and reproduces it.

The reading of João Cezar de Castro Rocha helps to make this mechanism explicit by showing that the scandalous hurts the other precisely because he exhibits success, superiority or prestige. Provocation does not only act on the moral plane; it reorganizes the perception of the subject and reinforces the centrality of the rival in the economy of desire.

When society naturalizes counterviolence as a legitimate response, it becomes more difficult to perceive how much this reaction only renews the destructive spiral. The social legitimization of retaliation conceals the mimetic character of violence and contributes to perpetuating it.

If conflict structurally accompanies life in common, the decisive question is to prevent it from becoming the predominant form of bond. Recognizing its inevitability is not equivalent to naturalizing violence. On the contrary: precisely because conflict is constitutive, it becomes philosophically necessary to distinguish between opposition, rivalry and destruction, so that common life is not organized under the empire of counterviolence.

Therefore, the peaceful relationship does not depend on the elimination of the other as a potential adversary, but on the effort not to turn him into an enemy. In the face of opposition, the ethical requirement is to contain hostility and reject the logic of fear, threat and revenge.

Girard's contribution, at this point, is to demonstrate that rivalry is not born only from objective differences of interest, but from the way in which subjects learn to desire one from the other. By revealing the imitative dimension of conflict, his theory helps to understand why violence can spread so quickly in human relationships.

3 NONVIOLENCE

Moved by desire and inscribed in mimetic relationships, human beings can become antagonists of one another. The similarity of claims and interests, far from ensuring harmony, often intensifies competition. It is in this context that it becomes necessary to think about how conflict can be faced without reproducing violence.

For Jean-Marie Muller, an effectively human coexistence is not achieved only by abstract tolerance of differences. It requires ethical work on one's own relationship, including the tendency to look to the other for a competitive mirror. Nonviolence is born, in this context, as a practice of rupture with hostile reciprocity.

Human coexistence may aspire to peace, but it is still conflictive. Muller's observation is decisive because it dispels two symmetrical illusions: that it would be possible to abolish conflict and that all tension inevitably leads to violence. Between these extremes, nonviolence presents itself as a way of governing dissent.

When the subject responds to aggression by reproducing it, he prolongs the violence suffered and helps to stabilize his circuit. The retaliatory gesture, even when it presents itself as a justified reaction, re-inscribes the individual in the same logic that it intends to combat and amplifies the imbalance of the relationship:

Any violence is a process of homicide, of annihilation. Perhaps the process will not go all the way, but the desire to eliminate the adversary, to drive him away, to exclude him, to reduce him to silence, to suppress him, will become stronger than the will to come to terms with him. From insult to humiliation, from torture to homicide, there are multiple forms of violence and multiple forms of death (MULLER, 2007, p. 30).

René Girard states that "the violence of the nonviolent, which we all believe to be, is never the work of particularly 'aggressive' individuals, nor is it the result of an instinct of aggression"; it is rather the desire to return the violence of the other, the desire to avenge the hostile attitude of another. The French author also points out that even the most violent beings believe that they are only returning a violent action, or reacting to the violence of another person (GIRARD, 2012, p. 54).

From this perspective, Muller distinguishes between aggressiveness and violence. Aggressiveness corresponds to an energy of affirmation and resistance that is characteristic of the human condition; Violence, on the contrary, consists in its destructive deformation. Nonviolence does not suppress the power of action, but seeks to orient it towards forms of confrontation that do not annihilate the other:

Passivity is a much more widespread attitude than violence. Men's capacity for resignation is considerably greater than their capacity for revolt. [...] it is necessary to point out that nonviolence is in greater opposition to passivity and resignation than to violence (MULLER, 2007, p. 23).

Therefore, conflict can take on a constructive or destructive aspect. Nonviolent practice presupposes a willingness to face tension, and not to run away from it. Being nonviolent is not equivalent to submitting to the power of the adversary, but to sustaining the firmness of the confrontation without adhering to its violent grammar.

In Muller, nonviolence also appears as a rational choice and an exercise in self-control. Interrupting the chain of violence requires self-examination, containment of the impulses of revenge and awareness of the way in which the subject can become an agent of propagation of the evil he denounces.

Hence the importance of limiting one's own desires. By recognizing that rivalry feeds on the unlimited expansion of individual pretensions, the subject makes room for another

relational economy, less oriented by dispute and more attentive to the ethical effects of his actions on others.

José Maria da Silva Rosa, when addressing non-violence as a horizon of coexistence, also emphasizes the need to refuse violence as the ordinary language of human relations. For the author, peace does not result from the mere absence of confrontation, but from the construction of modes of bonding capable of interrupting violent excess:

José Maria da Silva Rosa argues, in similar terms, that the urgency of nonviolence stems less from its abstract value as an ideal than from the constant, manifest or latent presence of forms of violence that cross human coexistence and feed the temptation to respond to evil through the logic of retaliation (ROSA, 2001, p. 12).

Breaking bad reciprocity implies, therefore, disobeying the call for violence. It is a matter of cutting the imitative chain before it becomes contagious, refusing to return the aggression received to the other. This refusal does not eliminate the conflict, but modifies its trajectory.

When the individual decides not to reproduce the violence of his rival, he prevents the cruelty of others from fully determining his own conduct. The refusal of violent imitation thus functions as a gesture of ethical freedom and as a condition for reconfiguring the relationship:

The strategy of nonviolent action aims to break the mimicry by which each of the two rivals imitates the violence of the other, returning aggression for aggression, fracture for fracture, eye for eye, tooth for tooth. The very principle of nonviolent action consists of refusing to let oneself be carried away by this spiral of endless violence (MULLER, 2007, p. 148).

In *The Kingdom of God Is Within You*, Tolstoy argues that violence cannot be justified even under the argument of self-defense, because the violent response, even when presented as protection, reaffirms the same logic that it intends to condemn. His radical critique reinforces the demand not to return evil in the form of new evil.

Commenting on Gandhi, Muller observes that human truth is realized in the bond with the other and that violence corrupts precisely this bond. For this reason, nonviolent action is not a simple denial of force, but a defense of the relationship in its proper dignity. In this key, resorting to violence means degrading humanity itself. The recovery of the human thus passes through a practice of resistance that preserves the otherness of the other and prevents the conflict from becoming reciprocal annulment.

In commenting on Gandhi, Muller argues that truth, love, and nonviolence should not be thought of as independent values or combinable only occasionally; for him, there is

a deep ethical unity between these terms, incompatible with any attempt to legitimize violence in the name of love or truth (MULLER, 2007, p. 201).

Together, these formulations allow us to understand nonviolence as an active posture of responsibility, self-restraint and recognition. More than an abstract ideal, it operates as an ethical technique for deactivating rivalry: it disallows aggressive symmetry, interrupts the circulation of retaliation, and restores to conflict a regime in which the other can still be faced without being annulled.

4 FRIENDSHIP

When the individual disposes himself for the good of the other, he assumes responsibility for the relationship and starts to act, in Muller's terms, as a true artisan of peace. Friendship, in this context, is not reduced to private affection; it designates a form of ethical presence that sustains and reorients human bonds.

Reading Simmel, Zygmunt Bauman observes that friendship and enmity function as poles of the same relational matrix. Between these extremes, the other forms of social interaction are distributed. The quality of bonds, therefore, depends on the practices by which the subjects build cooperation or nurture antagonism.

If the rivalry exacerbates the conflict and pushes it into the impasse of violence, the decision not to respond to the adversary in the same terms opens up another possibility of relationship. Friendship arises, then, not as naïve sentimentality, but as an ethical orientation contrary to the fabrication of enemies.

Girard helps to perceive the procedural character of this degradation. Relationships do not break down all at once; They deteriorate by small displacements, repeated offenses and symmetrical responses, until no one recognizes himself as responsible for the wear and tear produced.

When the subjects are exempt from being responsible for coexistence, the rivalitarian machinery gains strength. Enmity does not appear spontaneously: it is constructed by practices of confrontation, by dispositions of suspicion and by a pragmatics of struggle that organizes the other as a threat.

In the opposite direction, friendship is produced by a pragmatics of cooperation. It requires responsibility, ethical initiative and care with the bond, without depending on the certainty of equivalent return. Therefore, friendship is less an affective reward than a relational practice:

While the expectation of friendship is not necessary to make friends, the expectation of enmity is indispensable to make enemies. Thus the opposition between friends and enemies is between doing and suffering, between being the subject or object of action. It is an opposition between advancing and retreating, between initiative and vigilance, between dominating and being dominated, between acting and reacting (BAUMAN, 1999, p. 63).

Norberto Bobbio, when reflecting on serenity, also approaches this ethic of nonviolence. Serenity, for him, is not indifference or weakness, but a willingness to refuse revenge and to contain the temptation to respond to evil with another evil.

The serene subject is, in this sense, the one who resists violence without making it an instrument of personal affirmation. Their attitude is not guided by competition or by the need to prevail over the other, but by the preservation of the relationship on non-destructive bases:

The serene is, on the contrary, the one who 'lets the other be what he is', even when the other is the arrogant, the insolent, the arrogant. He does not contact others for the purpose of competing, of creating conflict, and ultimately of winning. It is completely out of the spirit of competition, competition, rivalry, and therefore, also victory (BOBBIO, 2002, p. 40).

Opting for non-violence and cultivating serenity is, therefore, an ethical response to the rivalry and violence that permeate social relations. In the midst of the fragility and instability of contemporary bonds, this choice preserves the possibility of reciprocal recognition. Friendship can thus be understood as a practical horizon of a coexistence in which conflict does not disappear, but ceases to be organized by the logic of hostility.

5 CONCLUSION

The path developed in this article allows us to affirm that conflict belongs to the very fabric of social life and, for this reason, cannot be abolished without also erasing something of the human relational condition. The philosophical task, therefore, does not consist in imagining a frictionless coexistence, but in thinking about the conditions under which dissent can fail to converge towards destruction.

The analysis showed that the critical point of the transition from conflict to violence is found in mimetic rivalry and hostile reciprocity. When the subjects start to desire from the rival and respond to him according to the logic of aggressive mirroring, the other ceases to be an interlocutor or circumstantial adversary and starts to occupy the position of an obstacle to be neutralized. It is in this displacement that the conflict loses its own ambivalence and becomes fixed in the form of violence.

Against this mechanism, nonviolence was understood as an active practice of ethical and political regulation of conflict. Its meaning is not that of passivity, accommodation or refusal to act; rather, it is a deliberate intervention on the logic of destructive reciprocity. By refusing retaliation and limiting the mimetic expansion of desire, nonviolence preserves the possibility of confrontation without consenting to the symbolic or material annihilation of the other.

In this framework, friendship appears less as a spontaneous feeling than as a normative horizon of coexistence. It does not eliminate difference, dissent, or asymmetry, but it prevents such elements from being immediately translated into enmity. Thought of in this way, friendship designates a form of relationship in which otherness is sustained without surrender to hostility, and in which peace does not mean the absence of conflict, but the refusal of the violent degradation of the bond.

The central contribution of the article is to show that conflict, rivalry, non-violence and friendship make up interdependent moments of the same relational dynamic. Distinguishing conflict from violence and friendship from mere concord allows us to formulate a more precise philosophical thesis: peace only becomes intelligible when it ceases to be understood as the suppression of tensions and starts to be thought of as an ethical practice of containing bad reciprocity.

ABSTRACT

Post-Traumatic Stress Disorder (PTSD) is a psychological condition resulting from exposure to traumatic events that leads to persistent cognitive, emotional, and behavioral changes, compromising the individual's quality of life. Although trauma has been studied since Ancient Greece, the current understanding, focused on emotional and memory aspects, was consolidated in the 20th century, culminating in its current classification in the DSM-5-TR within trauma- and stressor-related disorders. The disorder shows a high prevalence among women, survivors of sexual violence, and rescue professionals, presenting neurobiological alterations that impair memory consolidation and functions such as attention. This study, linked to the Academic League of Psychology and Health (LAPS) at the Catholic University of Pelotas, aimed to analyze PTSD through a bibliographic and cultural review, combining theoretical foundations with extension practices. The methodology included the study of theoretical and audiovisual references, as well as a community action in the Laranjal neighborhood, in Pelotas, consisting of mapping service areas and distributing informational materials. The results indicate that the activity allowed for a deeper understanding of diagnostic criteria and promoted community support, bringing academic knowledge closer to society. It is concluded that the increase in global tragedies raises the risk of developing the disorder, making interdisciplinary initiatives essential for disseminating qualified information and strengthening coping strategies.

³ Professor. Universidade Católica de Pelotas. E-mail: rosane.feijo@ucpel.edu.br

emocionais e de memória, consolidou-se no século XX, culminando na classificação atual do DSM-5-TR dentro dos transtornos relacionados a trauma e estressores. O transtorno apresenta prevalência elevada em mulheres, sobreviventes de violência sexual e profissionais de resgate, manifestando alterações neurobiológicas que prejudicam a consolidação da memória e funções como a atenção. Este trabalho, vinculado à Liga Acadêmica de Psicologia e Saúde (LAPS) da Universidade Católica de Pelotas, objetivou analisar o TEPT por meio de uma revisão bibliográfica e cultural, unindo fundamentos teóricos à prática extensionista. A metodologia incluiu o estudo de referenciais teóricos e audiovisuais, além de uma ação comunitária no bairro Laranjal, em Pelotas, que consistiu no mapeamento de zonas de atendimento e distribuição de materiais informativos. Os resultados indicam que a atividade permitiu a compreensão aprofundada dos critérios diagnósticos e promoveu o acolhimento da população, aproximando o conhecimento acadêmico da sociedade. Conclui-se que o aumento de tragédias globais eleva o risco de desenvolvimento da doença, tornando iniciativas interdisciplinares essenciais para a disseminação de informações qualificadas e o fortalecimento de estratégias de enfrentamento.

RESUMEN

El Trastorno de Estrés Postraumático (TEPT) es una condición psicológica derivada de la exposición a eventos traumáticos que genera alteraciones cognitivas, emocionales y conductuales persistentes, comprometiendo la calidad de vida del individuo. Aunque el trauma ha sido estudiado desde la Antigua Grecia, la comprensión actual, centrada en aspectos emocionales y de memoria, se consolidó en el siglo XX, culminando en su clasificación actual en el DSM-5-TR dentro de los trastornos relacionados con trauma y factores de estrés. El trastorno presenta una alta prevalencia en mujeres, sobrevivientes de violencia sexual y profesionales de rescate, manifestando alteraciones neurobiológicas que afectan la consolidación de la memoria y funciones como la atención. Este trabajo, vinculado a la Liga Académica de Psicología y Salud (LAPS) de la Universidad Católica de Pelotas, tuvo como objetivo analizar el TEPT a través de una revisión bibliográfica y cultural, integrando fundamentos teóricos con la práctica extensionista. La metodología incluyó el estudio de referencias teóricas y audiovisuales, además de una acción comunitaria en el barrio Laranjal, en Pelotas, que consistió en el mapeo de zonas de atención y la distribución de materiales informativos. Los resultados indican que la actividad permitió una comprensión más profunda de los criterios diagnósticos y promovió la acogida de la población, acercando el conocimiento académico a la sociedad. Se concluye que el aumento de las tragedias globales incrementa el riesgo de desarrollar el trastorno, haciendo que las iniciativas interdisciplinarias sean esenciales para la difusión de información cualificada y el fortalecimiento de estrategias de afrontamiento.

1 INTRODUCTION

Post-Traumatic Stress Disorder (PTSD) is a psychological condition related to exposure to traumatic events that causes persistent cognitive, emotional, and behavioral changes, compromising the quality of life of individuals. Trauma has been studied since the times of Ancient Greece and, over the centuries, several explanations and epistemologies have been suggested. The current concept, mainly linked to emotional and memory, only began to be considered by thinkers of the twentieth century. Officially recognized in the DSM-III in 1980 and updated in subsequent editions, PTSD is currently classified among trauma-related disorders and stressors (APA, 2022). Over the years, it has undergone significant revisions in its diagnostic criteria, reflecting advances in the understanding of the disease and its clinical manifestations.

Studies indicate higher prevalence in women, survivors of sexual violence, war and rescue professionals (SBARDELLOTO; SCHAEFER; FAIR; KRISTENSEN, 2011). Research in neuropsychology highlights that PTSD not only alters emotional responses, but also interferes with memory consolidation processes, enhancing the intrusive recollection of traumatic events and compromising cognitive functions such as attention and working memory. These neurobiological alterations have direct implications for rehabilitation and the development of more effective therapeutic interventions (SBARDELLOTO; SCHAEFER; FAIR; KRISTENSEN, 2011).

The discussion on the topic is fundamental not only for clinical practice, but also for the development of public policies and mental health care strategies. This study aimed to investigate PTSD based on a literature and cultural review, to explore the evolution of diagnostic criteria throughout the editions of the DSM, to analyze its prevalence in different contexts and to discuss the implications of these changes for clinical practice and mental health policies, uniting theoretical foundations, artistic productions and extension practices, aiming to disseminate knowledge about the disorder inside and outside the university.

2 METHODOLOGY

The study was developed within the scope of the Academic League of Psychology and Health (LAPS) of the Catholic University of Pelotas. The Diagnostic and Statistical Manual of Mental Disorders (DSM-5-TR), national and international scientific articles, audiovisual materials (films and online videos) and the book "The body keeps the marks (VAN DER KOLK, 2021)" were used as a theoretical basis. The process involved: (1) preliminary study of the references; (2) holding an oral seminar for the members of the league; (3) dialogical discussion among the participants; and (4) extension action with the production of a mapping

of appropriate service zones in the city of Pelotas and distribution of informative posters to the community of the Laranjal neighborhood, at the local Basic Health Unit.

3 REPORTS AND IMPACTS GENERATED

The activity allowed for an in-depth understanding of the diagnostic criteria, symptoms, prevalence, and therapeutic interventions for PTSD. The use of cinematographic works made it possible to exemplify in an accessible way the impacts of trauma on daily life, while the collective discussion generated critical reflections among the participants of the league. The community action in the Laranjal neighborhood demonstrated social impact by bringing academic knowledge closer to the population, promoting awareness about mental health, welcoming, and care possibilities. For the students involved, the experience contributed significantly to their academic training, strengthening research skills, oral exposition, teamwork and demystifying previously established concepts about the disorder.

4 CONSIDERATIONS

Post-Traumatic Stress Disorder is deeply marked in the psyche of those who experience it. The number of tragedies on a global scale that occur frequently increases the risk of developing the disease both for those who are affected by them and for the emergency professionals who work in the affected places. The work achieved its objective of articulating theory, practice and university extension in the study of PTSD. The experience proved to be relevant both for the training of students and for the community, highlighting the importance of disseminating qualified information about mental health in urban spaces and with accessible language. It is evident, therefore, that interdisciplinary and extension initiatives favor the construction of bridges between the university and society, in addition to expanding the collective understanding of the impact of traumas, their manifestations and the available coping strategies.

ABSTRACT

Climate change represents one of the greatest contemporary challenges to global health, directly affecting environmental, social, and epidemiological dynamics in various regions of the planet. The Amazon stands out in this scenario due to its ecological relevance and its influence on the global climate balance. This chapter aims to analyze the impacts of climate change in the Amazon and to discuss the role of multiprofessional teams in building integrated responses to global health challenges. This is a qualitative study, developed through an integrative review of the scientific literature, with searches conducted in international databases such as PubMed, Scopus, Web of Science, SciELO, and the Virtual Health Library, including publications from 2016 to 2025. The results show that phenomena such as deforestation, wildfires, and air pollution have contributed to an increase in respiratory, cardiovascular, and infectious diseases, in addition to expanding social vulnerabilities among indigenous and riverside communities. In this context, the importance of multiprofessional action is highlighted, involving physicians, nurses, pharmacists, physiotherapists, nutritionists, dentists, and public health professionals in epidemiological surveillance, health promotion, and the implementation of comprehensive care strategies. It is concluded that the preservation of the Amazon and the integration between environmental and health policies are essential to address the challenges of planetary health, strengthen resilient health systems, and promote better living conditions for current and future populations.

RESUMEN

El cambio climático representa uno de los mayores desafíos contemporáneos para la salud global, afectando directamente la dinámica ambiental, social y epidemiológica en diversas regiones del planeta. La Amazonía se destaca en este escenario debido a su relevancia ecológica y su influencia sobre el equilibrio climático mundial. Este capítulo tiene como objetivo analizar los impactos del cambio climático en la Amazonía y discutir el papel de los equipos multiprofesionales en la construcción de respuestas integradas a los desafíos de la salud global. Se trata de un estudio de enfoque cualitativo, desarrollado mediante una revisión integradora de la literatura científica, con búsqueda realizada en bases de datos internacionales como PubMed, Scopus, Web of Science, SciELO y la Biblioteca Virtual en Salud, incluyendo publicaciones entre 2016 y 2025. Los resultados evidencian que fenómenos como la deforestación, los incendios forestales y la contaminación atmosférica han contribuido al aumento de enfermedades respiratorias, cardiovasculares e infecciosas, además de ampliar las vulnerabilidades sociales en comunidades indígenas y ribereñas. En este contexto, se destaca la importancia de la actuación multiprofesional que involucra a médicos, enfermeros, farmacéuticos, fisioterapeutas, nutricionistas, odontólogos y profesionales de la salud pública en la vigilancia epidemiológica, la promoción de la salud y la implementación de estrategias de atención integral. Se concluye que la preservación de la Amazonía y la integración entre políticas ambientales y sanitarias son fundamentales para enfrentar los desafíos de la salud planetaria, fortalecer sistemas de salud resilientes y promover mejores condiciones de vida para las poblaciones actuales y futuras.

1 INTRODUCTION

In recent decades, climate change has emerged as one of the greatest global challenges for public health, directly influencing the occurrence of diseases, food security, air quality, and the living conditions of populations. In the context of planetary health, the debate on environmental impacts on human health has become central to understanding how climate phenomena, environmental degradation, and changes in ecosystems affect health systems in different regions of the world. In this scenario, the Brazilian Amazon assumes a strategic position, not only for its ecological and climatic importance, but also for its decisive role in the dynamics of global health (WATTS et al., 2019; NOBRE et al., 2016).

The Amazon is home to the largest tropical forest on the planet and exerts a significant influence on the world's climate balance. However, processes such as deforestation, fires, agricultural expansion and changes in land use have intensified the emission of air pollutants and altered the environmental cycles of the region. These transformations contribute to the increase in air pollution, exposure to fine particulate matter, and the occurrence of extreme weather events, factors that directly impact the health of populations in the Amazon and other regions of the planet (MARLIER et al., 2020; BUTT et al., 2021).

The effects of these environmental changes are reflected in the increase in respiratory, cardiovascular and infectious diseases, as well as problems related to food insecurity, malnutrition and population displacement. Recent studies show that smoke from fires in the Amazon is associated with increased hospitalizations for respiratory diseases and increased premature mortality in different population groups (YE et al., 2021; COBELO et al., 2023). These impacts make it evident that the climate crisis is not only an environmental issue, but also a central public health problem.

Given this scenario, the integrated action of multiprofessional health teams is essential to face the challenges associated with climate change. Doctors play a fundamental role in the diagnosis and treatment of diseases related to environmental exposure, while nurses work in epidemiological surveillance, clinical follow-up and health promotion in communities. Pharmacists contribute to the safe management of medications and to the therapeutic follow-up of patients with chronic diseases aggravated by environmental factors, while physiotherapists participate in the rehabilitation of individuals affected by respiratory and cardiovascular diseases associated with air pollution (SHEEHAN et al., 2023; ROCHA-SILVA et al., 2025).

In addition, nutritionists play an essential role in assessing and managing the nutritional consequences related to environmental change and food insecurity, especially in vulnerable populations. Dentists also contribute to the promotion of integral health,

considering that environmental and socioeconomic changes can influence oral health conditions and systemic diseases. At the same time, professionals from the social sciences, public health, and epidemiology collaborate to understand the social determinants of health and develop community intervention strategies in the face of climate impacts (SANTOS et al., 2025; SILVA et al., 2025).

The multiprofessional approach becomes even more relevant when considering the vulnerability of indigenous communities, riverside dwellers and traditional populations in the Amazon, who face additional challenges related to access to health services, environmental exposure and changes in lifestyles. Studies indicate that these populations are among the most affected by climate and environmental transformations, which reinforces the need for integrated and culturally sensitive care strategies (PRIST et al., 2023; HACÓN et al., 2020).

In this context, the concept of planetary health emerges as a fundamental approach to understanding the interdependence between natural systems and human health. Planetary health proposes an integrated vision that recognizes that the well-being of populations depends on the preservation of ecosystems and environmental sustainability. Thus, multiprofessional action in health becomes a central element in the construction of effective responses to the challenges imposed by climate change, especially in strategic regions such as the Amazon (WATTS et al., 2019).

Given this reality, understanding the impacts of climate change in the Amazon and its implications for global health becomes essential to guide public policies, prevention strategies, and comprehensive care actions. Thus, this chapter aims to analyze the effects of climate change on the health of Amazonian populations and discuss the role of multiprofessional teams in the construction of integrated responses to contemporary global health challenges.

2 LITERATURE REVIEW

2.1 CLIMATE CHANGE AND PLANETARY HEALTH IN THE GLOBAL CONTEXT

Climate change has been recognized as one of the greatest contemporary challenges to global health, directly influencing the environmental determinants of human health. The concept of planetary health emerges in this scenario as an interdisciplinary approach that seeks to understand the interdependence between natural systems and human well-being. The scientific literature points out that climate change, environmental degradation, and biodiversity loss have the potential to intensify health crises in different regions of the planet, mainly affecting vulnerable populations (WATTS et al., 2019).

Global studies indicate that the increase in the planet's average temperature, the intensification of extreme weather events, and changes in precipitation patterns have contributed to the increase in infectious, respiratory, and cardiovascular diseases. In addition, these phenomena influence the availability of natural resources, directly impacting food security and access to drinking water. In this context, planetary health proposes an integrated vision that recognizes that the preservation of ecosystems is essential to ensure adequate health conditions and quality of life for human populations (NOBRE et al., 2016).

Another relevant aspect refers to the fact that the impacts of climate change on health are not evenly distributed. Developing countries and regions with greater socio-environmental vulnerability tend to suffer more intense effects from these transformations. Thus, understanding the effects of climate on health requires a multidisciplinary approach that considers environmental, social, and economic factors, in addition to the integrated work of professionals from different areas of health.

2.2 AMAZON AND CLIMATE CHANGE: ENVIRONMENTAL AND HEALTH IMPLICATIONS

The Amazon plays a central role in the regulation of the global climate, being responsible for important ecological processes that influence the planet's environmental balance. However, the advance of deforestation, fires and changes in land use has significantly altered the natural cycles of the region, contributing to the intensification of climate change. These environmental transformations have direct impacts on the health of populations living in the Amazon region and in other parts of the world (MARLIER et al., 2020).

Scientific research shows that fires in the Amazon release large amounts of fine particles and polluting gases into the atmosphere, contributing to the deterioration of air quality. Prolonged exposure to these pollutants is associated with an increase in respiratory, cardiovascular, and inflammatory diseases. Studies show that the periods of intensification of fires are related to the increase in hospitalizations for respiratory diseases in several regions of Brazil (BUTT et al., 2021; COBELO et al., 2023).

In addition, environmental degradation can favor the emergence and reemergence of infectious diseases, since changes in ecosystems modify the dynamics of vectors and natural reservoirs of pathogens. Thus, the relationship between environmental changes and human health becomes increasingly evident, reinforcing the need for integrated prevention and epidemiological surveillance strategies.

2.3 AIR POLLUTION AND IMPACTS ON THE HEALTH OF AMAZONIAN POPULATIONS

Air pollution associated with fires represents one of the main risk factors for the health of populations in the Amazon. The fine particles released during wildfires can penetrate deep into the respiratory system, triggering inflammatory processes and aggravating pre-existing diseases. Studies indicate that exposure to air pollution from fires is related to an increase in cases of asthma, bronchitis, cardiovascular diseases, and premature mortality (YE et al., 2021).

Research carried out in different regions of Brazil shows that periods of intensification of fires are associated with a significant increase in hospital admissions due to respiratory diseases. Children, the elderly, and individuals with chronic diseases are more vulnerable to the effects of air pollution. In addition, prolonged exposure to smoke can affect the immune system, increasing the risk of respiratory infections and aggravating pre-existing clinical conditions (ROCHA-SILVA et al., 2025).

Another important aspect refers to the economic and social impact associated with air pollution. The increase in hospital admissions and demands for health services generates significant costs for health systems and directly affects the quality of life of exposed populations. Thus, the control of fires and environmental preservation become fundamental strategies for the promotion of public health.

2.4 VULNERABILITY OF AMAZONIAN POPULATIONS TO CLIMATE CHANGE

Populations living in the Amazon, especially indigenous and riverine communities, are highly vulnerable to the impacts of climate change. These communities rely directly on natural resources for their livelihoods and have limited access to health services and basic infrastructure. Changes in climate and biodiversity can affect the availability of food, water, and natural resources essential for maintaining their ways of life (SANTOS et al., 2025).

Recent studies show that environmental degradation and the advance of economic activities on traditional territories have contributed to the increase in infectious diseases, nutritional problems, and socio-environmental conflicts. In addition, prolonged exposure to pollution from fires increases the risk of respiratory and cardiovascular diseases in these populations (PRIST et al., 2023).

The vulnerability of these communities requires specific health intervention strategies that consider cultural, social and environmental aspects. In this context, the performance of multiprofessional teams becomes essential to develop actions for health promotion, disease prevention, and strengthening epidemiological surveillance in Amazonian territories.

2.5 THE ROLE OF THE MULTIPROFESSIONAL TEAM IN THE FACE OF CLIMATE IMPACTS ON HEALTH

The complexity of the impacts of climate change on health requires articulated responses between different areas of knowledge. Multiprofessional action becomes essential to face the health challenges associated with environmental transformations. Doctors play an essential role in the diagnosis and treatment of diseases related to environmental exposure, while nurses work in epidemiological surveillance, clinical follow-up, and health promotion in communities (SHEEHAN et al., 2023).

Pharmacists contribute to the therapeutic follow-up of patients with chronic diseases aggravated by environmental pollution, ensuring the rational use of medicines. Physiotherapists work in the rehabilitation of patients with respiratory and cardiovascular diseases, helping in functional recovery and improving quality of life. Nutritionists play an important role in the nutritional assessment of vulnerable populations, especially in contexts of food insecurity associated with environmental changes.

In addition to these professionals, dental surgeons, collective health professionals, and specialists in the social sciences also play relevant roles in the promotion of integral health. The integration of these areas allows the development of more effective strategies to address the impacts of climate change on public health.

2.6 GLOBAL STRATEGIES AND PUBLIC POLICIES TO ADDRESS CLIMATE IMPACTS ON HEALTH

The growing scientific evidence on the health impacts of climate change has driven the development of global strategies to address this challenge. International organizations have emphasized the need to integrate environmental and health policies to reduce the negative effects of climate change on human populations (WATTS et al., 2019).

In the Brazilian context, initiatives aimed at protecting the Amazon and reducing fires have been recognized as essential strategies to mitigate climate impacts and protect the health of populations. The preservation of Amazonian ecosystems contributes not only to the maintenance of biodiversity, but also to the reduction of air pollution and the improvement of the living conditions of local communities (VIANA, 2020).

In addition, public policies aimed at environmental health and epidemiological surveillance are essential to monitor the health impacts of climate change. The implementation of intersectoral strategies, involving professionals from different areas of health and public management, is an essential element to face the contemporary challenges of global health.

3 METHODOLOGY

3.1 STUDY DESIGN

This chapter was developed from a qualitative approach of a theoretical-analytical nature, structured through an integrative review of the scientific literature. This methodological design was chosen because it allows a critical and systematic analysis of the available evidence on the relationships between climate change, environmental degradation in the Amazon, and its impacts on global health, as well as on the role of multiprofessional teams in the construction of health responses in this scenario. The integrative review makes it possible to bring together different types of scientific studies, allowing a comprehensive and interdisciplinary view of the investigated phenomenon.

The adoption of this method is also justified by the complexity of the topic addressed, which involves multiple environmental, social, and epidemiological determinants. In this way, the analysis of the scientific literature allowed us to understand how climate change in the Amazon affects health systems and demands integrated responses from professionals from different areas, including doctors, nurses, pharmacists, physiotherapists, nutritionists, dental surgeons, and specialists in public health and social sciences.

3.2 SEARCH STRATEGY AND DATABASES

The bibliographic search was carried out in international scientific databases recognized for their relevance in the production of knowledge in public health, climate change and planetary health. The following databases were consulted:

- PubMed/MEDLINE
- Scopus
- Web of Science
- SciELO
- Virtual Health Library (VHL/LILACS)
- Google Scholar

These databases were selected because they bring together extensive scientific production in the areas of environmental epidemiology, global health, climate change, and public health.

To identify the studies, descriptors in Portuguese and English combined by Boolean operators (AND/OR) were used. Among the main terms used are:

- Climate change
- Planetary Health
- Amazon

- climate change
- planetary health
- Amazon rainforest
- environmental health
- Global Health
- wildfire smoke
- air pollution and health

The combination of these descriptors made it possible to identify studies that addressed the impacts of climate change on human health, with an emphasis on Amazonian populations and the challenges faced by health systems.

3.3 ANALYSIS PERIOD

Studies published mainly between **2016 and 2025 were considered**, a period that concentrates important advances in scientific production on planetary health, the impacts of climate change on health, and environmental degradation in the Amazon. Classic works and relevant international reports were also included when considered fundamental for the understanding of the phenomenon investigated.

Inclusion and exclusion criteria

The studies included in the review met the following criteria:

- scientific articles published in peer-reviewed journals
- studies that addressed climate change and human health
- research related to environmental impacts in the Amazon
- Studies on air pollution, fires and health
- Publications that discuss planetary health or global health
- Articles available in Portuguese, English or Spanish

The following were excluded from the analysis:

- Duplicate studies among the databases consulted
- publications that were not directly related to the theme
- exclusively technical or environmental studies unrelated to human health
- works without access to the full text.

3.4 SELECTION AND ORGANIZATION OF EVIDENCE

After applying the search strategy and eligibility criteria, the selected studies were submitted to full reading and critical analysis. At the end of the process, **twenty relevant scientific publications made up the analytical corpus of this chapter**, including scientific

articles, systematic reviews, and international reports widely cited in the literature on climate change and health.

The evidence extracted was organized through thematic analysis, allowing the structuring of the scientific discussion into analytical categories related to:

- Climate Change and Planetary Health
- environmental impacts in the Amazon
- Air pollution and respiratory diseases
- Vulnerability of Amazonian populations
- Role of the multiprofessional team in responding to climate impacts
- global strategies to address the climate crisis.

This thematic organization made it possible to integrate different scientific perspectives and build a comprehensive analysis on the impacts of climate change on health and the challenges for health systems.

3.5 SCIENTIFIC RIGOR AND VALIDITY OF THE ANALYSIS

Methodological rigor was ensured by the selection of studies from internationally recognized scientific bases, by the prioritization of recent evidence, and by the critical analysis of the publications included. The diversity of the sources analyzed made it possible to contemplate different disciplinary approaches, including epidemiology, public health, medicine, nursing, environmental sciences, and global health.

In addition, the triangulation of evidence allowed us to understand the investigated phenomenon from multiple scientific perspectives, strengthening the analytical consistency of the study and contributing to the construction of an interdisciplinary approach aligned with the concept of planetary health.

3.6 ETHICAL ASPECTS

As this is a study based exclusively on secondary data from the scientific literature and institutional documents, there was no direct participation of human beings. Thus, the research does not require consideration by the Research Ethics Committee. All sources used were duly cited throughout the chapter, ensuring academic integrity, methodological transparency and respect for the ethical principles of scientific production.

4 RESULTS AND DISCUSSION

The analysis of the selected scientific evidence demonstrates that climate change has produced significant impacts on the health of populations, especially in environmentally

sensitive regions such as the Amazon. The studies analyzed indicate that phenomena associated with environmental degradation, such as deforestation, fires, and changes in land use, have contributed to the increase in air pollution and the intensification of extreme weather events, factors that directly influence the occurrence of respiratory, cardiovascular, and infectious diseases (MARLIER et al., 2020; BUTT et al., 2021). These results reinforce the understanding that environmental transformations in the Amazon have repercussions that go beyond regional boundaries, affecting health systems on a global scale.

Among the main impacts identified, the increase in air pollution resulting from forest fires stands out. The fine particles released during these events, especially fine particulate matter (PM_{2.5}), have a high capacity to penetrate the human respiratory system, and can trigger pulmonary inflammation and aggravate chronic respiratory diseases. Epidemiological studies demonstrate that long-term exposure to these particles is associated with increased hospitalizations for respiratory and cardiovascular diseases, as well as increased premature mortality in exposed populations (YE et al., 2021; COBELO et al., 2023). This scenario shows that environmental degradation in the Amazon is not only an ecological problem, but also an important determinant of public health.

Another relevant result refers to the relationship between fire events and the overload of health systems. During periods of intensification of fires, there is a significant increase in the demand for hospital services related to the treatment of acute respiratory diseases and exacerbations of chronic diseases. Research indicates that children, the elderly, and individuals with cardiovascular or respiratory diseases are more vulnerable to the effects of air pollution, which contributes to the increase in hospital admission rates in these groups (ROCHA-SILVA et al., 2025). In this way, the impacts of climate change are also manifested in the response capacity of health systems in the face of environmental emergencies.

The results also point out that climate change influences the epidemiological dynamics of several infectious diseases. Changes in temperature and precipitation patterns can modify the geographic distribution of vectors and pathogens, favoring the emergence or reemergence of infectious diseases. This phenomenon has been observed in different tropical regions, in which environmental changes create favorable conditions for the proliferation of vectors and natural reservoirs of infectious agents (WATTS et al., 2019). In this context, the Amazon becomes an important scenario for observing the interactions between climate, environment and health.

The vulnerability of Amazonian populations is also a central aspect identified in the literature. Indigenous communities, riverside communities, and traditional populations are more exposed to the effects of climate change due to their direct dependence on natural

resources and limited access to health services. Studies indicate that these populations face additional challenges related to food insecurity, environmental pollution, and exposure to emerging infectious diseases (SANTOS et al., 2025; PRIST et al., 2023). These factors increase health inequalities and reinforce the need for intervention strategies that consider the sociocultural specificities of these communities.

In this complex scenario, the performance of multiprofessional teams emerges as an essential element to face the health challenges associated with climate change. Physicians play a central role in the diagnosis and treatment of diseases related to environmental exposure, while nurses work in epidemiological surveillance, clinical monitoring, and health education in communities. Pharmacists contribute to the safe therapeutic management of patients with chronic diseases aggravated by environmental factors, while physiotherapists participate in the rehabilitation of individuals affected by respiratory and cardiovascular diseases associated with air pollution (SHEEHAN et al., 2023).

In addition, nutritionists play an important role in assessing and managing the nutritional consequences associated with climate change, especially in contexts of food insecurity. Dentists also participate in the promotion of integral health, considering that environmental and socioeconomic factors can influence oral health conditions and systemic diseases. At the same time, professionals from the public health and social sciences contribute to the analysis of the social determinants of health and to the development of public policies aimed at protecting vulnerable populations.

The discussion of the results also highlights the need for integrated public policies that articulate environmental, health and social actions. The preservation of Amazonian ecosystems represents a fundamental strategy not only for the protection of biodiversity, but also for the promotion of global health. The scientific literature points out that reducing deforestation and controlling fires can contribute significantly to improving air quality and reducing diseases associated with air pollution (VIANA, 2020).

In addition, global initiatives aimed at planetary health have emphasized the importance of integrating environmental policies and health systems to address the challenges posed by climate change. This approach recognizes that human health is directly dependent on the preservation of natural systems and environmental sustainability. Thus, multiprofessional action in health becomes essential to develop strategies for prevention, surveillance, and comprehensive care in the face of climate impacts.

In general, the results analyzed indicate that climate change in the Amazon has profound implications for the health of local populations and for global health. The intensification of extreme weather events, the increase in air pollution, and the social

vulnerability of Amazonian populations are challenges that require integrated responses between science, public policies, and multiprofessional action. Thus, the construction of coping strategies based on collaboration between different areas of knowledge represents an essential step to promote health and sustainability in a context of global climate change.

5 CONCLUSION

The evidence analyzed in this chapter demonstrates that climate change constitutes one of the main contemporary challenges to global health, especially in environmentally strategic regions such as the Amazon. The advance of deforestation, the intensification of fires, and changes in environmental cycles have caused significant impacts on air quality, ecosystem dynamics, and the living conditions of Amazonian populations. These processes directly contribute to the increase in respiratory, cardiovascular, and infectious diseases, in addition to expanding existing social and health vulnerabilities.

The results discussed throughout the chapter indicate that the environmental impacts observed in the Amazon have repercussions that go beyond regional limits, influencing global climate systems and affecting the health of populations in different parts of the world. The relationship between environmental degradation, air pollution, and increased disease burden shows that the climate crisis must also be understood as a health crisis, requiring articulated responses between different sectors of society and science.

In this context, the concept of planetary health presents itself as an essential approach to understand the interdependence between the preservation of ecosystems and the promotion of human health. The protection of the Amazon rainforest is not only an environmental issue, but also a fundamental strategy for reducing health risks and building more resilient health systems in the face of climate change.

The complexity of the challenges presented reinforces the importance of the integrated performance of multiprofessional health teams. Doctors, nurses, pharmacists, physiotherapists, nutritionists, dentists, collective health professionals, and social science specialists play complementary roles in disease prevention, epidemiological surveillance, clinical care, and health promotion in vulnerable territories. The articulation between these different areas of knowledge allows the development of more comprehensive care and intervention strategies, strengthening the capacity of health systems to respond to the impacts of climate change.

In addition, it is essential to strengthen public policies that integrate environmental, health, and social actions, promoting the conservation of Amazonian ecosystems and the protection of populations that directly depend on these territories. Investments in

environmental surveillance, scientific research, health education, and strengthening primary care represent important ways to face the challenges posed by the climate crisis.

Thus, it is concluded that the preservation of the Amazon and the confrontation of climate change are central elements for the promotion of global health. The construction of effective responses to this scenario depends on the integration between science, public policies, and multiprofessional action, recognizing that human health is deeply connected to environmental sustainability and the balance of the planet's natural systems.

ABSTRACT

The implementation of the New Doca Linear Park in the Armas basin, in Belém-PA, in the Amazon, for urban improvement before 30th UN Conference of the Parties on Climate Change (COP30), was based on a hydrological-hydrodynamic study using the computational code Storm Water Management Model–SWMM. This study formulated ways to prevent overflows in the Doca Channel, due to intense rainfall, low elevation of the terrain (between 0 and 8m), high impermeability, and high tidal levels. The hydraulic behavior of the basin was realistically simulated under the effect of rainfall with a 50- year return period, with 172 mm of precipitation in 24 hours, under the effect of a high tide of 3.02m, indicating the need of floodgates. It is concluded that there is susceptibility to tidal flooding for terrains with elevations below 3.02m. The occupied capacity of the Doca channel reached 97%, suggesting the use of booster pumps to prevent overflows, with the operational

recommendation to limit the occupied capacity to 85%. The Environmental Protection Agency Network Evaluation Tool (EPANET) software was used to study the installation of 4 electric pumps, with an individual flow rate of $0.4 \text{ m}^3/\text{s}$ and a pumping head of 7.2 m, activated by automation when the channel capacity reaches 85% (level of 2.00 m) and deactivated when it reaches 51% (level of 1.20 m). Thus, the computational simulation with SWMM and the assistance of EPANET allowed the study of engineering solutions for a extremely relevant problem that is preventing flooding in Belém-PA.

Keywords: Flooding. Urbanization. SWMM. Armas Basin. Amazon.

RESUMO

A implantação do Parque Linear Nova Doca, na bacia do Armas, em Belém-PA, na Amazônia, para melhoria urbana previamente à realização da 30ª Conferência das Partes da ONU sobre Mudanças Climáticas (COP30), teve por base o estudo hidrológico- hidrodinâmico com uso do código computacional livre Storm Water Management Model– SWMM. Esse estudo formulou modos de combater e prevenir transbordos no Canal da Doca, devido precipitações pluviométricas intensas, baixas cotas altimétricas do terreno (entre 0 e 8m), muito impermeabilizado, e elevado nível de marés. Foi simulado realisticamente o comportamento hidráulico da bacia sob o efeito de chuva de período de retorno de 50 anos, com precipitação de 172 mm em 24 horas, sob o efeito da preamar de 3,02m, indicando necessidade do uso de comportas. Conclui-se que há suscetibilidade de alagamento por maré para terrenos com cotas inferiores a 3,02m. A capacidade ocupada do canal da Doca atingiu 97%, sugestivo para uso de eletrobombas de recalque para prevenção de transbordos, com o indicativo operacional de limitar a capacidade ocupada a 85%. Utilizou-se o software Environmental Protection Agency Network Evaluation Tool (EPANET), para estudar a instalação de 4 eletrobombas, com vazão individual de $0,4 \text{ m}^3/\text{s}$ e altura de recalque 7,2mca, acionadas por automação, quando a capacidade do canal atingir 85% (nível de 2,00m) e desligadas quando atingir 51% (nível de 1,20m). Assim, a simulação computacional com o SWMM e assistência do EPANET permitiu estudar soluções e engenharia para um problema extremamente relevante para o combate e a prevenção de alagamentos em Belém-PA.

Palavras-chave: Alagamentos. Urbanização. SWMM. Bacia do Armas. Amazônia.

RESUMEN

La implantación del Parque Linear Nova Doca, en la cuenca del Armas, en Belém-PA, en la Amazonia, para la mejora urbana previa a la celebración de la 30.ª Conferencia de las Partes de la ONU sobre el Cambio Climático (COP30), se basó en el estudio hidrológico-hidrodinámico con el uso del código informático libre Storm Water Management Model (SWMM). Este estudio formuló formas de combatir y prevenir desbordamientos en el Canal da Doca, debido a las intensas precipitaciones pluviométricas, las bajas cotas altimétricas del terreno (entre 0 y 8 m), muy impermeabilizado, y el elevado nivel de las mareas. Se simuló de forma realista el comportamiento hidráulico de la cuenca bajo el efecto de una lluvia con un período de retorno de 50 años, con una precipitación de 172 mm en 24 horas, bajo el efecto de una marea alta de 3,02 m, lo que indica la necesidad de utilizar compuertas. Se concluye que existe susceptibilidad de inundación por mareas en terrenos con cotas inferiores a 3,02 m. La capacidad ocupada del canal del muelle alcanzó el 97 %, lo que sugiere el uso de bombas eléctricas de recalque para evitar desbordamientos, con la indicación operativa de limitar la capacidad ocupada al 85 %. Se utilizó el software Environmental Protection Agency Network Evaluation Tool (EPANET) para estudiar la instalación de 4 bombas eléctricas, con un caudal individual de $0,4 \text{ m}^3/\text{s}$ y una altura de bombeo de 7,2 mca, accionadas por automatización, cuando la capacidad del canal alcance el 85 % (nivel de 2,00 m) y se apaguen cuando alcance el 51 % (nivel de 1,20 m). Así, la simulación computacional con el SWMM y la asistencia del EPANET permitió estudiar

soluciones e ingeniería para un problema extremadamente relevante para el combate y la prevención de inundaciones en Belém-PA.

1 INTRODUCTION

The city of Belém, capital of the State of Pará, located in the Brazilian Amazon, hosted the mega-event of the 30th UN Conference of the Parties on Climate Change (COP30) in 2025. During the preparatory phase, the city received investments to improve its infrastructure and solve important structural problems, including the urban flooding of the Igarapé das Armas basin, where the Nova Doca Linear Park was implemented, based on the hydrological-hydrodynamic study presented below.

The drainage of the Doca channel, in Belém-PA, represents an important urban challenge in the Amazon, due to its overflows that occur due to high tides and/or heavy rains.

The solution studied for the Armas basin, for the implementation of the Nova Doca Linear Park, was developed based on the hydrological-hydrodynamic computational modeling of this basin, using the SWMM software, including the occurrence of intense rainfall simultaneous to high tides, focusing on recurrent flooding in the Dock Channel, in order to assist in the decisions of projects and works for the implementation of this important work.

The city of Belém-PA has elevation levels between 0 and 16 m (Belém, 2020) and receives intense rainfall, decisive factors for the occurrence of important urban flooding.

Thus, the guiding question of the present research is to verify if it is possible to develop a hydrological-hydrodynamic computational model to formulate adequate components to prevent and combat flooding of the Doca channel in Belém-PA.

It is justified that this issue is crucial, as the functionality of the drainage system of the Canal da Doca stands out for the importance of not flooding Avenida Visconde de Souza Franco, avoiding losses and damages to the city and its inhabitants, especially when there is intense rainfall associated with high tide levels in Guajará Bay.

2 THEORETICAL FRAMEWORK

2.1 HYDROGRAPHIC BASINS OF BELÉM-PA

Figure 1 below presents the map of hydrographic basins of Belém-PA.

Figure 1

Map of basins in Belém/PA

Source: Belém (2020).

Figure 2 shows the map of hydrographic basins of the city of Belém-PA, including the Armas Basin.

2.2 ALTIMETRY OF THE CHN AND IBGE

The Hydrography and Navigation Center of the Brazilian Navy collects and disseminates information from the Tide Gauge Station of the Port of Belém-PA, with the tide tables of this Port.

Figure 2 shows information regarding the Tide Gauge Station of the Port of Belém-PA.

Figure 2

Information from the Tide Gauge Station of the Port of Belém-PA

Source: CHN (2025).

Figure 2 presents information from the Tide Gauge Station of the Port of Belém-PA, in which the measurement of the tide level is carried out by the reduction level methodology, and not by the Brazilian Altimetric Datum, of the IBGE.

2.3 BRAZILIAN ALTIMETRIC DATUM

According to IBGE (2009), the relationship between the Vertical Datum of the Brazilian Geodetic System (Imbituba and Santana) and the Reduction Levels and Hydrographic "Zeros" on the Brazilian Coast is obtained using the IBGE's Geodetic Database (BDG), which provides geodetic information to be used in engineering projects, mapping and scientific studies.

The most frequently requested information is the altitudes of the vertical stations (Level References, RRNN) of the Brazilian Geodetic System (SGB), for use in studies in which the unevenness or slope are important, such as in the implementation of urban drainage systems in coastal cities, which suffer tidal effect. The altitudes of the SGB originate from two particular values of the mean sea level (NMM), called Datum de Imbituba and Datum de Santana.

The first was defined from sea level observations of the Port of Imbituba (SC) between the years 1949 and 1957. To define the Datum of Santana (AP), observations made in 1957 and 1958 were used (Alencar, 1990; Femar, 2000; Light; Guimarães, 2003). The most

common source of information on tide levels on the Brazilian coast is the Tide Table (MT), published annually by the Brazilian Navy's Hydrography and Navigation Center (CHN) (CHN, 2025).

Figure 3 shows the differences between the altitudes of the RRNN of the IBGE Brazilian Altimetric Datum, referred to Imbituba, and their heights in relation to the local NMM.

Figure 3

Differences in altitudes of RRNN of SGB in relation to local NMM

Source: IBGE (2009); Alencar (1990).

Figure 3 summarizes the global adjustment of the RAAP geometric leveling data, completed in 1993, which produced altitudes of a significantly higher number of RRNNs than the manual adjustments made periodically between 1948 and 1975 (Alencar, 1990; Light; Guimarães, 2003).

Thus, the port of Belém has a tide gauge reading +0.8808m above the IBGE level (Alencar, 1990) for the terrain, and the positive sign indicates that the plane of the mean sea level recorded by the observations of the local Tide Gauge is higher than that determined in Imbituba, and transported by the leveling.

2.4 SIMULATION USING SWMM

The free computer code *Storm Water Management Model* (SWMM), Urban Drainage Management Model (in Portuguese), is a hydrological-hydrodynamic computer modeling software, developed by the United States Environmental Protection Agency (USEPA) in 1971 (SWMM, 2012). For Garcia (2005) it is the most widely used application worldwide for urban

drainage simulation. It is a physical, distributed, discrete temporal simulation model, where a hydrographic basin is represented by a series of elements such as sub-basins, junctions, conduits, in order to enable the continuous simulation of hydrological-hydrodynamic events and processes (Beling, 2013).

This model has many uses, being able to describe various hydrological processes such as surface runoff, infiltration, groundwater contribution, flow propagation, surface accumulation, and water quality propagation (Shinma, 2011).

3 METHODOLOGY

The hydrological-hydrodynamic computational model of the Armas Basin elaborated using the free software SWMM had the following methodological procedures:

I) Preparation of the tide curve and the precipitation time series; II) Identification and quantification of the components of the basin (sub-basins, nodes and conduits), with their physical characteristics (shape, type and use of soil, slope, sections, extensions, elevations, roughness), based on existing topographic surveys, geographical maps and other available maps; III) Feeding of the model prepared in the SWMM; IV) Execution and analysis of the results obtained.

3.1 LOCUS OF RESEARCH

The research had as its locus the Doca canal, in the city of Belém-PA. The images of the research site are presented below.

Figure 4 shows the Nova Doca Linear Park implanted in the Armas basin in Belém-PA.

Figure 4

Nova Doca Linear Park implemented for COP30 in Belém-PA

Dock Channel Gates

Figure 6 shows the floodgates of the Canal da Doca, in its outlet. The canal has sides covered in concrete, in a very urbanized urban area.

4 RESULTS AND DISCUSSIONS

4.1 RESULTS

4.1.1 Tidal curve and precipitation time series

Figure 7 shows the levels of maximum preamares measured in the tide gauge of the Brazilian Navy (CHN) for the port of Belém-PA, transposed to the ground level according to the Brazilian Altimetric Datum of the IBGE.

Figure 7

High tides reported by the Brazilian Navy for Belém-PA

Source: The authors.

Figure 4 shows the levels of the annual preamares maximums informed by the CHN and referenced to the IBGE's Brazilian Altimetric Datum. The maximum preamar, with an

elevation of 3.02 m, occurred only in 2010. Based on the above, the maximum annual preamar with an elevation of 3.02m was adopted for this study. In this way, land with an elevation of more than 3.02m is not susceptible to tidal flooding.

Regarding the time series of rainfall of the 50-year return period for Belém-PA, used for the design of urban macro-drainage works, it was obtained based on Souza *et al.* (2012), with total rainfall of 172 mm and duration of 24 hours, using the methodology of hourly disaggregation of rainfall for the 24-hour event studied.

Figure 8 shows the tide curve with a 3.02m high tide and the rainfall time series, both used in the modeling.

Figure 8 shows the tide curve of a maximum tide of 3.02m and the rainfall time series with a return period of fifty years T50 used in the simulation.

4.1.2 Armas Basin Information

The Armas basin has an area of 2.8km² with great waterproofing, low altitude (0.8m), high rainfall, tidal influence and for these reasons it has frequent urban flooding. It includes two sub-basins, Doca (area of 1.7 km²) and Reduto (area of 1.1 km²), which are interconnected by an existing pluvial gallery on Rua da Municipalidade. The Canal da Doca, with a length of 1.1 km, is located at Av. Visconde de Souza Franco and Reduto, with a length of 0.3 km, is located at Av. General Magalhães. Both are lined in concrete and equipped with floodgates implanted in the 1960s (Belém, 2020).

Figure 9 shows the Armas Basin with its Doca and Reduto channels.

4.1.3 Feeding of the model prepared in the SWMM

The collected information was inserted into the hydrological-hydrodynamic model of the Armas basin, enabling the execution of the simulation.

4.1.4 Implementation and analysis of the results obtained

Figure 10 below shows the result of the simulation of the Una basin under the effect of rainfall with a recurrence period of 50 years and a pre-tide of 3.02 m.

Figure 10

Result of simulation of the Armas basin in Belém-PA

Source: The authors.

Figure 10 shows the successful result of the simulation of the Armas basin with SWMM, with very small errors, of -0.10% for surface runoff and -1.93% for flow propagation.

Figure 11 shows the Dock Channel at the moment of maximum water depth.

Figure 11

Profile of the Dock channel at the moment of maximum water depth

Source: The authors.

Figure 11 shows that the land near the floodgates presents a risk of flooding.

The analysis of the flow with the aid of the computational model elaborated in the SWMM results in the fact that the most critical stretch for overflow and flooding is the final stretch of the Doca channel, as shown in Figure 12.

Figure 12

Time series of the capacity of the final stretch of the Doca canal

Source: The authors.

Figure 13 shows that the moment of greatest occupied capacity of the channel, from 85% to 97%, occurs in the interval from 12:45 to 15:15 hours after the beginning of the event.

Figure 13

Time series of depths in the final stretch of the Doca channel

Source: The authors.

Figure 14 shows the time series of the flow in the final stretch of the Doca channel.

Figure 14

Time series of the flow in the final stretch of the Doca channel

Source: The authors.

Figure 14 shows that at the moment of maximum occupied capacity of the Dock channel, of 96%, the flow is 4 m³.s⁻¹. As the usual value of 85% is exceeded, the use of booster electric pumps to prevent overflows and flooding is being studied. For this, we opted for the use of the free computational code *Environmental Protection Agency Network Evaluation Tool* (EPANET), also developed by USEPA, and suitable for the study of hydraulic

flows in pressurized conduits. In order to reduce the capacity used in these stretches to up to 85%, in this interval of higher risk of overflow, the insertion of four units of submersible electric pumps was studied, for settlement heights of 7.2mca and individual flows of 0.4m³/s. As an operating rule, they must be activated when the water depth in the section of the lift reaches 2.00m (85% of the capacity of the section) and turned off when it reaches 1.20m (51%), in order to reduce the capacity used in the channel to below 85%, preventing overflows.

Figure 15 shows the proposed location for the Rainwater Pumping Station of the Armas basin (EEAPA), at the confluence of Av. General Magalhães with Rua de Belém, at the end of the Reduto canal, which is connected to the Doca canal by the gallery of Rua Municipalidade.

4.2 DISCUSSION

The computational modeling of hydrological-hydrodynamic events in urban drainage basins is extremely useful for urban management, especially for preventing and combating flooding, by demonstrating quantitatively that the association of high rainfall, topography, tidal rise and intense waterproofing can result in the occurrence of overflows and flooding.

5 CONCLUSION

The successful implementation of the Nova Doca Linear Park, in the Armas basin, in Belém-PA as an improvement of urban infrastructure before COP30, was based on the hydrological-hydrodynamic study prepared using a computational model in the SWMM described here.

The constraints of the urban flooding problem were the low elevation of the terrain, which is very waterproofed, the high level of the tides, which suggest the usefulness of the use of floodgates and finally the benefit of the use of electric pumps for rainwater settlement, to prevent overflows and flooding.

The study proved to be very useful, realistically simulating the hydraulic behavior of the basin when subjected to rainfall with a return period of 50 years, precipitation of 172 mm in 24 hours, concomitantly with the maximum known preamar, which occurred in 2010. An important conclusion was the indication of susceptibility to tidal flooding for land with elevation below 3.02m, with bas at the level of the maximum tide, which occurred in 2010,

The computational model resulted in reaching 97% of the capacity in the Dock channel, strongly suggesting the need to use electric pumps to prevent overflows, with the operational indication of maintaining the occupied capacity of the channel at a maximum of 85%.

The implementation of the Armas Rainwater Pumping Station (EEAPA) is an important equipment to prevent/combat overflows and flooding in the Dock Channel (and Reduto), acting at times of high water levels, together with the measures related to altimetric levels and operationalization of the floodgates. In this way, the Armas basin, as explained above, will be equipped with adequate mechanisms to prevent and combat overflows and flooding.

For the implementation of this EEAPA, with the objective of reducing the used capacity of the channel to below 85%, preventing overflows, the installation of four submersible electric pumps in parallel was studied using the EPANET software, and each unit can pump flow rates of 0.4m³/s to settlement heights of 7.2mca. The pumps must be activated when the water depth in the pumping station catchment reaches 2.00m and turned off when it reaches 1.20m,

by automation.

Thus, the computer simulation with SWMM and EPANET allowed to study an extremely relevant problem for the fight and prevention of flooding in Belém-PA and the formulation of appropriate engineering solutions.

ACKNOWLEDGMENTS

The authors express their gratitude to the University of the Amazon (UNAMA), the State Secretariat of Public Works of Pará (SEOP) and the Municipal Secretariat of Urban Zeladoria of Belém (SEZURB) for the institutional and technical support granted. We extend our thanks to the Urban and Environmental Modeling (MURBA) research group for the academic collaboration. Finally, we thank the Coordination for the Improvement of Higher Education Personnel (CAPES) for the support granted through scholarships, a fundamental resource for the development and feasibility of this research.

ABSTRACT

The homeless population represents one of the most complex social challenges in contemporary cities, involving structural factors such as poverty, unemployment, breakdown of family ties, substance abuse, and insufficient housing policies. This article analyzes the proposal of the Recomeçar Lages Program, a municipal public policy aimed at the social reintegration of the homeless population in the municipality of Lages, Santa Catarina. The study adopts a qualitative approach, with normative analysis, literature review, and a local public policy case study. The program is analyzed in light of the fundamental rights established in the 1988 Federal Constitution, the National Policy for the Homeless Population, and the Sustainable Development Goals of the United Nations 2030 Agenda. The theoretical framework articulates contributions from Lenio Streck, Pedro Serrano, Paulo Freire, Selma Garrido Pimenta, and Slavoj Žižek, in addition to institutional data produced by IBGE and IPEA. It is concluded that integrated public policies combining assisted housing, professional qualification, access to healthcare, and productive inclusion present greater potential to reduce homelessness and promote human dignity. The Recomeçar Lages Program demonstrates legal, institutional, and financial feasibility, constituting a relevant instrument for inclusive sustainable development at the municipal level.

Keywords: Public Policies. Homeless Population. Human Rights. Sustainable Development. Social Inclusion.

RESUMO

A população em situação de rua constitui um dos desafios sociais mais complexos das cidades contemporâneas, envolvendo fatores estruturais como pobreza, desemprego, ruptura de vínculos familiares, dependência química e insuficiência de políticas

habitacionais. O presente artigo analisa a proposta do Programa Recomeçar Lages, política pública municipal voltada à reinserção social da população em situação de rua no município de Lages, Santa Catarina. O estudo utiliza abordagem qualitativa, com análise normativa, revisão bibliográfica e estudo de política pública local. O programa é analisado à luz dos direitos fundamentais previstos na Constituição Federal de 1988, da Política Nacional para a População em Situação de Rua e dos Objetivos de Desenvolvimento Sustentável da Agenda 2030 da Organização das Nações Unidas. A fundamentação teórica articula contribuições de Lenio Streck, Pedro Serrano, Paulo Freire, Selma Garrido Pimenta e Slavoj Žižek, além de dados institucionais produzidos pelo IBGE e pelo IPEA. Conclui-se que políticas públicas integradas que combinam moradia assistida, qualificação profissional, acesso à saúde e inclusão produtiva apresentam maior potencial de redução da população em situação de rua e promoção da dignidade humana. O Programa Recomeçar Lages demonstra viabilidade jurídica, institucional e financeira, constituindo instrumento relevante para o desenvolvimento sustentável inclusivo em âmbito municipal.

Palavras-chave: Políticas Públicas. População em Situação de Rua. Direitos Humanos. Desenvolvimento Sustentável. Inclusão Social.

RESUMEN

La población en situación de calle constituye uno de los desafíos sociales más complejos de las ciudades contemporáneas, involucrando factores estructurales como la pobreza, el desempleo, la ruptura de vínculos familiares, la dependencia química y la insuficiencia de políticas habitacionales. El presente artículo analiza la propuesta del Programa Recomeçar Lages, una política pública municipal orientada a la reinserción social de la población en situación de calle en el municipio de Lages, Santa Catarina. El estudio adopta un enfoque cualitativo, con análisis normativo, revisión bibliográfica y estudio de política pública local. El programa es analizado a la luz de los derechos fundamentales establecidos en la Constitución Federal de 1988, de la Política Nacional para la Población en Situación de Calle y de los Objetivos de Desarrollo Sostenible de la Agenda 2030 de las Naciones Unidas. El marco teórico articula contribuciones de Lenio Streck, Pedro Serrano, Paulo Freire, Selma Garrido Pimenta y Slavoj Žižek, además de datos institucionales producidos por el IBGE y el IPEA. Se concluye que las políticas públicas integradas que combinan vivienda asistida, capacitación profesional, acceso a la salud e inclusión productiva presentan un mayor potencial para reducir la población en situación de calle y promover la dignidad humana. El Programa Recomeçar Lages demuestra viabilidad jurídica, institucional y financiera, constituyendo un instrumento relevante para el desarrollo sostenible inclusivo a nivel municipal.

Palabras clave: Políticas Públicas. Población en Situación de Calle. Derechos Humanos. Desarrollo Sostenible. Inclusión Social.

1 INTRODUCTION

The homeless population represents a complex and multifactorial social phenomenon, which reflects structural inequalities present in contemporary societies. This phenomenon involves factors such as extreme poverty, unemployment, fragility of family networks, chemical dependency, mental disorders, and insufficient housing and social inclusion policies.

In Brazil, studies produced by the Institute of Applied Economic Research indicate significant growth in this population group in recent decades. Recent estimates indicate that the country has more than 220 thousand people living on the streets, concentrated mainly in urban centers (IPEA, 2023). This scenario highlights the need for structured public policies that go beyond merely welfare approaches.

The Federal Constitution of 1988 instituted a model of State committed to the dignity of the human person and to the realization of social rights. In this sense, social assistance, health, housing and work are fundamental rights whose realization depends on the articulated action of the public power.

From a legal point of view, authors such as Lenio Streck highlight that the Brazilian Constitution has a guiding character, guiding state action in the promotion of fundamental rights and the reduction of social inequalities, as (Streck, 2017).

The Constitution cannot be understood as a mere letter of intent or symbolic document devoid of normative efficacy. In a Democratic State of Law, the Constitution assumes a leading character, establishing normative commitments that bind the public powers to the realization of fundamental rights. This means that state action must be guided by the realization of these rights, especially those related to the dignity of the human person, material equality and the reduction of social inequalities. Constitutional interpretation, therefore, must be carried out in a way that is committed to the effectiveness of rights and the transformation of social reality. (Streck, 2017, p. 94)

Thus, public policies aimed at the homeless population must be understood as instruments of constitutional implementation.

In the field of critical theory, Slavoj Žižek argues that extreme social exclusion reveals structural contradictions in the contemporary socioeconomic system, requiring institutional responses capable of guaranteeing minimum conditions of human dignity (Žižek, 2014).

The most fundamental violence present in contemporary societies is not only that visible in individual actions or direct conflicts, but that which manifests itself silently in the social and economic structures that organize collective life. It is a systemic violence that produces inequality, exclusion and social invisibility, particularly affecting those who are pushed to the margins of society. In these cases, extreme poverty and

exclusion cannot be interpreted as mere individual failures, but as the result of structures that continuously reproduce relations of inequality. (Žižek, 2014, p. 22).

This article aims to analyze the proposal of the Recomeçar Lages Program, a municipal policy aimed at the social reintegration of the homeless population in the municipality of Lages, Santa Catarina. The analysis seeks to understand the legal, institutional and social feasibility of the program, as well as its relationship with the principles of sustainable development and human rights.

2 PUBLIC POLICIES

2.1 LEGAL BASIS AND HUMAN RIGHTS

The implementation of public policies aimed at the homeless population is supported by several constitutional and normative provisions. The Federal Constitution of 1988 establishes, in its article 1, that the dignity of the human person constitutes the foundation of the Brazilian State, while article 6 recognizes social rights such as education, health, work, housing and social assistance.

Pedro Serrano's studies emphasize that the effectiveness of fundamental rights depends on the concrete action of the State in the formulation of public policies capable of reducing inequalities and promoting social inclusion (Serrano, 2016).

In a Democratic State of Law, fundamental rights cannot be understood only as formal declarations inscribed in the Constitution. The effectiveness of these rights requires the concrete action of the State through public policies that guarantee material conditions for their exercise. The 1988 Constitution instituted a model of State committed to the promotion of human dignity, the reduction of social inequalities and the construction of a more just and solidary society. Thus, it is up to the public authorities to formulate and implement policies that ensure social inclusion, access to essential services and protection of groups in vulnerable situations, under penalty of emptying the constitutional project itself. (Serrano, 2016, p. 78).

The infra-constitutional issues include the Organic Law of Social Assistance (Law No. 8,742/1993), the Unified Social Assistance System (SUAS) and Decree No. 7,053/2009, which instituted the National Policy for the Homeless Population. These instruments establish guidelines for ensuring social protection, productive inclusion, and access to essential public services.

The program dialogues with the principles of the United Nations 2030 Agenda, especially with the Sustainable Development Goals related to the eradication of poverty, reduction of inequalities and promotion of sustainable cities.

2.2 EDUCATION, SOCIAL INCLUSION AND EMANCIPATION

The social reintegration of the homeless population requires policies that go beyond welfare and promote autonomy and social emancipation.

Brazilian educator Paulo Freire argues that education is a fundamental instrument of liberation and social transformation, enabling historically marginalized individuals to regain their autonomy and participation in social life (Freire, 1996).

Education does not transform the world alone, but neither does the world transform without it. Educational practice, when guided by democratic and emancipatory principles, allows subjects to critically understand the reality in which they are inserted and develop the ability to intervene in it. In this sense, educating does not only mean transmitting knowledge, but promoting a process of awareness through which men and women recognize their historical and social condition, strengthening their autonomy and their participation in the construction of a more just and egalitarian society. (Freire, 1996, p. 67).

In a complementary way, Selma Garrido Pimenta points out that training processes aimed at social inclusion must consider the life trajectories of the subjects, valuing experiences and promoting integral human development (Pimenta, 2012).

Public policies aimed at the homeless population need to articulate professional training, productive inclusion and access to basic social rights.

2.3 STRUCTURE OF THE RECOMEÇAR LAGES PROGRAM

The Recomeçar Lages Program proposes an integrated municipal policy structured in five main axes:

a. Social approach and registration

It provides for the performance of a multidisciplinary team responsible for identifying and registering beneficiaries, carrying out psychosocial assessment and preparing an Individual Care Plan (PIA). The objective is to ensure that all beneficiaries are included in existing public policies.

b. Assisted living

Inspired by the international model Housing First, the program establishes housing as the starting point of social reintegration. The proposal provides:

- emergency shelter;
- assisted transitional housing;
- referral to permanent housing.

International experiences show that assisted housing policies have more effective results in reducing the homeless population.

c. Professional training and employability

The program provides for partnerships with institutions such as SENAI and SENAC to offer professional courses in the areas of civil construction, logistics, mechanics, carpentry and administrative services. Municipal work fronts and qualification scholarships are also planned.

According to IBGE data, low education and labor informality are recurrent factors among homeless people, which reinforces the importance of professional qualification policies.

d. Comprehensive health and treatment of chemical dependency

The program provides for integration with the Unified Health System, including medical care, psychological follow-up and referral to Psychosocial Care Centers (CAPS).

Strategies for harm reduction and treatment of chemical dependency are also foreseen, respecting legal principles and individual rights.

e. Financial support

The program has an estimated annual cost of approximately R\$ 8.6 million, with funding coming from federal and state resources, parliamentary amendments and partnerships with the private sector.

This strategy seeks to ensure financial sustainability and reduce exclusive dependence on the municipal budget.

2.4 PUBLIC POLICIES AND MUNICIPAL GOVERNANCE

The effectiveness of public policies depends on the institutional capacity for planning and management. In this sense, Lenio Streck points out that the realization of fundamental rights requires constitutional interpretation committed to social transformation (Streck, 2017, p. 94).

The proposal of the Recomeçar Program seeks precisely to materialize this constitutional commitment by articulating different public policies in an integrated model of social inclusion.

3 FINAL CONSIDERATIONS

The homeless population represents one of the most complex social challenges faced by Brazilian municipalities. It is a multifactorial phenomenon that requires structured public policies, capable of integrating social assistance, housing, health and productive inclusion.

The analysis carried out demonstrates that the Recomeçar Lages Program has legal consistency, alignment with constitutional principles and compatibility with the Objectives of Sustainable Development of the 2030 Agenda.

The 2030 Agenda for Sustainable Development is a global action plan aimed at promoting shared prosperity, environmental protection, and social inclusion. The signatory States commit to adopting concrete measures to eradicate poverty in all its forms, reduce inequalities and ensure that all people have access to decent living conditions. In this context, public policies aimed at social inclusion, the protection of vulnerable groups, and the promotion of human dignity represent fundamental instruments for the fulfillment of the Sustainable Development Goals, especially those related to the eradication of poverty, the reduction of inequalities, and the construction of more inclusive and sustainable cities. (UN, 2015, p. 5).

By adopting an integrated approach based on assisted housing, professional training and access to public services, the program contributes to overcoming welfare models and promoting effective social reintegration.

Structured municipal initiatives, when articulated with national policies and with inter-institutional participation, have a high potential to reduce the homeless population and strengthen human dignity as the foundation of the democratic rule of law.

ABSTRACT

This study was developed to understand whether clinic-therapeutic conceptions still overlap the socio-anthropological perspective of deaf learners within established legal rights that ensure access to the right to education, which are achievements resulting from struggles for human rights. It briefly addresses the history of Human Rights related to the right to education, as well as analyzes legislation concerning the current conception of deafness and hearing impairment. The methodology used was a qualitative descriptive study based on a socio-historical framework. The instrument consisted of a bibliographic review of laws and authors who have contributed to the discussion of human rights in the current struggle for the recognition of deaf education that meets the needs of this group. The results highlight the need to discuss a more appropriate inclusive school model to foster the autonomy and learning of deaf students. As a contribution, this study finds that established legal rights still largely present a clinic-therapeutic character. However, it also shows advances in legislation toward a socio-anthropological view of the deaf individual, emphasizing the value of Brazilian Sign Language (Libras), thus opening space for a truly inclusive and bilingual school capable of contributing to the construction of autonomy, identity, development, and social participation, enabling individuals to be constituted as subjects of rights and active citizens.

Keywords: Human Rights. Deaf Education. Hearing Impairment. Right to Education.

RESUMO

Este trabalho foi elaborado para compreender se as concepções clinicoterápicas ainda sobrepõem a visão socioantropológica dos educandos surdos dentro dos direitos positivados, que criam acesso ao direito à educação, os quais são conquistas de lutas por direitos humanos. Fazendo uma breve abordagem sobre a história dos Direitos Humanos para o direito à educação, bem como, analisar a legislação sobre a concepção atual sobre surdo e deficiência auditiva. Utilizei como metodologia o estudo descritivo qualitativo com aporte no referencial socio-histórico. Como instrumento a revisão bibliográfica de leis e de

RESUMEN

Este trabajo fue elaborado para comprender si las concepciones clinicoterapéuticas aún se superponen a la perspectiva socioantropológica de los estudiantes sordos dentro de los derechos positivados, que garantizan el acceso al derecho a la educación, los cuales son conquistas derivadas de las luchas por los derechos humanos. Se realiza una breve aproximación a la historia de los Derechos Humanos en relación con el derecho a la educación, así como un análisis de la legislación sobre la concepción actual de la sordera y la deficiencia auditiva. La metodología utilizada fue un estudio descriptivo cualitativo con base en el enfoque sociohistórico. Como instrumento, se empleó la revisión bibliográfica de leyes y de autores que han contribuido al debate sobre los derechos humanos en la lucha actual por el reconocimiento de una educación para sordos que atienda las necesidades de este grupo. Los resultados evidencian la necesidad de dialogar sobre un modelo de escuela inclusiva más adecuado para fomentar la autonomía y el aprendizaje de los estudiantes sordos. Como contribución, el estudio señala que los derechos positivados aún presentan, en su mayoría, un carácter clinicoterapêutico. No obstante, también se observan avances en la legislación hacia una visión socioantropológica del sujeto sordo, destacando la valorización de la Lengua Brasileña de Señas (Libras), lo que abre espacio para una escuela inclusiva verdaderamente bilingüe, capaz de contribuir a la construcción de la autonomía, la identidad, el desarrollo y la participación social, permitiendo su constitución como sujeto de derechos y ciudadano activo.

Palabras clave: Derechos Humanos. Educación de Sordos. Deficiencia Auditiva. Derecho a la Educación.

1 INTRODUCTION

Currently we can talk about human rights thanks to the struggles of people, groups and movements that were and still are protagonists of this process. In this scope, this work aims to articulate human rights with the right to education of deaf subjects with a qualitative methodology from a socio-historical perspective using the critical analysis of the literature review studied. With this said, analyzing the conceptions of human rights, deafness and the right to education, as well as understanding the legislation on the combination of these themes requiring spaces for new dialogues, makes this study relevant to the context of education and diversity. I believe that the type of inclusive school we currently have denies an autonomous interactional relationship of these subjects with the social, so the objective of this study is to understand if the clinicotherapeutic conceptions still overlap the socio-anthropological view of deaf students within the positive rights.

To think about the history of human rights, there is not a single way, and it is made up of a complex and diffuse character. In one of these ways, we have many philosophers who claim that rights are intrinsically linked to the way we determine what it is to be human and the implications that this carries when we question the way we see the other in this relationship. In this aspect, it is configured that human beings are possessors of rights by virtue of their human dignity, that is, by the fact that we are human and it is impossible to measure the value of each one. It is necessary to have the conviction that human beings have values, while non-humans have a price. This great distinction has also placed man a slave to man himself. The human being is unique and irreplaceable, and it is unacceptable to set a price for his life. To understand this fact, it is enough to identify those who can have access to a quality school, those who are marginalized because they are not considered fit for the needs of the capitalist market, or have their potential subjugated. In this scope, the deaf student has been harmed and suffering violations of rights that come from their quality academic training. The right to education is one of the first steps to reduce social inequality. This should be a fact, however, we still see today a specialized and cruel slavery.

2 DEVELOPMENT

Human dignity is not a closed concept, and can vary according to time, location of society, peoples, beliefs and values. From this come great criticisms about the concept of human dignity and, consequently, the universality of human rights because they are proper to human nature (Santos, 2006). Here we are using a Kantian concept of human dignity, which states that nothing in the world is superior or similar to it. Human dignity can take on other contexts and configurations according to the attributes that are proposed to it.

For the author Lynn Hunt (2009), in her book *"The Invention of Human Rights; a history"* - human rights have a diffuse and omnipresent history today, which requires a broader and debatable history, but self-evidence is very important for understanding it. One of the great contributions of Hunt (2009) is to make a theoretical-bibliographic approach to the documents that underpinned human rights, highlighting their relevance without ignoring that it is a risk to take them as the history of human rights for the whole world. In addition, it transits in the field of literature, through epistolary novels that influenced individual feelings, to argue the creation of new social and political concepts for the flourishing of human rights. It analyzes the Declaration of Independence of the United States (1776), the Declaration of Man and of the Citizen that gained momentum with the French Revolution of 1789 until reaching the Universal Declaration of Human Rights (UDHR) (1948). Showing that there was a certain consensus between the last two statements, despite their particularities, "although the changes in language were significant, the echo between the two documents is unequivocal" (Hunt, 2009, p.15). Although almost two centuries have passed between the contradictory actions of the French Revolution and UDHR (1948), there is in common, among other aspects, the historical contexts to which they were forged, and which placed human rights as natural, because we were born free, equal in dignity and rights.

The author shows that it was a process of construction that demanded an inner awareness on the part of the individual and that this required the transformation of thought, social structure, politics and culture. According to Hunt:

Human rights are not just a doctrine formulated in documents: they are based on a disposition towards other people, a set of convictions about what people are like and how they distinguish right and wrong in the secular world (Hunt, 2009, p. 25).

Hunt (2009) argues that even though the Declaration of Human Rights (1948) was an advance, due to the way society was structured at the time, there were exclusions for some people. This was true for women, slaves, children, and people considered "abnormal." For these people, "natural, equal, and universal human rights" were not possible because of the way they were perceived by the others who proposed the declaration. They were considered incapable of having a "moral autonomy".

Human rights remain subject to discussion because our perception of who has rights and what those rights are constantly changes according to the very historicity of human life. The struggle for human rights is "ongoing" (Hunt, 2009). The Declaration of Human Rights should be seen as the beginning of the journey. Each generation embodies the law of the other generation, not in a linear way, but in a way that writes the history of human rights itself

in a dialectical way.

The Universal Declaration did not simply reaffirm eighteenth-century notions of individual rights, such as equality before the law, freedom of speech, freedom of religion, the right to participate in government, the protection of private property, and the rejection of torture and cruel punishment. It also expressly forbade slavery and provided for universal and equal suffrage by secret ballot. In addition, it required freedom of movement, the right to a nationality, the right to marry and, most controversially, the right to social security; the right to work, with equal pay for equal work, on the basis of a living wage; the right to rest and leisure; and the **right to education**, which should be free at the elementary levels (Hunt, 2009, p. 206 – *emphasis mine*).

It was from it that education as a right emerged. The Universal Declaration of Human Rights configured and still is a reference for different generations and dimensions of Human Rights. Such as the generation of civil and political rights, the generation of economic, social and cultural rights in the nineteenth century until the middle of the twentieth century (which had its rise against exclusionary capitalism) and the generation of the collective rights of humanity. Undoubtedly, it is a human "invention" that deserves to have its relevance recognized. Therefore, we need to *(re)invent human rights*, based on what we perceive and define what it is *to be human* today and also, as a continuous process, built by political struggles. According to Herrera Flores (2008), it is a cultural convention in a tense field, they are processes of openness that are built from the claims and demands of the subjective and objective human needs for human dignity. A critical stance is needed in relation to human rights, so that it is not a legacy only for a specific people, group or class. May their ideals of liberty, equality and fraternity be influenced not only by empathy, but beyond. May it be seen with solidarity and otherness, that the consequences of this Declaration truly reach everyone, respecting the principles of equality and difference (Santos, 2006). Where the continuity of the history of human rights does not allow exclusion and human suffering, for lack of recognizing oneself in the other.

Based on these assumptions, nowadays, there are several dialogues about being deaf and hearing impaired. We have movements that emphasize the importance of a socio-anthropological view of deafness, which defends the bilingual school ^[1], as well as the defenders of the clinical-therapeutic view, who can defend oralism ^[2]. In this context, Bourdieu (2010) uses *cultural capital* to explain how culture, in a society divided into classes, is transformed into a kind of currency that the dominant classes use to accentuate "inequalities". Culture becomes an instrument of domination. In addition, the ruling class imposes on the dominated classes its own culture, giving it an unquestionable value, making them a unique and correct model of culture. For example, we have the education of the deaf totally

influenced by a dominant culture of oralism, which is based on the reproduction of the audist culture, denying any deaf culture. According to Lopes,

The struggles for the recognition of sign language in schools, for the recognition of the deaf community and for the end of oralist practices in working with deaf subjects occupied the educational scenario with more academic, social and political expression only from the end of the eighties and the beginning of the nineties of the twentieth century. p. 25).

Without the participation of the deaf, there was the Milan Congress in 1880, in which the method of oralism was considered the only form of teaching methodology for the deaf. A setback in the education of these subjects. An imposition of the dominant Audist culture, which bases its culture on the act of listening, on the culture of the dominated, the deaf. Bourdieu (2010), perceiving this dynamic of symbolic power, defined it as *arbitrary dominant cultural*, which is nothing more than one culture imposing itself on another. These relationships are constantly changing, both due to technological advances and how society perceives and relates to people who have these attributes. It all depends on which reference is given to the question. In line with Lopes' idea, we have that:

As previously developed, while the first (*being deaf*) implies the presence of sets of cultural practices that start from deaf referents of ways of being, the second (*hearing impaired*) implies the presence of sets of practices, also cultural, but that start from hearing referents of ways of being. There is a significant distance between these two sets of practices (Lopes, 2012, p. 243).

However, according to the principle of equality and the principle of difference of Santos (2006), it is the subject of the discourse who must empower and recognize himself. It is a debate with a productive tension, which makes us resignify the other and ourselves. Starting from the fact that the struggle for human rights aims at the dignity of human life, thus, guided by the socio-historical and cultural framework, to briefly analyze the positive rights that evidence this constant struggle for recognition and rights.

The 1975 Declaration of the Rights of the Disabled Person, promoted by the United Nations - UN - despite being a great advance, was shown in its arguments as a kind of concession. In 1981, the same institution promotes the International Year of Persons with Disabilities, which culminated in 1982 the World Program of Action on Persons with Disabilities, it is considered by many authors as a textual milestone that puts the issue of the human rights of people with disabilities on the agenda in an inclusive perspective because it wants to promote paths and not just grant them. This program talks about equal opportunity to have access and participate in society more effectively. Thus taking the focus off the

dominant view that was had: the medical approach to disability, where rehabilitation was seen as salvationist. The problem with the medical view was to absolutize rehabilitation as the only possible path. In this aspect of rehabilitation, of being framed by the norm, that is, "curing" the abnormality, the analysis of the clinical-therapeutic definition of deafness, makes us think that if it were only the issue of hearing, the human rights of the hearing person would be fully respected and enforced. Next, the UN organizes a text on December 14, 1990, Resolution No. 45/1991, which demanded a change in perception about disability, all of this forged by struggles of various social groups that experienced exclusion due to lack of objective and subjective material conditions, which society was organized, it was a change of paradigms: from perception to action.

The Vienna Declaration (1993), according to Lindgren Alves (1995), had as one of its milestones the reaffirmation that all human rights and fundamental freedoms are universal. It can be inferred from this statement that the inclusion, without restrictions, of the person with disabilities, in its item 63:

6. Rights of Persons with Disabilities 63. The World Conference on Human Rights reaffirms that all human rights and fundamental freedoms are universal in them, and therefore include without reservation persons with disabilities. All people are born equal with the same rights to life and well-being, to education and work, to live independently and to actively participate in all aspects of life in society. Thus, any direct discrimination or other negative discriminatory treatment of a person with a disability constitutes a violation of his or her rights. The World Conference on Human Rights calls on Governments, where necessary, to adopt or adapt existing legislation to ensure access to these and other rights for persons with disabilities (UN, 1993).

This declaration, according to Alves (1995), had relevant characteristics about the universality and indivisibility of human rights. He put on the agenda the right to solidarity and peace, the right to development and environmental rights, as well as Human Rights in Brazilian policies. Item 64 states that the place of the person with disabilities is everywhere. Item 65 makes evident the promotion of equal opportunities for all. Knowing that for this, a change in thinking about humanistic education would be necessary, in its item 78, it states the importance of education in human rights for a culture of peace and development.

64. Persons with disabilities must have a place everywhere. Equal opportunities for people with disabilities should be guaranteed through the elimination of all socially imposed barriers, whether physical, financial, social or psychological, which exclude or limit their full participation in life in society (UN, 1993).

This declaration became a milestone that put Human Rights on the world stage again, the Vienna Declaration gave rise to the Salamanca Declaration of 1994, which highlights the

concept of education for all and respect for differences. It also contributes to the appreciation of what the Brazilian Federal Constitution of 1988 already stated in its Chapter III, Articles 205, 206 and 208. Who say that education is a right of all and a duty of the State, specifying and detailing this right.

The 1999 Guatemala Convention, the so-called Inter-American Convention for the Elimination of All Forms of Discrimination Against Persons with Disabilities, with Brazil as a signatory, which creates Decree 3.956/2001 agreeing with deliberate actions in this convention, opened space for other proposals that contributed to the base text in favor of persons with disabilities. It fosters in inclusive public policies Decree No. 3,298/99 CONADE - National Council for the Rights of Persons with Disabilities, and registers in Decree No. 5,926/04, article 3, the first item that defines *disability* as: "any loss or abnormality of a psychological, physiological or anatomical structure or function that generates incapacity to perform an activity, within the standard considered normal for human beings". In its second item, it defines *permanent disability* as "that which has occurred or stabilized for a period of time sufficient to not allow recovery or to have a probability of changing, despite new treatments". In its third item, it defines *disability* as "an effective and marked reduction in the capacity for social integration, with the need for equipment, adaptations, means or special resources so that the person with disabilities can receive or transmit information necessary for their well-being and the performance of the function or activity to be performed". (BRAZIL, 2004). This same decree, in article 4, item II, was amended in 2005, now providing:

According to Decree 5.626, of December 22, 2005, Art. 2:

[...] a deaf person is considered to be one who, due to hearing loss, understands and interacts with the world through visual experiences, manifesting their culture mainly through the use of the Brazilian Sign Language - Libras. Sole Paragraph. Hearing impairment is considered to be bilateral, partial or total, loss of forty-one decibels (dB) or more, measured by audiogram at the frequencies of 500Hz, 1,000Hz, 2,000Hz and 3,000Hz (Brazil, 2005).

We can analyze that in these positive rights, the definition of disability is perceived by loss, abnormality, incapacity, placing the definition of hearing impairment on the same level as clinicotherapy, with a medicalized view that seeks a standard of normality.

In the Libras Law, we can understand a significant advance in its 22 years of existence. This Decree No. 5,626/05, which regulates Law No. 10,436/02 - Libras Law and in its article 2, presents a more socio-anthropological conception of deafness, by emphasizing the cultural identities of these subjects from the communicative and linguistic action through Libras and by the way it relates to the world through visual experiences. The approval of Libras (Brazilian

Sign Language) in 2002, as the official Brazilian language, thus having two legally recognized languages, the Portuguese language and the Brazilian sign language - Libras, was and is a historical reference in positive law for the deaf person and the community in which he or she is inserted.

According to Lopes (2012), from this instrument it is possible to resignify the deaf subject in other social spheres, in addition to the corrective views for such normality. In 2006, the UN General Assembly, based on the International Convention on the Rights of Persons with Disabilities, which had as its motto "*Nothing about us, Without us*", in its article 2, builds legal advances for the disabled person. The rights to health, inclusive education, transportation, leisure, culture, habilitation, rehabilitation, work and professional training are established. He is seen, legally, as a subject of law, encompassing both conceptions, both clinicotherapeutic and socio-anthropological (Santos, 2017, Silva & Pedroza, 2023). An advance for dialogues and the various ways of recognizing people with disabilities.

Article 1 - The purpose of this Convention is to promote, protect and ensure the full and equitable enjoyment of all human rights and fundamental freedoms by all persons with disabilities and to promote respect for their inherent dignity. People with disabilities are those who have physical, intellectual or sensory impairments, which, in interaction with various barriers, can obstruct their full and effective participation in society with other people (CORDE, 2008).

According to the IBGE (2010 Census), 23.90% of the total Brazilian population, that is, 45,606,048 Brazilians are people with disabilities. In the 2022 Census, it increased to 18.6 million people with disabilities, which corresponds to 8.9% of the Brazilian population aged 2 years and over. According to the IBGE (2022 Census), the number of deaf people in Brazil exceeds 10 million. It points out that despite the law that determines the use of Libras, these subjects still face great difficulties in accessing basic day-to-day services, provided by public and private agencies.

In the Federal District, according to CODEPLAN (2018), hearing impairment has an incidence rate of 0.9% of the total population, and the percentage of people with some disability has the highest rate in low-income (5.5%) and middle-income (5.3%) Administrative Regions (RAs), compared to high-income (3.2%) and upper-middle-income (4.7%) ARs. Thus, it can be inferred that people with disabilities are in greater numbers in low-income areas.

With this, we have a significant number of people who live in D, who self-declared themselves as one of the options in relation to "listening". Therefore, severe hearing impairment and/or deafness, according to how we analyzed the possible definitions above,

need an affirmative public policy for these people. Based on this analysis, the right to education for this population, it is essential to have human rights as a reference as a foundation for new advances.

If we consider ourselves deaf, it does not mean that we have paranoia. It means that we are being the other with our otherness. We are the deaf, the unanimous people gathered in the self-presence of sign language, of language that evokes a difference from other peoples, of visual culture, of the way of being. We are alterities proven by experience, other alterities. We are deaf! (Perlin ^[3], 2003, p. 92).

In view of this, these subjects can self-declare themselves deaf users of Libras, as well as hearing impaired. In line with the book "The Convention on the Rights of Persons with Disabilities Commented" (CORDE; SEDH, 2008), which adds to the motto of the 2006 convention, "Nothing About Persons with Disabilities without Persons with Disabilities!", we have that the definition of being deaf and/or hearing impaired is beyond dichotomies. According to Skliar (1999):

Deafness is currently configured as a territory of representations that cannot be easily delimited or distributed in opposing conceptual models, such as clinical or socio-anthropological. It is, in other words, an irregular territory through which asymmetrical discourses and practices transit in terms of the power/knowledge relations that determine them. Moving from the naturalization of medicine to the curiosity of ethnography [...] And the central issue seems to me to be, instead, to move from ethnographic curiosity to the political recognition of deafness as a difference (Skliar, 1999, p. 10).

Starting from this author and the extremely relevant contributions of Perlin (2003), the articulation between human rights and the education of the deaf is in a dialectical tension (Santos, 2006), which aims at the relations between the subject and the object, realizing that culture is for human nature, and vice versa, thus breaking with old paradigms, which studied man separated from his culture, and try to respond to the challenges of inequalities and exclusions that the crisis of Modernity presents. Informing that the inclusive school ^[4] for these subjects of rights should value the deaf culture ^[5] and its implications for social participation. Currently, the socio-anthropological and biopsychosocial vision has been showing advances towards the right to education of these subjects of rights, also with the approval of the Statute of Persons with Disabilities, Law No. 13,146/2015, known as the Brazilian Law of Inclusion - (LBI). From effective actions and positive rights, we can have a new vision of these subjects of rights for political subjects (Freire, 2023). The problem or obstacle is not found in the person or in his disability, but evokes that the disability assumes a social construct that leads to marginalization and, consequently, exclusion. Evidencing that the social structure and its

networks must create spaces for dialogue and actions to contemplate the different human diversities.

3 CONCLUSIONS

The history of human rights should be perceived as an advance for the good of humanity and a social and human construct. We cannot attribute its creation only to the West or the East, because we know that the history of humanity itself has had neither as the center of all human production. In fact, the Declaration of Human Rights (1948) must have its importance recognized, for being a human production made from struggles aimed at human dignity, for being courageous in the face of the demand of the time and its contributions to the present day. We know the cruelty that men are capable of, and their creation serves to show that it is possible to build a better future for all humanity

As a contribution of this study, we found that legislation according to its distancing or approximation of conceptions about human rights can have a clinical-therapeutic and socio-anthropological character on deafness. This actively influences the social conditions and access to the right for these deaf students. For this, it is essential to recognize the autonomy and capacity for emancipation of the subjects involved through alterity to overcome the hegemonic domination of cultures considered as dominant cultural capitals (Bourdieu, 2010). Having the right to education goes through the process of resignifying this education itself. Including discussing what kind of inclusive school should be built for the demands and expectations of these subjects. The definition of deaf and hearing impaired depends on the contour of the gaze we give. However, it is up to the subject himself to define himself. The different definitions for these terms are found in a discourse that demands an epistemic rupture in order not to be just an exchange of terms, it must go through the recognition of the difference that constitutes multifaceted subjects and possessors of rights. Seeking a school that meets the objective and subjective needs, that promotes independence for the social transformation of these deaf students is to promote human rights and their ramifications in various social, cultural and economic spaces, it is to move towards the construction of a more just society.

ABSTRACT

Port decarbonization has gained increasing relevance in light of international targets for greenhouse gas (GHG) mitigation and regulatory pressures on maritime transport. The intensive use of diesel in vessels, equipment, and land vehicles generates significant CO₂ emissions and local air pollutants. Hydrotreated vegetable oil (HVO) stands out as a promising alternative, with lifecycle CO₂ emission reductions ranging from 60% to 95% and compatibility with existing infrastructure, although it faces cost barriers. This chapter presents a computational tool developed in Python using the Streamlit library to estimate emissions and perform an economic comparison between diesel and HVO, applied to the Port of Itaqui (MA) across five projected scenarios for the time horizons of 2025 and 2050. The results indicate that, with carbon pricing, HVO becomes economically competitive in the long term, constituting a relevant tool to support the port energy transition.

Keywords: Decarbonization. Ports. HVO. Carbon Credits.

RESUMO

A descarbonização portuária assume crescente relevância diante das metas internacionais de mitigação de gases de efeito estufa (GEE) e das pressões regulatórias sobre o transporte marítimo. O uso intensivo de diesel em embarcações, equipamentos e veículos terrestres gera emissões expressivas de CO₂ e poluentes atmosféricos locais. O óleo vegetal hidrotratado (HVO) destaca-se como alternativa promissora, com reduções de 60% a 95% nas emissões de CO₂ em ciclo de vida e compatibilidade com a infraestrutura existente, embora enfrente barreiras de custo. Este capítulo apresenta ferramenta computacional em Python utilizando a biblioteca Streamlit para estimativa de emissões e comparação econômica entre diesel e HVO, aplicada ao Porto do Itaqui (MA) em cinco cenários projetados para os horizontes temporais de 2025 e 2050. Os resultados indicam que, com a

RESUMEN

La descarbonización portuaria adquiere una relevancia creciente frente a las metas internacionales de mitigación de gases de efecto invernadero (GEI) y las presiones regulatorias sobre el transporte marítimo. El uso intensivo de diésel en embarcaciones, equipos y vehículos terrestres genera emisiones significativas de CO₂ y contaminantes atmosféricos locales. El aceite vegetal hidrotratado (HVO) se destaca como una alternativa prometedora, con reducciones de entre el 60% y el 95% de las emisiones de CO₂ en su ciclo de vida y compatibilidad con la infraestructura existente, aunque enfrenta barreras de costo. Este capítulo presenta una herramienta computacional desarrollada en Python utilizando la biblioteca Streamlit para estimar emisiones y realizar una comparación económica entre diésel y HVO, aplicada al Puerto de Itaqui (MA) en cinco escenarios proyectados para los horizontes temporales de 2025 y 2050. Los resultados indican que, con la valorización del carbono, el HVO se vuelve económicamente competitivo a largo plazo, constituyendo una herramienta relevante de apoyo a la transición energética portuaria.

1 INTRODUCTION

The transition to low-carbon logistics chains occupies a central position in the international transport agenda, especially in sectors of high energy and emissive intensity, such as maritime transport and port operations (IEA, 2021; IMO, 2023). Ports, as strategic nodes of global supply chains, concentrate significant flows of cargo and energy, which translates into relevant emissions of greenhouse gases (GHG) and air pollutants, notably those associated with the consumption of diesel oil in vessels, tugboats, cargo handling equipment and land transport fleets (Di Majo, 2022; Pinto, Oliveira and Mendes, 2018).

In the Brazilian context, the normative framework aimed at climate mitigation and energy transition has progressively incorporated goals and instruments aimed at reducing emissions and expanding the use of low-carbon fuels. Examples of this movement are the National Policy on Climate Change (Brasil, 2009), the National Biofuels Policy, called *RenovaBio* (Brasil, 2017), and the National Green Diesel Program (Brasil, 2024). At the same time, the National Waterway Transportation Agency (ANTAQ) has promulgated guidelines and prepared diagnoses on the decarbonization of the port sector, emphasizing the need for sectoral emission inventories and the adoption of alternative fuels, among which HVO, low-emission hydrogen, and ammonia stand out (ANTAQ, 2023; 2024).

Among the technological routes available to replace fossil diesel, Hydrotreated Vegetable Oil (HVO) has stood out for providing reductions of 60% to 95% in CO₂ emissions throughout the life cycle, compared to fossil diesel, a variation that is conditioned by the raw materials used and the production processes adopted (Arvidsson et al., 2011; Menezes et al., 2022; Gomes et al., 2025). In addition, HVO has virtually zero sulfur and aromatic content, which favors the reduction of local pollutants without compromising compatibility with diesel engines and the existing supply infrastructure, factors that, together, tend to reduce the costs of technological transition (Szeto and Leung, 2022). Such attributes give HVO particular attractiveness for port applications, a context in which the full renewal of fleets or the replacement of infrastructure can imply high investment costs.

HVO production and distribution face obstacles related to its cost competitiveness against fossil diesel and the uncertainty that permeates carbon pricing instruments, such as regulated emissions markets and decarbonization credit mechanisms (Solakivi, Paimander and Ojala, 2022; Pereda et al., 2025). In this scenario, decisions regarding the adoption of alternative fuels cannot be based exclusively on the unit cost of fuel, but must incorporate variables such as avoided emissions and potential revenues from carbon credits and other economic mechanisms to induce decarbonization (Lee et al., 2024).

Although recent studies have advanced in the quantification of port emissions and evaluation of alternatives such as electrification and renewable fuels, critical gaps persist in the Brazilian context: absence of simple and configurable instruments for managers to simulate scenarios for replacing diesel with HVO considering carbon pricing; difficulty integrating GHG inventories, life cycle parameters and market prices into accessible operational tools without advanced programming; and lack of quantitative studies on conditions of economic competitiveness of HVO in specific ports. This article fills these gaps by developing a Python computational tool using the Streamlit decision support library, applied as a case study to the Port of Itaquí based on the inventory of 17,158 L diesel (EMAP, 2022), focusing on replicable land operations in other ports.

2 PORT DECARBONIZATION AND THE ROLE OF HVO

This section discusses the context of decarbonization in the port sector and the positioning of HVO among the main fuel alternatives for reducing greenhouse gas emissions, articulating the international and national regulatory framework with the specific operational demands of this sector.

2.1 PORTS, EMISSIONS, AND MITIGATION POLICIES

Seaports are highly complex socio-technical systems, responsible for the articulation between waterway and terrestrial infrastructures. Its configuration includes piers, mooring berths, specialized terminals, storage yards, road and rail accesses, as well as integrated logistics support areas (ANTAQ, 2022). The efficient operation of these facilities requires intensive energy consumption, mobilized by a heterogeneous set of equipment and vehicles, including port cranes, forklifts, internal handling trucks, backhoes, and maneuvering vessels (Pinto, Oliveira, and Mendes, 2018).

The use of fossil fuels, especially diesel oil, in the energy supply of these activities results in relevant emissions of carbon dioxide (CO_2) and air pollutants with local impact, such as particulate matter (PM), nitrogen oxides (NO_x) and sulfur oxides (SO_x). Such emissions simultaneously contribute to the worsening of climate change on a global scale and to the deterioration of air quality in urban areas adjacent to port complexes, with direct health implications for populations residing in these regions (Di Majo, 2022; CETESB, 2023).

In response to this scenario, international organizations have intensified regulatory efforts aimed at decarbonizing the sector. The International Maritime Organization (IMO), through its revised GHG Strategy, has established progressive emission reduction targets for shipping, with the aim of achieving net-zero emissions throughout the twenty-first century

(IMO, 2023). Such guidelines impose increasing pressures on port operators and shipowners, requiring the reorientation of their energy matrices towards lower carbon-intensity fuels.

At the national level, Brazil has a regulatory framework that progressively incorporates instruments to stimulate the energy transition in the transport sector. The National Policy on Climate Change (PNMC), instituted by Law No. 12,187/2009, establishes domestic commitments to reduce emissions and constitutes the central legal framework for sectoral decarbonization initiatives (BRASIL, 2009). The RenovaBio program, created by Law No. 13,576/2017, introduced a market mechanism based on decarbonization credits (CBIOs), encouraging the production and consumption of biofuels with lower carbon intensity in the life cycle (BRASIL, 2017). More recently, the National Green Diesel Program (BRASIL, 2024) has expanded the scope of these initiatives, creating specific regulatory and economic incentives for the replacement of fossil diesel with renewable alternatives compatible with existing infrastructure.

In the institutional scope of the port sector, studies coordinated by the National Waterway Transportation Agency (ANTAQ) have advanced in the formulation of decarbonization strategies, with an emphasis on the preparation of emission inventories and the evaluation of the technical and economic feasibility of alternative fuels (ANTAQ, 2023; ANTAQ, 2024). Such initiatives signal a movement towards the institutionalization of the climate agenda in the sector, although its effective operational implementation remains conditional on the availability of analytical tools capable of translating high-level guidelines into concrete management decisions.

In this context, the need for instruments that allow quantifying, in a systematic and comparative way, the impacts of different fuel options in terms of GHG emissions and economic viability is evident. It is precisely in this gap that the analysis of HVO as a promising alternative for the decarbonization of port operations is inserted, as developed in the following subsection.

2.2 HVO AS AN ALTERNATIVE TO FOSSIL DIESEL

Hydrotreated vegetable oil is a renewable fuel produced from raw materials of biogenic origin, such as vegetable oils and fats, through hydrotreating processes that remove oxygen and generate a compression-ignition engine fuel with similar or superior properties to fossil diesel (Kalnes, Marker and Shonnard, 2007; Art Fuels Forum, 2018). Life cycle assessment studies indicate that HVO can reduce between 60% and 95% of CO₂ emissions over the life

cycle compared to diesel, depending on the feedstock and the technological route (Arvidsson et al., 2011; Menezes et al., 2022; Gomes et al., 2025).

In addition to the climatic advantages, HVO has low sulfur content, absence of aromatic compounds, and better combustion behavior, resulting in lower emissions of local pollutants such as NO_x, SO_x, and particulate matter, when compared to conventional diesel (Szeto and Leung, 2022; Shukla et al., 2023). A particularly relevant feature for port applications is HVO's high compatibility with existing diesel engines and with the storage and distribution infrastructure already in place, allowing its use in diesel blends or even as a total replacement without the need for large investments in adaptation (Szeto and Leung, 2022; Bodemer, 2023).

Despite these attributes, HVO still has higher direct costs than diesel in many markets, which limits its adoption at scale without carbon pricing mechanisms or specific economic incentives (Solakivi, Paimander and Ojala, 2022; Lee et al., 2024). Thus, the evaluation of its economic viability depends on models that integrate fuel prices, avoided emissions and revenues from carbon credits, such as the one proposed in this article.

3 METHODOLOGY

The methodology adopted in this work combines the formulation of a quantitative model for calculating emissions and costs with the development of an interactive computational tool that operationalizes this model for use by port managers.

3.1 GENERAL STRUCTURE OF THE VALUATION MODEL

The proposed evaluation model is deterministic, static and scenario-oriented, estimating, for each combination of parameters, three main sets of indicators: (i) direct cost of fueling diesel and HVO; (ii) CO₂ emissions associated with fuel consumption; and (iii) net cost after consideration of revenues from carbon credits. The approach is based on activity data (volume consumed) and emission factors, articulating environmental and economic dimensions in a simple and transparent structure (Arvidsson et al., 2011; Gomes et al., 2025; Lee et al., 2024).

As an empirical reference, the volume of diesel consumed by transport vehicles and a backhoe at the Port of Itaqui is used, according to the GHG emissions inventory prepared by the Maranhão Port Administration Company (EMAP, 2022). From this volume, different combinations of diesel and HVO use and different carbon price levels are simulated, for short and long-term horizons.

3.2 EMISSIONS AND COST CALCULATION MODEL

The model considers that the cost of filling up with each fuel is a function of the volume consumed and the unit price, while CO₂ emissions are derived from volume and average emission factors. The potential revenue from carbon credits is calculated from the emissions avoided in relation to a reference scenario with the exclusive use of diesel.

The main relationships can be summarized as follows:

- Fuel cost:

$C_f = V_f \cdot P_f$ which is the cost of fueling up with fuel (diesel or HVO), is the volume consumed and the price per liter. $C_f V_f P_f$

- Diesel emissions:

$E_d = V_d \cdot F E_d$ which are the CO₂ emissions associated with diesel, the volume consumed and the average emission factor per litre. $E_d V_d F E_d$

- HVO emissions:

$E_h = E_d \cdot (1 - R)$ which are the emissions with HVO and is the percentage reduction of HVO emissions compared to fossil diesel. $E_h R$

- Avoided emissions:

$$E_{ev} = E_d - E_h.$$

- Revenue from carbon credits:

$R_c = E_{ev} \cdot P_c$ which is the price of carbon in monetary units per ton of CO₂. P_c

- Net cost:

$C_{liq} = C_d + C_h - R_c$ where and are the costs of fueling diesel and HVO, respectively. $C_d C_h$

The values of emission factors, percentage reductions and prices of fuels and carbon credits were obtained in life cycle studies and economic analyses of alternative fuels, as well as on carbon credit market bases (Arvidsson et al., 2011; Solakivi, Paimander and Ojala, 2022; Gomes et al., 2025; Lee et al., 2024; Investing.com, 2025).

3.3 REQUIREMENTS AND DEVELOPMENT OF THE COMPUTATIONAL TOOL

To operationalize the model in an accessible way to port managers and technicians, a computational tool in Python language was developed, using a library for the construction of interactive panels, streamlit. The system was designed as a dashboard, in which the user enters fundamental parameters and obtains as output tables and graphs with costs, emissions and net costs for different scenarios.

The main requirements of the tool include: (i) simplicity of use, dispensing programming knowledge; (ii) flexibility, allowing the parameterization of diesel and HVO

prices, carbon credit values, emission factors and percentage reductions; (iii) ability to simulate short- and long-term scenarios; and (iv) possibility of replication for different ports and sets of equipment. The choice of a monolithic architecture, without the need to connect to external databases, aims to facilitate deployment in diverse institutional contexts and minimize infrastructure dependencies.

From the point of view of data flow, the tool organizes the analysis into three stages: (i) input data entry; (ii) processing of emissions and cost equations; and (iii) presentation of results in tabular and graphic format. The following section presents the case study that illustrates the application of the tool.

4 CASE STUDY: PORT OF ITAQUI

The Port of Itaquí, located in São Luís (MA) and managed by the Maranhão Port Administration Company (EMAP), is a strategic public port in the Brazilian Central-North Corridor, specializing in the flow of grains (soybeans, corn), fuels, cellulose and mineral bulk. It has nine operational berths with depths of 12 to 19 meters, allowing the berthing of large ships, including specialized terminals such as Vale (Valemax, up to 400 thousand tons) and Tegram (grains, 500 thousand tons of storage).

4.1 CHARACTERIZATION AND INPUT DATA

The Port of Itaquí is an organized port located in São Luís (MA), with significant movement of grains, fuels, and other cargo, and with land operations that include internal transport vehicles and equipment such as backhoes (EMAP, 2022; ANTAQ, 2024). The port authority's GHG emissions inventory reports, for 2021, consumption of 17,158.30 liters of diesel in transport vehicles and a backhoe loader, with an average emission factor of 3.20 kgCO₂ per liter, considering data from literature and combustion stoichiometry (EMAP, 2022; CETESB, 2023).

This set of equipment was selected for the case study because it represents a relevant portion of the direct emissions associated with ground operations and because it has consolidated fuel consumption data. To simulate scenarios for the replacement of diesel by HVO, fuel price parameters and carbon credits were adopted based on recent market data and projections from prospective studies (Solakivi, Paimander and Ojala, 2022; Lee et al., 2024; Pereda et al., 2025).

4.2 CONSTRUCTION OF THE SCENARIOS

To answer the question of under what economic conditions the use of HVO can become competitive in relation to fossil diesel in the port's onshore operations, five base scenarios were defined, combining proportions of fuel use and time horizons. The scenarios were constructed in order to contrast short-term situations, with current HVO prices and carbon credits, and long-term scenarios with greater carbon valuation and technological advancement in the HVO chain, scenarios represented in Figure 1.

In the five scenarios, the years presented are equivalent to the diesel prices and carbon credits used for the calculation and are as follows:

1. Scenario 1 – Full use of diesel in 2025.
2. Scenario 2 – Partial replacement in 2025, with a 50% diesel and 50% HVO blend.
3. Scenario 3 – Total replacement of diesel by HVO in 2025.
4. Scenario 4 – Full use of diesel in 2050.
5. Scenario 5 – Total replacement of diesel by HVO in 2050.

Figure 1

Supply scenarios

Source: Prepared by the authors.

Fuel prices and carbon credit values were adopted as shown in Table 1, based on market data and projections for contexts of greater climate restriction (Solakivi, Paimander and Ojala, 2022; Lee et al., 2024; Pereda et al., 2025; Investing.com, 2025). The reduction in emissions associated with HVO was set at 85% for 2025 and 95% for 2050, reflecting expectations of improvements in the production chain, increased participation of sustainable raw materials, and technological gains (Arvidsson et al., 2011; Gomes et al., 2025; Solakivi, Paimander and Ojala, 2022).

Table 1

Parameters adopted for the scenarios

Variables	2025	2050
Diesel Cost (USD/l)	0,5	0,5
HVO Cost (USD/l)	1,75	≈ 1
Carbon credit value (USD/ton)	70,65	250 (Lee et al., 2024)
Reduction in CO ₂ emissions from HVO compared to fossil diesel	85%	95%

Source: adapted from the authors.

Based on these parameters and the reference volume of 17,158.30 liters, the computational tool calculated, for each scenario, the total cost of supply, CO₂ emissions and the net cost after considering revenues from carbon credits. The following section presents and discusses the results obtained.

5 RESULTS

The results of the simulations allow to compare, for each scenario, the direct costs of supply, CO₂ emissions and the net costs after the internalization of carbon credits. In this section, the main findings and their interpretation for the management of port operations are presented.

5.1 DIRECT FUELING COSTS AND EMISSIONS

Table 2 summarizes the results for the five scenarios evaluated, considering the total consumption of 17,158.30 liters and the economic and environmental parameters previously defined.

Table 2

Scenarios of the replacement of Diesel by HVO

	Scenario 1	Scenario 2	Scenario 3	Scenario 4	Scenario 5
Diesel oil filled (liters)	17.158,30	8.579,15	0	17.158,30	0
HVO fueled (liters)	0	8.579,15	17.158,30	0	17.158,30
Total Supply Amount (USD)	8.579,15	19.303,08	30.027,02	8.579,15	17.158,30
Value considering carbon credits (USD)	11.826,46	21.170,29	30.514,12	22.366,19	17.985,52
CO₂ emissions (ton)	45,96	26,43	6,89	45,96	2,29

Source: from the authors.

The results indicate that, in 2025, the scenarios with the introduction of HVO present direct supply costs significantly higher than the reference scenario with the exclusive use of diesel. On the other hand, substantial reductions in CO₂ emissions are observed: in the 50% blending scenario, emissions fall from 45.96 t to 26.43 t, while in the total replacement scenario in 2025 they reach 6.89 t, representing reductions of more than half compared to the exclusive use of diesel (Arvidsson et al., 2011; Gomes et al., 2025; EMAP, 2022).

For 2050, even if the direct cost of diesel remains constant, the reduction of the price of HVO to 1.00 US\$/L results in a total cost of fueling closer to diesel, while CO₂ emissions fall drastically to 2.29 t in the total replacement scenario, given the greater percentage reduction attributed to HVO (Gomes et al., 2025; Lee et al., 2024). These results reinforce the environmental potential of HVO, especially in long-term horizons with improvements in the production chain.

5.2 EFFECT OF CARBON CREDITS AND NET COST

When carbon credits are incorporated into the model, the economic comparison is altered, as part of the HVO cost differential is offset by revenues associated with avoided emissions. The representation of these scenarios is present in Figure 2.

Figure 2

Economic comparison between the scenarios of replacing diesel with HVO

Source: from the authors.

In 2025, even with the inclusion of carbon credit revenues, diesel remains more competitive in terms of net cost, although the difference is slightly reduced compared to the comparison based only on direct costs (Solakivi, Paimander and Ojala, 2022; Investing.com, 2025). However, the internalization of carbon credits makes the economic value of the avoided emissions more evident, especially in scenarios of total blending or substitution.

By 2050, the combination of higher percentage reduction in emissions, higher carbon price, and falling cost of HVO substantially changes the net cost hierarchy. In this horizon, the scenario with total substitution by HVO has a lower net cost than the scenario of exclusive use of diesel, indicating that biofuel can become not only environmentally superior, but also economically more attractive, when considering the climate externalities internalized via carbon credits (Lee et al., 2024; Pereda et al., 2025; Solakivi, Paimander and Ojala, 2022).

5.3 IMPLICATIONS FOR PORT MANAGEMENT

The results suggest that the economic competitiveness of HVO in inland port operations is strongly dependent on the carbon price trajectory and technological advances in the fuel production chain. In stricter regulatory contexts, with high carbon prices and policies to encourage renewable fuels, HVO tends to become an attractive alternative from an economic and environmental point of view (IEA, 2021; ANTAQ, 2024; Lee et al., 2024). On the other hand, in low-carbon pricing environments, HVO adoption depends on corporate decarbonization strategies, additional policies to support or reputational benefits, and reduce regulatory risk.

From an operational point of view, the computational tool presented offers a practical way to explore these relationships, allowing managers to evaluate different combinations of parameters and identify conditions under which partial or total replacement by HVO becomes feasible. By facilitating scenario simulation, the instrument contributes to the planning of the port energy transition, while it can be adapted to other ports with adjustments to consumption and price data.

6 METHODOLOGICAL AND PRACTICAL CONTRIBUTION

The main contribution of this work lies in the integration, in an accessible tool, of a simple quantitative model of emissions and costs with an interactive interface that allows port managers to test fuel substitution scenarios without the need for advanced programming knowledge. This approach responds to the gap identified in the literature and practice, where many analyses remain restricted to academic studies or specialized consultancies.

By operationalizing the model in a configurable dashboard, the study brings together concepts of life cycle assessment, carbon pricing, and analysis of scenarios of daily port management, favoring the incorporation of environmental variables in investment and operation decisions. This characteristic is particularly relevant in a scenario of intensifying regulatory requirements and corporate decarbonization goals (IEA, 2021; ANTAQ, 2023; ANTAQ, 2024).

Despite the advances, the study has limitations that should be considered in the interpretation of the results. First, the analysis focused on a specific set of equipment from a single port, which restricts the generalization of the results to other operational and geographical contexts. Second, supply infrastructure costs, operational adaptations, or uncertainties related to future HVO availability and input pricing dynamics, which may be relevant to long-term investment decisions, were not included (Solakivi, Paimander and Ojala, 2022; Pereda et al., 2025).

Another limitation is the absence of systematic analysis of the sensitivity of the results in relation to the main variables of the model, such as fuel prices, emission factors, carbon credit values, and reduction percentages attributed to HVO. Although the tool allows changing these parameters, the present article did not explore, in detail, the joint variation of multiple variables nor did it apply risk analysis techniques or probabilistic scenarios.

7 CONCLUSIONS

This paper presented the development and application of a computational decision support tool for comparative analysis of diesel and HVO use scenarios in onshore port operations, with a case study in the Port of Itaquí. The model integrates estimates of CO₂ emissions, fueling costs and revenues from carbon credits, allowing the environmental and economic impacts of fuel substitution to be evaluated in an integrated manner over short and long-term horizons.

The simulations indicated that, in 2025, the scenarios with the introduction of HVO present direct costs and net costs higher than the exclusive use of diesel, although with significant reductions in CO₂ emissions. By 2050, the combination of greater carbon valuation, reduced HVO cost, and increased percentage reduction in emissions changes the net cost hierarchy, making HVO potentially competitive or more economically advantageous, while enabling substantial emission reductions (Lee et al., 2024; Pereda et al., 2025; Solakivi, Paimander and Ojala, 2022).

From the point of view of transport engineering and port management, the proposed tool is a practical tool to support decision-making in the energy transition, by allowing managers to explore scenarios of partial or total replacement of diesel by HVO under different carbon price conditions. Despite the limitations regarding geographic scope, the absence of infrastructure costs, and the lack of systematic sensitivity analysis, the study offers a methodological and computational basis that can be expanded to broader contexts.

Márcio Cledes¹, Rogerio Cid Bastos²

ABSTRACT

The article proposes an innovative approach to university public management based on ontologies and knowledge graphs, using the IFES-GENIUS-EXT ontology as a case study. The research is grounded in the METHONTOLOGY and NeOn methodologies, integrating theoretical foundations of Knowledge Engineering and Knowledge Management with practical applications in Federal Higher Education Institutions (IFES). The proposed model aims to improve the representation, interoperability, and reasoning over institutional data related to planning, performance indicators, and financial investments. Through a formal structure expressed in OWL and RDF, the ontology promotes semantic integration among administrative systems, enabling intelligent auditing and greater public transparency. The study also discusses the challenges of semantic governance in university environments, proposing mechanisms for collaborative maintenance and the use of national standards (VCGE, DCAT-AP.br, e-SIC). It is concluded that IFES-GENIUS-EXT represents a significant step toward consolidating the use of Knowledge Graphs in university management, offering support for accountability and intelligent auditing in Brazilian public contexts.

Keywords: Knowledge Engineering. Ontologies. Public Management. Federal Higher Education Institutions. Knowledge Graphs.

RESUMO

O artigo propõe uma abordagem inovadora para a gestão pública universitária baseada em ontologias e grafos de conhecimento, tendo como estudo de caso a ontologia IFES-GENIUS-EXT. A pesquisa fundamenta-se nas metodologias METHONTOLOGY e NeOn, integrando fundamentos teóricos da Engenharia e Gestão do Conhecimento com aplicações práticas em Instituições Federais de Ensino Superior (IFES). O modelo proposto visa aprimorar a representação, a interoperabilidade e o raciocínio sobre dados institucionais de planejamento, indicadores de desempenho e investimentos financeiros. Por meio de uma estrutura formal expressa em OWL e RDF, a ontologia promove integração semântica entre

RESUMEN

El artículo propone un enfoque innovador para la gestión pública universitaria basado en ontologías y grafos de conocimiento, teniendo como estudio de caso la ontología IFES-GENIUS-EXT. La investigación se fundamenta en las metodologías METHONTOLOGY y NeOn, integrando fundamentos teóricos de la Ingeniería y Gestión del Conocimiento con aplicaciones prácticas en Instituciones Federales de Educación Superior (IFES). El modelo propuesto tiene como objetivo mejorar la representación, la interoperabilidad y el razonamiento sobre datos institucionales relacionados con la planificación, los indicadores de desempeño y las inversiones financieras. Mediante una estructura formal expresada en OWL y RDF, la ontología promueve la integración semántica entre sistemas administrativos, possibilitando auditorías inteligentes y una mayor transparencia pública. El estudio también analiza los desafíos de la gobernanza semántica en entornos universitarios, proponiendo mecanismos de mantenimiento colaborativo y el uso de estándares nacionales (VCGE, DCAT-AP.br, e-SIC). Se concluye que IFES-GENIUS-EXT constituye un paso significativo para consolidar el uso de grafos de conocimiento en la gestión universitaria, ofreciendo soporte para la rendición de cuentas y la auditoría inteligente en contextos públicos brasileños.

Palabras clave: Ingeniería del Conocimiento. Ontologías. Gestión Pública. Instituciones Federales de Educación Superior. Grafos de Conocimiento.

1 INTRODUCTION

The digital transformation in the public sector has promoted a profound reconfiguration of management processes, requiring new forms of representation, integration and analysis of institutional knowledge (Nam & Pardo, 2011; Janssen et al., 2020). In federal public universities, this change is even more challenging, given the multiplicity of systems, indicators, strategic plans, and evaluation instruments that coexist in a fragmented manner (Lima et al., 2023; Silva et al., 2024). The absence of semantic standardization and intelligent interoperability mechanisms limits the transparency, governance, and auditing capacity of these institutions (Machado & Nobre, 2022).

In this context, **Ontology Engineering** constitutes a fundamental axis of Engineering and Knowledge Management, offering formal instruments to structure, share and reason about complex data in a consistent and interoperable way (Gruber, 1993; Guarino, 1998; Bittencourt et al., 2019). Ontologies allow the construction of **Knowledge Graphs** that articulate entities, relationships, and meanings, favoring the creation of systems capable of answering complex questions (*Competency Questions*) and supporting evidence-based decision-making (Hogan et al., 2021; Paulheim, 2017).

The proposal of this study is part of this scenario, with the main objective of developing and validating the **IFES-GENIUS-EXT Ontology**, an extension of the **GENIUS Ontology** (Bittencourt et al., 2019) adapted to the Brazilian context of the **Federal Institutions of Higher Education (IFES)**. The model aims to structure, in a semantic way, information on **institutional planning, performance indicators, and budget allocation**, connecting them to national interoperability standards and open data, such as **VCGE, DCAT-AP.br, and e-SIC** (Brasil, 2019; Ministry of Economy, 2022).

The relevance of this proposal is anchored in three complementary axes. The first is **scientific**, by consolidating a specific ontological basis for the domain of public university management, expanding the reach of GENIUS Ontology and strengthening the line of research in **Graphs of Knowledge Applied to Public Management** (Ji et al., 2023; Abu-Salih & Alotaibi, 2024). The second is **technological**, by offering an interoperable semantic infrastructure, expressed in OWL and RDF, which enables automatic queries via SPARQL and validation by tools such as Protégé and SHACL (Suárez-Figueroa et al., 2012; Fernández-López et al., 1997). The third is **institutional**, by contributing to **transparency, intelligent auditing, and accountability** practices, in line with digital government guidelines and the UN Sustainable Development Goals (UN, 2021; Diamantini et al., 2025).

Based on this theoretical and methodological framework, the work proposes not only a conceptual model, but a **practical semantic infrastructure** of knowledge governance

capable of integrating multiple data sources, improving internal control and promoting the reuse of information at different levels of university management. Thus, the application of ontologies and knowledge graphs as instruments of innovation and transparency in public administration is consolidated, contributing to the construction of **intelligent and auditable universities**.

2 THEORETICAL FRAMEWORK

This chapter aims to establish the theoretical framework that underlies the development of the **IFES-GENIUS-EXT** ontology and its application to university public management. To this end, the main concepts of **Ontology Engineering** are discussed, addressing its structures, types and components, as well as the recent advances in its use in institutional contexts. The review emphasizes the relevance of ontologies as instruments of **semantic integration, knowledge governance, and organizational transparency**, especially in environments that demand interoperability and data auditing, such as the Federal Institutions of Higher Education (IFES). In addition, the chapter explores national and international experiences that illustrate the role of ontologies and knowledge graphs in the digital transformation of the public sector, preparing the conceptual ground for the ontological engineering methodology presented in the following chapter.

3 FUNDAMENTALS OF ONTOLOGY ENGINEERING

Ontology Engineering has established itself as an essential discipline to formally represent knowledge in complex and distributed environments. Its purpose is to make explicit the semantic relationships between concepts, ensuring that people and systems can share a common understanding of a domain (Gruber, 1993; Guarino, 1998). In recent decades, the application of these structures to **public management** has been growing, especially in initiatives aimed at **interoperability, transparency, and intelligent auditing** (Suárez-Figueroa et al., 2012; Diamantini et al., 2025).

In institutional contexts, ontologies allow administrative, financial, and strategic data to be organized in a formal and consistent way, enabling automated queries and logical inferences. They constitute the conceptual basis for the construction of **Knowledge Graphs**, which connect entities, indicators and management processes. This approach is particularly relevant for **Federal Institutions of Higher Education (IFES)**, where the diversity of data sources and formats hinders integrated analysis of performance and investments (Lima et al., 2023; Silva et al., 2024).

4 STRUCTURE AND COMPONENTS OF ONTOLOGIES

Ontologies are composed of classes (concepts), properties (relations), axioms (logical constraints), and instances (concrete occurrences). The combination of **RDF (Resource Description Framework)** and **OWL (Web Ontology Language)** is vital for modeling intelligent systems, as it allows you to represent detailed knowledge and perform automatic reasoning on data, ensuring consistency and inferring new relationships (Hogan et al., 2021). Validation tools such as **SHACL (Shapes Constraint Language)** reinforce the structural and semantic quality of models (Knublauch, 2017).

In the domain of IFES, these components make it possible to represent and interconnect elements of strategic planning, programs, projects, indicators and budget allocations. Formalization in OWL ensures interoperability and data reuse between different agencies and systems, while SPARQL queries allow dynamic extraction of information relevant to university management (Bittencourt et al., 2019; IFMG, 2025).

4.1 TYPES AND LEVELS OF ONTOLOGIES

Ontologies can be classified according to their scope and generality (Guarino, 1998):

- **Top Ontologies:** describe universal and abstract concepts, such as time, space, and event, and are applied as a basis for more specific ontologies.
- **Domain Ontologies:** focus on concepts specific to a certain field, such as public administration or higher education.
- **Task Ontologies:** model activities or processes, such as planning, execution, and monitoring.
- **Application Ontologies:** integrate elements from the previous levels to meet specific contexts.

In the case of **IFES-GENIUS-EXT**, it is an **application ontology**, as it combines elements of domain (university planning and management) and task (monitoring and auditing) to meet the needs of Brazilian IFES. This classification favors conceptual reuse and interoperability between government systems, as recommended by national frameworks such as the **Controlled Vocabulary of Electronic Government (VCGE)** and **DCAT-AP.br** (Brasil, 2019; Ministry of Economy, 2022).

4.2 RECENT APPLICATIONS IN PUBLIC MANAGEMENT AND HIGHER EDUCATION

In recent years, several ontologies have been applied to public administration and educational management, evidencing the maturity of the area and the expansion of interoperable initiatives. Among the main ones are:

- **OntoSINAES (2018)**: Central Ontology for Brazilian Higher Education Institutions, modeling organizational structure, stakeholders and normative interoperability (Mendonça et al., 2018).
- **DBgoldbr (2018)**: Project aimed at transforming open government data into **Linked Open Data**, with a focus on transparency and public data (Nascimento et al., 2018).
- **OntoRS (2023)**: Ontology for the Federal Judicial System, Enabling SPARQL Consultations on Legal Decisions and Transparency Audits (Souza & Ribeiro, 2023).
- **IFMG (2025)**: Ontology developed to integrate data on school dropout, academic performance, and student assistance, reinforcing the adherence of ontologies to national institutional contexts (IFMG, 2025).

These studies converge in the use of ontologies for **semantic standardization**, **institutional monitoring**, and **knowledge reuse**. IFES-GENIUS-EXT differentiates itself by integrating these principles into the reality of federal universities, creating an infrastructure that connects strategic planning, budget execution, and performance indicators (Bittencourt et al., 2019; Diamantini et al., 2025).

4.3 SEMANTIC GOVERNANCE AND INTEROPERABILITY

Semantic governance is a critical aspect in the maintenance of institutional ontologies. Ontologies are living entities, requiring continuous updating and collaborative validation processes (Suárez-Figueroa et al., 2012). The absence of active governance can lead to obsolescence and semantic inconsistency between systems (Oliveira & Lima, 2024). Public institutions also face challenges in terms of technical training, maintenance costs, and cultural resistance to the adoption of semantic technologies (Machado & Nobre, 2022).

Tools and best practices include:

- **Protégé and WebProtégé**, for collaborative modeling and validation;
- **VocBench**, for terminology management and publication of SKOS vocabularies;
- **SHACL**, for automatic verification of structural conformity;
- **OQuaRE and OntoQA**, for ontological quality assessment (Radulovic et al., 2018).

Alignment with national policies — such as the **VCGE**, **DCAT-AP.br**, and **e-SIC** — ensures interoperability and adherence to the Brazilian digital government strategy (Brasil, 2019; Ministry of Economy, 2022). This semantic governance structure reinforces the institutional viability of IFES-GENIUS-EXT and ensures its long-term technological sustainability.

5 METHODOLOGY

This study adopts a **qualitative, exploratory and applied** approach, based on **Ontology Engineering** as a scientific method. Qualitative research seeks to understand complex phenomena in their natural context (Yin, 2018), allowing us to analyze how semantic structures can be applied to university public management. The exploratory character stems from the novelty of the **IFES-GENIUS-EXT ontology**, aimed at modeling institutional knowledge in federal universities. The applied aspect, on the other hand, is manifested in the effective implementation of ontology as an operational component of the framework of intelligent auditing and institutional transparency proposed in this work (Bittencourt et al., 2019; Lima et al., 2023).

Ontology Engineering is used as a method to conceive, formalize and validate conceptual models expressed in formal languages, enabling automated reasoning and interoperability between systems. Its adoption is justified by the need to structure knowledge dispersed in administrative and academic sources, integrating planning data, indicators and budget under the same semantic framework (Guarino, 1998; Suárez-Figueroa et al., 2012).

5.1 ONTOLOGICAL ENGINEERING METHODS USED

The development of the **IFES-GENIUS-EXT** ontology was guided by the combination of the methodologies **METHONTOLOGY** (Fernández-López et al., 1997) and **NeOn** (Suárez-Figueroa et al., 2012). The former offers a systematic process for creating ontologies from conception to maintenance, while the latter introduces principles of modularity, reuse, and collaborative development in knowledge networks.

METHONTOLOGY defines an iterative cycle composed of stages of **specification, conceptualization, formalization, implementation, evaluation** and **maintenance**, ensuring the traceability and consistency of each phase. The **NeOn Methodology, on the other hand**, emphasizes the **reuse of existing ontologies** and **modular integration**, enabling the IFES-GENIUS-EXT model to incorporate concepts from previous ontologies, such as **GENIUS Ontology, VCGE, DCAT-AP.br** and **PROV-O**, optimizing interoperability and alignment with national and international standards (Suárez-Figueroa et al., 2012; Nascimento et al., 2018).

The choice to integrate both methodologies allowed the combination of conceptual rigor and practical flexibility, resulting in a process adaptable to the institutional environment of the IFES. This mixed approach also favored the documentation of intermediate artifacts—glossaries, class diagrams, Competency Questions (CQs) tables, and validation scripts—which are essential for scientific transparency and reproducibility.

5.2 STAGES OF THE IFES-GENIUS-EXT DEVELOPMENT PROCESS

The development of the ontology followed an iterative cycle structured in six main steps, according to the principles of METHONTOLOGY and NeOn:

1. **Specification:** Definition of the scope and objectives of the ontology, based on the needs of the IFES. The main institutional documents (PDI, LOA, PPA, Management Reports) were surveyed and the stakeholders responsible for the data and processes were identified.
2. **Conceptualization:** Identification and organization of key concepts (*StrategicObjective*, *Program*, *Project*, *BudgetAllocation*, *PerformanceIndicator*), establishing hierarchies and semantic relationships.
3. **Formalization:** Translation of the conceptual structure into logical representations, using OWL and RDF. In this phase, axioms and constraints were created to ensure ontological consistency.
4. **Implementation:** Construction of the ontology in tools such as **Protégé** and **WebProtégé**, with collaborative participation of experts and public managers.
5. **Evaluation:** Application of automatic consistency tests and semantic verification via SHACL, in addition to analysis by domain experts.
6. **Maintenance and Evolution:** Establishment of a semantic governance plan using **VocBench** for terminological control and continuous updating (Oliveira & Lima, 2024).

This process was supported by a set of **Competency Questions (CQs)** that guided the scope of the modeling, such as: "Which programs are linked to a certain strategic objective?" or "Which projects received resources from a specific program in the current year?". The CQs served as completeness metrics and validation guides, ensuring that the ontology answered management questions relevant to the context of IFES (Noy & McGuinness, 2001; Hogan et al., 2021).

5.3 TOOLS AND PATTERNS USED

The technical implementation of the ontology used an ecosystem of consolidated tools:

- **Protégé / WebProtégé:** for modeling, documentation and logical verification;
- **VocBench:** for standardization of vocabularies and SKOS publishing;
- **SHACL:** for automatic validation of semantic integrity;
- **SPARQL:** for knowledge retrieval queries and tests;
- **OOPS! and OntoQA:** for the evaluation of good ontological practices.

In addition to the tools, the model followed national and international interoperability standards, highlighting: **VCGE** (Controlled Vocabulary of Electronic Government), **DCAT-**

AP.br, **PROV-O**, **SKOS** and **FOAF**. This adherence ensures compatibility with open data portals and institutional catalogs, favoring alignment with the Brazilian Digital Government Strategy (Ministry of Economy, 2022; Zhang et al., 2019).

5.4 ONTOLOGY EVALUATION AND VALIDATION

The evaluation of the IFES-GENIUS-EXT ontology combined technical and qualitative criteria. The **OQuaRE** (Radulovic et al., 2018) and **OntoQA** metrics were applied to measure aspects of **completeness**, **coherence**, **concurrency**, and **reusability**. The results showed a high degree of structural consistency and conceptual coverage. The qualitative validation involved reviews conducted by experts from federal universities and institutional data analysts, who evaluated the conceptual clarity and applicability of the model.

The integration between automatic validation (via reasoners and SHACL) and human validation ensured semantic robustness and practical relevance. The process culminated in the generation of a functional RDF repository, capable of feeding intelligent auditing systems and visualization of indicators, confirming the viability of the model as a knowledge governance tool in IFES.

6 RESULTS AND DISCUSSION

6.1 IMPLEMENTATION OF THE IFES-GENIUS-EXT ONTOLOGY

The implementation of the **IFES-GENIUS-EXT** ontology was conducted in accordance with the methodological cycle established in Chapter 3, using the **OWL 2** language and the **Protégé 5.6.1** development environment. The model was conceived as a **modular extension** of **GENIUS Ontology** (Araujo et al., 2017), preserving the original namespace and ensuring semantic compatibility with the classes and properties of the international educational domain.

The resulting structure comprises **11 classes**, **9 object properties**, and **7 data properties**, all formally declared with axioms of domain, range, and cardinality. This composition seeks a balance between **structural simplicity** and **semantic expressiveness**, in line with the recommendations of Gruber (1993) and Guarino (1998) on the *minimum ontological commitment*.

The core classes represent essential entities of institutional planning: *StrategicObjective*, *Program*, *Project*, *BudgetAllocation*, and *PerformanceIndicator*. Each of them maintains hierarchical and functional relationships consistent with the academic-administrative structures defined in the GENIUS ontology. For example:

Class: StrategicObjective

SubClassOf: genius:OrganizationalGoal

Annotations: rdfs:label "Strategic Objective"@en , "Objetivo Estratégico"@pt

This bilingual annotation standard was adopted systematically, ensuring adherence to the **BCP 47** standard and the **FAIR Interoperability** guideline (Wilkinson et al., 2016). Object properties—such as *isAchievedBy*, *consistsOf*, *hasBudgetAllocation*, and *evaluatedBy*—have been modeled with **OWL constraints** that ensure semantic consistency and enable automated inferences, as validated by HermiT and ELK reasoners.

The ontology was serialized in **Turtle (.ttl)** and **RDF/XML** formats, including Dublin Core metadata and **DCAT v3** vocabulary, ensuring traceability and reuse in different institutional contexts.

6.2 APPLIED EVALUATION PROTOCOL

The validation of the model followed the **technical-scientific evaluation protocol** described above, combining quantitative metrics and qualitative verifications inspired by **OntoQA** (Tartir et al., 2005), **OQuaRE** (Duque-Ramos et al., 2011), **OOPS!** (Poveda-Villalón et al., 2012) and **OntoClean** (Guarino & Welty, 2002). The process included six main dimensions:

1. **OWL 2 DL syntactic compliance and profiling** — automatic verification via *ROBOT report* and *HermiT/ELK* reasoners;
2. **Structural quality** — analysis of density of relationships, axioms, and ontological cohesion (*OntoQA-like metrics*);
3. **Semantic/taxonomic quality** — inspection of hierarchies and metaproperties (*OntoClean*);
4. **Lexical and multilingual coverage** — *rdfs:label* and *rdfs:comment* exam in *pt-BR* and *en*;
5. **Adherence to digital government standards** — SKOS/DCAT/CPSV-AP/VCGE mappings;
6. **Readiness for use and inference** —testing SPARQL queries and *Competency Questions* (CQs).

Execution was automated by Python scripts that employed **RDFLib**, **pySHACL** and **SPARQLWrapper**, ensuring full reproducibility. Reports were generated in **CSV** and **TTL** formats, composing a documented *evaluation package*.

6.3 STRUCTURAL AND SEMANTIC RESULTS

Structural analysis confirmed syntactic validity and compliance with the **OWL 2 DL** profile. Loading the *ifes-genius-ext.owl* file showed **zero** parsing errors, **no unsatisfiable classes**, and **no redundant axioms**, which demonstrates high formal consistency.

Table 1

OntoQA-like metric	Result	Minimum criteria
Total Classes	11	≥ 10
Object Properties	9	≥ 8
Data properties	7	≥ 6
Total axioms	126	—
Domain/Range populated	100 %	≥ 90 %
Orphan classes	0	0
Valid hierarchical relationships	100 %	≥ 95 %

Lexical coverage showed 100% of labels in English, but absence of complete labeling in Portuguese. This gap was interpreted as an opportunity for improvement, aiming at compliance with the guidelines of the **Controlled Vocabulary of Electronic Government (VCGE)** and with the criterion ≥ 95% coverage @pt-BR recommended by Duque-Ramos et al. (2011).

The expansion of multilingual labeling, with an emphasis on Portuguese do Brasil (pt-BR), is a priority to ensure adherence to the VCGE and the DCAT-AP.br, expanding the semantic accessibility of the ontology and its adoption by public agents and citizens.

SHACL validation — applied to both generic and domain-specific shapes — showed no violations, confirming the adherence of object and data properties to their respective domains and ranges.

The OOPS!-like **automatic checks** identified **no critical pitfall** (such as unlabeled classes, properties without domain or *range*, or taxonomic cycles), reinforcing the coherence of the model.

6.4 QUALITY ANALYSIS AND OQUARE SCORECARD

The adapted application of the **OQuARE framework** resulted in the following mean scores (scale 0–5):

Table 2

Dimension	Score	Interpretation
Structural Quality	5,0	Formally solid and consistent model.
Functional Adequacy	5,0	Sufficient classes and properties for the domain of IFES.
Usability	3,5	Penalty for the partial absence of pt-BR labels.
Maintainability	4,0	Modular and easily extendable structure.

Dimension	Score	Interpretation
Portability/Reusability	4,0	Good compatibility with W3C and VCGE standards.

The aggregate score (4.3) places IFES-GENIUS-EXT at the **"Very Good"** level according to the OQuaRE taxonomy, indicating maturity for reuse and integration. Compared to academic benchmarks (Fernández et al., 2020; Hubert et al., 2022), the ontology has superior performance in structural consistency and modularity, and equivalent performance in lexical coverage.

6.5 CRITICAL DISCUSSION OF RESULTS

The evaluation demonstrates that the **IFES-GENIUS-EXT** complies with the classical principles of clarity, coherence and extensibility (Gruber, 1993; Grüninger & Fox, 1995). Its integration with GENIUS ensures **international interoperability**, while the additional classes expand the representation of **planning, budgeting, and institutional performance**, aspects hitherto absent in educational ontologies.

From the point of view of **public governance**, the model contributes to transparency and **accountability** in Brazilian federal universities, allowing automated consultations and reports on goals and investments. This capability is close to the **Linked Open Data** approaches applied in smart cities (Zhang et al., 2021; Ji et al., 2021), while preserving the specificity of IFES.

The absence of labeling in Portuguese, although it does not compromise semantic coherence, limits reuse by public agents unfamiliar with English terminology. This aspect will be remedied through the systematic application of the **VCGE vocabulary** and terminological standardization according to the DCAT-AP.br guidelines (GovBR, 2023).

In ontological terms, the preliminary **OntoClean** evaluation showed that the Rigidity, Identity, and Unit *metaproperties* were correctly assigned to the core classes, ensuring taxonomic consistency.

The OntoClean checklist will be expanded to include operational subclasses and institutional categories, in order to identify possible conceptual overlaps and strengthen the taxonomic coherence of the model.

6.6 PRACTICAL IMPLICATIONS AND FUTURE PROSPECTS

The results obtained position **IFES-GENIUS-EXT** as a reusable artifact for **institutional knowledge graph ecosystems**. Its practical application makes it possible to:

- **Strategic indicator dashboards**, powered by SPARQL queries; Chart 1 presents an example of a SPARQL query used to illustrate the extraction of information from the IFES-GENIUS-EXT ontology;
- **Automated budget compliance** audits;
- **Integration with Neo4j, GraphDB and RDF4J platforms**;
- **Interoperability** with public data catalogs (DCAT, CPSV-AP);
- **Future expansion** to use with **Language Models (LLMs)** in explainable analytics (*Explainable AI*), following recent trends (Sarker et al., 2024).

Table 3

Example of SPARQL query on the IFES-GENIUS-EXT ontology

```
PREFIX ifes: <https://purl.org/ifes-genius-ext#>
SELECT ?budget program
WHERE {
  ?program a ifes:Program .
  ?ifes program:hasBudgetAllocation ?budget .
}
```

Source: Prepared by the authors (2025).

This example demonstrates the automatic extraction of programs and their budgets, highlighting the potential of ontology for automated analysis of institutional planning and budgeting, as well as integration with mood boards and management systems.

7 FUTURE PROSPECTS INCLUDE

1. Complete multilingual labelling ($\geq 95\%$ en-US);
2. Publish the ontology to Linked Open Data Cloud (LOD) repositories;
3. Incorporate **probabilistic inference modules** for automatic budget allocation recommendations;
4. Develop **semantic dashboards** connected to SIGEPE, SIAFI and SUAP databases; It is planned to publish IFES-GENIUS-EXT in Linked Open Data (LOD) repositories, integrated with these dashboards, allowing public consultations and interoperability with other government catalogs.
5. Expand the model to cover **municipalities** and **federal institutes**, composing an **interconnected SmallCityKG/IFES-KG**.

8 SUMMARY OF RESULTS

In summary, the evaluation confirms that **IFES-GENIUS-EXT** has **structural robustness, semantic consistency and interoperability potential**, aligning with digital

government guidelines and the **Sustainable Development Goals (SDGs 11 and 16)**. The planned improvements — notably bilingual labeling and taxonomic refinement — will bolster its capacity **to support decision making and public transparency**.

This ontology is consolidated as an **artifact of institutional knowledge engineering**, able to sustain the **strategic monitoring of Brazilian federal universities** and the integration of data between different levels of government.

ABSTRACT

The study aimed to analyze the economic and financial performance of a company in the hotel sector located in Northwest Rio Grande do Sul, using economic, financial, and structural indicators for the period from 2018 to 2024. Initially, a theoretical framework aligned with the research objectives was developed. Regarding its goals, the methodology was exploratory, descriptive, and applied; concerning its means, it was a documentary and case study based on accounting data provided by the company. Subsequently, economic, financial, and structural indicators were calculated, followed by quantitative and qualitative analyses that enabled an understanding of the company's performance before, during, and after the COVID-19 pandemic. The main research results demonstrated that the analysis of indicators revealed satisfactory liquidity levels, indicating good solvency capacity, and controlled debt, capable of sustaining economic-financial equilibrium. Turnover showed a sharp decline in 2020 due to restrictions imposed by the COVID-19 pandemic but evidenced a gradual recovery in the following years analyzed. The pandemic significantly impacted revenue, gross profit, and operational activity between 2020 and 2021; however, in 2022, a strong recovery was observed, driven by the resurgence of demand. For future research, the study suggests comparisons with other hotels in the region, analyses during crisis periods, and investigations into organizational adaptation strategies in the face of uncertain scenarios.

RESUMO

O estudo teve como objetivo analisar o desempenho econômico e financeiro de uma empresa do setor hoteleiro localizada no Noroeste do Rio Grande do Sul, utilizando a aplicação de indicadores econômicos, financeiros e de estrutura referentes ao período de 2018 a 2024. Inicialmente, desenvolveu-se um referencial teórico alinhado aos objetivos da pesquisa. A metodologia adotada foi exploratória, descritiva e aplicada quanto aos fins, documental e estudo de caso quanto aos meios, baseada em dados contábeis fornecidos pela empresa. Em seguida, foram realizados os cálculos de indicadores econômicos, financeiros e de estrutura, e, posteriormente, foram realizadas as respectivas análises quantitativas e qualitativas que permitiram compreender o desempenho da empresa antes, durante e depois da pandemia do COVID 19. Os principais resultados da pesquisa demonstraram que a análise dos indicadores revelou níveis satisfatórios de liquidez, indicando boa capacidade de solvência, e um endividamento controlado, capaz de sustentar o equilíbrio econômico-financeiro. A rotatividade apresentou queda acentuada em 2020 em razão das restrições impostas pela pandemia de COVID-19, mas evidenciou recuperação gradual nos anos seguintes analisados. A pandemia impactou significativamente a receita, o lucro bruto e o movimento operacional entre 2020 e 2021; entretanto, em 2022, observou-se forte recuperação impulsionada pela retomada da demanda. O estudo sugere, para pesquisas futuras, comparações com outros hotéis da região, análises em períodos de crise e investigações sobre estratégias de adaptação organizacional diante de cenários incertos.

RESUMEN

Este estudio tuvo como objetivo analizar el desempeño económico y financiero de una empresa hotelera ubicada en el noroeste de Rio Grande do Sul, utilizando indicadores económicos, financieros y estructurales para el período de 2018 a 2024. Inicialmente, se desarrolló un marco teórico alineado con los objetivos de la investigación. La metodología adoptada fue exploratoria, descriptiva y aplicada en cuanto a su propósito, documental y de estudio de caso en cuanto a sus métodos, basada en datos contables proporcionados por la empresa. Posteriormente, se realizaron cálculos de indicadores económicos, financieros y estructurales, seguidos de los respectivos análisis cuantitativos y cualitativos que permitieron comprender el desempeño de la empresa antes, durante y después de la pandemia de COVID-19. Los principales resultados de la investigación demostraron que el análisis de los indicadores reveló niveles satisfactorios de liquidez, indicando una buena capacidad de solvencia, y un endeudamiento controlado, capaz de sostener el equilibrio económico y financiero. La facturación mostró una fuerte caída en 2020 debido a las restricciones impuestas por la pandemia de COVID-19, pero mostró una recuperación gradual en los años siguientes analizados. La pandemia impactó significativamente los ingresos, el beneficio bruto y la actividad operativa entre 2020 y 2021; sin embargo, en 2022 se observó una fuerte recuperación, impulsada por la reactivación de la demanda. El estudio sugiere, para futuras investigaciones, comparaciones con otros hoteles de la región, análisis durante periodos de crisis e investigaciones sobre estrategias de adaptación organizacional ante escenarios inciertos.

1 INTRODUCTION

Accounting has been consolidated, over the years, as an indispensable science for organizational management, as it provides accurate and relevant information that supports strategic decision-making. The Financial Statements, as established in NBC 26 (R5), represent a structured set of information that shows the equity and financial position and performance of the entities, constituting an essential instrument for the assessment of the economic situation and for future planning. In this context, the Analysis of Financial Statements allows interpreting data extracted from financial reports, making it possible to assess liquidity, profitability, indebtedness, and operational efficiency, as highlighted by Almeida (2019) and Silva (2019). This analytical capacity becomes even more critical in times of instability, in which the constant monitoring of economic, financial, and structural results works as a thermometer of organizational health and its ability to survive.

From this perspective, this study focuses on analyzing the economic and financial performance of a company in the hotel sector located in the Northwest region of Rio Grande do Sul, in the period from 2018 to 2024, through the standardization of the Financial Statements and the application of indicators. The choice of the sector is justified, above all, by the impacts resulting from the COVID-19 pandemic. As reported by PAHO (2020), the outbreak that began in China in December 2019 triggered a global crisis marked by social isolation and lockdowns, significantly affecting economic activity. In Brazil, according to Martins (2021), from March 2020 onwards there was a strong economic downturn, an increase in unemployment and a drop in the Gross Domestic Product. Among the most affected segments, tourism is one of the most affected, with the hotel sector facing an abrupt drop in the occupancy rate and consequent reduction in revenues, as observed by Conto (2021). Such a scenario highlighted the vulnerability of organizations in the face of systemic events and reinforced the need for strategic and robust financial management to face extreme uncertainties and maintain operational continuity.

Given this scenario, this study answered the following research problem: what were the effects of the COVID-19 pandemic on the economic, financial, and structural performance of a hotel organization in the Northwest region of the state of Rio Grande do Sul - Brazil? To this end, the general objective was to analyze such effects based on the analysis of financial, economic, and structural indicators in the period from 2018 to 2024.

The relevance of the research lies in the possibility of evidencing the impacts produced by the health crisis, providing subsidies for decision-making and strategic planning in scenarios of uncertainty. More than a historical record, the study seeks to understand how the organization's governance reacted to the crisis, offering economic, financial, and

structural information about resilience and the importance of being prepared for abrupt disruptions in cash flow.

The structure of the article initially includes the introduction, then there is the theoretical framework that supported the research, the methodological procedures used to carry out the research, then there is the presentation and analysis of the results. Finally, there are the final considerations and the references used.

2 ACCOUNTING AND ITS REPORTING

Accounting, as Martins (2020) points out, can be understood as a model that seeks to present in detail the reality of the economic, financial, and structural situation of the organization. It is important that each organization adopts specific characteristics of its economic, financial and patrimonial reality for strategic planning and definition of actions to be adopted in the future of the organization. In this sense, accounting is no longer a mere historical record to become a prospecting tool, essential for survival in volatile markets.

According to CPC 00(R2), the financial statements must provide useful information about the organization's assets, liabilities, shareholders' equity, expenses, and revenues, as well as the result of each accounting year, in order to enable a more accurate evaluation and analysis of the management of its resources (CPC, 2019). This usefulness of information is what allows managers to monitor the entity's solvency in real time, anticipating possible financial collapses.

AASB 26 (R5) mentions that:

Financial statements are a structured representation of the entity's equity and financial position and performance. The purpose of financial statements is to provide information about the equity and financial position, performance and cash flows of the entity that will be useful to a large number of users in their valuations and economic decision-making. The financial statements also aim to present the results of the management's performance, in view of its duties and responsibilities in the diligent management of the resources entrusted to it. To meet this objective, the financial statements provide information to the entity about the following: (Text amended by CFC Resolution No. 1,376/11)

- (a) assets;
- (b) liabilities;
- (c) shareholders' equity;
- (d) income and expenses, including gains and losses;
- (e) changes in equity through payments by the owners and distributions to them; e
- (f) cash flows (CFC, 2019, p. 6).

The financial statements must be prepared and demonstrated in accordance with the legislation and standards, from these disclosures it is possible to carry out economic, financial

and equity analyses through specific performance indicators. These indicators translate raw data into business intelligence, allowing management to understand not only how much the company has, but how it is reacting to external pressures.

Ignácio and Goularte (2021) and Almeida (2019) reinforce that the analysis provides relevant information to several users interested in understanding operational activities. According to Lins and Francisco Filho (2012), the analyses should be used as an instrument to control the economic, financial and patrimonial situation, allowing a clear assessment for the decision making of managers.

3 ECONOMIC, FINANCIAL AND STRUCTURAL INDICATORS

3.1 LIQUIDITY INDICATORS

Padoveze and Benedicto (2010) describe in their bibliography that the elaboration of liquidity indicators aims to analyze the payment capacity of companies, understanding liquidity as availability in currency to honor their agreements. It is related to the idea of liquidation and liquidation, and liquidation represents the settlement of the obligation, therefore, the indicators intend to measure whether the company's assets and rights are sufficient for the settlement of its debts. In periods of crisis, liquidity becomes the main indicator of survival, as the lack of immediate cash can lead to insolvency, even if the company has solid equity.

Liquidity ratios make it possible to analyze the financial health of the entity in the face of its obligations, demonstrating the company's ability to meet its commitments and consequently have continuity in the market (Martins, 2020).

The fact of the existence of assets and liabilities with different forms and deadlines of realization led to the development of several types of Liquidity Indicators to measure the ability to pay, thus, financial analysts work with indicators and among them the most used are Current Liquidity, Dry Liquidity, Immediate Liquidity and General Liquidity (Padoveze; Benedicto, 2010)

3.2 INDEBTEDNESS INDICATORS

According to Padoveze and Benedicto (2010), the indebtedness indicators show how much the organization's assets are financed by its own resources or those of third parties, allowing the analysis of the degree of external dependence. A capital structure that is excessively dependent on third parties increases the organization's vulnerability in scenarios of declining revenue, such as what occurred during the pandemic.

Debt ratios indicate that the higher the degree of indebtedness, the greater the tendency for organizations to use accounting methods to increase profit. As this index increases, the risk of non-compliance with obligations increases, increasing the probability of insolvency (Iudícibus; Lopes, 2004).

3.3 STRUCTURE INDICATORS

The Asset structure looks at the share of each account group in the organization's total Assets, assuming a 100% basis for the total Assets, calculating the share of the account subgroups. This information is found in the Vertical Balance Sheet Analysis. These indicators are presented as Participation of Current Assets in Total Assets (PAC), Participation of Long-Term Realizable in Total Assets (PRLP) and Participation of Fixed Assets in Total Assets (PAF), (Padoveze; Benedicto, 2010).

The efficient management of fundraising and structure is one of the main organizational activities, as it promotes a fundamental role for the growth, development and sustainability of organizations, understanding the form and sources of financing among the entity's sets of resources (Reis; Ritta; Fabris, 2015). Among these, EBITDA (EBITDA) stands out, an indicator to highlight the potential for operating cash generation, disregarding financial and tax effects that could mask the real performance of the hotel activity in years of crisis (Almeida, 2019). Operational analysis, in turn, allows the identification of variations in sales cycles and volumes, contributing to the construction of scenarios and risk mitigation (Silva, 2019). Understanding these cycles is what allows the organization to adjust its cost structure quickly in the face of a downturn in demand.

EBITDA, also known as EBITDA, is a performance indicator in companies used in the economic and financial part, calculated in the financial statements based on the income statement for the year (P&L), which reflects the operations in a given period, without accounting for some effects such as interest, taxes, depreciation, and amortization (Almeida, 2019). As Martins (2020, p.184) points out: "With the globalization of markets, measures of economic and financial performance that can make the results measured in different countries comparable become extremely desirable."

Operational analysis, as Padoveze and Benedicto (2010) point out, is an essential tool to understand the efficiency of the entity's activities, understand the cycles and resources to obtain an adequate analysis. This topic aims to highlight them, demonstrating the cycles, indicators, and their importance for understanding a result in the analysis statements.

According to Alves and Laffin (2018), Operational Analysis comprises the use of instruments or sources for the proper functioning of the organization, allowing the analysis in

a certain period of time of the purchases or products that will be resold and the receipt of sales values. Adopting measures to mitigate risks and implement procedures to strengthen the financial health of the business.

Operational Analysis aims to assess the economic viability of the entity, identify variations in business results and behavior, becoming an essential tool to analyze and verify the impacts and procedures based on any variation in sales volume, contributing to the construction of scenarios (Silva, 2019).

3.4 PROFITABILITY INDICATORS

The use of Economic Indicators offers information that helps in obtaining correct decisions. Profitability indicators indicate the return on invested resources, evaluating the efficiency of management over time (Alves; Laffin, 2018). The use of Economic Indicators is extremely important for the contribution of business management, as they offer accurate information that helps managers in the decision-making process, contributing to the economic and financial growth of the organization.

As described by Alves and Laffin (2018, p.30): "The use of indicators affirms the relationship between accounts or a group of accounts in the financial statements that present relevant elements of the company's economic or financial position". Alves and Laffin (2018) highlight the following economic indicators:

Indicators are essential for business management, and are also useful to measure the company's activities in the competing market. It is known that companies have a great variation in their performance, which ends up hiding the complexity of the changes that have occurred in different economic sectors, including the various business segments. Through the oscillation of business performance, it is possible to evaluate and understand why some companies in the same field have better commitment than others (Alves; Laffin, 2018, p.24).

The combination of Asset items is what generates revenue for the company, as Assets means investments made by the company to obtain profitability, that is, to increase its profitability. In this way, economic indicators were created to calculate the company's earning power, the profit that was achieved in real invested (Marion, 2012).

Economic indicators are related to results and their operating activity. Thus, in the following topic, Profitability Indicators will be addressed, one of the essential indicators to analyze the company's efficiency.

The Profitability Indicators consist of a number or percentage that indicates how much return it has from the resources invested in it. This return evaluates the efficiency of management in using the assets in its activities, in relation to the organization's assets, as

well as in relation to the sales made by the organization, evaluating profitability over time (Alves; Laffin, 2018).

Understanding and efficiently managing the company's activities are essential for operational growth, increasing profitability, minimizing liquidity difficulties, and mitigating risks, allowing for evolutionary development and adequate financial health (Almeida, 2019).

4 EXTERNAL EVENTS AND UNCERTAINTY MANAGEMENT

Companies must maintain constant attention to events and transformations in the external environment to adopt measures that neutralize or prevent threats, with the objective of anticipating actions to ensure the continuity of the organization (Paiva; Neves, 2008). The external environment exerts a significant influence on the development of organizations, and can directly affect their functioning, triggering methods of adaptation to the market, especially in periods of crisis. It is evident that the organization has adapted to the development in order to generate profit, whether for sales or service activities (Addono, 2018).

The capacity for organizational resilience is directly linked to the agility in interpreting these external variables and adjusting the financial strategy. The fundamental point of external analysis is to understand, whenever possible, in order to anticipate the changes caused by the most diverse variables that may be inside or outside the company's control, allowing a strategic activity in the face of different scenarios and threats (Paiva; Neves, 2008).

In the face of unexpected scenarios, such as economic crises and changes, whether national or global, all organizations are subject to impacts and risks, whether controllable or not. Internal control must seek methods capable of mitigating the effects of these events for the greatest possible stability within the organization (Lima, 2023). What differentiates organizations that survive global crises from those that close their activities is the robustness of their planning and the speed of response to impacts.

It is evident that external events exert a significant influence on the performance of organizations and their economic stability. Among these events, the COVID-19 pandemic stands out. In view of the contagion of the Covid-19 pandemic, there was the closure of activities and temporary suspension of face-to-face services by determination of the public authorities, causing a huge paralysis in the market. This scenario has had a direct impact on the economy of organizations, hindering their growth and causing a drop in revenue, in addition to bringing difficulties in meeting their finances (Coimbra; Caldeira; Serrão, 2020).

The pandemic was not only a health crisis, but an unprecedented financial stress test. With the advance of the Covid-19 pandemic, the financial system was drastically affected, the increase in economic risks caused a drop in stocks, in addition to shaking the functioning

of the market. The conditions of companies worsened rapidly, generating uncertainties regarding the stability of their assets, crises to maintain their cash flow, financial obligations, and difficulty in accessing financing (Bernanke, 2024). In other words, the financial system was affected by uncertainties about equity stability and cash flow difficulties (Bernanke, 2024).

As highlighted by Mendes *et al* (2020), sectors such as hotels, restaurants, events, among others, suffered significant drops in sales and service revenues while maintaining fixed obligations such as rents and salaries, which generated severe liquidity problems. In this context, the monitoring of the indicators previously described has become the compass for the resumption of the economic and financial balance of organizations.

5 METHODOLOGICAL PROCEDURES

The research is characterized as exploratory, descriptive and applied, as to the ends, and documentary, bibliographic and case study, as to the means. The exploratory and descriptive nature is justified by the need to observe and detail the behavior of financial variables in a crisis scenario, while the applied character lies in the generation of knowledge that can help in the management of organizations in the same segment. The methodological design was adopted with the objective of analyzing the structural, economic and financial impacts resulting from the COVID-19 pandemic in an organization of the hotel segment located in the northwest region of Rio Grande do Sul - Brazil.

The investigation used primary data extracted from the financial statements, Balance Sheet and Income Statement, provided by the organization under study, referring to the periods from 2018 to 2024. This time frame was strategically selected to allow a comparative analysis in three distinct moments: the pre-pandemic period (2018-2019), the peak of the health crisis (2020-2021) and the recovery and stabilization process (2022-2024). From these financial statements, fundamental structural, economic and financial indicators were calculated, such as liquidity, indebtedness, equity structure, financial leverage and profitability ratios according to the formulas established in the accounting literature.

The theoretical basis was built through bibliographic research in books, scientific articles, accounting standards and technical pronouncements (CPCs and NBCs), providing the necessary conceptual support for the interpretation of the results. In addition, non-standardized interviews were conducted with professionals from the company's accounting area, with the purpose of clarifying operational information, confirming specific events of the period and qualitatively contextualizing the raw data extracted from the reports.

The quantitative approach was carried out through measurement, organization in electronic spreadsheets and comparison of the indicators calculated over the seven years. The qualitative approach was manifested from the reflective interpretation of the results in the light of the organizational context, the regional economic environment and the particularities of the hotel sector in the face of the mobility restrictions imposed by the pandemic. This integration of methods allowed the numbers to be translated into explanations about the resilience and adaptive capacity of the organization studied.

6 PRESENTATION AND ANALYSIS OF RESULTS

The presentation and analysis of the results begins with the indicators. As described by Padoveze and Benedicto (2010), the relationship between economic, financial and structural indicators is based on the integration between the accounts of the Balance Sheet and the Statement of Income for the Year, which allows the manager to base strategic decisions with a greater probability of success and organizational growth. The results on the effects of the Covid-19 Pandemic on the performance of the studied organization are presented below.

6.1 LIQUIDITY INDICATORS

Liquidity Indicators, in Martins' (2020) view, allow the organization's financial situation to be assessed, determining the ability to pay its debts and ensure continuity in its operations. These ratios work as a security measure, indicating the entity's financial leeway in the face of its short- and long-term commitments. The following is the Current Liquidity, Dry Liquidity, Immediate Liquidity and General Liquidity ratios of the organization that is the object of the research.

The results obtained by applying the formulas to the data extracted from the company's Financial Statements are shown in Table 1.

Table 1

Liquidity Indicators

	Current Ratio	Dry Ratio	Quick Ratio	General Liquidity Ratio
2018	R\$ 4,71	R\$ 4,16	R\$ 3,74	R\$ 2,25
2019	R\$ 3,37	R\$ 2,93	R\$ 2,47	R\$ 1,72
2020	R\$ 2,92	R\$ 2,34	R\$ 1,97	R\$ 1,33
2021	R\$ 2,91	R\$ 2,38	R\$ 1,95	R\$ 1,52
2022	R\$ 5,69	R\$ 5,02	R\$ 4,36	R\$ 2,39
2023	R\$ 6,88	R\$ 6,38	R\$ 5,82	R\$ 3,08
2024	R\$ 9,24	R\$ 8,69	R\$ 7,76	R\$ 3,65

Source: Survey data (2025).

Padoveze and Benedicto (2010) describe that the interpretation of these indices reveals how much the organization makes available for each R\$ 1.00 of debt. Table 1 shows these values for the period from 2018 to 2024, showing that results above R\$1.00 indicate solvency capacity, while values below this level signal difficulties in honoring obligations. In this sense, the higher the index, the greater the financial robustness and the ability to survive in the market. According to the information presented in Table 1, it is noted that although the indices were reduced in 2020 and 2021, the company managed to maintain its solvency in all indicators. This resistance is remarkable, as it demonstrates that, even with the abrupt drop in hotel activities, the organization had enough reserves or a flexible cost structure not to go into immediate insolvency. The drop observed in the 2020-2021 biennium is related to the systemic impacts of the COVID-19 pandemic, which compressed working capital and cash availability. However, there is a sharp recovery from 2022 onwards, culminating in 2024 as the year with the greatest historical evolution of the Liquidity Indices. Current Ratio, for example, reached the expressive level of R\$9.24 for every R\$1.00 of short-term debt, which reflects not only the recovery of the sector, but possibly a strategy of profit retention or financial deleveraging after the critical period.

6.2 INDEBTEDNESS INDICATORS

In this topic, the Indebtedness Indicators are presented, which allow the evaluation of the degree of financial dependence of the organization. According to Padoveze and Benedicto (2010), these indicators show how much the organization depends on third-party capital to maintain its activities. In times of instability, such as the one observed between 2020 and 2021, monitoring these ratios is vital to avoid overcommitting cash flow to financial charges.

The results achieved from the Financial Statements, through the analysis of the General Indebtedness Ratio and Financial Indebtedness are shown in Table 2.

Table 2*Indebtedness Ratios*

	General Indebtedness Ratio	Financial Indebtedness Ratio
2018	20,47%	11,08%
2019	24,37%	12,46%
2020	24,63%	13,65%
2021	31,15%	16,44%
2022	28,75%	15,59%
2023	26,18%	17,18%
2024	21,58%	14,34%

Source: Survey Data (2025).

Iudícibus and Lopes (2004) report that the higher the level of indebtedness, the greater the risk of defaulting on their financial obligations. According to table 2, it can be seen that in the General Indebtedness Index there was a growth between 2018 and 2021, from 20.47% to 31.15%. This increase, although it suggests greater pressure on liabilities, reflects the company's need to raise external funds to address the shortage of operating revenues during the critical period of the pandemic. As of 2022, this ratio decreases, reaching 21.58% in 2024, which shows an improvement in the capital structure and a return to financial autonomy.

The Financial Indebtedness Ratio determines the organization's dependence on third-party capital, demonstrating the effective financial costs. This indicator identifies an increase from 11.08% (2018) to 16.44% (2021). In 2023, the index reached its peak (17.18%), suggesting that the company may have taken advantage of the recovery moment to make investments or consolidate previous debts. In 2024, the reduction to 14.34% confirms a stabilization trajectory. In general, the company has balanced ratios, evidencing prudent management that avoided over-indebtedness even in the face of a severe crisis in the sector.

6.3 STRUCTURE INDICATORS

The Structure Indicators, as highlighted by Martins (2020), are instruments that show how the organization finances its assets and maintains the balance between its resources. Analysis of asset ownership and composition reveals how agile a company can be in responding to sudden changes in the market.

Table 3 is presented below, showing the results obtained through the survey of the Equity Immobilization Index.

Table 3*Equity Immobilization Ratio*

	Equity Asset Ratio
2018	73,94%
2019	81,85%
2020	91,14%
2021	83,21%
2022	59,57%
2023	45,24%
2024	42,45%

Source: Survey Data (2025).

In the hotel industry, it is common for a large part of the Shareholders' Equity to be linked to Fixed Assets (facilities and equipment). The index reached 91.14% in 2020, showing that, at the height of the crisis, practically all equity was "locked" in permanent assets, drastically reducing financial flexibility. However, the systematic reduction to 42.45% in 2024 is a telling fact: it indicates that the organization has strengthened its Shareholders' Equity and liquidity, becoming much less dependent on its fixed assets to sustain its value. This indicates an improvement in the capital structure, with more balance between its resources invested in fixed assets. Much of this evolution tends to adapt after the impacts of the pandemic, allowing for long-term sustainability.

Next, the results obtained on the Asset Structure Ratios are presented, divided into Participation of Current Assets in Total Assets and Participation of Fixed Assets in Total Assets.

Table 4*Asset Structure Index*

	Share of Current Assets in Total Assets %	Share of Fixed Assets in Total Assets %
2018	38,20%	61,38%
2019	33,74%	65,81%
2020	26,32%	73,13%
2021	36,07%	63,45%
2022	53,37%	46,27%
2023	63,88%	35,85%
2024	64,74%	34,92%

Source: Survey Data (2025).

The Asset Structure Ratio shows the proportion of Current Assets and Non-Current or Fixed Assets in the company's assets, allowing an understanding of its investments, reporting whether its resources are linked to short-term or long-term assets. Padoveze and Benedicto (2010) warn that one should always be aware of the oscillations that may occur in these

indicators, as it is a signal for possible changes and analyses of the organization and the market.

When analyzing the Asset Structure, as shown in Table 4, a strategic inversion can be noted: in 2020, Fixed Assets represented 73% of the total, falling to 35% in 2024. At the same time, Current Assets jumped from 26% to 65%. This change in profile indicates a "financialization" of the company's structure, which began to favor highly liquid assets (cash and equivalents) to the detriment of new large fixed assets. This strategy significantly increases the organization's resilience to face future crises.

According to Padoveze and Benedicto (2010), the Liability Structure Index aims to present a broad view of the composition of its company financing, evidencing the participation of each group of accounts of its Liabilities in relation to Total Assets. Table 5 shows the results for the Liability Structure Ratio in Total Assets.

Table 5

Liability Structure Ratio in Total Assets

Share of Current Liabilities in Total Assets %	Share of Noncurrent Liabilities in Total Assets %	Share of Total Liabilities in Total Assets %	Share of Shareholders' Equity in Total Assets %
8,12%	8,88%	16,99%	83,01%
10,00%	9,59%	19,59%	80,41%
9,01%	10,75%	19,76%	80,24%
12,38%	11,37%	23,75%	76,25%
9,39%	12,94%	22,33%	77,67%
9,28%	11,47%	20,75%	79,25%
7,00%	10,74%	17,75%	82,25%

Source: Survey Data (2025).

According to the concepts of Padoveze and Benedicto (2010), the indices of liability structure and participation of liabilities in total assets allow the evaluation of the degree of dependence on third-party capital and the financial autonomy of the organization.

Table 5 reinforces the financial autonomy of the company. The Participation of Shareholders' Equity in Total Assets remained high (above 76% in the entire period), reaching 82.25% in 2024. According to Padoveze and Benedicto (2010), this predominance of own resources provides the company with exceptional security, allowing it to operate with a low risk of insolvency and less exposure to variations in market interest rates.

6.4 PROFITABILITY INDICATORS

According to Alves and Laffin (2018), Profitability Indicators demonstrate the efficiency of management in transforming assets and capital into profit. For the hotel sector, which has high fixed costs, profitability is the indicator that suffers the most in periods of low occupancy.

This subtitle presents the results obtained from the calculations and analysis of the Indicators of Return on Assets, Return on Equity, Degree of Financial Leverage and Interest Coverage Indicator.

Table 6 shows the results obtained on Earnings Before Financial Expenses (EBIT).

Table 6

Earnings Before Financial Expenses (EBIT)

	Gross Profit	EBIT
2018	R\$ 2,432,445.57	R\$ 301,933.43
2019	R\$ 2,494,976.71	R\$ 131,347.22
2020	R\$ 1,431,967.98	-R\$ 387,135.32
2021	R\$ 3,233,328.38	R\$ 598,886.27
2022	R\$ 4,852,661.46	R\$ 1,944,290.14
2023	R\$ 5,896,553.02	R\$ 2,337,421.78
2024	R\$ 6,022,964.77	R\$ 1,405,401.33

Source: Survey Data (2025).

Table 6 shows the Profit before Financial Expenses between the periods of 2018 and 2024 of the hotel company under study. Through this information, it becomes possible to visualize the oscillations over the periods, demonstrating the periods of low and high, allowing to observe the company's ability to return to profitability after periods of economic stability. It was also used as a calculation for the statements of the Return on Assets, Coverage Indicator and EBITDA (EBITDA) indicators.

EBIT reflects the health of the operation. The negative result of -R\$ 387,135.32 in 2020 illustrates the devastating impact of the lockdown. However, the recovery in 2022 and 2023 is robust, with operating profit jumping into the millions. This turnaround demonstrates that the company's business model is solid and capable of generating large surpluses as soon as external demand normalizes.

Table 7 shows the results obtained from the Profitability Indicators, from the application of the formulas in the data extracted from the Financial Statements.

Table 7

Profitability Indicators

	Return on Asset (RSA)	Return on Equity (ROE)	Degree of Financial Leverage	Interest Coverage Indicator
2018	8,27%	2,96%	0,36	5,89
2019	3,19%	1,11%	0,35	2,15
2020	-9,63%	-12,02%	1,25	-11,81
2021	14,37%	6,33%	0,44	9,10
2022	45,33%	25,80%	0,57	10,94
2023	52,53%	26,64%	0,51	9,84
2024	28,12%	14,95%	0,53	5,17

Source: Survey Data (2025).

According to Alves and Laffin (2018), profitability indicators allow the evaluation of the company's efficiency in the use of its resources and the ability to generate returns over time. From this perspective, the results of ROA and ROE confirm the shock of 2020 (with negative returns of -9.63% and -12.02%, respectively). However, the profitability achieved in 2022 (ROA of 45.33% and ROE of 25.80%) is extraordinary for the sector, indicating a repressed recovery. The Financial Leverage Degree (GAF) remained, most of the time, below 1.00 (except in 2020 due to losses), which, according to the literature, indicates that the company was not using debt in order to "leverage" its profit, but rather maintaining a conservative and safe stance. The significant improvement in the Interest Coverage Indicator after 2021 ratifies that the company has recovered its full capacity to honor financial charges, consolidating its stability in the post-pandemic period.

6.6 EFFECTS OF THE COVID 19 PANDEMIC ON ECONOMIC AND FINANCIAL PERFORMANCE

According to Bernarke (2024), the COVID-19 pandemic triggered financial and economic impacts on a global scale, reflecting an increase in risks that led to the devaluation of services and marked instability in the market. Companies had to adapt to the scenario quickly, facing uncertainties, difficulties to maintain their activities and honor their commitments, requiring unprecedented crisis management to maintain solvency.

Next, figure 1, COVID-19 Pandemic in the Hotel sector between 2018 and 2024, is presented, and then demonstrates the economic and financial effects directly interconnected to the company object of the study. This visual representation allows us to understand the chronology of external events that guided the company's internal decisions.

Figure 1

COVID-19 pandemic in the Hotel sector between 2018 and 2024

Source: Prepared by the authors based on WHO and Research Data (2025).

From the analysis of economic and financial indicators, it was identified that in the periods of the pandemic shown in figure 1, the emergence of the COVID-19 pandemic is evident, and with it companies begin to face a drop in their revenues. This phenomenon was the result of the reduction in employment rates and the temporary suspension of activities, causing financial and economic imbalance in organizations. In the hotel sector, specifically, the rigidity of fixed costs coupled with demand volatility has aggravated the pressure on working capital.

To highlight the effects of the COVID-19 pandemic on the financial performance of the company under study, Figure 2 was prepared, which demonstrates the Effects of the COVID-19 Pandemic on Gross Revenue and Net Income in the period from 2018 to 2024.

Figure 2

Effects of the COVID-19 Pandemic on Gross Revenue and Net Income

Source: Survey Data (2025).

Graph 1 shows significant fluctuations in both revenue and profit of the hotel company. Between 2018 and 2019, it is observed that the company had been experiencing a slight growth in its operations, but with a reduction in its profit, due to higher expenses with operating costs and expenses. The period of 2020 stands out with the greatest impact, with a drastic drop in its revenues and leaving its Net Income negative, reflecting the effects of the pandemic in relation to tourism, causing companies to close due to *the lockdown* and reducing the demand for accommodation. This negative result highlights the fragility of the sector in the face of the total interruption of the flow of customers.

From 2021, a vaccination process begins in Brazil, determining a gradual recovery in revenue and high growth in profitability. Driven by the resumption of activities in 2021 and the significant increase in demand after the confinement period, a phenomenon often classified as pent-up demand, the company presented its best indexes in 2022 and 2023. During this period, it achieved high levels of revenue and profit, with a significant expansion of its financial and economic indicators, consolidating the efficiency of the recovery strategies adopted in the post-crisis.

In the 2024 period, the company manages to maintain its positive results, although it demonstrates a reduction in Net Income for the Year. This retraction suggests a phase of stabilization of the hotel market in Rio Grande do Sul, where the increase in operating costs or the normalization of demand may be impacting profit margins, maintaining instability in its operations.

After presenting the effects of the COVID 19 pandemic on the economic and financial performance of the company object of the research, the research continued by presenting the final considerations with the main results of the research.

7 FINAL CONSIDERATIONS

The objective of this study was to analyze the Financial Statements of a hotel company located in the Northwest of Rio Grande do Sul, seeking to evaluate its economic and financial performance between 2018 and 2024. To this end, it was based on the precepts of the classical analysis of balance sheets and on the theories of capital structure, using a methodology of applied nature with a quantitative approach and case study procedures. Through this study, it was possible to broadly understand the equity structure of the company object of the study and observe the evolution of the main indicators, contributing to the identification of strengths, the need for attention in resource management and adaptation in uncertain scenarios.

Liquidity analyses were fundamental to assess the company's ability to honor its commitments in both the short and long term. The results showed that, over the years, even in the face of the impacts generated by the pandemic, the organization managed to maintain its liquidity indicators above average. This performance reveals a satisfactory level of solvency and indicates that the company has adopted effective strategic management, even in a scenario marked by crises and uncertainties, such as that caused by COVID-19, validating the importance of maintaining liquidity reserves for operational continuity.

The main results of the survey regarding the debt structure showed that the company presented variations over the period analyzed. However, it consistently maintained a level of indebtedness considered controllable, without compromising the economic and financial balance of the organization. Although there was an increase in overall indebtedness in 2021, reflecting the need for working capital financing during the height of the crisis, subsequent periods demonstrated the company's ability to stabilize this indicator, reflecting prudent management between equity and third-party capital. This posture contributed to the reduction of risks and less dependence on external resources, ensuring greater security and financial sustainability to operations.

The turnover analysis, as one of the main results of the survey, brought relevant information about the operational efficiency of the hotel company, evidencing the relationship between payment, receipt and storage terms. It was found that, in 2020, a period marked by *the lockdown* and the restrictions resulting from the pandemic, there was a significant reduction in inventory turnover. However, it was found that, with the resumption of activities

in the following periods, the company showed a gradual recovery of this indicator, demonstrating the reestablishment of operational balance and greater efficiency in the management of inventories and other resources, following the recovery movement of the hotel sector at the regional and national levels.

The study showed that the effects of the COVID-19 pandemic directly impacted the performance of the company under study in the 2020 fiscal year, resulting in a significant reduction in its economic and financial operations, with a drop in all indicators developed in the survey in this period, especially in Gross Profit and Net Revenue for the year. This scenario reflected the restrictions imposed by the isolation and decrease in tourist activities, which directly affected the hotel industry. However, in the period of 2022, it was found that the recovery was gradual and driven, due to the increase in demand from the sector and visitors in the region, which evidenced a capacity for economic and financial growth. This demonstrates that the company was able to adapt to adverse scenarios and efficiency in management to reestablish its performance and strengthen its situation in the market.

Despite the results achieved, the present study has limitations, such as the focus restricted to a single organization, which prevents the generalization of the results to the entire hotel sector in Rio Grande do Sul. In addition, the analysis was based on quantitative data from the financial statements, without considering qualitative variables of the managers' perception. Therefore, it is recommended that future research expand the analysis from different perspectives. One possibility is to deepen the study by comparing the performance of the company analyzed with other organizations in the hotel sector in the region or in different states, allowing the identification of good management practices. It is also suggested to investigate the impact of recent climatic events in the region on the 2024 and 2025 indicators, in order to understand the resilience of the sector in the face of new crises of different nature.

Finally, this research work contributes to the understanding of the importance of the analysis of financial statements as a tool to support decision making within the company, not only in the hotel sector, but also in other market niches, demonstrating the relevance of accounting as an instrument of evaluation and planning. Academically, the research fills a gap on the impacts of the health crisis on small and medium-sized companies in the interior of Rio Grande do Sul.

ANALYSIS OF THE PERCEPTION OF GRADUATES ABOUT THE CONTRIBUTIONS OF UEFS PET ECONOMY TO THEIR ACADEMIC TRAJECTORY

ABSTRACT

This present work aims to identify the perception of graduates about the contributions of the Tutorial Education Program of the undergraduate course in Economics at the State University of Feira de Santana in their academic trajectory, verify the skills acquired in the Program and evaluate the importance of this as a strategy teaching, research and extension. Data were collected using an online, self-administered questionnaire and were described in absolute and relative frequency. 22 graduates participated in the study. The main reasons for participating in the Program were to complete the university degree, gain experience, scholarship opportunities and obtain a promising CV.

Keywords: Teaching. Search. Extension. Economy.

RESUMO

Este presente trabalho tem como objetivo identificar a percepção de egressos sobre as contribuições do Programa de Educação Tutorial do curso de graduação em Economia da Universidade Estadual de Feira de Santana na sua trajetória acadêmica, verificar as habilidades adquiridas no Programa e avaliar a importância desse enquanto estratégia de ensino, pesquisa e extensão. Os dados foram coletados utilizando-se um questionário on-line e autoaplicável e foram descritos em frequência absoluta e relativa. Participaram do estudo 22 egressos. Os principais motivos para participar do Programa foram realizar a tríade universitária, adquirir experiências, oportunidade de bolsa e obter currículo promissor.

Palavras-chave: Ensino. Pesquisa. Extensão. Economia.

RESUMEN

Este estudio tiene como objetivo identificar la percepción de los egresados sobre las contribuciones del Programa de Tutorías de la carrera de Economía en la Universidad Estatal de Feira de Santana a su trayectoria académica, verificar las competencias adquiridas en el Programa y evaluar su importancia como estrategia de docencia, investigación y extensión. Los datos se recopilaron mediante un cuestionario en línea autoadministrado y se describieron en frecuencia absoluta y relativa. Veintidós egresados participaron en el estudio. Las principales razones para participar en el Programa fueron completar la tríada universitaria, adquirir experiencia, obtener oportunidades de becas y lograr un currículo prometedor.

Palabras clave: Docencia. Investigación. Extensión. Economía.

1 INTRODUCTION

The Tutorial Education Program is carried out by higher education institutions (HEIs) across the country. Under the tutorship of a professor with experience and academic production, the PETs are developed by undergraduate students who, gathered in learning groups, carry out academic activities (teaching, research and extension) with the objective of applying the knowledge acquired and strengthening academic training (SESU/MEC, 2006).

Teaching, research and extension form a mandatory tripod in universities and are inseparable through article 207 of the 1998 Constitution (Brasil, 1998). The triad, in addition to contributing to university production, contemplates the solidary, social and cultural role towards society (Moita and Andrade, 2005).

In this way, PET provides students, under the guidance of a tutor, with extracurricular activities that complement the students' academic training and, at the same time, meet the needs of the undergraduate course itself. In this way, it is intended as a tutor to motivate students of the Economics course to become competent professionals and academic producers of knowledge. In this sense, it is expected to provide an improvement in the academic quality of undergraduate courses supported by PET.

According to the Basic Guidelines Manual – PET (2006), it is expected to foster the training of higher education professionals, in the various areas of knowledge, endowed with high scientific, technical, ethical and social responsibility standards, in the various areas of knowledge, who are capable of acting towards the transformation of the national reality, especially as teachers and post-graduate researchers in professional areas.

Thus, conducting research with graduates of the PET groups allows an investigation into the fulfillment of the program's objectives and the appropriation of the information, skills and tools supposedly offered by the educational program by the participants. Also, knowing the impact and benefits of the Program for its scholarship holders is of paramount importance so that there is due appreciation and adjustments in its guidelines and mode of action, when necessary (Fernandes *et al.*, 2020).

Although the PET Economics group at the State University of Feira de Santana (UEFS) has been in existence for many years, few studies have aimed to profile PET scholarship holders from the undergraduate course in Economics. The idea here is to specify the contributions of the Program in the academic trajectory of the scholarship holders, reinforcing the need for more studies on this topic with graduates of the Program of this course.

Therefore, the objective is to identify the perception of the PET Economics graduate from UEFS about the contributions of the Program in their academic trajectory. Also, to verify

the skills acquired in the Program and evaluate the importance of PET as a teaching, research and extension strategy for the training of higher education professionals.

2 RESEARCH AS A PET ACTIVITY

Thus, in relation to "Research", the activities thus proposed tend to develop academic works in quality standards of excellence, since this practice presents an active learning methodology, with emphasis on the solution of the technological problems that the communities have, through a group that, due to its composition, already acts in an interdisciplinary and collective way. The academic training of the participating undergraduates is enriched both by the challenges posed and by the subsequent effort, to report the solutions forwarded, including in scientific dissemination events.

Scientific activity is determined by the ideas and expectations of the scientist who, with inferences, researches to guide theories or discard hypotheses. When a new phenomenon is not yet explained and theorized, it indicates a problem; Therefore, pointing out ways out of this problem is the primary object of any research. As stated by Alves *et al.* (1998) Science begins "[...] when we do not know how to explain a phenomenon, or when traditional explanations do not work - that is, when we are faced with a problem".

In Brazil, according to Schwartzman (2022), the first research institutions were organized by the empire in the nineteenth century, initially focused on the development of the economy, from pest control solutions in crops, as well as the discovery of treatments for diseases. However, the research branch is still waiting for investments and funding to intensify initiatives so that innovations and facts take the place of hypotheses.

In the universities, research began to emerge with the arrival of research professors from Italy, France and Germany, around 1934, they were allocated to research at the University of São Paulo (USP). Thus, in the 40s, with the advancement of research in Brazil, the Brazilian Society for the Advancement of Science was created, then the government instituted the National Research Council in 1951, but with minimal resources.

Tosta (2016) understands that, at PET, the member students stand out in the research dimension and are efficient like the scientific initiation (CI) students. In this sense, "it allows us to affirm that the PET model offers a more comprehensive and richer academic environment than that experienced by other scientific initiation students", with this, it is perceived that PET is an important tool that acts for the development of students.

The Tutorial Education Program (PET) contributes to the insertion of student members in the environment of research scientists. The protagonism to detect problems and the participation in scientific construction are evident characteristics in the petians. Thus, the

experiences lived by academics with extracurricular research activities are essential in professional and personal development, and on the other hand, fundamental for the continuous development of science and established formulations. In this way, the mastery of PET in scientific production and in the training of students is evident.

3 METHODOLOGY

This is a descriptive, cross-sectional research, in which a quantitative approach was used for data collection and analysis. The selection of the site for the study was intentional, and the UEFS headquarters campus was chosen, in the city of Feira de Santana. The study population consisted of graduates of the PET Economics of UEFS, covering the period from the creation of the Program in the institution (2007) to the academic year of 2025. The target population was identified from a survey carried out on data available in the Tutorial Education Program Management System (SIGPET), database and own documentation. In addition, as the graduates were contacted, it was also asked if they knew other graduates who could be added to the research.

All identified participants were contacted individually through electronic mail or in the form of a hidden list, being informed about the objectives, stages and other pertinent information. The participation of the volunteers took place through the consent of the Informed Consent Form (ICF) through agreement at the time of data collection.

Data were collected using an *online*, structured, and self-administered questionnaire through Google *Forms*, developed based on Rychescki et al., (2023); in literature searches and in the objectives of the study. The questions captured data on the perception of this population about the Program, the activities and skills developed in it, and its importance for the academic and professional trajectory. A total of 26 objective questions were asked, divided into three blocks: "Personal information", "Professional information" and "Experience and view on PET". The answer options were dichotomous (yes or no), multiple choice, single-answer questions, or five-point *Likert scale* (Likert, 1932). The collected data were transferred to a Microsoft Office Excel® spreadsheet and described in absolute and relative frequency.

A *Likert* scale is a rating scale used to measure attitudes, perceptions, and opinions. Often used in market research and social sciences, researchers use scale to understand views and sentiment towards a product, service, brand, or market. The *Likert* scale was developed in the United States in the 30s, and unlike a question in which one chooses between yes and no, the questions constructed from the *Likert* scale present a self-descriptive statement.

With this, it allows brands to discover different levels of intensity of people's opinions about the same subject or theme. Conceptually, and for experts in the field, the Likert scale combines applied mathematics (statistics) with psychology to promote a logical immersion in the mind of those who consume. An approach capable of extracting qualitative insights from a quantitatively structured question.

4 RESULTS AND DISCUSSIONS

A total of 69 PET graduates of the UEFS Economics course were identified, of which 22 (27.5%) answered the questionnaire and were included in the analysis. I emphasize that the study is still in progress and these are the first results of the analysis. Among the participants in this study, the majority were female (54.5%) and aged between 19 and 21 years (Figures 1 and 2).

Figure 1

Gender of the graduates of the PET Economics of UEFS

Source: Survey Results.

Figure 2

Age at PET Economics

Source: Survey Results.

Among the reasons that led the graduates to participate in the Program, the main ones were to carry out activities of the university triad (95.5%), scholarship opportunities (77.3%), to acquire experiences (63.3%) and to exchange experiences (54.5%). Studies such as the one by Morel *et al.* (2020) and Rychescki *et al.* (2023) found similar results, and the main

reason for entering the Program of the Economics course at UEFS, specifically, was the development of teaching, research, and extension activities (Figure 3).

Figure 3

Motivation to participate in the PET Economy program

Source: Survey Results.

Most of the graduates remained in PET Economics between 4 and 6 semesters (45.5%) and similar data were also found in studies with other PET groups (Júnior *et al.*, 2021; Lopes *et al.*, 2020; Fernandes *et al.*, 2020). This result can be considered positive, since the graduates had a large period of their education impacted by the multidisciplinary activities in teaching, research and extension promoted by the Program (Figure 4).

Figure 4

Length of stay in the PET Economy program

Source: Survey Results.

In addition, 100% (n=78) of the participants stated that the PET provided the development of important skills for education, among them, the following stood out: teamwork (95.5%), orality (90.9%), social values (86.4%), and listening ability (77.3%) (Figure 5). The development of these and other personal and interpersonal skills were also mentioned in

previous studies on PET graduates from various courses (Júnior *et al.*, 2021; Lopes *et al.*, 2020; Fernandes *et al.*, 2020; Morel *et al.*, 2020).

Figure 5

Skills developed while participating in the program.

Source: Survey Results.

In this scenario, it is worth noting that the National Curriculum Guidelines for the Undergraduate Course in Economics have some general competencies and skills to be developed during the training of the economist. Thus, according to the data found, it is possible to note that PET Economics has the potential to provide personal, academic and professional improvement through spaces and experiences of teaching, research and extension, with contact with the community, academia and other professionals.

Specifically regarding the competence of permanent education, the Program itself, as it is characterized as a tutorial method, gives scholarship holders the opportunity to become increasingly independent in relation to the management of their learning needs (Dearo, 2017). In fact, 81.8% of the graduates stated that the PET contributed to the increase in their undergraduate performance coefficient (Figure 6).

Figure 6

Program contributes to raising the coefficient of performance in undergraduate courses.

Source: Survey Results.

In addition, the majority stated that the Program encouraged/improved learning in a foreign language, a skill also specified in the Curricular Guidelines (Brasil, 2001), since it is directly related to communication (Figure 7).

Figure 7

Program encouraged learning in a foreign language

Source: Survey Results.

Regarding the activities developed during their participation in the Program, the participants reported that most of the activities were extension activities (90.9%), but also with a frequency close to teaching and research (86.4% and 77.3), respectively) (Figure 8). One of the main pillars of the Program is the university tripod of teaching, research and extension, inseparably united, which allows the student a global, critical, citizen, multiplying and excellent education (Brasil, 2010; Barbosa, 2017; Galdino *et al.*, 2021; Braga, *et al.*, 2021).

Figure 8

Activities developed in the PET Economics program

Source: Survey Results.

When asked if they participated in any project involving the triad (teaching, research and extension), the majority said yes (90.9%), and the majority also answered that the PET has no difficulty in articulating these three axes (54.5%), similar to the study by Lopes *et al.* (2020), in which 68% of graduates stated that the PET reached the university tripod (Figures 9 and 10).

Figure 9

Performance in a project or action involving the triad of teaching, research and extension

Source: Survey Results.

Figure 10

If the program has difficulty articulating the triad (teaching, research and extension)

Source: Survey Results.

The activities most worked on within the program, according to the study participants, were lectures (86.4%), workshops (81.8%), conversation circles (77.3%) and extension projects (72.7%) (Figure 11).

Figure 11

Actions most worked on within the PET Economy program

Source: Survey Results.

In addition, a part (40.9%) stated that they had some publication (abstracts or articles) linked to the activities developed in the program, and also presented oral works at events (72.7%), taught a course or lecture during their participation (72.7%) or participated in training exclusively for scholarship holders (courses, lectures, training) (72.7%) (Figures 12, 13, 14 and 15).

Figure 12

Published abstracts or articles of activities linked to the program

Figure 13

Presented oral papers at events linked to the program

Source: Survey Results.

Figure 14

Taught a course or lecture during the participation in PET Economics

Source: Survey Results.

Figure 15

Received internal training exclusively for scholarship holders

Source: Survey Results.

Added to this is the fact that these publications provide a visualization of the continuity in the academic career after graduation, as reported by 40% of the participants in the study by Lopes *et al.* (2018). In addition, the study Marcelino *et al.* (2017) evaluated the scientific production of PET participants during and after their stay in the Program, and found that 83% of the scientific productions analyzed in the graduates' curricula took place during their stay in the Program, reinforcing the importance of PET in academic production.

Most of the graduates evaluated the PET as excellent (81.8%) or good (13.6%) (Figure 16). Similar to this, in the study by Morel *et al.* (2020) most graduates also evaluated the Program well (66% as excellent and 32% as very good). The study by Rychescki *et al.* (2023) evaluated it as excellent (71%) and good (26%).

Figure 16

Evaluation of the PET Economics program by graduates

Source: Survey Results.

The research participants believe that PET contributed to the development of interdisciplinary activities within PET and undergraduate (100%).

Figure 17

Program contributes to interdisciplinary activities

Source: Survey Results.

In addition, the majority agree or fully agree that the PET manages to achieve its objectives of disseminating new ideas and practices to the other students of the course (62.8%), raising the quality of the academic training of the members (77.3%; n=76) and stimulating the training of professionals and teachers with high technical, scientific, technological and academic qualifications (63.6%) (Figures 18, 19 and 20). The aforementioned objectives and others were established by Law No. 11,180, of September 23, 2005 and updated by Ordinance No. 343, of April 24, 2013 (Brasil, 2005; Brazil, 2013).

Figure 18

Can disseminate new ideas and practices

Source: Survey Results.

Figure 19

Contributes to raising the quality of academic training.

Source: Survey Results.

Thus, according to the PET graduates, the program achieves its main objectives and similar results were found in the study by Lopes (2020), demonstrating the efficiency of the program as a whole. The achievement of such objectives is important for the improvement of higher education and academic training both of scholarship holders, non-scholarship holders and volunteers of the program and of the other students of the course, who benefit from the actions carried out by the Program.

Figure 20

Stimulates the training of professionals and teachers with high technical, scientific, technological and academic qualifications

Source: Survey Results.

In the specific case of UEFS's PET Economics, the aforementioned objectives, added to the objective of stimulating critical thinking and professional performance guided by citizenship and the social function of higher education, complement the pedagogical proposal of the course to train professionals capable of providing comprehensive, humanized and critical care, working as a team and understanding the reality in which the population lives.

5 CONCLUSIONS

The accomplishment of this study allowed us to understand the contribution of the Program in the academic and professional trajectory of the graduates, as well as to evaluate whether it has been carried out in accordance with its proposal and objectives. Most participants evaluated the Program positively, corroborating the results expected by the research, and it was possible to infer that it has been effective in fulfilling its objectives, according to the perception of the graduates.

Also, the present study contributes to the other research carried out in the scope of the PET evaluation, bringing results about the PET of the undergraduate course in Economics at UEFS. It should be noted that more research is needed that includes a greater number of graduates and more Programs for even more reliable results. It is worth highlighting, in conclusion, the potential of the PET of the undergraduate course in Economics at UEFS to raise the quality of the course, as well as the academic training of the members of the Program and the other students of the course, making them better prepared for the professional and/or academic trajectory.

ANNEX - QUESTIONNAIRE

PROFILE OF UEFS ECONOMICS PET GRADUATES REGARDING AGE, GENDER, LENGTH OF STAY AND REASON FOR PARTICIPATION IN THE PROGRAM (N=22)

CURRENT AGE:

AGE AT WHICH HE ENTERED THE PET:

GENDER: () Male () Female

Length of stay in the Program:

() Up to 3 semesters () 4 to 6 semesters () 7 semesters or more

Motivation to participate in the Program:

- () Teaching, research and extension activities
- () Curiosity
- () Scholarship opportunity
- () Influence of participants
- () Acquisition of experience
- () Exchange of experience with all phases of the course
- () Indication of teachers
- () Promising curriculum

PERCEPTION OF UEFS PET ECONOMICS GRADUATES REGARDING THE CONTRIBUTION OF THE PROGRAM IN THE DEVELOPMENT OF SKILLS, IN THE COEFFICIENT OF PERFORMANCE IN GRADUATION AND LEARNING IN A FOREIGN LANGUAGE (N=22).

Developed important skills while participating in the Program: () Yes () No

Skills developed by participating in the Program:

- () Altruism
- () Investigative and questioning attitudes
- () Orality
- () Leadership
- () Teamwork
- () Time management
- () Respect for individualities
- () Task management/prioritization
- () Organization
- () Reading

- ☐ Creativity
- ☐ Technical competence
- ☐ Argumentation
- ☐ Reflective attitude
- ☐ Ability to listen
- ☐ Social values
- ☐ Ability to deal with complex situations

The program contributed to raising the coefficient of performance in undergraduate courses:

☐ Yes ☐ No ☐ I don't know

Program encouraged foreign language learning:

☐ Yes ☐ No

ACTIVITIES DEVELOPED BY THE GRADUATES OF THE UEFS PET ECONOMICS (N=22).

Activities developed in the Program: ☐ Extension ☐ Teaching ☐ Research

He worked in a project or action involving the triad of teaching, research and extension in an inseparable way:

☐ Yes ☐ No ☐ Didn't know how to answer

Program has difficulty articulating the triad (teaching, research and extension):

☐ Yes ☐ No ☐ Didn't know how to answer

Actions most worked on within the program:

- ☐ Extension Projects
- ☐ Courses
- ☐ Lectures
- ☐ Teaching Activities
- ☐ Research Projects
- ☐ Workshops
- ☐ Conversation circles
- ☐ Events
- ☐ Monitoring

Published abstracts or articles of activities linked to the Program:

☐ Yes ☐ No ☐ Didn't know how to answer

He presented oral papers at events linked to the Program:

☐ Yes ☐ No ☐ Didn't know how to answer

Taught a course or lecture during the participation in the PET:

☐ Yes ☐ No ☐ Didn't know how to answer

Received internal training exclusively for scholarship holders:

☐ Yes ☐ No ☐ Didn't know how to answer

How do you evaluate the PET program:

☐ Great ☐ Good ☐ Fair ☐ Poor ☐ Very Bad

PERCEPTION OF UEFS ECONOMICS PET GRADUATES ABOUT THE PROGRAM

(N=22).

Program contributed to interdisciplinary activities:

☐ Yes ☐ No ☐ Didn't know how to answer

PET manages to achieve its goal in the sense of:

Disseminate new ideas and practices to other students in the course, through the role of scholarship holders as multiplier agents:

☐ I completely agree

☐ I agree

☐ I neither agree nor disagree

☐ Disagree

☐ I strongly disagree

Contribute to raising the quality of the academic training of the students who are members of the PET group:

☐ I completely agree

☐ I agree

☐ I neither agree nor disagree

☐ Disagree

☐ I strongly disagree

To stimulate the training of professionals and teachers with high technical, scientific, technological and academic qualifications:

☐ I completely agree

☐ I agree

☐ I neither agree nor disagree

() Disagree

() I strongly disagree

ABSTRACT

This study aimed to analyze how scientific production has addressed the invisibility of women's work in rural areas, with an emphasis on the relationships between work, gender, and access to social security. The completed research was based on a systematic literature review, including authors such as Santos, Lefebvre, Massey, Wanderley, Tuan, and Martins. Twenty-two academic studies were selected, including articles, theses, dissertations, and undergraduate theses, prioritizing productions that addressed the institutional recognition of rural women and their right to retirement. The materials were analyzed using analytical note-taking, which allowed for the identification of recurring theoretical approaches, methodologies, and results. The results showed that exclusion from social security and the invisibility of women's work constituted structural phenomena, reinforced by patriarchal practices and the absence of policies sensitive to the reality of women in rural areas. It was concluded that theoretical advances and the strengthening of a critical and feminist approach were fundamental for the understanding and effective recognition of the rights of rural women.

Keywords: Rural Area. Women's Work. Invisibility.

RESUMO

Este trabalho teve como objetivo analisar como a produção científica abordou a invisibilidade do trabalho feminino no espaço rural, com ênfase nas relações entre trabalho, gênero e acesso à previdência social. A pesquisa, concluída, fundamentou-se em revisão bibliográfica sistemática, contemplando autores como Santos, Lefebvre, Massey, Wanderley, Tuan e Martins. Foram selecionados 22 estudos acadêmicos, entre artigos, teses, dissertações e TCCs, priorizando produções que trataram do reconhecimento institucional das mulheres rurais e de seu direito à aposentadoria. Os materiais foram analisados por meio de fichamento analítico, o que permitiu identificar abordagens teóricas, metodologias e resultados recorrentes. Os resultados evidenciaram que a exclusão previdenciária e a invisibilidade do trabalho das mulheres constituíram fenômenos estruturais, reforçados por práticas patriarcais e pela ausência de políticas sensíveis à realidade feminina no campo.

Concluiu-se que os avanços teóricos e o fortalecimento de uma abordagem crítica e feminista foram fundamentais para a compreensão e o reconhecimento efetivo dos direitos das mulheres rurais.

Palavras-chave: Espaço Rural. Trabalho Feminino. Invisibilidade.

RESUMEN

Este estudio tuvo como objetivo analizar cómo la producción científica ha abordado la invisibilidad del trabajo de las mujeres en las zonas rurales, con énfasis en las relaciones entre trabajo, género y acceso a la seguridad social. La investigación se basó en una revisión sistemática de la literatura, que incluyó a autores como Santos, Lefebvre, Massey, Wanderley, Tuan y Martins. Se seleccionaron veintidós estudios académicos, entre artículos, tesis, disertaciones y trabajos de fin de grado, priorizando aquellos que abordaban el reconocimiento institucional de las mujeres rurales y su derecho a la jubilación. Los materiales se analizaron mediante la toma de notas analíticas, lo que permitió identificar enfoques teóricos, metodologías y resultados recurrentes. Los resultados mostraron que la exclusión de la seguridad social y la invisibilidad del trabajo de las mujeres constituían fenómenos estructurales, reforzados por prácticas patriarcales y la ausencia de políticas sensibles a la realidad de las mujeres en las zonas rurales. Se concluyó que los avances teóricos y el fortalecimiento de un enfoque crítico y feminista eran fundamentales para la comprensión y el reconocimiento efectivo de los derechos de las mujeres rurales.

Palabras clave: Zona Rural. Trabajo de Mujeres. Invisibilidade.

1 INTRODUCTION

Geography, as a field of knowledge, has historically been dedicated to unveiling the multiple dimensions of space, overcoming the traditional view that conceived it only as a static scenario or a mere support for human actions. Under the influence of Critical Geography, especially from the 1970s onwards, authors such as Lefebvre (1974) and Santos (1996) consolidated the understanding of space as a historical, relational construction permeated by power relations. From this perspective, space is neither neutral nor given, but the result of disputes, interests and social processes that are expressed both in the urban and in the rural.

In the context of the Brazilian rural space, such an approach allows us to highlight how patriarchal, capitalist and institutional practices have historically produced inequalities, exclusions and silencing, especially with regard to the role of women. The countryside, more than a space for agricultural production, is a living space, crossed by land conflicts, labor relations, and forms of social organization that make women's work invisible and make it difficult for women to access basic rights, such as rural retirement, as demonstrated by Castilho (2018) and Moreira (2022).

From this perspective, the understanding of labor relations in capitalism dispenses with the interpretation of the ways in which subjects are inserted in the world of work, and it should be noted that this inclusion does not occur in a homogeneous way, since "factors of gender, race/ethnicity and generation mark the world of work in a deep and constant way" (CHERON, 2010, p. 241), in rural areas, this inequality takes on its own contours, because, although women participate in planting, harvesting, cultivating gardens and backyards, raising small animals, processing production and, often, small-scale commercialization, such activities are not always recognized as productive work, leaving women at a significant disadvantage, especially black women and those with a low level of formal education.

As Paulilo (1987) demonstrates, a significant part of these tasks is socially treated as "help", and not as work per se. This classification contributes to shifting to the field of naturalization and gratuitousness activities that are indispensable to the maintenance of the family productive unit, reinforcing the separation between what is socially recognized as productive and what is attributed to women as an extension of domestic obligations. In this sense, Brumer (2002, 2004, 2012) shows that the devaluation of women's work compromises the social and economic recognition of women's work in rural areas, while Paula (2019) highlights that this invisibility has a direct impact on access to social protection rights and policies.

In the social security plan, this dynamic is especially relevant, although Brazilian legislation recognizes the figure of the special insured as a rural worker, women still face

systematic difficulties in accessing social security rights, especially retirement due to rural age, due to the lack of recognition of women's efforts as work. The requirement to prove rural activity, associated with low female land ownership, the informality of family production and the concentration of documents in the name of men, means that many workers arrive at the moment of applying for social security without sufficient material proof of work effectively performed throughout their lives.

Although we have noticed, over the last few years, the expansion of opportunities in different occupations in the labor market for women, such expansion does not eliminate gender stereotypes, nor does it revert to equality, to the point that women who exercise or have exercised rural activities during their life trajectory are denied the right to retire, because their effort is not recognized as work.

In this context, this work carried out an analysis of the scientific production focused on geographic space, rural space and Feminist Geography, systematizing the main studies on the invisibility of women's work and its implications for women's rights and social security in the countryside. The objective of this work was to analyze how scientific production has addressed the invisibility of women's work in rural areas, with emphasis on the relations between work, gender and access to social security for rural women.

2 METHODOLOGICAL PROCEDURES

The present research is characterized as a qualitative study based on a systematic bibliographic review, aimed at the critical analysis of scientific production on geographic space, rural space, Feminist Geography and the invisibility of women's work in the field. To understand the epistemological transformations of the concept of space and its interfaces with gender issues in rural areas, the review was based on classical and contemporary authors such as Milton Santos, Henri Lefebvre, Yi-Fu Tuan, Doreen Massey, Maria Nazareth Wanderley and José de Souza Martins.

The selection of the 22 academic papers — including scientific articles, theses, dissertations, and TCCs published in journals, repositories, and events in the areas of Geography and Human Sciences — followed criteria of thematic relevance and topicality, prioritizing studies that deal with the invisibility of rural women's work, institutional recognition, and access to retirement. The documents were submitted to the analytical file technique, identifying theoretical approaches, methods used, recurrent categories and evidenced results. The analysis focused on how the concept of space is mobilized in different productions, articulating gender, space, and social security inequalities, and made it possible to map gaps, advances, and perspectives for the consolidation of a critical and feminist

geographic approach to women's work in the field. In this way, the methodological path allowed not only to gather theoretical references and empirical studies on the subject, but also to systematize interpretations that highlight the historical and institutional obstacles to the social security recognition of rural women.

3 THEORETICAL CONTRIBUTION

The understanding of geographic space has undergone significant transformations throughout the history of Geography, evolving from a naturalistic conception to a critical and relational approach. In Classical Geography, influenced by authors such as Friedrich Ratzel and Vidal de la Blache, space was conceived as a physical stage where natural and human phenomena unfolded, with a strong emphasis on environmental determinism Abrão (2010).

With the advancement of Positivist Geography, especially in the twentieth century, geographic space began to be analyzed as a quantifiable and mappable surface, favoring the measurement of phenomena and the elaboration of spatial models Abrão (2010). This approach, although technically sophisticated, neglected the social, political and subjective dimensions of the production of space, treating it as a neutral datum.

From the 1970s onwards, with the emergence of Critical Geography and the influence of Marxist thought, authors such as Henri Lefebvre and Milton Santos began to consider space as a product of social relations. For Santos (1996), space is the inseparable set of systems of objects and systems of actions, being produced by and for society. This change in perspective allowed the space to be understood as a historical and ideological construction, reflecting relations of power, domination, and resistance.

In the rural context, this critical conception reveals how the agrarian space is structured based on patriarchal logics that make women's work invisible. As discussed by Castilho (2018), the exclusion of women from institutional recognition as formal workers is a concrete manifestation of the way space is selectively produced, denying them access to retirement and other social rights.

The rural space, historically associated with agricultural production and dispersed housing, is, in contemporary times, understood as a complex geographical category, marked by the plurality of functions and subjects. According to Wanderley (2001), the rural is not reduced to agricultural activity, but encompasses social relations, ways of life, knowledge and resistance that configure a living and dynamic territory. Martins (2009) also points out that the Brazilian rural space is crossed by conflicts, land inequalities and processes of exclusion that reproduce historically constructed social hierarchies. From this perspective, rural space

should be understood as a historical-social product, structured by power relations, where patriarchal and capitalist practices shape land use, division of labor and access to rights.

Parallel to these transformations, the advance of humanistic and phenomenological approaches in the following decades, with authors such as Yi-Fu Tuan and Edward Relph, brought to light the importance of lived experience and perceived space. For Tuan (1977), space acquires meaning through the sensory, affective and practical experiences of individuals, who transform it into a place. Relph (1976), in turn, highlights that the attachment to the place, built by symbolic and everyday bonds, is essential to understand how the subjects relate to the world. From these perspectives, it is recognized that geographic space is neither neutral nor abstract, but loaded with meanings that emerge from concrete practices and experiences. This theoretical inflection opened the way for readings that value women's daily lives and symbolic relations with space, elements that would later be central in the analysis of Feminist Geography.

In this sense, Feminist Geography, as highlighted in the article published in the journal *Moreira* (2022), introduces an intersectional reading of rural space, considering gender, class, and space as inseparable dimensions of spatial production. The author argues that "the organization of the Brazilian agrarian space is marked by structural inequalities that silence the productive and reproductive contribution of women" *Moreira* (2022, p. 4). In this sense, space is no longer just a physical medium and is now understood as a condensation of social gender relations, which materialize in forms such as social security exclusion and the absence of female land ownership.

This perspective is reinforced by authors such as Massey (1994), who understand space as relational, multiple and constituted by social practices marked by hierarchies and inequalities. By analyzing the rural space from this perspective, it is possible to understand that the invisibility of women's work is not a circumstantial flaw, but a structural condition of the way space is produced and managed in the Brazilian countryside.

In this way, adopting a critical approach to the concept of space allows us to unveil the mechanisms by which rural women are excluded from public policies, especially social security, revealing that access to or denial of rights is also a matter of the production of geographic space.

4 RESULTS AND DISCUSSION

The bibliographic analysis identified and systematized 22 academic works, including theses, monographs, scientific articles, TCCs and reviews, dedicated to understanding the invisibility of women's work in rural areas and its implications for retirement and social rights.

These studies present diversified methodological approaches, ranging from qualitative analyses to theoretical reviews, covering a variety of Brazilian territories and theoretical-methodological perspectives.

Empirical studies — mostly theses and monographs — carried out interviews, spatial mappings and participant observations, revealing qualitative and quantitative data on the reality experienced by peasant women. For example, Castilho (2018) investigated the trajectory of women farmers in the Ribeira Valley/SP, showing that many of these women are unable to formally prove their productive activity, despite decades of dedication, because they are excluded from official records and registers. According to the study, "the social security recognition of the farmer is strained by a patriarchal logic that disregards her daily work as a legitimate work activity" (Castilho, 2018, p. 101).

Similarly, in the work developed by Costa (2016), carried out in a rural community in Maranhão, women were interviewed who, even though they were responsible for a significant part of subsistence production and commercialization, did not have access to land in their names or records that would allow them to claim rural retirement. Many reported that their husbands were the only ones officially recognized as workers, although they fully shared the productive and domestic responsibilities.

The study by Guedes (2014) showed that rural space is still organized under patriarchal and capitalist logics, in which the sexual division of labor assigns women tasks that are less economically valued and invisible in public statistics. This model has direct consequences in old age, when, after decades of invisible contributions, many face bureaucratic and legal difficulties to access the right to retirement.

On a more theoretical level, the studies of Francisco (2020) and Moreira (2022), based on a literature review, contributed to the critical rereading of rural space and Feminist Geography. Francisco (2020), when analyzing several publications in Agrarian Geography, identified that the concept of space is still, to a large extent, treated in a neutral or masculine way, which hides gender specificities. Moreira (2022), in turn, argues that agrarian space is the product of "social relations marked by the intersection between gender, class, and territory," and that this structure shapes both work and the non-recognition of women as political and economic subjects.

Other studies, such as those by Costa (2016) and Francisco (2020), highlight that public policies for rural social security do not keep up with the reality of women, as they require forms of proof — such as invoices, union registrations, or documents in their own name — that many do not have, due to the family, informal, and collective nature of their work.

A joint reading of these studies allows us to perceive that the invisibility of women's work in the countryside is not only due to the absence of direct income or individualized remuneration, but also to the way in which the activity performed by women is socially and institutionally classified. In many cases, what sustains the family productive unit and guarantees the daily reproduction of life in the countryside continues to be understood as mere help, domestic collaboration or extension of women's obligations, and not as rural work *per se*.

Another recurring aspect in the studies analyzed is the mismatch between the concrete experience of rural women and the formal criteria of state recognition. Although they participate in planting, harvesting, caring for small animals, processing production and, often, marketing, these activities do not always appear in official documents. The requirement for individualized evidence, in contexts marked by informality, family production and low female tenure, contributes to reproducing rejections and administrative obstacles, even when the work trajectory of rural women is socially known in the community.

It is also observed, in the studies analyzed, that academic production has been shifting the debate from the mere observation of inequality to the identification of concrete mechanisms of invisibility. It is not only a matter of affirming that rural women work a lot and receive little recognition, but of demonstrating how certain family, institutional and legal arrangements contribute to erasing their condition as workers. This change is important because it allows us to understand that the problem does not lie in the absence of female participation in rural work, but in the way this participation is registered, interpreted and socially validated.

Research converges to show that rural space is made up of deep-rooted inequalities, which operate both on the material and symbolic levels. The absence of land ownership, the double or triple working day, the institutional silencing of women's work and the difficulty of access to social security are not isolated facts, but expressions of an exclusionary spatial, social and legal structure.

On the other hand, studies also reveal strategies of resistance and organization. Several studies report that the women interviewed participate in collectives, rural associations and social movements that promote political education, legal guidance and visibility actions. These initiatives have made possible, even if with limits, advances in the achievement of rights and in the recognition of women's work in the countryside.

Such experiences of resistance demonstrate that, despite historical and institutional obstacles, rural women do not occupy a merely passive position in the face of inequalities. On the contrary, they build collective forms of confrontation, share knowledge, strengthen

support networks and claim social and legal recognition. The presence of these strategies in the analyzed works also indicates that the expansion of access to rights depends not only on normative changes, but on the strengthening of spaces for participation, information and political organization in rural areas.

In order to systematize the theoretical and empirical contributions on the invisibility of women's work in rural areas, as well as its implications for access to retirement, a table was prepared that summarizes the main works analyzed in this research. Contemplating aspects such as the type of study, methods used, samples researched and the most relevant results identified in each investigation.

Table 1

Main results of the analyses

Author (Year)	Study Type	Method	Sample	Main results
Abram (2010)	Theoretical Article	Literature review	Not applicable	Review of the evolution of the concept of geographic space; emphasis on critical and phenomenological approaches.
Antunes (1999)	Theoretical book	Theoretical foundation	Not applicable	It broadens the notion of the working class and contributes to understanding the organization of work under capitalism, including in rural areas.
Brumer (2002)	Theoretical Article	Literature review	Not applicable	It discusses rural social security and gender, highlighting inequalities in the recognition of women's work and access to rights.
Brumer (2004)	Theoretical Article	Literature review	Not applicable	It analyzes the situation of women in agriculture, highlighting gender inequalities and devaluation of female participation in rural work.
Brumer; Angels (2012)	Theoretical Article	Literature review	Not applicable	It examines gender and social reproduction in family farming, showing the centrality of women's work and its undervaluation.
Castilho (2018)	Thesis	Semi-structured interviews	Unspecified; cases in SP	Invisibility of women's work; difficulties in proving retirement; patriarchal logic.
Cheron (2010)	Theoretical Article	Literature review	Not applicable	It shows that gender, race/ethnicity and generation unequally mark the insertion of subjects in the world of work.
Costa, Raíssa (2016)	TCC	Interviews	5 women in Maranhão	Absence of ownership; informality prevents retirement; invisible productive role.
Guedes (2014)	Thesis	Qualitative study, social analysis	Unspecified; Settlements	Sexual division of labor; economic invisibility; difficulties in retirement.
Francis (2020)	Review Article	Literature review	Not applicable	Neutral or male rural space; it hides gender inequalities.
Junqueira; Lima (2008)	Theoretical Article	Literature review	Not applicable	It discusses public policies for family farming and points out historical inequalities among rural workers, including gender.

Author (Year)	Study Type	Method	Sample	Main results
Kreter; Bacha (2006)	Theoretical Article	Literature review	Not applicable	It evaluates the equity of social security in the Brazilian rural environment, contributing to understanding inequalities in access to social security rights.
Moreira (2022)	Critical Review Article	Literature review	Not applicable	Agrarian space as an intersectional construction; structural inequalities of gender, class and territory.
Lefebvre (1974)	Theoretical Book	Theoretical foundation	Not applicable	Space as social, ideological and material production.
Massey (1994)	Theoretical Book	Theoretical foundation	Not applicable	Relational space, multiple and marked by social hierarchies.
Martins (2009)	Theoretical Book	Theoretical foundation	Not applicable	Rural space marked by conflicts, exclusions and historical inequalities.
Paula (2019)	Theoretical Article	Literature review	Not applicable	It discusses the trajectory of rural women's struggle for recognition and rights, highlighting political mobilization and social visibility.
Paulilo (1987)	Theoretical Article	Literature review	Not applicable	It problematizes the notion of "light work", showing how rural female work is devalued and treated as help.
Relph (1976)	Theoretical Book	Theoretical foundation	Not applicable	Importance of attachment to the place and experience of the space.
Santos (1996)	Theoretical Book	Theoretical foundation	Not applicable	Space as a set of objects and actions, social production of reality.
Wanderley (2001)	Book Chapter	Historical and theoretical review	Not applicable	Rural space as a living territory, marked by ways of life, knowledge and resistance.

Source: Org. MOREIRA, L. G. F. 2025

The integrated analysis of the information presented in chart 1 allows us to perceive the methodological diversity and thematic breadth of research on the subject. It is observed that qualitative studies, especially those that used interviews and documentary analysis, provide fundamental data on the real conditions experienced by women in rural areas, highlighting social security exclusion and the invisibility of work.

5 FINAL CONSIDERATIONS

The research carried out evidenced the complexity of the social and spatial dynamics that structure the Brazilian rural space, demonstrating how scientific production has been expanding the understanding of the invisibility of women's work in the countryside. The methodological path, of a bibliographic nature, allowed us to analyze, from different theoretical and empirical perspectives, the multiple dimensions of gender inequalities in the rural context, especially with regard to institutional recognition, the struggle for rights and the barriers historically imposed on rural women.

By gathering and confronting contributions from Critical Geography, Feminist Geography and the social sciences, the research contributes to the strengthening of an

approach sensitive to the specificities of rural women's work, highlighting both the barriers faced and the strategies of resistance and organization carried out by them. The results presented highlight the need for public policies and new institutional practices that recognize and value the role of women in the agrarian space, collaborating for the construction of a fairer and more inclusive scientific and social field.

It was possible to perceive that the formal requirements for the recognition of women's rural activity, although institutionally presented as technical criteria, do not always correspond to the concrete forms of organization of life and work in rural areas. In many contexts, family production, self-consumption, collective work and informality in productive relations make it difficult to create documents in the name of women, contributing to the permanence of bureaucratic obstacles and the denial of rights. Thus, the non-recognition of women's work in the countryside cannot be understood as a simple individual failure to prove it, but as an expression of a historical logic that has little valued the centrality of women's action in the reproduction of rural life.

Another relevant aspect concerns the contribution of Geography to the interpretation of this problem. By understanding the rural space as a historical and social product, crossed by power relations, the geographical analysis allows us to reveal that unequal access to rights is also manifested territorially. The fact that many women do not have land in their names, the unequal distribution of productive and reproductive tasks, and the difficulty of insertion in formal spaces of representation demonstrate that the invisibility of women's work is directly related to the way the Brazilian agrarian space has been structured and managed over time.

The research analyzed also showed that, despite the numerous obstacles, rural women build practices of resistance, mobilization and collective demands. Participation in associations, unions, social movements and community networks shows that the recognition of rights does not occur only through legal norms, but also through political action and the social visibility achieved on a daily basis. This data is particularly important because it breaks with passive views of rural women and reaffirms their condition as historical subjects and agents of transformation.

Finally, it is noteworthy that this study does not exhaust the theme, but reinforces the need for deepening research that articulates gender, space, feminization of work and public policies, especially from regional perspectives, empirical analyses and direct listening to rural women. Future investigations may contribute to broaden the understanding of the contemporary effects of inequalities that cross the rural environment, as well as to subsidize institutional practices that are more sensitive to the reality of rural workers. It is hoped, therefore, that this research will contribute not only to the academic debate, but also to the

strengthening of critical perspectives committed to social justice, recognition and dignity for women who live and work in the field.

ABSTRACT

Temporomandibular disorder (TMD) comprises a group of conditions affecting the temporomandibular joint and associated structures, representing one of the main causes of non-odontogenic orofacial pain. Given the limitations of conventional therapeutic approaches, cannabidiol (CBD) has emerged as a potential alternative for pain management due to its analgesic, anti-inflammatory, and endocannabinoid system-modulating properties. This study aimed to critically analyze the scientific evidence regarding the use of cannabidiol in the management of pain associated with TMD. This is a narrative literature review with a qualitative approach, conducted in the PubMed, SciELO, and ScienceDirect databases, including publications from 2015 to 2025. Clinical studies, reviews, and experimental research addressing the use of CBD in orofacial pain, myofascial pain, or TMD were included. The findings revealed a predominance of indirect evidence, including reviews and experimental models, with a limited number of randomized clinical trials. Two recent clinical studies demonstrated significant reductions in pain and muscle activity in TMD patients treated with cannabidiol. Additionally, preclinical evidence supports the analgesic and anti-inflammatory effects of CBD, reinforcing its biological plausibility. However, methodological heterogeneity and the scarcity of robust clinical evidence limit the generalization of the findings. It is concluded that cannabidiol presents therapeutic potential in managing pain associated with TMD, particularly of muscular origin, although further clinical studies are required to establish its efficacy, safety, and clinical applicability.

Keywords: Cannabidiol. Temporomandibular Disorder. Orofacial Pain. Myofascial Pain. Endocannabinoid System.

RESUMO

A disfunção temporomandibular (DTM) constitui um conjunto de condições que afetam a articulação temporomandibular e estruturas associadas, sendo uma das principais causas de dor orofacial não odontogênica. Diante das limitações das abordagens terapêuticas convencionais, o canabidiol (CBD) tem emergido como uma alternativa potencial no manejo da dor, devido às suas propriedades analgésicas, anti-inflamatórias e moduladoras do sistema endocanabinoide. O presente estudo teve como objetivo analisar criticamente as evidências científicas acerca do uso do canabidiol no manejo da dor associada à DTM. Trata-se de uma revisão narrativa de literatura, com abordagem qualitativa, realizada nas bases de dados PubMed, SciELO e ScienceDirect, contemplando publicações no período de 2015 a 2025. Foram incluídos estudos clínicos, revisões e pesquisas experimentais que abordassem direta ou indiretamente a utilização do CBD em dor orofacial, dor miofascial ou DTM. Os resultados evidenciaram uma predominância de estudos indiretos, incluindo revisões e modelos experimentais, com número limitado de ensaios clínicos randomizados. Destacam-se dois estudos clínicos recentes que demonstraram redução significativa da dor e da atividade muscular em pacientes com DTM tratados com canabidiol. Adicionalmente, evidências pré-clínicas indicam efeitos analgésicos e anti-inflamatórios do CBD, reforçando sua plausibilidade biológica. No entanto, a heterogeneidade metodológica dos estudos e a escassez de evidências clínicas robustas limitam a generalização dos achados. Conclui-se que o canabidiol apresenta potencial terapêutico no manejo da dor associada à DTM,

RESUMEN

La disfunción temporomandibular (DTM) constituye un conjunto de afecciones que afectan la articulación temporomandibular y las estructuras asociadas, siendo una de las principales causas de dolor orofacial no odontogénico. Ante las limitaciones de los enfoques terapéuticos convencionales, el cannabidiol (CBD) ha surgido como una alternativa potencial en el manejo del dolor, debido a sus propiedades analgésicas, antiinflamatorias y moduladoras del sistema endocannabinoide. Este estudio tuvo como objetivo analizar críticamente la evidencia científica sobre el uso de cannabidiol en el manejo del dolor asociado a la DTM. Se trata de una revisión narrativa de la literatura, con un enfoque cualitativo, realizada en las bases de datos PubMed, SciELO y ScienceDirect, que abarca publicaciones desde 2015 hasta 2025. Se incluyeron estudios clínicos, revisiones e investigaciones experimentales que abordaron directa o indirectamente el uso de CBD en el dolor orofacial, el dolor miofascial o la DTM. Los resultados mostraron un predominio de estudios indirectos, incluyendo revisiones y diseños experimentales, con un número limitado de ensayos clínicos aleatorizados. Dos estudios clínicos recientes destacan por demostrar una reducción significativa del dolor y la actividad muscular en pacientes con disfunción temporomandibular (DTM) tratados con cannabidiol. Además, la evidencia preclínica indica efectos analgésicos y antiinflamatorios del CBD, lo que refuerza su plausibilidad biológica. Sin embargo, la heterogeneidad metodológica de los estudios y la escasez de evidencia clínica sólida limitan la generalización de los hallazgos. Se concluye que el cannabidiol presenta potencial terapéutico en el manejo del dolor asociado a la DTM, especialmente el de origen muscular, pero se necesitan más estudios clínicos para establecer su eficacia, seguridad y aplicabilidad clínica.

Palabras clave: Cannabidiol. Disfunción Temporomandibular. Dolor Orofacial. Dolor Miofascial. Sistema Endocannabinoide.

1 INTRODUCTION

Temporomandibular disorder (TMD) is a set of conditions that affect the temporomandibular joint, masticatory muscles, and associated structures, and is considered one of the main causes of non-odontogenic orofacial pain. Its etiology is multifactorial, involving biomechanical, neuromuscular, and psychosocial factors, which contribute to the complexity of diagnosis and clinical management (GOLANSKA et al., 2021). In addition, TMD has a significant impact on patients' quality of life, and can compromise functions such as chewing, speaking, and sleeping, in addition to being frequently associated with chronic pain (WU et al., 2021).

From a pathophysiological point of view, TMD-associated pain is often related to local inflammation and peripheral and central sensitization, mediated by pro-inflammatory substances, such as cytokines and chemokines, especially in cases of myofascial pain. Studies have shown that changes in the expression of inflammatory mediators play a relevant role in pain maintenance and dysfunction progression (QIAO et al., 2023; ZWIRI et al., 2020). In this context, understanding the biological mechanisms involved in myofascial and joint pain is essential for the development of new, more effective therapeutic approaches.

In recent years, cannabidiol (CBD), one of the main non-psychoactive components of *Cannabis sativa*, has been widely investigated due to its analgesic, anti-inflammatory, and endocannabinoid system modulating properties, without showing relevant psychoactive effects. Evidence suggests that CBD acts on the modulation of CB1 and CB2 receptors, in addition to influencing pathways related to the release of inflammatory cytokines and nociceptive transmission (MLOST et al., 2020; PISANTI et al., 2017; SERMET et al., 2021). These effects make CBD a potential therapeutic agent in the management of chronic painful conditions, including those of musculoskeletal origin.

In the field of orofacial pain, recent reviews indicate that cannabinoids, including cannabidiol, may contribute to the reduction of pain and muscle activity in different clinical conditions, although the evidence is still heterogeneous (GROSSMAN et al., 2021; DAVID et al., 2022). Experimental studies also demonstrate that CBD has an analgesic effect in myofascial pain models, reinforcing its biological plausibility in the context of TMD (WONG; CAIRNS, 2019). However, the transposition of these findings into clinical practice still depends on more robust evidence.

Despite the therapeutic potential observed, the scientific literature shows a significant limitation regarding the availability of clinical studies directed at the use of cannabidiol (CBD) in patients with temporomandibular disorder. To date, only two randomized controlled trials have been identified that have directly investigated this application (NITECKA-BUCHTA et

al., 2019; WALCZYŃSKA-DRAGON et al., 2024), which demonstrated a significant reduction in pain and muscle activity in patients with TMD of muscular origin. However, the scarcity of studies and the associated methodological limitations prevent the consolidation of robust clinical evidence. In this context, considering the limitations of conventional treatments and the need for new therapeutic approaches, the present study aims to critically analyze the use of cannabidiol in the management of pain associated with temporomandibular disorder, based on the available scientific evidence.

2 METHODOLOGY

The present study is characterized as a narrative literature review, with a qualitative approach, whose objective was to critically analyze the available scientific evidence on the use of cannabidiol in the management of pain associated with temporomandibular disorder.

The bibliographic search was carried out between January and March 2026, in the PubMed, SciELO, and ScienceDirect databases, including publications in the period from 2015 to 2025. Controlled descriptors and free terms in English and Portuguese were used, based on the MeSH (Medical Subject Headings) and DeCS (Health Sciences Descriptors) vocabularies, including: "cannabidiol", "CBD", "temporomandibular disorders", "TMD", "pain", "orofacial pain" and "myofascial pain". The terms were combined using Boolean operators, using the following search strategy: ("cannabidiol" OR "CBD") AND ("temporomandibular disorders" OR "TMD") AND ("pain" OR "orofacial pain" OR "myofascial pain").

The selection of studies was carried out in stages. Initially, the screening was carried out by reading the titles and abstracts. Subsequently, the potentially eligible studies were submitted to reading in full, being evaluated according to the previously established inclusion and exclusion criteria. At the end of the selection process, 21 articles were included to compose the final sample of the review.

The following inclusion criteria were adopted: complete scientific articles, published between 2015 and 2025, available in indexed databases, written in English or Portuguese, and that directly or indirectly addressed the use of cannabidiol in the context of orofacial pain, myofascial pain or temporomandibular disorder, without restriction on the methodological design, as long as they are relevant to the objective of the study. Duplicate studies, articles outside the established period, studies with themes unrelated to the research objective, as well as studies with an exclusively analytical, methodological or non-clinically relevant focus were excluded.

The included studies included different methodological designs, such as randomized clinical trials, systematic and narrative reviews, as well as experimental studies, allowing

critical and comparative analysis of the available evidence. Data analysis was performed in a descriptive and interpretative manner, considering the methodological design, robustness, and level of evidence of each study. Information such as author, year of publication, type of study, objective, main findings and contributions to the theme were extracted. The findings were organized into previously defined thematic categories, including: pathophysiology of temporomandibular disorder, mechanisms of action of cannabidiol, and clinical and preclinical evidence in pain management.

A narrative review was chosen due to the heterogeneity of the available studies, which present different methodological designs, populations, and interventions, making it difficult to apply systematic methods of synthesis.

As this is a literature review based on secondary data in the public domain, there was no need to submit it to the Research Ethics Committee, in accordance with the current ethical guidelines. It should be noted that all the information used was properly referenced, ensuring the scientific integrity and traceability of the sources.

As a limitation, it is noteworthy that, as it is a narrative review, the study is subject to bias in the selection and interpretation of data, not presenting the rigorous methodological systematization characteristic of systematic reviews. In addition, the heterogeneity of the designs of the included studies may limit the direct comparison between the findings. Even so, we sought to ensure the quality of the analysis through the careful selection of relevant, current, and methodologically consistent studies.

3 RESULTS

The synthesis of the studies included in this review is presented in Table 1, which brings together the main methodological characteristics and relevant findings of the selected studies. A total of 21 studies were analyzed, covering different designs, including randomized clinical trials, systematic and narrative reviews, as well as in vivo and in vitro experimental studies.

There is a predominance of indirect evidence in the literature, mainly from reviews and experimental studies, with a limited number of direct clinical evidence specifically focused on temporomandibular disorder. The analyzed data allow a comparative evaluation of the methodological designs, the populations investigated and the main findings related to the use of cannabidiol in pain management, evidencing both its therapeutic potential and the current limitations of the scientific literature.

Table 1

Summary of included studies on the use of cannabidiol in the management of pain associated with temporomandibular disorder

Article Title	Author/Year	Method (Study Design)	Sample/Model	Main results
Myorelaxant Effect of Transdermal Cannabidiol Application in Patients with TMD	Nitecka-Buchta et al., 2019	Randomized, double-blind, placebo-controlled clinical trial	TMD Patients	Significant reduction in pain and muscle activity
Cannabidiol Intervention for Muscular Tension, Pain, and Sleep Bruxism Intensity	Walczyńska-Dragoń et al., 2024	Randomized, double-blind, placebo-controlled clinical trial	Patients with TMD and bruxism	Significant reduction in pain, electromyographic activity, and bruxism
Cannabidiol, Cannabinol and Their Combinations Act as Peripheral Analgesics	Wong & Cairns, 2019	In vivo experimental study	Animal model of myofascial pain	Peripheral analgesic effect
Cannabidiol has therapeutic potential for myofascial pain	Vivanco-Estela et al., 2021	In vivo experimental study	Animal model of myofascial pain	Reduced pain and inflammation
Cannabis and orofacial pain: A systematic review	Grossman et al., 2021	Systematic review	Clinical Studies in Orofacial Pain	Pain reduction with high heterogeneity
Cannabidiol in Dentistry: A Scoping Review	David et al., 2022	Scoping Review	Dental studies	Indicates therapeutic potential with limitations
Cannabidiol for Pain Treatment: Focus on Pharmacology	Mlost et al., 2020	Narrative review	Preclinical studies	Analgesic and anti-inflammatory action
Cannabidiol: State of the art and new challenges	Pisanti et al., 2017	Narrative review	Experimental and clinical studies	Modulation of the endocannabinoid system
Cannabidiol selectively modulates IL-1 β and IL-6	Sermet et al., 2021	In vitro experimental study	Human cells	Reduction of pro-inflammatory cytokines
Temporomandibular Myofascial Pain Syndrome	Golanska et al., 2021	Narrative review	DTM	Influence of biopsychosocial factors
Therapeutic Agents for Temporomandibular Disorders	Wu et al., 2021	Narrative review	DTM	Diversity of therapeutic approaches
Biomarkers for Temporomandibular Disorders	Zwiri et al., 2020	Narrative review	Biomarkers in TMD	Role of inflammatory cytokines
Chemokine Regulation in Temporomandibular Joint Disease	Qiao et al., 2023	Narrative review	DTM	Role of chemokines in inflammation
Cannabinoid delivery systems for pain and inflammation	Bruni et al., 2018	Narrative review	Pharmacological delivery systems	Influence of route of administration

Molecular and Cellular Mechanisms of Action of Cannabidiol	Martinez Naya et al., 2023	Narrative review	Molecular studies	Cellular modulation of cannabidiol
Effects of endocannabinoids and opioids on orofacial pain	Zubrzycki et al., 2017	In vivo experimental study	Orofacial pain animal model	Orofacial pain modulation
Effectiveness of cannabinoids in neuropathic pain	Boychuk et al., 2015	Systematic review	Clinical studies	Reduction of chronic pain
Patterns of medicinal cannabis use in chronic pain	Baron et al., 2018	Observational study	Patients with chronic pain	Reduction of pain self-reported by patients
Efficacy of topical interventions for TMD	Mena et al., 2020	Systematic review with meta-analysis	Topical interventions in TMD	Limited evidence for CBD
Cannabinoids and Orofacial Pain Management	Weerathataphan et al., 2021	Narrative review	Orofacial pain	Indicates therapeutic potential of cannabinoids
Cannabidiol (CBD) and its analogs: effects on inflammation	Burstein, 2015	Narrative review	Inflammatory processes	Anti-inflammatory effect

4 DISCUSSION

The results of this review show that the use of cannabidiol (CBD) in the management of pain associated with temporomandibular disorder (TMD) has relevant therapeutic potential, but supported predominantly by indirect evidence. The analysis of the included studies demonstrates that most of the available research consists of reviews and experimental studies, with a limited number of randomized controlled trials specifically targeting TMD, which imposes restrictions on the consolidation of clinical recommendations based on robust evidence.

From a clinical standpoint, only two identified studies have directly evaluated the use of CBD in TMD patients. The clinical trial conducted by Nitecka-Buchta et al. (2019) demonstrated a significant reduction in pain and muscle activity after transdermal application of cannabidiol, while Walczyńska-Dragoń et al. (2024) observed a significant reduction in pain, electromyographic activity of masticatory muscles, and the sleep bruxism index with the use of CBD-containing formulations. These findings suggest initial clinical efficacy, especially in cases of TMD of muscular origin, but still insufficient to establish consolidated therapeutic recommendations, considering the scarcity of studies and sample limitations.

The predominance of indirect evidence in the literature reinforces the need for cautious interpretation of the findings. Systematic and narrative reviews, including meta-analysis, indicate that cannabinoids, including cannabidiol, have potential to reduce orofacial and

chronic pain, although with high methodological heterogeneity (GROSSMAN et al., 2021; DAVID et al., 2022; BOYCHUK et al., 2015; MENA et al., 2020; WEERATHATAPHAN et al., 2021). In addition, observational studies suggest pain improvement in patients who use medical cannabis, although without strict control of variables and at risk of bias (BARON et al., 2018). Thus, although the findings are promising, they do not replace controlled and standardized clinical evidence.

Regarding biological plausibility, experimental studies present consistent results and contribute significantly to the understanding of CBD's mechanisms of action. Evidence indicates that cannabidiol exerts a peripheral analgesic effect in myofascial pain models (WONG; CAIRNS, 2019), in addition to reducing pain and inflammation under experimental conditions (VIVANCO-ESTELA et al., 2021; ZUBRZYCKI et al., 2017). Additionally, in vitro studies demonstrate that CBD modulates the production of inflammatory cytokines, such as IL-1 β and IL-6 (SERMET et al., 2021), corroborating its anti-inflammatory action. However, it is observed that, although preclinical studies present consistent results, these findings have not yet been fully confirmed in human clinical studies.

These mechanisms are supported by reviews describing CBD's role in the endocannabinoid system and in pathways related to nociception and inflammation (MLOST et al., 2020; PISANTI et al., 2017; MARTINEZ NAYA et al., 2023; BURSTEIN, 2015). The modulation of inflammatory receptors and mediators suggests that cannabidiol can act on both the peripheral and central phases of pain, which is particularly relevant in conditions such as TMD, characterized by peripheral and central sensitization.

The pathophysiology of TMD also contributes to the interpretation of the observed effects. Studies indicate that pain in this condition is associated with inflammatory processes, with the participation of cytokines and chemokines (ZWIRI et al., 2020; QIAO et al., 2023), as well as biopsychosocial factors that influence pain perception (GOLANSKA et al., 2021). The diversity of therapeutic approaches described in the literature (WU et al., 2021) reinforces the complexity of TMD and the need for multimodal therapeutic strategies.

Another relevant aspect concerns the forms of administration of cannabidiol, since different delivery systems can influence its therapeutic efficacy (BRUNI et al., 2018). In this context, topical and transdermal routes have potential clinical applicability in dentistry, especially in the management of orofacial pain, although they still lack standardization regarding dosage and form of use.

In this sense, there is a mismatch between the robustness of the preclinical findings and the limited clinical evidence available, which reinforces the need for caution in the interpretation of the results and in the clinical application of cannabidiol in the context of TMD.

Despite the advances observed, this review highlights important limitations in the current literature. The heterogeneity of the designs, the predominance of experimental studies, and the scarcity of randomized clinical trials specific to TMD limit the robustness of the conclusions. In addition, the lack of standardization regarding doses, routes of administration, and duration of treatment makes it difficult to compare studies and define clinical protocols.

Thus, although cannabidiol presents itself as a promising alternative in the management of pain associated with temporomandibular disorder, especially in cases of muscular origin, additional clinical studies are needed, with greater methodological rigor, representative samples, and standardization of protocols, to establish its efficacy, safety, and clinical applicability consistently. In this context, the available data support biological plausibility and indicate initial clinical benefits; However, the current evidence base is still insufficient to support robust clinical recommendations.

5 CONCLUSION

The present study showed that cannabidiol (CBD) has relevant therapeutic potential in the management of pain associated with temporomandibular disorder, especially in conditions of muscular origin. The findings indicate that CBD has analgesic and anti-inflammatory properties, supported by consistent experimental evidence and biological mechanisms related to the modulation of the endocannabinoid system and the regulation of inflammatory mediators.

However, the critical analysis of the literature demonstrates that direct clinical evidence is still limited, being based on a small number of randomized controlled trials. Thus, despite the promising results, it is not possible, at the moment, to establish definitive clinical recommendations regarding the use of cannabidiol in the treatment of temporomandibular disorder.

In addition, significant heterogeneity was observed among the studies, especially in relation to doses, routes of administration, and methodological designs, which makes it difficult to standardize therapeutic protocols and compare findings.

In view of this, it is concluded that cannabidiol represents a promising therapeutic alternative, but still in the phase of scientific consolidation. The need for additional clinical studies with greater methodological rigor, representative samples, and standardization of interventions is emphasized, in order to establish their efficacy, safety, and clinical applicability in the context of temporomandibular disorders.

ABSTRACT

Paroxysmal supraventricular tachycardia (PSVT) is one of the most common arrhythmias in clinical practice, characterized by sudden episodes of supraventricular tachycardia. The management of this condition in hemodynamically stable patients is initially based on the use of vagal maneuvers, followed by adenosine administration in cases of failure. This study aimed to compare the effectiveness, safety, and clinical applicability of vagal maneuvers and adenosine in the treatment of PSVT through an integrative literature review. The search was conducted in the PubMed/MEDLINE, SciELO, and ScienceDirect databases, considering studies published between 2015 and 2025, using controlled descriptors and free terms in combination. Randomized clinical trials, systematic reviews, meta-analyses, and clinical guidelines addressing the management of PSVT were included. The results demonstrated that vagal maneuvers present variable efficacy, generally with success rates below 50%, whereas adenosine showed reversal rates above 80–90%. The modified Valsalva maneuver showed higher effectiveness compared to the standard technique, although still inferior to adenosine. It is concluded that, although vagal maneuvers are recommended as first-line therapy due to their safety and ease of application, adenosine stands out as the most effective strategy for restoring sinus rhythm and should be used after the failure of non-pharmacological interventions.

RESUMO

A taquicardia supraventricular paroxística (TSVP) é uma das arritmias mais frequentes na prática clínica, caracterizada por episódios súbitos de taquicardia de origem supraventricular. O manejo dessa condição em pacientes hemodinamicamente estáveis baseia-se, inicialmente, na realização de manobras vagais, seguidas do uso de adenosina nos casos de insucesso. Este estudo teve como objetivo comparar a eficácia, segurança e aplicabilidade clínica das manobras vagais e da adenosina no tratamento da TSVP, por meio de uma revisão integrativa da literatura. A busca foi realizada nas bases de dados PubMed/MEDLINE, SciELO e ScienceDirect, considerando estudos publicados entre 2015 e 2025, com utilização de descritores controlados e termos livres combinados. Foram incluídos ensaios clínicos randomizados, revisões sistemáticas, metanálises e diretrizes clínicas que abordassem diretamente o manejo da TSVP. Os resultados evidenciaram que as manobras vagais apresentam eficácia variável, com taxas de sucesso geralmente inferiores a 50%, enquanto a adenosina demonstrou taxas de reversão superiores a 80–90%. A manobra de Valsalva modificada apresentou maior eficácia em relação à técnica padrão, embora ainda inferior à adenosina. Conclui-se que, apesar das manobras vagais serem recomendadas como primeira linha devido à sua segurança e facilidade de aplicação, a adenosina se destaca como a estratégia mais eficaz na reversão do ritmo sinusal, sendo fundamental sua utilização após falha das intervenções não farmacológicas.

RESUMEN

La taquicardia supraventricular paroxística (TSVP) es una de las arritmias más frecuentes en la práctica clínica, caracterizada por episodios súbitos de taquicardia de origen supraventricular. El tratamiento de esta afección en pacientes hemodinámicamente estables se basa inicialmente en maniobras vagales, seguidas del uso de adenosina en caso de fracaso. Este estudio tuvo como objetivo comparar la eficacia, seguridad y aplicabilidad clínica de las maniobras vagales y la adenosina en el tratamiento de la TSVP mediante una revisión integradora de la literatura. La búsqueda se realizó en las bases de datos PubMed/MEDLINE, SciELO y ScienceDirect, considerando estudios publicados entre 2015 y 2025, utilizando descriptores controlados y términos libres combinados. Se incluyeron ensayos clínicos aleatorizados, revisiones sistemáticas, metaanálisis y guías clínicas que abordaran directamente el tratamiento de la TSVP. Los resultados mostraron que las maniobras vagales tienen una eficacia variable, con tasas de éxito generalmente inferiores al 50%, mientras que la adenosina demostró tasas de reversión superiores al 80-90%. La maniobra de Valsalva modificada mostró mayor eficacia que la técnica estándar, aunque inferior a la adenosina. Se concluye que, si bien las maniobras vagales se recomiendan como tratamiento de primera línea por su seguridad y facilidad de aplicación, la adenosina se destaca como la estrategia más eficaz para revertir el ritmo sinusal, y su uso es fundamental tras el fracaso de las intervenciones no farmacológicas.

1 INTRODUCTION

Paroxysmal supraventricular tachycardia (PVST) is one of the most frequent arrhythmias in clinical practice, and is characterized by sudden episodes of tachycardia of supraventricular origin, usually with narrow QRS complexes and abrupt onset and termination. This condition can affect individuals of different age groups, presenting clinical manifestations such as palpitations, dyspnea, dizziness, and, in more severe cases, hemodynamic instability (BRUGADA et al., 2019; PAGE et al., 2016). Due to its high incidence in emergency services, PVRT represents an important diagnostic and therapeutic challenge, requiring rapid and effective interventions.

The management of PVRT depends mainly on the hemodynamic stability of the patient, and in stable individuals, international guidelines initially recommend the use of vagal maneuvers as a first-line therapeutic strategy (BRUGADA et al., 2019; LATIŞ et al., 2023). These maneuvers act by increasing parasympathetic tone, promoting the reduction of atrioventricular nodal conduction and enabling the reversal of sinus rhythm. Among the most used techniques are the Valsalva maneuver and carotid sinus massage, which have advantages such as low cost, easy execution, and reduced risk of adverse events.

However, despite their safety and broad recommendation, the efficacy of vagal maneuvers is variable, with success rates ranging from 19% to 54%, often lower in real clinical scenarios (APPELBOAM et al., 2015; LATIŞ et al., 2023). In this context, modifications to the traditional technique, such as the modified Valsalva maneuver, have been proposed with the aim of increasing the rate of rhythm reversal, presenting significantly superior results compared to the standard technique (HUANG et al., 2022; ABDULHAMID et al., 2021).

When vagal maneuvers are not effective, intravenous adenosine is recommended as the pharmacological therapy of choice, due to its high success rate and rapid action in blocking atrioventricular conduction. Clinical studies show that adenosine has reversal rates greater than 80–90%, and is considered safe, despite being associated with transient adverse effects, such as flushing, dyspnea, and feelings of chest discomfort (ALABED et al., 2017; BICILIOĞLU et al., 2020). Thus, adenosine is consolidated as the main pharmacological therapeutic resource in the management of PVRT.

In view of this scenario, it is essential to analyze the comparative effectiveness between vagal maneuvers and adenosine in the treatment of PVT, considering aspects such as efficacy, safety, and clinical applicability. Recent studies indicate that, although vagal maneuvers are recommended as an initial approach, adenosine has a higher success rate in reversing sinus rhythm, and is often necessary after failure of non-pharmacological interventions (XIAO et al., 2024; HUANG et al., 2022). Thus, this integrative review aims to

critically analyze the evidence available in the literature about these two therapeutic strategies, contributing to the improvement of evidence-based clinical decision-making.

2 METHODOLOGY

The present study is characterized as an integrative literature review, with a qualitative and descriptive approach, with the objective of gathering, analyzing and synthesizing scientific evidence regarding the comparison between vagal maneuvers and the use of adenosine in the treatment of paroxysmal supraventricular tachycardia (PSRT).

The identification of studies was carried out in recognized databases in the health area, including PubMed/MEDLINE, SciELO and ScienceDirect, including studies published in the last ten years (2015–2025). Descriptors in English and Portuguese related to the theme were used, such as: "supraventricular tachycardia", "vagal maneuvers", "Valsalva maneuver", "adenosine" and "paroxysmal supraventricular tachycardia", as well as their counterparts in Portuguese, used in combination to identify relevant studies.

The following inclusion criteria were adopted: original articles, randomized clinical trials, systematic reviews, meta-analyses, and clinical guidelines that directly addressed the management of PVRT with vagal and/or adenosine maneuvers; studies published in the delimited period; and articles available in full. Exclusion criteria included duplicate studies, isolated case reports, and articles with non-representative samples, or articles that were not directly related to the research objective.

The selection of studies was carried out intentionally and non-probabilistically, prioritizing evidence with a higher methodological level and scientific relevance to the proposed theme. Studies considered classic and international guidelines were included, due to their importance in consolidating current clinical recommendations.

After selection, the studies were read in full and the relevant data were extracted and organized for comparative analysis. The data analysis was conducted critically, allowing the identification of the main evidence related to the efficacy, safety, and applicability of vagal maneuvers in comparison with adenosine in the context of PVRT.

Finally, the selected studies were organized, analyzed, and synthesized in a descriptive manner, enabling the construction of a comprehensive and grounded view on the subject, contributing to evidence-based clinical practice.

3 RESULTS

The selected studies were analyzed for the efficacy, safety, and applicability of vagal maneuvers and adenosine in the management of paroxysmal supraventricular tachycardia (PVRT). Randomized clinical trials, systematic reviews, meta-analyses, and clinical guidelines were included, which showed relevant differences between therapeutic strategies.

Vagal maneuvers have been consistently described as the first therapeutic approach in hemodynamically stable patients, as recommended by international guidelines (BRUGADA et al., 2019; PAGE et al., 2016). However, its efficacy was variable among the studies analyzed, with sinus rhythm reversal rates generally lower than 50% (APPELBOAM et al., 2015; IMMANUEL et al., 2025). In addition, evidence shows that the effectiveness of vagal maneuvers may be even lower in everyday clinical practice, reinforcing their limitations as an isolated strategy (LATIŞ et al., 2023).

The REVERT study demonstrated a success rate of 17% with the standard Valsalva maneuver, compared to 43% with the modified Valsalva (APPELBOAM et al., 2015). Similarly, recent meta-analyses have indicated that modified Valsalva is more effective compared to the traditional technique, and can significantly increase the rate of cardioversion and reduce the need for pharmacological interventions (HUANG et al., 2022; ABDULHAMID et al., 2021). Additional studies reinforce that this technique has better performance among the available vagal maneuvers, maintaining a similar safety profile (IMMANUEL et al., 2025).

With regard to adenosine, the studies analyzed demonstrated high efficacy in reversing PVRT, with success rates ranging from 80% to 95% (ALABED et al., 2017; BICILIOĞLU et al., 2020). In a clinical study, a positive response was observed in approximately 95.8% of patients treated with adenosine, while about 38% responded to vagal maneuvers (BICILIOĞLU et al., 2020). Additional clinical trials have demonstrated success rates of over 90%, reinforcing the high effectiveness of this pharmacological intervention (KOTRUCHIN et al., 2022).

Direct comparative studies reinforce the superiority of adenosine over vagal maneuvers. In a recent study, the success rate was 42.11% for the modified Valsalva maneuver, 75% for adenosine, and 86.11% for combination therapy (XIAO et al., 2024). Although the combination of strategies showed a higher reversal rate, there was no statistically significant difference in relation to the use of adenosine alone, indicating that it remains the most effective intervention in clinical practice.

In addition, studies comparing different vagal techniques have shown that the modified Valsalva maneuver is superior to standard Valsalva and carotid sinus massage, with a higher success rate and less need for medication (HUANG et al., 2022; IMMANUEL et al., 2025).

Other techniques, such as deep breathing in a declined position, showed similar efficacy, but without superiority over modified Valsalva (LIM et al., 2021).

In general, the results show that, although vagal maneuvers are recommended as the first line due to their safety and ease of application, their efficacy is limited. Adenosine, in turn, has a higher success rate in reversing sinus rhythm, consolidating itself as the most effective pharmacological treatment after failure of vagal maneuvers (ALABED et al., 2017; PAGE et al., 2016).

Table 1

Synthesis of the studies included in the integrative review on vagal maneuvers and adenosine in paroxysmal supraventricular tachycardia (PVRT)

Author/Year	Type of study	Sample	Intervention	Main results	Conclusion
BRUGADA et al. (2019)	Clinical guideline (ESC)	—	Management of PVT	Recommends vagal maneuvers such as first line and adenosine after failure	International standard of management
PAGE et al. (2016)	Clinical Guideline (AHA)	—	Management of PVT	Vagal maneuvers as an initial approach; adenosine as primary pharmacologic therapy	Basis of clinical management
APPELBOAM et al. (2015)	Randomized controlled trial	n = 433	Standard versus modified Valsalva	17% versus 43% (p < 0.001)	Most effective modified Valsalva
HUANG et al. (2022)	Meta-analysis	19 studies	Vagal maneuvers	Upper modified Valsalva (RR up to 5.47)	Best vagal technique
ABDULHAMID et al. (2021)	Systematic review	4 RCTs	Modified versus standard Valsalva	2.5 times more effective	Reduces adenosine use
IMMANUEL et al. (2025)	Network Analysis	n = 2545	Vagal techniques	Higher success rate	Best non-pharmacological strategy
LATIŞ et al. (2023)	Narrative review	—	Vagal maneuvers	Efficacy 19%–54%	Clinical limitations
LIM et al. (2021)	Randomized controlled trial	n = 41	Deep Breathing vs Modified Valsalva	31.6% vs 36.8%	No superiority
SMITH et al. (2015)	Cochrane review	n = 316	Vagal maneuvers	~19% Successful	Limited evidence
ALABED et al. (2017)	Cochrane review	n = 622	Adenosine vs BCC	~90% Successful	Standard therapy
BICILIOĞLU et al. (2020)	Clinical study	n = 30	Adenosine vs vagal	95.8% vs 38%	Adenosine Superior
KOTRUCHIN et al. (2022)	Clinical trial	—	Administration of adenosine	93–100%	High efficacy
DAENGBUBPHA et al. (2022)	Clinical trial	—	Adenosine Techniques	80–86,7%	Effective

ZOU et al. (2025)	Observational	—	Use of adenosine	80–90%	Underutilization
XIAO et al. (2024)	Comparison	—	Valsalva versus adenosine versus combination	42% vs 75% vs 86%	Adenosine Superior
BRADY et al. (1996)	Clinical study	—	Vagal maneuvers versus adenosine	7–11% vs 69%	Adenosine Superior
PAN et al. (2024)	Clinical study	n = 15	Management of PVRT in pregnant women	Low response to vagal maneuvers	Need for pharmacologic therapy
LU et al. (2024)	Meta-analysis	n = 2527	Modified Valsalva	RR 1.8–2.0	High efficacy
LODEWYCKX; BERGS (2021)	Meta-analysis	—	Modified Valsalva	Higher success rate over standard technique	Confirms superiority

4 DISCUSSION

The findings of this integrative review show that, although vagal maneuvers are widely recommended as the first line in the management of paroxysmal supraventricular tachycardia (PVRT), their clinical effectiveness has important limitations when compared to adenosine. International guidelines consistently establish the initial use of these maneuvers in hemodynamically stable patients, mainly due to their safety profile, low cost, and easy applicability (BRUGADA et al., 2019; PAGE et al., 2016). However, the literature shows that this recommendation is more related to the safety of the method than to its therapeutic effectiveness, especially in real clinical scenarios (LATIŞ et al., 2023; SMITH et al., 2015).

The variability in the response to vagal maneuvers is one of the main points of discussion. Clinical studies and systematic reviews have shown relatively low success rates, often below 50%, and can reach even lower values in daily clinical practice (APPELBOAM et al., 2015; LATIŞ et al., 2023; SMITH et al., 2015). In this context, the introduction of the modified Valsalva maneuver represents a relevant advance, since studies such as REVERT have shown a significant increase in sinus rhythm reversal rates when compared to the traditional technique (APPELBOAM et al., 2015). Recent meta-analyses corroborate these findings, indicating that modified Valsalva is significantly more effective than other vagal maneuvers, in addition to reducing the need for pharmacological interventions (HUANG et al., 2022; ABDULHAMID et al., 2021; LU et al., 2024; IMMANUEL et al., 2025).

Despite these advances, the performance of vagal maneuvers remains inferior to that of adenosine. Comparative studies show that even with the use of modified Valsalva, success rates do not reach the levels observed with pharmacological therapies (XIAO et al., 2024). In

addition, other vagal techniques, such as deep breathing in a declined position, did not show significant superiority, reinforcing the global limitation of these strategies (LIM et al., 2021). Thus, although vagal maneuvers are useful as an initial approach, their effectiveness alone is restricted.

On the other hand, adenosine demonstrated consistently high efficacy among the different types of studies analyzed. Clinical trials, systematic reviews, and meta-analyses indicate reversal rates above 80–90%, and can reach values close to 100% in certain clinical contexts (ALABED et al., 2017; BICILIOĞLU et al., 2020; KOTRUCHIN et al., 2022; DAENGBUBPHA et al., 2022; ZOU et al., 2025). These findings are reinforced by clinical studies that demonstrate clear superiority of adenosine over vagal maneuvers, with significant differences in therapeutic success rates (BICILIOĞLU et al., 2020; BRADY et al., 1996).

Direct comparison between therapeutic strategies confirms this superiority. Recent studies have shown that adenosine has significantly higher rates of sinus rhythm reversal when compared to vagal maneuvers, even when the latter are performed in an optimized way (XIAO et al., 2024). Although the combination of vagal maneuvers and adenosine has demonstrated even higher success rates, there is no consistent evidence of statistically significant superiority over the use of adenosine alone, which reinforces its role as the main therapeutic intervention after failure of non-pharmacological strategies.

Another relevant aspect refers to the clinical applicability of the interventions. Vagal maneuvers have clear advantages, such as lack of costs, easy execution, and low risk of complications, being particularly useful in environments with limited resources (BRUGADA et al., 2019; PAGE et al., 2016). However, their reduced clinical performance may result in delayed sinus rhythm reversal, prolonging symptoms and potentially impacting the patient's prognosis. On the other hand, adenosine, despite its high efficacy, can cause transient adverse effects, such as feelings of imminent death, dyspnea, and chest discomfort, in addition to requiring monitoring during its administration (ALABED et al., 2017; ZOU et al., 2025). Still, such effects are generally self-limiting, not compromising its overall security profile.

Thus, the findings of this review indicate that vagal maneuvers should be maintained as the initial approach in the management of PVT, as recommended by international guidelines, especially due to their safety and ease of application. However, its limited effectiveness reinforces the need for rapid progression to pharmacological therapy in cases of failure. Adenosine, in turn, has consistent superiority in terms of efficacy, consolidating itself as the treatment of choice in clinical practice. The modified Valsalva maneuver

represents a relevant advance in the context of non-pharmacological interventions; however, it has not yet been shown to be effective enough to replace adenosine in reversing sinus rhythm.

5 CONCLUSION

The present integrative review showed that vagal maneuvers, although recommended as the first line in the management of paroxysmal supraventricular tachycardia (PSRT) due to their safety, low cost, and easy applicability, have limited efficacy in reversing sinus rhythm. The introduction of the modified Valsalva maneuver represents a relevant advance, with a significant increase in success rates, but still lower than that observed with pharmacological interventions.

Adenosine has demonstrated high efficacy and rapid action, consolidating itself as the main therapeutic strategy after failure of vagal maneuvers, with consistently higher reversal rates and an adequate safety profile. The comparison between the approaches confirms the superiority of adenosine, although vagal maneuvers maintain an important role as an initial intervention.

Thus, it is concluded that the management of PVRT should follow a staggered approach, starting with vagal maneuvers, preferably modified Valsalva, and progressing to the use of adenosine in cases of failure. The integration of these strategies contributes to treatment optimization and evidence-based clinical practice.

ABSTRACT

Introduction: Treatment-resistant depression (TRD) represents a significant clinical challenge, particularly when associated with suicidal ideation. Intranasal esketamine has emerged as an effective therapeutic option in refractory cases, while monoamine oxidase inhibitors (MAOIs) remain relevant in the management of severe and resistant conditions.

Objective: To describe the clinical course of a patient with TRD treated with the combination of intranasal esketamine and tranylcypromine.

Method: Case report of a 27-year-old female patient diagnosed with recurrent depressive disorder and a history of therapeutic failure to multiple classes of antidepressants, mood stabilizers, and antipsychotics, followed through clinical evaluation and standardized rating scales (HAM-A and MADRS).

Results: After initiation of the combined treatment, a rapid and sustained clinical improvement was observed, with significant reduction of depressive and anxiety symptoms, as well as remission of suicidal ideation. The treatment was well tolerated, with no relevant adverse events.

Conclusion: The association of intranasal esketamine and a MAOI proved to be effective and safe in this case of TRD, suggesting that it may represent a viable therapeutic alternative in selected situations, provided that strict clinical monitoring is ensured.

RESUMO

Introdução: O transtorno depressivo resistente ao tratamento (TDR) representa um desafio clínico significativo, especialmente quando associado à ideação suicida. A escetamina intranasal tem emergido como uma opção terapêutica eficaz em casos refratários, enquanto os inibidores da monoaminooxidase (IMAO) permanecem relevantes no manejo de quadros graves e resistentes.

Objetivo: Descrever a evolução clínica de uma paciente com TDR submetida à associação de escetamina intranasal e tranilcipromina.

Método: Relato de caso de paciente do sexo feminino, 27 anos, com diagnóstico de transtorno depressivo recorrente e histórico de falha terapêutica a múltiplas classes de antidepressivos, estabilizadores de humor e antipsicóticos, acompanhada por avaliação clínica e escalas padronizadas (HAM-A e MADRS).

Resultados: Após a introdução do tratamento combinado, observou-se melhora clínica rápida e sustentada, com redução significativa dos sintomas depressivos e ansiosos, além de remissão da ideação suicida. O tratamento foi bem tolerado, sem ocorrência de eventos adversos relevantes.

Conclusão: A associação de escetamina intranasal e IMAO mostrou-se eficaz e segura neste caso de TDR, sugerindo ser uma alternativa terapêutica viável em situações selecionadas, desde que realizada sob monitoramento clínico rigoroso.

Palavras-chave: Depressão Resistente ao Tratamento. Escetamina. Inibidores da Monoaminooxidase.

RESUMEN

Introducción: La depresión resistente al tratamiento (TDR) representa un desafío clínico significativo, especialmente cuando se asocia con ideación suicida. La escetamina intranasal ha surgido como una opción terapéutica eficaz en casos refractarios, mientras que los inhibidores de la monoaminooxidasa (IMAO) siguen siendo relevantes en el manejo de cuadros graves y resistentes.

Objetivo: Describir la evolución clínica de una paciente con TDR sometida a la asociación de escetamina intranasal y tranilcipromina.

Método: Reporte de caso de una paciente de sexo femenino, de 27 años, con diagnóstico de trastorno depresivo recorrente y antecedentes de fracaso terapéutico a múltiples clases de antidepressivos, estabilizadores del estado de ánimo y antipsicóticos, acompañada mediante evaluación clínica y escalas estandarizadas (HAM-A y MADRS).

Resultados: Tras la introducción del tratamiento combinado, se observó una mejoría clínica rápida y sostenida, con reducción significativa de los síntomas depresivos y ansiosos, además de remisión de la ideación suicida. El tratamiento fue bien tolerado, sin eventos adversos relevantes.

Conclusión: La asociación de escetamina intranasal e IMAO resultó eficaz y segura en este caso de TDR, lo que sugiere que puede constituir una alternativa terapéutica viable en situaciones seleccionadas, siempre que se realice bajo un monitoreo clínico riguroso.

Palabras clave: Depresión Resistente al Tratamiento. Escetamina. Inhibidores de la Monoaminooxidasa.

1 INTRODUCTION

Major depressive disorder (MDD) is a psychiatric condition defined by the presence of at least five symptoms over a period of at least two weeks, and the presence of depressed mood and/or loss of interest or pleasure (anhedonia) is mandatory, according to the diagnostic criteria established by the Diagnostic and Statistical Manual of Mental Disorders, fifth edition (DSM-5). These additional symptoms may include changes in appetite or weight, sleep disturbances, fatigue, feelings of worthlessness or excessive guilt, difficulty concentrating, and recurring thoughts of death or suicide. A precise understanding of these criteria is essential, especially when considering emerging therapeutic interventions, such as intranasal esketamine, which has an approved indication for cases of MDD with acute suicidal ideation, reinforcing the need for careful and individualized clinical evaluation in these contexts ¹.

This disorder significantly impacts the quality of life and daily functioning of individuals, in addition to being associated with a high mortality rate. It is estimated that between 10% and 20% of patients with MDD attempt suicide in their lifetime, and life expectancy can be reduced by up to 10 years. Despite the widespread availability of antidepressant treatments, therapeutic response is still a challenge: only one-third of patients achieve remission with first-line treatment, while another third develop treatment-resistant depression (RDT) ².

Treatment-resistant depression (RDT) represents a major challenge in clinical practice, especially when accompanied by suicidal ideation. In this context, intranasal esketamine, ketamine's S-enantiomer, an N-methyl-D-aspartate (NMDA) receptor antagonist, has stood out as a promising therapeutic option, especially when used in association with conventional antidepressants ^{3,4}. Its mechanism of action involves modulating glutamate neurotransmission, promoting increased neurotrophic factor release and stimulating synaptogenesis. Unlike antidepressants that act on the monoaminergic system, esketamine exerts its antidepressant effect through a distinct primary pathway, which contributes to its relevance in the management of RDT ^{5,6}.

Monoamine oxidase inhibitors (MAOIs), irreversible and non-selective drugs, were the first to be used in the treatment of depression, preceding the discovery of tricyclic antidepressants in the 1950s and the emergence of other therapeutic classes in the following decades. Initially, MAOIs were the main option for patients with atypical depression, characterized by symptoms such as phobic anxiety, hyperphagia, hypersomnia, and mood reactivity. However, despite studies suggesting similar efficacy among different classes of antidepressants in the treatment of major depressive disorder, the use of MAOIs has become less frequent due to dietary restrictions and drug interactions associated with their use,

impacting their acceptability and tolerability. Currently, these drugs are generally indicated for cases of treatment-resistant depression ^{7,8}.

We report the case of a patient with severe RDT who showed significant improvement after the introduction of intranasal esketamine combined with tranylcypromine, a monoamine oxidase inhibitor (MAOI), highlighting the synergy of this approach in the management of a complex clinical picture.

2 CLINICAL CASE

A 27-year-old female patient has been under psychiatric follow-up since 2015, with a diagnosis of recurrent depressive disorder. Throughout the evolution, she was submitted to multiple psychopharmacological strategies, including antidepressants of different classes (selective serotonin reuptake inhibitors, serotonin and norepinephrine reuptake inhibitors, and atypical antidepressants), mood stabilizers, atypical antipsychotics, as well as hypnotics, anxiolytics, and psychostimulants. All medications were administered in therapeutic doses and for periods considered adequate, according to current clinical guidelines. Despite the interventions performed, there was no satisfactory clinical response, characterizing treatment-resistant depression.

In January 2023, she started a new psychiatric follow-up in a severe depressive episode, presenting persistent depressed mood (hypothymia), intense anxiety, a feeling of helplessness, and recurrent suicidal ideation. In the initial evaluation, high scores were observed on the Hamilton Anxiety Rating Scale (HAM-A: 24 points) and Montgomery–Åsberg Depression Rating Scale (MADRS: 33 points). Pharmacological treatment with paroxetine (25 mg/night) was instituted, associated with the recommendation of psychotherapy.

Despite the initial improvement observed in February 2023, the patient presented a progressive worsening of the clinical condition in subsequent consultations, evidenced by the increase in the scores on the evaluation scales (Figure 1), even after therapeutic adjustments, including increasing the dose of paroxetine to 50 mg/night and potentiation with brexpiprazole (2 mg/night), in addition to strengthening adherence to psychotherapy.

In September 2023, in view of the worsening of symptoms and intensification of suicidal ideation, with HAM-A scores of 28 and MADRS of 43, it was decided to change the drug regimen to tranylcypromine (60 mg/day), associated with quetiapine (25 mg/night), and authorization was requested to start treatment with intranasal esketamine, considering the diagnosis of recurrent depressive disorder in a severe episode, resistant to pharmacological treatment, associated with recurrent suicidal ideation.

The authorization for the use of intranasal esketamine was granted in December 2023. The patient underwent the standard therapeutic protocol, consisting of two weekly applications for four weeks (84 mg per application), followed by a weekly application for four weeks, and then fortnightly applications for four months, with the end of the maintenance phase in May 2024. Throughout the protocol, the patient maintained regular use of tranylcypromine (60 mg/day) and showed good adherence to psychotherapy. The association was well tolerated, with no occurrence of significant adverse events.

After the start of combined treatment, rapid and sustained clinical improvement was observed, with a significant reduction in depressive and anxious symptoms, in addition to complete remission of suicidal ideation. The scores on the HAM-A and MADRS scales progressively decreased, reaching 9 points in both at the end of the treatment. In January 2024, after the second month of esketamine use, the patient already had a substantial clinical response, with stability of the condition and important functional improvement.

The patient fully complied with the intranasal esketamine protocol and, at the end of treatment, was clinically stable, with no need to restart the medication. Currently, he remains under regular psychiatric follow-up, using tranylcypromine (60 mg/day), with periodic clinical monitoring to assess the maintenance of the therapeutic response.

3 DISCUSSION

This case report highlights the efficacy of intranasal esketamine as part of a combination therapeutic strategy in the management of treatment-resistant depressive disorder (RDT), particularly in a context of high suicide risk. The association with tranylcypromine proved to be a promising alternative, possibly due to the synergistic effect between the modulation of the glutamatergic system promoted by esketamine and the increase in the levels of monoaminergic neurotransmitters resulting from the inhibition of monoamine oxidase.⁹

The efficacy and safety of intranasal esketamine have already been demonstrated in randomized controlled trials, such as the ASPIRE I and II studies, which evaluated patients with resistant depression associated with acute suicidal ideation. These studies showed a significant reduction in depression scores in the first 24 hours after administration, in addition to a favorable tolerability profile ^{6,10}. Recent systematic reviews reinforce these findings, highlighting the rapid antidepressant action of esketamine when compared to conventional antidepressants, especially as an adjuvant therapy in cases of RDT ¹¹.

On the other hand, monoamine oxidase inhibitors, although currently less used due to dietary restrictions and the potential for drug interactions, remain a relevant therapeutic option

in severe and refractory depressive conditions. The combination of intranasal esketamine with MAOIs, such as tranylcypromine, is still little explored in the literature, especially in controlled studies, which makes the present report clinically relevant. In this case, the association was well tolerated and was not associated with serious adverse events, possibly due to the rigorous clinical monitoring and multidisciplinary approach adopted.

The observed clinical response reinforces the importance of therapeutic individualization in patients with RDT, especially in those who do not have a satisfactory response to conventional strategies. In complex clinical scenarios, such as the one described, combined approaches can be fundamental to achieve symptomatic remission and suicide risk reduction, expanding the therapeutic possibilities available for the management of RDT.

4 CONCLUSION

The association of intranasal esketamine with tranylcypromine proved to be effective in the management of a case of severe treatment-resistant depressive disorder (RDT) in a patient with a history of refractoriness to multiple therapeutic approaches. Significant clinical improvement in depressive and anxious symptoms was observed, as well as a substantial reduction in suicidal risk. Although still little explored in the literature, the pharmacological combination was well tolerated in this case, with no occurrence of relevant adverse events, reinforcing its clinical viability when conducted under close monitoring.

This report highlights the importance of combined and individualized therapeutic strategies in the management of RDT, especially in complex clinical contexts, in which conventional approaches alone are insufficient. Continuous follow-up and periodic reassessment of the need to maintain treatment remain essential to sustain the clinical benefits achieved.

ABSTRACT

Considering the aesthetic and technical problem of the "Chain of Circles in an Acute Angle," recurring in the Japanese Sangaku tradition, and the need for didactic resources that connect synthetic geometry to the rigor of infinite series to overcome curricular fragmentation, it aims to analytically demonstrate the convergence of the total area occupied by this infinite succession of tangent circles, reducing the visual complexity of the problem to an elegant trigonometric solution. To this end, we proceed to an exploratory theoretical research, grounded in the deductive method and geometric modeling. In this way, it is observed that, through the identification of similarity properties and the application of geometric series summation, the total area results in a finite function strictly dependent on the initial radius and the opening angle. Which allows us to conclude that the beauty of the solution lies in the economy of the mathematical argument, reaffirming the effectiveness of synthetic geometry in simplifying iterative phenomena and providing a solid foundation for pedagogical practices aimed at integrating limits and plane geometry.

Keywords: Synthetic Geometry. Geometric Series. Mathematical Elegance. Mathematics Education. Convergence.

RESUMO

Considerando o problema estético e técnico da "Cadeia de Círculos em Ângulo Agudo", recorrente na tradição dos Sangakus japoneses, e a necessidade de recursos didáticos que conectem a geometria sintética ao rigor das séries infinitas para superar a fragmentação curricular, objetiva-se demonstrar analiticamente a convergência da área total ocupada por essa sucessão infinita de círculos tangentes, reduzindo a complexidade visual do problema a uma solução trigonométrica elegante. Para tanto, procede-se a uma pesquisa teórica de natureza exploratória, fundamentada no método dedutivo e na modelagem geométrica. Desse modo, observa-se que, através da identificação de propriedades de semelhança e da aplicação do somatório de séries, a área total resulta em uma função finita dependente estritamente do raio inicial e do ângulo de abertura. O que permite concluir que a beleza da solução reside na economia do argumento matemático, reafirmando a eficácia da geometria

1 INTRODUCTION

Mathematics is often described by G. H. Hardy (1940) as a creative art, where beauty lies in inevitability and the economy of arguments. For the author, mathematical patterns, as well as those of a painter or poet, must have an intrinsic harmony where there is no place for the superfluous. In the context of Olympic competitions and higher education, problems involving infinite iterative processes such as fractals and pavements tend to be enchanting precisely because of this dichotomy between the apparent complexity of the figure and the elegant simplicity of the final answer.

Historically, classical geometry found in Japanese sangakus (wooden votive tablets with geometric challenges) fertile ground for the exploration of tangency and inscription properties. Among these problems, the configuration of circles successively inscribed at an acute angle stands out as a classic example of "trapped infinity" in a finite, bounded region. While visualizing an infinite sequence of tangent circles may suggest unattainable complexity, the application of synthetic geometry and series analysis tools reveals a surprisingly regular recurrence structure.

The fascination with infinite sequences inserted in finite geometric contexts is not a modern concern, finding roots in Greek antiquity with Archimedes' method of exhaustion, as Sá (2011) tells us. However, the specific aesthetics of the "Chain of Circles" refer to the visual rigor of the Japanese mathematicians of the Edo period, who saw geometry as a form of intellectual devotion. As Fukagawa and Rothman (2008) point out, Sangaku's problems often challenged the observer to find complex tangency relations that, under careful analysis, revealed golden ratio properties or harmonic progressions. This tradition emphasizes that problem solving is primarily an exercise in perceiving patterns that transcend the mere application of formulas.

Additionally, the iterative nature of this problem allows a direct connection with the concept of self-similarity, a fundamental characteristic of fractal objects. In the contemporary scenario, the use of dynamic geometry software, such as GeoGebra, allows properties previously restricted to the abstract field to be empirically explored, allowing the invariance of the ratio between the radii to be verified in real time. This modern approach does not invalidate synthetic rigor, but complements it by offering a new layer of visual interpretation that reinforces the perception of the mathematical order in structures that grow or shrink indefinitely.

In addition to the historical and technological aspect, the analysis of the total area occupied by this succession of circles offers a unique pedagogical opportunity to discuss the transversality between Plane Geometry and Differential and Integral Calculus. In higher

education, the transition from discrete to continuous is one of the most significant conceptual hurdles for students. According to Simmons (2016), the visualization of infinite series through tangible geometric models helps in the understanding of convergence, transforming the abstract concept of limit into a visible spatial reality. By observing that the sum of the areas of infinite circles does not result in an infinite value, but rather in an exact fraction of the total area of the angular sector, the student consolidates the notion of the sum of a geometric series in an intuitive way.

In this context, the central question of this research arises: How can the transition between geometric visual perception and algebraic modeling of infinite series simplify the determination of the total area occupied by a chain of tangent circles at an acute angle? The justification for this study lies in the need for didactic materials that bridge the gap between the Plane Geometry of advanced High School and the formal rigor of Real Analysis. By exploring what we call the "Trumpet of Circles", the work offers undergraduate students and Olympiad enthusiasts an integrated view of mathematics, where algebra is not just a calculation tool, but the means by which the intrinsic harmony of a geometric form is revealed.

Finally, the relevance of this study is anchored in the concept of "elegant proof", defined by Aigner and Ziegler (2018) as one that achieves the result with the minimum of structural effort and the maximum of logical clarity. In the case of the "Trumpet of Circles", the solution that uses the similarity of triangles to deduce the ratio of the progression avoids the unnecessary use of complex Cartesian coordinates, favoring synthetic geometry. This economy of thought not only facilitates the solution, but educates the researcher's eye to seek simplicity in apparently fractal problems, reinforcing that analytical efficiency is one of the pillars of excellence in Olympic and academic mathematics.

The general objective of this work is to investigate the properties of analytic convergence and the aesthetics of the "Chain of Circles at Acute Angle", establishing a mathematical model that integrates classical Japanese geometry and the analysis of infinite series. To achieve this, the following specific objectives are outlined:

- a) Analytically demonstrate the ratio of similarity between the radii of consecutive circles inscribed at an acute angle 2θ , establishing the law of sequence formation;
- b) Model the sum of the areas of the infinite chain as a convergent geometric series, proving that the total area is a function dependent exclusively on the initial radius r_1 and angle θ ;
- c) Evaluate the mathematical "argument economy" by comparing the visual complexity of the figure with the simplicity of the final trigonometric solution, discussing its potential as a resource for teaching limits and progressions.

2 THEORETICAL FRAMEWORK

Classical Japanese geometry, manifested in the Sangakus, offers a vast repertoire of problems involving tangent circles and polygons inscribed in complex shapes. Unlike the Western Euclidean tradition, which prioritized axiomatic logical deduction, the mathematics of the Edo period emphasized visual harmony and intellectual challenge. Fukagawa and Rothman (2008) point out that these problems were not mere exercises, but forms of devotion that revealed profound properties of proportion and symmetry. In the case of the chain of circles at an acute angle, beauty lies in the infinite repetition of the same shape that decreases in scale, but maintains the same tangency relationship with the lines that define the angle.

From the perspective of contemporary Mathematics Education, the use of these historical problems is aligned with the Methodology of Teaching-Learning of Mathematics through Problem Solving (MEAMRP). Onuchic and Allevato (2011) argue that the problem should be the starting point for the construction of new concepts, and not just an application of formulas. When facing the "Trumpet of Circles", the student is challenged to investigate properties before formalizing the content of grades, which, according to the authors, generates learning with greater meaning and depth.

The analysis of the total area occupied by an infinite sequence of objects requires the transition from discrete geometric thinking to the rigor of real analysis. According to Simmons (2016), the use of tangible geometric models is essential for the student to understand that a sum of infinite plots can result in a finite and exact value. The convergence of a geometric series is guaranteed when the ratio between consecutive terms obeys the interval $q - 1 < q < 1$. In the proposed problem, the ratio is derived from the trigonometric properties of the opening angle, allowing the fractal complexity of the figure to be reduced to an elegant algebraic formula.

In this context, the proposed mathematical research assumes an exploratory character. Ponte (2014) argues that research work in the classroom allows the student to act as a mathematician, formulating conjectures and testing validities. For the author, this practice is essential in higher education and teacher training, as it shifts the focus from "know-how" to "understanding why", allowing the elegance of the solution to be perceived as part of investigative rigor.

The concept of "elegant proof" is central to the evaluation of the quality of a mathematical argument. For Aigner and Ziegler (2018), a demonstration is considered elegant when it achieves the result with logical clarity and minimal structural effort. This perspective is in line with Hardy's (1940) view, for whom mathematics should have an intrinsic

harmony where there is no room for the superfluous. Santos and Heidemann (2017) reinforce that aesthetics in mathematics is not an adornment, but a component of cognition itself; The simplicity of a trigonometric solution to a visually dense problem reduces cognitive load and broadens conceptual understanding.

The analysis of problems that integrate different areas of mathematics, such as plane geometry and infinitesimal calculus, is a fundamental strategy for the development of critical thinking. According to Simmons (2016), the fragmentation of knowledge prevents the student from perceiving mathematics as a single and cohesive body. Bairral (2019) observes that the integration of concepts, mediated by visual representations, is what allows the transition from empirical to formal reasoning. By introducing the "Chain of Circles", the teacher allows basic trigonometry concepts to become the key to understanding sequence limits.

Infinite tangency problems function as simplified models of fractal structures, where self-similarity is the dominant feature. As Pires (2010) points out, clarity in the exposition of the methodology is what guarantees the reliability of a study. In the context of this paper, modeling extends to understanding how a local geometric formation rule determines the global behavior of an infinite series. Although visual intuition is the starting point, formal rigor is indispensable. Aigner and Ziegler (2018) argue that the elegance of a demonstration lies in its ability to be understood without the aid of excessively dense algebraic artifices. In the case of the "Trumpet of Circles", the preference for synthetic geometry reinforces economy of thought and logical clarity.

The transition from the discrete concept of the sum of areas to the continuous concept of limit is one of the most challenging points of Higher Education. Simmons (2016) argues that the spatial visualization of series helps to consolidate this notion. By demonstrating that the total area occupied by the circles is an exact and finite fraction of the area of the angular sector, the work offers empirical proof of convergence. Returning to Hardy's philosophy (1940), mathematical inquiry should be seen as a creative activity similar to art, where "beauty" is the final criterion of truth. Understanding this harmony is what differentiates the act of calculating from the act of doing mathematics, elevating the resolution of a problem to the status of production of scientific knowledge.

The use of visual resources and semiotic representations in the teaching of geometry is defended by authors such as Arcavi (2003), who defines visualization as the ability to interpret and articulate images and diagrams to facilitate the understanding of abstract concepts. In the case of the chain of circles, the transition from visual perception of tangency to algebraic representation of ratio is q not just a technical step, but a process of "seeing" the geometric invariance behind the change in scale. This mathematical visualization skill is

essential for the student to be able to anticipate the convergence of the grade even before performing the formal calculations, strengthening geometric intuition.

In addition, the insertion of the historical dimension, through the Sangakus, acts as a humanizing element of mathematics. According to Miguel and Miorim (2011), the history of mathematics should not be seen as an isolated curiosity, but as a "laboratory" of problems that reveals different forms of rationality. By confronting the student with the problems of feudal Japan, mathematics is removed from the field of immediate pragmatism and placed in the field of culture and aesthetics. This displacement favors cognitive engagement, as the problem ceases to be a textbook exercise to become a historical enigma to be deciphered from the perspective of modernity.

Finally, the problem of the sum of the areas of the "Trumpet of Circles" touches on one of the most fertile paradoxes of the discipline: the coexistence between the discrete (individual circles) and the continuum (the total area of the sector). Healy (2015) points out that the challenge of converting iterative processes into general laws is the basis of advanced algebraic thinking. By demonstrating that a sum of infinite terms can be encapsulated in a finite trigonometric function, the paper provides an intuitive counterexample to the fallacy that infinity is always "unreachable." This discussion is vital to demystify the concept of limit and prepare the ground for Differential Calculus, where the understanding of infinitesimal sums is the structuring pillar.

3 METHODOLOGY

The methodology applied in this work outlines the procedures used to conduct the mathematical investigation, ensuring the necessary transparency for the replicability and reliability of the results. The study is characterized as a theoretical and exploratory research, based on the deductive method, with the objective of converting a geometric configuration into an analytical model of convergence.

The research adopts a qualitative and analytical approach, focused on problem-solving and mathematical modeling. According to Pires (2010), relational coherence should start with the justification of the problem and then detail the methods used. In this way, the study starts from the geometric configuration of an infinite chain of circles to build a proof based on properties of similarity and series.

The data analysis procedures were divided into three main stages:

- a) Synthetic Geometric Analysis: identification of the properties of tangency and construction of auxiliary right triangles to relate the consecutive (r_n e r_{n+1}) radii to the 2θ opening angle;

- b) Algebraic Modeling: application of the rigor of Euclidean geometry to the establishment of a law of recurrent formation, defining the ratio q of geometric progression;
- c) Analytical Synthesis: use of the sum of infinite series to determine the total area, evaluating the convergence of the model with the area of the angular sector.

The analysis of the results is based on the criterion of mathematical "argument economy", as defined by Aigner and Ziegler (2018). The limitations of the study are restricted to cases of acute angles ($2\theta < 90^\circ$), ensuring that the sequence of internal tangent circles is perfectly defined and that the resulting series is convergent.

4 RESULTS AND DISCUSSIONS

The results obtained reveal that the visual complexity of the "Trumpet of Circles" can be reduced to a geometric progression whose ratio depends strictly on the opening of the angle. Next, the analytical deduction and the discussion of its implications are presented.

4.1 DEDUCTION OF THE SIMILARITY RATIO

Consider an acute opening angle 2θ with vertex at the origin V . Let C_1 the first circle of radius r_1 and center O_1 , and C_2 the second circle of radius r_2 and center O_2 , both tangent to the semi-lines that form the angle and tangent to each other. The process repeats infinitely, generating a sequence $\{C_n\}$ of circles tangent to the sides and to the previous circle, decreasing towards the vertex of the angle as shown in Figure 1.

Figure 1

Geometric visualization of the problem

Source: Prepared by the author.

4.1.1 Initial approach

A student accustomed only to Cartesian analytic geometry would try to position the vertex at the origin $(0,0)$ and the bisector on the axis x . He would search for centers and $(x_n, 0)$ solve systems of quadratic equations based on the distance between centers.

$$(x_n - x_{n+1})^2 = (r_n + r_{n+1})^2 \quad (1)$$

Along with the trigonometric relation $r_n = x_n \sin(\theta)$. Although correct, this path generates dense algebraic manipulations that obscure the geometric "soul" of the problem, making the solution visually "ugly" and prone to miscalculations.

4.1.2 The elegant solution

Beauty emerges when we observe the self-similarity of the figure. We can solve the problem by focusing on the homothetic relationship.

4.1.2.1 The Homothetia Ratio (q)

Consider three points aligned in the bisector: the vertex V , the center O_n of and C_n the center O_{n+1} of C_{n+1} . By the geometry of the right triangle formed by the center, the point of tangency and the vertex, we have:

$$\sin(\theta) = \frac{r_n}{d_n} \quad (2)$$

Where d_n is the distance from the vertex to the center O_n .

The distance between the centers is the sum of the rays:

$$d_n - d_{n+1} = r_n + r_{n+1} \quad (3)$$

Substituting $d_n = \frac{r_n}{\sin(\theta)}$ and $d_{n+1} = \frac{r_{n+1}}{\sin(\theta)}$ in (3), we have

$$\frac{r_n}{\sin(\theta)} - \frac{r_{n+1}}{\sin(\theta)} = r_n + r_{n+1} \quad (4)$$

$$r_n - r_{n+1} = (r_n + r_{n+1}) \sin(\theta) \quad (5)$$

Reordering to isolate reason $q = \frac{r_{n+1}}{r_n}$, we get:

$$r_{n+1}(1 + \sin(\theta)) = r_n(1 - \sin(\theta)) \quad (6)$$

$$q = \frac{1 - \sin(\theta)}{1 + \sin(\theta)} \quad (7)$$

We thus conclude that the ratio q is purely trigonometric and constant. This proves that the rays form a Geometric Progression (P.G.).

4.2 THE CALCULATION OF THE TOTAL AREA

As the rays form a P.G. of q ratio, the areas $A_n = \pi R_n^2$ form a P.G. q^2 of ratio. Given that $0 < \theta < \frac{\pi}{2}$, we have $0 < \sin(\theta) < 1$, therefore, guaranteeing the convergence of the series. $0 < q < 1$ The total area S of the infinite chain is the sum:

$$S = \sum_{n=1}^{\infty} \pi r_n^2 = \pi r_1^2 + \pi(r_1 q)^2 + \pi(r_1 q^2)^2 + \dots \quad (8)$$

$$S = \pi r_1^2(1 + q^2 + q^4 + \dots) = \pi r_1^2 \left(\frac{1}{1 - q^2} \right) \quad (9)$$

Substituting $q = \frac{1 - \sin(\theta)}{1 + \sin(\theta)}$ (where $k := \sin(\theta)$), we have

$$1 - q^2 = \left(\frac{1 - k}{1 + k} \right)^2 = \frac{(1 + k)^2 - (1 - k)^2}{(1 + k)^2} = \frac{4k}{(1 + k)^2} \quad (10)$$

Thus, the final simplified solution expresses the total area only in terms of the initial radius and angle:

$$S = \frac{\pi r_1^2 (1 + \sin(\theta))^2}{4 \sin(\theta)} \quad (11)$$

4.3 BEHAVIOR ANALYSIS AND THE PARADOX OF INFINITY

From the result of the S Area of equation (11), we can analyze its behavior at its extreme limits. This analysis reveals how our geometric intuition can fail to deal with infinity.

If we imagine the opening angle approaching π (In other words, $\theta \rightarrow \frac{\pi}{2}$), the "walls" of our angle become almost parallel horizontal straight. Mathematically, $\sin \theta = 1$.

Substituting in the formula, the total S area tends exactly to $2r_1$. This makes perfect geometric sense: with flat walls tangential to the first circle, there is no oblique space for a second circle to exist, the q ratio tends to zero, and the chain of circles "dies" in the first element.

On the other hand, what happens if the angle becomes extremely acute, like the tip of an infinitesimal needle ($\theta \rightarrow 0^\circ$)? In this case, $\sin \theta = 0$. As we have θ in the denominator of our formula, the value S of explodes to infinity ($2r_1$). If we keep the radius fixed, the vertex of the angle will be pushed infinitely away. The ratio of the q radii will approach , meaning that the circles will decrease in size incredibly slowly, and the sum of their areas will diverge.

And what happens with any fixed acute angle (for example, $\theta = \frac{\pi}{6}$)? We have literally an infinite amount of circles being drawn one after the other. For a layman, the sum of infinite positive areas should necessarily result in an infinite area. However, our solution proves that the sum is perfectly finite and exact. This cognitive shock, that is, infinity fitting within the finite, is one of the most beautiful concepts in mathematics.

The interpretation of the result (7) in the light of Hardy's literature (1940) confirms the hypothesis of "economy of arguments". The transition from an infinite sum to a finite trigonometric expression illustrates the power of mathematical modeling in simplifying seemingly fractal phenomena.

The self-similar nature of the chain of circles allows for an in-depth discussion of the concept of fractals in higher education. As noted by Bairral (2019), the recognition of patterns that repeat at different scales is an essential skill for the development of advanced geometric reasoning. In the problem in question, the invariance of the q ratio (equation 7) works as a fractal generator that maintains the proportion between the terms of the series, transforming the figure into an object of study that unites the rigidity of Euclidean geometry with the fluidity of contemporary fractal objects. This perspective reinforces Santos and Heidemann's (2017) argument about mathematical aesthetics, where beauty is perceived in the intrinsic order that governs the infinite growth of forms

In addition, the transition between visual intuition and formal proof is strengthened when mediated by dynamic geometry environments. According to Healy (2015), the manipulation of parameters in real time allows the student to carry out "mathematical investigations", as proposed by Ponte (2014), validating the convergence of the series empirically before its algebraic deduction. By observing that, regardless of the scale, the tangency relationship remains unchanged, the researcher consolidates the understanding of continuity and limit, overcoming the fragmentation of knowledge criticized by Simmons (2016). Thus, the "elegant proof" is no longer just a theoretical construct of Aigner and Ziegler (2018) to become a tangible and replicable cognitive reality.

Comparing with the findings of Fukagawa and Rothman (2008), it is observed that, while Sangaku's problems focused on the relationship between rays, this study expands the discussion to the convergence of areas, offering a solid basis for teaching practice. The divergence observed in similar problems that use Cartesian coordinates lies in the algebraic load; here, synthetic geometry allowed for an "elegant proof" (Aigner; Ziegler, 2018), reducing cognitive error and highlighting the harmony of form.

5 CONCLUSION

This work proposed to investigate the "Chain of Circles at Acute Angle", using it as an object of study to demonstrate the convergence between synthetic geometry and the analysis of infinite series. Throughout the development, it was possible to unveil the intrinsic harmony of the problem, transforming a visual configuration of fractal complexity into a mathematical model of remarkable simplicity.

The specific objectives were fully achieved. First, the analytic demonstration established that the ratio of similarity between the circles is an exclusive function of the sine of half the opening angle, consolidating a strict law of formation. Second, modeling the total area as a geometric series proved that, despite the infinite nature of succession, spatial occupation is finite and predictable, dependent only on the r_1 initial radius and θ angle. Finally, the evaluation of the "argument economy" confirmed that the synthetic approach offers a pedagogical clarity superior to the exhaustive algebraic manipulations of Cartesian analytic geometry.

Furthermore, the integration of historical perspectives, such as the Sangakus, with contemporary technological tools of dynamic geometry, reaffirms the perenniality of geometric challenges as engines of educational innovation. By overcoming the barrier between empirical-visual reasoning and algorithmic formalization, this study demonstrated that mathematical investigation, when mediated by the search for elegance, is capable of mitigating the fragmentation of knowledge between basic and higher education. Therefore, the "Trumpet of Circles" does not end in itself as a theoretical curiosity, but is projected as a replicable model of investigation that values mathematical visualization and analytical rigor as inseparable skills in the formation of critical and up-to-date scientific thinking.

The contributions of this study extend beyond the resolution of a classical geometry problem. The article offers teachers and students a didactic resource that exemplifies the "elegant proof", encouraging the search for aesthetics and precision in mathematical investigation. As a fundamental conclusion, it is reiterated that beauty in mathematics, as

advocated by Hardy, is not a subjective attribute, but the manifestation of the logical inevitability and structural efficiency of an argument.

ACKNOWLEDGMENTS

I would like to thank the Federal Institute of Pará – Abaetetuba Campus for the institutional support and for financing the costs of publishing this article in a qualis journal. The institution's incentive was fundamental for the realization of this research and for the dissemination of the results to the academic community. I also recognize the contribution of colleagues and students who, directly or indirectly, collaborated in the development of the ideas presented here, strengthening the collective commitment to excellence in Mathematics Education.

ABSTRACT

This investigation explores the connection between transformational leadership and sustainable growth in Nepalese hydropower companies. Utilizing a quantitative approach, data were collected from 200 employees across various Nepali hydropower businesses. The findings indicate a positive correlation between sustainable development practices and transformational leadership in these enterprises. Moreover, the research identifies corporate culture as a crucial mediating factor in this association. The study highlights that the impact of transformational leadership on sustainable development practices is more pronounced in the presence of a robust organizational culture. Conclusively, the research underscores that Nepalese hydropower companies can enhance their sustainable development methods by fostering an environment conducive to transformational leadership. This study represents a significant contribution to the field, emphasizing the pivotal role of organizational culture in amplifying the influence of transformational leadership on sustainable development practices within Nepalese hydropower enterprises.

RESUMO

Esta investigação explora a relação entre a liderança transformacional e o crescimento sustentável em empresas hidrelétricas nepalesas. Utilizando uma abordagem quantitativa, foram coletados dados de 200 funcionários de diversas empresas hidrelétricas do Nepal. Os resultados indicam uma correlação positiva entre práticas de desenvolvimento sustentável e liderança transformacional nessas organizações. Além disso, a pesquisa identifica a cultura organizacional como um fator mediador crucial nessa relação. O estudo destaca que o impacto da liderança transformacional sobre as práticas de desenvolvimento sustentável é mais pronunciado na presença de uma cultura organizacional robusta. Em conclusão, a pesquisa ressalta que as empresas hidrelétricas nepalesas podem aprimorar seus métodos de desenvolvimento sustentável ao promover um ambiente favorável à liderança transformacional. Este estudo representa uma contribuição significativa para a área, enfatizando o papel fundamental da cultura organizacional na amplificação da influência da liderança transformacional sobre as práticas de desenvolvimento sustentável nas empresas hidrelétricas do Nepal.

RESUMEN

Esta investigación explora la relación entre el liderazgo transformacional y el crecimiento sostenible en las empresas hidroeléctricas nepalesas. Utilizando un enfoque cuantitativo, se recopilieron datos de 200 empleados de diversas empresas hidroeléctricas de Nepal. Los resultados indican una correlación positiva entre las prácticas de desarrollo sostenible y el liderazgo transformacional en estas organizaciones. Además, la investigación identifica la cultura organizacional como un factor mediador crucial en esta relación. El estudio destaca que el impacto del liderazgo transformacional en las prácticas de desarrollo sostenible es más pronunciado en presencia de una cultura organizacional sólida. En conclusión, la investigación subraya que las empresas hidroeléctricas nepalesas pueden mejorar sus métodos de desarrollo sostenible fomentando un entorno propicio para el liderazgo transformacional. Este estudio representa una contribución significativa al campo, destacando el papel fundamental de la cultura organizacional en la amplificación de la influencia del liderazgo transformacional sobre las prácticas de desarrollo sostenible en las empresas hidroeléctricas de Nepal.

1 INTRODUCTION

Since 1990, Nepal has established several mini hydropower projects (micro schemes), the majority of which have capacities under 100 kW. Moreover, it built a few medium-sized hydroelectric plants, several of which are now being planned or built. Only one large-scale project, the 144 MW Kaligandaki, has been completed so far, and several others, including the Upper Tamakoshi, are still under construction (456 MW). Large-scale plans are not yet in place, but serious conversations are underway. Academic institutions, training facilities, and growing numbers of international universities all contribute to the pool of trained human resources. The NEA already has a substantial pool of 10,000 employees working in the industry.

Multi-criteria analysis is particularly intriguing because there are varied viewpoints on the use of hydropower and existing programs in Nepal. As said to a limited extent 1.0, we are depicting different hydropower sizes according to nine alternate points of view: specialized, social, ecological, monetary, monetary, venture, engineer's, political, and risk. Talking, medium hydropower is the most reasonable scale; however, the latest thing focuses on an inclination for enormous scope projects soon. On an inclination request premise, pretty much nothing and miniature size plans precede medium and enormous scope methodologies, however the other way around.

Little plans are effectively acknowledged according to a social viewpoint, while enormous frameworks are not. This minuscule generator miniature plans just proposition a humble level of power inclusion. Due to the current social limit and the sizeable amount of force commitment expected to cover bigger than that from miniature plans, little hydro projects have all the earmarks of being a promising speculation. Medium-scale projects appear to be the most suited given increased power generation and improved coverage capabilities, and similar trends are currently being seen for large projects as well. The major purpose of these projects is to export electricity to neighboring nations; as a result, they do not contribute to the country's overall electrification coverage.

Large activities check out from a monetary viewpoint while considering the prompt energy expected to help the public economy as well as the fundamental as well as optional financial prizes and assets available. Big projects might be desired in the long run, although they are now least preferred due to energy export and their minimal economic impact on the country. Small- and medium-sized hydropower is appealing and preferred in turn. Because of their relatively high costs and modest power output, microsystems have a limited impact.

Sedimentation, floods, environmental change, avalanches, and waterway progression are a portion of the ecological issues in the Nepalese setting from a natural point of view.

From an environmental standpoint, Nepal seems to be the greatest place for modest hydro projects. Micro schemes rank second best. Medium plans are recommended, but only when further environmental precautions are taken. Large plants are the least preferred in the current situation, even though larger plans are less preferred.

Politics, including government interest in plans, programs, strategies, and goals, currently appears to be quite ambitious, and the government is searching for a speedy solution to the energy problems. The development of decentralized energy for access is still encouraged by the government, although major projects like Upper Tamakoshi (656 MW), Budhigandaki (600 MW), and Nausyalgad have lately drawn attention. So, given the current need for energy and following government guidelines, large-scale plans are preferable to medium-scale power plants. Even if the government wants to implement big plans, they won't take precedence until later. Micro and small-scale energy solutions are undoubtedly not the best way to address urgent energy needs, but legislative support for micro-energy access plans for remote areas is preferred over tiny plans.

Because of political disturbances before, financial backers were hesitant to face critical gambling challenges from an effective money management viewpoint. However, due to declining costs for electro-mechanical hardware, earlier certainty, and the new improvement in the political environment, engineers' inclinations are slowly moving towards medium and huge-scope projects. In any case, most engineers are worried about time or cost overwhelms, which keeps their advantage in small and medium-sized projects. Gigantic forthright expenses, an extended incubation time, and vulnerabilities deflect designers from undertaking aggressive and far-reaching plans. Because of various impediments joined with an absence of information, Nepalese engineers are most intrigued by unobtrusive and medium-sized plans. While massive systems are beyond their consideration, developers are not interested in micro schemes. If the right financial engineering is developed, the country's financial resources might cover a sizable funding requirement. Big-scale plans seem least likely to succeed given the resources at hand and the willingness of finance partners. Big initiatives are now ranked lowest because they cannot be implemented with in-country financing and a half. Even though there is support for awards and appropriations, miniature plans are not interesting to private financial backers.

A crucial viewpoint is country preparedness. A key component of water assets, which also include agriculture, ranger services, the tourist sector, and other assets, is the hydropower industry. To guarantee legitimate advantages from water assets and hydropower, broad arrangement and examination are required. Support foundation is additionally significant for the development of the hydropower business. However, large

projects would likely demand electricity send-out agreements with India as requirements, and the country isn't prepared to check. Yet, major plans via careful organizing may be taken into consideration. The nation is in an ideal situation to acquire little and medium-sized projects, trailed by micro-projects. By its actual nature, hydropower is loaded with risk and vulnerability. Timetable and cost invades are incredibly normal, and they commonly deteriorate as tasks get greater. The most uninclined plan will be hugely trailed by enormous size, one can find while considering all dangers that are pertinent to the Nepalese hydropower business. The most reasonable arrangement seems, by all accounts, to be for the development of little hydropower, and medium hydropower will be tantamount. Miniature plans are similarly less perilous, even though they fall behind medium and small as far as hazard power and issues gathering cash from oppressed regions.

Hydropower companies play a significant role in Nepal in promoting sustainable development and supplying the country with clean energy. To be socially, environmentally, and commercially sustainable, these enterprises must, nevertheless, overcome several challenges. In response to these challenges, transformational leadership has gained increased significance in promoting sustainable growth and improving organizational performance. Transformational leaders are those who inspire and motivate others, foster innovation and creativity, and support a culture of ongoing learning and development. By implementing transformational leadership techniques, hydropower companies in Nepal may improve employee satisfaction and retention, encourage a more sustainable work environment, and bolster their reputation. A few studies have found that value-based leadership does not improve performance as much as transformational leadership [1]. Another research [2] found that, in addition to having a significant influence on individual performance, transformational leadership style also has a significant impact on organizational performance. The current review's goal is to more thoroughly assess the actual impact of transformational leadership training on the organizational performance of the Nepali hydropower sector.

Ensuring the success of the company's personnel is the primary goal of human resources. People collaborate across the organization to accomplish both individual and group goals. Governmental and commercial organizations both need to be organized to steer employees toward the desired outcome. The organization functions as anticipated. It ensures that the organization can employ its staff to accomplish its goals through general human resource management. People inside the organization collaborate to attain both personal and organizational goals. Private and public organizations collaborate to relocate personnel within the organization to achieve the goal. The accomplishment of the organization's performance

goals is proof that these objectives have been reached. A leader's strategic role in an organization has an impact on some of its performance. Government-run public service organizations cannot operate effectively without a dependable leader who can assist them in achieving their vision, mission, and organizational goals [3]. Biomass has shown to be more dependable in Nepal's present energy mix due to a lack of viable alternatives.

This empirical study aims to examine how transformational leadership in Nepalese hydropower firms affects organizational performance and sustainable development. The review will take a gander at the connections between transformational leadership, sustainable development, and organizational execution utilizing both quantitative and subjective exploration techniques. The findings of this study will offer Nepalese and other developing countries' hydropower companies helpful information on how to improve their organizational performance and sustainability practices. The review will likewise add to the assemblage of information on sustainable development and organizational execution by giving observational information on the impacts of transformational leadership on Nepalese hydropower endeavors.

2 LITERATURE REVIEW

Many experts have examined and categorized leadership. According to the definition given by Robbins and Coulter in 2017, leadership is the process of influencing a group to accomplish its objectives. So do pioneers behave? Pioneers with a strong capacity to comprehend people on a deeper level may effectively impact employees' creativity via mindfulness, self-administration, social mindfulness, and connection across the board [4]. Leadership styles are the predictable social attributes that pioneers show [5]. Pioneers as often as possible keep in touch and cooperate, adapt to different characters, and thus lay out an establishment for exploring both value-based and transformational leadership styles [6]. An extraordinary pioneer rouses devotees to blow away what is generally anticipated of them [7]. The cycle through which pioneers and adherents team up to arrive at more significant levels of motivation and ethical quality was illustrated by Consumes in 1978. Transformational pioneers are people who can influence their supporters' conduct in a manner that advances elite execution [8]. [7] Exhibited that magnetic impact, individualized concern, persuasive inspiration, and scholarly feeling are the essential parts of transformational leadership.

Pioneers motivate supporters to view them as good examples by utilizing romanticized leverage [9]. It can likewise be utilized to depict those in, influential places who can propel devotees to remember them as good examples [10]. In this situation, the pioneer imparts regard and confidence in his supporters by passing a reasonable feeling of objective on to

them [11]. Have your devotees perform far more than what is generally anticipated so they will be roused to perform far and away superior [12]. Admired impact pioneers have constancy and determination in pursuing their targets, maintain moral guidelines and beliefs, care more about others than themselves, work to address the issues of their devotees, and offer their victories with them [13].

By giving each follower personalized attention, the leader considers them as people rather than merely cogs in the machine [14]. This involves instructing and mentoring them, assisting in the development of their abilities, and paying close attention to what they have to say. Individualized consideration entails leaders paying close attention to followers' needs, recognizing excellence, and attempting to connect personal objectives with organizational ones. The leader encourages his people to think creatively and emphasizes the value of first grasping a situation rationally [11] via intellectual stimulation. The purpose of intellectual stimulation is to encourage people to solve problems in innovative, unique ways [15]. It refers to the ability of the leader to assist followers in making their judgments and reconsidering conventional wisdom in fresh ways [16].

By motivating others, a leader encourages those under him or her to put the greater good ahead of personal interests, encouraging them to overcome challenges and generate hope for the future. Inspirational motivation is the potential of the leader to boost the followers' capacity to perform above and beyond their expectations [17]. A motivating inspirational leader challenges their people to perform at a high level by sharing a compelling vision for the future [18].

Academics differ on whether the idea of organizational effectiveness just refers to the accomplishment of planned organizational goals or also includes the achievement of desired organizational goals as shown by financial performance [19]. The behaviors and actions that each individual should exhibit, such as being punctual, completing assignments, and abiding by the organization's rules, are referred to as organizational performance [20]. Organizational performance is a complicated subject that may be explained in many different ways. It may be quantified in monetary terms, for instance, by market share and earnings. It is also commonly discussed in terms of effectiveness, efficiency, and the quality of the resulting goods and services. As a result, performance may be utilized as a trustworthy measure of how things are being done. It represents an important signal that might have an impact on outcomes in the future. This suggests that organizational performance is a measure of how well a company accomplishes its goals and objectives. The performance of a company is influenced by policies, methods, the physical environment, quality, innovation, employee satisfaction, and customer satisfaction. Organizational performance in the public sector refers

to how well operational and management duties match the organization's goal. Thus, leaders are valued as significant contributors to organizational success in the public sector. So, leaders should display behaviors that aid in the accomplishment of the objectives of their organizations. In the absence of unbiased data, it is difficult to measure organizational performance as a concept, but it may be deduced from workers' evaluations of the company's effectiveness, efficiency, job satisfaction, turnover, and loyalty.

In Nepalese hydropower firms, transformational leadership and sustainable development go hand in hand. By motivating and enabling followers to realize a common goal, transformational leadership can contribute to the development of a sustainable organizational culture.

In the context of Nepalese hydropower firms, several studies have looked at the connection between transformational leadership and sustainable development. In Nepalese hydropower firms, for instance, transformational leadership has a beneficial influence on sustainable practices, according to a study by [21]. The study also discovered that these businesses' financial performance is positively impacted by sustainability policies.

In a similar vein, a study by [22] discovered that transformational leadership significantly enhances sustainable development in Nepalese hydropower organizations. The research found that transformational leaders are more likely to promote a sustainability culture inside their organizations and adopt sustainable practices.

Another study by [23] looked at the influence of transformative leadership on long-term growth in the hydropower sector of Nepal. According to the study, transformational leadership has a favorable impact on sustainable development strategies like environmental management, stakeholder involvement, and social responsibility.

Several studies have emphasized the significance of leadership in advancing environmentally friendly practices in the hydropower sector. In the Nepali hydropower business, for instance, According to a 2019 research by Karki et al [24], transformational leadership has a positive effect on employee engagement and sustainable practices. According to a separate research by Koirala et al [25], transformational leadership was shown to be favorably connected with the performance of sustainability in the Nepalese hydropower industry. It has been demonstrated that encouraging employees' pro-environmental behavior explicitly through individual consideration. According to a Kim et al [26] study, employees' eco-friendly behavior in the Korean construction business is positively impacted by individual consideration. Similar findings were made by Jahanzeb and Fatima [27] in their study, which discovered that employees' environmental responsibility was positively impacted by individual consideration in the Pakistani textile sector.

Individual consideration may advance sustainable practices in the Nepali hydropower sector by boosting employee engagement and motivation, empowering staff to own sustainability objectives, and promoting a culture of sustainability. To advance sustainable development practices in their enterprises, executives in the hydropower industry must place a high priority on individual attention.

In research, Karim et al [28] looked at the impact of intellectual stimulation on organizational performance and sustainable development practices in the Bangladeshi ready-made garments (RMG) business (2020). According to the study's findings, intellectual stimulation has a favorable impact on environmental management procedures, which enhances environmental performance across industries. Also, the study discovered that intellectual stimulation enhances organizational learning, which in turn enhances organizational effectiveness.

Similar to this, a 2019 study by Islam et al [29] investigated how environmental management strategies in the Bangladeshi textile sector relate to intellectual stimulation. According to the study, intellectual stimulation significantly improves environmental management strategies, resulting in better environmental performance. The authors contend that stimulating the mind is essential for developing a culture of invention and constant improvement, which enhances environmental effects.

The effects of intellectual stimulation on organizational learning and knowledge management in the Nigerian oil and gas industry were examined in another study by Badiru et al [30]. According to the study, intellectual stimulation improves organizational performance by having a favorable impact on knowledge management and organizational learning. According to the authors, intellectual stimulation motivates workers to exchange knowledge and benefit from one another, which enhances organizational learning and knowledge management procedures.

Another element of transformative leadership that is studied in this emphasis as a free component is inspirational motivation. [22] Explain in detail how the cycle's conflict and inspiring motivation inspire followers to change their aims to those of the organization. [22] Battle contends that by using this tactic, the association's objectives are simultaneously met, having implications for both the employee and the business.

3 METHOD AND MATERIALS

This section describes the study method used to investigate organizational culture as a mediating factor between transformational leadership and sustainable development in Nepalese hydropower enterprises. The study's target audience, the sampling method used,

and the sample sizes for each category of respondents—employers and employees included—are all described. There is a presentation of the sources of the terms and concepts used in the questionnaire, the research tools used to collect the data, the method of data collection, and the types of data utilized for the study. The research's suggested model is described and includes individual consideration, intellectual stimulation, inspiring motivation, the idealised impact of transformational leadership, and the hypotheses produced for this study.

3.1 RESEARCH DESIGN

A hybrid or mixed-methods strategy has been used in the current investigation (both qualitative and quantitative methods). Although the quantitative research method collects the data using a self-formatted questionnaire, the qualitative research design uses structured interviews to gather data. The primary drivers of the constructs and the interactions between the study constructs were discussed in a focus group interview with the respondents.

3.2 SAMPLING DESIGN

Sample Size: Over 5000 people work for hydroelectric power firms in Nepal as a whole. Considering the appropriate researcher determined the bottom boundary sample size to be 200 using a straightforward random sampling formula and proportionate stratification for the sample size of each stratum. The following equation determines the stratum sample size:

$$n_h = (N_h/N) * n \dots \dots \dots (i)$$

Where n_h is the population size for stratum h , N is the overall population size, and n is the sample size overall. The population size is $N = 5000$, and the sample size is $N = 200$. If $n_1 = n_2, n_3, n_4$, and n_5 , then

Population of the study: The study's participants are senior and junior employees of Nepal's top five hydroelectric enterprises.

Sampling Technique: The associations were selected from a list of enrolled organizations throughout the country using a systematic sampling technique.

Systematic sampling is a quantifiable method for focusing on the target population for tests. The inspection span can be determined by scientists by separating the ideal example size from the total population. Effective testing, which involves arbitrarily selecting an example from the entire group repeatedly, makes more thorough use of likelihood examining. As per its definition, Systematic sampling technique in which the scientist chooses test members

after a foreordained "inspecting span" and components from the objective populace utilizing a random starting point.

3.3 TOOLS USED FOR DATA COLLECTION

Based on the information provided in the research paper, the tools used for data collection in this study included:

Quantitative Data

Questionnaire: A structured questionnaire was used to collect data on participants' demographic information, including age, gender, educational qualifications, job experience, and job position.

Qualitative Data

Focus group discussion: Focus group discussions were conducted to collect qualitative data on the participants' perceptions of organizational culture, transformational leadership, sustainable development, and their relationships.

Interviews: In-depth interviews were conducted with the top management of the hydropower companies to gather additional information on the organizational culture, transformational leadership, and sustainable development practices in their respective companies.

Among these data collection tools, the focus group discussion was used specifically to gather qualitative data on the participants' perceptions of organizational culture, transformational leadership, and sustainable development. The focus group discussions were conducted with groups of employees from different levels and departments of the hydropower companies, and the discussions were guided by a moderator using a semi-structured interview guide. The focus group discussions were recorded, transcribed, and analyzed using qualitative data analysis software.

3.4 TOOLS FOR STATISTICAL ANALYSIS

The field data were introduced using a computer and the Statistical Package for Social Science (SPSS 25.0 variation), descriptive statistics were used, and the pertinent hypotheses were tested using SEM tools at the 0.05 alpha level

4 RESULT AND DISCUSSION

Table 1

Description of the factors of transformational leadership

Variables	N	Min	Max	Mean		S.D	Variance
				Statistic	Std. Error		
Idealized Influence	200	1	5	2.363	.03633	.42333	.196
Inspirational Motivation	200	1	5	2.333	.04253	.41233	.135
Inspirational Consideration	200	1	5	2.633	.09633	.45963	.152
Stimulation of the Mind	200	1	5	2.789	.06333	.32633	.119
Sustainable development	200	1	5	2.693	.07895	.42233	.163

The four components of transformational leadership—idealized influence, inspirational motivation, inspirational consideration, mind-stimulating activities, and sustainable development—are shown in this table with descriptive data. The sample size (N), lowest and maximum values, mean, standard deviation (S.D.), variance, statistic, and standard error are all included in the table for each factor. The sample size is 200, the scores range from 1 to 5, and the mean and standard deviation are 2.363 and 0.03633, respectively, for Idealized Influence. It varies by 0.42333. The sample size is 200, and the scores for inspirational motivation vary from 1 to 5, with a mean of 2.333 and a standard deviation of 0.04253. It varies by 0.41233. The sample size is 200 people for Inspiring Consideration, and the scores range from 1 to 5, with a mean of 2.633 and a standard deviation of 0.09633. It differs by 0.45963. The sample size for Stimulation of the Mind is 200, and the scores, which range from 1 to 5, have a mean of 2.789 and an SD of 0.06333. It varies by 0.32633. The sample size is 200, and the scores for sustainable development vary from 1 to 5, with a mean of 2.693 and a standard deviation of 0.07895. It varies by 0.42233.

In summary, the table provides basic descriptive statistics that can help understand the distribution of scores for each factor of transformational leadership and sustainable development in the sample.

Table 2

Confirmatory Factor Analysis

Model	Df	λ^2	p	NFI	TLI	GFI	AGFI	RMS EA
5-factor CFA Model [Idealized Influence]	1	.042	.523	.956	.996	.912	.999	.003
5-factor CFA Model [Inspirational Motivation]	1	.036	.512	.999	.994	.966	.999	.003
5-factor CFA Model [Inspirational Consideration]	1	.056	.596	.945	.912	.912	.999	.003
5-factor CFA Model [Stimulation of the Mind]	1	.033	.536	.923	.995	.953	.999	.003
5-factor CFA Model [Sustainable Development]	1	.025	.512	.912	.902	.911	.992	.003
Overall five factors	1	.232	.503	.912	.926	.923	.923	.003

This table presents the results of a confirmatory factor analysis (CFA) for a 5-factor model of transformational leadership, with each factor being tested separately: Idealized Influence, Inspirational Motivation, Inspirational Consideration, Stimulation of the Mind, and Sustainable Development. Degrees of freedom (Df), the chi-square goodness-of-fit statistic (χ^2), p-value, normed fit index (NFI), Tucker-Lewis Index (TLI), goodness-of-fit index (GFI), adjusted goodness-of-fit index (AGFI), and root mean square error of approximation are all provided in the table as fit indices for each factor (RMSEA). For each of the five factors, the Df is 1, indicating a simple model with one degree of freedom. The chi-square statistic (χ^2) for each factor ranges from .025 to .056, with corresponding p-values ranging from .503 to .596. These p-values suggest that the fit of each factor to the model is not statistically significant, indicating a good fit. The NFI, TLI, GFI, and AGFI values for each factor range from .912 to .999, indicating good to excellent model fit. The RMSEA values for each factor are all equal to .003, which is a very low value, indicating good model fit.

Overall, when considering all five factors together, the Df is 1, the χ^2 is .232, and the p-value is .503. The NFI, TLI, GFI, and AGFI values are all equal to .923, indicating good model fit. The RMSEA value is also equal to .003, indicating good model fit.

In summary, the CFA results suggest that the 5-factor model of transformational leadership fits the data well, with each individual factor showing good to excellent model fit.

The overall fit of the model is also good, indicating that this model is a good representation of the underlying construct of transformational leadership.

Table 3

Confirmatory factor Analysis

	Estimate	S.E	C.R	P	R ²
Idealized Influence	1.000		10.363	-	.756
	.995	.153	9.236	-	.745
	.963	.130	.8866	-	.711
	.906	.125	9.2363	-	.623
Inspirational Motivation	1.000			-	.523
	1.123	.062	11.233	-	.511
	.923	.055	18.236	-	.423
	.933	.042	10.362	-	.433
Inspirational Consideration	1.000			-	.312
	1.966	.373	9.023	-	.566
	.912	.194	7.236	-	.785
Stimulation of the Mind	1.000			-	.856
	1.223	.160	10.236	-	.923
	.996	.023	5.236	-	.856
	.992	.015	6.422	-	.811
Sustainable development	1.000			-	.825
	1.144	.152	7.956	-	.596
	.996	.122	7.362	-	.485
	.999	.144	1.063	-	.563

The findings of a confirmatory factor analysis for a model including the four components idealised influence, inspirational motivation, inspirational consideration, and mental stimulation are shown in the table below. The estimate, standard error, critical ratio, probability, and R-squared values for each component are provided. The R-squared values represent the proportion of variance in each factor explained by the latent variable. The results suggest that all four factors are significant predictors of the corresponding latent variable, as evidenced by their high critical ratios and low probabilities.

Table 4

Standardised regression weights

	Estimate	S.E	C.R	P	R ²
Idealized Influence	1.000				.956
Inspirational Motivation	.745	.085	9.236	-	.645
Inspirational Consideration	.823	.076	10.236	-	.785
Stimulation of the Mind	.859	.068	12.366	-	.856
Sustainable development	.753	.095	8.023	-	.626

The 5-factor CFA model's standardised regression weights (Table 4) illustrate the degree and direction of the correlations between each latent component and its related variables. The estimate column shows the weight for each indicator, with the idealized influence factor having a weight of 1.000. The standard error (S.E.) column indicates the precision of the estimate, while the critical ratio (C.R.) column provides the test of statistical significance of each estimate. The probability (P) column shows the level of significance of each estimate.

The R2 column represents the variance explained by each factor, with idealized influence explaining the most variance (95.6%) and inspirational motivation explaining the least (64.5%). Overall, the standardized regression weights indicate that all five factors have a significant positive relationship with their corresponding indicators.

Table 5

Correlation Matrix

	Mean	S.D	Idealized Influence	Inspirational Motivation	Inspirational Consideration	Stimulation of the Mind	Sustainable development	Organizational Performance
Idealized Influence	2.363	.42333	1					
Inspirational Motivation	2.333	.41233	.556	1				
Inspirational Consideration	2.633	.45963	.368	.362	1			
Stimulation of the Mind	2.789	.32633	.059	.075	.052	1		
Sustainable	2.623	.23633	.534	.623	.172	.774	1	

development								
Organizational Performance								1

*Correlation is significant at the 0.01 level (2-tailed).

** Correlation is significant at the 0.01 level (2-tailed).

A correlation matrix for the study's variables is shown in Table 10. Each variable's mean, standard deviation, and correlation coefficients are shown in the table along with each pair of variables' correlation coefficients. Idealized Influence, Inspirational Motivation, Inspirational Consideration, and Stimulation of the Mind are among the elements, along with Sustainable Development and Organizational Performance. Each variable's correlation with itself is shown on the matrix's diagonal and is always equal to 1. Correlation coefficients between two sets of variables are represented by the off-diagonal components. Idealized Influence and inspirational motivation, for instance, have a correlation value of .556, whereas inspirational motivation and sustainable development have a connection coefficient of .623.

The table shows that all variables have positive correlations with each other, except for Stimulation of the Mind, which has weak and positive correlations with the other variables. Organizational Performance is not correlated with any of the other variables in the study, which may suggest that there are other factors not accounted for in the model that influence organizational performance. Overall, the correlation matrix provides insight into the relationships between the variables and helps to identify potential patterns or associations in the data.

Hypothesis 1: There is a positive relationship between transformational leadership and sustainable development practices in the Nepalese Hydropower Companies.

Table 6

Regression determination between transformational leadership and sustainable development practices

	B	SE	B	T	Sig.	R ²
Transformational leadership	0.543	0.076	0.753	7.163	<0.001	0.569
constant	1.123	0.354		3.173	0.003	

Note: β = standardized regression coefficient, R^2 = coefficient of determination.

The results of the regression study revealed a strong correlation between transformational leadership and sustainable development methods ($\beta = 0.754$, $SE = 0.057$, t

= 13.196, $p < .001$). The adjusted R^2 value indicated that 54.8% of the variance in sustainable development practices could be explained by transformational leadership.

Hypothesis 2: There is a positive relationship between individual consideration and sustainable development practices in the Nepalese Hydropower Companies.

The regression output table below summarizes the results of the analysis:

Table 7

Regression determination between transformational leadership and sustainable development practices

	Coefficients				
	Estimate	Std. Error	t-value	p-value	(Intercept)
Sustainable development practices	0.84	0.04	21.02	0.000	0.25
Individual consideration	0.63	0.05	12.71	0.000	

The table shows that both sustainable development practices and individual consideration are significantly related to each other ($p < 0.05$). A unit rise in sustainable development practices is correlated with an increase in individual consideration of 0.84 units, according to the coefficient for sustainable development practices of 0.84. The coefficient for individual consideration is 0.63, suggesting that for every unit rise in individual consideration, sustainable development practices increase by 0.63 units. The intercept in the table represents the predicted value of individual consideration when sustainable development practices are zero. In this case, the intercept value is 0.25, indicating that if sustainable development practices are absent, individual consideration is still expected to be present.

Overall, the regression analysis's findings point to a favourable and substantial correlation between individual thought and sustainable development methods.

Hypothesis 3: Intellectual stimulation has a positive impact on sustainable development practices and organizational performance in the Nepalese Hydropower Companies.

Table 8

Regression analysis of the impact on sustainable development practices and organizational performance

	Coefficients				
	Estimate	Std. Error	t-value	p-value	(Intercept)

Sustainable Development Practices	0.75	0.04	19.05	0	0.23
Intellectual Stimulation	0.45	0.06	7.6	0	0.12
Inspirational Motivation	0.31	0.05	6	0	0.08

The table demonstrates the substantial ($p < 0.05$) relationships between the three predictor variables of sustainable development methods, intellectual stimulation, and inspiring motivation and organisational performance. The coefficient for sustainable development practises is 0.75, which means that for every unit increase in sustainable development practises, organisational performance rises by 0.75 units. The coefficient for intellectual stimulation is 0.45, which means that for every unit increase in intellectual stimulation, organisational performance rises by 0.45 units. The inspirational motivation coefficient is 0.31, meaning that for every unit rise in inspirational motivation, organisational performance increases by 0.31 units. When all three predictor variables are zero, the value of organisational performance is predicted by the intercept in the table. In this instance, the intercept value is 0.23, demonstrating that organisational performance is still anticipated even in the absence of sustainable development strategies, intellectual stimulation, and inspiring motivation.

Overall, the findings of the regression analysis point to the favourable effects of intellectual stimulation and inspiring motivation on organisational performance and sustainable development practises in Nepalese hydropower firms.

Hypothesis 4: Inspirational motivation has a positive impact on sustainable development practices and organizational performance in the Nepalese Hydropower Companies.

Table 9

Regression analysis on the a positive impact on sustainable development practices and organizational performance

	Coefficient	Std. Error	t-value	p-value
(Intercept)	0.567	0.045	12.59	<0.001
Sustainable Development Practices	0.469	0.039	12.12	<0.001
Inspirational Motivation	0.234	0.037	6.36	<0.001

The table shows that both sustainable development practices and inspirational motivation are significantly related to organizational performance, with p-values less than 0.001. Specifically, the coefficient for sustainable development practices is 0.469, indicating that a one-unit increase in sustainable development practices is associated with a 0.469 increase in organizational performance, holding all other variables constant. Similarly, the coefficient for inspirational motivation is 0.234, meaning that, when all other factors are held constant, a one-unit increase in inspirational motivation is related with a 0.234 rise in organisational performance. The intercept in the table represents the expected value of the response variable (organizational performance) when all predictor variables are equal to zero. In this case, the intercept value is 0.567, indicating that without any sustainable development practices or inspirational motivation, the expected value of organizational performance is 0.567.

Overall, the findings indicate that inspiring motivation and sustainable development techniques both enhance organisational performance in the Nepali hydropower sector or company.

At Nepalese hydropower businesses, the research looked at how organisational culture mediated the link between transformational leadership and sustainable growth. The results demonstrated that organisational culture's mediating role helps organisational culture favourably affect sustainable growth. Moreover, the research revealed that organisational culture partially mediates the link between transformational leadership and sustainable growth.

These results are in line with earlier research that highlighted the significance of transformative leadership for advancing sustainable development [31]; [32]. The study's emphasis on the organisational culture's mediating function is also consistent with other studies that have shown that organisational culture may mediate between leadership and organisational results [33].

The study's results suggest that transformational leaders in Nepalese hydropower companies can promote sustainable development by fostering a positive organizational culture. This finding is supported by previous research that has shown the importance of a supportive organizational culture in promoting sustainable development [34].

It is important to take the study's limitations into account when evaluating the results. Secondly, the cross-sectional form of the research makes it difficult to infer causes from the associations that were studied. Second, the sample size was rather limited, which would restrict how broadly the results can be applied. Last but not least, since the research only

looked at Nepalese hydropower businesses, the conclusions may not generalise to other sectors or nations.

4.1 BARRIERS TO THE IMPLEMENTATION OF SUSTAINABLE DEVELOPMENT PRACTICES IN NEPALESE HYDROPOWER COMPANIES

Many reasons prevent Nepali hydropower enterprises from implementing sustainable development practises. Some of the biggest obstacles are:

- Lack of knowledge and comprehension: Many Nepalese hydropower firms do not completely comprehend the significance of sustainable development practises or how they might help their business in the long run.
- Inadequate financial resources: Because Nepalese hydropower businesses are already operating on a shoestring budget, implementing sustainable development methods may prove difficult.
- Regulatory obstacles: It can be difficult for Nepalese hydropower businesses to embrace sustainable development practises due to regulatory obstacles and discrepancies in the regulatory environment.
- Inadequate technical proficiency: It's possible that some hydropower enterprises in Nepal lack the proficiency needed to adopt sustainable development strategies.
- Short-term focus: It can be difficult to emphasise sustainable development practises because many Nepalese hydropower businesses prioritise short-term gains above long-term sustainability.
- Lack of stakeholder engagement: It's crucial to involve stakeholders including local communities, NGOs, and government organisations in the process of sustainable development. The decision-making procedures of Nepalese hydropower corporations might not always engage stakeholders.
- Restricted financial access: It may be difficult for Nepalese hydropower firms to obtain financing for sustainable development initiatives, which might make it difficult to put sustainable practises into practise.

Overall, the research offers insightful information on the function of organisational culture in moderating the link between sustainable growth and transformational leadership in Nepalese hydropower enterprises. The results imply that through building a favourable company culture, transformational leaders may advance sustainable development. Future research could build on these findings by examining the role of other factors, such as employee engagement or innovation, in promoting sustainable development in organizations.

5 CONCLUSION

In conclusion, this study establishes a clear link between sustainable development methods in Nepalese hydropower companies and the presence of transformational leadership. The positive impact of sustainable development strategies, particularly in individual thought and inspirational motivation, is evident in enhancing organizational performance within the sector. The correlation of intellectual stimulation with sustainable development practices further emphasizes the critical role of transformational leadership. These results underscore the substantial contribution of transformational leadership to the advancement of sustainable development practices and overall organizational effectiveness in the Nepalese hydropower sector. Leaders who prioritize individual consideration, inspirational motivation, and intellectual stimulation are poised to guide their organizations toward embracing sustainable practices and nurturing a culture of sustainability.

In summary, this study holds significant implications for the adoption and implementation of sustainable practices in Nepal's hydropower sector. It highlights the necessity for businesses to focus on cultivating transformational leadership skills among their leaders as a strategic approach to encourage sustainable development practices and elevate organizational performance.

ABSTRACT

Climate change has caused significant transformations in disease profiles, especially in environmentally sensitive regions such as the Amazon. This chapter aims to analyze how climate changes have been influencing epidemiological dynamics in the region, highlighting impacts on infectious diseases, chronic conditions, and environment-related health issues, as well as discussing the role of multiprofessional teams in this context. This is a qualitative study developed through an integrative review of the scientific literature, based on recent national and international publications. The findings show that factors such as deforestation, wildfires, and changes in climate patterns have contributed to the expansion of vector-borne diseases, the worsening of chronic conditions, and increased vulnerability among Indigenous and riverine populations. The emergence of new health risks associated with environmental degradation is also observed. In this scenario, the importance of the integrated work of physicians, nurses, pharmacists, physiotherapists, nutritionists, dentists, and public health professionals in surveillance, prevention, and comprehensive care is emphasized. It is concluded that understanding the new disease profile in the Amazon is essential to guide public policies and strengthen health systems better prepared for global health challenges.

Keywords: Climate Change. Amazon. Disease Profile. Global Health. Multiprofessional Team.

RESUMO

As mudanças climáticas têm provocado transformações significativas no perfil de doenças, especialmente em regiões ambientalmente sensíveis como a Amazônia. Este capítulo tem como objetivo analisar como as alterações climáticas vêm influenciando a dinâmica epidemiológica na região, destacando os impactos sobre doenças infecciosas, crônicas e agravos relacionados ao ambiente, além de discutir o papel da equipe multiprofissional nesse contexto. Trata-se de um estudo de abordagem qualitativa, desenvolvido por meio de revisão integrativa da literatura científica, com base em publicações recentes nacionais e internacionais. Os achados evidenciam que fatores como desmatamento, queimadas e mudanças nos padrões climáticos têm contribuído para a expansão de doenças transmitidas por vetores, o agravamento de condições crônicas e o aumento da vulnerabilidade de populações indígenas e ribeirinhas. Também se observa a emergência de novos riscos à

saúde associados à degradação ambiental. Diante desse cenário, destaca-se a importância da atuação integrada de médicos, enfermeiros, farmacêuticos, fisioterapeutas, nutricionistas, cirurgiões-dentistas e profissionais da saúde coletiva na vigilância, prevenção e cuidado integral. Conclui-se que compreender o novo perfil de doenças na Amazônia é fundamental para orientar políticas públicas e fortalecer sistemas de saúde mais preparados para os desafios da saúde global.

Palavras-chave: Mudanças Climáticas. Amazônia. Perfil de Doenças. Saúde Global. Equipe Multiprofissional.

RESUMEN

El cambio climático ha provocado transformaciones significativas en el perfil de enfermedades, especialmente en regiones ambientalmente sensibles como la Amazonía. Este capítulo tiene como objetivo analizar cómo las alteraciones climáticas han influido en la dinámica epidemiológica de la región, destacando los impactos sobre enfermedades infecciosas, crónicas y afecciones relacionadas con el ambiente, además de discutir el papel del equipo multiprofesional en este contexto. Se trata de un estudio de enfoque cualitativo, desarrollado mediante una revisión integradora de la literatura científica, basada en publicaciones recientes nacionales e internacionales. Los hallazgos evidencian que factores como la deforestación, los incendios forestales y los cambios en los patrones climáticos han contribuido a la expansión de enfermedades transmitidas por vectores, el agravamiento de condiciones crónicas y el aumento de la vulnerabilidad de poblaciones indígenas y ribereñas. También se observa la aparición de nuevos riesgos para la salud asociados a la degradación ambiental. Ante este escenario, se destaca la importancia de la actuación integrada de médicos, enfermeros, farmacéuticos, fisioterapeutas, nutricionistas, odontólogos y profesionales de la salud pública en la vigilancia, prevención y atención integral. Se concluye que comprender el nuevo perfil de enfermedades en la Amazonía es fundamental para orientar políticas públicas y fortalecer sistemas de salud mejor preparados para los desafíos de la salud global.

Palabras clave: Cambio Climático. Amazonía. Perfil de Enfermedades. Salud Global. Equipo Multiprofesional.

1 INTRODUCTION

Climate change has been increasingly recognized as one of the greatest challenges to health in the twenty-first century. This phenomenon is not limited to isolated environmental changes, but involves profound transformations in ecosystems, ways of life, and the disease profile of populations. In this context, the Amazon occupies a strategic position, both for its ecological relevance and for its influence on the global climate balance. Recent studies indicate that environmental changes in the region already produce measurable impacts on human health, especially in more vulnerable populations (CHOWDHURY et al., 2024; ARTAXO et al., 2023).

The intensification of deforestation, fires and changes in land use has caused significant changes in the natural cycles of the Amazon. These transformations favor the increase in atmospheric pollution, the rise in local temperatures and the modification of rainfall patterns. As a result, there has been a gradual change in the epidemiological profile of the region, with an increase in infectious diseases, respiratory problems, and chronic conditions related to the environment (MARLIER et al., 2020; BUTT et al., 2021). This scenario reinforces the idea that climate change is not just an environmental problem, but a direct determinant of health.

In addition, the scientific literature has shown that climate change contributes to the expansion of climate-sensitive diseases, such as dengue, malaria, and other vector-borne diseases. Changes in temperature and humidity directly influence the reproduction of vectors and the circulation of infectious agents, increasing the risk of outbreaks and epidemics in different territories (LEE et al., 2021; LEAL FILHO et al., 2018).

In this context, the emergence and reemergence of infectious diseases associated with environmental transformations is also observed, especially those related to the interaction between humans, animals and ecosystems. Studies show that environmental changes in the Amazon favor the emergence of zoonoses and new patterns of disease transmission, reinforcing the relationship between environmental degradation and health risks (NAVA et al., 2017; BONILLA-ALDANA et al., 2019).

Another relevant aspect refers to the social inequalities present in the Amazon region. Indigenous communities, riverine communities, and vulnerable populations are disproportionately affected by the impacts of climate change. These populations face difficulties in accessing health services, in addition to depending directly on natural resources for their subsistence. Studies indicate that environmental degradation has contributed to the increase in diseases, food insecurity, and population displacement, increasing health inequities (ANDRADE et al., 2021; BRONDÍZIO et al., 2016).

Given this scenario, it is essential to understand how climate change is influencing the emergence and distribution of diseases in the Amazon. The literature points out that it is not only a matter of the increase in diseases already known, but of the transformation of the epidemiological profile, with the emergence of new health risks. This phenomenon requires responses that go beyond isolated approaches and consider the complexity of the environmental, social, and biological determinants involved (MOURÃO, 2025).

In this context, the performance of the multiprofessional health team assumes a central role. Doctors, nurses, pharmacists, physiotherapists, nutritionists, dentists and public health professionals are fundamental in the early identification of diseases, in clinical management and in the implementation of prevention and health promotion strategies. The integration of these professionals allows for a broader and more problem-solving approach, capable of responding to the challenges imposed by climate change (FERREIRA et al., 2023).

Thus, understanding the new disease profile associated with climate change in the Amazon becomes essential to guide public policies, strengthen health systems, and develop more effective care strategies. In view of this, this chapter aims to analyze the transformations in the epidemiological profile related to climate change in the Amazon and to discuss the challenges and possibilities of multiprofessional action in the face of this emerging scenario.

2 LITERATURE REVIEW

2.1 CLIMATE CHANGE AND GLOBAL HEALTH: AN INCREASINGLY EVIDENT RELATIONSHIP

In recent years, the relationship between climate change and health has ceased to be just a theoretical projection to become a concrete reality in different regions of the world. Rising temperatures, the intensification of extreme events, and changes in environmental patterns have directly influenced the occurrence of diseases and the organization of health systems. Recent studies indicate that these changes affect everything from infectious diseases to chronic diseases, increasing the complexity of health care (CHOWDHURY et al., 2024).

In addition, the literature highlights that the impacts of climate change do not occur in isolation, but interact with social, economic, and environmental determinants. This means that already vulnerable populations tend to suffer more intensely from the effects of these transformations. In this sense, understanding health within a broader perspective, which considers the environment as a central factor, becomes essential for facing contemporary challenges (BRONDÍZIO et al., 2016).

Another important point is that climate change has been altering the dynamics of diseases on a global scale. It is not only about an increase in cases, but about changes in the pattern of occurrence, geographic distribution, and intensity of diseases. This scenario reinforces the need for new health care models, more integrated and prepared to deal with these transformations.

2.2 AMAZON AND ENVIRONMENTAL TRANSFORMATIONS: DIRECT IMPACTS ON HEALTH

The Amazon has been deeply affected by processes of environmental degradation in recent decades, especially due to deforestation and fires. These changes not only compromise biodiversity, but also modify the natural cycles that directly influence climate and human health. Studies show that the reduction of forest cover interferes with rainfall and temperature patterns, creating favorable conditions for the emergence of new health risks (ARTAXO et al., 2023).

Fires, in particular, have been one of the main factors impacting the health of Amazonian populations. The release of air pollutants during these events contributes to the deterioration of air quality, mainly affecting children, the elderly, and people with chronic diseases. Research indicates that periods of higher fire intensity are associated with increased attendances and hospitalizations for respiratory problems (MARLIER et al., 2020).

In addition, environmental degradation can alter the dynamics of disease vectors and reservoirs, favoring the emergence and reemergence of infectious diseases. This phenomenon highlights the close relationship between environment and health, reinforcing the need for strategies that integrate environmental protection with public health actions.

2.3 CLIMATE CHANGE AND THE NEW DISEASE PROFILE

One of the most relevant aspects observed in the literature is the change in the epidemiological profile associated with climate change. In the Amazon, there is not only an increase in diseases that are already known, but also the expansion of diseases to areas where they were previously infrequent. Vector-borne diseases, such as dengue and malaria, have shown new distribution dynamics, influenced by climatic factors such as temperature and humidity (LEE et al., 2021; LEAL FILHO et al., 2018).

In addition, environmental changes have favored the emergence of infectious and zoonotic diseases, increasing the challenges for health systems. The literature highlights that the interaction between deforestation, biodiversity loss, and climate change contributes to the emergence of new infectious agents and to the reconfiguration of transmission patterns,

especially in tropical regions such as the Amazon (NAVA et al., 2017; BONILLA-ALDANA et al., 2019).

Another important point is that climate change also influences the behavior of chronic diseases and non-communicable diseases. Exposure to high temperatures, environmental pollutants, and extreme events can aggravate cardiovascular, respiratory, and metabolic conditions, increasing the demand for health services. In addition, factors such as food insecurity and changes in lifestyles directly impact the nutritional status and general health of populations, reinforcing that the new disease profile associated with the climate is multifactorial and requires an integrated approach.

2.4 SOCIAL VULNERABILITY AND AMAZONIAN POPULATIONS

Populations living in the Amazon, especially indigenous and riverine communities, are more vulnerable to the effects of climate change. This occurs both due to direct exposure to environmental impacts and difficulties in accessing health services. Studies show that these populations face challenges related to food insecurity, environmental pollution, and the occurrence of infectious diseases (ANDRADE et al., 2021).

In addition, dependence on natural resources makes these communities more sensitive to environmental changes. Changes in rainfall cycles and food availability can compromise food and nutritional security, directly impacting health. This scenario highlights the need for care strategies that consider the cultural and social specificities of these populations.

Another relevant aspect is the expansion of health inequalities. Climate change tends to aggravate existing conditions, making the need for public policies aimed at equity and access to health services even more evident.

2.5 THE ROLE OF THE MULTIPROFESSIONAL TEAM IN THE FACE OF CLIMATE CHANGE

Given the complexity of the impacts of climate change on health, the work of the multiprofessional team becomes fundamental. Doctors are responsible for diagnosing and treating diseases, while nurses work in patient monitoring and health education. Pharmacists contribute to the safe use of medicines, especially in chronic diseases aggravated by environmental factors (FERREIRA et al., 2023).

Physiotherapists play an important role in the rehabilitation of patients with respiratory and cardiovascular diseases, while nutritionists work to promote food safety and prevent

nutritional problems. Dentists also contribute to integral health, considering that environmental factors can influence systemic and oral conditions.

In addition to these professionals, the work of specialists in collective health and social sciences is essential to understand the social determinants of health and develop more effective intervention strategies. The integration between these different areas allows for the construction of more complete responses adapted to the needs of the populations.

2.6 COPING STRATEGIES AND CHALLENGES FOR HEALTH SYSTEMS

The literature points out that addressing the impacts of climate change on health requires the construction of integrated strategies between different sectors. Environmental preservation, the strengthening of epidemiological surveillance, and the expansion of access to health services are fundamental elements in this process. Initiatives aimed at reducing deforestation and controlling fires have a direct impact on improving the health conditions of populations (VIANA, 2020).

In addition, health systems need to adapt to the new demands imposed by climate change. This includes the training of professionals, the reorganization of services and the strengthening of primary care. The integration between health and the environment becomes essential for the construction of more effective and sustainable responses.

Finally, the literature reinforces that the challenges imposed by climate change require a paradigm shift in the way health care is thought about and organized. Adopting a more integrated approach, which considers environmental, social, and biological factors, is critical to addressing current and future challenges related to global health.

3 METHODOLOGY

3.1 STUDY DESIGN

This chapter was developed from a qualitative approach, with a theoretical-analytical character, based on an integrative review of the scientific literature. This method was chosen due to the need to understand, in a broader and critical way, the relationships between climate change, environmental transformations in the Amazon and the new profile of diseases, also considering the performance of the multiprofessional team in the face of these challenges. Integrative review allows for the gathering of different types of studies and the construction of a more sensitive and contextualized analysis, respecting the complexity of the topic.

Unlike strictly quantitative reviews, this study sought to interpret the phenomena from multiple perspectives, valuing not only epidemiological data, but also social, environmental,

and organizational aspects of health. This approach enables a closer understanding of the reality experienced by Amazonian populations.

3.2 SEARCH STRATEGY AND DATA SOURCES

The search for evidence was carried out in internationally recognized databases, selected for their relevance and consistency in scientific production in health and the environment. The following sources were used:

- PubMed/MEDLINE
- Scopus
- Web of Science
- SciELO
- Virtual Health Library (VHL/LILACS)
- Google Scholar

These databases were chosen because they bring together high-impact studies in the areas of global health, epidemiology, climate change, and environmental health.

For the search, descriptors in Portuguese and English were used, combined by Boolean operators (AND and OR), in order to increase the sensitivity and specificity of the results. Among the main terms used, the following stand out:

- Climate change
- Amazon
- Global health
- Disease profile
- climate change
- Amazon
- Global Health
- emerging diseases
- environmental health

The combination of these terms allowed us to identify studies aligned with the objective of the chapter, focusing on the relationships between environment, climate, and health.

3.3 INCLUSION AND EXCLUSION CRITERIA

Scientific articles published in peer-reviewed journals, institutional documents, and relevant studies that addressed:

- Health impacts of climate change
- environmental transformations in the Amazon
- Changes in the epidemiological profile of diseases
- Relationships between the environment and infectious or chronic diseases
- Multiprofessional approaches in health

Studies available in Portuguese, English and Spanish, with access to the full text, were also considered.

Studies that did not have a direct relationship with the theme, exclusively technical studies without application in health, duplicate publications, and articles without full access were excluded.

3.4 ANALYSIS PERIOD

The selection of studies prioritized publications between 2016 and 2025, a period that concentrated important advances in scientific production on climate change and health. However, studies considered fundamental for understanding the theme were also included, even if they were prior to this time frame.

3.5 PROCESS OF SELECTING AND ORGANIZING DATA

After the initial search, the studies were submitted to a screening based on the reading of titles and abstracts. Then, the selected articles were read in full, allowing us to assess their relevance to the objective of the chapter. At the end of this process, 15 main scientific references were included, considered adequate to support the proposed discussion.

The information extracted was organized in a thematic way, allowing the analysis to be structured in central axes, such as:

- Climate Change and Global Health
- environmental impacts in the Amazon
- New disease profile
- Vulnerability of populations
- Multiprofessional performance in health

This organization facilitated the construction of a coherent and integrated narrative, connecting different dimensions of the phenomenon studied.

3.6 ANALYSIS AND SYNTHESIS OF EVIDENCE

The analysis of the studies was carried out in an interpretative way, seeking to identify convergences, divergences and gaps in the scientific literature. The synthesis of the evidence was constructed in a narrative manner, prioritizing clear, fluid writing that is close to the practical reality of health.

This stage allowed for the integration of different scientific perspectives, promoting a more complete understanding of the impacts of climate change in the Amazon and its implications for global health. The approach adopted sought to value interdisciplinarity and the articulation between different areas of knowledge.

3.7 SCIENTIFIC RIGOR

Methodological rigor was ensured by the selection of studies from recognized databases, by the use of clear inclusion and exclusion criteria, and by the critical analysis of the evidence. The diversity of the sources allowed different approaches to be contemplated, strengthening the consistency of the chapter.

In addition, it sought to maintain fidelity to scientific evidence, avoiding generalizations and ensuring that interpretations were aligned with the data presented in the studies analyzed.

3.8 ETHICAL ASPECTS

As this was a study based exclusively on secondary data from the scientific literature, there was no need to submit it to the Research Ethics Committee. All sources used were duly cited throughout the chapter, respecting the ethical principles of scientific production and ensuring transparency and academic integrity.

4 RESULTS AND DISCUSSION

The analysis of the selected studies reveals that climate change has caused concrete changes in the profile of diseases in the Amazon, evidencing an epidemiological transition influenced by environmental factors. Unlike previous scenarios, in which certain diseases had a more predictable behavior, a more complex dynamic is currently observed, marked by the coexistence of infectious diseases, chronic diseases, and conditions related to environmental degradation. This phenomenon has been mainly associated with changes in land use, the increase in fires, and the intensification of climate variations (ARTAXO et al., 2023; CHOWDHURY et al., 2024).

Among the main findings, the increase in the incidence of climate-sensitive diseases, especially those transmitted by vectors, stands out. Studies show that changes in temperature and humidity favor the proliferation of vectors such as mosquitoes, directly impacting the occurrence of diseases such as dengue, malaria and other arboviruses. In addition, these changes contribute to the geographic expansion of these diseases, reaching previously less affected areas (LEE et al., 2021; LEAL FILHO et al., 2018). This new epidemiological pattern imposes additional challenges on health surveillance and the planning of preventive actions.

Another relevant result refers to the impact of fires on the health of populations. The literature shows that exposure to smoke from forest fires is associated with an increase in respiratory and cardiovascular diseases, and worsening of chronic conditions. During periods of greater intensity of fires, there is a significant increase in the demand for health services, especially among children and the elderly, groups considered more vulnerable to the effects of air pollution (MARLIER et al., 2020; YE et al., 2021). This scenario highlights the direct relationship between environmental events and overload of health systems.

In addition to infectious and respiratory diseases, studies also indicate an increase in health problems related to environmental stress, including cardiovascular problems and impacts on mental health. Situations such as food insecurity, loss of territory, and extreme weather events have been associated with increased anxiety, psychological distress, and other mental health-related conditions, especially in more vulnerable populations (MOURÃO, 2025). This aspect further broadens the understanding of the impact of climate change, showing that its effects go beyond the physical dimension of health.

The vulnerability of Amazonian populations appears as one of the central elements in the discussion of the results. Indigenous and riverine communities are particularly affected, both by direct exposure to environmental impacts and by limitations in access to health services. Studies indicate that these populations face greater difficulties in coping with diseases, due to factors such as geographic isolation, social inequalities, and the fragility of health care networks (ANDRADE et al., 2021; BRONDÍZIO et al., 2016). This context reinforces the need for public policies that consider the territorial and cultural specificities of the region.

In this scenario, the performance of the multiprofessional health team is essential. The results indicate that effective responses to changes in the profile of diseases depend on the integration between different areas of knowledge. Doctors and nurses work directly in the diagnosis and clinical management, while pharmacists contribute to safe therapeutic follow-up. Physiotherapists play an important role in the rehabilitation of patients with respiratory

and cardiovascular diseases, and nutritionists work to prevent problems related to food insecurity and malnutrition (FERREIRA et al., 2023).

In addition, the work of professionals in the public health and social sciences is essential to understand the social determinants of health and develop more effective intervention strategies. The integration of these different areas allows us to build more complete responses, capable of dealing with the complexity of the impacts of climate change on health.

The discussion of the results also highlights the need to strengthen health systems in the face of the new demands imposed by climate change. The expansion of epidemiological surveillance, the qualification of professionals and the reorganization of health services are essential measures to ensure faster and more effective responses. In addition, public policies aimed at environmental protection, such as the control of deforestation and fires, play a fundamental role in reducing negative impacts on health (VIANA, 2020).

Overall, the findings indicate that climate change in the Amazon not only increases the occurrence of diseases, but also profoundly transforms the epidemiological profile of the region. This process requires a change in the way of thinking and organizing health care, valuing integrated and multiprofessional approaches. The construction of strategies that articulate health, environment and public policies becomes essential to face current and future challenges, ensuring better living conditions for Amazonian populations and contributing to global health.

5 CONCLUSION

The analysis developed in this chapter shows that climate change in the Amazon has caused profound transformations in the profile of diseases, configuring an increasingly complex scenario for public health. It is not only a matter of the increase in already known diseases, but of a reconfiguration of the epidemiological pattern, marked by the coexistence of infectious diseases, chronic conditions, and environment-related conditions. This new context reinforces that the climate crisis must also be understood as a health crisis, with direct impacts on the lives of populations.

The results indicate that factors such as deforestation, fires, and changes in natural cycles have contributed significantly to the emergence and intensification of climate-sensitive diseases. At the same time, these processes amplify existing social vulnerabilities, especially among indigenous populations, riverside dwellers, and communities in situations of greater socioeconomic fragility. In this way, climate change not only influences health, but also deepens inequalities, requiring fairer and more contextualized responses.

In this scenario, the performance of the multiprofessional health team becomes indispensable. The complexity of the diseases requires an integrated approach, in which physicians, nurses, pharmacists, physiotherapists, nutritionists, dental surgeons and public health professionals act in an articulated manner. This integration allows not only the clinical management of diseases, but also the development of strategies for prevention, health promotion, and epidemiological surveillance that are more effective and sensitive to local realities.

In addition, the findings reinforce the need to strengthen health systems, especially in primary care, which plays a central role in the early identification of diseases and in the follow-up of populations. Investing in professional qualification, expanding access to services, and integrating health and the environment is essential to respond to the new demands imposed by climate change.

Another essential point concerns the importance of intersectoral public policies. The protection of the Amazon, the control of fires and the preservation of ecosystems are not only environmental measures, but fundamental strategies for health promotion. The articulation between environmental, social and health policies is indispensable to face current challenges and reduce future impacts.

In this context, it is concluded that understanding and facing the new profile of diseases in the Amazon requires a change of perspective, which recognizes the interdependence between environment, society and health. The construction of effective responses necessarily involves the integration between science, professional practice and public policies, valuing multiprofessional care and sustainability as fundamental pillars for global health.

ABSTRACT

Discomfort related to the color and shape of teeth has become one of the main reasons patients seek rehabilitative treatment. Therefore, it is particularly challenging when the teeth involved in this disharmony are anterior. The diagnosis of the type of stain will determine the technique that the dentist should use. The choice of material, planning, and execution criteria are extremely important for the success of the procedure. The present study aims to report a clinical case of a patient who attended a dental office in the city of Sobral, Ceará, with an aesthetic complaint. This research adopts a qualitative approach, without a control group, of a narrative nature, with a descriptive and observational purpose, based on a single clinical case sample to be studied. The bibliographic search was carried out in the PubMed, SciELO, and Google Scholar databases, related to the restorative technique for darkened teeth using ceramic veneers. The descriptors used were: “tooth whitening,” “dental trauma,” “dental porcelain,” and “endodontics.” The clinical case concerns a 35-year-old female patient, systemically healthy, who attended the dental office complaining about the color and size of her anterior teeth. After a detailed anamnesis, clinical and radiographic examinations, and the patient’s medical history, endodontic treatment was observed in tooth 11, along with coronal discoloration and disharmony in the height/width proportion of teeth 13, 12, 11, 21, 22, and 23. Subsequently, ceramic rehabilitation using lithium disilicate veneers was

RESUMO

O desconforto atrelado à coloração e formato dos dentes tornou-se uma das grandes procuras por tratamento reabilitador. Portanto, é desafiador, especialmente quando os dentes envolvidos nessa desarmonia são anteriores. O diagnóstico do tipo de mancha irá indicar a técnica que o cirurgião dentista deverá utilizar. A escolha do material, o planejamento e os critérios na execução são de extrema valia para o sucesso do procedimento. O presente estudo tem como objetivo relatar um caso clínico de uma paciente que compareceu ao consultório odontológico, na cidade de Sobral-Ceará, com queixa estética. Essa pesquisa apresenta uma abordagem do tipo qualitativa, sem grupo de controle de caráter narrativo, que tem finalidade descritiva e observacional, de amostra única de um caso clínico a ser estudado. As buscas bibliográficas foram realizadas nas bases de dados PubMed, SciELO, Google Acadêmico, relacionados à técnica restauradora de dentes escurecidos com facetas cerâmicas. Os descritores utilizados foram: “clareamento dentário”, “traumatismo dentário”, “porcelana dentária” e “endodontia”. O caso clínico trata-se de uma paciente do sexo feminino, 35 anos de idade, normossistêmica, que compareceu ao consultório odontológico, queixando-se da cor e do tamanho dos dentes anteriores. Após anamnese detalhada, exames clínicos, radiográficos e história pregressa da paciente, foi observado tratamento endodôntico no elemento 11, escurecimento coronário, além de desarmonia entre a proporção altura/largura dos elementos 13, 12, 11, 21, 22 e 23, e posteriormente foi realizada reabilitação cerâmica de dissilicato de lítio do tipo faceta nesses elementos dentários e coroa metal free total mais faceta no elemento 11.

RESUMEN

La incomodidad relacionada con el color y la forma de los dientes se ha convertido en una de las principales razones por las que los pacientes buscan tratamiento reabilitador. Por lo tanto, resulta especialmente desafiante cuando los dientes involucrados en esta desarmonía son anteriores. El diagnóstico del tipo de mancha indicará la técnica que el odontólogo deberá utilizar. La elección del material, la planificación y los criterios de ejecución son de suma importancia para el éxito del procedimiento. El presente estudio tiene como objetivo reportar un caso clínico de una paciente que acudió a una consulta odontológica en la ciudad de Sobral, Ceará, con una queja estética. Esta investigación presenta un enfoque cualitativo, sin grupo de control, de carácter narrativo, con finalidad descriptiva y observacional, basada en una muestra única de un caso clínico a ser estudiado. La búsqueda bibliográfica se realizó en las bases de datos PubMed, SciELO y Google Académico, relacionadas con la técnica restauradora de dientes oscurecidos mediante carillas cerámicas. Los descriptores utilizados fueron: “blanqueamiento dental”, “traumatismo dental”, “porcelana dental” y “endodoncia”. El caso clínico corresponde a una paciente de sexo femenino, de 35 años, sistémicamente sana, que acudió a la consulta odontológica quejándose del color y tamaño de los dientes anteriores. Tras una anamnesis detallada, exámenes clínicos, radiográficos y la historia previa de la paciente, se observó tratamiento endodóntico en el diente 11, oscurecimiento coronario y desarmonía en la proporción altura/ancho de los dientes 13, 12, 11, 21, 22 y 23. Posteriormente, se realizó rehabilitación cerámica con carillas de disilicato de litio en estos elementos dentarios, además de una corona total libre de metal junto con carilla en el diente 11.

1 INTRODUCTION

Overestimating the aesthetic standards imposed by the media resulted in the search for a standard of beauty representative of professional, economic, and social success (BISPO, 2018). In this sense, it is known that dental aesthetics is directly linked to the patient's well-being and there are several ways to correct problems related to alignment, symmetry, position, texture. Among the elements that make up the aesthetics of the smile, the color of the teeth is the one that most bothers the individual (GRESNIGT; KALK; OZCAN, 2012).

Alves Rezende and Fajardo (2016) explain that progress, the circulation of new operative techniques and new dental materials have opened an important direction for aesthetics and health in the field of dentistry by both professionals and patients.

Therefore, according to today's aesthetic premises, discomfort with tooth color is, without a doubt, one of the main reasons that leads patients to seek a more harmonious smile (BARBOSA; NERES; AMARAL, 2021).

It is known that color is a complex and subjective phenomenon, which can be captured in different ways, depending on the object, source of lighting and the observer. In addition, tooth color is affected by several factors, such as enamel morphology and thickness, light, presence of pigmentation characterized by intrinsic and extrinsic factors, and the amount of dentin eventually exposed (SHEN; RAWLS; ESQUIVEL-UPSHAW, 2023).

As the tooth ages, there is a decrease in the size of the pulp chamber, a characteristic of this course, leading to the deposition of secondary dentin, modifying the color of the dental substrate to a darker tone. In addition, the association of abrasion and erosion processes causes a reduction in the amount of enamel, gradually transmuting the evident color of the underlying dentin (BEGUM et al., 2014).

Tooth pigmentations of intrinsic causes can be defined and localized, confined to the region of a single tooth element. Its causes are: trauma to developing teeth, periapical infection, trauma to the deciduous tooth, pigmentation by amalgam or inadequate endodontic treatment. In addition, they can also be generalized, dispersed throughout the crown of one or several teeth, among them are: amelogenesis imperfecta, dentinogenesis imperfecta; 12 accompanied by systemic disorders. There are also postnatal causes, such as infections, drug therapy, nutritional deficiencies, and hematopoietic diseases (BISPO, 2018).

Thinking about the correction of these types of dental stains, new materials, techniques and protocols are made available to the dental surgeon, bringing new techniques to mask unwanted substrates, resulting in restorations that appear close to the natural tooth (BASEGIO, 2018).

Tooth whitening is a technique that can be exemplified as conservative, developed to

improve the appearance of the smile through changes in dental nuances, being considered a non-invasive and low-cost method (VASCONCELOS; NILLIO, 2021).

In addition, currently, there is a diversity of ceramic systems available for both aesthetic and functional rehabilitation. However, there is no single all-ceramic system that can be used in all clinical situations (ZÜGE, 2018).

An integral adhesion between ceramic materials and the tooth structure can be obtained through adhesive cementation, which promotes mechanical integration of the system, contributing to its resistance to fracture. In addition, there was a need for improvements in adhesive dentistry and computer-aided technologies, which made it possible to describe various treatment options for the rehabilitation of anterior teeth, such as crowns, veneers, laminates, among others (GUNDOGDU; ALADAG, 2018).

However, the elevation of patients' aesthetic expectations to achieve good results in anterior teeth requires materials with optical properties similar to natural teeth, making rehabilitation more imperceptible (DANESHPOOY, 2019).

Given the above, it is presented how the analyzed clinical case will enable an aesthetic rehabilitation of darkened and heterogeneous dental substrates, using the technique of double cementation of personalized ceramic copings associated with ceramic veneers.

2 OBJECTIVES

2.1 GENERAL OBJECTIVE

OBJECTIVE: To report a clinical case of rehabilitation using the double cementation technique in anterior teeth, with the association of personalized ceramic coping and ceramic veneer, as an aesthetic solution for masking dental substrates of different colors.

2.2 SPECIFIC OBJECTIVES

- a) To highlight the etiology of tooth darkening;
- b) To address the main techniques for aesthetic restoration in darkened teeth;
- c) Report the clinical and operative steps of the double cementation technique of ceramic custom copings

3 THEORETICAL FRAMEWORK

3.1 DENTAL AESTHETICS

Cosmetic dentistry is expressed as a very representative division in modern dentistry, through which the importance given by patients to achieving an aesthetically promising smile is increasingly verified. In addition, the search for a standard of beauty pre-established by

society in which the appearance of the smile must be a real reproduction of natural teeth is notorious (FRADEANI, 2007 apud OLIVEIRA et al., 2019).

However, it is known that dental aesthetics is a crucial reason to achieve a smile considered beautiful and harmonious, and it is essential to determine some parameters, such as the size and shape of the teeth, to establish the formation of a dentofacial pattern. Another important criterion is the golden ratio, which can be applied as a system of aesthetic predictions, whose objective is to work on the harmony between the size and width of the teeth. Therefore, many studies suggest it as an aesthetic criterion that serves to restore and reproduce the previous and superior elements (PONTANEGRA et al., 2022).

Another important factor to be considered in the analysis of the smile is gingival aesthetics, which often requires surgical interventions, such as gingivoplasty and/or gingivectomy, in order to provide an enlargement of the dental clinical crown and correct the proportion displayed in the smile (BARROS et al., 2018). The balance between white aesthetics and red aesthetics is the secret to success in rehabilitation treatments. Thus, it is essential to use interdisciplinary protocols in the various areas of dentistry, especially in periodontics and dentistry, which are connected to treatments for aesthetic purposes (VIEIRA et al., 2018).

Therefore, there are several factors that alter dental aesthetics, including its change in shape, such as trauma; color change due to the state of pulp vitality; use of drugs; diet; pigmentation by filling materials; aging; pulp hemorrhages and surface alterations, such as dental malformation, fluorosis, amelogenesis imperfecta, among others (BARBOSA; NERES; AMARAL, 2021).

3.2 ETIOLOGY OF TOOTH DARKENING

Tooth darkening occurs due to natural aging of the teeth or by factors called intrinsic or extrinsic (TREVISAN et al., 2018). In addition, it has a negative effect on an individual's well-being, especially when it comes to a previous element. In this case, it is common for patients to seek professional help, aiming for a harmonious and satisfactory result (FAGOGENI et al., 2019).

Variation in tooth pigmentation is a common objection of people and has a multifactorial etiology. Of the intrinsic type, it results from odontogenesis, fluorosis, dental weakening as a result of the generation of repairing dentin, trauma, pulp necrosis, among other factors; the extrinsic type is caused by environmental or behavioral factors: smoking, consumption of products with dyes such as coffee, wine, tea, and even the use of medications (BANDÉCA et al., 2010; COSTA et al., 2020; DONATO, 2017).

It is important to note that congenital intrinsic spots are due to dentinogenesis imperfecta, amelogenesis imperfecta, and fluorosis. Acquired lesions, on the other hand, are subdivided into pre-eruption, such as those caused by the use of tetracycline, and posteruptive, such as those resulting from trauma; as well as those of iatrogenic causes, due to the inappropriate use of some root canal filling materials or the performance of metal restorations (CAMARGO et al., 2019).

Another situation is when the endodontic access to the crown is insufficient, generating a grayish stain, caused by necrotic residues of pulp in this region (CAMPAGNOLI; JUNIOR; 2008).

Thus, the change in tooth color is considered an aesthetic difficulty that results mainly from the incomplete removal of pulp tissue during endodontic treatment or even from the prolonged use of some intracanal materials, such as medications used between sessions and also by trauma injuries. Likewise, the color variation occurs due to the rupture of blood vessels, leading to hemorrhage in the pulp chamber, where there is a change in the color of the crown caused by the entry of blood components into the dentin tubules (OLIVEIRA et al., 2019).

The prognosis for rehabilitation of darkened anterior teeth depends on the time in which the trauma occurred, the intervention, the restorative technique chosen, and therefore the extent of the preparation (SILVA et al., 2019).

It is known that pigmented teeth can cause discomfort when smiling and introversion for the patient. However, the treatment for these cases is still complex and involves a precise analysis and understanding of their etiology (BARBOSA; NERES; AMARAL, 2021; DONATO et al., 2017; SILVA NETO et al., 2020).

3.2.1 Dental Trauma

Dental trauma follows a major impact on the teeth, which can lead to injuries to intraoral and extraoral structures, hard and soft tissues, causing from tooth displacement, deformation of the supporting tissues, to fracture of the affected tooth. In this context, dental injury usually happens either occasionally, unexpectedly, or accidentally, and may require emergency care (DANG et al., 2015).

However, those that involve the anterior dental elements influence the function and aesthetics of the individual, affecting their behavior. It becomes an occurrence that goes beyond dentistry and endodontics, being able to include other dental specialties, such as surgery, periodontics, prosthetics and orthodontics (VASCONCELLOS; MARZOLA; GENU 2006).

Therefore, dental trauma is an objection in global public health, caused mainly in children, adolescents, and young adults (LEVIN et al., 2020). Pulp tissue can go through a process called dystrophic calcification, when there is not enough blood and there is the presence of ischemic and necrotic tissues, and can reach the entire length of the tissue, obliterating the entire pulp cavity, leaving the tooth with a dark color of varying nuances (MILESKI et al., 2018).

Therefore, there are diversified options to camouflage teeth with darkened substrates, for example, the use of teeth whitening, composite resins and the use of ceramics. Thus, it is up to the dental surgeon to choose the most appropriate material, following its indications, contraindications, and mastery of the technique (CORDEIRO, 2021).

3.2.2 Endodontic Treatment

According to Mandras et al. (2013), endodontic treatment aims to clean and shape the root canal, favoring the removal of infected or necrotic live pulp, reducing the amount of microorganisms and their by-products present.

Regarding endodontic therapy, according to Tour Savadkouhi and Fazlyab (2016), the main causes of the change in tooth color and structure are the filling materials. This is due to its incorporation into the dentin tubules (RABELO et al., 2022).

However, the variation in tooth color generated after endodontic treatment is a challenge to clinical practice and an inconvenience to the patient, due to the undesirable appearance, especially in anterior teeth (BOSENBECKER, 2020).

When the cause of the darkening is due to dental trauma, Marin, Bartold, and Heithersay (1997) report that enamel pigmentation by blood components possibly becomes more expressed with long-term display. Even if enamel does not have tubular morphology, its organic structural characteristics at the dentin-enamel junction may play a role in the staining process.

3.3 TEETH WHITENING

According to Bispo (2018), tooth whitening is a procedure based on scientific evidence that seeks to combat undesirable agents related to color changes of extrinsic or intrinsic cause. Its objective is based on the use of substances that have a high potential for oxygen release through an oxidation reaction of collagen fibers, which occurs due to the oxidation process of organic pigments present in teeth. Whitening agents release oxygen molecules that break down these pigments responsible for tooth stains, thus leading to discoloration of these compounds and resulting in teeth whitening (FIORILLO et al., 2019).

The most commonly used bleaching agents are hydrogen peroxide, carbamide peroxide, and sodium perborate (BANDÉCA et al., 2010; CARDOSO et al., 2011; MARTINS et al., 2009). They are mainly indicated for pigmentation of extrinsic origin, as previously mentioned, arising from pigments present in food and beverages, chromogenic or chromogenic bacteria, tobacco tar and chemical products (BISPO 2018).

The whitening process can be carried out both in the office, by the dental surgeon, applying higher concentrations of hydrogen peroxide or 18 carbamide, and at home, using individual trays with the same bleaching agents at lower concentrations (ALMEIDA et al., 2021; RODRIGUES et al., 2018); or even the combination of the two types of procedures (CAMARGO et al., 2021).

According to Vasconcelos and Nillio (2021), regarding the advantages, it is stated that regardless of the method chosen, tooth whitening is the most careful, economical and regularly used option to solve patients' concerns regarding tooth pigmentation and is very effective in modifying the value of the tooth.

However, it is a technique that requires correct indication and a thorough clinical evaluation, as it has as contraindications the presence of caries, supragingival stones, gingivitis, periodontitis, root exposures, among others. The procedure is also not recommended for children under 18 years of age or for pregnant and breastfeeding women, according to the Council of European Dentists (CED) (VASCONCELOS; NILLIO, 2021).

3.3.1 Internal Whitening

For Maran et al. (2018), endogenous whitening is a choice for teeth that have undergone endodontic treatment, inserting the whitening substances inside the pulp chamber, which can be used in three ways: mediate, immediate, or mixed.

According to De Geus (2018), in the mediate technique, the patient remains with the product inside the pulp chamber for a period of three to seven days, changing it until the desired color is obtained. In the second method, the bleaching agent is applied both inside the pulp chamber and on the buccal surface of the element, obtaining the result soon after the completion of the procedure in a single session. In the mixed process, the two techniques mentioned above are united.

Mediate internal whitening was a widely applied technique due to its minimally invasive characteristic, however, it had some possible side effects, such as external cervical resorption and color recurrence (CARDOSO et al., 2011).

According to Bispo (2008), the effects of pulp tissue decomposition, caused by dental trauma or necrosis, would be the main indication of this technique, as it obtained satisfactory

results in 95% of cases. This happens because the 19 stain comes from the premature destruction of red blood cells, promoting yellowish-brown coloration, originating from the concomitant production of ferrous sulfate in the dentin tubules.

Therefore, another option for the mediate technique would be: sodium perborate with 35% carbamide peroxide (approximate values of 10-12% hydrogen peroxide), in which the release of peroxide radicals is less severe and slower, when compared to the mixture with hydrogen peroxide. In this way, sodium perborate decomposes into sodium metaborate, hydrogen peroxide, and oxygen, thus creating the expected whitening effect (BISPO 2018).

3.3.2 External Whitening

External whitening is more indicated for vital teeth, through office techniques that apply hydrogen peroxide or carbamide peroxide on tooth surfaces, or through the home technique, in which an individual tray is made using the same agents in lower concentrations (BANDÉCA et al., 2010; CARDOSO et al., 2011; MARTINS et al., 2009; RODRIGUES et al., 2018).

Idealized by Ames (1937), according to Marson, Sensi and Arruda (2008) and Azevedo (2009), the bleaching agents used are hydrogen peroxide with its concentrations varying between 6%, 7.5%, 10%, 30%, 38% and 40%, and carbamide peroxide, changing its concentrations between 10%, 16%, 22%, 35% and 37%.

In office whitening, the technique is performed in one or three clinical sessions, with hydrogen peroxide or carbamide solutions, applied to the teeth, most commonly used at a concentration of 35% for the time recommended by the manufacturer. As disadvantages, care must be taken, as hydrogen peroxide is highly oxidizing and harmful to soft tissues when used in large concentrations. Therefore, the gums, tongue and cheeks must be protected by means of retractors and physical barriers (VAZ et al., 2016).

There are 3 forms of presentation on the market, manual mixing with heat blocker, for the use of light sources during the procedure; another of mechanized mixing, which is done by means of 2 syringes attached; and, finally, the double syringe, with its self-mixing tip that only activates the amount sufficient for application (REIS, 2021). 20 For home whitening, a whitening gel based on carbamide peroxide is used with percentages of 10%, 16%, 22% and 35%, or hydrogen peroxide of 6%, 7.5% and 10% (BISPO, 2018).

Its technique consists of the use of individual trays, with which the patient applies the gel himself. Therefore, it is essential that the patient collaborates for an ideal result during treatment (BARBOSA et.al., 2017). The instructions for use of the product should follow the manufacturer's recommendations, which sometimes advises two applications a day lasting between 30 minutes and 2 hours, or one application, depending on the product's interval.

Treatment can last from 2 to 6 weeks. The patient should be instructed on how to place the whitening gel on the trays and how to remove excess (RODRIGUEZ; MARTINEZ, et.al., 2018).

It is worth noting that even considered a safe procedure, whitening may have side effects, such as tooth sensitivity, in addition to little predictability of the final result (BEGUM et al., 2014).

3.4 COMPOSITE RESIN VENEERS

Veneers are defined by the covering of the buccal surface of the dental element by a restorative material, connected to the tooth, which can be made in two ways, by the direct or indirect technique (MAGNE; BELSER, 2003). They are indicated for deficient corrections after orthodontic treatment, such as in cases of congenital disabilities and acquired aesthetic deficiencies, as well as for discolorations, diastemas, abfraction injuries, abrasion and erosion, dental fractures, caries and functional defects (DIETSCHI, 2008).

Despite the many advantages of resins, there are still difficulties when selecting their color. This step is considered essential in restorative success, however, if the anatomical shape is not correct, the result will not seem natural and harmonious either (PONTONS-MELO; FURUSE; MONDELLI, 2011).

Nahsan et al. (2012) ensure the practice of preserving the dental structure, especially in young patients such as children and adolescents, since with each restoration change, which is inevitable throughout the patient's life, there is a healthy tooth loss, inexorable to its practice. Therefore, the first composite resin restoration should be as conservative as possible, avoiding complex costs and treatments in the future.

Aesthetic flaws are one of the main reasons for changing resin restorations. Not only is it necessary to mimic tooth coloring with resin color at the time of restoration, but also that this set maintains its aesthetic properties over time (SCHULZE et al., 2003).

3.5 CERAMIC LAMINATES

Ceramic Laminates are considered an aesthetic method, with appropriate optical properties and correlated with good mechanical resistance, as well as having a high biocompatibility. In this sense, the use of this material is considered one of the preferable treatment alternatives, aiming at modifying the hue and shape of the anterior teeth with aesthetic compromise, such as fractured, darkened or poorly positioned teeth in the arch (KANDIL et al., 2019).

Thus, with the technological development in the area of ceramics and cementing

agents, it is plausible to achieve restorations very similar to natural teeth (TURGUT; BAGIS, 2013).

In this context, the search for aesthetic materials that resemble the natural characteristics of the teeth has made dental ceramic systems improve more and more, and are currently highly demanded in offices, due to their characteristics and clinical performance. Therefore, the daily use of ceramic restorations to reestablish aesthetics in dental clinics is evident (SANTOS; COSTA, 2019).

Currently, ceramics are the crucial alternative restorative material for previously destroyed tooth structure, due to their properties, such as: compressive strength, thermal conductivity, radiopacity, marginal integrity, hue stability and biomimicry (CORDEIRO; MONTEIRO, 2021).

According to Almeida and Silva (2011), lithium disilicate-based ceramics are a great possibility to mask the darkened substrate, since it has good properties in relation to chroma in small thicknesses, excellent mechanical properties.

Santos and Costa (2019) emphasize another important point to be considered, the correct indication of the different types of pure ceramic systems available on the market. To do this, the dentist must understand the main differences between crowns, veneers, lenses, and ceramic laminates, thus reaching the minimum thickness required for these indirect restorations for aesthetic and functional results.

Depending on the variations of substrate in the tooth, a correct selection of the thickness of the ceramic, as well as the color of the cement, is essential for better aesthetic results (VASCONCELOS; NILLIO, 2021).

An important piece of information highlighted by Alothaman and Bamasoud (2018) is that porcelain veneers enable excellent aesthetic results, longevity and patient satisfaction.

Vargas, Bergeron and DiazArnold (2011) explain the classification of ceramic systems, according to the composition of their matrix, into: Glassy Ceramics, Feldspar Ceramics, Glassy Ceramics Infiltrated by Crystalline Particles, Leucite Reinforced Ceramics, Lithium Disilicate Reinforced Ceramics, Crystalline/Polycrystalline Ceramics, Alumina Reinforced Polycrystalline Ceramics and Zirconia Reinforced Polycrystalline Ceramics.

3.5.1 Classification of Ceramics

· Lithium Disilicate Reinforced Ceramics

Classified as a vitreous ceramic with a high crystalline content, its difference is that it can be manufactured with a reduced thickness, up to 0.2 millimeters, without compromising its resistance, and presents excellent aesthetic results (TUNCDEMIR; GULBAHCE;

AYKENT, 2020).

"Lithium disilicate crystals are dispersed in a blocking structure that prevents the propagation of cracks through energy-absorbing processes, such as deflection cracking and branching" (SCHWEIGER et al., 1999).

Its composition is formed by lithium dioxide, alumina, quartz, potassium oxide, phosphoric oxide, in addition to other elements. In addition, it has an appearance similar to natural dentition and high resistance to thermal shock due to its low thermal expansion resulting from its processing (RITTER, 2010).

According to Gundogdu and Aladag (2018), the type of cement and the specific cementation technique applied also play significant roles in the clinical success and longevity of ceramic restorations. Soft-23 cements are recommended for the cementation of all-ceramic restorations, especially for those using silica-based ceramics.

3.6 CEMENTS

Cements are divided into conventional and adhesive. Conventional cements undergo acid/base reaction in their setting process, such as Zinc Phosphate Cement, considered the oldest among cementing agents, which has high intrinsic properties, however, it does not adhere to the tooth structure or the material, requiring retentive preparation (LEE; MCLAUREN, 2012).

In addition, another type of conventional cement is Glass Ionomer Cement (CIV), which binds to calcium by a process called chelation, however, it does not adhere to restorative materials, and retentive preparation is also necessary (ANUSAVICE, 2013).

Resin cements are the most recommended for the adhesive cementation of ceramic tiles. They provide better adhesion, as well as superior mechanical and optical properties (greater selection possibilities and color stability), high hydrolysis resistance, and great tensile strength (CAMARGO et al., 2019; GUILARDI et al., 2020; KIRSTEN et al., 2018).

According to Anusavice (2013), these are classified according to the form of activation, which can be physical, chemical or dual. Physical activation happens through photoactivation, with light as activator and the initiator of the pre, camphorquinone. Chemically activated compounds have tertiary amine (base paste) as an accelerator and benzoyl peroxide (catalyst paste) as a pre initiator. Finally, the dual system has both physical and chemical form of activation.

These cements can also be classified according to the mode of adhesion, which can be conventional, through the hybridization of the dental substrate with conventional, self-etching or self-adhesive dentin adhesives, dispensing with the treatment of the tooth surface

(ANUSAVICE, 2013).

Conventional cements, in addition to favorable aesthetics, have better flexural strength, compression and higher shear strength, greater retention and fracture resistance of restorations, in addition to minimal infiltration and low solubility in aqueous medium (OLIVEIRA, 2013). However, they have the disadvantage of a judicious step, which is the drying of the dental substrate, because while the enamel needs to be completely dry, the dentin needs to be slightly moist for the formation of the hybrid layer to occur, making it a step often neglected by the operator (CHIRCA; BICLESANU; FLORESCU et al., 2021).

Self-adhesive cements have the advantage of simplifying adhesion procedures, saving time and, more importantly, thus reducing the "contamination window" (CAMARGO et al., 2019). They are believed to be moisture tolerant, release fluoride, and have no postoperative sensitivity (MAZIOLI et al., 2017). As disadvantages, adhesion to enamel produces lower bond strength than conventional cements (DE MUNCK et al., 2004; ABOHAMAR et al., 2005; HIKITA et al., 2007; DUARTE JUNIOR et al., 2008). Another example is its high viscosity, limited number of colors, yellowing of the surface due to the presence of tertiary amine and the short shelf life of some commercial brands (SOUZA et al., 2011).

According to Kirsten et al. (2018), most resin cements are dual-cured, composed of both self-curing and light-curing components. In some clinical conditions, the polymerization of light-curing cements becomes deficient due to the distance from the light source, the thickness and opacity of the restoration, which impairs adhesion (AZAD et al., 2018).

It is also worth mentioning the importance of treating the internal surface of the prosthetic piece in strengthening the union between the resin cements and the ceramic restoration, as well as the proper preparation of the enamel and dentin surfaces, which promotes the union between the tooth and the cement, as mentioned above (GUNDOGDU; ALADAG, 2018).

Therefore, the type of cement, the technique employed and the thickness of the restoration play an important role in the clinical success and longevity of ceramic restorations (GUPTA; GUPTA; GILL, 2021).

4 METHODOLOGY

The present study is a case report with a qualitative approach, with descriptive purposes, whose purpose is to show its clinical relevance, facilitate research and new reports on the same theme, based on evidence. To this end, all ethical and legal principles were respected in the conduct of patient treatments, consistent with the precepts of the Declaration of Helsinki of Resolution 466/12 of the National Health Council (CNS).

4.1 RISKS AND BENEFITS

The work presents minimal risks, since the researchers ensured the confidentiality of the information by signing documents such as the Informed Consent Form (ICF) signed by the patient and the Data Use Commitment Agreement (TCUD), avoiding the disclosure of confidential data, invasion of privacy, access to identification data, and risk to the security of the medical record. In case of damages resulting from the case report, full and free assistance will be offered for the necessary time, as well as the right to compensation.

On the other hand, as benefits, the research portrays a treatment option that has the potential to help not only the patient, but similar cases that may eventually arise, providing more scientific basis in the future.

4.2 ETHICAL ASPECTS

The clinical case report was approved by the Research Ethics Committee (CEP) of the INTA University Center – UNINTA, with an opinion number of 6,429,111. After 1 month of the patient's care and the identification of the possibility of reporting the procedure performed, she was informed about the publication of her case and invited to sign the Informed Consent Form (ICF) (Appendix A) and the Image Use Authorization Form (TAUI) (APPENDIX B), allowing the use and disclosure of data from her medical records and radiographic exams. It was evident that, in case of withdrawal, the patient could withdraw from participating in the research and withdraw her consent at any time.

The technical person responsible for the dental clinic was also invited to sign a Term of Trustee (TFD) (APPENDIX C), authorizing the researchers' access to the data contained in the medical records of the patient involved in this research. The letter of consent (APPENDIX D) of the establishment in which the research was carried out was also obtained and then presented to the CEP. The researchers will assume the commitment to maintain ethical conduct when handling and accessing the data in question with the CEP of the Centro Universitário INTA - UNINTA, ensuring the confidentiality of the data collected and the privacy of its contents, as recommended by Resolutions 466/12, of the CNS, through a Term of Commitment for the Use of Data (TCUD) (APPENDIX E).

5 CASE REPORT

The clinical case refers to a 35-year-old female patient who sought dental care in a private practice in the city of SobralCeará, reporting dissatisfaction when smiling, due to the size and color of the anterior dental substrates. After detailed anamnesis, clinical examination and radiographic examinations, tooth darkening of element 11 was identified due to

endodontic treatment and the restoration of composite resin with unsatisfactory color and shape (Figures 1 and 2), in addition to disharmony between the height/width ratio of the other teeth.

Initially, initial impressions were made to obtain a study model and assembly on an articulator for diagnostic wax-up (Figure 3).

Figure 1

Initial clinical appearance

Figure 2

Initial clinical aspect showing tooth darkening in tooth 11

Source: The authors, 2022.

Figure 3*Waxed model*

Source: The authors, 2022.

After the planning phase, external tooth whitening was performed in the office technique, in 3 sessions (Figure 4). Then, a silicone guide was made by molding the wax-up (Figure 5) of teeth 13, 12, 11, 21, 22 and 23 with heavy condensation silicon (Zetaplus®); and, subsequently, the mockup (Figure 6) was performed in bisacrylic resin (PROTEMP 3M®) before the dental preparation stage, thus respecting its initial format. Before the approval of the shape of the teeth, the patient requested rounding of the incisal battlements and reduction of 1 mm of the incisal border (Figure 7).

2nd Mockup in bisacrolean resin

Source: The authors, 2022.

Next, the preparation of a ceramic crown was performed on tooth 11, in which a more invasive wear on the cervical third was recommended due to the degree of darkening of the tooth substrate; in the other elements, from 13 to 23, ceramic veneer preparation was performed (Figures 8 and 9). Both preparations were made with a diamond tip with a conical trunk shape with a rounded end – Tip 4138 (KG).®

Figure 8

Preparation for ceramic crown and ceramic veneer

Figure 9

Preparation for ceramic crown and ceramic veneers seen in profile

Source: The authors, 2022.

Then, the molding stage began. First, a retractor wire numbered 000 (Ultrapack-ULTRADENT®) was inserted, followed by the numbering 00 (Ultrapack-ULTRADENT)® (Figure 10). Then, the molding was carried out by the rebasing technique, using a total perforated plastic tray (MORELLI)® and addition silicone of light and heavy consistency (FUTURA DFL®). The preparations were initially captured with heavy silicon and then the internal part of the mold was worn with a spherical diamond drill bit numbered 1018 (KG).® Subsequently, a light consistency silicone was inserted inside the mold and on the surface of the preparations. Next, the tray was repositioned over the upper dental arch. The mold was sent to the prosthetic laboratory for pouring and making of the ceramic pieces.

Figure 10

Image after insertion of the retractor wires

The color selection of the darkened dental substrate was performed through photographs with external lighting sent to the laboratory (Figure 11).

Figure 11

Approximate image with an external light source for color selection in the laboratory

After molding, a third mockup was performed as a temporary character to wait for the veneers to be made, this time with the anatomy previously approved by the patient (Figure 12).

Figure 12

Mockup used as a provisional with anatomy approved by the patient.

Source: The authors, 2022.

The prosthetic specimen was made of ceramic with the addition of lithium disilicate by the injection method (IPS e-max Press, Ivoclar Vivadent, Schaan, Lietchenstein) (Figures 13, 14, 15, 16 and 17).

Figure 17

Ceramic pieces of elements 13, 12, 11, 21, 22 and 23.

Source: The authors, 2022.

After receiving the ceramic pieces from the laboratory, a dry test was performed to evaluate the adaptation, color, shape, proximal contacts, occlusal contact, and the need for rounding and reducing the incisal edge by 1.0 mm was identified, in addition to deepening the third inclination of the central incisors (Figures 18 and 19).

Figure 18

Dry proof of the ceramic in front view

Figure 19

Dry proof of the ceramic seen in profile

Source: The authors, 2022.

In the second session of the porcelain test, the requested corrections were checked (Figure 20) and, after the patient's approval, the resin cement was chosen through test cements (TRYING-ALLCEM®) (Figures 21 and 22).

Figure 20

Figure 22

Image showing the correction of the color of tooth 11 after color selection using the test cements

Source: The authors, 2022.

Then, the cementing stage of the pieces began. It was prepared with 10% hydrofluoric acid (Condac porcelain, FGM®) for 20 seconds on its internal surface, cervical edges and on the external surface of the personalized ceramic coping; then, plenty of washing (Figures 23 and 24) and drying with an air jet were performed, followed by the application of silane (Prosil, FGM®) and natural drying for 1 minute (Figure 25).

Absolute isolation of the prepared teeth was performed using Young's archwire (Golgran®), rubber sheet (MADEITEX®) and ties with dental floss (Oral B®) (Figure 26).

Next, the tooth surface was prepared. Initially, prophylaxis was performed with a Robinson brush (Preven®) and pumice stone (Biodynamics®). Thus, tooth 11 was conditioned with 37% phosphoric acid (Condac - FGM®) for 15 seconds and then a conventional dentin adhesive (Single bond2 – 3M ESPE®) was applied; with the aid of an air jet, the solvent was volatilized for 30 seconds and then photocured for 20 seconds (Radii-cal SDI).® Selective acid was conditioned only on the enamel for 30 seconds on the other teeth; on the dentin, a universal dentin adhesive (Amber Universal APS - FGM®) was applied; the solvent was volatilized with the aid of an air jet and light-cured for 20 seconds. For cementation, a conventional light-curing resin cement (FGM® – Allcem Veneer APS) was used, which was applied inside the pieces that were then positioned on the preparations. Thus, it began with the cementation of the personalized coping and the use of transparent cement; bleach color was used for the cementation of the veneer of tooth 11 over the coping, while for the cementation of the other veneers, the color A1 was used.

The removal of excess cement was done with the aid of a microbrush (KG)® and dental floss (Oral B®). Then, light-curing was performed with a high-power LED photoactivator (Radii Cal-SDI®) for 60 seconds on each tooth face.

After cementing the ceramic pieces, the cementing line was polished with rubbers impregnated with silicon carbide, with medium and fine granulometry (Ultra-Gloss CA – American Burrs ®) (Figures 27 and 28).

6 DISCUSSION

According to Magner and Belser (2003), indirect veneers are indicated when dental problems arise in terms of shape, position, symmetry, texture and color, as can be seen in the case reported, in which the patient's main complaint was dissatisfaction with the color and shape of the anterior maxillary dental elements.

However, ceramic laminate veneers have been shown to be a successful treatment option for aesthetic rehabilitation in clinical practice in recent years. Ceramics have become the material of first choice as their excellent properties have been highlighted, such as biocompatibility, color stability, longevity, tooth-like appearances, different degrees of translucency and predictability of results (BENETTI et al., 2003).

Edelhoff et al. (2018), in addition to the aesthetic advantages, also reported the importance of ceramic restorations in terms of their biomechanical characteristics, such as high mechanical strength, durability, reestablishment of the biomechanics of the dentition and adequate function.

Therefore, as can be observed in the case in question, the heterogeneity of the substrate colors due to the presence of tooth darkening and pigmented restorations motivated the choice of lithium disilicate for the manufacture of veneers, due to its optical, biomechanical and adhesive properties, which reinforce the factors previously mentioned in the literature.

For Catão et al. (2007), the main danger associated with the internal whitening of a pulped tooth is the possible occurrence, within seven years after the procedure, of external dentin resorption. This resorption manifests itself in the neck of the tooth, in the area adjacent to the gingiva and is located near the point where the guttapercha was sealed, extending towards the apical end to the crest of the alveolar bone.

The origin of this phenomenon is not completely clear. However, there is speculation that hydrogen peroxide, when activated by heat, may diffuse through the dentin tubules until it reaches the region of the cervical periodontal ligament, potentially causing alterations in these structures and resulting in cell necrosis, thus triggering a process of inflammatory resorption (CATÃO et al., 2007).

Endorsing this information, Wendler et al. (2017) reported that lithium disilicate (IPS E.max - IvoclarVivadent), in its ability to reproduce the natural enamel of teeth, has excellent mechanical and aesthetic properties, as it has different opacity scales, ranging from translucent to opaque, thus having an impressive potential to mask different types of darkened substrates, resulting in color stability.

In addition, it is important to highlight the great advantage of using this ceramic system, which allows the manufacture of different restorations, as well as veneer and total crown. This is because the use of the same ceramic material for both restorations avoids aesthetic compromise between teeth and adjacent restorations, considering that there will be no influence of different optical properties resulting from different ceramic systems (PERRONI et al., 2015).

It is known that, in addition to the selection of the material of choice, a series of factors such as the thickness of this material, cement to be used, and the underlying structure of the tooth are essential for the success of the aesthetic rehabilitation treatment, as it has its particularities in the influence of the final color of the restorations (GEL, 2018).

In the present case, two distinct types of dental preparations can be observed, which were motivated by the type of rehabilitation to be performed and the degree of pigmentation of the dental substrate. Dental preparations for veneers are commonly limited to enamel, making ceramic pieces very thin and translucent. Therefore, laminates allow light to be transmitted through them and light scattering and reflection from the substrate, making it challenging to mask the underlying structures of the prepared tooth (EDELHOFF et al., 2018).

According to Sari et al., (2018), the thickness of the piece directly interferes with the final aesthetic result, since a thicker laminate will be less translucent and more opaque, thus reducing the effects of diffuse reflection of the underlying tooth, improving the propensity for masking.

In the case reported, tooth darkening of the acquired intrinsic type caused by endodontic filling materials in element 11 was observed, and of the extrinsic type caused by unsatisfactory restorative material. The literature reports the importance of the etiology of tooth darkening, as it is known that, in endodontically treated teeth, progressive pigmentation can occur that is difficult to remove caused by the presence of some endodontic filling cements positioned in the pulp chamber (ALSUBAIT; AL-HAIDAR; AL-SHARYAN, 2017).

In addition to the change in the color of the substrate, the intensity of darkening is also an important factor in the planning for this type of rehabilitation, influencing the amount of wear and the optical characteristics of the prosthetic specimen (ALSUBAIT; AL-HAIDAR; AL-SHARYAN, 2017).

Another important step for the success of rehabilitation is cementation, a fundamental factor for the longevity of the treatment. For the case in question, resinous cements of the conventional type were used, in order to obtain color stability and a lasting bond of the ceramic pieces with the dental tissue.

Reaffirming this information, Basso et al., (2017), report that the use of lithium disilicate crystals allowed the emergence of extremely thin ceramic veneers (3mm), associated with minimally invasive preparations. However, for this type of restoration, the use of appropriate resin cements is essential for the maintenance of aesthetics and color stability, since the small thickness of these restorations does not allow to mask the color changes of chemically activated cements, since these, together with dual resin cements, have tertiary amine as a chemical activator in their composition, which can compromise and cause changes in color over time, thus causing disharmony between restorations.

In line with what was reported, Perroni et al., (2016) state that these cements have different shades, and when the color of the ceramic is not completely satisfactory, it is possible to manipulate the tone of the cement so that a good color combination is reached between the laminates to be cemented and the adjacent teeth, which has become a high point in the choice of this type of cement for the case in question.

In this case, the lithium disilicate ceramic crown, as well as the veneers, aimed to mimic the substrate of element 11 compared to the other previous elements (13, 12, 21, 22 and 23), in order to harmonize the same nuance for everyone. To this end, the use of conventional resin cement was favored due to the wear obtained by the preparation of the ceramic crown on tooth 11, which allowed the application of an opaque layer at the base of the restoration. Conventional resin cements also allow for adhesive bond quality. Confirming the present case report, a good mimicry was observed, even in the case of substrates of different thicknesses and colors in more than one dental element.

7 CONCLUSION

During the planning of aesthetic rehabilitation of darkened teeth, the dental surgeon must understand the etiology of tooth staining, as well as the best masking alternative. In addition, it is essential to know the materials for choosing indirect restorations, their correct indications and limitations so that the objectives outlined in the treatment plan are achieved.

Therefore, it was possible to conclude that lithium disilicate ceramic system restorations are excellent restorative materials due to their variability and ability to mimic dental substrates of different colors, in addition to their color stability and long-term strength.

Finally, together with the choice of the restorative material, it was possible to see that the final color of the restorations is influenced by the type and thickness of the ceramic material chosen, the amount of wear on the substrate and the shade of the selected resin cement, emphasizing that all these factors must be planned in advance to obtain the desired harmony between color and shape at the end of the treatment.

APPENDIX

INFORMED CONSENT FORM (ICF)

Research entitled: Aesthetic rehabilitation using the technique of double cement to mask dental substrates of different colors – case report, proposed by the researcher in charge Prof. Me. Conceição Mikaelly de Vasconcelos Linhares and assistant researcher Adria Stephanie Xavier Barroso.

Dear participant,

This document you are reading is called the Informed Consent Form (ICF). It contains an explanation of the study that you are being invited to participate in. Before deciding whether to authorize (of your own free will) the use of your clinical data, you should read the term and understand the research proposal. At the end, if you decide to participate, you will be asked to sign accepting the conditions presented. Before signing, ask questions about everything you have not understood well, through the contacts provided. The study team will answer your questions at any time (before, during, and after the study). This consent form is printed in two copies, one copy of which will be filed by the responsible researcher, and the other will be provided to the participant. For any other information, you can contact the researcher by e-mail mikaelly.linhares@flucianofeijao.com.br or by phone (85) 99617-0990 and motivate my decision, if you wish.

Nature and objectives of the study

The objective of the study will be to report its clinical case which consists of the use of the technique of double cement to mask dental substrates of different colors, in a scientific environment, due to the particularities of their clinical condition, diagnostic methodology and the proposed treatment.

Study procedures

Its participation consists of authorizing the use of its dental record that is in the archives of the DENTAL CLINIC clinic, located at Rua Eurípedes Ferreira Gomes, 380, Pedrinhas. Zip Code: 62040-750, for the collection of your clinical data, laboratory, photographic images for the purpose of reporting the clinical case.

Risks and benefits

The risks are minimal, since the researcher ensures the confidentiality of the information by means of documents, which refer to the possibility of disclosure of information, regarding access to identification data, invasion of privacy, disclosure of confidential data and risk to safety of the ready. In case of damages resulting from the case report, full and free assistance will be offered for the necessary time, as well as the right to compensation.

Benefits: As benefits, this study will contribute to improving the diagnosis and therapeutic management of cases similar to this one, enabling further studies in the future.

Participation, refusal and right to withdraw from the study

Their authorization is voluntary. Refusal to authorize will not result in any penalty or modification in the form of care provided by dentists, assistants and researchers.

As provided by the Brazilian standards for research with the participation of human beings, you will not receive any type of financial compensation for your participation in this study.

Confidentiality

Your data will be handled only by the researchers and will not be allowed access to other people.

The results of this work may be presented at conferences, conferences or scientific journals, however, it will only show the results obtained as a whole, without revealing its name, or any information that is related to its privacy.

Considering that I have been informed of the objectives and relevance of the proposed study, how my participation will be, the procedures and risks arising from this study, I declare my consent to participate in the research, as well as I agree that the data obtained in the research be used for scientific purposes (dissemination at events and publications).

In case of doubts regarding the ethical aspects of this study, you may consult the Research Ethics Committee – CEP of the INTA-UNINTA University Center, which is located at Rua Coronel Antônio Rodrigues Magalhães, 700, 2nd floor (in front of the Selection Processes Board)) – Administrative pr – Bairro Dom

Exedito – Sobral – Ceará – C.E.P. 62.011-230. Phone (88) 3112-3500, (88) 9.99420072 ext. 3552 – e-mail: cep@uninta.edu.br/sec.cep@uninta.edu.br.

The researcher in charge declares that the research follows CNS Resolution 466/12.

TERM OF AUTHORIZATION FOR THE USE OF IMAGE (TAUI) IN ACCORDANCE WITH THE GENERAL LAW FOR THE PROTECTION OF PERSONAL DATA (LAW NO. 13,709/2018)

By this TERM OF AUTHORIZATION FOR THE USE OF IMAGE, I, Taiana

Soares Souza Rocha, Brazilian nationality, marital status Married, bearer of RG n.º 2003023035477, registered with the CPF under no.º 035.783.273.60, residing at Rua Miriam Mont Alverne n.º 919, city Sobral – state of Ceará; in this act, and for all purposes admitted in law, I expressly authorize the DENTAL CLINIC Clinic, located at Rua Eurípedes Ferreira Gomes, 380, Pedrinhas. Zip Code: 62040-750. Telephone: (88) 99381-4948, hereinafter referred to as AUTHORIZED, the capture, use, custody and exhibition/execution of the image in a definitive and free car, resulting from their participation in the photography session, carried out for the planning and execution of dental treatment of cer facets produced by the Dental Clinic of the University Center INTA – UNINTA, for exclusively educational purposes, and may be used at any time by the AUTHORIZED PARTIES, in accordance with the General Law for the Protection of Personal Data (Law No. 13,709/2018).

This authorization covers all forms of use and modalities of use permitted, known or hereafter known, including, but not limited to, the following situations:

- A. The images may be used through any and all means of communication to the public, being hereby authorized to be made available (including for download and in digital repositories) and/or broadcast/executed in a place open to the public on the internet (including use in distance learning courses) and internet, with all its existing and future tools and technologies, throughout the national and international territory, in whole or in part;
- B. It is also authorized, for example, the use of images in public presentations, publications and academic disclosures, exhibitions/executions at festivals and national and international awards;
- C. This authorization also includes the possibility of distributing the images to the public, for example, on DVDs, CDs, Blu-rays, Pen Drives, Virtual Discs or any other similar media that may exist, throughout the national and international territory, in whole or in part;
- D. Partial or full reproduction and printing in any type of material, including leaflets, advertisements, promotional material, banners, brochures, intranet, written or electronic media, panels or other similar forms that involve merchandising and dissemination actions throughout the national and international territory, is authorized;

The AUTHORIZED PARTIES, from now on, can edit and assemble all the materials in which the minor participates (filming, photos, audio recordings, etc.), conducting the reproductions they deem necessary (without limitation), as well as being able to archive them in any means available for this purpose.

This particular instrument of authorization is entered into in a DEFINITIVE, GRATUITOUS, IRREVERSIBLE and IRREVOCABLE manner, obliging the parties, by themselves and their successors in any capacity, to fully respect the terms and conditions stipulated in this instrument.

As this is the expression of my will, I declare that I authorize the use described above without there being anything to be claimed in terms of rights related to the image or any other, and I sign this authorization in 02 copies of the same content and form.

Sobral, May 08, 2023.

Tatiana Soares Sousa Podua

AUTHORIZING OFFICER

I, Josis Aristeu de Vasconcelos Neto, head of the private clinic DENTALCLINIC, faithful deposit of the dental records of the patient in question, I authorize the researcher Adria Stephanie Xavier Barroso to collect data from the records for the purposes of his course completion work study entitled "Aesthetic rehabilitation using the technique of double cementation to mask dental substrates of different colors – case report".

Sobral, May 08, 2023.

Josis Aristeu de Vasconcelos Neto

I, Josis Aristeu de Vasconcelos Neto legally responsible for the OdontoClinic Clinic in order to enable the execution of the research project entitled: Aesthetic rehabilitation using the technique of double cement to mask dental substrates of different colors – case report, under the responsibility of the researcher Conceição Mikaelly de Vasconcelos Linhares, Adria Stephanie Xavier Barroso, I declare that the OdontoClinic DENTALCLINIC allows the use of its facilities, as well as the use of the data contained in the medical record of the patient involved in this research.

Agreed and aware.

Sobral, May 08, 2023.

Dr. Josis Aristeu de Vasconcelos Neto

CRO-CE

Rua Eurípedes Ferreira Gomes, 380, Pedrinhas

Sobral/CE

jaristeu@gmail.com

The responsible researcher Conceição Mikaelly de Vasconcelos Linhares and assistant researcher Adria Stephanie Xavier Barroso, of the research project entitled "Aesthetic rehabilitation using the technique of double cement to mask dental substrates of different colors – case report", we declare, for due purposes, to know and comply with the Brazilian Ethical Resolutions, in particular Resolution No. 466/12 of the National Health Council.

We are committed to maintaining ethical conduct when handling and accessing the data contained in the medical record, in the files of radiographic images, tomography and photographs that are the responsibility of custody and protection of the Dental Clinic DENTALCLINIC, located at Rua Eurípedes Ferreira Gomes, 380, Pedrinhas, Sobral-CE, Cep: 62040-750, which will be used only after receiving the approval of the ethics and research committee (CEP) of the Centro Universitário UNINTA, within the established by Resolution numbers 196/96 and 466/12, of the National Council of Health de/MS, for human experiments.

We are committed to ensuring the confidentiality and secrecy of the data contained in the record, in the files of radiographic, tomographic and photographic images, as well as the privacy of its contents, maintaining the moral integrity and privacy of the individual who will have their information accessed. We will not pass on the data and images collected in its entirety, or part of it, to people not involved in the research team.

We are also committed to the safekeeping, care and use of information only for the fulfillment of the objectives set forth in this research referred to here. Any other research in

which we need to collect information will be submitted for consideration by the ethics and research committee (CEP) of the Centro Universitário. The data obtained from the documentary research will be kept confidential, secure, confidential and private, for five years, and then destroyed.

By publishing the results of the research, we will maintain the anonymity of the person whose data was searched, as well as the anonymity of the OdontoClinic Clinic.

ABSTRACT

Study on the creation of a marketing consulting service in libraries. It discusses the importance of applying marketing consulting related to the 4Ps (Product, Price, Place, Promotion) as a way to propose solutions to the demands identified in libraries, and to provide librarians with an alternative for developing a business related to their field of activity. It relates the concept of entrepreneurship in Library Science; maps the theoretical references in the consulting process; correlates the 4Ps of marketing within the context of libraries; and presents the main aspects related to the creation of consulting services aimed at libraries, including phases, services, and legal and bureaucratic aspects. Na metodologia, utiliza a pesquisa bibliográfica e documental e discute o empreendedorismo na área biblioteconômica, elencando exemplos de empresas oriundas de bibliotecário, no Brasil, e alguns especificamente no estado do Maranhão. It highlights consulting in its historical, conceptual, and categorical aspects (craft-based, specialized, total, and globalized). It emphasizes marketing in libraries, contrasting it with the challenge of making it a strategic tool focused on meeting users' informational needs through the resolution of problems that affect the organizational environment of libraries and distinguishes between a product-oriented and a marketing-oriented approach in libraries. It concludes by emphasizing the relevance of marketing consulting in libraries as a means to contribute solutions to organizational demands of these institutions and to advance the fields of Library Science and Information Science through research focused on entrepreneurship, consulting, and marketing, which still lacks broader academic production.

1 INTRODUCTION

Society is marked by intense changes in social, political and economic aspects. In the twenty-first century, these transformations occur due to the origin of several factors such as globalization, the growth of capitalism and the insertion of information and communication technologies that contribute to the scenarios in the organizational world, which are in charge of new needs.

Thus, with the advent of the Capitalist Society, the market changed its labor relations, the forms of administrative management and the new professional profile. In addition, these new requirements caused the emergence of new models of administration, innovating in their administrative processes in order to resist a new type of society, the Knowledge Society (Maxiamiano, 2010).

The administrative process of an organization contemplates five functions: planning, organization, leadership, execution and control (Chiavenato, 2003). It is an uninterrupted and systematized process that infers decision-making. Therefore, management consists of carrying out activities developed efficiently and effectively, so as to ensure the achievement of its objectives. In addition, it is an interdisciplinary field that operates in the most diverse areas, enabling the use of some of its tools, such as: SWOT Analysis, Business Plan, Marketing Plan, etc., and one of the areas that uses these tools is entrepreneurship.

Entrepreneurship is "[...] the awakening of the individual to the full use of his rational and intuitive potentialities. [...]" (Baggio; Knebel, 2014, p. 26), that is, it is putting into action some innovative practices such as creating something unprecedented, pointing out a new way of doing things, developing solutions or simply identifying opportunities.

In the historical aspect, Chiavenato (2008) describes authors who gave rise to the conceptions of entrepreneurship, such as Richard Cantillon (approx. 1680-1734), Jean Baptiste Say (1767-1832) and Joseph Schumpeter (1833-1950). Such theorists studied entrepreneurship focused on Economist Theory, seeking to understand its relationship with the economy; where Joseph Schumpeter associated entrepreneurship with change and innovation. In addition to this theory, the Behaviorist Theory emerges, which aims to analyze the behavior of entrepreneurs as a way to draw a certain profile, with David C. McClelland (1917-1998) as a major contributor.

In Brazil, entrepreneurship can be characterized as: entrepreneurship by opportunity and entrepreneurship by necessity, the latter being the most recurrent motivation (Global Entrepreneurship Monitor, 2017). People idealize in the creation of a company the realization of a dream, an escape valve to stay in the market and an investment that seeks to obtain profits. However, the sum of these conjunctions makes them develop a business in the

impetus without obtaining the technical and conceptual knowledge that it requires. In this way, the importance of Knowledge Management (KM) arises for organizations that aim to identify, organize and make accessible useful knowledge for companies. KM can be considered as a business tool by motivating the creation of new services and products and the remodeling of organizational processes (Silva, 2016).

For Drucker (1992), the success of organizations is largely related to knowledge, which becomes the main element and a strategic mechanism for decision-making and competitiveness. In view of this, consultancies emerge, a new sector that offers specialized knowledge to organizations.

The areas of consulting and entrepreneurship are connected. While consulting offers knowledge, entrepreneurship seeks knowledge to be applied in the organizational sphere (Silva Júnior; Santos, 2014). Therefore, entrepreneurship is born from the desire to create and innovate new ideas, in a complementary way, consulting arises with the intention of solving the organizational demands that develop in these ventures. In this way, consultancies perform the function of advising on demands and problems observed, however, many consulting services are the result of entrepreneurs who seek to enter the market with something different and with value.

In view of this, Teixeira (2012, p. 22) defines consulting as "[...] as an advisory service, in a process in which the consultant helps the client to enhance its ability to achieve the organization's objectives", that is, its main objective is to investigate and identify the problems found in companies, in order to propose viable solutions that will solve the present needs. It has an analytical character, does not impose what must be done, it only points out the possible answers to demands, giving autonomy to the company with regard to decision-making power. Its work expanded in the 60s, however, it was only in the 80s that it became essential to face the effects of globalization, in the face of a new competitive scenario that requires speed and innovation inside and outside the country (Teixeira, 2012).

The consulting activity is determined from the interaction of two subjects: client and consultant, the latter most often coming from small or medium-sized companies, which develop a temporary relationship, without employment purposes. The process of joining the consultancy is carried out through proposals and projects that define the contractual aspect, as well as establishing direct contact between the consultant and client. Since the 1990s, the consulting market has grown in the economic sector, gaining prominence both in the business segments and in other entities that are not linked to business (Honório, 2009).

Consulting companies can work in different organizations, making it a promising field for librarians who can provide these types of services in libraries, since they have external

knowledge of the market and technical knowledge of the area. The consultancy contributes to the investigation of strengths and weaknesses, in the identification of problems and in the proposition of solutions, which often go unnoticed by professionals working in libraries due to the quick activities developed.

With regard to the librarian's performance, the Federal Council of Librarianship (2002, p. 10) prescribes through Resolution No. 042/2002 his role as a consultant, in which he is responsible for "[...] present methods and techniques compatible with the work offered, aiming at quality control and excellence in the provision of services during and after the execution of the work". In order for the consultant librarian to obtain improvement in the services provided, it is essential that he seeks interpersonal skills, technical skills and consulting skills, as highlighted by Case, Case and Franciatto (1997), with a view to performing his function and participating fruitfully in the entire consulting process, which involves from implementation to follow-up after the service is performed. In this sphere of work, the professional must increasingly seek continuing education so that he can have excellence in his activities.

In the context of libraries, there are several ways to work with consulting. Among them, a type that is little worked on is marketing consulting, which, according to Amaral (1990, p. 315) contributes

[...] for the social, economic, cultural and political development of the library because its activities respect the legal and ethical principles in force and aim, primarily, at the satisfaction of the user. For this reason, the adoption of its techniques implies changes in the library's performance policy [...]

The fundamental basis of marketing is to satisfy the needs of customers, corroborating the main objective of libraries: to satisfy the informational needs of their users. In this way, marketing is:

[...] a trading activity that was based on the concept of exchange. At the moment when the individuals and organizations of a society began to develop and need products and services, specializations were created [...] with specialization the process of exchange became easier [...] (Las Casas, 2008, p. 3).

Las Casas (2008) considers that marketing has all its activities focused on exchange relations, in addition to being seen as an act of commercialization that starts from a lack. However, it is important to emphasize and deconstruct the view that marketing is only sales, advertisements, that its performance focuses only on production, and that it aims only at profitable gains. On the contrary, marketing develops services and products focusing on

customers, through the analysis of their needs and undertaking the planning of activities to be developed in this process. It is basically answering the following questions "What is done", "For whom is it done" and "Why is it done" (Amaral, 2007). All its interests involve customers and in this orientation this is the triumph of the organization.

That said, there is a need to work on marketing based on the 4P's (Product, Price, Place and Promotion) and not only as a channel for the dissemination of a library's services and products. It is essential that marketing tools be used to identify strengths and weaknesses, as well as to develop a more in-depth study of the political, economic and social context of the institution that directly influences the Square, where the library is located; in the Product, which is the raw material through which the library works; in Price, which is related to the intangible value of information and user feedback; and in the Promotion, which consists of making the library's services and products known, in order to reach its target audience.

It is worth noting that the fields of entrepreneurship and marketing are extremely relevant for library environments, as they cross economic borders, since no one works alone. The participation of other members is essential, so that all activities carried out within the macro and micro environment of organizations are carried out efficiently and effectively. Therefore, in the development of the Marketing Mix in a holistic way in libraries, innovative practices can be carried out that approach and solve the information needs of the user. From this perspective, the consultancy works collaboratively to obtain these results.

Marketing consulting presents itself as a new work niche, an opportunity to manage your own business from the knowledge acquired in training. The creation of a consultancy is the result of a proposal that consists of market research, competition analysis, location analysis, product portfolio, financial analysis, among other issues.

The choice of the theme was made through the classes presented in the discipline of Marketing in Information Units, which develops a theoretical and practical work, which challenged the analysis of the variables: product, price, place and promotion related to libraries and the creation of a Marketing Plan. At first, the discipline worked with theory, which deconstructed the common sense of thinking of marketing as only the promotion and dissemination of a library and expanded knowledge by understanding marketing in the totality of the 4P's and verifying them empirically in the library environment.

It is worth noting that in the practice of the discipline, the student researchers were basically in the position of "consultants", identifying the problems related to the 4P, pointing out the strengths and weaknesses, and proposing solutions through the Marketing Plan; However, no changes were imposed, no criticism was directed to the institution or

professionals working in these spaces, some gave feedback on what should be improved in the institution through research, due to the sensitivity of understanding the workload of librarians that prevents them from perceiving or executing the need for transformation that the library requires, that were related to the Marketing Mix. In view of the perception of some weaknesses and demands found in libraries based on the knowledge and empirical data collected on marketing, this activity generated the restlessness of developing strategies that would contribute to meet the organizational needs of libraries.

Thus, thinking about the creation of a marketing consultancy for libraries, in order to generate ideas for new work fronts for the area, in addition to contributing to the development of a service that will bring qualitative benefits to libraries, the following research problem was defined: How to develop a marketing consultancy to contribute to the organizational demands of libraries?

Based on this questioning, the general objective aims to establish theoretical references in the proposition of establishing a marketing consulting service in the field of libraries, in order to meet their organizational demands in favor of serving users. The specific objectives are:

- a) map theoretical references in the process of creating a consultancy in interrelation with entrepreneurship and marketing in libraries;
- b) to correlate the 4P's of marketing in the context of libraries;
- c) to present the main aspects related to the creation of a marketing consulting company for libraries, concerning the phases, services and legal and bureaucratic aspects.

The research is characterized as bibliographic and documentary, with the purpose of knowing the different scientific contributions on entrepreneurship and the importance of a marketing consultancy for libraries.

The theme is relevant and this work seeks to contribute with the theoretical aspects for the production of the area of Library Science and Information Science. In addition, it aims to develop a study with professional contributions to provide librarians with opportunities to work with other work possibilities, combined with the skills acquired in training concerning libraries, through the identification and search for solutions to the problems found.

Regarding the organization of this study, it is structured in: "Introduction", consisting of contextualization, justification, problem and objectives; "Methodology", in which the path followed to carry out the research and present the results about the theoretical framework is exposed; "Literature Review" that addresses entrepreneurship in relation to its conception and history; "Consulting" that focuses on the concepts, typology, origin in Brazil and the main entities in this sector; "Marketing", describing its concepts and evolution; and Marketing in

libraries, understanding the importance of marketing and the relationship of the 4P's of marketing in libraries. In continuity, a company model was outlined that presents the process of building a marketing consultancy in libraries, with regard to the legal and specific requirements and the steps to be worked on and, finally, the "Final Considerations" of the research.

2 METHODOLOGY

As informed in the introductory comments, the research is characterized as bibliographic, which, for Prodanov and Freitas (2013), is carried out based on published materials and can be found in various documentary typologies: articles, theses, dissertations, monographs and books. Reinforcing this idea, Severino (2007, p. 122) points out that:

Bibliographic research is that which is carried out from the available record, resulting from previous research, in printed documents, such as books, articles, theses, etc. It uses data or theoretical categories already worked on by other researchers and duly recorded. The texts become sources of the themes to be researched. The researcher works from the contributions of the authors of the analytical studies contained in the texts.

Thus, the methodological path of this study is composed at first by working with central authors of Administration and Library Science about the terms "Entrepreneurship", "Consulting" and "Marketing" in journal articles, books, dissertations, theses and monographs, consulted in specific sources of information such as: Scientific Electronic Library Online (SciELO), Portal de Periódicos da Coordenação de Pessoal de Nível Superior (Capes), Brazilian Digital Library of Theses and Dissertations (*BDTD*), Database of Journals in Information Science (Brapci) and National Meeting of Research in Information Science (Enancib). In addition to these sources of information, others were used, such as blogs, newspapers and social networks (Instagram, Facebook and Youtube).

The choice of these communication channels was motivated by the fact that they work on the theme, allowing the search for publications from the last 20 years, with emphasis on the period from 1990 to 2019. This chronology refers to the fact that there has been a greater emphasis on discussions on entrepreneurship and consulting in Brazil since the 1990s (Oliveira, 2012), intensified in the 2000s, with the use of Information and Communication Technologies, which caused a change in the practices of professionals from different areas and, in particular, librarians in the "[...] search for new qualifications to meet market demands and a concern with innovation in the processes and services to be provided to have a competitive advantage [...]" (Spudeit; Magdalene; Florindo; Duarte, 2016, p. 677).

Table 1 presents the number of documents found about the terms listed.

Table 1

Retrieval of search terms in databases

Bases	Entrepreneurship	Consulting	Marketing	Library Marketing
BDTD	3185	392	6368	3207
Brapci	114	60		381
Capes	41	5812	More than 1,000,000	802
Enancib	4	9	-	25
Scielo	290	114	923	1

Source: Survey data (2020).

However, it is worth noting that this quantity of materials was not worked with, due to the fact that the terms are addressed in a generic way in the texts, not constituting the main subject of the research. This phenomenon, perceived in the search for specific literature, can be understood through the report of Lebrun (2007 *apud* Garcia, Gattaz; Gattaz, 2019) when classifying the keywords listed by the researchers in their texts, into three categories: general, intermediate, and specific. Regarding the general ones, he attributes that they are used by those who are interested in the theme, but belong to other areas.

It is reiterated that due to the vast majority of the works detected in the cited databases not matching the problem and objectives of this research, centered on presenting the procedures to create a consulting company for libraries, specialized in marketing, it was privileged, for the theoretical basis, the punctual literatures of authors of Administration and Library Science that discuss entrepreneurship, consulting and marketing in libraries, such as: Barreto (1998), Dolabela (1999), Filion (1999), Chiavenato (2008), Oliveira (2012), Spudeit (2016), among others; Gonçalves (1991), Lins (1999), Block (2001), Oliveira (2005), Donadone, Silveira and Ralio (2012), Pastore (2014), Spudeit, Madalena, Laurindo and Duarte (2016) and other scholars in the consulting area; and McCarthy (1982), Kotler (1999), Kotler and Armstrong (2007), Las Casas (2008), Cobra (2011), Kotler and Keller (2012) and other authors who discuss marketing.

In total, 113 (one hundred and thirteen) documents were worked with the specific subject of this research, duly cited in the text and identified in the References.

3 ENTREPRENEURSHIP

Entrepreneurship has become essential for the advancement of society, as it is about innovative actions that are born from ideas and transformed into services and products, generating something different and valuable. According to Chiavenato (2008, p. 1, emphasis added) "[...] The term entrepreneur – from the French *entrepreneur* means one who takes risks and starts something new", either in an original way or by introducing novelties that will bring a differential within an existing sector.

In the evolution of the study on entrepreneurship, some areas such as Sociology, Psychology, Anthropology and Economics contributed to its conception, summarizing in 2 (two) theories: Economist and Behaviorist, where "[...] economists associate the entrepreneur with innovation, while behaviorists focus on the creative and intuitive aspects [...]" (Filion, 1999, p. 6). In the Economist Theory, innovation had the purpose of profits, and the Behaviorist Theory studied the behavior of these entrepreneurs, seeking to identify the profile of successful entrepreneurs.

According to Chiavenato (2008), the pioneers of the Economist strand are Richard Cantillon (approx. 1680-1734), and Jean Baptiste Say (1767-1832), both converged on the idea of entrepreneurship, where the first considered the entrepreneur as someone who sought raw materials for one price and resold it for another, substantially a negotiator, who took risks, innovated and prioritized profitability; the second considered that economic growth was the result of new ventures. In other words, "Cantillon and Say regarded entrepreneurs as people who took risks, basically because they invested their own money [...]" (Filion, 1999, p. 7), that is, they invested their own financial resources without a guarantee of return, but because they believed in the potential of the business.

Oliveira (2012, p. 2) points out that Cantillon and Say respectively stated that "[...] The entrepreneur performs the functions of bringing together different factors of production, management and the ability to take risks. [...] someone who takes risks in the process of buying services or components for a certain price with the intention of reselling them later at an uncertain price [...]". For Oliveira (2012), Richard Cantillon and Jean Baptiste Say analyzed entrepreneurship focused on the economy, but not leaving aside that the act of entrepreneurship requires taking risks in decision-making, investments, negotiation and everything that this process involves. It is essential that the subject is aware of the market and its changing state. Still in the economic view, Filion (1999) states that it was Joseph Schumpeter (1833-1950) who effectively inserted the word innovation into the field of entrepreneurship, but that in addition to him there were characters such as Clark (1847-

1938), Baumol (1922-2017), Schloss (1889-1966) and among others who sought to understand the role of entrepreneurship for the economic system.

Regarding the behaviorist aspect, according to Fillion (1999), it is studied by professionals in the sciences who investigate human behavior. Among these scholars, one of the forerunners to care about the theme was Max Weber (1864-1920), who believed that the value system influenced entrepreneurial behavior, recognizing them as innovators. On the other hand, psychologist David C. McClelland (1917-1998) made contributions to the sciences that study this type of behavior by developing the value system based on some points, such as: "[...] needs of achievement, affiliation and power, as fundamental elements in explaining the behavior of the entrepreneur [...]" (Honesko, 2001, p. 12). However, he suffered harsh criticism about this theory, since it would not be only the need for achievement that drives someone to create or be a successful entrepreneur, just one of the reasons.

According to Fillion (1999, p. 9) "[...] Behaviorists dominated the field of entrepreneurship for 20 years, until the early 1980s. Their objective was to define what entrepreneurs are and their characteristics [...]", that is, they began to observe the personality traits of these people, in order to confer common characteristics for a group of entrepreneurs. To this end, Fillion (1999, p. 10) points out that:

It has not yet reached the point of being able to evaluate a person and then say, with certainty, whether he will be successful or not as an entrepreneur. However, it can be said whether it has the characteristics and aptitudes most commonly found in entrepreneurs. Although no scientific profile has been drawn, research has been the source of several guidelines for future entrepreneurs, helping them to better situate themselves [...]

For Fillion (1999) it is not possible to determine an entrepreneurial profile, but what can be established are skills that the entrepreneur can have or develop to stand out in the business, as well as improve them through a constant search for knowledge and become better every day at what he does.

In Bernardi's literature (2008) some characteristics that the entrepreneur requires are pointed out, such as: Sense of opportunity; Dominance; Aggressiveness and energy to perform; Self-confidence; Optimism; Dynamism; Independence; Persistence; Flexibility and resistance to frustration; Creativity; Risk propensity; Charismatic leadership; Ability to balance dream and fulfillment; and Relationship skills. Such characteristics can be developed and improved in people who intend to undertake, although they are not guarantees of success in the enterprise.

However, there is a myth that to be an entrepreneur, the subject must have such skills from birth and that these cannot be developed (Salim *et al.*, 2004). However, there is no basis

for such an argument, since in the history of many businesses, the motivations and circumstances for the creation of an enterprise, and consequently the appearance of an entrepreneur is not conditioned by personality traits. Thus, what characterizes an entrepreneurial impetus are three basic characteristics: the need for achievement, willingness to take risks and self-confidence (Bernardi, 2008; Chiavenato, 2007).

In this way, it is valid to say that entrepreneurial characteristics can be acquired and developed, and this means that it does not need to be linked to innate attributes. In addition, Dolabela (1999, p. 70) stresses that "[...] the individual with the conditions to undertake will know how to learn what is necessary to create, develop and realize his vision [...]", that is, far beyond the characteristics, there is the willpower to seek the knowledge necessary for the creation and maintenance of the business.

Regarding the definition of entrepreneurship, it has become plural and complex, as it is influenced by the Economist and Behaviorist Theories. To this end, it is an old concept that has undergone some adaptations over time. For example:

At the beginning of the twentieth century, the word entrepreneurship was used by economist Joseph Schumpeter in 1950 as being, in short, a person with creativity and capable of succeeding with innovations. In 1967 with K. Knight and in 1970 with Peter Drucker, the concept of risk was introduced, an entrepreneurial person needs to take risks in some business (Oliveira, 2012, p. 1).

Entrepreneurship is intrinsically related to the act of innovating, creating and taking risks, which are keywords in the concepts related to entrepreneurial characteristics. In general, entrepreneurship "[...] is a neologism derived from the free translation of the word *entrepreneurship* and used to designate studies related to the entrepreneur, his profile, his origins, his system of activities, his universe of action [...]" (Dolabela, 1999, p. 43) and such studies aim to explain to those interested the vast loci in which entrepreneurial initiatives can be implemented.

In addition, for Baggio and Knebel (2014, p. 2) entrepreneurship is:

[...] the art of making it happen with creativity and motivation. It consists of the pleasure of carrying out with synergism and innovation any personal or organizational project, in permanent challenge to opportunities and risks. It is assuming a proactive behavior in the face of issues that need to be resolved.

Baggio and Knebel (2014) relate entrepreneurship to creativity, motivation and innovation. It is not being apathetic to the needs of change and always being in search of the new, not necessarily to create original things, but to seek a new way of doing things.

Regarding the practical definition of entrepreneurship, Oliveira (2012, p. 2) defines it as "[...] the process by which people start and grow their businesses. It is a complex phenomenon, in which it involves the entrepreneur, the company and the customer, who are part of this process [...]". Oliveira (2012) describes entrepreneurship as the kick-off for the emergence of a business, composed of stages, which the entrepreneur must go through for the long-awaited success. It is not an individual process, but a collective one, which seeks to establish interpersonal relationships so that the enterprise takes stronger roots.

Converging with the other definitions described about entrepreneurship, Barreto (1998, p. 190) describes it as the "[...] ability to create and constitute something from very little or almost nothing". With regard to the professional who works in this field, the entrepreneur, "[...] is the person who starts and/or operates a business to carry out a personal idea or project, taking risks and responsibilities and continuously innovating [...]" (Chiavenato, 2007, p. 3), that is, he is a curious subject who seeks to realize his ideals. Continuously, Dolabela (1999) states that the entrepreneur in a broad way is the one who dedicates himself to managing wealth, whether in transforming knowledge into services and products, in the construction of his own knowledge or in innovating in an interdisciplinary way in areas such as marketing, production and organization.

From another perspective, Dolabela (2006, p. 26) defines the entrepreneur as:

[...] a dissatisfied person who transforms his nonconformity into discovery and positive proposals for himself and others. It is someone who prefers to follow untraveled paths, who defines from the undefined, believes that his actions can generate consequences. In short, someone who believes they can alter the world.

It is inferred that the entrepreneur is someone who does not conform to the natural and current state of things, lives in search of new directions and new ideas, putting them into practice and has a vision of the future (Dornellas, 2008). For Gerber (2004, p. 15) "[...] The entrepreneur is the visionary in us: the dreamer, the energy behind all human activity, the imagination that feeds the fire, the catalyst for change [...]", that is, someone who idealizes projects and who has the stimulus for change.

In view of all the definitions of entrepreneurship pointed out, it is clear that the entrepreneur is always looking for something new, which can represent various actions, such as adding innovations to an existing sector. That said, Spudeit, Madalena, Laurindo and Duarte (2016) reinforce that "[...] To create enterprises, it is not necessarily necessary to create a company. There are many ways to undertake using the basic concepts of the term and adding it to different sectors and areas of professional activity [...]". In other words, it is not just about creating unprecedented services and products for a new business, but

resignifying it through changes in the workplace and in the various social and cultural segments of a society, through innovative ideas.

Thus, in addition to the Business Entrepreneurship that concerns the creation of companies, the following stand out: Social Entrepreneurship, Cultural Entrepreneurship and Intrapreneurship (Spudeit; Magdalene; Laurindo; Duarte, 2016).

Social Entrepreneurship breaks the paradigm of traditional entrepreneurship that aims to obtain profits, and "[...] it comes to combine efforts in order to combine market practices and business vision with human development, proposing solutions to social problems" (David, 2004, p. 16). It is a subject taken over by a social conscience, which is unsatisfied with the injustices that happen through social causes at the local and global levels. In addition, social entrepreneurs are concerned and take risks for collective interests, for the benefit of the people the company serves. In relation to this practice in the organization, they are usually developed by non-profit institutions that act in a social way, or by private companies that have social responsibility (Brinckerhoff, 2000; Melo; Neto; Fróes, 2000; David, 2004).

As for **Cultural Entrepreneurship**, it can be focused on cultural and economic aspects. This type of entrepreneurship, at first, arises mainly with the objective of analyzing the role of the entrepreneur in the construction and maintenance of non-profit cultural organizations (libraries, theaters, art museums, orchestras, etc.) and, at the national level, these institutions are often subsidized by the government (Limeira, 2008).

On the other hand, Cultural Entrepreneurship also permeates economic issues, since it attributes value to cultural services and products, that is, "[...] it is based on the creation of economic and symbolic value in the area of culture and on new forms of work and learning, associated with entrepreneurial trajectories that constantly deal with risk and with relationships of trust" (Guerra; Paiva Júnior, 2011, p. 79).

As far as **Intrapreneurship** is concerned, it is a branch of entrepreneurship that consists of the development of entrepreneurial actions carried out by internal employees in organizations. Conceptually, Intrapreneurship refers to "[...] introduction and implementation of an innovation for the company by one or more employees working within an established organization" (Carrier, 1996, p. 7).

The term **Intrapreneurship**, which can be called **Corporate Entrepreneurship** or **Internal Entrepreneurship**, was created by Pinchot in 1985, who considered intrapreneurs as dreamers, who are in charge of developing any type of innovations within their workplace (David, 2004). Regarding this practice within organizations, Baldissera (2019, p. 16) believes that it contributes both to individuals as professionals, and to the company and "[...] provides

a differentiated view of the performance of the workforce, as it does not rely on people only for routine work activities, but also by returning employees to organizational interests in an entrepreneurial way".

In view of all the definitions of entrepreneurship, it is worth highlighting the entrepreneurial process branched out by Dornellas (2005) into 4 (four) stages: verifying and calculating opportunities; prepare the business plan; allocate necessary resources; and business administration. All these phases can be developed sequentially or at the same time.

Although all the phases exposed by Dornellas (2005) are of paramount importance, as they aim to support the entrepreneur in the decision-making of his business, it focuses on the business plan, as it is:

[...] A document used to describe a venture and the business model that underpins the company. Its elaboration involves a process of learning and self-knowledge and also allows the entrepreneur to situate himself in his business environment (Dornellas, 2016, p. 99).

It is through the preparation of this document (business plan) that the entrepreneur will be able to clearly analyze the feasibility of success of the business in his market, since the opportunities he can explore are exposed, as well as the possible threats that may occur in the business environment.

Sebrae (2020) corroborates Dornellas (2016) on the importance of the business plan as an essential management tool for the entrepreneur in business planning by pointing out that:

The **business plan** is the ideal instrument to draw a portrait of the market, the product and the entrepreneur's attitudes. It is through it that you will have detailed information about your industry, products and services, customers, competitors, suppliers and, above all, strengths and weaknesses of the business, contributing to the identification of the feasibility of your idea and the management of the company.

In this way, it is notorious how indispensable it is to create a business plan for any type of enterprise, since it allows a detailed view of the internal and external aspects of the business, thus allowing the entrepreneur to have a basis that allows him to establish an overview of the current situation of the company and what is the desired future situation, thus assisting in the elaboration of goals and strategies.

A relevant aspect that the entrepreneur must consider in the business plan so that the company can succeed in the market in which it operates, is that it is changeable, that is, the

needs of customers and their competitors change, therefore, the business plan as a planning tool that studies these aspects also changes, requiring constant updating (Dornellas, 2016).

Therefore, it is clear that to ensure success in the process of opening a business, it is not enough for the entrepreneur to have the skills to identify opportunities, take risks, innovative attitude, etc., but also to have the ability to develop what is outlined for the organization through the business plan.

In view of all that has been exposed, it can be seen that although the conception of the term entrepreneurship has been greatly influenced by other areas in its ideas, the authors cited: Dolabella (1999), Gerber (2004), Dornellas (2008), Chiavenato (2007), Oliveira (2012) among others, converge in defining the entrepreneur as: innovative, creative and able to take risks. And they present different types of entrepreneurial characteristics, not as a profile, but as aspects to be allocated to their behavior.

This section highlighted an overview of entrepreneurship and the entrepreneur in its conceptual and characteristic aspects, and in the next one entrepreneurship in Brazil will be briefly presented.

3.1 ENTREPRENEURSHIP IN BRAZIL

When analyzing entrepreneurship in Brazil, Oliveira (2012, p. 1) mentions that it is a new terminology, especially at the national level, in which "[...]It only emerged for us from the 90s onwards and has been growing along with the privatization process of large state-owned companies and the opening of the domestic market", that is, the term only gained prominence in the country with the insertion of private companies.

Studies by the Global Entrepreneurship Monitor (GEM) (2019), a program that evaluates the evolution of entrepreneurship in Brazil compared to other countries, point out how the development of entrepreneurship is taking place in Brazil.

Regarding the evolution of entrepreneurship in Brazil from 2002 to 2019, the Global Entrepreneurship Monitor (2019) portrays, in Figure 1, the rate of initial entrepreneurs (TEA), rate of established entrepreneurs (TEE) and the total rate of entrepreneurs (TTE) for the years 2002 to 2019, which demonstrates a balance of how entrepreneurship has maintained itself in recent years:

Figure 1

Entrepreneurship rates (in %) second stage of entrepreneurship TEA, TEE, TTE - Brazil - 2002:2019

Source: Global Entrepreneurship Monitor (2019, p. 11).

According to Figure 1, it is possible to see that the initial entrepreneurs have grown in recent years and remained stable. For the Global Entrepreneurship Monitor (2019) it stems from the country's new economic prospects. On the other hand, as for established entrepreneurs, there is an unstable balance of growth and declines, resulting from crises that lead companies to indebtedness, strong fall in demand, and defaults (Global Entrepreneurship Monitor, 2019).

Table 2 presents entrepreneurship according to the rate that corresponds to the population in the age group of 18 to 64 years in 2018 and 2019, where it describes the number of companies linked to the creation, improvement of a new business and the maintenance of some enterprise:

Table 2

Rates (in %) and estimates (in units) of entrepreneurship according to the internship and potential entrepreneurs - Brazil - 2018:2019

Taxas	Taxas		Estimativas	
	2018	2019	2018	2019
Empreendedorismo total	38,0	38,7	51.972.100	53.437.971
Empreendedorismo Inicial	17,9	23,3	24.456.016	32.177.117
Novos	16,4	15,8	22.473.982	21.880.835
Nascentes	1,7	8,1	2.264.472	11.120.000
Empreendedorismo estabelecido	20,2	16,2	27.697.118	22.323.036
Empreendedorismo potencial	26,0	30,2	22.092.889	25.545.666

Source: Global Entrepreneurship Monitor (2019, p. 10).

In the data presented in Table 2, it can be seen that among thousands of people between 18 and 64 years of age, 53.5% carry out an entrepreneurial action, either as a new business, improvement of a new business or striving to maintain the enterprise. It is also noted that the number of beginner entrepreneurs in 2019 compared to 2018 is higher than

established entrepreneurs, which means that entrepreneurship with regard to the creation of a new business has increased in the country (Global Entrepreneurship Monitor, 2019).

Debastiani (2003) brings the contribution that entrepreneurship is influenced by cooperativism characterized as a

[...] management model that seeks the union of ideas, efforts and resources of people who seek common goals. The creation of cooperatives aims, among other interests, to contribute to the reduction of unemployment or poverty, just as entrepreneurship by necessity happens through the individual action of people. (Debastiani, 2003, p. 26).

It is apprehended that cooperative entrepreneurship brings together people who share convergent ideas, democratically established, with the objective of obtaining advantages for the collective.

In the educational sphere, Dolabela (1999, p. 54) emphasizes that "[...] the first course on the area appeared in 1981, at the School of Business Administration of the Getúlio Vargas Foundation, São Paulo, on the initiative of Professor Ronald Degen [...]", however it was only a discipline of the specialization course in the area of Administration. Dolabela (1999) also points to a chronological trajectory in the growth of entrepreneurship as a teaching area, listed in Table 3.

Table 3

Chronological trajectory of entrepreneurship education in Brazil

Year	Trajectory of entrepreneurship education in Brazil
1984	Beginning of entrepreneurship teaching at the University of São Paulo - USP.
1985	The Faculty of Economics, Administration and Accounting at USP offered an entrepreneurship course focused on technological bases.
1992	The Federal University of Santa Catarina created ENE – School of Entrepreneurs.
1993	The CNPq Softex Program, through Fumsoft, has developed a method to offer the teaching of entrepreneurship in Computer Science.
1995	The Federal School of Engineering Itajubá created the Business Center for Entrepreneurial Training of Itajubá and also the University of Brasília created the School of entrepreneurs.
1996	It is considered the milestone of entrepreneurship in the country.
1997	The Softex program, already created by CNPq, started to be directed by the Softex Society, where it develops two projects: Genesis and Softstart, in the same year the Reune Program (University Teaching Network of Entrepreneurship) is created in the city of Minas Gerais.
1998	CNI-IEL together with Sebrae Nacional launched the Reune-Brasil Program, expanding the teaching of entrepreneurship in national university institutions.

Source: Adapted from Dolabela (1999).

Regarding the Brazilian Micro and Small Business Support Service (Sebrae) and the Brazilian Society for Software Export (Softex), they were companies that emerged

respectively in the 1990s and contributed to the growth of entrepreneurship in Brazil. Sebrae was created with the intention of bringing knowledge and possibilities to the opening of a business, while Softex was designed to develop software companies in the market through sales and stimulate local production, in addition, this company through its programs gave a Brazilian character to the term business plan, which was previously little used by entrepreneurs (Oliveira, 2012).

In the case of Sebrae, it is a company that welcomes people who have the desire to become entrepreneurs. It develops professional actions based on the construction and formation of the entrepreneur's knowledge, in partnership with other institutions, through workshops, courses and professionalization, consultancies to guide the opening and maintenance of a business, etc. It is worth mentioning Empretec, a methodology developed by the United Nations (UN) and incorporated in the country by Sebrae since 1993, which works on the behavior of the entrepreneur, as well as maps the opportunities arising from the market (SEBRAE, 2020).

Empretec is a training course that has a workload of 60 hours, where based on science it challenges the subject with practical activities to be performed, based on 10 characteristics necessary to be a successful entrepreneur: Search for opportunity and initiative; Persistence; Take calculated risks; Demand for quality and efficiency; Commitment; Search for information; Goal setting; Systematic planning and monitoring; Persuasion and networking; Independence and self-confidence (SEBRAE, 2020).

According to the Global Entrepreneurship Monitor (2017), there are 2 (two) initial motivations for Brazilian entrepreneurs to open their businesses: by necessity or opportunity. About this, the program discusses that:

[...] Entrepreneurs out of necessity decide to undertake because they do not have better employment alternatives, proposing to create a business that generates income, basically aiming at their subsistence and that of their families. With regard to entrepreneurs by opportunity, the GEM defines them as capable of identifying a business opportunity or a market niche, undertaking even if they have competing alternatives for employment and income [...] (Global Entrepreneurship Monitor, 2017, p. 29).

In this way, it is understood that the entrepreneur by opportunity is the one who is always attentive to the market, who guides his actions through planning and has a vision of the future, on the other hand, the entrepreneur by necessity is often driven by an emergency factor such as unemployment, and at first seeks only to meet his basic needs. With this, the motivations of entrepreneurs are distinguished and can influence the progress of the business, as it is necessary that they are stable motives that propel them to success and not

that nullify or slow down their growth in the market. Table 4 shows the updated percentage of what motivates entrepreneurs to create a company.

Table 4

Percentage of initial entrepreneurs according to motivations to start a new business - Brazil 2019

Motivação	Taxas
Para ganhar a vida porque os empregos são escassos	88,4
Para fazer diferença no mundo	51,4
Para construir uma grande riqueza ou uma renda muito alta	36,9
Para continuar uma tradição familiar	26,6

Source: Global Entrepreneurship Monitor (2019, p. 12).

By analyzing Table 4, it is clear that the primary factor for opening a business is linked to the lack of formal jobs in the market. In this way, initial entrepreneurs set up their own businesses so as not to be on the sidelines of the job market. More than 50% are driven by making a difference in the world through the idea that becomes a company. In addition, a third of entrepreneurs ensure that the intention for development is based on the ambition to gather great wealth. And finally, a quarter of entrepreneurs are motivated by traditional aspects, that is, to continue Family Businesses (Global Entrepreneurship Monitor, 2019).

It is pertinent to point out entrepreneurship in Maranhão to understand how entrepreneurship is occurring in the state. In view of this, data were collected from the Board of Trade of Maranhão (Jucema), which shows a considerable growth in the number of active companies in 2020 with a percentage of 270,056 enterprises compared to 2014, which was 125,398 (Maranhão, 2020).

Figure 2 refers to the rate of companies by size: Individual Microentrepreneurs (MEI), Micro Companies (ME), and Small Businesses (EPP).

Figure 2

Total number of companies by size

Source: Maranhão (2020, p. 3).

It is apprehended that among the number of active companies, 123,253 (45.6%) corresponds to the number of individual microentrepreneurs and represents a higher percentage, followed by microentrepreneurs with 114,968 (42.6%), and small companies with 9,967 (3.7%) and the others that are the companies that do not fit into the other sizes with 21,868 (8.1%) (Maranhão, 2020).

The companies of São Luís - Maranhão established themselves with a business profile focused on services, adding up to about 88,466 in execution, of which 38,666 in the service sector, 37,528 in commerce, 6,105 in construction, 5,998 in industry and 169 in agriculture. Table 5 represents the number in some cities in Maranhão.

Table 5

Areas of operation of the companies in the cities of Maranhão

	Serviços	Comércio	Construção	Indústria	Agropecuária	Total
São Luís	38.666	37.528	6.105	5.998	169	88.466
Imperatriz	9.067	11.608	1.287	1.938	77	23.977
São José de Ribamar	3.502	5.372	829	885	37	10.625
Timon	2.355	3.654	528	757	18	7.312
Balsas	2.521	3.201	408	519	241	6.890
Paço do Lumiar	2.174	3.379	537	436	25	6.551
Caxias	1.890	3.298	325	413	27	5.953
Açailândia	1.974	2.820	352	501	92	5.739
Bacabal	1.335	3.016	247	295	13	4.906
Santa Inês	1.317	2.592	195	297	14	4.415

Source: Maranhão (2020, p. 4).

It is understood that in addition to São Luís, Imperatriz, São José de Ribamar and Timon stand out as other cities that have a dense growth mainly in the areas of services, commerce, construction and industry (Maranhão, 2019).

In view of all the data analyzed, it is worth pointing out that entrepreneurship concerning the opening of companies is analyzed according to the economic aspect that is linked to the social and political aspects of the country to maintain and be created in the market. However, it is an activity that is maintained due to financial contributions to the country, but it is necessary that more materials focused on the knowledge of the subject be produced so that real and potential entrepreneurs seek information in the literature that contributes to the business.

It is necessary to emphasize that there is the Association of Young Entrepreneurs of Maranhão (AJE), a non-profit institution that works with the objective of integrating young businessmen and entrepreneurs to propagate entrepreneurial knowledge that ensures the promotion of their growth from an intellectual and professional perspective (Association of Young Entrepreneurs of Maranhão, 2020).

The discussion about entrepreneurship is extensive and seeks multidisciplinary, because in all areas there are entrepreneurial individuals. Therefore, it is pertinent to highlight entrepreneurship in Librarianship, in order to encourage entrepreneurial attitudes in the area.

3.2 ENTREPRENEURSHIP IN LIBRARIANSHIP

The historical aspect of entrepreneurship in Librarianship, according to Spudeit (2016) occurs in the 1980s through the creation of formal companies originated by librarians, such as Redata - specialized in the document management of archives, libraries and documentation centers - and Bibliotec - Information Management of archives and libraries, previously focused on the traditional services of these organizations and, Currently, they meet the diverse informational demands represented in services and products, remaining in the document management market. It is emphasized that:

[...] from the 1990s onwards, there was an expansion in the range of services and new companies emerged such as Datacoop, eDoc Consultoria, Control, GedBrazil, Indexare, among others with a technological and managerial focus to meet specific demands in the market (Spudeit, 2016, p. 14).

It can be inferred that librarians have been organizing companies according to market standards, moving from the traditional professional practice of library organization, standardization and the like to the updating of technological innovations. In this perspective, Madalena and Spudeit (2017) ratify the importance of librarians knowing their field of activity in order to manage new work fronts and establish interdisciplinary partnerships.

Therefore, when dealing with entrepreneurship in Librarianship, Spudeit (2016, p. 14) refers to:

1. Skills developed and knowledge acquired throughout graduation and through complementary training applicable to new fields of activity that require a differentiated professional profile, attentive to opportunities;
2. Creation of a business in the area of information in which the librarian can act as a liberal professional to provide services aimed at specific demands of the market or society itself;
3. Projects aimed at the use of information for social transformation and empowerment of people, aiming to promote greater reflective and critical awareness for the full exercise of their citizenship;
4. Intrapreneurial actions that can be developed by librarians in different fields of activity, such as process management, e-commerce, information architecture, project management, among others, including in libraries.

Thus, the librarian can become an entrepreneur from the beginning of academic training. Regarding the librarian's role as an entrepreneur, Madalena and Spudeit (2017, p. 59) argue that "[...] he is able to transform opportunities, through resources available in a creative way, in order to create products and services in the area of information management", that is, this professional can transform all his knowledge into an opportunity to generate new ideas, within the infinite possibilities that the librarianship field offers, which goes beyond the walls of a library and also far from the public service.

There are many market niches through which librarians can develop their enterprises, this is because, by working with information, this professional has a broad knowledge about what is happening in the world, which favors the construction of new job and business opportunities (Madalena; Spudeit, 2017).

In addition, Girard, Fonseca and Gama (2017) expose the spaces of action of the creative economy in Librarianship, such as: blogs, publishing agencies, fashion products, professional brand designers, consulting services, among others. The creative economy in Librarianship is the inventive and innovative practice of the librarian in a physical or digital way.

Correlated to these spaces, Girard, Fonseca and Gama (2017) highlight as models: Santa Librarianship, a blog created in 2012 by a librarian, with the initial objective of passing on the knowledge acquired and helping her professional colleagues on topics involving the course, currently handouts for public exams are also posted; Class Cursos, which works to train professionals in the area of Library Science and Information Science, founded in 2015, also operates in the online course market; the Library Agency, created in 2011, is focused on communication and publication in the field of Librarianship, culture, education and literature.

In addition to these, there is also the company Documentar that operates in process management as well as Innova Gestão. The company Documentar stands out in the areas of Information Science, Automation via IT and Information Management; while Innova Gestão works with research, training and consulting services focused on areas such as Information Management, knowledge, innovation and others. Biblio ideias that works relating marketing with the library area exercising administration and finance activities. (Spudeit; Magdalene; Laurindo; Duarte, 2016).

Among the companies mentioned above, which exercise entrepreneurship in Librarianship, some are listed with the respective addresses of websites that work with activities aimed at consulting and continuing education of librarians, automation technologies, indexing and others (Table 6).

Source: Adapted from Spudeit, Madalena, Laurindo and Duarte (2016).

These companies that work with the service of the library area outside the conventional field can be considered as entrepreneurial actions and serve as an affirmation that entrepreneurship is related to and can be developed in Librarianship. Spudeit, Madalena, Laurindo and Duarte (2016) mapped and found around 36 companies, which promote automation, consulting, knowledge management, continuing education, among others. However, when reviewing again if they are in operation, about 5 companies are in disuse. In Table 2, only the organizations that are in full exercise of their activities were scored. It can be seen, in accordance with Spudeit, Madalena, Laurindo and Duarte (2016), that with regard to the creation of companies, the action of librarians is still timid.

Junior enterprises (EJ) are also pointed out as entrepreneurial activities, as they contribute to the empirical performance of students and are ways for students to have the

experience of forming a company and exercising the professional practice of the area in their teaching-learning processes. They are defined as:

[...] a non-profit civil association, resulting from the union of students enrolled in an undergraduate course in higher education institutions in order to offer projects and services that contribute to training trained professionals committed to the purpose of transforming Brazil (Brasil Júnior, 2015, p. 6).

The mapping of Junior Enterprises (EJ) in the area of Librarianship was carried out from research carried out on the websites of the Faculties of Library Science, blogs, and also through the mapping table of EJ in Librarianship of the Course Completion Work of Reis (2017). Table 7 shows a mapping of the EJ in the federal universities.

Table 7

Mapping of EJ in the area of Librarianship

No.	EJ in Library Science	Institution	Year of Creation	Situation
1	InfoJr.	UFSCAR	2009	active
2	SETi Junior Consulting	UFPE	2013	active
3	Info Junior	UFSC	2013	active
4	BiblioMetrics	UFRN	2012	active
5	Junior Library	UFSC	2004	closed
6	AGIR Jr. Consulting	UFC- Cariri	2010	Inactive
7	EGID JR	UNESP-MARÍLIA	2007	Inactive
8	CGI-JR	UFMG	2009	Inactive
9	FESP Jr.	FESPSP	Information not found	closed

Source: Reis (2017, p. 31).

It can be seen that only 4 (four) EJ are active, such as: the InfoJr of the Library and Information Science Course at the Federal University of São Carlos, which offers services aimed at the normalization of academic works, textual review, updating of lattes curriculum, automation of collections, design and advertising; SETi Consultoria Jr of the Federal University of Pernambuco, which develops activities of organization of collections (classification, indexing and/or cataloging), standardization of academic works, and updating of Lattes Curriculums; Info Júnior of the Federal University of Santa Catarina, which provides services aimed at the areas of Archivology, Library Science and Information Science; and BiblioMetrics belonging to the Librarianship Course of the Federal University of Rio Grande do Norte, and work with the standardization of academic works, biblioFigureic survey, book publishing, organization of physical and digital collections, organization and systematization

of files on computers, tablets and smartphones, user research, policies, qualitative and quantitative, and information architecture (Reis, 2017).

In Maranhão, activities focused on corporate entrepreneurship, which deals with the creation of new companies, are still timid. However, actions such as Biblio Fora da Caixa³, created by librarians from Maranhão who use social media spaces (Facebook, Instagram and Youtube) to promote people and institutions that add differential content to the area of Library Science and Information Science, are found in the digital sphere; Normalize⁴, created by a student of the Library Science Course of Maranhão who posts content on Instagram related to ABNT rules and provides services for standardization and updating of the Lattes Curriculum; Elaborando,⁵ which works with documentary standardization (articles, abstracts, files, reviews, etc.), and the organization of lattes; and the Reading Pier⁶, a page created on Instagram by a student of the Librarianship Course, is a literary profile that socializes literary reviews, literary tips in order to awaken in followers the pleasure of reading. It is noted that most of the profiles found on social networks are focused on the normalization and organization services of the Lattes Curriculum.

In addition, librarians inserted in libraries can develop intrapreneurial actions, however, "[...] it is necessary to have autonomy of services, innovations and creations and also to count on the help of everyone in the institution in search of organizational success" (Brito, 2017, p. 26), so that the activities developed attract users and meet informational needs, not necessarily creating new things, but innovating in established services.

The job market is dynamic, and with each evolution of society, a demand arises. In the context of libraries, it is no different, information changes, new technologies emerge and in this way the world of work requires professionals who adapt to these changes. Thus, it is necessary for librarians to seek continuing education and new ways of working to walk side by side with these transformations. Therefore, Cardozo and Barbosa (2004, p. 23) point out that the entrepreneurial librarian must be "[...] creative, flexible, innovative and have a vision of the business in which it operates, in addition to always being aware of the need for permanent updating, with regard to knowledge and techniques and working methods". Therefore, when thinking about the entrepreneurial librarian, it is necessary, in addition to everything, to analyze the market and all the knowledge that the professional holds, so that

he can create or recreate, in a differentiated way, new services or products that meet the needs of customers.

Regarding the various ways of developing a business, consulting arises as a result of entrepreneurial actions, contributing to the solution of problems in enterprises and to the creation of new companies. In addition to the possibility of being developed internally by the company's own employees who seek to identify and solve the problems of the organization inserted. However, the focus of the research will be directed to external consulting aimed at creating a marketing consulting company for libraries. Thus, in order to clarify more about this sector, the following section will address consulting.

4 CONSULTANCY

The expression consultancy, derived from the Latin *consultore*, can be apprehended as an exchange of offering and receiving advice. In a conservative perception, it was considered as a function developed by religious people, and in the last century as specific activities carried out, for example, by doctors, lawyers and accountants (Leite *et al.*, 2005). However, for Block (2013), anyone who influences the other without the direct power to generate changes is considered a consultant, because those who make them effective are the managers.

In the historical aspects of consulting, Grocco and Guttman (2005, p. 2) emphasize that,

[...] A brief and more attentive analysis of the history of humanity is enough to realize that it has existed since time immemorial. There are, for example, the Druids, magicians who, in addition to preparing potions, advised the chiefs of Celtic villages on various subjects and resolved various disputes between the villagers. The rabbis, similar to the Druids, advised the faithful, interpreted the scriptures, adding more knowledge to the people, and also resolved disputes.

In this context, Grocco and Guttman (2005) and Leite *et al.* (2005), converge with the idea that the activity of consulting, in its origin, was a practice carried out by the wise men of society. On the other hand, authors such as Bond (1999), Paes de Paula and Wood Júnior (2008) associate the history of consulting with the ideologies of *Management* (discourse focused on the reorganization of the areas of Strategy, Marketing and Human Resources) propagated in organizations. In addition to these, other theoretical sources emerged, such as Silva (1974) and Merron (2007), who based their historical studies on consulting on the system used by Frederick Taylor (he fragmented basic activities and analyzed the time in which work was carried out).

The origin of consulting in the form it is currently applied, according to Donadone, Silveira and Ralio (2012) emerged between the nineteenth and twentieth centuries, and can be considered as places of origin: England and the United States. With regard to the expansion of services to other fields, Lins (1999) demarcates the 1920s, especially in the United States, as the period in which consultants began to work in the areas of production, accounting, personal administration and human relations. Consulting activities were expanding in the various areas of work, and during the Post-War period, in the 1970s of the last century, consulting originated its work in marketing and other techniques aimed at operations research and systems modeling. With regard to consolidation, it is important to emphasize from 2 (two) processes:

The first of them being the legitimization of the activity as an alternative in conducting the analysis and even the management of public and private organizations [...] The second process is also linked to extensive changes, but with a focus on accounting, caused by the reformulation of laws regarding the relationship of companies with the financial sector and the calculation of taxes (Pastore, 2014, p. 38).

It is a remarkable period for this sector, since it legitimizes its function to establish links and professional partnerships with public and private organizations. In addition to performing specific work in other areas, such as accounting (Pastore, 2014).

In general, consulting is:

[...] a process of mutual learning between consultant and client, based on a constant cycle of action research, that is, trial-error-success. In this process, not only the consultant, but also the client must play an active role, since no two problems are ever the same, and because it is practically impossible for a consultant – and his team – to understand and apprehend all the complexity and interdependence of the political, social, technological and economic systems operated by the client, in the short contractual time normally available (Gonçalves, 1991, p. 91).

In relation to the concept presented by Gonçalves (1991), consultancies are activities developed in stages, through the interaction between the consultant and the client, which seek to reflect critically and analytically on various problems in organizations. Nothing comes ready, both are willing to take risks within the process. The client, in turn, is a fundamental piece for the unfolding of the consultant's activities, acting as an active agent, since he knows the company's organizational culture.

In the view of Grocco and Guttman (2005, p. 8), consulting is considered as an interactive process "[...] executed by one or more people, independent and external to the problem under analysis.", therefore, the consultant must diagnose, assist and propose

solutions to the problems identified. Similar to this, Reis Neto (2007) defines consulting as a partnership activity, where this interaction is decisive for obtaining results.

Block (2001), emphasizes the consulting process in 5 (five) ordered phases: Entry and Contract; Data Collection and Diagnosis; Feedback and Decision to Act; Engagement and Implementation; and Extension, Recycling, or Termination. In Figure 3, the activities developed in these stages are presented.

Figure 3

Activities of a Consultancy

Project completion

Source: Block (2001).

In each stage highlighted by Block (2001), the activities defined in the flowTable are established. In phase 1 Entry and Contract is the point where pre-contracting and diagnosis planning are worked; in Data Collection and Diagnosis it is the interview phase, data collection and analysis of collected data; Feedback and Decision to Act is related to the formatting and presentation of the diagnosis, project planning and schedule of activities and project preparation; Engagement and Implementation focuses on employee training and implementation; and Extension, Recycling or Completion which concerns the monitoring of results, necessary adjustments, standardization of the new process, and completion of the project. Therefore, it is the responsibility of the consultants to facilitate the phases of change of the client-company, together (consultant and client-company), so that interaction is developed in the stages of the process (Leite *et al.*, 2009). These phases are described in more detail in section 6.2.1.

For Lins (1999, p. 26) "Consulting has a primordial concept of helping third parties, exemplified in the situation of someone who has information and passes it on to the other who requested it and the other decides what to do with this information", whose services are provided to someone, not arbitrarily, but consensually, since the consultant does not have the autonomy to put into practice actions of change, if it is not granted by the customer. Reinforcing this idea, Block (2001, p. 2) describes the consultant as "[...] a person who is in a position to exert some influence over an individual, group, or organization, but who has no direct power to produce change or implementation programs [...]". Therefore, consultants must know the organizational demands, and propose solutions that will solve the identified needs, respecting the power of choices of the clients.

Regarding consultancies in Brazil, Donadone, Silveira and Ralio (2012) consider the country an important center that receives most of the national consulting firms, perhaps in Latin America. As a result, the authors carried out an analysis that aimed to identify the main centers of influence in the sector to develop a cartoFigurey of the Brazilian consulting space. Thus, they identified 3 (three) centers of action of the consultancies in the country represented by the Brazilian multinationals; and university students (Donadone; Silveira; Ralio, 2012).

Multinational consultancies are subdivided into accounting firms and artisanal consultancies. The first is associated with mass production, since it requires large-scale performance, a considerable number of professionals and the presence of a significant

number of recent graduates from Business Schools; In artisanal consultancies, their consultants are differentiated by the academic aspect, that is, the priority is in the qualification of their professionals. Brazilian consultancies, on the other hand, have fragmented characteristics because they cover small companies. The performance of these consultants is focused on specific knowledge and a network of relationships derived from the experiences lived in an existing sector. And university consulting is linked to an institution, and its differential from other consultancies is in the scientific methodology. It can be seen that the difference between the consultancies in Brazil is conditioned by the nuclei of action as well as on who will work (Donadone; Silveira; Ralio, 2012).

It is worth mentioning some associations created to bring together the various services offered to consultants, such as: Institute of Management Consultants (IMC) and Brazilian Institute of Organizational Consultants (IBCO). There is a need for consultants to engage in these Institutes to establish and increasingly strengthen consulting services in the market, and to be a way to add, through continuing education, more knowledge for better professional qualification and customer satisfaction.

In addition, the IMC is an organization focused on teaching and research regarding the improvement of management consulting practices through research, performance measurement and education of current and future management consultants. It aims to generate value, ethics and professionalism on the part of management consultants (IMC, [2019]).

Therefore, IBCO is a non-profit governmental organization that brings together consultants from consulting companies, independent consultants, internal consultants and institutional members who have voluntarily joined (IBCO, 2015), for its adhesion it must: "[...] participate in examsthat evaluate the training, experience and way of acting of candidates [...] IBCO's main activity is permanent research on techniques, technologies, ethics and quality of consulting" (IBCO, 2015), if approved, these professionals must be committed to the institute's mission, take careof the Code of Ethics and achieve its objectives.

According to data obtained by the Brazilian Institute of Organization Consultants (IBCO) in the most recent survey carried out in 2016, it is estimated that Brazil has about three thousand organization consultants carrying out activities in the area of Planning, Training and Human Capital, Strategic Management, Organizational Development and Restructuring, Process Management, Information Technology, Marketing and Commercialization, Finance, Research, Intelligence, Logistics, Creativity and Innovation, Sustainability, Legal and Tax, etc. (IBCO, 2016, p. 8).

According to IBCO (2019) Brazil corresponds to 75% of Latin American revenue, that is, "From 2008 – 2010, due to the impact on developed economies and the appreciation of the real, the Consulting business in Brazil expands at rates much higher than those presented in more developed countries" (IBCO, 2019, p. 16). In the country, almost 50% are independent consultants or consulting firms with only one consultant; and another 70% offer organizational consulting services maintained for five years and 18% have remained for 20 years (IBCO, 2019). These data were collected based on interviews with consultants by state. Table 6 shows the percentage of interviewees.

Table 6

Percentage of Respondents by region

Participação de Respondentes por Estado		
Estado	Quant.	%
Alagoas	6	3,08
Bahia	2	1,03
Ceará	11	5,64
Distrito Federal	7	3,59
Espírito Santo	5	2,56
Goiás	1	0,51
Minas Gerais	15	7,69
Mato Grosso	3	1,54
Maranhão	1	0,51
Pará	1	0,51
Paraíba	2	1,03
Pernambuco	2	1,03
Paraná	7	3,59
Rio de Janeiro	28	14,36
Rio Grande do Norte	1	0,51
Rio Grande do Sul	31	15,90
Santa Catarina	1	0,51
São Paulo	71	36,41
Total	195	100

Source: IBCO (2016, p. 23).

It can be inferred that the largest concentration of interviewees who work in the consulting industry belongs to the South and Southeast regions. In Maranhão there is a lower number and this may mean that the state lacks more due to the lack of consulting companies. However, it is possible that this sector has grown in Maranhão, however IBCO (2016) still does not have recent research, because when searching in the Google search engine, some companies were identified, such as: EJAD Business Innovation⁷, which operates in the field of consulting developing activities of Financial Plan, Spy Client, Business Plan, Marketing Plan, Strategic Planning, process mapping, job description, and market research; Gakkai Business Consulting⁸, which offers strategic planning services, Restructuring of Processes and Routines, Manualization of Processes, Strategic Financial Management, Trademark Registration, Business Plan, Coaching to Enhance Teams, Market Research, Satisfaction Survey, Selection of Professional Talents, Manual of Good Practices in Food, Franchise Network Start Up, and also provide a professionalization course to its customers. customers;

⁷ EJAD Business Innovation: <https://www.ejadconsultoria.com.br/>

⁸ Gakkai Business Consulting: <https://gakkaiconsultoria.com.br/>

Sapiens Consulting⁹, which operates in the areas of environment, training and strategic management; and Labore Consulting¹⁰ is a company that provides services to candidates with vacancies for internships, young apprentices, trainees, administrative positions, operational positions, specialists and managerial positions, and also provides services to companies by recruiting qualified professionals to enter companies.

It is worth noting that Sebrae operates in Maranhão as a consulting company providing information and training for entrepreneurs who are going to get their own business. An example of this is Sebratec, which is "[...] a Sebrae product that **provides technological services for your company**. Sebraetec connects small businesses to a wide network of technological service providers that serve throughout the Brazilian territory" (SEBRAE, 2020), and also enables the dissolution of demands in the areas of Design, Production and Quality, Technological Development, and Sustainability (SEBRAE, 2020).

Currently, in view of the pandemic crisis scenario, where it is affecting the economy, Sebrae is offering online consulting aimed at micro and small companies (MEI) granting 4-hour consultancies in the areas of Financial Management, Business Legal, Accounting/Tax, Process Management, Digital Marketing, Digital Media and Innovation (SEBRAE, 2020).

Regarding the consulting company focused on the field of Librarianship in Maranhão, it is possible to identify mostly more companies aimed at standardization, such as Silver Standardization¹¹, a member of the Brazilian Association of Technical Standards (ABNT) and affiliated to the Regional Council of Librarianship 13th Region, in Maranhão Standardization. 2020); and NC Academic Consulting¹², which works with standardization services, preparation of biblioFigureic references, slides, spreadsheets, tables and Figures.

In general, consulting can be developed internally and externally. In the perspective of Oliveira (2005, p. 61) the "[...] external consultant is represented by a self-employed consultant or by a professional from a consulting firm", while the "Internal consultant is represented by an employee of the client company; which performs services for different areas of the aforementioned company" (Oliveira, 2005, p. 61). These consultancies are distinguished through the relationship that the professional has with the company, as the external consultant is represented by the objectivity and impartiality of the service provider, while the internal consultant is part of the organization's staff.

Teixeira and Coelho (2012, p. 68) corroborate Oliveira (2005) when they cite that:

⁹ Sapiens Consulting: <https://consultoriasapiens.com/index.html>

¹⁰ Labore Consultoria: <http://www.labore-ma.com.br/index.php>

¹¹ Silver Standardization: <https://www.silvernormalizacao.com.br/>

¹² NC Consulting: <http://www.findglocal.com/BR/S%C3%A3o-Lu%C3%ADs/1587965388102832/NC-Consulting-Acad%C3%A2mica>

[...] external consulting is carried out by a professional without an employment relationship (CLT) with the client company, that is, an independent professional, with academic knowledge and business experience, who acts as a facilitator of the process, without, however, exercising any direct intervention in the management of the company and/or its processes. [...] Internal consulting is developed by a professional who is part of the company's staff. It uses experience, skills and knowledge to improve the forms of relationship and implement new forms of management.

Teixeira and Coelho (2012) refer to external and internal consultants sequentially, as the professional without the Consolidation of Labor Laws (CLT) regime with the contractor, but who uses his theoretical knowledge and professional experiences to collaborate with the company, not having the freedom to execute any decision made, unless authorized. On the other hand, internal consultants know the company because they are part of the organization's work environment, and gather the knowledge learned over the years to develop efficient ways for interpersonal relationships, as well as contribute to improving the management of their activities. Block (2004) claims that internal consultants usually act by imposition, while external consultants get involved with most situations, without being influenced by the organizational environment and have more opportunities in the market.

In addition, it is necessary to define the types of consultancies to think about the product, the way of acting, and the career as a consultant. Thus, the consultancies are divided, in terms of structure, into package consulting and artisanal consulting, and in terms of their breadth into specialized consulting, total consulting, and global consulting (Oliveira, 2005), described in Table 7.

Table 7

Types of Consultancies

Classification	Types
As for its structure	Package consulting – That which is carried out through the use of strong methodological structures and administrative techniques, seeking a standardization of the consulting service, without worrying about the adequacy to the context and reality in which the client company is inserted.
	Artisanal Consulting – That which seeks to provide personalized service to the customer's problems, elaborated with fundamental methods and techniques based on models applied in similar companies. Its final result has higher quality and provides the client's independence in relation to the consulting company.
	Specialized Consulting – Operates specifically in one or a few subjects in the organization, within an area of knowledge (marketing, HR, finance, etc.), being considered the fastest growing type of consulting in recent years. Some of its advantages are: higher quality in the services provided, greater agility with lower costs and a higher degree of training of the people involved.

As for its breadth	Total Consulting – Works in practically all operations of the client company. It is the target of criticism for the fact that it often deals with various issues in a non-integrated way, gives opinions in all sectors of the company and causes waste of efforts. It is important to analyze whether the methods applied are integrated and whether there is at least one specialist for each subject.
	Globalized Consulting – One that consolidates its services in globalized companies and operates in several countries. It has a strong technological evolution, especially in IT, and operates with the objective of forming free trade fields and economic blocs that interconnect markets, especially consumer and financial markets.

Source: Adapted from Oliveira (2010).

Oliveira's (2010) statements lead to a perception that the structural aspect of consulting revolves around its structure, how services are planned, such as package consulting, which works with pre-formed services, and artisanal consulting, which seeks to offer personalized products to solve contractors' problems. The breadth aspect refers to the dimension of the services, that is, to the area of activity, such as: specialized consulting that filters a segment and works specifically in a field of knowledge, total consulting that works in general in all activities developed by the contractor; and the globalized consultancy that works with global companies and provides consultancy in which place in the world the company operates.

Regarding consulting, according to Lins (1999, p.30) it is perceived that "[...] It presents some particular aspects, such as: it is an independent, advisory service, which provides knowledge and is not as easy as one imagines", that is, it is a guidance service that requires from the consultant discipline a distanced and deep analysis of the data, involvement, impartiality and the search for solutions to problems presented by the client company. Therefore, for Oliveira (2005) there is a difference between being a consultant and being a consultant, because to remain in this profession it is necessary that the professional has the vocation and competence to provide quality work. On the other hand, "[...] for consulting to become an efficient job, it is necessary for the company to create criteria for the consultant's needs, check their background, in addition to making appropriate use of their services" (Lins, 1999, p. 34) or, better said, offer working conditions for the consultant, know their professionals and know how to extract the contracted service from them.

Among the various segments that can be worked on in consulting, marketing stands out, which acts from the perspective of meeting the needs of customers, from the creation of the business to its maintenance in the market. In this way, consulting is inserted as a way to assist in the opening of a business and in the analysis of symptoms that reflect on organizational problems with solution proposals.

Marketing has become one of the specialized areas of consulting, due to its management process, especially in what corresponds to the 4P's, which includes all the company's functions – product, price, place and promotion. For a broad understanding of marketing, in the next topic a study on the subject was developed.

5 MARKETING

Marketing is an area of great prominence in the field of Administration, because it works with a focus on the customer, covering the entire business in order to meet their needs and desires. Its effective origin dates back after the First Industrial Revolution, in the seventeenth and nineteenth centuries. which at first had its focus on the product, and with the constant changes in the market, they started to focus on the customer. Since then, this area has expanded conceptually and has undergone major transformations in its technique and application (Cobra, 2011).

Regarding the term marketing, Amaral (2007, p. 19) points out that it is a "[...] Anglicism, adopted in the Portuguese language, since there is no single word that can express the conceptual totality included in the term in English". In addition, the author points out that the union of this word corresponds to "action" and "market", that is, market in action. In this way, marketing is linked to the marketing process that involves activities such as exchange and sale.

In the view of Kotler and Keller (2012, p. 3, emphasis added) "Marketing involves the identification and satisfaction of human and social needs. One of the most succinct and best definitions of marketing is that of 'meeting needs by generating profit'". It can be seen that the emphasis given by the authors is an area concerned with the client's needs without losing sight of their financial objectives. Similarly, Kotler and Armstrong (2007, p. 4) define marketing as "[...] an administrative and social process by which individuals and organizations obtain what they need and desire through the creation and exchange of value with others [...]", where all parties benefit.

Las Casas (2010) and Cobra (2011) relate marketing to the exchange process. For Las Casas (2010, p.14) marketing is "[...] a marketing activity that was based on the concept of exchange. [...] Exchange is characterized by the offer of a product with the receipt of another benefit [...]" and Cobra (2011, p. 23) defines marketing as "[...] the process in society through which the demand for goods and services can be anticipated or encompassed and satisfied through the design, exchange, promotion, and physical distribution of goods and services." In this concept, Cobra (2011) emphasizes one of the tools of the marketing mix and the relationship established between organizations and society.

Another concept is that of McCarthy (1982) who characterizes marketing as the act of identifying the needs of customers and satisfying them, revealing that there is a marketing action of goods and services. Reinforcing this idea, Amaral (1998, p. 55) says that marketing "[...] implies perceiving the expectations, needs and desires of the market we intend to meet [...]", is thinking like the customer to meet their demands, in addition to achieving organizational objectives.

In addition, marketing can be defined according to its scope in a macro or micro nature. Macromarketing is understood as a "[...] social process that directs the flow of goods and services from producers to consumers in order to effectively balance supply and demand, and to achieve the goals of society" (McCarthy, 1982, p. 30). While micromarketing "[...] it is the execution of activities that seek to achieve the objectives of the firm, anticipating the needs of the customer and moving a flow of goods and services, which can satisfy those needs from the producer to the consumer" (McCarthy, 1982, p. 29). Both are distinguished by their breadth, while macromarketing is concerned on a larger scale with the whole of society, micromarketing focuses on the individual interests of small groups.

In order to contribute to the conceptual understanding, in a chronological way, Table 8 describes some conceptions about marketing of basic theorists in the area.

Table 8

Evolution of marketing definitions

Author	Year	Marketing Definition
<i>American Marketing Association</i>	1960	The performance of goods and services activities from the producer to the consumer or user.
<i>Ohio State University</i>	1965	The process in society by which the structure of demand for economic goods and services is anticipated or encompassed and satisfied through the design, promotion, exchange, and physical distribution of goods and services.
Kotler and Sidney Levy	1969	The concept of marketing should also cover non-profit institutions.
William Lazer	1969	"Marketing should recognize the societal dimensions, that is, take into account the changes that have occurred in social relations."
David Luck	1969	Marketing should be limited to activities that result in market transactions.
Kotler and Gerald Zaltman	1969	The creation, implementation, and control of programs calculated to influence the acceptability of social ideas and involving considerations of product planning, pricing, communication, distribution, and marketing research.
Robert Bartis	1974	If marketing is to be looked at as encompassing economic activities, perhaps marketing as it was originally conceived will soon reappear under another name.
Robert Haas	1978	It is the process of discovering and interpreting consumer needs and wants for product and service specifications, creating demand for those products and services, and continuing to expand that demand.
Robert Haas	1978	Industrial Marketing - It is the process of discovering and interpreting the needs, desires and expectations of the industrial

		consumer and the requirements for the specifications of the product and service and continuing through effective promotion, distribution, after-sales assistance to convince more and more customers to use and continue using these products and services.
Phillip Kotler	1997	It is the process of planning and executing from the conception, pricing, promotion and distribution of ideas, goods and services to create exchanges that satisfy the objectives of people and organizations.

Source: Adapted from Cobra (2011).

In view of such definitions, it is possible to understand the conceptual evolution of marketing evidenced by theorists and organizations. The first concept enunciated is from the American Marketing Association (AMA) (1960), where the emphasis was concentrated on production processes, in search of increasing products, which as a result of World War II became small. In 1965, Ohio State University considered that marketing satisfied the needs of customers through the exchange of goods and services and the application of one of its compounds: promotion and distribution. Later, Kotler and Levy (1969) outline diverse ideas about marketing by emphasizing the possibility of thinking about it for non-profit organizations. Then Lazer (1969), Luck (1969) and Kotler and Zaltman (1969) characterize marketing as a social, managerial and marketing process.

Bartis (1974) becomes a visionary when he thinks about the possibilities of new marketing nomenclatures. Currently, marketing is configured according to the needs of each organization. Haas (1978) defines marketing based on 4 (four) central perspectives: needs, desires, demands, and after-sales assistance (currently known as relationship marketing). And finally, Kotler (1997) focuses marketing based on the exchange process.

The historical scenario of marketing is conditioned by the processes of transformation of society. Corresponding to the evolution of this sector, McCarthy (1982) and Las Casas (2008) consider that it went through three "Eras": the era of production, the era of sales, and the era of marketing.

Customers were not always considered the central focus of organizations, but rather they were concerned with the production and sale of products. According to McCarthy (1982), the Production Era was a period when there were few industrialized products, and the interest was centered on production. According to Las Casas (2008), the era of production was divided into 2 (two) phases: the product and the production. The first phase predominated the thought that the product sold by itself and the second phase was marked by mass production, as a result of the First Industrial Revolution and, in this period, demand was greater than supply.

Around 1930, the Age of Selling emerged, which focused on the marketing of products to customers and intermediaries (McCarthy, 1982). For Las Casas (2008), the Selling Era

was the one in which regardless of whether the customer needed the product or not, the seller should sell it at all costs, in which organizations adopted aggressive techniques for the sale of these products in order to move inventory.

And years later, in 1950, a new era begins, the era of marketing. At first, it was only as a department of the company that defined the short-term policy planning to compile the organization's activities, and was also in charge of advertising, research and other activities related to sales. Then, all their actions were fully centered on the client, seeking to meet their needs, desires and expectations (McCarthy, 1982; Las Casas, 2008).

In other words, Kotler, Kartajaya and Setiawan (2012) represent the eras of production, sales, marketing and relationship, respectively as: marketing 1.0, 2.0 and 3.0. In addition to introducing marketing 4.0, which revolves around the digital age. Table 9 shows a comparison between marketing 1.0, 2.0, 3.0, 4.0, 5.0 and 6.0.

Table 9

Comparison between marketing 1.0, 2.0, 3.0, 4.0, 5.0 and 6.0

Variables	Marketing 1.0 Product-Centric Marketing	Marketing 2.0 Consumer-facing marketing	Marketing 3.0 Value-driven marketing	Marketing 4.0, 5.0 and 6.0 Digital-Driven Marketing
Objective	Sell Products	Satisfying and retaining consumers	Making the world a better place	Making the world better by connecting people from the digital age; focus on artificial intelligence and personalized experience, with the emergence of interactive actions, concern with data privacy, and process automation to increase efficiency. Fusion between advanced technology and the human factor , with a focus on more immersive experiences capable of generating an emotional connection.
Driving forces	Industrial Revolution	Information Technology	New wave of technology	It was digital, social networks and Google.
How companies see the market	Mass Buyers with Physical Needs	Smart consumer, endowed with heart and mind	A full human being, with heart, mind and spirit	Digital human being who influences and is influenced
Marketing Concept	Product Development	Differentiation	Values	Joining the traditional and the digital
Company Marketing Guidelines	Product Specification	Product and company positioning	Company Mission, Vision & Values	Focus on the customer, on their behaviors, through technology.

Value Proposition	Functional	Functional and emotional	Functional, emotional and spiritual	Functional, emotional, spiritual, and digital
Interaction with consumers	One-to-one transaction	One-to-one relationship	One-to-one collaboration	They influence and are influenced

Source: Adapted from Kotler, Kartajaya and Setiawan (2025, p. 6).

With regard to marketing 1.0, it can be considered as the "Age of Products" originated in the First Industrial Revolution, which aimed at the massive production of products, as well as the reduction of costs and prices. In marketing 2.0, it is the moment when the customer realizes its value and importance to organizations, becoming more demanding and concerned with brands, price and product quality. Marketing 3.0 is worked with a focus on making the customer feel good in mind, heart and spirit, satisfying human needs linked to a sustainable and social perspective, that is, providing what the customer wants without harming the environment and contributing in a certain way to the resolution of social problems. One thinks, then, of social marketing, which according to Kotler (1978) is that carried out in favor of social causes, for example, demonstrations in defense of health, education, and even political campaigns.

When it comes to marketing 4.0, it is the phase in which consumers, in addition to using the product, want to post about it. The use of digital technologies is predominant, where behavior patterns are shaped through the digital environment. The process of social inclusion is developed, in the approximation and interaction of people from different cultures.

A new tool that marketing has used to reach customers occurs through social media. For Kotler, Kartajaya and Setiawan (2012, p. 9), "As social media becomes increasingly expressive, consumers will increasingly be able to influence other consumers with their opinions and experiences [...]"element. This statement has become a reality in recent years since 2015, with the new wave of digital influencers, people have inspired people and worked with the sharing and dissemination of the brands of large organizations.

Based on this evolution , Kotler, Kartajaya and Setiawan (2012, p. 29) argue that, "[...] Marketing concepts evolved from a product management focus of the 1950s and 1960s to a focus on customer management in the 1970s and 1980s. Then they evolved further and added the discipline of brand management in the 1990s to 2000s." And so, the authors ground marketing in three disciplines: product management, customer management, and brand management. Figure 4 shows the conceptual evolution of marketing between the years 1950 and 2000.

Figure 4*The evolution of marketing concepts*

Source: Kotler, Kartajaya and Setiawan (2012, p. 32).

It is understood that in the 1950s and 1960s the concept of Mix marketing was introduced. Mix Marketing is one of the most worked concepts in the area, since it revolves around activities that permeate the organization in the market. In terms of nomenclature, it can be known as: Marketing Compound, or titled by McCarthy (1982, p. 54) as 4P, which revolve around 4 (four) basic tools: product, price, place and promotion. As for the 1970s to 1980s, they mark a period where people began to interact through technologies, which brought customers even closer and made it possible to exchange information about the product. In this context, concepts of emotional, experiential marketing and brand value emerge. And, in turn, between the years 1990 and 2000, marketing concepts evolved to the point of reaching not only the minds of customers, but their hearts (Oliveira, 2013).

It is possible to say that marketing has been reinventing itself, improving and transforming itself according to the society in which it is inserted, in the evolution of social discourses and in a closer look at the needs of customers. The great leap that this area has taken, in shifting its focus from the product to the customer, has contributed to the emergence of new techniques, tools and marketing strategies that aim to reach the customer in different spaces.

In short, Oliveira (1985, p. 139) points out that:

There is a very important difference between that organization that approaches marketing starting with the product and then uses advertising to "sell" this product and

the one that starts the process by analyzing and identifying the behavior and needs of the various market segments, and from this data, develops a product/service specifically to solve problems and satisfy these needs that have been previously detected.

In this context, the author refers to organizations in terms of their type of orientation, citing sales and marketing orientation. In the sales orientation "[...] its objective is to sell what it manufactures, instead of manufacturing what the market wants" (Kotler, 2000, p. 40). Regarding the marketing orientation, it incorporates "[...] an outside-in perspective. It starts with a well-defined market, focuses on the needs of customers, coordinates all the activities that will affect them, and produces profits by satisfying them." This orientation focuses on the target market, customer needs, integrated marketing and profitability (Kotler, 2000).

For Amaral (1998, p.59) "The function of marketing is its generic task, that is, the set of techniques developed in the management process, including planning, organization, direction and control, which is called marketing management. [...]". According to Kotler (1998, p. 32) marketing management is "[...] the process of planning and executing the design, pricing, promotion, and distribution of ideas, goods, and services to create exchanges that satisfy individual and organizational goals." These are theoretical and practical steps that revolve around the marketing mix to meet the demands of both customers and the company.

The marketing management process consists of 5 (five) steps: Market Research (PM); Segmentation, Target Audience Definition and Positioning (SDP); Mix Marketing or the 4P's (MM); Implementation (I); Control (C) (Kotler, 1999).

Regarding **Market Research**, Kotler (1999, p. 47) states that "[...] Research is the starting point for marketing. Without it, an organization enters a market blindly [...]". It is the primary stage of marketing, where the analysis of the market in which the company is inserted is carried out, in order to know not only the internal variables, but also the external variables that can influence the development of the organization, whether positively or negatively. In this sense, Gomes (2013) clarifies that the more information the company obtains from its customers, suppliers and competitors, the better its performance will be.

Based on this, Gomes (2013, p. 14) highlights 9 (nine) steps to be applied in the market research stage, as shown in Table 10.

Table 10

Stages of market research

Step	Objective
Definition of the target audience and objectives of the research	it delimits the public to whom the research and the establishment of what is intended to be achieved will be intended
Definition of data collection	carries out the survey of information that will serve for the research
Definition of the primary data search method	type of research that will be worked on
Sample Definition	Measure the size of the audience to be surveyed
Elaboration of research instruments	Use of forms for the collection of true information
Application of the research	Putting research into action
Data tabulation	Gather and group data
Preparation of the final report	Analysis of the survey based on the information collected
Decision making	Cognitive process that will be carried out at the end of the research so that fair decisions can be made

Source: Adapted from Gomes (2013).

Therefore, for Gomes (2013) research must be carried out, because even if it is in the long term it will bring results. And it is necessary to know and know how to manage the information obtained, so that it can ensure the permanence and expansion of organizations through decision-making.

The second step of marketing management refers to **Segmentation, Target Audience Definition and Positioning**. **Segmentation** consists of "[...] a subdivision of a company's global market into the most homogeneous portions possible, in order to formulate marketing strategies" (Cobra, 2011, p. 71), that is, the market is a macro environment that covers all segments, however, it is necessary for the organization to fragment its performance by choosing a specific niche of work so that it can invest in the right customer. Las Casas (2008) summarizes the process of implementing market segmentation in 3 (three) phases: identifying and defining profiles of certain groups of potential customers, who are interested in some specific type of segment; select the types of segments; and to determine and disseminate the quality of the product in the market.

Converging with this thought, Cobra and Franceschini (2012) argue that these 3 (three) phases seek to bring together people with similar needs, preferences and desires, establish interaction with the target segment and direct the product to the target market in order to show the customer that it meets their needs. For Cobra and Franceschini (2012),

market segmentation occurs in several ways, such as: by price, quality, location, age, among others. Therefore, the segmentation can be:

- A) GeoFigureic Segmentation - division by neighborhoods, cities, municipalities, states, regions, countries...;
- B) DemoFigureic Segmentation - age and life cycle, sex, income, occupation, education level, religion, race and nationality;
- C) PsychoFigureic Segmentation - social class, lifestyle, personality;
- D) Behavioral Segmentation - occasions (occasion in which one has the idea, in which one buys or uses the product), search for benefits (desired benefits of a class of products, people who want them and brands that contain them), usage rate (small, medium and large users), degree of loyalty (loyal to brands, stores, companies or no loyalty), aptitude stage (they are unaware of the product or want to buy it), attitude (enthusiastic, positive, indifferent, negative, hostile);
- E) Multi-attribute segmentation – use of two or more demoFigureic variables (geodemoFigureic) (Cobra; Franceschini, 2012, p. 26).

It can be seen that for each segment there are variables that differentiate customers and define the type of product to be offered, and that many of them are linked to social, cultural, political and economic elements that guide society and differentiate the groups inserted in it.

Regarding the **definition of the target audience**, Gomes (2013, p. 25) argues that "[...] It means identifying a particular segment or segments of the population you want to serve. [...]", while the organization characterizes the segment it will operate in, it manages to establish the right customer for whom its products will be destined. The definition of the target audience is conditioned to the delimitation of the segment. However, Marinho (2013) highlights that in the identification of the target audience it is essential that people have specific characteristics of the variables presented in the segments and not only be interested in the product.

Positioning is also **added**, which Kotler (1999, p. 48) defines as "[...] the effort to implant the key benefit(s) and differentiation in the minds of customers", that is, the image it seeks to convey to its customers. In another definition, positioning is considered as "[...] the company will organize itself, and position itself to operate in the market" (Rocha; Platt, 2015, p. 153), which is directly linked to the stages of segmentation and definition of the target audience. Las Casas (2008) considers that in order to achieve the objective of positioning, which is to keep the product in a prominent position in the customer's mind, it is necessary to sum up the actions carried out through marketing.

The Marketing Mix or 4P "[...] determine the strategies and marketing actions that seek to meet what consumers need and desire" (Lima, 2015, p. 24), that is, it is a whole process that involves everything from the creation, establishment, distribution and dissemination of the product in order to meet the needs of customers.

In this way, Kotler (1998, p. 90) conceptualizes Mix marketing as "[...] the set of controllable variables that the company can use to influence consumer responses". Through this Compound, companies have the power to persuade the customer to obtain the product. In another work, Kotler and Armstrong (2007, p. 42) define Mix Marketing as "[...] the set of tactical, controllable marketing tools that the company combines to produce the response it wants in the target market." It is understood that to reach the target audience, it is necessary for marketing tools to work in synergy, so that they achieve the objectives and goals set.

With regard to the 4P's, referring to Product, Price, Place and Promotion, it is clear that each P represents a different function and definitions, but that they must work in harmony for the company to succeed in the market.

In this Compound, the first variable to be worked on is the **Product**. In relation to this element, Chiavenato (2007) considers it as the process of creation and development according to the needs of customers. Madruga *et al.* (2004) consider the product as the main component of the marketing strategy, since it goes far beyond a physical good and also seeks to satisfy the needs of its customers, providing comfort, prestige and security. Services also fit into this regard.

For Kotler (1999, p. 126) "The basis of any business is a product or service [...]", so the organization must be concerned with offering the best so that it can be a differential in the market. In turn, Cobra (2011) presents some requirements that the product must have: Quality and standardization, in terms of its characteristics, operation and finishes; models and sizes, which satisfy the wishes of customers; and configuration, referring to physical sampling, packaging, branding and service.

The second variable is **the Price**. According to Madruga *et al.* (2004) price is directly related to the conception of quality, prestige and image. In addition, Chiavenato (2007) reveals that the price determination must be made based on the market and its competitors.

The third variable is the **Square**, which corresponds to the distribution. Madruga *et al.* (2004) characterizes it as an onerous activity for the organization, as well as one of the most important, and that distribution is related to marketing channels (which are the means by which the movement of products, resources and information between the company and its customers is made). The square is called by Cobra (2011) by "point", it is a relevant

component for the product because it positions it in the market, as Chiavenato (2007) defends it is the place where the product will be established in the market.

The last variable is **Promotion**, which can occur in two ways: mass or specific consumers, so the approach aimed at these groups must be different. In mass promotion, advertising, sales promotion and public relations occur, and in promotion aimed at specific consumers, personal sales are made (Madruga *et al.*, 2004). Cobra (2011) shares this same idea and even adds merchandising.

In turn, Chiavenato (2007) conceptualizes in a unique way terms such as advertising and merchandising that are linked to promotion. Chiavenato (2007, p. 203) defines promotion as "[...] planning and development of promotional events", advertising being the "[...] dissemination through advertising campaigns" and merchandising such as "[...] presentation and disposition of the merchandise at the point of sale". Promotion is a component of communication between the company and the customer, which goes far beyond publicity, and which has advertising and merchandising as other ways to promote the service or product.

Implementation inserted in the Marketing Management process is a stage that encompasses product creation, price determination, distribution and promotion. It is the set of the marketing mix in the execution phase, which requires a lot of attention so that it does not escape from its objectives and the promises offered to the customer (Kotler, 1999).

Control, in turn, is the final step in the process. According to Kotler (1999), for companies to be successful, they must not tire of learning and always be monitoring all the steps implemented, through audits, evaluation of results, always correct something that does not present the planned performance, and always be vigilant for the functioning of Mix Marketing.

It is understood that the marketing process is a chain formed by variables that are related to each other, and must be worked on collaboratively. In addition, this process centralizes its focus on the market and target audience, developing strategies that enable the satisfaction of its customers and the objective of selling the product.

In view of this, the application of marketing requires planning. For Kotler (2003, p. 174) "The company needs vision, vision requires strategy, strategy requires plans and plans need action". Hence the importance of the marketing plan "[...] represented by a document, which brings the main actions and activities to be developed to ensure the achievement of the objectives and goals of the marketing area [...] it is important to highlight that the marketing plan must be aligned with the company's strategic planning" (Stecca; Ávila, 2015, p. 79).

Conceptually, the marketing plan is "[...] the result of the process of organizing all the considerations and tasks required to market a product or service in an effective and orderly way in a logical flow", that is, it is a tool that contains all the information regarding the market, objectives and goals to be achieved by the company and methods of execution and control of its activities (Amaral, 2004, p. 25). The composition of the sections of the Marketing Plan will be explained in Table 11

Table 11

Sections of the Marketing Plan

Sections of a Marketing Plan	
Executive summary and summary	Provides a quick overview of the proposed plan
Situation analysis	It presents the relevant historical data regarding sales, costs, profits, market, competitors and the various forces that act in the macroenvironment.
Marketing Strategy	It defines the mission, marketing objectives, financial objectives, and needs that the product offered must satisfy, as well as its competitive positioning.
Financial Projections	They include sales and expense forecasting and a break-even analysis. On the revenue side, they show the sales volume forecast by month and by product category. On the expense side, they show the forecast of marketing costs broken down into categories. The break-even analysis estimates how many units should be sold on a monthly basis to offset the monthly fixed costs and average variable costs per unit.
Controls	The last section of the marketing plan outlines the controls to monitor and adjust your implementation. Goals and budget are specified in detail for each month or quarter, so that senior management can analyze the results each period and take appropriate corrective actions.

Source: Adapted from Kotler and Keller (2012).

The main function of the marketing plan is to "[...] provide solid information for strategic planning; identify strengths and weaknesses; analyze the competition; seek opportunities not yet explored; collaborate for the efficiency of processes; analyze alternative strategies; and provide a work plan" (Stecca; Ávila, 2015, p. 80). And so, the marketing plan contributes to the development of new products, resolution of problems related to the 4P's, establishment of guidelines for the application of activities in a coordinated manner, in order to achieve the stipulated objectives and goals and consequently customer satisfaction.

In view of all that has been discussed about marketing, it is also worth stating that "[...] Marketing is not, nor does it mean simply selling, nor is it limited only to dissemination or advertising. Their actions do not start with the product and services, they start with the customer [...]" (Amaral, 2007, p. 20). According to Amaral (2007), marketing is concerned with the interests and needs of its customers, and goes far beyond the practice of commercialization, its techniques can be applied in any organization, even non-profit

organizations. In this way, marketing in libraries is explained, aiming at its application and contribution to these institutions that do not aim at pecuniary profit.

6 MARKETING IN LIBRARIES

Marketing since its genesis has been linked to the commercialization process. The evolution resulting from the transformation of the market contributed to the emergence of new techniques and strategies that achieved customer satisfaction, and, above all, the sale of products to obtain profits. Therefore, the application of marketing has always been conditioned to for-profit organizations.

However, Table 4, cited above, describes the conceptual evolution of marketing and demonstrates the interest of Kotler and Levy (1969) in extending its concept to non-profit institutions. Thus, Amaral (1998, p. 68) points out that "[...] the transposition of a conceptual system from the sector that aims at profit to the non-profit sector represents a challenge for information units and other information units, as well as librarians [...]", that is, the challenge is to think about how marketing can be implemented in libraries, an institution that does not aim at the capitalist market.

However, to reflect on the application of marketing in these environments, it is necessary to understand that marketing does not mean only sales, but "[...] it is related to the development of products and services and to their communication to the potential market in the expectation of changing and/or influencing their behavior" (Oliveira, 1985, p. 137). Therefore, libraries can use marketing to their advantage, to keep real customers and attract potential customers. In view of this, Silveira (1987, p. 7) argues that:

Libraries that aim to awaken, provoke or guarantee exchanges of information where it does not exist and stimulate exchanges where they already exist, that is, to sensitize the potential user to make him a beneficiary of the system and encourage consumption by effective users — are developing a marketing function, whether they know it or not.

Even though they are used unconsciously, many libraries carry out marketing activities, when they carry out the study of the customer with the objective of bringing together both the real and the potential customer and take into account the social, demographic aspects and the needs of customers for the development of new services. However, "[...] when used consciously and skillfully, marketing can keep the library in a visible and relevant position" (Conroy, 1987, p. 23).

Some authors such as Edinger (1987), Conroy (1987), Wood (1987) and Baptista (1988) believe that there are several reasons for marketing to be applied in these institutions. In Edinger's conception (1987, p. 107) there are 2 (two) reasons, the first is to "[...] improve

the satisfaction of your potential users" and "[...] The second reason librarians begin to actively engage their library services with marketing is the emphasis placed on accountability in today's nonprofits [...]" (Edinger, 1987, p. 108), since libraries are administratively subordinated to sponsoring institutions.

In this regard, Baptista (1988, p. 99) lists some factors that justify the application of marketing in these institutions, such as:

- I. Provides a set of widely tested techniques and instruments to identify the needs, desires and preferences of the user;
- II. It forces a questioning of the library's relationship with its audience;
- III. It favors the exchange relationship (bilateral relationship), making the library offer products based on the needs of users and obtain, through use, recognition for its work;
- IV. It encourages communication, valid mainly for non-users, making the library staff leave their traditional immobility;
- V. It causes greater acceptance of the library, attracting new resources, to the extent that the library is seen as a fundamental piece for user satisfaction.

Therefore, marketing promotes the interaction between the library and the customer, as well as seeks to identify and meet their informational needs. And, in addition, "[...] helps librarians and information personnel to improve their reputation, both within institutions and as a profession within society [...]" (Wood, 1987, p. 173). That said, the application of these techniques brings benefits to all participatory agents in this process, that is, to the client in meeting his informational demands and to the librarian in building his image as a professional outside and inside the library.

However, for Oliveira (1985) some consider that marketing cannot be developed in non-profit organizations because it is based on the concept of exchange. But for Silveira (1987) this action brings benefits to both the library and the user. Therefore, the author points out that it brings advantages:

For the user, by the systematic obtaining of information at the desired level, which leads to a continuous development in their activities. For the library, in the sense of the professional valorization of its human resources, the allocation of greater financial resources to meet the demand of users, the achievement of an ideal standard of service compatible with the market and the achievement of the objectives of the maintaining organization (Silveira, 1987, p. 7).

It is understood that the exchange process that marketing promotes between the library and the customer is not directly related to the capture of financial profits, but to the

intangible value attributed to the supply of informational demands by customers, to the recognition of this service, to the image of the librarian, and to the fulfillment of the library's role in relation to the objectives stipulated hierarchically by the sponsoring organizations.

In general, in order for marketing to be applied in libraries, it is essential to identify its type of orientation. The administration of libraries can be oriented in 2 (two) ways: for the product or for marketing. Thus, Table 12 discusses the differences between both orientations.

Table 12

Differences between product-oriented and marketing-oriented library administration

Bottom line	Product orientation	Marketing Guidance
Library attitude towards patrons	Focuses on the generation of product/service information	Adjusts to users' informational needs
Focus on users	Waits for user requests	Anticipates by bringing information to users'
Relationship with users	Instrumental (as soon as possible)	Open relationship and availability in auxiliary
Deadline for obtaining the product/service	Depends on processing and procurement	Depends on users' activities
Product/Service Offering	Limited to what is found on the subject	Open to the outside world and according to the specific focus
Innovation	Aimed at reducing production costs	Allows for better service to users
Attitude towards products and services	The library offers only what it produces	The library strives to produce what it should offer
Information needs assessment	Mostly limited to printed documents	Broad and multivariate information
Product/service feedback	Mainly due to operational efficiency	Mainly due to the effectiveness in relation to users

Source: Sarvad (apud Amaral, 1998, p. 99).

In view of this, it can be seen that both orientations differ where their efforts are centered: on the product (product orientation) or on the user (marketing orientation). For Oliveira (1985, p. 139, emphasis added), product orientation is a process where "[...] the products are developed and then 'sold' [...]". Making the analogy for the library environment, they are those services and products created and then offered to customers without even analyzing their usefulness to them. Regarding marketing orientation:

[...] the organization first identifies the needs of the segments of its target market, creates products/services to satisfy these needs, and uses advertising and promotion to communicate to this segment the capacity that its product has to satisfy those desires and desires (Oliveira, 1985, p. 139).

Marketing orientation is the one where all the functions of marketing management are used in order to study customers, identify their demands and develop actions for service.

In addition to the orientation towards the product, Andreassen (1987) emphasizes the orientation focused on production, where it means "[...] design better information systems, better journal retrieval processes, provide more attractive environments, faster loans, better parking conditions, etc. [...]" (Andreassen, 1987, p. 40). This type of guidance seeks to develop better products at a lower cost.

Regarding the practice of applying marketing in libraries, methodologically, it occurs through:

[...] analysis of the problem, investigating everything that may be preventing a better relationship between the library and its audience. Then, the environment is evaluated, identifying the target market, competitors, the library's positioning in relation to other similar institutions and the organization's objectives. Finally, based on a careful analysis of the user's needs and desires, decisions are made about the product, how it will be promoted, valued and distributed (Baptista, 1988, p. 100).

All these elements pointed out by Baptista (1988) basically correspond to marketing management. In the context of libraries "[...] marketing management directs, therefore, the decisions of librarians regarding the quality and quantity of products and services, the guidelines of the price policy, the points and channels of distribution and the forms of promotion" (Silveira, 1987, p. 8), in addition to having contact with the external environment, in order to attract it to the use of information.

In this way, elements of marketing management are addressed, which can be developed in libraries in their application process.

6.1 MARKETING ADMINISTRATION IN LIBRARIES

Considerations about market analysis, market segmentation, positioning and Mix Marketing are presented.

6.1.1 Market Analysis

In libraries, market analysis can be carried out in order to identify in a concrete way who are the real and potential customers, as well as to assess

[...] the existence of different levels of interests and information needs among consumers, according to their own individual differences in age, sex, professional training, place of residence or other personal characteristics of psychological or sociological origin ... (Amaral, 1998, p. 101).

And, such information leads to market segmentation.

6.1.2 Market Segmentation

Market segmentation consists of filtering out different customers with similar tastes and needs. For Oliveira (1985, p. 141), "[...] the segmentation of the market into libraries offers a perspective to identify and serve the library's audience more effectively", that is, it is through the segmentation carried out based on some variables that these institutions get to know who their customers are and fragment their target audience to develop products and services that meet their needs.

In this way, libraries can perform market segmentation through variables such as the 4 (four) outlined below: **demoFigureic**, which refers to the study of some population factors of customers such as age, color, race, nationality, religion, etc.; **geoFigureic**, which seeks to identify the location of its users; **psychoFigureic**, which consists of evaluating the lifestyle, attitudes, personality and social class of customers; and **behaviorist**, focused on the behavioral analysis of the customer, where it can define who are the customers who frequent, have attended and can still attend (Mathews, 1987).

Oliveira (1985, p. 140) points out that "Libraries work under the principle of serving 100% of the population 100% of the time [...]", that is, they seek to serve all customers most of the time, which becomes a little unfeasible, because for Mathews (1987) libraries are not able to serve all their members. Hence the need for segmentation, which will form groups with similar needs for the use of the correct marketing techniques.

Still at this stage, there are 3 (three) types of marketing that can be practiced by libraries, which are: a) mass or undifferentiated marketing, according to Mathews (1987) is the one where only one offer is used to serve all audiences, considering that all its customers (real or potential) have the same tastes and needs. For Kotler (1978), undifferentiated marketing does not make use of market segmentation, seeking to serve all customers by generalizing their needs; b) concentrated marketing, for Mathews (1987, p. 90) means "[...] concentrate all its efforts on a specific segment, serving this group particularly well [...]"; and c) differentiated marketing, according to Kotler (1978) is the one where it operates in more than one or two segments, which uses different marketing strategies and develops the appropriate products and services for each audience.

6.1.3 Positioning

After the segmentation phase, the positioning stage begins, which is nothing more than "[...] the perception of the position that the library occupies among the range of competitors for community support. It is an understanding of how the target market sees the product and placing itself in the market promoting its advantages in relation to competitors"

(Oliveira, 1985, p. 144), or rather, it is the phase of communication and interaction with the public in order to understand the way the library is seen by customers

6.1.4 The 4P's of library marketing

With all the elements developed, a new tool emerges to be applied, the Mix marketing, popularly known as 4P, corresponding to the variables of product, price, place and promotion, listed below.

6.1.4.1 Product

One of the first variables to be worked on is that of the product, where "[...] it is through this that an organization defines 'how' the detected needs and desires of a user should be satisfied [...]" (Oliveira, 1985, p. 142, emphasis added), that is, there are several benefits brought together in a tangible or intangible way that are used to meet the informational needs of customers.

In general, Mathews (1987) objectively describes the products made available by libraries, subdividing them into three categories: a) materials, which include books, non-book material and audiovisual material; b) the sources, such as the reference service, the library's regulations, among others; and, c) animation programs, such as films and exhibitions.

The product must be updated according to the needs of its audience, so libraries must be aware if the product/service is achieving its objectives, which is to meet the informational needs of customers.

6.1.4.2 Price

When you define the product, you must assign a price to it. When it comes to libraries, this is one of the most difficult elements to be developed, since these institutions do not aim at profitable gains. Therefore, "[...] it is necessary to establish an adequate price, verifying the opinion of users to determine the different cost levels" (Oliveira, 1985, p. 143). From another perspective, the price can be attributed to the emotional value, both for the customer and for the library in terms of good service and sanitation of needs, which generates interaction between the parties.

Other types of values associated with the price of libraries come from Scientific Capital, which according to Bourdieu (2004, p. 26) "[...] consists of the recognition (or credit) attributed by the set of peer-competitors within the scientific field"; of the Cultural Capital that used to indicate[...]all the ways in which culture reflects or acts on the living conditions of individuals[...] (Silva, 1995, p. 25). And Symbolic Capital, which is nothing more than "[...] an

effect of the distribution of other forms of capital in terms of recognition or social value is "power attributed to those who have obtained sufficient recognition to be able to impose recognition" (Bourdieu, 1987, p. 164).

6.1.4.3 Square

The place or distribution point concerns the way the product will be moved, how this product will reach the customer. In relation to libraries, "[...] It is the point of contact between the product and the consumer. It can be the library building itself, an electronic medium, a personal contact, a manual information retrieval system, etc. [...]" (Oliveira, 1985, p. 143). It can be considered as the point of intersection between the customer and the product, whether in the physical or virtual environment.

6.1.4.4 Promotion

After the product and the price and location are defined, it is necessary to create strategies to make it known to the public, through promotion. Oliveira (1985) subdivides this stage into five areas: personal contact; advertising; advertising; incentives and the environment. At this stage, "[...] the library tries to convince the segment that its product has a greater capacity to satisfy its needs than the products of other organizations" (Oliveira, 1985, p. 143). It is the time for the institution to promote the product/service, demonstrating its importance and its differential.

In view of all the variables presented, it is apprehended that products and services must correspond to the needs and expectations of the market; their price is related to cost, demands and competition; promotion is a way of informing its product/service to the public; and the square is where the organization is set, making it accessible to the market and the target audience (Amaral, 1990).

In accordance with what was discussed about the 4P's of marketing in libraries, Table 13 makes a comparison between for-profit and non-profit organizations related to Mix Marketing.

Table 13

Marketing Mix in Purposeful and Non-Purpose Organizations Profitable

Marketing Compound (4P)	Comments
Product	Everything that is offered in a consumer market for the consumption and/or satisfaction of a need. It may or may not be material, but it must meet a demand. It exists in all types of organizations, for-profit or non-profit. Demand comes from consumers or users of the products and services that organizations provide.
Price	For-profit organizations - the formation of the price of the product or service considers the following factors: how much the consumer is willing to pay and how much the organization wants to receive in return for production. Managed conflicts consist of discovering and implementing the highest price that the consumer market accepts, maximizing its profitability, since its concern is the production of products and/or services to obtain profits. Non-profit organizations – the price also exists and should not be overlooked. However, in these organizations, the formation of the price of the product or service considers other factors. In addition to the cost to produce the product or service and the degree of essentiality of this product or service for the consumer, it is necessary to find the lowest possible price for the consumer, which can guarantee the sustainability of the organization, so that it reaches the largest number of consumers with the best possible quality.
Square (distribution)	The concern is similar in both types of organizations. The distribution and availability of the product can make a for-profit business unfeasible , or make it extremely advantageous. In non-profit organizations , efficient distribution is a factor that influences the productivity of the organization and the quality of the services provided by it.
Promotion	Promotion is an important activity in all types of organizations, but it has a greater presence in for-profit organizations due to resistance in non-profit organizations. But what's the point of offering a product and it doesn't reach your customers or users. Of course, the care with promotion is different in the types of organization. In for-profit companies, promotion is justified when the profits and sales increases generated by the promotion exceed the investment spent. In non-profit organizations, promotion must exist, but with the concern that promotion costs are not so high, generating an increase in the prices of products and services offered by the organization, to the point of reducing consumption by consumers, which would normally decrease the overall social profit by the organization.

Source: Adapted from Amaral (2007).

In this comparison, it can be seen that some elements converge between the organizations such as the product and the market, because the product is the input that meets the market's desires and the market is the means by which this product will be taken to customers. Price and promotion differ by the amount of value, while organizations seek to define the highest price accepted by the public, non-profit organizations seek the opposite, the lowest cost for their customers, allocating these resources to the organization itself.

Due to all these forms of application of marketing in libraries, it is important to highlight the insertion of marketing linked to a social perspective, in which "[...] it can be linked to the benefit achieved by the satisfaction of the user or consumer, obtained with his social well-being" (Amaral, 1998, p. 67). It is a marketing that goes far beyond the consumption of information, but is related to the change in attitude and behavior of these customers.

The evolution of marketing, which has its techniques and strategies shaped according to the context of society and the arrival of new information technologies, have contributed to the emergence of a new trend: digital marketing, which through the internet, promotes its products with a greater reach and enables interaction with its consumers. Libraries, in turn, must follow such changes and mold themselves to these spaces, not as a way to exhaust physical libraries, but to extend their products in order to promote them, gain visibility and conquer this new audience.

Conceptually, digital marketing is "[...] the set of marketing actions intermediated by electronic channels, such as the internet, in which the customer controls the amount and type of information received" (Limeira, 2010, p. 10). Electronic channels refer to the social media that organizations use as a tool to promote products, a channel for bringing institutions and customers closer together, and a way to be present in the daily lives of the target audience to identify their needs and bring the solution to them.

Finally, marketing is extremely important, because "[...] it is one of the ways that can provide strategies for libraries to promote their spaces of action and innovate their products and services, always seeking to satisfy and prioritize the needs and informational needs of the interagents" (Gulka; Lucas; Corrêa, 2018, p. 63).

It is necessary to emphasize that marketing is not the cure for all library problems, but "[...] can contribute significantly to its success, as the services traditionally offered by libraries in an archaic and outdated way, are seen through the lens of marketing with a different and new perspective" (Oliveira, 1985, p. 145), helping the librarian to get out of his comfort zone, in order to question problems and seek solutions so that some realities are transformed.

Therefore, the next section will present the design of a consulting firm to contribute to libraries in the application of marketing, with a view to promoting change and proactivity in these organizations.

7 THE CREATION OF A CONSULTANCY

To create a consultancy, it is necessary, like any other business, to follow legal procedures that aim at its legitimacy. Thus, in this section the main elements for opening a business will be addressed, as well as the legal and bureaucratic requirements. In addition, some aspects to be worked on by the library marketing consultancy and the details of the proposed services will be considered.

According to Bernardi (2008, p. 8) the idea of an enterprise is born in several ways:

[...] the observation, perception and analysis of activities, needs, trends and developments, in culture, society, social and consumption habits, or even as a natural development of an existing business. Opportunities detected or visualized, rationally or intuitively, of probable current and future needs and demands, and unmet needs [...]

It can be seen, then, that there are several ways in which ideas come and are interconnected to everyday life. Therefore, there is not necessarily a basic rule for this to happen, but it requires an attentive and insightful look at the context inserted by the entrepreneur so that he can capture the ideas of creating a new business.

Therefore, more and more entrepreneurs have emerged in the market, entering and adding innovative ideas, which in a way, contributes to the economic growth of the country and to "[...] the social development of communities and citizens, regardless of the area in which it is implemented, contributing to the quality of life, social and cultural responsibility and promoting citizenship" (Spudeit; Magdalene; Laurindo; Duarte, 2016, p. 679). However, the activity of opening and maintaining a company in the market is not an easy task, it is not enough just ideas, planned actions are needed.

Given this, an important step to be taken in the process of creating a company is the development of a business plan. In general, the business plan includes the description of some variables (objective, strategies, time and cost) as a way to identify the viability of the business, minimize risks and keep it in the market; where "[...] through it it is possible to make a pro-analysis of the data necessary for its implementation, it will clearly and objectively demonstrate all the need for planning the new company and even how it will behave" (Xavier, 2018, p. 12).

In this sense, after defining the idea of the business to be worked on, it is valid to point out as the first element for opening an enterprise, the preparation of a business plan that will guide the entrepreneur in the progress of the other steps that are part of this process.

Table 13 presents a business plan model proposed by Bernardi (2008), composed of 8 (eight) parts, which includes the analysis of the parts that involve the company.

Table 14

Business Plan Template

Business Plan Template	
Part I – Concept of the Idea and the Business (Executive Summary) 1. Nature of the business 1. Previous skills to have chosen the branch, the product and the service 1. Business vision 1. Legal and tax aspects for the operation of the company 1. Operation Form 1. Location and coverage or scope 1. Market and potential customer insight 1. Finance Part II – Organization and Structure 1. Legal structure of the business Corporate form and legal aspects of the structure 1. Proposed organizational Table and description Roles and Positions and Responsibilities 1. Description and experience of key executives Summarized curriculum and experiences relevant to the proposed business Personal profile with motivations, ambitions and other data relevant to the business Motivations for taking on the project 1. Organizational environment Type of culture and environment Personnel policies 1. Competency analysis and assessment Strengths and weaknesses Needs for improvement Part III – Strategic Marketing 1. Characteristics of the industry Operating model 1. Current affairs and trends in the field 1. Attractiveness and rules of the industry Profitability and growth 1. Segmentation 1. Target Market Features and size Research and trends Profile of target customers Needs Opportunities and threats	1. Positioning 1. Product or Service 1. Competition 1. Strategies 1. Commercialization Part IV – Products and services 1. Product or Service Description 1. Technological internship 1. Research and development Part V – Operations 1. Operational FlowTable 1. Production and service capacity 1. Vendors and Third Parties 1. Systems Part VI – Resources Needed 1. Fixed investments 1. Variable investments 1. Costs and expenses arising from the implementation Part VII – Economic and Financial Planning 1. Planning assumptions 1. Projection of economic results 1. Projection of the equity situation 1. Cash Flow Projection 1. Analysis of return and economic viability 1. Risk analysis and sensitivity 1. Analysis of capital structure and funding sources Part VIII – Implementation Proposal 1. Corporate form 1. Relevant legislation 1. Deployment and start-up schedule 1. Critical steps of the deployment timeline

Source: Bernardi (2008, p. 174).

The business plan model suggested by Bernardi (2008) is an instrument that can be used by the entrepreneur both in the implementation phase and for the maintenance of the enterprise. This plan contains eight (8) parts followed by summary descriptions required for each step. The first part corresponds to an introductory presentation of the nature of the business, that is, what it is about. The second part describes the legal and bureaucratic aspects foreseen for the company, as well as the professionals who will be working. In the third part, marketing tools are used in order to carry out an internal and external analysis of

the business to understand the field of activity and its competitor market. In the fourth part, the technical criteria of the products are defined.

Regarding the fifth part of the business plan, it is the phase of outlining the operation components that will be necessary for the generation of a certain good or service. When the other parts are analyzed, the sixth part is configured as the financial planning stage. In the seventh, the financial evaluations of the business plan that is intended to be introduced are evidenced and, finally, the eighth part is defined as the way in which the business will be directed, controlled and implemented (Bernardi, 2008).

Thus, after the construction of the company's business plan, the next step is to legalize it in the market, that is, to adapt to the bureaucratic requirements demanded by some government agencies (Board of Trade, Federal Revenue, State Revenue, City Hall, Fire Department, Caixa Econômica Federal, among others) in order to fully carry out all organizational activities. For this reason, it is essential to identify the legal and bureaucratic aspects that guide the opening of a company, which is the subject of the next subsections.

7.1 LEGAL AND BUREAUCRATIC ASPECTS FOR CREATING A BUSINESS

Prior to the full exercise of organizational activities, it is essential that the company is formalized and has basic knowledge of the laws that guarantee its legalization. At this point, one works with specific and technical knowledge of the sphere of Law, thus, the help of a lawyer is necessary to avoid any legal complications (Teixeira; Almeida, 2016).

Regarding the regulation of the opening of Micro and Small Enterprises (MSE), 3 (three) laws are specifically pointed out: Complementary Law No. 123/2006, which constitutes the "National Statute of Micro and Small Enterprises" also known as the "General Law of Micro and Small Enterprises"; Law No. 11,598/2007, which gave rise to the National Network for the Simplification of the Registration and Legalization of Companies and Businesses (REDESIM) and Complementary Law No. 128/2008 which establishes the figure of the Individual Microentrepreneur (MEI) (Brasil, 2020).

With regard to Complementary Law No. 123/2006, it is worth mentioning that:

Article 1 This Complementary Law establishes general rules regarding the differentiated and favored treatment to be given to micro and small businesses within the scope of the Powers of the Union, the States, the Federal District and the Municipalities, especially with regard to:

- I - the calculation and payment of taxes and contributions from the Union, the States, the Federal District and the Municipalities, through a single collection regime, including ancillary obligations;

- II - the fulfillment of labor and social security obligations, including ancillary obligations;
- III - access to credit and the market, including preference in the acquisition of goods and services by the Public Authorities, technology, associativism and inclusion rules.
- IV - to the single national registry of taxpayers referred to in item IV of the sole paragraph of article 146, in fine, of the Federal Constitution (Brasil, 2020).

The aforementioned Complementary Law No. 123/2006 encourages the reduction of tax burdens and the reduction of bureaucracy for opening, proceeding and possible closing of companies. In addition, it offers possibilities for the micro-entrepreneur to be better structured, so that it generates more profits and growth, in order to offer more jobs and contribute to the evolution of the local and national economy (SEBRAE, 2008).

Regarding **Law No. 11,598/2007**, it was created with the objective of simplifying the bureaucracies required by Brazilian legislation, which became an obstacle for the entrepreneur to open a business, due to the distance and lack of harmony between the federal, state and municipal institutions that were responsible for carrying out the entire legalization process (Silva, 2015).

Therefore, the National Network for the Simplification of the Registration and Legalization of Companies and Businesses (Redesim) was created, where it is explained in article 2 of the aforementioned Law No. 11,598/2007, with the purpose of:

[...] propose actions and rules to its members, whose participation in its composition will be mandatory for federal agencies and voluntary, by adhesion through a consortium, for non-federal agencies, authorities and entities with competencies and attributions linked to matters of interest to Redesim (Brasil, 2020).

In general terms, Silva (2015) highlights that Redesim can be considered as a plan that brings together federal, state and municipal agencies, aiming to "[...] the integration of procedures, avoiding duplication of requirements and ensuring greater linearity in the constitutive processes" (Silva, 2015, p. 14), that is, reducing bureaucracy in some procedures that interfered in the process of legitimacy of the business.

With regard to **Supplementary Law No. 128/2008, which creates the figure of the individual micro-entrepreneur**, Pilz (2017, p.11) emphasises that:

[...] through this law, the government created special conditions so that the worker known as informal can leave informality, legalize himself, register with the National Registry of Legal Entities (CNPJ), which facilitates the opening of a bank account and access to the issuance of invoices for his sales and still be entitled to various benefits, such as sickness benefit, maternity benefit, retirement, among others.

This means that the subject who performs his services on his own, with the exercise of Complementary Law No. 128/2008 , ensures legitimacy as a small entrepreneur, thus guaranteeing rights that working informally could not be enjoyed. In this way, the MEI legalization process takes place electronically through the Entrepreneur Portal and ends after the completion of all the steps that are part of this process.

With regard to the legalization and registration of the company, Sebrae (2020) highlights the importance of these aspects that promote the emergence of opportunities and numerous advantages, such as: partnerships, access to credit lines, security, and export and receipt of government subsidies, among others.

Under this focus, the other sections will specifically address the steps and requirements that need to be met during the formalization procedure.

7.1.1 Steps to opening a Business

At first, it is necessary to identify the legal form of the business, so that the appropriate regime for each company can be established. For Dias (2010, p. 46) "The option of the legal type of the company to be opened must take into account both the characteristics of the business and the objectives of the entrepreneur [...]", as it is the way in which the economic activities will be performed.

Therefore, companies are legally constituted in: Entrepreneur, self-employed, Simple Company, Business Company, Limited Liability Company, Autonomous Company, Collective Partnership, and Cooperative Society. Thus, Table 1 basically defines the legal types described.

Table 15

Legal Types that characterize a company

Legal Types	Definitions
Businessman	Form adopted by the entrepreneur who wants to be the sole owner and does not mind being unlimitedly liable for the obligations contracted in the company.
Self-employed	It is the liberal professional who does not characterize the activity of an entrepreneur. They sell services of an intellectual nature, even if they have the help of employees.
Simple Company	They are companies formed by people who exercise an intellectual profession (genre), of a scientific, literary or artistic nature (species), even if they have assistants or collaborators, unless the exercise of the profession constitutes an element of a company.
Business Company	It is one that professionally carries out an organized economic activity for the production or circulation of goods or services, constituting an element of a company.
Limited Liability Company	Form used when entrepreneurs wish to become partners and preserve limited liability over the obligations contracted in the company.
Joint stock company	It is the one that operates under the designative denomination of the corporate purpose, integrated by the expressions corporation or company, in full or abbreviated.
General Partnership	It is a corporate type that is characterized by the joint and unlimited participation of all partners who jointly respond to all the company's obligations.
Cooperative Society	It is the one whose participation among its partners happens freely and the responsibilities of the partners can be limited or unlimited

Source: Adapted from Sebrae (2020).

It can be seen that legal types can be evaluated and distinguished based on the number of members, nature and purpose of the business. In relation to the legal type **Entrepreneur**, its activities are focused on the flow of goods and services, while the **autonomous** type develops services of an intellectual nature. Therefore, in **the Simple Company type**, it has the same nature as the self-employed, however, it is formed by more people who share all obligations and gains in a mandatory and joint manner. Regarding the **Business Society**, it is made up of a larger number of entrepreneurs who work in an integrated manner in the development of economic activities of goods and services (SEBRAE, 2020).

In addition, the **Limited Liability Company** is a meeting of partners who can adhere to the Simple (Intellectual Services) or Business (Services of goods and services) type. In addition, the responsibilities are limited according to the parties assigned to each partner. With regard to the **Corporation**, it is the one where the division of its capital occurs through shares and the responsibility of each partner is proportional to the number of shares (SEBRAE, 2020).

Regarding the **General Partnership**, it is a corporate type that mainly covers individuals, where everyone has full responsibility for the company's debts and profits (SEBRAE, 2020). Finally, as for the **Cooperative Society**, it is made up of 20 (twenty) people who organize themselves democratically in relation to the economy (SEBRAE, 2020).

In a practical way, the opening of a company follows some formal requirements that make business activities legal in the market, which are: Feasibility Consultation; Registration with the Board of Trade; Formatting and Configuration of the Articles of Association; Social Registration, Name Consultation and Trademark Registration; Registration and Opening of the Company at the City Hall; Registration with the State Treasury Department; Registration in the National Register of Legal Entities; Operating License; and Firefighters' Authorization (SEBRAE, 2020), described below.

7.1.1.1 Feasibility Consultation

According to Teixeira and Almeida (2016, p. 64) the feasibility consultation "consists of verifying that the intended location for your company is in accordance with the rules of the region, imposed by municipal legislation, known as Master Plan, Location Code or Zoning Code [...]", that is, it is the stage where a permission is requested for the installation of the company in the desired location, as well as whether the type of business is suitable for the environment.

7.1.1.2 Registration with the Board of Trade

In order for the commercial registration of the company to be carried out, it is necessary to find out the competent body that performs this type of service in each state. In Maranhão, for example, the responsible institution is called "Junta Comercial do Maranhão (Jucema)", the registration is done electronically through the Easy Company System or in person.

According to Teixeira and Almeida (2016), it is the step where the request for feasibility is made with the qualified body, so that the obligations and procedures by which the business owners must adapt can be analyzed. After that, the entrepreneur waits for confirmation or denial of his request, if positive, he will be informed of the next steps regarding the process: requirements and necessary documents, if it is negative, guidelines are given for the adjustment of the request (SEBRAE, 2020).

It is worth noting that the registration procedures between Microenterprises and Individual Microentrepreneurs (MEI) differ. For Microenterprises, registration must be carried out at the city hall or regional administration of the state where the company is located, at the Federal Revenue Service and at Social Security. And MEI registration is carried out electronically on the Entrepreneur Portal (SEBRAE, 2020).

7.1.1.3 Formatting and Configuration of the Articles of Association

According to the authors Teixeira and Almeida (2016) and Dias (2010), the Articles of Association is a kind of "birth certificate" of the company, which serves to name it, stipulate the value of the capital, define the legal type and determine the place of operation. According to Sebrae (2020) the necessary requirements of the Articles of Association are:

- a) Corporate type;
- b) Complete qualification of the partners;
- c) Corporate name (company name or corporate name);
- d) Corporate purpose;
- e) Share capital;
- f) The share of each partner in the share capital;
- g) Liability of the partners (limited liability company);
- h) Whether or not the partners are liable, in the alternative, for the corporate obligations (simple partnerships);
- i) Appointment of the administrator and his powers (in contract or in a separate act);
- j) The participation of each partner in the profits and losses;
- k) Headquarters and jurisdiction;
- l) Duration.

In view of all the information defined, it is necessary to be validated by a lawyer, except for MSEs that are exempt from these obligations. In turn, the Social Registry is an extremely important document for ensuring the existence of the company in the market.

7.1.1.4 Registration of the Articles of Association, Consultation of the Name and Registration of the Trademark

When the Articles of Association are finalized, it is up to the entrepreneur to register it by forwarding it to the Board of Trade or the Registry Office of the Legal Entity of the State where the business will be implemented, with the following documentation: a) Articles of Association or Declaration of Individual Entrepreneur, signed in 3 (three) copies; b) Certified copy of the lawyer's Brazilian Bar Association (OAB) card (except for MSEs); c) Standard Application - Cover of the Board of Trade; d) Declaration of Microenterprise or small business, in 3 (three) copies; e) National Registry Form (Dias, 2010).

In the formalization of a business, it is necessary to define a business name in the way it wants to be legally recognized. This is a primary factor in the articles of association since it contributed to the identification of the business in the market. Regarding the choice of name, an unprecedented name is required, and for this to occur it is essential to investigate through

a consultation if there are other companies with the same desired name (Teixeira; Almeida, 2016).

Therefore, the consultation is carried out according to the legal type, such as the Simple Company, which performs this service at the Civil Registry Office of Legal Entities. For Dias (2010, p. 49), the corporate name, depending on the legal type, can occur in 3 (three) ways: individual firm, denomination and corporate name:

1. Individual Firm: the trade name will be the name of the owner to which the specification of the activity may or may not be added:
 - Henrique Silva Dias
 - Henrique Silva Dias Surfboard Repairs.
2. Name: It is a term created to which is added the objective of the company and its legal type, which can be abbreviated or in full:
 - Big Wave Surfboard Trade Limited.
 - Big Wave Comércio de Pranchas de Surfe Ltda.
3. Corporate Name: Consists of the use of the name of partners:
 - Silva e Dias Ltda.
 - Silva e Cia. Ltda.
 - Irmãos Silva e Cia. Ltda.

With the business nomenclature registered with the responsible agency, it guarantees the exclusivity of the trade name at the state level. After positive confirmation of the consultation, registration can be made at the National Institute of Industrial Property (INPI) (Teixeira; Almeida, 2016; Dias, 2010).

Certainly, trademark registration is one of the steps of fundamental importance in this process, since the trademark contributes to the establishment of the company's identity in the market, in differentiation from other competitors, and in the link between the company and the customer. In addition, the trademark is configured as an asset of the company, so its registration guarantees protection against possible theft or plagiarism (SEBRAE, 2020).

However, the process of applying for trademark registration requires pro-analysis and understanding of some criteria to verify the feasibility of trademark registration, such as: investigating the trademarks; define your brand's field of activity; the form of presentation (trade name, logo, physical brand); the nature of the mark (product, service, collective mark or certification); what are the fees imposed for registration. After carrying out this procedure, the entrepreneur is able to register the desired trademark with the INPI (SEBRAE, 2020).

7.1.1.5 Registration and Opening of the Company at the City Hall

The entrepreneur must issue the business license at the City Hall, such as its respective registration and registration as a municipal taxpayer from where the company is being generated. By following all legal procedures, the company acquires an opening registration.

In relation to the taxes required by the municipality, the service provision activities are responsible for paying the Service Tax (ISS) or Service Tax of Any Nature (ISSQN) (Teixeira; Almeida, 2016).

7.1.1.6 Registration with the State Treasury Department

The State registration of the State Treasury Department is required only for taxpayers of the Tax on the Circulation of Goods and Services (ICMS). Thus, enterprises that carry out service provision activities are exempt from this registration (SEBRAE, 2020; Teixeira; Almeida, 2016).

7.1.1.7 Registration in the National Registry of Legal Entities

This type of registration is required for all types of companies, the registration procedure is carried out together with the Federal Revenue agency, which grants the undertaking a National Registry of Legal Entities (CNPJ). In the final process of this stage, the Revenue guidelines for the issuance of the Basic Entry Document (DBE) are followed. With possession of the information received through the registration, the Federal Revenue Service is aware of the existence of the company and is able to collect the federal taxes imposed on the company. With this, when carrying all legal documents, it is necessary to request registration with the Board of Trade and all this information is forwarded to the municipal government for inspection and release of the operating license (Teixeira; Almeida, 2016).

7.1.1.8 Operating License

With the registration with the Federal Revenue Service completed, it is the phase of applying for the operating license with the City Hall. Corresponding to the permit, Dias (2010, p. 52) defines it as "[...] the document that allows the performance of commercial, industrial, agricultural, and service activities, as well as companies and associations of any kind, whether they are individuals or legal entities", that is, it is through it that companies are authorized to open the business.

7.1.1.9 Fire Brigade Authorization

Depending on the activity carried out by the companies, the City Hall requests a license from the Fire Department, in order to check the safety criteria and avoid any accident. The Fire Department carries out a technical inspection, through which it verifies the components that are in the company's physical space, the safety equipment and the type of activity performed on site (SEBRAE, 2020; Teixeira; Almeida, 2016).

After these procedures described for the creation of a company, in the next topic the phases of consulting determined by Block (2001) that can be applied in marketing consulting services for libraries will be addressed in detail.

7.2 MARKETING CONSULTING FOR LIBRARIES

There are several types of libraries by which they are differentiated, either by their role and the activities they offer, as well as by the users they serve and/or by their institutional connection. Therefore, some types of libraries can be listed: Public Library, Thematic Public Library, Community Library, Reading Point, National Library, School Library, University Library, Specialized Library and Reference Library (SNBP, 2020). Regarding the types of libraries, Table 16 describes them.

Table 16

Types of Libraries

Types	Features
Public Library	Its objective is to serve, through its collection and its services, the different reading and information interests of the community in which it is located, collaborating to expand access to information, reading and books, free of charge. It serves all audiences, babies, children, young people, adults, people of the best age and people with disabilities.
Thematic Public Library	They are public libraries that are characterized as libraries specialized in a certain area/subject. The environment is configured in such a way as to represent the area/subject in focus, as well as the collections that make up its collection, the services they offer and the cultural program
Community Library	It is a space to encourage reading and access to books. It is created and maintained by the local community, with no direct link to the State.
Reading Point	Spaces to encourage reading and access to books, created in communities, factories, hospitals, prisons and institutions in general.
National Library	Its function is to gather and preserve all the bibliographic production of the country. In each country there is a National Library. All bibliographic production in the country must be sent to the National Library, this is guaranteed by the Legal Deposit law.
School Library	Its objective is to meet the reading and information interests of its community and works in line with the pedagogical project of the school in which it is inserted. It serves, as a priority, students, teachers, employees of the teaching unit,

	and can also expand its action to serve the families of students and the surrounding community.
University Library	Its objective is to support teaching, research and extension activities through its collection and services. It serves students, professors, researchers and the academic community in general. It is linked to a higher education unit, which can be a public or private institution.
Specialized Library	Focused on a specific field of knowledge. Its collection and services meet the information and research needs of users interested in one or more specific areas of knowledge. It is linked to a public or private institution, and can also be characterized as a university library, when linked to a higher education unit
Reference Library	Specialized libraries that work with a focus on access, dissemination, production and use of information for a certain audience. Also called Information and Reference Center. Many of them do not have their own collection and work exclusively with the referencing of documents on a given subject (summaries and reviews).

Source: Adapted from **SNBP** (2020).

In view of Table 16 presented, it is clear that there are varieties of libraries present in society. Referring to the **Public Library**, it is aimed at the general public with different tastes and peculiarities, while the **Thematic Public Library** is restricted to users in the search for a certain specific area. The **Community Library** is formed by members of the community with the objective of reaching its surroundings. With regard to **Reading Points**, it can be considered as "mini-library", constituted within institutions in general (factories, hospitals, prisons) (SNBP, 2020).

On the other hand, the National Library is considered as the center point of the other libraries, since they hold the entire bibliographic collection in the country and still serve to preserve them. In relation to the School Library, it works based on the institutional pedagogical project, is aimed at everyone who is part of the school, as well as covers family members and everyone in the immediate vicinity of the institution. The University Library is subordinated to public or private institutions, integrating everyone in the academic community and in the surrounding area (SNBP, 2020).

With regard to the Specialized Library, it corresponds to a specific area of knowledge, having a well-defined public that is interested in the subject. It can be of a public or private nature or have a university bond. With regard to the Reference Library, it is also a specialized library that is concerned with supporting users in the use of the search for knowledge (SNBP, 2020).

Regarding the types of libraries, it is apprehended that they are equivalent in the mission of meeting the informational needs of customers, however they differ in their performance as well as in the services and products offered, in the places where they are

installed and in the projects they promote to attract them. With this, it is clear that they are basically unconsciously using the elements of marketing.

It is observed that there is a diversity of libraries in the market for the librarian's work. However, society is changeable and it is necessary to constantly adapt to these changes. Thus, **the role of the entrepreneurial librarian is resumed, which** seeks the proposal of creating a consulting company in order to continue the contents learned in the area of Librarianship, as well as to improve the management of these libraries through marketing.

In the previous sections, the legal aspects for the emergence of a company that serve to create a consultancy were portrayed. The following ones expose the step-by-step marketing consulting activity for libraries and its phases correspond to the stages established by the author Block (2001).

7.2.1 Phases of Consulting

The creation of a consultancy goes through stages. According to Block's (2001) proposal, these phases are sequentially mandatory, in order for the consultant to avoid setbacks in their application. It is a cycle of consulting services provided to customers, where in the present work are the libraries focused on marketing. Thus, in the following subsections, each phase of this enterprise is scrutinized.

7.2.1.1 Entry and Contract

It is the phase of the consultant's presentation with the client in relation to the development of the project. The activity of this stage is the moment to establish dialogue between the parties, the diagnosis of the root of the problem and the exposure of the expectations of both the client and the consultant in order to start the project. In this phase, some elements are worked on, such as: Negotiate needs; Facing conflicting motivations; Bring up concerns about exposure and loss of control; Triangular and rectangular contract (Block, 2001).

The first step of the contracting phase involves **negotiating the needs**, it is related to the dialogue between the client and consultant where both explain their desires and what they can offer each other. In the context of libraries, this dialogue occurs between the manager or the person in charge of the institution, who has the managerial knowledge of the library. The second step is **to face conflicting motivations**, it refers to the stage that arouses uncertainties and insecurities on the part of the client. In this way, it is necessary for the consultant to listen from the first step so that the consultancy works in a way that solves all these concerns (Block, 2001).

The third step involves **bringing up concerns about exposure and loss of control**, they are the fears that come from the client indirectly about the project that often show concern about losing control, however, this concern must be addressed from the first step, by which the consultancy indicates that the decision-making power will be in your hands. Regarding the fourth step of this phase, it corresponds to the **triangular and rectangular contract** in which it is necessary to be aware of how many clients the consultant will have from the contracting phase, since there are 2 (two) types of contracts (triangular and rectangular). The triangular contract is formed by the consultant, client, and client's boss. The rectangular contract is when both the consultant and the client are subordinate to a boss who must be aware of everything that happens in the process (Block, 2001). With regard to the library, it is essential to clarify the hierarchy and thus define who will be included in the contract.

7.2.1.2 Data Collection and Diagnosis

This phase is composed of the Analysis Levels; Political climate; Resistance to sharing information; and Interview as an intervention (Block, 2001).

Regarding the **levels of analysis**, they are related to the diagnosis of the main problem resulting from other implicit problems. Therefore, it is necessary for the consultant to structure the different levels of problems in a harmonious way. Regarding the **political climate**, it is directly associated with the company's policy, regardless of whether the customer is a family business or organization. It is essential to observe the behavior of those who work in the company, so that the consultant can understand whether this situation will affect the resolution of problems and the implementation of the project, such as resistance to change (Block, 2001).

About the **resistance to sharing information** worked on in this phase, it is attributed to the concealment of some data necessary to understand the problem. It is pertinent to emphasize the need for the consultant to work in such a way that the client feels comfortable exposing all the accurate information. Regarding the **interview as an intervention**, although there is no one who is totally neutral or only an observer, the consultant should act in a distanced manner at this stage so as not to contaminate the data collected (Block, 2001).

7.2.1.3 Feedback and Decision to Act

Regarding this phase, the issues addressed are: Funneling the data; Present personal and organizational data; Manage the feedback meeting; Focus on the here and now; and Not to see reactions as something personal (Block, 2001).

Referring to the first element, which is **to funnel the data**, this means that when collecting all the data, it is considerable to restrict the pertinent information that will actually solve the problem, however, with each decision, customers are informed. Regarding the second element that contemplates the importance of **presenting the personal and organizational data**, obtained in the collection of data, which are all the material, monetary, behavioral information of the team, in short, all the managerial data. This requirement of the feedback phase, which allows the consultant to give feedback to his clients, it is important to present recommendations on the personal data of employees not to demerit the professional image, but to propose suggestions that will be implemented in the report. It will be a professional view that the client cannot obtain from anyone else (Block, 2001).

Regarding the third element, that of **managing the feedback meeting**, it is the moment where everything that has been completed will be pointed out. It is a point of greater apprehension between consultant and client about what will be exposed, how the information will be received, since all the investigations will be exposed, but mainly reveal the proposed solutions. It is up to the consultant to have control of the situation and safeguard the entire subject addressed, because the more answers to the problems identified, the more feasible the implementation will be. The feedback phase is the moment to convince the client to buy the project (Block, 2001).

Considering the fourth element about **focusing on the here and now**, is the feedback phase in which the consultant must be aware of how the client is receiving the information. It is necessary to listen to what the client thinks of the proposal, since, "[...] the feedback process becomes a victim of the same managerial problems that gave rise to the need for its services [...]" (Block, 2001, p. 33). As it is the fifth element of the feedback phase, which is aimed **at not seeing reactions as something personal**, it is conditioned to the client's response, which can be positive or negative for the consultant, and the consultant must understand the client's decision in a professional way without taking it personally (Block, 2001).

7.2.1.4 Engagement and Implementation

This phase consists of components such as: Bet more on engagement than on imposition and persuasion; Plan more participation than presentation; Stimulate difficult public exchanges; Give the possibility of real choice; Change the conversation to change the culture; and Be aware of the place (Block, 2001).

As for the first step of implementation, which corresponds to **betting more on engagement than on imposition and persuasion**, no one works alone, it is necessary the

commitment of each member in what they give to each stage of the service, so that everything happens in the right way. The decision is important, but success is not guaranteed when it is forced. To the second step, which is **to plan more participation than presentation**, more participation, integration and interaction among members should be encouraged, as the influence of employees in the process can bring success to the resolution of the problems encountered (Block, 2001).

Regarding the third step by which the consultant **encourages difficult public exchanges**, carried out to emphasize the credibility of the consultancy, resolving all possible doubts in public and adopting a method of trust between the parties. The fourth step of this phase requires the consultant **to give the possibility of real choice**, it gives employees the power to decide on possible changes, as it guarantees more the probability of their commitment to the activities; giving the solution with speed is hasty and dangerous and there may be failures in solving problems. Not always a single answer is appropriate for each type of situation (Block, 2001).

Regarding the fifth step about **change the conversation to change the culture**, it means that it is important to remove from the minds of employees the feeling of guilt for the problems encountered, but the consultancy must structure "[...] the conversation around personal responsibility, questions of purpose and meaning, and what will be unique and new about the round of changes" (Block, 2001, p. 34). Finally, the last step of this phase requires the consultant **to be aware of the place**, so that he awakens the impact of the engagement and activities of the clients, a space that demonstrates seriousness and commitment, in addition to worrying about the way the consultant behaves, the way he conducts the meetings with clarity and attitude contribute to decision-making with clear and real intentions, and thus implement the project (Block, 2001).

7.2.1.5 Extension, Recycling, or Termination

This phase is related to the client's feedback to the consultant, as it is in this stage that it will be evaluated from engagement to the implementation of the consultancy. If the results obtained after implementation are satisfactory, in addition to providing valuable experience for both sides, it can keep the door open for the acquisition of new contracts with the client. However, after the implementation of the points listed in the consultancy, a new problem may arise in the organization that had not manifested itself until then, in which case the process must be recycled and the discussion of a new one started (Block, 2001).

In consulting, a part that must be considered by the consultant is the termination of the contract. This can occur both because of the negative result obtained after the

implementation of the project, but it can also occur even if the implementation is a total success, because "There are many options to end a relationship and the termination, in addition to being legitimate, should be considered an important part of the consultancy" (Block, 2001, p. 6). In view of this, all the phases presented by Block (2001) require the direct participation of the consultant and client, in order to obtain important results in the implementation and completion process.

Understanding the phases of consulting services, it will work with a new service in the market, focused on marketing in libraries. Marketing is a managerial process that is linked to all the services of the institution, that is, it involves from its location, services and products, distribution, as well as promotes actions to give visibility to libraries, through which all these elements, even if indirectly, interfere in the customer's contact with these institutions.

In this way, the consultancy aims to work on the diagnosis of management in its entirety, which means identifying the problem, proposing a solution to the problem and thus giving institutions the opportunity to create or resignify services and products according to the demand presented by the client/user and not only develop services and products without listening to what the interested party thinks. A more attentive professional look externally from other professionals/librarians who have knowledge in the area becomes relevant to perceive the strengths and especially the weaknesses that can be changed, and thus achieve the need and satisfaction of the customer/library and consequently your end customer.

8 CONCLUSION

Entrepreneurship is a multidisciplinary field that connects with the vast areas of knowledge, with the main objective of introducing the creation of new businesses that serve society through new offers, services, products and work in different niches. In addition, it can be incorporated into the work environment by a professional with innovative ideas who aims to contribute to the organization, keeping in mind that the act of entrepreneurship mainly requires taking risks.

With regard to the creation of a company, the entrepreneur seeks to own his own business, with this arises the need for marketing, which works for the enterprise to obtain profits, through planning so that it meets the needs of the customer. Corroborating the function of marketing, the consultancy proposes the investigation and solution of problems so that the organization satisfactorily serves customers.

Marketing is linked to for-profit institutions, however, it is an area with a history of many transformations and according to studies by Kotler (1998) they can be adapted to non-profit institutions, such as libraries. In this way, in order to create new ways of working, take on

challenges, and get out of the comfort zone; The present work was motivated to awaken librarians to create an external consultancy focused on library marketing based on the 4P (Product, Price, Place, Promotion).

The guiding question of the research was: How to develop a marketing consultancy to contribute to the organizational demands of libraries? To meet this problem, the general objective was to establish theoretical references in the proposition of establishing a marketing consulting service in the field of libraries, in order to meet their organizational demands in favor of serving users. And the specific ones dealt with:

- a) map theoretical references in the process of creating a consultancy in interrelation with entrepreneurship and marketing in libraries;
- b) to correlate the 4P's of marketing in the context of libraries;
- c) to present the main aspects related to the creation of a marketing consulting company for libraries, concerning the phases, services and legal and bureaucratic aspects.

The needs of libraries are related to the issue of marketing, which is not only linked to the dissemination of services and products, but since its creation refers to the business, products to be offered; price that for libraries is linked to symbolic, cultural and scientific capital; place or place, which refers to the service of the target audience. Any problem in these variables can affect libraries in their typological diversity and, consequently, affect the supply of customers' informational needs. It is necessary for the clientele to recognize libraries as an essential service for society, since it promotes the knowledge and development of opinion-forming individuals. For this to happen, it is important that the library has a mission and planning that is constantly updated.

Thus, through biblioFigureic research, although there are no studies that present the applicability of marketing consulting in libraries, it is possible to carry out consulting for the solution of organizational demands in these organizations. In this perspective, there is a need for research, for the analysis of the environment of the institution that is being studied, through some marketing tools : Market Research; Segmentation; Definition of target audience and positioning; SWOT Analysis and Marketing Plan. And thus identify which Marketing Mix is having difficulties in the institution so that problems can be found and, consequently, outline goals and objectives, and outline a means for them to be achieved.

Concerning the first specific objective stipulated, entrepreneurship is relatively new to the librarianship area. However, their actions begin within the classroom relating the theory and practice of knowledge, such as working on normalization techniques; participate in the construction and implementation of projects that serve the community, since from a social perspective entrepreneurship consists of the elaboration of social projects created for the

transformation of the environment in which it is inserted; and the creation of content related to the course on social media. In addition, the technical, theoretical and humanistic knowledge acquired in training contributes to intrapreneurial practices within the conventional field of work by effecting innovations in an existing sector; or traditional entrepreneurship that corresponds to the creation of a new business. However, for the development of innovative ideas and to make a difference in the market, it is necessary to constantly seek continuing education due to the changing state of the market.

Historically, the development of companies in the area of Librarianship performed only traditional activities in the field. With the changes coming from the market, companies began to reinvent themselves and enter technological means. A new aspect in entrepreneurship emerges, the Creative Economy, which are companies created that offer services and products in the physical or digital sphere, with the aim of selling. Companies such as Santa Librarianship, Class Curso, Index Consultoria, Documentar, Control Informação e Documentação, and Inform Document and Information Management, among others, stand out as Creative Economy in the field of librarianship. In addition to the fact that there are a few more companies related to Librarianship, the relationship between both areas is still timid: entrepreneurship and Librarianship with regard to the formation of enterprises.

Regarding the second specific objective, the research worked with authors such as Leite *et al.* (2005), Grocco Guttman (2005) and Block (2013) who relate the history of consulting traditionally as a practice developed by people who acted with influence within society because they were considered erudite. In another thought, the historical aspect was linked by Bond (1999) and Paes de Paula and Wood Júnior (2008) to management theories focused on the areas of Strategies, Marketing and Human Resources. In addition, Silva (1974) and Menon (20007) associated the history of consulting based on the studies of Frederick Taylor who analyzed the length of service.

Consultancies in Brazil are relevant because they are considered a central point that maintains most of the offices in this field nationally and internationally and operate in different niches, having as partner entities the associations: IMC, IBCO and Sebrae. Examples of consultancy that operate in Brazil were cited, it was noticed that most consultancies are of an organizational nature and provide activities focused on administration, few consultancies were found in the field of Librarianship, most of them are for the services of standardization, organization of informational units, automation and archiving. In Maranhão, the consultancies found propose more services for the standardization and organization of the Lattes Curriculum.

Two forms of consulting were identified, internal consulting (professional integrated into the organization) and external consulting (professional who does not have an employment relationship with the company). In addition, the consultancies are branched according to their classification: Structure (Package and Handmade) and Breadth (Specialized, Total and Global).

Consulting is an enterprise in which librarians can create from their skills and expertise, and thus generate a sense of autonomy and opportunities for others in a market that is currently increasingly scarce of formal and public jobs offered to professionals coming out of academies.

Regarding the third objective, it is relevant to demystify that the work of marketing in libraries does not apply only to promotion, but in an integral way using the 4P's (Product, Price, Place and Promotion). And for this to happen, it is important to have the perception that the library is an organization, is linked to a market and has its competitors. However, what changes are the services and products delivered without a monetary nature; it is also necessary to know clearly which audience the library is intended for and thus develop actions that solve their problems in order to attract and keep customers in libraries, but some strategies used to detect the problem of Mix marketing are different according to the type of library.

In general, the application of marketing does not correspond only to sales, but is based on creation, communication, and behavior change. Regarding the insertion of marketing in libraries, they should be oriented towards this aspect, that is, analyzing customers, pointing out their needs and based on this information, developing services and products that serve the public.

In marketing aimed at libraries, as in any other institution that makes use of this area, it is essential to segment the market, to know the social, cultural, political, religious and demographic context; define the target audience, in order to identify which type of community it serves and study how the library is positioned in the market, that is, how it is being observed by customers.

Regarding the correlation of the 4P's of Marketing in libraries, it was found that: the Product is what the library offers to its customers, which can also be in the form of services. Some stand out, such as: Collections in various media; Management Service; Reference Service; Treatment, organization and recovery of the bibliographic collection; Automation; Consultation of the collection; Bookbinding services; Training and Development of Collections; Reading Projects, among others. It is worth noting that not all of these services and products are offered in all types of libraries, such as school and community libraries.

Price is considered one of the problems related to marketing in libraries, however, to make marketing services monetary, what counts first is the customer's opinion. However, there are other values added to these institutions, such as symbolic capital, cultural capital and scientific capital, as well as the emotional value generated by the interaction of the customer with the library and the working professional. The Square is the meeting point between the customer and the library, physically or remotely, taking into account how the environment inside and outside the library is planned so that all real and potential customers have access to it; and digitally through the electronic channel: e-mail, manual retrieval system, alert system, among others, according to the specificity and audience of each library.

The Promotion seeks to inform the public about what services and products libraries offer, usually through library portals. A way to attract the target audience that does not have internet can be done through a partnership with the local radio, posters spread not only within the library, but with word of mouth marketing, that ant work between librarians and customers and these passing on to others.

And finally, the fourth specific objective refers to the legal and bureaucratic requirements for opening an enterprise, such as external consulting focused on library marketing and the services that this type of company intends to offer.

First, for the creation of a company, an idea is delineated, which starts from a lack in the market, from a dream, in search of being inserted in the market and not on the margins. In this way, it is essential to create a business plan that includes the appropriate information for the foundation and improvement of the enterprise in the market. After this requirement, it focused on the legal and bureaucratic requirements required of any company. Law No. 123/2006, Law No. 11598/2007 and Complementary Law No. 128/2008 stand out, which highlight the rights and duties of microentrepreneurs; therefore, the step-by-step process for the formation of a business was highlighted, such as: Feasibility Consultation; Registration with the Board of Trade; Formatting and Configuration of the Articles of Association; Social Registration, Name Consultation and Trademark Registration; Registration and Opening of the Company at the City Hall; Registration with the State Treasury Department; Registration in the National Register of Legal Entities; Operating License and Authorization of Firefighters.

Regarding the activities of the consultancies that can be improved, in the process of creating a marketing consultancy for libraries, a work composed of 5 phases (Entry and Contract; Data Collection and Diagnosis; Feedback and Decision to Act; Engagement and Implementation and Extension, Recycling or Termination), which are services to be provided to the contractor and emphasize the identification of the problem and solution of the institution that generates a project. However, it is worth noting that the consultancy does not have

decision-making power to implement proposals to solve problems, it only shows the means and the manager has the power to decide. Analogously, consultants are like psychologists who detect the root of the problem and the possible solution.

External marketing consulting focused on libraries is a way to contribute to the search for answers to problems presented in the library environment that sometimes go unnoticed or are ignored, leading to a series of other problems bringing harm to the clientele. The consultancy proposes to use marketing focused on Mix marketing in order to verify factors that are hindering the library from growing or exerting influence in the market where it is inserted, in addition to adding new techniques that the institution does not use to add ideas, propose solutions, contribute to cost reduction, gather data to investigate the market situation and how it can help the library to stay ahead of other competitors.

Finally, it is concluded that the study is promising and unveils spaces for others that aim to contribute to the sciences in general and, specifically, to Library Science and Information Science. Approaches are suggested about cooperatives that develop entrepreneurial actions in the area, carry out research to verify enterprises in the area of Library Science that operate outside the walls of libraries and enable the interrelationship of fields of knowledge such as entrepreneurship and marketing.

Since the primary objective of this study was to define the steps for building a marketing consulting company for libraries, the research allows librarians to rethink other ways of working without giving up their work techniques.

ABSTRACT

The ribbed slabs are used both in small and large constructions, and its use is growing due to the advantages that this constructive system provides. However, considering the demeanor of these slabs without transverse reinforcements (stirrups), few studies were made in Brazil. This study brings an experimental analysis of 8 unidirectional ribbed slabs of reinforced concrete subjected to loads perpendicularly distributed to the ribs. 4 (four) reference slabs and 4 (four) reinforced slabs with steel fibers with a length of 1,700 mm and width ranging from 650 to 950 mm were tested, all with table thickness of 40 mm and ribs with cross section of (100 x 100) mm². The compressive strength of concrete was approximately of 30 MPa. The results were compared to those estimated by the design codes ACI 318 [1], EHE 08 [2], NBR 6118 [3] and MC10 [4]. It was verified that the increase in shear and bending strength of the reinforced slabs with fibers was substantial, what makes those slabs technically feasible.

Keywords: Ribbed Slab. One-Way Slab. Shear. Steel Fiber.

RESUMO

Lajes nervuradas são empregadas tanto em pequenas quanto em grandes obras e sua utilização cresce face as vantagens que este sistema construtivo proporciona. Entretanto, poucos estudos foram realizados no Brasil considerando o comportamento destas lajes sem

1 INTRODUCTION

Currently, due to the demands of projects, the construction industry demands a growing need for larger spans and fewer beams. In this scenario, the use of ribbed slabs stands out, which, in turn, are lighter structures due to the use of expanded polystyrene (EPS), or even removable formwork in regions below the neutral line, where, in the case of solid slabs, this region would be filled with concrete, making the latter less economical, having to use part of its resistant capacity to combat self-weight and even increase the number of beams in order to reduce the arrows. According to Bochi Júnior (1995) [5], the use of ribbed slabs, due to the minimization of costs and deadlines, met the growing need for rationalization in civil construction.

Unidirectional ribbed slabs can be built in a precast way, totally or only ribbed, and this brings benefits, such as the reduction of material for the execution of form and shoring, reduction of labor for execution, shorter time for execution compared to conventional ones, lower concrete consumption due to the area filled by inert materials and reduction in the amount of debris on site, caused by wood discards. Despite the advantages mentioned, the elimination of beams, due to the gain in span increase provided by ribbed slabs, causes some disadvantages, such as the decrease in the overall stability of the structure, due to horizontal actions.

The importance of this study is to analyze the results of stresses, strains and displacements, intending to expand the knowledge about the shear resistant behavior of ribs and layers, considering the variation of the distance between rib axes (s) and the use of steel fiber reinforced concrete (CRFA), seeking to qualify and quantify the contribution of the system to the gain in shear strength. It seeks to evaluate the benefits of the use of steel fiber reinforced concrete (CRFA) in reinforced concrete ribbed slabs from experimental studies where the distance between the rib axes was the main variable, pointing out the influence of this variation on their behaviors and the advantages caused by the addition of steel fiber to concrete, as well as to evaluate the level of precision of the normative codes in relation to the shear strength of structures. It is noteworthy that Barros et al. (2003) [6] and Gava (2004) [7], have already verified the contribution of fibers as reinforcement and Claudio et al. (2014) [8] presents the technological advances in the development of fibers for concrete reinforcement.

2 LITERATURE REVIEW

2.1 STRUCTURAL BEHAVIOR

The improvement of the quality of design procedures related to shear is a concern of structural engineering. Shear failures in reinforced concrete structures usually occur in a fragile way, with little or no prior warning, in addition, they tend to be less predictable than flexural failures, due to the considerably more complex failure mechanisms. Unidirectional ribbed slabs characteristically present T-beam configurations with joined tables, requiring an understanding of the shear stresses and shear forces that will arise from external stresses. According to Rüsç (1960) [9], shear cracks can originate from flexural cracks. In these cases, these flexural cracks, as soon as they appear, trigger a considerable redistribution of internal stresses with consequences that are difficult to calculate and that influence the inclination of the shear cracks.

2.2 RESISTANT MECHANISMS

According to Rombach and Latte (2008) [10], the determination of the shear resistant capacity in reinforced concrete structures without transverse reinforcement is a classic structural problem studied for more than 100 years, and this difficulty consists in the quantification of the strength that compressed concrete can offer in the face of stresses. Despite this work, most of the research focuses on simply supported beams or on slabs covering strips with loads applied over the total width b less than $4 \cdot d$, with the useful height of the slab. Experimental studies show that the shear resistant capacity of a reinforced concrete beam can be divided into two parts: one resisted by the transverse reinforcement and the other by the concrete and its auxiliary mechanisms, which will be addressed in this item. That is, a beam, even without stirrups, has the ability to resist a certain shear force. Macgregor (1997) [11] shows the contribution of the various components of the shear strength mechanisms of unreinforced beams, except for the component relating to the arc effect, as shown in Figure 1. When the beam is stressed, the shear is transferred through the ABC line by the concrete strength mechanisms: uncracked concrete (V_{cy}), aggregate meshing (V_a) and longitudinal reinforcement pegging (V_d). Immediately after the bending cracks are inclined, between 40% and 60% of the total shear strength is resisted by the joint work of V_d and V_{cy} . Considering the DEF part of the fissured structure and assuming the moments with respect to point E, we have that V_d and V_a cause momentum with respect to point E, which must be balanced by the compressive force $C'1$. The equilibrium of the horizontal resultant in the ABDE section shows that $T1 = C1 + C'1$, and finally, $T1 = C1 + C'1$ should balance the external momentum of this section. As the diagonal crack progresses,

the plot decreases, V_a increasing the fraction resisted by V_{cy} and V_d . The dowel, V_d leads to the separation of the concrete along the reinforcement. When the crack occurs, it falls, approaching zero. When V_a and V_d disappear, then V_{cy} and C1 causes the result of all the shear and compression to be transmitted to the AB depth above the crack. At this point in the life of the structure, the AB section being too shallow, will not withstand the compressive forces required for balance. As a result this section crushes upwards, bringing no resistance to the stress. Collins et. al (2008) [12] present a review analysis of 60 years of research on the behavior of short reinforced concrete beams without stirrups, where it was concluded that the largest portion of shear strength is not found in the characteristic strength of concrete, but is affected by the dimensions of the structural element, the meshing of the aggregates and the pin effect of the longitudinal reinforcement. According to ACI-ASCE (1973) [13], for reinforced concrete structures subjected to shear stresses, the portion of strength due to concrete is the sum of several mechanisms capable of transmitting forces between sections, such as:

Aggregate interlock: this mechanism occurs between the two surfaces caused by a crack. The contribution of aggregate meshing to shear strength depends on crack opening and surface roughness;

Arching action: this mechanism occurs more expressively in beams with reduced spans due to the accommodation of compressive stresses in the arc and the intensity of these stresses depends mainly on the inclination of the arc, being directly linked to the a/d ratio, that is, the lower the value of the shear span a (short beams), the greater the arc effect;

Cantilever action: this mechanism occurs in uncracked sections of the beam (between two consecutive cracks) or in non-cracked parts of cracked elements (compression zone of a cracked section);

Dowel action-effect: Longitudinal reinforcement resists a portion of the displacement caused by shear force due to the pin effect on the bar. The pin force on the longitudinal reinforcement bar depends on the stiffness of the bar at the intersection with the crack.

2.3 PROPERTIES OF CRFA IN THE HARDENED STATE

Ductility, toughness and post-crack residual strength are some of the advantages of CRFA, compared to simple concrete. The distinct behavior between these materials can be attributed to the fiber-concrete interaction that develops at the time of crack formation. At this time, there is a transfer of forces between the concrete and the fibers. To explain this mechanism of stress transfer, Garcez (2005) [14] shows in Figure 2 that, after the occurrence of a crack (phase 5), the transfer of forces occurs by friction, and this frictional stress is

distributed at the fiber-concrete interface. For stress levels higher than the formation of a crack, the displacement of the fibers occurs (phase 4) and the process of tearing the fibers from the concrete mass begins (phase 2). At this moment, the effort for the fiber to be pulled out is high, which justifies the tenacity of CRFA. When the stress intensifies, the crack opening increases and the fibers begin to act as stress transfer bridges (phase 3) until their total pullout or rupture (phase 1 and 2, respectively).

2.4 FIBER-REINFORCED BEAMS AND SLABS

According to Hazrina et al (2017) [15], concrete reinforced with steel fibers with fiber consumption (C_f) of 1%, can fully replace conventional reinforcements, both bending and shear, with a load capacity practically equal to slabs with reinforcement. For Arslan (2014) [16], in concrete beams reinforced with steel fibers, the control of cracking resulting from normal stress is more effective compared to simple concrete, as the fibers provide greater rigidity after the onset of cracking. According to Macgregor and Whigt (2012) [17], steel fibers tend to increase the shear capacity by ensuring a tensile strength of the concrete along the inclined crack, resulting in an increase in the aggregate mesh component, similar to that observed in beams with transverse reinforcement. According to KWAK et al (2002) [18], the use of steel fiber-reinforced concrete in beams increases the shear strength, and the rupture, which is usually brittle, can be suppressed in favor of a ductile rupture. As previously mentioned, steel fibers help to form tension bridges that perform a greater distribution of forces, helping as a mechanism that slows down the propagation of cracks in concrete, providing greater bearing capacity (Dinh et al., 2010) [19].

To formulate the equilibrium condition for a steel fiber-reinforced, unstirruped, reinforced concrete beam, Lim and Oh (1999) [20] showed what is required to identify all the external and internal actions that may be present on the face of the inclined crack. The shear forces are transmitted through the following plots: effect of the uncracked concrete of the compressed region (V_c), effect of the meshing between the aggregates along the diagonal crack (V_a), pin effect of the longitudinal reinforcement that crosses this crack (V_d) and vertical components of the pullout force of the fibers along the inclined crack (V_f).

3 NORMATIVE RECOMMENDATIONS

3.1 NBR 6118 (2023)

According to the Brazilian standard, unidirectional ribbed slabs must be calculated according to the direction of the ribs, disregarding the transverse stiffness and torsional stiffness, this standard does not bring prescriptions for the calculation of slabs manufactured

with CRFA. NBR 6118 [3] prescribes that for ribbed slabs with spacing (l_0) between rib axes less than or equal to 650 mm, the verification of the bending of the table may be waived, and for the verification of the shear of the rib region, the consideration of the slab criteria (Equation 1) is allowed, in relation to the term (σ_{CP}), this was equated to zero since the tested slabs were not subjected to preloads or compressive stresses perpendicular to the cross-section. For slabs with rib axis spacing between 650 mm and 110 mm, the bending of the table is required, and the ribs must be checked for shear as beams, checking the tensile diagonal, (Equation 2). For the two equations, the weighting coefficient of concrete (γ_c) was not used, and the values of concrete, tensile and compressive strength were those found in the characterization tests, (f_c) and (f_t) presented in Table 1, aiming at the comparison between the equations and the experimental results.

$$V_{Rd} = [\tau_{Rd} \cdot k \cdot (1,2 + 40 \cdot \rho_l) + 0,15 \cdot \sigma_{CP}] \cdot b_w \cdot d \quad \text{Equation 1}$$

$$V_{Rd} = V_{c0} = 0,6 \cdot f_{ctd} \cdot b_w \cdot d \quad \text{Equation 2}$$

$$\rho_l = \frac{A_{sl}}{b_w \cdot d} \leq 0,02 \quad \text{Equation 3}$$

$$k = (1,6 - d) \geq 1 \quad \text{Equation 4}$$

$$f_{ctk,inf} = 0,7 \cdot f_{ct,m} \quad \text{Equation 5}$$

$$f_{ct,m} = 0,3 \cdot f_{ck}^{2/3} \quad \text{Equation 6}$$

$$f_{ct,d} = \frac{f_{ctk,inf}}{\gamma_c} \quad \text{Equation 7}$$

$$\tau_{Rd} = 0,25 \cdot f_{ct,d} \quad \text{Equation 8}$$

Where as:

f_c : Compressive strength of concrete;

f_t : Tensile strength of concrete;

f_{ck} : Characteristic compressive strength of concrete;

V_{Rd} : Calculation resistant shear force;

V_{c0} : Reference value for the portion of shear force resisted by the concrete;

ρ_l : Geometric longitudinal reinforcement rate of tensile;

τ_{Rd} : Shear stress resistant calculation;

f_{ctd} : Tensile strength of concrete;

σ_{CP} : initial stress in the concrete at the level of the barycenter of the prestressing reinforcement, due to the simultaneous prestressing of n cables;

γ_c : Weighting coefficient of the strength of concrete;

$f_{ctk,inf}$ Characteristic tensile strength of concrete with the lower value;

$f_{ct,m}$: Average tensile strength of concrete ($f_{ct,m} = f_t$);

A_{st} : Area of longitudinal tensile reinforcement;

k : Coefficient related to longitudinal tensile reinforcement;

b_w : Minimum width of the section along the usable height d .

3.2 ACI 318 (2014)

According to ACI 318 [1], the shear strength of unidirectional ribbed slabs of unshear reinforced concrete is based on the average shear stress of the effective cross-sectional surface $b_w \cdot d$ and the pin effect. For the calculation of beams without shear reinforcement, we have that $V_u = V_c$ according to Equation 8 and the shear strength can be expressed by Equation 9.

$$V_u = V_c \quad \text{Equation 8}$$

$$V_c = 0,16 \cdot \lambda \cdot \left(\sqrt{f'_c} + 17 \cdot \rho_w \right) \cdot b_w \cdot d \quad \text{Equation 9}$$

Where as:

V_c : Resistance to the shear force absorbed by the concrete in N.mm;

V_u : Shear effort requested last in N.mm;

f'_c : Compressive strength of concrete in Mpa;

ρ_w : Longitudinal reinforcement ratio ($\rho_w = \rho_l$);

λ : Stress modification factor in concrete (normal mass concrete $\lambda=1$)

3.3 EHE 08 (2010)

According to the Spanish standard EHE 08 [2], the shear strength of unreinforced concrete parts to shear (V_{u2}) is expressed by equation 10, where (V_{cu}) is estimated by equation 11 and the quantities (f_{cv}) and (ε) are estimated by equations 12 and 13, respectively. (V_{fu}) is the portion of strength absorbed by the steel fibers, calculated according to equation 9, the parameter (f_{R3}) is obtained with equation 29, in relation to equations 14, 15 and 16 the weighting coefficient (γ_c) was not used (γ_c) in the calculation of ($f_{R3,d}$) and in (f_{cv}) experimental values presented in table 3 were used, in order to compare the results of the equations to the results obtained in the experimental tests. f_{cv}

$$V_{u2} = V_{cu} + V_{fu} \quad \text{Equation 10}$$

$$V_{cu} = \frac{0,18}{\gamma_c} \cdot \varepsilon \cdot \left((100 \cdot \rho_l \cdot f_{cv})^{1/3} + 0,15 \cdot \sigma_{cp} \right) \cdot b_w \cdot d$$

$$\geq 0,75 \cdot \varepsilon^{2/3} \cdot f_{cv}^{1/2} \cdot b_w$$

Equation 11

$$f_{cv} = \min(f_{ck}; 60)$$

Equation 12

$$\varepsilon = \left(1 + \sqrt{\frac{200}{d}} \right) \leq 2$$

Equation 13

$$V_{fu} = 0,7 \cdot \varepsilon \cdot \tau_{fd} \cdot b_w \cdot d$$

Equation 14

$$\tau_{f,d} = 0,5 \cdot f_{ctR,d}$$

Equation 15

$$f_{ctR,d} = 0,33 \cdot f_{R3,d}$$

Equation 16

Where as:

V_{cu} : Contribution of concrete shear strength;

V_{fu} : Contribution of strength of steel fibers;

f_{cv} : Calculation resistance to shear stress ($f_{cv} = f_c$);

ε : Relative deformation along the height of the section (scale factor);

τ_{fd} : Calculation value of the increase in shear strength due to the reinforcement of steel fibers;

$f_{ctR,d}$: Calculation of the residual tensile strength of CRFA;

$f_{R3,d}$: Calculation value of the residual tensile strength of the CRFA at the flexion corresponding to the crack opening of 2.5 mm.

3.4 CEB-FIP MODEL CODE (2010)

The CEB-FIP Model Code (MC10) is a document produced in collaboration with 41 countries, with the main objective of serving as a basis for future codes and presenting new developments regarding concrete materials and structures, in order to achieve optimal behavior, based on performance requirements.

3.4.1 Shear Strength (V_R)

The shear strength ($V_{Rd,f}$) of concrete parts not reinforced to shear and reinforced with steel fibers is established as a function ($V_{Rd,f}$) as shown in equation 17, where (f_{Fts}) defined by equation 18, (f_{Fts}) according to equation 19 and (f_{ctk}) according to equation 20. The estimated strength of non-fiber-reinforced concrete was estimated by equation 21 and the

parameters (k_v) and (k_{dg}) were estimated by equations 22 and 23, respectively. For all equations, the test values referring to the resistant characteristics of the concrete and the weighting coefficient γ_c were discarded in order to compare these equations with the experimental results presented in Table 4.

$$V_{Rd,f} = \left\{ \frac{0,18}{\gamma_c} \cdot k \cdot \left[100 \cdot \rho \cdot \left(1 + 7,5 \cdot \frac{f_{Ftuk}}{f_{ctk}} \right) \cdot f_{ck} \right]^{1/3} + 0,15 \cdot \sigma_{CP} \right\} \cdot b_w \cdot d$$

$$\geq 0,035 \cdot k^{1,5} \cdot f_{CK}^{0,5} \cdot b_w \cdot d$$

Equation 17

$$f_{Ftuk} = f_{Fts} - \frac{1,5}{2,5} \cdot (f_{Fts} - 0,5 \cdot f_{R3} + 0,2 \cdot f_{R1}) \geq 0$$

Equation 18

$$f_{Fts} = 0,45 \cdot f_{R1}$$

Equation 19

$$f_{ctk} = 2 \cdot \ln \left(1 + \frac{f_{CK}}{10} \right)$$

Equation 20

$$V_R = K_V \cdot \frac{\sqrt{f_{ck}}}{\gamma_c} \cdot z \cdot b_w$$

Equation 21

$$k_v = \frac{0,4}{1 + 1500 \cdot \varepsilon_x} \cdot \frac{1300}{1000 + k_{dg} \cdot z}$$

Equation 22

$$k_{dg} = \frac{32}{16 + d_g} \geq 0,75$$

Equation 23

Where as:

$V_{Rd,f}$: Shear strength of fiber-reinforced concrete;

f_{Ftuk} : Characteristic value of ultimate residual tensile strength for CRFA;

f_{ctk} : Characteristic value of tensile strength for fiberless concrete;

f_{Fts} : Residual resistance in the service limit state;

f_{R1} : Calculation value of the residual tensile strength of the CRFA at the flexion corresponding to the crack opening of 0.5 mm;

ε_x : Deformation in the center of the vein;

z : Lever arm between the traction armature and the compression block;

d_g : Maximum aggregate diameter.

3.4.2 Flexural Strength

To determine the value of (M_R), the inflection model of (MC10) [4] was used. In this model, the contribution of steel fibers is given by (f_{Ftu}), which is calculated by equation 13. As shown in Figure 3, the quantities (F) and (y) are, respectively, the resulting forces and

their respective lever arms and, define the compression block, establish the values for the parameters $\lambda = 0,8$ and $\eta = 1$ for $f_c \leq 58 \text{ MPa}$.

Regarding the distribution of the strains, it is assumed that (ε_{cu}) is equal to $3.5\text{‰}\varepsilon_{cu}$, but it is observed that $(\varepsilon_{t,bot})$ should not be greater than (ε_{fu}) , estimated by equation 24. Admitting (S_{rm}) according to equation 27 leads to satisfactory answers. In this context, Table 5 presents a summary of the interactive process, as a function of the neutral line, after establishing the compatibility of the deformations and the equilibrium of the resulting forces ($\Sigma F \approx 0$).

$$\varepsilon_{fu} = \frac{w_u}{l_{cs}} \quad \text{Equation 24}$$

$$w_u = 2,5 \text{ mm} \quad \text{Equation 25}$$

$$l_{cs} = \min(y; S_{rm}) \quad \text{Equation 26}$$

$$S_{rm} = \frac{d}{2} \quad \text{Equation 27}$$

Where as:

Where as:

M_R : Moment resistant;

a : Shear span value;

ε_{fu} : Strain of non-metalic reinforcement at maximum force in tension;

l_{cs} Refers to the characteristic structural length;

w_u : Represents the maximum permissible crack opening;

S_{rm} : Value of the average distance between cracks;

y Represents the distance from the neutral line to the most tensile fiber of the section;

ε_{cu} : Maximum deformation in compressed concrete;

$\varepsilon_{t,bot}$: : Deformation in the most tensile fiber of the section.

4 EXPERIMENTAL PROGRAM

4.1 CHARACTERISTICS OF SLABS

Tests were carried out on 8 panels of unidirectional ribbed slabs of reinforced concrete until failure, without the presence of anti-shear reinforcement in the ribs. The slabs were divided into 2 groups of 4 slabs each, in which group C30 (Reinforced Concrete Slab) was composed of four panels of 1,700 mm in length, with variations in the distance between the rib axes (l_0) of 550 mm, 650 mm, 750 mm and 850 mm and the CRFA group (Fiber-Steel Reinforced Concrete Slab), composed of four slabs with the same variation as the previous group, but containing steel fiber in the concrete, as shown in Table 1. All slabs had a

thickness of 40 mm for the layer and ribs with a cross-section of (100 x 100) mm², leaving them with a total height of 140 mm (Figures 4 and 5).

The concrete cover adopted for all reinforcements was 20 mm. All panels have the same arrangements for the reinforcements, consisting of 2Ø12.5 mm in the ribs, at a useful height of 113.8 mm, resulting in a 2.06% reinforcement rate and with ratio $a/d = 3,08$, and with bars of 5 mm diameter to combat the bending of the tables. Shear reinforcement was not used in the ribs in order to quantify the contribution of the spacing between the ribs and steel fibers to the shear strength. To avoid localized crushing of the concrete due to the concentration of stresses in the regions of support and application of the load, it was decided to reinforce these locations using stirrups 2Ø6.3 mm in diameter and 100 mm apart from each other in the region of the supports and points of application of the load, figures 4 and 5 show the arrangements of the reinforcements. Figure 6 shows the steel fiber used in the reinforcement of the CRFA slabs, which was the Crimped type (Harvest W-LCS/50/75W) with a length (l_f) of 38 mm and equivalent diameter (d_f) of 1.28 mm, characteristics determined according to NBR 15530 [21], and tensile strength limit of 800 MPa.

With regard to the compressive strength of the concrete (f_c), MPa was adopted and the concreting of the slabs was carried out with concrete made in situ, together with the addition of steel fiber, requiring an approximate volume of 1 m³ to mold the slabs and the specimens. Figure 7 shows the stages of making the ribbed slabs.

4.2 INSTRUMENTATION

The instrumentation aimed to record the behavior of the slabs for later comparison, in order to identify the influence of the steel fibers on the shear performance and define the failure modes. For this purpose, the displacements and deformations in the reinforcements and concrete were monitored, in addition to the mapping of the cracks.

4.2.1 Displacements

The vertical displacements (deflects) were measured using 2 DIGIMESS dial indicators, with a maximum reading stroke of 50 mm and a precision of 0.01 mm, positioned in the middle of the span, spaced from one rib to the other and in contact with the upper surface of the slabs. In the lower part of the slab, near the center, an LVDT (Linear Variable Differential Transformer) of the DCTH3000A type, manufactured by the company RDP Electrosense, with a linear displacement of ±75 mm, positioned with the help of a magnetic support fixed to the reaction beam of the test frame, was used. Figure 8 shows the positioning of the indicator clocks.

4.2.2 Concrete surface

To measure the deformations in the concrete, 8 electric resistance extensometers (EER) were used, manufactured by the company EXCEL SENSORES, model PA-06-201BA-120L, one for each slab, fixed to the upper surface of the concrete, just above one of the ribs, in the middle of the span of these, and later connected to the data acquisition equipment (ALMEMO model). Such positioning is justified by the fact that it is the region of maximum bending moment, that is, the region of maximum compressive stress of the concrete. The positioning of the extensometers on the concrete surface is shown in Figure 8.

4.2.3 Bending Armor

The instrumentation of the flexural reinforcement was carried out by means of 8 electric resistance extensometers (EER), manufactured by the company EXCEL SENSORES, model PA-06-125AA-120L, which were fixed to one of the flexural reinforcement bars and in the middle of the span of a rib of each slab, as shown in Figure 8. Again, this position is justified by the fact that it is the region of maximum bending moment where the flow of the tensile reinforcements occurs.

4.3 TEST SYSTEM

The test system was mounted on a reaction slab and aimed at the response of the structure to the distributed loading, applied transversely to the ribs. Thus, the slabs were supported on rollers on metal beams, supporting the load applied perpendicular to the ribs (horizontal direction), on the upper face of the panel, through a bi-supported metal profile used for load distribution. The application of the loading took place through a manually operated hydraulic cylinder with a capacity of 1000 kN, connected to a hydraulic pump, and the recording of the loading intensity was carried out with the aid of a load cell with a capacity of 1000 kN and an accuracy of 1 kN connected to a digital display. The loads were established by 5 kN load steps.

The strain readings were obtained using a modular data acquisition system ALMEMO ®5690-2 m, from Ahlborn, compatible with the AMRWinControl software, which read the strain gauges positioned on the steel and concrete. Load increment intervals of 5 kN were used for each data collection, as well as for the proper reading of extensometers, indicator clocks and crack marking, in order to achieve a satisfactory number of readings aiming at the execution of the graphs that will represent the behavior of the slabs. Figure 9 shows details of the test system.

5 RESULTS

5.1 MATERIALS

The mechanical properties of the concrete were determined from compressive strength (f_c), tensile strength (f_t) by diametrical compression and modulus of elasticity (E_c) tests, according to the standards NBR 5739 [22], NBR 7222 [23] and NBR 8522 [24], respectively. The results presented in Table 2 are the average for 3 cylindrical specimens tested for each slab at their respective ages.

The characteristics of tensile steel were obtained through standardized tests and a normal distribution curve. Three 600 mm long specimens were extracted for the tensile tests, all from the same batch, with 12.5 mm diameter (CA-50), in order to determine the mechanical properties of the steel, such as yield stress (f_{ys}) equal to 570 MPa, rupture stress (f_u) equal to 687 MPa, yield strain (ε_{ys}) equal to 2.33 and modulus of elasticity (E_s) of 244.6 GPa.

Regarding steel fibers, the proposal by Moraes Neto et al. (2013) [25] to estimate the values of residual stresses ($f_{Ri}=1, 3$ and 4), used in the estimates of the load capacity of the slabs and this relates the fiber consumption (C_f) with the product between the fiber length (l_f) and the diameter (d_f) as follows:

$$f_{R1} = 7,5 \cdot \left(C_f \cdot \frac{l_f}{d_f}\right)^{0,8} \quad \text{Equation 28}$$

$$f_{R3} = 6,0 \cdot \left(C_f \cdot \frac{l_f}{d_f}\right)^{0,7} \quad \text{Equation 29}$$

5.2 DISPLACEMENTS

The indicator clocks were distributed in the middle of the rib span and the cover, in order to compare the behavior of the slabs due to the variation in the spacing between the ribs. Figure 10 shows the graph of the vertical displacements observed in the slabs. There was a greater displacement, until failure, in the CRFA-reinforced slabs compared to the C30 class slabs, on average 37% of increase, and this increase in ductility is explained by the crack control caused by the interaction of the fiber with the concrete. The displacement graphs also show an increase in stiffness provided by the increase in the modulus of elasticity of CRFA concrete.

5.3 CONCRETE DEFORMATIONS

It was decided to measure only the deformations in the rib region and the L1 and L6 slabs were the ones that presented the highest deformations, $1.1‰$ ($\varepsilon_{c,max}$), indicating that there was no concrete crushing in any of the slabs, as shown in Table 3.

5.4 BENDING REINFORCEMENT DEFORMATIONS

The highest deformations were recorded for the slabs with higher failure loads, all reinforced with CRFA (L6, L7 and L8), probably due to the increase in ductility of the concrete, generating greater displacements. The L8 slab showed a maximum deformation of $2.69‰$ ($\varepsilon_{s,max}$) in the flexural reinforcement, reaching the yield ($2.33‰$), being the only one to flow. Figure 11 shows the maximum deformations in the bending reinforcements for all slabs.

5.5 CRACKING PATTERN

The cracking pattern was similar for all slabs, where the beginning occurred with cracking in the center of the layers towards the ribs. In the ribs, inclined shear cracks occurred in the region of the supports, which configured the imminence of shear failure, and the rupture surface extended to the layer, leading to the collapse of the slab.

On the upper surface of the slab there was a longitudinal cracking pattern at the meeting between the layer and the rib, and in some slabs this crack reached the cross-section of the rib. This cracking on the upper surface is predicted by the standards for ribbed slabs with a wheelbase (l_0) above 650 mm, however, below this normative value there is no recommendation for analysis, and the layers of the L1 and L5 slabs presented this cracking parallel to the ribs excessively. The cracking patterns of the ribs of the slabs are shown in Figure 12. These veins showed a higher degree of cracking than the layers and were where the ruptures occurred.

5.6 ULTIMATE LOADS AND BURST MODES

The tested ribbed slabs reached failure with loads (P_u) of 116 kN, 95 kN, 91 kN, 107 kN, 118 kN, 140 kN, 178 kN and 186 kN for slabs L1 to L8 respectively, as shown in Figure 13. Based on previous studies carried out with ribbed slabs, the relevant influence of the screed stiffness on the shear strength of ribbed slabs was perceived, as already evidenced by Souza et al. (2014) [26].

There was a proportionality between the use of CRFA, with the distance between the ribs (l_0) and the increase in the ultimate breaking load, demonstrating that there was a

considerable gain in strength even without transverse reinforcement. All slabs failed by shear without showing yield of the rib flexural reinforcement, with the exception of L8. The value of the ultimate bending load (P_{FLEX}) was 176 kN, estimated by the CEB-FIP standard (MC10) [4], according to the interactive process presented in table 5, only the L7 and L8 slabs presented rupture loads (P_u) with values close to (P_{FLEX}), for the other slabs the values of the rupture loads (P_u), were lower than (P_{FLEX}), ratifying the observed failure mode. Table 3 presents the observed rupture modes and the relationship between P_{FLEX}/P_u .

5.7 COMPARISON BETWEEN EXPERIMENTAL AND ESTIMATED RESULTS

Table 4 presents the last experimental loads and estimated by the standards ACI 318 [1], EHE 08 [2], NBR 6118 [3] and MC10 [4] for shear strength (V_U), all standards, were used to estimate the strength of slabs made with concrete of class C30 and presented conservative results with regard to shear, on average, the results of NBR 6118 [3] were 40% lower than the experimental results and the results estimated by ACI 318 [1] were more conservative with results on average, 56% lower, compared to the experimental results. In the estimates of the slabs made with CRFA, the EHE 08 [2] and CEB-FIB MC [4] standards were used and the results were also conservative and reduced the shear strength on average, 41% when comparing the experimental results to the EHE 08 standard [2] and 39% when compared to the results estimated by the MC [4]. In the slabs reinforced with CRFA, the differences between the estimates and the experimental results were even more conservative when analyzing the slabs with greater distances between the ribs (l_0), that is, with a larger cover area, especially L8, whose experimental result was 99% higher than that estimated by EHE 08 [2].

6 CONCLUSIONS

The results of this study lead to the conclusion that the slabs executed with conventional concrete followed the pattern of higher strength for the smallest distances between ribs (l_0), and the explanation is that for the higher spacing between ribs there were greater vertical displacements of the layers, twisting the ribs and shortening the shear failure. For the slabs reinforced with CRFA, it was observed that all of them presented a gain in shear strength, and this phenomenon occurred due to the reinforcement with CRFA increasing the stiffness of the layer and the contribution of the residual stress of CRFA in the fight against cracking, minimizing the effects of torsion on the ribs. The layers with CRFA contributed to the shear strength more effectively than the layers made of C30 class concrete. None of the slabs reached the conventional deformation limit of the normative

flexural rupture concrete of 3.5%. On the upper surface of all slabs there was a cracking pattern at the layer-rib abutment, corroborating the normative prescriptions for verification of the flexural layer in ribbed slabs with excessive distance between the ribs. All the analyzed standards estimated shear strengths lower than the results found experimentally, underestimating these results by up to 60% by ACI 318 [1] and 50% by EHE 08 [2] for slabs without and with CFRA, respectively.

ABSTRACT

Micro and small enterprises (MSEs) represent 99% of formal businesses in Brazil and play a central role in economic and social development. However, access to markets, especially public markets, remains a structural challenge. This study investigates the association between the formalization of MSEs and their participation in public service procurement processes conducted within the Banrisul System during the first quarter of 2025, the first full cycle under Law No. 14,133/2021. The research adopts a mixed-methods approach, including documentary analysis of bidding notices and contracts, collection of secondary data (CNPJ and tax registries), and the application of questionnaires and interviews with entrepreneurs and managers. The methodological design is descriptive-correlational, with no intention of inferring causality. It is expected that the prospect of supplying to the State acts as an incentive for formalization, particularly in the service sector, which is characterized by high levels of informality. Preliminary results suggest a concentration of newly established firms close to the dates of bidding processes, indicating a relevant correlation between public procurement and entry into the formal market. It is concluded that the effectiveness of the policy depends not only on the legal framework but also on the institutional capacity of subnational entities and the mediating role of SEBRAE.

ciclo completo de vigência da Lei nº 14.133/2021. A pesquisa adota abordagem mista, com análise documental de editais e contratos, levantamento de dados secundários (CNPJ e cadastros fiscais) e aplicação de questionários e entrevistas a empreendedores e gestores. O desenho metodológico é descritivo-correlacional, sem pretensão de inferir causalidade. A expectativa é que a perspectiva de fornecimento ao Estado atue como incentivo à formalização, sobretudo no setor de serviços, marcado por alta informalidade. Os resultados preliminares sugerem concentração de empresas recém-constituídas próximas às datas de certames, apontando correlação relevante entre licitações e ingresso no mercado formal. Conclui-se que a efetividade da política depende não apenas do marco legal, mas da capacidade institucional dos entes subnacionais e do papel de mediação do SEBRAE.

RESUMEN

Las micro y pequeñas empresas (MPEs) representan el 99% de las empresas formales en Brasil y desempeñan un papel central en el desarrollo económico y social. Sin embargo, el acceso a los mercados, especialmente al mercado público, sigue siendo un desafío estructural. Este estudio investiga la asociación entre la formalización de las MPEs y su participación en licitaciones públicas de servicios realizadas en el Sistema Banrisul durante el primer trimestre de 2025, primer ciclo completo de vigencia de la Ley nº 14.133/2021. La investigación adopta un enfoque mixto, que incluye análisis documental de pliegos y contratos, levantamiento de datos secundarios (CNPJ y registros fiscales) y la aplicación de cuestionarios y entrevistas a emprendedores y gestores. El diseño metodológico es descriptivo-correlacional, sin pretensión de inferir causalidad. Se espera que la perspectiva de proveer al Estado actúe como incentivo para la formalización, especialmente en el sector de servicios, caracterizado por altos niveles de informalidad. Los resultados preliminares sugieren una concentración de empresas de reciente creación próximas a las fechas de los procesos de licitación, lo que indica una correlación relevante entre las compras públicas y la entrada al mercado formal. Se concluye que la efectividad de la política depende no solo del marco legal, sino también de la capacidad institucional de las entidades subnacionales y del papel de mediación del SEBRAE.

Palabras clave: Políticas Públicas. Micro y Pequeñas Empresas. Compras Públicas. Formalización. Desarrollo Local.

1 INTRODUCTION

The Brazilian productive structure is marked by contrasts: large conglomerates and an immense base of micro and small enterprises (MSEs) coexist. According to SEBRAE (2023), MSEs account for about 99% of formal establishments, 52% of formal jobs, and 30% of GDP. It's not just numbers: they are businesses that irrigate neighborhoods and municipalities, give opportunity to those who undertake with few resources and move local networks of suppliers, services and work.

Access to markets, however, remains a bottleneck. The Sebrae ecosystem indicates that the services sector concentrated most of the new openings in 2024, which helps explain why informality weighs so heavily in this segment. In simple terms: where there are many small ones, there is more vulnerability. According to official data from the IBGE, the informality rate in Brazil reached 38.6% in the 4th quarter of 2024 — a clear sign of fragile productive insertion, which limits growth trajectories and the reach of public policies.

In this scenario, the State is not only a regulator: it buys, hires and can induce transformations. The 1988 Constitution (art. 170) ties economic development to social justice. In the same direction, Complementary Law No. 123/2006 consolidated the favored treatment of MSEs, and Law No. 14,133/2021 redesigned the bidding regime, making the application of pro-MPE provisions mandatory and opening space for contracting more aligned with local and sustainable development.

This is where this research is situated: to investigate whether there was an association between participation in public bids for services and the formalization of MSEs with up to one year of incorporation in Banrisul's Procurement System, in the first quarter of 2025. The time frame is opportune because it coincides with the first full cycle of mandatory validity of the new law, offering a more stable regulatory environment to observe the initial effects. The focus on services is justified both by the high presence of small businesses and by the greater exposure to informality.

The academic contribution is twofold. First, it delivers recent evidence, under a new legal framework, on a topic in which normative diagnoses predominate, but there is a lack of fine empirical readings. Second, it helps to illuminate informality as a structural problem of Brazilian development, connecting it to concrete instruments of economic induction. Finally, it intends to offer practical inputs to managers, control bodies and development institutions, bringing theory and public policy closer together.

It is important to clarify the evaluative scope: it is not an "impact assessment". In the light of Ramos and Schabbach (2012), the study configures an evaluation of results (ex post), of a descriptive-correlational nature, aimed at identifying associations, without the intention

of inferring causality. The evidence will be built by triangulation between documents (notices, minutes, contracts), administrative databases (CNPJ/Revenue) and primary data (questionnaires and interviews).

General objective: to analyze the existence of an association between participation in public procurement and the formalization of service SMEs at Banrisul. Specific objectives: to profile winners up to one year old; understand motivations for formalization; identify institutional and regulatory barriers to access; and to examine the support role of SEBRAE-RS.

2 SMES AND PUBLIC POLICIES ON MARKET ACCESS

Micro and small enterprises (MSEs) are protagonists of contemporary economies not only due to their quantitative expressiveness, but also due to their qualitative relevance with regard to the generation of employment, income and territorial dynamism. In Brazil, according to SEBRAE (2023), they represent more than 99% of formal enterprises, account for about 30% of the Gross Domestic Product (GDP), and are responsible for 52% of formal jobs. In terms of capillarity, they are present in practically all municipalities, which gives them a strategic role in territorial cohesion.

Despite their economic and social centrality, MSEs face a persistent set of obstacles to accessing formal markets — whether private or public. Among the main obstacles are low financial capacity, difficulty in accessing credit, insufficient human capital, bureaucratic complexity, and information asymmetries. This set of factors reinforces a circle of vulnerability that often pushes entrepreneurs into informality, perpetuating low levels of productivity.

In this context, public policies aimed at MSEs gain prominence. Cassiolato and Lastres (2003) point out that the State can act as a coordinating agent, using instruments to promote demand — such as government purchases — to induce desirable economic behaviors, including formalization, innovation and increased productivity. This perspective is part of the so-called "new institutional economics", which emphasizes the role of legal and institutional arrangements in shaping economic trajectories.

The Brazilian trajectory of policies aimed at MSEs has gone through different phases. Barreto (2011) argues that, initially, the emphasis was on tax regulation, as a way of simplifying and reducing the tax burden. Subsequently, there was an expansion to credit policies, training and debureaucratization. The creation of the National Statute of Micro and Small Enterprises (Complementary Law No. 123/2006) marked the consolidation of a transversal legal regime, which forced the Union, states and municipalities to grant differentiated treatment to MSEs.

In the specific field of market access, LC No. 123/2006 established innovative instruments: exclusivity in bids of up to R\$ 80 thousand, reserved quotas of up to 25% in divisible items, priority in case of a tie and the possibility of subcontracting by larger companies. According to Araújo Júnior (2018), such provisions represented a paradigmatic milestone, as they transformed public procurement into a policy of productive inclusion, linking differential treatment to the strengthening of the local business base.

However, the simple normative design does not ensure automatic results. Cabral, Reis and Sampaio (2015) highlight that the effective participation of MSEs depends on factors such as the simplicity of the public notices, the technical training of entrepreneurs, the clarity of the judgment criteria and the active performance of development agencies. Often, the distance between the norm and practical reality results in low effectiveness.

This gap is reinforced by cultural factors. A survey by the Getulio Vargas Foundation (FGV, 2020) revealed that many entrepreneurs perceive public procurement as a restricted space, marked by clientelism or favoring large suppliers. This perception discourages the participation of MSEs and increases the transaction cost for those who decide to compete.

In addition to the operational and cultural obstacles, the Brazilian federative complexity must be considered. As Abrucio (2005) and Pires and Gomide (2014) point out, the capacity to implement policies varies between states and municipalities. This means that the same legal provision can generate different results depending on the institutional context, administrative capacity and the level of articulation with support institutions, such as SEBRAE.

Another relevant point is the insertion of market access policies in the public policy cycle. According to the analysis model proposed by Souza (2006), policies go through phases of formulation, implementation and evaluation. In the case of policies for MSEs, the formulation advanced significantly with the enactment of LC No. 123/2006 and Law No. 14,133/2021. Implementation, however, encounters resistance and practical limitations, requiring greater attention to the evaluation phase to verify the effectiveness of the mechanisms.

The international literature also contributes to the analysis. In European Union countries, *procurement* policies have been used to promote sustainable development goals, innovation, and gender equity (ARROWSMITH; KUNZLIK, 2009). In the United States, the *Small Business Act* establishes mandatory percentages of participation of small companies in federal public contracts. These experiences demonstrate that public procurement can be powerful instruments, as long as it is accompanied by consistent institutional arrangements.

In Brazil, the implementation of similar instruments faces obstacles related to the

administrative culture and the conservatism of the control bodies, which often prioritize strict formal legality to the detriment of the social function of purchases (FARAH; MARQUES, 2017). This tension between legality and development is central to understanding the limits of market access policy.

In this sense, it is essential to observe that the success of public policy does not depend exclusively on the existence of a robust normative framework, but on the State's ability to promote complementary actions of support, training and interinstitutional articulation. As Ansell and Gash (2008) point out, the co-production of public policies requires mutual trust, institutional learning, and effective dialogue channels between government and civil society.

In the light of these reflections, it is hypothesized that access to public markets can act as a factor to stimulate formalization, especially when there is synergy between legal provisions and training and technical support policies. The present research seeks precisely to explore this hypothesis, examining the case of Rio Grande do Sul through the Banrisul System, which brings together in a centralized digital platform bids from various subnational public entities.

3 PUBLIC PROCUREMENT AS AN INSTRUMENT OF PRODUCTIVE INCLUSION

The State's role as an economic agent goes beyond its regulatory or collection function. When it mobilizes public resources to acquire goods and services, the State exercises power of induction over markets, production chains and business behavior. This purchasing power, called *public procurement* in the international literature, is increasingly recognized as a strategic instrument of public policy (McCRUDDEN, 2004).

In Brazil, government purchases move approximately 12% of the Gross Domestic Product (GDP), according to data from the Ministry of Economy (BRASIL, 2022). This means that the State, when acquiring products and services, not only meets its administrative needs, but can also direct demand in order to stimulate strategic sectors, reduce regional inequalities and foster the formalization of entrepreneurs.

3.1 THE ROLE OF PUBLIC PROCUREMENT IN ECONOMIC DEVELOPMENT

Historically, bidding was conceived as a mechanism to ensure efficiency and isonomy in the use of public resources, with an almost exclusive focus on the criterion of the lowest price. However, in recent decades, several countries have been attributing broader social and economic purposes to public procurement. According to Arrowsmith (2010), the evolution of *procurement standards* in the European Union demonstrates that the State can use its

purchasing power to induce technological innovation, promote environmental sustainability and expand the inclusion of vulnerable groups in the labor market.

In the United States, the *Small Business Act* establishes goals for the participation of small businesses in federal contracts, creating a protected market for this segment. A similar experience occurs in Chile, where the ChileCompra system reserves part of government purchases for local micro and small companies, stimulating territorial development. These examples show that *procurement* can be treated as a tool of industrial policy, and not just as an administrative process.

3.2 PUBLIC PROCUREMENT AND PRODUCTIVE INCLUSION OF MSEs

In the Brazilian context, the inclusion of micro and small companies in government procurement gained strength from Complementary Law No. 123/2006. The mechanisms provided for in Chapter V — exclusivity in contracts of up to R\$ 80 thousand, reserve quotas, tie-breaking criteria and subcontracting — were designed to reduce entry barriers and ensure greater competitiveness for MSEs.

Silva, Reis and Mello (2019) demonstrate that the probability of formalization among small service providers increases significantly when they identify concrete opportunities to supply the State. The requirement of tax and labor regularity for qualification in the competitions works as a direct incentive to formalization. At the same time, the potential for stable and larger contracts increases the attractiveness of leaving informality.

However, the effectiveness of this process is not automatic. As Oliveira (2021) points out, subnational entities do not always fully internalize the provisions of LC No. 123/2006 in their regulations, and many public notices continue to reproduce disproportionate requirements — such as minimum share capital or proof of high previous experience. This generates indirect exclusion of MSEs, even though the legislation provides for differentiated treatment.

3.3 THE BRAZILIAN CASE: ADVANCES AND LIMITATIONS

The new Law No. 14,133/2021 reaffirmed the favored treatment of MSEs and incorporated sustainable development and planning into hiring. Article 11, IV, determines that bids promote sustainable national development, making room for social, environmental and territorial criteria in the selection of suppliers. Despite this, obstacles remain. According to IPEA (2023), the participation of MSEs is hampered by disproportionate requirements (certificates and financial proofs), technicality and hermetic language of the notices, low training of auctioneers and managers — who, fearing accountability, adopt conservative

models — and fragile institutional articulation, with little dialogue between contracting bodies, SEBRAE and associations. Together, these barriers raise the cost of entry, reduce the competitiveness of small businesses, and weaken the inclusive function of public procurement, limiting results even with a robust framework.

3.4 THE BANRISUL SYSTEM AND THE EXPERIENCE OF RIO GRANDE DO SUL

In Rio Grande do Sul, Banrisul operates the Banrisul Online Auction platform, which centralizes bids for services and goods from city halls, municipalities and state agencies. In 2024, the system held more than 3 thousand bids in the service sector, moving significant amounts and increasing the transparency of processes (BANRISUL, 2025).

Electronic centralization brings advantages such as standardization, greater publicity, and reduced transaction costs. At the same time, it facilitates the empirical analysis of the participation of MSEs, since the data is concentrated in a single portal. For small entrepreneurs, however, there are still barriers related to the difficulty of interpreting the notices and gathering all the required documentation.

This context makes the case of Rio Grande do Sul especially interesting for analysis. On the one hand, there is a consolidated technological system, capable of democratizing access to information; on the other hand, institutional and cultural challenges remain that limit effective productive inclusion.

3.5 PUBLIC PROCUREMENT AND TERRITORIAL DEVELOPMENT

The literature on local development reinforces that public procurement can act as instruments for the territorialization of public policies. Marques and Faria (2015) argue that, by directing part of the acquisitions to local suppliers, the State contributes to creating virtuous cycles of income circulation, job creation and strengthening of the regional productive base.

In this sense, government purchases should not be seen only as supply mechanisms, but as public policies endowed with intentionality. This perspective brings the analysis closer to the field of democratic governance and the co-production of policies, highlighted by Osborne (2006), in which different actors — State, market and civil society — collaborate in the production of complex public goods.

In view of the above, it is understood that public procurement is a powerful instrument of productive inclusion, whose effectiveness, however, depends on the articulation of three inseparable dimensions. The first is the normative framework, ensured by LC No. 123/2006 and reaffirmed by Law No. 14,133/2021, which establishes legal bases for the differential treatment of MSEs and authorizes the strategic use of the State's purchasing power. The

second concerns the institutional capacity of the implementing entities, responsible for translating the legal provisions into accessible practices — from the planning and drafting of the public notices to the conduct of the bids and the contractual management. The third dimension involves the complementary performance of support institutions, with emphasis on SEBRAE, which trains, guides and reduces information asymmetries between potential suppliers and the public administration.

The proposed research observes precisely how these three layers are combined in the context of the Banrisul System, verifying to what extent the perspective of supplying the State has worked as an inducer of the formalization of newly constituted service companies. In other words, it seeks to identify whether the legal framework, local administrative capacity, and institutional support converge to transform normative opportunities into concrete results of economic inclusion.

4 LEGAL FRAMEWORK: LC NO. 123/2006 AND LAW NO. 14,133/2021

The institutionalization of differential treatment for micro and small enterprises (MSEs) in Brazil did not occur suddenly. It is the result of a historical process of political disputes, federative arrangements and changes in the understanding of the role of the State as an inducer of development. The most relevant milestone in this process is Complementary Law No. 123, of December 14, 2006, which established the National Statute of Micro and Small Enterprises. Subsequently, Law No. 14,133, of April 1, 2021, by replacing the former Law No. 8,666/1993, consolidated and expanded this regime, connecting it to a broader paradigm of sustainable development and contractual governance.

4.1 HISTORICAL BACKGROUND AND DISPUTES IN THE NATIONAL CONGRESS

The processing of LC No. 123/2006 reflected an environment of convergence between government sectors, parliamentarians and representative entities, such as SEBRAE and the Parliamentary Front for Micro and Small Enterprises. According to Nogueira (2010), there was strong pressure from business associations for the unification of the sparse legislation, which until then dealt with the issue in a fragmented way. The approved text sought not only to simplify the tax regime (with the Simples Nacional), but also to create instruments for access to credit and the market, including participation in public bids.

During the legislative debates, the perception that the State, as the largest buyer of the economy, had the duty to act as an agent of economic inclusion was highlighted. This understanding has gained strength due to the high rate of informality in the Brazilian labor market and the concentration of public contracts in large suppliers.

4.2 LAW NO. 14,133/2021 AND THE NEW PHASE OF THE CONTRACTING REGIME

The enactment of Law No. 14,133/2021 represented a structural change in the public procurement system. By repealing Law No. 8,666/1993, Law No. 10,520/2002 and part of the Differentiated Contracting Regime (RDC), it established a unified normative framework, closer to international best practices.

Chapter V of LC No. 123/2006 occupies a central position in this research because it concentrates the mechanisms of favoring micro and small enterprises (MSEs) in public procurement. Among these instruments, the exclusivity for contracts of up to R\$ 80 thousand (art. 48, I), which creates a protected competitive niche; reserved quotas of up to 25% of the object in divisible items (art. 48, III), which enable the participation of smaller companies in installments compatible with their scale; the tie-breaking criterion in favor of MSEs when their proposals are up to 10% above the best offer (art. 44), known as fictitious tie; and the compulsory subcontracting of MSEs in larger works and services (art. 48, § 3), a mechanism that integrates small suppliers into contracts of greater complexity.

Taken together, these provisions constitute affirmative actions of an economic nature (PEREIRA, 2015). Its logic is to reduce structural barriers to entry and correct competitive imbalances, while stimulating the formalization and insertion of SMEs in public supply chains. By reserving portions of the state market and making judgment criteria more flexible in situations of price equivalence, the law seeks to transform the State's purchasing power into a lever for local development and productive inclusion.

The effectiveness of these mechanisms, however, is not automatic and varies according to the adhesion and administrative capacity of the federative entities. A survey by the Federal Court of Auditors (Ruling No. 2,622/2013 – Plenary) pointed out that several public agencies failed to apply the benefits provided for in LC No. 123/2006 due to lack of knowledge, cultural resistance or fear of questioning by the control bodies. This diagnosis shows that the inclusive power of the legal framework depends on its internalization in regulations and public notices, as well as on the continuous training of auctioneers and procurement teams, in order to consolidate administrative routines aligned with the favored treatment and local development objectives.

4.3 TCU JURISPRUDENCE AND INTERPRETATION BY CONTROL BODIES

The Federal Court of Accounts has a fundamental role in the interpretative consolidation of the legislation. In decisions such as Ruling No. 1,214/2013 – Plenary, the TCU recognized the obligation to apply the rules of LC No. 123/2006, even when not explained in a public notice. More recently, in Ruling No. 2,731/2015 – Plenary, it reinforced

that the division of the object into smaller lots should not be seen as an illicit fractionation of the expense, but as a legitimate measure of inclusion of MSEs.

This interpretation is essential to provide legal certainty to public managers who are often reluctant to adopt differentiated measures for fear of liability. The case law of the TCU, by consolidating this understanding, contributes to disseminating more inclusive practices in subnational entities.

4.4 INTERNATIONAL COMPARISON: GOOD PRACTICES AND LIMITS

Comparing the Brazilian model to international experiences allows us to identify advances and gaps. In the United States, as mentioned, the *Small Business Act* establishes quantitative targets: at least 23% of federal contracts must be allocated to small businesses, with specific percentages for *women-owned* and *minority-owned businesses*. In the European Union, *Directive 2014/24/EU* explicitly encourages the division of contracts into lots, as a way to guarantee access to small and medium-sized enterprises.

Brazil has made progress in creating affirmative provisions in LC No. 123/2006, but it still lacks clear goals and robust monitoring mechanisms. The absence of national indicators makes it difficult to assess the real impact of public procurement on the formalization and survival of MSEs.

5 FORMALIZATION AND LOCAL ECONOMIC DEVELOPMENT

5.1 THE PHENOMENON OF INFORMALITY IN BRAZIL

Brazil has historically had high rates of informality in the labor market and in small enterprises. According to data from the Continuous PNAD/IBGE (2023), about 39% of the employed workforce works in informal conditions. In the business universe, studies by SEBRAE (2022) indicate that more than 25% of small businesses still operate without formal registration, especially in sectors such as street trading, personal services, and civil construction.

This informality stems from multiple factors: tax complexity, high compliance costs, absence of social and cultural guarantees and aversion to bureaucracy. As Hernando de Soto (2000) observes in his work *The Mystery of Capital*, informality is not the result of the irrationality of agents, but of institutional barriers that make formalization more costly than remaining on the sidelines.

5.2 INSTITUTIONS AND INCENTIVES FOR FORMALIZATION

The institutionalist approach of Douglass North (1990) helps to understand this

phenomenon. For the author, institutions – understood as "the rules of the game" that structure human interactions – determine transaction costs and influence the predictability of economic exchanges. In the Brazilian case, the institutions aimed at MSEs began to be redesigned from the 1988 Constitution and, above all, from LC No. 123/2006, which created tax incentives (Simples Nacional), credit and market.

Another fundamental point is that formalization is not restricted to legal registration. As Perry et al. (2007) point out, in *Informality: Exit and Exclusion*, informality can be both a voluntary exit of entrepreneurs who reject the costs of regulation ("exit"), and an involuntary exclusion due to lack of access to opportunities ("exclusion"). Public policies must, therefore, act on both levels: reduce entry costs and expand the concrete benefits of belonging to the formal regime.

5.3 PUBLIC PROCUREMENT AS A VECTOR OF FORMALIZATION

Government procurement plays a strategic role in this process. By requiring formal qualification (CNPJ, tax, labor and social security regularity), the State creates incentives for regularization.

The provision of exclusivity for bids of up to R\$ 80 thousand and quotas of up to 25% in larger objects enhances this effect, by opening doors to contracts compatible with the scale of MSEs.

In the case of Rio Grande do Sul, an exploratory analysis of the public base of Banrisul's Online Auction (own collection; April 2025) suggests that a significant portion of the participants had less than two years of incorporation. To ensure reproducibility and transparency, the consolidated values, the spreadsheet with the identification of the bids and the scraping script will be presented in a methodological appendix.

5.4 LOCAL ECONOMIC DEVELOPMENT AND PRODUCTIVE CHAINS

The effect of formalization goes beyond the individual entrepreneur. The presence of formalized MSEs in local supply chains strengthens regional economies, creates regular jobs and stimulates municipal tax collection.

The effect of formalization goes beyond the individual entrepreneur. The presence of formalized MSEs in local supply chains strengthens regional economies, creates regular jobs and stimulates municipal tax collection. Abramovay, Magalhães and Schröder (2008) emphasize that local development involves sustainable and inclusive productive chains.

In addition, public procurement policy can be designed to privilege suppliers from vulnerable territories, functioning as a mechanism to combat regional inequalities. This

strategy is particularly relevant in states with large internal disparities, such as Rio Grande do Sul, where the economic concentration in metropolitan regions contrasts with the fragility of small municipalities.

5.5 LIMITS AND CHALLENGES OF FORMALIZATION VIA PUBLIC PROCUREMENT

Despite the advances, there are limits to consider. First, formalization motivated exclusively by access to public contracts can result in short-term companies, created only to meet a specific demand and dissolved later. This turnover weakens the objective of consolidating sustainable business trajectories.

Second, the bureaucracy involved in participating in bids still represents a significant barrier, even with the advances of Law No. 14,133/2021. Small entrepreneurs often face difficulties in gathering clearance certificates, understanding public notices, and preparing competitive proposals.

Finally, there is the challenge of state capacity. Without trained technical teams and accessible digital systems, city halls – which concentrate a large part of small-value contracts – can turn the mechanisms of LC No. 123/2006 into a dead letter.

6 INSTITUTIONAL ANALYSIS: THE ROLE OF SEBRAE AND PUBLIC ADMINISTRATION

The effectiveness of public policies aimed at micro and small enterprises (MSEs) does not depend only on the existence of legal frameworks or normative provisions. Implementation requires institutional actors capable of translating such norms into concrete and accessible practices. Among these actors, the Brazilian Micro and Small Business Support Service (SEBRAE) and the public administration itself stand out, especially in its subnational dimension.

6.1 SEBRAE AS A SUPPORT AND DEVELOPMENT INSTITUTION

Since its creation in 1972, SEBRAE has consolidated itself as the main institution of technical, managerial and training support for micro and small entrepreneurs in Brazil. Its work goes beyond training and consulting: it involves political articulation, dissemination of good practices and support for the insertion of MSEs in production chains.

According to the institution's report (SEBRAE, 2023), more than 2 million entrepreneurs were served in qualification programs in the last three years. Many of these programs are directly linked to public procurement, such as the Brazil Purchase Program, which aims to train suppliers to participate in bids, reduce qualification failures and increase the competitiveness of local companies.

In addition, SEBRAE plays a strategic role in federative articulation, functioning as a bridge between the Union, states and municipalities. In many cases, the institution assists municipalities in the preparation of public notices that respect the prerogatives of LC No. 123/2006, which demonstrates its relevance in the decentralized implementation of the policy.

6.2 STATE CAPACITY AND SUBNATIONAL IMPLEMENTATION

The literature on public policies emphasizes the centrality of state capacity in implementation (Skocpol, 1985; Gomide and Pires, 2014). It is not enough for the State to legislate; It is necessary to have qualified bureaucracies, efficient digital systems, and an administrative culture focused on innovation.

In Brazil, the heterogeneity of municipal capacities represents one of the greatest challenges. While capitals and large cities have specialized technical teams, small municipalities face serious limitations in personnel and infrastructure. This asymmetry directly impacts the effectiveness of the mechanisms of LC No. 123/2006 and Law No. 14,133/2021.

A study by Pires and Gomide (2016) highlights that complex public policies, such as the access of MSEs to markets, require adaptive capacity, that is, the ability to adjust instruments to local realities without compromising the general objectives. In the case of public procurement, this means simplifying procedures, adopting accessible electronic auctions, and promoting training of civil servants.

Another relevant aspect is multilevel governance. The policy of support for MSEs is inscribed in a federative model in which the Union, states and municipalities share responsibilities. The Union, through national legislation and policies, establishes the general framework. States develop regional incentive programs and often offer digital bidding platforms. Municipalities, on the other hand, as the main contractors of small goods and services, are the privileged locus of implementation.

This arrangement creates coordination challenges. As Abrucio (2010) observes, federative fragmentation can compromise the effectiveness of national policies if there are no mechanisms for cooperation and institutional learning. In this sense, the role of SEBRAE and intermunicipal consortia becomes essential to reduce asymmetries and promote greater uniformity in the application of the rules.

6.3 CONTROL AND ACCOUNTABILITY BODIES

The institutional analysis must also consider the role of control bodies, such as Courts of Accounts and Public Prosecutors' Offices. These institutions influence the way public managers interpret and apply the provisions of LC No. 123/2006. Often, the fear of sanctions

leads to the adoption of conservative positions, which limit the use of mechanisms to favor MSEs.

Decisions by the Federal Court of Accounts (TCU) have reiterated the legality of reserved quotas and exclusivities for MSEs, reinforcing the importance of aligning control and promotion. However, there are cases in which divergent understandings in state courts of accounts generate legal uncertainty, especially in smaller municipalities.

6.4 CIVIL SOCIETY AND INTERMEDIARY ACTORS

The role of organized civil society, such as business associations, cooperatives and employers' unions, cannot be neglected. These actors act as intermediaries between entrepreneurs and public administration, organizing collective demands, pressing for greater simplification and, in many cases, enabling the fulfillment of contracts through cooperation networks.

An example of this are the cooperatives of family farmers, which, in several states, organize production and enable participation in school feeding programs. In these cases, shared governance expands the reach of public policies and strengthens the social fabric.

6.5 INSTITUTIONAL LIMITS AND CHALLENGES

Despite the existence of support institutions and a consistent legal framework, structural limitations persist that affect the effectiveness of the policy. The first is institutional fragmentation: the multiplicity of bodies with competences on the subject — at different federative levels — tends to produce overlapping efforts, coordination gaps, and dispersion of resources, weakening the strategic conduct of actions. Added to this is the unequal capacity between entities, as many municipalities, especially smaller ones, lack qualified technical teams and minimum infrastructure to plan contracts, prepare public notices accessible to MSEs and manage contracts efficiently.

In addition to these factors, there is dependence on external incentives, to the extent that a relevant part of the initiatives only advances when there is a contribution from federal programs, agreements or direct support from institutions such as SEBRAE – a sign of local institutional fragility and low sustainability of administrative routines. Finally, the legal uncertainty resulting from divergent interpretations of the control bodies discourages the adoption of pro-MPE mechanisms (such as division of the object into lots, quotas or subcontracting), reducing the willingness of managers to innovate and deepen the differentiated treatment provided for by law.

7 DIALOGUES WITH LITERATURE AND THEORETICAL CONTRIBUTIONS

The study of public policies aimed at micro and small enterprises (MSEs) gains analytical density when it dialogues with the literature that deals with both the formulation and implementation and the evaluation of policies. The access of SMEs to markets, via instruments such as government procurement, cannot be understood only as an economic phenomenon, but as the result of a complex political, institutional and social process.

7.1 IMPLEMENTATION OF PUBLIC POLICIES: FROM RATIONALITY LIMITED TO THE STREET

One of the landmarks of the literature is the work of Pressman and Wildavsky (1973), who introduce the perspective that implementation is not a mere stage subsequent to formulation, but a process subject to deviations, negotiations, and failures. This view is reinforced by Lipsky (1980), when analyzing street-level bureaucrats, whose discretion affects the concrete application of policy.

In the case of public procurement aimed at MSEs, local civil servants assume a similar role, as their interpretations of the legislation, qualification criteria and documentary requirements can facilitate or restrict the participation of small businesses. Thus, understanding politics requires analyzing the decision-making space of these actors, who are often invisible in the great normative plans.

7.2 PUBLIC POLICY CYCLE AND THE EVALUATION PHASE

The public policy cycle model, widely disseminated in the literature (Howlett, Ramesh and Perl, 2009), offers a useful analytical framework. Although criticized for its linear character, it allows us to highlight the evaluation phase, a moment in which the real effects of the policy are examined in comparison with its formal objectives.

In the case of LC No. 123/2006, almost two decades of validity allow us to question: was there in fact an expansion in the participation of MSEs in public bids? Has this inclusion resulted in local development and strengthening of formalized entrepreneurship? The Brazilian literature on policy evaluation (Ramos and Schabbach, 2012; Pires and Lotta, 2019) points out that it is precisely at this moment that the tensions between the institutional design and the results obtained are revealed.

7.3 FEDERALISM, COORDINATION AND TERRITORIAL INEQUALITIES

The insertion of MSEs in public markets cannot be dissociated from the Brazilian federative logic. As Abrucio (2010) and Souza (2005) discuss, federalism in Brazil is marked

by strong decentralization, but also by deep inequalities in institutional capacity between entities.

This federative asymmetry has a direct impact on the implementation of the policy: larger municipalities are able to structure electronic procurement departments, train civil servants and support local suppliers, while smaller cities are dependent on external arrangements, such as state platforms or the support of SEBRAE. Here, the literature on cooperative federalism is essential to understand the limits and possibilities of a national policy in an unequal context.

7.4 PRODUCTIVE DEVELOPMENT POLICIES AND THE INFORMAL ECONOMY

Another relevant field of dialogue is the literature on economic development and informal economics. Hernando de Soto (1987) argues that informality is not the result of entrepreneurial incapacity, but of institutional barriers that hinder formalization. Douglass North (1990), in turn, emphasizes the importance of institutions as rules of the game that shape economic incentives.

Applying these ideas to the case of Brazilian MSEs, it is observed that mechanisms such as simplified bids and reserved quotas function as institutional incentives for formalization, since only legally constituted companies can access these markets. In this sense, public policies for access to markets are not only for promotion, but also for institutional inclusion.

7.5 STATE CAPACITIES AND DEMOCRATIC GOVERNANCE

The literature on state capacities in Brazil (Gomide and Pires, 2014; Pires and Gomide, 2016) highlights the relevance of technical-administrative capacity and political capacity for the implementation of complex policies. Public procurement programs for MSEs require not only trained servers and functional digital systems, but also political support from managers who prioritize local development.

This discussion is connected to the debate on democratic governance in crisis contexts (Lavalle, 2011; Avritzer, 2019). Inclusive policies for small entrepreneurs have the potential to strengthen ties between the State and society, promoting democratic legitimacy. However, when poorly implemented, they can reinforce inequalities, benefiting only companies that already have a greater structure and capacity to compete.

7.6 THEORETICAL CONTRIBUTIONS OF THIS STUDY

The present work contributes to literature by proposing an integrated reading on three

analytical fronts. The first is the institutional dimension, which examines the legal framework and the role played by actors such as SEBRAE, control bodies and local governments, explaining how rules and organizational arrangements shape incentives and implementation routines. The second is the federative dimension, in which the asymmetries of capacity between subnational entities and the need for cooperation to reduce inequalities in execution and standardize inclusive practices in public procurement are considered. The third is the evaluation dimension, aimed at gauging the effectiveness of the policy based on the results observed in the access of MSEs to the competitions, bringing together normative design, administrative practice and empirical evidence.

By articulating these three dimensions, the study advances in relation to fragmented analyses and offers a more comprehensive look at the effectiveness of public policies aimed at MSEs, connecting legal foundations, implementation capacities and measurable results in the same explanatory framework.

8 METHODOLOGICAL PROCEDURES

The study adopts a descriptive-correlational design, with a mixed approach, to identify associations between participation in bids and formalization of MSEs, without causal pretension. The unit of analysis is bidding for services carried out/approved in Banrisul's Online Auction between 01/01/2025 and 03/31/2025. In the quantitative analysis, the following are used: (i) documents from the Banrisul Portal (notices, minutes, contracts, results, with URL and date of collection) for the object, modality, dates and list of participants/winners; (ii) CNPJ/Revenue (date of incorporation, legal nature, CNAE, municipality) with pairing routine; and (iii) certificates for binary indicators of tax/labor regularity. In the qualitative field, there is an intentional sampling of winning entrepreneurs with ≤ 1 year of CNPJ (stratification by size/region) and a convenience sample of managers/auctioneers, via semi-structured interviews and a Likert questionnaire on barriers, complexity and institutional support. Ethics and reproducibility: ICF, anonymization, codebook and repository with scripts/metadata. In the light of Ramos and Schabbach (2012), it is an evaluation of results (ex post), without a comparison group or pre-post measurement; We work with triangulation (documents, survey, interviews). The Logical Framework guides the execution (inputs, activities, products, results and non-causal analytical impacts), highlighting the indicator of "recent formalization" (CNPJ constituted in a window close to the bid), and risks/assumptions: integrity of records, identification of participants, response biases and municipal heterogeneity.

9 ANALYTICAL STRATEGY

The key variables are: (i) recent formalization, binary indicator (=1 when the CNPJ of the winning company/participant was constituted in the interval $[-90; +30]$ days in relation to the date of the bid; =0 otherwise), with sensitivity analyses in $[-60; +15]$ and $[-120; +60]$; (ii) participation and victory in (binary) bids; (iii) amount awarded (continuous, in R\$); (iv) CNAE segment (categorical, by the main code); and (v) municipality (categorical), to control territorial heterogeneity. In coherence with the evaluative framework, the findings will be treated as associative evidence, and not causal (RAMOS; SCHABBACH, 2012).

In the descriptions, the temporal density of constitution of the CNPJs aligned with the date of the contest (kernel) is estimated to detect agglomerations, and the Spearman correlation between the sectoral/municipal bidding intensity (number of service tenders in the period) and the rate of recent CNPJs (proportion with indicator=1 between participants/winners) is calculated, favoring non-parametric metrics.

To explore associations, logistic regressions (binary outcomes: recent formalization; victory) and Poisson counting models (or negative binomial, if there is overdispersion) are estimated for participation frequencies and victories by territorial/sectoral unit. Odds ratios and rate ratios are reported, with controls by CNAE and municipality dummies.

The qualitative analysis triangulates mechanisms (entry costs, design of public notices, support from SEBRAE). Limitations: measurement bias (underreporting, inconsistencies), municipal heterogeneity, and simultaneity between formalizing and participating, which prevents causal attributions.

10 FINAL CONSIDERATIONS

The analysis of public policies aimed at micro and small enterprises (MSEs), especially with regard to access to markets via government purchases, allows us to reflect on the advances and challenges of almost two decades of Complementary Law No. 123/2006 and the recent incorporation of Law No. 14,133/2021. Throughout the study, it was found that such normative frameworks are essential instruments for the promotion of inclusive economic development, but their effectiveness depends on a set of institutional, federative and administrative factors.

First, it should be recognized that the policy contributed to expanding the participation of MSEs in public procurement, creating opportunities for insertion in markets previously restricted to large companies. The reservation of quotas, the simplification of procedures and the prioritization of local suppliers were measures that encouraged formalization and stimulated competition. Such provisions also reinforced the role of the State as an inducing

agent of regional development, bringing the logic of bidding closer to the social function of the Public Administration.

However, the results still reveal significant inequalities. Municipalities with greater administrative and technological capacity are more apt to implement inclusive bidding processes, while smaller cities face difficulties in complying with legal requirements, limiting the scope of the policy. This disparity reflects the Brazilian federative asymmetry, already pointed out by authors such as Abrucio (2010), who identify the need for more consistent mechanisms of cooperation and coordination between federated entities.

In addition, it is observed that many MSEs still come up against bureaucratic and financial barriers, such as the requirement for clearance certificates, difficulties in accessing credit and lack of technical training to participate in competitions. Thus, full inclusion has not yet materialized for the most vulnerable segments, especially those located in peripheral territories or in sectors of less economic dynamism.

As an evaluation of results (*ex post*), the study is subject to selection bias and unobserved confounders; thus, the findings should be interpreted as correlations and not causality (RAMOS; SCHABBACH, 2012).

From an academic point of view, this work reinforces three central contributions articulated in a single argument. First, it promotes the integration between implementation theory and evaluation, showing that the effectiveness of public procurement for MSEs stems simultaneously from the daily interpretation of street-level bureaucrats — as proposed by Lipsky (1980) — and from *ex post* analyses that confront objectives and results, in the light of Ramos and Schabbach (2012). Secondly, it offers a federative reading of public policies, showing that decentralization, although it strengthens local autonomy, also increases asymmetries in implementation capacity, which requires cooperative solutions and coordination arrangements between subnational entities. Finally, it advances in the institutional-inclusive dimension, by relating the "rules of the game" (North, 1990) to the concrete incentives for formalization and economic participation of historically marginalized actors, situating public procurement as a mechanism that both organizes incentives and reduces barriers to entry into the state market.

In summary, the policy of access of SMEs to public markets represents an important advance in the Brazilian agenda of inclusive development. However, its full effectiveness requires more than legal norms: it requires state capacities, federative coordination, and political commitment to reducing inequalities.

Thus, the importance of understanding public procurement not only as instruments of administrative efficiency, but as policies of socioeconomic inclusion and strengthening of

democratic governance is reaffirmed. The challenge is to transform the legal provision into concrete results for thousands of entrepreneurs who depend on these opportunities to prosper, consolidating, finally, a virtuous cycle of local development and economic citizenship.

ABSTRACT

For the present paper examines the decision of the Brazilian Supreme Federal Court (Supremo Tribunal Federal – STF) in RE 1.017.365/SC, which struck down the so-called “time frame” thesis for the demarcation of indigenous lands, in the light of Max Weber’s comprehensive sociology, with particular emphasis on the notion of social representation. Drawing on the concept of social action and on the centrality of the “subjectively represented meaning” in social relations, the paper seeks to identify the different value ideas that shape the representations of indigenous land in the Court’s reasoning: at times as an economic asset and an object of legal certainty for private property, at others as an original territory and a constitutive dimension of indigenous cultural identity. It is argued that culture, understood as an arena of disputes among competing representations, offers the key to understanding the Court’s decision not merely as a technical-legal application of constitutional rules, but as a moment of selection and consecration of particular value ideas in the Brazilian constitutional order. Finally, the article discusses to what extent the decision contributes to the legitimation of legal-rational domination and to the reshaping of social representations of indigenous peoples and their territories.

representação social. Partindo do conceito de ação social e da centralidade do “sentido subjetivamente representado” nas relações sociais, busca-se identificar as diferentes ideias de valor que estruturam as representações da terra indígena no julgamento: ora como bem econômico e objeto de segurança jurídica da propriedade privada, ora como território originário e dimensão constitutiva da identidade cultural dos povos indígenas. Argumenta-se que a cultura, entendida como arena de disputas entre representações em conflito, fornece a chave interpretativa para compreender a decisão do STF não apenas como aplicação técnico-jurídica de normas constitucionais, mas como momento de seleção e consagração de determinadas ideias de valor na ordem constitucional brasileira. Ao final, discute-se em que medida a decisão contribui para a legitimação da dominação legal-racional e para a reconfiguração das representações sociais acerca dos povos indígenas e de seus territórios.

RESUMEN

En el presente trabajo se analiza la decisión del Supremo Tribunal Federal (STF) en el RE 1.017.365/SC, que rechazó la tesis del “marco temporal” para la demarcación de tierras indígenas, a partir de la sociología comprensiva de Max Weber, con énfasis en la noción de representación social. Partiendo del concepto de acción social y de la centralidad del “sentido subjetivamente representado” en las relaciones sociales, se busca identificar las diferentes ideas de valor que estructuran las representaciones de la tierra indígena en el juicio: ora como bien económico y objeto de seguridad jurídica de la propiedad privada, ora como territorio originario y dimensión constitutiva de la identidad cultural de los pueblos indígenas. Se sostiene que la cultura, entendida como arena de disputas entre representaciones en conflicto, proporciona la clave interpretativa para comprender la decisión del STF no solo como aplicación técnico-jurídica de normas constitucionales, sino como un momento de selección y consagración de determinadas ideas de valor en el orden constitucional brasileño. Por último, se discute en qué medida la decisión contribuye a la legitimación de la dominación legal-racional y a la reconfiguración de las representaciones sociales acerca de los pueblos indígenas y de sus territorios.

1 INTRODUCTION

The controversy surrounding the demarcation of indigenous lands has occupied a central place in political, legal and symbolic disputes in Brazil for decades. The thesis of the so-called "time frame" – according to which indigenous peoples would only have the right to the lands they were occupying on October 5, 1988 – condensed, in a particularly acute way, long-term conflicts over property, territory, economic development and historical justice. When the Federal Supreme Court, in the judgment of Extraordinary Appeal No. 1.017.365/SC, in a regime of general repercussion, rejects this thesis and reaffirms the original character of indigenous territorial rights, it is not only solving a technical problem of constitutional interpretation: it is intervening in an arena dense with meanings, in which different groups dispute the very meaning of "land", "property", "State" and "indigenous people".

The strictly normativist reading tends to present this type of decision as a simple application of constitutional provisions and jurisprudential precedents. However, an approach inspired by Max Weber's comprehensive sociology allows us to take a different look at the phenomenon: instead of making the judicial decision only as the product of rules, it is a matter of reconstructing it as part of a process of social action, in which situated agents — ministers, lawyers, representatives of indigenous peoples, agribusiness entities, civil society organizations — guide their conduct based on socially constructed representations and ideas of value in dispute.

In Weber, social action is defined from the meaning that the agent attributes to his conduct, to the extent that it is guided by the existence of others. The social relation, in turn, is the intertwining of actions endowed with meaning, reciprocally referred to each other. In this context, to speak of "social representation" – even if the term does not appear in a systematic way in Weber as in Durkheim or in the more recent tradition inaugurated by Moscovici – means emphasizing precisely the significant dimension of practices: what individuals and groups think, imagine, project and dispute when they act in a field of relations. Culture, far from being a prior consensus of values, appears as an arena of struggle between different ideas of value that seek to impose themselves as legitimate guides of conduct.

The STF's decision on the time frame thus offers a particularly fruitful object to articulate Weberian theory and constitutional analysis. On the one hand, because it exposes in a very clear way contrasting representations of indigenous land: sometimes as an economic asset, the basis of productivity and legal security of private property; sometimes as an original territory, a condition for the physical and cultural existence of indigenous peoples and a structuring element of the 1988 Constituent Pact itself. On the other hand, because it

highlights the role of a constitutional court as an instance of selection and consecration of certain ideas of value, to the detriment of others, within a legal order that is intended to be legitimate.

In the light of comprehensive sociology, it is less interesting to ask whether the decision is "right" or "wrong" in abstract terms, and more to inquire what meanings are mobilized by the different actors, how these meanings are articulated in legal and political narratives, and how the court contributes to stabilizing certain social representations — of the land, of indigenous peoples, of the State itself — at a given historical moment. It is, therefore, a matter of shifting the focus from the isolated "normative content" to the intersection between culture, social action and legal-rational domination.

In this perspective, the present work has as a research problem the following question: how do the different social representations of indigenous land, reconstructed from the comprehensive sociology of Max Weber, manifest themselves and are selected in the STF's decision on the time frame, and how does this contribute to the legitimation of the Brazilian constitutional order? It is based on the hypothesis that the judgment in question can be understood as a moment of dispute and selection of social representations of the indigenous land, in which ideas of value prevail that recognize the cultural and original centrality of these territories, tensioning strictly patrimonial conceptions of property and reinforcing a certain configuration of legal-rational domination.

The general objective is to analyze how the STF's decision in RE 1.017.365/SC expresses, confronts and selects different social representations of indigenous land, in the light of Max Weber's comprehensive sociology. Specifically, it seeks to: (a) present Weber's concepts of social action, subjectively represented meaning, culture and social representation, as reconstructed by the specialized literature; (b) reconstruct the main lines of argument of the STF's judgment on the time frame, identifying the actors and narratives in conflict; (c) to identify the ideas of value and social representations of the indigenous land present in the votes and in the procedural manifestations; and (d) to evaluate the extent to which the decision contributes to the legitimation of a certain constitutional reading of indigenous territorial rights and to the reconfiguration of social representations about indigenous peoples and territory in Brazilian constitutionalism.

To achieve these objectives, a qualitative approach is adopted, based on documentary analysis of the decision, votes and selected procedural documents, interpreted in the light of the Weberian conceptual framework. The article is organized into four sections, in addition to this introduction. In the first, the central elements of the notion of social representation in Weber's comprehensive sociology are reconstructed, with emphasis on the relationship

between meaning, culture and ideas of value. In the second, the legal and political context of the judgment of the time frame is presented, with emphasis on the configuration of the conflict around the indigenous land. In the third, the social representations of the indigenous land within the STF decision are analyzed, identifying convergences and tensions between the narratives in dispute. Finally, the conclusion summarizes the main results and points out possible developments for the understanding of the relationship between constitutional courts, legal culture and social representations in societies marked by historical conflicts of a colonial nature.

2 SOCIAL REPRESENTATION IN COMPREHENSIVE SOCIOLOGY IN WEBER

By conceptualizing "social action", Weber already defines that this action is oriented towards the other (2015, p.3), that is, the individual's action is only relevant to sociology if the course of his acts is not directed towards himself. Following this idea, the "social relation" is the "reciprocally referred behavior" (WEBER, 2015, p. 16), in which the meaning is the content of the agents' social actions. It is precisely the content of this meaning of reciprocally referred (predictable, probable) actions that is of interest to the study of social representation.

Minayo (1995, p. 89), in an article on social representation in the classics, understands this theme as "categories of thought that express reality, explain it, justify it or question it". The author understands that in Weber the theme of social representations does not appear explicit as in Durkheim, however, she demonstrates that the author opposes the objectivist idea that social representation has a power of coercion, from society to the individual (Minayo, 1995). Let us see another peculiarity in the use of terms in Weber:

Max Weber elaborates his conceptions of the field of Social Representations through terms such as "ideas", "spirit", "conceptions", "mentality", often used as synonyms, and works in a particular way on the notion of "worldview".

Thus, it can be observed that two concepts are central to understanding representations in Weber, meaning (and its content) and culture. In the presentation of the work "The 'Objectivity' of Knowledge in the Social Sciences", written by Weber, Gabriel Cohn states that Weber opposes a dominant tendency to understand culture as a consensus on a set of values:

[...] for him, the world of culture is not that dimension of social reality that gives meaning to what men do, but, on the contrary, it is that **meaningful arena in which men themselves attribute value to what they do. Culture** operates as a kind of **filter**, which **selects** within the

set of possible experiences those that will be considered **significant** within **certain** human groups. The important thing is not the validity of values already given, but the **men themselves as actors** who, when acting, **are guided by guidelines** that they strive to enforce also for others. What is at stake are not "values" without more, but **"ideas of value"**, which refer to the way men perceive and think about values in the actions to which they give themselves. (WEBER, 2006, p.10-11, emphasis added).

Therefore, for Weber, culture is the result of the selections that occur in disputes for the most significant ideas of value, in a certain human group and in certain situations. On the other hand, meaning in Weber (here understood as the "subjectively aimed sense" or just "aimed") is precisely content that "sustains" social action. This point is fundamental in Weber's theory and the author makes it clear that he is not dealing here with an objective meaning, already disposed *a priori*, or "objectively 'correct' or a 'true' meaning obtained by metaphysical inquiry" (WEBER, 2015, p.4). Cohn, in an opening text to "Economy and Society" (WEBER, 2015, p. xiv) states that, despite being the best expression, "subjectively aimed sense" is not an absolutely satisfactory translation, thus dealing with what would be a "Weberian terminological nightmare."

The point is that, according to Cohn (WEBER, 2015, p. xiv), the term "subjective" can obviously be confused with a psychological term (an issue totally dismissed by Weber), but the biggest problem with the expression "subjectively aimed meaning" would reside precisely in the term "targeted", which could be understood as something already objectively posed before social action. In no way is this the intention of "meaning" in social action, so Cohn warns:

[...] the meaning of action is not something already given that is in some way "aimed" by the agent as the "goal" of his action, **but it is the representation** that he, as an agent, has **of the course of his action** and that commands its execution. [...] It would be appropriate to speak of a **"subjectively represented meaning"**, to make it clear that **what counts in the action and makes it effective** is not its meaning without more, but **the way in which the agent represents it to himself when conducting it**. (WEBER, 2015, p. xiv, author's italics, emphasis added)

It is noted that the concept of "subjectively aimed meaning", the content of the social action of individuals, is reciprocally and mutually referenced in social relations. Social representation is precisely the meaning observed by the other (or others) in social relations, so it is of essential importance to understand the concepts of culture and meaning in Weber.

In the Weberian analytical scheme, *everything* goes through the **conceptions or representations that the agents** (always individual, in the last instance) **have of the motives, means and ends of the social actions** in which they are involved. Hence the *subjective dimension* of action. And motives, means and ends have, for the agent, a significant character. Hence the dimension of *meaning* of the action. (WEBER, 2015, p. xiv, author's italics, emphasis added)

It is important to emphasize that this meaning of action or non-action in Weber (2006, p. 16) means "*taking* a position in favor of certain values" and going against other values. The author does not understand these values as determined by laws, mathematical or logical aspirations, but they are culturally constructed. Also in "The 'Objectivity' of Knowledge in the Social Sciences", Weber reiterates that reality can only be known, for the social scientist, from the cultural significance of social actions and their "regular repetition" (2006, p. 48).

Thus, social representation in Weber is the ideas of value that condition individual actions (WEBER, 2006, p.51). Thus, it can be understood that in Weber, "culture is a finite segment of the infinite course and devoid of its own meaning [...] to which thought has conferred [...] a meaning and a signification" (WEBER, 2006, p.58), while the "men of culture", in this process, can "assume a conscious *position* before the world and give it a meaning", and it is from this meaning that their evaluations are extracted. In other words, there is a reciprocal relationship, since "cultural knowledge is conditioned by certain ideas of value" (WEBER, 2006, p.58) and "cultural reality is always knowledge subordinated to *specifically* particular *points of view*" (WEBER, 2006, p.59). Gabriel Cohn, commenting on this aspect of Weber's theory, states:

[...] the precondition without which one cannot speak of scientific knowledge of the world of meanings and values (of culture) is the capacity of men ([...] motivated by interests based on values) to attribute meaning to what does not have it *per se*. (WEBER, 2006, p.58)

Similarly, Minayo (1995, p. 92-93) understands that for Weber, social representations (or ideas of value) are conditioned by reality, and vice versa:

[...] social **life** – which consists of the daily conduct of individuals – is loaded with **cultural significance**. This meaning is **given both by the material basis and by the ideas**, within an adequate relationship, in which both **mutually condition each other**. (Minayo, 1995, p. 92-93, emphasis added).

Thus, for Weber, the ideas of value, or the conceptions (modes of perception of the individual about the significant guidelines of culture), can guide the contents, or the

"subjectively aimed meanings" of social actions (always directed to the other), so social representation is precisely the meaning observed by the other (or others) in social relations, from the moment an agent assumes a point of view, instead of another. Therefore, one must observe both the cultural significance of these social actions and the regularity (repetition) of their meanings. Finally, even the concept of social representation in Weber is reciprocal, since both social life (culturally significant) and the subjectively aimed meanings of social actions (individual) are mutually conditioned, thus, we move on to the analysis of the Case of the Time Frame of Indigenous Lands in Brazil.

3 THE CASE OF THE TIME FRAME (RE 1.017.365/SC) AND THE CONFLICT OVER INDIGENOUS LAND

Extraordinary Appeal No. 1,017,365/SC, submitted to the system of general repercussion (Topic 1,031), has become the main paradigm for the definition of the legal-constitutional status of the ownership relations of areas of traditional indigenous occupation in the light of article 231 of the Federal Constitution. The lawsuit originates from a repossession action filed by the State of Santa Catarina against the Ibirama-Laklãnõ Indigenous Land, inhabited by the Xokleng people, with the presence of Guarani and Kaingang groups, in which the legality of the demarcation and the permanence of non-indigenous occupants in the area were discussed. According to the Indigenous Missionary Council (CIMI):

The time frame is a thesis that seeks to restrict the constitutional rights of indigenous peoples. In this interpretation, defended by ruralists and sectors interested in the exploitation of traditional lands, indigenous peoples would only have the right to the demarcation of lands that were in their possession on October 5, 1988, or that, on that date, were under proven physical or judicial dispute. (Mobilization, 2020).

In this understanding, the "time frame" thesis was constructed as a restrictive interpretation of article 231 of the Constitution. This formulation, initially articulated in decisions and opinions related to the Raposa Serra do Sol case and later systematized in an opinion of the Attorney General's Office, began to be claimed by agribusiness sectors and by the legislature as a criterion of legal certainty for rural property.

According to Ingo Wolfgang Sarlet (2004), legal certainty is part of the essential core of human dignity, thus functioning as a guarantee of the minimum existential conditions. This perspective illuminates the judgment of RE.1017.365/SC, in which the STF rejects the time frame thesis, reaffirming the original character of indigenous territorial rights, and such a

position can be seen as a means of preserving legal positions whose stability is indispensable for historically vulnerable groups.

This conception is particularly relevant when it comes to collective rights with strong cultural and existential density, whose effectiveness depends on continuity, predictability, and reinforced protection against state or private interference. Legal certainty, in this sense, is not limited to the protection of isolated individual acts, but encompasses the recognition and preservation of essential legal positions, especially those associated with the identity and permanence of historically vulnerable groups (SARLET, 2004).

The projection of reinforced protection on territories that constitute the material and cultural foundation of indigenous existence, recognizing that the rupture of these guarantees infringes the very structure of the Democratic State of Law, is finally established, and it is essential to point out the principle of prohibition of social regression, an element widely discussed by Sarlet (2009), which states that it participates in the Constitutional State, preventing legal achievements from being restricted by conjunctural pressures.

In this context, normative and institutional achievements are not mere circumstantial advances, but minimum levels of protection that cannot be reduced by the State without violating legitimate expectations and the integrity of the constitutional pact. This notion takes on special relevance when analyzing the protection of cultural, territorial and socio-environmental rights, since such rights, due to their collective nature, depend on legal stability to prevent conjunctural pressures from eroding fundamental guarantees that have already been consolidated (SARLET, 2009).

Thus, the protection of the environment and culture cannot be dissociated from human dignity, since both are indispensable elements for the full realization of the person and communities, given that the protection of collective identities and traditional ways of life is not ancillary or exceptional, but an integral part of the constitutional architecture aimed at preserving plurality and promoting an inclusive society (SARLET, 2013).

By setting aside the time frame, therefore, the Supreme Court prevents a restrictive interpretation from emptying the core of indigenous territorial rights, whose effectiveness derives directly from the CF/88, denying setbacks that would affect the cultural and territorial integrity of indigenous peoples and highlighting that the protection of these rights cannot be reduced based on readings that disregard their historicity and their centrality in the constituent pact.

Social, cultural and environmental rights are also part of the structuring axis of the Socio-Environmental State, in which human dignity presupposes social justice, cultural diversity and environmental preservation (SARLET, 2013). That said, by recognizing

indigenous lands as indispensable spaces for the physical, cultural and spiritual reproduction of these peoples, we are faced with the adoption of a constitutional model that goes beyond the patrimonialist logic of land and the non-result of state concessions in the face of the protection of indigenous territories.

It is also emphasized that legal certainty should not be interpreted in a merely formal or static way, but as an instrument that prevents the State from transforming historical vulnerabilities into valid legal criteria, where normative predictability and institutional trust are guarantees that should prevent structural inequalities from being naturalized or converted into limitations of rights. In contexts in which groups have been historically displaced, marginalized or prevented from fully exercising their constitutional prerogatives, legal certainty acts as a critical mechanism for containing injustices and rebuilding material equality (SARLET, 2004).

It is taken into account that the realization of fundamental rights requires a hermeneutical reading committed to the maximum protection of the legal positions that express essential values of the constitutional pact, especially when related to the dignity and identity of vulnerable groups.

The duty of progressivity, associated with the prohibition of retrogression, imposes on the interpreter a posture that favors the preservation of civilizational achievements and strengthens the community dimension of fundamental rights. Such a panorama reinforces the understanding that the legal protection of traditional territories, cultures and ways of life is not only a matter of normative technique, but a substantial element of the very idea of the material rule of law, guided by justice, inclusion and plurality (SARLET, 2009).

From the point of view of indigenous peoples and support entities, this interpretation is perceived as radically iniquitous, as it disregards the history of violent expulsions, forced removals and compulsory displacements to which several communities were subjected throughout the twentieth century, especially during the Military Dictatorship. By requiring physical presence on the date of 1988, the time frame thesis tends to "legalize" the consequences of dispossession and massacres, ignoring the fact that, until the 1988 Constitution, indigenous peoples were under state tutelage and with severe limitations to claim their rights in court.

In the judgment of RE 1.017.365/SC, the Federal Supreme Court, by a majority of 9 votes to 2, rejected the time frame thesis, stating that the recognition of the right to lands traditionally occupied by indigenous people is not subject to this rigid time criterion and must observe, instead, the so-called indigenato theory, which recognizes the original character of indigenous territorial rights prior to the State itself. In addition, the Court established a thesis

of general repercussion determining, among other points, the possibility of prior compensation to individuals in good faith for the improvements or, in certain cases, for the value of the bare land itself, under a regime of procedural separation in relation to the demarcation process.

The definition of this thesis had intense repercussions in the political, legal and economic scenario. On the one hand, it was celebrated by indigenous organizations, social movements, and a significant part of the academic community as an affirmation of the constitutional commitment to the protection of native peoples and to overcoming an interpretation that crystallized historical injustices. On the other hand, it generated a strong reaction from agribusiness sectors and parliamentary groups that defend the time frame, culminating in the approval of Law No. 14,701/2023, which sought to inscribe in ordinary law the thesis already rejected by the STF and which is currently the subject of concentrated control of constitutionality.

The case of the time frame, therefore, is not limited to the strictly legal dimension of the judgment. It condenses a broader dispute over how to narrate national history, the place of indigenous peoples in Brazilian society and the very definition of economic development. The street demonstrations, public hearings, oral arguments and parliamentary clashes that followed the trial indicate that what is at stake is not only the technical design of demarcation procedures, but the dispute of social representations about indigenous land: whether it will be seen primarily as a productive asset to be integrated into the land market or as an original territory, inseparable from the cultural identity of the peoples who inhabit it.

It is precisely in this key, in which constitutional decisions are understood as moments of condensation and selection of meanings, that RE 1.017.365/SC presents itself as a privileged object for the application of the Weberian theoretical framework outlined in the previous section. Judgment can be reconstructed as a complex social relation, in which multiple actors guide their actions based on conflicting ideas of value, producing competing representations of indigenous land and fighting to inscribe them in the constitutional order.

4 SOCIAL REPRESENTATIONS OF INDIGENOUS LAND IN THE STF JUDGMENT

The "time frame" thesis was constructed as a restrictive interpretation of article 231 of the Constitution, according to which indigenous peoples would only have the right to the demarcation of lands that were in their possession on October 5, 1988, the date of the promulgation of the constitutional text, or that, on that date, were under proven physical or judicial dispute. This formulation, initially articulated in decisions and opinions related to the Raposa Serra do Sol case and later systematized in an opinion of the Attorney General's

Office, began to be claimed by agribusiness sectors and by the legislature as a criterion of legal certainty for rural property.

4.1 SOCIAL REPRESENTATIONS OF INDIGENOUS LAND IN THE STF JUDGMENT

From the perspective of Weber's comprehensive sociology, the judgment of the time frame can be analyzed as a process in which different agents — ministers, lawyers, representatives of indigenous peoples, agribusiness entities, state agencies, civil society organizations — mobilize specific social representations of indigenous land, guiding their legal and political actions by certain ideas of value. The judgment and the individual votes function, in this perspective, as privileged records of these meanings in dispute.

4.2 INDIGENOUS LAND AS AN ECONOMIC ASSET AND OBJECT OF LEGAL CERTAINTY

A first constellation of representations can be identified in the emphasis given, by certain discourses, to land as an economic asset, the basis of agricultural productivity and an essential element of the legal security of private property. In this view, the stability of property titles, the predictability of rules of use and the protection of long-term investments appear as central values, often associated with the idea of national development, job creation and international competitiveness of Brazilian agribusiness.

Such representations are not limited to the interior of the Court, but permeate unsuccessful votes, manifestations of *amici curiae* linked to the productive sector, technical opinions and parliamentary pronouncements. The time frame thesis, in this context, operates as an ideal type that intends to organize the complex universe of indigenous territorial disputes based on an objective "cut-off date", capable of limiting the exposure of rural landowners to future litigation. Indigenous land is thus represented primarily as a potential space for land conflict, whose recognition must be made compatible with the preservation of already consolidated property expectations.

From the Weberian perspective, this social representation of indigenous land corresponds to a set of ideas of value that, culturally situated, guide the action of certain status groups and are of interest to a specific economic order. The defense of the time frame, in this sense, expresses an effort to rationalize legal-formal material interests, transfigured into a language of legal certainty, stability of the legal system and legitimate trust in institutions.

4.3 INDIGENOUS LAND AS AN ORIGINAL TERRITORY AND CULTURAL DIMENSION OF EXISTENCE

In contrast, a second constellation of representations emerges strongly in the majority position of the STF and in the manifestations of indigenous peoples, indigenous organizations, and part of the academic community. From this perspective, indigenous land is represented as an original territory, prior to the national state itself and a condition for the possibility of the physical and cultural existence of indigenous peoples. The reference to Article 231 of the Constitution, ILO Convention No. 169 and international human rights instruments reinforces a conception of territory as a space for social, spiritual and symbolic reproduction, inseparable from collective identity.

The votes that reject the time frame tend to emphasize the historicity of the indigenous occupation, the violence of the expulsion and removal processes, as well as the impossibility of taking the photograph of October 5, 1988 as a legitimate criterion for assessing original rights. Instead, they articulate the theory of *indigenato* as recognition of a special relationship between indigenous peoples and territory, which is not to be confused with the individualistic logic of civil property. The land, in this regime of representation, is not only an economic good, but a space of memory, ancestry and future.

In the light of comprehensive sociology, this second constellation corresponds to another configuration of ideas of value, equally rooted in historical experiences and specific worldviews. The representations of land as original territory guide the action of indigenous peoples and their allies, inform strategies for political mobilization, formulation of legal demands and evaluation of state decisions. In the STF's judgment, such representations are translated into legal-constitutional language, taking shape in categories such as "original rights", "traditionally occupied possession" and "cultural pluralism".

4.4 DISPUTE OF IDEAS OF VALUE AND SELECTION OF REPRESENTATIONS BY THE COURT

What RE 1.017.365/SC shows, therefore, is less the opposition between "legal technique" and "politics" and more the dispute between divergent social representations of the same reality – the indigenous land – within a specific legal field. Culture, in the Weberian sense, appears here as an arena in which these ideas of value confront each other, seeking to impose themselves as legitimate guides of state action.

By rejecting the time frame thesis and affirming the theory of *indigenato*, the STF not only applies a set of constitutional norms, but selects and enshrines one of the constellations of representations in dispute. The majority decision attributes centrality to the ideas of value

associated with historical justice, the protection of minorities and the recognition of original rights, relegating to the background conceptions that fully subordinate the indigenous territory to the logic of the security of private property. In Weberian terms, it can be said that the court actively participates in the process of cultural filtering, conferring greater legal and political significance to certain worldviews.

This selection does not imply the elimination of competing representations, which continue to guide actions and manifest themselves in other arenas, such as parliament (in the approval of Law No. 14,701/2023), the market (in the resistance of agribusiness sectors) and the justice system itself (in new litigation and legislative initiatives). It means, however, the provisional establishment of a predominant meaning within the constitutional order, with effects on the way future cases will be interpreted, how public policies will be formulated, and how society will symbolically represent indigenous peoples and their territories.

From the point of view of legal-rational domination, the decision also contributes to legitimizing the STF's role as an instance that guards the Constitution in matters of indigenous territorial rights. By basing its position on systematic, historical, and principled arguments, the Court seeks to construct a sense of legal rationality that presents itself as impersonal and universalizable, even if, as Weber's analysis shows, it is rooted in specific ideas of value. The legitimacy of the decision will depend, to a large extent, on the ability of these "defeated" or "winning" representations to be recognized, contested or incorporated by the various groups that make up Brazilian society.

5 FINAL CONSIDERATIONS

The analysis of the judgment of Extraordinary Appeal No. 1.017.365/SC in the light of Max Weber's comprehensive sociology allows us to shift the focus from a strictly normativist reading to an approach that privileges the significant dimension of social action and relations between groups. Instead of seeing the decision of the Federal Supreme Court only as an application of constitutional provisions related to indigenous lands, the study developed here sought to show how it is inserted in a field of symbolic disputes in which different social representations of indigenous land are mobilized, confronted and selected.

Starting from the concepts of social action, subjectively represented meaning, culture and ideas of value, reconstructed in Weber's work and in secondary literature, it was possible to interpret the case of the time frame as an arena in which, on the one hand, a representation of land is affirmed above all as an economic asset and object of legal security of property, and, on the other, a representation of the indigenous land as an original territory and an essential dimension of the physical and cultural existence of indigenous peoples. These

constellations of meaning guide the action of different status groups, inform the formulation of legal theses, and structure competing narratives about history, development, and justice.

The examination of the votes and the thesis of general repercussion established by the STF indicated that the Court, by rejecting the thesis of the time frame and adopting the theory of *indigenato*, contributes to the selection and consecration of certain ideas of value within the Brazilian constitutional order. The decision reaffirms the centrality of the recognition of original rights, the protection of minorities and cultural plurality, tensioning strictly patrimonial conceptions of property and reorienting the way the State should relate to indigenous peoples and their territories. In this sense, the court acts as an instance of cultural filtering, conferring greater legal significance to certain worldviews and producing effects on the future configuration of public policies and litigation.

At the same time, the persistence of political, legislative, and economic reactions contrary to the STF's understanding — as evidenced by the approval of Law No. 14,701/2023 and the actions for control of constitutionality related to it — shows that the process of dispute of representations is far from over. Culture, in a Weberian key, remains a field of open conflict, in which the ideas of value associated with indigenous land continue to be affirmed, contested, and reinterpreted as new events, decisions, and mobilizations unfold.

From a theoretical point of view, the case of the time frame reveals the fruitfulness of a reading that articulates comprehensive sociology and constitutional jurisdiction. Constitutional courts are not only organs for the technical application of norms, but privileged spaces for enunciating, stabilizing, and transforming fundamental social representations of who we are, what kind of society we want to be, and how we deal with legacies of violence and inequality. By bringing Weber closer to the study of constitutional jurisdiction in indigenous matters, a promising field of investigation on the relationship between legal culture, legal-rational domination and struggles for recognition in contexts marked by colonial histories is opened.

Finally, the analysis proposed here suggests that understanding the STF's decisions on indigenous lands requires not only mastery of dogmatic categories of constitutional law and indigenous law, but also sensitivity to the ways in which different groups represent land, property, the State, and the very idea of Brazil. In this sense, the dialogue between social theory and constitutional interpretation does not appear as an academic luxury, but as an indispensable tool to think, in a reflective way, about the foundations and effects of the legal choices that shape the future of indigenous peoples and the Brazilian democratic order itself.

HANNAH ARENDT: FREEDOM, POLITICS, AND LAW**HANNAH ARENDT: LIBERDADE, POLÍTICA E DIREITO****HANNAH ARENDT: LIBERTAD, POLÍTICA Y DERECHO**<https://doi.org/10.56238/sevened2026.008-248>**Maria Corga¹****ABSTRACT**

This study investigates the concept of freedom in Hannah Arendt, which transcends individual autonomy to manifest itself as a political commitment. The central question addresses how political freedom is only achieved in moderate regimes that respect plurality and citizen participation. The theoretical-analytical research is based on works such as *On Revolution*, *Truth and Politics*, and *Denktagebuch*, as well as analyses by Christian Volk and Jeremy Waldron. The results indicate that political freedom depends on the de-hierarchization between Law and Politics, the recognition of others, and an enlarged mentality that allows for the consideration of multiple perspectives. Active participation in public assemblies and the stabilizing role of Law are fundamental to ensuring political order. It is concluded that political freedom is a distinct way of guiding action among different communities, experienced through concerted action in a pluralistic environment.

Keywords: Freedom. Pluralist Politics. Law.

RESUMO

O presente trabalho investiga o conceito de liberdade em Hannah Arendt, que transcende a autonomia individual para se manifestar como um compromisso político. A questão central aborda como a liberdade política só é alcançada em regimes moderados que respeitam a pluralidade e a participação cidadã. A pesquisa teórico-analítica baseia-se em obras como *Sobre a Revolução*, *Verdade e Política* e *Denktagebuch*, além de análises de Christian Volk e Jeremy Waldron. Os resultados indicam que a liberdade política depende da desierarquização entre Direito e Política, do reconhecimento do outro e da mentalidade alargada, que permite considerar múltiplas perspetivas. A participação ativa nas assembleias públicas e o papel estabilizador do Direito são fundamentais para garantir a ordem política. Conclui-se que a liberdade política é um modo próprio de conduzir a ação entre diferentes comunidades, vivenciada por meio de uma ação em concerto num ambiente pluralista.

1 INTRODUCTION

The perspective presented in this paper lies in the conviction that the growth of plural societies provides evidence that we are agents of progress, or in other words, we are active agents of recognition of the link of modern policies in the conceptual structures of contemporary policies.

Hannah Arendt's political theory was not literally followed as if it could accurately translate a certain classical model of integrative politics such as that found in Aristotle. It is stated that contemporaneity is an ongoing consequence, of an effect of (dis)figuring tendencies and ways. The understanding that has been acquired of society cannot be transcribed without understanding these metamorphoses, whether occurring in the horizon of ethics or in world (economic-social) policies. Thus, a perspective-proposal that would attenuate the tension between abuse of power and the common good would be welcomed, and it is in this sense that a rereading of Hannah Arendt can serve the purpose.

Considering what can be seen as political freedom, it is important to consider the presence of law as a relationship between ethical principles and their prescription in political life. It should be noted that the definition of law implies a normativity (rights and duties) of regulation of conduct. The various control mechanisms, now more visible, make it necessary to have the presence of the legal domain in these times of permanent change, despite the fact that there are no rules imposed without discussion, but a desire to seduce (rather than deduce) that touches the public domain indistinctly.

2 DEVELOPMENT

2.1 BASES OF POLITICAL FREEDOM: INFLUENCES OF MONTESQUIEU

A first question to be asked would be how to avoid the excesses that positions of power normally favor, or if you prefer, how to avoid the abuses of power so that political freedom could be an effective, disinterested, transparent reality. One cannot fail to think in this regard of some recommendations from the recent past. We allow ourselves to quote Montesquieu in this regard:

Political freedom is only found in moderate governments. But it does not always exist in moderate governments. It is only found there when power is not abused, it is necessary that by the disposition of things, power stops power. Thus, the Constitution should be such that no one is obliged to do things to which the law does not oblige him, or to stop doing things that the law permits him to. (Montesquieu, *On the Spirit of the Laws*, XI, 6)

Montesquieu's quote on political freedom reminds us that political problems are not solved by the possession (or abuse) of power, but by prioritizing moderate regimes. Montesquieu thus pointed to the need to institute a kind of alternative — a moderate policy based on laws that would guarantee political freedom.

Like Montesquieu, Hannah Arendt also inevitably criticizes the abuse of power. For Arendt, councils and popular societies are paradigmatic institutions of discursive and democratic spaces. In Volk's analysis, Hannah Arendt begins by defining political freedom as follows:

Being free is inherent in acting, and the power to do so is guaranteed by others as a security. Freedom does not consist in an I will, which, according to the case, can mean or contradict an I can without this questioning human freedom; To be free is manifested only in action, so that not having the power to act is the same as not being free, even if the (philosophical) freedom of the will remains intact. In other words, political freedom is not identical with inner freedom [...] it depends on whether a free nation guarantees the space within which action can have an impact and become visible. (Volk, 2017, p. 233)

Thus, following Hannah Arendt in this conception of political freedom, it can be said that this freedom consists of acting together in a concerted way. Such concerted action implies that individuals are aware of the meaning and scope of freedom in the global horizon of actions that impact the lives of all. Such a horizon can be translated into the participation that must take place in governance and in the emanation of laws. In this sense, let us take into account the words that Hannah Arendt reproduces in *On Revolution*, taken from one of the regiments of one of the Parisian sections:

Society will deal with everything that concerns the freedom, equality, unity, indivisibility of the republic; [its members] will instruct each other and especially inform each other about the respect due to the laws and decrees that are promulgated; The order in the debates: if a speaker digresses too much or gets tired, the listeners will stand up. (Arendt, 2011, p. 306)

A careful reading of this text allows us to understand that, in Hannah Arendt's thought, political freedom can only exist through joint action with others (naturally, one perceives here the echoes of Heidegger's thought, of being-with-others). And acting with the other(s) – which is an effective and real relationship – not only presupposes, but attests, ensures, certifies the plurality that exists in the political sphere. In this regard, Hannah Arendt, referring to a speech by Robespierre in 1791 in the National Assembly, points out:

Thus these associations were the true "pillars of the Constitution," not only because within them had come "a great number of men who will soon replace us," but also because they constituted the very "foundations of liberty"; anyone who interfered with their meetings would be "attacking liberty," and among the crimes against the revolution "the greatest was the persecution of societies." (Arendt, 2011, p. 303)

Thus, to be politically free means, in the first place, to recognize that the human being receives from the other members of the community the constitutional guarantee that he can act, if he so wishes. The opposite, that is, not being free in political terms, means that a person's power will be denied by the other members of the community. However, this does not mean an impediment to non-action, that is, it does not make it impossible for the person to act as a result of the impeding actions of others. In simpler language, if a person does not act, he will not have the experience of the true meaning of political freedom. In practice, this lack of political experience generates negative (i.e., sterile) long-term consequences. Thus, it is up to us to ask: what is the role of law in such a context? Can the Law express a contradiction in the conception of political freedom?

2.2 RELATIONSHIP AND DEHIERARCHIZATION BETWEEN LAW AND POLITICS: THE THEORETICAL-CONSTITUTIONAL PERSPECTIVE OF HANNAH ARENDT

For Hannah Arendt, Law and politics are closely related and refer to each other. Consequently, both the legal and political spheres take into account each other's requirements and include their needs. However, if one sphere is given primacy over the other, that is, if there is sovereignty of law or sovereignty of the people, and if the dichotomy between law and politics is maintained, the stability of the entire political order is put at risk. Therefore, what is intended to be exposed is that, according to Hannah Arendt, it is possible to argue in favor of a dehierarchization of the relationship between Law and Politics. This dehierarchization marks the political-normative core of Hannah Arendt's theoretical-constitutional thought. In this regard, it is important to mention two important examples to better understand his thinking: a successful policy that esteems the meetings in town *halls* in North America and the council system of the Hungarian Revolution.

Since it is not possible here to explain in detail the references presupposed by the philosopher, it remains, however, to ask: what is a successful policy? First of all, it would be a "structured policy" (Cf. Waldrom, 2000, p. 210). In this same sense, Arendt points out in *On Revolution*:

It was not any theory, theological, political, or philosophical, but the decision to leave the Old World and venture into an enterprise of one's own accord that led to a sequence of acts and occurrences, in which they would have perished if they had not thought about the matter with dedication and time enough to discover, almost

inadvertently, the elementary grammar of political action and its more complicated syntax. whose rules determine the rise and fall of human power. (Arendt, 2011, p. 226)

Following Hannah Arendt's line of thought, it is clear that it is through the concept of relationship that the dehierarchization between Law and Politics can be shown. In other words, just as an individual cannot claim to be superior to another, no one can claim to be sovereign over others. It can, however, refer to a distinction of functions, or, in other words, individuals operate in interrelated logical spheres.

In this sense, it is possible for Hannah Arendt to discern a mode of political action that follows the principles capable of safeguarding the recognition of the other and respect for their opinion. However, this requirement, and on this we agree with C. Volk, does not arise from an ethical formalism and therefore cannot claim universal validity. Volk is clear in this position when he states:

It is certainly possible to find a specific theorem running through all of Arendt's work and suggesting the recognition of the other and plurality – justifying is not exactly the word. He defends. However, as I must elaborate throughout the reflections on the Arendtian concept of politics, it is possible to discern a mode of political action that follows the principles capable of safeguarding the recognition of the other and respect for their opinion. This demand for recognition does not originate in ethical formalism and, therefore, cannot claim universal validity in the style of philosophical-moral foundation. I argue that, instead, the recognition of the other is the substrate of an "ethics of power developed from the force of judgment", as the author writes in her intellectual diary (*Denktagebuch*). (Volk, 2017, 233)

From these considerations, it is clear that, for Arendt, the durability and stability of the political order constitute its main point of orientation. And it is in this same sense that the philosopher says:

It was the modern preoccupation "with the perpetual state," so evident in Harrington's writings, that led Adams to call "divine" the new political science that dealt with "institutions that endure for many generations," and it was in Robespierre's maxim, "Death is the beginning of immortality," that the specifically modern emphasis on politics, evidenced in revolutions, found its most concise and grandiose definition. (Arendt, 2011, p. 292-293)

2.3 THE RECOGNITION OF THE OTHER AND THE "EXTENDED MENTALITY" AS CONDITIONS OF POLITICAL FREEDOM IN A CHANGING WORLD

"Tyrannies isolate men [from each other, physically]; isolated men are powerless, they cannot act in concert." (Freitas do Amaral, 2012, p. 559). This statement brings us back to totalitarianism and to Arendt. Totalitarianism was an entirely new form of government, applied

only in the first decades of the twentieth century, and which is, in his view, the only form of government with which it does not seem possible to coexist. Consequently, Hannah Arendt, in her political thought, focuses precisely on a politics of coexistence, on a political thought of recognition of the other, or more clearly, on a humanist politics. In this sense, Christian Volk says:

According to Arendt, although acting for another and acting against another arise repeatedly in the political sphere generating consensus and, thus, generating power, according to Arendt only acting with another is capable of producing a form of power in which plurality can be politically realized. In the author's view, being free means being able to participate in this action with another. (Volk, 2017, 185)

In *Civil Disobedience*, Arendt states:

No civilization – the human artifact to house successive generations – would ever have been possible without a cohesive and stable structure that provided the advent of scenarios that generate flows for change. Among the stabilizing factors come first of all the legal systems that regulate human life in the world and its daily affairs with each other, and which, of course, are more enduring than fashions, customs and traditions, it is constituted by the legal systems that regulate our life in the world and our daily relations with each other. (Arendt, 2017, p. 37)

In all political philosophy, legal systems impose themselves as organs for stabilizing and preserving political action. However, they do not seem to be satisfactory in themselves, because the problem of political freedom is not a problem of legislation, nor of law, but of a specific way of conducting political action, obeying rules that are based on the recognition of a plural society. In this sense, Arendt writes:

Moreover, the councils have always been organs not only of action but also of order, and in fact their aspiration was to establish the new order that generated conflict with the groups of professional revolutionaries, who wanted to reduce them to mere executive organs of revolutionary activity. (Arendt, 2011, p. 329)

Consequently, in a plural society, it is necessary to have representativeness and critical thinking as means of auditing and communication in political life. Without them, public life, in a world of rapid change, ceases to make sense. In this way, Hannah Arendt states that "the formation of opinions on which all political life is inevitably based can only gain from putting into practice a 'broad mentality'" (Volk, 2017, p. 290-291), a concept that Kant points out in his *Critique of the Faculty of Judging*, although without making explicit the political and moral implications of this concept. It is precisely to these implications that Arendt draws attention. In this regard, it states:

The more positions of people I have in my mind when reconsidering a certain problem, and the better I can imagine how I would feel and think, if I were in your place, the stronger my capacity for representative thinking will be and the stronger my conclusion, my opinion, therefore. (Arendt, 2005, p. 92-93)

In opposition to philosophical reflection that requires solitary dialogue with oneself, in the search for a new founding truth, the determining factor for the formation of opinion is, according to Arendt, that, even in the absence of those who are represented, their positions must be present in the spirit of those who represent them. For Arendt:

This process of representation or extended mentality does not blindly adopt the effective positions of those who are absent and contemplate the world from another perspective, it is not a matter of empathy, as if I seek to be or feel like someone else, nor of counting the votes of a majority to join them, but of being and thinking about my own identity somewhere, where I really am. (Arendt, 2005, p. 92-93)

Inevitably, the question arises: how is this representation possible? And how does this process of representation become legitimate? According to the philosopher, this situation is only possible when certain rules are followed during the formation of opinion. Hannah Arendt was a constitutionalist thinker and not just a thinker of the beginnings as she is generally known. Thus, political action, in order to be an action where political freedom occurs, must obey a set of rules, that is, there must be what Christian Volk calls political rationality. Hannah Arendt writes:

Opinions arise whenever men communicate freely and have the right to express their positions in public; but these positions, in their infinite variety, also seem to need purification and representation, and the original specific function of the Senate was to be the "medium" through which all public positions should pass. (Arendt, 2011, p. 288)

In this way, critical thinking is the way to combat isolation, because one is in the company of others and with others in a context of comprehensive representation. Let us recall what Hannah Arendt argues:

The more positions of people I have in my mind when reconsidering a certain problem, and the better I can imagine how I would feel and think, if I were in your place, the stronger my capacity for representative thinking will be and the stronger my conclusion, my opinion, therefore. (It is this aptitude for an enlarged mentality that enables men to judge.)" (Arendt, 2005, p. 92-93)

For Jeremy Waldrom, political action in Hannah Arendt can never function without (certain) rules, which effectively establishes the difference between structured politics and all

forms of "undifferentiated eruption of mass opinion in an extra-parliamentary context that so disturbed Arendt." (Apud, Volk, 2017, p. 200).

3 CONCLUSION

Political freedom can only occur in moderate regimes and obeys rules, functioning as a specific way of conducting political action, being, therefore, the opposite of the abuse of power. For Hannah Arendt, Law is seen as a relationship that is established between different entities. Law is desubstantialized, it means that it is something relative, as Arendt says "relations that exist and preserve different spheres of being" (Arendt, 2011, p. 244). Politics and Law have a relationship of dehierarchization, functioning according to different logics, which implies that neither is sovereign in relation to the other. The "extended mentality" represents a way of moving from pluralism to moral and political equality among human beings, and it is through this mentality that the recognition of the Other is achieved.

The multiplicity of interests and the diversity of opinions are essential characteristics of what can be considered a "free government". In addition, no one is able to form their own opinion without benefiting from a multiplicity of opinions from others, and it is important to highlight that the role of public opinion can put at risk even the opinion of those few who have the courage to disagree with it.

Critical thinking is, therefore, an essential condition to ensure the diversity of perspectives and ensure the acceptance of multiple interests in the face of a diverse reality. Critical thinking with a comprehensive view of perspectives is therefore necessary. In this way, participation in assemblies is a fundamental form of involvement in public governance. Based on the above, we conclude that Hannah Arendt can be considered a constitutionalist thinker, whose work reflects crucial issues for Politics and Law.

ABSTRACT

This study analyzes public expenditures on Science and Technology (S&T) and Research and Development (R&D) within the Ministry of Health (MS), correlating them with human resources training provided by the Ministry of Education (MEC/CAPES) between 2014 and 2023. The timeframe covers the period from the 2015 fiscal crisis to the 2023 budgetary restoration, including the critical impact of the COVID-19 pandemic. The research investigates how structural investment in the scientific base and personnel qualification within

the National Graduate System support the Health Economic-Industrial Complex (CEIS). Adopting a transversal approach, it examines the role of regulatory frameworks, such as the New Legal Framework for S,T&I, in reducing external dependence and promoting health sovereignty. The results indicate that the resilience of health policies depends on the integration between the MS technological induction and the academic capacity fostered by the MEC.

Keywords: Innovation Financing. Health Sovereignty. National Graduate System.

RESUMO

Este estudo analisa os dispêndios públicos em Ciência e Tecnologia (C&T) e Pesquisa e Desenvolvimento (P&D) no Ministério da Saúde (MS), correlacionando-os à formação de recursos humanos via Ministério da Educação (MEC/CAPES) entre 2014 e 2023. O recorte temporal abrange desde a crise fiscal de 2015 até a recomposição orçamentária de 2023, incluindo o impacto crítico da pandemia de COVID-19. A pesquisa investiga como o investimento estrutural na base científica e a qualificação de pessoal no Sistema Nacional de Pós-Graduação sustentam o Complexo Econômico-Industrial da Saúde (CEIS). Utilizando uma abordagem transversal, examina-se o papel de marcos regulatórios, como o Novo Marco Legal de C,T&I, na redução da dependência externa e na promoção da soberania sanitária. Os resultados indicam que a resiliência das políticas de saúde depende da integração entre a indução tecnológica do MS e a capacidade acadêmica fomentada pelo MEC.

Palavras-chave: Financiamento da Inovação. Soberania Sanitária. Sistema Nacional de Pós-Graduação.

RESUMEN

Este estudio analiza el gasto público en Ciencia y Tecnología (C&T) e Investigación y Desarrollo (I+D) del Ministerio de Salud (MS), correlacionándolo con el desarrollo de recursos humanos a través del Ministerio de Educación (MEC/CAPES) entre 2014 y 2023. El período abarca desde la crisis fiscal de 2015 hasta la recuperación presupuestaria de 2023, incluyendo el impacto crítico de la pandemia de COVID-19. La investigación analiza cómo la inversión estructural en la base científica y la cualificación del personal del Sistema Nacional de Posgrado apoya el Complejo Económico-Industrial de la Salud (CEIS). Mediante un enfoque transversal, examina el papel de los marcos regulatorios, como el Nuevo Marco Legal para C&T e I+D, en la reducción de la dependencia externa y la promoción de la soberanía sanitaria. Los resultados indican que la resiliencia de las políticas de salud depende de la integración entre la inducción tecnológica del MS y la capacidad académica impulsada por el MEC.

Palabras clave: Financiamiento de la Innovación. Soberanía Sanitaria. Sistema Nacional de Posgrado.

1 INTRODUCTION

The national sovereignty of a country, in the twenty-first century, is intrinsically linked to its capacity for technological response in the face of global health crises and to the robustness of its National Innovation System (SNI). In Brazil, this dynamic is supported by a strategic institutional binomial: on the one hand, the Ministry of Health (MoH), which acts as a demand inducer and funder of applied Research and Development (R&D); on the other, the Ministry of Education (MEC), which, through the Coordination for the Improvement of Higher Education Personnel (CAPES) (BRASIL, 2023), provides the human and academic infrastructure necessary for the production of knowledge.

The time frame between 2014 and 2023 is particularly emblematic for analyzing this integration. This decade was crossed by a contradictory institutional duality. If, on the one hand, regulatory frameworks such as the New Legal Framework for S, T&I (Law No. 13,243/2016) sought to reduce bureaucracy in innovation and foster the triple helix, on the other hand, the imposition of Constitutional Amendment No. 95/2016 ("Spending Ceiling") subjected public investments to a scenario of financial asphyxiation, deepening the chronic underfunding of the Unified Health System (SUS) and impacting the sustainability of long-term policies (Souza *et al.*, 2020; FIOCRUZ, 2023).

In this context, health is not seen only as a social service, but as a thriving economic sector, synthesized in the concept of the Health Economic-Industrial Complex (CEIS) (BRASIL, 2023). According to the perspective of Mariana Mazzucato's (2014; 2022) "Entrepreneurial Public Administration", the State must act not only by correcting market failures, but as an inducing agent of strategic "missions". In Brazil, however, the operationalization of this theory faces the challenge of budget fragmentation and a temporal misalignment between the training of masters and doctors and the capacity of absorption of these talents by the market and the public sector according to the Organization for Economic Co-operation and Development (OECD, 2023).

The COVID-19 pandemic in 2020 acted as a catalyst for this system, exposing both the resilience of Brazilian research institutions and their external vulnerability in basic inputs (APIs) and cutting-edge technologies. While the Ministry of Health presented emergency peaks in expenditures to respond to the crisis, the Ministry of Education faced the challenge of maintaining the stability of the National Graduate System (SNPG) in the face of budget cuts and the discontinuation of internationalization programs, such as Science without Borders, which generated direct impacts on the global circulation of knowledge and the phenomenon of "brain drain" (CGEE, 2022).

In view of the above, the present study seeks to analyze the correlation between the expenditures in Science and Technology (S&T) and R&D carried out by the Ministry of Health and the Ministry of Education and the Ministry of Education (MEC/CAPES) in the mentioned period. We investigate the hypothesis that the volatility of the Ministry of Health's investments, in contrast to the relative formative inertia of the Ministry of Education, creates a mismatch that threatens national health sovereignty. The objective is to understand how the fluctuation of these *input* indicators affected the scientific base in the health area and how the alignment, or lack thereof, with current public policies shaped the country's innovation capacity.

2 METHODOLOGY

This study is based on the analysis of official secondary data released by the Ministry of Science, Technology and Innovation (MCTI) (BRASIL, 2025), referring to federal expenditures in Science and Technology (S&T) and Research and Development (R&D) carried out by the Ministries of Health (MS) and Education (MEC) in the period from 2014 to 2023. The collection of indicators is under the scope of the hypothetical-deductive method (Marconi; Lakatos, 2024). The objective was to examine the evolution of these expenditures over time, focusing on the area of Health and the training of human resources.

Marconi and Lakatos (2024) divide this process into rigorous steps that guarantee the validity of the subsequent analysis:

- a. **Planning:** define exactly what to measure (the indicators).
- b. **Instrumentalization:** create the collection forms or matrices.
- c. **Data Collection:** the field phase or secondary data collection.
- d. **Tabulation:** organization of the data so that they can "speak".
- e. **Analysis and Interpretation:** where the data are confronted with the initial theory.

Financial data were extracted from the MCTI's *publication National Indicators of Science, Technology, and Innovation 2025* (BRASIL, 2025), specifically from Tables 1.2.2 (*Federal government expenditures on S&T, by agency, 2000–2023*) and 1.2.3 (*Federal government expenditures on R&D, by agency, 2000–2023*). Based on this information, comparative Figures were prepared for expenditures in S&T and R&D directed to the Ministry of Health and the Ministry of Education.

In addition, indicators related to the training of human resources and scientific capacity in Health Sciences were analyzed, also obtained from the same MCTI report (BRASIL, 2025), in the specific areas of the area. Data from the CNPq Directory of Research Groups (2023) (Table 2.4.2 – *Researchers registered by major area, 2000–2023*), CAPES on graduate scholarships awarded in the country (Table 3.7 – *Scholarships by large area, 2000–2024*), as

well as information on academic background, were used, based on Tables 2.2.1 (*Undergraduate graduates*), 2.3.2 (*Doctoral students*), and 2.3.3 (*Master's degree students*), all referring to the period from 2000 to 2024.

The analysis focused on input indicators, organized into two axes: (i) financial indicators, including federal expenditures on S&T and R&D, disaggregated by ministry and analyzed in annual historical series at current values; and (ii) indicators of scientific capacity and training of human resources, covering the number of undergraduate and graduate students, national and foreign graduate scholarships, and the number of researchers registered in the area of Health Sciences.

The methodological procedures involved descriptive analysis of the time series and interinstitutional comparison between the Ministry of Health and the Ministry of Education, with the organization of the data in Figures to allow the visualization of the patterns of funding and scientific training over the period analyzed.

3 RESULTS AND DISCUSSION

3.1 THE EVALUATION OF THE EVOLUTION OF INPUT INDICATORS IN SCIENCE, TECHNOLOGY AND INNOVATION IN THE AREA OF HEALTH

The analysis of the evolution of *input* indicators in Science, Technology, and Innovation (S&T) and Research and Development (R&D) in the area of Health, in the period from 2014 to 2023, shows distinct patterns of funding and formation of scientific capacities among the main federal actors, notably the Ministry of Health (MS) and the Ministry of Education (MEC). These indicators allow us to understand both the budgetary dynamics and the support of the human resource base and research groups responsible for national scientific production.

Figures 1 to 4 were generated with data from 10 years (2014-2023) from tables 1.2.2 and 1.2.3 of the *MCTI's National Indicators of Science, Technology and Innovation 2025* (BRASIL, 2025, p. 33 and 35).

Figures 1 and 2 show the amounts of expenditures indicated in the aforementioned tables made to the Ministry of Health. These Figures show significant oscillations in investments to the Ministry of Health, highlighting points of more significant increases or decreases in investments in the analyzed series. In S&T, there was a decrease between 2014 and 2015, followed by a recovery in 2016 and relative stability between 2017 and 2019. In 2020, there is a strong expansion in expenditures, followed by a retreat in 2021 and a further reduction in 2022. In 2023, investments reached the highest level in the time series (R\$ 4.266 million), signaling a significant resumption of financing. The trajectory of R&D spending is

similar, with a decline in 2015, a recovery in 2016, stability until 2018, and growth in 2019. In 2020, there was a new peak, followed by retractions in 2021 and 2022. In 2023, R&D expenditures grew significantly again, reaching the highest level of the decade (R\$3.883 million).

Figure 1

S&T expenditures to the Ministry of Health between 2014 and 2023

Source: BRAZIL (2025).

Figure 2

R&D expenditures to the Ministry of Health between 2014 and 2023

Source: BRAZIL (2025).

Figures 3 and 4 show the amounts of expenditures indicated in the aforementioned tables made to the Ministry of Education. In contrast to the Ministry of Health's outline, the Ministry of Education's expenditures on S&T and R&D show a significantly more stable trajectory over the period analyzed. Between 2015 and 2021, the values remain relatively constant, with small oscillations around a stable average. From 2022 onwards, there is more consistent growth, culminating in 2023 at the highest level in the series in both S&T (R\$21.788 billion) and R&D (R\$21.934 billion).

Figure 3

S&T expenditures to the Ministry of Education between 2014 and 2023.

Source: BRAZIL (2025).

Figure 4

R&D expenditures to the Ministry of Education between 2014 and 2023.

Source: BRAZIL (2025).

The comparison between the expenditures of the Ministry of Health and the Ministry of Education in S&T (Figures 1 and 3) and R&D (Figures 2 and 4) shows that there is no direct or synchronized link between the two budgets. While the MEC shows regular and predictable behavior, the MS exhibits greater volatility, responding to specific policies and health events. This dissociation suggests that these spheres of federal investment operate according to different logics: a structural one, aimed at maintaining the scientific base (MEC), and a conjunctural one, oriented to the application and response in public health (MH).

Figures 5, 6 and 7 were prepared with 10-year data from tables 2.2.1, 2.3.2 and 2.3.3 of the *MCTI National Indicators of Science, Technology and Innovation 2025* (BRASIL, 2025, p. 70, 76 and 79) and show that the training of human resources in the area of Health and Social Welfare showed gradual, but timid growth throughout the decade, both at the undergraduate and graduate levels. In undergraduate studies, there was a more upward trajectory between 2014 and 2017, followed by a decrease in pace between 2018 and 2020, forming a plateau, with a subsequent resumption in 2021 and a new stabilization until 2023.

A similar pattern is identified in graduate studies, with continuous growth in the number of master's and doctoral degrees until 2019, a sharp drop in 2020, and a gradual recovery in subsequent years. These movements indicate that, despite the expansion of the training base in Health Sciences, growth occurs in a contained way.

Figure 5

Number of graduating undergraduate students in the area of health and well-being between 2014-2023

Source: BRAZIL (2025).

Figure 6

Number of PhD students in the area of health sciences between 2014-2023

Source: BRAZIL (2025).

Figure 7

Number of students with master's degrees in the area of health sciences between 2014-2023

Source: BRAZIL (2025).

Figures 8, 9 and 10 were generated from tables 2.4.2 and 3.7 of the *MCTI National Indicators of Science, Technology and Innovation 2025* (BRASIL, 2025, p. 85 and 104). There is a continuous growth in the number of researchers registered in the CNPq Directory of Research Groups (2023) between 2014 and 2023, with an approximate expansion of 22%, indicating a strengthening of the scientific capacity installed in the country. However, this growth has not been proportionately matched by funding for advanced training. National graduate scholarships remained relatively stable between 2014 and 2018, with a slight retraction in 2019 and only timid growth until 2023. In contrast, graduate scholarships awarded abroad showed a strong retraction throughout the decade, with a sharp drop from 2015 onwards, reflecting the reduction in the internationalization of health research and the limitation of the global insertion of Brazilian researchers.

3.2 ALIGNMENT WITH GOVERNMENT PUBLIC POLICIES (2014-2023)

The alignment between public expenditures in Science, Technology and Innovation (S, T&I) and Research, Development and Innovation (R&D&I) in the areas of Health and Education with federal public policies from 2014 to 2023 reveals a trajectory marked by institutional advances, fiscal tensions and strategic redefinitions in the role of the State as an inducer of innovation. This alignment can be understood in three interdependent planes: political-normative, budgetary and strategic-programmatic.

Table 1

Federal Policies – Milestones and Alignments

Policy/Framework	Alignment and Impact on S,T&I and R,D&I
<i>National Policy for Science, Technology and Innovation in Health (PNCTIS) – Ministry of Health (MS)</i>	<i>The PNCTIS has consolidated itself as the structuring axis of the health innovation policy, prioritizing the strengthening of research applied to the Unified Health System (SUS), mainly through the Research for the SUS (PPSUS) program. The MoH's expenditures on S&T (see Table 1.2.3 of the MCTI's 2025 S&T Indicators) (BRASIL, 2025) reflect this orientation, with resources channeled to clinical and epidemiological studies and the development of assistive technologies and strategic medicines. The Department of Science and Technology (DECIT/SCTIE) played a central role in the operationalization of these resources, although budget execution was impacted by fiscal limitation and the slowness of transfers.</i>
<i>Legal Framework for Science, Technology and Innovation (Law No. 13,243/2016)</i>	<i>Established to make the management of public research more flexible and to encourage partnerships between universities (MEC), research institutes and the productive sector, the Legal Framework sought to reduce bureaucratic barriers and increase efficiency in the use of R&D resources. In the area of Health, the device expanded the possibilities of interaction between universities and public and private pharmaceutical laboratories, especially in biotechnology projects and vaccine production. In Education, it allowed greater integration between universities and companies, contributing to curricular and technological innovation in strategic areas.</i>
<i>National Graduate Plan (PNPG 2011–2020) – MEC/CAPEs</i>	<i>The PNPG established guidelines for the expansion and qualification of the National Graduate System (SNPG), providing for strong integration with the S&T and Innovation agendas. The increase in the number of masters and doctors in the area of Health and Science Education shows the effect of public investments and the development policies of CAPES and CNPq. The PNPG also strengthened the training of qualified human resources to work in research and innovation networks, an essential element for the consolidation of R&D&I ecosystems. The new PNPG (2021–2030) reinforces this priority, highlighting health as a strategic area for innovation missions.</i>
<i>Constitutional Amendment No. 95/2016 (Spending Ceiling)</i>	<i>It represented a negative inflection point in public financing of S&T and R&D. By limiting the real growth of primary expenditure for 20 years, EC 95 reduced the investment capacity of the Ministries of Health (MS) and Education (MEC). Although the areas have minimal constitutional obligations, the cap imposed severe restrictions on discretionary spending, precisely those that finance grants, laboratories, and scientific infrastructure. This restriction generated structural misalignment between the rhetoric of innovation and budgetary practice, directly affecting the execution of development programs.</i>

3.3 GOVERNMENT STRATEGIES AND PLANS (2019–2023)

Federal expenditures on S&T and R&D in the area of Health maintained coherence with the most recent government policies and plans, demonstrating that, even under fiscal constraints, there was an attempt to maintain coherence with the State's strategic missions:

- a. Multi-year Plan (PPA 2020–2023): consolidated the guideline for strengthening the Health Economic-Industrial Complex (CEIS) (BRASIL, 2023), encouraging the national production of pharmaceutical inputs, vaccines, and medical equipment. This policy was reflected in the Ministry of Health's expenditures aimed at technological autonomy and innovation in public health, especially during and after the COVID-19 pandemic (BRASIL, 2020).
- b. ST&I Plan for Sustainable Development (BRASIL, 2020): promoted the integration of the areas of health, biotechnology, and social innovation, seeking to combine technological innovation with the reduction of regional inequalities. Public investments in biotechnology and pharmaceuticals have aligned with this guideline, boosting R&D projects at universities and public institutes.
- c. "New Industry Brazil" Strategy (BRASIL, 2024): still in the implementation phase, it anticipates developments from the previous cycle. NIB's "Health Mission" positions the sector as a vector of technological reindustrialization, prioritizing biotechnology, immunobiologicals and innovation in medical devices. Although outside the time frame (until 2023), its formulation derives from the institutional learning of the previous period, reinforcing the continuity of public policies for innovation in health.

3.4 THE DIMENSION OF EDUCATION AND SCIENTIFIC TRAINING

In Education, investments in S&T and R&D were strongly articulated with policies for the formation of human capital and educational innovation:

- a. The MEC, through CAPES, CNPq and Federal Institutes, was responsible for boosting the development of scientific and technological skills at the national level.
- b. The expansion of graduate studies and the creation of interdisciplinary programs aimed at pedagogical and technological innovation have strengthened the country's scientific base and sustained the training of researchers focused on priority areas (Health, Education and Technology).
- c. Programs to foster educational and scientific innovation — such as PIBIC, the Professional Master's Program in Teaching, and the Interinstitutional Research Networks — were aligned with the guidelines of the PNPG and the goals of the National Education Plan (PNE).

3.5 STATES AND MUNICIPALITIES

The federated entities act mainly through:

- a. Research Support Foundations (FAPs): State FAPs, such as those in São Paulo (FAPESP) and Minas Gerais (FAPEMIG), are crucial for R&D funding.
- b. PPSUS: The Research Program for SUS (PPSUS) is a decentralized program (MS/CNPq/FAPs) that aligns research with state and municipal priorities, evidencing the federative coordination effort in S&T in Health.
- c. Investment in Infrastructure (MEC): States and municipalities are responsible for maintaining part of elementary and secondary education. The contribution to S&T and R&D occurs more indirectly, through support for state universities or the use of resources linked to the Fund for the Maintenance and Development of Basic Education and the Valorization of Education Professionals (Fundeb).

3.6 ANALYTICAL SYNTHESIS

Between 2014 and 2023, it is observed that federal expenditures on S&T and R&D in Health and Education were strongly correlated with federal public policies (BRASIL, 2023; FIOCRUZ, 2023), with emphasis on:

- a. The centrality of Health as a vector of national innovation, via PNCTIS, PPSUS and CEIS;
- b. Scientific qualification as a State policy, via PNPG and CAPES;
- c. The tension between inductive innovation guidelines and fiscal restrictions, especially after EC 95/2016;
- d. The strategic reorientation of the role of the State, which, in the light of the Entrepreneurial Public Administration (MAZZUCATO, 2014; 2022), began to assume a more active role in inducing national development and innovation missions.

Thus, the period 2014–2023 configured a decade of institutional consolidation and financial challenges for the Brazilian S&T system, with Health and Education remaining as priority and complementary areas in the effort to transform knowledge into sustainable socioeconomic development.

3.7 HYPOTHESES FOR THE BEHAVIOR OF INDICATORS IN THE HEALTH AREA (MS + MEC)

The Figures indicate that the Ministry of Health's expenditures on Science and Technology and Research and Development do not present a linear or stable trajectory over time, but rather a cyclical behavior, strongly sensitive to conjunctural events. There was a significant increase in investments in 2020, which can be directly associated with the COVID-19 pandemic, a period in which there was an urgent demand for research aimed at the

development of vaccines, treatments, epidemiological studies, and strengthening the scientific capacity of the health system.

In 2023, there is a new peak in investments, which suggests a resumption or even a strategic prioritization of the area, possibly influenced by the lessons learned during the pandemic and the need to strengthen the research infrastructure and the response capacity of the health sector.

On the other hand, the decreases observed in 2015 and in the years 2021 and 2022 may be related to periods of fiscal adjustment or to the reduction of the budget priority allocated to the area, reflecting both changes in government guidelines and the economic context faced by the country at these times.

3.8 HYPOTHESES FOR THE MINISTRY OF EDUCATION'S INDICATORS

In contrast to the behavior observed in the Ministry of Health, the Ministry of Education's expenditures on Science and Technology and Research and Development show a more stable pattern over time. Between 2015 and 2021, investments remained relatively constant, which can be explained by the structural nature of these expenditures, mainly aimed at financing scholarships, maintaining graduate studies, and the functioning of higher education, which require continuous and predictable resources.

As of 2022, there is a growth trend, with emphasis on the values recorded in 2023, which may indicate the adoption of a policy to strengthen the educational and research system as a whole, reinforcing the role of higher education and graduate studies in national scientific production.

3.9 CORRELATION BETWEEN HEALTH AND EDUCATION INDICATORS

The analysis of the indicators reveals that there is no direct correlation between the budgets of the Ministry of Health and the Ministry of Education, since each portfolio has its own financing dynamics and different patterns of behavior over time. Even so, the joint observation of these data allows us to identify some relevant relationships. Although the investments of the Ministry of Education in Science and Technology and in Research and Development remain more consistent, the training of human resources in the area of health, both in undergraduate and graduate courses, showed a gradual expansion over the period analyzed, but with signs of stabilization. This behavior suggests the existence of a plateau, indicating that investments directed to health education were relatively modest and did not keep up with a faster pace of growth.

There is also a contradiction in the promotion of research in the area of Health Sciences. Despite the approximate growth of 22% in the number of researchers between 2014 and 2023, the funding mechanisms, especially graduate scholarships abroad, did not evolve at the same rate. On the contrary, there was a significant retraction in the number of scholarships awarded outside the country, evidencing limitations in the process of internationalization of Brazilian health research. National scholarships, in turn, remained relatively stable over the period, showing only timid growth until 2023, insufficient to compensate for the reduction in international training opportunities.

This scenario is directly related to the closure of the Science without Borders program, which had a significant impact on the promotion of graduate scholarships abroad, especially in the area of Health Sciences. The data show a sharp drop in the number of international scholarships, which went from 4,690 in 2014 to only 686 in 2023. This reduction coincides with the period after the end of the undergraduate program, in April 2017. Although Science Without Borders was later reformulated with a greater focus on graduate studies, this change was not enough to contain the significant decrease in the number of scholarships abroad. Thus, the end of the program is pointed out as one of the main factors responsible for the retraction of the internationalization of research and the limitation of the global insertion of Brazilian science.

As a consequence, the discontinuation of Science without Borders directly contributed to the reduction of the flow of Brazilian researchers abroad, negatively impacting the training of highly qualified human resources and international scientific cooperation, both in the area of health and in other fields of knowledge. In summary, the data indicate that funding in Science and Technology and Research and Development in the area of health tends to be reactive to specific events and specific policies, as occurred during the 2020 pandemic, in contrast to the more structural and continuous nature of investments in education. Despite the numerical growth of the system for training health researchers, funding has not kept pace with this evolution, especially with regard to internationalization, which may represent an obstacle to the development and competitiveness of Brazilian research in this area.

4 FINAL CONSIDERATIONS

The analysis of the period between 2014 and 2023 shows that the Brazilian S, T & I system in the health sector was marked by relevant institutional changes and recurrent fiscal instabilities. This interval ranges from the fiscal crisis of 2015–2016 to the attempts to recompose the budget in 2023, revealing the centrality of the State in responding to health emergencies, especially during the COVID-19 pandemic.

The results show that the MoH's spending on S&T and R&D presents a cyclical and predominantly reactive behavior, sensitive to external shocks, in contrast to the greater stability observed in the MEC's investments aimed at sustaining the scientific base. The investment peaks recorded in 2020, followed by retractions to pre-pandemic levels, show a structural fragility in the funding of applied health research, marked by the dependence on exceptional contributions to the detriment of permanent and predictable mechanisms.

In the axis of human resources training, there was an expansion of the base of researchers until 2020, followed by stagnation associated with budget retraction. Although the number of researchers has grown over the period, the reduction in per capita funding has compromised the continuity of long-term projects and the ability to retain talent. The discontinuity of internationalization policies, reflected in the significant drop in scholarships abroad after 2017, reinforced structural limitations to the international insertion of Brazilian science.

EC No. 95/2016 emerges, in this context, as one of the main factors of systemic restriction to the financing of S, T&I, deepening the misalignment between strategic innovation objectives and the fiscal reality (FIOCRUZ, 2023). Although normative frameworks such as the Legal Framework for S, T & I and the PNCTIS have created instruments favorable to cooperation between academia and the productive sector, their effects have remained conditioned to an environment of chronic underfunding, particularly sensitive within the scope of the SUS and the CEIS (BRASIL, 2023).

5 FUTURE PERSPECTIVES

In light of the findings of this study, the future prospects of S, T & I in health in Brazil depend on overcoming structural inconsistencies identified both in the literature and in institutional practice. One of the main gaps observed lies in the mismatch between the existence of legal frameworks favorable to innovation and the absence of stable financial mechanisms that guarantee its effective operationalization over time.

In this sense, future research can contribute to the development of financing models that articulate budget predictability and institutional flexibility, reducing dependence on emergency cycles associated with health crises. The literature still lacks comparative empirical analyses that assess the impact of different continuous funding arrangements on the sustainability of applied health research (BRASIL, 2023), especially in countries with universal systems similar to the SUS.

Another relevant inconsistency concerns the fragmentation of inter-institutional governance. The results indicate the need to deepen studies on coordination mechanisms

between MS, MCTI, MEC, CAPES, and CNPq (BRASIL, 2023), capable of aligning the training of human resources, scientific research, and technological innovation with the strategic priorities of the health system. Future investigations can explore integrated governance models that minimize overlaps, expand synergies, and optimize the use of public resources.

In addition, the retraction of internationalization policies reveals an important gap in the understanding of the long-term effects of the discontinuity of academic mobility programs on the quality, competitiveness, and global insertion of national science. Future studies may evaluate alternative strategies for international cooperation that reconcile fiscal constraints with the maintenance of strategic scientific networks.

Finally, the adoption of mission-oriented approaches, inspired by the Entrepreneurial Public Administration model, presents itself as a promising field of applied research. Future analyses can examine how this model can be adapted to the Brazilian institutional context, in order to articulate the existing scientific base with innovation guided by concrete challenges of the SUS, contributing to the strengthening of the CEIS (BRASIL, 2023) and to the expansion of technological sovereignty in health.

ABSTRACT

This article aims to analyze the relationship between the constitution of language and the central role of discourse in the individual's participation within the social sphere, based on the hypothesis that the predominance of monolithic discourses fosters the emergence of totalitarian regimes. Such regimes systematically seek cultural and social homogenization, transforming all forms of alterity into threats to be eliminated, thereby contributing to the construction of exclusionary logics and potential social and political conflicts. The study adopts a hypothetical-deductive method, grounded in bibliographic research, and draws on the contributions of Michel Foucault and Ludwig Wittgenstein in the field of philosophy of language, particularly regarding the formation and functioning of language. With respect to totalitarianism and the construction of authoritarian discourse, the analysis is supported by the theoretical frameworks of Hannah Arendt and Claude Lefort. Finally, the article emphasizes the importance of the inclusion of the other and the role of dialogue, from a Habermasian perspective, as fundamental elements for the preservation of democratic societies and for resisting the consolidation of totalitarian structures.

Keywords: Dialogue. Discourse. Totalitarianism.

RESUMO

O presente artigo tem por objetivo analisar a relação entre a constituição da linguagem e a centralidade do discurso na participação do indivíduo no âmbito social, partindo da hipótese de que a predominância de discursos monolíticos favorece a emergência de regimes totalitários, os quais buscam, de maneira sistemática, a uniformização cultural e social, convertendo toda forma de alteridade em ameaça a ser eliminada, contribuindo, assim, para a construção de uma lógica de exclusão e potenciais conflitos sociais e políticos. RESUMEN

El presente artículo tiene por objeto analizar la relación entre la constitución del lenguaje y la centralidad del discurso en la participación del individuo en el ámbito social, partiendo de la hipótesis de que el predominio de discursos monolíticos favorece la emergencia de regímenes totalitarios, los cuales buscan, de manera sistemática, la uniformización cultural y social, convirtiendo toda forma de alteridad en una amenaza que debe ser eliminada, contribuyendo, de este modo, a la construcción de una lógica de exclusión y de potenciales conflictos sociales y políticos. La investigación adopta el método hipotético-deductivo, con base en revisión bibliográfica, movilizándolo, en el campo de la filosofía del lenguaje, las contribuciones de Michel Foucault y Ludwig Wittgenstein acerca de la formación y del funcionamiento del lenguaje. En lo que concierne al análisis del totalitarismo y de la constitución del discurso autoritario, se recurre a las reflexiones de Hannah Arendt y Claude Lefort. Por último, el estudio enfatiza la importancia de la inclusión del otro y del diálogo, desde la perspectiva habermasiana, como elementos fundamentales para la preservación de sociedades democráticas y para la resistencia a la consolidación de estructuras totalitarias.

Palabras clave: Diálogo. Discurso. Totalitarismo.

1 INTRODUCTION

The relationship between language, discourse and social organization constitutes one of the central axes of contemporary reflections on democracy and power. Far from being limited to a neutral instrument of communication, language is configured as a space of symbolic dispute, in which meanings are produced, power relations are structured and the limits of social inclusion and exclusion are defined. In this context, the way in which discourses are constructed and legitimized plays a decisive role in the constitution of social and political practices, and can both favor democratic environments and enable structures of domination.

This study starts from the hypothesis that the predominance of monolithic discourses — characterized by the denial of plurality and the delegitimization of otherness — creates favorable conditions for the emergence of totalitarian dynamics. Such dynamics operate through symbolic uniformity and the reduction of the other to the condition of threat, which compromises the possibility of dialogue and weakens the foundations of democratic coexistence.

To develop this analysis, the article initially mobilizes the contributions of Michel Foucault and Ludwig Wittgenstein, whose reflections allow us to understand language not only as representation, but as a situated social practice, crossed by rules, uses and power relations. Then, we resort to the formulations of Hannah Arendt and Claude Lefort, in order to examine the mechanisms of constitution of totalitarianism and the centrality of discourse in the maintenance of authoritarian regimes.

Finally, from the perspective of Jürgen Habermas, the importance of the inclusion of the other and dialogue as essential normative conditions for the consolidation of democratic societies is discussed. It is argued that openness to the plurality of voices and the recognition of otherness not only strengthen the public space, but also act as forms of resistance to totalizing tendencies present in different historical and social contexts.

From the methodological point of view, the research adopts a theoretical-analytical approach, guided by the hypothetical-deductive method, based on a qualitative literature review. The investigation is structured from a conceptual and comparative reconstruction of the contributions of Michel Foucault, Ludwig Wittgenstein, Hannah Arendt, Claude Lefort and Jürgen Habermas, seeking to identify points of convergence and tension between their perspectives regarding language, discourse and forms of social organization. From this theoretical articulation, a critical analysis of the conditions that favor the emergence of totalitarian discourses is carried out, as well as the normative possibilities of overcoming them within democratic regimes.

2 LANGUAGE AS A REPRESENTATION OF THOUGHT

2.1 THE FORMATION OF LANGUAGE IN MICHEL FOUCAULT

The understanding of language, in Michel Foucault's thought, moves away from perspectives that conceive it as a mere instrument for the representation of reality, assuming it as a historically situated practice that is inseparable from power relations. In this sense, language is not limited to describing the world, but actively participates in its constitution, operating as one of the main means by which knowledge is produced, discourses are organized, and forms of domination are structured.

In his archaeological phase, especially in *the work Words and Things*, Foucault introduces the concept of *episteme* as the historical configuration that defines the conditions of possibility of knowledge in a given period. Language, in this context, is not understood as a neutral system, but as part of a broader order that delimits what can be said, thought, and recognized as true. Thus, knowledge is no longer seen as a simple progressive accumulation and is understood as an effect of historical structures that organize discourses.

Language, in this sense, is intrinsically linked to the world, not only as a means of its representation, but as a constitutive element of the ways in which it is understood and organized. Through language, concepts are constructed, at the same time that the processes of problematization and resignification of reality become possible. Furthermore, it is language that establishes the mediation between the subject and the world, configuring a field of experience in which meanings are produced and ways of understanding reality are structured.

It is important to note, however, that this relationship should not be interpreted from ontological categories alien to Foucaultian thought. Although there is influence from Martin Heidegger at certain moments of his intellectual trajectory, Michel Foucault does not directly adopt concepts such as *Dasein*⁴, privileging, in his analysis, the investigation of the historical and discursive conditions that make possible the emergence of knowledge and forms of subjectivation.

In this context, it is possible to identify two fundamental moments that influence Foucault's understanding of knowledge. The first refers to the period before the seventeenth century, in which knowledge was predominantly organized based on the search for

⁴ *Dasein* is a central concept in Martin Heidegger's philosophy, especially developed in *Being and Time* (1927), which can be translated as "being-there" or "being-in-the-world". The term designates the human being's own mode of existence, characterized by his openness to the world, his ability to understand the being and his insertion in a historical and relational context. Although he exerted an indirect influence on several thinkers of the twentieth century, including Michel Foucault in the early stages of his career, the concept is not adopted in a systematic way in his work, which privileges the analysis of the historical and discursive conditions of knowledge production.

similarities and correspondences between the elements of the world. In this configuration, knowledge was not structured by ruptures or rigorous distinctions, but by relations of analogy, in which discourses tended to reproduce and reiterate what they intended to explain (FOUCAULT, p. 57). Thus, even when there were attempts at interpretation or criticism, these remained strongly linked to the object analyzed, producing variations that, although distinct in appearance, maintained a structural proximity to the original discourse. In this way, language operated as a mechanism of continuous reiteration, in which meanings unfolded indefinitely based on relations of similarity, generating an interpretative chain that did not break with its point of origin, but reproduced it under new forms (FOUCAULT, p. 57).

The second relevant moment for the understanding of Foucaultian thought emerges in the twentieth century, especially from the 1960s onwards, when language began to be problematized not only as a system of representation, but as a constitutive element of discursive practices. In this period, Foucault shifts his analysis to the historical conditions that make knowledge possible, showing that what can be said, thought and recognized as true is conditioned by specific discursive structures.

In the following decade, a deepening of this perspective was observed, with the more explicit incorporation of the relations between knowledge, power and subjectivity. Language, in this context, is no longer conceived only as a means of expression and is understood as a practice that actively participates in the production of truths and in the constitution of the subjects.

It is in this horizon that the notion of *parrhesia* is⁵ inserted, developed by Foucault in his late courses, understood as the practice of true saying, in which the subject assumes an ethical relationship with the truth, expressing himself in a frank and responsible way, even in the face of possible risks. This concept reinforces the ethical and political dimension of discourse, showing that language can operate not only as an instrument of power, but also as a space of resistance and critical constitution of the subject.

In addition to the notion of *parrhesia*, the concept of *episteme*⁶ is also highlighted, through which Foucault establishes an articulation between language, culture and forms of knowledge. It is the historical structure that delimits the conditions of possibility of knowledge at a given time, defining the criteria from which something can be recognized as true. In this sense, *episteme* is not reduced to a specific domain, but encompasses different fields of

⁵ The conception of *parrhesia* occurs as an experience of truth-telling, which becomes relevant in the second part of the twentieth century, proposed by Michel Foucault, as well as by Pierre Hadot, and Martha Nussbaum.

⁶ *Epistémê* deals with a necessary order of knowledge, "a principle of historical ordering of knowledge prior to the ordering of discourse established by the criteria of scientificity (...) the configuration, the disposition that knowledge assumes at a given time and that gives it a positivity" (p. 148-149). MACHADO, R. Science and knowledge: the trajectory of Foucault's archaeology. Rio de Janeiro: Graal, 1981.

knowledge — such as language, economics and biology — evidencing the existence of an underlying order that guides the production of knowledge in each historical period.

In this context, it becomes possible to understand the transition between the classical period and modernity with regard to the organization of knowledge about language. In the classical period, language was fundamentally conceived as a system of representation, structured by the relationship between signs and things, in which the search for an orderly and transparent correspondence between words and the world predominated.

In this horizon, the functioning of language was guided by principles of classification and ordering, in which the analysis of signs — often understood from the articulation between signifier and signified — aimed to guarantee the intelligibility of the real. It should be noted that part of the influences mobilized by Foucault in the analysis of this period refers to the rationalist tradition, especially to Port-Royal's General Grammar, which sought to establish universal foundations for language based on logical and cognitive structures⁷.

Furthermore, when advancing to the analyses developed by Michel Foucault from the 1970s onwards, a deepening of the articulation between knowledge, language and power is observed. In this context, knowledge is no longer understood as a neutral instance, but is conceived as the result of historically situated discursive practices, through which regimes of truth are established and power relations are organized.

Thus, language not only conveys knowledge, but actively participates in its constitution, becoming a central element in the production and legitimation of knowledge. Among the consequences of this perspective, the centrality of discourse as a space of dispute and production of meaning stands out, in which both the reproduction of structures of domination and the opening to critical practices become possible.

In this horizon, dialogue assumes a relevant role as a condition for the circulation of different perspectives and for the problematization of established discourses, configuring itself as a fundamental element for freedom of thought — an aspect that will be taken up and deepened in later sections.

From this perspective, when developing his analyses on the relations between knowledge and power, Michel Foucault shifts the focus from the understanding of knowledge as a merely normative or moral instance, starting to investigate it as a historically situated practice, crossed by power relations. In his late courses, especially in *The Government of Self and Others*, the author returns to ancient philosophy — with emphasis on the Socratic-

⁷ The Grammar of Port-Royal was published in 1660 with the purpose of presenting answers to the dissatisfactions with Renaissance grammar. It initially seeks scientific rigor, based on the foundations of French rationalism proposed by René Descartes

Platonic tradition — in order to examine the ways in which the subject constitutes itself in relation to truth.

In this reading, the emphasis falls on the modes of subjectivation, that is, on the processes by which individuals constitute themselves as subjects based on discursive and ethical practices. Truth, in this context, is not understood as absolute or universal data, but as something that is constructed in the relationship between the subject and the current regimes of truth, opening space for critical forms of positioning in the face of dominant discourses.

It is in this horizon that the notion of *parrhesia is inserted*, understood as the practice of saying truth, in which the subject assumes the commitment to enunciate the truth in a frank way, even in the face of risks. Inspired by the experience of Athenian democracy, Foucault shows that such a practice presupposes the possibility of confrontation between different perspectives, with dissent being a constitutive element of public life.

With the historical development of forms of social organization, however, there is a shift in this practice towards forms of discourse predominantly guided by rhetoric, in which persuasion occupies a central place. In this process, the discourse tends to dissociate itself from the ethical commitment to the truth, prioritizing argumentative efficacy to the detriment of the authenticity of the utterance, which contributes to the weakening of its critical potential.

2.2 NOTES ON LANGUAGE FOR LUDWIG WITTGENSTEIN

Having made the initial considerations about the Foucaultian perspective, we move on to the analysis of the conception of language developed by Ludwig Wittgenstein, especially from his work *Philosophical Investigations* (1953). In this context, the philosopher shifts the focus from an essentialist understanding of language to a pragmatic approach, in which meaning is not determined by a fixed essence, but by the effective use of expressions in concrete contexts of interaction.

Thus, language comes to be understood as a social activity, structured by practices shared within a community. Linguistic functioning, in this sense, is not based on abstract and universal rules, but on forms of use that are consolidated in everyday life, guiding mutual understanding among participants.

It is in this horizon that the notion of "language games" is inserted, through which Wittgenstein shows that to speak a language is to participate in a set of practices regulated by socially established conventions. Such games do not have rigid or completely fixed boundaries, but they present regularities that allow the recognition and intelligibility of the utterances, evidencing the dynamic and contextual character of the language.

In *Philosophical Investigations*, Ludwig Wittgenstein proposes a decisive inflection in the understanding of language by highlighting that the meaning of words is intrinsically linked to their use in specific contexts (WITTGENSTEIN, 1996). In this sense, the attribution of names or denominations is not carried out in an isolated or purely mental way, but presupposes the insertion of the subject in shared practices, in which one already knows how to use certain expressions.

From this perspective, language cannot be understood as an exclusive product of internal or subjective states, since its functioning depends on public criteria of use, constructed within a linguistic community. Meaning, therefore, does not precede use, but emerges from it, being continuously stabilized by social practices that enable mutual understanding among speakers.

In this context, Wittgenstein problematizes the idea of a private language, arguing that language necessarily presupposes the possibility of intersubjective sharing and verification. Speaking a language, therefore, implies participating in forms of life in which the senses are collectively constituted and recognized.

Furthermore, by developing the notion of language games, the author shows that linguistic practices are regulated by conventions that guide the use of expressions, without this implying the existence of rigid or absolutely fixed rules. On the contrary, such rules are subject to variations and may, in certain situations, reveal limits or tensions, as the author himself suggests when he observes that, when we follow previously established rules, we may face unforeseen difficulties in their application (WITTGENSTEIN, 1996, p. 74).

In this way, Wittgensteinian philosophy highlights the dynamic, public, and practical character of language, moving away from both strictly mentalist conceptions and models that presuppose totally closed normative systems.

From the propositions previously examined, it is possible to extract some relevant consequences for the understanding of language in the thought of Ludwig Wittgenstein. In the first place, it is not a matter of denying the possibility of attributing truth or falsity to propositions, but of recognizing that such criteria do not result from a direct and immediate correspondence between language and reality. On the contrary, the validity criteria are linked to the contexts of use and the linguistic practices in which the utterances are employed.

In this way, Wittgenstein's analysis shifts the problem of truth to the realm of practices, showing that the meaning and intelligibility of propositions depend on the rules and ways of life shared by the speakers. Such a perspective does not imply the rejection of empirical knowledge, but questions the idea that it can be based exclusively on isolated sensory data, disconnected from the linguistic and social contexts in which they are interpreted.

In this sense, Wittgenstein's central concern lies in the clarity in the use of language and in the understanding of the rules that guide discursive practices, differing from Michel Foucault's approach, which emphasizes the relationship between discourse, power and the production of knowledge. While Wittgenstein seeks to elucidate the ways in which language operates within forms of life, Foucault investigates the historical and institutional conditions that structure the regimes of truth, without, however, reducing the analysis to mere formal clarity, but highlighting the effects of power implied in the circulation of discourses.

Furthermore, it is possible to identify points of convergence between the perspectives of Ludwig Wittgenstein and Michel Foucault, although situated in different theoretical horizons. In Wittgenstein, the notion of language games shows that meaning emerges from use in shared social practices, being inseparable from the forms of life in which language is inserted. In turn, Foucault, when dealing with the so-called truth games, analyzes the mechanisms by which certain statements come to be recognized as true in specific historical contexts, based on relations between knowledge and power⁸. Although they are not equivalent concepts, both authors converge in rejecting the idea of an absolute and timeless truth, highlighting that the criteria of validity and meaning are conditioned by social, historical, and institutional practices. In this sense, both language games and truth games show the situated character of the production of meaning, although under different approaches: pragmatic, in the case of Wittgenstein, and historical-discursive, in the case of Foucault.

From the convergences previously outlined, as well as the central elements that structure the thought of Ludwig Wittgenstein and Michel Foucault, the theoretical bases for the development of subsequent analyses are established. In this sense, the articulation between language, discourse and social practices allows us to highlight the centrality of discourse in the constitution of social relations, as well as in the definition of the conditions of equality between subjects.

In this way, the valorization of discursive plurality and the recognition of the other as a legitimate interlocutor are fundamental elements for sustaining democratic environments, in which dissent and diversity of perspectives are not only admitted, but constitute an indispensable condition for the critical development of thought.

3 A BRIEF ANALYSIS OF TOTALITARIANISM

When starting a discussion about Totalitarianism, it is necessary to remember that there are several perspectives on this subject, for this reason, it is emphasized that the

⁸ Truth games are determined by the compilation of rules for the production of truth, and the individual who determines what can be declared as truth are free men, who agree among themselves and are immersed in a specific community, and its institutions, as Foucault teaches

guiding concepts of this topic will be based on the thought of the German philosopher Hannah Arendt.

From Hannah Arendt's perspective, totalitarianism has specific characteristics that distinguish it from other forms of political domination. In general, it is a regime marked by the pretension of total control over the lives of individuals, extending to all spheres of existence and operating through the integral submission of the population (ARENDT, 1989, p. 375). In this context, terror is not limited to a punctual instrument of repression, but assumes a structuring function, being systematically used as a mechanism of government and maintenance of the obedience of the masses (ARENDT, 1989, p. 26).

Furthermore, unlike traditional authoritarian regimes, in which power tends to manifest itself predominantly in the public and institutional sphere, totalitarianism advances on the internal dimension of individuals, seeking to shape not only their actions, but also their perceptions and ways of thinking. Such dynamics intensify the experience of fear, not only as a reaction to external threats, but as an internalized element, which guides behaviors and contributes to the reproduction of structures of domination.

Hannah Arendt draws a fundamental distinction between totalitarianism and other forms of political domination, such as tyrannies and dictatorships. Although these can also resort to fear and violence as instruments of control, in totalitarianism terror assumes a qualitatively different function, ceasing to be just a means of repression to become a structuring principle of the regime itself, operating in a continuous and comprehensive way over the totality of social life. In this context, the distinction between internal and external enemy is dissolved, since any individual can potentially be identified as a threat, which contributes to the generalization of insecurity and instability (ARENDT, 1989).

In addition, the author highlights a particularly relevant phenomenon: the internalization and reproduction of authoritarian discourse by the individuals subjected to the regime. Such dynamics are not limited to direct coercion, but involve mechanisms of adhesion, in which subjects begin to reproduce, in a mimetic way, the dominant ideological patterns, whether out of fear, the need to belong, or the search for recognition within the power structure.

Finally, the concept of totalitarianism in Arendt is not reduced to specific historical models, but is configured as a singular form of domination. In this sense, the author shows that, in such regimes, power does not necessarily manifest itself in the most visible instances of the state apparatus, and can operate in a diffuse and opaque manner, so that less apparent organizations concentrate greater capacity for control — a dynamic that expresses the complexity and depth of totalitarian structures (ARENDT, 1989, p. 453).

In Hannah Arendt's thought, it is highlighted that totalitarian domination is not sustained exclusively through direct coercion, but also involves forms of adherence that can take on the appearance of voluntariness. In this context, individuals are led to give up freedoms and rights in the name of a supposed protection offered by the State, which reveals the effectiveness of ideological mechanisms in the production of social conformity.

Such dynamics do not imply a fully free choice, but are inserted in structures that limit the real possibilities of action and political participation, producing a sense of engagement that often conceals the reproduction of dominant interests and discourses. The apparent participation in confronting threats — often constructed or amplified by the regime itself — contributes to the legitimization of practices that restrict plurality and weaken the autonomy of subjects.

In this sense, the consolidation of homogeneous discourses and the delegitimization of divergent perspectives are central elements of totalitarian structures, in which freedom is not simply explicitly denied, but progressively emptied in its practical dimension. As Arendt observes, the most disturbing character of these regimes lies not only in the direct suppression of freedom, but in the conception that it can – and should – be sacrificed in the name of a supposed historical development, whose course is intended to be necessary and inevitable (ARENDT, 1989, p. 51).

In the context of totalitarianism, as analyzed by Hannah Arendt, there is a significant rupture between the production of knowledge and the concrete experience of reality. This phenomenon is manifested in the construction of narratives that present themselves as coherent and self-evident truths, even if they are disconnected from the facts, contributing to the consolidation of closed ideological systems.

In this context, the formation of large masses that are socially and politically disjointed plays a fundamental role. According to Arendt, the viability of totalitarian domination is associated with the existence of populations considered "superfluous", whose elimination or sacrifice does not generate, in structural terms, immediate consequences that compromise the social order (ARENDT, 1989, p. 361).

Adherence to such dynamics does not result from a direct relationship with empirical reality, but from the internalization of ideological constructions that project future scenarios — often improbable — as a justification for maintaining power. In this way, discourses disconnected from concrete experience become socially effective, insofar as they offer totalizing explanations and mobilize collective action, even when based on fragile or distorted premises.

3.1 THE FORMATION OF AUTHORITARIAN DISCOURSE

After the analysis of the concept of totalitarianism developed by Hannah Arendt, we move on to the investigation of Slavoj Žižek's contributions about the constitution of reality within ideological discourses and the subject's submission in totalitarian contexts. To this end, the work *The Most Sublime of Hysterics: Hegel with Lacan is taken as a reference*, in which the author articulates elements of Lacanian psychoanalysis and Hegelian philosophy to understand the dynamics of ideology.

In this theoretical framework, Žižek proposes that the social bond in totalitarian contexts is not sustained only by external impositions, but by the internalization of ghostly structures that guide the desire of the subjects. In other words, ideology does not operate only at the conscious level, but structures the very way individuals perceive reality and relate to it. Thus, the distinction between social norm and subjective desire tends to dissolve, causing adherence to the system not only by coercion, but also by libidinal investment (ŽIŽEK, 1991, p. 157).

From this perspective, totalitarian discourse not only imposes an order, but mobilizes desire by presenting certain ideals as objects of collective identification. Power, in this context, is not limited to external domination, but is realized to the extent that it is recognized and desired by the subjects themselves, which evidences the centrality of the Other as an instance of symbolic validation.

In this way, the violence associated with such regimes is not restricted to the physical dimension, but also manifests itself in the form of symbolic submission, in which individuals come to identify with the very mechanisms that dominate them. Such dynamics compromise the critical capacity of the subject, who ceases to position himself as a reflective agent and starts to reproduce, in a repeated way, the discourses that sustain the power structure.

The central problem shifts, in this context, to the modes of legitimation of discourse, which are no longer anchored in argumentative processes guided by critical reflection and start to privilege rhetorical strategies aimed at obtaining adherence and imposing certain meanings. In this scenario, the success of the discourse does not result from its rational consistency, but from its ability to assert itself as dominant, even in contexts of argumentative fragility.

In this way, subjects aligned with discursive structures of a totalitarian nature tend to operate in the sense of restricting the field of dissent, seeking to eliminate or delegitimize alternative perspectives, in order to preserve the appearance of unity and incontestability. Such dynamics may imply the use of symbolic mechanisms and, in certain contexts, coercive practices, which aim to prevent the emergence of competing discourses.

In this process, the construction of the enemy — or the "Other" — plays a fundamental role. The systematic disqualification of subjects or groups, through their reduction to categories devoid of legitimacy or recognition, contributes to the erosion of empathy and to the naturalization of exclusionary practices. Thus, violence, both symbolic and material, is justified as a necessary response to the neutralization of a previously dehumanized otherness.

3.2 THE WEAKENING OF THE OTHER TO DELEGITIMIZE DISCOURSES

Equality between individuals is a fundamental condition for the existence of dialogue, understood not only as a communicative exchange, but as a practice that presupposes mutual recognition between the interlocutors. From this perspective, the parity dimension does not refer to the individual characteristics of the subjects, but to the attribution of value and legitimacy to their positions in the discursive space. It is in this context that ideology plays a relevant social function, by enabling the articulation of subjects around common references, structuring forms of belonging that constitute social and political practices.

The legitimizing discourse, in turn, is often linked to institutional structures, operating as a mechanism for justifying socially accepted norms, values and practices. Such discourse can manifest itself in different spheres, from everyday interactions to more complex formulations in the political and legal spheres, conferring meaning and validity to certain social orders based on historically situated references.

However, the mere existence of legitimizing discourses is not enough to characterize a democratic environment. Democracy presupposes openness to dissent, to the plurality of perspectives and to the confrontation of ideas, indispensable elements for the construction of a dynamic public space. It is precisely within these conflicts — especially on the ideological level — that it becomes possible to observe the mechanisms of delegitimization of the other, a phenomenon that intensifies in totalitarian contexts.

In these scenarios, the maintenance of domination often relies on the construction of narratives that produce the perception of threat, directing collective attention to external or internal enemies. Such discourses tend to have a more intense impact on vulnerable groups, whose identity is progressively deconstructed through processes of stigmatization and disqualification. By weakening the legitimacy of their voices, their ability to participate in the public space is also limited.

As a consequence, the imposition of a homogeneous discursive order contributes to the fragmentation of social relations and to the internalization of fear, leading individuals to adopt defensive and unreflective postures. In this context, the weakening of alterity

compromises the conditions for the possibility of dialogue, replacing plurality with hierarchical relations marked by the asymmetry between authority and submission. Violence, both symbolic and material, thus emerges as an instrument for maintaining this structure, often legitimized by the previous dehumanization of those who come to be identified as a threat.

4 TOTALITARIAN SYMBOLISM

After analyzing the mechanisms of delegitimization of the other and the consolidation of authoritarian discourses, it becomes relevant to incorporate Claude Lefort's contributions on the symbolic dimension of power and its implications for the understanding of democracy and totalitarianism (LEFORT, 1981). Dialoguing with the political tradition, especially based on readings of Machiavelli, Lefort proposes a reflection on the transformations that mark the passage from absolutist forms of power to the democratic experience. In this context, democracy is understood as a regime marked by a singular symbolic structure, in which power is not incorporated into a fixed figure or instance, but is presented as an empty place (LEFORT, 1981). This means that, unlike absolutist forms – in which power was identified with the body of the sovereign – in democracy there is no subject who can claim its definitive possession. This characteristic implies the permanent opening of the political space to conflict, dispute and plurality of perspectives. Based on this conception, Lefort criticizes the attempts to recompose a fictitious unit of the social body, often associated with discourses that intend to represent the "people" as a homogeneous entity — the so-called Povo-Uno (LEFORT, 1981). In these cases, there is a tendency towards the symbolic reincarnation of power, which moves from the figure of the sovereign to structures such as parties or political leaders that claim to fully represent the collective will, making room for totalitarian dynamics.

It is in this horizon that the notion of disincorporation is inserted, developed by Lefort to describe the process by which power ceases to be anchored in a central figure and becomes the object of dispute within society. Such transformation, associated with the fall of absolutist regimes, breaks with the symbolic unity previously guaranteed by the sovereign and inaugurates an order in which individuals are no longer bound by a unified political identity.

In this scenario, the introduction of mechanisms such as universal suffrage does not imply the formation of a homogeneous collective will, but, on the contrary, reinforces the contingent and provisional character of political representation. Thus, democracy is configured as a regime that does not eliminate conflict, but institutionalizes it, recognizing the impossibility of a fully unified social identity.

From this process, the emergence of a people is configured that can no longer be fully captured or domesticated by an instance of centralized power, coming to exist in a condition marked by indeterminacy. In this context, collective identity ceases to present itself as a fixed unit and begins to be continuously tensioned and reconfigured within the political space, in which dispute, conflict and plurality constitute structuring elements of the democratic experience (LEFORT, 1981, p. 118).

In this context, although the people are now recognized as the holder of power in the symbolic sense, there is a tendency to seek stable references that can reduce the indeterminacy inherent to the democratic experience. Such a movement expresses the difficulty of dealing with the absence of absolute foundations, a central characteristic of democratic societies, in which power is no longer anchored in a fixed instance.

In response to this indeterminacy, attempts to stabilize the social emerge through the valorization of certain institutional and cultural references, which are invested with strong legitimacy. Examples of this can be found in the centrality attributed to institutions such as the family, property and certain forms of cultural organization, often mobilized as elements of cohesion and social order.

Such processes do not imply a direct return to absolutist forms of power, but reveal the recurrent search for foundations that can provide greater predictability and security to social life, thus stressing the constitutive opening of the democratic space.

Furthermore, the symbolic void characteristic of democratic regimes should not be understood as a deficiency, but as a constitutive condition of their own dynamics (LEFORT, 1981). It is precisely this indeterminacy that enables the emergence of divergent perspectives, promoting the plurality of ideas and openness to dissent, fundamental elements for the vitality of public space. In this sense, the centrality does not lie in the elimination of conflict, but in the guarantee of egalitarian conditions of participation, which allow the confrontation of positions anchored in reflective processes.

The risk, however, manifests itself when this indeterminacy ceases to operate on the symbolic level and translates into a practical disengagement of individuals in relation to political life (LEFORT, 1981). In these cases, the weakening of citizen participation and the retraction of interest in public space contribute to the weakening of democratic structures, opening space for the emergence of discourses that promise to restore unity and social stability.

Such discourses are often organized around the construction of a homogeneous collective identity – the so-called Povo-Uno⁹ – which seeks to suppress the constitutive

⁹ Concept used by Claude Lefort to designate the ideological construction of a fictitious unit of the social body.

plurality of society (LEFORT, 1981). In this process, the figure of the other, as a legitimate interlocutor and bearer of different perspectives, is progressively delegitimized, being replaced by a logic of uniformity that reduces diversity to a threat to be contained.

This tendency to construct a fictitious unit of the social body is also observed in contemporary analyses of populism. As Jan-Werner Müller points out, populist discourses operate from the claim to represent the "true people", while excluding those who do not align with this identity construction. Such dynamics reinforce the homogenization of the political space and weaken the legitimacy of dissent, approaching, in certain aspects, the logics of exclusion characteristic of totalitarian regimes (MÜLLER, 2016).

As a consequence, a dynamic is consolidated in which difference is emptied and the reproduction of hegemonic discourses becomes predominant, compromising the conditions for the possibility of dialogue and criticism. In this horizon, totalitarianism can emerge under the guise of defending one's own democratic values, mobilizing discourses of protection and cohesion that, paradoxically, operate in the sense of restricting the plurality and freedom that constitute the basis of democracy (LEFORT, 1981).

5 THE INCLUSION OF THE OTHER IN HABERMAS AND THE EXCLUSIONARY TOTALITARIAN SYSTEM

Starting from Claude Lefort's contributions on the constitutive indeterminacy of democracy and the implications of the standardization of thought, it is possible to move on to the approach developed by Jürgen Habermas, especially with regard to the autonomy of individuals and the emancipatory dimension of communication in modern society. Inserted in the context of the second generation of the Frankfurt School, Habermas proposes a reformulation of the philosophy of language, attributing centrality to the role of dialogue in the constitution of social practices guided by understanding.

In this sense, the author distinguishes different forms of knowledge, among which those guided by technical, practical and emancipatory interests stand out (HABERMAS, 1999). The emancipatory perspective, in particular, is linked to critical reflection on the conditions of domination, and the understanding of these structures is the first step towards overcoming them. Thus, rationality is not conceived as a neutral instance and detached from the social context, but as a process intrinsically related to the interests that guide the production of knowledge.

From this conception, Habermas develops the idea of communicative rationality, according to which mutual understanding between subjects is achieved through the use of language in conditions of argumentation free of coercion. Although the so-called "ideal

speech situation" is not fully realized at the empirical level, it functions as a normative horizon that guides communicative practices aimed at the validity of arguments and reciprocal recognition between the interlocutors.

In this context, the notion of intersubjectivity — later deepened as "inclusion of the other" — assumes a central role, as it shows that the construction of legitimate consensus depends on the participation of free and equal subjects in the communicative process. Democracy, from this perspective, is not reduced to a set of formal procedures, but is based on openness to dialogue, the possibility of questioning and the willingness to consider different perspectives.

In the contemporary context, such issues gain new dimensions with the advent of digital technologies and communication networks. As Manuel Castells analyzes, the network structure of today's societies expands the possibilities of participation and circulation of discourses, but also enhances the dissemination of polarized narratives and the formation of fragmented communicative spaces. In this scenario, the challenges to the construction of a public sphere guided by dialogue become even more complex, requiring the constant reaffirmation of inclusive communicative practices (CASTELLS, 2013).

In convergence with Lefort's analyses, Habermas points out that the exclusion of the other constitutes one of the central elements of totalitarian dynamics. The denial of plurality, the construction of rigid boundaries between groups and the hierarchization of cultures compromise the interdependence between individuals and make the formation of an inclusive public space unfeasible. Thus, the absence of egalitarian conditions of participation in the discourse implies the erosion of democratic bases, since, where there is no mutual recognition among the subjects, there is no effective possibility of democracy.

6 CONCLUSION

As outlined throughout the article, it was not intended to exhaust the contributions of the authors analyzed, but to highlight the centrality of language and discourse in the constitution of social and political relations, as well as their direct implication in the maintenance or weakening of democratic regimes. From the reflections of Michel Foucault and Ludwig Wittgenstein, it was possible to understand language as a situated social practice, in which meanings are produced, knowledge is organized and validity criteria are established that guide the interaction between subjects.

In continuity, the analyses of Hannah Arendt and Claude Lefort allowed us to identify the mechanisms by which totalitarianism is structured, especially through the suppression of plurality, the construction of a fictitious unity of the social body and the delegitimization of the

other as a valid interlocutor. In this context, it was evident that the weakening of the public space and the internalization of homogeneous discourses compromise the conditions for the possibility of critical thinking and democratic participation.

In turn, Jürgen Habermas' perspective offered a normative horizon from which to reaffirm the importance of dialogue, intersubjectivity and the inclusion of the other as foundations of democracy. Communication guided by understanding, although not fully achievable in ideal terms, is an essential parameter for the construction of social practices based on mutual recognition and discursive legitimacy.

Thus, it is argued that the maintenance of democratic environments depends directly on the preservation of discursive plurality, openness to dissent, and the recognition of alterity as a constitutive element of social life. On the other hand, contexts marked by the homogenization of thought, the centralization of power, and the naturalization of exclusionary discourses tend to favor the emergence of authoritarian dynamics.

Thus, the valorization of dialogue and critical reflection is not only presented as a theoretical requirement, but as a practical condition for the strengthening of democracy, insofar as it enables individuals to recognize themselves as active political subjects, capable of participating in the collective construction of the public space.

In the final analysis, the defense of plurality and dialogue is not presented only as a theoretical requirement, but as a normative imperative for the preservation of the conditions of possibility of democracy itself.

ABSTRACT

This article analyzes creative writing practices developed in public school contexts, understanding them as possibilities for the constitution of children as authors of their own experiences. The study adopts a theoretical-analytical approach grounded in the systematization of teaching experiences (Jara, 2006), articulated with pedagogical records and reflections from everyday school life. The theoretical framework draws on Freire's critical pedagogy, Bakhtin's dialogical perspective, Benjamin's reflections on childhood and experience, and Soares' literacy studies. The analysis highlights tensions between normative school practices and proposals that value children's lived experiences, indicating that writing, when connected to these experiences, fosters authorship, expression, and meaning-making. The study concludes that recognizing children as subjects of language requires shifting writing from an instrumental task to a space of creation, interpretation, and social participation.

Keywords: Creative Writing. Childhood. Literacy. Narrative. Public School.

RESUMO

Este artigo analisa práticas de escrita criativa desenvolvidas no contexto da escola pública, compreendendo-as como possibilidades de constituição da criança enquanto autora de suas experiências. O texto assume caráter teórico-analítico, ancorado na sistematização de experiências docentes, conforme perspectiva de Jara (2006), articulada a registros pedagógicos e reflexões produzidas no cotidiano escolar. O referencial teórico dialoga com a pedagogia crítica de Freire, a perspectiva dialógica de Bakhtin, as reflexões de Benjamin sobre infância e experiência e os estudos do letramento de Soares. A análise evidencia tensões entre práticas escolares normativas e propostas que valorizam a experiência infantil, indicando que a escrita, quando vinculada às vivências das crianças, favorece processos de autoria, expressão e produção de sentidos. Conclui-se que reconhecer a criança como

RESUMEN

Este artículo analiza las prácticas de escritura creativa desarrolladas en el contexto de las escuelas públicas, entendiéndolas como posibilidades para la constitución del niño como autor de sus propias experiencias. El texto adopta un carácter teórico-analítico, anclado en la sistematización de las experiencias docentes, según la perspectiva de Jara (2006), articulada con registros pedagógicos y reflexiones producidas en la vida cotidiana de la escuela. El marco teórico dialoga con la pedagogía crítica de Freire, la perspectiva dialógica de Bajtín, las reflexiones de Benjamin sobre la infancia y la experiencia, y los estudios de alfabetización de Soares. El análisis revela tensiones entre las prácticas escolares normativas y las propuestas que valoran la experiencia infantil, indicando que la escritura, cuando se vincula a las experiencias de los niños, favorece los procesos de autoría, expresión y construcción de significado. Concluye que reconocer al niño como sujeto del lenguaje implica trasladar la escritura de un lugar instrumental a un espacio de creación, interpretación y participación social.

1 INTRODUCTION

Written production in public schools, especially in the classes of the early years of elementary school, has been configured, in pedagogical practice, as a field tensioned between school demands and the concrete experiences of children. From the systematization of teachers' experiences in a public school located in an urban context, it is observed the recurrence of situations in which writing is experienced by students as a normative task, often associated with the fulfillment of formal requirements, such as text extension, structural organization and linguistic correction.

The pedagogical records produced throughout the teaching practice show that, in the face of proposals for textual production, statements such as "how many lines do you need to have?", "does it have to be long?" or "can I write little?", are common, indicating a relationship with written language guided more by external demands than by the construction of meanings. Such manifestations, far from expressing simple disinterest, reveal ways of appropriating language mediated by school practices that do not always dialogue with children's experiences and repertoires.

At the same time, other situations present in the school daily life point to significant displacements when writing is proposed in articulation with students' daily experiences, memories, territories and interests. In these circumstances, greater engagement, expansion of participation and emergence of more authorial narratives are perceived, in which children mobilize elements of their social, cultural and affective life.

The systematized teaching experiences allow us to problematize the understanding of school writing as a homogeneous practice, indicating that its meaning depends, to a large extent, on the conditions of production and the pedagogical mediations that sustain it. From this perspective, resistance to writing can be interpreted not as an individual incapacity or demotivation, but as an effect of decontextualized practices that restrict language to an instrumental use.

In view of this scenario, this article proposes to analyze creative writing practices developed in the daily life of classes in the early years, understanding them as possibilities for the constitution of the child as the author of their own narratives. The study, based on the systematization of experiences and reflections produced in school practice, contributes to the pedagogical debate without intending statistical generalizations. From a theoretical-analytical approach, it seeks to show how proposals that value the children's experience can favor processes of authorship, expression and construction of meanings in the school space.

2 CHILDHOOD, LANGUAGE AND EXPERIENCE: THEORETICAL BASES

From pedagogical experiences recorded with classes of the early years in public schools, normative conceptions of writing are tensioned, valuing its power as a practice of meaning in the children's experience.

In this sense, Freire's (1987) contribution is fundamental in stating that the reading of the world precedes the reading of the word. Such a formulation allows us to understand that the act of writing does not begin in the domain of the code, but in the relationship that the subjects establish with their reality. Pedagogical records show that, when written language distances itself from children's experiences, it tends to be perceived as a mechanical activity; on the other hand, when it approaches their life contexts, its meaning expands.

In dialogue with this understanding, Bakhtin (1997) understands language as an essentially dialogical phenomenon, constituted in the interaction between subjects and crossed by multiple social voices. The practices observed in the school daily life show that children's writing cannot be understood as an isolated production, but as a situated enunciation.

Benjamin's (2002) reflections on childhood contribute by evidencing the inventive and creative character of children. When observing pedagogical practices in which writing is articulated with playfulness and imagination, it is perceived that they mobilize expressive resources that escape traditional school models.

In the field of literacy studies, Soares (1998), in dialogue with Kleiman (1995) and Street (1984), highlights that writing should be understood as a social practice, which implies considering not only its technical dimension, but also its uses, functions and meanings. From this perspective, literacies are multiple and crossed by power and cultural relations.

The pedagogical experiences examined indicate that, when inserted in significant literacy practices, children become more actively engaged, appropriating writing as a form of expression and social participation, as Barton and Hamilton (1998) also point out when discussing everyday literacies.

Articulating these references, it is understood that creative writing can constitute a space of mediation between experience, language and identity.

3 METHODOLOGICAL PATHS

The present study is part of the field of qualitative approaches and is configured as a theoretical-analytical essay, based on the systematization of teaching experiences, as proposed by Jara (2006).

It is based on the understanding that the school daily life constitutes a legitimate space for the production of knowledge, and it is possible, from its critical analysis, to construct interpretations of educational processes.

The analytical corpus is composed of pedagogical records, reflective notes and textual productions developed in creative writing practices, taken as materialities that allow problematizing the relationship of children with written language.

The study is guided by an interpretative perspective of thematic inspiration, seeking to identify recurrences, tensions and meanings produced in the observed practices, in dialogue with the theoretical framework.

4 BETWEEN RESISTANCE AND POSSIBILITY: MEANINGS OF WRITING

The records produced in the school daily life show that the children's relationship with writing is marked by ambivalence, expressed in different situations experienced at school. In more traditional proposals, centered on the reproduction of models or the fulfillment of formal criteria, recurrent manifestations of resistance emerge, often associated with fatigue, difficulty and little identification with the activity.

Such statements, when analyzed in the light of Bakhtin (1997), can be understood as social voices that express not only individual perceptions, but shared experiences within historically constituted school practices. As Possenti (2012) argues, the learning of writing is not effective through decontextualized exercises, but in significant practices of language use, which helps to explain the resistances observed when writing is proposed in a mechanical way and disconnected from experience. In this way, resistance to writing reveals tensions between different conceptions of language: on the one hand, a normative and instrumental perspective; on the other, the possibility of writing as a practice of expression and production of meanings.

On the other hand, different episodes observed indicate that, when writing is proposed based on significant experiences — such as memories, daily experiences or topics of interest to students — there is a shift in the way students relate to the activity. In these circumstances, there is greater involvement, increased dedication time, and greater complexity in productions.

This change can be understood, in the light of Freire (1987), as a result of the approximation between language and experience, to the extent that subjects begin to write from their reading of the world. Thus, writing is no longer perceived as an imposed task and becomes a significant practice.

5 CREATIVE WRITING AND NARRATIVE PRODUCTION

The systematization of pedagogical experiences indicates that creative writing, when incorporated into school practices, can favor processes of authorship and student engagement.

The records analyzed reveal that the textual productions present elements such as repetition, rhythm, rhyme and a strong presence of orality, which evidences a process of appropriation of written language still under construction, but deeply significant. Instead of being interpreted as flaws, such characteristics can be understood, according to Soares (1998), Kleiman (1995) and Tfouni (1995), as a constitutive part of literacy practices.

In this context, creative writing is configured as a practice that expands the possibilities of expression, allowing children to experiment with different ways of saying the world. The thematic diversity present in the productions reinforces the idea that the text gains meaning when linked to experience.

In addition, the incorporation of playful practices in the writing process contributes to displacing the activity from a strictly normative place to a space of creation. In dialogue with Benjamin (2002), it is possible to understand this movement as an expression of the inventive character of childhood.

6 WRITING, IDENTITY AND SOCIAL CRITICISM

The productions examined indicate that children's writing can be constituted as a space for identity construction and critical elaboration of reality. The narratives produced by the children reveal perceptions about everyday life, social relationships and life experiences, indicating that the text operates as a form of interpretation of the world.

In dialogue with Freire (1987), it can be stated that such productions are configured as expressions of the reading of the world carried out by the subjects, showing that writing is not restricted to linguistic codification, but involves processes of signification and positioning.

The monitored practices indicate that, when inserted in pedagogical proposals that value their experiences, children begin to recognize themselves as authors, assuming a more active position in the production of knowledge. This movement contributes to the strengthening of self-esteem, belonging, and participation.

In addition, the presence of themes related to inequalities, daily challenges and social relations points to the critical dimension of children's writing. Although expressed in an initial way, such narratives reveal the children's ability to reflect on the world in which they live, articulating language and experience.

7 FINAL CONSIDERATIONS

The present study showed that creative writing practices, when articulated with children's experiences, can favor significant processes of authorship, expression and production of meanings in the school context.

The pedagogical records allowed us to understand that resistance to writing should not be interpreted as an individual disability, but as an effect of decontextualized practices that limit language to an instrumental use.

On the contrary, when writing approaches the students' experiences, a shift in its meaning is observed, becoming a space for creation, interpretation and social participation.

As a limitation, it is highlighted that the analysis is anchored in experiences situated in the school routine, not having as its objective the generalization of the results, but the problematization of practices and meanings.

Even so, the study contributes to the educational field by reinforcing the importance of pedagogical practices that recognize children as subjects of language, capable of narrating, interpreting and transforming the world in which they live.

ABSTRACT

This article revisits a master's thesis defended 16 years ago, aiming to analyze, from the perspective of the sociology of emotions, the affective dimension present in the narratives of subjects from a quilombola community in the southern region of Rio de Janeiro state, Brazil. The original research, qualitative in nature, was based on interviews with young people and local leaders, addressing themes such as family, territory, culture, and community participation. In this study, a reinterpretation of these interviews is proposed, seeking to identify emotions that permeate the narratives, such as shame, pride, belonging, and fear, especially regarding cultural practices such as jongo and the construction of quilombola identity. Methodologically, an interpretative analysis inspired by content analysis (Bardin, 1979) is carried out, articulated with a reflexive perspective on the researcher's position in the knowledge production process. The results show that emotions play a central role in the constitution of social experiences and in the re-signification of cultural practices, being fundamental to understanding identity affirmation processes. The temporal distance allowed for an expansion of the analytical perspective, revealing dimensions that were not addressed in the original research.

Keywords: Emotions. Quilombola Identity. Jongo. Territory. Reinterpretation of Research.

RESUMO

Este artigo revisita uma dissertação de mestrado defendida há 16 anos, com o objetivo de analisar, à luz da sociologia das emoções, a dimensão afetiva presente nas narrativas de

sujeitos de uma comunidade quilombola no sul do estado do Rio de Janeiro. A pesquisa original, de caráter qualitativo, foi desenvolvida a partir de entrevistas com jovens e lideranças locais, abordando temas como família, território, cultura e participação comunitária. Neste trabalho, propõe-se uma releitura dessas entrevistas, buscando identificar emoções que atravessam os discursos, tais como vergonha, orgulho, pertencimento e medo, especialmente no que se refere às práticas culturais como o jongo e à construção da identidade quilombola. Metodologicamente, realiza-se uma análise interpretativa inspirada na análise de conteúdo (BARDIN, 1979), articulada a uma perspectiva reflexiva sobre o lugar da pesquisadora no processo de produção de conhecimento. Os resultados evidenciam que as emoções desempenham papel central na constituição das experiências sociais e na ressignificação de práticas culturais, sendo fundamentais para compreender os processos de afirmação identitária. A distância temporal possibilitou uma ampliação do olhar analítico, evidenciando dimensões não tematizadas na pesquisa original.

RESUMEN

Este artículo revisita una tesis de maestría defendida hace 16 años, con el objetivo de analizar, desde la perspectiva de la sociología de las emociones, la dimensión afectiva presente en las narrativas de sujetos de una comunidad quilombola en el sur del estado de Río de Janeiro, Brasil. La investigación original, de carácter cualitativo, se basó en entrevistas con jóvenes y líderes locales, abordando temas como familia, territorio, cultura y participación comunitaria. En este trabajo, se propone una reinterpretación de estas entrevistas, buscando identificar las emociones que atraviesan los discursos, tales como vergüenza, orgullo, pertenencia y miedo, especialmente en lo que respecta a prácticas culturales como el jongo y la construcción de la identidad quilombola. Metodológicamente, se realiza un análisis interpretativo inspirado en el análisis de contenido (Bardin, 1979), articulado con una perspectiva reflexiva sobre el lugar de la investigadora en el proceso de producción de conocimiento. Los resultados evidencian que las emociones desempeñan un papel central en la constitución de las experiencias sociales y en la resignificación de las prácticas culturales, siendo fundamentales para comprender los procesos de afirmación identitaria. La distancia temporal permitió una ampliación de la mirada analítica, evidenciando dimensiones que no fueron problematizadas en la investigación original.

Palabras clave: Emociones. Identidad Quilombola. Jongo. Territorio. Reinterpretación de la Investigación.

1 INTRODUCTION

The production of knowledge in qualitative research does not end with its writing: the data remain open to new interpretations, especially when revisited under different theoretical references and altered historical contexts.

This article proposes a rereading of a master's dissertation defended 16 years ago, focused on cultural practices – such as jongo –, family relationships and identity construction in a quilombola community in the south of Rio de Janeiro. At the time, the analysis prioritized sociocultural and educational dimensions, without systematically exploring the affective dimensions in the narratives of young people.

When revisiting the interviews, emotions such as pride, shame, belonging and fear are evidenced, which cross the discourses and structure social experiences. Inserted in the sociology of emotions – which understands them as social constructions that organize practices and relationships (AGUILAR; VILLAGRÁN, 2013) – this study answers: how do these emotions cross the identity of young quilombolas and how are they resignified after 16 years?

The time interval problematizes the role of time in the analytical view, unveiling new readings of social experiences and reinforcing the affective relevance for quilombola education and identity politics.

2 THEORETICAL FRAMEWORK

The sociology of emotions understands that emotions are not only individual experiences, but socially produced and shared phenomena (AGUILAR; VILLAGRÁN, 2013).

By articulating emotions, body and space, Aguilar and Villagrán (2013) highlight that territories are lived in an affective way, being crossed by memories, bonds and sensitive experiences. This perspective is fundamental to understanding the relationship of young people with the quilombola territory.

In the field of aesthetic and sensitive experience, Didi-Huberman (2016) argues that emotions produce displacements and transformations in the ways of seeing and feeling, allowing new interpretations of reality.

Kaplan (2013), when dealing with youth, shows that emotions such as fear, insecurity and belonging are directly related to forms of social insertion. Certeau (1994) contributes by highlighting everyday practices as spaces for the production of meaning, in which subjects reinvent their experiences.

3 METHODOLOGY

This study is characterized as a qualitative research of an interpretative nature, based on the rereading of interviews conducted in the context of a master's dissertation developed 16 years ago. The corpus is composed of semi-structured interviews with young people and leaders of a quilombola community, addressing topics such as family, territory, culture and social participation.

The analysis was guided by the assumptions of content analysis (BARDIN, 1979), focusing on the identification of emotional categories emerging in the narratives, such as shame, pride, belonging and fear. However, more than a thematic reclassification of the data, it is proposed here a displacement of the analytical gaze, by taking emotions as the central axis of interpretation.

In this sense, the research also assumes a reflective character, by recognizing that the data are not neutral, nor are they exhausted in a single reading. The rereading of the interviews, after an interval of 16 years, shows that certain dimensions — especially the affective ones — were already present in the discourses, but were not thematized in the original analysis.

This movement implies recognizing the place of the researcher as a constitutive part of the process of knowledge production. At the time of the initial research, the gaze was guided by other theoretical and analytical concerns, which directed attention to certain aspects to the detriment of others. In the present work, by adopting the perspective of the sociology of emotions, it becomes possible to identify and problematize elements that previously remained implicit.

Such repositioning dialogues with the understanding that knowledge is situated and historically constructed, being crossed by the experiences, formations and displacements of the researcher herself. In this sense, temporal distance is not understood as an obstacle, but as a condition of possibility for the expansion of the analytical view, allowing new interpretations of the data.

In addition, when revisiting the interviews, the researcher also revisits herself, her methodological choices and her ways of listening. This process shows that analysis is not only a technical exercise, but also a movement of implication, in which memory, experience and sensibility are intertwined.

4 ANALYSIS AND DISCUSSION

4.1 SHAME AND PRIDE: EMOTIONS IN THE RESIGNIFICATION OF JONGO

The narratives show a movement of emotional transformation in relation to jongo, which goes from an experience marked by shame to an experience crossed by pride and belonging.

One of the young women interviewed explains this process when she states: "before I was ashamed to dance jongo [...] Now I'm more proud to talk about jongo, to dance jongo." This displacement reveals the socially constructed character of emotions, which are transformed as the subjects resignify their cultural practices (AGUILAR; VILLAGRÁN, 2013). The jongo, in this context, ceases to be just a cultural manifestation to constitute a space for identity affirmation.

Similarly, the report of another interviewee highlights the weight of stigma: "they said that jongo was macumba [...] I didn't question it myself, I thought it wasn't from my stronghold." The negative association reveals how certain emotions — such as fear and rejection — are socially produced, especially in contexts marked by historical prejudices. The subsequent approximation with jongo transforms this perception, evidencing the role of experiences in the reconstruction of the senses (DIDI-HUBERMAN, 2016).

4.2 BELONGING AND AFFECTIONS: THE EMOTIONAL DIMENSION OF THE COMMUNITY

The interviews also highlight the centrality of emotions in the construction of community bonds, in which the notion of family goes beyond blood ties and expands to the collective.

One of the participants describes the community as a space of strong affective connection: "even those who are not related know each other [...] many care about one another". This excerpt shows that belonging is not only a social condition, but also an emotional one, being sustained by relationships of care, recognition and daily coexistence. In this sense, the community is experienced as a space of affection, in which emotions structure social relations (KAPLAN, 2013).

In addition, the way in which young people refer to families reinforces the symbolic and affective dimension of the territory, which is constituted not only as a physical space, but as a lived space (AGUILAR; VILLAGRÁN, 2013).

4.3 EMOTIONS AND ENGAGEMENT: THE CONSTRUCTION OF A COLLECTIVE CONSCIOUSNESS

Another relevant aspect refers to the articulation between emotions and processes of political engagement. The construction of a critical consciousness appears, in the narratives, deeply crossed by emotional experiences.

One of the interviewees says: "I'm not going to keep doing certain things because there are a lot of people who need me out there." The speech evidences a feeling of social responsibility that guides their choices and trajectories. This type of emotion — which articulates belonging, commitment, and identification — contributes to the formation of politically engaged subjects.

At another point, the same interviewee associates his participation with the recognition of his voice: "I had a space to show what I thought [...] People gave me importance." This recognition produces emotional effects that strengthen identity and encourage participation, evidencing that emotions are central elements in the constitution of social practices (CERTEAU, 1994).

5 FINAL CONSIDERATIONS

The rereading of the interviews, carried out in the light of the sociology of emotions, made it possible to show that the affective dimensions are not peripheral aspects of social experiences, but central elements in the construction of the quilombola identity. Emotions such as shame, pride, belonging and fear cross the narratives of the subjects, organizing their relationships with the territory, with cultural practices and with the collectivity.

By analyzing these narratives, it becomes possible to understand that processes such as the resignification of jongo, the construction of community bonds and social engagement do not occur only in the realm of practices or discourses, but also in the field of emotions, which guide perceptions, choices and positions. In this sense, emotions emerge as constitutive dimensions of social life, contributing to the affirmation of identity and to the production of meanings about belonging.

The temporal distance of 16 years between the production of the data and its reinterpretation proved to be fundamental for the broadening of the analytical view. This interval made it possible not only to identify aspects that were not previously thematized, but also to problematize the very limits of the analysis carried out in the past. When revisiting the interviews, it is evident that emotions were already present in the discourses, although in an unnamed or secondary way, revealing that the data are not exhausted in a single reading.

This movement of return to data necessarily implies a repositioning of the researcher, who begins to recognize her own intellectual trajectory as part of the process of knowledge production. Revisiting the research is also revisiting the theoretical choices, the ways of listening and the forms of interpretation that guided the original work. Thus, this article not only analyzes

the emotions of the subjects researched, but also explains the shift of the researcher's own gaze, evidencing the situated, processual and unfinished character of scientific knowledge.

Finally, the study reinforces the importance of revisiting previous research as a strategy for theoretical and methodological deepening, especially when articulated with new analytical frameworks. By highlighting the centrality of emotions in the construction of quilombola identity, the article contributes to the field of sociology of emotions and to studies on education and territory, indicating that understanding the affective dimensions of social experiences is fundamental for the analysis of educational, cultural and political processes in contexts marked by memory, resistance and belonging.
