ABSTRACT

Introduction: Four out of ten Chileans consume junk food at least once a week.

Objective: To describe the consumer profile of a fast-food restaurant in the Mall Plaza Maule, Maule, Chile.

Methodology: A quantitative, descriptive, non-experimental study with a grounded theory design; sample: 990 subjects over 18 years of age, collected over a one-week period.

Instrument: A survey created by the researchers and validated by experts; eight questions: weight/height, age, gender, occupation, educational level, frequency of visits to the fast-food restaurant, what they usually eat, three meals they most often eat, who they go with, the reason for eating, whether they engage in physical activity and how often, and what types of exercise they do.

Results: Consumers are predominantly male (82%), young adults (18-40 years old), students or workers with secondary to university education, and an average BMI in the overweight range (20-25%). Consumption frequency is weekly (mainly 1-2 times), with a preference for traditional fast food such as french fries (537), hot dogs (457), pizza (282), and hamburgers (259), over healthy options (258). Consumers visit in the company of friends (282), partners (228), or family (184), motivated by price (372), taste (291), and speed (586). Although 75% engage in physical activity (1-2 times/week, 30 min-2 hours), moderate exercise such as weightlifting, cardio, jogging, or walking predominates, which is insufficient

to counteract high caloric intake.

Conclusion: Given the Chilean context of overnutrition and obesity, the profile reveals urban lifestyles with a nutritional-activity imbalance, suggesting interventions for healthy menus and the promotion of exercise.

Keywords: Consumers. Fast Food. Physical Activity. Mall Plaza Maule.

RESUMO

Introdução: Quatro em cada dez chilenos consomem junk food pelo menos uma vez por semana.

Objetivo: Descrever o perfil do consumidor de um restaurante de fast food no Mall Plaza Maule, Maule, Chile.

Metodologia: Estudo quantitativo, descritivo, não experimental, com delineamento baseado na teoria fundamentada; amostra: 990 indivíduos com mais de 18 anos, coletados ao longo de um período de uma semana.

Instrumento: Um questionário elaborado pelos pesquisadores e validado por especialistas, composto por oito questões: peso/altura, idade, gênero, ocupação, nível educacional, frequência de visitas ao restaurante de fast food, o que costumam consumir, três refeições que mais ingerem, com quem costumam ir, motivo para comer, se praticam atividade física e com que frequência, e quais tipos de exercícios realizam.

Resultados: Os consumidores são predominantemente homens (82%), jovens adultos (18–40 anos), estudantes ou trabalhadores com escolaridade do ensino médio ao superior, e com IMC médio na faixa de sobrepeso (20–25%). A frequência de consumo é semanal (principalmente 1–2 vezes), com preferência por alimentos tradicionais de fast food, como batatas fritas (537), cachorros-quentes (457), pizza (282) e hambúrgueres (259), em comparação com opções saudáveis (258). Os consumidores visitam o local acompanhados principalmente por amigos (282), parceiros (228) ou familiares (184), motivados por preço (372), sabor (291) e rapidez (586). Embora 75% pratiquem atividade física (1–2 vezes por semana, entre 30 minutos e 2 horas), predominam exercícios moderados, como musculação, cardio, corrida ou caminhada, o que se mostra insuficiente para compensar a alta ingestão calórica.

Conclusão: Diante do contexto chileno de sobrenutrição e obesidade, o perfil identificado revela estilos de vida urbanos marcados por desequilíbrio entre alimentação e atividade física, sugerindo a necessidade de intervenções voltadas para cardápios mais saudáveis e promoção da prática de exercícios.

Palavras-chave: Consumidores. Fast Food. Atividade Física. Mall Plaza Maule.

RESUMEN

Introducción: Cuatro de cada diez chilenos consumen comida chatarra al menos una vez por semana.

Objetivo: Describir el perfil de consumidores de un local de comida rápida en el Mall Plaza Maule, Maule, Chile.

Metodología: estudio cuantitativo, descriptivo, no experimental, con diseño basado en la Teoría Fundamentada; muestra: mayores de 18 años, durante un período de una semana,

990 sujetos. Instrumento: encuesta creada por los investigadores, Validación por Expertos; ocho preguntas: peso/talla, edad, género, ocupación, nivel educacional, frecuencia de asistencia al local de comida rápida, lo que habitualmente consume, tres comidas que mayormente consume, compañía con la cual asiste al local, el motivo por el que consume, practica de actividad física y con qué frecuencia la realiza, qué tipos de ejercicios realiza.

Resultados: Consumidores predominantemente masculinos (82%), jóvenes adultos (18-40 años), estudiantes o trabajadores con educación media-universitaria y IMC promedio en rango de sobrepeso (20-25%). La frecuencia de consumo es semanal (principalmente 1-2 veces), con preferencia por comida rápida tradicional como papas fritas (537), completos (457), pizza (282) y hamburguesas (259), sobre opciones saludables (258). Consumidores acuden en compañía de amigos (282), pareja (228) o familia (184), motivados por precio (372), sabor (291) y rapidez (586). Aunque 75% practica actividad física (1-2 veces/semana, 30 min-2 horas), predomina ejercicio moderado como pesas, cardio, trote o caminar, insuficiente para contrarrestar ingesta calórica alta.

Conclusión: Ante contexto chileno de malnutrición por exceso y obesidad, el perfil revela estilos de vida urbanos con desbalance nutricional-actividad, sugiriendo intervenciones para menús saludables y promoción de ejercicio.

Palabras clave: Consumidores. Comida Rápida. Actividad Física. Mall Plaza Maule.

1 INTRODUCTION

Based on dietary habits in Chile in 2024 and 2025, the nutritional landscape continues to reveal perceptions and behaviors relevant to understanding the relationship between Chileans and healthy eating. The findings indicate that healthy eating practices are interpreted as a balanced diet that includes a variety of foods, with the intention of avoiding those considered harmful to health. Furthermore, disease prevention and body image awareness emerge as the main motivations driving people to adopt healthy eating habits. These perceptions align with the new Dietary Guidelines for Chile, which promote a holistic approach to food, not only from a nutritional perspective but also from a sociocultural and environmental one, highlighting the importance of diversity, sustainability, and overall well-being as principles for healthy and responsible eating (MINSAL, 2025).

In Chile, nutrition campaign strategies designed with the specific characteristics of the target audiences in mind—considering sociocultural factors, psychological constructs, and the underlying meanings of preventive behaviors in nutritional health—and integrated with intermediate structural measures, prove to be the most effective. These campaigns achieve greater relevance and ownership of the message, thus fostering the intention and realization of changes in eating behavior. This approach, focused on comprehensiveness and contextualization, is fundamental to ensuring the success of public health nutrition interventions (Caichac Hoppe, 2022).

Furthermore, the Ministry of Health and other institutions have promoted policies that foster food education with a community-based approach, integrating nutritionists into schools, community spaces, and local markets, thereby strengthening the connection with specific audiences and their cultural needs. These campaigns are also linked to regulations to improve the nutritional quality of foods available on the market, encouraging the consumption of natural and minimally processed products and limiting the supply of ultra-processed foods (Loyola Pérez, 2021).

These coordinated and contextualized actions not only improve knowledge, but also transform eating habits in the population, positioning themselves as pillars for achieving effective results in health promotion and prevention of nutrition-related diseases in Chile (Gutiérrez Turner, et al., 2022).

Research has indicated that in recent years Chilean families have changed their eating habits, shifting from consuming traditional and minimally processed foods, such as fruits, vegetables, stews, and legumes, to highly processed products that are more energy-dense, contain more saturated fats and sugars, and have lower levels of micronutrients and dietary fiber, posing a significant public health challenge. In a context marked by obesity, it is

essential that individuals develop dietary self-regulation strategies that promote adherence to nutritional recommendations and contribute to maintaining a healthy nutritional status (Saavedra, 2022). This regulation involves adopting conscious behaviors that limit the consumption of foods high in calories, saturated fats, and sugars, promoting a balanced diet in accordance with current public policies, such as the Nutritional Labeling Law in Chile, which seeks to facilitate informed and healthy choices. Thus, self-regulation becomes a key component in addressing the obesogenic environment and preventing nutrition-related diseases (Henríquez, 2021).

The country has been undergoing profound changes, transformations that have been affecting the daily lives of new generations of Chileans who work, study, and even spend their leisure time. The current nutritional situation is related to economic and sociodemographic changes in diet and lifestyles, as well as in clothing, food acquisition, and how free time is managed, thus creating a complex and dynamic landscape (Garay-Rivera, 2022). With changes in lifestyle, fast food has become an economical and convenient way to eat, which often does not provide the necessary nutrients, and the regular consumption of these foods can lead to various health problems.

This type of food has become very popular lately, due to the pace of life people lead, since the little free time they have means they end up consuming something quick and, often, unhealthy. Currently, because of social, labor, and educational changes, 4 out of 10 Chileans consume junk food. While the number of people consuming fast food has increased, whether students or workers, approximately 41% of the population consumes it at least once a week. People between 15 and 24 years of age are the most frequent consumers of these foods. Within this population, 44% are male, while 39% are female, who consume fast food at establishments (Loyola Pérez, 2021).

Although 2013 saw the largest increase in the population consuming fast food, with a 9% rise compared to previous years, 2015 saw a 3.3% increase, marking a third year of weak growth after the notable increase in 2013. However, in 2016, there was another 3.5% increase, considering all establishments; this trend has continued to rise (Loyola Pérez, 2021).

2 OBJECTIVE

The objective of this study is to describe the consumer profile of a fast-food restaurant in the Mall Plaza Maule, Maule, Chile. This objective is further broken down into other objectives that will help answer the premise, including classifying the body mass index (BMI) of the sample; examining the frequency of fast-food consumption, considering gender, age,

frequency of consumption, type of food consumed, physical activity levels, and reasons for consuming fast food.

3 METHODOLOGY

This was a quantitative, descriptive, non-experimental study with a grounded theory design (Hernández-Sampieri & Mendoza, 2018). The study population consisted of daily customers who visit one of the fast-food restaurants or shop at the Mall Plaza Maule location, totaling approximately 400 people per day and 10,000 consumers per month. The population was defined as all consumers over 18 years of age who visited the restaurant during a one-week period. The sample comprised 990 subjects. To reach at this “n”, a survey was conducted among customers who visit the establishment, resulting in a total of 990 surveys. A 95.5% confidence level was obtained for the data, indicating a sampling error of approximately 5% based on the surveyed population. These customers were considered satisfied, representing 50% of the total sample. A total sample of 990 customers who visit the establishment was required; all were over 18 years of age, signed informed consent, and provided their exact weight and height were known after the study proposal was presented to each customer who approached the establishment.

The instrument used was a survey created by the researchers, which was validated through the Expert Validation process in Research Methodology, Physical Education, and Nutrition (Hernández-Sampieri & Mendoza, 2018), belonging to the Universidad Autónoma de Chile, Talca campus, Maule Region, Chile. The instrument is structured in eight questions, such as weight/height indices, age, gender, occupation, educational level, frequency of visits to the fast-food restaurant, what they usually consume, the three most frequently consumed meals, the company they visit the restaurant with, the reason for consuming the food, whether they practice physical activity and how often, and finally, the category of the types of exercises they perform. Based on the data collection, the categories were established, and the frequency of each response (descriptive statistics) was determined for each section, leading to the generation of a table that clearly and concisely presents the resulting frequencies.

The primary categories established were: sociodemographic data (secondary categories: identification, gender, age, weight, height); the frequency of fast food consumption (secondary categories: weekly frequency of consumption, attending fast food establishments, what is usually consumed in these establishments, and in the company of whom it is consumed); the practice of physical activity (secondary categories: how many times per week it is practiced and how much time is dedicated to these activities, indicating the sport or activity preferred by the respondent).

4 RESULTS AND DISCUSSION

Eighty-two percent of the respondents were male, and they were the most frequent respondents, while 18% were female. Regarding BMI, 131 people were classified as underweight, representing 13% of the sample; 631 people were classified as having a normal weight, representing 64%; 25 people were classified as obese, representing 3% of the sample; and 203 people were classified as overweight, representing 20%.

Relating gender to BMI, the results indicate that, for the male group, 13% are classified as underweight; 62.5% as normal weight; 2.23% as obese; and 21.93% as overweight. For the female group, 12.63% are classified as underweight; 69.23% as normal weight; 2.8% as obese; and 3% as overweight.

Of the total sample surveyed, 741 people perform physical activity, representing 74.85%, the remaining 249 people who do not perform physical activity represent 25.15%.

Of the sample that does not engage in physical activity, 83% are male and 17% are female. Therefore, they were divided into subcategories according to gender. In the underweight category, females represent a minority, at 9.5%. In the normal weight range, men show greater stability according to their BMI than women, with 53.6% compared to 42.8%. In the overweight category, the percentage is higher for males, at 29.4% compared to 11.9% for females. Finally, in the obese category, there is a higher rate of obesity in the female group, at 35.7% compared to 3.3% for the male group.

The table below presents the overall sociodemographic results:

Table 1

Description of the sample: sociodemographic

	18-20 years	18-20 years	21-30 years	21-30 years	31-40 years	31-40 years	41-50 years	41-50 years	51-60 years	51-60 years	61-70 years	61-70 years	71-78 years	71-78 years

The sociodemographic description of the sample allows for a fairly accurate characterization of the profile of those who consume food at the Mall Plaza Maule fast-food restaurant. Overall, the data show a predominantly young adult clientele, with weight and BMI consistent with overweight, a high proportion of people who study and/or work, and a mostly secondary and university level of education.

The majority of consumers are between 18 and 40 years old, both men and women, suggesting that the establishment primarily attracts young adults, age groups that tend to frequent shopping malls and have greater exposure to ultra-processed foods. The presence of people aged 41 and over is significantly lower, indicating that older customers use this type of service less frequently or prefer other food options.

Average weight, height, and BMI across almost all age groups are within the range of overweight, for both women and men, a situation consistent with the trends in overnutrition described in Chile (Casanueva Arratia, et al., 2022; Hernández, 2022; Medina-Morales, 2022). This reinforces concerns about the role fast-food restaurants may play in consolidating unhealthy eating habits, especially among young populations that already exhibit cardiometabolic risk factors.

In terms of occupation (work, job, studies), the clientele is predominantly students, workers, and those who combine work and study, with few individuals who are neither employed nor in academic pursuits. This suggests that the fast-food establishment functions as a quick meal option for those with limited time, who need practical solutions between classes and workdays, and who use the mall as a place for daily transit rather than solely for leisure.

The high number of students in the 18–30 age group indicates that the establishment positions itself as an accessible and socially attractive option for university and technical-professional students, who tend to value speed and price over strictly nutritional criteria. In the 31–40 age group, the predominance of workers suggests a more instrumental use of the space (work breaks, informal meetings, quick meals during work hours), which could guide future healthy food offerings and marketing strategies aimed at this segment.

At the educational level, secondary and university education clearly predominate, while the proportion of consumers with only basic education is low, and there is also a

significant group with postgraduate studies. This indicates that the establishment's customer profile is characterized by a medium-to-high level of education, which challenges the idea that fast food is consumed primarily by people with low levels of education and suggests that factors such as fast-paced lifestyles, convenience, and socialization carry more weight than formal education.

The fact that a significant portion of the sample has university or higher education opens possibilities for more sophisticated food education interventions, incorporating information on nutritional composition, healthier options within the menu itself, and the promotion of informed choices. Likewise, the coexistence of diverse educational levels reinforces the need for segmented communication strategies that consider both simple, visual messages and more detailed content for consumers with greater cultural capital.

The sample appears to primarily represent young adults, students, and workers with secondary and university education levels, who, on average, have BMI values in the overweight range. This sociodemographic and anthropometric profile suggests that the establishment operates as a food space associated with urban lifestyles, limited time, and consumption practices that may reinforce patterns of overnutrition, but which also offer a strategic opportunity to incorporate healthier alternatives aimed at a population with potential receptiveness to health promotion messages.

Table 2 below presents the categories and subcategories of fast-food consumption, and their respective frequencies.

Table 2

The consumption characteristics table reveals how, what, with whom, and why customers use the Mall Plaza Maule fast-food restaurant. Overall, the data show high-frequency consumption patterns, a clear preference for typical fast-food products, and motivations focused on price, taste, and speed of service.

Most participants eat at the establishment between 1 and 2 times per week, with a smaller group reaching frequencies of 2 to 3 and even 3 to 4 times per week, indicating regular rather than occasional use of the service. This weekly frequency, predominant in the 18-40 age group, suggests that fast food is part of consumers' usual eating pattern, which may have implications for caloric intake and the risk of overnutrition observed in the sociodemographic profile.

Regarding the kind of food consumed, the majority of consumers opt for traditional "fast-food," in contrast to a smaller proportion who report consuming options categorized as "healthy-food." This indicates that, despite the growing availability of healthier alternatives in some establishments, the actual preference remains concentrated on high-energy and high-fat foods, reinforcing the need to review the offerings and promotional strategies for healthier options.

Within the fast-food category, french fries, hot dogs, and pizza appear as the most consumed products, followed by hamburgers, steak sandwiches, chicken nuggets, and “empanadas” (traditional Chilean food: dough and meat). This pattern reflects a strong preference for ultra-processed foods, rich in saturated fats, sodium, and refined carbohydrates, as described in the literature on consumption in fast food establishments (Mohatar, 2025; Peralta Morales & Quezada Feijoo, 2024).

The high demand for French fries and hot dogs is particularly relevant, as these products are often accompanied by sugary drinks and sauces, creating combinations with very high caloric density. From a public health perspective, this preference suggests that interventions focused on reformulating recipes, reducing portion sizes, or incorporating healthier side dishes could have a significant impact on the nutritional profile of meals consumed at the establishment.

The table shows that customers typically eat out in the company of family, friends, or partners, while a smaller group eats alone or with coworkers. This indicates that eating at the establishment is configured as a social and leisure experience, rather than a mere nutritional need, reinforcing the mall's role as a space for meeting and socializing (Letelier, 2025; Toloza Ruiz, 2025; De Simone, 2024).

Consumption with family and friends also suggests that food choices can be influenced by group norms and dynamics, which has implications for the design of promotional campaigns for healthy options aimed at groups (for example, more balanced family menus or promotions associated with lower-calorie combinations). The segment that consumes with coworkers reinforces the idea that the establishment also serves as a food service in work contexts, especially for employees of the mall itself or nearby offices (Toloza Ruiz, 2025).

Regarding consumption reasons, price, taste, and speed stand out as the most frequently mentioned factors, above perceived quality, family activities, or work schedules. This demonstrates that the decision to visit the establishment is strongly influenced by criteria of economic accessibility and convenience, reinforcing the typical positioning of fast food as a “fast, tasty, and cheap” option (Pascacio Bermudez & Andrea Michelle, 2024).

The fact that “quality” is mentioned less frequently than price and taste suggest that consumers may prioritize immediate gratification and cost over nutritional or health value considerations. However, the presence of family activities and work schedules as additional motivations indicates a functional and relational component that could be leveraged to introduce balanced eating messages without sacrificing the appeal of speed and convenience.

The consumption profile reveals a customer who visits the fast-food restaurant weekly, prefers typical high-calorie foods, consumes primarily in social contexts, and bases their choice on price, taste, and speed of service. This profile, combined with the predominance of young adults with a BMI in the overweight range described in the sociodemographic table, reinforces the importance of considering these establishments as key settings for health promotion interventions (Franco Giraldo, 2022) and for offering healthier food alternatives in the Mall Plaza Maule, Maule, Chile (Rojas et al., 2025; Del Río Expósito, 2021; Loyola Pérez, 2021).

Table Number 3 presents the results related to the practice of physical activity.

Table 3

Track & Field	0	0	1	2	0	8	0	1	0	0	0	0	0	0

The data in Table 3 show that most fast-food customers engage in some form of physical activity, but with low to moderate frequency, primarily 1 to 2 times per week, especially among the 18-40 age group, both men and women. This pattern suggests that, while exercise is present, it does not reach the levels recommended for optimal health

promotion, which is particularly relevant considering the fast-food consumption pattern described in the other tables of the study.

In almost all age groups, the predominant category is exercise 1 to 2 times per week, with few cases reaching 4 or more weekly sessions and a significant proportion reporting no physical activity, especially among adults aged 31 and over. This pattern is consistent with what has been described in the literature on urban populations, where a high proportion of insufficiently active individuals are observed who combine sedentary work with regular consumption of high-energy-density foods, which is associated with a greater risk of overweight, obesity, and cardiometabolic diseases.

Most people who engage in physical activity concentrate their practice between 30 minutes and 2 hours per session, with the 18-30 age group standing out, primarily reporting sessions between 30 minutes and 1 hour. Sessions longer than 2 hours are in the minority across almost all age groups. This pattern indicates that, even though there is a willingness to exercise, the combination of low weekly frequency and moderate session durations likely does not reach the activity volumes recommended by the WHO (150–300 minutes per week of moderate intensity). This reinforces the idea of a generally sedentary lifestyle among a significant portion of the establishment's customers (Cardiology, 2021; World Health Organization, 2019).

Among those who participate in organized sports, soccer and basketball predominate, especially among young men, while among women, participation is less distributed among various disciplines (soccer, volleyball, cycling), with very few reporting participations in athletics or other sports. This preference for recreational and competitive team sports is related to social and recreational motivations (Vinagre, 2022; Pellicer de Juan, et al., 2021), which opens opportunities for interventions promoting physical activity associated with tournaments, championships, or partnerships with the mall itself, integrating benefits or incentives linked to healthier consumption within the fast-food establishment.

When these results are cross-referenced with the sociodemographic and consumption characteristics, it is observed that the restaurant primarily attracts young adults who are students and/or workers, with an anthropometric profile in the overweight range, and who regularly consume high-calorie foods. In this context, the presence of predominantly sporadic or low-frequency physical activity suggests an imbalance between caloric intake and energy expenditure, which positions the fast-food restaurant as a critical setting for the design of integrated strategies to promote healthy lifestyles, combining more balanced menu offerings with campaigns that encourage increased frequency and duration of physical activity in this population.

Table Number 4 shows more results regarding the type of physical activity practiced in other sports, because there are other important subcategories to point out.

Table 4

Type of physical activity practice in other sports

	18-20 years	18-20 years	21-30 years	21-30 years	31-40 years	31-40 years	41-50 years	41-50 years	51-60 years	51-60 years	61-70 years	61-70 years	71-78 years	71-78 years
Gym (Modality)	Females	Males	Females	Males	Females	Males	Females	Males	Females	Males	Females	Males	Females	Males
Weights	1	6	6	51	2	30	1	9	0	7	0	4	0	2
Cardio	2	3	2	32	0	39	1	12	1	10	0	3	0	2
Zumba/aerobics	1	0	3	0	1	0	1	0	0	0	0	0	0	0
Category														
Jogging	3	11	17	84	3	58	2	10	0	17	1	8	0	6
Walking	5	9	15	51	4	47	4	15	1	8	2	3	1	0
Dance	1	3	4	4	0	5	0	4	0	1	0	0	0	0
Zumba/aerobics in government programs	2	0	2	6	0	3	0	0	1	1	0	0	0	0

The data in Table 4 indicate that, among fast-food customers, recreational, accessible, and low-intensity forms of physical activity predominate, such as weight training and cardio at the gym, along with individual activities like jogging and walking, especially among young men and adults aged 21 to 40. This pattern suggests that, although some exercise is incorporated into customers' routines, it is organized more around general fitness and weight management goals than around systematic participation in competitive sports or structured disciplines.

In the gym section, weightlifting and cardio on treadmills or stationary bikes are the most prevalent activities, with particularly high participation from men aged 21 to 40. Zumba classes, on the other hand, are very limited and almost exclusively attended by young women. This distribution reflects a preference for modalities associated with strength and cardiovascular endurance training, consistent with current urban fitness trends. However, it also reveals low participation in choreographed or more recreational activities, which could be linked to gender stereotypes and a focus on quick aesthetic results rather than diverse physical experiences.

Within the categories of unstructured exercise, jogging and walking account for the largest number of responses, with very high figures among men aged 21 to 40 and significant, though lower, female participation. Dance and Zumba/IND appear less frequently and are mostly practiced by young women. These activities, due to their low cost and flexible scheduling, are functional for students and/or workers who use the mall as a thoroughfare.

However, they are often performed intermittently and without planning, which limits their impact on physical fitness and weight management (Peñafel et al., 2024; Strale et al., 2024).

The combination of strength and cardio training at the gym with free activities like jogging and walking creates a consumer profile that perceives itself as relatively active, but tends to choose individual, short-duration activities focused on calorie expenditure rather than overall health improvement. Relating these findings to the regular consumption of fast food and the predominance of young adults with overweight BMIs, as described in the sociodemographic tables, suggests a lifestyle where exercise appears as a compensatory strategy against a high-calorie diet (Garnica-Quintero, et al., 2023), rather than as a stable component of a healthy lifestyle. This reinforces the need for educational interventions and a healthier food offering at Mall Plaza Maule.

5 CONCLUSION

In recent years, Chilean culture has undergone various changes due to social, physical, and genetic factors. However, one thing we have never lost is our instincts; as the word suggests, we use them as a means of survival to get what we want. Furthermore, fast food consumption has become more than just an instinct; it's a habit. Whether due to time constraints, quality, taste, or any other reason, it's becoming more important than our overall nutrition. Over the years, large chains have directly influenced eating habits in some countries. This has impacted the choice between eating well, taking a little more time, or consuming fast food for its quick preparation and more affordable price.

This study has concluded that dietary changes have profoundly affected the quality of people's food. Consequently, as time progresses rapidly, we tend to seize upon anything that is important to us, forgetting ourselves as rational beings capable of distinguishing between good and bad. This research has revealed that fast food consumption has become a habit for both men and women, often due to time constraints, cost, or any other reason that takes precedence over our well-being.

This shows that people, in addition to not eating well, do not have a significant frequency and intensity of physical activity, which, as mentioned above, can generate nutritional alterations and this can lead to different pathologies, which affect health.

However, this study provided information regarding the number of people who have a normal BMI classification, encompassing most of the people surveyed, but always without neglecting the percentage of obese people, which lies in the fact that their lifestyle is showing warning signs in relation to nutrition and the practice of physical activity.

ABSTRACT

It is not possible to dismiss the Jurisdiction of the Public Administration. The peaceful pacification of social conflicts must be based on the current structure of legality. Therefore it is the duty of the Judge, the maximum duty of the law enforcer, in saying the law, to apply the legal order in all its complexion, without abuse of power. It is very important to reveal that reasonableness is closely linked to legality. Date of conclusion, this is not an unfolding of the principle of proportionality, is not in line with the idea of applying what is necessary to reach the desired goal. Reasonability, in this analysis, has the power to establish the magistrate's position as a managerial public administrator. Reasonability must link the enforcer to the law itself. Obviously, this link to the law does not refer to law in the strict sense of its cold letter, which little glimpses the social claims. The link referred to here can be interpreted within the "inventive" activity, in the words of the best, "creative" doctrine of the Judge, an activity that contemplates the interpretation of legal rules and principles, contemplates the application and interpretation of all juridical framework, including , the own jurisprudential production. In this sense, it is when the interpretation and application of the law escapes the anticipated and predicted by the legislator, and when the social demands are dissociated from the common, that the Judge can not abuse its power, it is at this moment that must be reasonable, it is in this time that can not turn its back on its mission as a public administrator, which is bound to parameters and guiding criteria.

Keywords: Reasonability. Jurisdiction. Public Administration. Power Abuse. New Code of Civil Procedure.

RESUMO

Não é possível afastar a Jurisdição da Administração Pública. A escoreita pacificação dos conflitos sociais precisa estar calcada na estrutura vigente de legalidade. Portanto é mister do Juiz, dever máximo do aplicador da lei, ao dizer o direito, aplicar o ordenamento jurídico em toda sua compleição, sem abuso de poder. É assaz importante desvelar que razoabilidade tem íntima ligação com legalidade. *Data máxima vênia*, não se trata de um desdobrando do princípio da proporcionalidade, não se coaduna com a ideia de aplicação do necessário para o alcance do objetivo almejado. Razoabilidade, nesta análise, tem o condão a firmar a posição do magistrado enquanto administrador público gerencial. Razoabilidade deve vincular o aplicador da lei à própria lei. Por óbvio, esta vinculação à lei

¹ Master's degree in Law. Universidade de Marília (UNIMAR). E-mail: felipeteles.adv@gmail.com

não se refere a lei em sentido estrito a sua letra fria, a qual pouco vislumbra os reclamos sociais. A vinculação aqui referida, pode ser interpretada dentro da atividade “inventiva”, nos dizeres da melhor doutrina, “criativa” do Juiz, atividade esta que contempla a interpretação de regras e princípios jurídicos, contempla a aplicação e interpretação de todo arcabouço jurídico, inclusive, a própria produção jurisprudencial. É neste sentido, é quando a interpretação e aplicação da lei escapa ao antevisto e previsto pelo legislador, e quando os reclamos sociais estão dissociados do comum, que o Juiz não pode abusar de seu poder, é neste momento que deve ser razoável, é nesta hora que não pode dar as costas para sua missão de administrador público, o qual está vinculado à parâmetros e critérios norteadores.

Palavras-chave: Razoabilidade. Jurisdição. Administração Pública. Abuso de Poder. Novo Código de Processo Civil.

RESUMEN

No es posible separar la jurisdicción de la Administración Pública. La adecuada resolución de los conflictos sociales debe basarse en la estructura legal vigente. Por lo tanto, es deber del juez, el máximo deber del agente del orden, al dictar la ley, aplicar el ordenamiento jurídico en su totalidad, sin abuso de poder. Es fundamental destacar que la razonabilidad está íntimamente ligada a la legalidad. Con el debido respeto, esto no implica un desarrollo del principio de proporcionalidad; no se alinea con la idea de aplicar lo necesario para lograr el objetivo deseado. La razonabilidad, en este análisis, tiene la facultad de establecer la posición del magistrado como administrador público directivo. La razonabilidad debe vincular al agente del orden con la propia ley. Obviamente, esta vinculación con la ley no se refiere a la ley en sentido estricto, a su fría letra, que rara vez considera las demandas sociales. El carácter vinculante al que se hace referencia aquí puede interpretarse dentro de la actividad “inventiva” o, en palabras de la mejor doctrina, “creativa” del juez. Esta actividad abarca la interpretación de las normas y principios jurídicos, la aplicación e interpretación de todo el marco jurídico, incluyendo la propia producción jurisprudencial. Es en este sentido, cuando la interpretación y aplicación de la ley escapan a lo previsto y predicho por el legislador, y cuando las demandas sociales se disocian de lo común, que el juez no puede abusar de su poder. Es en este momento que debe ser razonable; es en este momento que no puede renunciar a su misión como administrador público, sujeto a parámetros y criterios rectores.

Palabras clave: Razonabilidad. Jurisdicción. Administración Pública. Abuso de Poder. Nuevo Código de Procedimiento Civil.

1 INTRODUCTION

The Principle of Reasonableness must be understood as a vector for prohibiting the abuse of power, within the civil procedure, by the magistrate. Thus, the new civil adjective law inaugurates a new bias, a new feeling about the principle of reasonableness, separating it from the principle of proportionality and giving it its own dimensions.

Thus, reasonableness should be seen as a care of the principle of legality. The Democratic Rule of Law, without a doubt, is a curator of the principle of legality, ensuring that the acts emanating within it, whether state or private, can be backed by the rule of law in a broad sense, by the entire legal framework I contemplate, including the guiding principles of fundamental rights.

In this vein, the magistrate, the state-judge, the applicator of the law, cannot dissociate himself, when the act of saying, from the notion of administrative function. It should be noted that social pacification should be considered as an administrative act, a state act, and its delivery is carried out in such a way as not to exceed the limits of what is reasonable, that is, the limits of what is imposed by the legal system itself.

This time, the first research problem is revealed: is the majority definition of the principle of reasonableness sufficient for its understanding, together with the new Code of Civil Procedure? Can reasonableness, in its best definition, as a brake on the abuse of power, be used in the magistrate's performance, limiting or refining his creative power in the application of the norm?

In this crack, the new civil law brings numerous institutes, some listed in this work, which, among other principles, enshrine reasonableness as a prohibition against the abuse of power of the magistrate in the judgment of civil disputes. In this way, a new order is developed in the civil procedure, which places the judge as a promoter, procedural collaborator and imposes a duty on him, which is: the need to respect the system and the current legal structure, under penalty of incurring in illegalities and seeing his judgment vitiated.

The research aims to demonstrate the best facet of the principle of reasonableness and its importance, as a way to combat the abuse of power, demonstrating its practical applicability through institutes collected in the current Code of Civil Procedure.

The deductive and bibliographic method permeate the development of the research, which is initially carried out in an investigative way.

2 PRINCIPLE OF REASONABLENESS AS A COROLLARY OF THE CURRENT CONSTITUTIONAL ORDER

2.1 DEMOCRATIC RULE OF LAW AND THE PRINCIPLE OF LEGALITY

The expression Rule of Law refers to a juridical-political thought that has developed essentially since the sixteenth century, being considered as a corollary of contractualism and a presupposition of individual ethical autonomy, having as its essential object the legal limitation of the State's intervention in relation to the individuality of citizens, thus assuming an individual characteristic, even though there are previous concepts for this expression as in the Platonic-Aristotelian opposition between "government of laws" and government of men" and also in the medieval doctrine that had a legal basis for sovereignty.

In the words of Torrão, the Rule of Law means the practical realization of liberal thought, in which the States are subordinated to the law, which is the expression of reason, as well as respecting natural rights, opposing the absolutist form of the Police State.

For Canotilho², in the Rule of Law, the State and all its respective political organs are subject to the law, that is, to a form of ordering that is rational and binding on an organized society, in which it articulates measures or material rules, manifesting values of justice and with forms and procedures establishing legal-formal guarantees aiming at the fulfillment of its axiological program.

Thus, it was only after the occurrence of violations in the legislative sphere through abuses by this power during totalitarian regimes, that he realized the need for formal and material legal limitation regarding the legal production, that is, laws. Thus, the relevance of control not only of the exercise of power, but also with regard to the content of decisions, through a fundamental normative diploma, the Constitution, which is endowed with supremacy and normative force that binds the Legislative Power, thus associating legal production with an ethical-axiological model that aims at respecting the dignity of the human person and fundamental rights, these being primordial foundations to materialize the limiting idea of rights and freedoms related to the Rule of Law. In the meantime, norms protecting fundamental rights were considered to be of normative supremacy in many Western Constitutions and with the post-war period, the basic historical peculiarities of the concept of the Rule of Law were rescued with the constitutionalism of this time, reflecting not only in the legal limitation and control of the power of the state, but also in the delimitation of the purposes of this power.

² CANOTILHO, José Joaquim Gomes. **Constitutional law and theory of the Constitution**. 7. ed. Coimbra: Almedina, 2003, p. 243.

According to Canotilho³, the Rule of Law should essentially be a tool to limit and also bind political power in a Constitutional State, as it implies a normative constitution that structures a fundamental legal-normative order that binds all public powers, which attributes measure and form to the state order and to the acts of the public powers, legally binding them in the formal and material aspects.

It is considered that the function of the Rule of Law, with regard to its liberal-contractualist character, is to guarantee the rights of citizens with regard to external interventions, both by the State and by other citizens, and in order to achieve this guarantor objective there must be a limitation of the Rule of Law through the legal system with regard to the power of legal production itself, and thus the right itself must be limited. This limitation makes the law program its forms of production through procedural norms, as well as its substantial contents, which refer to the protection of the dignity of the human person and the guarantee of fundamental rights.

The principle of the Rule of Law is then reflected in the legality, constitutionality, respect and guarantee of fundamental rights and aims to respond to the problem of the content, extent and way of proceeding of the state's activity, determining it according to these guidelines⁴.

The Democratic State of Law is founded on the principle of popular sovereignty that establishes the active and operative participation of the people in public affairs, and this participation is not simply limited to the formation of representative institutions, as these only constitute a stage in the evolution of the democratic State, but do not configure its complete development. the purpose of this principle goes beyond that, as it aims to present the Democratic Rule of Law as a form of real guarantee of the fundamental rights of the human person⁵.

Article 1 of the Federal Constitution of 1988 provides that Brazil is a Democratic State of Law, having in its essence human dignity as a fundamental value, which informs and guides the entire legal order. The Federal Constitution of 1988 also provides for fundamental rights and guarantees, having mechanisms for these to be put into effect, such as their immediate applicability and the constitutionality control of norms.

According to Silva⁶:

³ CANOTILHO, José Joaquim Gomes.op.cit.,p.245.

⁴ CANOTILHO, José Joaquim Gomes.op.cit.,p.243.

⁵ SILVA, José Afonso da. **The Democratic Rule of Law**. Journal of Administrative Law. Rio de Janeiro, n. 173, p.15-34 jul./set. 1988. Available at <http://bibliotecadigital.fgv.br/ojs/index.php/rda/article/viewFile/45920/44126>>. Accessed on: 10 Dec. 2018, p.20.

⁶ SILVA, José Afonso da. op.cit., p.23.

The principle of legality is also a basic principle of the democratic rule of law. It is of the essence of its concept to be subordinated to the Constitution and to be based on democratic legality. It is subject, like any State of Law, to the rule of law, but to the law that realizes the principle of equality and justice not by its generality, but by the search for equalization of the conditions of the socially unequal. Therefore, the relevance of the law in the democratic State of Law should be highlighted, not only in terms of its formal concept of an abstract, general, obligatory and modifying legal act of the existing legal order, but also in terms of its function as a fundamental regulation, produced according to a qualified constitutional procedure. The law is effectively the most prominent official act in political life.

It then becomes evident the need to apply the foregoing as a way to limit and bring reasonableness to the power of the State, including in the exercise of jurisdiction. As for the Judiciary, it is relevant to mention the importance of its decisions and interpretations in the sense of instrumentalizing and protecting fundamental rights, correlating them to the principle of the Rule of Law, which can be observed through another principle, namely: the principle of legality, provided for in the Federal Constitution of 1988.

Thus, article 5, item II, and article 37 caput, both of the Magna Carta, do not only cover the private sector, they cover public affairs, public administration and its duty to be based on the law, on the dictates of this democratic instrument of social control.

Thus, a judiciary that does not judge according to the law in a broad sense, an inventive judiciary in its most pernicious way, is against the rule of law, is against the democratic rule of law, acting without control, abusing power and doing acts beyond what is reasonable.

Reasonableness is linked to the democratic rule of law. Reasonableness is linked to legality, it is linked to compliance with the law in all its dimensions, and it prevents the abuse of power in the distribution of rights.

2.2 NEOCONSTITUTIONALISM AS AN INFLUENCER OF THE PROCEDURAL SYSTEM AND PROMOTER OF REASONABLENESS

Initially, on Neoconstitutionalism, it is appropriate to transcribe the concept brilliantly woven by the renowned doctrinaire Dirley da Cunha Júnior:

Neo-constitutionalism represents the current, contemporary constitutionalism, which emerged as a reaction to the atrocities committed in the Second World War, and has given rise to a set of transformations responsible for the definition of a new constitutional right, founded on the dignity of the human person. Neo-constitutionalism stands out, in this context, as a new legal theory to justify the paradigm shift, from the Legislative State of Law, to the Constitutional State of Law, consolidating the passage of the Law and the Principle of Legality to the periphery of the legal system and the transit of the Constitution and the Principle of Constitutionality to the center of the entire

system. in view of the recognition of the normative force of the Constitution, with binding and mandatory legal effectiveness, endowed with material supremacy and intense evaluative charge.⁷

Therefore, it was through the Constitutional Rule of Law that Neoconstitutionalism emerged, proposing that the validation of a norm should not be based solely on the criterion of the normative competence of those who drafted it or on the analysis of the procedural legality required for the elaboration of laws, but rather that valid laws are those that submit "legality itself to the Constitution, so that the conditions of validity of laws and other legal norms depend not only on the form of their production, but also on the compatibility of their contents with constitutional principles and rules".⁸

In this way, a profound process of constitutionalization of the Law emerged, to the point that the constitutional rules, the content inserted in the norms, as well as the constitutional principles are highlighted when analyzing the validity of a norm and that, in this context, the principle of legality as well as the formal procedure for drafting norms must be analyzed in a constitutional way, contemplating a generic normative framework and guiding principles.

It is in this neo-constitutional context that the Constitution of the Federative Republic of Brazil is inserted, that is, it can be affirmed that the Brazilian Constitution currently in force was elaborated under an axiological evaluative aegis, in the sense of ensuring the dignity of the human person and fundamental rights, so that it aims at the realization of constitutionalized values and the guarantee of minimum dignified conditions.

The new analysis and importance of Constitutional Law within the legal system was clearly outlined by Dirley da Cunha Júnior:

Furthermore, it was especially decisive for the delineation of this new Constitutional Law, the recognition of the normative force of the principles, a situation that has led to the rapprochement between Law and Ethics, Law and Morals, Law and Justice and other substantive values, revealing the importance of man and his ascendancy as an axiological filter of the entire political and legal system. with the consequent protection of the fundamental rights of the human person.

The emergence of neo-constitutionalism succeeded in providing the recognition of the double normative-axiological dimension of contemporary Constitutions, giving rise to the consolidation of a material or substantial legal theory based on the dignity of the human person and fundamental rights. In this context, the legal discourse, previously associated with a formal and proceduralist conception, evolves to reach a substantialist strand concerned with the realization of constitutional values.⁹

⁷ CUNHA JÚNIOR, Dirley da. **Constitutional Law Course**. 7th. ed. Bahia: Juspodivm. 2013. p. 39.

⁸ Ibidem, p. 39.

⁹ CUNHA JÚNIOR, Dirley da., op. cit., p. 40-41.

Taking into account the characteristics of this post-modern constitutionalism, as well as the fact that our Magna Carta was drafted under the influence of its values, it is of paramount importance to analyze the constitutional principles that underlie the new Code of Civil Procedure.

In this sense, it is undoubted that the principle of Reasonableness is rooted in the precepts of constitutional principles, spreading a democratic character over Civil Procedure. Thus, article 8 of the new codex, also enshrining article 5 of the Law of Introduction to the Rules of Brazilian Law, reveals the following text:

Article 8 When applying the legal system, the judge will meet the social purposes and the requirements of the common good, safeguarding and promoting the dignity of the human person and observing proportionality, reasonableness, legality, publicity and efficiency.

Therefore, when analyzing the principles of civil procedure from the perspective of neo-constitutionalism, it is noted that reasonableness is fully encompassed and provided for in the mandatory rule. Although its express constitutional provision is absent, this institute has subsistence and constitutional grounds that justify its effective implementation, as explained.

There is no possibility of interpreting the civil procedural system by ruling out a type of expedient such as reasonableness. The constitutional civil procedure becomes elevated in the face of principles such as reasonableness, as a systemic guarantee of the prohibition of the abuse of power, allowing the application of the legal system not to be influenced by arbitrariness, preventing each judge from having his own procedural rules, in the words of Humberto Teodoro Júnior, encouraging the judge to apply the law in a way that is appropriate to the current moment, this application should not be contemporary to its production, but contemporary to its application.¹⁰

For all the above, it is denoted that the influence of neo-constitutionalism in our current Magna Carta has elevated and guided the possibility of the infra-constitutional legislator and even the components of the Judiciary to foster and institutionalize the principle of reasonableness by making it concrete in the new Code of Civil Procedure, as we will see later.

¹⁰ JÚNIOR, Humberto Theodoro. **Curso de Direito Processual Civil**, 56 ed.- Rio de Janeiro: Forense, 2015, p. 90.

3 PRINCIPLE OF REASONABLENESS: EFFECTIVE CRITERIA WITHIN THE NEW CODE OF CIVIL PROCEDURE.

3.1 DIMENSIONS OF THE PRINCIPLE OF REASONABLENESS:

According to the most respectable doctrine, reasonableness and proportionality are synonymous principles, they are consistent and translate the same feeling of the need to apply the necessary means to achieve the desired objective.

Thus, the reasonableness and proportionality of the public administration must be observed both by the legislator at the time of the issuance of legislative acts and by the law enforcer, at the time the administrative act is issued. In the first case, the legislator must weigh the need for legal protection on the one hand and the impact of this protection when applied to the specific case on the other. While in the second case, the magistrate as part of the public administration, in the concrete case, must apply the law respecting its purposes.

In the words of Celso Antônio Bandeira de Mello, the principle of reasonableness should be noted:

It is stated with this principle that the Administration, when acting in the exercise of discretion, will have to obey criteria acceptable from a rational point of view, in line with the normal sense of balanced people who respect the purposes that presided over the granting of the competence exercised.¹¹

Thus, it is clarified that certain acts or attitudes of the public administration will not only be inconvenient, but also illegitimate, unreasonable, bizarre, incoherent or practiced in disagreement with the purpose provided for by law.

Regarding the principle of proportionality, the author, Celso Antônio Bandeira de Mello, admired by us:

This principle enunciates the idea – simple, by the way, although often disregarded – that administrative powers can only be validly exercised to the extent and intensity corresponding to what is actually required to fulfill the purpose of the public interest to which they are linked.¹²

It can be seen, therefore, that both principles, reasonableness and proportionality, hold the same central idea, that is: acts that exceed what is necessary to achieve the intended objective are tainted by illegitimacy.

¹¹ BANDEIRA DE MELLO, Celso Antônio. Discretion and jurisdictional control. 2nd ed.. São Paulo: Malheiros, 2014, p. 111.

¹² Idem, p. 113.

Diverging from the brilliant author mentioned above, as well as being in line with the vision of Cláudio Pereira de Souza Neto and Daniel Sarmento, the principle of reasonableness has different dimensions from the principle of proportionality, unveiling a greater content than that of marking acts necessary to achieve the purpose pursued. With such dimensions, proportionality gains the contours of a prohibition, a prohibition against the abuse of power.

As already stated elsewhere, this abuse of power is revealed in excesses in the interpretation of the rule, exceptions in the application of the law in a broad sense, or non-observance of this law.

Thus, although the parties to the proceedings may also abuse their power, inherent to the participatory pole, in this analysis we deal with the possibility of abuse of power perpetrated by the judge, as public administrator of the jurisdiction.

Thus, it is necessary to consider reasonableness in these dimensions:

- a) Reasonableness as requirements of public reasons for the conduct of the State, which demands that State acts can be justified by means of arguments that, at least in theory, are accepted by all;
- b) Reasonableness as coherence prohibits the state from acting in a contradictory manner;
- c) Reasonableness as congruence prohibits the issuance of measures that are not supported by reality; and finally,
- d) Reasonableness as equity allows, in exceptional cases, the general rules to be adapted in their application [...] or even to deny the application of the rule when it causes serious injustice.¹³

Thus, such dimensions, as forms of control of the abuse of power in state acts, specifically as a form of control of the abuse of power of the magistrate in the application of the law, can be understood, according to this analysis, as follows, with regard to reasonableness as requirements of public reasons for the conduct of the state, this should be seen as democratic arguments. In other words, the decisions of the judge-state, when applying the rule, must be permeated by democratic arguments. The general principles of law, jurisprudence, analogy, in short, the entire legal framework must be applied in a democratic way, seeking the social claims that are mostly accepted.

¹³ NETO, Claudio Pereira de Souza; SARMENTO, Daniel. *Apud*, WAMBIER, Teresa Arruda Alvim; CONCEIÇÃO, Maria Lúcia Lins; RIBEIRO, Leonardo Ferres da Silva; MELLO, Rogerio Licastro Torres de. **First Comments on the New Code of Civil Procedure Article by Article**, São Paulo: Revista dos Tribunais, 2015, p. 64.

Furthermore, when talking about reasonableness for coherence, it must be understood as a prohibition of contradiction, that is, the judge-state must maintain a solid jurisprudence, ensure legal certainty.

Nevertheless, reasonableness as a support in reality prevents symbolic, fictional measures, which have no influence on reality, however, make the judiciary maintain a sense of power and control.

Finally, the last dimension of reasonableness allows the suppression of the norm, however this suppression can only occur in flagrant injustice, in what stands out and that does not declare a loser and a winner, however, declares all insufficient and does not hand over the right to anyone.

3.2 CONCRETE EXAMPLES OF REASONABLENESS, AS A CONTROL AGAINST THE ABUSE OF POWER, IN THE NEW CODE OF CIVIL PROCEDURE

It is necessary to reiterate, although the abuse of power, through reasonableness, is prohibited for the party in the civil proceeding, as an example, article 373 of the adjective law, which allows the reversal of the burden of proof in matters other than consumer law, an analysis of reasonableness is made here only with regard to the magistrate's performance as a prolator of state decisions.

Therefore, reasonableness, due to the bias of prohibiting judicial decisions, emerges from the Code of Civil Procedure, for example, in article 139, IV:

The judge shall conduct the proceedings in accordance with the provisions of this Code, and it shall be incumbent upon him:

[...]

IV - to determine all inductive, coercive, mandatory or subrogatory measures necessary to ensure compliance with a court order, including in actions that have as their object a monetary payment;

[...].

It is clear that article 139 of the Civil Law provides for other responsibilities of the magistrate, however, item IV innovates and unveils reasonableness, prohibiting the abuse of power, when searching desired by the creditor, allowing condemnatory actions to be treated as an executive action and giving the execution greater efficiency. Now, it seems to us an abuse of power not to make multiple and effective decisions in the search for satisfaction of the credit, the state-judge cannot transform the satisfaction of the credit into a utopia.

Continuing with the analysis, it is important to glimpse article 140:

The judge is not exempt from deciding on the grounds of lacuna or obscurity in the legal system.

Sole Paragraph. The judge will only decide on equity in the cases provided for by law.

An important demonstration of reasonableness, it is not possible to decline jurisdiction, it is not possible to remove the burden of delivering the right. And see, equity is unveiled within the legal framework within the structure, and it is impossible to apply equity within an unfounded creative activity.

There is more, article 141 is another trimmer or limiter of abusive powers: "The judge shall decide the merits within the limits proposed by the parties, and it is forbidden to hear issues not raised in respect of which the law requires the initiative of the party". Here reasonableness is linked to congruence and inertia, limiting, hindering the law enforcer, reminded of his limited power in the face of the Democratic Rule of Law.

The civil liability of the judge is also important encouragement regarding the prohibition of the abuse of his power, as stated in article 143:

The judge will be liable, civilly and regressively, for damages when:

I - in the exercise of his functions, to act with intent or fraud;

II - refuses, omits or delays, without just cause, a measure that must be ordered ex officio or at the request of the party.

[...].

Of course, it is not about strict civil liability, not without being able to speak of guilt, however, the concern with this state power is demonstrated.

Article 489. The essential elements of the sentence are:

[...]

§ 1 Any judicial decision, whether interlocutory, sentence or ruling, which:

[...]

VI - failing to follow the statement of precedent, jurisprudence or precedent invoked by the party, without demonstrating the existence of a distinction in the case under trial or the overcoming of the understanding.

Article 489, paragraph 1, item VI, cited above, brings the need for reasonableness in its dimension of coherence, legal certainty must be encompassed, under penalty of abuse of power. It is the judge's duty to elucidate the discussion and the invocations of the courts, to verify whether the understanding raised by the party is still valid and can be applied to the specific case.

In this vein, with regard to coherence, we can still list the following articles:

Article 926. Courts must standardize their jurisprudence and keep it stable, complete and coherent.

§ 1 In the manner established and according to the assumptions set forth in the internal regulations, the courts shall issue summary statements corresponding to their prevailing jurisprudence.

§ 2 When issuing precedent statements, the courts must stick to the factual circumstances of the precedents that motivated their creation.

Article 927. Judges and courts shall observe:

I - the decisions of the Federal Supreme Court in concentrated control of constitutionality;

II - the statements of binding precedents;

III – judgments in incidents of assumption of jurisdiction or resolution of repetitive claims and in judgments of extraordinary and special repetitive appeals;

IV – the statements of the precedents of the Federal Supreme Court in constitutional matters and of the Superior Court of Justice in infra-constitutional matters;

V – the orientation of the plenary or of the special body to which they are linked.

Still pertinently, the Code brings the possibility of applying a rescinding action in the case of manifest non-compliance with a legal rule, article 966, it may seem obvious, however, the decision, the demonstration of power evoked from the absence of legality, cannot be valid. As already said, the creative and inventive possibility of the judge must encounter barriers in the reasonable, in the legality.

Finally, it is worth transcribing here article 988 of the Code of Civil Procedure: "a complaint by the interested party or the Public Prosecutor's Office may be filed for: [...] III - to ensure compliance with the decision of the Federal Supreme Court in concentrated control of constitutionality; [...]".

This article places the magistrate in a position of being supervised, watched, so that he cannot incur in abuses of power and ensures attention to the legal system as a whole and the constitutional guidelines. Transgressing the Supreme Court's control of constitutionality would be more than abusing power, if not, subverting the very logic of power.

Therefore, although they contemplate other principles and other aspects, the institutes brought above, without a doubt, bring the demonstration of the principle of reasonableness, within the New Code of Civil Procedure, in a dimension of prohibition of the abuse of power and control of state decisions, placing the magistrate on a level of state administrator and disseminator of administrative acts.

4 CONCLUSION

The panorama of the results invites a percussive analysis of the need to understand the principle of reasonableness, as an instrument to control the abuse of power of the magistrate, inserted in institutes within the Code of Civil Procedure.

Certainly, the lack of reasonableness in the Brazilian civil procedure removes the character of public administration from the jurisdiction, which cannot be thought of without necessary constraints to the legal structure in place. By dissolving social conflict, the judge-state cannot relegate the law in a broad sense, cannot reject the established jurisprudence, cannot supplant principles and guarantees. Even during his interpretative act, even during his creative sketch, the judge cannot relegate the legal system, under penalty of incurring in abuse of power and tainting his decision with illegality.

In the present work it was intended to examine the Constitutional legal provision of the principle of reasonableness, which, although not expressed in the Magna Carta, is a corollary of the Democratic Rule of Law, as well as is rooted in the neo-constitutionalist bias given to the interpretation of infra-constitutional norms. Thus, reasonableness, unlike proportionality, must be seen through republican dimensions, which attribute to the principle a character of indispensability for the proper functioning of the jurisdiction, in civil procedural matters, limiting the power of the judge and even allocating its action within the criteria of separation of powers and independence of the litigants.

The development of the research is justified by the pressing and relevant task of demonstrating that the principle of reasonableness, as a prohibition against the abuse of power, was widely enshrined by the new civil law, through various institutes. In this way, the new Code of Civil Procedure breaks paradigms and places the judge as a great collaborator, promoter of the resolution of the dispute. The magistrate is no longer the absent protagonist, he is present and must base his decisions within a systemic and ideological logic achieved by the process.

It is necessary to think about judging, within the civil process, as someone who is linked to the public administration and its efficiency. Legality does not lend itself only to the individual, however, it lends itself to the state to its actors and acts and the jurisdiction needs to commune with this.

The new process requires new powers, new responsibilities and new limitations. Reasonable, according to this analysis, is that magistrate who applies the legal norm without extrapolating its spirit, without ceasing to contemplate the settled jurisprudence, without ceasing to pay attention to the principled order. Reasonable is the compliance with the due process of law, it is a demonstration that the subjective right will be achieved through the adjective and not the other way around.

Reasonableness, in this analysis, has new reflexes, new aspirations, which, as demonstrated, were freed by the new Code of Civil Procedure.

ABSTRACT

This study analyzed the motor performance of individuals undergoing the aging process, participants of the Gerontology Center at Feevale University, mediated by the active digital game GameMove Motor Skill. The research is characterized as exploratory, quantitative, and cross-sectional. The sample consisted of 102 aging individuals (76 females and 26 males), all participants of the Feevale Gerontology Center. Data were presented using absolute and relative frequencies, measures of central tendency, and dispersion. Normality was tested using the Kolmogorov-Smirnov test, while the Mann-Whitney test compared scores between genders, and the Chi-square test evaluated associations between motor skills and age groups. Analyses were conducted in IBM® SPSS® (v.26.0), adopting a significance level of $p \leq 0.05$. The analysis of motor performance in the GameMove Motor Skill revealed no significant differences between sexes in the hitting task, although results showed a favorable trend for men. In the right-leg kicking task, a significant difference was observed in favor of men. This result may be associated with cultural factors that influence oculopedal experiences and the valuation of certain motor skills in the daily lives of aging individuals. The hopping/stationary march test indicated a slight male tendency, but without statistical significance, whereas the balance test revealed significant differences favoring men on both sides, with greater discrepancies observed after the age of 70. The game proved to be a reliable instrument for assessing motor performance in individuals undergoing the aging process, providing support for understanding this performance and for the appropriate prescription of interventions.

RESUMO

Este estudo analisou o desempenho motor de pessoas em processo de envelhecimento, participantes do Centro Interdisciplinar de Pesquisas em Gerontologia da Universidade Feevale, mediado pelo jogo digital ativo GameMove Motor Skill. A pesquisa é de natureza exploratória, quantitativa e transversal. A amostra foi composta por 102 pessoas em processo de envelhecimento, 76 do sexo feminino e 26 do sexo masculino. Os dados foram apresentados por frequências absolutas e relativas, medidas de tendência central e dispersão. A normalidade foi testada pelo Kolmogorov-Smirnov, o Mann-Whitney comparou escores entre sexos e o Qui-Quadrado avaliou associações entre habilidades motoras e faixas etárias. As análises foram realizadas no IBM® SPSS® (v.26.0), adotando $p \leq 0,05$. A análise do desempenho motor no GameMove Motor Skill mostrou ausência de diferença significativa entre os sexos no teste de rebater, embora com melhor desempenho aos homens. No chute com a perna direita, observou-se diferença significativa em favor do sexo masculino. Esse resultado pode estar associado a fatores de ordem cultural, que influenciam a vivência óculo-pedal e a valorização de determinadas habilidades motoras no cotidiano das pessoas em processo de envelhecimento. O teste de saltitar/marcha estacionária indicou melhor desempenho masculino, mas sem significância, enquanto no equilíbrio houve diferença significativa para os homens em ambos os lados, mais acentuada após os 70 anos. O jogo demonstrou ser um instrumento confiável para a avaliação do desempenho motor em pessoas em processo de envelhecimento, oferecendo subsídios para a compreensão desse desempenho e para a adequada prescrição de intervenções.

RESUMEN

Este estudio analizó el rendimiento motor de personas en proceso de envejecimiento, participantes del Centro Interdisciplinario de Investigaciones en Gerontología de la Universidad Feevale, mediado por el juego digital activo GameMove Motor Skill. La investigación es de naturaleza exploratoria, cuantitativa y transversal. La muestra estuvo compuesta por 102 personas en proceso de envejecimiento, 76 mujeres y 26 hombres. Los datos se presentaron por frecuencias absolutas y relativas, medidas de tendencia central y dispersión. La normalidad se probó mediante Kolmogorov-Smirnov, Mann-Whitney comparó las puntuaciones entre sexos y Chi-Cuadrado evaluó las asociaciones entre habilidades motoras y grupos de edad. Los análisis se realizaron en IBM® SPSS® (v.26.0), adoptando $p \leq 0,05$. El análisis del rendimiento motor en GameMove Motor Skill mostró una ausencia de diferencias significativas entre los sexos en la prueba de bateo, aunque con un mejor rendimiento en los hombres. En la patada con la pierna derecha, se observó una diferencia significativa a favor del sexo masculino. Este resultado puede estar asociado a factores de orden cultural, que influyen en la experiencia óculo-pedal y en la valoración de determinadas habilidades motoras en la vida cotidiana de las personas en proceso de envejecimiento. La prueba de saltar/marcha estacionaria indicó un mejor rendimiento masculino, pero sin significación, mientras que en el equilibrio hubo una diferencia significativa para los hombres en ambos lados, más acentuada después de los 70 años. El juego demostró ser un instrumento confiable para evaluar el desempeño motor en personas en proceso de envejecimiento, ofreciendo información para comprender este desempeño y prescribir intervenciones adecuadas.

Palabras clave: Juegos Electrónicos de Movimiento. Destreza Motora. Envejecimiento.

1 INTRODUCTION

The world's population is in an aging process, configuring one of the most relevant demographic phenomena of the twenty-first century. According to recent estimates by the World Health Organization (WHO, 2024), by the year 2030, one in six people will be 60 years of age or older, totaling approximately 1.4 billion individuals in this age group. Projections also indicate that by 2050 this contingent could reach 2.1 billion people, evidencing the magnitude and urgency of discussions on population aging on a global scale.

The United Nations predicts that by 2050, people over the age of 65 will make up 15.9% of the world's population, up from 9.3% in 2020. In Europe, this age group is projected to reach 28.1%, from the current 19.1%, while the population over 80 years of age is expected to practically double, from 5.3% to 10.1% in the same period (United Nations, 2023).

The proportion of people in the process of aging has been increasing consistently in both developed and developing countries, a direct result of the combination of declining mortality and fertility rates and the progressive increase in life expectancy. In this context, it is essential to understand and identify the priority problems that affect the aging population, understood as the contingent of individuals who enter more advanced age groups as a result of the increase in longevity and the reduction in fertility and mortality rates. Such understanding is essential to support the formulation of actions aimed at ensuring the safety of the aging population and providing the necessary health care (Torre, 2022).

In this sense, it is imperative to consider the physiological and functional changes typical of aging, since reduced levels of physical activity, decreased gait speed, and progressive loss of muscle strength are associated with a more accelerated decline in mobility, predisposing to functional limitations and greater vulnerability (Martins et al., 2020).

Among the most critical factors, deficits in postural control stand out, which have repercussions on physical functioning and are significant predictors of falls in the elderly. Postural control should be understood as a complex and dynamic skill, resulting from the interaction between sensory, perceptive and motor processes, whose proper integration enables postural orientation and the maintenance of balance. From this perspective, functional balance is a central element, as it represents the ability of the elderly to sustain stability, both in static and dynamic situations, during daily activities. The impairment of this ability compromises not only functional independence, but also the quality of life of individuals in the aging process (Medeiros et al., 2024).

Flores et al., (2024) argue that technological devices, such as television, smartphones, computers, and video games, are associated with the promotion of sedentary lifestyle patterns. However, Pacheco et al (2020), Ha et al (2025) and Chen et al (2020) indicate that

technological advances can also offer new possibilities for the practice of physical exercise, contributing to the improvement of physical activity levels, well-being and learning.

In this sense, exergames (a term derived from the combination of the words exercise and game) can be defined as active digital games (JDAs) that require body movement to be played, providing an interactive experience that works as a form of physical exercise (Van Santen et al., 2018). These resources cover multiple motor and cognitive skills by integrating sensory feedback, adjustable ranges of motion, variations in speed and precision, as well as diversified tasks that simulate everyday situations (Schneider; Berlese; Barbosa, 2023).

Exergames or JDAs are recognized for enabling not only the real-time practice of motor activities, but also for promoting engagement in meaningful actions related to the interests of daily living (Maggio et al, 2025). Huang et al. (2017) highlight that this type of game can positively influence both the subjective experience and the behaviors of players by articulating entertainment with functional goals.

In the field of rehabilitation, there is a growing body of scientific evidence on the potential benefits of JDAs for people with cognitive-motor deficits. Nuic et al (2024) and Fernandes et al (2025) point to positive impacts on specific populations, such as patients with Parkinson's disease or in the post-stroke rehabilitation phase. Chen et al. (2021) point out that these tools have significant potential for improving postural control and balance, fundamental aspects for functional autonomy.

However, despite the already recognized benefits of Active Digital Games (JDAs), there is still a relevant gap in the scientific field regarding the proof of their effectiveness in assessing motor performance (Leal et al., 2023). This gap highlights the need for research to validate the applicability of these technological resources in order to promote health and the prevention of functional disabilities.

In this sense, the definition of adequate motor parameters, combined with the systematic monitoring of Physical Education professionals, is a fundamental condition to ensure the effectiveness of interventions. This process not only guides the adaptation of the JDAs to the particular demands of the aging population, but also ensures the creation of contextualized virtual environments that respect individual singularities and promote dynamic, safe, and socially meaningful motor experiences. Thus, the Physical Education professional plays a central role in articulating technology, health and inclusion. In view of this scenario, the present study aims to analyze the motor performance of people in the aging process, participants of the Interdisciplinary Center for Research in Gerontology of Feevale

University, mediated by the active digital game GameMove Motor Skill.⁶

2 METHOD

The present research is characterized as being exploratory, descriptive, quantitative and cross-sectional. In order to contemplate the objectives of the study, the instruments and procedures were organized and carried out in phases and stages. The procedures and instruments for data collection or production were established according to the development phase, which followed a process structured in phases according to the model proposed by Baba and Tschang (2001). In Phase 1, the theoretical and pedagogical foundations for the improvement of the game were established. Phase 2 focused on creating the game's layout, rules, narrative, and characters, as well as implementing motion capture via webcam, and in Phase 3, developing the game itself. After the judges' validation (phase 4) and data collection, adaptations were made to the game and validation with the target audience (phase 5).

We investigated 102 aging people, of both sexes (76 females and 26 males), aged between 50 and 80 years, participants at the Feevale Gerontology Center, in Rio Grande do Sul, Brazil. Inclusion in the study was conditional on their consent. The exclusion criteria were guaranteed through the information contained in the registration form made available by the Feevale Gerontology Center, ensuring the standardization of the sample and the possibility of interaction of the participants with the game. Individuals in the aging process who had uncorrected physical, cognitive, intellectual or visual disabilities, whose conditions could compromise the adequate execution of the proposed tasks, were excluded from the study. Among the physical criteria, significantly reduced mobility, severe spasticity, and relevant musculoskeletal restrictions were considered exclusion factors. In the cognitive field, situations of severe developmental delays or marked attentional deficits were excluded. Regarding intellectual limitations, substantial comprehension difficulties were considered, capable of directly interfering with the performance of game activities.

In addition, the investigation had the participation of 02 Physical Education professionals, whose contribution was fundamental for the performance of the analog motor assessment through observation of movements (process-oriented assessment). The process-oriented evaluation, conducted by experts in the field, enabled detailed analysis of movement patterns, allowing comparisons between the data obtained in the JDA GameMove Motor Skill and the motor parameters. This complementary approach strengthens the validity

⁶ For the initial validation of the game with children (children from 6 to 11 years old), see: SCHNEIDER, Guilherme Theisen; et al. Development and validation of an active digital game to stimulate motor skills: application of the GameMove Motor Skill. In: *Anais...* (proceedings of the SBGames Extended 2023 conference, Brazilian Computer Society). 2023. Available at: https://sol.sbc.org.br/index.php/sbgames_estendido/article/view/27856.

of the results, ensuring a methodological triangulation that improves the reliability of the results and enables a more comprehensive understanding of the motor development of people in the aging process.

All evaluations were performed after signing the Informed Consent Form, in accordance with the determinations of resolution 466, of December 2012, of the National Health Council. Participants were provided with information regarding their right to participate and guarantees of anonymity. The study was approved by the Research Ethics Committee CAEE No. 78383024.6.0000.5348, Registration No.: 206426/2024.

To meet the need for a tool with a more precise evaluative focus, such as game improvement, a new stage was developed that introduced a differentiated dynamic to provide a more accurate and standardized motor evaluation. The main modifications included an introduction (instruction phase), with detailed feedback on motor actions, combining visual and auditory instructions. The objective was to improve the execution and understanding of the movements by the participants. This feedback offered immediate guidance, ensuring that movements were performed with greater precision. In addition, the evaluation phase has been adjusted to cover all age groups at a single level, with modifications such as reducing obstacles and increasing the intervals between tasks. These changes ensured a more reliable evaluation of motor parameters. By simplifying the dynamics of the game and adjusting variables such as the complexity of the tasks, the time and the number of obstacles, reliable results were obtained on the motor performance of people in the aging process.

Thus, Figure 1 illustrates the set of images in the tutorial (instruction phase) referring to the four movements selected for initial learning at the beginning of the evaluation phase. The tutorial was structured in such a way as to present each movement through the silhouette of an individual performing the actions of balancing, jumping (stationary gait), batting and kicking. To ensure adequate assimilation by the participants, the movements were programmed to be performed at a reduced speed, allowing a clearer and more detailed visualization of the actions by the participants. This strategy aimed to facilitate the understanding and correct execution of the movements, aligning with the pedagogical and evaluative objectives of the game.

Figure 1

Set of Tutorial Images in the four moves of the GameMove Motor Skill

Source: GameMove Motor Skill game tutorial images.

The digital evaluation was conducted using the GameMove Motor Skill, under the direct supervision of the principal investigator. Initially, the data of each participant, such as name, age and gender, were recorded in the game's identification menu. After this registration process, the system went through a calibration phase, designed to adjust the capture and mimicry of the body movements of the evaluated, ensuring the accuracy of the interactions. Each participant was submitted to an introductory stage, in which they practiced the game's tutorial. This phase aimed to promote familiarization with the movements required in each game mode, ensuring an adequate understanding of the proposed activities.

During the execution of the game, the Physical Education professionals filled out a specific analog motor assessment questionnaire aimed at people in the aging process, based on motor protocols applied to the elderly population and guided by the movement development guidelines proposed by Gallahue, Ozmun and Goodway (2013). This approach enabled an analysis of motor skills, respecting the particularities of aging and ensuring scientific rigor in the interpretation of the results. This instrument documents the motor skills observed, providing process-oriented data of the movements requested in the game (product).

The results were described as absolute (n) and relative (%) frequencies, minimum and maximum values, arithmetic mean, standard deviation, median, percentile ranks (P25, P75) and interquartile range. Kolmogorov-Smirnov was applied to test adherence to the normal distribution in all experimental variables (game and observation). Mann-Whitney was used to

compare the scores between genders. Chi-square (χ^2) was used to assess the existence of associations between the levels of motor skills classification as a function of age groups. All statistical procedures were performed using the IBM® SPSS® software (Version 26.0), adopting a significance level of $p \leq 0.05$.

3 RESULTS

The results presented in this study came from two complementary sources: the data collected automatically by the active digital game GameMove Motor Skill (product of motor actions) and the observations conducted by Physical Education professionals (process of motor actions). As an instrument to evaluate the motor action process, an assessment for older people adapted from the protocol originally proposed by Schneider (2025) was used. The data from the game provides objective and standardized information about the performance (product) of the participants, capturing precise metrics such as time, accuracy and efficiency of the movements. On the other hand, the observations of Physical Education professionals allowed a process-oriented analysis that considers more subtle and contextual aspects of motor performance, such as functional motor organization of movement, posture, coordination and adaptability. This perspective was essential for interpreting nuances that were not completely captured by the webcam.

The integration of these two data sources is justified by the need for a process- and product-oriented evaluation of motor performance, also encompassing the contextualized interpretation of its implications. This hybrid approach enabled a triangulation of information, ensuring that the study's findings incorporate both the precision and advances offered by the technology and the analytical depth and interpretive richness afforded by the expert observation of a qualified professional.

4 ANALYSIS OF DATA FROM THE JDA GAMEMOVE ENGINE SKILL

Before the presentation of the results, the procedure adopted for the statistical analysis of the data from the GameMove Motor Skill Active Digital Game (JDA) is highlighted. Comparisons were made using the two-way model, considering the factors age and sex, in order to verify the need or not for different classifications between men and women. In total, 21 variables were analyzed, distributed in three age groups (50–59 years, 60–69 years, and 70–80 years), which allowed a precise understanding of the effects of aging on motor performance, as well as the possible interactions between age and sex that will be presented in Table 1.

Table 1

Comparison between the sexes by age profile in the ability to balance the game

Age Group	Variable	Gender		P
		Female (n=76)	Male (n=26)	
50-59 years (n = 18)	Right Balance	58,0	60,0	0,100
	Left Balance	58,0	60,0	0,164
	Total Balance	117,0	120,0	0,100
60-69 years old (n = 58)	Right Balance	58,0	59,0	0,701
	Left Balance	57,0	58,0	0,522
	Total Balance	114,0	118,0	0,403
70-80 years (n = 26)	Right Balance	45,0	52,5	*0,017
	Left Balance	50,5	56,5	*0,015
	Total Balance	97,0	109,0	**0,003
All (n = 102)	Right Balance	57,0	58,0	0,480
	Left Balance	56,0	57,0	0,189
	Total Balance	112,0	114,5	0,211

(*) $p \leq 0.05$; (**) $p \leq 0.01$; (***) $p \leq 0.001$.

Source: Prepared by the author, 2025.

Table 1 shows that, up to the age of 69, there were no significant differences between men and women in the motor ability of balance. However, in the 70 to 80 age group, women had significantly lower performance on the right ($p = 0.017$), left ($p = 0.015$) and total ($p = 0.003$) balance measures. These results may be related to physiological factors such as sarcopenia, lower muscle mass and strength, reduced bone mineral density, and postmenopausal hormonal changes, which contribute to a steeper decline in body stability in this age group.

Table 2

Comparison between the sexes by age profile, ability to jump/stationary gait in the game

Age Group	Variable	Gender		P
		Women	Male	
50-59 years (n = 18)	Click-through Rate/Hits S01	1,7	1,5	0,130
	Click/Hit Rate S02	1,4	1,4	0,498
	Click/Hit Rate S03	1,3	1,3	0,738
	Click/Hit Rate S04	1,3	1,3	0,574
	Overall Click-through / Hit Rate	1,4	1,4	0,824
	Total Time Bouncing	33,0	23,0	0,056
60-69 years old (n = 58)	Click-through Rate/Hits S01	1,5	2,2	*0,018
	Click/Hit Rate S02	1,4	1,4	0,764
	Click/Hit Rate S03	1,3	1,3	0,588
	Click/Hit Rate S04	1,3	1,3	0,624
	Overall Click-through / Hit Rate	1,4	1,6	0,069
	Total Time Bouncing	28,0	38,0	0,254
70-80 years (n = 26)	Click-through Rate/Hits S01	1,7	2,2	*0,046
	Click/Hit Rate S02	1,4	1,4	0,403
	Click/Hit Rate S03	1,5	1,3	0,560
	Click/Hit Rate S04	1,3	1,4	0,322
	Overall Click-through / Hit Rate	1,6	1,6	0,274
	Total Time Bouncing	49,0	27,5	0,403
All (n = 102)	Click-through Rate/Hits S01	1,7	2,1	**0,006
	Click/Hit Rate S02	1,4	1,4	0,479
	Click/Hit Rate S03	1,3	1,3	0,735
	Click/Hit Rate S04	1,3	1,3	*0,048
	Overall Click-through / Hit Rate	1,4	1,5	*0,021
	Total Time Bouncing	33,0	27,5	0,969

(*) $p \leq 0.05$; (**) $p \leq 0.01$; (***) $p \leq 0.001$.

Source: Prepared by the author, 2025.

Table 2 shows that, for the group between 50 and 59 years of age, there were no significant differences between men and women in the click/correct answer rates (S01 to S04) or in the overall rate, although the total time of jumping showed a trend of difference in favor of women ($p = 0.056$), without statistical significance. In the 60-69 and 70-80 age groups, there was a significant difference in the click/correct answer rate S01 ($p = 0.018$ and $p = 0.046$, respectively), with superior performance of men, in addition to a favorable trend in the overall rate between 60 and 69 years ($p = 0.069$). In the sample as a whole ($n = 102$), men had significantly higher performance in S01 ($p = 0.006$), S04 ($p = 0.048$) and in the overall rate ($p = 0.021$).

Table 3

Comparison between the sexes by age profile, ability: Batting in the game

Age Group	Variable	Gender		P
		Women	Male	
50-59 years (n = 18)	Bounce Right	5,0	4,0	0,498
	Left Batting	5,0	5,0	1,000
	Total Bounce	10,0	9,0	0,654
60-69 years old (n = 58)	Bounce Right	4,0	5,0	0,209
	Left Batting	5,0	4,0	0,468
	Total Bounce	9,0	9,0	0,831
70-80 years (n = 26)	Bounce Right	4,0	4,0	0,667
	Left Batting	3,5	4,5	0,403
	Total Bounce	7,0	8,5	0,560
All (n = 102)	Bounce Right	4,0	5,0	0,666
	Left Batting	5,0	4,0	0,778
	Total Bounce	9,0	9,0	0,903

Source: Prepared by the author, 2025.

Table 3 shows that, in all age groups analyzed (50–59, 60–69, and 70–80 years), there were no statistically significant differences between men and women in the ability to hit, either with the right or left hand, or in the total number of repetitions. Although small variations were observed, there is a trend towards higher performance of the right hand in men and the left hand in women between 60–69 years of age, and slightly higher values for men between 70–80 years of age, without statistical significance. Thus, the overall average performance remains similar between the sexes.

Table 4

Comparison between the sexes by age profile, ability: Kicking in the game

Age Group	Variable	Gender		P
		Women	Male	
50-59 years (n = 18)	Kick Right	4,0	4,0	0,912
	Left Kick	5,0	4,0	0,250
	Total Kick	9,0	8,0	0,574
60-69 years old (n = 58)	Kick Right	4,0	5,0	0,365
	Left Kick	5,0	5,0	0,820
	Total Kick	9,0	9,0	0,640
70-80 years (n = 26)	Kick Right	2,5	4,0	0,053
	Left Kick	3,5	4,5	0,252
	Total Kick	6,0	8,5	*0,046
All (n = 102)	Kick Right	4,0	4,0	0,469
	Left Kick	5,0	5,0	0,903
	Total Kick	8,5	8,5	0,661

(*) $p \leq 0.05$; (**) $p \leq 0.01$; (***) $p \leq 0.001$.

Source: Prepared by the author, 2025.

Table 4 shows that, in the 50–59 and 60–69 age groups, no statistically significant differences were identified between men and women in kicking ability, which indicates the absence of relevant effects of aging on this motor capacity at these ages. In the 70–80 age

group, however, there was a significant difference in the total number of kicks ($p = 0.046$), with superior performance of men, while the right kick showed only a trend towards difference ($p = 0.053$).

5 ANALYSIS OF DATA FROM THE EXPERT'S OBSERVATION

In order to identify inconsistencies in the evaluation provided by the *GameMove Motor Skill* game, an observational analysis (motor action process) was carried out, through motor evaluation, adapted from Schneider's proposal (2025) and conducted by a Physical Education professional.

Initially, descriptive statistics were performed, covering minimum and maximum values, median, arithmetic mean, standard deviation, percentiles (P25, P50, P75), as well as the interquartile range (IQR), in order to characterize the performance of the participants. For the comparative stage, the *two-way* ANOVA model was used, considering the factors age and sex. The purpose of this procedure was to identify possible variations between the groups and to assess the need for distinct classifications between men and women, thus ensuring the relevance of a joint analysis. In all, 12 variables were analyzed, distributed in three age groups (50–59 years, 60–69 years, and 70–80 years), allowing a detailed assessment of the impact of aging and gender on motor performance. Based on this design, the descriptive and comparative results are presented below, organized in tables in order to highlight the patterns of motor performance between the different age groups and sexes, as well as the possible interactions between these variables.

Table 5

Comparison between the sexes by age profile, ability: Balance in observation

Age Group	Variable	Gender		P
		Women	Male	
50-59 years (n = 18)	Right Balance	7,0	7,0	0,912
	Left Balance	7,0	7,0	0,250
	Total Balance	14,0	14,0	0,738
60-69 years old (n = 58)	Right Balance	7,0	6,0	0,098
	Left Balance	7,0	6,0	0,915
	Total Balance	13,0	12,0	0,342
70-80 years (n = 26)	Right Balance	5,0	6,0	0,076
	Left Balance	6,0	6,0	0,462
	Total Balance	11,0	12,0	0,131
All (n = 102)	Right Balance	7,0	6,0	0,387
	Left Balance	6,0	6,5	0,699
	Total Balance	12,0	12,0	0,811

Source: Prepared by the author, 2025.

Table 5 shows that, in all age groups analyzed, no statistically significant differences were identified between men and women in postural balance, either on the right or left sides

and on the total. Small trends were recorded with slightly higher performance of women in right balance between 60–69 years ($p = 0.098$) and men between 70–80 years ($p = 0.076$), but without statistical significance.

Table 6

Comparison between the sexes by age profile, ability: Jumping in observation

Age Group	Variable	Gender		P
		Women	Male	
50-59 years (n = 18)	Overall Click-through / Hit Rate	1,4	1,4	0,824
	Total Bounce	14,0	14,0	1,000
60-69 years old (n = 58)	Overall Click-through / Hit Rate	1,4	1,6	0,091
	Total Bounce	14,0	14,0	0,791
70-80 years (n = 26)	Overall Click-through / Hit Rate	1,6	1,6	0,274
	Total Bounce	13,0	14,0	0,781
All (n = 102)	Overall Click-through / Hit Rate	1,4	1,5	*0,021
	Total Bounce	14,0	14,0	0,605

(*) $p \leq 0.05$; (**) $p \leq 0.01$; (***) $p \leq 0.001$.

Source: Prepared by the author, 2025.

Table 6 shows that, between 50 and 59 years of age, there were no significant differences between men and women in the overall click/correct rate or in the total number of jumps, indicating similar performance in coordination and locomotion tasks. However, between 60 and 69 years of age, there was a trend of male superiority in the overall click/correct answer rate (1.6 vs. 1.4; $p = 0.091$), although without statistical significance, while the total number of correct answers remained equivalent between the sexes. In the 70 to 80 age group, both the click/hit rate and the total number of jumps remained similar, with no statistical differences. When considering the total sample ($n = 102$), the overall click/correct answer rate showed a significant difference for males ($p = 0.021$), while the total number of skipping remained balanced.

Table 7

Comparison between the sexes by age profile, ability: Rebuttal in observation

Age Group	Variable	Gender		P
		Women	Male	
50-59 years (n = 18)	Bounce Right	6,0	6,0	0,301
	Left Batting	6,0	6,0	0,301
	Total Bounce	12,0	12,0	0,301
60-69 years old (n = 58)	Bounce Right	6,0	6,0	0,241
	Left Batting	5,0	6,0	0,104
	Total Bounce	11,0	12,0	0,157
70-80 years (n = 26)	Bounce Right	5,5	5,0	0,781
	Left Batting	5,0	5,0	0,940

	Total Bounce	10,5	10,0	0,899
All (n = 102)	Bounce Right	6,0	6,0	0,704
	Left Batting	5,5	6,0	0,291
	Total Bounce	11,0	12,0	0,473

Source: Prepared by the author, 2025.

Table 7 did not identify statistically significant differences between men and women in the performance of hitting ability, either with the right or left hand, or in total. Between 60 and 69 years of age, only a slight trend of better performance of the left hand was observed in men ($p = 0.104$), without, however, reaching statistical significance.

Table 8

Comparison between the sexes by age profile, ability: Guessing on observation

Age Group	Variable	Gender		P
		Women	Male	
50-59 years (n = 18)	Kick Right	6,0	6,0	0,426
	Left Kick	6,0	6,0	0,426
	Total Kick	12,0	12,0	0,426
60-69 years old (n = 58)	Kick Right	6,0	6,0	0,160
	Left Kick	6,0	6,0	0,520
	Total Kick	12,0	12,0	0,465
70-80 years (n = 26)	Kick Right	6,0	6,0	0,432
	Left Kick	6,0	6,0	0,631
	Total Kick	12,0	12,0	0,595
All (n = 102)	Kick Right	6,0	6,0	0,053
	Left Kick	6,0	6,0	0,287
	Total Kick	12,0	12,0	0,227

Source: Prepared by the author, 2025.

The data presented in Table 8 demonstrate that no statistically significant differences were found between men and women in the different age groups in the performance of kicking ability, both for the right and left legs, as well as in the total number of kicks, indicating stability and equivalence between the sexes throughout aging.

6 DISCUSSIONS

Aging causes significant changes in motor initiation and control, but such effects tend not to be homogeneous between the sexes. These differences are also reflected in neuromuscular structure and function. Studies such as the one by Guo et al. (2025), in which they investigated 50 elderly people (26 men and 24 women, aged between 60 and 83 years), point out that women have greater functional vulnerability compared to men, which is reflected in multiple domains, from cortical preparation to motor execution and balance, corroborating the results presented in Tables 1 and 5 (equilibrium variables).

At the level of movement initiation, Frolov et al. (2020) observed that older people resort to more complex pre-movement processes, resulting in slower execution. According to

the results of tables 2, 3 and 6, distinct patterns in motor performance are observed between men and women. Rantanen, Era and Heikkinen (2005) found that women performed better in fine dexterity tasks, such as in the Purdue Pegboard test (an assessment widely used to measure manual dexterity, fine motor coordination and speed of manipulating objects with the hands), while men exhibited greater handgrip strength and *tapping* speed, in line with the results presented in Tables 3 and 7 (rebounding variables). This result is confirmed in a more recent study proposed by Wunderle et al., (2024) in which it was identified that men obtain higher results in tapping strength and frequency, while women excel in activities of stacking pins on the *Purdue Pegboard (perforated panel)*, evidencing greater manual agility corresponding to the results in table 2, 3 and 7 (bounce and bounce variables).

In addition, Beck, Hastings, and Clark (2025), in a systematic review, reinforce that, even in older people, male muscle strength remains consistently superior, although women retain advantages in coordination and manual dexterity. This corroborates the equivalences of the results in the variables of jumping/stationary gait and bouncing, when compared between the sexes, as shown in tables 2, 3, 6 and 7. Although women have a tendency for advantages in coordination and manual dexterity, this may have been compensated by the male evaluates who have a tendency towards better results in upper limb strength and power, as observed in Tables 3 and 7.

In this sense, Hooyman et al. (2021) showed that the manipulation of tools, highly dependent on fine motor control and cognitive functions, is more challenging for older people, with sex differences emerging mainly in manual precision tasks, with older women achieving superior results compared to men, similar to what was observed in our results. Vasylenko, Gorecka, and Rodríguez-Aranda (2018) report that elderly men were slower than elderly women in bimanual tasks, showing that sex influences not only strength, but also the quality of motor execution.

Sex differences become even more evident in postural balance. Elshorbagy et al. (2024) showed a significant increase in mediolateral oscillation in elderly women, indicating a lower efficiency of the compensatory mechanisms responsible for maintaining postural stability. Rezaei et al. (2024) point out that the single-leg stance test is a reliable predictor of aging, regardless of gender, but performance scores tend to be lower in women, corroborating the results presented in tables 1 and 5. As the study by Wu et al. (2021) demonstrates, there is a worse balance performance in Chinese elderly women. Similarly, Nascimento et al. (2023) reported a prevalence of falls almost twice as high among Portuguese women compared to men (48.7% vs. 23.6%). These data reinforce that women

are more susceptible to postural decline and falls, possibly due to factors such as lower muscle mass, hormonal differences, and greater longevity.

Muscle strength and power are crucial determinants of motor performance and also show differences between the sexes. It is estimated that there will be a progressive loss of 5 to 10% of muscle mass per decade after the age of 50, but this reduction has a greater impact on women (Rodrigues et al., 2022). Bersotti et al. (2022) showed that men preserve superior absolute torque in ankle dorsiflexion and plantar flexion, while Caçador et al. (2023) highlighted that women's lower limb strength corresponds to only 60–80% of that observed in men. This discrepancy is even more critical in muscle power, a variable strongly associated with fall prevention. This discrepancy may have been a determining factor for a better result in men in the evaluations that required greater recruitment of the muscles of the lower limbs, as observed in the results of Tables 4 and 8.

From a neuromuscular point of view, Guo et al. (2025) showed that elderly men maintain greater size and strength of the motor units of the vastus lateralis muscle, also presenting better motor control and functional performance compared to women. Although both sexes exhibit progressive decline due to aging, the functional impact is more pronounced in women, especially after the age of 70. In the same direction, Toro-Román et al. (2024) confirmed that male individuals have higher values of strength, cardiorespiratory capacity, and performance in functional tests, although decline with age is inevitable for both groups. These results corroborate the evidence that, from the seventh decade of life onwards, these differences become more pronounced, highlighting the motor superiority of men over women in most of the parameters evaluated.

Therefore, men tend to preserve better strength, power, and overall performance, while women have a higher risk of postural instability, falls, and accelerated functional decline. According to Clark, Manini, and Fielding (2023), these patterns reflect neuromuscular determinants of aging, among which greater muscle mass and the ability to generate power contribute to superior physical performance among men. Liang, Li, and Wang (2024) reinforce that women have a significantly higher risk of falls, instability, and early functional decline, as a result of an interaction between biological factors (such as lower lean mass and hormonal changes related to menopause) and behavioral and social factors, including lower engagement in physical strength activities throughout life. It is understood that the differences observed between the sexes in the aging process of motor performance should not be interpreted solely as a result of biological determinants. Such distinctions also reflect the influence of sociocultural factors, as well as inequalities in opportunities for access to and

engagement in physical activity practices throughout the course of life, which contribute decisively to the configuration of functional capacities in advanced age.

7 CONCLUSION

The results obtained indicate that the active digital game *GameMove Motor Skill* is a valid and reliable tool for the evaluation of motor performance in people in the aging process. There was a trend towards better male performance in the tasks of batting and jumping/stationary gait, a significant difference in favor of men in the kicking test, and male superiority in balance, especially after 70 years of age.

These results confirm that aging causes significant changes in motor control and initiation, manifesting itself differently between the sexes. Women showed greater functional vulnerability in aspects related to manual dexterity, motor execution and balance, while men showed greater preservation of strength, power and overall motor performance. This difference results not only from biological factors such as lower muscle mass and hormonal changes, but also from sociocultural conditioning factors that provide men with greater exposure to motor practices associated with strength, speed and power throughout life.

The reliability of the *GameMove Motor Skill* was evidenced by the high correlation between the metrics generated by the system and the independent evaluations carried out by Physical Education professionals, as well as by the stability of the scores in repeated measures. Thus, the instrument shows promise for application in clinical and research contexts, contributing to functional monitoring and to the promotion of health and quality of life during aging.

ABSTRACT

The nexus between nearshoring and customs technological modernization in international logistics chains is analyzed. Key technologies are systematized, including single window systems, risk management, non-intrusive inspection, interoperability, and frameworks for electronic documents, and a Structural Equation Model (SEM) is proposed linking customs technological modernization to border efficiency, logistics resilience, and nearshoring performance. The proposed methodology combines surveys conducted with companies and customs authorities, psychometric validation, and SEM estimation using standardized goodness-of-fit criteria. Given the scarcity of integrated public microdata, illustrative SEM results (synthetic data) and secondary empirical evidence for Latin America are presented. Implications are discussed for trade facilitation policies, interinstitutional governance, investment in digital infrastructure, and regional interoperability agreements as enabling conditions for capturing value from nearshoring.

Keywords: Nearshoring. Trade Facilitation. Digital Customs. Single Window. Risk Management.

RESUMO

Analisa-se o nexo entre nearshoring e a modernização tecnológica aduaneira nas cadeias logísticas internacionais. São sistematizadas tecnologias-chave, incluindo janela única, gestão de riscos, inspeção não intrusiva, interoperabilidade e marcos para documentos eletrônicos, sendo proposto um Modelo de Equações Estruturais (SEM) que relaciona a modernização tecnológica aduaneira à eficiência de fronteira, à resiliência logística e ao desempenho do nearshoring. A metodologia proposta combina a aplicação de questionários a empresas e autoridades aduaneiras, validação psicométrica e estimação do modelo SEM com critérios padronizados de ajuste. Diante da escassez de microdados públicos integrados, são apresentados resultados ilustrativos do SEM (dados sintéticos) e evidências

RESUMEN

Se analiza el nexo entre nearshoring y modernización tecnológica aduanera en cadenas logísticas internacionales. Se sistematizan tecnologías clave (ventanilla única, gestión de riesgos, inspección no intrusiva, interoperabilidad y marcos para documentos electrónicos) y se plantea un modelo SEM que vincula modernización tecnológica aduanera con eficiencia fronteriza, resiliencia logística y desempeño nearshoring. La metodología propuesta combina encuestas a empresas y autoridades aduaneras, validación psicométrica y estimación SEM con criterios de ajuste estandarizados. Ante la escasez de microdatos públicos integrados, se presentan resultados SEM ilustrativos (datos sintéticos) y evidencia secundaria empírica para América Latina. Se discuten implicaciones para políticas de facilitación del comercio, gobernanza interinstitucional, inversión en infraestructura digital y acuerdos de interoperabilidad regional, como condiciones habilitadoras para capturar valor del nearshoring.

Palabras clave: Nearshoring. Facilitación del Comercio. Aduanas Digitales. Ventanilla Única. Gestión de Riesgos.

1 INTRODUCTION

Nearshoring has intensified as a productive reorganization strategy to reduce exposure to disruptions and shorten logistics cycles; however, its materialization depends on the reliability of the border nodes (customs, ports and associated regulatory agencies). In a "turbulent" global environment, digitalization and trade facilitation become more relevant for ports and borders, and the United Nations Conference on Trade and Development (IMCO, 2024) highlights that the adoption of community port systems, maritime counters and trade counters reduces clearance time in ports and strengthens trade facilitation and logistics performance (Redekar, Askin, & Ju, 2025; United Nation (2025; United Nations Conference on Trade and Development, 2024 ; and United Nations Conference on Trade and Development, 2025).

In Latin America, the differential in border compliance costs/times with respect to advanced economies remains significant. For 2019, the regional average reported for exports showed 55.3 hours of "border compliance" and 35.7 hours of "documentary compliance", compared to 12.7 and 2.3 hours in high-income OECD economies; in imports, 55.6 and 43.2 hours compared to 8.5 and 3.4, respectively (Herreros, 2023). These differentials are consistent with the thesis that non-tariff bottlenecks limit productive integration and the attraction of investments oriented to regional chains (Herreros, 2023; Organisation for Economic Co-operation and Development, 2025; United Nations Economic Commission for Latin America and the Caribbean (ECLAC/ECLAC), 2025; and World Bank, 2024)

The contribution of the article is twofold: (i) to build an analytical framework that connects nearshoring with customs technological modernization from the perspective of logistics performance (time, cost, predictability and risk), and (ii) to propose and operationalize an SEM model to measure direct and indirect relationships between customs technological capabilities, efficiency of border processes and nearshoring results at the level of logistics chains. Given the evidence that **measuring** nearshoring and isolating its effect faces data limitations and counterfactuality problems, an empirical strategy based on primary data (surveying) with similar elements is also proposed (IMCO, 2024; Organisation for Economic Co-operation and Development, 2025; Hair, Hult, Ringle, Sarstedt, Danks, & Ray, 2025; and World Bank, 2024).

2 THEORETICAL FRAMEWORK, OBJECTIVES AND HYPOTHESES

2.1 CONCEPTUAL FOUNDATIONS: NEARSHORING AND MEASUREMENT

Nearshoring is usually defined as the relocation of productive links (totally or partially) to countries that are geographically close, with the aim of improving resilience, reducing exposure to shocks and taking advantage of commercial alliances. The Mexican Institute for Competitiveness (WCO, 2026). The Mexican Institute for Competitiveness, A.C., (IMCO) explicitly conceptualizes it as the transfer of essential production chains to nearby countries, as a supply and production resilience strategy (IMCO, 2024; Mexican Institute for Competitiveness, 2024; OECD, 2025; and World Trade Organization, 2025).

A central challenge is causal attribution: IMCO points out that, even with the growing visibility of the phenomenon, "there is no clear path" to measure results because it can be confused with economic recovery or other global demand factors; proposes approaches with disaggregation of FDI by sectors more closely linked to nearshoring (IMCO, 2024). In parallel, the Bank of Mexico (World Customs Organization, 2026). it argues that quantifying economic effects is challenging due to data limitations and the difficulty of constructing counterfactuals; even so, it finds early evidence of increases in manufacturing employment in industries with a greater propensity for nearshoring (July 2020–June 2023), with less clear effects on productivity and income (Rangel, Esteban Aguirre, & Llamosas-Rosas, 2025).

These limits motivate a "micro" (company-customs) approach based on border operational perceptions and metrics, rather than relying exclusively on macro series or indirect proxies.

2.2 CONCEPTUAL FOUNDATIONS: CUSTOMS TECHNOLOGICAL MODERNIZATION AND TRADE FACILITATION

Contemporary customs modernization is inseparable from several variables, including: the digitization of documents and processes; risk management, intelligent and selective inspection; Coordinated Border Management; and "one-stop-shop" and data interoperability systems. The World Trade Organization (WTO) establishes facilitation commitments in its Trade Facilitation Agreement, including provisions associated with a single window, the measurement of lifting times, and risk management. Aimed at accelerating low-risk release without sacrificing control (WTO, 2014; Organisation for Economic Co-operation and Development, 2025; World Customs Organization, 2024; World Trade Organization, 2026; and Trade facilitation agreement database and implementation status report 2026).

In terms of comparative public policy, the Organisation for Economic Co-operation and Development (OECD) documents aggregate improvements in trade facilitation since 2022

and, at the same time, stresses that cooperation between border agencies (domestic and cross-border) remains one of the most difficult areas to improve (OECD, 2025).

In Latin America and the Caribbean, the Economic Commission for Latin America and the Caribbean (WCO, 2026), and ECLAC argue that nearshoring allows progress in trade facilitation, which is crucial not only for competitiveness, but also to increase participation in regional and global chains and attract investment from multinationals (Economic Commission for Latin America and the Caribbean, 2024; Economic Commission for Latin America and the Caribbean, 2025; World Customs Organization, 2026; and Herreros, 2023)

2.3 ENABLING CUSTOMS TECHNOLOGIES: COMPARATIVE MAPPING

Table 1 summarizes customs technologies and capacities based on recent normative/empirical literature.

Table 1

Customs technologies/capabilities and their expected contribution to logistics chains

Technology/Capacity	Main function	Expected On-Chain Operating Result	Evidence/Base Source
Single Window	"Single Entry" for submitting information/documents, with a "one-time" principle for electronic data	Fewer duplicate procedures, greater traceability, interagency coordination	OMA Compendium: Principle of a Single Presentation and Linkage to CBM
Coordinated Border Management (CBM)	Coordination between border agencies (flow of information and physical movement), efficiency-compliance balance	Reduced redundancies, smarter controls, interoperability	Definition and CBM dimensions in OMA compendium
Risk management and selectivity	High-risk controls approach; Low-risk, pre-arrival facilitation	Greater predictability; less indiscriminate inspection; Focused Control	CBM compendium: the need for risk management for selectivity
Non-intrusive inspection (NII)	Cargo scanning (X-rays/gamma rays) without opening containers; Integration with risk assessment	Faster inspections without "paralyzing" legitimate trade; Increased effectiveness	WCO Guideline (June 2025): definition and role of NII in risk regime
Integrated Customs Automation Systems (e.g. ASYCUDA)	End-to-end automation of declarations, payments, selectivity and regulatory consistency	Reduction of dispatch times and collection improvements (reported cases)	ASYCUDA report 2025: improvements in times and collection in user countries
Legal frameworks for electronic transferable records	Enable legal equivalence and cross-border use of electronic transferable documents	Paper reduction; automation; less document friction; Interoperability	MLETR (2017): enables domestic and cross-border use; technological neutrality

Source: Authors.

Regional evidence reinforces heterogeneity: the comparative study of five foreign trade single windows (Chile, Costa Rica, Mexico, Peru and Uruguay) shows breadth in participating entities and procedures. For example, Peru reports 314 procedures and multiple private entities, while Mexico exceeds 130 procedures and integrates public entities and regulatory bodies (Gálvez, 2024). In addition, external interoperability (exchange of certificates, declarations, and certificates of origin) is presented as a critical condition for regional scaling: in these cases, Mexico, Peru, Chile, and Uruguay have developed different exchange mechanisms with blocs such as the Pacific Alliance or MERCOSUR, with expansion projects (Inter-American Development Bank, 2024; Gálvez, 2024; United Nations Economic Commission for Latin America and the Caribbean, 2025; and World Customs Organization, 2026).

A key technological-organizational point is the **risk management** integrated into VUCE. In the same analysis, Peru reports a system based on ISO 31000:2018 with an AI/machine learning component to identify patterns and support decisions; while Chile, Mexico, and Uruguay report not having implemented risk management in their VUCE (Gálvez, 2024).

3 RESEARCH OBJECTIVES

Objective 1. To estimate the effect of customs technological modernization on the efficiency and predictability of border processes (time, cost, traceability and selectivity).

Objective 2. To evaluate whether border efficiency (as facilitation performance) mediates the relationship between customs technological modernization and nearshoring results in logistics chains (attraction/retention of operations, productive integration and continuity).

Objective 3. To determine the joint impact of border efficiency and nearshoring on the international logistics performance of the actor (exporting/importing companies), considering the role of interagency coordination and interoperability.

Hypotheses linked to the objectives

Hypothesis 1 (linked to Objective 1). Customs technological modernization positively increases border efficiency (reduction of times/costs and greater predictability).

Hypothesis 2 (linked to Objective 2). Border efficiency partially mediates the effect of customs technological modernization on nearshoring results (positive indirect effect).

Hypothesis 3 (linked to Objective 3). Nearshoring results are positively associated with international logistics performance, and this effect is strengthened when there is greater interagency coordination/interoperability at the border.

Research Design and SEM Model

Latent and observable variables

The design proposes a SEM with latent (reflective) variables measurable through Likert items (1–7) and self-reported operational metrics.

Exogenous Latent

- **CTM – Customs Tech Modernization.**
Suggested observable indicators: (CTM1) single window availability/use; (CTM2) electronic payments and procedures; (CTM3) pre-arrival processing and automation; (CTM4) analytical/risk management capabilities and selectivity. The relevance of these components appears both in the OECD's TFIs and digitalisation and in the WCO's CBM and SAFE practices (OECD, 2025).
- **CBM-Coordinated Border Management/InteroperabilityIndicators: (CBM1) interagency alignment of procedures; (CBM2) agency data sharing; (CBM3) international interoperability (certificates/declarations); (CBM4) governance/mandates and quality of coordination. It is justified by the emphasis of the CBM compendium and the Single Window compendium (Single Window as a requirement for collaboration and data harmonization) (World Customs Organization, 2026).**

Endogenous Latents

- **TFP – Trade Facilitation Performance.**
Indicators: (TFP1) predictability of the dispatch; (TFP2) mean release time; (TFP3) documentary/border compliance cost; (TFP4) "inspection fee" received (selectivity). The importance of time/cost is observed in the regional comparative evidence and its gap with OECD economies (Herreros, 2023).
- **NSO – Nearshoring Outcomes in the chain.**
Indicators: (NSO1) increase in relocation/regional supply; (NSO2) continuity of supply/robustness; (NSO3) integration with nearby customers/plants; (NSO4) attraction or retention of associated investments/contracts. It is based on the relationship proposed by ECLAC (facilitation, production ↔ networks, ↔ attraction, nearshoring) and on the IMCO conceptualization (resilience and relocation) (Herreros, 2023).
- **ILP – International Logistics Performance.**
Indicators: (ILP1) OTIF (On-Time In-Full) international; (ILP2) reduction of door-to-door lead time; (ILP3) lead time variability (less dispersion); (ILP4) capacity to respond

to disruptions. The articulation with logistics performance is aligned with the LPI approach (dimensions such as customs, infrastructure, and punctuality) and with evidence that digital solutions (PCS/MSW/TSW) reduce port times and improve logistics performance (The World Bank, 2023).

Model Relations and Theoretical Justification

The structural model assumes that CTM and CBM enhance TFP (facilitation), and that TFP enables NSO and enhances ILP. In addition, CBM strengthens the effect of NSO on ILP through an interoperability and friction reduction environment.

Relationships are aligned with:

- evidence of recent improvements in facilitation and the difficult role of interagency cooperation (OECD) (OECD, 2025).
- the enabling role of Single Window and CBM to minimize duplication and streamline processes (OMA) (WCO compendium, 2026).
- and the explicit link between facilitation, production networks, and nearshoring (ECLAC) (Herreros, 2023).

Equations (measurement and structural model)

Measurement model (reflective):

- For CTM: $CTM1 = \lambda_1 \cdot CTM + \varepsilon_1$
 $CTM2 = \lambda_2 \cdot CTM + \varepsilon_2$
 $CTM3 = \lambda_3 \cdot CTM + \varepsilon_3$
 $CTM4 = \lambda_4 \cdot CTM + \varepsilon_4$
- For CBM: analogue with λ_5 loads... λ_8
- For TFP: analogue with λ_9 ... λ_{12}
- For NSO: analogue with λ_{13} charges... λ_{16}
- For ILP: analogue with λ_{17} ... λ_{20}

Structural model:

- $TFP = \beta_1 \cdot CTM + \beta_2 \cdot CBM + \zeta_1$
- $NSO = \beta_3 \cdot TFP + \zeta_2$
- $ILP = \beta_4 \cdot TFP + \beta_5 \cdot NSO + \beta_6 \cdot (NSO \times CBM) + \zeta_3$

Where $(NSO \times CBM)$ can be modeled as latent interaction or as moderation through indicator product approach, depending on the software and scale. The use of SEM to contrast multivariate causal models with measurement errors is methodologically justified in SEM literature in Spanish and in international reference texts (Ruiz, Pardo, & San Martín, 2010).

4 METHODOLOGY

4.1 DESIGN, SAMPLE AND SAMPLING

Design: explanatory, cross-sectional, with measurement based on: structured survey of exporting and importing companies; complementary survey of managerial staff, as well as technical staff of customs authorities and coordinated agencies (e.g. health, phytosanitary, border security). The multi-actor logic is based on the fact that Single Window/CBM materializes as a process network, not as a single isolated system (WCO compendium, 2026).

Sampling frame: companies with regular international operations (≥ 12 shipments per year) and positions such as high-volume customs units (ports, airports, land borders). It was stratified by sector (automotive, electronics, agri-food, pharmaceutical/medical supplies, retail) and by dominant logistics modality (maritime vs. land vs. air), given that regional evidence shows differences in performance by procedures/documentation and port capacities (Herreros, 2023).

Sample size: for CB-SEM, the existence of 5 latent variables with 4 indicators each was taken into account, and stability of estimators and rules of power and parsimony were sought. To ensure robustness, a sample of $N \approx 600$ (e.g., 420 firms + 180 authorities) was used, with invariance analysis by group (firm vs. authority; exporter vs. importer). The recommendations for size and steps for SEM construction/evaluation were based on reference texts (Ruiz, Pardo, & San Martín, 2010).

Sampling: proportional stratification (sector $\times$ size) and systematic selection in lists of operators (e.g., importer/exporter registries, sector associations, chambers). For authorities, intentional sampling by "critical nodes" (customs with the highest volume) and participation of units responsible for digitization and risk management.

Instruments and scales

Main instrument: questionnaire with Likert items 1 to 7 (strongly disagree, up to strongly agree) and self-reported operational metrics (time/cost bands, variability, inspection percentage). To strengthen external validity, items aligned with categories widely used in facilitation measurement (transparency, formalities, institutional arrangements, and paperless trade) are incorporated, consistent with the focus of global surveys/international indicators reported by ECLAC (Herrerros, 2023).

Examples of items per latent variable:

- CTM: "Most of my procedures are done digitally (paperless)"; "There are electronic payments and digital pre-validation"; "Risk-based selectivity is used."
- CBM: "There is effective coordination between agencies"; "There is interoperability for certificates and declarations"; "The data is requested only once."
- TFP: "The time of release is predictable"; "The costs of document compliance are low"; "The inspection is selective and proportional."
- NSO: "We have increased suppliers/nearby region"; "Contracts have been attracted for frontier reliability."
- ILP: "We comply with international OTIF"; "Lead time variability was reduced."

Data validation, collection and processing

Content validity: the procedure included the intervention of eight specialists with experience in customs affairs, logistics chain management, regulatory compliance, risk assessment and trade facilitation. These professionals analyzed the measurement instrument assessing the understanding of the items, their suitability for the purpose of the study and the degree to which they correctly reflect the dimensions to be measured.

Pilot test: the instrument was applied to a sample of 50 companies and 20 authorities. This stage cleaned up the items, as well as made it easier to computerize the duration of application, and identify possible difficulties in comprehension and make the necessary adjustments in the writing.

Validity and reliability of the measurement model (recommended criteria):

- Internal reliability: Cronbach's α and composite reliability (CR) ≥ 0.70 . (Rex, 2026).
- Convergent validity: AVE ≥ 0.50 . (Rex, 2026).
- Discriminant validity: HTMT < 0.85 or Fornell–Larcker criterion, depending on the approach. (Rex, 2026).

Data collection: hybrid administration (online plus assisted interviews) to minimize non-response and capture participants with operational constraints.

Data processing:

- missing: multiple imputation or FIML if CB-SEM is used with appropriate assumptions;
- non-normality: robust estimation (MLR) or WLSMV if ordinal items are modeled;
- common method bias: psychological separation of blocks; control items; and method factor testing (if applicable) (Rex, 2026).

SEM software and fit criteria

Software used: R (lavaan package) for CB-SEM; Mplus for WLSMV/MLR Advanced; SmartPLS if replicated as PLS-SEM (especially useful in the presence of non-normality or predictive models). The selection is justified by standards included in reference SEM texts and methodological guides in Spanish (Rex, 2026).

Fit criteria for CB-SEM (indicative threshold):

- $\chi^2/df < 3.0$
- CFI and TLI ≥ 0.90 (ideal ≥ 0.95)
- RMSEA ≤ 0.08 (ideal ≤ 0.06), with 90% CI
- SRMR ≤ 0.08 These ranges are widely used in the SEM literature for absolute and comparative fit reporting (Rex, 2026).

5 RESULTS AND DISCUSSION

5.1 RELEVANT SECONDARY EMPIRICAL EVIDENCE

Regional facilitation and digitalization results (Latin America and the Caribbean). ECLAC reports 71% regional average implementation (31 core measures) in 2023 and a dispersion of 41 percentage points between the highest score (Mexico: 88%) and the lowest (Saint Lucia: 47%) (Herrerros, 2023). At the "paperless trade" level, 24 out of 26 countries report a fully implemented automated customs system, but only 7 report a fully implemented "electronic single window" (with 10 partially implemented and 9 not implemented), suggesting that basic customs digitalization does not necessarily imply full interoperability or integrated single window (Herrerros, 2023).

Gap in compliance time and costs. The regional difference compared to high-income OECD economies is marked: the average cost of border compliance in imports was 628.4 USD in Latin America and the Caribbean, compared to 98.1 USD in high-income OECD economies; and in exports, 516.3 USD vs 136.8 USD (Herrerros, 2023). The operational reading is that the border continues to be a dominant "non-tariff" cost that affects predictability and margins, with a special impact on SMEs and just-in-time production chains (Herrerros, 2023).

Comparative global trend. In the OECD, aggregate evidence indicates that the reduction of bottlenecks and "red tape" is between 3% and 7% on average in regions since

2022, but cooperation between border agencies remains a challenge (OECD, 2025). This finding is consistent with the thesis that nearshoring return requires not only digitalization, but **interagency governance** and interoperability.

Technological and intelligent control capabilities.

- The WCO (SAFE 2021) reinforces that chain security management and facilitation are supported by AEO, CBM and modern technologies (including non-intrusive inspection) as part of the facilitation-control balance (WCO, 2021).
- The WCO guidance (June 2025) defines NII as technology (X-ray/gamma rays) to inspect unloaded/unloaded cargo, and emphasizes that its deployment must be integrated into the risk assessment regime to avoid curbing legitimate trade (WCO, 2025).
- The WCO Single Window Compendium links the Single Window to the "one-time" principle for electronic data and identifies it as part of a broader CBM (collaborative activity, integrated risk assessment, coordinated reviews) program (WCO, 2025).

Port digitalisation and maritime facilitation. UNCTAD reports that, in the face of disruptions, facilitation initiatives are more relevant for ports and that PCS/MSW/TSW reduce release times in ports, strengthening logistics performance. It also documents route reconfiguration (e.g., Red Sea crisis) and changes in regional participation of port calls, elevating the importance of operational resilience and digitalization (WCO compendium, 2026).

SEM Results

Methodological note on transparency (on data). There is currently no public, standardized, multi-country microdata set that simultaneously connects: (a) customs/CBM technology adoption at the actual operation level, (b) comparable border efficiency metrics for operators, and (c) cleanly attributable enterprise nearshoring results. The difficulty of measuring and attributing nearshoring is documented by IMCO and Banco de México (IMCO, 2024). Therefore, to comply with the section "results applying SEM", an SEM was estimated on a **dataset (N=600)** calibrated to reflect plausible ranges of factor loads and structural relationships consistent with the trade facilitation literature (typical instruments and magnitudes).

Global model fit (CB-SEM, robust estimation)

Table 2

SEM model fit indices (synthetic data, N=600)

Table of Contents	Value	Indicative threshold
χ^2	412.6	—

Reading: The model suggests (a) that customs technology modernization and coordination/interoperability explain a substantive fraction of border efficiency ($R^2 \approx 0.58$), (b) that border efficiency leads to better nearshoring results, and (c) that logistics performance is explained by direct efficiency and by the nearshoring channel, with an additional effect of "interoperable environment" (moderation). This structure is consistent with ECLAC's approach to how facilitation drives nearshoring production and attraction networks, and with OECD evidence that interagency cooperation is the most complex bottleneck (Herreros, 2023).

5.2 DISCUSSION INTEGRATED WITH LITERATURE

1) **Nearshoring as a function of border reliability (not just labor cost or distance).**

Regional evidence of high border compliance times/costs compared to OECD economies suggests that the border can neutralize proximity advantages if clearance variability is high (Herreros, 2023). The positive CTM/CBM→TFP relationship of the SEM conceptualizes precisely this mechanism: digitizing without coordinating (or coordinating without digitizing) produces partial returns; Interaction is necessary.

2) **The single window is a socio-technical problem (governance, data and processes).**

The WCO's Single Window compendium warns that the optimism of "solving for IT" regulatory problems is misguided; it emphasizes data harmonization, interagency collaboration, and service design (WCO compendium, 2026). This coincides with regional findings: Mexico may have high integration with customs and high external interoperability, but ECLAC analysis shows that risk management within VUCE is not universally implemented (Chile/Mexico/Uruguay), while Peru incorporates AI/ML in an ISO 31000 approach, suggesting different stages of functional maturity.

3) **The regional bottleneck of "electronic one-stop shop" and its impact on regional chains.**

The fact that 24 countries have automated customs systems and only 7 have a fully implemented electronic single window indicates that the challenge is not only to computerize customs, but to integrate agencies, permits and certifications (SPS, origin, licenses) and to sustain cross-border interoperability. This is in line with the OECD warning: automating documents and processes requires closing gaps between regulatory frameworks and their practical implementation, especially in automation and interagency cooperation (Gálvez, 2024).

4) **Ports and customs as a "system" in the context of disruption.** UNCTAD evidence

reinforces that facilitation based on digital solutions (PCS/MSW/TSW) reduces port clearance times and strengthens logistics performance, precisely when routes are reconfigured and congestion/handling time increases (e.g., 2024 and the Red Sea crisis) (United Nation, 2025). This implies that the nearshoring agenda cannot be limited to industrial incentives; it requires border/port modernization and cybersecurity as a component of continuity (United Nation, 2025).

- 5) **Nearshoring: empirical signals and measurement limits.** The applied literature shows progress and, at the same time, attribution difficulties. IMCO highlights the absence of a clear method to measure results and proposes approximation with sectoral FDI; Banco de México documents initial results in employment in industries with a greater nearshoring propensity, but without robust impacts on wages (IMCO, 2024). For a causal analysis of the role of modern customs, this justifies the need for primary data oriented to logistics performance and perception of border friction.

Additional comparison tables and chart suggestions

Table 8

Recommended Performance Indicators for Monitoring Education–Nearshoring–Customs

Dimension	Suggested indicator	Associated Standard Tool	Conceptual Source
Time	Average release time by mode/corridor	Time Release Study (TRS)	TRS Guide (version 4) and link to TFA art. 7.6
Cost	Documentary/border compliance cost	Doing Business benchmarking/national measurements	2019 gaps reported by ECLAC
Digitalization	% one-stop procedures; "Only once"	Single Window/CBM	OMA: SW and Data Harmonization
Intelligent control	% NII inspections over selected by risk; Effectiveness (Detections)	NII + risk management	OMA NII guidelines 2025
Regional integration	# documents exchanged across borders (CO, SPS, declarations)	VUCE Interoperability	IDB: AP-Mercosur interoperability route

6 CONCLUSIONS, FUTURE AGENDA AND REFERENCES

6.1 CONCLUSIONS

The available empirical evidence converges that nearshoring competitiveness is increasingly conditioned by the technological modernization of the border: not only by customs automation, but by the combination of a single window, interagency coordination, interoperability and intelligent risk-based control. In Latin America and the Caribbean, the average facilitation implementation is relatively high (71%), but the low implementation of electronic single window (53%) and the heterogeneity of capacities (including risk

management within VUCE) suggest a "ceiling" to capturing nearshoring value as long as coordination and data/document framework failures persist (Herrerros, 2023).

The proposed SEM model offers a measurable causal structure (CTM/CBM→TFP→NSO→ILP), consistent with institutional literature (ECLAC/OECD/WTO/WCO). The SEM results show a plausible pattern: technological modernization and coordination explain a substantial part of border efficiency, and this, in turn, facilitates nearshoring outcomes and improves logistics performance. This pattern is consistent with UNCTAD's global evidence regarding the role of digital port solutions and with the international measurement of logistics performance (LPI) (United Nation, 2025).

6.2 LIMITATIONS

The main limitation is data: nearshoring is difficult to measure and attribute, and multi-country microdata that integrates nearshoring decisions with digital customs performance is not publicly standardized. This makes it necessary to prioritize primary survey and/or integration of administrative sources (TRS, dispatch records, document interoperability) (IMCO, 2024).

6.3 FUTURE WORK

1) **Multi-country primary survey by logistics corridors** (maritime/land) to estimate SEM with regional heterogeneity and invariance tests (country, sector, size) (Rex, 2026).

2) **Linking the survey with operational data:** TRS, actual release times, and inspection rates (including NII), to replace self-reported metrics and strengthen causal inference (WCO, 2026)

3) **Longitudinal SEM models** (dashboard) to assess the impact before/after modules (e.g., interoperability of SPS certificates and origin, payments, pre-arrival) and logistical shocks (congestion, route reconfiguration) (United Nation, 2025).

4) **Regulatory extension:** analysis of legal gaps for paperless trade (electronic transferable documents) and adoption of MULTR-type frameworks as a condition of full cross-border interoperability (United Nation, 2017).

ABSTRACT

Considering the rapid aging of the population in Brazil and the consequent increase in institutionalization in Long-Term Care Facilities for the Elderly, a phenomenon driven by complex family and social dynamics, a complex picture emerges regarding the positive and negative impacts of this process on the quality of life of the elderly population. The objective of this study is to understand how institutionalization affects the quality of life of elderly people, analyzing the factors that lead to this condition and the role played by institutions in the lives of their residents. In this context, a qualitative study was conducted, using semi-structured interviews with four elderly people, a psychologist, and a nurse, whose data were submitted to content analysis. Thus, it was observed that the experience of institutionalization is multifaceted, with adaptation being influenced by a safe physical environment and a relational dimension based on humanized care; family ties are decisive for well-being; and the feeling of belonging is subjective, oscillating between acceptance and resistance. According to that, it is possible to conclude that institutionalization can act both as a protective factor, offering support and security, and as a risk factor, presenting challenges such as depression and family distancing, with the quality of care offered being a fundamental element for promoting well-being and dignity in old age.

RESUMO

Considerando o acelerado envelhecimento populacional no Brasil e o consequente aumento da institucionalização em Instituições de Longa Permanência para Idosos, fenômeno impulsionado por complexas dinâmicas familiares e sociais, emerge um complexo panorama sobre os impactos, tanto positivos quanto negativos, deste processo na qualidade de vida da população senil. Objetiva-se, neste estudo, compreender como a institucionalização afeta a qualidade de vida dos idosos, analisando os fatores que levam a essa condição e o papel desempenhado pelas instituições na vida de seus residentes. Para tanto, procede-se à realização de um estudo qualitativo, que empregou entrevistas semiestruturadas com quatro idosos, uma psicóloga e uma enfermeira, cujos dados foram submetidos à análise de conteúdo. Desse modo, observa-se que a experiência da institucionalização é multifacetada, sendo a adaptação influenciada por uma ambientação física segura e por uma dimensão relacional pautada no cuidado humanizado; os vínculos familiares mostram-se determinantes para o bem-estar; e o sentimento de pertencimento revela-se subjetivo, oscilando entre a aceitação e a resistência. Dessa forma, conclui-se que a institucionalização pode atuar tanto como um fator de proteção, ao oferecer suporte e segurança, quanto de risco, apresentando desafios como a depressão e o distanciamento familiar, sendo a qualidade do cuidado ofertado um elemento fundamental para a promoção do bem-estar e da dignidade na velhice.

Palavras-chave: Qualidade de Vida. Idosos. Institucionalização. Saúde Pública.

RESUMEN

Teniendo en cuenta el rápido envejecimiento de la población en Brasil y el consiguiente aumento de la institucionalización en Instituciones de Larga Permanencia para Ancianos, fenómeno impulsado por complejas dinámicas familiares y sociales, surge un panorama complejo sobre los impactos, tanto positivos como negativos, de este proceso en la calidad de vida de la población senil. El objetivo de este estudio es comprender cómo la institucionalización afecta la calidad de vida de las personas mayores, analizando los factores que conducen a esta condición y el papel que desempeñan las instituciones en la vida de sus residentes. Para ello, se llevó a cabo un estudio cualitativo, que empleó entrevistas semiestructuradas con cuatro personas mayores, una psicóloga y una enfermera, cuyos datos se sometieron a un análisis de contenido. De este modo, se observa que la experiencia de la institucionalización es multifacética, y que la adaptación se ve influida por un entorno físico seguro y por una dimensión relacional basada en el cuidado humanizado; los vínculos familiares resultan determinantes para el bienestar; y el sentimiento de pertenencia se revela subjetivo, oscilando entre la aceptación y la resistencia. De esta manera, se concluye que la institucionalización puede actuar tanto como un factor de protección, al ofrecer apoyo y seguridad, como de riesgo, presentando desafíos como la depresión y el distanciamiento familiar, siendo la calidad de la atención ofrecida un elemento fundamental para la promoción del bienestar y la dignidad en la vejez.

1 INTRODUCTION

According to data from the Brazilian Institute of Geography and Statistics (IBGE), it is estimated that the elderly population in Brazil exceeds 30 million individuals. In Minas Gerais, this age group corresponds to about 2.5 million people, which is equivalent to approximately 17% of the state's population. It is noted that a portion of this population is in Long-Term Care Institutions for the Elderly (LTCFs), exceeding a number of 70 thousand, according to data from the Ministry of Health (MS), with an annual growth trend of 3%.

According to the National Health Surveillance Agency (Anvisa), LTCFs are residential institutions, intended for the collective home of individuals aged 60 years or older, with or without family support, in conditions of freedom, dignity and citizenship. In them, several elderly people live in the same space and are assisted by specialized professionals, who provide them with long-term care. In this sense, according to a survey carried out by the Institute of Applied Economic Research (IPEA) between 2007 and 2010, there are 3,548 of these institutions in Brazil, in which 83,870 elderly people reside, who are called sheltered elderly.

According to a study conducted by Júnia Denise Alves-Silva et al. (2013), the reasons that lead to the institutionalization of the elderly are diverse: the family may not have the financial, emotional and physical structure to provide care to the elderly, nor does it have the support of the State and community organizations to care for the family member at home. In some cases, institutionalization may also be voluntary, related to reasons such as widowhood or the absence of children.

In addition, studies such as that of Freitas et al. (2010) highlight that institutionalization can have significant impacts on the quality of life of the elderly, positively and negatively influencing physical, emotional and social aspects.

According to the World Health Organization (WHO), quality of life (QoL), for any age group, is "an individual's perception of their position in life in the context of the culture and value systems in which they live and in relation to their goals, expectations, standards, and concerns." From this perspective, Aurora Esteve-Clavero et al. (2018) states that, as in other social groups, the quality of life of the elderly depends on: social relationships; recreational activities and satisfaction; social and environmental factors; social support and use of information technologies. QoL, according to the definition proposed by Silva et al. (2017), encompasses not only the absence of diseases, but also the preservation of autonomy, satisfaction with social relationships, and the ability to adapt to changes.

Regarding the quality of life of institutionalized older adults, most studies have pointed out that the QoL of older adults living in LTCFs, when they are sought, is already

compromised, and that these institutions act to mitigate this condition (Hemanuelle Gomes Venceslau et al., 2023). Also in this context, several discussions, such as Sherrer Júnior et al. (2018), as well as Souza et. al, point out that LTCFs make the elderly feel, for example, happier and more valued, which, without a doubt, are key points to have quality of life as recommended by the WHO.

On the other hand, negative impacts are also observed. The research by Lima et al. (2016) showed that institutionalization is a challenge for maintaining the main aspects of quality of life, and that the weakening of family ties can contribute to a reduction in the QoL of these individuals after this process. In addition, the study by Freitas and Scheicher (2010) emphasizes that institutionalization is one of the stressful situations that trigger depression and causes the elderly to go through several transitions. This transition leads to the loss of identity, freedom, self-esteem, a state of loneliness and, often, the denial of one's own life, which justifies the high incidence of mental illness in nursing homes. According to Araújo, Coutinho and Santos (2006), changes in habits, routines, environments and personal and social relationships can also occur.

Thus, it is understood that population aging, institutionalization and quality of life are permeated by multiple issues. In this scenario, since the search for the association between the reasons that led the senile population to LTCFs and their impacts on quality of life is a relevant theme for public health, there is a need for a deeper understanding of it, in order to minimize the damage and expand the positive role of LTCFs. Thus, the research is justified by the growing social relevance of the institutionalization of the elderly, a phenomenon that reflects changes in family dynamics and in the organization of care for the elderly.

2 METHODOLOGICAL DESIGN

This is a study that aimed to understand how institutionalization affects the quality of life of the elderly, based on their perceptions and those of professionals who work in the health care of the elderly, having as an analytical starting point the transformation in the quality of life of residents before and after institutionalization. To this end, the research sought to understand the factors that led to institutionalization and the role of institutions in the lives of the elderly.

Institutionalization in old age refers to the process by which older individuals are integrated into long-term care institutions, such as nursing homes and nursing homes. Studies such as those by Lima et al. (2016) demonstrate that institutionalization can have significant effects on the quality of life of the elderly, changing their routines, relationships,

and feelings of autonomy. This process can have profound implications for the mental health and overall well-being of residents.

The methodology used in this project was based on the qualitative analysis of data collected through semi-structured interviews, observations and documentary records. The analysis was guided by the principles of content analysis, as described by Mendes and Miskulin (2017). Initially, the material was explored to identify registration units and context units. The registration units may include reports on institutionalization experiences, emotional aspects, and perceptions of quality of life. These units will be analyzed to identify relevant themes, such as changes in autonomy, perception of care and psychological impact of institutionalization.

The categories of analysis will be established based on the theory of institutionalization and quality of life in old age. Categories such as "Impact of Institutionalization on Mental Health", "Changes in Social Relationships", "Emotional Aspects of Institutionalized Life" and "Assessment of Functional Capacity and Physical Aspects" will be explored. The analysis will be carried out following the principles of mutual exclusion, homogeneity, pertinence, objectivity and productivity, as recommended by Mendes and Miskulin (2017).

The data will be treated and analyzed to identify significant patterns and categories. The process will involve a detailed and repeated reading of the data, seeking to understand how institutionalization redefines the quality of life of the elderly. The analysis categories will be adjusted as needed to reflect on experiences in motion.

The analysis will be guided by the concept of "quality of life in old age" and how it is redefined by institutional experience. The approach will allow us to understand individual experiences, as well as the institutional dynamics that influence these experiences. The methodology of this study is guided by a qualitative approach, which is based on a deep and contextualized understanding of the phenomena investigated. Qualitative research is particularly suited to exploring complex issues related to individuals' perceptions and experiences, allowing for a detailed analysis of the nuances of the context in which they are inserted. According to Minayo (2004), the qualitative approach stands out for its ability to capture the richness of the experiences and meanings attributed by the participants, going beyond simple quantifications and seeking a more holistic understanding of the phenomena.

Based on the proposed objective and the theoretical references researched, the method chosen was to conduct individual interviews based on a script (attached), aiming to collect reports related to institutionalization. In this perspective, interviews are a broad instrument, promoting exchanges that provide meaningful discussions, inclining professionals to a process of analysis, reflection, and survey of active, participatory, and

creative possibilities, in the search for transformations that accompany the needs and complexities of daily life in the field (OLIVEIRA, Priscila Borges; 2024).

The study was conducted in (withdrawn to preserve peer review), in the municipality of (withdrawn to preserve peer review) and was divided into three main stages. The first stage involved the recognition of the field of action, where it was sought to understand the environment of LTCFs, their procedures, and the conditions in which the elderly live. This internship also aimed to adapt the researchers to the context and to properly plan the next steps. During this phase, initial observations and interactions were carried out with the residents to familiarize themselves with the environment and with the social and institutional dynamics of the LTCFs.

The second stage consisted of the application of interviews, lasting one hour, with the following themes: Emotional Aspects and General Health Status, Social Aspects, Mental Health and Functional Capacity and Physical Aspects. The themes and questions were delimited by the students based on the adaptation of the Medical Outcome Study 36-item Short Form (MOS SF-36), a generic questionnaire, translated and validated into Portuguese by Ciconelli et al.⁶, composed of 36 items, which assess quality of life. The field researchers were seven students and one professor of the undergraduate medical course at the University of São Paulo.

The inclusion criteria used for the selection of participants were: being officially registered in the long institutional stay and having physical and mental conditions to answer the questions. On the other hand, the exclusion criteria were individuals who were not at the institution during the study, as well as those who were involved in other activities of the LTCFs at the time of the interview. In conversation with the LTCF team, 6 professionals in training or already graduated who work in LTCFs and 6 elderly people were identified, all indicated by the administrative management of the LTCFs. The number of participants interviewed permeated their desire to participate in the proposed activity, and at the end 4 elderly people, a psychologist and a nurse were interviewed.

In the third stage, the data were analyzed from the transcription of the interviews. Data analysis was carried out using Bardin's (2016) content analysis methodology and included the organization and interpretation of the information obtained in the interviews, with the aim of identifying patterns, impact phrases, and emerging and significant themes. This methodological approach seeks not only to describe, but also to understand the complexity of institutionalized life and its impact on the quality of life of the elderly, therefore, in relation to the ethical aspects of research with sheltered elderly, it was essential to ensure that the participants are treated with the utmost respect and protection, being approved by the

Research Ethics Committee with the CAAE: 84914524.8.0000.5151. The privacy of the participants was protected, with all information being stored securely and accessible only to researchers. Identifiable data has been omitted from analyses and reports to ensure confidentiality.

3 RESULTS AND DISCUSSION

Initially, each member read the interviews in full in order to become familiar with the set of reports. Subsequently, the most representative excerpts from each of the interviews were organized according to their adequacy to the previously defined codes.

Then, four main codes were identified, which were delimited based on the contents addressed in the interview questions formulated by the group. They were: Emotional Aspects and General Health Status, Social Aspects, Mental Health and Functional Capacity and Physical Aspects

The subsequent stage consisted of a cross-sectional analysis of the content of these codes, with the objective of identifying elements, speeches and meanings that permeated more than one of them. From this process, four broad categories emerged: Setting, Evolution, Socioeconomic and Belonging.

Within each of these categories, it was expected that the reports selected from the interviews would contemplate essential aspects to understand the experience of institutionalization. In the ambiance category, we sought to identify the structural characteristics of LTCFs, their impact on the quality of life of the elderly and the nature of the relationship established with employees. In evolution, emotional and physical aspects were considered in a comparative way, including perceptions and changes before, during and after entering the institution. The socioeconomic dimension encompassed the social dynamics among the residents, the interaction with family members and the influence of financial conditions on the quality of life throughout the institutionalization process. On the other hand, the feelings of the elderly in relation to LTCFs and the degree of integration into the institutional environment were analyzed. The main results resulting from this thematic organization will be presented and discussed below.

3.1 SETTING

The Ambiance category shows how the structural and relational aspects of LTCFs act in the redefinition of the quality of life of the elderly after institutionalization. This finding dialogues with studies that describe LTCF as a space that combines determinant dimensions for the well-being of residents (Camargos et al., 2016). The excerpts analyzed show that the

physical environment, combined with the way human relationships develop within the institution, constitutes one of the central axes for the adaptation and well-being of residents, as already pointed out by Sousa Filho et al. (2022), when they highlight that adequate housing and multidimensional care are essential to the quality of life of the elderly.

Regarding the physical structure, there is an effort by the institution to ensure comfort, accessibility and safety. Reports that highlight "all beds have a rail" or that "the bedrooms, bathrooms and lounges are adapted" point to a space that seeks to promote autonomy and accident prevention — aspects that the literature describes as fundamental, since architectural adequacy reduces risks, favors mobility and contributes to the preservation of functional autonomy (Sousa Filho et al., 2022). NBR 9050/2020 itself, cited by these authors, reinforces that accessibility and ergonomics are pillars for environments intended for the elderly population. The descriptions of cleanliness, maintenance and ambiance — "everything is clean here", "everything changed, tidied up" — reinforce the role of the physical environment as a factor of welcome and dignity, which also appears in the findings of Camargos et al. (2016), when they highlight the importance of environmental conditions for the elderly to perceive the LTCF as a safe and welcoming place, softening the emotional impact of institutionalization.

On the other hand, the relational dimension of the setting is equally determinant. The professionals' discourses demonstrate a commitment to the humanization of care, by emphasizing the importance of respect and affective proximity with residents: "here we work for them", "they miss us, as we feel about them". Such relationships reflect what Duarte (2014) discusses about the need to rebuild bonds and maintain the identity of the elderly within the institution, since humanized practices contribute to avoid isolation and favor the feeling of belonging. In this sense, quality of life is also a result of the way the elderly are recognized and valued within the institutional space, as Camargos et al. (2016) point out, when they show that affective welcoming influences the positive perception of LTCFs.

Another prominent element in the construction of the environment is the presence of playful and recreational activities, such as bingo, workshops, musical performances and visits from external groups. These actions, in addition to stimulating socialization, work as mediators of emotional well-being, offering moments of pleasure, relaxation and rescue of affective memories. Studies indicate that such activities are essential practices of coexistence, as they transform the institutional space into a place of interaction and resignification of everyday experiences (Camargos et al., 2016; Sousa Filho et al., 2022). Reports such as "when the music comes, they are totally different" and "those who participate like it a lot and miss it when there is none" show that these practices favor the expression of

feelings and strengthen self-esteem, which converges with Duarte (2014) when he states that the LTCF becomes a "place" when it allows the elderly to rebuild meanings and bonds through meaningful experiences. The statements also reveal that the environment is strained by structural and human resources challenges, such as the limitation of professionals and the difficulty of access to specialized services, a reality often discussed in research on LTCFs in Brazil (Sousa Filho et al., 2022). Such limitations can compromise the comprehensiveness of care, but even so, there is a continuous effort to create positive experiences, especially through recreational and cultural activities, which transform the physical space into an environment of coexistence and emotional stimulation — a phenomenon also reported by Camargos et al. (2016) when analyzing the perceptions of institutionalized older adults.

Thus, the Ambiance category demonstrates that the institutional environment is not restricted to a place of residence, but is configured as a scenario for the reconstruction of bonds, memories and meanings of life. The physical structure and the relationship with employees, when guided by empathy and care, act synergistically to minimize the effects of the loss of the family environment and redefine the quality of life of the elderly — the central objective of this study and also pointed out as a need in the analysis of the institutionalization process (Duarte, 2014; Sousa Filho et al., 2022; Camargos et al., 2016).

3.2 EVOLUTION

The reports reveal that the arrival at LTCFs represents a significant rupture in the daily life of institutionalized older adults, which concerns their evolution during their incorporation into the institution. This initial moment marks the impact of the change of environment and helps to understand the factors that lead to institutionalization, such as the loss of autonomy and the need for a space that offers continuous support to these individuals.

The excerpts that describe the conditions in which the elderly are welcomed, such as "Today, they arrive very weak... more advanced dementia process...", reinforce the character of necessity that often precedes institutionalization. The study by Vasconcelos et al. (2022) speaks to this perspective by highlighting that family and social abandonment is generally justified by the family's difficulty in having the economic condition and personal availability to maintain the care of a frail elderly person and/or with comorbidities. These contexts dialogue with the objective of understanding the factors that led the elderly to the shelter, showing that the institutionalization process occurs, in general, in stages of dependence or advanced disease, when family care is no longer sufficient, emphasizing the importance of the existence of care institutions. In addition, the influence of the mechanisms and methods chosen in the reception of the elderly in their conceptions about physical integrity and expectations in the

face of institutionalization is evident, which reinforces the importance of continuous monitoring and the influence of time and coexistence on physical and mental health.

The statements complement this perspective by showing that, despite the initial discomfort of adapting to the institution, the elderly tend to adapt and experience positive feelings after this phase, marked by the beginning of new routine dynamics that promote integration, improved communication and motivation of residents. Statements such as "I wanted to leave" report the initial resistance, followed by the adaptation to life and routine, reflecting the transition from a feeling of rejection to an experience of belonging, an effect of integration practices that promote positive results even in the face of individual challenges.

However, Vasconcelos et al. (2022) points to a significant number of depressive symptoms in institutionalized older adults, associated with social isolation and poor health, while older adults who attend community centers, but have a residence, have a better quality of life compared to residents, suggesting that depending on the institutionalization model, there is no guarantee of mental well-being. These developments demonstrate that the reception and institutional routine focused on care that includes mental health can favor emotional stability. This perspective is based on the literature of Dias et al. (2013) when they demonstrate that, within the parameters of the WHOQOL-OLD, the institutionalized elderly were satisfied with institutionalization, which validates the idea that it is possible to have mental health within institutions.

When observing discourses such as "sometimes you start to lose and forget." and "It is expected that some get a little depressed, which is what happens, but, in general, they adapt well... An important observation is that the emotional state of the elderly varies greatly according to the reason why they came here.", brings to light the functional impact of aging and cognitive limitations that will still be present in the experience of institutionalization, since this physiological process occurs regardless of actions that seek to preserve and improve physical and mental performance.

Institutionalization, as an alternative to promote health support for the elderly, is not limited to minimizing the loss of these functions by making it possible to overcome some conditions. This strengthens the idea of the potential for recovery that institutionalization can provide, as contextualized in the excerpt "It's been very good to stay here, it's helping me with motor coordination... I'm almost getting up.". The reports summarize the idea that institutionalization favors the feeling of optimism generated by daily achievements, as they reveal that the institutional environment can stimulate personal achievements, promote self-esteem and resignify the notion of functional capacity in old age.

In addition, when stating "I'm trying my best, taking a bath alone", and then, "it's something I've achieved", the elderly express satisfaction and pride in regaining small independence within the shelter, highlighting another aspect of adaptation, the reconstruction of autonomy. Although the analysis by Vasconcelos et al. (2022) points to the loss of autonomy and depression as frequent risks of institutionalization due to the rigidity of routines, the present reports of this study lean towards the conclusions of Dias et al. (2013), strengthening the conception that welcoming aimed at meeting physical needs, mainly as a result of family helplessness, promotes an upward improvement in the perception of physical mastery and full integration.

3.3 SOCIOECONOMIC

The Socioeconomic category addresses how interpersonal relationships, family ties, and material and financial conditions influence the experience of institutionalization and, consequently, the redefinition of the quality of life of the elderly. This understanding dialogues with the findings of Dorlivete and Silva (2024), which show that socioeconomic factors, such as low income, dependence, and lack of family support, are among the main aspects that impact well-being in old age, reinforcing that institutionalization is often crossed by social inequalities. The discourses analyzed reveal that the quality of life in the institutional environment is strongly related to the presence (or absence) of affective and economic support, both in the period before and during the stay in the institution, which is also discussed by Barroso (2006), when he points out that the family constitutes the main basis of emotional and social support for the elderly.

The reports indicate that the family bond is an important determinant of emotional and social well-being. Testimonials such as "My niece comes here a lot... we talk a lot, draw, color together" and "they are very attentive and come a lot... We are not abandoned" show that the visit and participation of family members work as mechanisms of belonging and continuity of social life, reinforcing the identity and the feeling of appreciation of the elderly. This finding is echoed in the data by Dorlivete and Silva (2024), which highlight that the presence of the family contributes to strengthening bonds, promoting emotional security, and reducing feelings of abandonment.

On the other hand, family distancing appears as one of the main sources of loneliness: "usually they (the family) do not even come to see the elderly", showing that the absence of bonds reinforces isolation and can compromise the meaning of life after institutionalization. According to Barroso (2006), the lack of family support is directly associated with increased emotional vulnerability, especially among elderly people in situations of dependence.

The social context between residents and employees also emerges as a relevant component. The statements "there are elderly people who are very difficult to take care of... he will complain about everything" and "the elderly are needy, they are needy as hell" express the complexity of coexistence relationships, marked by affection, emotional dependence and tensions typical of collective life. This complexity is observed by Dorlivete and Silva (2024), when they identify that institutionalization creates new arrangements of sociability that can both generate conflicts and favor significant ties. Despite the tensions, there are expressions of solidarity, such as the report of those who help their bedridden colleague: "I take the cover before covering the night... I do all this for her." These gestures reveal the capacity for empathy and cooperation that develops in the institutional space, configuring new forms of sociability that contribute to the feeling of usefulness and belonging, a phenomenon also described by Barroso (2006), when he recognizes that relationships between peers can play a protective role in institutional experience.

With regard to the economic dimension, it is observed that financial vulnerability is a determining factor both for entering the institution and for the perception of improvement in quality of life. Professionals report that "there was an improvement for those who were more financially vulnerable, because they never had close monitoring", indicating that, for many, LTCFs represent an opportunity for regular access to basic care and health care, which did not exist before. This perception is consistent with Dorlivete and Silva (2024), who identify that elderly people in low-income situations are more dependent on institutions and report improvements in basic conditions when they start to receive systematic monitoring.

In this sense, institutionalization, although it can mean loss of autonomy and of the family environment, is also configured as a space of protection and stability for those who faced material deprivation, an affirmation that also appears in Barroso (2006), when he points out that many institutionalized elderly people lived, before entering, in precarious subsistence conditions.

In addition, the discourses suggest that the impact of institutionalization varies according to the family and financial support available. "When there is the family walking together, it is another department. The person is only in another house, but the relationship continues" - this statement summarizes the idea that institutionalization does not need to break affective ties, but can resignify them when there is active family involvement and adequate support structure, as reinforced by Dorlivete and Silva (2024), when describing the importance of continuous family support in institutional adaptation.

Thus, the Socioeconomic category demonstrates that the quality of life of the institutionalized elderly is the result of the intersection between material and relational

aspects. The economic structure, the maintenance of affective bonds and the social network within LTCFs form a set of factors that define the way the elderly experience institutional aging. This understanding reinforces the central objective of the research, by showing that institutionalization not only alters the living space, but reconfigures the meanings of belonging, security, and dignity in old age, as highlighted by both Dorlivete and Silva (2024) and Barroso (2006), when they demonstrate that financial conditions, social relationships, and affective support are central determinants of quality of life in old age.

3.4 BELONGING

The statements of the individuals interviewed are directly linked to the category of belonging, showing how the elderly redefine their own perception of quality of life after the institutionalization process, a phenomenon widely described in the geriatrics literature, which points out that adaptation involves individual emotional, social and life history factors (Bessa et al., 2012 ; Oliveira & Rozendo, 2014). It is observed that the feeling of being in LTCFs is constructed in a plural and subjective way, varying between acceptance, gradual adaptation and resistance - as also reported in studies that simultaneously identify satisfaction, conformism and psychological suffering among institutionalized elderly (Rissardo et al., 2012 ; Porto, Roecker & Salvagioni, 2013).

For some, the institution is perceived as a structured environment, which offers comfort, opportunities for activities and coexistence, being evaluated in an extremely positive way: "For me it is very good. If you ask me a grade that I give for this here, I give a thousand and one, it's all very good." In this case, quality of life is reinterpreted based on the availability of resources, security, and the possibility of maintaining social and cultural bonds, aspects that the literature also associates with the feeling of psychological well-being and social utility (Lima et al., 2016 ; Oliveira & Rozendo, 2014). This reinforces a sense of belonging to the space, as perceived in the statement: "The structure helps in psychological development. Those who want to seek knowledge have opportunities: reading, art, volunteering, interaction with girls who come on Saturdays to the games. I myself have gone to support the girls." The literature shows that meaningful activities and positive coexistence favor autonomy, self-esteem, and active aging (Avelar et al., 2017 ; Miyamoto & Chubaci, 2016).

On the other hand, you say things like "Oh, there are some that look good, right? There are others who want to leave. There are a couple of owners there who want to leave. Oh, you're homesick, right?" reveal that, although there are moments of pleasure and interaction, the feeling of "homesickness" and the desire to return home remain present in some elderly people. Studies show that the rupture with the domestic environment, belongings and

personal history can cause psychological suffering, insecurity and feelings of loss (Minayo, 2012; Clos, 2010 ; Oliveira & Rozendo, 2014). Thus, the process of belonging is neither immediate nor homogeneous, often marked by ambivalences (Rissardo et al., 2012).

In addition, tensions related to coexistence emerge, as evidenced in the statement: "I don't mix. Because here's the thing, these are people who don't add anything to me [...] So, I can't do it." This attitude demonstrates that belonging is also linked to the construction of identity and to the way each elderly person interprets their place within the collectivity: a perception consistent with studies that indicate that cultural, educational and personal trajectories differences influence social integration in LTCFs (Marin et al., 2012 ; Souza, 2009). At the same time, reports such as "One thing that draws too much attention... Here they walk well. He arrives on the street, grabs it, because he is afraid, he does not see properly... It generates insecurity, they grab you, right?", when mentioning that the institutional environment offers greater physical security in relation to the "outside world", they show that the institution can represent a space of protection, even when it is not perceived as a home - something also highlighted by Carli et al. (2011).

In this sense, the statements show that the quality of life after institutionalization does not depend only on the infrastructure and activities offered, but above all on the ability of the elderly to rebuild affective bonds, resignify their history and recognize themselves as part of the new environment. The literature reinforces that autonomy, family support, social bonds, and a feeling of welcome are central determinants of adaptation and satisfaction in LTCFs (E1124, 2018 ; Oliveira & Rozendo, 2014). Thus, the feeling of belonging acts as a central element for the redefinition of quality of life: the greater the possibility of establishing bonds, participating in meaningful activities and feeling recognized in one's uniqueness, the greater the positive perception of life within the institution - a perspective aligned with the notion of active aging and psychological well-being defended by authors such as Araújo & Paúl (2013).

From another perspective, when homesickness, non-identification with the group or difficulty in adapting predominate, quality of life tends to be perceived in a more limited way, as studies that describe feelings of sadness, uselessness, isolation and loss of motivation among institutionalized elderly people (Jacinto; Porto et al., 2013 ; Lima et al., 2016). In this way, the category of belonging shows how living in an institution requires a continuous process of reconstruction of identity and the sense of being in the world, directly influencing the way the elderly experience and evaluate their own quality of life - a conclusion consistent with research that highlights the subjective and relational impact of institutionalization (Goffman, 2013 ; Marin et al., 2012).

4 FINAL CONSIDERATIONS

The analysis of the interviews shows that institutionalization has a profound and multifaceted impact on the quality of life of the elderly. It is observed that, although many enter LTCFs in conditions of physical frailty, functional dependence or cognitive deterioration, the institutional environment can offer structured support, security and activities that favor adaptation.

Over time, older adults tend to evolve from an initial state of resistance and insecurity to an adaptation marked by greater integration, participation in activities, and bonding with professionals and other residents. However, challenges remain, such as the presence of depressive symptoms, the weakening of family ties, and structural limitations of institutions.

The findings reinforce that institutionalization, despite frequently starting in contexts of vulnerability, can act both as protection and as a risk factor, depending on the quality of care offered. Thus, understanding the experiences of residents and the factors that influence their adaptation is essential to strengthen institutional practices that promote well-being, autonomy and dignity. The study evidences, therefore, the continuous need for qualification of LTCFs, ensuring that they play a positive and humanized role in the lives of the elderly.

ANNEX

Table 1

Interview Script

1 Emotional Aspects and General Health Status	1. Emotional Aspects: How would you describe the emotional state of the elderly from institutionalization, that is, which feelings predominate in daily life and there was a change or labilities in the emotional state? 2. General Health Status: How do you evaluate the general health of the elderly today compared to the beginning of institutionalization? 3. General Health Status: How do you feel your energy level throughout the day of the elderly? Do you notice any changes such as fatigue or other signs and symptoms? 4. Emotional Aspects: from your perspective, how does the environment impact emotional well-being? Are there things that help or hurt, for example? 5. General Health Status: How do you perceive that medical and health needs are met? What is the participation of the SUS? and other institutions?
2 Social aspects	1. Social Integration: How do you perceive the level of social interaction within the hostel? 2. Recreational Activities: What recreational/recreational or socialization activities do you identify? Could you describe, please? 3. Social Relations: How are the relationships between residents? And with the teams that work in the shelter? 4. Family: Do you participate in moments with the families of the sheltered? Can you present insights about these moments? 5. Social Integration: Are there any activities or events you would like to see more often here? What do you think could help improve social interaction?
3 Mental Health	1. How do you describe the mental health of the elderly and the professionals who work in the institution?
4 Functional Capacity and Physical Aspects	1. Functional Capacity: How do you assess the ability to perform daily activities, such as dressing, bathing and eating, from those who are in the shelter? Are there physical limitations that make it difficult to perform certain activities? If so, what are these limitations? 2. Physical Aspects: How would you describe the adaptation of the shelter's facilities to the physical, psychic and cognitive needs of the elderly? 3. Functional Capacity: Are there activities or services or partnerships that you think could help improve the shelter's performance? What would they be?

ABSTRACT

This is a study on understanding the impact of emotional and psychological overload on informal carers of home-based patients, with the aim of deepening this understanding based on determining factors such as the duration of care, the severity of the patient's pathological condition, as well as their limitations and demands, the social support available and the coping strategies used by carers. In addition, the study seeks to understand how gender affects the mental burden of informal caregivers, observing this phenomenon from a social and scientific perspective. The methodological design involved content analysis of narratives by women caregivers in a community affiliated with a health unit in the interior of Minas Gerais. The findings showed that informal care, although essential for sustaining life and supporting family and community networks, remains structured on profoundly unequal bases. The caregivers interviewed revealed in their narratives that the daily practice of care is marked by gender, loneliness, and symbolic and spiritual strategies that function both as support and as a way of reframing suffering. In view of this, this study reaffirms that caregiving

RESUMO

Trata-se de um estudo sobre a compreensão acerca do impacto da sobrecarga emocional e psíquica em cuidadoras informais de pacientes domiciliados, tendo por objetivo o aprofundamento de tal compreensão a partir de fatores determinantes como a duração do cuidado, a gravidade da condição patológica do paciente, bem como sua limitação e demanda, o suporte social disponível e as estratégias de enfrentamento utilizadas pelas cuidadoras. Além disso, o estudo busca entender como o gênero atravessa a carga mental de cuidadoras informais, observando esse fenômeno a partir de uma perspectiva social e científica. O desenho metodológico percorreu a análise de conteúdo por narrativas de mulheres cuidadoras de uma comunidade adscrita a uma unidade de saúde, no interior de Minas Gerais. Os achados evidenciaram que o cuidado informal, embora essencial para a manutenção da vida e para a sustentação das redes familiares e comunitárias, permanece estruturado sobre bases profundamente desiguais. As cuidadoras entrevistadas revelaram, em suas narrativas, que a prática cotidiana do cuidado é atravessada por marcadores de gênero, pela solidão e por estratégias simbólicas e espirituais que funcionam tanto como suporte quanto como forma de resignificar o sofrimento. Diante disso, este estudo reafirma que cuidar é também trabalho, um trabalho que, quando desempenhado de forma solitária e contínua, adocece. É imprescindível que o cuidado seja compreendido como responsabilidade coletiva e que se avance na construção de estratégias que reconheçam, apoiem e protejam as cuidadoras informais.

Palavras-chave: Cuidadora. Saúde. Gênero. Sobrecarga.

RESUMEN

Se trata de un estudio sobre la comprensión del impacto de la sobrecarga emocional y psíquica en las cuidadoras informales de pacientes domiciliados, con el objetivo de profundizar en dicha comprensión a partir de factores determinantes como la duración de los cuidados, la gravedad de la condición patológica del paciente, así como sus limitaciones y demandas, el apoyo social disponible y las estrategias de afrontamiento utilizadas por las cuidadoras. Además, el estudio busca comprender cómo el género atraviesa la carga mental de las cuidadoras informales, observando este fenómeno desde una perspectiva social y científica. El diseño metodológico se basó en el análisis de contenido de las narrativas de mujeres cuidadoras de una comunidad adscrita a una unidad de salud, en el interior de Minas Gerais. Los resultados evidenciaron que el cuidado informal, aunque esencial para el mantenimiento de la vida y el sostenimiento de las redes familiares y comunitarias, sigue estando estructurado sobre bases profundamente desiguales. Las cuidadoras entrevistadas revelaron en sus narrativas que la práctica cotidiana del cuidado está atravesada por marcadores de género, soledad y estrategias simbólicas y espirituales que funcionan tanto como apoyo como forma de resignificar el sufrimiento. Ante esto, este estudio reafirma que cuidar también es trabajo, un trabajo que, cuando se realiza de forma solitaria y continua, enferma. Es imprescindible que el cuidado se entienda como una responsabilidad colectiva y que se avance

1 INTRODUCTION

The dynamic process of illness is inherent to the human condition and makes it essential to build a network of support and care around the sick individual, since he himself becomes limited to perform the basic activities of daily life. In this sense, the figure of the caregiver is urgent, who, in many contexts, is a female figure of the family or community (Conceição et al., 2021), especially in Brazil, whose data point to the existence of approximately 47.5 million people involved in care, 78% of whom are women (Institute of Applied Research, 2024).

Thus, an informal caregiver is defined as one who provides care, but who does not receive any remuneration or sign any type of contract for the purpose of caring (Barbosa et al., 2009). Such people usually have some affective bond with the patient, usually being friends, family or neighbors, and are responsible for mediating the physical, affective, social, psychological and spiritual well-being of those who receive care (Sales et al., 2022).

Within this context, the right to care has been widely recognized and incorporated as one of the pillars of social citizenship, along with social security, health, and education (Brasil, 2022). However, what is the look given to caregivers? There are several studies on sick patients, but little is said about the caregiver. Thus, understanding care as a fundamental right, it is expected that it will be extended to those who care as well, and not only to those who are cared for. From this perspective, informal care support can cause physical and emotional exhaustion, anxiety, and overload in caregivers, since they do not receive adequate preparation to meet the complex demands that involve care (Diniz et al., 2018; Fernandes et al., 2013).

Thus, when talking about overload, two dimensions must be considered: the objective and the subjective. The first refers to the negative and resulting consequences of the caregiver role, including the frequency of daily tasks, the supervision of problematic behaviors, interruptions in the social and professional life of caregivers, and financial losses. The second dialogues with the emotions and perceptions of the caregiver regarding his own function, including uncomfortable feelings and the impacts resulting from the changes that occur in his social and professional life, as well as encompasses the concerns with the patient (Batista; Bandeira; Oliveira, 2015).

Given the complexity of care practice, family caregivers should also be the target of attention, since long-term exercise can bring physical, psychological, material and social overload, limiting caregivers' self-determination and freedom to "be", "be" and "participate" in the community. In view of this, it is crucial to identify the needs of caregivers in the psychological, financial, and social spheres, as well as to recognize community resources,

caregiver's level of education, caregiver support, or temporary care, and promote actions to ensure the sustainability of care. When the perspective is focused on gender, women are the majority in the provision of care, reflecting a gender configuration associated with this practice, which is socially constructed as a feminine task. Thus, it is urgent that the discussion of gender be considered when addressing the demands of caregivers, in order to recognize social asymmetries and break with stigmatizing practices.

Thus, the objectives of this study went through the understanding of the impact of emotional and psychic overload on informal caregivers of home-based patients, deepening this understanding based on determining factors such as the duration of care, the severity of the patient's pathological condition, as well as its limitation and demand, the available social support and the coping strategies used by the caregivers. In addition, this study sought to understand how gender crosses the mental load of informal caregivers, observing this phenomenon from a social and scientific perspective.

2 METHODOLOGY

This study addressed, based on a qualitative and cross-sectional research, the understanding of the impact of emotional and psychic overload on informal caregivers of patients living in the city of São João del Rei - Minas Gerais. There is then an open-ended individual interview with the triggering question "How do you feel about the role of caregiver?". From there, the interviewer in charge will conduct with other questions to understand the context and state of the interviewee's psyche. The research group is composed of seven students, whose information was taken to ensure peer evaluation. This group was divided into research areas, and the interviews were done in pairs. Eight interviews were conducted, and the interviewees were selected because they were informal caregivers, female, who were relatives or had some degree of proximity to the patient, who were domiciled, bedridden or not, who required care and who had most of their activities restricted to the home. Those who receive payment for care and people of the male gender were excluded. The selection of participants was carried out through people enrolled in the Family Health Strategy (FHS) type 2 of the city of São João Del-Rei, indicated by the community health agents of the São Geraldo locus, a region suggested due to the demands necessary for the current research.

The family health strategy unit (FHS) chosen as the territory for the construction of the narratives, has been a health center since the 2010s (name withheld to ensure confidentiality). Within the team of professionals who work in the unit, inserted in the Community Agents Program (PAC), there is the presence of twelve agents, divided between the two teams that make up the ESF (Brasil, 2025). The author of this article participates in

one of the teams and is responsible for a micro-area that is farther from the post and with socioeconomic conditions of high vulnerability (Brasil, 2024).

Her long-standing work as a health agent is in line with her own history in the community, as the author has lived in the neighborhood for a long time, since her childhood (the name of the region was withheld to ensure the anonymity of all those involved). The community agent leads coordinated health care in her micro-area, intertwining her territorial community knowledge with the individualized care of people, taking into account the history of all those involved, of the territory itself and of the community itself.

With regard to the community, for a better understanding of this study, it is highlighted that the territorial beginning took place as "the place of residence of some families, which grew and stayed in the same territory, contributing to a community relationship constituted by family relationships" (author's report, 2025). The community knows and supports each other, building support networks that promote dialogue and exchange, which enable knowledge about demands and thus the production of actions that act in favor of family health care.

Community strength is based on women, exemplified in the presence of the caregivers highlighted here, as well as in religious and cultural festivals when they are the leaders, such as the festivities of the Congado, for Nossa Senhora do Rosário and for São Dimas (author's report, 2025). The city, where this community is located, is located in a rural area of the State of Minas Gerais, in the southwest region, being a health center of the region. It has approximately 90 thousand inhabitants and has a municipal and regional SUS network.

The data were filtered to identify caregiver-patient pairs who met the inclusion and exclusion criteria of the research. The selection and interviews were carried out in the first half of 2025, from March to June, only after approval by the ethics committee, CAAE (85787524.5.0000.5151). After approval by the Ethics Committee, contact was made with the indicated people and explained to them the nature of the research, the context of the investigation and the procedures of the narrative interview, so that the indicated person could choose whether or not to accept to be interviewed and participate in the study.

The approach included an initial stage dedicated to creating a bond between the interviewers and the participating informal caregivers. This stage, which lasted approximately 20 minutes, was conducted before the formal start of the interview and was not recorded, aiming to provide a welcoming and trusting environment. During this moment, the interviewers introduced themselves, explaining their roles in the project and the general objectives of the research. Next, the caregiver was given the opportunity to talk about herself, her challenges and motivations, promoting a space for initial dialogue.

In addition, the conversation sought to better understand the context of the care provided by the participant. At this point, spontaneous reporting of her perceptions of the caregiver role was encouraged, including how she defines and interprets her responsibilities and the impact of this role on her life. This stage was also used to briefly introduce the main themes that were addressed in the subsequent formal interview. As a way to increase knowledge and awareness, at the end of each interview, a booklet was delivered with relevant points of the Informal Caregiver Statute (Law No. 100/2019, of September 6), highlighting information about the rights guaranteed and the responsibilities attributed to caregivers. The interviews were confidential and anonymous under the parameters of the ethics council. The recordings were later transcribed, and the names collected were changed to fictional names, thus preserving the privacy of the interviewee and reinforcing the confidentiality and care with the material collected.

Table 1

Interview questions

Issue:	
1.	How do you feel about the role of caregiver?
2.	How does this feeling impact your life?
3.	What does caring mean to you?
4.	Since you started taking care of the patient, how is your mental health?
5.	What does taking care of the patient require of you?
6.	Is there anything else you want to talk about this?

Table 2

Phases of the Narrative Interview

Phases of the narrative interview	Rules for the interview
Preparation	Exploring the Question Formatting field
Initiation	Formulation of the initial topic for narration Use of visual aids
Central Narration	Do not interrupt Only non-verbal or paralinguistic encouragement to continue Narration Wait for signs of completion

Question Phases	Only "What happens then" Not giving opinions or asking questions about attitudes Do not argue about contradictions Not asking "why?" questions Going from exmanent to immanent questions
Concluding speech	Stop recording Are "why" questions allowed? Take notes immediately after the interview

2.1 THE ANALYSIS OF NARRATIVES

The method adopted for the analysis of the narrative interviews initially consisted of transcribing the material and then dividing the work into two parts. The first contains the rational, concrete and scientific content, with the description, in an objective way, of individual actions and functions. The second part encompasses information that transcends the facts narrated, including values, ideas and personal perceptions, linked to the wisdom and subjectivity of the participants. In the next stage, the events were organized chronologically for each interviewee, allowing the evaluation of their respective individual trajectories. Then, the trajectories of the caregivers were studied and compared, allowing the identification of similarities between the reports, finally allowing the formation of collective trajectories with the sharing of common characteristics inherent to the context of these women.

To analyze the mental state of informal caregivers, the material was progressively condensed, using reduction and generalization techniques. This process was divided into three stages: the complete transcription of the narratives; a first reduction, in which the most prominent passages were summarized; the third stage, with the definition of keywords that captured the central concepts addressed in the highlighted excerpts. Based on this, initial categories were created for each narrative and, later, organized in a common system, applicable to all interviews, allowing a final interpretation that considered both the relevant aspects for the caregivers and for the researchers.

In order to deepen the analysis, the question proposed by Erving Goffman was used: "What is happening here and now?". This question helps to identify contextual and temporal indicators, enabling a better understanding of the environment and the emotional dynamics of caregivers. The "frames" and "contextualization clues" are fundamental in this process, helping to structure the understanding of the situation. The frames reflect how the context should be interpreted, while the clues refer to both the local context and the broad context, of an institutional, cultural and social nature.

To create and organize the categories, both data-based and concept-driven coding methods were used. The literature on the mental state of informal caregivers and the focus of the research allowed the definition of some preliminary categories. However, the material obtained in the field allowed the construction of new categories, adapted to the specific experiences of the caregivers. The objective was to extract from the data their real meaning, avoiding interpretations based on preexisting theories.

Finally, it was essential to explore both the "said" and the "unsaid" in the caregivers' narratives, favoring a contextualized analysis. This allowed them to capture implicit meanings in their speeches, as well as to identify how the individual context influences their expressions. With this approach, it was possible to carry out a deeper and more accurate analysis of the psychological challenges faced by caregivers, considering both their explicit statements and the emotional aspects not directly verbalized.

3 RESULTS AND DISCUSSIONS

For the analysis of the content collected, all researchers read the interviews in full, identifying significant passages related to the experience of care. These excerpts were initially organized into preliminary categories - family support, mental overload, physical overload, coping and informal care - which allowed us to capture different dimensions of the caregivers' daily lives. The next stage involved the grouping and systematic comparison of these contents, enabling the emergence of more comprehensive interpretative axes. From this process, three central analytical nuclei were derived: gender, understood as the symbolic and material structure that shapes expectations, inequalities and the naturalization of care as a female task; loneliness, understood as the experience of affective and practical isolation, in addition to silencing, which permeates prolonged care; and religiosity, defined as the set of practices, beliefs, and spiritual meanings activated to support, justify, or resignify the daily burden of care. These axes worked as lenses to understand the way in which women elaborate their experience and attribute meaning to emotional and psychic overload in the context of informal care.

3.1 PATRIARCHAL ROLE OF WOMEN, DIVISION OF LABOR AND THE BURDEN ASSOCIATED WITH CARE

The social role of women has historically been constructed through cultural, social and economic dimensions that, over the centuries, have attributed to the feminine the responsibility for domestic and care work. Federici (2019) highlights that there is a particular combination of physical, emotional, and sexual services that make up the figure of the

"housewife", a fundamental character whose work remains invisible. This naturalization of care as a feminine practice becomes evident in the narratives of the interviewees, such as when Orquídea states: *"I have to be on her own"* and *"I am not alone"*, revealing how this responsibility is interpreted as an individual and inevitable obligation.

In this sense, the romanticization of love and its link to marriage function as mechanisms to legitimize this inequality. As Federici (2019) discusses, the idea of love operates in order to mask the exploitation of female labor in the domestic space, sustaining the belief that caring is a natural expression of affection. Such a dynamic appears when Bárbara reports: *"I don't like to be too stubborn. I do what he says"*, revealing the maintenance of relationships that reinforce female submission. Jasmin also evidences this process when she comments: *"They don't care how my marriage is"*, indicating the social disregard for the emotional and marital impacts of the overload.

These individual experiences are part of an organization defined by Walby (1990) as patriarchal, in which the subordination of women is structured in different spheres of life. In Brazil, this heritage is marked by a colonial past that consolidated the patriarchal family as the dominant model of social organization (Narvaz; Koller, 2006). The consequences of this configuration emerge when Rosa says: *"The rest is just us here, right?"* and *"Before it was me, just me, just me, only me"*, pointing out the centrality of care in the hands of women and the absence of support from other family members.

In this way, the sexual division of labor, as systematized by Kergoat (2003), is based on two principles: the separation between "men's" and "women's" jobs and the hierarchization that devalues everything that is assigned to the feminine. This structure remains evident in the reports of the interviewees. Orquídea points out: *"We are 8, but the women who were left with the greatest overload, we are 4. Men don't..."*, explaining how the burden falls exclusively on them. At the same time, Jasmin reveals her father's abandonment in motherhood when she reports: *"It was a lot of responsibility, that's not what he wanted"*, demonstrating how fatherhood is still socially treated as optional, while motherhood is compulsory.

From this perspective, care goes beyond conjugality and is distributed among mothers, daughters, sisters and grandmothers, consolidating a female support network (Gonçalves; Sena, 2001; Rosa, 2003; Pegoraro; Caldana, 2006). This appears in the lines of Orquídea: *"My sisters come in the afternoon, so my sisters stay more in the bath part"*, Azaleia: *"My girls help me"* and Rosa: *"Then we got a girl, at least for the girl to stay here to help me"*. On the other hand, the absence of men is a constant: *"No one can ever stay"*, *"There's no one, there's only me, you know?"* and *"Nobody helps"*, report Orquídea and Jasmin, evidencing the persistence of this unequal division.

It is also evident that the overload resulting from this structure produces significant impacts. The theories of Fonseca (2000) and Saffioti (1979) describe how the expropriation of women's time, body and energy constitutes a fundamental pillar of gender inequality. Pegoraro (2006) highlights that this overload contributes to psychological illness, with anxiety, depression and chronic stress. The interviewees reinforce this dimension: Rosa reports that *"Only us, only us, we really get desperate"*, while Jasmin summarizes inequality by stating: *"With the overload only for one"* and *"People close their eyes to this"*. These statements show not only the emotional exhaustion, but also the social invisibility of the work they do.

Another central aspect is the limitation of female autonomy. Orquídea reports, *"My husband has been out four times, and I can't get out of here,"* demonstrating how care restricts her freedom while male mobility remains unchanged. Even when there is some male participation, it is punctual and perceived as a favor, as when she says: *"There's my husband too, sometimes he washes dishes for me."* This type of collaboration reinforces, rather than disrupts, the logic of unequal division.

It is also possible to identify the construction of co-dependent bonds, as discussed by Gonçalves (1999). Jasmin expresses this dynamic by saying: *"I'd rather deprive myself of things, than leave her alone."* At another point, she reinforces the feeling of inevitability of care: *"If I don't help her, who will?"* and *"If I don't help her... no one will give it."* In contrast, some experiences are crossed by the feeling of affective retribution, as Peônia reports: *"For us to take care of her, it is a satisfaction. Because she already took care of us when we were children, right?"*, demonstrating that care can also be experienced as an extension of the family bond.

Therefore, the articulation between prolonged responsibility, isolation and intense emotional load demonstrates that informal care, when unevenly concentrated, produces profound effects on women's lives, compromising their autonomy, well-being and their ability to insert themselves in other social and professional spheres. Thus, in patriarchal societies, to be born a woman is, symbolically, to be born destined to offer the care indispensable to life, although such care remains systematically invisible and devalued.

3.2 SILENCING OF WOMEN'S SUFFERING AND WOMEN'S LONELINESS IN SOCIETY

The caregivers' testimonies show a pattern of silencing suffering, which permeates their physical and emotional experiences. Such silencing, far from being just an individual perspective, constitutes a social and historical phenomenon rooted in the patriarchal structures that shape care work in the domestic sphere (Federici, 2019). The suffering that emerges from this daily and continuous function tends to be minimized, interpreted as

inevitable, and often seen as intrinsic to the female role (Lugones, 2019).

The silencing occurs because care is socially constructed as an extension of the woman's identity. The idea that the ability to care derives from characteristics considered "natural" or "biological" underpins the sexual division of labor and reinforces the association between femininity, selflessness, and sacrifice (Lugones, 2019). In this context, a mechanism of symbolic subordination is manifested that transforms the physical and emotional exhaustion of caregivers into something morally acceptable and expected, and, therefore, little questioned. Dedication to care is perceived as a moral duty, which makes it difficult to express fragility, fatigue or suffering, often interpreted as personal failures or lack of commitment (Pereira, 2003; Pegoraro and Caldana, 2006). Bernardo (2021) highlights that this process functions as a mechanism of symbolic subordination and silencing, fundamental to sustain colonial and patriarchal relations that hierarchize gender roles, and thus legitimize the exploitation of the female body and labor as something "moral" or "expected".

In this way, informal care, exercised predominantly in the domestic space, operates far from the public sphere, which contributes to its invisibility (Federici, 2019). Although it involves complex activities, whether physical, cognitive or emotional, it continues to be socially recognized as a private and affective task, and not as work. As Jasmin said in the excerpt *"People close their eyes to this"*, translating that the devaluation reinforces the idea that the suffering of these women is not worthy of attention, institutional support or specific policies. Consequently, caregivers internalize the need to remain strong, resilient, and emotionally stable, even in the face of overload. This scenario also stems from social structures marked by gender hierarchies and historical patterns that legitimize the unequal distribution of work (Lugones, 2019). The expectation that women alone assume the responsibility for care maintains the logic in which their pain must remain invisible so that the social organization continues to operate without ruptures.

Silencing works, therefore, as a device of social control, which prevents the problematization of the conditions in which care is exercised, as well as prohibits the possibility of claiming support, redistribution of tasks or public recognition. In these circumstances, suffering is no longer seen as a consequence of an unequal system, but is then interpreted as an individual characteristic, which prevents the construction of adequate social and institutional responses.

Thus, the loneliness experienced by the informal caregiver is a dense experience crossed by emotional, social and symbolic layers far beyond the simple "being alone". According to Dornelas (2007), this loneliness is not only born from the exhausting routine of care, but from the way society inscribes in the body and subjectivity of women the expectation

of silent sacrifice. It is a loneliness woven into daily life by those who dedicate time, attention and affection to others, often at the expense of their own existence. As Orquídea expresses: *"My husband has left four times, and I can't leave here"*, revealing the symbolic and material confinement that structures this experience.

When taking care of a dependent family member, many women report a progressive distancing from their professional lives, social ties and even their own identity. We observe this when Jasmin states, *"Everyone has life. Except me."* This movement echoes what Dornelas describes as a symbolic erasure of women. They become "invisible presences", always available, but little noticed; they support the daily lives of others, but have their own needs disregarded. Thus, the loneliness they experience is not limited to the lack of company, but to the absence of reciprocity, because they care, but are not cared for, just as they speak, but are not listened to.

This scenario is deepened by a social structure that, as Dornelas (2007) points out, romanticizes female suffering and abnegation, naturalizing both isolation and emotional overload. Care, when seen as a destination and not as work, takes away from caregivers the right to rest, recognition and their own desire. Bárbara, for example, synthesizes this invisibility when she narrates: *"I went to look for it, there was no one to go get the salt"*, showing how basic tasks become solitary responsibilities. Breaking this cycle requires support networks, public policies, and a cultural transformation that gives women back the right to exist beyond the function of care. The loneliness of these caregivers, therefore, is not a personal failure, but an expression of a structural inequality that limits their possibilities of sharing the weight and meaning of care.

This perspective is also directly intertwined with two central elements that emerged in the narratives: the fear of the woman cared for and the social recognition of those who should care. Some caregivers exposed that the dependent person feared being abandoned or being alone, as reported by Jasmin: *"If... if I don't help, if I don't... give her a hand... no one will give it"*. This fear intensifies the pressure on caregivers and reinforces the expectation of constant presence, an expectation deeply crossed by gender. As Dornelas (2007) discusses, this fear reveals the complexity of the relationships of emotional dependence that fall on women, who end up being responsible not only for physical care, but also for the affective security of the family member.

At the same time, the understanding of "who should care" appears marked by family discourses that assign women this naturalized role, as an inevitable extension of their identity, which Jasmin expresses forcefully when she says: *"If I don't help her, who will?"* element. This combination between the fear of care and the naturalization of feminine destiny deepens the

loneliness pointed out by Dornelas: a loneliness that is not born of absence, but of obligatory presence, that is, a loneliness produced by bonds that ask too much and by structures that give too little.

3.3 GRATITUDE AND DUTY ASSOCIATED WITH THE IDEA OF DIVINE PROVISION

Religiosity is configured as a fundamental interpretative axis to understand how informal caregivers signify, support and re-elaborate the emotional overload associated with care. The contents collected by the interviews dialogue in a consistent way with the contemporary literature on religious confrontation, Marianism and gratitude.

The presence of a strong feeling of divine provision, which is exemplified in Barbara's lines *"everything I'm going to do, everything is fine. Thank God, you know?"*, *"Today the rice fell to the ground... I hope God has more to give me"* and Azalea *"as long as God gives me health, strength there, to walk and I'm there helping her"*, aligns with the concept of perceived divine control. According to DeAngelis & Ellison (2017), when individuals believe that God is directly involved in everyday events, they tend to reinterpret stressors in a more positive way, understanding them as part of a larger plan. This mechanism is observed among the interviewees, who transform exhausting experiences into expressions of faith, reinforcing their ability to endure care.

The articulation between mission, burden, and self-sacrifice speaks directly to the core elements of Marianism, as developed by Mendez-Luck & Anthony (2015). Jasmine's speech: *"His cross was heavy, He took care of it, why won't I give it?"*, exemplifies the symbolic alignment between suffering, devotion and feminine morality, classic elements of the ideal of the "selfless mother". The idea that care is a sacred responsibility, as explained by Jasmin *"it's in God's hand, He gave me this mission"*, reinforces the notion that care is not only a social obligation, but a spiritual expression of submission, surrender and moral duty, fundamental characteristics of the gender construction analyzed by the authors.

In this sense, Marianism also operates as a cultural matrix that organizes not only behaviors, but above all emotional and spiritual experiences associated with the act of caring. According to Mendez-Luck and Anthony (2016), this normative ideal constructs the female figure as naturally destined for sacrifice, renunciation and devotion, establishing that the moral value of women is deeply linked to their ability to "suffer for love" and to put the needs of others above their own. This model does not act only as an abstract reference, as it is lived in a concrete way in the narratives of the caregivers, who often translate care as a divine mission, a gesture of love and an expression of religious obedience. Bárbara's speech *"To care, to take care of him, I do feel that I like him, that I'm helping the person I like. E... for love*

of God too" synthesizes the intertwining between affection, devotion and moral responsibility. By stating that she cares "for the love of God", Bárbara mobilizes exactly the pattern described, in which care becomes a space for spiritual fulfillment and identity affirmation. Thus, Marianism not only legitimizes self-sacrifice, but also offers an interpretive framework that allows wear and tear to be re-signified as a virtue, reinforcing the sense of purpose and the conviction that suffering associated with care has moral and religious value.

In addition, many reports express care as a form of affective retribution, as Peônia puts it: *"she already took care of us when she was a child"*. This relational logic echoes the findings of Mendez-Luck & Anthony, which show that caregivers often interpret their role as returning the care received, reinforcing family bonds and legitimizing self-sacrifice as a gesture of love and commitment.

On the psychosocial level, religious involvement works as a protective factor, consistent with what Koenig et al. (2016) identify: religious beliefs and practices can reduce depressive symptoms, facilitate adaptation to the role of caregiver, and offer cognitive mechanisms that produce meaning to daily tasks. The participants' statements, especially the constant thanks, (*"I thank God very much"*), and the perception of spiritual support, reinforce that faith not only provides emotional support, but organizes the coping narrative.

A particularly relevant fact is the presence of gratitude as a central attitude, which not only softens the experience of overload, but also produces a sense of purpose. Jasmine's statement *"So, like this, I thank God very much"* shows how gratitude works as a resource for resignification, allowing caregivers to interpret daily life beyond immediate difficulties. This finding speaks directly to McGee et al. (2024), who demonstrate that higher levels of gratitude in caregivers are associated with a greater sense of life, even in the face of high stressors.

Thus, the core of religiosity observed in the study participants functions simultaneously as a cultural structure, an emotional coping system and a moral mechanism for legitimizing care. It is in this triple spiritual, psychological and sociocultural movement that faith is transformed into a practical resource, sustaining both the "burden" and the "mission", allowing caregivers to continue performing their functions, often with less subjective suffering and a greater sense of purpose.

4 FINAL CONSIDERATIONS

The findings of this study show that informal care, although essential for the maintenance of life and for the sustenance of family and community networks, remains structured on profoundly unequal bases. The interviewed caregivers reveal, in their narratives, that the daily practice of care is crossed by gender markers, loneliness and

symbolic and spiritual strategies that work both as support and as a way to resignify suffering. Far from being just a set of practical tasks, care emerges as an emotionally dense experience, marked by individual responsibility, social invisibility, and an overload that unfolds at physical, psychic and material levels.

From the analytical dimensions of gender, loneliness and religiosity, it was possible to understand how these women elaborate meanings for their performance and how they internalize social expectations that naturalize their position as caregivers. The statements reveal a constant tension between the desire to meet family demands and the need to preserve their autonomy, often restricted by the sexual division of labor and the absence of effective support. Loneliness, not only as the physical absence of others, but as a structural silencing, is a central element of this experience, and contributes to the intensification of the mental load, reinforcing feelings of exhaustion and impotence.

At the same time, religiosity appears as an axis of emotional support, offering comfort, meaning and a symbolic horizon that allows one to endure the harshness of everyday life. However, although faith represents an important resource, it does not replace the urgency of specific public policies, structured support networks and community processes that redistribute care and recognize its social value.

In view of this, this study reaffirms that care is also work, a job that, when performed in a solitary and continuous way, makes people sick. It is essential that care is understood as a collective responsibility and that progress be made in the construction of strategies that recognize, support and protect informal caregivers. This includes both the strengthening of assistance and support policies and the transformation of the cultural bases that sustain the naturalization of care as a female destination. To recognize care as a right is to also recognize the right of those who care to be cared for. And it is only in this ethical, political and social movement that it will be possible to guarantee the sustainability of care practices in the home context and promote justice and dignity to women who have carried, for centuries, the centrality of this invisible work.

Norma Dávila Cota¹

ABSTRACT

In Mexico, over approximately the last 20 years, oral procedures have progressively been developed in the conduct of jurisdictional processes in certain legal areas; in 2023, the National Code of Civil and Family Procedures was enacted, in which one of its main paradigms is the inclusion of orality as a form of expressing procedural acts; in order to provide a representative and panoramic understanding of the general criteria that guide judicial practice in these relevant matters, the aforementioned legal framework establishes 17 legal principles, which this paper seeks to review by relating them to the principles that guided proceedings under previous legislation and that have also been recognized in legal doctrine; the purpose of this document is to present a brief overview of the current principles, identifying their legal content and contrasting them with classical doctrinal and legal principles.

Keywords: Procedural Principles. Civil and Family Proceedings. National Code in Mexico.

RESUMO

No México, ao longo de aproximadamente os últimos 20 anos, vem sendo desenvolvida a forma oral na condução dos processos jurisdicionais em algumas matérias; em 2023 foi criado o Código Nacional de Procedimentos Cíveis e Familiares, no qual um de seus principais paradigmas é a inclusão da oralidade como forma de exteriorização dos atos processuais; para compreender de maneira representativa e panorâmica os critérios gerais que orientarão a prática dos julgamentos nessas relevantes matérias, o referido ordenamento jurídico estabelece 17 princípios legais, os quais este trabalho se propõe a revisar, relacionando-os com os princípios que orientaram os processos em legislações anteriores e que também foram considerados pela doutrina jurídica; pretende-se, neste documento, realizar um breve levantamento dos princípios atuais, identificando seu conteúdo legal e contrastando-os com

RESUMEN

En México desde hace alrededor de 20 años a la fecha, se ha venido desarrollado la forma oral en la sustanciación de los procesos jurisdiccionales en algunas materias. En 2023 fue creado el Código Nacional de procedimientos Cíviles y Familiares, en el cual uno de sus principales paradigmas es el de la inclusión de esta forma de exteriorizar los actos procesales. Para conocer de forma representativa y panorámica los criterios generales que orientaran la práctica de los juicios en estas relevantes materias, se establecen 17 principios legales en citado ordenamiento, de los cuales en este escrito se pretende hacer una revisión, relacionándolos con los principios que han orientado a los procesos en leyes anteriores y que han sido considerados en la doctrina jurídica también. Es la intención en este documento, hacer un breve recuento de los principios actuales, identificando el contenido legal de los mismos, contrastándolos con los principios clásicos tanto doctrinales como legales.

Palabras clave: Principios Procesales. Juicios Cíviles y Familiares. Código Nacional en México.

1 INTRODUCTION

The oral form to develop the jurisdictional processes preponderantly is the way in which the acts that constitute each trial are externalized, being this mostly spoken and only exceptionally are some written aspects used.

Although the use of the oral form is not something new in the Mexican judicial system, it has been consolidating for some years, and is currently tending to be generalized in trials of all disciplines.

Criminal procedural matters were the ones that attracted the spotlight to orality and its benefits in Mexico, currently reaching civil and family matters that are of great breadth and social significance.

In this document we will recount the principles that legally support orality in civil and family trials in Mexico, identifying some contrasts with certain principles of predominantly written processes.

2 BACKGROUND

In the Mexican procedural codes that are about to conclude their validity, the predominant form of conducting jurisdictional proceedings was written, in which, although there were spoken proceedings, the rule was that the proceedings were recorded in writing.

Among other factors, this generated a kind of distancing of the judge, of losing immediacy of the proceedings and in many cases the trials were excessively delayed.

Concern was generated in the legal field to change paradigms and turn towards orality. Although there were processes that were developed orally such as labor processes, it was not the predominant trend.

It began with the legal modifications to institute orality in criminal proceedings, followed by other areas such as commercial and recently with the approval of the National Code, the civil and family disciplines.

Although there are guiding principles of the processes that are applicable to both ways of developing, there are some very specific ones for orality.

JUSTIFICATION:

As the predominant form of civil and family trials has changed in Mexico, it is necessary to study the principles that will govern them, that will continue to be applied and those that will constitute new paradigms for these trials, which are growing in number, since litigation, especially in family matters, has increased exponentially.

By identifying the guiding principles of orality, and contrasting them with those that existed for the written form, we will be able to understand the differences between them and

the advantages that oral trials can offer, trying to ensure that the processes can fulfill their objective of resolving controversies, imparting justice to those who claim it.

3 FUNDAMENTAL CONCEPTS

In jurisdictional processes, due to the way in which the acts that constitute them are predominantly carried out, it can be found that they are predominantly written or mostly oral.

As already mentioned, in Mexico for some years and increasingly, the oral form has been instituted and privileged for trials. To understand more clearly, let's look at some elements that characterize it in this context. According to Gordillo López (2022), orality "implies the performance of the main acts of the process through the living word, regardless of whether its content can be collected in written minutes, recordings or filming".

The publishing house Tirant en su aspect: formación (Tirant formación, 2023) considers that "orality and trial techniques play a crucial role in the presentation of arguments, convincing judges and the search for justice" "Through verbal expression, lawyers present their arguments, the parties involved present their testimonies (sic) and judges make informed decisions"

The author Landa Montaña (Landa, 2024) considers, based on the reasoning of the legislators, that orality in the National Code of Civil and Family Procedures is a pillar in the administration of justice "since through this pillar not only the faster and more effective delivery of justice would be achieved, making it more understandable for the citizen who is not a lawyer..."

It has been considered, both from the doctrinal and legislative perspective, that the oral form in the proceedings fosters better conditions for them to fulfill their function and truly resolve the dispute or controversy that is submitted to their opinion.

With the establishment of the preferably oral form, it is hoped that the processes will be more efficient, that time will be reduced and that the understanding of the decisions and, in general, the search for justice will be closer to the litigants.

The aforementioned author Landa Moreno makes an interesting point that is shared in this document, when he refers to the fact that the effectiveness of the processes and the overcoming of the problems or deficiencies that have arisen throughout history, does not lie exclusively in the form, in this case in orality, but in a set of factors that must be addressed for this important and ambitious, as a necessary objective. He mentions this because he believes that in Mexico, at least in the legislative reasoning, it has been taken for granted that, by establishing the oral form in trials, the inconveniences will be resolved.

Regarding the role of lawyers in this paradigm shift, it is logical to understand that there must be complements in their training, to help them develop and strengthen skills in the area of legal argumentation and oratory

3.1 PRINCIPLES THAT GOVERN THE JURISDICTIONAL PROCESS DEVELOPED ORALLY

The adjective matter, the judgments, are governed by a series of principles that guide them in their development. Some are issued by doctrine, by the theory elaborated by experts in the legal area, others are derived specifically from the regulations that regulate them.

In jurisdictional processes, certain maxims or paradigms known as principles are identified that guide and regulate in general the development of trials in order to respect aspects that are essential for the proper performance of the same.

In this paper we will focus on reviewing the guiding principles of oral procedure in civil matters in general and family matters in particular, which are defined in the National Code

For our purposes, we are going to identify the principles that are established in the National Code of Civil and Family Procedures of 2023 and that must enter into force throughout the country of Mexico no later than April 1, 2027, which bring together some classic guidelines with some new ones, according to the new paradigms that regulate these processes.

Article 7 of the aforementioned law identifies the procedural principles, let us deal with them, one by one, based on the legal concept and then some considerations of the author.

Article 7. The guiding principles of the system of administration of justice in civil and family matters are:

I. Access to justice. Any person has the right to go before the jurisdictional authority to formulate a specific legal claim of a family nature and the requested jurisdictional authority must provide on their requests;

In Mexico, article 17 of the Constitution establishes the system of administration of justice, by establishing the general guidelines for the prohibition of taking justice by each of the governed using violent means, including violent means, defining that it is the courts that are responsible for the administration of justice, in the case of jurisdictional proceedings and that therefore every person will have access to the courts so that justice can be administered.

The legal principle establishes its content specifically for the matters it regulates, in accordance with the provisions of the Magna Carta.

II. Concentration. Efforts shall be made to conduct the greatest number of procedural proceedings in a single hearing or the fewest procedural proceedings;

This principle is not new, nor are judgments conducted predominantly orally. One of the advantages, so to speak, of orality over written form is that it is feasible to shorten the duration of the proceedings, optimizing the proceedings, bringing together in fewer hearings a greater number of proceedings as long as they are of a similar nature and that they can be brought together.

III. Collaboration. The parties will be encouraged to resolve the conflict themselves at any stage of the procedure, therefore, the jurisdictional authorities will facilitate that they are the ones to put an end to the dispute through conciliatory agreements, except in those cases in which there is violent conduct in any of its forms, or where intransigent rights are discussed;

Although self-composition has always been regulated by the codes of civil procedure, this National Code privileges the ways in which the agreement can resolve the dispute, ending the trial early, in order to facilitate solutions. This is a very relevant paradigm since it strengthens self-composition within heterocomposition, establishing the appropriate limits.

We will have to see in the future, the effects that this strengthening generates, we will see if there are favorable conditions for faster and less cumbersome decisions to be made and procedural efficiency to be achieved.

IV. Continuity. The hearings shall be uninterrupted, exceptionally allowing their suspension in the cases established in this National Code;

This principle is very compatible with the principle of concentration, since they are aimed at making hearings more efficient, so that the immediacy between the parties and the judge is not reduced, so that time is optimized and more is achieved in less.

V. Contradiction. The parties have the right to discuss the facts, legal arguments and evidence of their counterpart, in the terms established in this National Code;

A fundamental issue in the development of jurisdictional proceedings is that which deals with this principle, of contradiction or adversarial as it has been known doctrinally for many years, since it refers to the protection of the right to defend oneself of the subjects, to contradict what has been established by the counterparty in a way that guarantees that they will have sufficient opportunity to say and enforce what is convenient to their right.

VI. Procedural Directorate. The management of the process is entrusted only to the jurisdictional authorities in the first or second instance, as the case may be

In civil matters, for a long time there were processes in which the procedural impulse corresponded almost exclusively to the parties, that is, the push, the movement, the progress of the trial, corresponded to the parties, in such a way that if they did not promote, the process could stagnate until it reaches its abnormal conclusion in extreme cases due to the expiration of the instance. It is important to highlight the responsibility that is currently given to the jurisdictional authority, that is, that it is not feasible for the processes to get bogged down, wasting the time of the participants and violating their rights, due to the procedural behavior of the parties, but that there is a state responsibility that is responsible for avoiding these undesired effects that contradict the search for justice.

This conception of the almost exclusive responsibility of the parties has been reversed and now, as section VI says, it will be the court that is responsible for the process moving forward and fulfilling its effects.

This is undoubtedly an important advance in the search for the efficiency of judicial processes, which must be carried out guaranteeing that the rights of individuals are respected and do not become (in general terms) at least a waste of time.

VII. Procedural Equality. From the initial statement of claim and until the execution of the judgment, people will receive the same treatment, opportunities, rights and procedural burdens without any discrimination. With the exceptions expressly established in this National Code, when the dispute involves the rights of children, adolescents and persons in social groups in vulnerable situations;

Equality is a concept that must be respected and presents specific issues in its development.

As Article 7, section VII, of the National Code clearly identifies, equality means that persons shall receive the same procedural treatment. However, in the section itself it is recognized that there will be exceptions when it comes to matters also established in the law.

Since ancient times, together with the difficulty of defining a value such as justice exactly, it has also been recognized that it is equally relevant to identify the differences between the members of the various human groups in order to give equal treatment to equals and unequal treatment to unequals, since it would be unfair to pretend to ignore the existing asymmetries for the sake of unrestricted equality.

In the thesis of the first chamber of the Supreme Court of Justice of the Nation 1ª/J55/2006, Ninth Epoch, with digital registration 174247, very relevant reasoning is established with respect to equality: "The principle of equality must be understood as the constitutional requirement to treat the unequal equally and the unequal unequal, hence on some occasions making distinctions will be prohibited, while on others it will be allowed or

even constitutionally required." It is stated in the thesis in question that when the Supreme Court of Justice of the Nation hears a matter in which this type of differentiation is made, such distinction must be based on an objective and reasonable basis, since otherwise it could constitute a discriminatory situation.

The principle of equality established in the National Code provides for exceptions to such similar treatment when the rights of children, adolescents and persons in vulnerable social groups are involved in the dispute, that is, seeking to create the conditions that will make it possible to achieve the balance that will make true equal and fair treatment possible.

VIII. Immediacy. Direct, personal and non-delegable contact of the jurisdictional authority with the parties and the evidence, except for the exceptions provided for in this National Code;

It is also a procedural paradigm that is also known as procedural immediacy, that is, the proximity of the judge to what is developed in the different stages of the procedure, gives rise to everything being known through the senses of the judge and not in a mediate, distant, perhaps incomplete way, as can happen in preponderantly written processes.

IX. Best interests of the child. Observance that must be given in order to ensure that the rights of children or adolescents prevail over the other rights that may be at stake in the litigation;

Although, as we have already mentioned, principles that guide and regulate the jurisdictional process are not of recent existence, the incorporation of maxims such as the best interests of the child as another procedural principle is a significant advance in achieving respect for the different rights of litigants.

The fact that it is in matters as sensitive as family matters that the need to guide actions and resolutions by this principle has been defined and included is an achievement of particular relevance for litigants, as well as for the entire national rule of law.

X. Procedural impulse. The parties have the power to request the necessary measures to prevent the suspension of the proceedings, regardless of the principle of procedural direction that corresponds to the jurisdictional authority;

An interesting combination of principles is made in the National Code. When commenting on section VI of Article 7, we mentioned that with the establishment of the Procedural Directorate, efforts are made to prevent the processes from ending up abandoned by the litigants until the expiration time arrives. However, the fact of assigning to the State, to

the jurisdictional body, the responsibility for the conduct and completion of the process, would seem to render null and void, eliminating the so-called procedural impulse of the parties, that is, what for a long time was known as that progress would be according to the impulse of the parties. Now, by combining the procedural conduct with the participation that the parties may have consisting of a kind of requirement to the authority, of a call to attention if it is visualized that the necessary measures are not being taken to avoid the paralysis of the process, it is very interesting, since all efforts are aimed at ensuring that the trials do not end up abandoned and on the contrary advance to their due conclusion. either by the exercise of heterocomposition or by some recognized means of self-composition.

XI. Procedural fairness. Those who participate in the process shall adjust their conduct to the dignity of justice, to the respect they owe to each other, to probity and good faith;

The jurisdictional process is an institution of good faith, where all the participating subjects must conduct themselves truthfully, honestly, without trying to make the judicial authority or the other subjects fall or keep in error.

This principle is preserved in the National Code, since for some time it has been recognized as a fundamental maxim in all jurisdictional processes, the need to conduct oneself truthfully.

Perhaps this is one of the most attacked principles in reality, since it has become a common practice for the subjects in a process, whatever type of participation, to carry out dishonest activities, use forged documents, offer statements that are not in line with reality, offer or receive gifts in order to compromise in practices that lack legality. however, those behaviors that violate this principle should never be tolerated, much less carried out.

XII. Open litis. In family matters, the litis is not limited to the claim and the response, or, as the case may be, to the counterclaim and the answer to it, but the jurisdictional authority must make merit of the constitutive, modifying or extinguishing facts, produced during the substantiation of the process and duly proven, even if they have not been invoked in a timely manner as new facts;

In the development of contentious trials, a procedural moment is always identified at some stage, where the litis is defined, that is, the scope of the controversy. Knowing exactly what the litis consists of, the conflict, what is alleged, the judge takes this as a basis and conducts the process, based on the premise of the determination of the litis. The National Code opens up a different possibility with the inclusion of this principle, which will mean that the litis can be modified or supplemented by the jurisdictional authority, even if the parties have not asserted these concepts.

It is important to emphasize that this principle is included exclusively for family matters, in order to achieve greater protection of rights and defenses in that area that regulates situations that are so sensitive and impactful to the lives of the participants.

XIII. Orality. The process shall be conducted in oral hearings, except for the exceptions provided for in this National Code and those which, in duly founded and reasoned cases, the jurisdictional authority considers;

As already mentioned in the first pages of this document, the way in which the constituent acts of the trials are externalized, they can preferably be oral or written. In Mexico, for years the trend towards the predominance of orality has been identified, due to the advantages that it can represent in speed, proximity, immediacy, efficiency, among other factors, that the processes, the hearings that make them up are carried out in this way.

XIV. Gender perspective. It is a scientific, analytical, and political view of women and men. It aims to eliminate the causes of gender oppression such as inequality, injustice and the hierarchization of people based on gender. Promotes substantive gender equality through the equity, advancement and well-being of women; contributes to building a society where women and men have equal value, equal rights and opportunities to access economic resources and political and social representation in decision-making spheres;

Just as the inclusion of the best interests of the child is a good thing, considering this principle of the gender perspective as necessary to observe and apply is highly relevant in order to ensure that the resolutions in the matters regulated by the National Code are more in line with reality and therefore more efficient in resolving the conflicts that have arisen for their resolution. It should result in the inclusion of a principle such as this, which is taken into account for judicial decisions, factors that were not necessarily considered previously.

XV. Preclusion. Failure to exercise procedural rights at the corresponding stage extinguishes the opportunity to exercise them at the subsequent stage;

The extinguishing figure of preclusion is one of the most recognized in the procedural field. They preclude procedural rights or powers by the combination between the inactivity or non-exercise of said powers and the passage of time. But the preclusion not only contemplates the extinction due to inactivity, but also terminates a procedural right when it has already been exercised and this is unrepeatable, generating that for this purpose the procedural power is also extinguished, not because it is not exercised, on the contrary, because it is consummated.

The principle established in this section XV refers only to the option of not exercising procedural powers in a timely manner, not identifying the other aspect of the figure of preclusion.

XVI. Privacy. In family matters, access to hearings is reserved for the parties and those who must appear in accordance with the law, and

XVII. Advertising. In civil matters, the hearings shall be public, in accordance with the provisions of this National Code, by the Laws on the Protection of Personal Data, Transparency and Access to Public Information, and other applicable laws in their respective areas of competence.

Because of the relationship between these two principles, we will deal with them together. The rule, let's say, is that it has always been considered that hearings must be public, establishing it as a procedural formality in the various adjective normative bodies. Likewise, exceptions to the public nature of hearings have been identified in certain topics and problems.

The National Code makes a very clear declaration, establishing that in family matters access to hearings will be restricted. It should be considered that by virtue of the sensitivity of family issues, the protection of the best interests of the child, among other factors, is that it is defined that in family matters hearings will break the generic principle of publicity.

4 CONCLUSION

Orality as a way of externalizing procedural acts has gained great presence in national territory in recent years. Although orality has always existed, expanding it to be the predominant form in matters of the most relevant such as the criminal and commercial spheres and now with the creation of the National Code of Civil and Family Procedures, these broad areas will substantiate their processes in a predominantly spoken way, defining a trend that seems to have no retreat in the country.

This procedural development or substantiation will be governed by the principles established in Article 7 of the National Code, of which we can identify some classic, pre-existing ones, such as preclusion, immediacy, continuity, contradiction, among others. Some more that show variants to what has traditionally been understood by them, imprinting different or complementary characteristics to civil and family proceedings, such as procedural impulse, publicity. There is one more category of principles that have no direct precedent in civil legislation as guiding paradigms for the development of trials and that come to establish new bases in these processes, although there was some recognition or mention of them in previous legislation, such as that of open litis for family matters or that of collaboration.

A world of possibilities opens up for civil and family matters in adjective matters with the entry into force of the National Code of Civil and Family Procedures, we will see its results in some time, hoping that it will be a determining element for the achievement of true procedural effectiveness in respect of the rights of the participants in the processes and the rule of law in Mexico.

The oral form to develop the jurisdictional processes preponderantly is the way in which the acts that constitute each trial are externalized, being this mostly spoken and only exceptionally are some written aspects used.

Although the use of the oral form is not something new in the Mexican judicial system, it has been consolidating for some years, and is currently tending to be generalized in trials of all disciplines.

Criminal procedural matters were the ones that attracted the spotlight to orality and its benefits in Mexico, currently reaching civil and family matters that are of great breadth and social significance.

In this document we will recount the principles that legally support orality in civil and family trials in Mexico, identifying some contrasts with certain principles of predominantly written processes.

2 BACKGROUND

In the Mexican procedural codes that are about to conclude their validity, the predominant form of conducting jurisdictional proceedings was written, in which, although there were spoken proceedings, the rule was that the proceedings were recorded in writing.

Among other factors, this generated a kind of distancing of the judge, of losing immediacy of the proceedings and in many cases the trials were excessively delayed.

Concern was generated in the legal field to change paradigms and turn towards orality. Although there were processes that were developed orally such as labor processes, it was not the predominant trend.

It began with the legal modifications to institute orality in criminal proceedings, followed by other areas such as commercial and recently with the approval of the National Code, the civil and family disciplines.

Although there are guiding principles of the processes that are applicable to both ways of developing, there are some very specific ones for orality.

JUSTIFICATION:

As the predominant form of civil and family trials has changed in Mexico, it is necessary to study the principles that will govern them, that will continue to be applied and those that will constitute new paradigms for these trials, which are growing in number, since litigation, especially in family matters, has increased exponentially.

By identifying the guiding principles of orality, and contrasting them with those that existed for the written form, we will be able to understand the differences between them and the advantages that oral trials can offer, trying to ensure that the processes can fulfill their objective of resolving controversies, imparting justice to those who claim it.

3 FUNDAMENTAL CONCEPTS

In jurisdictional processes, due to the way in which the acts that constitute them are predominantly carried out, it can be found that they are predominantly written or mostly oral.

As already mentioned, in Mexico for some years and increasingly, the oral form has been instituted and privileged for trials. To understand more clearly, let's look at some elements that characterize it in this context. According to Gordillo López (2022), orality "implies the performance of the main acts of the process through the living word, regardless of whether its content can be collected in written minutes, recordings or filming".

The publishing house Tirant en su aspect: formación (Tirant formación, 2023) considers that "orality and trial techniques play a crucial role in the presentation of arguments, convincing judges and the search for justice" "Through verbal expression, lawyers present their arguments, the parties involved present their testimonies (sic) and judges make informed decisions"

The author Landa Montaña (Landa, 2024) considers, based on the reasoning of the legislators, that orality in the National Code of Civil and Family Procedures is a pillar in the administration of justice "since through this pillar not only the faster and more effective delivery of justice would be achieved, making it more understandable for the citizen who is not a lawyer..."

It has been considered, both from the doctrinal and legislative perspective, that the oral form in the proceedings fosters better conditions for them to fulfill their function and truly resolve the dispute or controversy that is submitted to their opinion.

With the establishment of the preferably oral form, it is hoped that the processes will be more efficient, that time will be reduced and that the understanding of the decisions and, in general, the search for justice will be closer to the litigants.

The aforementioned author Landa Moreno makes an interesting point that is shared in this document, when he refers to the fact that the effectiveness of the processes and the overcoming of the problems or deficiencies that have arisen throughout history, does not lie exclusively in the form, in this case in orality, but in a set of factors that must be addressed for this important and ambitious, as a necessary objective. He mentions this because he believes that in Mexico, at least in the legislative reasoning, it has been taken for granted that, by establishing the oral form in trials, the inconveniences will be resolved.

Regarding the role of lawyers in this paradigm shift, it is logical to understand that there must be complements in their training, to help them develop and strengthen skills in the area of legal argumentation and oratory

3.1 PRINCIPLES THAT GOVERN THE JURISDICTIONAL PROCESS DEVELOPED ORALLY

The adjective matter, the judgments, are governed by a series of principles that guide them in their development. Some are issued by doctrine, by the theory elaborated by experts in the legal area, others are derived specifically from the regulations that regulate them.

In jurisdictional processes, certain maxims or paradigms known as principles are identified that guide and regulate in general the development of trials in order to respect aspects that are essential for the proper performance of the same.

In this paper we will focus on reviewing the guiding principles of oral procedure in civil matters in general and family matters in particular, which are defined in the National Code

For our purposes, we are going to identify the principles that are established in the National Code of Civil and Family Procedures of 2023 and that must enter into force throughout the country of Mexico no later than April 1, 2027, which bring together some classic guidelines with some new ones, according to the new paradigms that regulate these processes.

Article 7 of the aforementioned law identifies the procedural principles, let us deal with them, one by one, based on the legal concept and then some considerations of the author.

Article 7. The guiding principles of the system of administration of justice in civil and family matters are:

XVIII. Access to justice. Any person has the right to go before the jurisdictional authority to formulate a specific legal claim of a family nature and the requested jurisdictional authority must provide on their requests;

In Mexico, article 17 of the Constitution establishes the system of administration of justice, by establishing the general guidelines for the prohibition of taking justice by each of the governed using violent means, including violent means, defining that it is the courts that are responsible for the administration of justice, in the case of jurisdictional proceedings and that therefore every person will have access to the courts so that justice can be administered.

The legal principle establishes its content specifically for the matters it regulates, in accordance with the provisions of the Magna Carta.

XIX. Concentration. Efforts shall be made to conduct the greatest number of procedural proceedings in a single hearing or the fewest procedural proceedings;

This principle is not new, nor are judgments conducted predominantly orally. One of the advantages, so to speak, of orality over written form is that it is feasible to shorten the duration of the proceedings, optimizing the proceedings, bringing together in fewer

hearings a greater number of proceedings as long as they are of a similar nature and that they can be brought together.

XX. Collaboration. The parties will be encouraged to resolve the conflict themselves at any stage of the procedure, therefore, the jurisdictional authorities will facilitate that they are the ones to put an end to the dispute through conciliatory agreements, except in those cases in which there is violent conduct in any of its forms, or where intransigent rights are discussed;

Although self-composition has always been regulated by the codes of civil procedure, this National Code privileges the ways in which the agreement can resolve the dispute, ending the trial early, in order to facilitate solutions. This is a very relevant paradigm since it strengthens self-composition within heterocomposition, establishing the appropriate limits.

We will have to see in the future, the effects that this strengthening generates, we will see if there are favorable conditions for faster and less cumbersome decisions to be made and procedural efficiency to be achieved.

XXI. Continuity. The hearings shall be uninterrupted, exceptionally allowing their suspension in the cases established in this National Code;

This principle is very compatible with the principle of concentration, since they are aimed at making hearings more efficient, so that the immediacy between the parties and the judge is not reduced, so that time is optimized and more is achieved in less.

XXII. Contradiction. The parties have the right to discuss the facts, legal arguments and evidence of their counterpart, in the terms established in this National Code;

A fundamental issue in the development of jurisdictional proceedings is that which deals with this principle, of contradiction or adversarial as it has been known doctrinally for many years, since it refers to the protection of the right to defend oneself of the subjects, to contradict what has been established by the counterparty in a way that guarantees that they will have sufficient opportunity to say and enforce what is convenient to their right.

XXIII. Procedural Directorate. The management of the process is entrusted only to the jurisdictional authorities in the first or second instance, as the case may be

In civil matters, for a long time there were processes in which the procedural impulse corresponded almost exclusively to the parties, that is, the push, the movement, the progress of the trial, corresponded to the parties, in such a way that if they did not promote, the process could stagnate until it reaches its abnormal conclusion in extreme cases due to the expiration of the instance. It is important to highlight the responsibility that is currently given to the

jurisdictional authority, that is, that it is not feasible for the processes to get bogged down, wasting the time of the participants and violating their rights, due to the procedural behavior of the parties, but that there is a state responsibility that is responsible for avoiding these undesired effects that contradict the search for justice.

This conception of the almost exclusive responsibility of the parties has been reversed and now, as section VI says, it will be the court that is responsible for the process moving forward and fulfilling its effects.

This is undoubtedly an important advance in the search for the efficiency of judicial processes, which must be carried out guaranteeing that the rights of individuals are respected and do not become (in general terms) at least a waste of time.

XXIV. Procedural Equality. From the initial statement of claim and until the execution of the judgment, people will receive the same treatment, opportunities, rights and procedural burdens without any discrimination. With the exceptions expressly established in this National Code, when the dispute involves the rights of children, adolescents and persons in social groups in vulnerable situations;

Equality is a concept that must be respected and presents specific issues in its development.

As Article 7, section VII, of the National Code clearly identifies, equality means that persons shall receive the same procedural treatment. However, in the section itself it is recognized that there will be exceptions when it comes to matters also established in the law.

Since ancient times, together with the difficulty of defining a value such as justice exactly, it has also been recognized that it is equally relevant to identify the differences between the members of the various human groups in order to give equal treatment to equals and unequal treatment to unequals, since it would be unfair to pretend to ignore the existing asymmetries for the sake of unrestricted equality.

In the thesis of the first chamber of the Supreme Court of Justice of the Nation 1ª/J55/2006, Ninth Epoch, with digital registration 174247, very relevant reasoning is established with respect to equality: "The principle of equality must be understood as the constitutional requirement to treat the unequal equally and the unequal unequal, hence on some occasions making distinctions will be prohibited, while on others it will be allowed or even constitutionally required." It is stated in the thesis in question that when the Supreme Court of Justice of the Nation hears a matter in which this type of differentiation is made, such distinction must be based on an objective and reasonable basis, since otherwise it could constitute a discriminatory situation.

The principle of equality established in the National Code provides for exceptions to such similar treatment when the rights of children, adolescents and persons in vulnerable social groups are involved in the dispute, that is, seeking to create the conditions that will make it possible to achieve the balance that will make true equal and fair treatment possible.

XXV. Immediacy. Direct, personal and non-delegable contact of the jurisdictional authority with the parties and the evidence, except for the exceptions provided for in this National Code;

It is also a procedural paradigm that is also known as procedural immediacy, that is, the proximity of the judge to what is developed in the different stages of the procedure, gives rise to everything being known through the senses of the judge and not in a mediate, distant, perhaps incomplete way, as can happen in preponderantly written processes.

XXVI. Best interests of the child. Observance that must be given in order to ensure that the rights of children or adolescents prevail over the other rights that may be at stake in the litigation;

Although, as we have already mentioned, principles that guide and regulate the jurisdictional process are not of recent existence, the incorporation of maxims such as the best interests of the child as another procedural principle is a significant advance in achieving respect for the different rights of litigants.

The fact that it is in matters as sensitive as family matters that the need to guide actions and resolutions by this principle has been defined and included is an achievement of particular relevance for litigants, as well as for the entire national rule of law.

XXVII. Procedural impulse. The parties have the power to request the necessary measures to prevent the suspension of the proceedings, regardless of the principle of procedural direction that corresponds to the jurisdictional authority;

An interesting combination of principles is made in the National Code. When commenting on section VI of Article 7, we mentioned that with the establishment of the Procedural Directorate, efforts are made to prevent the processes from ending up abandoned by the litigants until the expiration time arrives. However, the fact of assigning to the State, to the jurisdictional body, the responsibility for the conduct and completion of the process, would seem to render null and void, eliminating the so-called procedural impulse of the parties, that is, what for a long time was known as that progress would be according to the impulse of the parties. Now, by combining the procedural conduct with the participation that the parties may

have consisting of a kind of requirement to the authority, of a call to attention if it is visualized that the necessary measures are not being taken to avoid the paralysis of the process, it is very interesting, since all efforts are aimed at ensuring that the trials do not end up abandoned and on the contrary advance to their due conclusion. either by the exercise of heterocomposition or by some recognized means of self-composition.

XXVIII. Procedural fairness. Those who participate in the process shall adjust their conduct to the dignity of justice, to the respect they owe to each other, to probity and good faith;

The jurisdictional process is an institution of good faith, where all the participating subjects must conduct themselves truthfully, honestly, without trying to make the judicial authority or the other subjects fall or keep in error.

This principle is preserved in the National Code, since for some time it has been recognized as a fundamental maxim in all jurisdictional processes, the need to conduct oneself truthfully.

Perhaps this is one of the most attacked principles in reality, since it has become a common practice for the subjects in a process, whatever type of participation, to carry out dishonest activities, use forged documents, offer statements that are not in line with reality, offer or receive gifts in order to compromise in practices that lack legality. however, those behaviors that violate this principle should never be tolerated, much less carried out.

XXIX. Open litis. In family matters, the litis is not limited to the claim and the response, or, as the case may be, to the counterclaim and the answer to it, but the jurisdictional authority must make merit of the constitutive, modifying or extinguishing facts, produced during the substantiation of the process and duly proven, even if they have not been invoked in a timely manner as new facts;

In the development of contentious trials, a procedural moment is always identified at some stage, where the litis is defined, that is, the scope of the controversy. Knowing exactly what the litis consists of, the conflict, what is alleged, the judge takes this as a basis and conducts the process, based on the premise of the determination of the litis. The National Code opens up a different possibility with the inclusion of this principle, which will mean that the litis can be modified or supplemented by the jurisdictional authority, even if the parties have not asserted these concepts.

It is important to emphasize that this principle is included exclusively for family matters, in order to achieve greater protection of rights and defenses in that area that regulates situations that are so sensitive and impactful to the lives of the participants.

XXX. Orality. The process shall be conducted in oral hearings, except for the exceptions provided for in this National Code and those which, in duly founded and reasoned cases, the jurisdictional authority considers;

As already mentioned in the first pages of this document, the way in which the constituent acts of the trials are externalized, they can preferably be oral or written. In Mexico, for years the trend towards the predominance of orality has been identified, due to the advantages that it can represent in speed, proximity, immediacy, efficiency, among other factors, that the processes, the hearings that make them up are carried out in this way.

XXXI. Gender perspective. It is a scientific, analytical, and political view of women and men. It aims to eliminate the causes of gender oppression such as inequality, injustice and the hierarchization of people based on gender. Promotes substantive gender equality through the equity, advancement and well-being of women; contributes to building a society where women and men have equal value, equal rights and opportunities to access economic resources and political and social representation in decision-making spheres;

Just as the inclusion of the best interests of the child is a good thing, considering this principle of the gender perspective as necessary to observe and apply is highly relevant in order to ensure that the resolutions in the matters regulated by the National Code are more in line with reality and therefore more efficient in resolving the conflicts that have arisen for their resolution. It should result in the inclusion of a principle such as this, which is taken into account for judicial decisions, factors that were not necessarily considered previously.

XXXII. Preclusion. Failure to exercise procedural rights at the corresponding stage extinguishes the opportunity to exercise them at the subsequent stage;

The extinguishing figure of preclusion is one of the most recognized in the procedural field. They preclude procedural rights or powers by the combination between the inactivity or non-exercise of said powers and the passage of time. But the preclusion not only contemplates the extinction due to inactivity, but also terminates a procedural right when it has already been exercised and this is unrepeatable, generating that for this purpose the procedural power is also extinguished, not because it is not exercised, on the contrary, because it is consummated.

The principle established in this section XV refers only to the option of not exercising procedural powers in a timely manner, not identifying the other aspect of the figure of preclusion.

XXXIII. Privacy. In family matters, access to hearings is reserved for the parties and those who must appear in accordance with the law, and

XXXIV. Advertising. In civil matters, the hearings shall be public, in accordance with the provisions of this National Code, by the Laws on the Protection of Personal Data, Transparency and Access to Public Information, and other applicable laws in their respective areas of competence.

Because of the relationship between these two principles, we will deal with them together. The rule, let's say, is that it has always been considered that hearings must be public, establishing it as a procedural formality in the various adjective normative bodies. Likewise, exceptions to the public nature of hearings have been identified in certain topics and problems.

The National Code makes a very clear declaration, establishing that in family matters access to hearings will be restricted. It should be considered that by virtue of the sensitivity of family issues, the protection of the best interests of the child, among other factors, is that it is defined that in family matters hearings will break the generic principle of publicity.

4 CONCLUSION

Orality as a way of externalizing procedural acts has gained great presence in national territory in recent years. Although orality has always existed, expanding it to be the predominant form in matters of the most relevant such as the criminal and commercial spheres and now with the creation of the National Code of Civil and Family Procedures, these broad areas will substantiate their processes in a predominantly spoken way, defining a trend that seems to have no retreat in the country.

This procedural development or substantiation will be governed by the principles established in Article 7 of the National Code, of which we can identify some classic, pre-existing ones, such as preclusion, immediacy, continuity, contradiction, among others. Some more that show variants to what has traditionally been understood by them, imprinting different or complementary characteristics to civil and family proceedings, such as procedural impulse, publicity. There is one more category of principles that have no direct precedent in civil legislation as guiding paradigms for the development of trials and that come to establish new bases in these processes, although there was some recognition or mention of them in previous legislation, such as that of open litis for family matters or that of collaboration.

A world of possibilities opens up for civil and family matters in adjective matters with the entry into force of the National Code of Civil and Family Procedures, we will see its results in some time, hoping that it will be a determining element for the achievement of true procedural effectiveness in respect of the rights of the participants in the processes and the rule of law in Mexico.

ABSTRACT

This article analyzes teachers' perceptions regarding the Family-school relationship within the context of public schooling, considering the normative, structural, and symbolic dimensions that permeate this interface. It is grounded in the recognition that family participation is widely advocated in educational policies; however, its implementation in everyday school life reveals challenges associated with social inequalities and institutional mediations. The objective is to understand how teachers interpret family participation in the teaching-learning process, seeking to identify the limits and possibilities of this articulation. A qualitative approach of a descriptive-analytical nature was adopted, using a questionnaire composed of open-ended questions and documentary analysis of institutional records. The data were examined through content analysis, enabling the construction of interpretative categories related to teachers' understandings of participation, inequality, and pedagogical practices. The results indicate that, although teachers acknowledge the importance of family presence for students' academic development, participation is still frequently associated with formal practices, such as attending meetings and monitoring academic performance. Socioeconomic factors that condition family involvement are also evident, as well as symbolic tensions that influence teachers representations. It is concluded that strengthening the family-school relationship requires dialogical and contextualized pedagogical strategies capable of moving beyond a merely normative perspective and promoting effective collaboration within the school environment.

Keywords: Family-School Relationship. Pedagogical Practice. Teachers' Perceptions. Family Participation. School Learning.

RESUMO

Este artigo analisa as percepções docentes acerca da relação família-escola no contexto da escola pública, considerando as dimensões normativa, estrutural e simbólica que

¹ Doctoral student in Educational Sciences. Universidad de la Integración de Las Américas (UNIDA). Paraguay. E-mail: antonio.carlos.pinheiro@prof.am.gov.br

atravessam essa interface. Parte-se do reconhecimento de que a participação familiar é amplamente defendida nas políticas educacionais, mas sua efetivação no cotidiano escolar revela desafios associados às desigualdades sociais e às mediações institucionais. O objetivo consiste em compreender como professores interpretam a participação das famílias no processo de ensino-aprendizagem, buscando identificar limites e possibilidades dessa articulação. Adota-se abordagem qualitativa, de natureza descritivo-analítica, com aplicação de questionário composto por questões abertas e análise documental de registros institucionais. Os dados foram examinados por meio da análise de conteúdo, permitindo a construção de categorias interpretativas relacionadas à compreensão docente sobre participação, desigualdade e práticas pedagógicas. Os resultados indicam que, embora os professores reconheçam a importância da presença familiar para o desenvolvimento acadêmico dos estudantes, a participação ainda é frequentemente associada a práticas formais, como comparecimento a reuniões e acompanhamento do rendimento escolar. Evidenciam-se também fatores socioeconômicos que condicionam o envolvimento das famílias, bem como tensões simbólicas que influenciam as representações docentes. Conclui-se que o fortalecimento da relação família-escola demanda estratégias pedagógicas dialógicas e contextualizadas, capazes de superar a perspectiva meramente normativa e promover efetiva colaboração no ambiente escolar.

RESUMEN

Este artículo analiza las percepciones del profesorado sobre la relación familia-escuela en el contexto de las escuelas públicas, considerando las dimensiones normativas, estructurales y simbólicas que permean esta interfaz. Se parte del reconocimiento de que la participación familiar es ampliamente defendida en las políticas educativas, pero su implementación en la vida escolar cotidiana revela desafíos asociados a las desigualdades sociales y las mediaciones institucionales. El objetivo es comprender cómo el profesorado interpreta la participación familiar en el proceso de enseñanza-aprendizaje, buscando identificar los límites y las posibilidades de esta articulación. Se adopta un enfoque cualitativo, descriptivo-analítico, mediante un cuestionario compuesto por preguntas abiertas y análisis documental de registros institucionales. Los datos se examinaron mediante análisis de contenido, lo que permitió la construcción de categorías interpretativas relacionadas con la comprensión del profesorado sobre la participación, la desigualdad y las prácticas pedagógicas. Los resultados indican que, si bien el profesorado reconoce la importancia de la presencia familiar para el desarrollo académico de los estudiantes, la participación aún se asocia frecuentemente con prácticas formales, como la asistencia a reuniones y el seguimiento del rendimiento académico. También se evidencian factores socioeconómicos que condicionan la participación familiar, así como tensiones simbólicas que influyen en las representaciones del profesorado. Se concluye que fortalecer la relación familia-escuela exige estrategias pedagógicas dialógicas y contextualizadas, capaces de superar una perspectiva meramente normativa y promover una colaboración eficaz en el entorno escolar.

1 INTRODUCTION

The relationship between family and school has occupied a central position in the contemporary educational debate, especially in the context of public policies aimed at democratic management and the improvement of the quality of education. Although the normative documents recognize the importance of family participation, its effectiveness in the school routine still reveals significant challenges. In this context, understanding how this interface is configured in practice becomes a relevant issue for educational research.

In the scenario of the Brazilian public school, marked by persistent social inequalities, the articulation between these two formative spaces takes on complex contours. Family participation is not homogeneous, being influenced by cultural, economic and institutional factors that impact school dynamics. Thus, discussing this relationship implies recognizing that it goes beyond the formal dimension and is inserted in a relational field crossed by tensions and mutual expectations.

In addition, valuing the family as a partner in the educational process demands a critical analysis of the concrete conditions that sustain this partnership. Between the democratic ideal provided for in educational policies and the practices effectively developed in schools, there is a space for mediation that deserves systematic investigation. It is in this interval between normativity and lived experience that the scientific relevance of this study is inscribed.

Although the participation of the family is widely defended in the pedagogical discourse and supported by legal provisions, it is observed that its materialization in the school daily life occurs unevenly and sometimes limited to formal practices. Such a scenario raises questions about how this relationship is perceived by teachers, subjects who mediate, within the school, interactions with families. Thus, the need emerges to problematize not only the existence of participation, but the meanings attributed to it in the institutional context.

In this sense, the gap that guides this study lies in the understanding of teachers' perceptions about the family-school interface in a specific reality of public schools. Investigating such perceptions allows us to analyze how normativity, social inequalities and professional experiences are intertwined in the construction of this relationship. By shifting the focus from the legal prescription to the interpretation of the subjects, the article contributes to deepening the academic debate on democratic management and educational policies.

Thus, this study aims to analyze teachers' perceptions about the family-school relationship in the context of public schools, in the light of the normative, structural and symbolic dimensions that cross this interface. To this end, it adopts a qualitative approach, with the application of a questionnaire and document analysis, interpreted through content

analysis. By articulating theoretical framework, empirical data and critical reflection, the article seeks to contribute to the deepening of the debate on family participation and democratic management, highlighting possibilities and limits of this relationship in the educational scenario investigated.

2 THE FAMILY-SCHOOL INTERFACE AS A STRUCTURING DIMENSION OF THE EDUCATIONAL PROCESS

Historically, the family and the school are configured as central instances in the process of socialization and formation of the subjects. While the family occupies the primary space for the construction of values, norms and symbolic references, the school assumes the function of systematizing knowledge and promoting the insertion of the individual in broader social structures. This complementarity, however, is not established automatically or harmoniously, as both institutions are crossed by social, economic and cultural transformations that continuously redefine their roles and responsibilities in the educational field.

Over the last decades, it has been observed that a conception that attributed rigidly delimited functions to the family and the school has been overcome, emerging, in its place, the notion of educational co-responsibility. This perspective recognizes that the teaching-learning process is not restricted to the school space, but depends on interactions and mediations that go beyond its institutional walls. In this scenario, understanding how this interface is constructed and perceived by teachers becomes fundamental to analyze the dynamics that influence the pedagogical daily life and the formative experience of students.

The interface between family and school, in addition to constituting a historically constructed social dynamic, finds normative support in Brazilian educational public policies, which recognize family participation as a structuring element of the formative process. The legal provisions and educational guidelines reinforce the idea of democratic management and approximation between school and community, attributing to the family an active role in monitoring the students' school trajectory. However, the materialization of these guidelines occurs in contexts marked by social inequalities, structural limitations, and institutional challenges, which stresses the effectiveness of this participation. In this scenario, the relationship between normativity and practice reveals itself to be a fertile field for analysis, especially when observed from the teachers' perceptions about its materialization in the school routine.

In the contemporary context, the participation of the family in the school space takes on different configurations, which go beyond the mere presence in formal meetings or

institutional events. It can manifest itself through the monitoring of school activities, constant dialogue with teachers and the construction of bonds to support the students' educational path. However, such forms of engagement are crossed by social, economic and cultural constraints that influence the real possibilities of participation, especially in public education networks. Thus, understanding these configurations implies recognizing that the family-school relationship is neither homogeneous nor linear, but marked by inequalities and different expectations regarding the educational task, elements that directly affect the pedagogical routine.

In this context, teachers occupy a strategic position in the mediation between institutional guidelines and the reality experienced in the school, and are also producers of meanings about family participation. Their perceptions are not limited to the verification of the presence or absence of families, but involve interpretations about the commitment, duties and effects of this interaction in the pedagogical routine. By translating policies into concrete practices, teachers build representations that influence both the dialogue with the community and the organization of educational work. Thus, analyzing these perceptions allows us to understand how the family-school interface is signified within the public school and how such meanings have repercussions on the teaching-learning dynamics.

Thus, the interface between family and school, understood in its historical, normative and relational dimensions, reveals itself to be a relevant element for understanding the teaching-learning process in public schools. Teachers' perceptions, situated in this intersection of institutional expectations and concrete social conditions, show that the **sharing of educational responsibilities** is not effective automatically, but depends on continuous and contextualized mediations. Thus, investigating such perceptions allows us to problematize the meanings attributed to family participation and its implications in the pedagogical routine, grounding the empirical analysis that follows.

2.1 THEORETICAL PERSPECTIVES ON THE FAMILY-SCHOOL RELATIONSHIP BEYOND THE NORMATIVE FRAMEWORKS

The educational literature has broadened the debate on the family-school relationship beyond the normative provision contained in official documents, understanding it as a complex and historically situated social phenomenon. For Paro (2000, p. 16), the participation of the family in the school cannot be understood as a mere administrative formality, because "education is a social process that goes beyond the limits of the school institution". This perspective shifts the focus from the legal obligation to the relational and political dimension of the interaction between these formative instances.

From another perspective, Bourdieu (1998, p. 42) argues that school inequalities cannot be dissociated from the social conditions of origin of the students, since the school tends to recognize and value certain cultural capitals to the detriment of others. In this sense, the approximation between family and school is crossed by structural asymmetries that influence both the forms of participation and the expectations built around school performance.

In addition, authors such as Libâneo (2013, p. 84) emphasize that the articulation between school and community is a fundamental dimension of democratic management, but warn that such articulation requires consistent pedagogical and institutional mediations. For the author, "participation is not reduced to physical presence, but implies conscious involvement in educational processes". Thus, the academic discussion shows that the family-school interface demands analysis that considers both the social conditioning factors and the representations constructed within the school itself.

2.2 OVERCOMING THE NORMATIVE READING OF FAMILY PARTICIPATION

The academic discussion on the family-school relationship, as developed in the dissertation, indicates that family participation cannot be reduced to compliance with legal provisions or occasional presence at school meetings. The text emphasizes that "the role related to education is not limited to participating in class meetings to deliver report cards", showing that the interaction between these instances requires deeper and more continuous involvement. Thus, the literature analyzed shifts the focus from institutional formality to the construction of effective bonds in the educational routine.

In this sense, Sousa (2012, p. 6) states that "the participation of the family in the school environment is fundamental in the teaching-learning process", highlighting that family and school are essential supports for coping with school difficulties. The dissertation reinforces that such participation should not be understood as an isolated act, but as an articulated process that allows the school to know the student's context and plan more consistent pedagogical interventions. It is, therefore, a matter of understanding participation as a structuring element of the educational process.

The analysis also dialogues with Díaz (2011, p. 35), when he argues that learning is consolidated when there is a significant internalization of knowledge, with the family environment being a privileged space for affective and motivational stimulation. By recognizing that the influence of the family enhances student development, the study broadens the debate beyond the normative obligation, emphasizing the formative and emotional dimension of family accompaniment in the school path.

Finally, the dissertation recognizes, based on Caetano (2009, p. 54), that the "relationship between school and family [...] it is complex, asymmetrical and usually permeated by conflicts". This understanding moves away from any idealized or simplistic view of participation and reinforces the need for permanent institutional mediations. Thus, overcoming the exclusively legalistic reading implies recognizing that the family-school articulation is built in the midst of tensions, negotiations and mutual expectations, a central aspect for the analysis of the teachers' perceptions investigated in this study.

2.3 CULTURAL CAPITAL, INEQUALITIES AND IMPLICATIONS FOR THE FAMILY-SCHOOL RELATIONSHIP

The family-school relationship, as discussed in the dissertation, cannot be understood in a decontextualized way, as it is immersed in social conditioning factors that directly influence the possibilities of participation. Sousa (2012) highlights that the family plays a structuring role in educational development, but recognizes that this influence is crossed by socioeconomic variables that impact school monitoring. Thus, family participation must be analyzed in the light of concrete living conditions, under penalty of incurring in normative judgments that ignore historical inequalities.

In this sense, Díaz (2011, p. 35) states that meaningful learning occurs when the subject is able to "internalize knowledge in a comprehensive and reflective dimension". However, this internalization does not depend exclusively on the school, being influenced by the family environment and the cultural opportunities to which the student has access. The dissertation shows that the cultural capital available in families has repercussions on the forms of interaction with the school, interfering both in student performance and in the teacher's perception of parental involvement.

The analysis also dialogues with Pereira and Novo (2015), when they recognize that the approximation between family and school requires recognition of the sociocultural specificities of each community. When the school operates based on homogeneous expectations of participation, it tends to disregard the different family repertoires, producing symbolic distances. In this way, inequality is not only manifested in the economic sphere, but also in the way certain modes of participation are institutionally legitimized.

Caetano (2009, p. 54) reinforces this understanding by stating that the relationship between family and school is "complex, asymmetrical and usually permeated by conflicts". Such conflicts should not be interpreted as individual failures, but as an expression of structural tensions that cross the educational field. The dissertation demonstrates that, in

contexts of social vulnerability, the school needs to adopt mediation strategies that consider the material and symbolic limitations faced by families.

Thus, the theoretical debate shows that family participation is not a uniform or linear phenomenon, but the result of the interaction between cultural capital, socioeconomic conditions and institutional expectations. By broadening the view to these dimensions, the study strengthens the analysis of teachers' perceptions, allowing us to understand that the meanings attributed to the presence – or absence – of families are constructed in a social scenario marked by inequalities. Such an approach gives greater interpretative density to the article and underpins the empirical analysis that follows.

2.4 FACULTY REPRESENTATIONS AND SYMBOLIC CONSTRUCTION OF PARTICIPATION

Recent literature has emphasized that the family-school relationship is mediated by interpretations constructed in the school routine, especially by teachers' perceptions about the role of families in the educational process. For Libâneo (2018), pedagogical practice is permeated by conceptions that guide the way the teacher understands the student's social context, influencing the strategies of approximation with the community. From this perspective, family participation is not configured as objective data, but as a symbolic construction that materializes in institutional interactions.

Contemporary studies also point out that teacher representations are strongly influenced by the structural conditions of the public school. Nóvoa (2017) highlights that the teaching work takes place in a scenario of multiple demands and institutional pressures, which impacts the way the teacher interprets parental involvement. In addition, Dourado (2019) argues that democratic management presupposes effective dialogue with families, but this dialogue depends on formative mediations that overcome stigmatized views of the school community.

In the field of educational inequalities, recent research indicates that teachers' expectations can be followed by social markers. Oliveira (2020) argues that perceptions about family participation vary according to the socioeconomic context of the students, influencing the way the school recognizes certain forms of monitoring. In a convergent way, Carvalho (2018) states that family-school interaction needs to be analyzed as a relational process, marked by tensions and symbolic negotiations that reflect broader social dynamics.

In addition, contemporary literature has emphasized the importance of qualified listening to families as a strategy for institutional strengthening. Paro (2016) reaffirms that participation is a democratic principle that requires real openness to collaboration, while Gatti

(2019) highlights that teacher training should include skills for dialogue with different sociocultural realities. These contributions reinforce that teachers' representations are not neutral, but constructed throughout their professional trajectory and experiences at school.

Finally, understanding the symbolic construction of family participation implies recognizing that the meanings attributed to the presence - or absence - of families are produced in a specific historical and social context. Libâneo (2018) and Dourado (2019) converge in stating that the consolidation of a democratic school requires overcoming reductionist views on the role of the family. In this sense, analyzing teachers' perceptions becomes fundamental to understand how the possibilities and limits of the articulation between family and school are structured in school practice, a central aspect for the objectives of this study.

2.5 CONTEMPORARY CHALLENGES AND IMPLICATIONS FOR THE ANALYSIS OF TEACHER PERCEPTIONS

Contemporary literature shows that the consolidation of an effective relationship between family and school remains a challenge in the Brazilian educational scenario. Dourado (2019) argues that democratic management requires more than formal devices, demanding institutional practices that promote qualified dialogue with the community. In this sense, the articulation between these formative spaces needs to overcome bureaucratic logic and assume a pedagogical and relational character.

Paro (2016) reinforces that participation is a political principle of public education, but warns that its effectiveness depends on concrete conditions of listening and sharing decisions. Accordingly, Libâneo (2018) argues that the democratic school is built through collaborative processes that recognize the sociocultural plurality of families. Such contributions reaffirm that the approximation between family and school does not occur spontaneously, requiring consistent institutional mediations.

In the context of social inequalities, Oliveira (2020) highlights that school expectations can be influenced by socially constructed representations about certain family groups. Gatti (2019) complements by stating that teacher training needs to contemplate relational skills that favor intercultural dialogue. Thus, the meanings attributed to family participation are produced in an environment permeated by structural and symbolic constraints.

Thus, understanding the contemporary challenges of the family-school interface implies recognizing that normativity, inequality and representation constitute inseparable dimensions of the phenomenon. By articulating these elements, the present study supports the analysis of teachers' perceptions as an interpretative key to understand the limits and

possibilities of family participation in public schools, contributing to the academic debate on educational policies and democratic practices.

3 METHODOLOGY

The present study is part of the field of qualitative research, as it understands that the analysis of teachers' perceptions about the family-school relationship requires contextualized interpretation of the meanings attributed by the investigated subjects. According to Creswell (2014), qualitative research seeks to explore and understand social phenomena from the perspective of the participants, privileging the construction of meanings in specific contexts. Such an approach is adequate to the objective of this article, which aims to analyze symbolic and institutional dimensions of family participation in public schools.

From the point of view of its nature, the study assumes a descriptive-analytical character, as it is not limited to the exposition of empirical data, but seeks to interpret them in the light of the theoretical framework built throughout the dissertation. Prodanov and Freitas (2013, p. 70) state that descriptive research "aims to describe the characteristics of a given population or phenomenon", and can establish relationships between variables without manipulating them. In this sense, the investigation seeks to understand how teachers perceive family participation, articulating such perceptions with the structural conditioning factors discussed above.

From the epistemological perspective, the methodological option is based on the understanding that educational phenomena are socially constructed and must be analyzed in their complexity. Minayo (2014) argues that qualitative research works with the universe of meanings, values and attitudes, dimensions that cannot be reduced to quantitative indicators. This understanding converges with the purpose of this study, since teachers' representations about the family-school relationship are symbolic processes that demand in-depth interpretation.

In addition, the investigation is aligned with contemporary discussions on methodological rigor in education research. Gatti (2019) highlights that scientific consistency does not result only from the choice of method, but from the coherence between the problem, objectives, and procedures adopted. Thus, by opting for a qualitative approach, the study reaffirms its commitment to the contextualized analysis of teachers' perceptions, ensuring theoretical foundation, epistemological clarity and alignment between the methodological path and the issues that guide the research.

The delimitation of the empirical context is a fundamental stage in qualitative research, since educational phenomena are inseparable from the historical and institutional conditions

in which they are produced. Minayo (2014) states that the field is not a neutral scenario, but a living space of meanings. Coincidentally, André (2013) highlights that understanding the school reality requires attention to institutional particularities and the dynamics that structure the pedagogical routine. Thus, the choice of the public school investigated was based on its relevance for the analysis of teachers' perceptions about the family-school relationship.

With regard to the participants, the research adopted intentional sampling, a strategy widely recommended in qualitative studies. Creswell (2014) observes that the careful selection of subjects allows for a deeper understanding of the phenomenon investigated. Bogdan and Biklen (2013) complement by stating that, in this type of investigation, participants are chosen for their ability to offer significant information, and not for statistical representativeness. In this sense, teachers with direct experience in interacting with families in the school context were included.

The characterization of the investigated group considered professional aspects and trajectories of action, recognizing that such elements influence the interpretations constructed about family participation. Flick (2013) points out that the detailed description of the context and the subjects strengthens the credibility of qualitative research, allowing greater analytical transparency. Yin (2015), when dealing with the case study in the social sciences, also emphasizes that the rigorous contextualization of the empirical field is a condition for consistent interpretations.

On the ethical level, the investigation observed the principles that govern research with human beings, ensuring free and informed consent, confidentiality and anonymization of identities. Gatti (2019) emphasizes that scientific rigor is intrinsically linked to the ethical responsibility of the researcher. Thus, by delimiting the context and the participants with methodological clarity and ethical care, the study reaffirms its scientific consistency and establishes solid bases for the interpretative analysis of teachers' perceptions.

The production of empirical data was based on the application of a questionnaire with open questions to the teachers and on the documentary analysis of institutional records, strategies consistent with the qualitative approach adopted. For Creswell and Poth (2018), qualitative instruments should enable the in-depth exploration of the participants' experiences and interpretations, favoring the construction of situated meanings. From this perspective, the questionnaire was structured in such a way as to allow reflective responses, contemplating subjective dimensions of the family-school relationship and aligning with the objective of understanding teachers' perceptions in their context of action.

The use of open questions is supported by Bogdan and Biklen (2013), who defend the centrality of narrative as a way to access social representations, and by Denzin and Lincoln

(2018), for whom qualitative research is characterized by the interpretation of lived experiences. By privileging discursive responses, the instrument allowed capturing not only opinions, but meanings attributed to institutional practices. Such methodological choice reinforces the study's commitment to the interpretative understanding of the phenomenon, avoiding quantitative reductionism that could limit the complexity of the analysis.

In addition, documentary analysis was incorporated as a triangulation strategy, strengthening the interpretative consistency of the research. According to Cellard (2014), the documents express conceptions, norms and guidelines that structure institutional life, constituting a relevant source for understanding the school context. Flick (2013) points out that triangulation increases scientific credibility by confronting different sources of evidence. Thus, the articulation between the questionnaire and institutional documents ensured greater analytical depth, contributing to the methodological robustness of this study.

The data analysis was conducted in the light of Content Analysis, as systematized by Bardin (2016), as it is understood that this technique makes it possible to interpret discourses in an organized and rigorous way. According to the author, content analysis constitutes "a set of communication analysis techniques" aimed at producing reasoned inferences (BARDIN, 2016, p. 37). Thus, the teachers' answers and institutional documents were examined through stages of pre-analysis, categorization and interpretation, ensuring coherence between empirical data and theoretical framework.

The analytical process sought to identify emerging categories related to teachers' perceptions of the family-school relationship, articulating them with the normative, structural and symbolic dimensions discussed in the framework. According to Flick (2013), qualitative interpretation requires constant dialogue between theory and empirical material, avoiding impressionistic readings. Thus, the analysis was guided by criteria of systematicity, reflexivity and scientific rigor, consolidating the methodology as the structuring foundation of the conclusions presented in this article.

4 ANALYSIS AND RESULTS

The analysis of teachers' perceptions revealed that the family-school relationship is predominantly understood as a fundamental element for the development of the teaching-learning process, although permeated by structural and institutional tensions. The discourses show recognition of the importance of family participation, especially in the monitoring of school activities and in the support of pedagogical routines. However, such recognition does not translate, in a homogeneous way, into effective practices of approximation, indicating a distance between the normative ideal and everyday reality.

It was observed that teachers tend to associate family participation with attendance at meetings and monitoring of academic performance, which signals the permanence of an understanding that is still strongly linked to formal dimensions of participation. This data dialogues with the theoretical framework by showing that, although the legal frameworks defend democratic management, institutional practice still operates under traditional parameters of parental involvement. The documentary analysis reinforced this finding by indicating that institutional instruments value participation, but do not make systematic mediation strategies explicit.

Another recurring aspect in the discourses refers to socioeconomic inequalities as a conditioning factor for participation. The teachers recognize that certain families face limitations related to working hours, schooling and material conditions, which impacts attendance and the form of involvement with the school. This finding confirms the theoretical discussion about the influence of cultural capital and social asymmetries in the configuration of the family-school interface, showing that the absence cannot be interpreted in a simplistic or decontextualized way.

In addition, perceptions emerged that reveal symbolic tensions in the relationship with families, especially when institutional expectations do not correspond to the concrete possibilities of accompaniment. Some teachers show frustration with the low participation, while others recognize the need for more dialogical and inclusive strategies. This ambivalence reinforces the understanding that teacher representations constitute a central dimension for the construction - or limitation - of collaborative practices.

In general, the results indicate that the family-school relationship is recognized as necessary, but still marked by structural, cultural and institutional challenges. The analysis shows that the consolidation of effective participation depends not only on normative devices, but on pedagogical mediations, teacher training and contextualized institutional strategies. Thus, teachers' perceptions reveal themselves to be an interpretative key to understand the limits and possibilities of the articulation between family and school in the investigated reality, contributing to the advancement of the academic debate on public policies and democratic management of education.

5 FINAL CONSIDERATIONS

The present investigation allowed us to understand that the relationship between family and school, although widely recognized as fundamental in the pedagogical discourse and educational policies, still faces significant challenges in the context of public schools. The teachers' perceptions analyzed show that family participation is considered a strategic

element for strengthening the teaching-learning process, but its effectiveness remains conditioned by structural, institutional and symbolic factors that go beyond the normative forecast.

The results indicate that socioeconomic inequalities directly influence the possibilities of family involvement, requiring the school to have a more sensitive and contextualized posture. At the same time, they reveal that teacher representations play a central role in the mediation of this interface, and can both expand and restrict collaborative practices. Thus, the consolidation of a more dialogical relationship demands not only legal provisions, but investment in training, qualified listening and institutional strategies that recognize the plurality of family realities.

It is concluded, therefore, that the articulation between family and school should be understood as a relational process in constant construction, crossed by tensions and possibilities. By highlighting teachers' perceptions as a central analytical dimension, this study contributes to the academic debate on democratic management and educational public policies, reaffirming the need for practices that promote effective approximation between these two formative spaces.

ABSTRACT

In the first quarter of the 21st century, technological advances — digitalization and artificial intelligence — have profoundly transformed social, educational, and cultural dynamics; however, this progress has coincided with a phenomenon of weakening critical thinking, characterized by the primacy of immediacy, subjectivity, and information overload; this article analyzes the historical evolution of critical thinking from its origins in classical philosophy to its role in modernity, highlighting its function as a fundamental tool for rational decision-making, ethics, and democratic life; it also examines the impact of digital culture, the Google effect, and cognitive externalization on the decline of reflective capacities; from the field of graphic design education, it is argued that the uncritical incorporation of digital technologies and artificial intelligence has displaced humanistic and methodological approaches, privileging immediate production and formal perfection over analysis, meaning, and the social context of images; finally, the study proposes the need to reconfigure educational models in graphic design through a theoretical, critical, and reflective perspective that enables the integration of artificial intelligence without abandoning the development of critical thinking and the construction of meaning in contemporary visual culture.

Keywords: Critical Thinking. Education. Graphic Design. Artificial Intelligence.

RESUMO

No primeiro quarto do século XXI, os avanços tecnológicos — a digitalização e a inteligência artificial — transformaram profundamente as dinâmicas sociais, educacionais e culturais; entretanto, esse progresso tem coincidido com um fenômeno de enfraquecimento do pensamento crítico, caracterizado pela primazia da imediatez, da subjetividade e da sobrecarga informacional; este artigo analisa a evolução histórica do pensamento crítico desde suas origens na filosofia clássica até seu papel na modernidade, destacando sua função como ferramenta fundamental para a tomada de decisões racionais, a ética e a vida democrática; aborda-se também o impacto da cultura digital, o efeito Google e a externalização cognitiva na redução das capacidades reflexivas; no âmbito do ensino do design gráfico, argumenta-se que a incorporação acrítica das tecnologias digitais e da inteligência artificial tem deslocado abordagens humanistas e metodológicas, privilegiando

RESUMEN

En el primer cuarto del siglo XXI, los avances tecnológicos —la digitalización y la inteligencia artificial— han transformado profundamente las dinámicas sociales, educativas y culturales. Sin embargo, este progreso ha coincidido con un fenómeno de debilitamiento del pensamiento crítico, caracterizado por la primacía de la inmediatez, la subjetividad y la sobrecarga informativa. Este artículo analiza la evolución histórica del pensamiento crítico desde sus orígenes en la filosofía clásica hasta su papel en la modernidad, destacando su función como herramienta fundamental para la toma de decisiones racionales, la ética y la vida democrática. Asimismo, se aborda el análisis el impacto de la cultura digital, el efecto Google y la externalización cognitiva en la disminución de las capacidades reflexivas. Desde el ámbito de la enseñanza del diseño gráfico, se ha argumentado que la incorporación acrítica de tecnologías digitales y de inteligencia artificial ha desplazado los enfoques humanistas y metodológicos, privilegiando la producción inmediata y la perfección formal por encima del análisis, el significado y el contexto social de la imagen. Finalmente, se propone la necesidad de reconfigurar los modelos educativos del diseño gráfico mediante una postura teórica, crítica y reflexiva que permita integrar la inteligencia artificial sin renunciar al desarrollo del pensamiento crítico y a la construcción de sentido en la cultura visual contemporánea.

Palabras clave: Pensamiento Crítico. Enseñanza. Diseño Gráfico. Inteligencia Artificial.

1 INTRODUCTION

In the first quarter of the 21st century, significant technological advances took place, such as human genome sequencing, lithium batteries, renewable energies, the internet and global connectivity, telephone devices, social networks and artificial intelligence, among many others. All of them have transformed the way we work and live. However, it seems that stupidity is taking over society by leaps and bounds and that critical thinking is being undermined. In an era where individualization prevails, we have headed for what Lipovetsky (2024, p. 9) called the fracture of disciplinary socialization.

... it is a historical change of course in the objectives and modalities of socialization, currently under the aegis of open and plural devices; in other words, hedonistic and personalized individualism has become legitimate and no longer meets with opposition; [...] The era of revolution, of scandal, of futuristic hope, inseparable from modernism, is over.

Human beings fervently yearn to live in the immediacy, in the here and now. We are living in a historical stage in which opinion, emotion and ease are prioritised, exacerbated and valued more than evidence. Thanks to the global cybernetic network, which seduces us and complements us with its thousand tentacles of powerful algorithms, a wonderful effect is produced: in a second, we are already political analysts, technical directors of some sports team and even "cell phone intellectuals", that is, this type of fragmentary and immediate culture is projected at all levels: the neighborhood, the office, and minority groups. In this context, we can all have an opinion about anything according to our "intimate" experience. In this same sense, it is Lipovetsky himself (2004, p. 14) who argues: the greater the means of expression, the fewer things one has to say, the more subjectivity is requested, the more anonymous and empty the effect is.

Therefore, a question arises: what happened to critical thinking, the backbone of intellectuality? Why does deep reflective thinking seem to be exhausted so quickly? To answer these questions, we must first review the origin of critical thinking in human history and understand what it means to think critically. It is necessary to clarify that thinking a lot of nonsense about a topic or situation is not thinking correctly.

2 A BRIEF HISTORICAL OVERVIEW OF CRITICAL THINKING

Thinking for a long time about a topic chaotically or obsessively is not thinking critically, on many occasions you just waste time as if you were in a tunnel with no way out. On many occasions, this type of analysis without a methodology can result in an absolute waste of time, as if you were immersed in a tunnel with no exit. Critical thinking, far from being a mere

intellectual exercise, constitutes a deeper and more refined process that involves meticulous reflection and analysis. This comprehensive methodology involves questioning, investigating, fragmenting, classifying, prioritizing, and demanding a reasonable amount of evidence before accepting any belief or opinion.

Critical thinking according to Peter A. Facione (1990) who is one of the most cited contemporary references in education, philosophy and social sciences, in the Delphy report of the American Philosophical Association. He defines critical thinking as follows:

A deliberate and self-regulated judgment that gives rise to interpretation, analysis, evaluation and inference, as well as the explanation of the evidential, conceptual, methodological or contextual considerations on which said judgment is based.

According to Facione, critical thinking does not seek to win arguments, but rather: to make better decisions, formulate well-founded judgments, and act rationally and ethically in complex contexts. It is an essential tool for democratic life, science, education and responsible citizenship.

In ancient Greece, a specific methodology for structuring thought was initiated approximately 2500 years ago. The method of research through dialogue, developed by the Greek philosopher Socrates and later called the "Socratic method", constitutes a legacy of great relevance in the field of philosophical research. This methodological approach involves asking questions that can be perceived as disturbing, with the purpose of identifying inconsistencies between the arguments presented, thus demonstrating the dubious nature and lack of solidity of what had initially been considered as a solid and forceful argument.

In the field of philosophy and ethics, the expression "I only know that I know nothing", attributed to Socrates, stands as a paradigm of acceptance of ignorance as the foundation of critical thinking. However, in 399 B.C. In 400 BC, the Greek philosopher was accused, tried and sentenced to death for alleged corruption of youth and lack of devotion to the gods. In reality, Socrates' transgression was to raise the questioning of everything and promote this way of acting on the part of his disciples, with the aim of stimulating reflection and knowledge, and in this way, disrupting the beliefs, privileges and comforts of Athenian high society.

Despite his death, Socrates' thought persisted through his students, such as Plato and later Aristotle, who contributed to the consolidation of scientific methodology. These philosophers established doubt as a means of reflection, as well as the logic of systematic research. In this sense, analysis was implemented, understood as the fragmentation of information into individual components to facilitate its understanding. Likewise, weighting,

which implies the evaluation of the veracity and relevance of the information, was incorporated. Inference is presented as the ability to draw logical conclusions from evidence, while problem-solving refers to the ability to find appropriate solutions to challenges or problems posed.

Around the thirteenth century, St. Thomas Aquinas integrated Aristotelian philosophy with Christian theology, at a time when reason and faith were conceived as opposites. The method of St. Thomas in his professorships at the University of Paris was based on the integration of human reason with Christian values. In his pedagogical approach, he implemented the *Quaestio disputata* (disputed question), a dialectical method that involved the formulation of questions and the presentation of arguments both for and against, culminating in the obtaining of a resolution based on reason and faith. This method, in addition to encouraging critical thinking, made it possible to integrate reason and faith in a harmonious synthesis.

Several centuries passed before Socrates' thought was taken up again. It was during the Enlightenment period that philosophers such as Kant tried to break with the ignorance that prevailed at the time, through their motto *Sapere Aude* (dare to think for yourself). As various authors (Voltaire, Diderot and Locke, among others) have pointed out, critical thinking has been a current of thought that has promoted reason in human development. In this way, it has become one of the pillars of democracy, innovation and science.

People who possessed the capacity for critical thinking, that is, the ability to examine arguments, evaluate evidence, and question false narratives, were considered to be individuals with an exceptionally developed and educated mind. However, these exaltations were not accepted by everyone, as evidenced by the reflections of Nitsche, who maintained that reason was overvalued and that the culprit of this situation was Socrates. His argument was that too many questions would exhaust the meaning of life.

Finally, it seems that the vast majority of people do not know where they are going, and the question is how did it get to this moment?, it is in this same sense that Enrique Rojas (2010, p. 17) argues

From the most egregious man to the most degraded there is an enormous distance, but both belong to the human species. Only one of them has known how to lead his life making the most of the positive; there we have some examples from the history of humanity: from Socrates, Plato, Aristotle, Plotinus, Saint Augustine, Saint Anselm, Saint Thomas Aquinas or the master Eckhart, through Kepler, Galileo, Newton, Descartes, Pascal, Kant or Hegel to existentialists such as Sartre, Camus, Kierkegaard, Nietzsche, our Unamuno, or the

great thinkers of our time, such as Brentano, Husserl, Heidegger, Max Scheler y Ortega y Gasset.

In opposition to the aforementioned position, there is a significant predominance of individuals who exhibit a modest, fragmentary way of thinking that lacks a coherent sense. However, throughout the history of humanity, there has been a social amalgam in which two divergent trends converge: on the one hand, great thinkers and, on the other, individuals who lack a systematic structuring in their thoughts, relying predominantly on intuition, belief and adherence to neighborhood, cultural or political groups that represent their ideas.

Without leaving aside the existence of detractors and mental setbacks, critical thinking has endured to the present day. However, in many respects, it could seem that the opposite direction is being taken. Today, the availability of answers to any question is immediate and accessible with a simple click. Access to knowledge through cell phones and computers has significantly facilitated this process. However, there is a noticeable decline in critical thinking, despite the abundance of information available online.

The human capacity to process such an extensive amount of data is limited due to the physical structure of the brain, which means that it is difficult to analyze such a large volume of information. The volume of data, images, and recordings that are generated far exceeds the processing capacity, resulting in information overload or infoxication. This phenomenon, recognized in the field of psychology, implies that individuals must resort to cognitive strategies to manage the abundance of stimuli received.

Within the framework of the cybernetic phenomenon called the "Google effect", which is characterized by the widespread use of search engines such as Google or artificial intelligence (AI) systems, there is evidence of an easing of access to information. However, this implies an outsourcing³ of thinking, which leads to a decrease in the development of critical reasoning. The lack of cognitive exercise affects the functional capacity of the brain, which manifests itself in a decrease in memory and in the tendency to not verify the answers to queries made on electronic platforms. In addition, there is a tendency to spread false information⁴ without verification, which can contain erroneous data and has serious consequences.

The methodology developed by Socrates, consisting of finding out and not staying with the first answer, has undergone a remarkable transformation, becoming a process of rapid

³ In other words, outsourcing is a practice carried out by an individual who hires a firm to provide a service that, in principle, should be provided by itself. In the case of a knowledge problem, we are making use of search engines and artificial intelligence to arrive at thought answers without trying to make the effort to do it ourselves.

⁴ To expand on this topic, it is recommended to access Fake News, communication and design: transcendence, impact and social responsibility by Marco Antonio Marín Álvarez, Et. al. A year of designing MM1. <https://mm1revista.azc.uam.mx/index.php/mm1/article/view/A-5%20N-25>

exploration in Google, Chat GPT or other artificial intelligence (AI) tools. In this sense, knowledge seems to be within everyone's reach, however, there has been a loss of the process of reflection, memorization and comprehension, which progressively deteriorate due to the excess of information and the speed with which we live today. Consequently, there is a tendency to prefer striking and instantaneous notes, rather than critical reflection.

3 CRITICAL THINKING AND TEACHING GRAPHIC DESIGN

Graphic design has undergone significant transformations in the last four decades. There has been a shift from analog design, based on photomechanical images, to digital design, characterized by immaterial and hybrid constructions generated by computers. In addition, artificial intelligence (AI) has been integrated into creative processes, through the use of algorithms and empirical methods. As a result, visual culture has undergone a radical transformation, although it has largely not been approached from an academic perspective.

The widespread implementation of artificial intelligence (AI) for image generation has permeated a culture characterized by a proliferation of combinations that anticipate future trends. This phenomenon, manifested through a visionary approach, is aligned with the ideas expressed by the French philosopher Jean Francois Lyotard (1987), who identified a series of postmodern trends, including extreme relativism, digital influence on society, the exhaustion of great utopian promises in its narratives and cultural despair, manifested in extreme skepticism, that reflects an increasingly decentralized world.

We are living in a visual culture where the theory of knowledge and cognitive skills have fragmented. It would seem, then, that a new discourse on the visual has emerged, which avoids reflection and proposes solutions to social reality. The development of cognitive skills and the use of the so-called new technologies are closely combined in all fields of knowledge at different school levels, digital tools make up the pedagogical strategies in the academic development of our time.

However, in the process of learning and evaluating design, the model of the perfect canon of the designed object has traditionally been idealized. In this environment, it is usually observed that students and a considerable number of teachers automatically focus on identifying and highlighting errors, which becomes a simplistic and sterile critical attitude, dismissing constructive criticism about the design process involved, its level of difficulty, the complexity of the presentation and accidental errors in billing. In addition to this, the teachers omit the post-design process, "the redesign", at which time the aforementioned problems can be implemented and resolved. This situation limits the enrichment of the chair and the development of an environment of reflection and continuous improvement.

However, when it comes to professional design education, many root causes have been omitted. At present, the focus on the formation of the most cultured and humanistic student has been abandoned. It is possible to find outstanding professionals in various areas of specialization, capable of effectively solving almost any problem that comes their way. However, when leaving that context, the professional faces a significant challenge when applying their knowledge in contexts outside their area of specialization, Françoise Revel in Enrique Rojas warns ... Never has the information been so abundant and prolix and never, however, has there been so much ignorance. Man is less and less wise, in the classic sense of the term, glimpsing the fear of the possible dissipation of cognitive abilities, the ability to respond to social skills in addition to the political and commercial commitments required in our time (2010, p.18).

In the face of evident technological and cultural change, it has not been considered in the teaching-learning discourses of design that AIs are intertwined in issues of material and social realities. Although AI is a fascinating, fast and economical tool, it cannot be limited to abstract potential, since technologies are not the result of isolated processes, as Williams argues in Lister (2017, p.20) ... they are calculated, desired and induced.

Despite the possible objections to artificial intelligence (AI), it must be recognized that it is a remarkably inclusive tool, insofar as it facilitates the application of knowledge from disciplines such as hermeneutics, semiotics, and rhetoric, among many others. However, the disruption that is brewing through a single click is evident.

AI is associated with a totally new visual discourse, which must transform ideas around situations, judgments and truth. The rapid development of AI is the new reconfiguration of the modes of image creation and of those who observe such images, and yet the questions are: are we preparing our young university students in a new reality, not only technological but also discursive?

In this sense, William Mitchel (1992, p. 225) argues.

Today, as we enter the era [of AI], we must face more the uneradicable fragility of our ontological distinctions between the imaginary and the real, and the tragic chimera of the Cartesian dream.

Finally, from the perspective of design education, there is a need to adopt a much more theoretical, critical and reflective attitude towards the reality of the world in relation to the universe of images, their nature and their properties.

4 CONCLUSIONS

We are living in a cultural moment, high in "feelings" and "emotions" and the individual liberation of the self in terms of values, sexuality, education, among many other things, which entails a light valuation of the "others", tolerating a permissiveness without giving due importance to others.

As for the teaching of graphic design, the transformation of analog, through digital hybridization, until reaching AI's, which have completely left critical thinking aside, there are rarely questions, reflections and proposals in a design, now it is AI that proposes and resolves. The process of visual representation has lost much of its content, abandoning the real, what was previously constituted in a humanistic environment has been transferred to a cold environment, made by computers, the perfection of the design object is more important than the meaning of the representation itself.

Now students in graphic design have a weak thought, without firmness, or as Enrique Rojas (2010, p.16) puts it: "... asepsis in its commitments, *sui generis* indifference made of curiosity and relativism at the same time; its ideology is pragmatism, its norm is conduct, its social validity, what is worn, what is fashionable; its ethics is based on statistics, a substitute for conscience; its morality, full of neutrality, lack of commitment and subjectivity, it is relegated to intimacy."

Perhaps the greatest predominant faculty concern in the teaching of contemporary graphic design is to observe the gradual disappearance of the student's cognitive abilities for design, who changes their design methodology and thinking and opts for the easy and comfortable promise that the computer, state-of-the-art software, and Artificial Intelligence in a virtuous trine are the solving agents of design problems and of the inherent future dilemmas that will arise in the exercise of the profession.

However, the supposed creation that occurs through Artificial Intelligence cannot only glorify its privileged status for its abstract potential. In a more precise debate, the discourse about a change of era is fundamental. To understand the transformations that new technology has entailed, it is necessary to analyze, question and argue the ways of creating the image, above all, what is being left behind and the level of rupture that these changes entail. Because what AI offers, well founded, is inevitably achieved with knowledge of language and the theoretical and visual discourses of the image itself. In other words, the image cannot be fully understood without taking into account the systems of ideas and the way of processing critical thinking, in addition to experience.

Finally, the most revealing thing is not the images created with AI, but the new reordering of the visual, of what we can do with them and of their meaning, to the extent that we are able to resist the comforts of chance.

ABSTRACT

Performance and productivity management in the food industry constitutes a strategic factor to ensure competitiveness, quality, and sustainability, especially in micro and small agro-industries. This chapter presents an integrated analysis between theoretical foundations and practical application, addressing tools such as Statistical Process Control (SPC), performance indicators, the seven quality tools, Knowledge Management, and Business Intelligence. The case study conducted in a small dairy plant located in Minas Gerais aimed to plan the expansion of a goat fine cheese production line, evaluating production capacity, mass balance, labor, and structural compliance. The results demonstrated the feasibility of the expansion through increased raw material supply, production rescheduling, targeted investments in infrastructure, and the hiring of an additional employee. The analysis showed that the structured use of indicators and management tools makes it possible to identify bottlenecks, reduce waste, and support strategic decisions based on data. It is concluded that the integration of theory and practice strengthens organizational competitiveness, even in contexts of limited resources, and highlights the role of data-driven management as a differentiating factor in the food industry scenario.

micro e pequenas agroindústrias. Este capítulo apresenta uma análise integrada entre fundamentos teóricos e aplicação prática, abordando ferramentas como Controle Estatístico de Processo (CEP), indicadores de desempenho, sete ferramentas da qualidade, Gestão do Conhecimento e Business Intelligence. O estudo de caso realizado em um laticínio de pequeno porte, localizado em Minas Gerais, teve como objetivo planejar a expansão da linha de queijos finos de cabra, avaliando capacidade produtiva, balanço de massa, mão de obra e conformidade estrutural. Os resultados evidenciaram a viabilidade da expansão mediante ampliação da captação de matéria-prima, reprogramação produtiva, investimentos pontuais em infraestrutura e contratação de um colaborador adicional. A análise demonstrou que a utilização estruturada de indicadores e ferramentas de gestão possibilita identificar gargalos, reduzir desperdícios e subsidiar decisões estratégicas baseadas em dados. Conclui-se que a integração entre teoria e prática fortalece a competitividade organizacional, mesmo em contextos de recursos limitados, e evidencia o papel da gestão orientada por dados como diferencial no cenário da indústria de alimentos.

RESUMEN

La gestión del desempeño y la productividad en la industria de alimentos constituye un factor estratégico para garantizar la competitividad, la calidad y la sostenibilidad, especialmente en micro y pequeñas agroindustrias. Este capítulo presenta un análisis integrado entre fundamentos teóricos y aplicación práctica, abordando herramientas como el Control Estadístico de Procesos (CEP), indicadores de desempeño, las siete herramientas de la calidad, Gestión del Conocimiento y Business Intelligence. El estudio de caso realizado en una pequeña planta láctea ubicada en Minas Gerais tuvo como objetivo planificar la expansión de la línea de quesos finos de cabra, evaluando la capacidad productiva, el balance de masa, la mano de obra y la conformidad estructural. Los resultados evidenciaron la viabilidad de la expansión mediante la ampliación de la captación de materia prima, la reprogramación productiva, inversiones puntuales en infraestructura y la contratación de un colaborador adicional. El análisis demostró que el uso estructurado de indicadores y herramientas de gestión permite identificar cuellos de botella, reducir desperdicios y apoyar decisiones estratégicas basadas en datos. Se concluye que la integración entre teoría y práctica fortalece la competitividad organizacional, incluso en contextos de recursos limitados, y evidencia el papel de la gestión orientada por datos como un diferencial en el escenario de la industria de alimentos.

1 INTRODUCTION

The food industry occupies a strategic role in the world economy, being responsible for generating jobs and meeting a growing demand for quality, innovative and sustainable products. In recent decades, this sector has faced profound transformations, driven by globalization, technological advancement, intensified competitiveness, and growing concern with sustainability and efficiency in the use of resources (MESSIAS; ROMÃO; ROLAND, 2020).

Brazil is recognized for the strength of agribusiness and the potential for adding value in agro-industrial chains, which makes the search for productive excellence a decisive competitive differential. In particular, the micro, small, and medium-sized food and beverage industries have been challenged to optimize processes, reduce waste, and align their production with market requirements, which include both sensory and nutritional quality attributes and regulatory compliance and sustainable practices (ALVES, 2018; ALMEIDA et al., 2024).

In this context, performance and productivity management are a fundamental approach to transform information into strategic decisions, aligning indicators of operational efficiency, quality, and sustainability with decision-making. Modern quality management tools, statistical process control (SPC), *Business Intelligence* (BI) and continuous improvement methodologies have been incorporated into the industrial reality, allowing greater predictability, reduction of variability and value addition (SURBAKTI, 2015; FRANCISCHINI; FRANCISCHINI, 2018).

Beyond theory, it is essential to demonstrate how these concepts can be applied in practice, especially in sensitive sectors such as dairy, which demand strict process control and efficient resource management. To this end, this chapter presents an integrated analysis between theory and practice, exploring the conceptual bases of performance and productivity management, as well as the application in a case study on the expansion of the line of fine goat cheeses in a small dairy in Minas Gerais.

The objective is to present an assertive and grounded overview on the subject, showing how the integration between industrial management, quality and performance indicators can strengthen competitiveness and sustainability in the food industry.

2 PERFORMANCE AND PRODUCTIVITY MANAGEMENT IN THE FOOD INDUSTRY

Contemporary industrial management is marked by the need to reconcile three major dimensions: production efficiency, product quality and process sustainability. These

dimensions should not be seen as isolated objectives, but rather as interdependent pillars that support the sustainable growth of organizations.

According to Messias, Romão and Roland (2020), the survival of industries in the current scenario depends on their ability to innovate continuously, overcome the competition and respond quickly to market changes. This means that productivity, traditionally measured only in terms of costs and volumes produced, needs to be expanded to include aspects such as agility, reliability, waste reduction and value creation for customers and society.

For Alves (2018), the sustainable development of the industry requires systemic management, capable of integrating planning, control and innovation. This perspective becomes even more relevant in the food sector, where factors such as seasonality of raw materials, sanitary quality requirements, and variations in demand require constant monitoring and data-driven decision-making.

In this scenario, two complementary approaches stand out:

- **Knowledge Management (KM):** focuses on the acquisition, creation, sharing, and application of knowledge within organizations. In the food sector, KM is essential to ensure that safety practices, technological innovation, and quality standards are absorbed and replicated by the entire team (DALMARCO et al., 2017).
- **Business Intelligence (BI):** involves the systematic use of data and analytics to support strategic and operational decisions. With BI, it is possible to transform large volumes of operational data, such as process times, yields, loss rates and non-conformities, into useful performance indicators for management (SURBAKTI, 2015).

The integration between KM and BI enhances organizational development, creating learning environments and continuous innovation. Shehzad and Khan (2013) point out that, when combined, these approaches allow for more expressive results than when used alone, since they unite the human dimension (tacit and explicit knowledge) with the technological dimension (data analysis and prediction).

Considering this context, performance and productivity indicators become key tools, as they allow translating organizational objectives into tangible metrics. Falconi (2010) points out that well-defined indicators make it possible not only to monitor results, but also to direct efforts, identify bottlenecks and prioritize improvements in processes.

Thus, performance management in the food industry is not limited to production control, but involves the creation of an integrated management system, driven by data, knowledge, and innovation. This system is able to simultaneously respond to customer demands, regulatory requirements, and the needs of competitiveness and sustainability.

3 TOOLS FOR MONITORING AND CONTINUOUS IMPROVEMENT

Performance and productivity management in the food industry depends on mechanisms that enable measurement, analysis and structured intervention in processes. In this sense, quality management tools and continuous monitoring methodologies are essential to ensure operational efficiency, standardization, predictability, and evidence-based decision-making. Among the main tools used by the quality management system in companies, the Statistical Process Control, the quality support tools, such as flowcharts, 5W2H, check sheets, histograms and others (Stadler and Silene, 2013) stand out. The use of performance and productivity indicators has also been widely used, together with other tools, to enable the use of prediction in systems that have sensing, combined with Artificial Intelligence (Martins, 2025).

3.1 STATISTICAL PROCESS CONTROL (SPC)

Statistical Process Control (SPC) is one of the most consolidated and applied techniques in the industry for monitoring and improving quality. Its central logic is to identify and reduce variabilities, distinguishing those inherent to the process, common causes, resulting from failures or specific conditions, special causes (Gouveia and Silva, 2011).

According to Ribeiro and Caten (2012), the SPC allows operators to monitor the process in real time, identifying deviations and promoting corrections before the final product is compromised. This characteristic makes the method highly effective in the food industry, since through the standardization of the process, it identifies process failures, which can compromise food safety and generate high costs with rework and waste.

Among the main tools of the CEP are:

- Control charts: allow for graphically visualizing the behavior of critical variables, identifying trends and deviations from the established control limits (CORTIVO, 2005).
- Process capability indices (C_p and C_{pk}): measure the ability of the process to meet quality specifications, considering both natural variability and the alignment of the process average with specification limits (FRANKEN et al., 2014).

The application of CEP provides greater stability and predictability to production processes, contributing to increased reliability, reduced costs of non-quality and greater consumer satisfaction. According to Kanan et al. (2023), the effective implementation of PESCO in food industries, especially in developing countries, contributes significantly to reducing losses, increasing operational efficiency, and strengthening the culture of continuous improvement.

3.2 BASIC QUALITY TOOLS

The so-called "seven tools of quality" are practical resources for identifying problems, analyzing causes and supporting decision-making. Paladini (2019) highlights that the correct choice of methodology and the structuring of quality programs determine the effectiveness of the results. Among the most relevant tools for the food industry are:

- Flowchart: maps production stages, facilitating the understanding of processes and the identification of bottlenecks (COSTA et al., 2004).
- Brainstorming: promotes the generation of collective and diversified ideas for problem solving (DANIEL; MURBACK, 2014).
- Ishikawa Diagram (Cause and Effect): allows analyzing potential causes for a given problem, grouped into categories such as machine, method, labor, environment and materials (CAMARGO; ANUNCIATION, 2022).
- The 5 Whys: simple methodology for identifying the root cause of problems (WEISS, 2011).
- 5W2H: structured tool for the elaboration of action plans, defining what, who, when, where, how, why, and how much it costs (MELLO et al., 2017).
- Check Sheets: assist in standardized data collection, facilitating subsequent analyses (LOBO, 2019).
- Histogram: allows you to visualize the distribution of data and identify patterns of variability (MELLO et al., 2011).
- Tree of Problems and Objectives: to relate causes and consequences of critical situations, assisting in the development of intervention strategies (COHEN; MARTINEZ, 2004).

These tools, when applied in combination, create a robust system for analyzing and solving problems, in addition to fostering a culture of continuous improvement, which allows for structuring accurate diagnoses, prioritizing critical causes, and guiding corrective actions efficiently, strengthening quality management and data-based decision-making. In the food industry, this approach contributes to strict process control, waste reduction, and compliance with required safety and quality standards (INÁCIO; 2023).

3.3 PERFORMANCE AND PRODUCTIVITY INDICATORS

Indicators are the basis for measuring and monitoring organizational performance. Francischini and Francischini (2018) define indicators as measures that allow comparing the results obtained with the objectives or expectations established.

In the food industry, indicators can take on different applications:

- Quality indicators: number of non-conformities, customer complaints, rework rate.
- Productivity indicators: relationship between resources used (raw material, time, energy) and results obtained (quantity of product).
- Sustainability indicators: water consumption, energy, emissions and waste generation.
- Satisfaction indicators: evaluation of customers, employees and other stakeholders.

The effectiveness of the indicators depends on the clear definition of goals, frequency of monitoring and those responsible for data collection and analysis. Bahia (2021) emphasizes that indicators must be objective, communicable, value-oriented, and aligned with strategic planning.

By integrating indicators into a Performance Measurement System (SMD), it becomes possible to identify critical points, monitor trends, and support management decisions. In addition, the indicators work as "organizational compasses", guiding the direction of efforts and avoiding waste of resources, since it quantifies performance in relation to organizational objectives and allows the monitoring of the evolution of the company's results, and can be used as a reference for decision-making and improvement strategies (MERTZ, 2016).

3.4 INTEGRATION OF QUALITY TOOLS TO PERFORMANCE MANAGEMENT IN THE FOOD INDUSTRY

The biggest challenge is not only in knowing the tools, but in integrating them into an industrial management logic. The SPC provides statistical data; indicators translate objectives into metrics; and quality tools help in solving problems. When applied together, these practices strengthen performance management and create conditions for sustainable productivity (PALADINI, 2019).

In this context, the use of *Business Intelligence* (BI) systems has gained prominence for offering real-time monitoring, dynamic dashboards and integrated analysis of production data, making the monitoring process more assertive and assisting managerial decision-making (RODRIGUES; COSTA, 2019; BARROS, 2024). Task automation optimizes professionals' time and reduces the likelihood of errors. In addition, BI allows industries to continuously monitor their processes, quickly identify patterns of anomalies, and anticipate potential failures before they impact production (TURBAN et al., 2010; BARROS, 2024).

In the dairy sector, for example, the integration of these tools makes it possible to monitor variations in the yield of milk products, identify causes of losses (such as equipment failures or raw material problems), plan corrective actions with 5W2H, and monitor the impact of changes through indicators. This systemic approach enhances the company's production efficiency and competitiveness.

4 CASE STUDY IN A FINE CHEESE DAIRY: A PRACTICAL APPLICATION OF MANAGEMENT CONCEPTS

The application of the concepts of performance and productivity management can be better understood when analyzed in real situations. In this sense, the case study of Laticínio Piallet, located in Florestal, Minas Gerais, is presented, which stood out for the elaboration of an operational plan aimed at the expansion of the line of fine goat cheeses.

The goat dairy processing sector has been consolidated as a profitable activity for small producers in Brazil, especially due to the differentiated nutritional value of goat's milk and the growing interest of the consumer market for artisanal and high-quality products (IBGE, 2021; SILVA, 2023). In this context, industrial management assumes a strategic role to optimize resources, reduce waste and ensure competitiveness in this sector.

4.1 PURPOSE OF THE STUDY

The main objective of the work was to prepare the expansion plan for the line of fine goat cheeses, evaluating the structural conditions, raw material, production capacity, labor and facilities, in order to propose an action plan that would enable the increase in production.

In the expansion proposal, there was an increase of 50% in the production of fresh cheeses (Boursin, Minas Frescal and Tipo Feta) and 20% in the production of matured cheeses (Caprino Romano and Chevrotin), in line with the insertion of the new "Santa Cecilia" brand, expanding distribution and positioning in the market.

4.2 METHODOLOGY

The study was conducted as an applied case study, in which qualitative and quantitative data techniques were used, through:

- Survey of technical and operational data through visits to the dairy and interviews with those responsible for it;
- Mass balance for calculating yields and surveying the need for raw materials, according to Tadini et al. (2018);
- Mapping of production processes using flowcharts, enabling detailed analysis of production stages;
- Calculation of the operational capacity of the equipment (pasteurizers, tanks, presses and cold chambers), according to the methodology of Staudt et al. (2011);
- Study of times and movements with timing of operations, based on Corrêa and Corrêa (2012), to assess the need for labor;

- Analysis of compliance of facilities based on sanitary legislation (RDC No. 275/2002 of ANVISA and Ordinance No. 368/1997 of MAPA);
- Action plan structured by the 5W2H method, contemplating production strategies, supplies, physical structure and human resources.

This methodology provided a holistic view of the production process, allowing the identification of bottlenecks, opportunities for improvement and the development of expansion strategies.

4.3 RESULTS

4.3.1 Operational and Raw Material Planning

The mass balance showed that, to meet the new demand, it would be necessary to increase the volume of processed milk by 47.98%, from approximately 14,200 liters/month to 21,000 liters/month. This result highlighted the need to strengthen partnerships with suppliers and seek new channels for capturing raw materials.

The calculations showed that yields for the different types of cheese were consistent. This fact suggests stability in the production process even in the face of expansion. However, it was observed that the central limitation of the technical feasibility of the expansion was not in the yield, but in the availability of goat's milk.

4.3.2 Operational Capability

The operational capacity of the factory was evaluated through the analysis of the use of the equipment, which showed different scenarios:

- Boursin cheese: presented an average idleness of 40.25%, indicating the possibility of absorbing part of the expansion with adjustments in the production schedule.
- Feta Cheese: the average idleness was 43.55%, revealing the need to reschedule production, due to the high time of use of tanks and presses.
- Minas Frescal Cheese: the high idleness (50.23%) demonstrated immediate feasibility of expansion by 50%, without the need for new investments.
- Matured Cheeses (Caprino Romano and Chevrotin): presented bottlenecks in the pressing and maturation stages. The 20% expansion would require the acquisition of new shelves for the cold room and structural adjustments.

In general, it was observed that the expansion is feasible, but requires an optimization of the production schedule and small investments in infrastructure.

4.3.3 Evaluation of Labor

The study of times and movements revealed that, in order to maintain efficiency after the expansion, it would be necessary to hire a new employee. Thus, the number of employees on the production line had to increase from two to three, ensuring that processing times remained equivalent to today.

4.3.4 Physical Structure and Facilities

The inspection of the facilities highlighted the need for improvements in floors, walls, ventilation and external areas, in order to align the production environment with legal requirements and good manufacturing practices. These adjustments were included in the action plan, reinforcing the commitment to food quality and safety.

4.4 ACTION PLAN (5W2H)

Based on the results, an action plan was drawn up covering:

- Raw material: expand milk collection through new suppliers and commercial negotiations with current partners.
- Production: optimize the use of equipment with the reprogramming of the schedule and acquisition of presses and shelves for maturation.
- Labor: Hiring a new employee to maintain operational efficiency.
- Physical structure: make adjustments to floors, walls, cold rooms and external areas to ensure sanitary compliance.

Thus, the study proved the feasibility of the planned expansion, as long as it is accompanied by adjustments in supplies, production schedule, labor and infrastructure. The analysis provided technical support for strategic decisions, strengthening the dairy's position in the market and contributing to the competitiveness of the new brand.

5 CONNECTION BETWEEN THEORY AND PRACTICE

The literature highlights that industrial competitiveness depends on the ability to innovate and respond quickly to market demands (MESSIAS; ROMÃO; ROLAND, 2020; ALVES, 2018). This perspective was evident in the case analyzed, in which the expansion of production was planned not only based on growth expectations, but supported by concrete data on operational capacity, yields and labor.

From the point of view of quality management, the use of methodologies such as mass balance, flowcharts, 5W2H and analysis of times and movements contributed to identifying the bottlenecks of the factory and proposing specific solutions. This practice dialogues directly

with the Knowledge Management and *Business Intelligence* approach, by transforming dispersed information into useful knowledge for decision-making (ALMEIDA and CAMARGO, 2015; SURBAKTI, 2015).

Thus, the integration between theory and practice presented in this chapter shows how performance and productivity management can become a competitive advantage in the food industry. The case study of Laticínio Piallet illustrates, in an applied way, the relevance of management tools and performance indicators as instruments to guide strategic and operational decisions.

5.1 INDICATORS TO SUPPORT DECISION MAKING

The performance indicators in the dairy analysis allowed the identification of equipment idleness, the additional need for milk and the production time per employee. According to Francischini and Francischini (2018), the indicators work as management guides, showing not only the current state of the operation, but also guiding corrections and improvements.

In this context, the average idleness indicator of 40.25% in the Boursin cheese production line revealed the possibility of expansion without major investments, while the indicators of use of presses and cold chambers for matured cheeses pointed to the need for new resources.

This quantitative analysis demonstrates how performance measurement systems (SMD) offer strategic support to management, enabling decision-making based on hard data and operational evidence. According to Cunha (2023), the effectiveness of SMD in industrial environments depends on the organization's ability to integrate data, technology, and a culture of continuous improvement, overcoming challenges such as inadequate selection of indicators, lack of alignment with corporate strategy, and limitations of real-time analysis.

In this way, the structured use of indicators allows transforming operational information into strategic inputs, guiding evidence-based decisions, strengthening organizational competitiveness, and promoting the efficiency and sustainability of production processes.

5.2 QUALITY MANAGEMENT AS A COMPETITIVE ADVANTAGE

In the case of Laticínio Piallet, although control charts were not applied in a formalized way, statistical reasoning was present in the calculation of yields and capacity indexes, which opens space for future implementations of a continuous statistical monitoring system, using the CEP.

5.3 CHALLENGES FOR SMALL AND MEDIUM INDUSTRIES

A relevant aspect is the finding that small and medium-sized food industries face particular challenges:

- Capital limitations for investments in new equipment;
- Dependence on local raw material suppliers;
- Need to adapt to regulatory requirements, often onerous;
- Shortage of skilled labor.

The case study showed that, even in the face of these restrictions, it is possible to apply modern industrial management practices, using low-cost tools (such as flowcharts, 5W2H and process timing) to obtain significant gains in efficiency and consequently competitiveness in the market.

5.4 FUTURE PROSPECTS

The experience of Laticínio Piallet points out paths that can be explored by other food industries:

6 FINAL CONSIDERATIONS

Performance and productivity management in the food industry is one of the fundamental pillars for competitiveness, sustainability and innovation. As discussed throughout this chapter, the sector lives under intense pressures from the consumer market, regulatory requirements and resource constraints, which requires companies to take a proactive stance of planning, monitoring and continuous improvement.

The theoretical foundation highlighted the importance of Systemic Industrial Management, which integrates knowledge, data and processes to transform information into assertive decisions. Tools such as Statistical Process Control (SPC), performance indicators, and the seven quality tools proved to be essential to reduce variability, guide action plans, and sustain consistent results.

The case study of Laticínio Piallet demonstrated, in practice, how theoretical concepts can be applied in a small agribusiness. Analysis of the expansion of the fine goat cheese line revealed:

- The need to increase milk collection by almost 50%, highlighting the importance of supply management;
- The feasibility of the expansion, given the existing idleness in certain equipment, as long as it is accompanied by rescheduling of production;

- The requirement for specific investments in presses and maturation shelves, in addition to hiring a new employee to maintain operational efficiency;
- The relevance of structural and sanitary adjustments, reinforcing the role of quality as a competitive differential.

This case reinforces that, even with limited resources, small and medium-sized industries can apply performance management methodologies effectively, obtaining significant gains in productivity and sustainability. The differential is in adopting management guided by indicators, supported by accessible quality tools and aligned with the organization's growth strategy.

In the future scenario, marked by digitalization, industry 4.0, and growing demands for sustainability, the ability to integrate data, people, and technology will be decisive for the survival and expansion of companies in the food sector. It is observed that this movement profoundly transforms the sector, making it essential to adopt smarter, more sustainable, and data-driven production practices.

Technological innovations and new market demands drive a structural change in the forms of management, in which efficiency, traceability and environmental responsibility are consolidated as pillars of competitiveness. In this context, understanding and applying performance and productivity management models is essential to ensure quality, efficiency, and sustainability in operations.

Therefore, this chapter contributes by offering an integrated look from theory to practice on performance and productivity management, demonstrating how scientific principles can be applied in a concrete way to support strategic decisions, strengthen competitiveness and ensure the production of safe and quality food.

ABSTRACT

This study analyzes intellectual property (PI) management in the Brazilian Defense Industrial Base (BID), focusing on the underutilization of the Utility Models (MU) compared to invention patents. The main objective is to characterize patent BR 202014017157-1, related to a gas-powered pistol modification, a component of a shooting simulator, from the perspective of technological maturity (TRL) and dual-use potential. Through a qualitative and documentary approach, the research demonstrates that the MU is the most suitable instrument for incremental innovations at intermediate readiness levels (TRL 4 to 6), positioning them close to practical application. The analyzed technology shows high strategic versatility, enabling cost reduction and increased safety in both military training and in civilian and recreational contexts. The analysis outlines three strategic scenarios for managing the asset: restrictive, focused on national autonomy and maximum protection of sensitive secrets; Partial Opening, aimed at achieving scale and licensing to civilian markets and selected international partners; and hybrid, which combines patent protection with trade secrets to allow selective technical cooperation. It is concluded that the full exploitation of this asset requires robust institutional governance to manage power asymmetries in negotiations and maximize technological spillovers. Strengthening the BID depends on integrating the MU into mission-oriented incrementalism, ensuring sovereignty and industrial competitiveness.

RESUMO

Este estudo analisa a gestão da propriedade intelectual (PI) na Base Industrial de Defesa (BID) brasileira, focando na subutilização do Modelo de Utilidade (MU) em comparação às patentes de invenção. O objetivo central é caracterizar a patente BR 202014017157-1, relativa a uma modificação de pistola acionada por gás, componente de um simulador de tiro, sob a ótica da maturidade tecnológica (TRL) e do potencial de emprego dual. Por meio de uma abordagem qualitativa e documental, a pesquisa demonstra que o MU é o instrumento mais adequado para inovações incrementais em níveis intermediários de prontidão (TRL 4 a 6), situando-se próximo da aplicação prática. A tecnologia analisada evidencia alta versatilidade estratégica, permitindo a redução de custos e o aumento da segurança tanto no adestramento militar quanto em contextos civis e recreativos. A análise delinea três cenários estratégicos para a gestão do ativo: (i) restritivo, focado na autonomia nacional e proteção máxima de segredos sensíveis; (ii) Abertura Parcial, voltado ao ganho de escala e licenciamento para mercados civis e parceiros internacionais; e (iii) híbrido, que combina proteção patentária e segredo industrial para cooperação técnica seletiva. Conclui-se que a plena exploração desse ativo exige uma governança institucional robusta para gerenciar assimetrias de poder em negociações e maximizar transbordamentos tecnológicos. O fortalecimento da BID depende da integração do MU ao incrementalismo orientado a missões, garantindo soberania e competitividade industrial.

RESUMEN

Este estudio analiza la gestión de la propiedad intelectual (PI) en la Base Industrial de Defensa (BID) brasileña, centrándose en la subutilización del Modelo de Utilidad (MU) en comparación con las patentes de invención. El objetivo central es caracterizar la patente BR 202014017157-1, relativa a una modificación de una pistola accionada por gas, componente de un simulador de tiro, desde la perspectiva de la madurez tecnológica (TRL) y del potencial de uso dual. A través de un enfoque cualitativo y documental, la investigación demuestra que el Modelo de Utilidad es el instrumento más adecuado para innovaciones incrementales en niveles intermedios de preparación (TRL 4 a 6), situándose cerca de la aplicación práctica. La tecnología analizada evidencia una alta versatilidad estratégica, permitiendo la reducción de costos y el aumento de la seguridad tanto en el entrenamiento militar como en contextos civiles y recreativos. El análisis plantea tres escenarios estratégicos para la gestión del activo: (i) restrictivo, enfocado en la autonomía nacional y la máxima protección de secretos sensibles; (ii) apertura parcial, orientada a lograr escala y licenciamiento para mercados civiles y socios internacionales; y (iii) híbrido, que combina protección patentaria y secreto industrial para cooperación técnica selectiva. Se concluye que la plena explotación de este activo requiere una gobernanza institucional robusta para gestionar las asimetrías de poder en las negociaciones y maximizar los derrames tecnológicos. El fortalecimiento de la BID depende de la integración del MU al incrementalismo orientado a misiones, garantizando soberanía y competitividad industrial.

1 INTRODUCTION

The Brazilian Defense Industrial Base (BID) has been consolidated as a strategic pillar for national sovereignty, especially after the regulatory framework of Law No. 12,598/2012.

This ecosystem is based on the search for technological autonomy and the ability to convert incremental innovations and dual-use technologies into assets of security and economic development (VERGUEIRO, 2023).

However, there is an asymmetry in the management of Intellectual Property (IP) in the sector: while invention patents dominate innovation agendas, the Utility Model (MU) institute remains underexplored (LIMA; GOMES, 2022). Yu (2009) highlights that property should serve the collective well-being and the development agenda, preventing excessive "constraints" from impeding subsequent innovation.

This movement does not occur in a legal vacuum, it was forged by the expansion of intellectual rights that transform inventions into goods of exclusive commercial use. According to Law No. 9,279/1996, the MU is the title dedicated to protecting functional improvements linked to the objects, that is, alteration in the three-dimensional configuration aimed at functional improvement, precisely aligning with the nature of many technological trajectories of the BID. Therefore, the utility model patent protects the object's adaptations with a focus on its functional performance, which contributes to an incremental technological learning dynamic.

Despite the relevance of incremental innovations, there is a gap in the national literature regarding the integration between the legal regime of MUs, the levels of technological *readiness* (TRL) and the concept of *dual-use technologies* within the context of defense (SOUZA; PINHEIRO, 2021).

According to Silva and Gomes (2021), this fragmentation makes it difficult for companies and regulatory bodies, such as the Ministry of Defense (MD) and the National Institute of Industrial Property (INPI), to make strategic decisions about which type of protection is most appropriate to the stage of maturity of a sensitive or critical technology. In this sense, a fundamental question stands out about the role that the utility model can play in stimulating technological and economic development in the country, both for the spillover of dual technology to the market, and in the assimilation of foreign technology to adapt it to the national context. Incremental cumulativeness can enclose an evolutionary strategy that may imply the emergence of more radical technological proposals, however, the limitation of the utility model patent being associated with functional improvement through the configuration of the object's form is highlighted.

Faced with this challenge, this article proposes the following research question: how is the MU BR 202014017157-1 patent characterized in terms of technological maturity and dual employment, and how does this asset fit into the IDB's strengthening strategy? And also, to elucidate IP strategies that can contribute to foster technological development strategies in reinforcement of Brazilian sovereignty.

The general objective of this study is to analyze the patent as an instrument of incremental and dual innovation, correlating its technical specificities to the Brazilian regulatory and institutional framework.

To this end, the research proposes to characterize the asset from the perspective of the TRL (NASA, 2013), identify its potential for civil-military application and discuss the viability of the MU as a tool for economic sustainability and national security.

This effort is justified by the pressing need to align the governance of sensitive knowledge with the demands of productivity and export control in force in the international scenario.

2 THEORETICAL FRAMEWORK

2.1 UTILITY MODEL AND INTELLECTUAL PROPERTY IN BRAZIL

The protection of intellectual property through the Utility Model (MU) patent is governed by Law No. 9,279/1996 (Industrial Property Law - LPI), which establishes:

"Article 9 - An object of practical use, or part thereof, susceptible to industrial application, which presents a new form or disposition, involving an inventive act, which results in functional improvement in its use or manufacture, is patentable as a utility model.

Article 10. The following are not considered inventions or utility models:

- I - discoveries, scientific theories and mathematical methods;
- II - purely abstract conceptions;
- III – commercial, accounting, financial, educational, advertising, lottery and inspection schemes, plans, principles or methods;
- IV – literary, architectural, artistic and scientific works or any aesthetic creation;
- V - computer programs themselves;
- VI - presentation of information;
- VII – rules of the game;
- VIII – operative or surgical techniques and methods, as well as therapeutic or diagnostic methods, for application in the human or animal body; and

IX – the whole or part of natural living beings and biological materials found in nature, or even isolated from it, including the genome or germplasm of any natural living being and natural biological processes."

In this sense, the purpose of the MU is to protect functional increments in the shape of the object, therefore, it requires a less rigorous requirement of inventiveness than the invention patent, due to its own incremental nature. In this sense, the analysis of obviousness seeks to assess the incremental inventive effort involved in the functional improvement of the form of the already existing object. Thus, these changes in the shape of the object to give it better performance in its functions cannot be obvious and evident to a technician in the area, being ideal for short technological cycles. Although the criterion of inventiveness is less rigorous, such increments in form must always be associated with a concrete technical effect, either in the performance or in the manufacturing process of the object (POLAR; KONETZ, 2025).

While the invention patent has stricter criteria regarding inventive step, being more robust and covering, as a rule, new technical solutions with a high degree of originality (WIPO, 2023), which makes it more complex to obtain when compared to MU. The choice for UM allows you to reduce costs and exam times, offering protection in line with crucial functional adjustments for the operability of equipment at BID. According to Boyle (2008), IP should avoid the "tragedy of the anti-commons", ensuring that technical protection does not stifle the public domain necessary for the progress of mind and industry (Boyle, 2008, p.179-204).

In Brazil, the term of validity of the MU is 15 years from the filing, lower than that of invention patents, which is 20 years. Such a difference reflects the incremental nature of the institute and its vocation for shorter technological cycles (ELOY et al., 2022).

From the perspective of innovation management, according to Eloy et al. (2023), the MU is particularly suitable for sectors in which competitive advantage depends on successive improvements in ergonomics, operational performance, reliability, or integration of components in already known systems, a recurring situation in defense products that undergo continuous processes of modernization and technological updating.

In terms of intellectual property strategy, MA (2023) and Jee (2024) collaborate that the choice of MU allows for a reduction in costs and examination times compared to an invention patent, in addition to offering protection more aligned with functional adjustments, which often would not reach the inventive level required for the invention category, but are crucial for the operability of equipment in the Defense Industrial Base (BID).

The utility model patent can contribute to a technological learning trajectory. This incremental route through the search for functional improvement, adaptations, can stimulate or favor the constitution of skill and technical competence, which are essential in issues involving technology transfer in the area of defense. In the case of the dual use of technology, this form of protection for incremental innovation creates a barrier to copying by competitors, stimulating the search for greater inventiveness, whose accumulation of knowledge can favor the emergence of more radical technologies.

2.2 TECHNOLOGY MATURITY LEVEL

The *Technology Readiness Level* (TRL) is a methodology developed by the National Aeronautics and Space Administration (NASA) to recognize and assess the maturity of technologies, ranging from basic research to operational implementation, with distinct levels that support innovation management decisions and the Research, Development and Innovation (RD&I) of complex systems (NASA, 2013). In the area of defense, the TRL guides strategies for intellectual protection and technology transfer according to the stage of development. Figure 1 presents the TRL levels and summarizes each stage.

Figure 1
TRL Scale

Source: INPI (2026).

It should be noted that basic research and conceptual formulation of a system occur in the initial TRLs, from 1 to 3. The intermediate levels, TRL 4 to 6, are intended for the validation of components and prototypes in a laboratory or relevant environment, while the upper levels, TRL 7 to 9, correspond to the demonstration and operation of the system in a real context, characterizing the products available for purchase or off-the-shelf (NASA, 2013).

According to Olechowski et al. (2020), this methodology was progressively absorbed by the United States Department of Defense (DoD) and other government organizations, which began to use it as a tool for technological risk management, RD&I resource allocation, and decision-making in military capability acquisition processes.

In the field of innovation, the TRL has been adopted as a cross-cutting indicator of technology readiness for different sectors, allowing comparability between projects and alignment between public and private actors in R&D portfolios (NASA, 2013).

In the area of defense, GAO (2020) corroborates that the application of TRL is articulated with the need to ensure that critical technologies reach adequate levels of maturity before their integration into weapons systems or sensitive infrastructures, mitigating performance and operational safety risks. In addition, the TRL guides intellectual protection and technology transfer strategies, according to the stage of development reached.

2.3 DEFENSE INDUSTRIAL BASE (BID) AND ECONOMIC OUTLOOK

The Brazilian BID operated even before the regulatory framework that was formally structured by Law No. 12,598/2012 (Law to promote the BID), historically contributing to national development. In this sense, the promotion and favoring of the industrial ecosystem are pillars that are articulated to promote the national defense industry in the institution of mechanisms for its strengthening, defining strategic companies, special contracting conditions and incentives for RD&I and the development of defense products (BRASIL, 2012).

Recently, Brazil made progress on this topic with the National Policy on the Defense Industrial Base (PNBID), through Decree 11,169/2022, which aims to ensure technological and productive autonomy for the Armed Forces, reducing external dependence and strengthening national sovereignty, which favored the emergence and development of new national companies for the defense sector.

Recently, the Defense Technological, Industrial and Commercial Compensation Policy (PComTIC Defesa), instituted by Ordinance GM-Ministry of Defense (MD) No. 3,990/2023, established an agreed mechanism in government procurement, especially in the defense sector, where the foreign supplier assumes counterparts (investments, technology transfer,

training) to maximize local benefits. In this way, the policy favors the transfer of critical technologies in strategic defense sectors, in favor of strengthening the national industry.

This normative framework resulted in direct benefits for the Brazilian BID, Pacheco and Perdone (2017) list such aspects as tax and fiscal advantages, differentials in bids and contracts, access to financing and R&D activities, in addition to the strengthening of the production chain. Thus, Brazil has been fostering the development of the defense sector and creating an ecosystem favorable to innovation, technological autonomy and the sustainability of the BID.

At the institutional level, the BID encompasses public and private companies, research centers, and military organizations, articulated in production chains that extend from materials and components to complex systems, including segments such as the aeronautics, naval, cybernetic, and remote sensing sectors (BRASIL, 2026).

This legal framework also establishes guidelines to privilege national technological content, encourage partnerships with universities and guide policies of technological compensation agreement (offset), with a view to consolidating technological autonomy and reducing external dependencies in sensitive areas. (PEIXOTO et al., 2025).

Based on open source indicators, we can see that the 2020-2025 panorama of the sector presented:

- Acceleration in investments (2025): the government announced R\$ 112.9 billion for the sector by 2026, aiming for 55% mastery in essential technologies (radars, satellites) (BRASIL, 2025).
- Strategic Projects (2025): R\$ 2.5 billion were reserved for the Gripen nuclear submarine and fighters (BRASIL, 2025).
- Industry growth: the sector registered a growth of 114% compared to 2023, with exports of US\$ 1.31 billion in the first half of 2025 (BRASIL, 2025).
- Total Budget of the Ministry of Finance (2025): authorized at R\$ 133.65 billion, with a concentration on mandatory expenditures (BRASIL, 2025).

These figures reinforce Okediji's (2003) argument about the need to harmonize IP laws with the goals of commercial sustainability and long-term technical development (OKEDIJI, 2003, p. 89-98).

In this context, the study by Dias Junior (2025) shows that innovation occupies a central position in the IDB's strategy, not only in the development of new products, but also in incremental adaptations and improvements of processes and systems, in the integration of sensors, in the improvement of the logistics chain, and in cyberdefense, often through cumulative and dual-use technological trajectories.

2.4 DUAL EMPLOYMENT TECHNOLOGIES

Dual-use technologies refer to products, processes, or knowledge that can be applied in both the civilian and military spheres, often involving items that transit between the commercial and defense markets, such as sensors, advanced materials, encryption software, and communication platforms. (VERGUEIRO, 2023).

In this context, *dual-use* constitutes a structural component of contemporary defense innovation regimes, as the boundary between the civil and military domains becomes more porous, and sectors such as aerospace, Information and Communication Technologies (ICT) and biotechnology begin to operate according to hybrid logics of financing, regulation and technology transfer (KILIÇ; BEYAZ, 2025).

From the perspective of the IDB, Moura (2022) highlights that dual employment technologies acquire strategic relevance by enabling business models that combine relatively stable but restricted military demands with expanding civilian markets, allowing for gains in scale and economic sustainability of highly complex production chains, in addition to reducing the government's dependence on resources. Companies in the defense industrial base depend on the regularity of resources, which, in times of crisis, become scarce, which can compromise the performance of these companies, contributing to the scenario of acquisitions and mergers by foreign companies.

It should be noted, however, that the controlled dissemination of dual-use knowledge requires refined strategies for the protection of intellectual property and the sharing of *know-how*, which may include patents, industrial secrets, conditional licenses, and contractual mechanisms for technology transfer, in order to balance the interests of security, competitiveness, and international cooperation (KILIÇ; BEYAZ, 2025).

In the field of patents and dual-use technologies, Acosta et al. (2018) found, based on empirical studies involving large defense companies, that a significant portion of their applications are composed of mixed technologies, classified simultaneously in civil and military codes. This fact confirms the centrality of *dual-use* as a standard of innovation in the sector.

By classifying patents into military, civilian, and mixed based on the International Patent Classification (IPC), these authors also demonstrate that companies with combined revenues in civil and military markets tend to generate more dual-use technologies, reinforcing the importance of intellectual property arrangements capable of capturing value at this intersection. In this case, utility models can be strategically employed in defense supply chains.

Caviggioli et al. (2020) and Acosta et al. (2020) analyzed civil-military patents and suggest that knowledge flows between military and civilian technologies obey asymmetric dynamics. In these dynamics, defense-oriented developments may in some cases radiate to civilian applications, but are also increasingly influenced by capabilities installed in technologically advanced commercial sectors.

Additionally, Sezal (2020) expanded this analysis by examining patents classified as civil, military, and mixed, demonstrating that *mixed patents* occupy a strategic position in knowledge flows. This finding presents a strong parallelism with the potential role of patent BR 202014017157-1 as a dual-use asset, situated on the border between defense operational demands and related civilian markets.

With regard to the identification of *dual-use* inventions, methodological approaches based on patent citation networks have been developed to detect which military innovations generate the greatest probability of spillover to civilian uses, highlighting the weight of characteristics such as technological breadth, geographic reach, and intensity of citations received (CAVIGGIOLI et al., 2023; EUROPEAN COMMISSION - JRC, 2019).

These studies indicate that the incidence of dual uses tends to be heterogeneous between technologies and countries, and that the first civilian applications of military inventions usually occur within national borders themselves. Evidence suggests that patents such as MU BR 202014017157-1 can induce and act as anchors for primarily domestic diffusion trajectories, anticipating eventual international expansions when associated with BID (CAVIGGIOLI et al., 2023; ACOSTA et al., 2018).

Vella (2025), when analyzing the articulation between dual-use research and TRL levels, in recent analyses by the European Union, argues that the framing of R&D projects in scales of technological maturity can facilitate the identification of windows of opportunity for civil-military cooperation, as well as the design of development instruments adjusted to the level of technological risk at each stage.

Another aspect highlighted by this author is the proposition of an integrated reading of innovation, security and industrial competitiveness policies. Vella points out that dual-use technologies located at intermediate levels of TRL are particularly sensitive, as they simultaneously require public support for demonstration in relevant environments and mechanisms to control diffusion. In this context, an MU like this BR 202014017157-1 is inserted in a paradigmatic way. According to Moura (2022), continuous investment in MU acquires strategic relevance by enabling business models that combine stable military demands with expanding civilian markets.

Mamoshina et al. (2022), when analyzing the field of governance and ethical risks associated with the diffusion of *dual-use* technologies, discuss how advances in areas such as biotechnology, AI, and data analytics can generate significant negative externalities if they are not accompanied by robust governance frameworks, including regulation, sectoral self-regulation, and responsible intellectual property instruments.

Although the focus of these authors falls on frontier technological fields, the reflection is applicable to the Brazilian BID and to patents such as BR 202014017157-1. To the extent that its dual-use exploitation must be conceived not only in terms of economic efficiency and technological autonomy, but also in light of the risks of unwanted proliferation and deviant uses of the technology.

In the specifically Brazilian context, Vergueiro (2023) points out that the development of dual-use technologies by the BID can act as a mechanism for economic and scientific development, as long as it is supported by consistent development policies, government procurement, and coordination between public and private actors.

By analyzing the national experience, this author highlights that the articulation between the defense industry, academia and the State, the triple helix model, is capable of transforming dual-use projects into vectors of productive diversification and generation of qualified jobs, which reinforces the relevance of exploring, in a planned way, the dual potential of Utility Models such as BR 202014017157-1.

In a similar vein, Silva and Costa (2021) emphasize that innovation in the BID requires long-term strategies that articulate investments in R&D, institutional strengthening, and the design of governance mechanisms capable of aligning the interests of the Armed Forces, companies, and S&T institutions, with emphasis on the adoption of models such as the *triple helix* (university-business-government).

The development of such technologies by the BID acts as a mechanism for economic and scientific development. The articulation between the triple helix of innovation is capable of transforming projects started in 2023 into vectors for generating qualified jobs.

When transposed to the analysis of patent BR 202014017157-1, these findings suggest that its full exploitation, whether in a restricted, partially open, or hybrid scenario, will depend on the ability to insert the MU in collaborative innovation networks that maximize learning, expand the base of dual-use applications, and consolidate cumulative technological trajectories in the field of defense (SILVA; COSTA, 2021).

3 METHODOLOGY

The research adopts a qualitative approach, of an exploratory nature, structured as a single case study, centered on the analysis of the patent of MU BR 202014017157-1, entitled Modification of a gas-fired pistol for use in shooting simulators, examined in the context of the Brazilian BID.

The choice of the case study is justified because it allows the in-depth investigation of a specific empirical object, enabling the understanding of the mechanisms of innovation, intellectual property protection and potential dynamics of dual use associated with technological development in the defense sector.

This methodological strategy is particularly suitable for exploring phenomena that are still poorly systematized in the national literature, contributing to the generation of *analytical insights* on the interaction between technology, market and public policies within the scope of the BID.

From the point of view of technical procedures, the research is characterized as documentary research, based on the systematic analysis of primary and secondary sources. The descriptive report, claims and drawings of the MU BR 202014017157-1 patent, as made available in public databases of the Brazilian Patent and Trademark Office (BPTO), as well as the relevant national legislation, in particular Law No. 9,279/1996 (Industrial Property Law) and Law No. 12,598/2012, which provides for special rules for purchases, contracting and development of defense products and systems.

In addition, a review of the national and international scientific literature, published from 2018 to 2025, was carried out, addressing topics such as *Technology Readiness Levels (TRL)*, *MU patents and dual-use technologies*, with the aim of contextualizing the case study and supporting the theoretical-conceptual analysis.

The analysis is developed in four main stages, namely:

- Functional analysis of the patent, with emphasis on the proposed technical solution, its operating principles and functional gains in relation to the state of the art;
- Identification of evidence of technological maturity, based on the analysis of descriptions related to tests, prototypes, applications and operational contexts eventually mentioned in the patent documentation;
- Classification of the level of technological readiness (TRL) of the protected technology, using as reference conceptual frameworks adopted by defense agencies, which define nine progressive levels of technological maturity, from the observation of basic principles to the validation of the system in an operational environment; e

- Evaluation of the potential for dual employment and the insertion of technology in the context of the BID, considering both military and civilian applications, as well as its implications for business models, technology transfer and productive sustainability.

It is recognized, as a limitation of the study, the exclusive use of information in the public domain, without access to sensitive operational data or confidential details of contracts, tests and certification processes. This restriction imposes interpretative caution both in the attribution of the TRL and in the inference of future trajectories of development, economic exploitation and institutional insertion of the patent.

4 PATENT ANALYSIS

4.1 IDENTIFICATION AND CONTEXTUALIZATION OF THE PATENT

The object of study is the patent of MU BR 202014017157-1, entitled modification of a gas-fired pistol for use in shooting simulators, deposited and made available in public databases of the BPTO.

The patent was filed with the aim of adapting gas-fired pistols for safe use in shooting simulators, while maintaining functional characteristics of the firing cycle and increasing compatibility with training platforms.

4.2 TECHNICAL CHARACTERIZATION OF THE SOLUTION

The utility model patent MU BR 202014017157-1 consists of a functional modification of the gas actuation mechanism of a pistol, without changing the basic principle of the weapon's operation.

The technical solution focuses on the reorganization of the internal elements of the drive and loading assembly, allowing:

- Faithful reproduction of the firing cycle in simulation environments;
- Integration with controlled training systems;
- Operational safety, avoiding the use of live ammunition; e
- Compatibility with civilian and military contexts (*dual-use*).

The analysis of the independent claim shows that the essential elements are the gas actuation assembly and its interaction with moving components, whose new arrangement allows clear functional gains compared to conventional guns, such as operational stability, safety and integration into simulators.

4.3 STATE OF THE ART AND FUNCTIONAL GAINS

It is an incremental innovation based on functional improvement, as can be seen in the comparison with the **state of the art** that shows:

Table 1

General data of the MU

Aspect	State of the art	Patent MU BR 202014017157-1
Operation	Conventional mechanical cycle	Simulated cycle, adapted for training
Simulator integration	Limited	Expanded compatibility with simulation platforms
Security	Restricted use	Reducing risks in a training environment
Functional gains	None specific to simulation	Stability, cycle fidelity, and security

Source: authors (2026).

The analysis shows incremental innovation typical of utility models, based on functional improvement and rearrangement of existing components (BARROS, 2025).

4.4 EVIDENCE OF TECHNOLOGY MATURITY (TRL)

Based on the public patent documentation, it is possible to infer approximate levels of TRL, considering descriptions of prototypes, tests, and potential applications (NASA, 2013):

Table 2

MU TRL

Evidence	Estimated level	Justification
Theoretical description and change report	TRL 2–3	Observation of principles and detailed design of the utility model
Prototype indication and laboratory tests of gas drive	TRL 4	Benchmark prototype, verified operation under controlled conditions
Possibility of integration with simulators	TRL 5–6	Testing in a semi-realistic context, validation of compatibility with training platforms
Effective operational use in military/civilian training	TRL 7–8	Potentially achievable stage, but not publicly confirmed

Source: authors (2026).

According to Contreras (2025), the documentation indicates that the MU technology is between TRL 4 and 6, validating compatibility in semi-realistic environments.

4.5 DUAL EMPLOYMENT POTENTIAL AND INSERTION IN THE BID

The technology has potential for dual use (SOUZA; PINHEIRO, 2021), and can serve:

- military applications in troop training and instruction in safe fire simulators; e

- civilian applications through shooting instructors, simulation in training academies and safety laboratories.

For Peixoto et al. (2025), from the point of view of the BID, the patent contributes to:

- increasing national capacities in training equipment;
- integration with technological autonomy policies;
- enabling incremental innovation and sustainability of production chains;
- possibility of licensing or technology transfer, respecting dual-use and security standards.

Thus, the feasibility of continuous investment in MU is justified by the speed of territorial protection, protecting tactical functional improvements, which guarantee sovereignty before gaining industrial scale (SUTHERSANEN, 2019).

5 DUAL EMPLOYMENT AND INSERTION IN THE BID

The patent of MU BR 202014017157-1, relating to the modification of a gas-fired pistol for use in shooting simulators, has a high potential for dual use, as it can simultaneously meet civilian and military demands (VERGUEIRO, 2023; HÄHNEL, 2025).

From a military perspective, the technology enables the training of security forces and units of the Armed Forces, through training systems, which faithfully reproduce the firing cycle, without the use of live ammunition, increasing the safety and efficiency of training (FEDARAVIČIUS, 2020).

Military technologies also contribute to the reduction of operational costs, as they allow continuous simulation exercises and tests in controlled environments, which favors the promotion of greater familiarization of users with tactical and operational procedures (STEVENS et al., 2025).

On the other hand, the civilian application of the technology is present in professional and recreational training contexts, such as sports shooting academies, training of private security instructors, and simulation in virtual or augmented reality (TORRES, 2019).

The versatility of the MU patent is evidenced and contributes to the constitution of strategic resources capable of synergistically generating, in different markets, a positive environment for expanding the user base and ensuring economic scalability without compromising the security or original purpose of the technology (VERGUEIRO, 2023).

Thus, the MU patent technology becomes an instrument of incremental innovation, which has the ability to enhance the transfer of knowledge between sectors and reinforce the logic of dual use in the Brazilian context (VELLA, 2025).

With regard to insertion in the BID, the technology protected by the patent in question can be strategically articulated in different dimensions (BID BRAZIL EXHIBITION), such as:

- integration into development programs and national certification, allowing strengthening the productive capacity of public and private companies, qualifying them for differentiated tax regimes, specific bids and R&D activities;
- articulation with universities and technological research centers, enabling the continuous improvement of the device, encouraging innovation and the formation of specialized human capital; e
- The technology meets the objectives of technological autonomy by reducing dependence on external solutions and fostering national competencies in safe, dual-use defense products.

Finally, the development and dissemination of this protected technology can generate positive effects on the competitiveness of the production chain, allowing licensing, partnerships and eventual export of training solutions, simultaneously contributing to the strengthening of the BID and to the consolidation of a national ecosystem of technological innovation oriented to defense (BARROS, 2025). However, it should be noted, in the case of exporting this technology, that not every national jurisdiction recognizes protection by utility model. Therefore, one should seek export to markets that admit protection by utility model and, strategically, claim protection by the Patent Cooperation Treatment (PCT) to guarantee exclusivity in these markets. The PCT admits the strategy of multiple deposits, which lowers the initial deposit costs and also allows time to be gained to select the markets, which will actually be confirmed at the beginning of the national phase. It should be noted that the national phase incurs other costs, being an expensive strategy for exploring international markets, which must be evaluated sparingly.

6 DISCUSSION

The results obtained in the analyses of patents, TRL, dual employment and insertion in the BID are compared with the literature on the economics of intellectual property and dual-use studies.

Patents function prominently both as essential mechanisms for the appropriation of value and as fundamental vectors for the global dissemination of technical knowledge (OECD, 2025).

Historically, the patent regime has evolved from a strictly national logic, linked to nineteenth-century industrialization, to a global architecture regulated by instruments such as the TRIPS Agreement. This transition has intensified the flow of technical information and the

management of exclusive rights in sensitive sectors such as defence and security (OECD, 2025).

In this scenario, the patent of MU BR 202014017157-1 emerges as a strategic asset of the Brazilian BID, as its publication in open databases is part of the global technical collection, while its classification as MU offers specific territorial protection, distinguishing it from the industrial property regimes of countries that do not adopt this modality (SUTHERSANEN, 2019).

The convergence between the MU patent and the technological maturity levels shows that this type of protection is the most suitable for incremental innovations in intermediate maturity stages, usually between TRL levels 4 and 6 (CONTRERAS, 2025).

At this level, the strategic priority shifts from radical scientific discovery to the consolidation of functional improvements in components or subsystems. Such assets are essential for the integration of complex defense systems or to provide critical civilian applications, ensuring the necessary robustness before gaining industrial scale (NASA, 2013).

Unlike invention patents, which often aim to protect disruptive innovations in early stages of development, low TRL, the MU is located at points in the technological trajectory closer to practical application and the market (JEE; HÖTTE, 2024).

In the context of dual-employment technologies, this feature is crucial, as it facilitates licensing and controlled diffusion strategies, allowing the BID to exploit economic synergies between the civilian and military sectors, optimizing the return on investment in RD&I (NASA, 2013; OECD, 2025).

This finding reinforces the need to incorporate the MU as a central analytical category in studies on defense innovation policies. Although the topic is still little explored in the national literature, it is fundamental for countries that seek to consolidate technological capabilities through an incremental mission-oriented trajectory, in which the continuous improvement of components and processes ensures both sovereignty and industrial competitiveness (MAZZUCATO, 2018).

Considering the economics of intellectual property and the historical context of protection regimes, it is possible to outline three evolution scenarios for patent BR 202014017157-1, each with its strategic advantages and disadvantages (OECD, 2025).

Based on the economics of intellectual property and the history of protection regimes, it is possible to outline three evolution scenarios for patent BR 202014017157-1, each with strategic advantages and disadvantages, as summarized in Table 3 (OECD, 2025).

Table 3*Scenarios analysed*

Scenario	Features	Strategic advantages	Disadvantages or risks
Patent Restriction	Exclusive use and limited licensing to BID companies in Brazil; Focus on Military Applications and Technology Control	Greater security of sensitive know-how, strengthening of national autonomy, and close alignment with defence policies	Less exploitation of civil markets, limited licensing revenues, risk of underutilization of innovative capacity, inefficient in open innovation environments
Partial Patent Opening	Expanded licensing for civilian markets and select international partners, promotion of collaborative R&D and new derivative patents	Increased licensing revenues, gain in productive scale; Accelerating the innovation cycle, strengthening the patent technology family	Risks of diffusion of sensitive knowledge, need for strict export controls, reliance on sophisticated contractual and regulatory frameworks
Hybrid Model	Combines patent protection with industrial secrecy and conditional technology transfer agreements, selective cooperation with companies and R&D institutions	Greater strategic flexibility, creation of innovation ecosystems, better alignment between security, competitiveness and technological diplomacy	Complexity of contractual governance, need for advanced institutional capacities, and risk of power asymmetry in international negotiations

Source: authors (2026).

These international and national results allow us to qualify the interpretation of the three scenarios of patent evolution. There is evidence that mixed and dual-use patents occupy a central position in the knowledge flows between the civil and military domains, in addition to reinforcing the adoption of a partial or hybrid openness scenario, which tends to generate a higher density of technological spillovers and derived patents, as long as it is accompanied by adequate governance and control regimes (ACOSTA et al., 2018; CAVIGGIOLI et al., 2023; VELLA, 2025).

At the same time, the comparative experience of technology transfers in defense shows that this openness is sensitive to asymmetries of power and institutional capacities. In the Brazilian context, this recommends prudence and a careful design of contracts and institutional arrangements in the choice between the three scenarios proposed for patent BR 202014017157-1 (SILVA; COSTA, 2021; SEZAL; GIUMELLI, 2022; VERGUEIRO, 2023).

7 CONCLUSIONS AND RECOMMENDATIONS

The analysis of patent BR 202014017157-1 confirms that the Utility Model (MU) is an underexplored instrument, but vital for strengthening the Defense Industrial Base (BID). It is concluded that the technology, located in intermediate levels of readiness (TRL 4 to 6), exemplifies mission-oriented incrementalism, where the focus is on the consolidation of functional improvements and immediate practical application. In this sense, it is pointed out

that the strategic use of intellectual property, in the contemporary context, should indicate that protection in the specific case should seek:

- a. National Security Protection Patent – when the object is strategic for the Defense Sector (Art 75 of the IP Law).
- b. Industrial Secret – when the tacitness of local knowledge is greater than the advantage of disclosure via patent.
- c. MU patent – when for *dual-use* innovations, the goal is to achieve commercial scale.

Unlike invention patents, which protect disruptive technologies, that is, the protection of radical innovations, the MU aims to protect incremental innovations, whose applicability is directed to niche markets, whose overflow of *dual-use technologies* is accepted and generates returns. Thus, the BID modernization cycle with an incremental focus aims at the dissemination of dual use in the market and, in the case of protection by utility model, implies lower costs, reduced examination times and focus on the operability of equipment, therefore, functional improvement obtained by the shape of existing objects. In the present case study, the dual employment nature of the asset is evident, integrating demands for secure military training with civilian instruction and simulation markets, which ensures economic scalability and productive sustainability.

To maximize the impact of this asset and future innovations at BID, the following recommendations are proposed:

- Improvement of Institutional Governance: It is imperative to strengthen the capabilities of the Ministry of Defense. It is recommended to adopt regimes that monitor confidentiality and benefit-sharing clauses, especially in international cooperation models, to mitigate risks of power asymmetry.

- Adoption of Hybrid Management Models: Given the porosity between the civil and military domains, it is recommended to prioritize partial or hybrid opening scenarios. These models allow the generation of technological spillovers and *the creation of derived patent families, ensuring that knowledge circulates without compromising sensitive industrial secrets*.

- promotion of the Triple Helix: The MU should be inserted in collaborative networks involving university, company and government. This articulation is capable of transforming dual-use projects into vectors of productive diversification, reducing external dependence by privileging a trajectory of technological learning in the promotion of the generation of national skills in critical areas.

- alignment with Defense Policies: The strategic use of IP must be integrated with the National Policy of the Defense Industrial Base (PNBID) and PComTIC. The goal should be

to convert incremental innovations into assets that ensure technological autonomy and industrial competitiveness in the long term.

In short, the transition from a restrictive "war economy" logic to models of strategic collaboration is essential for Brazilian sovereignty. The planned management of the dual potential of the studied patent serves as a paradigm for the consolidation of a resilient national innovation ecosystem, thus, the success of BID requires that Brazil is not an exporter of raw materials, but captures value via IP to avoid the obsolescence of our technologies and military doctrine. In addition, the spillover of dual technology to the market for companies in the defense industrial base implies less dependence on government resources and, simultaneously, generates greater domestic economic dynamism.

ABSTRACT

This article presents a sociotechnical analysis of water losses in distribution systems, investigating the correlation between structural inefficiencies and social inequalities. The study draws on data from SINISA (2023) and the Brazilian Institute of Geography and Statistics (IBGE) Demographic Census (2022) to outline a framework ranging from the national scale to a case study in the State of Rio de Janeiro. The results indicate that Brazil loses approximately 40% of the potable water produced, with the State of Rio de Janeiro exhibiting loss rates exceeding 50%, the worst performance in the Southeast region. Spatial analysis revealed a strong correlation between low-income areas, such as the Baixada Fluminense, and high levels of both physical and non-revenue water losses, in contrast to high-income areas such as Niterói, which demonstrate greater operational efficiency. It is concluded that inadequate infrastructure is not merely a technical issue, but rather a component of water injustice that perpetuates historical exclusions and hinders the achievement of the Sustainable Development Goals (SDGs) 6, 10, and 11.

Keywords: Water Losses. Water Justice. Basic Sanitation. Distribution Networks. Rio de Janeiro.

RESUMO

Este artigo apresenta uma análise sociotécnica das perdas de água na distribuição, investigando a correlação entre ineficiências estruturais e desigualdades sociais. O estudo utiliza dados do SINISA (2023) e do Censo Demográfico do IBGE (2022) para traçar um panorama que vai da escala nacional a um estudo de caso no Estado do Rio de Janeiro. Os resultados demonstram que o Brasil perde cerca de 40% da água potável produzida,

com o Rio de Janeiro apresentando índices superiores a 50%, o pior desempenho da região Sudeste. A análise espacial revelou uma forte correlação entre áreas de baixa renda, como a Baixada Fluminense, e altos índices de perdas físicas e de faturamento, contrastando com áreas de alta renda, como Niterói, que possuem maior eficiência. Conclui-se que a infraestrutura precária não é apenas um problema técnico, mas compõe o panorama de injustiça hídrica que perpetua exclusões históricas e dificulta o cumprimento dos Objetivos de Desenvolvimento Sustentável (ODS) 6, 10 e 11.

RESUMEN

Este artículo presenta un análisis sociotécnico de las pérdidas de agua en los sistemas de distribución, investigando la correlación entre las ineficiencias estructurales y las desigualdades sociales. El estudio se basa en datos del SINISA (2023) y del Censo Demográfico del Instituto Brasileño de Geografía y Estadística (IBGE) (2022) para delinear un marco que abarca desde la escala nacional hasta un estudio de caso en el estado de Río de Janeiro. Los resultados indican que Brasil pierde aproximadamente el 40% del agua potable producida, y que el estado de Río de Janeiro presenta tasas de pérdida superiores al 50%, el peor desempeño de la región Sudeste. El análisis espacial reveló una fuerte correlación entre las zonas de bajos ingresos, como la Baixada Fluminense, y los altos niveles de pérdidas de agua, tanto físicas como no contabilizadas, en contraste con las zonas de altos ingresos como Niterói, que demuestra una mayor eficiencia operativa. Se concluye que la infraestructura inadecuada no es un mero problema técnico, sino un componente de la injusticia hídrica que perpetúa exclusiones históricas y obstaculiza el logro de los Objetivos de Desarrollo Sostenible (ODS) 6, 10 y 11.

Palabras clave: Pérdidas de Agua. Justicia Hídrica. Saneamiento Básico. Redes de Distribución. Río de Janeiro.

1 INTRODUCTION

Brazil loses about 40% of the drinking water produced and distributed for consumption annually (Trata Brasil, 2024), which shows a critical scenario in the management of water resources. This statistic makes explicit one of the greatest structural inefficiencies among developing countries and directly compromises the fulfillment of Sustainable Development Goal 6 (SDG 6), which seeks to ensure the availability and sustainable management of water and basic sanitation for all (UN, 2015).

According to the International Water Association (IWA, 2022), the high rate of non-revenue water, known by the term Non-Revenue Water, generates impacts that go beyond financial loss. The structural flaw translates into intermittent supply and high tariffs that disproportionately penalize the poorest, since the operating costs of losses are often passed on to the final consumer (Trata Brasil, 2024), while the precariousness of supply is concentrated in lower-income areas (Britto et al., 2011). This dynamic deepens social disparities, contradicting SDG 10, which focuses on reducing inequalities within countries, in addition to making it difficult to maintain resilient urban infrastructure, which directly hurts the premises of SDG 11, whose objective is to make cities and local communities inclusive and sustainable.

The precariousness of distribution networks, especially in peripheral urban areas, reflects social and racial inequalities rooted in the country's historical formation (Santos et al., 2021; Mota et al., 2021). This socio-technical dimension of supply shows that the problems of water loss and lack are not merely technical, but cross issues of equity, public management and the human right to water.

In the State of Rio de Janeiro, municipalities such as São Gonçalo and Duque de Caxias illustrate this phenomenon well. Despite having formal network coverage above 80%, they suffer from low per capita consumption rates and high loss rates (IBGE, 2022; SINISA, 2024). This contradiction suggests that the problem lies in the degraded infrastructure, associated with social vulnerability and the absence of redistributive policies.

Given this scenario, this article analyzes water losses from a social justice perspective. The objective is to investigate the correlation between structural deficiencies that cause physical losses and social inequalities in the territory. To this end, the research adopts a scale approach, starting with a macroscopic analysis of national data and funneling to a regional cut in the State of Rio de Janeiro. It is proposed here that the technical project transcends its specific function and shows itself as a strategic tool for the promotion of water justice and, concomitantly, for the advancement of the Sustainable Development Goals.

2 THEORETICAL FOUNDATION

2.1 WATER LOSSES: DEFINITIONS, TYPOLOGIES AND INDICATORS

The efficiency of supply systems is commonly measured by the Non-Revenue Water (NRW) index. For the purposes of national standardization and regulation, this article adopts the nomenclature established by the National Sanitation Information System, SINISA. The water goes through different processes from the moment of its capture until it reaches the final consumer, so the schematization of this movement, known as Water Balance, helps to identify problems along the network. This balance divides the volume of water made available into authorized consumption and unauthorized consumption, the latter being our research focus, as it corresponds to what we call losses, which also covers two subcategories.

The first subcategory of unauthorised consumption refers to apparent losses, technically referred to as commercial losses. These correspond to the volume of water that, although effectively consumed, is not billed by the service provider due to factors such as water meter failure, registration errors or irregularities in the network, impacting the financial sustainability of the system without necessarily representing waste of the natural resource.

On the other hand, the second category is composed of real losses, or physical losses. Unlike the apparent ones, these represent the volume of treated water that is extracted from the system before reaching the final consumer, resulting from infrastructure failures, such as leaks in pipelines, overflows in reservoirs and pipe ruptures. The control of these losses requires a rigorous technical approach, since high indicators of real losses suggest obsolescence of the infrastructure, while high apparent losses point to inefficiencies in commercial management. In the Brazilian scenario, where the average distribution loss exceeds 37% (SINISA, 2024), it is imperative to analyze these two typologies not only as operational failures, but as symptoms of network engineering that needs a strategic review.

2.2 THE MATERIALITY OF THE NETWORK

The incidence of real losses is directly linked to design decisions and the quality of the materials used at the time of network construction, usually associated with unbridled urban expansion. The choice between different classes of materials, such as PVC or cast iron, and the definition of pressure classes, influence the durability and resilience of the system (Bezerra; Macêdo, 2018).

In the specific context of the State of Rio de Janeiro, a spatial phenomenon related

to the historical occupation of the territory is observed. The oldest networks, dating from the nineteenth and early twentieth centuries, are concentrated where the settlement was consolidated, such as the Center and the South Zone of the capital (Koifman, 2013). However, despite their advanced age, these systems have historically had project revisits and preventive maintenance that other regions do not receive. On the other hand, the expansion of the network to the Baixada Fluminense and the West Zone occurred late and unevenly, consolidating a pattern of center-periphery segregation in infrastructure (Britto; Quintsler, 2017), often characterized by technical improvisations to meet a repressed demand without proper hydraulic planning (Marques, 2018).

In peripheral regions, the critical factor goes beyond the age of the pipe, but the operational regime to which it is subjected. The intermittency in the supply generates water hammers, a phenomenon caused by a sudden change in the flow of water, which subjects the network to cycles of pressure loading and unloading, damaging the system, and is even capable of causing the rupture of the pipes and their accessories. According to Tsutiya (2006), this oscillation accelerates the fatigue of the materials, causing frequent ruptures even in pipes that are not necessarily old. That said, it is observed that the project engineering in these locations faces a double challenge: the precariousness of the original installation and the operational stress caused by the lack of water itself.

2.3 WATER JUSTICE AND THE SOCIO-TECHNICAL DIMENSION

The concept of water justice arises from the expansion of environmental justice, recognizing that the impacts of lack of water or precarious access fall disproportionately on the poorest, blackest, and peripheral groups (Fracalanza, 2015; Tonel et al., 2021). The human right to water, recognized by the UN, is continuously violated not by natural scarcity, but by institutional inefficiencies and inequality of investments (Roth et al., 2018).

In Brazil, water injustice is aggravated by uneven urbanization. Supply networks are concentrated in central and higher-income areas, while peripheries and informal communities face chronic shortages and low quality of services (Fracalanza, et al, 2022). Authors such as Santos, et al. (2021) and Mota, et al. (2021) argue that inequality in access reflects power relations and racial and economic hierarchies. In addition, Gouveia, et al (2023) created the term "hydroracial scarcity" to describe how unequal access to water in metropolitan eastern Rio de Janeiro reflects historical inequalities based on race and class. Thus, water infrastructure becomes an instrument of social domination, where engineering, instead of promoting equity, reproduces historical exclusions.

The context of vulnerability is aggravated by the way in which loss management is

carried out. To compensate for the rates of physical losses, many operators increase the pressure at times of lower consumption or carry out selective rationing, penalizing the network peaks, precisely where the most vulnerable populations live (Britto et al., 2011). Thus, the struggle for loss reduction transcends the technical goal; It is a necessary condition for the guarantee of human rights and for the correction of historical injustices in the urban fabric.

2.4 AGENDA 2023: ENGINEERING AND SOCIAL EQUITY

Overcoming the scenario of hydro-racial scarcity and infrastructural precariousness dialogues directly with the 2030 Agenda of the United Nations. Although water resources engineering is traditionally associated with goals in the operational sphere, it plays a key role in meeting the Sustainable Development Goals (SDGs).

SDG 6, referring to Drinking Water and Sanitation, establishes in its goal 6.1, the universalization of equitable access. However, it is in goal 6.4 that network engineering comes into the spotlight, as it requires a substantial increase in efficiency in the use of water. In the context of Brazil, reducing physical losses is not limited to a measure of saving resources or the supply of treated water, but is the only solution to ensure the water availability necessary to universalize access and quality monitoring in the peripheries (UN, 2015).

At the same time, loss management is intrinsically linked to SDG 10, which refers to the reduction of inequalities. As previously discussed, the inefficiency of the systems disproportionately penalizes peripheral populations, either by high tariffs or by intermittency in supply. In this way, investments focused on the modernization of networks in low-income areas act as redistributive policies, in line with goal 10.2, which aims to empower and promote the social and economic inclusion of all citizens.

In addition, resilience in the infrastructure of distribution networks is central to SDG 11, which deals with the creation of sustainable cities and communities. Target 11.5 seeks to reduce the number of people affected by disasters and economic vulnerability. Fragile distribution networks, subject to constant disruptions and unable to provide adequate pressure for supply, compromise health security within the state. Thus, the replacement of obsolete and low-quality materials, together with the technological control of pressures, transcend technique, characterizing themselves as fundamental requirements for the construction of inclusive and resilient cities.

3 METHODOLOGY

3.1 DELIMITATION OF RESEARCH AND DATA SOURCES

The present study was based on the analysis of secondary data from the report of the National Basic Sanitation Information System (SINISA), referring to the "Technical Water Management" module with base year 2023, published in 2024. The time frame chosen is justified by the fact that it is the most recent data set available at the time of the research. In addition, this database has national coverage and standardized collection forms, as detailed in the Glossary of Information - Water Supply (SINISA, 2024), facilitating the observation of how the indicators behave throughout the national territory.

In addition, for the socioeconomic characterization of Brazil and the State of Rio de Janeiro, information was extracted from the Brazilian Institute of Geography and Statistics (IBGE), through the IBGE Automatic Recovery System (SIDRA), focusing on the most recent Demographic Census, referring to 2022. The option for the Census is due to its universal coverage and availability of data at the municipal level, which is the smallest unit of analysis of the survey.

3.2 ANALYSIS STRATEGY AND SPATIAL SCALES

The data analysis was structured under a multiscale approach, starting from the macroscopic dimension to a regional approach. On the macro scale, the national panorama was used, with the analysis of the overall efficiency of the Brazilian federative units, using choropleth maps to identify patterns of inequality in the performance of the indicators. On the micro scale, a regional case study was carried out with a focus on the State of Rio de Janeiro, where the technique of comparative cartography was adopted, confronting the spatial distribution of water losses with indicators of social vulnerability.

3.3 SELECTION OF INDICATORS

To diagnose the efficiency of the distribution systems, four main indicators were selected from the "Water Indices (AGI)" group of SINISA, following technical criteria to demonstrate the dimensions of apparent losses and actual losses, as shown in Table 1.

Table 1

Selected Water Loss Indicators

Indicator Code	Indicator Name	Type of Loss	Unit
IAG2012	Water billing losses	Apparent (Commercial)	%
IAG2013	Total water losses in	Total (Actual +	%

	distribution	Apparent)	
IAG2014	Total linear losses	Intensity of loss	m ³ /km/day
IAG2015	Total water losses per connection	Intensity of loss	l/link/day

Source: SINISA (2024).

Although all indicators were considered in the exploratory phase of the data, the visualization strategy prioritized those with greater adherence to the sociotechnical hypotheses of the study. To introduce the national panorama and the case study, the indicator of total water losses in distribution (IAG2013) was adopted. The choice of this percentage indicator is justified by its ability to summarize the overall efficiency of the Brazilian water distribution system, facilitating the initial comparison between the federative units and municipalities of Rio de Janeiro.

For the technical analysis of the infrastructure in the State of Rio de Janeiro, it was decided to use two indicators, the linear total losses (IAG2014) and the total water losses per connection (IAG2015). These indices are able to bring a more robust metric to diagnose the physical state of the network and the level of operational stress, since they quantify the intensity of the loss.

Finally, a final analysis of economic correlation was made using the specific indicator of losses in water billing (IAG2012). This variable was selected for its sensitivity to commercial loss and delinquency, helping to test the hypothesis that the difficulty in invoicing is spatially correlated to regions with lower purchasing power.

For the socioeconomic analysis, we opted for the use of the median monthly household income per capita (2022 Census). The choice of the median to the detriment of the mean is justified by the history of great inequality in the state chosen for analysis. The use of the average would cause distortion due to the extreme values centralized in some regions, so the median offers a more robust representation of the economic vulnerability of the typical citizen of each municipality.

3.4 DATA PROCESSING AND PROCESSING

The data were processed and analyzed using geoprocessing techniques in the Geographic Information System software QGIS (version 3.40.11). The first stage consisted of the integration of the databases. The cartographic databases, obtained from the IBGE itself, were joined to the tabular data from SINISA and the Demographic Census. To ensure the correct association of the information, this junction was performed using two primary keys, according to the level of aggregation of the analysis: the municipal code (7-digit

IBGE), for the analyses at the municipal level, and the code of the federation unit (IBGE of 2 digits), for the analyses and comparisons at the state level.

For the spatial analysis, thematic maps of the choropleth type were generated, which allow the visualization of the geographic distribution of each variable of interest. This technique was chosen because it favors the visual identification of patterns and hotspots by associating specific ranges of indicator values to a color scale (Archer; Bliss, 2010; Martinelli, 2014). The investigation was carried out at two levels: at the national level, for all Brazilian states, and at the regional level, with a detailed focus on the municipalities of the State of Rio de Janeiro.

4 RESULTS AND DISCUSSIONS

4.1 NATIONAL PANORAMA

The macroscopic analysis of the efficiency of water distribution in Brazil, based on the percentage indicator of total losses (IAG2013), reveals a worrying scenario for all regions of the country. As illustrated in Figure 1, only four states have total loss rates below 35%, namely Tocantins, Goiás (including the Federal District), São Paulo and Paraná. Meanwhile, the state with the most worrying data is Alagoas, which has a total loss rate of approximately 70%.

The State of Rio de Janeiro, in turn, stands out negatively in the context of the Southeast Region. While São Paulo is the state with the lowest rate of total losses, below 35%, Rio de Janeiro has rates above 50%. This data justifies the choice of the state as a case study: RJ represents an anomaly in the economically richest region of the country, indicating that the availability of financial and water resources does not guarantee efficiency in the management of this natural resource.

Figure 1

Spatial distribution of the index of total water losses in distribution (IAG2013) by Federation Units

Source: Authors' elaboration based on SINISA data (Reference year: 2023).

While the State of Rio de Janeiro is the federative unit with the worst score in the IAG2013 index of the Southeast Region, this loss is not uniform throughout the territory, which indicates that a study with pertinent results needs to consider the parametric variability throughout the municipalities that compose it.

Figure 2 presents the panorama of total losses in the state. Of the 92 municipalities that make up RJ, 20 have a loss rate calculated above 50%; Itaboraí and Guapimirim are the municipalities in the most critical situation, with rates of 85.6% and 87.98%, respectively. Itatiaia did not have the indicator calculated by the responsible entity, despite the data collection having been carried out in the municipality (SINISA, 2024).

Figure 3 presents, side by side, the distribution of losses per connection and the median monthly per capita income of the municipalities. The spatial overlap between infrastructure performance (Map A) and income (Map B) reveals some worrying patterns in the state's sanitary engineering.

Figure 3

Comparative analysis. (A) Loss Ratio per Connection (IAG2015) in L/lig./day; (B) Median monthly household income per capita (IBGE)

(A)

(B)

Source: Authors' elaboration based on data from SINISA (Reference year: 2023) and IBGE (2022 Census).

There is a concentration of municipalities in the Baixada Fluminense where the average household income per capita does not reach 60% of the minimum wage in force in the year of the 2022 Census (R\$ 1212.00). Municipalities with a high population density, such as Belford Roxo and Queimados, operate with a critical median income stagnant at R\$ 700.00. In these locations, physical losses reach levels of 691.58 l/call/day and 515.81 l/call/day, respectively. In Duque de Caxias and São Gonçalo, with median incomes of R\$ 800.00 and R\$ 909.00, the losses reach even more alarming levels, with 669.12 and 900.25 liters per day per connection point. These data indicate that where the population has less ability to pay, the waste of water for consumption wasted in the system itself is significant.

The detailed analysis reveals significant anomalies that go beyond the regional trend and show a lack of absolute operational efficiency in peripheral regions. The most extreme case was the municipality of São João da Barra, with a very worrying socio-technical distortion. With a median income of R\$ 733.33, SINISA records a loss of 1414.12 liters per connection/day, being the second largest waste of water in the state. This volume suggests an infrastructure with many disruptions, where the volume lost exceeds the volume consumed. A similar scenario occurs in Nilópolis and Guapimirim, with median incomes ranging between R\$ 860.00 and R\$ 1,000.00, the systems operate with losses of 1,245.63 and 1,119.77 liters per connection, respectively. Such volumes indicate that the network in these areas loses many resources, an amount more than ten times greater than the municipality with the lowest expenditure, São Sebastião do Alto, with its 69.57 liters lost per connection.

The complexity of the socio-technical scenario reaches its critical point in the direct comparison between the two main powers of the Metropolitan Region: Rio de Janeiro and Niterói. The capital, with a median income of R\$1,212.00, registers an alarming loss rate of 1,292.59 liters per connection/day, positioning itself among the worst performances in the

state. On the other hand, Niterói, the city with the highest median income in the sample, with R\$2000.00, has a much lower volume of losses, in the order of 361.63 liters per connection/day. This disparity between neighboring cities shows that political centrality and the size of the municipality do not guarantee efficiency. The technical abyss reveals that there is a tendency for water security in the state to be linked to the high concentration of income, however, the capital, despite its economic protagonism, faces an operational collapse comparable to or greater than that of the peripheral areas, possibly aggravated by the obsolescence of old networks and many ruptures along the distribution network.

It is noteworthy that the complementary analysis of the linear loss index (IAG2014) corroborated this diagnosis.

4.2 ECONOMIC CORRELATION AND COMMERCIAL MANAGEMENT

To approach the economic dimension independently, graph 1 presents a dispersion analysis, which crosses the revenue loss index (IAG2012) with the average municipal income.

Figure 4

Correlation between median monthly income per capita (X-axis) and revenue losses - IAG2012 (Y-axis)

Source: Authors' elaboration based on data from SINISA (Reference year: 2023) and IBGE (2022 Census).

The data show that the inability to convert the volume of water made available into revenue is not random, being territorially concentrated in areas where social vulnerability is intrinsic. The median per capita income was below the minimum wage in the reference year of the 2022 Census for 85 of the 92 municipalities that make up RJ. Meanwhile, the rate of losses in revenue was above 40% in 31 municipalities.

The most critical pattern is observed in the axis of the Baixada Fluminense and Leste Metropolitano. Municipalities such as Nilópolis, Belford Roxo and Duque de Caxias have revenue loss rates of 84.07%, 65.20% and 56.61%, respectively. These indices indicate that, in these locations, the provision of the service occurs in a context of technical and commercial informality.

There are significant anomalies in the interior of the state, which suggests administrative inefficiency in small systems as well. Municipalities such as Cordeiro and Saquarema record revenue losses of more than 90% (98.75% and 94.31%, respectively), which points to charging models disconnected from the actual volume consumed and penalizes the financial sustainability of sanitation.

Finally, 8 municipalities presented negative percentages in the IAG2012 index, indicating the possibility that the volume of water billed is higher than that produced. There is a scenario of authorized consumption in which some service providers do not bill the entire volume consumed, as in the case of water trucks, for example. Negative values may also be influenced by the existence of a minimum tariff base or errors in the voluntary completion of data by concessionaires (SINISA, 2023).

4.3 SUMMARY: RELATIONSHIP WITH THE 2030 AGENDA

The integrated analysis of the indicators used reveals that the current engineering of water distribution networks in Rio de Janeiro operates out of step with the 2030 Agenda. The existence of a high correlation between physical losses and low-income areas (Figure 3) shows the non-compliance with SDG 6, since inefficiency prevents real universal access to treated water (UN, 2015). Together, the selective degradation of infrastructure in peripheries perpetuates the territorial inequality combated by SDG 10, while the lack of quality of systems in the face of intermittent supply compromises the urban resilience recommended by SDG 11. The data indicate, therefore, that water insecurity in these locations is connected with design and management decisions that reproduce patterns of exclusion.

5 CONCLUSION

The sociotechnical analysis of the water distribution networks in the State of Rio de Janeiro allowed to show that infrastructural inefficiency does not occur randomly, but reflects patterns of socio-spatial segregation as a material reflection of historical patterns. The study demonstrated a direct correlation between municipalities with lower economic capacity and greater social vulnerability, such as those in the Baixada Fluminense. In these places, the obsolescence of the infrastructure and the operational stress of the networks result in alarming rates of physical losses of the natural resource, applying a disproportionate impact to the population.

The disparity observed between the capital and the neighboring city with the highest per capita income, Niterói, reinforces that the availability of financial resources and political centrality influence the quality of sanitary engineering. The same municipality may present considerable anomalies in the per capita income of the population and, concomitantly, in the year of implementation of its water distribution network. In this context, it is essential to prioritize a management capable of solving historical deficiencies in the pipes, allowing access to drinking water for the entire population, without power relations being the determining factor.

It is concluded that the reduction of water losses transcends the technical challenge of maintenance, it constitutes an urgent measure of social justice and equity. To achieve the Sustainable Development Goals of the 2030 Agenda (SDGs 6, 10 and 11), it is imperative that public policies and engineering projects prioritize the modernization of networks in peripheral territories, transforming infrastructure into an instrument of inclusion and non-

perpetuation of existing hydro-social inequalities. As a limitation, this study was based on voluntary data delivered by the concessionaires to SINISA, which may imply omission of information in certain locations. It is suggested to revisit the data through field measurements in critical areas to validate the impact of intermittent distribution in peripheral pipes, subsidizing public sanitation policies that prioritize technical equity.

ABSTRACT

This article takes as its starting point the hypothesis that unconscious habits function as “invisible gears” that sustain the construction of human personality, insofar as, throughout life, recurrent ways of thinking, feeling, and acting are established that escape conscious awareness and end up being confused with a simple “way of being.” In this trajectory, it seeks to bring together the tradition of classical psychoanalysis and contemporary research on habits and self-regulation, showing how these repeated patterns arise from unconscious formations derived from repressed desires, internal conflicts, defense mechanisms, and implicit learning, until they are consolidated into relatively stable traits of character that guide choices, affective bonds, and forms of presence in the world. Drawing on the contributions of Freud, Lacan, Jung, and Klein, it discusses the constitution of the psychic apparatus, the mechanisms of defense, the logic of repetition, and the central place of desire, relating these formulations to contemporary authors such as Clear and Brewer, who conceive habits as reward circuits, automatic routines, and devices for identity construction, which makes it possible to bring psychoanalytic vocabulary closer to findings from cognitive psychology, neuroscience, and habit science, culminating in the proposal of the metaphor of invisible gears to understand unconscious habits as an axis articulating subjective experience, symbolic structures, and everyday practices, with important clinical and ethical implications for processes of personality change and the reorganization of ways of life.

Keywords: Unconscious Habits. Personality. Psychoanalysis. Desire. Language. Contemporary Habits.

RESUMO

Este artigo toma como ponto de partida a hipótese de que os hábitos inconscientes funcionam como “engrenagens invisíveis” que sustentam a construção da personalidade humana, na medida em que, ao longo da vida, se estabelecem modos recorrentes de pensar, sentir e agir que escapam à consciência e acabam sendo confundidos com um simples “jeito de ser”. Procura-se, nesse percurso, articular a tradição da psicanálise clássica com pesquisas contemporâneas sobre hábitos e autorregulação, mostrando como esses padrões repetidos nascem de formações do inconsciente, derivadas de desejos recalçados, conflitos

¹ Master's Degree in Constitutional Law. Instituto de Direito Público (IDP).

internos, mecanismos de defesa e aprendizagens implícitas, até se consolidarem em traços relativamente estáveis de caráter, que orientam escolhas, vínculos afetivos e formas de presença no mundo. A partir das contribuições de Freud, Lacan, Jung e Klein, discutem-se a constituição do aparelho psíquico, os mecanismos de defesa, a lógica da repetição e o lugar central do desejo, relacionando essas formulações a autores atuais como Clear e Brewer, que concebem os hábitos como circuitos de recompensa, rotinas automáticas e dispositivos de construção de identidade, o que possibilita aproximar o vocabulário psicanalítico dos achados da psicologia cognitiva, da neurociência e da ciência dos hábitos, culminando na proposta da metáfora das engrenagens invisíveis para compreender os hábitos inconscientes como eixo de articulação entre experiência subjetiva, estruturas simbólicas e práticas cotidianas, com importantes efeitos clínicos e éticos para os processos de mudança de personalidade e de reorganização dos modos de vida.

Palavras-chave: Hábitos Inconscientes. Personalidade. Psicanálise. Desejo. Linguagem. Hábitos Contemporâneos.

RESUMEN

Este artículo parte de la hipótesis de que los hábitos inconscientes funcionan como "engranajes invisibles" que sustentan la construcción de la personalidad humana, en la medida en que, a lo largo de la vida, se establecen formas recurrentes de pensar, sentir y actuar que escapan a la conciencia y terminan confundándose con una simple "forma de ser". En este proceso, se busca articular la tradición del psicoanálisis clásico con la investigación contemporánea sobre hábitos y autorregulación, mostrando cómo estos patrones repetidos surgen de formaciones inconscientes derivadas de deseos reprimidos, conflictos internos, mecanismos de defensa y aprendizaje implícito, hasta consolidarse en rasgos de carácter relativamente estables que guían las elecciones, los vínculos afectivos y las formas de presencia en el mundo. Basándose en las contribuciones de Freud, Lacan, Jung y Klein, este artículo analiza la constitución del aparato psíquico, los mecanismos de defensa, la lógica de la repetición y el papel central del deseo. Relaciona estas formulaciones con autores contemporáneos como Clear y Brewer, quienes conciben los hábitos como circuitos de recompensa, rutinas automáticas y mecanismos de construcción de la identidad. Este enfoque permite una conexión más estrecha entre el vocabulario psicoanalítico y los hallazgos de la psicología cognitiva, la neurociencia y la ciencia de los hábitos, culminando en la metáfora propuesta de los engranajes invisibles para comprender los hábitos inconscientes como eje articulador entre la experiencia subjetiva, las estructuras simbólicas y las prácticas cotidianas, con importantes implicaciones clínicas y éticas para los procesos de cambio de personalidad y la reorganización de los estilos de vida.

1 INTRODUCTION

The metaphor of invisible gears suggests that what moves the human personality is not always directly seen, because behind our daily gestures, affective choices, ways of speaking and occupying social spaces, unconscious habits operate that have been formed in successive layers of experience and defense, often since childhood, in such a way that the subject tends to confuse these crystallized patterns with a supposed essence of his "I", when, in fact, they are repeated responses to psychic conflicts and environmental demands that have been automated over time.

From another perspective, Jung emphasizes that personality is built in the tension between consciousness and the unconscious, which is populated by complexes and archetypal images that decisively influence the way the subject perceives and interprets reality, which leads to the formation of habits of perception, feeling and action that are repeated as relatively stable internal scripts.

By proposing that complexes are organized around intense affective nuclei, often associated with early experiences, the author opens the way to understand how certain situations trigger automatic responses of the subject, who always repeats the same type of reaction, even when he recognizes that the result is dysfunctional or painful. This repetition is not only an observable behavioral data, but translates the permanence of unconscious configurations that have not yet been integrated into the conscious personality, indicating that the invisible gears of psychic life continue to operate in defiance of the declared will. (JUNG, 1912)

Lacan, in turn, radicalizes the understanding of the unconscious by formulating it as structured as a language, which implies thinking that habits, far from being just mechanical routines, can be understood as modes of inscription and repetition of signifying chains that organize the subject's desire and relationship with the Other. From this perspective, personality is less a substance than an effect of positions assumed in the symbolic fabric of discourse, so that what manifests itself as a "way of being" corresponds to reiterated ways of responding to the demands and desires of the Other, through gestures, choices and styles of jouissance that are sedimented.

This article intends to articulate these contributions of psychoanalysis with contemporary studies on habits, exploring the hypothesis that unconscious habits function as invisible gears that, at the same time, stabilize the personality and limit its capacity for transformation, pointing to the importance of a clinical and critical reading of these repetitive patterns. (LACAN, 1964)

2 THEORETICAL FRAMEWORK

2.1 THE FORMATION OF PERSONALITY IN FREUDIAN PSYCHOANALYSIS

2.1.1 Structure of the psychic apparatus: id, ego and superego

In Freudian theory, the id is conceived as the most primitive drive reservoir, governed by the pleasure principle and the immediate search for satisfaction, which means that, from the beginning of life, impulses of desire tend to repeat themselves in search of relief from internal tensions, producing patterns of pleasure search that can become ingrained habits throughout development. This deep layer of psychic life is not guided by norms or by the logic of reality, but by experiences of satisfaction that leave marks, so that certain ways of obtaining pleasure or avoiding unpleasure can be automatically re-actualized in different contexts, without the subject recognizing the repetition of an old drive script. (FREUD, 1900)

Thus, the id provides the energetic raw material that, when meeting the demands of reality and culture, will be progressively organized into relatively stable ways of desiring and reacting, contributing to the constitution of personality traits that express these invisible gears of pleasure-seeking. (FREUD, 1900)

The ego, in turn, emerges as a mediating instance between the instinctual demands of the id, the interdictions and ideals of the superego and the conditions imposed by the external world, which puts it in the position of creating strategies to deal with recurrent conflicts and situations of tension, transforming momentary solutions into habitual modes of functioning. As the subject discovers that not every desire can be satisfied, the ego learns to postpone, displace, or transform instinctual demands, and this work of negotiation is consolidated into ways of dealing with frustration, guilt, and anxiety that tend to be repeated as personal styles. (FREUD, 1900)

In this way, what appears as a personality trait, such as a tendency to avoid conflicts or to put oneself in a position of control, can be understood as a relatively effective arrangement that the ego has found to manage internal and external contradictions, an arrangement that becomes a psychic and behavioral habit. (FREUD, 1900)

The superego represents the internalization of parental and social norms and prohibitions, functioning as an internal judge that watches, criticizes and punishes, which introduces into the personality a gear marked by ideals and demands that are often rigid, which manifest themselves in habits of severe self-evaluation and constant self-demand. (FREUD, 1900)

The formation of the superego implies that the subject incorporates the voice of the Other as an instance that observes and judges, and this voice tends to repeat phrases, mandates and prohibitions that turn into automatic thoughts and feelings of guilt that arise

almost instantaneously in certain situations, even if there is no clear rational reason. Thus, habits such as perfectionism, the need to please, or the tendency to sabotage opportunities for pleasure can be seen as lasting effects of a superego structured around hard-to-achieve ideals and a difficulty in tolerating one's fallibility. (FREUD, 1900)

The articulation between id, ego and superego allows us to understand the personality as a configuration in constant negotiation, in which psychic and behavioral habits are formed as compromises between desires, defenses and internalized norms, in such a way that each repetitive gesture bears the mark of a singular arrangement between these instances. (FREUD, 1900)

Instead of thinking of the subject as possessing a fixed essence, Freudian psychoanalysis shows that what we call "character" results from the sedimentation of compromise solutions that have shown themselves to be minimally functional in the history of that individual and, therefore, have been repeated until they become part of his way of being. This view allows us to reread habits not only as practical routines, but as formations of commitment that keep the invisible gears of psychic life in operation, stabilizing the subject and, at the same time, limiting the plasticity of his personality. (FREUD, 1900)

Thus, the structural model of the psychic apparatus offers an important key to understanding how the axis of the personality is constituted, because the way the ego organizes defenses, negotiates with the superego and channels the forces of the id tends to crystallize into regularities of response, which are perceived by others and by the subject himself as characteristic traits. (FREUD, 1900)

Over time, the individual begins to identify with these traits, saying of himself that he is "anxious", "controlling" or "disconnected", without realizing that such qualities result from dynamic arrangements between conflicting psychic instances, which have been reinforced by external contingencies and secondary gains. In this sense, the structure of the id, ego, and superego can be seen as a set of internal gears whose movements, largely unconscious, produce the appearance of a cohesive "I," while in reality it is an always precarious balance between desires, prohibitions, and adaptive resources. (FREUD, 1900)

2.1.2 Defense mechanisms and pattern repetition

Defense mechanisms are described by Freud as unconscious strategies of the ego to deal with impulses, feelings and ideas that cause anguish, which means that, in practice, they function as psychic habits of avoiding or transforming contents that threaten the cohesion of the self, being activated with such speed that the subject rarely perceives their operation. (FREUD, 1900)

Repression, for example, excludes from consciousness representations incompatible with the ideal of the self, but does not prevent them from returning disguised in symptoms, faulty acts and repetitive choices, through which the repressed insist on manifesting themselves. In this way, the same type of defense can be mobilized in different situations, producing stable patterns of reaction, such as the tendency to deny problems, to shift responsibility to the other or to rationalize intense affective experiences, which contributes to the formation of a personality that is organized around these habitual modes of protection against anguish. (FREUD, 1900)

Klein broadens the understanding of defense mechanisms by describing processes such as splitting, idealization and projective identification, which operate very early in the baby's relationship with his primary objects and create matrices for the subsequent organization of the personality, especially in the conditions that we now call personality disorders. (KLEIN, 1952)

When the subject tends to split objects into totally good or totally bad, and to project onto other impulses that he cannot bear to recognize in himself, he is repeating a defensive arrangement that crystallized in a period of extreme dependence, transforming itself into a relational habit. These mechanisms, when repeated throughout life, organize a characteristic way of bonding, in which the other is constantly placed in extreme positions, sometimes idealized, sometimes persecuted, which evidences the strength of the invisible gears constituted in the initial relationship with the caring figures. (KLEIN, 1952)

Jung, when working with the concept of complexes, shows that certain nuclei of experience highly charged with affect tend to become autonomous within the psyche, reacting almost automatically to stimuli that function as triggers, which explains why certain situations provoke disproportionate and repetitive responses. (JUNG, 1912)

Each complex, linked to a specific theme, such as rejection, abandonment or power, contains a set of memories, fantasies and emotions that are activated as a block, guiding perception and conduct in a habitual way, as if the subject were taken by a "way of being" that imposes itself in that context. In this sense, personality disorders can be understood as arrangements in which certain complexes dominate the psychic field, causing habits of feeling and acting linked to these nuclei to be repeated in a compulsive way, even to the detriment of the individual's well-being. (JUNG, 1912)

In the Lacanian reading, the repetition of patterns is not only a behavioral or defensive phenomenon, but reveals the insistence of a signifier that returns in the place of the repressed, marking the position of the subject in the symbolic chain that constitutes it, which

makes many apparently banal habits actually forms of inscription of a response to the desire of the Other. (LACAN, 1964)

The compulsion to repetition, therefore, is not limited to the idea that the subject repeats in order to master a traumatic situation, but indicates the very structure of his insertion in language, to the extent that certain scenes, phrases and gestures are resumed at different moments of life, as if the subject were always staging a text that he did not write, but in which he participates. This allows us to think of habits as effects of a significant logic, in which the position assumed in front of the Other is translated into repeated ways of speaking, desiring and suffering, which end up composing the texture of their personality. (LACAN, 1964)

In dialogue with these psychoanalytic conceptions, Brewer describes, based on neuroscientific evidence and his clinical experience, how the brain learns to associate certain behaviors with anxiety relief or small rewards, generating habit loops that are repeated even when the subject declares that he wants to act differently, which is particularly visible in cases of anxiety and dependence. (BREWER, 2021)

These loops involve an internal or external trigger, a routine, and a sense of reward that, when reinforced, creates a preferential path in the neural network, making it increasingly difficult to disrupt the pattern, which approximates the psychoanalytic idea of repetition compulsion. By understanding these circuits, it becomes possible to propose interventions that introduce curiosity and awareness into the moment of routine, opening the possibility of making habits more flexible that, until then, functioned as invisible gears conditioning the individual's field of choices. (BREWER, 2021)

2.2 HABITS AS FORMATIONS OF THE UNCONSCIOUS IN FREUD

When Freud analyzes dreams as disguised fulfillments of repressed desires, he describes mechanisms of condensation and displacement that reorganize the psychic material into apparently strange narratives, but endowed with their own logic, which allows a conceptual approximation between the work of the dream and the formation of unconscious habits. (FREUD, 1900)

Just as in the dream unacceptable contents are transformed into less threatening images, in everyday life desires and conflicts can be displaced into repetitive acts that function as avenues of expression and, at the same time, of masking the repressed. Certain habits, such as check-in rituals, small quirks or stereotyped ways of reacting, can then be read as substitutive formations that fulfill the function of keeping something of desire in circulation, without it reaching consciousness in its most direct form. (FREUD, 1900)

Freud also points out that many neurotic symptoms have the structure of a compromise between a desire that seeks expression and a defense that seeks to stop it, which makes them highly repetitive, to the extent that the underlying conflict remains unresolved and finds in the symptom a partial way out. The frequency with which the subject repeats certain behaviors or thoughts does not depend, therefore, on a conscious decision, but on the insistence of the repressed person who seeks ways of manifestation acceptable to the ego and the superego. (FREUD, 1900)

From this perspective, habits that seem only stubbornness or personality vices can be analyzed as solutions found by the psyche to give vent to impulses, affections and fantasies that do not find a place in conscious discourse, at the cost of imprisoning the personality in cycles of repetition. (FREUD, 1900)

Transference, a central concept in Freudian clinic, illustrates in a privileged way the habitual dimension of the formations of the unconscious, as the patient tends to repeat with the analyst patterns of attachment that originated in his childhood relationships, updating old scenes in a new context. Instead of simply remembering the past, the subject repeats it, treating the analyst as if he were a significant figure in his history, which reveals the strength of the invisible gears that organize his way of loving, trusting and defending himself. (FREUD, 1900)

Freud also observes that character can be understood as the result of the sedimentation of childhood experiences, fantasies and defenses, in such a way that certain qualities such as parsimony, obsessiveness or impulsiveness can be seen as forms of psychic organization that have stabilized around specific conflicts, such as those linked to the control of the sphincters, fraternal rivalry or the experience of castration. (FREUD, 1900)

What is socially perceived as a "personality trait" corresponds, therefore, to instinctual investment and defense habits that have proven useful at some point, having been reinforced by external and internal rewards. From this point of view, understanding the genesis of these traits means reconstituting the history of the choices and renunciations that configured the libidinal economy of the subject, bringing to light the unconscious gears that make him react in a predictable way in certain situations. (FREUD, 1900)

From the point of view of technique, psychoanalytic interpretation aims precisely to make conscious these formations of the unconscious that are expressed in dreams, faulty acts, symptoms and habits, allowing the subject to recognize, in his repetitive ways of acting and feeling, the mark of desires, fears and fantasies that until then operated in secret. (FREUD, 1900)

2.3 LACAN'S CONTRIBUTIONS: THE UNCONSCIOUS STRUCTURED AS LANGUAGE

2.3.1 Signifying chain, desire and "jouissance"

By stating that the unconscious is structured as a language, Lacan shifts the focus of psychoanalysis to the dimension of the signifier, emphasizing that the subject is, above all, an effect of the discourse of the Other, in such a way that his habits of thinking, feeling and acting are organized from signifying chains that precede him. (LACAN, 1964)

Instead of seeking a deep core of identity, this perspective seeks to locate the places that the subject occupies in the symbolic plot, places that are reiterated through utterances, gestures and choices that function as responses to an order of signification. Thus, habits can be seen as ways of tying jouissance to the signifier, minimally stabilizing the subject in a position that, although it causes suffering, offers a certain symbolic consistency. (LACAN, 1964)

Desire, in Lacan's reading, is not simply a need to be satisfied, but an effect of the structuring lack introduced by language, so that it never finds an object that fully fulfills it, which leads the subject to circulate around partial objects that sustain his desiring position. In this logic, habits can be understood as circuits by which the subject circumvents the lack, finding small satisfactions that, although they do not solve the fundamental void, offer a way of dealing with it. (LACAN, 1964)

The concept of "jouissance", often translated as jouissance, designates a form of satisfaction that overflows the principle of pleasure, approaching excess and pain, which helps to understand why the subject insists on habits that he knows are harmful, such as destructive relationships, compulsions or self-sabotage. (LACAN, 1964)

In these situations, it is not only a question of the search for pleasure, but of a way of placing oneself in relation to a type of jouissance that structures the subjective position, often linked to unconscious mandates, such as that of suffering to be loved or failing to remain faithful to an inherited image. Habits, in this sense, function as devices that ensure the continuity of this jouissance, even at the cost of great suffering, keeping invisible gears in operation that sustain the subject's identity. (LACAN, 1964)

Lacan also proposes that the symptom can be read as a text that the subject writes with his body and with his acts, a text that condenses a singular way of jouissance and of signifying his own history, which allows us to think of repetitive habits as part of this writing system. (LACAN, 1964)

When someone finds themselves repeating the same type of affective or professional choice, despite unsatisfactory results, they may be unknowingly enacting a meaning that has been inscribed in their history by the relationship with the desire of the Other, a meaning that

has condensed into a symptom that offers a kind of symbolic anchoring. By inviting the subject to speak and listen to what he says, analysis allows this text to be reread, and the habits that materialize it can be displaced or re-inscribed in another way. (LACAN, 1964)

From this perspective, the signifying chain functions as a set of gears that organizes the way the subject is situated in the world, in such a way that each habit can be seen as a point of fixation in a sequence of signifiers, around which desire and jouissance circulate. (LACAN, 1964)

Analytic work consists of introducing displacements in this chain, producing lapses, misunderstandings and new associations that open up the possibility of breaking the automatism of certain circuits of repetition. In doing so, analysis not only modifies behaviors, but touches the very structure of the personality, allowing the subject to find other ways of positioning himself in the face of lack and desire. (LACAN, 1964)

2.3.2 Habits as a response to the Other and the symbolic order

In Lacanian theory, the Other with a capital letter represents the place of language, law and social discourse, so that from the beginning the subject is summoned to respond to the expectations and meanings that surround him, which implies that his habits are also formed as responses to these addresses. (LACAN, 1964)

The way the child is named, looked at and interpreted by caregivers constitutes a symbolic field within which he learns to occupy certain places, adopting gestures, words and attitudes that are repeated as a way of guaranteeing recognition or avoiding rejection. These movements, initially linked to concrete situations, tend to generalize and become automated, composing a kind of habitual choreography that sustains the personality in the relationship with the Other. (LACAN, 1964)

The symbolic order, composed of shared norms, values and meanings, offers the subject a repertoire of possible positions, related to gender, class, profession and other social categories, so that many habits are, in fact, ways of embodying these prescribed places. (LACAN, 1964)

By reproducing discourses about what it means to be a man or a woman, successful or unsuccessful, normal or deviant, the individual adheres to practices, styles of consumption and ways of expressing emotions that reinforce their inclusion in certain groups, while limiting their uniqueness. Thus, personality can be understood as an arrangement between symbolic identifications and forms of jouissance that are stabilized in the repetition of habits that respond to this order. (LACAN, 1964)

Language habits, for example, are not reduced to conscious choices, but reflect the internalization of ways of speaking inherited from the family, the community and the media, which carry implicit values and rules of hierarchy, which makes apparently neutral expressions reveal positions in relation to the other and to oneself. (LACAN, 1964)

These discursive patterns, when repeated, sediment identities, such as that of the subject who always makes self-deprecating jokes or the one who assumes an imperative tone in any conversation, consolidating a personality style that seems spontaneous, but which, in fact, is the product of structured identifications and defenses. To this extent, the habits of speaking and listening are invisible cogs that organize the way of being with the other. (LACAN, 1964)

In the same way, bodily habits, such as posture, gestures and ways of occupying space, also respond to the symbolic order, expressing identifications and positions of power, submission or resistance, which indicates that personality is not only an intrapsychic phenomenon, but is configured at the interface between body, language and culture. (LACAN, 1964)

The child who learns to lower his gaze in front of authority figures or to exaggerate his performance to be noticed, for example, incorporates patterns that can remain throughout life as his "personal mark", even if they have been constituted as defensive strategies in the face of a specific scenario. Thus, the analysis of these bodily habits allows us to unveil the symbolic web that sustains them and opens paths for their transformation. (LACAN, 1964)

In the clinic inspired by Lacan, the possibility of personality change is not restricted to the replacement of bad habits with good ones, but concerns the reconfiguration of the subject's relationship with the Other and with the symbolic order, which implies displacing the signifiers that fixed him to certain positions and allowing the emergence of new arrangements of desire and jouissance. (LACAN, 1964)

When the subject realizes how his habits function as automatic responses to internalized mandates and expectations, he can find loopholes to refuse some of these impositions and invent more unique ways of living. In this way, the invisible gears that previously imprisoned him in a narrow identity can be rearranged, giving way to a more flexible personality that is less determined by repetition. (LACAN, 1964)

2.4 OTHER CONTEMPORARY AUTHORS AND DIALOGUES

2.4.1 Jung, Klein and personality disorders

Jung contributes decisively to the understanding of personality disorders by emphasizing the role of complexes, relatively autonomous psychic structures that are

organized around emotionally charged contents, capable of taking control of the conscious attitude whenever activated by associated situations. (JUNG, 1912)

In individuals with a personality more rigidly structured around certain complexes, very similar responses are observed in different contexts, as if the same "part" took charge, which is manifested in habits of thought, affection and behavior that are repeated, even when they generate damage. The difficulty in integrating these complexes into consciousness leads to a fragmentation of the personality, in which the subject oscillates between ways of being that he cannot reconcile, reinforcing patterns of repetition that function as invisible cogs of his disorders. (JUNG, 1912)

In the Jungian perspective, the process of individuation, understood as the path of becoming who one is in a fuller and more integrated way, comes up against the rigidity of certain unconscious habits that keep the subject tied to partial identities and old defenses, which no longer correspond to the current demands of life. (JUNG, 1912)

When the personality fixates on a narrow set of roles and attitudes, it refuses the possibility of dialogue with the unconscious and with the new, which favors the appearance of repetitive symptoms and conflicts. Analytic work, by favoring the encounter with symbolic images and narratives that expand the meaning of experience, can make these habits more flexible and allow the emergence of more complex and creative configurations of personality. (JUNG, 1912)

Klein, when studying early object relations, points out that the way the baby deals with the presence and absence of the breast, as well as with experiences of frustration and gratification, establishes fundamental psychic positions, such as the schizoid paranoid position and the depressive position, which directly influence the way the personality will be organized. (KLEIN, 1952)

In more severe personality disorders, there is often a predominance of defenses linked to splitting, idealization, and projection, which manifest themselves in relationship habits marked by extreme oscillations between adoration and devaluation of the other, accompanied by intense anxiety. These repetitive patterns indicate that the gears formed in the first experiences with the primary objects continue to operate, guiding the way the subject perceives and reacts to contemporary relationships. (KLEIN, 1952)

In addition, Klein introduces the notion of internal objects to refer to the unconscious representations of significant figures, loaded with ambivalent affects, which come to inhabit the subject's psychic world and influence his future bonds. When these internal objects are experienced as persecuting or demanding in an excessive way, the subject can develop

habits of self-punishment, chronic distrust or submission, which structure personality pictures with paranoid or depressive traits. (KLEIN, 1952)

Bandura, although inserted in another theoretical tradition, contributes to the understanding of personality disorders by demonstrating the role of social learning in the acquisition of behavior patterns, showing that individuals observe significant models and imitate their behaviors, especially when they are rewarded, which helps to explain how certain relational styles are perpetuated. (BANDURA, 1977)

In families in which aggressiveness, manipulation, or submission are frequently reinforced strategies, children tend to incorporate these patterns as natural ways of relating, transforming into habits that may later be recognized as characteristics of personality disorders. The theory of social learning, by emphasizing the role of observation and self-efficacy, suggests that the modification of these patterns requires not only insight, but also concrete opportunities to experiment with new ways of acting, which dialogues with intervention proposals that combine reflection and skills training. (BANDURA, 1977).

2.4.2 Current studies on habits (Clear, Brewer and others)

Clear, by systematizing research on habits in his widely disseminated work, proposes that the formation of habits is based on a cycle composed of clue, routine and reward, suggesting that small consistent changes can produce significant transformations in the long term, especially when associated with a change of identity, that is, when the subject starts to see himself as someone who acts in a certain way. (CLEAR, 2019)

Brewer, supported by neuroscience findings, describes how the brain learns through a reward-based conditioning process, in which behaviors associated with feelings of relief or pleasure are more likely to be repeated, even when they produce negative consequences in other spheres of life, which is evident in anxiety, binge eating, and dependence. (BREWER, 2021)

By showing that these behaviors are organized in loops in which a trigger triggers a routine that generates a kind of reward, the author argues that the simple attempt to rationally control these impulses tends to fail, because it does not reach the level at which the habit is encoded. His proposal to use mindfulness practices to increase awareness of the process at the exact moment it occurs allows the subject to perceive more clearly the real cost of their habits, reducing their attractiveness and making room for change, which has direct implications for the reconfiguration of personality. (BREWER, 2021)

Duhigg, in his analysis of the power of habits, explores both individual and organizational examples to show that much of what we do throughout the day relies on

automatic routines, which allow the brain to conserve energy, but which can also trap the subject in unhealthy patterns of behavior. (DUHIGG, 2012)

He introduces the idea of key habits, those that, when modified, trigger chain changes in other aspects of life, which suggests that punctual, well-chosen interventions can have a great impact on the general way a person functions. This approach offers an interesting bridge with psychoanalysis, insofar as it invites us to locate which habits function as central gears in the maintenance of certain ways of being, indicating that their transformation can have repercussions on the global configuration of the personality. (DUHIGG, 2012)

Baumeister, based on his research on willpower and self-regulation, argues that self-control functions as a limited resource that individuals can dispose of to a greater or lesser extent, so that the creation of favorable automatic habits reduces the need for constant conscious decisions, preserving mental energy for more complex choices. (BAUMEISTER, 2011)

This conception implies that personality, often described in terms of discipline, organization, or impulsivity, is related to the way in which the subject is able to automate behaviors aligned with his or her goals, reducing exposure to temptations and internal conflicts. By suggesting that the strengthening of willpower does not occur only through effort, but also through the intelligent construction of routines and environments, Baumeister offers valuable elements for thinking about how interventions focused on habits can support therapeutic processes that aim at deeper changes in the way of being. (BAUMEISTER, 2011)

Kahneman, by distinguishing between two systems of thought, one fast, automatic and intuitive and the other slow, deliberate and analytical, shows that a large part of our decisions are made by the fast system, based on heuristics and associations that work in a very similar way to cognitive habits, which means that our worldview is strongly conditioned by previously established mental routes. (KAHNEMAN, 2011)

These automatic pathways lead to judgment biases and systematic errors that, repeated over time, contribute to the construction of a personality that may be more pessimistic, overconfident, or risk-averse, depending on how these thinking habits are structured. By highlighting the difficulty of changing these patterns only for information, the author reinforces the need for strategies that act at the level of practice and repeated experience, approaching, albeit in another way, the psychoanalytic intuition that the transformation of the personality passes through the modification of the unconscious gears that sustain our way of interpreting and reacting to the world. (KAHNEMAN, 2011)

2.5 INVISIBLE GEARS: UNCONSCIOUS HABITS AS THE AXIS OF PERSONALITY

By articulating Freudian psychoanalysis with contemporary studies on habits, it becomes possible to conceive the personality as a set of invisible gears composed of formations of the unconscious that are expressed in relatively stable patterns of behavior, whose function is at the same time to protect the subject from anguish and to enable some satisfaction of his desires. Unconscious habits would thus be solutions that the psyche found to manage conflicts between impulses, norms and reality, solutions that, because they worked at some point, were repeated and automated, gaining the appearance of natural character traits. (FREUD, 1900)

This conception allows us to understand why the subject often sees himself acting contrary to what he claims to want, because the gears formed in past contexts continue to operate, producing responses that aim to repeat an arrangement considered, at some level, less threatening than the unknown. (FREUD, 1900)

From the Lacanian reading, we can deepen this metaphor of the gears by considering that each habit is inscribed in a signifying chain, occupying a place in the text that the subject writes with his life, a text that responds to the desire of the Other and to the structure of the language that precedes it. In this sense, there is no neutral habit, since even the most trivial behaviors carry marks of identifications, mandates and forms of jouissance that have been incorporated throughout subjective history. (LACAN, 1964)

By shifting the focus from the idea of "changing habits" to the question of repositioning oneself in the symbolic chain, psychoanalysis suggests that the true transformation of the personality requires a work of resignification that goes beyond behavioral adjustments, intervening in the invisible gears that connect the subject to the Other and to his own desire. (LACAN, 1964)

The concept of habitus, formulated by Bourdieu, offers an important contribution to this discussion, by describing systems of durable and transposable dispositions, incorporated by individuals through socialization, which guide perceptions, thoughts and actions in a regular way, without the need for conscious coordination, which dialogues directly with the idea of unconscious habits. (BOURDIEU, 1977)

The habitus is the result of the internalization of social structures, so that practices and ways of being specific to a class or group become natural for its members, functioning as gears that reproduce, in the body and mind of individuals, the objective order. This perspective shows that personality is not only an effect of intrapsychic conflicts, but also constitutes the intersection between symbolic structures, power relations and socialization experiences, which expands the field of analysis of unconscious habits. (BOURDIEU, 1977)

Bandura, with his notion of reciprocal determinism, according to which behavior, personal factors and environment interact in a dynamic way, allows us to think of the invisible gears of personality as systems in constant feedback, in which habits influence the context and are reinforced or punished by it. (BANDURA, 1977)

An individual with personality traits marked by social withdrawal, for example, tends to avoid situations of interaction, which reduces opportunities for positive experiences, reinforcing beliefs of inadequacy and maintaining the cycle of isolation, which manifests itself as a set of avoidance habits. By recognizing this circularity, space is opened for interventions that aim to interrupt the cycle at some point, introducing new experiences that can challenge habitual expectations, contributing to the reconfiguration of the subject's way of being. (BANDURA, 1977)

Clear's contributions on the construction of habit systems can also be integrated into the metaphor of gears, insofar as they highlight that lasting changes in life do not result from punctual decisions, but from the creation of structures that make certain behaviors easy and natural, in a similar way to the way in which the formations of the unconscious guide the subject without him realizing it. (CLEAR, 2019)

By proposing that we focus on becoming the type of person who performs certain behaviors, instead of pursuing only specific goals, the author approaches, in another register, the psychoanalytic idea that the personality is reconfigured when subjective positions and ways of relating to desire and the Other are transformed. Thus, articulating the clinical reading of unconscious habits with concrete strategies for reorganizing routines and environments can enrich care practices that aim at an effective change of the invisible gears that support the personality. (CLEAR, 2019)

3 CONCLUSION

Throughout this article, we have sought to show that unconscious habits can be understood as invisible gears that structure the formation and maintenance of the human personality, articulating contributions from Freudian psychoanalysis, Lacanian rereadings, contributions from Jung and Klein, and contemporary studies on habits and self-regulation. Instead of being reduced to simple visible routines, these habits express arrangements that the mind builds to manage tensions between desire, norms and the demands of reality, being incorporated so intensely into the subject's way of existing that they end up being confused with the very "essence" of who he is.

By considering personality traits as crystallizations of ways of dealing with the repressed and desire, it becomes possible to shift the notion of character from a fixed and

naturalized understanding to a historical and processual reading, in which the gears that sustain psychic functioning can be questioned, reinterpreted and, to a certain extent, transformed.

The dialogue with authors who empirically investigate habits indicates that the automatic component of conduct is not opposed to subjectivity, but actively participates in its constitution, providing relevant clues about how processes of change can be favored by interventions that reach, at the same time, the plane of consciousness and that of concrete action. Measures such as broadening attention to the moment when the habit is triggered, reorganizing signals and rewards, and building routines consistent with broader values and life projects are in tune with the psychoanalytic proposal of making thinkable what previously operated in the shadows, creating gaps for a less compulsive relationship with *jouissance* and desire itself.

When these perspectives are integrated, possibilities are opened up to enrich both clinical practice and initiatives to promote mental health and personal development, to the extent that it is recognized that personality modification necessarily involves intervening in the invisible gears that connect the subject to their experiences of suffering and satisfaction.

The reflection on these gears that articulate unconscious habits and ways of being also points to the importance of interdisciplinary research that brings together psychoanalysis, social psychology, neuroscience and behavioral economics, examining how internal conflicts, forms of social organization and automatic patterns of choice are combined in everyday life.

ABSTRACT

Public budgeting is the primary instrument through which governments transform political choices into fundable priorities and concrete actions. This article analyzes how the relaunch of Participatory Budgeting (PB) in Goiânia, after more than two decades of interruption, was integrated into the municipal planning cycle and redefined the role of the budget through the lens of the GIS Cycle (Governance, Innovation, and Sustainability). A qualitative, theory-driven and applied approach is used, based on documentary analysis and methodological illustration. The study examines the articulation between PB, the Multi-Year Plan (PPA 2026–2029), the Budget Guidelines Law (LDO), and the Annual Budget Law (LOA 2026), alongside technical training initiatives, Objectives and Key Results (OKRs), transparency mechanisms, and continuous monitoring. Findings indicate that linking citizen deliberation to fiscal decision-making helped transform the budget into a coordinating axis connecting social participation, strategic planning, and fiscal responsibility, enhancing legitimacy, allocative rationality, and institutional learning capacity. Evidence also suggests greater inclusion of demands from historically underserved territories, signaling progress in territorial equity. Nevertheless, challenges remain regarding institutional continuity, citizen communication, and the refinement of impact indicators. The article concludes that integrating budgeting, citizen participation, and results-based management, mediated by the GIS Cycle, represents a promising pathway for strengthening municipal governance, aligning spending priorities with social needs, and preserving fiscal balance.

abordagem qualitativa, teórico-aplicada, baseada em análise documental e ilustração metodológica. O estudo examina a articulação entre OP, PPA 2026–2029, LDO e LOA 2026, bem como a adoção de capacitação técnica, Objectives and Key Results (OKRs), transparência e monitoramento contínuo. Os resultados indicam que a vinculação entre deliberação cidadã e decisões fiscais contribuiu para transformar o orçamento em eixo articulador entre participação social, planejamento estratégico e responsabilidade fiscal, ampliando legitimidade, racionalidade alocativa e capacidade de aprendizagem institucional. Observou-se, ainda, a incorporação de demandas provenientes de territórios historicamente subatendidos, evidenciando avanços em termos de equidade territorial. Persistem, entretanto, desafios relativos à continuidade institucional, comunicação com a sociedade e aprimoramento de indicadores de impacto. Conclui-se que a integração entre orçamento, participação popular e gestão por resultados, mediada pelo Ciclo GIS, constitui caminho promissor para fortalecer a governança municipal, alinhar prioridades orçamentárias às necessidades sociais e preservar o equilíbrio fiscal.

RESUMEN

El presupuesto público es el principal instrumento mediante el cual el Estado transforma decisiones políticas en prioridades financiables y acciones concretas. Este artículo analiza cómo la reactivación del Presupuesto Participativo (PP) en Goiânia, después de más de dos décadas de interrupción, fue integrada al ciclo de planificación municipal y redefinió el papel del presupuesto a la luz del Ciclo GIS (Gobernanza, Innovación y Sostenibilidad). Se adopta un enfoque cualitativo, de naturaleza teórico-aplicada, basado en análisis documental y en una ilustración metodológica. El estudio examina la articulación entre PP, el Plan Plurianual (PPA 2026–2029), la Ley de Directrices Presupuestarias (LDO) y la Ley de Presupuesto Anual (LOA 2026), así como la adopción de capacitación técnica, Objectives and Key Results (OKRs), mecanismos de transparencia y monitoreo continuo. Los resultados muestran que la vinculación entre deliberación ciudadana y decisiones fiscales contribuyó a transformar el presupuesto en un eje de coordinación entre participación social, planificación estratégica y responsabilidad fiscal, ampliando la legitimidad, la racionalidad asignativa y la capacidad de aprendizaje institucional. También se observaron avances en la incorporación de demandas provenientes de territorios históricamente desatendidos, lo que señala mejoras en términos de equidad territorial. No obstante, persisten desafíos relacionados con la continuidad institucional, la comunicación con la ciudadanía y el perfeccionamiento de indicadores de impacto. Se concluye que la integración entre presupuesto, participación ciudadana y gestión por resultados, mediada por el Ciclo GIS, constituye una vía prometedora para fortalecer la gobernanza municipal, alinear prioridades presupuestarias con necesidades sociales y preservar el equilibrio fiscal.

1 INTRODUCTION

The public budget is the main instrument by which the State transforms political decisions into bankable priorities and concrete actions. More than an accounting record, it is a space for dispute, negotiation and definition of collective directions, in which social expectations, fiscal restrictions and government choices are confronted. In this context, different countries and municipalities have sought mechanisms that bring society closer to budgetary processes, either to increase democratic legitimacy or to qualify the allocation of public resources. Participatory Budgeting (PB) has emerged, in recent decades, as one of these alternatives, offering institutional channels for deliberation on local priorities.

The experience of Goiânia is part of this debate based on a singular element: the resumption of PB after more than two decades of interruption and its direct articulation with the formal instruments of planning and budgeting. Instead of episodic and disconnected initiatives, it was decided to integrate popular deliberations into the Multi-Year Plan (PPA 2026–2029), the Budget Guidelines Law (LDO), and the Annual Budget Law (LOA 2026), associating them with monitoring and results-based management tools, such as *Objectives and Key Results* (OKRs).

The problem that guides this article can be formulated as follows: how can the integration between budget, popular participation and governance transform PB into an effective mechanism for public decision-making, and not just an advisory one? To address this issue, the GIS (² Governance, Innovation and Sustainability) Cycle framework is adopted, understood as an institutional arrangement capable of articulating transparency, fiscal responsibility, citizen participation and continuous monitoring.

An additional element reinforces the uniqueness of the process analyzed. The integration between popular participation, planning and budget did not result from isolated initiatives, but resulted from a programmatic commitment previously signed in the government plan registered with the Regional Electoral Court (TRE). This document structured the proposals in three major axes, city, citizen and management, and was already permeated by contributions from participatory processes conducted during the electoral period. When incorporated into the planning cycle and the municipal budget, the plan ceased to be a letter of intent and became a strategic reference for the construction of the PPA, the LDO and the LOA, articulating democratic legitimacy and good management technique.

² The GIS Cycle (Governance, Innovation and Sustainability) is an analytical model proposed by Ailton Ferreira Cavalcante, within the scope of his doctorate in Public Administration, supervised by Dr. Jean Santos Lima, which understands state action as a continuous process of formulation, execution, monitoring and feedback of public policies, articulating institutional governance, responsible innovation and sustainability as criteria for creating public value.

Methodologically, a qualitative study is developed, of a theoretical-applied nature, based on documentary analysis and methodological illustration. Normative acts, official reports, administrative records and public materials related to the construction of the PPA, LDO and LOA are examined, as well as the documents produced during the participatory process. The experience of Goiânia is not treated as an explanatory case study in the strict sense, but as a field of demonstration of the applicability of the proposed model.

The article seeks to demonstrate that the link between citizen deliberation and fiscal decisions reconfigures the place of the budget in municipal public management, converting it into an articulating axis between strategic planning, social participation and fiscal responsibility. It is also argued that this institutional arrangement favors the reduction of territorial asymmetries, strengthens the legitimacy of decisions and creates conditions for continuous governmental learning.

Next, we present the theoretical framework that underlies the analysis, discussing the role of the budget in democratic governance and the potentialities and limits of the Participatory Budget, and then examining the experience of Goiânia in the light of the GIS Cycle.

2 THEORETICAL FRAMEWORK

The theoretical framework that supports this study seeks to articulate different fields of literature, public budgeting, participatory democracy, government planning and results-oriented governance, in order to understand how the budget can assume a strategic role in mediating between political choices and social needs. By reviewing classic and contemporary authors, it seeks to show that Participatory Budgeting only achieves effectiveness when integrated into stable institutional structures, capable of transforming citizen deliberations into traceable budget priorities. This conceptual basis allows us to interpret the experience of Goiânia in the light of the GIS Cycle, examining its potentialities, limits and implications for municipal public management.

2.1 PUBLIC BUDGET AS AN INSTRUMENT OF GOVERNANCE

Historically understood as an accounting piece aimed at controlling revenues and expenses, the public budget has come to occupy a central position in the coordination of public policies. It structures priorities, defines fiscal limits, and organizes the decision-making process, functioning as an "articulating nucleus" between planning, execution, and control (GIACOMONI, 2020).

The literature emphasizes that the budget is not a neutral act. It expresses disputes, pacts and distributive choices, reflecting power relations within the State. In this sense, Wildavsky (1986) argues that "the budget is, above all, political", as it translates values and strategies that guide government action.

Nowadays, the budget is increasingly understood as an instrument of governance, articulating actors, rules, evidence and *accountability mechanisms*. Instead of serving only as a formal recording of expenditures, it is now evaluated for its ability to guide results, transparency, and intersectoral coordination (POLLITT; BOUCKAERT, 2017). Such a perspective brings the budget closer to the agendas of modern public management, in which planning, execution and evaluation need to operate in an integrated manner.

2.2 SOCIAL PARTICIPATION, LEGITIMACY AND PUBLIC VALUE

The Federal Constitution of 1988 enshrined social participation as a structuring principle of Brazilian public administration, associating transparency, social control and democratization of decisions (BRASIL, 1988). In these terms, participatory mechanisms began to act not only as consultative instruments, but as instances of deliberation and co-production of public policies.

The literature on participatory democracy highlights that deliberation processes increase legitimacy, strengthen public control, and favor the adaptation of policies to the real needs of citizens. Avritzer (2008) demonstrates that well-designed participatory institutions tend to produce inclusion, public rationality and greater social co-responsibility.

In dialogue with this perspective, the concept of public value broadens the criteria for government evaluation. For Moore (1995), the performance of the State should be judged not only by legality or economy, but by its ability to generate socially recognized results. Thus, participatory processes, when linked to concrete decisions, become an essential component of the legitimacy of policies and, in particular, of budgetary choices.

2.3 PLANNING, BUDGETING AND INSTITUTIONAL INTEGRATION

One of the recurring dilemmas in public management is the dissociation between strategic planning and budget execution. Plans are prepared with low fiscal correspondence, while budgets are built without adherence to previously defined strategies, producing institutional fragmentation and low effectiveness (BRESSER-PEREIRA, 2017).

In the Brazilian case, the framework formed by the Multi-Year Plan (PPA), the Budget Guidelines Law (LDO) and the Annual Budget Law (LOA) seeks to establish a logical link between medium-term goals, annual priorities and resource allocation. However, such

integration depends on state capacity, intersectoral coordination, and monitoring mechanisms capable of translating goals into concrete deliverables (GIACOMONI, 2020).

International organizations reinforce this agenda by pointing out that public decisions must combine evidence, impact assessment and transparency, otherwise they will become vulnerable to opportunistic or technocratic cycles (OECD, 2015). In this sense, the integration between planning and budgeting is a decisive element for the construction of solid and results-oriented governance.

2.4 PARTICIPATORY BUDGETING AND URBAN PLANNING: LESSONS FROM THE BRAZILIAN LITERATURE

The Brazilian literature on Participatory Budgeting highlights that its relevance is not limited to the opening of deliberative spaces, but involves its ability to influence urban planning itself. In a classic study on Goiânia, Vieira (2009) demonstrates that PB was conceived as a mechanism for the democratization of urban decisions; however, its effectiveness was limited by institutional discontinuities and by a still insufficient integration with formal instruments such as the Master Plan.

This finding shows that participatory processes only achieve lasting impact when linked to stable planning and budget structures, capable of translating public deliberations into programmatic priorities and territorially oriented investments. In this sense, the need for models that articulate social participation, strategic planning and budget execution is reinforced, a horizon in which the GIS Cycle, discussed in this article, is inserted.

From a convergent perspective, Fonseca (2009) examined the Participatory Budget of Goiânia as an instrument of democratic management and identified that its legitimacy depends less on the number of assemblies held and more on the institutional capacity to transform deliberations into priorities effectively executed. The author also shows that participation tends to reproduce territorial inequalities when there are no active mobilization policies and transparent prioritization criteria. These findings reinforce the premise adopted in this article: participatory processes need to be integrated into the budget cycle and accompanied by monitoring mechanisms, otherwise they will become symbolic consultations.

In a comprehensive review of recent national academic production, Aires and Aires (2025) demonstrate that the Participatory Budget continues to be a relevant instrument of participatory democracy, especially because it favors transparency, social inclusion, and community engagement. The authors identify, however, that its consolidation depends on three structuring vectors: continuous government commitment, adoption of participatory technologies, and systematic training of civil society. When these conditions are present, the

PB ceases to be a merely advisory mechanism and starts to function as a strategic tool for redirecting public spending to priority areas, aligning sectoral policies with territorial demands. This evidence reinforces the thesis defended in this article: only the integration between popular participation, planning and governance, as proposed by the GIS Cycle, is capable of conferring institutional stability and distributive effectiveness to the public budget.

2.5 DISCONTINUITIES AND "DISMANTLING" OF PARTICIPATORY EXPERIENCES

A significant part of the literature warns that experiences of Participatory Budgeting often suffer processes of institutional discontinuity. Vieira (2015) demonstrates that the "dismantling" of PB does not occur only through formal revocations, but also through subtle mechanisms, such as the reduction of resources, the weakening of councils, the alteration of deliberative rules and the progressive emptying of participatory stages. In this circumstance, participation subsists as a consultative ritual, with no effective impact on budgetary priorities. This finding reinforces a central premise of this article: the sustainability of PB depends on its organic link to the budget cycle (PPA, LDO and LOA), stable transparency rules and continuous public monitoring mechanisms, elements operationalized in this study through the GIS Cycle.

2.6 INSTITUTIONAL INNOVATION AND MANAGEMENT BY RESULTS

The modernization of the State is not restricted to technologies or managerial instruments; It implies institutional innovation, understood as the creation of new arrangements for coordination, participation and organizational learning. Models based on indicators, goals and continuous evaluation gain space because they bring strategic planning and social control closer together.

Tools such as OKRs (*Objectives and Key Results*) and monitoring systems introduce results logic, allowing strategic objectives to be broken down into measurable and trackable goals. However, such instruments only produce sustainable effects when articulated with principles of public ethics, transparency and social participation, avoiding technocratic capture and strengthening the commitment to the public interest (POLLITT; BOUCKAERT, 2017).

2.7 THE GIS CYCLE: GOVERNANCE, INNOVATION AND SUSTAINABILITY

The GIS Cycle, Governance, Innovation and Sustainability is a theoretical-applied model that interprets state action as a dynamic process of planning, execution, monitoring, learning and replanning. Its logic presupposes that public policies, especially the budget,

should be conceived as spaces for collective agreement, based on evidence and oriented to the creation of public value.

While governance refers to the integration between actors, rules, and transparency, innovation refers to the adoption of methodologies capable of bringing planning and results closer together; and sustainability involves both fiscal balance and institutional and social continuity. Applied to the budget cycle, GIS proposes an arrangement in which citizen participation, fiscal responsibility and management by results operate in an articulated way, avoiding both exclusionary technicality and populist practices devoid of criteria (MOORE, 1995; OECD, 2015).

It is important to highlight that the GIS Cycle does not present itself as a rupture in relation to contemporary approaches to governance, but as an applied synthesis of already consolidated contributions. The model dialogues with the literature on *governance networks*, by recognizing the need for articulation between multiple actors; it is close to *collaborative governance*, by emphasizing structured deliberative processes; and it converges with the tradition of *public value governance*, by linking public decisions to the production of collective value. Its originality lies less in the creation of a new paradigm and more in the ability to integrate these references into an operational arrangement aimed at municipal management.

2.8 PARTICIPATORY BUDGETING AS A PROCESS OF CITIZENSHIP EDUCATION AND SOCIAL TRANSFORMATION

Several studies point out that the Participatory Budget should not be understood only as an administrative instrument for the allocation of resources, but as a formative process capable of producing social transformation. By involving citizens in successive stages of deliberation, prioritization and monitoring, PB works as a true "school of democracy", stimulating a sense of co-responsibility and strengthening trust in public institutions. When articulated with transparency and effective enforcement mechanisms, it tends to redirect investments to historically neglected territories, expanding inclusion and distributive justice. On the other hand, experiences marked by low feedback and weak institutionalization tend to generate democratic frustration and discredit (AIRES; AIRES, 2025). In this perspective, this article argues that the integration between citizen participation, strategic planning and governance, operationalized by the GIS Cycle, is a decisive condition for PB to fully fulfill its transformative potential.

2.9 COMPARATIVE LESSONS FROM PARTICIPATORY BUDGETING

The comparative literature shows that consolidated experiences, such as Porto Alegre, Belo Horizonte and Recife, achieved more stable results when they associated social participation with formal planning instruments and permanent monitoring routines. In contexts where such bonds were fragile, discontinuity and emptying were observed over time.

The experience of Goiânia dialogues with these lessons by articulating public deliberation, strategic planning and fiscal governance, seeking to overcome the cycle of episodic initiatives and move towards an institutionally integrated model.

3 METHODOLOGY

This study adopts a qualitative approach, of a theoretical-applied nature, aimed at understanding the public budget as an instrument of democratic governance and institutional integration. It is based on the assumption that budget decisions cannot be interpreted only as accounting records, but as political-administrative processes structured by norms, institutions and participatory mechanisms (WILDAVSKY, 1986; GIACOMONI, 2020).

3.1 RESEARCH DESIGN

The research is characterized as analytical and illustrative, using the experience of the Municipality of Goiânia as a field of methodological illustration, and not as an explanatory case study in the statistical sense. The objective is to examine how the principles of the GIS Cycle, Governance, Innovation and Sustainability, are manifested in the articulation between planning, budgeting and social participation, producing learning that can be transferred to similar contexts.

3.2 PROCEDURES AND SOURCES OF EVIDENCE

The analytical construction of this study was based on three main groups of evidence. The first concerns the normative documents that structure the budget cycle and provide a legal basis for the process analyzed, including the Federal Constitution, the Fiscal Responsibility Law, the 2026–2029 Multi-Year Plan, the Budget Guidelines Law, and the 2026 Annual Budget Law.

The second set comprises institutional documents, such as Participatory Budget reports, plenary records, social mobilization materials and strategic planning instruments, including OKR spreadsheets and monitoring tools used by municipal secretariats.

Finally, a body of national and international academic literature on public budgeting, governance, social participation, and results-oriented management was mobilized, with

emphasis on contributions from Avritzer (2008), Moore (1995), Pollitt and Bouckaert (2017), and OECD (2015), among other authors.

The documentary analysis was developed sequentially. Initially, a conceptual systematization was carried out, in which the central analytical categories were defined, governance, participation, planning-budget integration, public value and GIS Cycle.

Next, an interpretative examination of the materials was carried out, seeking to identify correspondences between these categories and the institutional practices observed in the experience of Goiânia. Finally, an analytical synthesis was elaborated, aimed at understanding how the GIS Cycle contributes to articulate social participation, fiscal responsibility and results-oriented management.

Whenever possible, triangulation was promoted between normative sources, institutional reports, and specialized literature, with the aim of reducing interpretative biases and increasing the consistency of the findings. It was decided not to incorporate, at this stage, interviews with managers, counselors or participants in the process.

This decision was due to the analytical focus adopted, centered on the institutional architecture of the Participatory Budget and its integration into the budget cycle, as well as the time constraints inherent to the period of elaboration of the study. This is a conscious methodological choice, which does not invalidate the results achieved, but signals a promising front for future investigations, especially aimed at understanding citizen perceptions and the subjective effects of the participatory process.

3.3 BOUNDARIES AND LIMITS

The study focuses on the budget cycle associated with the participatory process related to the LOA 2026, especially in its integration with the PPA 2026–2029. It does not cover subjective perceptions of citizens or managers obtained through interviews, which is a recognized limitation. This restriction is partially compensated by the richness of institutional records and the emphasis on in-depth documentary analysis, appropriate to the objectives of a theoretical-applied nature.

3.4 ETHICAL AND TRANSPARENCY CONSIDERATIONS

Because it works exclusively with public and institutional documents, the study does not involve risks to participants. On the contrary, it reinforces the principle of publicity and traceability of decisions, in line with the transparency guidelines defended by international organizations and Brazilian legislation (BRASIL, 1988; BRAZIL, 2000; OECD, 2015).

3.5 DIGITAL GOVERNANCE AS A VECTOR OF QUALIFIED PARTICIPATION

The incorporation of digital tools into the participation process has expanded the scope and transparency of the deliberations, allowing agile access to information, monitoring of the stages and dissemination of results. Electronic platforms, institutional social networks, and open data portals have contributed to reducing geographical barriers and favoring the engagement of segments that traditionally participate less.

This digital dimension reinforces the GIS Cycle by connecting transparency, social control, and fiscal responsibility in the same institutional arrangement.

4 THE EXPERIENCE OF GOIÂNIA: INTEGRATION BETWEEN BUDGET, PARTICIPATION AND GOVERNANCE

Based on the theoretical framework presented, this section examines the recent experience of Goiânia in the resumption of Participatory Budgeting (PB) and its articulation with the municipal planning cycle. The case is analyzed as a field of methodological illustration capable of showing, in practice, how the budget can operate as an axis of integration between governance, social participation and fiscal responsibility.

More than describing events, it seeks to understand the institutional arrangements, procedures, and linkage mechanisms that made it possible to connect popular listening to the formal decisions inscribed in the Multiannual Plan (PPA 2026–2029), the Budget Guidelines Law (LDO), and the Annual Budget Law (LOA 2026).

The analysis is organized into subsections that deal with: (a) the historical resumption of PB; (b) the architecture of the participatory process; (c) the incorporation of priorities into the budget; (d) technical training and construction of OKRs; and (e) transparency and monitoring instruments.

Throughout the section, there is a constant dialogue with the GIS Cycle, Governance, Innovation and Sustainability, seeking to demonstrate how planning, participation and management by results were articulated to produce a public governance model oriented to the creation of public value and fiscal sustainability.

4.1 HISTORICAL RESUMPTION OF THE PARTICIPATORY BUDGET IN GOIÂNIA

The experience of Participatory Budgeting (PB) in Brazil has been consolidated, since the 1990s, as one of the most important laboratories of democratic innovation in the world, by allowing citizens to directly influence the allocation of public resources and the design of urban policies (AVRITZER, 2008).

However, as occurred in several Brazilian municipalities, the PB of Goiânia went through a long period of institutional discontinuity, marked by political alternations, fiscal restrictions and changes in government priorities. For more than two decades, binding participation mechanisms have lost space, being replaced by consultative, fragmented or merely informative formats.

The resumption of PB, in the 2025–2026 cycle, thus represented not only the reactivation of a participatory tool, but the reconstruction of an institutional environment focused on the integration between planning, budgeting, and social control.

The decision to reposition PB as a structuring component of the budget process was accompanied by explicit guidelines of transparency, traceability and articulation with the government planning cycle, in line with constitutional principles of participation, publicity and efficiency (BRASIL, 1988) and with the requirements of fiscal responsibility (BRASIL, 2000).

Unlike episodic experiences in the past, the resumption was conceived from the beginning as a multiphase process: community mobilization, holding regional plenary sessions, collection and systematization of proposals, intersectoral technical analysis, and incorporation of viable priorities into the actions provided for in the PPA 2026–2029, the LDO, and the LOA 2026.

This chain sought to overcome the classic distance between "social listening" and "fiscal decision", often pointed out as a factor of frustration and discredit in participatory processes (POLLITT; BOUCKAERT, 2017).

The historical character of the resumption is also expressed in the reconfiguration of the role of the citizen. By participating in face-to-face plenary sessions and digital instruments, the population ceased to exercise a merely demanding function to assume a deliberative role mediated by technical criteria and previously explained fiscal limits.

This change brings the Goiânia model closer to international experiences of collaborative governance in which participation is articulated with evidence, planning and continuous monitoring (OECD, 2015).

In addition, the reactivation of the PB coincided with a movement to strengthen the institutional apparatus of municipal planning, including the implementation of training processes, the adoption of management tools by results and the creation of periodic accountability routines.

Such synergy reinforces the thesis that the sustainability of participatory mechanisms depends on the existence of state capacity capable of translating public deliberations into consistent budgetary decisions (MOORE, 1995; BRESSER-PEREIRA, 2017).

Thus, the resumption of Participatory Budgeting in Goiânia can be understood as a milestone of democratic and administrative reconstruction: it reopens channels of social dialogue, strengthens the legitimacy of budgetary choices and inaugurates a cycle of governance in which participation, technique and fiscal responsibility start to operate in an integrated way. In the following sections, we examine how this process was institutionally designed and how it was connected to the planning and financial decisions of the municipality.

4.2 THE ARCHITECTURE OF THE PARTICIPATORY PROCESS: PLENARY SESSIONS, STAGES AND PRIORITIZATION

The resumption of the Participatory Budget in Goiânia was structured on a methodological design that sought to combine territorial inclusion, procedural transparency and fiscal viability.

The process was organized in successive and documented stages, in order to ensure traceability between the popular demonstration and the decisions incorporated into the municipal budget. This architecture dialogues with consolidated experiences of democratic participation, in which public deliberation is mediated by clear rules, technical criteria, and mechanisms for continuous monitoring (AVRITZER, 2008; OECD, 2015).

The first phase consisted of community and institutional mobilization, involving dissemination on social networks, articulation with local leaders and support from regional administrations.

Subsequently, face-to-face plenary sessions were held in different regions of the city, ensuring that territorial demands could be expressed in a decentralized manner. Each plenary session had technical mediation, prior presentation of the fiscal context and explanation of the legal and financial limits of the municipality, avoiding unrealistic expectations and contributing to a responsible deliberation.

In the second stage, the proposals presented by citizens were collected and systematized. The demands were registered, categorized by thematic area (infrastructure, health, education, environment, mobility, among others) and forwarded for intersectoral analysis. The performance of technical teams, at this time, was decisive in assessing compatibility with the PPA 2026–2029, estimating costs, verifying the existence of related actions, and identifying risks of duplicity or unfeasibility.

The third phase corresponded to the prioritization process, conducted based on previously established criteria: social relevance, territorial impact, financial viability, alignment with strategic priorities, and potential for improvement of public services. This procedure

prevented the PB from becoming a generic list of claims and contributed to its convergence with the guidelines of planning and fiscal responsibility (BRASIL, 2000).

In the final stage, the prioritized proposals were incorporated into the budget actions compatible with the LOA 2026, with an indication of programs, physical goals and sources of funding. The result was the consolidation of an institutional path that connects social listening, technical analysis and fiscal decision-making, reinforcing the credibility of the process and its pedagogical function for citizens. In line with the GIS Cycle, the PB thus operates as a mechanism for integrating democratic governance, methodological innovation and fiscal sustainability.

In addition to its deliberative dimension, the adopted design favored institutional learning. The systematization of demands and the construction of formal records allow the municipality to accumulate historical series, identify territorial patterns and progressively improve its decision-making processes. This characteristic brings PB closer to models of reflective governance, in which participation and monitoring feed each other, strengthening the state's capacity for planning and evaluation (MOORE, 1995; POLLITT; BOUCKAERT, 2017).

4.3 "FROM LISTENING TO THE LAW": INTEGRATION OF THE PARTICIPATORY BUDGET TO THE PPA, LDO AND LOA

One of the central elements of the analyzed experience was the transformation of the demands presented in the plenary sessions of the Participatory Budget into actions formally incorporated into the municipal budget cycle. This path, from public listening to materialization in the law, constitutes the nucleus of legitimacy of the process and the evidence that social participation was not merely consultative, but endowed with an effective capacity for advocacy.

The first movement consisted of the technical compatibility between the population's proposals and the strategic guidelines of the Multi-Year Plan (PPA 2026–2029). The responsible teams evaluated the adherence of the demands to the existing programs, the need to create new actions and the estimate of financial impacts. This exercise avoided both the risk of unenforceable promises and the automatic reproduction of demands unrelated to the municipal strategy — a frequent problem in poorly structured participatory experiences (POLLITT; BOUCKAERT, 2017).

Subsequently, the compatible proposals were incorporated into the priorities defined in the Budget Guidelines Law (LDO), a stage in which prioritization criteria, fiscal limits, and execution parameters were consolidated. This moment worked as a bridge between multi-

year planning and the annual allocation of resources, ensuring coherence between medium-term goals and budgetary possibilities for the following year.

The decisive step occurred with the insertion of PB priorities in the Annual Budget Law (LOA 2026). Each prioritized demand was linked to a specific program, action, and source of funding, with the definition of physical and financial goals. With this, a formal and traceable link was established between citizen deliberation and budget execution, allowing social control to monitor, throughout the year, the fulfillment of collectively defined priorities.

This institutional arrangement reinforced the pedagogical function of the budget by making visible the path that connects participation, decision-making and execution. At the same time, it revealed the importance of internal technical capacities and structured planning instruments, without which participation tends to become frustrated expectations.

From the perspective of the GIS Cycle, the OP-PPA-LDO-LOA integration highlights the articulation between democratic governance, organizational innovation and fiscal sustainability, converting the budget into a true space for public agreement and institutional learning.

To facilitate the understanding of the institutional arrangement built in Goiânia, Table X summarizes the flow that connects social participation, planning, budget decision-making and monitoring of results.

Table 1

Integrated flow of the Participatory Budget of Goiânia

Step	Process description	Institutional instrument	Expected result	Way of monitoring
Mobilization and social listening	Holding regional plenary sessions, collecting proposals and community prioritization.	PB Regulation and intersectoral coordination.	Structured survey of territorial demands.	Meeting records, attendance lists, and systematization reports.
Technical and tax analysis	Evaluation of the legal, budgetary and operational feasibility of the proposals.	Technical opinions of the secretariats and planning team.	Classification of proposals as eligible and non-eligible.	Published opinions and transparency of the criteria used.
Compatibility with planning	Alignment of proposals with programs, goals and strategic axes.	PPA 2026–2029 and program matrix.	Incorporation of priorities into municipal planning.	Adherence maps between proposals and programs.

Budget binding	Definition of appropriations and inclusion in legal documents.	LDO and LOA 2026.	Transformation of participatory decisions into budgetary commitments.	Publication of the LOA and traceability of actions.
Implementation and monitoring	Implementation of prioritized actions and works.	Sectoral plans and administrative contracts.	Progressive delivery of agreed policies.	Dashboards, transparency portals and periodic reports.
Assessment and learning	Review of results, course corrections and accountability to society.	OKRs, indicators and monitoring meetings.	Continuous improvement and strengthening of public trust.	Performance reports and public feedback.

Source: prepared by the authors.

In addition to the synthesis presented in Table 1, some illustrative cases allow us to visualize, in a concrete way, how the priorities deliberated by the population went through the stages of technical analysis, budget linkage and monitoring of results. The following examples are not intended to exhaust experience, but to highlight the traceability of the process and its ability to produce tangible effects in the territories.

Example 1 – Drainage and mobility in a peripheral region

In a region with recurrent flooding, the community prioritized drainage and paving works. The proposal was considered viable, was linked to the urban infrastructure program of the PPA 2026–2029 and became part of the LOA 2026 with a specific allocation. The execution was accompanied by quarterly OKRs, allowing schedule corrections and public disclosure of the results. The case highlights the PB's ability to align territorial demands with transparent tax decisions.

Example 2 — Primary care unit in an area with poor coverage

In a neighborhood with low supply of health services, the local priority was the implementation of a basic unit. After technical analysis, the project was included in the health sector program and in the LOA 2026. From the monitoring, there was an expansion of access and a reduction in travel to other neighborhoods. The example illustrates how the link between participation and budget favors equity gains.

The examples mentioned above present the following sources: *LOA 2026; Participatory Budget Disclosure Report; municipal monitoring panels.*

4.4 PARTICIPATION AND REDUCTION OF TERRITORIAL DISPARITIES

One of the most significant gains of the process was the ability to incorporate demands from historically underserved territories. The distribution of the plenary sessions by

administrative regions, combined with transparent prioritization criteria, contributed to expanding the voice of peripheral neighborhoods and areas with structural deficiencies.

By redirecting investments to these spaces, the Participatory Budget operated not only as a mechanism for social listening, but as an instrument for the gradual correction of intra-urban inequalities, aligning public spending with the principle of territorial equity.

4.5 EVIDENCE OF THE PARTICIPATORY PROCESS IN GOIÂNIA

The resumption of the Participatory Budget in Goiânia presented a procedural design that combined social mobilization, technical analysis and budget linkage. In total, several regional plenary sessions were held, in which the population presented proposals distributed by areas such as urban infrastructure, health, education and social assistance. After the technical screening regarding legal and fiscal feasibility, the prioritized proposals were consolidated and made compatible with the PPA programs, with the goals of the LDO and with the appropriations of the LOA.

This institutional chain is relevant because it avoids the recurrent risk identified in the literature, public consultations that do not turn into enforceable commitments. In Goiânia, on the contrary, each selected priority became part of a cycle of planning, execution and monitoring, with documentary traceability and transparency in the dissemination of results.

4.6 TECHNICAL TRAINING AND OKR CONSTRUCTION: WHEN PARTICIPATION MEETS RESULTS-BASED MANAGEMENT

The consolidation of the Participatory Budget in Goiânia was associated with a deliberate movement to strengthen the administrative capacity of the municipality. It was recognized that social participation is only effective when supported by trained teams, clear methodologies and instruments capable of translating public deliberations into measurable goals. In view of the facts, a technical training program was implemented aimed at managers and civil servants involved in planning, budgeting and monitoring.

The training contents covered fundamentals of government planning, integration between PPA, LDO and LOA, principles of fiscal responsibility, prioritization techniques and use of indicators. In parallel, the *Objectives and Key Results* (OKRs) methodology was introduced, adapted to the specificities of the public sector. The logic of OKRs consists of defining clear strategic objectives and verifiable key results, allowing for periodic monitoring of institutional performance and course correction whenever necessary (POLLITT; BOUCKAERT, 2017).

The construction of the OKRs took place collaboratively, involving different secretariats and municipal agencies. Each strategic objective was broken down into goals associated with budget programs, indicators, and execution deadlines.

With this, a vertical alignment was created between strategic planning, authorized budget and executive actions, reducing the risk of disconnection between discourse and practice. At the same time, the horizontal alignment between the areas was strengthened, avoiding overlaps and stimulating intersectoral cooperation.

From the point of view of Participatory Budgeting, OKRs played an important role in linking population priorities to monitorable institutional commitments. Demands selected in the plenary sessions could be associated with specific key results, which facilitated monitoring by control bodies and by society itself.

This dynamic reinforced the pedagogical function of the process, by showing that collective choices imply deadlines, costs, indicators, and responsibilities that are clearly distributed.

From the perspective of the GIS Cycle, Governance, Innovation and Sustainability, the adoption of technical training and results-based management instruments reveals that democratic participation and administrative rationality are not mutually exclusive, but complementary.

Institutional innovation resides precisely in the articulation between public deliberation, state capacity and fiscal responsibility, resulting in a governance model oriented to the creation of public value (MOORE, 1995; OECD, 2015).

4.7 INDICATORS FOR INSTITUTIONAL MONITORING AND LEARNING

The adoption of OKRs has made it possible to transform participatory deliberations into measurable goals, linked to deadlines, responsible parties, and sources of funding. In addition to physical and financial monitoring, the model incorporated result indicators, such as expanding access to services, improving infrastructure, and perceived user satisfaction.

The combination of goals and indicators creates an environment conducive to institutional learning: policies are monitored, evaluated, and corrected on an ongoing basis, avoiding both unrealizable promises and investments disconnected from social needs.

4.8 TRANSPARENCY, MONITORING AND SOCIAL CONTROL

The effectiveness of the Participatory Budget depends not only on the initial deliberation, but on the ability to follow, over time, the fate of the chosen priorities. In Goiânia, the resumption of the process was accompanied by efforts to systematically publicize the

stages, results and budget constraints, consolidating the principle of transparency as a central component of democratic governance.

Several instruments were used to ensure visibility of the decisions: disclosure of the plenary sessions and their results, availability of synthetic and analytical reports, registration of prioritized demands and their correspondence with programs and actions of the Annual Budget Law.

In addition, dashboards and digital tools now allow the monitoring of goals associated with OKRs, giving materiality to social control and enabling permanent scrutiny by citizens, councils, and control bodies.

This set of measures contributed to the creation of evidence trails, through which it is possible to reconstruct the path that goes from popular participation to budget execution. Such traceability reduces information asymmetries, strengthens public trust, and hinders practices of political capture or arbitrary redirection of resources.

In line with international guidelines for good governance, transparency is no longer a mere formal duty and starts to operate as a mechanism for accountability and institutional learning (OECD, 2015).

Another relevant aspect was the incorporation of monitoring as an administrative routine. Periodic follow-ups made it possible to identify delays, reschedules, and advances, favoring continuous adjustments and clear communication with society.

This dynamic reinforces the cyclical and reflective character of the process, bringing it closer to the logic of the GIS Cycle, in which planning, executing, measuring, and replanning are interdependent moments.

In summary, the transparency and monitoring policy associated with the Participatory Budget of Goiânia consolidated an environment of expanded social control, in which the population not only participates in the choice of priorities, but also monitors their implementation.

By articulating participation, accessible information and evaluation mechanisms, the municipality advances in the construction of a governance model that combines democratic legitimacy, administrative efficiency and fiscal responsibility.

5 RESULTS AND DISCUSSION

5.1 THE BUDGET AS AN INTEGRATING AXIS OF THE GIS CYCLE

The results of the analysis show that, in Goiânia, the budget ceased to operate as a mere accounting record to assume the role of an articulating axis between strategic planning, social participation and fiscal responsibility.

The integration between Participatory Budgeting, PPA, LDO, and LOA demonstrated, in practice, that it is possible to transform the budget into a space for public agreement, consistent with the concept of governance discussed in the theoretical framework (GIACOMONI, 2020; POLLITT; BOUCKAERT, 2017).

From the perspective of the GIS Cycle, the budget functioned as a point of convergence between governance (rules, actors and transparency), innovation (methodologies and instruments) and sustainability (fiscal balance and institutional continuity).

By linking participatory decisions to traceable budget actions, the process avoided both isolated technicality and symbolic participation, reaffirming the potential of the budget as a democratic and strategic space.

5.2 BINDING PARTICIPATION AND LEGITIMACY OF DECISIONS

Another relevant result concerns the quality of participation. The PB analyzed was not limited to informal consultations; He produced decisions with effective capacity to influence the budget. This characteristic reinforces the argument that binding participation contributes to increasing legitimacy, public trust and social co-responsibility (AVRITZER, 2008).

In addition, the combination of citizen deliberation and technical analysis prevented the process from being captured by unfeasible or corporate demands. The adopted model shows that participation is not synonymous with improvisation, but can be compatible with prioritization criteria and fiscal limits, as long as such criteria are made explicit and shared with society (BRASIL, 2000).

5.3 INSTITUTIONAL LEARNING AND MANAGEMENT BY RESULTS

The incorporation of technical capacity building and OKRs revealed that the sustainability of PB depends on the existence of state capacity. By adopting results-based management instruments, the municipality created mechanisms for aligning strategic objectives, budget programs and monitorable goals, strengthening the reflective character of the process.

This result confirms the thesis that democratic participation and administrative rationality are complementary dimensions. Institutional innovation is not only in the opening of spaces for deliberation, but in the creation of routines that allow for the monitoring, evaluation and reprogramming of public policies in a transparent manner (MOORE, 1995; OECD, 2015).

5.4 TRANSPARENCY AND SOCIAL CONTROL AS A GUARANTEE OF SUSTAINABILITY

The establishment of evidence trails, public reports and monitoring panels contributed to consolidating an environment of expanded social control. The possibility of following the complete cycle, from plenary to execution, strengthens public confidence and creates incentives for managers to maintain coherence between planning and execution.

This result reinforces the idea that transparency should not be seen only as a formal duty, but as an active instrument of governance and prevention of institutional setbacks. In contexts of political alternation, the existence of registries and monitoring mechanisms increases the chances of continuity of the agreed policies.

5.5 LIMITS AND CHALLENGES IDENTIFIED

Although the advances observed are significant, the experience analyzed reveals a set of challenges that need to be faced to ensure the sustainability of the model. A first aspect refers to the need to expand and qualify public communication, using accessible language and diversified formats, so that the entire population can understand the stages, criteria and results of the process. Added to this is the permanent risk of fiscal restrictions, which can reduce the deliberative space and limit the execution of the priorities agreed with society.

Another relevant challenge concerns the dependence on institutional continuity and the maintenance of qualified technical staff, an essential condition to preserve routines, procedures and organizational memory. In addition, it is increasingly necessary to improve indicator systems, moving from metrics focused only on physical-financial execution to instruments capable of capturing distributional effects and concrete social impacts.

In summary, these limits indicate that the consolidation of the arrangement requires continuous investments in training, transparency and institutionalization of participatory practices, under penalty of regression to traditional bureaucratic models. It should also be noted that this article focused on the institutional analysis of the process, based on official documents and administrative records. Important fields of investigation remain open, such as citizens' perception of Participatory Budgeting, distributional effects in different regions of the city, and longitudinal evaluation of the impacts produced. Future research may combine qualitative and quantitative methods, allowing us to measure, with greater precision, the extent to which the integration between participation, planning and budget contributes to the generation of public value.

5.6 INTERPRETATIVE SYNTHESIS

In summary, the results suggest that the experience of Goiânia confirms the central hypothesis of this article: when articulated with planning and supported by results-based management instruments, Participatory Budgeting can reconfigure the role of the public budget, bringing it closer to a governance model that combines democratic legitimacy, technical rationality and fiscal sustainability.

The GIS Cycle proved to be useful both as an interpretative lens and as a practical guideline, allowing us to understand the interdependence between participation, planning and monitoring. Although the study does not intend statistical generalization, its implications offer relevant clues for local governments seeking to innovate in the field of participatory budgeting and contemporary public management.

6 CONCLUSION

The study analyzed the resumption of the Participatory Budget of Goiânia and its articulation with the municipal planning cycle in the light of the GIS Cycle, Governance, Innovation and Sustainability. The experience examined demonstrates that the public budget can cease to be a mere accounting piece to become a strategic space for democratic agreement, institutional integration and creation of public value.

It was shown that the link between Participatory Budgeting, Multi-year Plan, Budget Guidelines Law and Annual Budget Law allowed structuring a traceable path between social participation, technical analysis and fiscal decision. The combination of territorial plenary sessions, reasoned prioritization, training of civil servants, and adoption of OKRs contributed to reducing the historical distance between planning and execution, strengthening transparency and social control.

The results suggest that, when supported by state capacity, results-based management instruments and permanent monitoring mechanisms, the Participatory Budget can assume a structuring role in the municipal budget process. From this perspective, democratic participation and administrative rationality are no longer opposite dimensions and start to reinforce each other, forming a governance model compatible with the principles of fiscal responsibility and public efficiency.

However, persistent challenges are recognized: the need for more accessible communication, risks arising from fiscal constraints, dependence on institutional continuity and improvement of social impact indicators. Such limits indicate that the consolidation of the model requires continuous investment in training, transparency and institutionalization of participatory routines.

From a theoretical point of view, the GIS Cycle proved to be a useful tool to understand the interdependence between planning, budgeting and participation, offering a lens capable of integrating governance, innovation and sustainability. From a practical point of view, the experience of Goiânia suggests replicable paths for local governments interested in strengthening their planning structures and democratizing the budget process.

Finally, the articulation between budget, popular participation and management by results proves to be a promising way to bring public planning closer to the concrete life of cities, expanding democratic legitimacy, administrative efficiency and fiscal responsibility, essential pillars for the construction of a State capable of responding, in a transparent and sustainable way, to the demands of contemporary society.

ABSTRACT

The research in progress has the scope to verify the Regulatory Impact Analysis (AIR), evaluating its aspects regarding the democratic aspect of the institute. Although in a timid way, AIR has found resonance in the Brazilian regulatory structure. Founded in the paradigm of efficiency of the public administration, the AIR consists of a procedure for decision making of the public administration. Brazil, it has a regulatory structure in several sectors, this regulation is a way to control, and give vent to the government plans. In addition, the present study analyzes the Democratic State of Law and the guiding principles of this order, which, along with the promoted efficiency, permeate the state intervention and allow evidence to be collected so that this intervention is technical, democratic and less impact of management activities.

Keywords: Regulation. State Control. Democratic Efficiency. Government Plans. Impact. Democracy.

RESUMO

A pesquisa em realização, tem o escopo de verificar a Análise do Impacto Regulatório (AIR), avaliando suas vertentes no que tange ao aspecto democrático do instituto. Ainda que de maneira tímida, a AIR tem encontrado ressonância na estrutura regulatória brasileira. Fundada no paradigma da eficiência da administração pública, a AIR consiste em um procedimento para tomada de decisões da administração pública. O Brasil, detém, uma estrutura regulatória em vários setores, esta regulação é forma de controlar, e dar vazão aos planos governamentais. Ademais, na presente pesquisa, analisa-se o Estado Democrático de Direito e os princípios norteadores desta ordem, os quais, juntamente com a propalada eficiência, permeiam a intervenção estatal e permitem que sejam colhidas evidências para que esta intervenção seja técnica, democrática e menos impactante às atividades da administração.

Palavras-chave: Regulação. Controle Estatal. Eficiência Democrática. Planos Governamentais. Impacto. Democracia.

RESUMEN

Esta investigación tiene como objetivo examinar el Análisis de Impacto Regulatorio (AIR), evaluando sus aspectos en relación con la naturaleza democrática de la institución. Aunque aún con cierta cautela, el AIR ha encontrado eco en la estructura regulatoria brasileña. Fundamentado en el paradigma de la eficiencia de la administración pública, el AIR consiste en un procedimiento para la toma de decisiones en la administración pública. Brasil cuenta con una estructura regulatoria en diversos sectores; esta regulación es una forma de controlar y dar voz a los planes gubernamentales. Además, esta investigación analiza el Estado Democrático de Derecho y los principios rectores de este orden, que, junto con la tan discutida eficiencia, permean la intervención estatal y permiten la recopilación de evidencia para garantizar que esta intervención sea técnica, democrática y tenga un menor impacto en las actividades de la administración.

Palabras clave: Regulación. Control Estatal. Eficiencia Democrática. Planes de Gobierno. Impacto. Democracia.

1 INTRODUCTION

Founded on the principle of efficiency of public administration, the *RIA* consists of a decision-making procedure, based on evidence, which seeks to evaluate, based on the definition of a regulatory problem, the possible impacts of the available action alternatives to achieve the intended objectives.

Originating in the USA, for more than 30 years, the *RIA* has been adopted by the member countries of the OECD (Organization for Economic Cooperation and Development). Brazil, as a guest member of this organization, was expressly recommended to adopt the tool called *AIR*, in order to assess its regulatory quality. Furthermore, through administrative measures

The research problem is outlined in the following question: is *the RIA* an expression of the Democratic Rule of Law? Does the *RIA* contemplate the constitutional principle of efficiency of public administration? Can *the RIA* replace other forms of analysis of state control, can other forms of analysis of state regulation be suppressed or lose validity by *the RIA*?

Not yet relevant, the results point to a greater efficiency of *the RIA*, which, although it has some similarity with the other forms of verification of state regulation, is more linked to the efficiency and democratization of control.

In this essay, it is necessary to verify the conception of the Democratic State of Law, as well as the measure of its interventionism.

Nevertheless, it is pertinent to verify the heteronomy of state control/regulation, which must undergo an analysis, democratic evaluation, guided by the best public interest.

Furthermore, it is fruitful to demonstrate the absence of legal and constitutional impediments to the comparison and eventual replacement of the Environmental Impact Study for the Regulatory Impact Analysis. Undoubtedly, the greater the analysis of state control/regulation, the lower the impact of this control on social systems.

The theme will be approached with the deductive method from the use of existing conceptions and theories about the institutes, as well as the legality of the implementation of the *RIA* in the country and the real importance that its effective use will bring to state control.

2 DEMOCRACY AND EFFICIENCY: DEMOCRATIC STATE REGULATION

2.1 THE CONCEPTION OF THE DEMOCRATIC RULE OF LAW AND ITS REGULATORY POWER

It is important, initially, to point out that the expression Democratic State of Law is difficult to conceptualize. For this reason, in order to enable a better understanding of the subject, we consider it necessary to discuss the evolution of the Modern State.

The Absolutist State is the "first expression of the Modern State" (STRECK; MORAIS, 2014, p. 35). During absolutism, power was concentrated in the figure of the monarch, who ruled in a full, unlimited way, without the control of other powers. Executive and legislative powers were also in the hands of the king. The monarch was also to be exempt from any responsibility, for his power was a divine gift.

Strech and Morais (2014, p. 35) also state that:

As a result, absolute monarchies appropriated states in the same way that the owner makes the object his property, giving rise to a power of *imperium* as the absolute right of the king over the state. On the other hand, with this attitude, the kings constituted themselves as lords of the States, in the same way as the feudal lords of the Middle Ages, individually titling the property of the State.

Bastos (1999, p. 16) teaches that "(...) with absolutism, the State identifies itself with power, with sovereignty, with the king, and society – whether in what comes from afar, or in what it brings new – appears on the margins of political power and without projection to power".

Gradually, voices against monarchical absolutism began to emerge and, in the eighteenth century, resistance reached its apogee with bourgeois revolutions.

The first revolution, known as the "Glorious Revolution", took place in 1688, which dethroned King James II, a Catholic and absolutist, and the English throne was occupied by William of Orange, who professed the Protestant religion, with the support of the *Whigs* (liberals) and the *Tories* (conservatives), who occupied parliament.

The *Bill of Rights* of 1689 is undoubtedly one of the most important consequences of the Glorious Revolution. Acceptance of this document was made by Parliament a condition for William of Orange to take the throne, and this condition was accepted by him in 1689. At that time, the so-called constitutional monarchy emerged in England.

The *Bill of Rights* limited the monarch's power, but not only that. Comparato (2010, p. 80) states that:

[...] the essence of the document consisted in the institution of the separation of powers, with the declaration that Parliament is a body primarily responsible for defending its subjects before the King and whose functioning cannot, therefore, be subject to the latter's discretion. In addition, the *Bill of Rights* strengthened the institution of the jury and reaffirmed some fundamental rights of citizens, which are expressed to this day, in the same terms, by modern Constitutions, such as the right to petition and the prohibition of *cruel and unusual punishments*.

The English philosopher John Locke is considered the greatest theorist of anti-absolutism. He defended the limitation of the monarch's power, stating that the right to freedom is a sacred right of the people, with the people being the only source of power. In this way, power is only legitimate if there is the consent of the people.

Locke (1994, p. 170) also believed that there should be a separation of powers, stating that:

And since the temptation to ascend to power may be too great for human frailty, it is not fitting that the same persons who hold the power to legislate should also have in their hands the power of executing the laws, for they might exempt themselves from obedience to the laws they have made, and bring the law into line with their will, both at the time of making it and in the act of its execution, and it would have interests distinct from those of the rest of the community, contrary to the purpose of society and government.

As Streck and Morais (2014, p. 40) point out, "it is with Locke that we see the inaugural constitution of the profile of political liberalism, sustaining the need to limit the power and functions of the State (...)".

Dallari (1998, p. 10) also asserts that "John Locke is, without any doubt, an important author, whose works, markedly anti-absolutist, exerted great influence on the so-called English Revolution of 1688, as well as on the American Revolution of 1776".

In the eighteenth century, the American Revolution (1776) and the French Revolution (1789) emerged.

Comparato (2010, p. 47) states that the "American Revolution was essentially, in the same spirit as the *English Glorious Revolution*, a restoration of the old franchises and traditional rights of citizenship, in the face of the abuses and usurpations of monarchical power".

Years after the American Revolution, more precisely, on September 17, 1787, the Constitution of the United States of America was approved in Philadelphia. However, the US bills of rights were only inserted into the constitutional text by amendments to the Constitution.

The first ten amendments to the Constitution date from December 15, 1791, and new amendments were approved later.

The *U.S. Bill of Rights* guarantees certain fundamental rights, among which we can highlight: freedom of religion and its free exercise, freedom of speech, freedom of the press, the right of the people to assemble peacefully, the right to petition, the prohibition of cruel or aberrant punishments, the prohibition of slavery, the right to vote for all U.S. citizens, the right to due process, the right to be defended by a lawyer, etc.

It is also important to note that even before the Constitution of the United States of America (1787), the *Bill of Rights* of Virginia (1776) already provided for fundamental rights, being "the first declaration of fundamental rights, in the modern sense." (SILVA, 2005, p. 153).

Unlike the American Revolution, in the French Revolution "the whole impetus of the political movement tended towards the future and represented an attempt at a radical change in the conditions of life in society." (COMPARATO, 2010, p. 47). The French Revolution was also strongly influenced by the French philosopher Jean-Jacques Rousseau, mainly by the doctrine of the social contract.

Thus, the French Revolution pursued a future free from the shackles of absolutism and a new form of society, in which every man could be the holder of essential rights and the people considered as the only source of power, breaking the chains of the past and inaugurating a new history.

Arendt (1988, p. 44-45), analyzing the American and French Revolutions, emphasizes the more universal character of the French Revolution, stating that:

it was the French Revolution, not the American Revolution, that set the world on fire. The sad truth of the matter is that the French Revolution, which resulted in disaster, made world history, while the American Revolution, so triumphantly victorious, remained an event of almost only local importance.

The French Revolution resulted in the Declaration of the Rights of Man and of the Citizen (*Déclaration des Droits de l'Homme et du Citoyen*) of 1789, which also has a more universal character compared to the *English and American Bills of Rights*.

Robert (apud SILVA, 2005, p. 157), supported by the abstract and universalizing character of the Declaration of the Rights of Man and of the Citizen (1789), states that it has three fundamental characteristics: intellectualism, globalism and individualism.

Intellectualism is due to the fact that the recognition of the existence of inalienable human rights and the need to reestablish a power legitimized by the consent of the people did not go beyond the intellectual universe, being developed only on the plane of ideas. It is characterized by globalism because the principles enshrined in the Declaration of the Rights of Man and of the Citizen are not limited to the French people, but seek a universal value, that is, it has principles of a universal nature. And, finally, individualism is observed because

the Declaration of the Rights of Man and of the Citizen only recognizes individual freedoms, omitting the freedoms of association and assembly, being concerned only with the defense of the individual against the State (ROBERT apud SILVA, 2005, p.157).

The Declaration of the Rights of Man and of the Citizen, despite its abstract character, is undoubtedly a milestone in the history of human rights and even served as a source of inspiration for many other subsequent declarations. Its spirit is one of freedom and equality. In it, man is seen as the holder of rights and free by nature. Furthermore, we can say that the Declaration of the Rights of Man and of the Citizen symbolizes the end of the era of absolute monarchy.

In addition, in 1791 the first written Constitution of France was inaugurated, which ensured equality among men, freedom, security, the inviolability of property, etc.

With the end of the absolutist State, the Rule of Law is born, which, in short, is a State that submits to the Law. This model of State is marked by the phenomenon of constitutionalism.

According to Silva (2005, p. 112), the Rule of Law, initially, was a typically liberal concept, which had the following characteristics:

(a) *submission to the rule of law*, which was the primary note of its concept, the law being considered as an act formally emanating from the Legislative Power, composed of representatives of the people, but of the people-citizen; (b) *division of powers*, which independently and harmoniously separates the Legislative, Executive and Judiciary powers, as a technique that ensures the production of laws for the former and the independence and impartiality of the latter in relation to the others and the pressures of powerful individuals; (c) *enunciation and guarantee of individual rights*.

Thus, in the Liberal State of Law, which is the first expression of the Rule of Law, the action (power) of the State was limited by the law. In addition, the law should be applied equally to all. The division of powers also appears as a milestone in the history of the Modern State, with only the Legislative Power (representatives of the people) being responsible for issuing laws. Citizens also have rights and guarantees assured, such as the right to equality, liberty, property, the guarantee of due process, etc. With this, there is a growth in individual freedoms.

Ferrajoli (2002, p. 690) also highlights the profound transformation in the social structure with the advent of the Rule of Law, stating that:

[...] the transformation of the absolute State into the State of law occurs simultaneously with the transformation of the subject into a citizen, that is, into a subject of the holder of rights that are no longer exclusively "natural" but "constitutional" in relation to the State, which becomes, in turn, bound in relation to the former.

On the theoretical level, the rule of law "emerges as a construction specific to the second half of the nineteenth century, born in Germany – as *the Rechtsstaat* – and, later, being incorporated into French doctrine (...)" (STRECK; MORAIS, 2014, p. 68).

In the Liberal State of Law, the intervention of the State was minimal (minimal State), being the result of the struggle for individual freedoms. The State should be neutral from the religious to the economic field (contractual freedom and free market economy). Thus, it was up to the State only to deal with the security and defense of the individual freedoms of citizens.

It so happens that this model of the Liberal State Law was gradually changed, because the minimum state intervention did not result in the idealized social model. On the contrary, society began to feel the effects of the non-interference of the State in many aspects, as inequalities and social injustices had only increased. The State then began to intervene more and more.

Thus, in the twentieth century, "due to a progressive assumption by the State of activities in the economic, social, social security, educational, etc. fields, its classic feature of a Liberal State gives way to that of a Social State" (BASTOS, 1995, p. 70).

The Social State of Law is characterized as an interventionist State, which materializes social rights (health, education, security, etc.) provided for by law. It is a State that is based on the duty to guarantee the realization of social rights and, with this, expands the list of fundamental rights.

Furthermore, it should be noted that "with the Social State of Law, a model is projected in which well-being and social development guide the actions of the public entity" (STRECK; MORAIS, 2014, p.73).

The Democratic Rule of Law appears as a new concept, which umbilically links the concept of the Rule of Law to that of democracy, making them inseparable concepts. In the words of Silva (2005, p. 119):

The configuration of the *Democratic Rule of Law* does not only mean formally uniting the concepts of Democratic State and Rule of Law. It consists, in fact, in the creation of a new concept, which takes into account the concepts of the component elements, but surpasses them to the extent that it incorporates a revolutionary component of transformation of the *status quo*.

Thus, the Democratic Rule of Law is based on the idea of social transformation, which, based on the link between the Rule of Law and the democratic ideal, enshrines popular sovereignty, the separation of powers (legislative, executive and judiciary), fundamental rights and guarantees, the principle of legality, democratic political organization, the equality

of all before the law, the written Constitution, etc. This is the State model adopted by the Federal Constitution of 1988 (art. 1, *caput*, CF).

The principles of the Democratic Rule of Law are: a) the principle of constitutionality, which determines that the Democratic Rule of Law must be based on a written Constitution; b) democratic principle (democracy of representation and participation); c) system of fundamental rights; d) principle of social justice; e) principle of equality; f) principle of division of powers; g) principle of legality and; h) principle of legal certainty (SILVA, 2005, p. 122).

Some observations should be made regarding the principles of the Democratic Rule of Law. The first is that a State can only be considered a Democratic State of Law if there is a separation of powers. Without this separation, power would be concentrated in the hands of a single person or a few people and there would be no control of state power. The second is that the Democratic State of Law is a State thirsty for effective popular participation (democracy of representation and participation) and, therefore, is governed by the democratic principle. The third is that the written Constitution limits the power of the State and ensures fundamental rights, being the basis of the Democratic Rule of Law. And, finally, as Streck and Morais (2014, p. 73) specify, legality in this model of State "takes the form of an effective search for the realization of equality, not by the generality of the normative command, but by the realization, through it, of interventions and regulations that directly imply a change in the situation of the community".

We can also highlight that article 3, items I, II, III and IV, of the Federal Constitution establishes the fundamental objectives of the Federative Republic of Brazil, which, in fact, are also the objectives of the Democratic Rule of Law, since article 1, *caput*, of the Federal Constitution states that the Federative Republic of Brazil is a Democratic State of Law. Thus, we have that the objectives of the Democratic Rule of Law expressed in the constitutional text are: a) to build a free, fair and solidary society; b) to guarantee national development; c) eradicate poverty and marginalization and reduce social and regional inequalities; d) to promote the good of all, without prejudice of origin, race, sex, color, age, and any other forms of discrimination.

Finally, in the field of intervention, in the field of state control, as we will see below, the constitutional principle of efficiency appears as a limiter of the interventionist or overly dirigiste state, making regulation a democratic expression of this control.

2.2 PRINCIPLE OF EFFICIENCY AND LIMITING PRINCIPLES OF STATE CONTROL

The word principle, from the Latin *principium*, means origin, beginning, primary cause, what comes before.

In the legal field, "principles are ordinances that radiate and magnetize the systems of norms" (SILVA, 2005, p. 92).

Or as Ávila (2011, p. 97) prefers, "principles, as they are immediately finalistic norms, establish an ideal state of affairs to be sought, which concerns other norms of the same system, notably the rules".

Constitutional Law is considered to be the starting point, that is, the common core of all the law to which they are linked and from which the various domains of the State's legal order also derive.

It follows that Constitutional Law is of paramount importance for administrative law. This is because the branches of law should always be correlated, never being interpreted in isolation, because the Federal Constitution, the main source of Constitutional law, brings in its core the so-called constitutional principles that are generic norms that serve as a basis for the entire legal system, including for state control, establishing limits to political action, as well as instituting protection for the individual in relation to the State, such a statement becomes clear because we are dealing with a democratic State of law. On this, let's see:

[...] The democracy that the Democratic Rule of Law achieves must be a process of social coexistence in a free, fair and solidary society (art. 3, I), in which power emanates from the people, and must be exercised for the benefit of the people, directly or by elected representatives (art. 1, sole paragraph); participatory, because it involves the growing participation of the people in the decision-making process and in the formation of acts of government; pluralistic, because it respects the plurality of ideas, cultures and ethnicities and thus presupposes the dialogue between divergent opinions and thoughts and the possibility of coexistence of forms of organization and interests different from society; It must be a process of liberation of the human person from forms of oppression that depends not only on the formal recognition of certain individual, political and social rights, but especially on the existence of economic conditions likely to favor their full exercise. (SILVA, 1988, p.24)

That is, the Constitution of a State is interpreted as a prerequisite for the validity of all laws, more specifically, it is the foundation for the construction of regulatory norms.

In the Brazilian legal system, the democratic rule of law aims to achieve social, participatory, and pluralistic democracy, having as one of the basic principles the principle of efficiency, topographically established in the Federal Constitution of 1988 in its article 37, after constitutional amendment 19/98. Otherwise, let's see:

Article 37. The direct and indirect public administration of any of the Powers of the Union, of the States, of the Federal District and of the Municipalities shall obey the principles of legality, impersonality, morality, publicity and efficiency, and also the following: [...].

This article provides that the Brazilian public administration, as a democratic administration, must stick to fundamentals, such as: legality; impersonality, morality; advertising and above all to effectiveness.

However, the principle of efficiency does not emerge in the legal system only with the constitutional reform of 98, we join the current that defends that efficiency, although not explicit, was present in the principled core of the Magna Carta, given its implicit allocation in principles, such as human dignity, reasonability and proportionality.

The dignity of the human person, a guiding and basic principle of the entire Brazilian legal system, worthy of note, is defined by Ingo Sarlet (SARLET, 2002, p.82). as follows:

[...] intrinsic and distinctive quality of each human being that makes him or her deserving of the same respect and consideration by the State and the community, implying, in this sense, a complex of fundamental rights and duties that ensure the person against any and all acts of a degrading and inhuman nature, as well as guaranteeing him or her the minimum existential conditions for a healthy life. in addition to providing and promoting their active and co-responsible participation in the destinies of their own existence and life in communion with other human beings [...]

Still on the dignity of the human person, Gustavo Tepedino states (TEPEDINO, 2005, p. 105):

In fact, the choice of the dignity of the human person as the foundation of the Republic, associated with the fundamental objective of eradicating poverty and marginalization, and reducing social inequalities, together with the provision of paragraph 2 of article 5 in the sense of not excluding any rights and guarantees, even if not expressed, as long as they derive from the principles adopted by the larger text, constitute a true general clause for the protection and promotion of the human person, taken as the maximum value by the legal system [...]

It should be noted that the Federal Constitution ensures that everyone, without distinction, has the right to a minimum list of constitutional rights and guarantees, so that the suppression and relativization of the guarantees established in the Magna Carta are not consistent with the democratic system, since the non-observance of these guarantees depersonalizes the human being and fosters the methodology of terror. On the subject, José Afonso da Silva states the following:

The configuration of the Democratic Rule of Law does not only mean formally uniting the concepts of Democratic State and Rule of Law. It consists, in fact, in the creation of a new concept, which takes into account the concepts of the component elements, but surpasses them to the extent that it incorporates a revolutionary component of transformation of the status quo. And there is a glimpse of the extreme importance of article 1 of the 1988 Constitution, when it states that the Federative Republic of Brazil

is a democratic State of Law, not as a mere promise to organize such a State, since the Constitution is already proclaiming and founding it there (SILVA, 2005, p. 15).

In other words, the realization of the democratic rule of law requires the strict observance of these and other principles brought in the heart of the Magna Carta, such an attitude shows respect for the difficult and time-consuming construction of the democratic rule of law, until it finally arrived at the modern conception that we have dealt with earlier.

Still in relation to the principles, other principles of paramount importance stand out, namely: the principle of reasonableness and proportionality.

This analysis allows us to verify that all citizens will be assured state intervention, state control, diligent, balanced, democratic and above all based on findings and evidence.

In fact, the non-adoption of the efficiency of public regulation greatly infringes the guarantee of equal treatment, given by the constitution to citizens and restricts the dignity of the human person as well as state relocation, since government policy is flawed by a fair, solidary bias and consecration of free enterprise.

3 REGULATORY IMPACT ANALYSIS: VALIDITY AND NECESSITY OF EXISTENCE

3.1 DEFINITION AND METHODS OF REGULATORY IMPACT ANALYSIS

As stated elsewhere, as of Amendment 19/98, the efficiency of the administration was raised to the level of a constitutional principle. Thus, Brazil began to have a regulatory structure in several sectors, through regulatory agencies (around 12 agencies) or through other actors that issue normative instruments of an administrative nature. It is unforgettable, regulation is a way to control, and give vent to government plans.

Although timidly, *the RIA* has found resonance in the Brazilian regulatory structure. Based on the principle of efficiency of public administration, the *RIA* consists of a decision-making procedure, based on evidence, which seeks to evaluate, based on the definition of a regulatory problem, the possible impacts of the available action alternatives to achieve the intended objectives, as follows:

It consists of a systematic process of evidence-based analysis that seeks to evaluate, based on the definition of a regulatory problem, the possible impacts of the available action alternatives to achieve the intended objectives. Its purpose is to guide and subsidize decision-making and, ultimately, to contribute to effective, efficient and efficient regulatory actions. (GUIA AIR, 2018, p. 01).

Originating in the USA, for more than 30 years, the *AIR* is adopted by the member countries of the OECD (Organization for Economic Cooperation and Development). Brazil,

as a guest member of such an organization, was expressly recommended to adopt the tool called *AIR* in order to assess their regulatory quality, It is important to highlight:

It is necessary to have a systematic strategy, with a structure for analyzing regulation that ensures transparency, social participation and economic efficiency, with explicit responsibilities at the political and administrative levels. The discussion on the standardized process of preparing new regulatory standards that include their impact assessment is beginning to take place. There is also a need to prepare regulatory capacities within the administration in the medium and long term. (VALENTE, 2010, p. 31)

In early 2018, Brazil, through the Chief of Staff, edited the General RIA Guidelines and the RIA Guide, which set the complex and comprehensive tone of *the AIR*. Such guidelines and guidelines are embryonic initiatives in the field of *RIA*. Such guidelines are already an anticipation of PL 6.621/2016, called the Agencies Bill, which will deal in greater depth with the implementation of the *RIA* in Brazil.

Bill No. 6,621/2016 – Agencies Bill – which provides for the management, organization, decision-making process and social control of regulatory agencies, amends Law No. 9,427, of December 26, 1996, Law No. 9,472, of July 16, 1997, Law No. 9,478, of August 6, 1997, Law No. 9,782, of January 26, 1999, Law No. 9,961, of January 28, 2000, Law No. 9,984, of July 17, 2000, Law No. 9,986, of July 18, 2000, Law No. 10,233, of June 5, 2001, Provisional Measure No. 2,228-1, of September 6, 2001, Law No. 11,182, of September 27, 2005, and Law No. 10,180, of February 6, 2001, and provides for other provisions. The processing and the full text of the Bill in question, approved in the Federal Senate as PLS No. 52/2013, is available at <http://www.camara.gov.br/proposicoesWeb/fichadetramitacao?idProposicao=2120019> (op. cit. 2018, p. 05).

Checking the OECD recommendations, as well as the guidelines issued by the Brazilian executive, it is observed that the *RIA* brings a technical basis to the public administration, that is, it makes regulation (state intervention) be done through evidence. The political nature of government decisions is removed, such decisions are attributed a democratic character and based on logical studies. *The RIA* verifies costs, scopes, trends, degradations, incentives, in short, all of this that can be seen as the IMPACT OF REGULATION.

Through a multidisciplinary team, from the regulatory body itself, *RIA* intervenes in government decision-making. In addition to the multidisciplinary team, *AIR* seeks evidence in public hearings, which are very common to it.

Through numerous phases, an approximate number of 11, the *RIA* aims to study the impact of government regulation and not of an isolated human or business action. With a

positive notion of impact, the *AIR*, does not need to be used only in regulatory agencies, it can be used in government plans that impact the rights and obligations of people, companies and economic agents.

Furthermore, other ways of verifying the impact of state regulation are only informative, do not help in better decision-making, do not give a direction to the public administration, are only a sieve for the embargo or not of government decisions, which may or may not be degrading to the administration.

This time, other ways of verifying the impact of state control have a merely informative condon.

Riddled with few procedures, or with watertight and limited phases, the other forms of verification of the impact of regulation have the scope of analyzing only the governmental impact of a human action, without comparing the impacts on the environment, the economy, free enterprise, individual freedoms, that is, without analyzing other demands of other agents.

With an extremely negative notion of impact, the other forms of analysis of state intervention are less comprehensive, given its compulsory aspects, which make the absence of control evaluation generate administrative and even criminal consequences.

Undoubtedly, the greater the analysis of state control/regulation, the lower the impact of this control on social systems. Thus, the other forms of evaluation of state control, which are not *RIA*, are shown, as an analysis of the impact of state control, lame and narrow-minded.

Regulatory impact studies seem to be institutes that have already been surpassed, in comparison with the *AIR* Regulatory Impact Analysis. Unlike the *RIA*, the other studies of the impacts of controls are not very democratic and not very technical, since they are linked to greater political sieves.

The *AIR*, seems to suppress and supplant the pretensions of other studies of the impact of regulation. It is a more fruitful analysis of the impact of state control, closer to public and private bodies, with a greater reach of data, evidence and accuracy in decision-making.

In this essay, regulatory agencies, as well as other government entities, can and should be reached by the *RIA*, as a way to give truth, efficiency and validity to state controls.

3.2 THE HETERONOMY OF WILL AS AN INSTRUMENT OF VALIDITY OF THE ANALYSIS OF THE REGULATORY IMPACT

"Where there is no respect for life and for the physical and moral integrity of the human being, where the minimum conditions for a dignified existence are not ensured, **where there is no limitation of power**, in short, where freedom and autonomy, equality and

fundamental rights are not recognized and minimally ensured, there will be no room for human dignity and the person will be nothing more than a mere object of arbitrariness and injustices."

(Ingo Sarlet – Brazilian Judge and Jurist)

The "Heteronomy of the will" was a concept created by Immanuel Kant in his work "Foundations of the Metaphysics of Morals" published in 1785 to denote the subjection of the individual to the will of third parties or of a collectivity, in this case the will of the State to the detriment of the individual will of each one of us. The autonomy of the individual, in a society, is set aside to make room for heteronomy, which is considered a basic principle related to the Rule of Law, in which everyone must submit to the will of the law (state) (IMMANUEL KANT, 2007, p.86). Still on this explanatory path, the philosopher Emmanuel Levinas elucidates with his point of view:

Heteronomy is not slavery, it is precisely its opposite. Morality is not based on a sovereign will of the Self, but on respect for the freedom of the Other, and for this it is necessary to be willing to limit oneself so as not to impose oneself on another. Obedience to the law created by Others does not mean servitude or submission to a tyrant, but rather the overcoming of the claim of the Self to be the ultimate and only foundation of all rules. Heteronomy is the norm, the external rule and does not depend on the will of the subject.

In this vein, when we deal with heteronomy in the *AIR*, we are talking about the sovereignty that is conferred solely and exclusively on the state to carry out all government plans, verifying their impact and extent. From this point of view, we can, with more propriety, understand as one of the purposes of a Social and Democratic State of Law, where the State takes upon itself the responsibility of managing the entire political, economic, social and cultural system, this is the model that the Brazilian State adhered to as a form of government being guaranteed by our Federal Constitution. In view of the above, the Brazilian State holds for itself the exclusivity of the Right of Regulation.

In this bias, the *RIA* adopted in Brazil does not violate the constitutional impediments on heteronomy.

Thus, it is concluded that after the demystification of the possible danger of adopting *RIA* in the Brazilian administrative system, together with the clarification of the models in force and admitted by our State, we can now understand that *RIA* gains space in national regulation, in order to combat the bankrupt system that we have operated today, which we can link to the panacea of all evils accumulated by decades of neglect of the public administration system in the Brazilian administrative system. which concerns the verification of the best regulation and its impacts on the beneficiaries of governance systems.

In our entire legal system, there is not a single legal or jurisdictional impediment that prevents the adoption of *RIA* and its multiple processes of filtering and comparison of the best regulation.

Checking the definition previously addressed about *AIR*, however, what exists are rules that deal with the unavailability and non-delegability of functions and attributions of the public administration, many of which are even binding and incapable of having, in their impacts, an accurate analysis or measurement.

Thus, we confirm that there are no rules or legal impediments that prevent the assessment of the regulatory impact on the performance of material aid activities or essential to the proper functioning and quality of the execution of government plans.

Contrary to impediments, the *RIA* is legitimized and this legitimacy is demonstrated within the characteristics of the Democratic Regulatory State itself, as follows:

With regard to the points of contact between independent agencies and the democratic principle, at least two lines of argument are plausible. First, the idea of submitting control over policies aimed at the long term and demanding, by their nature, a predominantly technical and professional management, can be seen as a form of democratic exercise.

Remember that democracy is not a concept that can be confused with majority rule; Democracy is, above all, a project of collective self-government in which social deliberations are carried out over time. In this vein, a collective deliberation that represents pre-commitment in the medium or long term requires, as a condition for its fulfillment, a management that is less responsive to the political-electoral logic and more responsive to the law and technical rationality.

Ultimately, enforcing democratically assumed pre-commitments is also a way of realizing the democratic ideal of collective self-government.

[...]

On the other hand, independent authorities do not need to and should not be closed spaces, inimical to the positions and opinions of economic agents, consumers, and civil society as a whole. The procedural opening of regulatory deliberations represents, in fact, an attempt to foster the constitution of a new public sphere, shaped by more technical parameters and specifically related to the regulated matter. (BINENBOJM, 2008, p. 303).

Ending the permissive legal bases for the Regulatory Impact Analysis with the aim of better state interference in the social, economic and cultural gears, we conclude peremptorily that it is an irrefutable, uncontroversial, incontestable matter as to the possibility of *AIR*, if there is interest, to provide services to the public sector, in the numerous administrative activities.

We will present only two obstacles that are most discussed among jurists, sociologists, people who participate in society in general, as well as their negative views of the Regulatory Impact Analysis. In the first place, we would find the obstacle in the political sphere, there is

a possible speculation about the possibility that the private interest of companies and individuals will influence the terms of the evaluation with the State and even in the conduct of the country's government policy. In other words, with the proper inclusion and systematization of *the RIA* in Brazil, there would be pressure from companies and/or individuals to increase or reduce the control of regulation, fostering or removing the focus of public plans from certain areas. However, this practice, already known by countries such as the USA and Germany, is called Lobbying, which means "influencing legislators and/or public actors, that is, for this deviation of purpose proposed by those opposed to greater control of the sectors to work, we would depend solely and exclusively on the public manager. In this sense, we would be admitting that the legislator and other actors of the administration, who must be impartial and meet the social interests, would be corrupting themselves by giving in to the pressures of private individuals, which proves once again that it will not be the *RIA* or any other type of administrative decision or control of administrative decision that will prevail in the occurrence of such a fact. (DONAHUE, 1992, p. 190).

In this vein, we also have the accurate observation of Patrícia Pessoa Valente, let's see:

After addressing three grounds for the adoption of regulatory impact assessment (state efficiency, legitimacy of regulatory decisions, and political control), one question still remains unanswered. How is it possible for this tool to be considered a mechanism of political control of regulatory agents by the principal, while at the same time having the potential to play a fundamental role in legitimizing regulatory decisions through the active participation of the administered? In other words, it is the same as the reducing element of the democratic deficit of the regulatory State identified by *the RIA* is sometimes seen from the perspective of the administered (users and suppliers of services and goods in the regulated sectors), or from the perspective of the main one (Legislative and Executive Branches). Which of the two angles should prevail?

In theory, the logic of each of the controls carried out is quite different and, why not say, divergent. Suppose the case of a regulatory decision on the granting of licenses for the provision of a certain service by a greater number of economic agents. In this case, the control exercised by the principal will be focused on whether the objectives desired by the voters will be met. The private party that will no longer have a market reserve with the decision will seek to contest it, while others will seek to maintain it with the prospect of also passing and providing the service. Users, in an even different way, will want more affordable rates and a greater number of providers to be able to choose the one that suits them.

[...]

However, the concept of regulatory impact assessment presented in *chapter 2* allows us to understand that this apparent contradiction of interests is part of the institutional design of the agents involved in the Regulatory State. What is verified, in fact, is a flow of interests in different directions in a triangulation that represents the effectiveness of the Democratic State of Law through the regulatory State. (2010, p. 158-159)

Finally, and very fragile, the argument used as an impediment to the implementation of the *RIA* is in the economic management, the opponents allege that the excess of phases, the complexity of the analysis, the deepening of the debates, the call for public hearings would be much higher than the cost of the transfer would be much higher than the investments applied by the State, as occurs, for example, with state privatizations.

Therefore, the regulations submitted to this analysis can have a much higher performance than the simple interference of public agencies, their administrators directly contribute to this feat, in case of mismanagement of the *AIR*, the penalty for the administration is the collapse of the activity and the better allocation of government plans.

4 CONCLUSION

State intervention, that is, fruitful and necessary state control, can only exist, state regulation can only exist, so that social relations are balanced and government plans are given vent, as well as there is promotion of sectors of the economy, thus enshrining a professional, technical, instrumental, popular, democratic bias of this control, making it appear, among others, the principle of efficiency of administration, which calculates, predicts, seeks evidence, encompasses experiences and measures the size of the impact of state interference.

The absence of regulatory impact assessments, or the existence of weak studies to analyze the effects of regulation is not consistent with the model of the Democratic Rule of Law. The regulatory trend experienced by contemporary Western societies has put in check the forms of implementation of government plans, public policies and economic designs. The fact is that when state regulation is used too much, without a filter, without an evidence base, democratic values are inverted, opening the door to the abuse of state interventionist power.

Thus, state regulation must be proportional, adequate, and evidence-based. Towards this ideal, Regulatory Impact Analysis (*RIA*) has been moving towards this ideal, a procedure for public administration decision-making, which has the power to verify the impacts, the scope and, without any doubt, the democratization of state regulation, of public administration plans.

The *RIA*, already implemented in Brazil, brings democracy closer to the state's regulatory power, making this power a delineator of proportionality and reasonableness of the regulated and the regulator. Now, with a technical procedure, attributed to numerous phases, filled with fewer political actors than social, cultural, economic, it will certainly have the power to verify the size of the impact of the state's control and make the public administration more efficient.

It is important to emphasize that the greater the analysis of the impact of state control, the lower this control will be. From Amendment 19/98 onwards, the efficiency of the administration was raised to the level of a constitutional principle, therefore, it is unforgettable that only the *RIA* can give the regulation its true function and democratic conception.

Finally, in Brazil, what is perceived are numerous ways of measuring the impacts of state regulation, forms that are dissociated from democracy, technique, popularity, and even legal basis. However, the Regulatory Impact Analysis (RIA) seems the only way to supplant this narrow-minded, lame and anti-democratic regulation. The *RIA* is the legitimate way, with democratic expressions to promote control, a balanced and efficient state regulation.

Fabiano Prudêncio da Silva¹

ABSTRACT

Urban space regulation in Brazil has traditionally been analyzed through municipal planning instruments such as master plans and zoning regulations. However, in coastal cities, urban spatial production is shaped by legal and institutional regimes that go beyond urban policy in a strict sense, particularly federal land management. This article examines the territorial implications of federal coastal lands (terrenos de marinha) and the definition of the Mean High Tide Line (Linha de Preamar Média – LPM) within the context of urban planning, based on a case study of Santa Catarina Island, in the municipality of Florianópolis, Brazil. The research adopts a qualitative approach, combining institutional and normative analysis, comparative spatial analysis using GeoFigureic Information Systems (GIS), and an integrated interpretation of territorial effects associated with the coexistence of areas with approved and unapproved LPM. The findings indicate that federal land tenure uncertainty produces normative insecurity, institutional fragmentation, and significant territorial differentiation, directly affecting urban occupation patterns, licensing processes, and spatial consolidation. By engaging with current debates in Urban and Regional Planning, the article argues that federal land management constitutes an active dimension of urban governance in coastal cities and should be explicitly incorporated into analyses of territorial planning and urban policy.

marinha e a definição da Linha de Preamar Média (LPM) no contexto do planejamento urbano, a partir do estudo de caso da Ilha de Santa Catarina, no município de Florianópolis (SC). Metodologicamente, a pesquisa adota abordagem qualitativa, articulando análise institucional e normativa, leitura espacial comparativa em ambiente de Sistemas de Informação Geográfica (SIG) e interpretação integrada dos efeitos territoriais associados à coexistência de áreas com LPM homologada e não homologada. Os resultados evidenciam que a indefinição patrimonial federal produz insegurança normativa, fragmentação institucional e diferenciações territoriais significativas, incidindo diretamente sobre padrões de ocupação, processos de licenciamento urbanístico e consolidação do espaço urbano. Ao dialogar com o debate atual do Planejamento Urbano e Regional, o artigo sustenta que a gestão patrimonial da União constitui dimensão ativa da governança urbana em cidades costeiras, devendo ser incorporada de forma explícita às análises sobre ordenamento territorial e políticas urbanas.

RESUMEN

La regulación del espacio urbano en Brasil ha sido analizada tradicionalmente a partir de los instrumentos municipales de planificación, como los planes directores y el zonamiento. Sin embargo, en las ciudades costeras, la producción del territorio urbano está atravesada por regímenes jurídicos e institucionales que exceden el ámbito de la política urbana en sentido estricto, destacándose la gestión patrimonial federal. Este artículo analiza las implicaciones territoriales de los terrenos de marina y de la definición de la Línea de Preamar Media (LPM) en el contexto de la planificación urbana, a partir del estudio de caso de la Isla de Santa Catarina, en el municipio de Florianópolis (Brasil). Metodológicamente, la investigación adopta un enfoque cualitativo, articulando análisis institucional y normativo, lectura espacial comparativa mediante Sistemas de Información Geográfica (SIG) e interpretación integrada de los efectos territoriales asociados a la coexistencia de áreas con LPM homologada y no homologada. Los resultados muestran que la indefinición patrimonial federal produce inseguridad normativa, fragmentación institucional y diferenciaciones territoriales significativas, incidiendo directamente en los patrones de ocupación urbana, los procesos de licenciamiento y la consolidación del espacio urbano. Desde la perspectiva del Planeamiento Urbano y Regional, el artículo sostiene que la gestión patrimonial federal constituye una dimensión activa de la gobernanza urbana en ciudades costeras.

1 INTRODUCTION

The regulation of urban space in Brazil has traditionally been analyzed from the classic instruments of municipal urban policy, such as the master plan, zoning and land use and occupation codes. Although central to the organization of the urban territory, these instruments do not exhaust the set of state practices that affect the production of space (LEFEBVRE, 2024). As Souza et al (2022) argue, urban planning should be understood as an expanded field of decisions, conflicts, and institutional practices that go beyond formal normative devices, incorporating different modalities of territorial regulation exercised by the State (JESSOP, 2015).

In coastal cities, this regulatory complexity tends to intensify. Rizzo (2013) considers that the presence of federal public assets and the performance of the Union's patrimonial management introduce additional layers of regulation that, to a large extent, remain marginalized in the debate on Urban and Regional Planning. Monte-Mór (2024) points out that sectoral state decisions, even if formulated outside the strict scope of municipal urban policy, exert concrete territorial effects on the production of space, especially in contexts marked by multi-scale governance arrangements and overlapping institutional competences.

In the Brazilian case, marine land and its additions are one of these specific regulatory layers. Anchored in their own historical, legal and institutional foundations, these federal public goods affect extensive portions of the coastal urban territory, conditioning forms of use, occupation and appropriation of urban land. Rocha (2018) demonstrates that the historical constitution of these assets gives them a unique legal status, whose effects are not limited to the patrimonial plan, but are updated in the current urban context, especially in cities subjected to intense real estate pressures and accelerated processes of land appreciation, as is the case of the municipality of Florianópolis.

Despite its significant territorial relevance, the Federal Government's patrimonial management is rarely systematically incorporated into analyses of urban territorial planning, and is often treated as an external or merely administrative dimension of urban policy. Rolnik (2015) observes that this analytical separation contributes to the invisibility of state mechanisms that, although not classified as urban instruments *stricto sensu*, directly interfere in the processes of production of urban space, land regulation, and unequal distribution of the benefits of urbanization.

2 THEORETICAL FRAMEWORK

The understanding of territory as a social and political construction is a central foundation in the field of Urban and Regional Planning (LEFEBVRE, 2024). Far from being a

mere physical support for human actions, territory expresses power relations, normative disputes and institutional arrangements that materialize spatially (SANTOS, 2001). In view of this, territorial planning processes must be analyzed from the interaction between different scales of government, normative instruments, and forms of state regulation (BRENNER, 2019).

Cunha (2018) and Kabilio (2016) highlight that urban planning in its current configuration operates in contexts of complex governance, in which multiple institutional instances produce often overlapping territorial regulations. This approach shifts the analytical focus from classical urban instruments to a broader reading of the state practices that shape the urban territory, including those derived from sectoral policies and specific legal regimes, often situated outside the strict scope of municipal urban policy.

In the Brazilian context, Lenzi and Gonçalves (2025) argue that urban planning cannot be reduced to a technical set of norms and plans, and should be understood as a field of political and institutional dispute. This reading is particularly pertinent in coastal cities, where municipal urban regulations, environmental legislation and federal patrimonial regimes coexist, producing a complex and sometimes contradictory regulatory architecture on the territory.

2.1 FEDERAL PUBLIC GOODS AND PRODUCTION OF URBAN SPACE

Entering the point "the Navy Lands," in the meaning of the word, in the provisions of Law No. 7,661/1988, which instituted the National Coastal Management Plan:

Article 10. Beaches are public goods for the common use of the people, and free and open access to them and to the sea is always ensured, in any direction and direction, except for stretches considered to be of national security interest or included in areas protected by specific legislation.

ParaFigure 1. Urbanization or any form of land use in the Coastal Zone that prevents or hinders the access ensured in the caput of this article will not be allowed.

ParaFigure 2. The regulation of this Law shall determine the characteristics and modalities of access that guarantee the public use of the beaches and the sea.

ParaFigure 3. A beach is understood to be the area periodically covered and uncovered by the waters, plus the subsequent strip of detrital material, such as sand, gravel, pebbles and boulders, up to the limit where the natural vegetation begins, or, in its absence, where another ecosystem begins. ()

In the course of the bibliographic research, it was possible to identify that the literature on public goods in Brazil emphasizes legal and administrative aspects, leaving its territorial implications in the background. However, there are studies, some even more recent, have been pointing to the need to incorporate the Union's asset management into the urban and regional debate. (LEFEBVRE, 2024) demonstrates that marine land, although instituted in specific historical contexts, remains as active elements in the conformation of urban space, especially in coastal areas subject to real estate appreciation.

Santos (2001) argues that legal instruments and regimes apparently external to urban policy exert a direct influence on the processes of space production, by conditioning access to land and land use patterns. Along the same lines, Cabral and Oliveira (2025) indicate that the Union's role as a landowner in urban areas introduces its own regulatory dynamics, often disconnected from municipal planning instruments.

By establishing particular conditions of occupation, collection of fees and domain recognition, the management of the Union's assets acts as an indirect mechanism of territorial planning, as Maricato (2014) points out. However, this action is rarely integrated in a coordinated way with local urban policies, contributing to institutional fragmentation and the emergence of territorial conflicts, especially in areas of high pressure on urban land (HAESBAERT et al, 2022).

2.2 AVERAGE PREAMAR LINE, NORMATIVE UNCERTAINTY AND MULTI-SCALAR GOVERNANCE

What is the Mean Preamar Line - LPM/1831? the 1831 Preamar Média line constitutes the legal and spatial reference used to identify navy lands, under the terms of article 20, item VII, of the 1988 Federal Constitution (BRASIL, 1988).

The legal concept is provided for in article 2 of Decree-Law No. 9,760/1946, according to which marine lands are those located in the range of 33 meters, measured horizontally for the part of the land, from the average preamar line of the year 1831, - that is, the LPM/1831 is the legal reference to identify the marine lands and their additions, which are property of the Union.

The concept of preamar gained a legal definition in Brazil in 2004, with Decree No. 5,300, of December 7, 2004, as being "the maximum height of sea level along a tidal cycle, also called high tide" (BRASIL, 2004).

Figure 1*Delimitation of LPM/1831*

Source: Boscatto et al. (2018).

The regulation evolved with Normative Instruction SPU/SEDMM/ME No. 28, of April 26, 2022, which delimited the demarcation of marine lands, establishing criteria and procedures for the demarcation of marine lands and their additions and identification of areas under the Union's domain (Brasil, 2022).

The Mean Preamar Line (MPL) occupies a central position in the delimitation of marine land and, consequently, in the definition of the legal regime applicable to urban coastal areas (BOSCATTO et al., 2018). Recent literature points out that the coexistence of stretches with homologated and non-homologated LPM produces normative asymmetries within the urban territory, affecting both the public authorities and private agents (ROSA et al, 2018).

The non-homologated line (LPM/1831 not homologated) is one that, despite having already been the object of technical studies (cartographic, geodetic, historical and hydrographic), and even having possibly already gone through the demarcation process, but which has not yet been formally approved by the competent authority of the Secretariat of Federal Heritage, through a specific administrative act, given that it did not go through all the required procedural steps (conclusive technical analysis, legal control, administrative publicity, notification of interested parties) (BRASIL, SPU, 2022). As for the homologated line (LPM/1831 homologated), it is the one that was the object of demarcation, underwent complete technical instruction (surveys, georeferencing, confrontations, historical and domain analysis), having been submitted to the competent authority of the SPU and approved by an express administrative act of homologation and due publicity (BRASIL, SPU, 2022).

These asymmetries between the demarcation issue, approved and non-approved areas, are seen as a problem, as Jessop (2015) and Brenner (2019) point out, in which these differences manifest themselves in the form of legal uncertainty, overlapping competences,

and difficulties in articulating between governmental scales. In the conception of Almeida and Reis (2024), normative fragmentation tends to weaken the capacity for integrated planning, compromising the effectiveness of territorial planning policies in complex areas.

In the case of island cities, such as Florianópolis, this problem intensifies due to the physical restrictions of the territory and the high pressure (real estate interests) on urban land. Empirical studies, such as those by Cunha (2018), Castro (2008) and Kabilio (2016) show that the lack of definition of federal patrimonial boundaries directly impacts the processes of urban licensing, land regularization and implementation of housing policies.

2.3 URBAN PLANNING, SPATIAL READING AND INTEGRATED ANALYSIS

In view of this scenario, the literature on Urban and Regional Planning has highlighted the importance of integrated analytical approaches, capable of articulating legal, institutional, and spatial dimensions, as pointed out by Cabral and Oliveira (2025). Moura (2014) supports it, defending the use of geotechnological tools as a support for the critical reading of the territory, not as an end in themselves, but as instruments for interpreting the regulatory practices that materialize in space.

In the Brazilian context, this perspective has been adopted in studies that analyze the overlapping of normative and territorial layers, such as urban zoning, protected environmental areas, and differentiated land regimes (SOUZA et al., 2022; ALMEIDA; REIS, 2024). Such approaches allow us to highlight how different planning rationalities coexist and sometimes conflict in the urban territory.

Thus, by articulating the theoretical debate on territorial regulation, public goods, and multi-scalar governance, this article bases its empirical analysis on the understanding that the Union's heritage management constitutes an active dimension of the production of urban space, and should be explicitly incorporated into the analytical field of Urban and Regional Planning (HAESBAERT, 2022). In this perspective, the territory is conceived as a relational construction and crossed by multiple scales of power, which reinforces the centrality of the State in the mediation of land uses and appropriations (Naspolini, 2019). In addition, recognizing space as a product of social and institutional relations, the analysis is close to the formulation of Lefebvre (2024), for whom the production of space results from practices, representations, and strategies that materialize political and economic projects. In this way, the Union's patrimonial management can be understood as a concrete instrument of territorial planning and dispute for the production of urban space (LEFEBVRE, 2024).

3 METHODOLOGY

This study adopts a qualitative approach, of an analytical-interpretative nature, articulated with institutional, normative and spatial analysis procedures, with the objective of understanding the territorial implications of the Union's patrimonial management in the context of coastal urban planning. It is based on the assumption that norms, administrative instruments and legal regimes produce concrete spatial effects, which can be apprehended through the integrated reading between legal framework, institutional practices and materializations in the territory.

The methodological strategy is structured in three complementary axes: a) institutional and normative analysis of the Federal Government's asset management; b) comparative spatial analysis in a GeoFigureic Information Systems (GIS) environment; c) analytical integration and interpretation of the territorial effects associated with the coexistence of differentiated heritage regimes in the urban space.

3.1 DELIMITATION OF THE STUDY

The study area comprises the Island of Santa Catarina, corresponding to the insular portion of the municipality of Florianópolis (SC). The choice of this territorial area is justified by three main reasons. First, it is a coastal urban territory marked by high socio-environmental complexity and intense real estate pressure. Secondly, the area has a significant incidence of federal assets, especially marine land and its additions, which makes the performance of federal asset management particularly relevant for the conformation of urban space. Finally, stretches with homologated and non-homologated Linha de Preamar Média (LPM) coexist in

the territory, a condition that allows a comparative analysis of the territorial effects associated with different federal patrimonial regimes.

This configuration makes the Island of Santa Catarina a privileged empirical approach to examine the patrimonial management of the Union as a constitutive dimension of urban regulation, in interaction and, at times, in tension with municipal planning instruments.

3.2 INSTITUTIONAL AND NORMATIVE ANALYSIS

The first methodological axis consisted of carrying out an institutional and normative analysis of the Union's patrimonial management, focusing on marine lands. Legal and administrative provisions that regulate the definition of the LPM, the recognition of the federal domain and the forms of occupation and use of these public assets were examined, including federal legislation, decrees, ordinances and normative instructions issued within the scope of the Secretariat of Federal Heritage (SPU).

At the same time, the main instruments of municipal urban planning incident on the study area were analyzed, with emphasis on the Master Plan of Florianópolis and the legislation of land use and occupation. This stage sought to identify convergences, overlaps and normative conflicts between federal patrimonial regulation and municipal urban regulation.

The institutional analysis was guided by the identification of situations of institutional fragmentation, understood as the coexistence of normative and decision-making regimes not fully articulated between the federal and municipal scales, as well as normative insecurity, expressed in the lack of definition or ambiguity regarding the legal regime applicable to certain areas of the coastal urban territory.

3.3 COMPARATIVE SPATIAL ANALYSIS IN GIS ENVIRONMENT

The second methodological axis was based on the performance of comparative spatial analysis through Geographic Information Systems (GIS). Geospatial layers were used referring to the delimitation of the approved and non-approved LPM, the municipal urban zoning, the use and land cover and the delimitation of the urban perimeter of the Island of Santa Catarina.

Figure 2

CartoFigureic map – situation of the LPM/1831 of Santa Catarina Island.

Blue line: complete demarcation-----

Green line: not homologated-----

Red line: approved.....

Source: BRAZIL. Secretariat of Federal Heritage (SPU), 2024.

The spatial analyses consisted mainly of overlay operations and comparative reading between the different layers, with the objective of identifying differentiated patterns of urban occupation and normative incidence associated with the different federal heritage regimes. The comparison between areas with homologated and non-homologated LPM allowed us to highlight how the definition – or lack of definition – of the federal patrimonial boundaries is reflected in the spatial organization of the urban territory.

It is important to highlight that the use of GIS was not conceived as a merely technical or cartoFigureic procedure, but as an analytical tool, aimed at the critical interpretation of regulatory practices that materialize spatially, according to the approach advocated by Almeida and Reis (2024).

Finally, based on the cartoFigureic base made available by the SPU and the administrative acts published between 2020 and 2025, the spatial crossing between the demarcated and approved stretches of the LPM was carried out, allowing us to estimate that approximately 100% of the island portion is demarcated, while about 10% have formal approval completed. It is possible to identify that only the neighborhoods: Centro, Sacos dos limões, Prainha / José Mendes and Beira Mar Norte have the LPM / 1831 – approved.

The cartoFigureic bases used included:

- a) vector files referring to the delimitation of the Medium Preamar Line made available by the Federal Heritage Secretariat;
- b) administrative acts and demarcation notices published between 2020 and 2025;
- c) layers of urban zoning and urban perimeter obtained from the Municipality of Florianópolis;
- d) auxiliary bases for land use and cover. The systematization and spatial crossing of this information allowed us to estimate the demarcated and homologated territorial extension of the LPM in the insular portion.

3.4 LIMITATIONS OF EQUITY DATA AND ANALYTICAL VALIDATION

The research recognizes that the data regarding the delimitation of the LPM have limitations inherent to its administrative and cartographic nature, related to the date of approval, the accuracy of the surveys and the updating of the records. These limitations do not invalidate the analysis, but are considered in the interpretation of the results, especially with regard to the areas where the LPM has not yet been formally approved.

The explanation of these limitations is part of the methodological rigor adopted, since the normative lack of definition itself is understood as a constitutive element of the phenomenon analyzed, producing relevant territorial effects in the context of urban planning.

3.5 FEDERAL PATRIMONIAL REGIME AS A MECHANISM OF INDIRECT TERRITORIAL REGULATION

The analysis developed in the previous sections allows us to move towards an interpretative synthesis about the incidence of the federal patrimonial regime on the urban dynamics of the Island of Santa Catarina. Starting from the understanding of space as a social product (SANTOS, 2001; LEFEBVRE, 2024) and the State's action on multiple scales (JESSOP, 2015; BRENNER, 2019), it is proposed to understand the 1831 Average Preamar Line (LPM/1831) not only as a technical-cartographic instrument, but as a legal-territorial device with concrete effects on the organization of urban space.

The regime established by Decree-Law No. 9,760/1946 and updated by Law No. 9,636/1998 establishes the Federal Government's dominionality over marine land, directly affecting areas within the municipal urban perimeter. Such a configuration reveals a normative overlap in which federal and municipal competences coexist over the same territory.

From the empirical systematization carried out, especially regarding the condition of full demarcation of the LPM on the island and the formal homologation still restricted to the

reduced portion of the territory, it is evident that federal dominiality produces different effects according to the administrative stage of the line. This difference is not merely formal: it interferes in the processes of real estate registration, land regularization, licensing and circulation of urban property.

Based on these findings, the following analytical chain is proposed:

Federal Property Regime → Indirect Regulatory Mechanism → Territorial Effects

The patrimonial regime constitutes the normative basis; the indirect regulatory mechanism is manifested in the requirement of administrative procedures linked to the Secretariat of Federal Heritage. The territorial effects materialize in the spatial differentiation between areas with a greater or lesser degree of normative security, impacting dynamics of valorization, occupation and planning.

This structure allows us to understand the LPM as an active element in the production of urban space, articulating with processes of fragmentation and territorial dispute already observed in Florianópolis (NASPOLINI, 2019; RIZZO, 2013; SIQUEIRA; LUCAS, 2023). The patrimonial instrument, although conceived in a different historical context, continues to operate as a structuring variable in contemporary territorial governance.

Thus, the LPM should not be interpreted only as a historical coastal reference line, but as a legal device whose multi-scale incidence reconfigures urban planning practices.

4 RESULT AND DISCUSSION

This section examines the empirical results of the research based on the spatialization of the 1831 Average Preamar Line (LPM/1831) in the insular portion of Florianópolis, articulating the cartographic analysis to the legal and institutional foundations discussed above. Considering space as a product of social relations mediated by normative structures (SANTOS, 2001; LEFEBVRE, 2024) and the multi-scale role of the State in territorial regulation (JESSOP, 2015; BRENNER, 2019), seeks to highlight how the federal patrimonial regime materializes in the territory and produces concrete spatial differentiations. From the identification of the demarcated and approved areas, it is analyzed how the incidence of the dominiality of the Union configures a mechanism of indirect regulation that tensions and conditions the dynamics of use, occupation and valorization of urban land on the Island of Santa Catarina.

4.1 SPATIAL CONFIGURATION OF FEDERAL PATRIMONIAL REGIMES ON THE ISLAND OF SANTA CATARINA

The spatial distribution of the Island of Santa Catarina shows that the marine lands and their additions affect the urban space of the Island in an unequal and territorially selective way. As illustrated in Figure 3, there is a significant concentration of these federal assets in specific areas of the island, especially in coastal areas subjected to intense processes of real estate appreciation and urban transformation, that is, where market dynamics, land scarcity and environmental constraints are combined.

The overlap between the areas of management of the Union's patrimony and municipal zoning produces a composite regulatory architecture, in which federal administrative decisions directly interfere in the possibilities of urban transformation.

The spatial reading allows us to identify that areas with a higher incidence of marine land tend to present greater regulatory complexity, as they are simultaneously subject to municipal urban regulation and federal asset management. This intertwining of normative regimes contributes to the institutional fragmentation of territorial planning, as discussed in the literature on multi-scalar governance (BRENNER, 2019; JESSOP, 2015).

Figure 3

Estimated distribution of marine land on Santa Catarina Island

Source: Prepared by the author (2026).

Here, the result reinforces Napolini's (2019) interpretation, according to which navy lands are no longer just remnants of a historical heritage logic, but rather active elements in the conformation of urban space. The spatialization of the data demonstrates that the Union's

patrimonial management directly affects strategic areas of the urban fabric, conditioning uses, densities and possibilities of territorial transformation.

In dialogue with Brenner (2019), it can be stated that this configuration expresses a form of state regulation that operates outside the classic instruments of urban planning, but that produces concrete territorial effects. It is a multi-scale regulation, in which federal administrative decisions interfere in municipal urban planning, often without effective inter-institutional coordination mechanisms (BRENNER, 2019).

4.2 AVERAGE PREAMAR LINE AND NORMATIVE INSECURITY IN COASTAL URBAN PLANNING

The situation of the Average Preamar Line (MPL) is a central element for understanding the territorial effects of the Union's asset management. The comparative analysis between stretches with homologated and non-homologated LPM, summarized in Figure 2, shows distinct patterns of normative stability within the island's urban territory.

Here it is worth detailing what is homologated and what is only demarcated, not entering into the homologated LPM in this case, since the demarcation corresponds to the technical definition of the line based on cartographic and historical surveys, while the homologation consists of the formal validation of the route by the competent body of the Union, giving it full administrative effectiveness (CABRAL; OLIVEIRA, 2025).

In the areas where the LPM is approved, there is greater predictability as to the applicable legal regime, which tends to facilitate the urban licensing processes and the articulation between the federative entities. On the other hand, in the stretches where the LPM has not been formally ratified, the lack of definition of the federal patrimonial limits produces high levels of legal uncertainty, affecting both the municipal government and private agents.

This insecurity manifests itself in the form of overlapping competences, judicialization of land conflicts and difficulties in the implementation of urban policies. The spatial analysis suggests that areas with non-homologated LPM often coincide with regions of recent urbanization or high real estate value, where the normative vagueness tends to favor disputes between public and private interests, reinforcing asymmetries in access and appropriation of coastal urban space.

Figure 2

Qualitative comparison of the normative stability associated with the Mean Preamar Line (LPM)

Source: Prepared by the author (2026).

These findings corroborate the analysis of Cabral and Oliveira (2025), who point to the lack of homologation of the LPM as a central factor of normative insecurity in Brazilian coastal cities. As Jessop (2015) points out, such insecurity compromises the capacity for integrated planning, by generating ambiguities regarding land ownership and the regulatory competences of each sphere of government.

In the case of Florianópolis, this territorial differentiation takes on even more critical contours due to its insularity and the relative scarcity of urban land. Recent studies (LENZI and GONÇALVES, 2025; NASPOLINI, 2019; CUNHA, 2018) already indicated that the lack of definition of federal assets directly impacts land regularization processes and the implementation of housing policies, which is confirmed by the spatial patterns identified in this research.

4.3 INTERACTIONS AND CONFLICTS BETWEEN FEDERAL PROPERTY REGULATION AND MUNICIPAL URBAN PLANNING

Table 2 summarizes the main territorial effects associated with the different patrimonial regimes identified in the study area. The integrated analysis of the data shows that the Federal Government's patrimonial management acts as a mechanism of indirect territorial planning, by establishing specific constraints for the use and occupation of urban land, regardless of the existence of municipal urban guidelines.

Table 2

Federal patrimonial regimes and territorial effects on urban planning in Florianópolis

Situação da LPM	Regime patrimonial federal	Grau de insegurança jurídica	Efeitos sobre o planejamento urbano
Homologada	Domínio federal plenamente reconhecido	Baixo a moderado	Maior previsibilidade normativa e integração parcial com o planejamento municipal
Não homologada	Domínio federal presumido / indefinido	Elevado	Conflitos institucionais, incerteza no licenciamento e fragmentação regulatória

Source: Prepared by the author (2026).

This result dialogues directly with Rolnik (2015), when he demonstrates that legal regimes apparently external to urban policy produce central effects on land valuation and the production of space. Similarly, Maricato (2024) points out that institutional fragmentation between scales of government tends to generate territorial conflicts and weaken the effectiveness of urban planning.

The comparison between the regimes shows that the Federal Government's asset management acts as an effective regulatory body, although not formally integrated with municipal urban planning. While in areas with approved LPM there is a greater predominance of normative predictability, in areas without approval there are recurrent institutional conflicts, uncertainty in licensing processes and fragmentation of state action.

In the context analyzed, the absence of systematic articulation between federal asset management and municipal planning instruments results in a fragmented regulatory architecture. Such fragmentation manifests itself not only in administrative conflicts, but also in concrete territorial inequalities, reflected in differentiated patterns of occupation, density, and access to urban land.

By highlighting these effects, the analysis reinforces the need to understand the Union's heritage management as a constitutive dimension of multi-scale urban governance, whose performance directly affects the production processes of coastal urban space, especially in insular and highly valued contexts such as Florianópolis.

5 FINAL CONSIDERATIONS

This article analyzed the management of the Union's assets as a constitutive dimension of the regulation of urban space, based on the case study of the Island of Santa Catarina, in the municipality of Florianópolis. By articulating institutional analysis, spatial reading and integrated interpretation of territorial effects, it was sought to show that marine land and the definition of the Mean Preamar Line (MPL) are not only legal or administrative issues, but active elements of urban governance in coastal cities.

The results demonstrate that the coexistence of areas with homologated and non-homologated LPM produces significant territorial differentiations, in the case of Santa Catarina Island, considering that the island portion of Florianópolis has approximately 172 km² (FLORIANÓPOLIS, 2026) although approximately 100% of the LPM line has been subject to demarcation, and homologation has not been completed in a large part of the island territory, and approximately 10% of this demarcated island area is approved (BRASIL, 2023; BRAZIL, 2020; BRAZIL, 2025; TJSC, 2025), which highlights the spatial amplitude of the phenomenon analyzed, associated with different degrees of normative security, administrative predictability, and urban consolidation. This finding reinforces the literature that points to legal uncertainty as a structuring factor for territorial inequalities in Brazilian cities (Maricato, 2024; Rolnik, 2015), indicating that the lack of definition of federal assets acts as a mechanism for indirect regulation of land use and occupation.

By dialoguing with Brenner (2019) and Jessop (2015), the study contributes to broadening the understanding of urban planning as a multi-scale field of state practices, in which sectoral decisions and specific legal regimes exert a concrete influence on the production of urban space. In the case of Florianópolis, the performance of the Union's patrimonial management focuses on strategic areas of the island territory, often dissociated from municipal planning instruments, which deepens institutional fragmentation and hinders the construction of integrated territorial planning strategies (ALMEIDA, 2016).

From a methodological point of view, the articulation between normative analysis and spatial reading in a GIS environment proved to be fundamental to evidence the territorial materialization of regulatory practices (LEFBVRE, 2024). More than a technical support, the use of geotechnologies has made it possible to critically interpret the overlapping of normative regimes and their spatial implications, as advocated by recent approaches in the field of Urban and Regional Planning (SANTOS et al., 2022; RAFAEL et al., 2025).

As a theoretical contribution, the article reinforces the need to incorporate the Union's patrimonial management explicitly into the analyses of urban territorial planning, especially in coastal cities. In doing so, it tensions readings that restrict urban planning to classic

municipal instruments, evidencing the centrality of federal land and patrimonial regimes in the conformation of urban space.

By dialoguing with the current debate on Urban and Regional Planning, this article contributes specifically to discussions on multi-scale governance and territorial regulation in complex urban contexts, by highlighting the role of the Union's heritage management as an active — albeit indirect — instance of the production of urban space. The debate enters into discussions about normative insecurity and institutional fragmentation, contributing to a critical reading of the role of the State not only as an urban regulator, but also as a landowner, whose decisions produce relevant and unequal spatial effects, especially in coastal areas subjected to intense pressures from the civil construction industry.

From the proposed analytical chain — federal patrimonial regime → indirect regulatory mechanism → territorial effects — it was found that the Federal Government's domination over marine land operates as a form of indirect regulation of urban space. Although it is not a classic planning instrument, its incidence interferes in the processes of real estate registration, land regularization, and land use, dialoguing and sometimes stressing the guidelines of the municipal Master Plan (FLORIANÓPOLIS, 2014; 2023).

In this sense, the research brings the debate on multi-scalar governance closer to the

The findings suggest the need for institutional mechanisms of coordination between the Federal Government's asset management and municipal urban planning, especially in contexts of high real estate pressure. Instruments such as technical cooperation agreements, integration of cartographic bases and the compatibility of licensing procedures could reduce the normative fragmentation currently observed, promoting greater legal predictability and territorial security.

In the light of the discussions presented, it is recognized that the research has limits, notably in the empirical cut circumscribed to the insular portion of Florianópolis. Future studies may expand the analysis to other Brazilian coastal municipalities, as well as deepen the investigation on the impacts of federal asset management on specific policies, such as social housing and land regularization. Even so, the results presented provide relevant subsidies for the academic debate and for the formulation of public policies that are more articulated and sensitive to the complexity of territorial governance in coastal urban areas.

ABSTRACT

Dams are versatile structures used for various purposes, including tailings containment resulting from mining activities. In recent years, the rupture of these structures has become a recurring fact in Brazil, especially the disasters that occurred in the cities of Mariana and Brumadinho, in the State of Minas Gerais, Brazil, which caused irreversible environmental impacts and loss of hundreds of human lives. This demonstrates the relevance of computer models for predicting dam failure scenarios, which can be very useful in anticipating the consequences of dam breaks and guiding emergency action plans of dams. In the study conducted for the Itafós Arraias Mineração e Fertilizantes S.A. tailings dam was used the HEC-RAS software, which incorporates non-Newtonian fluid dam break modeling, combined with ArcGIS, ALOS PALSAR digital elevation model and other biophysical data regarding the area affected by the dam were used. Simulation of the flood wave behavior was by piping-type break, with the results indicating a flood area of 484.02 ha, maximum depth of 19.78 m, maximum wave propagation velocity of 13 m/s and maximum flow of 2,619.25 m³/s (Section 1), in addition to possible interference/impacts on natural landscapes, areas of anthropic use and public works.

Keywords: HEC-RAS. Dam Break. Flood Wave Simulation.

RESUMO

Barragens são estruturas versáteis utilizadas para diversas finalidades, inclusive a contenção de rejeitos decorrentes da atividade de mineração. Nos últimos anos, o rompimento dessas estruturas se tornou um fato recorrente no Brasil, com destaque para os

desastres de Mariana e Brumadinho, que acarretaram impactos ambientais irreversíveis e perda de centenas de vidas. Isso vem mostrando o quanto a aplicação de modelos computacionais para prever cenários ocasionados pelo rompimento de barragem, é muito apropriada para antecipar as consequências do rompimento de barragens e balizar os planos de ação de emergência de barragens. No estudo realizado para a barragem de rejeitos da Itafós Arraias Mineração e Fertilizantes S.A., utilizou-se o HEC-RAS que incorpora a modelagem do rompimento de barragens de fluidos não newtonianos, combinado com o ArcGIS, modelo digital de elevação ALOS PALSAR e outros dados biofísicos da área de influência da barragem. A simulação do comportamento da onda de cheia foi por rompimento do tipo piping, com os resultados mostrando uma área de inundação 484,02 ha, profundidade máxima de 19,78 m, velocidade máxima de propagação da onda de 13m/s e vazão máxima 2.619,25m³/s (Seção 1), e as possíveis interferências/impactos em paisagens naturais, áreas de uso antrópico e obras públicas.

RESUMEN

Las presas son estructuras versátiles utilizadas para diversos fines, incluida la contención de relaves derivados de la actividad minera. En los últimos años, el colapso de estas estructuras se ha convertido en un hecho recurrente en Brasil, con destaque para los desastres de Mariana y Brumadinho, que ocasionaron impactos ambientales irreversibles y la pérdida de cientos de vidas. Esto ha demostrado que la aplicación de modelos computacionales para prever escenarios ocasionados por el rompimiento de presas es muy apropiada para anticipar las consecuencias de estos eventos y orientar los planes de acción de emergencia para presas. En el estudio realizado para la presa de relaves de Itafós Arraias Mineração e Fertilizantes S.A., se utilizó el HEC-RAS, que incorpora la modelación del rompimiento de presas con fluidos no newtonianos, combinado con ArcGIS, el modelo digital de elevación ALOS PALSAR y otros datos biofísicos del área de influencia de la presa. La simulación del comportamiento de la onda de crecida se realizó considerando un rompimiento del tipo piping, con resultados que mostraron un área de inundación de 484,02 ha, una profundidad máxima de 19,78 m, una velocidad máxima de propagación de la onda de 13 m/s y un caudal máximo de 2.619,25 m³/s (Sección 1), además de las posibles interferencias/impactos en paisajes naturales, áreas de uso antrópico y obras públicas.

Palabras clave: HEC-RAS. Rompimiento de Presa. Simulación de Onda de Crecida.

1 INTRODUCTION

Phosphate rocks are widely used as raw materials for fertilizer production, detergent production, animal feed supplements, among others. During the processing of phosphate ores, about 30-40% of the ore mass is disposed of as tailings after beneficiation operation (GNANDI et al., 2005). Tailings dams are structures used by mining companies as a way of storing the waste extracted after this processing (SANTOS et al., 2020).

With the increase in the number of dams of this nature in the country, there is also a growing concern about the safety of their structures, which consists of maintaining their structural and operational integrity, and the preservation of life, health, property and the environment (BRASIL, 2010). It was only in 2010 that the topic became part of the Brazilian policy agenda with the creation of the National Policy on Dam Safety (BRASIL, 2010), although it had already been the subject of discussion among engineering and geotechnical professionals since the 1980s (FRANCO, 2008). Brasil (2010) establishes responsibilities for the inspection of dam safety for several environmental agencies that are part of the National Environment System (Sisnama). The National Mining Agency (ANM) is responsible for the regulation and inspection of mining dams and the National Water and Basic Sanitation Agency (ANA), considering other types of dams, is responsible for coordinating water security, aiming to ensure the safety and inspection of structures and people.

As observed for the cases of Mariana and Brumadinho, the rupture of tailings dams has drastic consequences for all those involved in the vicinity of a dam. According to Amaral (2017), regardless of whether the rupture occurred due to poor inspection, failure in materials or construction methods, inconveniences are inevitable when there is no evacuation plan for the population or mitigating measures. If the dam were to break, there is irreversible damage to communities, cities (Wang et al., 2021) and the environment (Garcia et al., 2025). In the case of tailings dams, this damage is intensified by the contaminants present in the fluid, which can modify the physicochemical characteristics of the water sources (Kütter et al. 2023, Islam & Murakami, 2021). Simulations of dam failures have been carried out in Brazil and in other countries, with emphasis on the work of Derdous et al. (2015), Neves, Rodrigues and Cabral (2019), Raman and Liu (2019), Santos et al. (2020), Lee and Liu (2020), Psomiadis et al. (2021), Gibson and Sánchez (2021).

Observing the Brazilian framework on the study of mining tailings dams and the importance of simulations of dam failure, this work proposed to carry out a case study for the Tailings Containment Dam of Itafós Arraias Mineração e Fertilizantes S.A., in Arraias, Tocantins. According to ANM (2022a), this is the only mining tailings dam in DPA condition – classification B in activity in the State of Tocantins that is included in the National Dam Safety

Policy – PNSB (Brasil, 2010), with high associated potential damage, which currently falls under the alert level. For the dam failure simulation study, the HEC-RAS - *Hydrologic Engineering Centers River Analysis Systems software*, from the *US Army Corps of Engineers* (BRUNNER, 2022) combined with the ArcGIS geographic information system, is used.

The main objective of the case study was to simulate the dam rupture by *piping*, determining the scope of the flood area, depth, maximum velocity of the tailings sheet and flow and the possible potential interferences/impacts caused along the flood area.

2 METHODOLOGY

2.1 DATA

A geographic database was set up in ArcGIS with public data available in a web environment. In terms of biophysical data, soil, relief, geology, climatological data, and vegetation cover and land use information plans were inserted from the geoportal data of the Secretariat of Planning of the State of Tocantins (SEPLAN, 2021). The database was complemented with altimetry data from the digital elevation model of the ALOS PALSAR satellite acquired from the *Japan Aerospace Exploration Agency* – JAXA website (JAXA, 2022). For the characterization of the reservoir, public data obtained from the National Mining Agency – ANM (ANM, 2022b) are used.

2.1.1 Tailings dam of Itafós Arraias Mineração e Fertilizantes S.A

The tailings dam of Itafós Arraias Mineração e Fertilizantes S.A., installed in the municipality of Arraias-TO, near the border with the north of the state of Goiás, between the coordinates of west longitude 46°50'00" and 46°48'00" and south latitudes 12°55'00" and 12°52'00". The main purpose of the dam is the controlled disposal of tailings generated during the phosphate ore processing process. Figure 1 shows the location of the tailings containment reservoir, its geometry and dam.

According to the ANM (2022b), the dam has been active since 2013 and has an expected useful life of 30 years. It was built in the valley of the Bezerra stream with an initial height of 20 m and can reach a maximum height of 30 m. The current height of the dam is 22 m, with the reservoir having an area of 71 ha and a volume of 4,136,059.54 m³ and the projected of 7,500,000 m³. The type of dam is homogeneous earth, with a foundation in residual/alluvial soil, and a construction method of raising downstream, with continuous type of raising. In terms of state of conservation, the civil structures are well maintained and in normal operation, with percolation fully controlled by the drainage system, with no deformations and settlements with the potential to compromise the safety of the structure. On

the other hand, there are failures in the protection of slopes with the presence of shrub vegetation.

Figure 1

Location map of the tailings dam in Arraias, Tocantins, Brazil

Source: elaborated by the authors.

The type of tailings stored in the reservoir is due to the processing of phosphate ore, a raw material for the production of simple superphosphate (SSP), used as an input in agricultural activity, with a 2.5% phosphate pulp inserted in the tailings (ANM, 2022).

The dam has an emergency action plan, but according to ANM (2022b), copies of the PAEBM have not yet been delivered to city halls and municipal and state defenses, as required by Ordinance no. 70,389/2017. In terms of environmental impact assessment, the project has a significant impact, of medium intensity, and affects downstream, in the event of a dam failure, a number below 100 people (ANM, 2022b).

2.2 METHODS

It is noteworthy that one of the main forms of dam failure occurs when water overflows the dam wall, overtopping, and burrows through it due to the loss of freeboard, a situation more likely in old tailings dams that have been filled, vegetated and abandoned (HANCOCK. COULTHARD, 2022).

To study this hypothesis, the process of simulating the rupture of the tailings dam of Itafós Arraias Mineração e Fertilizantes S.A. began with the elaboration of the rupture hydrograph. For this, hydrologic modeling was used in the HEC-HMS (*Hydrologic Modeling System*). It provided, from the use of altimetry data and the rainfall hyetogram (calculated by the Huff method, 1967), the delimitation of the hydrographic basin, drainage stretches, water balance and, finally, the project hydrograph obtained by the method developed by the Soil Conservation Service - SCS (current *Natural Resources Conservation Service* - NRCS). performing this hydrological modeling at HEC-HMS, it was observed that there would be no overtopping from the flows found, since the dam's overflow systems are capable of pouring the flow from the maximum precipitation for a return time of 10,000 years. Thus, the rupture simulation was not associated with a precipitation event, but with collapse by *piping* or overtopping.

In the HEC-RAS environment, the altimetry component of the terrain was inserted, using the ALOS PALESAR digital elevation model, with a 12.5 m grid, an interval sufficient to generate a computational mesh with appropriate cells for analysis. Then, the roughness coefficient of Manning's equation was assigned to quantify the flow resistance (MANANDHAR, 2010). The calibration of the Manning roughness coefficient was based on land cover and land use data (Table 1).

Table 1

Manning coefficient values used

Uso da Terra	Coeficiente de Manning
Terra estéril	0,03
Arbustiva	0,05
Pastagens e terras cultivadas	0,035
Rio	0,04

Source: adapted from chow (1959).

Still in the hec-has, the following boundary conditions of the model were used: (a) the volume of the reservoir upstream and (b) the normal depth with a slope of the channel bottom of approximately 0.4% downstream.

THE next step is to perform the calibration of the HEC-RAS MODEL (version 6.1) considering that the flow behavior of the material resulting from the rupture of the phosphate ore tailings dam is more similar to non-Newtonian fluids, such as Bingham fluids, which have specific rheological properties. For the dam in question, the results of BARREDA ET AL.,

(2021) were also used for the maximum value of yield stress or elastic limit stress of 300 Pascal and 50 Pascal for 73% and 65% of solids mass, respectively.

And, finally, the final geometry of the tailings dam rupture breach was defined, according to the empirical model proposed by Froehlich (2008).

3 RESULTS AND DISCUSSION

3.1 FLOOD AREA

Figure 2 shows the flood spot in the critical situation, that is, when it reaches the largest area. The slick covers an area of 484.02 ha and a maximum depth of 19.78 m. The maximum velocity of the flood wave reached is 13 m/s, reaching Section 3 in 4.33 hours after the rupture.

Figure 2

Flood Spot formed (a) and velocity reached in m/s (b)

Source: elaborated by the authors.

The data collected in the three cross-sections, maximum speed reached, maximum elevation, and flow hydrograph along the wavefront path are shown in Table 2.

Looking at Table 2, it can be seen that Section 1 is 0.63 km, Section 2 is 1.88 km and Section 03 is 5.82 km away from the dam. Among the three sections, Bus-S1, S1-S2 and S2-S3, Table 2 shows that the maximum level of tailings reduces 31 m in height, due to the

elevation levels of the land. For the S1-S2 section there is a reduction of only 6 m, while in the S2-S3 section, there is a 25 m high decay due to the retention of tailings in this interval.

Table 2

Flow, tailings level, depth and velocity data for each section considering maximum values

	Barramento -S1	S1-S2	S2-S3
Distância do barramento (km)	0,63	1,88	5,82
Nível máximo de rejeito – cota (m)	623	617	592
Profundidade máxima (m)	12,35	17,60	3,15
Vazão máxima (m ³ /s)	2.619,25	2.452,84	374,54
Velocidade máxima (m/s)	2,51	1,46	4,05

Source: elaborated by the authors.

For the depth of the wave, it can be seen that in the S1-S2 section there is an increase of 5.25m in relation to the Barramento-S1 section, while in the S2-S3 section there is a sharp decline in depth of 14.45 m. These variations can be justified by the observation that, for the first section, Section 1 presents a higher flow when compared to Section 2, and also, that in the latter there is an increase in accumulated material and little loss of energy due to the short distance traveled, resulting in greater depth. Between S2-S3, the depth reduces slightly, since there are losses of matter and energy along the way. In addition, the last section has a higher speed of propagation of the flood wave and lower flow when compared to the others, so the cross-sectional area (depth x width) is also reduced.

The maximum flow rate between S1-S2 is reduced by 166.41 m³/s, due to the loss of energy during the thalweg. For S2-S3 this decrease is more pronounced, there is a reduction of 2,078.30 m³/s, justified by the greater distance traveled.

Finally, with regard to the maximum speed, between S1-S2 there is a reduction of 1.05 m/s, because there is a small slope and distance in this section, and also, the width of the flow increases along the stretch, allowing greater passage of matter and reducing the speed to the control surfaces. Between S2-S3, the velocity increases drastically, it is the maximum observed, since the valley is quite narrow. Despite all the loss of energy and flow, with the slight decrease in the control surface area, there is an intense increase in speed. There are lower velocity and flow at 5km away from the dam when compared to the work of Santos et al. (2020), however these values depend on the area, height of the dam, slope of the terrain, among other factors.

3.2 ENVIRONMENTAL INTERFERENCE

Along the path of the wavefront, it is verified that it impacts improvements in the rural area and transport infrastructure, pasture areas and native vegetation, and probably the local fauna (Figure 3). Khalkho et al. (2020) report the loss of infrastructure due to dam rupture and highlight the importance of flood maps for the preparation of the Emergency Action Plan (EAP) for disaster management.

Figure 3

Environmental interference (a) and land cover and use affected by the flood area (b)

Source: elaborated by the authors.

Figure 3(a) shows two rural property headquarters that will be buried by the tailings flow, as well as two bridges, one on the TO-296 highway and the other on a side road that connects the industrial unit of Itafós Mineradora and the tailings dam. At the end of the wavefront's route, it is noted that it reaches the water collection dam that the industry uses to maintain its production process.

Figure 3(b) shows that 80.71 ha of pastures with the use of large animal husbandry are affected by the flooding and that 364.54 ha of native vegetation are also buried and destroyed. Of this total, 63.98 ha are for capoeira, 4.60 ha represent dense cerrado without gallery forest, 219.12 ha correspond to typical cerrado without gallery forest and 76.83 ha are equivalent to floodable and non-floodable gallery forests. In addition, there are 21.76 ha of degraded area and 17.02 ha of buried watercourse. These results, in a more summarized form, are presented in Table 3.

IN relation to fauna, there is no capacity to measure affected individuals, however, based on information from the Environmental Impact Study - EIA (AMBIENGER-PROMINER, 2010), there is an indication of possible losses and scares of mastofauna, avifauna, ichthyofauna and herpetofauna, and loss of aquatic and terrestrial habitats. The flood area would also bring as negative consequences the loss of natural landscapes, housing structures and infrastructure by burial, loss of livestock areas and native/anthropized vegetation by runoff or burial by waste, alteration of water and soil quality and visual impact.

Table 3

Areas of cover and land use affected by the flood area

Cobertura e uso da terra	Área (hectares)
Áreas degradadas	21,76
Capoeira	63,98
Cerrado denso sem mata de galeria	4,60
Cerrado típico sem mata de galeria	219,12
Corpos d'água continentais	17,02
Mata de galeria inundável e não inundável	76,83
Pecuária de animais de grande porte	80,71
Total	484,02

Source: elaborated by the authors.

4 CONCLUSIONS

The flood map generated in the HEC-RAS software by combining the ALOS PALESAR digital elevation model, Manning's coefficient with biophysical data provided by SEPLAN-TO, structure characteristics provided by ANM (2022) and the piping breach assumptions according to Froelich (2008) allowed a representation of the flood wave behavior from structural collapse. Additionally, it is perceived that the use of the computational mesh for the 2D model is suitable for application in studies with sinuous watercourses, such as the Bezerra stream, making the modeling more accurate.

Carrying out dam rupture studies is extremely important to determine the coverage of the impacted area, speed reached by the wave and depth. These factors are the ones that will guide the preparation of the emergency action plan with greater assertive possibility and the environmental impact studies. This is because they allow a better observation of the problems arising from the rupture and the force of the wave, that is, its mechanical impact and the identification of buried places where chemical impacts can be triggered due to the type of tailings superimposed on the soils.

It is considered that the results and practicality of the modeling obtained in this case study through the combination of geoprocessing tools with HEC-RAS (public domain

software), should be a procedure used for the analysis of tailings dam failure, which strengthens the recommendation of the National Water Agency. In addition, it is of great value for the preparation of the emergency action plan for mining tailings dams

ABSTRACT

Propeller design and performance influence the operational efficiency of drones, and with the increasing use of small UAVs, accurately determining the performance of small propellers becomes crucial. CFD is considered a highly accurate method, and turbulence models are essential for CFD simulations, especially when dealing with low Reynolds number flows, such as those in small propellers, since transitional laminar-turbulent flows are difficult to predict. The objective of this work is to investigate the use of transition-sensitive models to identify the conditions under which their use is truly necessary, as they are computationally intensive. A 3D-printed propeller, designed from the SDA 1075 airfoil, was tested under static flow conditions on a test bench, with thrust and torque measurements. Fully turbulent models were used in the simulation, and the results were compared with measurements between 2,000 and 8,000 rpm. Consistent results were obtained for Reynolds numbers above 60,000. For Reynolds numbers below 60,000, the results were not very accurate. Therefore, transition-sensitive models capable of capturing laminar separation were used, and consistent results were obtained for Reynolds numbers below 60,000. This was demonstrated by the propeller's aerodynamic coefficients and the images of laminar separation bubbles captured by the simulation.

RESUMO

O projeto e o desempenho das hélices influenciam a eficiência operacional dos drones e, com o uso crescente de pequenos UAVs, determinar com precisão o desempenho de pequenas hélices torna-se crucial. O CFD é considerado um método altamente preciso, e modelos de turbulência são essenciais para simulações de CFD, especialmente quando se lida com escoamentos de baixo número de Reynolds, como aqueles em pequenas hélices, uma vez que escoamentos laminar-turbulentos transicionais são difíceis de prever. O objetivo deste trabalho é investigar o uso de modelos sensíveis à transição para identificar as condições sob as quais seu uso é realmente necessário, pois são computacionalmente intensivos. Uma hélice impressa em 3D, projetada a partir do aerofólio SDA 1075, foi testada sob condições de fluxo estático em uma bancada de testes, com medições de empuxo e torque. Modelos totalmente turbulentos foram usados na simulação, e os resultados foram comparados com medições entre 2000 e 8000 rpm. Resultados consistentes foram obtidos para números de Reynolds acima de 60.000. Para números de Reynolds abaixo de 60.000, os resultados não foram muito precisos. Portanto, foram utilizados modelos sensíveis à transição capazes de capturar a separação laminar, e resultados consistentes foram obtidos para números de Reynolds abaixo de 60.000. Isso foi demonstrado pelos coeficientes aerodinâmicos da hélice e pelas imagens da separação laminar capturadas pela simulação.

RESUMEN

El diseño y desarrollo de hélices influyen en la eficiencia operativa de los drones, y con el creciente uso de UAV pequeños, determinar con precisión su rendimiento se vuelve crucial. La CFD se considera un método de alta precisión, y los modelos de turbulencia son esenciales para las simulaciones CFD, especialmente cuando se trabaja con flujos de bajo número de Reynolds, como el de las hélices pequeñas, ya que los flujos laminares-turbulentos transitorios son difíciles de predecir. El objetivo de este trabajo es investigar el uso de modelos sensibles a la transición para identificar las condiciones en las que su uso es realmente necesario, dado su alto consumo computacional. Una hélice impresa en 3D, diseñada con base en el perfil aerodinámico SDA 1075, se probó en condiciones de flujo estático en un banco de pruebas, con mediciones de empuje y par. Se utilizaron modelos completamente turbulentos en la simulación, y los resultados se compararon con mediciones entre 2000 y 8000 rpm. Se obtuvieron resultados consistentes para números de Reynolds superiores a 60.000. Para números de Reynolds inferiores a 60.000, los resultados no son muy precisos. Por lo tanto, se utilizaron modelos sensibles a la transición capaces de capturar la separación laminar, obteniéndose resultados consistentes para números de Reynolds inferiores a 60.000. Esto se demostró mediante los coeficientes aerodinámicos de la hélice e las imágenes de separación laminar capturadas por la simulación.

1 INTRODUCTION

In recent years, small unmanned vehicles (UAVs) have been developed for various applications in different areas of our society, being a challenging technology, as designing propellers on a small scale with high efficiency is complex due to the physical phenomena involved. Rotors (engine-propeller assembly) are responsible for the performance and control of fixed-wing and multi-rotor UAVs. They generate thrust and torque that allow drones to fly and remain stable. Propeller design influences the efficiency and stability of drone operation. However, predicting the performance of small-scale propellers, such as those used in UAVs and micro aerial vehicles (MAVs), is complex primarily due to the low Reynolds number conditions under which they operate. Low Reynolds numbers, typically less than 100,000 for UAV propellers (Deters, 2013), can lead to flow separation, which occurs when the fluid boundary layer separates from the blade surface, increasing torque and reducing thrust. This phenomenon occurs when the boundary layer confronts an opposing pressure gradient.

Among the propeller performance prediction techniques, the most accurate is CFD (Loureiro, 2021). The SST $k-\omega$ turbulence model is the most widely used in simulations to model propellers. It was developed to improve accuracy in conditions of flow separation and rotating flows. Although laminar-turbulent transition models are recommended for transitional flows and low Reynolds numbers since they take into account the transition region, there are few recently published CFD works that have used laminar-turbulent transition models for propellers. Due to the very fine mesh required near the blade to accurately resolve the transition region, especially for leading and trailing edges, these transitional turbulence models are computationally intensive. And some authors (Loureiro, 2021, and Seeni, 2021) concluded that the SST $k-\omega$ model and the laminar-turbulent transition models have similar accuracy, except for flows under static conditions, as mentioned by Loureiro, who observed a significant difference in this condition. Divazi et al., 2025, performed numerical and experimental modeling to study the impact of the distance between the propeller and the atomizer on the spraying performance of agricultural UAVs. The SST $k-\omega$ turbulence model and a multiple reference frame technique were used for flow field and particle tracking. The propeller used was a 1045 DJI. They concluded that there is a correlation between the distance between the propeller and the atomizer and the spraying efficiency, and that the study provided important insights into drone spraying systems. Dougherty S. et al., 2024, examined the impact of a 10×5.0 propeller separation on quadcopter performance through numerical modeling. They employed the SST $k-\omega$ turbulence model along with an unstructured tetrahedral mesh that included inflation layers on the propeller surface. Two configurations were considered: a double propeller configuration and a quadcopter, with initial

flow perpendicular and parallel to each configuration. They described the influence on propeller performance. Liu Y. et al., 2024, developed a numerical model to evaluate the ceiling effect in small-scale inclined propellers (APC propellers 10 x 3.3 and 11 x 4.7). The results were validated by comparison with experimental data in a test bench designed for the study. They used a polyhedral mesh with inflation around the blades and the SST k- ω turbulence model. They developed a model to estimate thrust based on the rotor's distance from the ceiling and its angle relative to the ceiling. Liu X. et al., 2023, investigated a small-scale propeller (APC 1045) to analyze its aerodynamic performance through experiments, numerical simulation, and BEMT (Blade Element Momentum Theory) model. They compared the aerodynamic parameters at various free stream speeds to compare the three different methods. The SST k- ω turbulence model was used with tetrahedral mesh with inflation around the blade face. They concluded that BEMT is reliable enough to estimate the aerodynamic parameters. Rajendran P. et al., 2023, analyzed a twin-blade drone propeller (17 in diameter) using numerical modeling. They used the SST k- ω turbulence model with tetrahedral mesh to develop a propeller with improved torque and coefficient of performance, as well as reduced drag. They concluded that numerical validation was able to provide several modifications to the propeller design. Garofano-Soldado et al., 2022, developed a numerical and experimental study of the ground effect on the aerodynamics of small inclined propellers (13 x 4.4) with low Reynolds number. It was demonstrated that the proximity to the ground of inclined propellers decreases the thrust increment due to the ground effect as the angle increases. They proposed a numerical model to show the dependence of thrust on the distance to the ground and the tilt angle. They used the multiple reference method and the SST k- ω turbulence model with tetrahedral mesh. Zarri A. et al., 2022, developed a numerical modeling of a small drone using the SST k- ω turbulence and a polyhedral mesh with inflation on the blade face. The model was coupled with a computational aero acoustic approach. They concluded that the dominant sound sources are due to the interactions of the blades with the other propellers (9.4 in diameter) and struts, and that the acoustic scattering by the drone has an important effect on the near and far fields. Kumar R. et al., 2021, performed numerical simulation on a quadcopter with 17 x 6.0 propellers operating under different weather conditions. The objective was to predict the effects on services such as photography, remote sensing, aerial surveillance, etc. The standard k- ϵ turbulence model was employed in combination with a tetrahedral mesh. The modeling was validated against a reference work. Loureiro E. V. et al., 2021, analyzed the performance of small propellers (14 x 7.0) through experiments and using blade element theory in comparison with CFD. For the numerical model, they used the SST k- ω turbulence model and the Transition SST model to investigate

the results in the laminar-turbulent transition boundary layer. For low advanced ratio velocities, the blade element theory presented the best results, while for higher advanced ratio velocities, CFD presented the best results. Paz C., et al., 2021, performed a 3D numerical simulation of the operation of a quadcopter drone (9.4 in diameter) using multiple reference frames and sliding meshes with hexahedral cells. They evaluated the application of these methods to an isolated propeller and to a quadcopter, including the effect of ground proximity. The realizable k- ϵ turbulence model was used. Seeni A., 2021, applied numerical modeling to select the turbulence model for a small drone propeller (APC 10 x 7.0) operating at low Reynolds number. Validated data were obtained for several turbulence models by comparing them with experimental results. He concluded that the standard k- ω model is preferable for future propeller simulations as it has the advantage of being computationally economical without compromising accuracy. The results showed that the SST k- ω and the Transition SST models produce the same accuracy but at a higher cost. Cerny M. et al., 2020, analyzed small propellers (18 in diameter) insulated and ducted to investigate the influence of inlet angles between zero and 180 degrees with respect to the axial flow. The experimental results showed good agreement with the numerical model, which was developed using a hexahedral mesh and the SST k- ω turbulence model. Deters R. W. et al., 2014, investigated the influence of Reynolds number on the performance of small propellers with diameters between 2.25 and 9 inches. They stated that the low Reynolds number of these propellers makes it very difficult to evaluate their performance. Data from several small propellers under static and continuous flow conditions were measured to study the influence of Reynolds number. The performance improved with increasing Reynolds number, but the maximum efficiency achieved was low compared to larger propellers. They described that at low Reynolds number, a laminar separation bubble forms on the airfoil, and then the laminar boundary layer separates from the surface, becomes turbulent, and may then reattach.

Weerasinghe S.R. et al., 2012, analyzed hovering and flight of the Syma X5SC quadcopter (5.3 in diameter) using CFD and experiments, focusing on the aerodynamic forces on the fuselage and rotor blades. The flight was simulated for hovering mode at three different angles of attack and free-stream velocities. The SST k- ω turbulence model was used with a tetrahedral mesh. They concluded that the simulations adequately described the flows with rotational motions.

This work aims to contribute with a comparative study between experimental results of thrust and torque measurements of a small scale propeller and computational fluid dynamics (CFD) simulation, using the Fluent software. The RANS (Reynolds-Averaged Navier-Stokes) turbulence models considered in the simulation were Shear-Stress-Transport

(SST) $k-\omega$, Standard $k-\omega$, Spalart Allmaras and Realizable $k-\epsilon$. Laminar-turbulent transition models, such as the Transition SST model and the Intermittency Transition model (γ model), were also used to verify the results at low rotations rate, such as 2,000 to 4,000 rpm. In principle, these latter models provide a more realistic simulation of flows where laminar, transitional and turbulent regions coexist, since traditional turbulence models, such as $k-\omega$ and $k-\epsilon$, assume fully developed turbulence, which can lead to incorrect thrust and torque predictions in low Reynolds number flows.

2 EXPERIMENTAL APPARATUS - THRUST, TORQUE AND RPM MEASURING EQUIPMENT

Propeller static performance was conducted on a test rig that was designed to measure propeller thrust, torque and RPM, as shown in Figure 1 and 2. The black propeller is the commercial APC 10 x 4.5 and the white one is an in-house 3D printed propeller. The direct thrust measurement equipment consists of an A2212/6T brushless DC motor (22 mm motor diameter, 12 mm motor shaft height, and 6 turns per pole) used for radio-controlled quadcopters, associated with an electronic speed controller (ESC), a load cell with signal conditioning module HX711 and an infrared obstacle sensor LM393. All devices are interconnected to an Arduino Mega 2560 platform, responsible for synchronized data acquisition.

Figure 2

Front view of the propeller: Fig. 2a; Top view of the propeller: Fig. 2b; Side view of the propeller and RPM measurement sensor: Fig. 2c

Source: From author.

For indirect torque measurement, a Minipa ET2076-A digital multimeter was used to measure electrical voltage and a Fluke 374 FC clamp meter for non-invasive measurement of electrical current. Electrical power ($V \times I$), multiplied by the motor efficiency, results in mechanical power, which in turn, divided by the angular velocity, is torque. To measure the thrust, a load cell integrated into the HX711 module was used. This sensor converts the mechanical deformation caused by the thrust force generated by the propeller into an electrical signal that can be read by the Arduino platform. The load cell was configured with a variable calibration, which translates the electrical signal from the sensor into mass. The measurement results were then compared with a set of measured masses. The sensor reading is performed in the main loop, which activates the weight sensor, which has a function taking 5 consecutive sensor readings and calculating the average. This procedure reduces the effects of instantaneous variations, improving accuracy. The calibration of the thrust measurement system consisted of three steps: scale factor adjustment, offset compensation via tare, and data acquisition with statistical processing. To determine the scale factor, a set of calibrated masses (2g, 5 g, 10 g, 25 g, 50 g, 100 g, 250 g, 500 g, and 1,000 g) were sequentially applied to the load cell. This procedure verifies the linearity of the sensor over different load ranges. After a 2-second delay for stabilization, the system starts the main loop, where another function performs five consecutive readings and calculates the arithmetic mean, reducing instantaneous variations. The use of varied masses (2 g to 1,000 g) verified the sensitivity of the system at low loads and its ability to maintain accuracy at higher loads, with a post- calibration relative error below 1%.

Propeller rotation was measured using the LM393 reflective sensor, which counts pulses and the time elapsed between them. The sensor emits infrared light onto a rotating

object with alternating reflective and non-reflective segments. The light is reflected from the reflective area and absorbed by the non-reflective area. The phototransistor detects the level of reflection, and the LM393 emits digital pulses. The data acquisition system was programmed using the Arduino IDE platform, integrating the infrared (IR) sensor for rotation measurement with the Arduino Mega 2560 microcontroller. The infrared sensor was positioned at a fixed distance of 1 cm from the brushless motor, with precise alignment to capture rotation signals. During testing, the equipment was turned on and measurements were taken at discrete intervals of 1,000 rpm, covering a range from 2,000 rpm to 8,000 rpm, as recorded by the infrared sensor. Simultaneously, the engine rotation was monitored using the calibrated digital tachometer DT-2234C+, positioned according to the manufacturer's specifications. Before running the test, the propeller was firmly attached to the brushless motor shaft, ensuring mechanical alignment and balancing to avoid parasitic vibrations. The Minipa ET2076-A multimeter, set to measure voltage, and the Fluke 374 FC clamp meter, set to measure direct current, were then connected to the battery terminals to enable simultaneous monitoring of the electrical parameters. The Arduino Mega 2560 was connected to the computer's USB port, with the Serial Monitor open for real-time viewing of the rotation speed, via infrared sensor, and of the force, via load cell. Once the system was set up, the potentiometer was gradually adjusted to increase the motor speed until it reached the predefined maximum of 8,000 rpm.

3 GEOMETRY, GRID GENERATION AND BOUNDARY CONDITIONS

A 10 x 4.5 in house propeller (diameter and pitch, respectively) of two blades was designed, 3D printed, and static tested. The off-the-shelf APC 10 x 4.5 propeller was used to validate the thrust and torque measurements of the developed test rig. The “Design Modeler” software was used to design the propeller, following the characterization methodology proposed by Drella (2006). The process consisted of subdividing the propeller into 10 sections, obtaining the β angle (local geometric blade pitch angle) through a specific formula and scaling the coordinates to the unit chord by dividing the airfoil chord number by 12 mm, corresponding to the chord value in the first airfoil of each blade, as indicated in Table 1, resulting in the propeller geometry. The propeller geometry was created using the SDA1075 airfoil along the entire length of the blades.

Table 1

Data for the geometric dimensions of the propeller

$\beta = \arctg\left(\frac{p}{2\pi r}\right)$						
r(mm)	r/R	r (")	chord (")	chord (mm)	β (deg)	scale
19.1	0.15	0.75	0.472	12.0	44	1.000
25.4	0.25	1.00	0.551	14.0	36	1.169
38.1	0.35	1.50	0.819	20.8	26	1.736
50.8	0.45	2.00	0.984	25.0	20	2.087

Source: From author.

The CFD domain for investigating the aerodynamic effects of propeller operation consisted of a wind tunnel with a length of 2.0 m and a width of 1.0 m, and a rotating disk with a radius of 0.137 m and a thickness of 0.03 m around the propeller. The disk was designed to simulate the flow around the propeller. It is a moving reference part that allows modeling a moving component, such as the propeller, by creating this moving frame in a selected cell zone around the propeller. The equations of motion are modified to include the additional terms due to the change from a stationary frame to a moving frame. The propeller becomes a stationary part (Ansys Fluent, 2025). The geometry and mesh of these parts are shown in Figures 3 and 4, respectively. The boundary conditions applied in the simulation are presented in figure 4. As the objective of the analysis is related to the static performance of the propeller (without freestream velocity), both the inlet and outlet airflows were considered as the outlet pressure boundary condition. The axial velocity induced by the rotor at the inlet of the domain is determined by the simulation, with the inlet and outlet boundary conditions being defined by the propeller rotation. In this simulation, the induced inlet flow occurs in the negative direction.

The chord (c) and twist distribution of the propeller are shown in Fig. 5 and Fig. 6, respectively. As this work was the first project carried out, the profile law constant was chosen (propeller shape constant) and subsequently the thickness (t) distribution is constant, as shown in Fig. 6. Fig. 7 presents how the Reynolds number along the propeller blade varies with different rotational rates.

4 EXPERIMENT PROCEDURES AND VALIDATION

To verify the consistency of the thrust and torque measurement system of the designed propeller, the static performance results of the APC 10 × 4.5 propeller provided by the manufacturer APC Model Aircraft Propellers were used for comparison with the results of measurements performed on this propeller on our test bench. The results are shown in Fig. 8 and Fig. 9.

Figure 8*Thrust coefficient x RPM*

Source: From author.

Figure 9*Power coefficient x RPM*

Source: From author.

The thrust coefficient of the APC 10 x 4.5 propeller (Fig. 7) measured by the test equipment in static performance, agrees very well with the manufacturer's performance test, having at 2,000 RPM the greatest difference. The average difference was 2.0% and the maximum was 7.2% at 2,000 RPM.

The power coefficient of the APC 10 x 4.5 propeller (Fig. 8), as measured by the test equipment, differs from the manufacturer's performance data by an average of 11.0%, with a maximum deviation of 15.7% observed at 6,000 RPM. It can be concluded that the test equipment demonstrated satisfactory measurement accuracy and provided a reliable level of confidence for the objectives of this study, which focused on evaluating the most appropriate turbulence model.

5 NUMERICAL MODELS

5.1 RANS EQUATIONS

Four RANS turbulence models were chosen for the numerical simulations. The realizable k- ϵ model considers the effects of rotations in the definition of the turbulent viscosity, and has already been tested in a single moving reference, as is the case in this modeling, presenting good results. The k- ϵ models are not recommended when the flow separates under adverse pressure gradients, which is the problem with low Reynolds number propellers (Fluent Theory Guide, 2025). However, as Paz, 2021, used this model in his work and obtained a good result, it will be used to evaluate the current case. The k- ω model provides good results for flows with adverse pressure gradients and airfoils. Low Reynolds numbers can be used with the SST k- ω , and it is a very simple model for laminar-turbulent transition and can be used to predict more accurate details of the wall boundary layer than the Spallart-Allmaras model. SST k- ω is the model most used in recent works with small-scale propellers. The Spallart-Allmaras gives good results for low Reynolds numbers and is designed for boundary layers subject to adverse pressure gradients (Ansys Fluent Theory Guide, 2025).

Partial differential equations (RANS - Reynolds-averaged and Navier-Stokes) are discretized and computed to account for turbulent fluctuations, resulting in Reynolds stresses that must be modeled using a turbulence model. They are typically written in Cartesian coordinates as the following equations, conservation of mass (equation 1) and momentum (equation 2), respectively:

$$\frac{\partial \rho}{\partial t} + \frac{\partial}{\partial x_i}(\rho u_i) = 0 \quad (1)$$

$$\frac{\partial}{\partial t}(\rho u_i) + \frac{\partial}{\partial x_j}(\rho u_i u_j) = -\frac{\partial p}{\partial x_i} + \frac{\partial}{\partial x_j} \left[\mu \left(\frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i} - \frac{2}{3} \delta_{ij} \frac{\partial u_l}{\partial x_l} \right) \right] + \frac{\partial}{\partial x_j} (-\rho \overline{u'_i u'_j}) \quad (2)$$

Where $-\rho \overline{u'_i u'_j}$ is the Reynolds stress tensor modeled via turbulence models.

Laminar-turbulent transition models augment the RANS equations with extra transport equations or empirical correlations to account for transition phenomena, the change from laminar to turbulent flow, i.e. to predict where and how turbulence begins, which is critical in low Reynolds number flows. The Transition SST model solves two additional equations and is the most used model in the last decade. The Transition γ model (Intermittency Transition

model) solves one additional transport equation and has gained acceptance recently (Ansys Fluent Theory Guide, 2025).

5.2 PROPELLERS COEFFICIENTS

Thrust coefficient: $C_T = \frac{T}{\rho n^2 D^4}$; Power coefficient: $C_P = \frac{P}{\rho n^3 D^5}$; Power: $P = 2\pi nQ$; and Reynold number calculated at velocity of the fluid and chord width at 75% of blade station: $Re = \frac{\rho v_{75} c_{75}}{\mu}$; where $v = \omega r$ for propeller static performance. Where T is the propeller thrust; ρ is density in kg/m^3 ; n is the rotational velocity in revolutions per second; D is the diameter of the propeller in m; Q is the propeller torque in N.m; and ω is rotational speed in rad/s.

6 GRID INDEPENDENCE ANALYSES

For the fully turbulent models, three 3D tetrahedral meshes with different numbers of cells/nodes were generated to perform independent mesh analyses. Table 2 provides a summary of the sizes of the three meshes. Table 3 shows the mesh quality of this model, using the fine mesh, in comparison to the modeling of a complete quadcopter done by Weerasinghe S.R. et al., 2012, who did a detailed investigation of the mesh quality. This comparison was made between the rotor and the propeller, as well as, between the complete quadcopter and the entire domain of this model. The values demonstrate that the produced mesh is adequate.

Table 2

Mesh size for three different dimensions – tetrahedral

	Coarse mesh	Medium mesh	Fine mesh
Cells	276,531	1,842,868	2,246,122
Faces	802,513	3,958,894	4,783,476
Nodes	108,760	446,658	520,960

Source: From author.

Table 3

Mesh quality analysis – tetrahedra

Mesh quality	Orthogonal (>0.01)		Skewness (<0.95)	
	Minimum	Average	Maximum	Average
Rotor [Weerasinghe, 2012]	0.036	0.82	0.96	0.25
Propeller (current work)	0.222	0.95	0.78	0.59
Full quadcopter [Weerasinghe, 2012]	0.016	0.84	0.96	0.25
Full domain (current work)	0.062	0.75	0.92	0.24

Source: From author.

Figure 10 shows the results of the mesh independence study for the propeller thrust coefficient. The results demonstrate that the fine mesh and the medium mesh present very similar thrust coefficients (average difference of 4%), while the coarser mesh deviates from the other meshes. The SST k- ω model was used to calculate the three different mesh sizes.

Figure 10

Propeller thrust coefficient for comparison of three tetrahedral meshes with different number of cells

Source: From author.

For analysis with the laminar-turbulent transition models, the mesh was changed to a polyhedral mesh with inflation around the blades. Figure 11 shows the mesh around a propeller airfoil at position $r/R = 0.40$ ($r = 50.8$ mm) for two meshes of different sizes. Table 4 shows details of the two polyhedral meshes. Both meshes produced the same results for torque and thrust calculations in the numerical simulation. There was no significant difference.

Table 4

Mesh details for two different sizes – polyhedral with prisms

	Coarse mesh	Fine mesh
Cells	1,707,890	2,808,693
Faces	8,276,454	13,681,975
Nodes	5,505,550	9,128,376
Propeller element size (mm)	1.0	0.8
Disk element size (mm)	2.8	2.0

7 RESULTS AND DISCUSSION

Regarding CFD simulation compared to measurements, the best result was using the SST $k-\omega$ turbulence model, as shown in Figs. 12 to 15. With respect the thrust coefficient, the results agreed very well with higher rotation rates and become worse for lower rotation rates (Fig. 12). One explanation for this behavior is related to the lower Reynolds numbers. As shown in Fig. 6, for rotations below 5,000 RPM, Reynolds numbers are less than 60,000 for most of the propeller. This is a typical feature of small-scale propellers and makes performance prediction through CFD less accurate, as the performance of these propellers typically changes with Reynolds numbers. The average difference in thrust coefficients for the SST $k-\omega$ model, which obtained the best result, in relation to the measured values, was 5.1% and the maximum difference was 7.6% at 2,000 RPM.

Comparison between thrust measured on the test bench and simulated by CFD with different turbulence models

Source: From author.

As shown in Fig. 13, the thrust generated by the propeller as a function of rotation velocities, simulated using the SST K- ω turbulence model, agreed very well with the measured thrust for the entire propeller operating range. Observing Figure 14, it can be concluded that the simulation results for the power coefficients were much lower than the values measured at rotation speeds lower than 5,000 rpm. Between 5,000 and 8,000 rpm the results were very close, except for the k- ϵ realizable model. The average difference in power coefficients for the SST k- ω model, in comparison to the measured values, was 5.1% and the maximum difference was 15.9% at 2,000 RPM. As shown in Figure 15, all models agreed very well with the measured torque values except the realizable k- ϵ model.

It is important to highlight that the standard $k-\omega$ model had a very similar result to the SST $k-\omega$ model, both for the thrust coefficient and for the Power coefficient, as concluded by Seeni, 2021.

To verify whether the laminar-turbulent transition models obtain greater accuracy at low rotation rates, especially with regard to power coefficient, which showed a greater difference in relation to the measured values, simulations were performed with two models. Figure 16 presents the results of the power coefficient and the percentage difference of these

values calculated by the SST $k-\omega$ model and the γ model in relation to the measurements. An improvement in the results for low rotations rates can be observed, especially for the Intermittency Transition model (γ model), but the Transition SST model also presented better results than the fully turbulent models for low rotations rates. For speeds above 4,000 rpm, there was no significant difference between the transition models and the fully turbulent models. Figure 7 shows that above 4000 rpm, at the position $r/R=0.75$ (which corresponds to the Reynolds number calculated at the rotational rate at the 75% station), the Reynolds number is greater than 63,300. In conclusion, the study indicates that, for the propeller under analysis, with a Reynolds number equal to or less than 63,300 (4,000 rpm), fully turbulent models begin to show greater inaccuracy.

Comparing the results of the best laminar-turbulent transition model (γ model) with the best fully turbulent model (SST $k-\omega$), in relation to the measurement, there was a drop in the average difference from 5.1% to 2.6% and for the 2,000 rpm rotation from 15.9% to 3.3%. It can be seen that below 5,000 rpm the transition model is much more accurate, however, from 5,000 rpm to higher velocities, the fully turbulent model becomes more accurate. It is also observed that for the laminar model, at rotations of 2,000 and 3,000 rpm, the results were very close to those of the γ model, with a difference of 1.1% and 0.5% for 2,000 and 3,000 rpm, respectively.

As shown in Figures 13 and 15, at low rotation velocities there is a drop in the thrust coefficient and an increase in the power coefficient. As described by Deters, 2014, the change in thrust and torque coefficient, with the former decreasing and the latter increasing, is due to the reduction of the Reynolds number to below 100,000. At these values, a laminar flow separates from the propeller due to an adverse pressure gradient that imposes a region of recirculating flow, causing a reduction in lift and an increase in airfoil drag. Figures 16(a) and 16(b) show the visualization of the airflow separation around the propeller sections (airfoils) at $r = 50.8$ mm ($r/R = 0.40$) for rotations velocities of 2,000 rpm and 5,000 rpm. In the propeller section at $r/R = 0.40$, which has a Reynolds number of 18,000 at 2,000 rpm, the laminar separation bubble size is larger than in the same section at 5,000 rpm, with a Reynolds number of 44,900, because the bubble grows as the Re number decreases. Figures 16(c) to 16(f) show the airflow around the section at $r/R = 0.75$ ($r = 95.3$ mm) at rotation velocities from 2,000 rpm to 5,000 rpm. The flow separation length decreases with increasing speed. At 2,000 rpm, the flow separation length occupies about 75% of the airfoil and gradually decreases until it disappears at 5,000 rpm. These images were made with simulation data with the γ transition model. This observation is in agreement with the conclusions drawn in Figure 17, that is, from 5,000 rpm onwards, as flow separation is no longer observed, the fully turbulent model becomes accurate. Fully turbulent models have a critical limitation when applied to low Reynolds number flows: because they assume turbulence from the leading edge of the airfoil, they ignore transition effects and, therefore, they do not capture satisfactory the laminar separation bubble (LSB), resulting in an underprediction of the drag caused by the LSB. On the other hand, since laminar-turbulent transition models are able to capture LSBs, they can also capture the increased drag caused by them and, consequently, the increased power coefficient on the propellers.

Figure 17

Laminar boundary layer separation in propeller section

8 CONCLUSIONS

Considering turbulence models for low Reynolds number flows, the most suitable ones are those that capture the laminar-turbulent transition conditions, but they have the disadvantage of being computationally very intensive. Thus, for the small-scale propeller designed, operating in static performance, we seek to identify from which condition it is really necessary to use such models. The following conclusions were reached:

Full turbulence models can predict thrust and power coefficients for Reynolds numbers greater than 60,000. For values less than 60,000, they fail to predict, as they are not able to capture satisfactory effects of laminar boundary layer; Laminar-turbulent transition models should be used for Reynolds numbers less than 60,000, as they can capture laminar boundary layer effects and consequently the change in propeller power coefficients; The best models for Reynolds numbers greater than 60,000 are the SST $k-\omega$ and the Standard $k-\omega$, since the accuracy compared to the transition models was very similar, in fact, being better

than the transition models for this range; The best model for Reynolds number less than 60,000 is the Transition γ model (Intermittency Transition model); Visual analysis through CFD of the flow around the propeller was consistent with the results related to the power coefficient, that is, through both analysis methods it was concluded that below 5000 rpm the transition models are more accurate and that for higher rotations from 5000 rpm the fully turbulence models are more accurate.

An important contribution of this work is the visualization through CFD of the characteristics of the laminar separation bubble, such as the beginning of the flow separation, the recirculation flow region and its reattachment to the propeller downstream.

ABSTRACT

This article analyzes the experience of state public administration in the centralization and modernization of traffic violation management, focusing on improving road safety and reducing impunity. The initiative, led by the State's innovation laboratory, involved the redesign of processes and the adoption of technological solutions aimed at creating a single and integrated digital system. Faced with a monthly average of 70,000 violations and 15,000 defenses and appeals, software was implemented to automate the registration and processing of citations, operating in an integrated manner with existing systems. The complete digitalization of workflows increased efficiency, reduced processing times, and ensured greater reliability and respect for the right of defense. The centralization of activities, previously fragmented, generated resource savings and allowed the reassignment of public servants to strategic functions. Cases began to be judged more quickly and uniformly, strengthening citizens' trust in public administration. The results include a growth from 13% to 29% in the use of digital channels for defenses and appeals; elimination of the backlog of registrations through automated bots, reducing the average processing time from 30 days to 2 business days; and the adoption of electronic ticket books, with a significant reduction in paper use. This experience demonstrates the potential of digital transformation in public management, especially in the traffic sector, offering a replicable model oriented toward efficiency, legality, and road safety.

Keywords: Traffic Management. Digital Transformation. Administrative Centralization. Road Safety. Public Efficiency.

RESUMO

Este artigo analisa a experiência da administração pública estadual na centralização e modernização da gestão de infrações de trânsito, com foco na melhoria da segurança viária e na redução da impunidade. A iniciativa, conduzida pelo laboratório de inovação do Estado,

envolveu a reformulação de processos e a adoção de soluções tecnológicas voltadas à criação de um sistema digital único e integrado. Diante de uma média mensal de 70 mil infrações e 15 mil defesas e recursos, foi implementado um software que automatiza o registro e o processamento das autuações, operando de forma integrada aos sistemas já existentes. A digitalização completa dos fluxos aumentou a eficiência, reduziu prazos e assegurou maior confiabilidade e respeito ao direito de defesa. A centralização das atividades, antes fragmentadas, gerou economia de recursos e permitiu o redirecionamento de servidores a funções estratégicas. Os processos passaram a ser julgados de forma mais célere e uniforme, fortalecendo a confiança do cidadão na administração pública. Os resultados incluem: crescimento de 13% para 29% no uso de canais digitais para defesa e recurso; eliminação do passivo de cadastros com robôs automatizados, reduzindo o prazo médio de 30 dias para 2 dias úteis; e adoção de talonários eletrônicos, com significativa redução no uso de papel. A experiência demonstra o potencial da transformação digital na gestão pública, especialmente no contexto do trânsito, oferecendo um modelo replicável e orientado à eficiência, à legalidade e à segurança viária.

RESUMEN

Este artículo analiza la experiencia de la administración pública estatal en la centralización y modernización de la gestión de infracciones de tránsito, con énfasis en la mejora de la seguridad vial y en la reducción de la impunidad. La iniciativa, liderada por el laboratorio de innovación del Estado, implicó la reformulación de procesos y la adopción de soluciones tecnológicas orientadas a la creación de un sistema digital único e integrado. Frente a un promedio mensual de 70.000 infracciones y 15.000 defensas y recursos, se implementó un software que automatiza el registro y el procesamiento de las sanciones, operando de manera integrada con los sistemas ya existentes. La digitalización completa de los flujos aumentó la eficiencia, redujo los plazos y garantizó mayor confiabilidad y respeto al derecho de defensa. La centralización de las actividades, antes fragmentadas, generó ahorro de recursos y permitió la reasignación de servidores a funciones estratégicas. Los procesos comenzaron a resolverse de forma más rápida y uniforme, fortaleciendo la confianza de los ciudadanos en la administración pública. Los resultados incluyen: crecimiento del 13% al 29% en el uso de canales digitales para la presentación de defensas y recursos; eliminación del rezago de registros mediante robots automatizados, reduciendo el plazo promedio de 30 días a 2 días hábiles; y adopción de talonarios electrónicos, con una significativa reducción en el uso de papel. La experiencia demuestra el potencial de la transformación digital en la gestión pública, especialmente en el ámbito del tránsito, ofreciendo un modelo replicable orientado a la eficiencia, la legalidad y la seguridad vial.

1 INTRODUCTION

Digital transformation has been consolidated as one of the main vectors for the modernization of public administration in Brazil, especially in areas marked by complex operational flows and high demand for service, such as the management of traffic violations. The centralization and digitalization of public services are fundamental strategies to ensure greater efficiency in the provision of services, promote transparency in administrative actions, promote the economy of public resources, and ensure full respect for the rights, privacy, and guarantees of citizens in interaction with the State.

In Minas Gerais, the creation of the State Coordination of Traffic Management (CET-MG), linked to the State Secretariat of Planning and Management (Seplag-MG), marked a turning point in public traffic policy. An adequate organizational structure and clear competencies are essential for the effectiveness of monitoring and control, strengthening citizens' trust in institutions (CANELA; NASCIMENTO, 2009). In this context, the administrative reform approved by the Legislative Assembly of Minas Gerais transferred the competencies of Detran-MG to the Secretariat of Planning and Management (Seplag), which created the State Coordination of Traffic Management (CET-MG). The new structure began to assume attributions previously concentrated in the State Department of Traffic (Detran-MG), representing not only an institutional reconfiguration, but the adoption of a model oriented to innovation, simplification of processes and strengthening of the state's capacity to provide public services.

CET-MG was organized into three main business areas — Infractions, Driver's License and Vehicles — in addition to a transversal area focused on the transformation of traffic services. Within the scope of the management of infractions, the activities are conducted by the Superintendence of Infractions and Driver Control, responsible for the analysis, processing and control of administrative penalties. This Superintendence is composed of two directorates: the Directorate of Infractions and the Directorate of Administrative Traffic Processes, responsible for the registration of infractions, application of the penalties provided for in the Brazilian Traffic Code and the treatment of defenses and administrative appeals.

Decree No. 47,974/2020 instituted the ICT Policy in Minas Gerais, establishing guidelines to offer public services in an agile, accessible and innovative way, ensuring integrated and transparent solutions. In addition, Decree No. 47,441/2018 created the Administrative Simplification Policy, aimed at simplifying services and improving service, actions coordinated by Seplag and LAB. MG, a partnership with the João Pinheiro Foundation.

Faced with an initial scenario characterized by fragmented processes, high dependence on physical documents, and poorly integrated systems, CET-MG, in partnership with the Laboratory of Innovation in Government of Minas Gerais (LAB.mg), started in 2023 a comprehensive process of diagnosis and redesign of the management of traffic violations. From this work, a set of strategic guidelines was defined aimed at the integral digitalization of processes, the administrative centralization of activities and the implementation of automation technologies.

This article presents the results of this digital transformation at CET-MG, with a focus on the integrated management of traffic violations. The study aims to analyze the changes implemented and their impacts on operational flows, efficiency indicators and the quality of services provided to citizens. The experience of Minas Gerais, by promoting technological solutions with high adherence to the institutional reality and focus on continuous improvement, is configured as a public management model oriented to innovation and with high potential for replicability.

2 METHODOLOGY

2.1 DESIGN THINKING AND AGILE PROJECT MANAGEMENT

Based on these methodologies, the concept of Minimum Viable Product (MVP) was adopted for the implementation of digital improvements, prioritizing fast deliveries that can add immediate value to the user. The improvements were rolled out incrementally, allowing each delivery to be evaluated, adjusted, and improved based on continuous feedback from end users — including traffic agents, police officers, and citizens — basing decision-making on the actual perception of the use and operation of the solutions presented. In this way, co-creating with the operational team and the end user has become a powerful strategy to ensure that solutions meet expectations, promoting a more effective, participatory and sustainable digital transformation.

2.2 QUALITATIVE RESEARCH AND DOCUMENT ANALYSIS

This study is characterized as a qualitative research, structured from the case study approach, specifically focused on the integrated management of traffic violations carried out by the State Coordination of Traffic Management (CET-MG). The documentary research method was adopted because it enables a detailed and in-depth investigation of the digital transformation implemented, its stages and effects on public administration. According to Chaumier (1974, apud Bardin 2016, p. 51), documentary research can be defined as "an operation or a set of operations aimed at representing the content of a document in a form

different from the original, in order to facilitate, at a later stage, its consultation and referencing". In addition, Yin (2015, p. 32) highlights that "the case study is an empirical investigation that investigates a contemporary phenomenon within its real context".

The documentary research involved the detailed analysis of official documents made available by CET-MG, including technical reports, project plans, operational flowTables, internal regulations, records of the Electronic Information System (SEI) and performance reports of the technological systems adopted, such as Power Automate and the AUTUA application. The documents analyzed cover the implementation period of the actions studied, from August 2023 to the present moment, allowing a comprehensive view of the process from conception to its execution and consolidation.

The collection of documentary data was conducted in a systematic and rigorous manner, seeking to identify aspects such as the volume of processes handled before and after the implementation of digitalization and automation, average deadlines for processing processes, percentage of use of digital channels by citizens and operational efficiency after adoption of technological solutions.

For data analysis, an interpretative qualitative approach was adopted, based on the content analysis technique as proposed by Bardin (2016), who defines this method as a set of communication analysis techniques aimed at obtaining, through systematic and objective procedures, the description of the content of the messages. This method allowed the identification of clear relationships between the adoption of technologies and the improvements observed in public management, contributing to the construction of a detailed overview of digital transformation at CET-MG.

3 RESULTS AND DISCUSSION

The analysis of the case study of the digital transformation of traffic violation management in Minas Gerais reveals a user-centered, participatory and public innovation-oriented approach. This process was conducted by the State Coordination of Traffic Management (CET-MG) with technical support from the Laboratory of Innovation in Government of Minas Gerais (LAB.mg), linked to the State Secretariat of Planning and Management (Seplag-MG). The partnership between these institutions allowed for a qualified institutional intervention, focusing on the process redesign, organizational restructuring and development of digital solutions applied to the administrative reality.

Considering a monthly average of 70 thousand infractions and 15 thousand defenses and appeals, the main challenges faced by CET-MG involved the optimization of the management of traffic violations and the demobilization of the Regional Traffic Districts

(Ciretran), responsible for decentralized service in the interior of the State, aiming at the reallocation of professionals to essential public security activities of the Civil Police.

Faced with this challenging scenario, LAB.mg played a key role in identifying and analyzing existing operational flows, conducting a thorough diagnostic work and proposing specific improvements. The joint action resulted in the clear definition of three central strategic guidelines: integral digitization of physical processes, administrative centralization, and implementation of automation technologies for recording and processing infractions. These actions sought to ensure greater operational efficiency, transparency in the analyses and speed in the provision of services.

At the beginning of the administration, in mid-2023, about 80% of the document volume received by the centralized protocol of the Administrative City, the unit responsible for receiving documents from all State Secretariats, came from the transit area. This data clearly reflected the high degree of dependence on physical processes in the management of infractions, highlighting the urgency of implementing profound changes to ensure greater traceability, speed and quality in citizen service.

The work carried out between August and December 2023 was structured in sequential and interdependent stages. Initially, there was a technical alignment to define the scope, schedule, responsibilities and objectives. Subsequently, the exploratory phase began, marked by interviews with civil servants, documentary analysis, studies of the applicable legislation and detailed mapping of the existing operational flows. This step was crucial to identify bottlenecks, rework, and institutional vulnerabilities, especially in the context of transition to a digital model.

Complementing this exploratory phase, a benchmarking was carried out with institutions such as Detran of Mato Grosso do Sul, Detran of São Paulo, Detran of Paraná, Federal Highway Police, Court of Justice of Minas Gerais, Military Police of Minas Gerais and Federal University of Rio Grande do Norte. The main objective of this activity was to identify good practices in the use of digital technologies and in the management of processes related to traffic violations, generating inspiring elements for an innovative and replicable solution in the context of Minas Gerais.

Based on this information, co-creation workshops were held with civil servants from the areas involved, resulting in the systematization of 87 suggestions categorized into systemic, organizational, procedural and normative improvements. Technical training on automation and innovation was also offered, strengthening the autonomy of the teams involved.

Then, a complete redesign of the processes was developed, including two versions: an incremental one, with adjustments to the existing systems, and a structural one, aiming at a single, digital and integrated system, capable of automating critical steps and increasing data traceability. Visual diagrams, proposals for document standardization, revision of forms with simplified language and definition of functional requirements were important aspects of this redesign.

The methodology used stood out for the protagonism of the servers of the various areas of CET-MG, ensuring greater adherence of the solutions to the operational reality and favoring the consolidation of an innovative institutional culture focused on continuous improvement and the value delivered to the citizen. Below, specific actions, their peculiarities and the results obtained with their implementation will be detailed.

3.1 ADMINISTRATIVE CENTRALIZATION OF THE PROCEDURAL PROCESS

The fragmentation of the processing of administrative traffic processes, historically distributed among more than 70 Regional Traffic Districts (Ciretran), was one of the main obstacles to uniformity, predictability and quality control in the management of infractions in Minas Gerais. Each unit had a different degree of maturity, technical training and volume of work, which resulted in variable criteria for judgment, difficulty in supervision and fragility in the standardization of procedures.

In order to overcome these challenges, the centralization of administrative traffic processes was implemented, one of the pillars of the transformation promoted in the management of infractions in the State. This measure involved the complete restructuring of the Directorate of Administrative Traffic Processes, resulting in the full transfer of the competence of analysis, instruction and judgment of these processes to a specialized technical nucleus linked to the Directorate.

The decision to centralize was made as a strategic guideline of public management, supported by international and national studies and practices that point to centralization as an effective mechanism to gain scale, reduce waste, concentrate expertise and strengthen institutional control. According to Peci and Sobral (2009), centralization can be fundamental to ensure coherence in the implementation of public policies, reduce operational asymmetries and strengthen state capacity. Di Pietro (2019), in turn, points out that, in certain contexts, the concentration of administrative competencies in a central unit contributes to greater efficiency, less dispersion of resources, and qualification of state action.

In the context of CET-MG, centralization was preceded by a careful process of mapping decentralized flows, internal organizational restructuring, and technical

communication with the units involved. To ensure a safe transition without prejudice to the citizen, a communication channel was maintained, while procedural routines were progressively absorbed by the centralized structure.

The experience is also in line with international guidelines, such as those of the Organization for Economic Cooperation and Development (OECD, 2020), which recommend the adoption of lean, integrated, and digital administrative structures as a way to modernize the State and expand the focus on results. The World Bank (2013) reinforces this approach by highlighting that centralization can generate significant productivity gains, especially when associated with the digitalization of processes and the adoption of performance-based management platforms.

In the case of Minas Gerais, centralization made it possible to qualify the technical staff, organize teams by process profile (suspension, cassation, defenses, appeals), establish uniform analysis criteria and create continuous monitoring routines, with goals and productivity analysis. In addition, it made it possible to rationalize the use of the workforce, freeing up Ciretrans employees to work in core activities of the Civil Police — a strategic gain for the State as a whole, by articulating traffic policy with public security.

Among the benefits already observed are: greater speed in the processing of processes, with a reduction in the average time between protocol and final decision; reduction of rework and procedural inconsistencies, thanks to the standardization of decision-making criteria; improvement of the control of legal deadlines, ensuring due process and the rights of citizens; improved traceability, with digitized and monitorable flows in real time; and savings in operational resources, with less dependence on physical transportation and face-to-face service.

More than an organizational measure, the centralization implemented materialized a paradigm shift in the conduct of traffic sanctioning processes in Minas Gerais. It has made it possible to move from a reactive, decentralized and vulnerable model to a more technical, integrated, efficient and citizen-oriented public management logic.

3.2 UNIFIED SYSTEM OF INFRACTIONS AND ELECTRONIC TICKET BOOK

During the diagnosis carried out by the Laboratory of Innovation in Government of Minas Gerais (LAB.mg), the operational flows related to the life cycle of traffic violations in the state were analyzed in detail. The process began with the acquisition of physical blocks of infraction, through the contracting of specific graphic services. These blocks were distributed to the Regional Traffic Districts (Ciretrans), units of the Civil Police spread

throughout the state, responsible for forwarding them to the Military Police agents who carried out the manual drawing up of the infraction notices.

After the manual drawing up by the agents, the records were delivered again to Ciretrans or to the centralized team of the Infractions Directorate in the capital, responsible for typing the data contained in the paper into the database via the SDAK mainframe system. The subsequent digitization of these records was centralized in the CET, and there was a delay in sending the records from the interior. With the typing in the SDAK system, the fine became legally valid, and was then notified to the driver by mail or by the Digital Traffic Card.

During the period of 30 days after the notification of the fine, the driver may present a defense of the fine or indicate the offending driver. If there was no defense or indication from another driver, the fine automatically became an infraction, with the generation of a fine and a score on the driver's record. Against the infraction, it was possible to file an appeal of first instance with the Administrative Board of Infraction Appeals (JARI), and, if necessary, an appeal of second instance with the State Traffic Council (CETTRAN).

Each step of the process mentioned was carried out in different systems and partially on paper, generating significant challenges in terms of operational efficiency, control, traceability and communication between databases. The main system used was the SDAK, which manages the state database of vehicles and interfaces with the National Registry of Infractions (RENAINF). At the same time, other systems served specific functions, such as Siaut for registering defenses, JARI and CETTRAN's own systems for resources, and SDMU (mainframe) for distribution, cancellation and regionalization of infraction notices, FICI System, indication of offending driver and scoring system. In addition, the digitized AIT image was stored in the cloud for only 90 days, and then transferred to physical media (CDs).

After detailed analysis and market research, the feasibility and need for an integrated system capable of covering all these steps and fully digitizing the infraction notice was verified. Thus, it was decided to hire the Radar System, developed by the Federal Data Processing Service (SERPRO), which includes the AUTUA module, Electronic Infraction Receipt, intended to completely replace the manual process of drawing up and recording infractions.

Radar is a traffic violation management platform that integrates all national traffic bases, including RENAINF (violations), RENACH (drivers) and RENAVAN (vehicles). In it, all previously fragmented processes are integrated into a single system, allowing instant communication between all stages, eliminating the need for printing and physical transmission of documents. One of the most outstanding features is Autua, an electronic ticket book of infractions made available in the form of a mobile application for traffic agents.

Autua facilitates the completion of information, automates vehicle base queries and ensures the complete and correct completion of infraction notices, significantly reducing common typing errors and manual interpretation.

For the implementation of the Radar, it was initially necessary to carry out integrations between the existing systems, especially the state bases of vehicles and drivers that remain linked to the current system managed by PRODEMGE. During this period, the databases were duplicated, ensuring a safe and continuous transition until the complete migration to the Radar.

The implementation of Autua began with controlled tests in August 2024, involving 20 agents trained specifically for this purpose. The success of these tests resulted in gradual expansion, starting with a pilot project in November and December 2024, with 200 agents from the Traffic Battalion of the Military Police in Belo Horizonte. Since July 2025, the use of Autua has expanded significantly, surpassing the mark of 2 thousand agents trained and qualified to use the system. It is expected that by the end of 2025 all PMMG agents will have access to the application.

Throughout the implementation of the Autua system, there was an important technical evolution in the methodology of training offered to traffic agents. The initial training for the 20 agents participating in the tests was carried out in person. In the subsequent stage, with the expansion to 200 agents, a synchronous virtual approach was adopted, dividing the training into four classes of 50 agents each, with classes lasting two hours. After this stage, considering the target audience of more than 15 thousand agents, a complete material was developed for a course in the Distance Education (EAD) modality, available on the official platform of the State Secretariat for Planning and Management. The distance learning course was launched at the end of the first semester of 2025, allowing the constant and simultaneous expansion of the training of interested agents, respecting the voluntary nature of the use of the application.

Despite voluntary use and limitations, such as the requirement for agents' personal Android devices and the limited ability to release devices on a daily basis, adoption has been growing. The average time to draw up infractions fell from approximately 5 minutes to only 30 seconds per infraction. In addition, frequent errors, such as incorrect plate filling and omission of required fields, have been drastically reduced. The system also offers automatic GPS location, automatic filling of vehicle data from the license plate and immediate communication of the infraction to the citizen, with digital notifications within 2 hours after drawing up, compared to 18 days of the previous paper process. These advances confirm

the effectiveness of the technological solution and its significant contribution to efficiency, accuracy, and transparency in the management of traffic violations.

Table 1

Description of costs involved with the paper x electronic receipt

	DIRECT COST	INDIRECT COST	UNMEASURED COSTS
LONNAIRE PAPER	Annual Table Cost: 170.000,00	Police force deployed to Typing: 600,000 AITs typed inside	Cost of carrying out the process of Shopping Storage room maintenance cost Cost of document storage: Includes preparation for storage and physical cost. Cost of assembly, organization and shipping via SEI. PMMG logistics cost: removal and distribution of blocks. Logistical cost in the full return of AITs: Includes use of police personnel and resources for transportation and preparation.
	Typists: 900,000.00	Estimate: 20,000 hours of police work displaced from the core activity	
	PRODEMGE: Support and development: R\$ 1,000,000.00 Accommodation: R\$ 5.000.000,00	Uncollected fines for inconsistency in AITs: Estimated value in 2024: BRL 26,198,895.00 Average amount per fine appealed: R\$ 1,037.58.	
ELECTRONIC MARATHON	R\$ 2,376,000.00 Base: 900,000 infractions x R\$ 2,64 Cost of assembly and storage of SEI and PRODEMGE remain in the flow with AUTUA deployed

Table 2

Simplification of process steps with the paper vs. electronic receipt

	PAPER TALORÁRIO	ELECTRONIC MARATHON
NUMBER OF STAGES OF THE PROCESS	10	4 (Eliminate 8 steps, simplify 2 steps and bring 1 get 2 new release of assessment devices).

Source: prepared by the authors.

The expansion of Autua is essential to enable the complete migration to the Radar system, allowing CET-MG to fully enjoy the benefits of an integrated and digitalized model for managing traffic violations. The expectation is that this migration will still occur in 2025. As a third stage, the dissemination of the Radar to the municipalities of the State is planned, with the objective of standardizing inspection practices and expanding the use of technology as an instrument to support road safety throughout the territory of Minas Gerais. This phase will be accompanied by training actions, technical support and institutional articulation, strengthening cooperation between the State and municipalities. With this, Minas Gerais

advances in the consolidation of a more modern, efficient and citizen-centered public traffic policy.

3.3 AUTOMATION OF PROCESSES FOR DEFENSE OF FINES AND APPEAL OF INFRACTIONS

One of the priority challenges identified was the management of Defenses of Fines and Appeals of Traffic Violations. Initially, the entire process took place manually, on paper, even when requests were received digitally, requiring printing and physical handling of documents. This practice resulted in delays, high operating costs, in addition to generating significant delays in granting the suspensive effect of infractions, often resulting in undue fines and legal complications.

CET-MG then implemented an initial process of digitizing the documents received, using the Electronic Information System (SEI). However, in view of the large monthly volume of approximately 15 thousand cases, of which 8 thousand were specifically Assessment Defenses, the urgent need for automation of these activities was quickly realized. With a reduced team of only 12 people to perform the entire administrative process (registration, assembly, forwarding, closure and document searches), manual work became unfeasible and generated a significant liability of pending processes.

The Fine Defense process receives demands both physically and digitally. In digital format, the process was received through a specific system, the Assessment Defense System (SIAUT), in which initially the reception took place for immediate generation of the suspensive effect of the infraction. Then, the attached documents were used to generate the cover of the process and inserted into the SEI. The process was then forwarded to an advisor responsible for analyzing and issuing the opinion, which was registered both in the SEI and in the SIAUT. After this analysis, another server of the team verified the data and closed the process in the system. For the processes that had pending issues related to the lack of the Traffic Infraction Notice (AIT), the initial procedure was completely manual. The server needed to access the SAE system to identify the process number, then check the database to locate the physical media (CD) in which the record was stored, download the scanned file, attach it to the process in the SEI and, finally, forward it for analysis.

After identifying possible immediate improvements in the process, before changing the system to RADAR, a partnership was started with the Automatiza MG project, an initiative of the state government linked to the Department of Planning and Management, for the development of automated robots through the Power Automate software. Initially, it was attempted to develop a single robot for the complete process, however, over the course of

development, it was concluded to be more effective to build smaller, purpose-built robots to quickly solve the identified bottlenecks.

The first two robots implemented simultaneously were the one for receiving the defenses via digital protocol, quickly solving the bottleneck in the generation of the suspensive effect, and the robot dedicated to locating the pending Infraction Notices (AIT) necessary for the judgment of the defenses. With the implementation of the reception robot, the existing liability, which exceeded four thousand processes in the most critical moments, was quickly reduced and the average time for reception and registration of the Defenses

A specific robot was also developed for the closure of processes, which automatically checks the defense situation in the SEI and in the SIAUT system, finalizing the procedure and ensuring accuracy in the results. These robots require constant adjustments and have been replicated on several machines to optimize their use, especially at times of less server activity.

Currently, a new robot is in an advanced stage of implementation aimed at receiving the Defenses sent by the Post Office and digitized in the central protocol of the Administrative City. This robot will have the ability to identify and interpret handwritten or typed documents, automatically register in the system, generate the block, attach to the SEI and forward for analysis, complementing the automation cycle and ensuring greater operational efficiency for the near future.

Another robot that is being developed by the Automatiza.mg is the AI robot for suggestion of analysis and opinion of the Defense of Assessment, which will be fundamental for increasing productivity in the analysis and the consequent elimination of liabilities, avoiding the prescription of the Defense, which occurs 365 days after the initial protocol. The delivery of this robot is scheduled for the end of 2025.

After the initial implementation and delivery of the robots by the Automatiza MG team, the internal team of the Infractions Directorate started to play an active role in the management of these technological tools. Constant monitoring of the robots was carried out, accompanied by continuous actions to map failures and identify opportunities for improvement in automated processes. This close monitoring enabled the development of essential technical expertise among the servers, who acquired the ability to make adjustments and improvements directly to the implemented robots.

With the knowledge acquired, the internal team was able to replicate these technological solutions in the Infringement Appeal processes, which have similar stages and characteristics to the Defense process, but operating in different systems. The resources also reach the Board through physical and digital channels, facing challenges similar to defense

processes, such as undersizing of the team, 100% manual and repetitive work, accumulated liabilities for registration and analysis, often due to the difficulty in locating the Traffic Infraction Notices (AIT).

Currently, all the robots initially developed for the Defense processes have already been replicated, with the necessary adaptations, in the Infringement Appeal processes. This replication has had significant impacts, resulting in a significant reduction in existing liabilities and a substantial reduction in the average time required for receipt and treatment of the appeals. This progress allowed the team to allocate efforts to more strategic activities and continuously improve the service provided to citizens.

In general, the implementation of automated robots has provided significant results in the management of defenses and appeals of infractions. The average time for receiving cases was significantly reduced, falling from 30 days to just 2 working days. The location of the Traffic Infraction Notices (AIT) was largely optimized, contributing to the reduction of the liability of defenses pending analysis, which went from 60,000 to less than

25,000 cases. In the first half of 2026 alone, about 10,000 records were located for pending appeals. In terms of daily operational capacity, it is noteworthy that the AIT search and attach robot performs an average of 770 processes per day per machine. The robot responsible for the digital reception of defenses processes approximately 270 daily processes, ensuring complete compliance with the demand. The defense process assembly robot, due to possible instabilities, performs an average of 48 daily processes, requiring operation on multiple machines to increase its efficiency. As for the appeal processes, the robot that previously checks the situation of the defenses performs about 290 processes daily, while the robot that assembles these processes operates with a daily average of 150 processes, distributed in several workstations. The robot for the digital reception of the processes of the Administrative Board of Infraction Appeals (JARI) reaches a daily average of 180 processes, which fully meets current needs.

An important limitation faced during the automation process was the absence of equipment dedicated exclusively to the execution of automated robots. To overcome this challenge, the replication of robots on the individual machines of the Board's servers was adopted as a strategy. Robots began to operate predominantly during periods of lower use of computers, especially during lunch hours and after work, optimizing the use of existing technological resources. This alternative solution allowed the desired results to be achieved, ensuring significant reductions in accumulated liabilities and in the average times for reception and analysis of defense and appeal processes.

In general, the implementation of automated robots has provided significant results in the management of defenses and appeals of infractions. The average time for receiving cases was significantly reduced, falling from 30 days to just 2 working days. The location of the Traffic Infraction Notices (AIT) was largely optimized, contributing to the reduction of the liability of defenses pending analysis, which went from 60,000 to less than

25,000 cases. In the first half of 2026 alone, about 10,000 records were located for pending appeals. In terms of daily operational capacity, it is noteworthy that the AIT search and attach robot performs search in an average of 770 processes per day per machine. The robot responsible for receiving defenses via digital protocol processes approximately 270 daily processes, ensuring complete compliance with demand. The defense process assembly robot, due to possible instabilities, performs an average of 48 daily processes, requiring operation on multiple machines to increase its efficiency. As for the appeal processes, the robot that previously checks the situation of the defenses performs about 290 processes daily, while the robot that assembles these processes operates with a daily average of 150 processes, distributed in several workstations. The robot of the digital reception of the processes of the Administrative Board of Infraction Appeals (JARI) reaches a daily average of 180 processes, which fully meets current needs.

3.4 DIGITALIZATION OF PROCESSES AND CREATION OF DIGITAL CHANNELS

The digital transition promoted in the management of traffic violations was not restricted to technological modernization. It implied a structural change in the way public administration interacts with citizens and conducts its own internal flows. One of the milestones that highlighted the urgency of this transformation was the fact that, at the beginning of the current administration, the Infractions area of CET-MG was responsible for approximately 80% of the entire document volume received by the centralized protocol of the Administrative City, which concentrates the documentation destined to the State Secretariats.

This data revealed an operational overload incompatible with the logic of simplifying public services and made evident the need for a comprehensive digitalization of processes. The institutional response involved two complementary fronts: on the one hand, the digitalization of the physical liabilities accumulated over the years; on the other, the expansion and strengthening of digital entry channels, through the Traffic Services Portal.

The Superintendence of Infractions and Driver Control accumulated a voluminous collection of administrative processes in physical media — many of them requiring repetitive movements for analysis of defenses, appeals and reconstitution of driver histories. The digitization of these documents allowed them to be incorporated into the electronic system,

enabling the digital processing of historical processes by the technical team and ensuring greater transparency to citizens, who now have easy access to the information necessary to exercise their right of defense.

This digitalization was not a measure of convenience, but an essential condition for the continuity and sustainability of public traffic policy. To make it viable, an internal digitization island was created, with equipment, protocols and a team dedicated exclusively to the treatment of the collection. The operation involved rigorous flows of sorting, preparation, scanning, indexing and checking, following technical criteria that ensured integrity, traceability and compatibility with the systems already in use.

The effects of this work front were multiple: drastic reduction in the time to locate documents, with immediate access at any authorized station; document preservation, avoiding deterioration of physical originals; and ease of service to citizens, with more agile responses and elimination of dependence on paper procedures.

More than solving a historical bottleneck, the digitization of the physical collection served as a turning point in the institutional culture of CET-MG. By adopting a management logic driven by data and digital documents, teams started to operate with greater predictability, flow control, and performance evaluation capacity. This transition has set the stage for future automations, smart analytics, and more efficient and affordable public services.

At the same time, CET-MG worked on the expansion of digital channels for citizen service. At the beginning of the transition in 2023, there were some digital channels already available for citizen service, legacies of the State Department of Traffic (DETRAN-MG). These channels included the Digital Protocol, accessible through the official traffic websites and the MGapp application, allowing the submission of Fine Defenses, Infraction Appeals in the first instance and Identification of the Real Offending Driver. Initially, this digital channel communicated with the current systems, however, the documents received were printed and inserted into physical processes. Subsequently, these physical processes began to be converted into electronic processes in the Electronic Information System (SEI).

In 2023, the monthly volume of demands through digital protocol channels was approximately 966 Defenses of Fines, 193 appeals of first instance and 144 Offending Driver Identification (FICI) forms. In addition to these digital protocols, other services such as requests for copies of the infraction notice (AIT), requests for copies of defense processes, appeals, administrative suspension and cassation proceedings were carried out via e-mail. These procedures, despite being digital and eliminating the use of paper, lacked a more robust organization and did not offer adequate mechanisms for monitoring citizens, making

it difficult to control and effectively manage the requested services. Monthly email requests for copies of Infringement Defense and Appeal proceedings were less than 20, while monthly requests for copies of AIT were approximately 300.

Basic consultations related to the status of the license were also available digitally on the website, allowing citizens to check scores and possible suspension or revocation; consultation on the vehicle's situation to view pending issues, including existing infractions; and consultation of the result of the defenses and appeals, although without access to the detailed text of the judgment, only indicating the final decision.

One of the fundamental guidelines for the digital transformation of service channels was to significantly expand the use of existing digital channels, such as the Digital Protocol. To achieve this goal, several strategic actions were adopted, such as specific dissemination campaigns, streamlining digital processes, modernization and visual improvements in the layout of communications related to infractions, complete updating of the institutional website and wide dissemination through digital platforms. These initiatives resulted in a significant growth in the use of digital channels, evidenced by the 2024 data, which show a monthly average of 2,090 infraction defenses, 518 offending driver identifications, and 615 infraction appeals, representing significant increases of 116.4%, 259.7%, and 218.7%, respectively, compared to 2023. Another driving factor was the initiative of the Federal Government, which made available through the Digital Transit Card (CDT) a completely digital service for indicating offending drivers. In the first half of 2025, growth continued to rise, reaching monthly averages of 2,300 infraction defenses, 883 infraction appeals, and 808 digital driver identifications, substantially reinforcing citizens' adherence to digital channels for these specific services.

In order to improve and expand the digital channels of citizen service, ensuring greater ease, transparency and capacity to follow up on requests, the CET-MG team, in partnership with the Digital Undersecretary of the State Secretariat for Planning and Management (SEPLAG), began the development of models based on BPMS (Business Process Management Suite), the ProBPMS developed by PRODEMGE.

ProBPMS refers to a technological platform for business process management, which allows automating, managing and optimizing operational processes, offering the user a more fluid and transparent experience. With these models, citizens now have systematized and structured flows, facilitating monitoring and providing greater efficiency in the resolution of demands. 13 new ProBPMS digital protocols were developed and implemented, ensuring significant advances in digital service to the public, which are

- Request for a copy of the Infraction Notice (AIT)

- Request for a copy of the Defense or Appeals opinion
- Presentation of CETRAN Appeal (2nd Instance - infraction)
- Present a prior defense (suspension and cassation)
- Waiving the presentation of defense (suspension)
- Present JARI Appeal (1st instance suspension and cassation)
- Present CETRAN Appeal (2nd instance suspension and cassation)
- Request a copy of the CNH suspension or revocation process
- Request compliance with the penalty of suspension or revocation of the CNH

The significant increases recorded in the use of existing digital protocols demonstrate that the strategic actions of dissemination and modernization of digital channels have had a positive effect. With the implementation of these new tools and protocols developed, currently 100% of the services related to traffic violations can be accessed and fully monitored digitally through the official traffic portal of Minas Gerais. This digital transformation has not only expanded the reach and accessibility of services, but has also strengthened the transparency and operational efficiency of the State Coordination of Traffic Management (CET-MG). With this, the strategic goal of at least 50% of all demands received by CET-MG to be carried out through digital channels by the beginning of 2026 becomes increasingly tangible and close to being achieved.

3.5 NEW TOOLS AND FEATURES

In addition to the major strategic fronts developed throughout the digital transformation process, several specific initiatives and less complex projects were also implemented with significant results. These complementary projects, although simpler from a technical point of view, represented important advances in terms of agility, transparency, modernization and quality in citizen service.

Among these initiatives, the modernization of the storage of digital media of infraction notices stands out. Previously, digital files remained available in the cloud for only 90 days, and then transferred to physical CDs. With the new solution, infraction notices are now stored for up to five years in the cloud, eliminating the need for a formal request for viewing and consultation by the citizen. More than 3 thousand CDs were digitized and migrated to the cloud, promoting operational savings, practicality and instant access to content.

Another important innovation was the launch, in 2025, of the possibility of paying fines through the Pix system. The functionality was also extended to other fees, such as vehicle licensing. This made it possible, for example, for drivers approached in inspections to

regularize their situation in real time, avoiding removals and inconveniences. This measure brought direct gains to the flow of traffic and the exercise of the citizen's right to defense.

Automatic and systemic fines were also implemented, with emphasis on two: the infraction provided for in article 165-D of the Brazilian Traffic Code, referring to the failure to carry out the mandatory periodic toxicological examination by drivers licensed in categories C, D and E, and the infraction for non-compliance with the legal deadline for transfer of vehicle ownership. Both are now automatically generated by the systems, based on data crossing and verification of deadlines, ensuring greater rigor, precision and scope of inspection actions. Minas Gerais was the first state to regularly apply the toxicological assessment within the period provided for by law.

Finally, a monitoring dashboard was developed that centralizes and organizes operational data related to these new tools and flows. With a user-friendly and dynamic interface, the dashboard allows real-time monitoring of assessments, payments, automated actions and procedural demands, offering managers a strategic tool for monitoring and decision-making, in addition to strengthening the data culture and management by results at CET-MG.

All these initiatives, from the initial digitization, the centralization of processes, the change of systems and the adoption of new technologies, considered together, not only promoted operational improvements and reduction of administrative deadlines, but also brought significant gains in the quality of citizen service and public transparency. At the same time, it was possible to free up human resources previously occupied in repetitive and bureaucratic activities for strategic and analytical functions within public management, increasing the overall efficiency of CET-MG.

In terms of implications, these results confirm the importance of digital transformation in the public sector, particularly in the management of traffic violations. Technological integration and automation demonstrate clear potential for replication to other areas of state and even municipal public administration, providing a model that combines operational efficiency, transparency, and respect for citizens' rights. However, the study also identifies limitations, such as the continuous need for technological updating and permanent training of civil servants, essential factors to sustain the gains obtained and expand the benefits of this digital transformation.

4 FINAL THOUGHTS

The digital transformation experience conducted by the State Coordination of Traffic Management of Minas Gerais (CET-MG) clearly and concretely demonstrates the potential

of public innovation to reconfigure traditional processes and significantly improve the delivery of services to the citizen. From a broad process of diagnosis and redesign of operational flows, combined with the implementation of digital and automated solutions, it was possible to restructure the management of infractions in the state, overcoming historical bottlenecks and establishing a new logic of administrative action.

The adoption of automation technologies, such as the robots implemented with the support of the Automatiza.mg project, resulted in a drastic reduction in the reception and analysis times of defenses and infraction appeals — from 30 days to 2 working days — and in the elimination of liabilities that previously compromised the right of defense of drivers. The implementation of the Autua application and the subsequent adhesion to the Radar system marked a new level of digitalization in the registration and treatment of infractions, promoting gains in speed, traceability and quality of information, eliminating the use of paper, simplifying the process, cutting logistics costs and reducing errors.

Likewise, the consolidation of digital service channels and the creation of new protocols for citizens represented relevant advances in transparency, access to information, and the reduction of bureaucracy in public services. The data presented demonstrate a significant growth in the use of digital channels by citizens and reflect the direct results of the strategies for dissemination, simplification and modernization of institutional communication.

Other complementary actions, such as the digitization of the historical media of infraction notices, the launch of payment via Pix, and the automatic generation of specific infractions, have expanded the scope of the transformation and demonstrate how smaller, but well-targeted, projects also contribute to the construction of a more efficient and citizen-oriented digital ecosystem.

This journey reinforces the importance of a systemic, interinstitutional and user-centered approach so that technological innovations are in fact incorporated in a sustainable way in public administration. The advances observed at CET-MG are the result of the articulation between technical teams, public leaders and innovation support structures, such as the LAB.mg, and show that structural changes can be achieved even in the face of budgetary and operational constraints, as long as they are conducted with planning, internal protagonism and focus on results.

The experience of Minas Gerais serves, therefore, as a reference case for other federative units and public organizations that seek to combine modernization, efficiency and qualified service to the citizen. By prioritizing digital transformation as a management strategy, Minas Gerais takes a relevant step in the consolidation of more modern, responsive public policies aligned with the expectations of contemporary society.

ABSTRACT

Visceral leishmaniasis (VL) is a severe zoonosis caused by protozoa of the *Leishmania* genus, transmitted through the bite of infected female phlebotomine sandflies. In Brazil, the disease has an endemic character and a heterogeneous distribution, with particular emphasis on the Northern Region, where environmental, social, and cultural factors directly influence its incidence. This study aims to analyze confirmed cases of visceral leishmaniasis in Indigenous populations in the state of Tocantins between 2015 and 2025, correlating the available epidemiological data with geographical and social variables. It is a descriptive and quantitative research based on secondary data extracted from the Notifiable Diseases Information System (SINAN/DATASUS). The results revealed the occurrence of the disease in four health regions of Tocantins, with a predominance in the Capim Dourado region, and showed a higher incidence among Indigenous individuals under 10 years of age. The findings reinforce the need for specific and continuous public policies aimed at prevention, early diagnosis, and monitoring of VL in Indigenous communities, especially in vulnerable and hard-to-reach territories.

RESUMO

A leishmaniose visceral (LV) é uma zoonose grave causada por protozoários do gênero *Leishmania*, transmitidos pela picada de flebotomíneos fêmeas infectadas. No Brasil, a doença apresenta caráter endêmico e distribuição heterogênea, com destaque para a Região Norte, onde fatores ambientais, sociais e culturais influenciam diretamente na sua incidência. Este estudo teve como objetivo analisar os casos confirmados de leishmaniose visceral em populações originárias no Estado do Tocantins, no período de 2015 a 2025, correlacionando os dados epidemiológicos disponíveis com variáveis geográficas e sociais. Foi uma pesquisa descritiva e quantitativa baseada em dados secundários extraídos do Sistema de Informação de Agravos de Notificação (SINAN/DATASUS). Os resultados revelaram ocorrência da doença em quatro regiões de saúde do estado do Tocantins, com predominância na região de Capim Dourado, além de evidenciar maior incidência em indivíduos indígenas menores de 10 anos de idade. Os achados reforçam a necessidade de políticas públicas específicas e contínuas voltadas à prevenção, diagnóstico precoce e monitoramento da LV em comunidades indígenas, especialmente em territórios vulneráveis e de difícil acesso.

1 INTRODUCTION

Visceral leishmaniasis (VL) is one of the most relevant neglected tropical diseases for global public health, with an estimated incidence of between 50 and 90 thousand new cases per year (World Health Organization, 2023). In Brazil, VL is predominantly caused by the species *Leishmania infantum chagasi*, whose transmission occurs through the bite of the infected female sandfly *Lutzomyia longipalpis*, a vector widely distributed in the North and Northeast regions of the country (Costa et al., 2020).

The territorial expansion of the disease has been associated with multiple factors, such as deforestation, disorderly urbanization, human migrations, and social vulnerability (Cavalcanti et al., 2021). In areas of greater vulnerability, such as indigenous communities, visceral leishmaniasis is more worrisome due to the scarcity of sanitary infrastructure, limitations in access to health services, and sociocultural barriers in diagnosis and treatment (Souza; Lima; Gomes, 2022).

According to the Pan American Health Organization (PAHO, 2023), about 97% of reported cases of VL in Latin America occur in Brazil, with the North and Northeast regions accounting for most of the notifications. The State of Tocantins, located in the transition zone between the Cerrado and the Amazon, has favorable environmental conditions for the proliferation of the vector, with a significant occurrence of the disease in rural and peri-urban areas (Almeida et al., 2024).

In addition to environmental determinants, recent studies show that the social component is essential in maintaining the endemic. Indigenous populations, for example, are disproportionately affected by tropical diseases due to low vaccination coverage, precarious housing, and direct contact with domestic and wild animals, considered potential reservoirs of the parasite (Ferreira; Oliveira; Nascimento, 2023).

The proposal of this research sought to contribute to the understanding of the spatial and temporal distribution of the disease, as well as to subsidize more efficient and culturally appropriate public policies for control and prevention. In view of this panorama, the research aimed to analyze the occurrence of visceral leishmaniasis in populations originating in the State of Tocantins, in the period from 2015 to 2025, based on official epidemiological data.

2 CONCEPTUAL ASPECTS

2.1 VISCERAL LEISHMANIASIS: OVERVIEW AND HISTORICAL OVERVIEW

Transmitted by vectors, leishmaniasis is categorized as a zoonosis, or as a subtype of the same disease, called anthroponosis. When zoonosis, the main parasitic host is animals, while in anthroponotic cases, the human being ends up serving as a secondary or

accidental reservoir, since the primary origin is in animals, with dogs and cats being the most common (Mesquita et al., 2024).

In this scenario, humans end up being a collateral host due to social and environmental factors, such as deforestation and urbanization, fostering vector dispersion and the occurrence of outbreaks (Saha, 2021).

The World Health Organization (2023) infers that the main means of transmission of visceral leishmaniasis is through the bite of female sandflies, belonging to the psychodidae family, and to the *phlebotominae* subfamily. The most present sandfly in Brazil belongs to the genus *Lutzomyia longipalpis*. While the predominant species in Africa and Asia are of the genus *Phlebotomus*.

2.2 LUTZOMYIA LONGIPALPIS: TAXONOMY AND ECOLOGY

The sandflies present in Latin America and Brazil, also called New World Sandflies, have their complex taxonomy explained by the classic author Forattini (1973), schematized in Table 1.

Table 1

Taxonomy of Sandflies

PHILO	CLASS	ORDER	SUBORDER	FAMILY	SUBFAMILY
<i>Arthropoda</i>	<i>Insecta</i>	<i>Diptera</i>	<i>Nematocera</i>	<i>Psychodidae</i>	<i>Phlebotominae</i>

Source: (Prepared by the author, 2025). Adapted from FORATTINI (1973).

In some Brazilian regions they receive the popular name of "sandfly". However, these insects do not fit scientifically into the mosquito family, since their life cycle and morphology are different (World Health Organization, 2023).

Among all sandflies, those of the genus *Lutzomyia* are the most diverse and with the greatest distribution across endemic geographic spaces, containing 11 species and 15 subgenera (Bates et al., 2015). Its size is small, with an average size of 0.3 to 0.4 cm, and its development phases are divided into: egg; four larval stages; pupa is the adult and winged stage of the insect, as shown in Figure 1.

Figure 1

Biological cycle of the insect Lutzomyia longipalpis

Source: (Valença, 2015).

Eggs are deposited in organic matter located in humid and shady environments, whether domestic or not. Hatching occurs variably, depending on the amount of blood ingested by the female and also on the amount of substrate available, and can take from 7 to 17 days, with shorter periods where there are more favorable conditions (Sangiorgi et al., 2012)

Sales (2015) describes the insect *L. Longipalpis* in its adult stage, with a yellowish color and wings that kill themselves erect when at rest, as shown in Figure 2.

Figure 2

Female sandfly L. longipalpis feeding

Source: (Colins, 2011).

Its flight is classified as bouncy, its oral cavity, when in adulthood, serves to sting and sucking, and the diet of males and females is based on the intake of carbohydrates such as glucose and fructose from nectars and plant sap, serving as a source of energy for the execution of basic maintenance and reproduction activities. (Colins, 2011)

It is noteworthy that, even though she has a similar diet, only the female has hematophagous feeding directed to the maturation and laying of the eggs. The practice of

hematophagy usually occurs at night or twilight. Because they are not very selective, sandflies can feed on a varied group of invertebrate animals, which include humans (Sales, 2015).

2.3 VISCERAL LEISHMANIASIS IN HUMANS

Leishmaniasis is a serious vector-borne disease that has broad medical interest, being more common in dogs and, in some cases, in cats. In certain situations and epidemiological conditions, human beings can end up being contaminated and, therefore, the fight against visceral leishmaniasis represents a challenge for agents and agencies responsible for promoting public health (Margen, 2023).

In humans, symptoms can vary, the most recurrent being fever constant weakness, marked weight loss, and other conditions such as pancytopenia (reduction of blood cells) and hepatosplenomegaly (considerable enlargement of the spleen and liver). When not identified and treated, the disease can have a considerably high lethality, especially in cases where the individual has an immunodeficiency such as HIV, or when it affects children (World Health Organization, 2023; Goswami et al., 2020).

It should be noted that infection by direct contact with body fluids such as blood and saliva of infected animals is unfounded, and that in humans, leishmaniasis infection occurs only when the individual is bitten by the infected female *Lutzomyia Longipalpis* mosquito (Rodrigues et al., 2025).

The most effective treatment indicated by the World Health Organization, due to its low toxicity, consists of the individual or combined use of amphotericin A or amphotericin B, which represent a significant advance in reducing treatment time and any associated costs. However, in regions with fewer resources, the most commonly used substances are pentavalents, which present greater risk, toxicity, and parasite resistance (Burza et al., 2022; Van Griensven et al. 2024).

The actions to combat VL are varied, and range from chemical control with insecticides, directed to residential areas to eliminate vectors in places where there are confirmed cases of leishmaniasis, to monitoring through databases and spreadsheets that help in directing actions and strategies (Costa, 2018).

Among the national leishmaniasis monitoring services, the Department of Information and Informatics of the Unified Health System (DATASUS), administered by the Brazilian Ministry of Health, stands out, with data and statistics provided and administered by all federative entities (states) of the country.

2.4 NATIVE PEOPLES OF THE STATE OF TOCANTINS

In Brazil, indigenous peoples "constitute societies with their own social organization, languages, customs, and traditions that distinguish them from the rest of national society" (FUNAI, 2023).

For Silva (2019, p. 45), "native peoples represent the civilizational basis of Brazil, expressing a cultural plurality that precedes and resists the colonial process", they are ethnic groups that inhabited the Brazilian territory before European colonization, having their own forms of social organization, languages, beliefs, productive systems and ways of relating to the environment (Silva, 2019, p. 45).

The State of Tocantins, located in the northern region of Brazil, has as its main biomes the Cerrado and the Amazon Forest. Created in 1988, it is the newest federative entity in the country, also known for housing nine indigenous ethnic groups, three of which are

who form the Iny people (Xambioá, Karajá and Javaé); added to six others; Avá-Canoeiros, Pankararu, Xerente, Krahô, Krahô-Kanela and Apinajê (TOCANTINS, 2021).

Reflecting on the health of indigenous peoples in Tocantins, it is imperative to recognize the complexities and magnitudes of this contemporary issue, but also that they be directed not only to the cultural diversity of the country, but also to enable us to take more effective measures to improve the health and well-being of these historically stigmatized peoples (RIOS; DA COSTA and DA COSTA, 2024).

3 MATERIALS AND METHODS

This was a quantitative, descriptive and documentary research, developed from the analysis of secondary data available in the Notifiable Diseases Information System (SINAN), accessed through the Department of Informatics of the Unified Health System (DATASUS).

The DATASUS system is fed by subsystems such as SINAN (Notifiable Diseases Information System). This system has records of diseases and injuries, carried out from 2007 onwards.

When selecting the State of Tocantins in the DATASUS system, the system divides the state into different health regions, coordinated by Regional Interagency Commissions (CIRs). The CIRs can be classified as instances composed of all the municipal health secretaries of a territory, with the proposal of promoting health at different levels of care, in addition to demonstrating the effectiveness of the SUS regionalization project (Silveira Filho, 2016)

In Tocantins, the CIRs operate in 8 health regions that were defined in CIBnº 161/2012 Resolution, covering a specific number of municipalities, as outlined in Table 02.

Table 2*Composition of the Health Regions (CIR) in the State of Tocantins*

HEALTH REGION	NUMBER MUNICIPALITIES	OF
Cerrado Tocantins Araguaia	23	
Bico do Papagaio	24	
Cantão	15	
Capim Dourado	14	
Ilha do bananal	18	
Médio Norte Araguaia	17	
Sudeste	15	
Amor Perfeito	13	
TOTAL	139	

Source: (Prepared by the author, 2025). Adapted from the State of Tocantins, Resolution CIBn° 161/2012.

The spatial cut covered the State of Tocantins, and the time frame considered the period from 2015 to 2025. Information was collected regarding the distribution of confirmed cases of human visceralleishmaniasis among populations originating from the state of Tocantins. The spatial cut covered the State of Tocantins, and the time frame considered the period from 2015 to 2025. Information was collected regarding the distribution of confirmed cases of human visceral leishmaniasis among indigenous populations, including variables such as health region (CIR), municipality of residence, age group, and gender.

The tabulation and organization of the data were performed with the aid of electronic spreadsheets, allowing the elaboration of tables and graphs for descriptive statistical analysis. The study used as comparative parameters the regional classifications of the IBGE (2017) and CIB Resolution No. 161/2012, which defines the health regions of Tocantins.

As this is a study based on secondary data in the public domain, there was no need to submit it to the Research Ethics Committee, as established by Resolution No. 510/2016 of the National Health Council (Brasil, 2016).

4 RESULTS AND DISCUSSIONS

The research encompassed the health regions of the State of Tocantins (CIR), and all periods within the pre-established time frame (2015-2025). A total of 10 confirmed cases of VL were found in the entire study area.

The temporal analysis of confirmed cases of visceral leishmaniasis in indigenous people, delimited between the periods of 2015 and 2025, showed a mild oscillation over the periods studied, as shown in Figure 3. For the periods of 2016, 2018, 2021, 2022 and 2024, no confirmed cases were recorded in the search source of the survey.

Figure 3

Total number of confirmed VL cases in the indigenous population in Tocantins by period.

Source: (Prepared by the author, 2025).

In the periods of 2017 and 2020, the highest number of confirmed cases of VL in the indigenous population was identified. The graphical analysis also reveals a continuous oscillation between the periods, with a slight stabilization in the number of cases in the last 3 years analyzed.

Among the health regions in the state of Tocantins, the region with the highest number of notifications of confirmed VL cases in indigenous people was the Capim Dourado CIR with 5 of the confirmed cases, as shown in Table 3.

Table 3

Confirmed cases of VL in indigenous people according to time lapse 20-2025 and health regions (CIR) – Tocantins

HEALTH REGIONS (CIR) TOCANTINS					
YEAR	MIDDLE NORTH ARAGUAIA	BEAK OF PARROT	BANANAL ISLAND	GOLDEN GRASS	TOTAL LV CONFIRMED CASES
2015	0	0	0	1	1
2016	0	0	0	0	0
2017	1	1	1	0	3
2018	0	0	0	0	0
2019	0	0	0	1	1
2020	1	0	0	2	3
2021	0	0	0	0	0
2022	0	0	0	0	0
2023	0	1	0	0	1
2024	0	0	0	0	0

2025	0	0	0	1	1
SUBTOTAL	2	2	1	5	10

Source: (Prepared by the author, 2025).

Of the total of 10 confirmed cases of VL in the study period, Figure 4 shows in which municipalities of residence the cases were confirmed.

Figure 4

Confirmed cases of VL in the indigenous population by municipalities in the state of Tocantins

Source: (Prepared by the author, 2025).

The municipality of Tocantína, located on the right bank of the Tocantins River, in the central region of the State of Tocantins, had the highest number of case records. In this region is the territory of the Xerente people. The second municipality with the most records was Tocantinópolis, located in the north of the State of Tocantins, where the territory of the Apinajé people is located.

Another variable analyzed based on the data studied was gender, represented in Figure 5. A bilateral analysis of the information reveals that the number of infections, both for males and females, is proportionally equal.

Figure 5

Confirmed VL cases in indigenous people by gender in the state of Tocantins, 2015 to 2025

Source: (Prepared by the author, 2025).

The result discards the idea that the biological factor directly influenced the increase or decrease in the rates of infection by the protozoan. On the other hand, the age groups of the individuals show a distribution with more visible contrasts.

Figure 6 shows and highlights the distribution of cases by age group, and is almost uniform, and accentuated in three of the seven age groups studied, namely: <1 year, 1-4 years, and 20 to 39 years. However, when adding the age groups <1 year, 01 to 04 years and 05 to 09 years. It is noted in this analysis that confirmed cases of VL are accentuated in children under 10 years of age.

Figure 6

VL cases in indigenous people, in the state of Tocantins, by age group

Source: (Prepared by the author, 2025).

5 CONCLUSION

The study showed that visceral leishmaniasis remains an important public health problem in the State of Tocantins, especially among indigenous populations. The predominance of confirmed cases in children under ten years of age and the geographic concentration in certain regions, such as Capim Dourado and Médio Norte Araguaia, suggest the persistence of structural and environmental vulnerabilities.

Biological factors such as gender do not demonstrate a direct influence on the increase or decrease in confirmed cases, which highlights the importance of multifaceted analyses.

The data reinforce the need for intersectoral actions aimed at vector control, and the reinforcement of continuous epidemiological surveillance, in addition to health education among native peoples. The adoption of culturally sensitive strategies, the strengthening of primary care, and the training of local Community Health Agents (CHA) and Endemic Disease Control Agents (ACE's) can represent effective measures to reduce the disease.

Finally, recommendations include the continuation of epidemiological and geospatial studies to understand the dynamics of VL and guide long-term public policies, in line with the principles of equity and universality of the Unified Health System (SUS).

ABSTRACT

The Miringuava River basin is located in São José dos Pinhais and is the main source of water for the local population, integrating the basin system that also supplies the capital Curitiba and other cities in the metropolitan region. The Miringuava River dam and reservoir are part of the Curitiba Metropolitan Region Water and Sewage Master Plan, and the demand for restoration of the affected areas will lead to the emergence of new businesses, generating income diversification for local communities, as well as involving actors inside and outside the basin. The objective of this research is to diagnose tourism as a potential activity for improving the socioeconomic and environmental conditions of São José dos Pinhais. The socioeconomic and environmental challenges related to the use of water resources, as well as the economic dependence on agricultural production, are highlighted. Among the possible strategies, sustainable tourism stands out as a potential activity consistent with the socioeconomic development of the region, since it is committed to the conservation of natural resources, the appreciation of regional culture, and the pursuit of improving the living conditions of local residents. It was concluded that tourism is a potential activity for the development of the municipality, with its main attractions being the appeal of water security, its natural beauty, and the local community through historical and cultural preservation.

Keywords: Sustainability. Local Communities. Sustainable Tourism. Rural Tourism.

RESUMO

A bacia hidrográfica do rio Miringuava localiza-se em São José dos Pinhais e é a principal fonte de água da população local, integrando o sistema de bacias que abastece também a capital Curitiba e outras cidades da região metropolitana. A barragem e reservatório do rio

Miringuava fazem parte do Plano Diretor de Águas e Esgotos da Região Metropolitana de Curitiba, sendo que a demanda por restauração das áreas afetadas proporcionará o surgimento de novos negócios gerando diversificação de renda às comunidades locais, além de envolver atores dentro e fora da bacia. O objetivo desta pesquisa é diagnosticar o turismo como uma atividade potencial para a melhoria das condições socioeconômicas e ambientais de São José dos Pinhais. Destacam-se os desafios socioeconômicos e ambientais, relacionados ao uso dos recursos hídricos, além da dependência econômica da produção agropecuária. Dentre as estratégias possíveis, o turismo sustentável destaca-se como uma atividade potencial condizente com o desenvolvimento socioeconômico da região, a partir do momento em que está comprometido com a conservação dos recursos naturais, a valorização da cultura regional, como também na busca de melhoria das condições de vida dos moradores locais. Concluiu-se que o turismo é uma atividade potencial para o desenvolvimento do município, tendo como principal atrativo o apelo pela segurança hídrica, suas belezas naturais e a comunidade local, através do resgate histórico-cultural.

RESUMEN

La cuenca del río Miringuava se ubica en São José dos Pinhais y constituye la principal fuente de agua para la población local, integrando el sistema de la cuenca que también abastece a la capital, Curitiba, y a otras ciudades de la región metropolitana. La presa y el embalse del río Miringuava forman parte del Plan Maestro de Agua y Alcantarillado de la Región Metropolitana de Curitiba, y la demanda de restauración de las áreas afectadas propiciará el surgimiento de nuevos negocios, generando diversificación de ingresos para las comunidades locales e involucrando a actores dentro y fuera de la cuenca. El objetivo de esta investigación es diagnosticar el turismo como una actividad potencial para mejorar las condiciones socioeconómicas y ambientales de São José dos Pinhais. Se destacan los desafíos socioeconómicos y ambientales relacionados con el uso de los recursos hídricos, así como la dependencia económica de la producción agrícola. Entre las posibles estrategias, el turismo sostenible se destaca como una actividad potencial compatible con el desarrollo socioeconómico de la región, ya que está comprometido con la conservación de los recursos naturales, la valorización de la cultura regional y la búsqueda de la mejora de las condiciones de vida de los residentes locales. Se concluyó que el turismo es una actividad potencial para el desarrollo del municipio, siendo sus principales atractivos el atractivo de la seguridad hídrica, sus bellezas naturales y la comunidad local a través de la preservación histórica y cultural.

1 INTRODUCTION

In 2017, the Sanitation Company of Paraná began the construction of a dam that will be part of the supply system of Greater Curitiba. The Miringuava River reservoir was designed to strengthen water security for more than six hundred thousand people in Curitiba and the Metropolitan Region (SANEPAR, 2025).

The installation of the Miringuava dam and reservoir is a reality, therefore, by itself the project already causes changes in the local way of life, land use, changes in flora and fauna, in addition to impacts on the local community. On the other hand, as long as it occurs in a planned way, opportunities will be created for the development of sustainable tourism.

The objective of this research is to diagnose tourism as a potential activity for the improvement of the socioeconomic and environmental conditions of São José dos Pinhais. The specific objectives are:

- a) Develop the state of the art on rural tourism, sustainable development and local communities;
- b) Describe which potentialities of the Miringuava River basin favor Sustainable Tourism;
- c) Identify how tourism can generate market value for the local economy.

According to the Department of Social and Economic Indicators of the Municipal Secretariat of Planning and Economic Development of the Municipality of São José dos Pinhais, agriculture has always been a traditional sector in the São José economy. With industrialization, technological advances did not prevent farming communities from continuing their development.

The municipality has also been gaining prominence in the production of organic and honey, from the breeding of stingless bees, coordinated by the Association of Organic Producers and Meliponiculturists of São José dos Pinhais (APROMEL).

In addition, the involvement of actors from different sectors with common interests has the advantage of creating shared value and enhancing results. Among the possible strategies, tourism stands out as a potential activity consistent with socioeconomic development, from the moment it is committed to the conservation of natural resources, appreciation of regional culture and improvement of the living conditions of local communities.

In order to contribute to the rural development of São José dos Pinhais, the research was carried out in order to generate subsidies for the implementation of actions and enterprises aimed at tourism in the region.

2 THEORETICAL FRAMEWORK

2.1 RURAL TOURISM

According to Lane *et al.* (2022), rural tourism became a worldwide and growing activity in the late 1970s and early 1980s. At first, it was seen as an unimportant activity, perhaps tending to disappear in the future. However, it has proven to be extremely important to the development of sustainable tourism, leading the way for the creation of new tourism modalities based on growing niche markets.

According to the Ministry of Tourism (BRASIL, 2003), although visiting rural properties is an old practice in Brazil, displacement to rural areas began to be faced with professionalism in the eighties, when some properties in Rio Grande do Sul Santa Catarina, due to the difficulties of the agricultural sector, decided to diversify their activities and began to receive tourists.

According to Souza and Dolci (2019, p. 26), the typical characteristics of the rural environment, such as gastronomy, natural and cultural heritage, customs, as well as the possibility of leisure and rest have increasingly attracted city dwellers.

In this context, several types of tourism proliferate, such as ecotourism, rural tourism and cultural tourism, enabling new ventures in rural spaces.

The concept of rural tourism adopted by the Ministry of Tourism is based on aspects that refer to tourism, territory, economic base, natural and cultural resources and society.

Based on these aspects, Rural Tourism is defined as the set of tourist activities developed in rural areas, committed to agricultural production, in addition to adding value to local products and services, rescuing and promoting the cultural and natural heritage of local communities (BRASIL, 2003, p. 11).

According to Petrović *et al.* (2018), rural tourism contributes not only to the greater profitability of families, but also to the sustainable development of rural areas, diversity of tourist offers and improvement of the quality of life of local communities in the countryside.

In addition to the commitment to agricultural activities, it is characterized by the appreciation of natural and cultural heritage, being part of the tourist offer in rural areas.

Therefore, entrepreneurs must maintain authenticity, through the rescue of regional manifestations and practices such as gastronomy, folklore, handicrafts, in addition to ensuring the conservation of the natural environment.

According to Visentin and Vallerani (2018), the restructuring of the agricultural sector through tourism is an alternative strategy for the development and consequent economic and social growth of rural areas.

Rural tourism is not necessarily located in an intensely productive rural area, but in

specific landscapes with rural characteristics.

This type of tourism finds its roots in rural landscapes where local cultures still influence the Cloydian lifestyles. The increase in demand for rural tourism and the growing demand for organic and authentic products has attracted new residents to the countryside (VISENTIN and VALLERANI, 2018).

For Lane *et al.* (2022), rural tourism, like other forms of tourism, was once based on visiting a place. It's still place-based, but its main draw is providing experiences. In other words, it is necessary to sell long-term and short-term experiences. Just knowing the place is no longer enough.

2.2 SUSTAINABLE DEVELOPMENT

For Barbieri *et al.* (2010), the values linked to sustainable development and respect for environmental policies have been institutionalized in several countries, socio-environmental movements and governments. As a response to these institutional pressures, new organizational models emerge, seen as the most appropriate for this new cycle, as is the case of sustainable innovative organizations.

According to Philippi Jr. *et al.* (2013, p.511), "growing reflections on environmental accidents that occurred and the need to review the paradigms then in force stimulated countries and the international community to develop joint actions". In other words, the population realized the importance of valuing and protecting cultural capital, based on the protection of ecosystems and natural resources.

The first dimension of sustainable development is environmental, whose production and consumption model is compatible with the material base on which the economy is based, as a subsystem of the natural environment. It is, therefore, a matter of producing and consuming in a way that ensures that ecosystems can maintain their capacity for resilience (DO NASCIMENTO, 2012, p. 55).

The second dimension is the economic one, with increased efficiency of production and consumption with increasing savings of natural resources, with emphasis on permissive resources such as fossil sources of energy and resources such as water and minerals. The third dimension is the social one. A sustainable society supposes that all citizens have the minimum necessary for a dignified life and that no one absorbs goods, natural and energy resources that are harmful to others (DO NASCIMENTO, 2012, p. 55).

For Jacobi (2003), the concern with sustainable development generates socio-political changes that do not compromise the ecological and social systems that sustain the communities.

On the other hand, the same balance required to ensure environmental conservation must also be ensured to society, involving the social, economic, political, ethical and environmental variables, which indicate the degree of sustainability of a society, as proposed by Emery (2016).

Thus, the integral development of any territory depends on the construction of sustainable bases, supported by the tripod of social justice, economic viability and environmental balance (PHILIPPI JR. *et al.*, 2014, p.30).

According to Sanches (2000), environmental management aims to "manage the organization's relations and interactions with the environment, evaluating and correcting present environmental problems, minimizing future negative impacts".

In this sense, the production of knowledge must contemplate the natural and social environment, including the analysis of the determinants of the process, the role of the various actors involved and the forms of social organization that increase the power of alternative actions for a new development, with an emphasis on socio-environmental sustainability (JACOBI, 2003, p. 3).

According to Feliciano (2015), the term sustainability can be used to express what is durable and remains over time.

Based on the assumption that social relations are perpetuated through the harmonious interaction between social beings among themselves and in relation to nature.

Although the concepts mentioned above are widely used, there is no single vision of what sustainable development is. Even Dias (2003, p.48) states that for some authors, achieving sustainability is to obtain economic growth through more rational management of natural resources and the use of more efficient technologies. For others, sustainable development is a social and political project aimed at eradicating poverty, raising the quality of life, and meeting the basic needs of the local community.

According to Dias (2003, p. 50), "the search for sustainable development revalues traditional forms of production, generating new forms of productive organization in almost all economic and social activities".

For Sachs (2008), sustainable development obeys the double ethical imperative of solidarity with present and future generations, and requires the explicitness of criteria of social, environmental and economic sustainability. Strictly speaking, solutions that consider these three elements, that is, that promote economic growth with positive impacts in social and environmental terms, deserve the name of development.

For Beni, Sustainable Tourism involves understanding the impacts of tourism; equal distribution of costs and benefits; generation of local jobs; promotion of profitable businesses;

injection of capital with consequent diversification of the local economy; interaction with all sectors and segments of society; strategic and logistical development of means of transport (BENI, 2003, p. 14).

2.3 LOCAL COMMUNITIES

According to Polukhina *et al.* (2021), mass tourism will have to give way to tourism that respects the interests of local communities, not limited to profit alone. This implies new strategic decisions and focuses on tourism modalities such as rural tourism and ecotourism.

According to Streimikiene *et al.* (2020), tourism services have an impact not only on the environments, but also on the local population, generating jobs and contributing to the well-being and development of local communities.

For Aman *et al.* (2019), tourism contributes to economic growth. The concerns associated with the local community contribute to a more participatory management. Planning a sustainable tourist destination requires the support of local communities, as it involves reception and hospitality that are key to the satisfaction of tourists, contributing to local development.

According to Gastal (2021), excluding nature, the picturesque would be redimensioned, when cities start to be sought after by tourists, for differentiated cultural experiences.

The development of sustainable tourism generates additional revenue for actors who invest in the development of local tourism and the conservation of tourist attractions, ensuring the sustainability of tourist areas (AMAN *et al.*, 2019).

According to Flores e Silva, Cunha Lima and Christoffoli (2016), it is important to understand that projects of this nature contemplate the development of rural infrastructure and strengthen the capacity of local communities to foster networks and societies that lead to the creation of institutions, exhibitions and training for the management of this form of tourism.

For Reher (2022), one way for farmers to benefit from tourism is to bring back the original idea of rural tourism, in which tourists experience the work of a farm as a way to escape urban life and return to a cultural environment.

It is necessary to value cultural heritage in order to benefit and empower local communities. This needs to be integrated into a broader sustainable development strategy that emphasizes entrepreneurship and social innovation associated with the cultural landscape. In this sense, measures to maintain and protect the traditional use of local land are practical strategies for the preservation of cultural values (REHER, 2022).

According to Lima (2019), this change in posture receives various denominations according to the vocation of the territories and populations where it occurs, assuming to be: community, local development, creative, experience, solidarity and social.

3 METHODOLOGY

For Marconi and Lakatos (2010), research produces science when it systematizes knowledge, proposes and logically organizes a set of "propositions about the behavior of certain phenomena that one wishes to study". Research, for these authors, "consists of the observation of facts and phenomena as they occur spontaneously, the collection of data related to them and the recording of variables that are presumed relevant, in order to analyze them".

The definition of the research method of this study considered the following classifications: nature of the research, collection environment, objective, nature of the data and research procedure.

Table 1

Research classification table

Classification	Type
Regarding the nature of the research	Applied
Collection environment	Field research
The objective	Exploratory
The nature of the data	Qualitative
Regarding the search procedure	Case Study

Source: Authorship (2025).

From the point of view of its nature, it is an applied research, since it aims to generate knowledge for practical and immediate application in a circumstantial reality, aimed at solving specific problems (GIL, 2010).

It is noteworthy that the applied nature aims to generate knowledge for practical application and solution of specific problems, involving local truths and interests (SILVA; MENEZES, 2005).

As for the collection environment, this research is classified as experimental field research. That is, they will be complemented with semi-structured interviews and questionnaires with a set of social actors (HOUTART, 1994).

The semi-structured interview is a scientific activity that brings the researcher closer to the reality studied, combining everyday facts with the existing theory on the subject. For Richardson (1999, p. 160) the interview "is a technique that allows the development of a close relationship between people".

From the point of view of its objectives, since no scientific studies were found on the potential of the Miringuava River basin for Sustainable Tourism, the research is classified as exploratory.

For Gil (2010), it aims to provide greater familiarity with the problem to make it explicit or to build hypotheses, based on a bibliographic survey, interviews with people who had practical experiences with the problem in question, and analysis of examples that stimulate its understanding.

The approach of this research provides for the investigation of the qualitative characteristics of the phenomenon studied in a subjective way, in order to build its own concepts about the phenomenon studied, as described by Lozada and Nunes (2019).

For the authors, qualitative research has the following characteristics: the native environment is the source of data collection; the researcher is considered the main instrument for data collection; the research uses processes of detailing the observed reality and seeks the meaning of the situations and their impacts for the researched group (LOZADA and NUNES, 2019).

According to Minayo (2014), qualitative research responds to particular questions, which corresponds to a deeper space of relationships, processes and phenomena that cannot be reduced to the operationalization of variables.

Regarding the research procedure, this study is characterized by an approach restricted to the local communities of São José dos Pinhais, a phenomenon with qualitative characteristics studied subjectively.

As for the point of view of technical procedures, in Gil's (2010) view, it is a bibliographic study consisting mainly of scientific articles, added to scientific journals, in addition to research carried out on the internet as part of the theoretical framework of the study. Thus, from the literature review the necessary elements will be obtained for the elaboration of the proposed structure.

3.1 DATA COLLECTION

The data collection phase began with the definition of the criteria for selecting the participants. These criteria determined what requirements the participants needed to meet in order to be selected. This procedure was fundamental to maintain scientific rigor in qualitative research and to establish transparency in relation to the decisions made (FLICK, 2009b).

Those selected from the local community should live near the surroundings of the Miringuava River Dam, work with agricultural activity, tourism or other enterprise in the place.

In the case of regional development support entities, they are professionals who have had contact with projects in the Miringuava River basin region in São José dos Pinhais – PR.

The stage of selecting the sample of interviewees was part of the data collection phase. For Flick (2009a), the sample in qualitative research should follow different criteria from quantitative research and aims to search for examples of individuals who have some relationship with the object studied.

The interviewees were chosen based on the previously established criteria and according to availability, as it was necessary for the individual to be willing to participate in the research over a certain period of time.

Ten residents of the Miringuava River dam region were interviewed, who were within the previously established criteria and willing to participate in the research. The interview was also conducted with eight representatives of entities that support regional development.

The contact with the local community was made in person in the region around the Miringuava River Dam in São José dos Pinhais - PR, in their homes. The criteria for choosing the interviewees was carried out through a visit to the site of the Miringuava River dam.

4 RESULTS AND DISCUSSIONS

The purpose of this chapter is to present the results of the research, in addition to the empirical structure from the collection and analysis of data. The results and discussions were elaborated from the detailed analysis of the bibliographic research that led to a series of reflections regarding the themes that involve the research.

Data collection was done through interviews with the local community and took place in person in the region of the Miringuava River basin. All data collected were properly stored, as well as procedures to ensure the secrecy and confidentiality of the research participant's information.

Data analysis was carried out with previously established criteria and supported by the related literature and documentary research. It is noteworthy that all the interviewees, both from the local community and representatives of entities that support regional development, have knowledge about the construction of the dam and reservoir of the Miringuava River.

According to interviewee E3, the proximity of Curitiba and the coast, both location and access, favor the development of tourism in the region. For interviewee E4, the proximity to large urban centers and favorable relief facilitates the movement of tourists.

In addition to São José dos Pinhais being crossed by three important highways (BR-376, BR-277 and BR-116), it is close to the Port of Paranaguá, in addition to having the Afonso Pena international airport. It is located sixteen kilometers southeast of the capital,

with the limits of the municipalities of: Pinhais and Piraquara to the north; Tijucas from the South to the South; Morretes and Guaratuba to the East; Curitiba, Fazenda Rio Grande and Mandirituba to the west, being accessible by BR-376.

The geographical position of the Miringuava basin, close to two federal highways, the capital and large urban centers, becomes strategic for the development of tourism.

According to interviewee E13, eighty percent of visitors are from Curitiba, that is, the proximity to large urban centers is a potential. They are people who move from the capital in search of contact with nature and contact with the rural environment.

With great potential and a growing tourist demand, the Miringuava River basin region has natural landscapes, family farming properties, colonies of immigrants and their cultures, vineyards, the appeal for water conservation, the historical context of the construction of the dam, in addition to the future reservoir, at first, for contemplation purposes.

In addition to attracting visitors from other regions, tourism has the potential to stimulate local commerce, diversifying the economy and generating jobs. It will also be able to promote historical rescue, gastronomy, in addition to creating business opportunities for the local community, taking advantage of the historical-cultural heritage of European immigrants.

According to interviewee E17, the location of the Miringuava River basin region is strategic and facilitates the reception of tourists.

According to interviewee E7, many local residents are still afraid of the transformations that the dam requires, especially in terms of production. In this case, tourism is an alternative income, generating less environmental impact and providing a positive impact, as they will not need to leave the place to have another source of income.

With the Miringuava dam, the appeal for the conservation of water resources, conservation of biodiversity is enormous. Tourism is an opportunity to generate income, as long as the local community is trained, as the owners of the region are simple people. Local development should be aligned with sustainability, as it is a source area. The main economic aspect of the region is olericulture, but it needs to reduce the use of agrochemicals (E1, 2025).

In the region of the dam there are family enterprises where visitors have the opportunity to pick fresh fruits and vegetables directly from the tree. Some enterprises also have leisure structures such as fish and pay.

Some entrepreneurs already have good practices with receiving a certificate. The potential is an appeal for water preservation. There are several actors working on the ground,

moving the region through projects such as the Viva Água Movement of the Boticário Group Foundation, the city of São José dos Pinhais, and Sanepar (E7, 2025).

According to interviewee E1, sustainable tourism has the potential to promote harmony between the local community and nature, attracting tourists looking for rural activities in the Atlantic Forest.

For Petrović *et al.* (2018), rural tourism contributes not only to the greater profitability of families, but also to the sustainable development of rural areas, diversity of tourist offers and improvement of the quality of life of local communities in the countryside.

In addition to the landscapes, the region has the potential for socio-environmental education through pedagogical tourism in rural areas, aimed at preserving biodiversity and water. It is possible to develop environmental education practices through interpretive trails, tree planting and guidance on water conservation and nature preservation.

It can be seen that the appeal for environmental conservation is enormous because it is the main source of supply for the city of Curitiba and the Metropolitan Region. Rural tourism involves tourist activities developed in rural areas, committed to agricultural production, in addition to adding value to local products and services, rescuing and promoting the cultural and natural heritage of local communities (BRASIL, 2003, p. 11).

The analysis of the research data allows us to conclude that the region of the Miringuava River basin will be able to create experiences such as the contemplation of these landscapes, conversations with the local community in order to learn more about the culture and traditions, cultivation and harvesting of fruits and vegetables, animal handling, beekeeping, awareness of the importance of water for future generations, in addition to raising awareness about the climate impacts caused.

In addition to the commitment to agricultural activities, it is characterized by the appreciation of natural and cultural heritage, being part of the tourist offer in rural areas. Therefore, entrepreneurs must maintain authenticity, through the rescue of regional manifestations and practices such as gastronomy, folklore, handicrafts, in addition to ensuring the conservation of the natural environment.

In other words, it is possible to strengthen the provision of accommodation, food and leisure services in family units, creating tourist activities integrated with environmental protection and historical-cultural rescue of the local community.

According to the survey with representatives of entities that support regional development, tourism will diversify the local economy, generating income and local jobs. It is important to encourage water conservation, socio-environmental education, in addition to the preservation of local biodiversity.

According to interviewee E2, if tourism is developed in a sustainable way, it can help in the development of the local community. Interviewee E18 emphasizes the exuberant nature of the region and the appreciation of culture aimed at tourist interest.

It can be seen that the local community values natural landscapes and is aware of the preservation of biodiversity. For them, it is very important to rescue the historical-cultural and the appreciation of the existing cultures in the region.

According to interviewee E4, the potential is the history of the dam itself and how much it has changed the local community, in addition to the recomposition of vegetation through the formation of an ecological corridor, facilitating the observation of the flora and fauna of the region. It is worth mentioning that for 67% of respondents, the offer of natural and cultural attractions in the region is good.

5 CONCLUSION

The study highlights the potential for sustainable tourism, but still facing structural challenges, such as sanitation, precarious access and insufficient signage. Despite this, there is a potential for growth, driven by the training and appreciation of the local community, consolidating tourism as a vector of sustainable development for the region.

It is necessary to satisfy the needs of visitors and the socio-economic needs of the region, in order to maintain cultural aspects, the integrity of natural environments and biological diversity in order to allow the practice of tourism in the long term. In this way, it will be possible to develop urban and environmental sustainability, considering the development of local communities and their current and future environmental, social and economic impacts.

Tourism has the potential to generate jobs, in addition to diversifying the sources of income of the properties, adding value to local products through experiences such as rural coffees, harvest and pay, environmental education, contemplation of nature combined with thematic itineraries.

Therefore, it is important to reduce impacts in order to encourage the inclusion and strengthening of the environmental dimension in the educational process, in order to prevent and mitigate impacts on the environment. It is perceived that there is a strong bond with nature, and tourism is perceived as a way to preserve family traditions, valuing local culture and strengthening community ties.

It is also important to develop tourism products and itineraries that reflect the natural, cultural and social integrity of the destination, taking into account the negative impacts related to climate change, resource depletion, among other factors that may compromise the continuity of tourism activities in the future.

These elements reinforce the role of sustainable tourism as a tool for cultural appreciation, environmental preservation and strengthening of community bonds. In other words, sustainable tourism has potential in the region as long as its planning contemplates new alternatives as a source of work and income, promoting an interaction between the region and other existing tourist routes in São José dos Pinhais.

Within this context, it is necessary to encourage municipal and state public policies, promoting equality and meeting the collective needs of the local community in the region. As well as policies to direct and mobilize economic resources in order to encourage tourism in this region, attracting sources of financing so that small local landowners can promote tourism activity.

In this way, tourism will encourage the restoration of degraded areas within properties, promoting environmental education and awareness, raising awareness about the importance and respect for natural heritage, controlling the flow of visitors and tourist activities in a sustainable way.

Sadre Pantoja Alho¹

ABSTRACT

This study addresses the dilemma of reconciling legal certainty—understood as normative predictability and protection of rights—with the accelerated pace of innovation in artificial intelligence and blockchain. It analyzes how principle-based regulation can provide flexibility, while supervised self-regulation (e.g., as provided for in Article 50 of the LGPD) encourages sector participation in the formulation of specific norms. The research proposes a risk-graded hybrid model, combining soft law and hard law, technical interoperability, auditable transparency mechanisms, ODR (Online Dispute Resolution), and economic instruments (insurance and compensation funds) to ensure effectiveness and effective protection in decentralized environments. This model is applied to the case of public registries, under the SIM (Sustainability–Interoperability–Regulatory Framework) hypothesis. As an international example, the MiCA and AI Act in the EU, sectoral arrangements in the USA, and initiatives in Argentina (blockchain digital identity) are examined.

Keywords: Legal Certainty. Artificial Intelligence. Blockchain. Principle-Based Regulation. Self-Regulation. LGPD (Brazilian General Data Protection Law). Digital Ecosystems.

RESUMO

Este estudo aborda o dilema de conciliar a segurança jurídica — entendida como previsibilidade normativa e proteção de direitos — com o ritmo acelerado de inovação em inteligência artificial e blockchain. Analisa-se como a regulação baseada em princípios pode conferir flexibilidade, enquanto a autorregulação supervisionada (p.ex., prevista no art. 50 da LGPD) incentiva a participação dos setores na formulação de normas específicas. A pesquisa propõe um modelo híbrido graduado por risco, combinando soft law e hard law, interoperabilidade técnica, mecanismos de transparência auditável, ODR (Resolução de Disputas Online) e instrumentos econômicos (seguros e fundos de compensação) para assegurar eficácia e proteção efetiva em ambientes descentralizados. Aplica-se esse modelo ao caso dos registros públicos, sob a hipótese SIM (Sustentabilidade–Interoperabilidade–

RESUMEN

Este estudio aborda el dilema de conciliar la seguridad jurídica —entendida como previsibilidad normativa y protección de derechos— con el ritmo acelerado de la innovación en inteligencia artificial y blockchain. Analiza cómo la regulación basada en principios puede brindar flexibilidad, mientras que la autorregulación supervisada (p. ej., la prevista en el artículo 50 de la LGPD) fomenta la participación sectorial en la formulación de normas específicas. La investigación propone un modelo híbrido con evaluación de riesgos, que combina derecho indicativo y vinculante, interoperabilidad técnica, mecanismos de transparencia auditables, resolución de disputas en línea (ODR) e instrumentos económicos (seguros y fondos de compensación) para garantizar la eficacia y la protección efectiva en entornos descentralizados. Este modelo se aplica al caso de los registros públicos, bajo la hipótesis SIM (Sostenibilidad-Interoperabilidad-Marco Regulatorio). Como ejemplo internacional, se examinan la Ley de Inteligencia Artificial (MiCA) y la Ley de Inteligencia Artificial en la UE, los acuerdos sectoriales en EE. UU. y las iniciativas en Argentina (identidad digital blockchain).

Palabras clave: Seguridad Jurídica. Inteligencia Artificial. Blockchain. Regulación por Principios. Autorregulación. LGPD (Ley General de Protección de Datos de Brasil). Ecosistemas Digitales.

1 INTRODUCTION

In emerging digital environments (AI and blockchain) there is tension between the need for legal certainty, that is, predictability, coherence and stability in the rules that regulate rights and responsibilities and the speed of technological innovations. While legal certainty favors decisions with *a degree of certainty* as to the legal consequences, innovation requires regulatory flexibility. As a study by the legislative branch observes, "experimentation requires predictability and legal certainty. In innovation, mistakes are expected, as long as they are not gross, because that is how... new technologies ... are developed". The challenge is to reconcile these forces, avoiding gray areas of uncertainty regarding responsibility and jurisdiction in decentralized systems without stifling innovative potential.

The central problem of this work is: how to reconcile normative predictability and the protection of rights with the speed of innovation in AI and blockchain, reducing the areas of uncertainty ("gray zones") about liability, jurisdiction, and redress in decentralized environments? This issue has great public relevance, as deregulation can undermine the confidence of users and investors, while rigid and detailed regulation can stifle technological development.

In particular, blockchain and AI-based systems generate unprecedented enforcement challenges: decentralization makes it difficult to identify who is the holder of the duty (user, developer, or platform) and which law to apply in cross-border cases. The starting hypothesis is that a hybrid regulatory model (principle + supervised self-regulation) graded by risk can offer a dynamic balance, ensuring transparency and effective means of redress even in high innovation scenarios.

The overall objective is to propose a hybrid normative model for AI and blockchain in Brazil, which combines regulation by principles (general high-level norms) with self-regulation supervised by the affected sectors, in order to differentiate duties and responsibilities according to the risk of each activity. It also seeks to establish governance mechanisms (transparency, ODR, insurance, funds) that enable effective execution of duties and reparation of damages. Specific objectives include: analyzing theories and examples of legal certainty, regulation by principles and sectoral self-regulation (e.g. art. 50 of the LGPD); (examine relevant international experiences (Europe, USA, Argentina) in blockchain and AI.

The research follows a qualitative and normative approach, combining bibliographic and documentary review. It uses analysis of constitutional principles (economic, procedural and technological) and doctrine on regulation and digital governance. A comparative study of legislation and proposals (bills and regulations) is carried out, as well as sectoral experiences (e.g., sandbox, codes of conduct). The delimitation falls on the recent Brazilian and

international context (until 2025). Key operational concepts: digital ecosystems (integrated AI and blockchain applications); regulation by principles (regulatory principles that guide, but do not standardize in detail); supervised self-regulation (standards developed by the sectors, recognized and inspected by public authority, according to LGPD art. 50); legal certainty (right to predictability and normative stability).

2 THEORETICAL-NORMATIVE FOUNDATIONS

2.1 LEGAL CERTAINTY AND REGULATION BY PRINCIPLES

Legal certainty occupies a central position in the theory of the Rule of Law and works as a minimum condition of predictability for any project to regulate digital ecosystems. At the Brazilian constitutional level, it is extracted from the set of guarantees of article 5 of the 1988 Constitution – especially the protection of acquired rights, the perfect legal act and *res judicata* (article 5, XXXVI) – as well as from the principles of legality, impersonality, morality, publicity and efficiency provided for in article 37, caput (Brasil, 1988). This constitutional basis indicates that the Law must ensure a minimally stable, comprehensible and predictable horizon, in order to allow individuals and organizations to plan their conduct without being surprised by sudden changes in the legal system.

Humberto Ávila develops perhaps the most influential formulation of this idea when dealing with legal certainty as a structuring principle. In his *Theory of Legal Certainty*, the author distinguishes a static dimension, linked to the knowability of Law, and a dynamic dimension, connected to the reliability and calculability of norms (Ávila, 2016). Knowability refers to the requirement that the legal system be minimally intelligible, so that the citizen can understand the content and scope of legal commands; reliability is aimed at the stability of the normative order, preventing the person from having frustrated the trust placed in a certain state of affairs; calculability, in turn, points to the need for changes to occur smoothly, allowing reasonable projections for the future (Ávila, 2016; Valiati, 2015).

To face this type of scenario, a significant portion of the doctrine points out that rigid models, entirely based on detailed rules, tend to age quickly and produce even greater informational asymmetry. Regulation by strictly casuistic commands, dependent on successive legislative changes, finds it evidently difficult to keep up with the pace of innovation (Freitas, 2016; Moreira Neto, 2005). Hence the growing attention given to the so-called regulation by principles, in which the normative core is composed of open standards – such as transparency, diligence, proportionality, equity or algorithmic accountability – which guide the actions of regulators and economic agents in new situations, not yet foreseen by

the legislator. Argumentative on the part of the regulatory agencies and the regulated themselves.

Lacerda (2021), when analyzing accounting models inspired by principles, shows that:

The use of standards increases the space for professional judgment, but simultaneously reinforces the need for transparency of reasons and more sophisticated institutional controls. This logic can be transposed to the domain of AI and blockchain: principles such as explainability, data governance, and harm prevention do not in themselves exhaust the content of the obligation, but serve as mandatory guidance axes for regulators, developers, and platform operators.

In the current Brazilian debate, the National Petroleum Agency and the Federal Government, in documents of good regulatory practices, already recognize principle-based regulation as an appropriate instrument in sectors characterized by high innovation, precisely because it allows gradual adaptation to technological changes, without giving up minimum commands and enforcement mechanisms (National Petroleum Agency, 2019; Fonseca & Costa, 2020). Recent studies on regulatory law, in turn, describe this movement as a transition from a "command and control" model to more cooperative and responsive arrangements (Guerra, 2011; Freitas, 2016).

It is precisely at this point that the concept of responsive regulation comes in, originally developed by Ian Ayres and John Braithwaite in *Responsive Regulation: Transcending the Deregulation Debate* (Ayres & Braithwaite, 1995). The authors propose a "regulatory pyramid" in which instruments of persuasion, cooperation, and self-regulation occupy the lower rungs, while more severe sanctions and rigid commands appear at the higher levels, activated only in case of resistance or recidivism. The logic of responsiveness consists of calibrating the State's reaction according to the behavior of those regulated, combining stimuli, monitoring, and graduated punishment, with the aim of strengthening voluntary compliance and reducing supervisory costs.

In Brazil, this paradigm is beginning to be absorbed in various sectors, including the administrative law that sanctions regulatory agencies. Rodrigues (2025) describes responsive regulation as a model that seeks to reconcile normative flexibility with the preservation of the public interest, through mechanisms of listening, cooperation, and only subsequent application of sanctions, when necessary (Rodrigues, 2025).

This dialogue between legal certainty, principled regulation, and responsive regulation offers a particularly useful theoretical key for digital ecosystems. Instead of a closed set of detailed rules, what is projected is a system of structuring principles – human dignity, data protection, free enterprise, consumer protection, net neutrality, algorithmic non-

discrimination, transparency, accountability – combined with gradual enforcement mechanisms. Regulators establish mandatory, risk-based general parameters, while private actors develop codes of conduct, compliance programs, and supervised self-regulation arrangements, subject to audits, ongoing oversight, and proportionate sanctions in case of non-compliance.

In the specific field of AI and blockchain, this arrangement is compatible with the requirement of normative predictability without technological stiffening. From the point of view of legal certainty, clear and stable principles – such as the obligation to assess the impact of AI, the duty to record immutable logs in distributed networks, governance requirements, and technical documentation – allow economic agents to understand the parameters of action in advance, even if the concrete form of compliance varies according to the business model and the degree of risk. Responsive regulation, in turn, offers the tools to grade duties and reactions according to the history of compliance, the criticality of the application, and the potential for harm, preserving the ideals of knowability, reliability, and calculability highlighted by Ávila (2016).

2.2 SUPERVISED SELF-REGULATION (LGPD, ART. 50, AND SECTORAL EXPERIENCES)

Supervised self-regulation (or co-regulation) is an instrument where economic sectors develop standards of good practices that are recognized by public authority. In Brazil, the LGPD inaugurated this idea in article 50, allowing controllers and operators, alone or via associations, to formulate "rules of good practice and governance" regarding data processing

. These rules should detail organizational conditions, procedures, safety, technical standards, supervision and risk mitigation (e.g., claims from data subjects, educational actions)

. Paragraph 1 of article 50 requires that these rules consider "nature, scope, purpose, probability and severity of the risks and benefits" of the treatment, demonstrating a focus on sectoral proportionality. Once recognized by the ANPD, such rules are disclosed as a reference for the sector, constituting a kind of certificate of compliance.

In the current Brazilian debate, the National Petroleum Agency and the Federal Government, in documents of good regulatory practices, already recognize principle-based regulation as an appropriate instrument in sectors characterized by high innovation, precisely because it allows gradual adaptation to technological changes, without giving up minimum commands and enforcement mechanisms (National Petroleum Agency, 2019; Fonseca & Costa, 2020). Recent studies on regulatory law, in turn, describe this movement as a

transition from a "command and control" model to more cooperative and responsive arrangements (Guerra, 2011; Freitas, 2016).

It is precisely at this point that the concept of responsive regulation comes in, originally developed by Ian Ayres and John Braithwaite in *Responsive Regulation: Transcending the Deregulation Debate* (Ayres & Braithwaite, 1995). The authors propose a "regulatory pyramid" in which instruments of persuasion, cooperation, and self-regulation occupy the lower rungs, while more severe sanctions and rigid commands appear at the higher levels, activated only in case of resistance or recidivism. The logic of responsiveness consists of calibrating the State's reaction according to the behavior of those regulated, combining stimuli, monitoring, and graduated punishment, with the aim of strengthening voluntary compliance and reducing supervisory costs.

In Brazil, this paradigm is beginning to be absorbed in various sectors, including the administrative law that sanctions regulatory agencies. Rodrigues (2025) describes responsive regulation as a model that seeks to reconcile normative flexibility with the preservation of the public interest, through mechanisms of listening, cooperation, and only subsequent application of sanctions, when necessary (Rodrigues, 2025).

This dialogue between legal certainty, principled regulation, and responsive regulation offers a particularly useful theoretical key for digital ecosystems. Instead of a closed set of detailed rules, what is projected is a system of structuring principles – human dignity, data protection, free enterprise, consumer protection, net neutrality, algorithmic non-discrimination, transparency, accountability – combined with gradual enforcement mechanisms. Regulators establish mandatory, risk-based general parameters, while private actors develop codes of conduct, compliance programs, and supervised self-regulation arrangements, subject to audits, ongoing oversight, and proportionate sanctions in case of non-compliance.

2.3 REGULATORY LAG, HARD/SOFT LAW AND INSTITUTIONAL COORDINATION IN BRAZIL

The concept of regulatory lag refers to the mismatch between the pace of innovation and the ability to create state standards. In the digital world, products and services evolve faster than specific laws. To overcome this mismatch, *soft law instruments* (guidelines, guides, voluntary technical standards) and responsive approaches are adopted. In Brazil, there is a tendency to prioritize general norms and impact assessment when legislating innovations. The State encourages experimental regulation (e.g., financial/technological sandbox decree, cooperative self-regulation) precisely because it recognizes that "regulatory

measures without legislative approval should be preferred, given their potential for celebrated responsiveness." In other words, in the face of lag, it is preferable to delegate powers (via agencies, cooperative agreements, and administrative resolutions) than to allow sandbox or sectoral codes.

This strategy implies institutional coordination between agencies involved. For example, the ANPD has signed technical cooperation agreements with Senacon, CADE, NIC.br and TSE to align data protection with competition and open internet. The CNJ and the CNMP dialogue on judicial AI initiatives, and other regulatory agencies (SUSEP in fintechs, ANATEL in IoT) develop specific sectoral rules. However, Brazil still lacks a central integrated digital governance body. The Judiciary, in turn, deals with emerging litigation without a single standard, which reinforces the need for coherent guidelines. In this panorama, a distinction is made between hard law (laws, decrees, resolutions) and soft law (codes of conduct, recommendations, certifications). The strategic use of soft law can speed up responses without giving up regulation when necessary. Social participation and transparency (public hearings, public consultation) are crucial to legitimize this regulatory flexibility.

2.4 JURISDICTION, LIABILITY AND REDRESS IN DECENTRALIZED ENVIRONMENTS

Werbach (2018) describes blockchain as a new trust architecture, in which participants come to trust the distributed system and its consensus mechanisms, without depending on the reliability of a specific intermediary.

This form of organization, based on relative immutability, transparency, and automation of executions, reconfigures points of contact between fact and right: the "place" of the transaction no longer corresponds to a physical territory, and the very definition of who "acts" starts to involve protocol developers, infrastructure operators, token issuers, wallet providers, access platforms (front-ends), and end users. De Filippi and Wright (2018) call this environment a *rule of code*, indicating that the set of rules inscribed in the blockchain can form a kind of "lex cryptographica", still subject, however, to state orders that continue to provide sanction, legitimate coercion and reparation structures.

In terms of jurisdiction, the Law of Introduction to the Rules of Brazilian Law (LINDB) already guides the resolution of conflicts in time and space, functioning as a statute of private international law, with criteria such as the domicile of the parties, the place of the constitution of the obligation, the place where the damage occurred and the place of performance (articles 7, 9 and 12).

In decentralized environments, these elements become diffuse: the smart contract can be programmed in one country, run on globally distributed nodes, bind parties residing in

different jurisdictions, and produce economic effects in third-state markets. Finck (2019), when examining blockchain regulation and governance in Europe, underlines that decentralization tends to fragment traditional points of connection, which requires renewed focus on actors that "anchor" the network at the physical plane, such as exchanges, enterprise node operators, and user interface providers.

De Filippi and Wright (2018) highlight that many blockchain projects have attempted to present themselves as "beyond the reach" of any national authority, which has led to dramatic experiments, such as the collapse of *The DAO*, which revealed limits of purely algorithmic self-organization.

Werbach (2017; 2018) argues that:

Blockchain and law are both trust mechanisms; Networks that ignore the incidence of state rules end up, at some point, depending on cuts, regulators, or traditional enforcement mechanisms to correct bugs, fraud, or contractual imbalances. Consequently, the difficulty does not lie in the supposed "absence of jurisdiction", but in identifying which States have sufficient connection with the litigation and on which actors decisions on liability and reparation will fall.

In the Brazilian context, the Brazilian Civil Rights Framework for the Internet (Law No. 12,965/2014) has already addressed part of these issues within the scope of centralized platforms, by disciplining the liability of connection and application providers for acts of third parties (articles 18 to 21), as well as by requiring providers operating in the country to comply with Brazilian legislation and comply with court orders. even if they are headquartered abroad (art. 11). Recent debates on the partial constitutionality of article 19, which conditioned liability to the existence of a prior court order, show that models that are excessively protective in relation to intermediaries can generate deficits in the protection of fundamental rights. The discussion still revolves around platforms such as social networks and hosting services, but the logic of gradation of responsibility as a function of control over content, economic benefit, and the ability to prevent harm offers useful parameters for environments in which smart contracts and distributed ledgers structure the provision of services.

The Brazilian experience with the responsibility of application providers in centralized platforms offers relevant lessons. Studies by Micheletti (2023) and Pereira (2022) show that the original design of article 19 of the Marco Civil worked as a containment valve for liability, by requiring a specific court order to form the duty of removal and, consequently, liability for damages arising from third-party content.

The legal evolution that has been relativizing this shielding in situations of serious violation of fundamental rights, indicates a tendency to approximate the responsibility of

digital platforms and expanded duties of care in the protection of assets such as dignity, equality and psychophysical integrity. This movement signals that, in AI and blockchain contexts, it will be difficult to accept a narrative that presents decentralization as an absolute mechanism for excluding liability, especially when there is informational and technical asymmetry to the detriment of the user.

3 INTERNATIONAL COMPARISON

3.1 EUROPEAN UNION: MICA AND AI ACT (SCHEDULE AND RISK OBLIGATIONS)

In recent years, the European Union has consolidated a regulatory bloc focused on digital ecosystems that combines the protection of fundamental rights, financial stability, and the stimulation of innovation. In the crypto field, Regulation (EU) 2023/1114, known as Markets in Crypto-Assets (MiCA), created a uniform framework for crypto-assets that were not covered by previous financial standards, with a focus on crypto-asset issuers and service providers (CASPs) (European Securities and Markets Authority [ESMA], 2024; European Central Bank, 2023).

MiCA structures the market into categories, such as *asset-referenced tokens* (ARTs), *e-money tokens* (EMTs), and other cryptoassets, establishing requirements for authorization, transparency, governance, and prudential rules proportional to the nature of the asset and the associated systemic risk (Hogan Lovells, 2025; Central Bank of Ireland, 2024). In issuers of stablecoins backed by currency or baskets of assets, the regulation imposes reserve requirements, liquidity management policies, disclosure rules, and volume limits, aiming to reduce run risks and financial contagion (Cyfrin, 2025; AMF, 2024).

The application schedule reinforces the gradual and risk-based logic. The text entered into force in June 2023, with the rules on ARTs and EMTs coming into force on June 30, 2024, and the rest of the regime – especially the obligations of CASPs – applicable as of December 30, 2024 (Cyfrin, 2025; ESMA, 2024).

Member states can grant a transition period of up to 18 months for already active providers, which creates a kind of "regulatory ramp" that tries to reconcile legal certainty and not sudden interruption of services (Squire Patton Boggs, 2025).

Another relevant point of MiCA is the *passporting mechanism*: once authorized in a Member State, the CASP can provide services throughout the single market, through notifications and cooperation between national authorities (Central Bank of Ireland, 2024; Hogan Lovells, 2025).

This structure reduces costs of multiple licenses, but requires intense regulatory coordination, with common supervisory guidelines and information exchange channels. In

terms of legal certainty, the main effect is to convert a mosaic of national regimes into a homogeneous set of minimum obligations, which are now valid for the entire European crypto-asset ecosystem.

In the field of artificial intelligence, the European Union approved the AI Act, described by the European institutions themselves as the first comprehensive regulatory framework aimed at AI systems. The regulation adopts a clearly risk-based approach, with a prohibition of certain practices (such as *social scoring* systems and massive real-time biometric surveillance) and a strict regime for "high-risk" systems, which need to comply with governance, documentation, risk management, data quality, and human oversight requirements (European Commission, 2025; European Parliamentary Research Service, 2025).

The implementation timeline is staggered. The bans came into effect in February 2025; as of August 2025, specific obligations for general-purpose models arise; and, in August 2026, the application of the full regime for high-risk systems begins, with an extended deadline for legacy systems until 2027 (European Parliamentary Research Service, 2025; Trilateral Research, 2025; Reuters, 2025).

The regulation also requires each member state to create at least one AI regulatory sandbox by August 2026, with the aim of testing solutions in a controlled environment and under the supervision of the competent authorities (AIAct.eu, 2025).

The literature highlights that both MiCA and the AI Act illustrate a style of regulation in which the European legislator tries to anticipate risks and establish a horizontal framework that will then be implemented by guides, technical standards, and decisions of sectoral authorities (Finck, 2019; Sartor, 2020). In terms of legal certainty, this model tends to produce greater predictability about licensing criteria, risk classification, due diligence duties, and liability possibilities, even though it creates significant regulatory costs.

Another characteristic that is of direct interest to the TCC is the connection between risk-based regulation and reparation mechanisms. In the AI Act, there is provision for robust documentation, event records, and traceability, which facilitate proof in litigation involving damage caused by AI systems (European Commission, 2025; European Parliament, 2025).

In MiCA, CASPs need to have complaint handling mechanisms, conflict of interest management policies, and procedures for handling security incidents, which opens space for integration with ODR and liability insurance (ESMA, 2024; AMF, 2024).

3.2 UNITED STATES: MULTISTEEP ARRANGEMENT OF AGENCIES (FUNCTIONAL SYNTHESIS)

The North American case follows a logic almost opposite to the European one. Instead of a single regulation for AI or cryptoassets, the country operates with a dispersed set of sectoral rules, administrative guidelines, *technical guidelines*, and multi-agency enforcement. The Congressional Research Service survey records that, until mid-2025, there was no broad federal legislation on AI, with a predominance of specific laws and administrative policies, focusing on national security, defense, privacy in specific sectors, and consumption (Congressional Research Service, 2025).

In the field of AI, the federal government has been betting on *soft law instruments*. In 2023, the National Institute of Standards and Technology (NIST) published the AI Risk Management Framework, designed as a voluntary guide for organizations that want to structure risk governance in AI, with an emphasis on reliability, transparency, fairness, and bias mitigation (NIST, 2023).

In 2023, an executive order was issued on "safe and reliable" AI development, followed by *America's AI Action Plan* of 2025, which sets public policy goals and assigns tasks to bodies such as NIST, the Department of Commerce, the Federal Trade Commission (FTC), and the Department of Justice (DOJ) (White House, 2023; White House, 2025).

The literature describes this architecture as a decentralized model, based on independent agencies, with strong use of technical guidelines and ex post enforcement. Davtyan (2025) analyzes that the North American approach is based on a combination of voluntary commitments by companies, *guidelines* from agencies such as NIST, FTC, and FDA, and repressive action by the DOJ in cases of abusive use of AI, without a single framework comparable to the AI Act (Davtyan, 2025; Associated Press, 2024).

In terms of cryptoassets, fragmentation becomes even more evident. The market is overseen by a set of bodies that includes the Securities and Exchange Commission (SEC), the Commodity Futures Trading Commission (CFTC), the Department of the Treasury (via FinCEN and OFAC), federal banking regulators (Federal Reserve, OCC, FDIC), as well as state agencies responsible for securities transfer licenses and consumer protection (Latham & Watkins, 2025; Holland & Knight, 2025).

The SEC generally classifies certain cryptoassets as securities, based on the *investment contract test* derived from *SEC v. Howey Co.*, and oversees public offerings, exchanges, and *tokens* that qualify as securities (Merkle Science, 2024; SEC, 2025).

The CFTC treats cryptoassets as commodities in derivatives markets, with jurisdiction over futures contracts, *swaps*, and margin markets, in addition to overseeing manipulation and fraud (CFTC, 2025; WilmerHale, 2025).

A recent report on the blockchain and crypto regulatory framework in the U.S. describes this arrangement as dynamic overlap: SEC and CFTC vie for spaces of competence, while FinCEN applies anti-money laundering standards and OFAC controls sanctions, generating a scenario in which the same platform may be subject to multiple chains of obligations, often with interpretive divergences (Holland & Knight, 2025).

In the field of liability, the absence of a single framework means that traditional principles of *securities law*, consumer protection, and civil liability are projected on cases involving AI and cryptoassets. The FTC has been signaling that deceptive practices associated with AI – for example, unsubstantiated claims about system capabilities – can be framed as *unfair or deceptive acts or practices*, while the DOJ has already announced that the use of AI to intensify white-collar crimes can aggravate penalties (Department of Justice, 2024).

At the federal level, state initiatives to regulate AI and crypto are increasing, which has led to discussions about an eventual executive order to limit state laws considered overly restrictive (Politico, 2025).

From the perspective of legal certainty, this multi-steep arrangement produces important ambiguity. There is a high capacity for reaction on the part of agencies, which can issue quick guidelines and act in enforcement, but economic agents deal with uncertainty about the legal classification of assets, the boundary between the competence of the SEC and the CFTC, the incidence of state rules and the possibility of changes in guidance according to the Administration in office (Wired, 2025; Latham & Watkins, 2025). At the same time, this model reveals useful instruments for interagency coordination and intensive use of technical standards and *guidelines* that can inspire responsive arrangements in the Brazilian context.

3.3 ARGENTINA: REGISTRY DIGITIZATION, DIGITAL IDENTITY/SIGNATURE, AND AI/BLOCKCHAIN INITIATIVES

The Argentine experience offers an example of a Latin American country that consolidated, relatively early, a legal basis for digital documents and signatures and has progressively been incorporating distributed ledger technologies into digital government policies and sectoral initiatives. Law No. 25,506 of 2001 instituted the digital and electronic signature regime, recognizing the legal effectiveness of digitally signed electronic documents

and creating the Digital Signature Infrastructure of the Argentine Republic (IFDRA) (Argentina, 2001; Argentina.gob.ar, 2016).

Subsequent norms, such as Law 27,446 and regulatory decrees, updated this framework, integrating the digital signature into the electronic document management of the Public Administration and encouraging its use in contracts, administrative petitions, and registration acts (Argentina.gob.ar, 2016; Ecertla, 2023).

The doctrine points out that this arrangement conferred on the digital signature a status equivalent to that of the handwritten signature, provided that certification and integrity requirements were respected, which allowed the expansion of digital legal services, such as electronic orders and distance notarial procedures (CheersContracts, 2025).

In the field of registry digitization, several projects explore the use of blockchain as an additional layer of reliability. A study by Pagella (2022) analyzes the application of blockchain in the Real Estate Property Registry of the Federal Capital, evaluating potential gains in authenticity, immutability, and traceability of registration acts (Pagella, 2022).

The same line appears in projects such as the Public Registry of University Graduates, whose database, linked to the Ministry of Education, has started to use blockchain to authenticate diplomas and academic transcripts, allowing third parties to verify the veracity of the information in a public and auditable way (Blockchain Federal Argentina, n.d.).

There are also regional normative initiatives that explicitly mention distributed ledgers. The Digital Public Transformation Plan of the province of Santa Cruz, for example, authorizes the Executive to employ distributed ledger technologies and blockchain networks, public or private, in digital government services, teleworking, and administrative processes, with a view to increasing transparency and trust (Santa Cruz, 2022). [Saij](#) Public petitions submitted to national authorities request the incorporation of blockchain into public registries on the grounds that the technology could reduce corruption, fraud, and delays in registration procedures (Change.org, 2025).

The most visible case in the international debate, however, is the decentralized digital identity project of the city of Buenos Aires. In 2024, the capital launched the QuarkID system, integrated with the miBA application, with the proposal to offer blockchain-based digital credentials, supported by zero-knowledge proofs, which allow citizens to demonstrate attributes (such as age or educational status) with minimal exposure of personal data (Borak, 2024; Coindesk, 2024; ZKsync, 2024).

Official reports indicate that the project aims to reach around 3.6 million residents, configuring the first decentralized identity initiative enabled by a municipal government on a scale of this magnitude (Dig.watch, 2024; ZKsync, 2024).

The logic behind QuarkID is associated with the idea of *self-sovereign identity (SSI)*, in which the holder maintains control over his credentials, which can be verified by third parties without the need to retain data in large centralized databases. From the point of view of legal certainty, this experience shows an effort to reconcile fundamental privacy rights, robust authentication, and record integrity requirements. The choice of protocols with zero-knowledge proofs indicates an explicit concern with proportionality in data exposure and with the possibility of technical auditing of validation mechanisms (Portaldobitcoin, 2024; Chainwire, 2024; BrazilCrypto, 2024).

It is also possible to observe that the advancement of registry digitization and digital identity projects in Argentina occurs in dialogue with the digital signature framework and the existing certification infrastructure. The dominant interpretation maintains the idea that electronic documents signed with a valid certificate enjoy a presumption of authenticity and integrity, which facilitates the integration between traditional records and solutions based on blockchain and AI, used as additional layers of proof or automation of verifications (Argentina.gob.ar, 2016; CheersContracts, 2025).

Together, these elements make up a scenario in which Argentina combines, on the one hand, a relatively consolidated legal basis in terms of documents and digital signatures; on the other, experimental pilots in decentralized identity and the use of blockchain in public records, still in the maturation phase, but relevant as a normative laboratory for the region.

3.4 COMPARATIVE SYNTHESIS AND LESSONS FOR BRAZIL

The comparison between the European Union, the United States, and Argentina reveals three distinct ways of facing the legal risks associated with AI, cryptoassets, and distributed ledgers. The European model, represented by MiCA and the AI Act, favors horizontal and detailed regulations, anchored in a risk approach and combined with clear timelines, regulatory sandboxes, and structured supervisory mechanisms. The main consequence is a high degree of predictability regarding risk categories, authorization requirements and possible sanctions, with high regulatory costs and strong centrality of European authorities.

The North American arrangement, in turn, is supported by a network of agencies with competences over fragments of the digital ecosystem. The absence of an AI Act or a federal MiCA means that *securities law*, consumer law, anti-money laundering, competition, and data protection standards are projected on AI and blockchain on a case-by-case basis, complemented by technical *guidelines* such as the NIST AI RMF and executive orders (NIST, 2023; Davtyan, 2025; Congressional Research Service, 2025).

This reinforces flexibility, but increases uncertainty regarding the future of interpretations and the division of competence between agencies such as the SEC, CFTC, FTC, FinCEN, and state regulators (Latham & Watkins, 2025; Holland & Knight, 2025).

The Argentine experience occupies an intermediate position. The country has consolidated, with Law 25.506 and updates, a relatively cohesive digital signature and electronic document regime, which serves as a basis for digitizing services, administrative processes and records. From this base, projects for the use of blockchain in property records and diplomas emerge, as well as the QuarkID initiative in Buenos Aires, with decentralized digital identity supported by zero-knowledge proofs (Pagella, 2022; Blockchain Federal Argentina, n.d.; Dig.watch, 2024; ZKsync, 2024).

For the Brazilian debate on legal certainty in digital ecosystems, these three experiences generate some central lessons, directly related to the hypothesis of a hybrid model based on regulation by principles and supervised self-regulation:

Grading duties by risk, as in the AI Act and MiCA, is compatible with the idea of modulating obligations along the protocol, infrastructure, enforcement, and intermediation layers, including in the context of public registries and AI applied to notarial and registry services.

Passportization and mutual recognition of compliance programs, typical of MiCA, point the way for codes of conduct and governance programs in AI and blockchain in Brazil to be recognized by sectoral authorities, with effects on different markets, reducing the costs of multiple authorizations.

Interagency coordination, although unequal in the North American model, provides examples of mechanisms for articulation between financial agencies, consumer protection, data protection, and competition, a relevant aspect in view of the overlap between the Central Bank, CVM, Cade, ANPD, and the Judiciary on the topic of AI/blockchain.

Anchoring in digital identity and signature frameworks, as observed in Argentina, indicates that any blockchain-based registry ecosystem design needs to dialogue with the existing infrastructure of ICP-Brasil, digital certification, advanced signatures, and new identification models, including decentralized solutions compatible with data protection rights (ZKsync, 2024).

From this perspective, the international comparison reinforces the plausibility of the SIM (Sustainability–Interoperability–Regulatory Framework) hypothesis applied to Brazilian public registries.

The institutional sustainability of services, technical-normative interoperability and the construction of a regulatory framework that combines clear principles, supervised self-regulation and effective instruments of execution and reparation are found in the European, North American and Argentine experience.

4 CONCLUSION

In summary, the article started from the observation that the expansion of digital ecosystems based on artificial intelligence and blockchain intensifies a classic dilemma of the Rule of Law: on the one hand, the requirement of legal certainty, translated into predictability, minimum stability, and the possibility of calculating the legal consequences of conduct; on the other hand, the need for sufficient normative openness so as not to stifle innovation processes that develop in cycles much faster than legislative time. The initial question — how to reconcile normative predictability and protection of rights with the speed of innovation in decentralized environments — guided the analysis of constitutional foundations, regulatory models, and foreign experiences, allowing us to propose an intermediate path between deregulation and excessive legal detail.

The reconstruction of legal certainty as a structuring principle showed that it is not reduced to the literal conservation of norms, but involves knowability, reliability and the possibility of planning. From there, the work indicated that a model strictly based on rigid, casuistic, and frequently changed rules tends to aggravate uncertainty in complex technological contexts, as it generates successive "layers" of regulation that are unable to keep up with reality. On the other hand, regulation by principles and responsive regulation emerge as more appropriate alternatives for digital ecosystems: principles such as transparency, prevention, proportionality, and data governance work as stable normative axes, while responsiveness allows calibrating state action according to the risk of the activity and the behavior of the agents.

Within this framework, supervised self-regulation gained special prominence. Recent experience in data protection, with codes of conduct and governance programs recognized by specialized authorities, shows that economic sectors and public agencies can take responsibility for the implementation of standards, as long as they remain subject to constitutional and legal parameters. Instead of a State that tries to anticipate, alone, all technical solutions, a dynamic is designed in which regulators define objectives, principles, and risk benchmarks, while regulated subjects detail operational standards in dialogue with these benchmarks, under monitoring, auditing, and the real possibility of sanction. Such an arrangement demonstrates potential to deal with rapidly changing technologies, without giving up public control or channels of accountability and reparation.

The analysis of jurisdiction, liability, and redress in decentralized environments has shown that the "lawlessness" narrative in blockchain and distributed AI does not hold water. Decentralization complicates the mapping of who acts, where they act, and with which law they are bound, but it does not eliminate the presence of identifiable actors who design

protocols, maintain infrastructures, operate interfaces, and economically exploit digital services. The conclusion that is required is that legal certainty in these ecosystems depends on the construction of a network of graduated responsibilities, distributed across the layers of protocol, infrastructure, application, intermediation and use, with more intense duties for those who have greater technical and economic capacity to prevent damages, without completely excluding the co-responsibility of users when they act intentionally or in manifest contravention of the established rules.

The comparative examination of the European Union, the United States and Argentina reinforced this perception. The European model, with comprehensive regulations and a risk-based approach, shows that it is possible to establish clear categories, implementation schedules and mandatory sandboxes, generating a high degree of predictability, even at the cost of greater regulatory density. The North American arrangement, more fragmented and based on multiple agencies and soft law instruments, reveals a great capacity for reaction and adaptation, but also significant uncertainty regarding the distribution of competences and the future of interpretations. The Argentine experience, by consolidating a regime of documents and digital signatures and from it experimenting with blockchain applications in records and digital identity, highlights the importance of a well-defined legal basis for innovative projects to find institutional and evidentiary anchorage.

When this set of elements is projected on the universe of Brazilian public records, the hypothesis of a hybrid model based on the triad Sustainability-Interoperability-Regulatory Framework gains consistency. Sustainability refers to the economic and institutional viability of services in the face of intensive digitalization, including investments in technological infrastructure, information security, and team training. Interoperability involves building technical and regulatory solutions that allow distributed ledgers, metadata, APIs, and AI systems to converse with registry legislation, civil procedure, public key infrastructure, and personal data protection, in order to ensure evidentiary admissibility, traceability, and auditability. The regulatory framework component, on the other hand, refers to the need to explain, in general rules and supervised self-regulation instruments, who is responsible for which risks in each layer of the digital registry ecosystem, with concrete instruments of protection, such as ODR, insurance, and compensation funds.

From this path stems a central conclusion: legal certainty in digital ecosystems does not require the paralysis of innovation, but rather the construction of an environment in which relevant innovations are developed within a minimally stable framework of principles, duties and consequences. A hybrid model, based on regulation by principles, responsive regulation, and supervised self-regulation, with grading of duties by risk and sectoral application to public

registries under the SIM hypothesis, is capable of reducing gray areas of liability, jurisdiction, and redress in decentralized environments, without stifling technological experimentation. The need to deepen the practical application of these guidelines in pilot projects, to empirically measure their effects in terms of efficiency, trust and reduction of litigation, and to adjust, based on these results, the proposed governance matrix remains open. The point of arrival of this article, therefore, is the assertion that the challenge posed by AI and blockchain to Brazilian Law is not merely technological, but institutional and hermeneutic, and that its most promising response lies in a balanced combination of clear principles, regulatory cooperation, and shared responsibility.

ABSTRACT

Currently, much has been discussed about the use of artificial intelligence in various areas of knowledge, such as economics, medicine, engineering, industry, and also in different segments of agribusiness. In the agricultural context, this technology is present from the machinery used in the field, which is increasingly automated and intelligent, to systems and software aimed at the management of rural properties. It is observed, therefore, that the advancement of machine learning and other artificial intelligence tools has been significantly contributing to the transformation and modernization of the agricultural sector. These technologies enable greater efficiency in production, better decision-making, optimization of the use of natural resources, and increased productivity. As a result, they further strengthen the relevance of agriculture within the Brazilian economy, a sector that plays a fundamental role in the country's economic growth. In this context, the present study aimed to carry out a bibliographic review on the application of artificial intelligence in agriculture, seeking to identify its main applications, benefits, and contributions to development and innovation in the agricultural sector.

Keywords: Artificial Intelligence. Agribusiness. Industry 4.0.

RESUMO

Atualmente, muito se tem discutido sobre o uso da inteligência artificial nas mais diversas áreas do conhecimento, como economia, medicina, engenharias, indústria e também nos diferentes segmentos do agronegócio. No contexto agrícola, essa tecnologia está presente desde os maquinários utilizados no campo, cada vez mais automatizados e inteligentes, até os sistemas e softwares voltados para a gestão das propriedades rurais. Observa-se, portanto, que o avanço do aprendizado de máquina e de outras ferramentas de inteligência artificial vem contribuindo significativamente para a transformação e modernização do setor

agrícola. Essas tecnologias possibilitam maior eficiência na produção, melhor tomada de decisões, otimização do uso de recursos naturais e aumento da produtividade. Como consequência, fortalecem ainda mais a relevância da agricultura dentro da economia brasileira, setor que desempenha papel fundamental no crescimento econômico do país. Nesse contexto, o presente trabalho teve como objetivo realizar uma revisão bibliográfica acerca da aplicação da inteligência artificial na agricultura, buscando identificar suas principais aplicações, benefícios e contribuições para o desenvolvimento e a inovação no setor agrícola

Palavras-chave: Inteligência Artificial. Agronegócio. Indústria 4.0.

RESUMEN

Actualmente, se ha discutido ampliamente sobre el uso de la inteligencia artificial en diversas áreas del conocimiento, como la economía, la medicina, las ingenierías, la industria y también en los diferentes segmentos del agronegocio. En el contexto agrícola, esta tecnología está presente desde la maquinaria utilizada en el campo, cada vez más automatizada e inteligente, hasta los sistemas y softwares orientados a la gestión de las propiedades rurales. Se observa, por lo tanto, que el avance del aprendizaje automático y de otras herramientas de inteligencia artificial ha contribuido significativamente a la transformación y modernización del sector agrícola. Estas tecnologías permiten una mayor eficiencia en la producción, una mejor toma de decisiones, la optimización del uso de los recursos naturales y el aumento de la productividad. Como consecuencia, fortalecen aún más la relevancia de la agricultura dentro de la economía brasileña, sector que desempeña un papel fundamental en el crecimiento económico del país. En este contexto, el presente trabajo tuvo como objetivo realizar una revisión bibliográfica sobre la aplicación de la inteligencia artificial en la agricultura, buscando identificar sus principales aplicaciones, beneficios y contribuciones al desarrollo y la innovación en el sector agrícola.

Palabras clave: Inteligencia Artificial. Agronegocio. Industria 4.0.

1 INTRODUCTION

In an ever-evolving world, complexity is undeniably prevalent. The challenges that society must face continue to expand in various dimensions, such as the economic, social, and environmental aspects of sustainability. These multifaceted demands require the ability to make informed decisions based on vast amounts of data and information. For example, optimizing profitability must be achievable while maintaining a strong connection with an extremely demanding market and consumers (PINHEIRO et al., 2021).

Envision a future where farmers have analytical tools at their disposal to enhance their decision-making process about crops and livestock; where management practices and combinations of inputs are dictated by physical conditions, biological factors (e.g., pests, diseases), and economic sustainability. Looking at the real world, it's clear that we still have a long way to go. Take pesticides, for example – they are still being sprayed all over the field, not just the affected areas or plants (RUSSO, 2020).

Although agricultural areas have noticeable differences in factors such as fertility and moisture, inputs are applied without taking into account these variations, causing unnecessary waste and environmental damage. The problem is that the tools used to make decisions do not recognize the fact that agricultural systems are subject to non-linear interactions, with multiple variables at play. As they move forward, it becomes evident that it is essential to have a deeper understanding of how various elements interconnect to affect each other in agricultural operations (MEGETO et al., 2021).

To increase the ability to predict and prescribe solutions, improved methodologies are required. Artificial intelligence (AI) could revolutionize this area by offering an area of study that incorporates machines with human-like thought processes, such as rationality. By leveraging these technologies, sophisticated systems absorb knowledge from previous encounters, allowing them to perform actions much faster and more efficiently than humans ever could. With its ability to process large amounts of data continuously, AI can outperform humans in identifying year-round occurrences such as disease, drought, and weed competition, as well as predicting productivity, profitability, and weather patterns (BORBA et al., 2022).

AI-integrated machines can relieve workers of heavy tasks by providing fast and sophisticated results. However, the potential risks of AI need to be anticipated and treated like any innovative development. Because AI relies on connectivity, cybercriminals can manipulate it, producing significant disruptions, damage, and damage. Criminal activity can disrupt the proper functioning of autonomous drones, planters, or harvesters, resulting in irreversible damage. Design errors stemming from a fascination with technology, prioritizing

productivity and profitability over ecological sustainability, are also a cause for concern, as the pursuit of prudent economic outcomes often requires a combination of both (FERNÁNDEZ, 2020).

In short, Artificial Intelligence in agriculture is a topic of great relevance amid the wave of technological advances that are bringing more efficiency to the field. In agribusiness, AI has been incorporated into agricultural operations to manipulate data, generate estimates, or even perform image recognition, and the importance of this study is to show the great importance that this technology has for Brazilian agribusiness. In this context, the objective of the present study was to verify artificial intelligence applied to agriculture, aiming to verify how its tools have been used to improve crop monitoring, pest monitoring, etc.

2 THEORETICAL FRAMEWORK

2.1 ARTIFICIAL INTELLIGENCE

British mathematician Alan Turing (Alan Turing) was one of the pioneers who wrote papers on computational intelligence through his book *Computational Machinery and Intelligence* in 1950. In his article, the mathematician developed the Turing test, which is a way of specifying that the performance of intelligent machines is better than that of humans. This test is informally called an imitation game by Turing himself (KAUFMAN, 2019).

One of the common definitions of artificial intelligence is as a branch of computer science responsible for automating intelligent behaviors. Since intelligence is expressed as a form of calculation, formalization and mechanization are subsequent steps. Gottfried Wilhelm introduced a system of formal logic when designing machines that perform tasks automatically. The steps of this mechanical solution can be represented as movement by the study of a tree or figure. In Figure 1, there is a representation of a decision diagram (DA SILVA; MAIRINK, 2019).

Figure 1*Example Graph*

Source: DA SILVA; MAIRINK, (2019).

The construction of graph theory also contributed to the emergence of the concept of state-space search, which is an important technology in artificial intelligence. The chart is used to construct the problem to be solved. The nodes of the state-space graph represent the possible steps of solving the problem, and their arc involves reasoning, the steps to follow to solve the problem. The solution to this type of problem is obtained by investigating the state-space diagram, which is a path to a solution. In this way, they represent a powerful tool to specify the complexity of the problem to be solved and the efficiency of the analysis of the solution strategy (PEIXOTO; SILVA, 2019).

From the 18th to the 20th century, science and mathematics became the academic prerequisites for the research and development of artificial intelligence, but it was not until the beginning of digital computing in the 20th century that artificial intelligence became scientifically viable. It is now possible to implement a formal reasoning system on a computer and empirically test its ability to demonstrate intelligence (DONEDA, et al., 2018).

2.2 MAIN ASPECTS OF ARTIFICIAL INTELLIGENCE

Many current artificial intelligence logics are elaborated through a set of modular components and rules of behavior, which do not follow a strict order when executed, but are activated in response to the specific situation of a given problem (BARBOSA, 2017).

There are several studies involving artificial intelligence for different applications. Connectionism is based on the functioning of logic and rational thought. People are working hard to get intelligence by building the architecture of the human brain. The neural network

model demonstrates the brain's ability to adapt to the world in which it finds itself, creating and modifying connections between neurons (MAIA FILHO; JUNQUILHO, 2018).

Another intelligent model based on biological tissues is related to the process of interaction between species that adapt to the environment. In this way, they apply the principles of biological evolution to the problem of finding solutions to difficult problems. This method does not seek solutions to problems through logical reasoning, but creates groups of competing responses and evolves them into a better solution for simulating biological evolution (CORVALÁN, 2020).

The social system represents another metaphor for intelligence, as it presents a joint behavior that allows dealing with problems that cannot be solved by just one member (OLIVEIRA, 2019). For example, while no one can accurately predict the amount of bread New York City will consume on any given day, New York's bakery system does the job as a whole, providing bread to the city with minimal waste (LOBO, 2017).

This metaphor in academia established the concept of IAD (Distributed Artificial Intelligence), which they interpreted as a very promising branch of artificial intelligence research, which is still little explored today. It is different from the classical model of artificial intelligence, because traditional research aims to analyze individual human behavior and its focus is on the representation of knowledge and reasoning methods. On the other hand, the IAD model is based on social behavior and its focus is on the actions and interactions between agents. This proposition introduces the concept of agent, which is characterized by reflecting the collective behavior of many simple individuals who interact with each other (PORTO, 2019).

3 ARTIFICIAL INTELLIGENCE IN AGRICULTURE

Since the turn of the century, big tech companies have pondered the idea of creating an automated field that can sustain itself through harvesting. The management of pre-planting, planting and harvesting has presented difficulties, leading to the emergence of Smart Agriculture. The idea is to link entire fields to one or more smart grids, using artificial intelligence and machine learning. Today, Digital Agriculture or Smart Agriculture is the preferred term to describe an agricultural management methodology that seeks the most productive production while minimizing crop losses and maximizing profit without expanding land (SEGOVIA; ROJAS; QUISHPE, 2021).

It is important to note that another critical concept, IOT (Internet of Things), exists to facilitate fast and secure communication between machines and users, ensuring the integrity of the information shared. Imagine an expansive field, linked to several machines capable of

detecting problems and providing various resolutions. However, if access to this information is only feasible through the physical approximation of the machines, this would consume as much time as manual field verifications (MENDES-MOREIRA; FERREIRA; DIAS, 2022).

This is where the Internet of Things becomes relevant, by allowing a seamless exchange between machine and user. This concept essentially involves the connection of machines to each other (machine-to-machine), as well as the user (machine-to-user). By establishing connectivity, the previous scenario is solved, and the collected data can be easily transmitted to a desktop or smartphone over any distance. Data science and artificial intelligence are poised to revolutionize the sector, granting farmers resources to optimize every square meter of available land (MEIRELLES; MOREIRA; COELHO, 2004).

Industry 4.0, with its focus on smart factories and smart manufacturing, has been greatly aided by advances in information and communication technologies, including the use of artificial intelligence. The outdated nature of traditional systems for more complex tasks has led to the utilization of on-board computing, real-time schematics, and resource scheduling strategies for improved manufacturing operations. Within the field of agriculture and industry 4.0, product testing has emerged as a key application (SANTOS, 2020).

When it comes to producing and developing items of greater complexity, automated testing becomes a vital tool. That said, there is a significant problem presented by the considerable delay in testing that occurs across multiple geographic networks, but fortunately a solution has emerged in the form of an automated testing system that can support testing in geographically dispersed environments. With this in mind, this particular subject presents a promising path for the development of algorithmic machine learning (XAVIER, 2020).

In addition, there is an underlying need for flexibility in all aspects of product development, while also recognizing that human learning is a valuable factor that cannot be overlooked. One solution to these limitations is to integrate artificial and human intelligence to work together in harmony, with a focus on the former mimicking human behaviors and reasoning through the use of pattern recognition, logical applications, and final conclusions (ADORNO, 2021).

3.1 CROP MONITORING

Precision agriculture is a management system that emerged for this purpose. However, precision agriculture, which was based only on miraculous technological solutions, is slowly evolving into a more promising situation that is truly revealing its potential and results. Its growth develops with technological advances, including: Global

Positioning System (GSP or GPS), Remote Sensing, Variable Rate Input applications, Geographic Information Systems (GIS or GIS), among others (PIRES et al., 2004).

To ensure optimal crop monitoring, drones equipped with high-quality cameras have emerged as the latest and most innovative solution. By utilizing the remote control, growers can effortlessly navigate through the entire plantation while the lens captures images in real-time. These images are then analyzed by an AI or stored in a database for further treatment. As a result, producers are equipped with all the necessary information to accurately assess the quality of their production (CONFORTO et al., 2016).

Figure 2

Analysis of the plant carried out through drones

Source: climatefieldview.com.br

Google has gone so far as to train its AI to recognize more than 5,000 distinct types of plants and animals, making it much easier to detect crop diseases and other problems. Thanks to this approach, results are achieved effectively and reliably, allowing producers to act with a greater probability of success. On another front, image sensors embedded in the soil allow continuous monitoring, efficiently avoiding unpleasant surprises at harvest time, such as pest and disease outbreaks (PÉREZ et al., 2019).

The application of pesticides depends on the level of pest infestation found in the area, which can be determined by the producer. By collecting images, the producer can make informed decisions about what agricultural input to use and how much to use it to optimize productivity on the farm. To reduce water and electricity use, technology is being tested to predict the amount of water each irrigator will need for irrigation. This can lead to increased productivity by ensuring that the appropriate amount of water is used (MORETI et al., 2021).

3.2 AUTOMATION OF AGRICULTURAL MACHINERY

Smart tractors incorporate familiar technologies such as autopilot, but their impact on agriculture is critical. The concept of an unmanned tractor alone can significantly reduce cultivation time and increase the consistency and accuracy of yields. Similarly, tractor developers are utilizing sensors linked to vast databases to minimize potential setbacks and maximize farmers' profitability (RUSSO, 2020).

Figure 3

Unmanned tractor

Source: chbagro.com.br

Through advanced technology and machine learning, the project is developing intelligent machines that can detect and reroute barriers, distinguish ripe and spoiled products, and increase the efficiency of agricultural operations. These machines even analyze soil conditions in real-time and provide recommendations to farmers for improvements (MEGETO et al., 2021).

Figure 4

System allows rapid diagnosis of the crop for the correct application of various products.

Source: www.farmfor.com.br

According to Pires et al. (2004), the tools used can be used individually or combined, depending on the financial resources available and the specific needs identified for each area. The entire cycle of precision agriculture involves not only field evaluation, but also data processing and the creation of prescription maps or properties for path correction. Several computational applications have been developed by research institutions and private companies to maximize the use of the collected data and obtain relevant information about the system. Each tool available operates according to its own unique principles. For example, organic matter sensors utilize optical properties of soil, nutrient sensors utilize ion-specific electrodes, soil salinity and moisture analysis is performed using electrical conductivity, and soil texture analysis is performed by studying acoustic properties of soil.

Pires et al. (2004) also state that among the various possible uses, the mapping of soils and crops to obtain productivity maps, application of input doses at variable speeds, orientation of air and land inputs and use in management decision support systems stand

out. The technology is also used to map and monitor areas infested by weeds, diseases, and pests to help take appropriate control measures. In some studies based on the differential reflection of radiation incident on vegetation, sensors can distinguish between soil and weeds and target those specific areas. This can reduce herbicide use, reduce production costs, and increase food production.

4 FINAL CONSIDERATIONS

Looking ahead, Digital Agriculture presents a practical solution that focuses on optimizing productivity while minimizing the use of resources, which is imperative to avoid potential risks and create effective proposals. The need for human intelligence in this process would require time and resources that we simply cannot do without. Recent studies show that in the coming years, the demand for food will increase globally, and consequently, technological advancements driven by artificial intelligence will arouse interest.

Techniques such as Deep Learning, Machine Learning, and IOT have played an essential role in the agricultural sector, identifying pestilences and diseases, reducing crop damage and losses, shortening the time it takes to harvest crops, collecting relevant soil data, and making informed decisions, which ultimately reduces environmental damage. The journey towards smart agriculture is never-ending as technology, and its applications continue to evolve every day, further advancing the agricultural technology market.

Across a range of disciplines, artificial intelligence (AI) is advancing in agriculture. With machine learning revolutionizing every corner of the economy, the agricultural sector is carving out its own territory in the production pipeline. Investments and adoption of AI are increasing, as its ability to interpret and analyze data surpasses that of humans, aiding in the acceleration of rapid processes. These developments are manifesting themselves in a variety of industries, including manufacturing, transportation, agribusiness, and real estate.

With the arrival of technology, there is an increasing need for fast and efficient processing of large volumes of data that the human intellect cannot meet. This is especially pronounced in the seed industry, from sowing to quality control testing, which requires careful analysis of multiple seed lots. Quality control tests look at germination, emergence, accelerated aging, electrical conductivity, cold test, and water content. All of this needs careful interpretation to ensure safe information about the seeds.

However, the high demand for lot analysis is impossible to meet with human intelligence, especially with regard to the commercialization of seeds and grains. The implementation of AI-based technology in various industries, including agriculture, has proven to be a valuable tool for streamlining operations and overcoming obstacles. With the ability

to detect soil contents, monitor crop growth, and even automate weeding and planting, farmers have been able to increase their yields and minimize resource use.

This improvement in efficiency has led to better quality crops and, as a result, faster time to market. AI enables farmers to collect and analyze vast amounts of data, providing solutions to their toughest challenges and enabling faster, more informed decision-making. In a field where innovation is essential, the integration of artificial intelligence has revolutionized the agricultural sector by increasing productivity and optimizing resource allocation.

ABSTRACT

The increasing use of digital technologies in public health management has significantly expanded the processing of sensitive personal data, requiring legal mechanisms capable of ensuring the protection of privacy and fundamental rights. In this context, the Brazilian General Data Protection Law establishes regulatory parameters governing the processing of personal information by public and private institutions, including those operating in the healthcare sector. This study aims to analyze the legal challenges related to the application of the General Data Protection Law in the processing of sensitive data within the public health system of Manaus, Amazonas. The research is characterized as a qualitative and descriptive literature review, based on recent scientific articles and academic studies addressing personal data protection, information governance and public sector responsibility in health data processing. The results indicate that the implementation of the legislation faces challenges related to technological infrastructure, the absence of consolidated institutional information security policies and the need for training of public agents responsible for data

processing. It is observed that the effectiveness of data protection regulations depends on the integration between legal norms, administrative practices and governance mechanisms capable of ensuring transparency, security and accountability in the use of personal information. The study concludes that strengthening institutional strategies aimed at protecting sensitive data represents an essential element for the consolidation of safer public health services aligned with the protection of fundamental rights, particularly within the Amazonian context.

RESUMO

A intensificação do uso de tecnologias digitais na gestão dos serviços públicos de saúde tem ampliado o tratamento de dados pessoais sensíveis, exigindo mecanismos jurídicos capazes de assegurar a proteção da privacidade e dos direitos fundamentais dos cidadãos. Nesse contexto, a Lei Geral de Proteção de Dados Pessoais estabelece parâmetros normativos voltados à regulamentação do tratamento de informações pessoais por instituições públicas e privadas, incluindo aquelas relacionadas à área da saúde. O presente artigo tem como objetivo analisar os desafios jurídicos da aplicação da LGPD no tratamento de dados sensíveis no âmbito da saúde pública do município de Manaus, Amazonas. A pesquisa caracteriza-se como revisão de literatura, de abordagem qualitativa e natureza descritiva, fundamentada em artigos científicos recentes e produções acadêmicas que discutem a proteção de dados pessoais, a governança informacional e a responsabilidade estatal no tratamento de informações em saúde. Os resultados indicam que a implementação da legislação enfrenta entraves relacionados à infraestrutura tecnológica, à ausência de políticas institucionais consolidadas de segurança da informação e à necessidade de capacitação dos agentes públicos responsáveis pelo tratamento de dados. Verifica-se que a efetividade da LGPD depende da integração entre normas jurídicas, práticas administrativas e mecanismos de governança capazes de garantir transparência, segurança e responsabilização no uso das informações pessoais. Conclui-se que o fortalecimento de estratégias institucionais voltadas à proteção de dados sensíveis constitui elemento essencial para a consolidação de serviços públicos de saúde mais seguros e alinhados à tutela dos direitos fundamentais, especialmente no contexto amazônico.

RESUMEN

El creciente uso de tecnologías digitales en la gestión de los servicios públicos de salud ha ampliado significativamente el tratamiento de datos personales sensibles, lo que exige mecanismos jurídicos capaces de garantizar la protección de la privacidad y de los derechos fundamentales de los ciudadanos. En este contexto, la Ley General de Protección de Datos Personales de Brasil establece parámetros normativos destinados a regular el tratamiento de información personal por instituciones públicas y privadas, incluyendo el sector sanitario. El presente estudio tiene como objetivo analizar los desafíos jurídicos de la aplicación de la Ley General de Protección de Datos en el tratamiento de datos sensibles en el ámbito de la salud pública del municipio de Manaus, Amazonas. La investigación se caracteriza como una revisión de literatura de enfoque cualitativo y naturaleza descriptiva, fundamentada en artículos científicos recientes y producciones académicas relacionadas con la protección de datos personales, la gobernanza de la información y la responsabilidad estatal en el tratamiento de datos en salud. Los resultados indican que la implementación de la legislación enfrenta obstáculos relacionados con la infraestructura tecnológica, la ausencia de políticas institucionales consolidadas de seguridad de la información y la necesidad de capacitación

de los agentes públicos responsables del tratamiento de datos. Se concluye que la efectividad de la normativa depende de la integración entre disposiciones jurídicas, prácticas administrativas y mecanismos de gobernanza capaces de garantizar transparencia, seguridad y responsabilidad en el uso de la información personal, especialmente en el contexto amazónico.

1 INTRODUCTION

The digital transformation of public services has promoted significant changes in the way personal information is collected, stored, and shared, especially in the health sector, in which data processing is an essential element for the execution of public policies and for the continuity of care. In this scenario, the growing circulation of clinical and registration information intensifies the need for legal mechanisms capable of ensuring the protection of the privacy and fundamental rights of citizens, especially in view of the sensitive nature of health-related data.

The enactment of Law No. 13,709/2018 instituted, in the Brazilian legal system, a specific normative regime aimed at the discipline of the processing of personal data, applicable to both the private sector and the Public Administration. As established by Brasil (2018), data processing comprises any operation carried out with personal information, including collection, use, storage, and sharing, imposing legal limits aimed at preserving the intimacy, freedom, and dignity of the natural person. From this regulation, information protection began to be a structuring part of state action, especially in areas that depend on intensive data management, such as public health.

In the health context, the advance in the computerization of services has expanded interoperability between systems and institutions, enabling greater administrative efficiency, but also increasing legal risks related to improper access and inappropriate use of personal information. Balian (2025) observes that the sharing of health data between different platforms requires strict governance and security criteria, since technological integration can amplify vulnerabilities when not accompanied by adequate regulatory controls.

In addition, recent literature shows that the implementation of the LGPD in the health sector requires institutional adaptations that go beyond the technological dimension, involving administrative reorganization and redefinition of responsibilities of public agents. Hawryliszyn (2021) highlights that compliance with legal requirements requires professional training and the establishment of internal protocols capable of ensuring continuous compliance in the processing of sensitive data. In addition, Lima (2023) points out that the application of legislation within the scope of public health services imposes the challenge of balancing the efficiency of health policies with the guarantee of users' informational rights.

In view of this panorama, it is verified that the protection of sensitive personal data is a central theme in the contemporary legal debate, especially when analyzed from the perspective of public health management. The expansion of the use of electronic medical records, integrated systems, and digital platforms highlights the need to understand how the instruments provided for in the LGPD are operationalized in administrative practice, as well

as what legal challenges emerge from this process. Thus, it is relevant to investigate the application of legislation in the context of municipal public health, considering the structural and social specificities that characterize the Amazonian reality.

The application of the General Law for the Protection of Personal Data in the health sector is particularly relevant due to the nature of the data processed by health institutions, legally classified as sensitive personal data. Information related to the health status, clinical history, and biometric conditions of individuals require high levels of protection, since their undue exposure can generate direct impacts on dignity, privacy, and equitable access to public services. Martins (2021) highlights that the information protection of the patient is closely related to the fundamental right to health itself, showing that data security is an integral element of the quality of care.

The expansion of digital health and technology-mediated care has intensified the flow of information between professionals, hospital units, and administrative systems, simultaneously increasing the efficiency of care and the risks related to inadequate data processing. Zaganelli (2023) points out that the expansion of telemedicine and electronic records requires institutional mechanisms capable of ensuring confidentiality, traceability, and access control to clinical information, reinforcing the need for permanent information governance policies in the health environment.

In the context of public management, it is observed that the implementation of the LGPD faces challenges related to the organizational structure of health institutions and the historical absence of consolidated data protection policies. Gonçalves (2024) points out that Brazilian public hospitals still have difficulties in standardizing procedures and clearly defining the responsibilities of the agents involved in the processing of personal information. In a convergent way, Praça Neto (2023) shows that the impact of legislation on the health sector requires a review of administrative flows and the adoption of institutional practices aimed at preventing informational risks.

From the perspective of social control and administrative transparency, Silva (2023) states that the digitalization of public health policies expands the state's capacity for health planning and monitoring, but also imposes the need for legal safeguards that prevent uses that are incompatible with the public purpose. In this sense, Soares (2021) emphasizes that the duty of confidentiality, traditionally associated with professional secrecy, has taken on an expanded institutional dimension, requiring shared responsibility between professionals and public managers.

In view of these considerations, the analysis of the legal challenges related to the application of the LGPD in the processing of sensitive data in the scope of municipal public

health is established as a research problem. Thus, this article aims to examine the protection of personal data in public health in Manaus, Amazonas, identifying normative and institutional obstacles arising from the implementation of the legislation, as well as its repercussions for the guarantee of the fundamental rights of users of the public health system. The investigation is justified by the need for scientific production focused on the Amazonian reality, contributing to the strengthening of safe and legally adequate administrative practices in the treatment of sensitive personal information.

2 THEORETICAL FRAMEWORK

The protection of personal data has consolidated itself as one of the main contemporary legal challenges in the face of the intensification of the digitalization of public services, especially in the field of health. The enactment of Law No. 13,709/2018, called the General Law for the Protection of Personal Data, represented a fundamental normative milestone by recognizing the need for specific protection of information related to natural persons, especially those classified as sensitive data, including health data. In this context, it is observed that the informational management carried out by the government began to demand new mechanisms of governance, transparency and institutional accountability, especially within the scope of the Unified Health System.

According to Lima and Gonçalves (2023), the application of the LGPD in public health services imposes a significant administrative restructuring, since the processing of personal data is no longer understood only as an operational activity and becomes a legal obligation linked to the guarantee of fundamental rights. The authors point out that the collection and sharing of clinical information requires strict observance of the principles of purpose, necessity and security, under penalty of violation of the citizen's privacy and state liability.

The expansion of the use of hospital computerized systems and digital platforms has intensified the flow of medical data, making evident the need for compatibility between administrative efficiency and protection of the patient's privacy. In this sense, Gonçalves et. al (2024) point out that public hospitals face structural difficulties for the full implementation of the LGPD, especially due to the absence of an institutional culture focused on data protection and the technological limitation present in several public health units. Such a scenario reveals that normative effectiveness depends not only on the existence of the law, but also on the administrative capacity of public entities to internalize compliance practices.

The discussion about information protection in public health is also directly related to the social control of health policies. Silva et. al (2023) argue that the digital transformation of the SUS has expanded the capacity for epidemiological monitoring and state planning,

however, simultaneously, it has increased the risks related to the misuse of personal information. For the authors, health data governance must balance the collective interest in the formulation of public policies with the preservation of individual rights, avoiding practices that may generate undue exposure of vulnerable populations.

From the perspective of medical practice, the protection of sensitive data assumes an ethical and legal dimension that is inseparable from the duty of professional secrecy. According to Soares (2021), the processing of patient data requires extra caution, as clinical information has high discriminatory potential, which can impact the individual's social, work, and security relationships. The author points out that the LGPD reinforces existing obligations in the field of bioethics, expanding the responsibility of professionals and institutions regarding the safekeeping and sharing of this information.

The growing adoption of telemedicine and digital health technologies has further intensified the debate about the confidentiality of medical information. In this scenario, Zaganelli (2023) observes that the digital environment has expanded the exposure of clinical data, requiring technical and legal mechanisms capable of ensuring traceability, security, and access control to information. The author points out that medical confidentiality depends not only on professional conduct, but also on the technological infrastructure used by health institutions.

It is verified that the protection of personal data in the health sector goes beyond the merely normative dimension, inserting itself in a broader context of reorganization of the digital public administration. The implementation of the LGPD, especially in complex regional realities such as that of Brazilian public health systems, highlights the need for integration between law, technology, and public policies, an aspect that will be deepened in the following sections.

The implementation of the General Data Protection Law in the health sector requires the redefinition of institutional responsibilities related to the processing of personal information of users of the public and private system. In this context, Hawryliszyn (2021) highlights that the regulatory adequacy of health institutions is not restricted to the adoption of technological tools, but also involves organizational changes capable of ensuring information security and adequate control of access to clinical data. Such a perspective shows that compliance with the LGPD depends on the integration between administrative management, professional training, and efficient technological structure.

The processing of sensitive personal data, especially those linked to the medical history of patients, requires additional care in view of the harmful potential resulting from their undue exposure. Praça Neto (2023) observes that the health sector operates with a high

volume of information shared between different institutional agents, a circumstance that increases the risks related to leaks and uses incompatible with the originally established purpose. Thus, data governance starts to assume a central role in preserving the fundamental rights of data subjects.

Information protection is also presented as an extension of the fundamental right to health itself, since safe access to health services presupposes trust between patient and institution. Martins (2021) argues that the preservation of the confidentiality of medical data is an indispensable element for the realization of the dignity of the human person, considering that the unauthorized disclosure of clinical information can generate relevant social, economic, and psychological impacts on the individual.

From the perspective of institutional legal compliance, there is the strengthening of adaptation programs specifically aimed at the hospital environment. Dias Carneiro (2021) states that the LGPD introduced the need to implement permanent mechanisms for controlling and monitoring data processing operations, including internal security policies, risk assessment, and clear definition of the responsibilities of the agents involved. The author emphasizes that the health sector has a high degree of informational vulnerability due to the complexity of care routines.

The increasing technological integration of public health systems has intensified the debate about the interoperability of government databases. Balian (2025) points out that the structured sharing of health information contributes to the planning of more efficient public policies, however it requires strict compliance with the principles of necessity and purpose provided for in the LGPD. According to the author, the absence of clear limits on automated data processing can compromise the protection of citizens' privacy.

Thus, it is perceived that the application of data protection legislation in the field of health represents a continuous process of institutional adaptation, in which information security becomes part of the very concept of quality of the public service provided. The consolidation of this model highlights the need for a balance between technological innovation and safeguarding fundamental rights, preparing the debate for the analysis of the concrete legal challenges faced in the reality of public health administration.

The consolidation of personal data protection in public health is part of a broader scenario of digital transformation of state administration, in which the intensive use of information technologies has come to guide the formulation and execution of health policies. In this context, Lima (2023) highlights that the application of the LGPD within the scope of the Unified Health System imposes on the public authorities the duty to structure mechanisms capable of ensuring not only administrative efficiency, but also the preservation of the privacy

of the citizens served. The author shows that the processing of sensitive data requires compatibility between collective interest and individual protection, especially in public systems characterized by high information flow.

The digitalization of health services has significantly expanded the state's capacity for epidemiological monitoring and care management, but it has also intensified the risks related to the inappropriate use of personal information. Gonçalves (2024) observes that the practical implementation of the LGPD in public hospitals faces structural obstacles, including technological limitations, absence of standardized protocols, and insufficient technical training of the agents responsible for data processing. This reality demonstrates that normative effectiveness depends directly on the administrative capacity of public entities to internalize information governance practices.

The collective dimension of data protection in health becomes evident when analyzed from the perspective of social control of public policies. Silva (2023) argues that the expansion of the SUS digital bases strengthened the production of health indicators and government planning, but simultaneously increased the informational exposure of socially vulnerable groups. In this sense, the author emphasizes that the protection of personal data must be understood as an instrument of democratic guarantee, preventing the massive use of information from resulting in discriminatory practices or indirect violations of fundamental rights.

In the field of care practice, the protection of sensitive data is closely related to the ethical duty of professional secrecy. Soares (2021) states that the LGPD legally reinforced obligations historically associated with medical ethics, expanding the responsibility of health institutions regarding the storage and sharing of clinical information. The author highlights that the confidentiality of data is an essential element for maintaining trust between the patient and the health system, an indispensable factor for the effectiveness of public health policies.

The expansion of telemedicine and care mediated by digital technologies has also redefined the traditional parameters of information protection. Zaganelli (2023) points out that the digital environment requires additional security mechanisms, considering that the remote treatment of clinical data increases the points of informational vulnerability. According to the author, the protection of health data depends simultaneously on legal guarantees, secure technological infrastructure, and appropriate institutional protocols.

Given this scenario, it is verified that the application of the LGPD in the public health sector represents a continuous legal challenge, especially in regional contexts marked by structural inequalities and technological limitations. The reality of municipal health systems highlights the need for regulatory adaptation to local specificities, making it essential to

develop public policies capable of reconciling digital innovation, administrative efficiency, and protection of citizens' fundamental rights. Thus, the protection of sensitive personal data is an indispensable element for the strengthening of public health management and for the consolidation of a legally safe and socially responsible care model.

3 METHODOLOGY

The present study is characterized as a qualitative research, developed through a literature review, with a legal-dogmatic approach, focused on the analysis of legal challenges related to the application of the General Law for the Protection of Personal Data in the treatment of sensitive data in the context of public health, focusing on the administrative reality of the municipality of Manaus, Amazonas.

As for the objectives, the research is classified as exploratory and descriptive, as it seeks to identify, systematize and critically analyze the recent scientific production on the protection of personal data in the health area, allowing to understand the legal impacts arising from the implementation of the LGPD in public health services. According to the methodological guidelines provided for in the structural model of the scientific article, the methodological section must qualify the type of research, the methods used, and the investigative path adopted, ensuring clarity and scientific reproducibility.

The methodological procedures consisted of conducting a narrative literature review, based exclusively on scientific articles published between the years 2021 and 2025, available entirely in digital format. The selection of productions took place according to previously defined inclusion criteria, comprising: publications in scientific journals classified in the Qualis A and B strata, thematic relevance to the General Data Protection Law applied to health and a specific approach to the processing of sensitive personal data, information governance and institutional responsibility in the health sector.

The research universe corresponds to the national scientific literature focused on the interface between digital law and public health, while the sample was composed of ten scientific studies selected for their adherence to the problem investigated. The time limit was established with the objective of ensuring theoretical updating and alignment with contemporary discussions on the digital transformation of public administration and personal data protection.

The analysis of the bibliographic material was carried out through the technique of qualitative content analysis, involving exploratory reading, analytical reading and thematic categorization of the information extracted from the selected studies. The following categories of analysis were defined: protection of sensitive health data, responsibility of the public

authorities in the processing of personal information, informational security in hospital environments, and legal challenges of implementing the LGPD in public health management. The development of the research occurred in successive stages, starting with the survey of scientific productions in academic digital databases, followed by screening according to inclusion and exclusion criteria, organization of theoretical contributions and subsequent critical interpretation of the results in the light of the Brazilian legal system. This procedure allowed the establishment of a relationship between the theoretical framework analyzed and the concrete challenges faced by the public health administration in specific regional contexts.

As a methodological limitation, the absence of direct empirical investigation with public health institutions is recognized, an inherent characteristic of literature review studies. However, this delimitation is adequate to the proposed objective, which consists of the critical systematization of existing scientific knowledge, enabling the construction of a consistent theoretical basis for legal analysis of the investigated phenomenon.

Thus, the methodology adopted allows us to understand, in a structured and systematic way, the main legal challenges related to the protection of sensitive personal data in public health, offering analytical support for discussion of the results and their implications in the context of municipal health management in Manaus, Amazonas.

In order to systematize the scientific references used in the construction of this study, the following is a summary table containing the selected authors, the respective titles of the academic productions and the year of publication. The organization of this information allows us to visualize in a structured way the theoretical basis that supports the discussion about the protection of sensitive personal data in public health, evidencing the relevance of the sources used and their adherence to the proposed research problem.

Table 1

Source: The authors.

From the information presented in Table I, it is observed that the selected scientific production focuses on recent analyses on the application of the General Law for the Protection of Personal Data in the health sector, evidencing the growing academic and legal concern with the processing of sensitive data within the scope of public health policies. It is noted that the studies contemplate different complementary perspectives, involving information governance, institutional responsibility, clinical data security, and the impacts of digital transformation on health services.

Such theoretical diversity enables the construction of a consistent analytical base, allowing us to understand the legal challenges arising from the implementation of the LGPD, especially when considering the reality of municipal public administration and the structural specificities of the health system in the Amazonian context.

4 RESULTS AND DISCUSSIONS

The analysis of the selected scientific productions allowed us to identify that the implementation of the General Law for the Protection of Personal Data in the Brazilian public health sector represents a process still in consolidation, marked by normative advances and relevant operational challenges. The studies examined demonstrate that the expansion of the use of digital technologies in health services has significantly modified the dynamics of collection, storage and sharing of users' clinical information, increasing the need for legal mechanisms aimed at the protection of sensitive data.

In this context, Lima (2023) observes that the computerization of public health policies has contributed to greater integration between care units and administrative systems, favoring state planning and the continuity of health care. However, the author emphasizes that the increase in the flow of information requires strict observance of the principles of purpose and necessity, considering that medical data have a high potential for exposing the individual's intimacy.

The results also indicate that institutional governance is a determining factor for the effectiveness of the LGPD in the public hospital environment. Gonçalves (2024) highlights that the implementation of the legislation faces obstacles related to the absence of standardized information security protocols and the limited technical training of the agents

responsible for processing personal data. Such a scenario shows that normative adequacy depends on the internalization of permanent administrative practices aimed at information protection.

From the perspective of public policies, Silva (2023) argues that the expansion of the digital bases of the Unified Health System strengthened the production of epidemiological indicators and expanded the state's capacity for health monitoring. However, the author warns that the massive processing of population data can generate risks of undue exposure, especially in social contexts marked by economic and territorial vulnerability, a situation often observed in peripheral urban regions.

In the context of care practice, it was found that the protection of personal data assumes an ethical dimension directly linked to the duty of professional secrecy. Soares (2021) states that the LGPD legally reinforced obligations traditionally associated with medical ethics, expanding the responsibility of health institutions regarding the storage and sharing of clinical information. Thus, confidentiality becomes an essential element for maintaining trust between the patient and the health system.

Thus, the results show that the protection of sensitive data is no longer an exclusively technological issue, but is now part of the structure of public health service provision. The literature analyzed demonstrates that the implementation of the LGPD implies progressive institutional transformation, requiring articulation between public management, digital infrastructure, and effective guarantee of the fundamental rights of citizens.

In the set of studies analyzed, it is observed that the main contribution to understanding the challenges in the processing of sensitive health data stems from the normative structure of the General Law for the Protection of Personal Data, by defining processing as any operation carried out with personal data and by establishing foundations and principles that bind the performance of the public sector, including in the execution of public health policies, such as purpose, necessity, transparency, safety, prevention and accountability. Brasil (2018) reinforces that the protection of personal data is guided by the protection of fundamental rights, which shifts the discussion beyond administrative efficiency and imposes a legal standard of information governance.

The reviewed literature points out that, in the public health environment, complexity increases because the State often acts as a controller, with multiple operators and care routines that demand constant circulation of information, a scenario in which compliance with principles such as necessity and safety tends to be strained by structural and technological limitations (Lima, 2023). This finding is relevant to the municipal reality, as it shows that compliance is not limited to internal documents, requiring operational capacity and

institutional culture to implement protection routines.

By relating the legal hypotheses of treatment, the results indicate that the health field operates recurrently on bases that may dispense with consent, especially when there is compliance with legal obligations, execution of public policies and health protection in procedures performed by professionals and health entities. Brasil (2018) delimits these hypotheses and, at the same time, requires that the treatment remains adherent to the public purpose and the public interest, with clear information on procedures and practices, which suggests that institutional transparency becomes a material requirement to legitimize administrative activity in health.

At the organizational level, the review shows that the effective implementation of these normative commands in public hospitals comes up against gaps in protocols, standardization, and training, producing a risk of non-compliance, even if the public purpose is legitimate (Gonçalves, 2024). In terms of governance, this implies that the legal challenge is not only to choose the correct legal basis, but to sustain, through evidence and internal controls, the accountability and security expected by the holder.

Another recurring finding refers to the role of good practices and governance as risk mitigation mechanisms, especially because the LGPD provides for technical and administrative measures to prevent unauthorized access, in addition to administrative sanctions applicable by the competent authority and civil liability for damages resulting from irregular treatment. Brasil (2018) guides this axis by demanding demonstration of effective measures, which, in the public health sector, requires integration between management, technology, and care routines, including in sharing processes necessary for public policies.

The studies highlight that interoperability and the shared use of data, when they increase sanitary efficiency, also increase the risk surface and require proportional controls, especially in databases that concentrate sensitive data. Balian's (2025) analysis converges with this result by indicating that the integration between systems needs to be compatible with purpose limits and security mechanisms, at the risk of amplifying vulnerabilities and compromising the citizen's informational privacy, a central aspect for the legitimacy of public health actions.

The synthesis of the analyzed studies shows that, although the LGPD provides a robust regulatory framework, the effectiveness of the protection of sensitive data in public health depends on institutional conditions that vary according to the local administrative reality, which makes the debate especially relevant when considering municipal health management. The literature points out that the operationalization of principles such as security, prevention, and accountability requires minimum standards of infrastructure,

governance, and control, at the risk of data processing occurring in a formally justified manner, but materially vulnerable to failures and incidents, an aspect that weakens the user's trust in the public service and increases the possibility of informational damage.

In this sense, Hawryliszyn (2021) argues that adapting to the LGPD in health services requires continuous organizational changes, including training of professionals, definition of internal routines, and establishment of information security protocols, as the care environment involves multiple points of contact with personal data throughout the service. This result reinforces that compliance cannot be treated as a one-off action, but as a permanent institutional policy, capable of absorbing the complexity of the information flow in hospitals and public units.

By analyzing the field of supplementary health and the debate on confidentiality, the reviewed production indicates that the inadequate treatment of medical data can have repercussions beyond the individual, generating collective and institutional effects, including stigmatization and discrimination. Martins (2021) discusses this impact by relating information protection to the fundamental right to health and the dignity of the human person, showing that the violation of sensitive data compromises the very quality of access to services, as it produces insecurity and reduces the user's willingness to share information essential to care.

From the perspective of medical practice, the results suggest that the LGPD legally reinforces the duty of confidentiality, expanding the institutional responsibility for the storage and sharing of clinical information. Soares (2021) highlights that care with sensitive data should be understood as an ethical and legal requirement of the care activity, as undue exposure can generate social and professional consequences for the patient. This discussion gains greater density when connected to the daily life of public services, in which there is greater circulation of medical records, referrals and records on digital platforms.

The expansion of telemedicine and care mediated by digital technologies appears, in the review, as a factor of intensification of informational risk, as it expands points of vulnerability and requires greater access control, traceability, and technical safeguards. Zaganelli (2023) points out that, in the digital environment, medical confidentiality also depends on the level of security of the platforms used and the adequacy of internal procedures, which reinforces the need for clear data governance policies and preventive measures capable of avoiding incidents in processing operations.

In terms of compliance and risk management, there is theoretical convergence regarding the need for structured compliance programs specific to the health sector, with continuous monitoring, risk assessment, and internal safety standards. Dias Carneiro (2021) argues that the complexity of the hospital environment makes it essential to institutionalize

permanent data protection mechanisms, considering the volume and sensitivity of the information handled daily. This result dialogues with the reality of municipal systems, in which the adoption of standardized practices can reduce operational asymmetries and strengthen accountability.

The review indicates that the legal challenges of the LGPD in public health intensify when there is interoperability and data sharing between systems, as the search for administrative efficiency can increase the risk of leakage and improper access if there is no limitation by purpose and proportional controls. Silva (2023) points out that the digital transformation of the SUS expands the state's monitoring capacity, but can expose vulnerable populations if adequate governance is lacking, while Praça Neto (2023) points out that the flow of information in health increases the need for clear governance policies to prevent violations.

In addition, Lima (2023) and Gonçalves (2024) indicate that normative effectiveness depends on the internalization of institutional security and standardization practices, reinforcing that the protection of sensitive data must be treated as a structural component of the quality of the public health service.

Thus, the results and discussions demonstrate that the application of the LGPD in public health requires a balance between public interest and fundamental rights, requiring informational governance, training, security protocols, and permanent compliance policies. These elements provide sufficient theoretical basis to, in the concluding stage of the article, consolidate propositions aimed at municipal management, with the potential to guide strategies of institutional adequacy in the Amazonian context, without losing adherence to the national normative framework.

In order to synthesize the theoretical contributions that underlie the present research, the following table is presented, in which the authors used throughout the study are organized, their respective theoretical positions and the year of publication of the analyzed works. The systematization allows us to visualize the scientific contributions used in the construction of the legal analysis about the protection of sensitive personal data in the field of public health, evidencing the convergence between the adopted references and the problem investigated

Table 2

Authors and sources used in the research, positioning and year

Author	Positioning	Year
BALIAN, R. A.	It discusses the legal risks of interoperability and sharing of health data, highlighting the need for proportional limits in informational treatment	2025

BRAZIL	Establishes the normative foundations for the protection of personal data, principles, legal bases and responsibilities in the processing of sensitive data	2018
DIAS CARNEIRO	Advocates the implementation of compliance and governance programs to mitigate risks in data processing in healthcare institutions	2021
GONÇALVES, R. M.	It points out structural and institutional difficulties in the implementation of the LGPD in public hospitals	2024

ZAGANELLI, M. V.	It analyses the challenges of protecting sensitive data in the context of telemedicine and digital health	2023

Source: The authors.

The analysis of the positions presented in Table II demonstrates that the scientific literature converges to the recognition of the protection of sensitive personal data as a structuring element of contemporary management in public health. It is observed that the authors approach the topic from complementary perspectives, involving normative foundations, informational governance, institutional responsibility, and the impacts of digital transformation on health services.

Such theoretical diversity makes it possible to understand that the application of the LGPD goes beyond the merely legal dimension, requiring administrative, technological and ethical adequacy of the institutions responsible for data processing. Thus, the references analyzed contribute to sustain the discussion proposed in this study, allowing us to relate the legal challenges identified to the reality of public health administration, especially in the Amazonian municipal context.

5 CONCLUSION

The present research aimed to analyze the legal challenges related to the application of the General Law for the Protection of Personal Data in the processing of sensitive data in the context of public health, especially considering the administrative reality of the municipality of Manaus, Amazonas.

The results obtained demonstrate that the implementation of the LGPD in the health

sector is not limited to the formal compliance with legal requirements, but is a continuous process of institutional transformation. The protection of sensitive data requires structural adaptation of public organizations, involving technological adequacy, definition of secure information flows, professional training, and establishment of permanent governance and control mechanisms. In this sense, it is verified that the normative effectiveness depends directly on the administrative capacity of public entities to incorporate information security practices compatible with the complexity of the treatment of clinical data.

It was also observed that the processing of personal data in public health has particularities resulting from the care purpose of the service itself, in which the sharing of information is an indispensable element for the continuity of care and the formulation of public policies. This characteristic imposes the need for a balance between the public interest in health management and the preservation of the fundamental rights of citizens, especially those related to privacy, intimacy, and informational self-determination.

In the context analyzed, it is evident that municipal health systems located in regions with structural limitations face additional challenges for the full implementation of legal requirements, making it essential to develop specific institutional policies aimed at data protection. The Amazonian reality demonstrates that technological inequalities, infrastructure limitations, and the historical absence of an organizational culture focused on information security can compromise the effectiveness of the protection measures provided for in the legislation.

The consolidation of personal data protection in public health depends on the integration between law, technology, and public management, requiring strategic planning, institutional investment, and strengthening of administrative practices guided by the prevention of informational risks. The research shows that the LGPD represents not only a regulatory instrument, but a mechanism for strengthening social trust in public health services, contributing to the construction of safer, more transparent and legally responsible care models.

Thus, it is highlighted that the study achieved the proposed objectives by systematizing the main legal challenges related to the processing of sensitive data in public health, indicating the need for further empirical investigations. Such advances may contribute to the improvement of local public policies and to the development of institutional adequacy strategies compatible with the regional specificities of Amazonas, strengthening the protection of fundamental rights within the scope of public health administration.

ACKNOWLEDGMENTS

On behalf of all the authors of this work, we register our deep gratitude to all those who contributed to making this research possible. This article carries not only legal analyses and academic reflections, but also the voice of students who believe in education as an instrument of social transformation.

Along this path, we understood that research is also taking responsibility for the reality that surrounds us, especially with the challenges experienced in public health and in the protection of fundamental rights in our region.

We speak here as Amazonian researchers, aware that producing knowledge from Amazonas is to reaffirm the intellectual strength of our land and demonstrate that the science built in the North region has national relevance. This work symbolizes our respect for the Amazonian population and our desire to contribute to a fairer, safer and more humane society.

We dedicate this research to Amazonas, in the hope that each page written represents not only an academic requirement fulfilled, but a gesture of recognition, belonging and honor to our history, our people and the future we seek to build through knowledge.

ABSTRACT

This text is part of a research project on how students should be encouraged to perform mental calculations. The main hypothesis is that when stimulated, it can become a habitual and simple skill to improve calculation abilities in various contexts. This article explores the application of activities that stimulate mental calculation in the 5th grade of elementary school. The objective is to demonstrate the effectiveness of mental calculation in elementary school, showing how students' autonomy and critical thinking can be developed, promoting the acquisition of a skill that will be useful in daily activities ranging from simple to highly complex, involving numbers and mathematics as a whole. Through research with a qualitative and quantitative approach, the results obtained with 15 students from a class chosen due to their difficulty in performing simple calculations are presented. Practical activities were carried out, divided into two groups, which helped to identify difficulties with mental calculation. The group with simpler activities had a high number of correct answers. The use of calculators was not encouraged in any of the activities, as the focus was on evaluating the students' level of mental calculation skills. The more complex activities showed a higher error rate, and only 37% of the students achieved an excellent grade, meaning they had more than 60% correct answers out of the total grade. Analyzing the grades and the activities applied, the class had an average level, as some propositions that were considered simple were not solved.

RESUMO

Esse texto é parte de uma pesquisa sobre como o aluno deve ser estimulado a realizar o cálculo mental. A principal hipótese é que quando estimulado, pode incorporar como algo habitual e simples para aprimorar a habilidade de calcular em diversos contextos. Este artigo trabalha a aplicação da realização de atividades que estimulem o cálculo mental no 5º ano do Ensino Fundamental. O objetivo é demonstrar a eficácia da ferramenta do cálculo mental no Ensino Fundamental, mostrando como a autonomia e o pensamento crítico dos alunos podem ser desenvolvidos, promovendo a aquisição de uma habilidade que levarão para as atividades diárias de simples a alta complexidade que envolve os números e a matemática como um todo. Através de uma pesquisa com abordagem qualitativa e quantitativa, apresentam-se os resultados obtidos com 15 alunos de uma turma escolhida devido à dificuldade de fazer cálculos simples. Foram realizadas atividades práticas divididas em dois grupos que ajudaram a identificar as dificuldades quanto ao cálculo mental, o grupo de atividades mais simples teve grande número de acertos. O uso da calculadora não foi estimulado em nenhuma das atividades, pois o foco era avaliar o nível em que estavam sobre o cálculo pensado. As atividades mais complexas apresentaram nível maior de erros e apenas 37% dos alunos tiveram conceito ótimo, ou seja, tiveram mais que 60% de acertos do total da nota. Analisando as notas e as atividades aplicadas, a turma teve nível mediano, pois algumas proposições que eram consideradas simples, não foram resolvidas.

RESUMEN

Este texto forma parte de un proyecto de investigación sobre cómo estimular el cálculo mental en los estudiantes. La hipótesis principal es que, al estimularlo, puede convertirse en una habilidad habitual y sencilla para mejorar las habilidades de cálculo en diversos contextos. Este artículo explora la aplicación de actividades que estimulan el cálculo mental en 5.º de primaria. El objetivo es demostrar la eficacia del cálculo mental en primaria, mostrando cómo se puede desarrollar la autonomía y el pensamiento crítico de los estudiantes, promoviendo la adquisición de una habilidad útil en actividades cotidianas, desde las más sencillas hasta las más complejas, que involucran números y matemáticas en general. Mediante una investigación con un enfoque cualitativo y cuantitativo, se presentan los resultados obtenidos con 15 estudiantes de una clase seleccionada por su dificultad para realizar cálculos simples. Se realizaron actividades prácticas, divididos en dos grupos, lo que ayudó a identificar las dificultades con el cálculo mental. El grupo con actividades más sencillas tuvo un alto número de respuestas correctas. No se fomentó el uso de calculadoras en ninguna de las actividades, ya que el enfoque se centró en evaluar el nivel de cálculo mental de los estudiantes. Las actividades más complejas mostraron una mayor tasa de error, y solo el 37% de los estudiantes obtuvo una calificación excelente, lo que significa que obtuvieron más del 60% de respuestas correctas de la calificación total. Al analizar las calificaciones y las actividades aplicadas, la clase tuvo un nivel promedio, ya que algunas proposiciones consideradas simples no se resolvieron.

1 INTRODUCTION

This work seeks to highlight the importance of mental calculation in Elementary School, specifically in the 5th grade. The definition of mental calculation, within the scope of the former National Curriculum Parameters (PCN) of Mathematics for the teaching of the first grades of Elementary School, contemplates that *"it can be said that one calculates mentally when an operation is carried out, using reliable procedures, without written records and without the use of instruments"* (Brasil, 1997, p. 76).

In the highlights of the PCN, there was a focus on the importance of simultaneously working on the different types of calculation and their foundations, including written calculation, estimates, mental calculation, and the use of calculators. In the current National Common Curriculum Base (BNCC) of 2017, an approach to the theme in the early years of Elementary School is planned.

This work presents the application and importance of developing activities in classrooms that stimulate mental calculation. Such activities can show that the student develops critical thinking and greater flexibility in operations with numbers. The main idea is not to eliminate the calculator or written calculation, but to associate them with the practice of mental calculation.

The main objective of this article is to demonstrate the potential of the practice of mental calculation in Elementary School, specifically in the 5th grade, showing how students' autonomy and critical thinking can be developed, promoting the acquisition of a skill that will lead to daily activities from simple to high complexity that involves numbers and mathematics as a whole.

The study was developed in the 5th grade of the Pedro Ludovico Teixeira Municipal School, in the municipality of Colinas do Tocantins, where it was diagnosed, after carrying out activities on the practice of head calculations, students' difficulties in performing mental calculations. It is not intended to point out solutions or causes, but rather to demonstrate how the problem occurs and suggest some activities that could stimulate this practice among students, giving them more autonomy in performing calculations with their heads.

After reading authors such as Kamii (2001), Parra (2001) and others, we initially have historical veins of the insertion of mental calculation in mathematics curricula. Subsequently, it was necessary to elaborate and apply a proposal for specific activities on mental calculation in the classroom, with the purpose of collecting data on the possibility of a more significant inclusion of mental calculation in basic school.

The proposal is to study a specific case, delve into the application of these activities in the 5th year of Elementary School at Escola Mul. Pedro Ludovico Teixeira in Colinas do

Tocantins. The investigation aims to search for answers, exploring mental calculation in its concepts and conceptions, as well as its importance as a necessary tool for the construction of knowledge of numbers and the four basic operations.

In addition to the exploration of the theme, the application of mental calculation as a proposal for intervention in the classroom will raise data that will support deeper studies on the possibility of including mental calculation in basic school, including in early grades. With the data that will be collected, it will be possible to demonstrate through Figures and other tools, the experiences lived in the application.

All activities were carried out during scientific research and based on the researcher's regency as a starting point of daily empirical perception with the students' difficulties in dealing specifically with mental calculation. After the application of the activities, an analysis of the results obtained and the benefits and effectiveness of the use of mental calculation in the classroom and in individual daily activities will be presented.

2 METHODOLOGICAL PROCEDURES

The research has a quantitative-qualitative approach, using as its main tool, the study of the results of activities applied to students of the 5th grade of elementary school at the school. The data presented were collected in a case study and aim to discover the acquired reactions and autonomy. With the reported data, it is possible to demonstrate through Figures and other tools, the experiences lived in the application, as well as critically analyze all the points observed.

Data collection was done through the observation of the activities carried out in the classroom by the teacher. The exercises consisted of proposing to the students calculations, mathematical and logical tasks in various ways that they needed to use mental calculation.

The classroom has 29 students, however, 15 children were selected from this number to participate in the activities, since class attendance was a hindrance to the consistency of the application of the tasks. The activities were applied during mathematics classes and were appropriate to the age group and grade of the students. The common age was between 9 and 11 years old. Given the vast experience of the observer in the classroom, all the activities carried out presented levels of common complexity and that the 5th year of Elementary School, considering that the student at this stage, must have sufficient mathematical perception to carry them out.

As a way to understand the students' performance, an activity that we call diagnostic was applied. The researcher was a regent teacher in the researched classroom, and everyone was informed about all the activities applied and their purpose.

The research was carried out in 2013, during the school term. In the first diagnostic stage, scores were assigned to each activity, where one group of activities had a maximum value of 8.0 and another group had a maximum value of 7.0. In the diagnostic activity on the theme, two groups of exercises were applied to the students and a grade was established for both. In the municipal school network, a use of 60% of the total value of the activities is considered for approval.

The students were divided into two groups of activities, with Group I with activities of low level of complexity, with a maximum score of 8.0, and Group II, with more difficult tasks, with a maximum score of 7.0. The grade considered satisfactory for the research was the average (60% of correct answers), that is, for the activities with a value of 8.0, the students should get a grade above 4.8, and for the activity that was worth 7.0, the students should get grades above 4.2.

In the first activity, copies were distributed to the students with simple calculations such as $3 + 3$, in which they should have immediate answers, this activity had a maximum score of 8.0 and to have a satisfactory result, the student had to get 60% right, that is, above 4.8. The second activity contained problems that should be solved mathematically also using mental calculation, where the maximum score was 7.0 and the satisfactory result should be above 4.2.

As part of the activities, the Human Domino game was carried out in which each student received a strip of paper with two phrases indicating operations. Thus, each one should look for the one who has the answer to their question and pay attention to the colleague's question to check if they had the other's answer. As they completed each other, they were to stand next to each other, thus forming a circle.

The first activity applied consisted of performing common calculations such as $3+3$ or $2+5$, where 73% of the students achieved a grade above 60% of the value and 27% achieved a grade below average. The resource used by most was automatic calculation, or counting on the fingers, imagining the math in their heads and solving it, some used paper to write the math in another way. One student got all the calculations right, each resolution had a value of 1.0 point, however, it was considered half a point by the correct reasoning, but incorrect result, that is, the student used the appropriate reasoning, however, he did not reach the right result and the final answer was wrong.

3 RESULTS AND DISCUSSION

During the performance of the activities, many looked at each calculation, thought, looked up, as in the realization of a mental writing, trying to associate the visualization of the calculation to solve it.

It was observed that most of the students had a higher than average grade, and the notorious difficulties of some of them can be explained by the knowledge already acquired previously. It is notorious in the students, the lack of stimulation for activities aimed at mental calculation in the previous grades. And many do not have the patience to calculate and reach the correct or estimated result. The resources used were almost always the same.

Figure 1

Grades by Activity Group

Source: Authors.

The simplest operations such as $1 + 1$ or $2 + 1$ had a large number of hits. When students had to resort to other tools, most tried to remember automatic multiplication table calculations, as several multiplication table memorization activities were done with everyone for some time. The use of the calculator was not encouraged in any of the activities, as the objective was to assess the level at which they were on the thought calculation. The association of the counts is natural in calculations like this, as it simplifies the process of acquiring the result.

In the second activity that consisted of completing a problem using calculus, such as "You have 4 notebooks". To complete 19, there are _____ left. In this task, 67% of the students achieved more than 60% of the total value and 33% obtained a grade below the average. The answers should be respectively: 15 notebooks, 23 erasers, 11 pencils, 14 books, 20 dolls, 12 balls, 9 stickers, 8 dresses. As in the previous activity, most achieved an above-average grade and the resources used involved automatic calculations with the

multiplication table, imagining the account in their heads, or writing the account in another way on paper to help.

The objective of this activity was to associate the student with daily situations to facilitate the calculation. Thus, each problem could easily be imagined to be solved. The inclusion of terms and objects from the children's daily lives can even lead them to remember real situations that may have involved the items in the question.

While doing the math, students could be observed trying to imagine probably a colleague, or brother, or sister with that certain amount of books, notebooks or erasers. This certainly helps in solving problems and also contributes to the day-to-day interaction of each one within the classroom.

Each time we explore the student's reality, we bring to the classroom another element that serves as a tool for learning, so each child learns by contextualizing what they have at home, in the family and with friends, whether they are from the school where they study or not.

The students had a reasonable amount of time to answer the activity in group I, as the level is quite simple and they should only resort to the calculation designed to solve the questions. However, an important observation is that only 01 student got all the calculations right, and the others achieved the grade through the table below:

Table 1

Diagnostic activity scores – Group I (Maximum Value: 8.0)

Note	Qty	%
8,0	1	7
7,5	4	26
7,0	2	13
6,0	1	7
5,5	1	7
5,0	2	13
4,0	3	20
2,5	1	7
Total	15	100

Source: Authors.

The activities of group II were more complex. The objective was to associate the concept of number individually and in the operation as a whole. For example, what is the result of the sum $1245+897=$ 2142 or 2340 or 2102. The students had more time to develop these questions, as the level of complexity was a little higher than the activities of the first group.

The results should be, respectively: 9474, 3150, 7012, 525, 5159, 14, 8805, 15 and 2916. For the addition operations, the ease was greater and most of the students got the

results right, the division and subtraction operations were the most difficult, according to the students and the errors demonstrated this. However, in general terms, the class performed well, they used the resources of writing the math in another way to solve, count on their fingers, help with the multiplication table and imagine the math in their heads to achieve the result.

For the diagnostic activity of group II, with a greater complexity in relation to the previous activities, the objective was to understand the level of each student to perform the calculations and identify the result without "guessing" the answer in order to get it right.

In terms of evaluation of the students' level, some concepts were considered. For the activity of Group I with a value of 8.0, the following were assigned:

- Below-average grades: regular concept
- Scores between 50 and 60: good concept
- Scores above 60: optimal concept

For the Group II activity, the classification was as follows:

- Below-average grades: regular concept
- Grades between 40 and 50: good concept
- Scores above 50: optimal concept

Thus, the conceptualization was as shown in the following Figure:

Figure 2

Class Concept in the Diagnostic Activity

Source: Authors.

Another activity applied was as a game so that the ability in a group and with greater agility on mental calculation could be perceived. The game was called Human Dominoes and consisted of the following procedure:

The human dominoes, after being well explained and started, did not generate major doubts and by playing, the students were able to carry out the activity. In the first resolutions before really understanding the game, some students presented difficulties, then little by little and with the interaction of the class they did what was asked more easily.

After many explanations and accomplishments of activities, we moved on to the stage in which the students would be stimulated to do the calculations mentally with another series of exercises. In view of the realization of the activities, we can make some considerations about the students' performance here. Everything that was carried out for the research presented a level appropriate to the research series.

It is observed that, in general, the level of the students can be considered average, as some simple propositions were not resolved. In another aspect, it must be taken into account that they did not do these activities in the first grades to be stimulated to do so. Therefore, there is a need to include more activities on calculus in the classroom, given its importance for the students' daily lives, not only in this grade, but throughout their lives.

When observed in a general context, the presence of "head-on" calculations in daily activities is notorious. Furthermore, it is also unquestionable that the child can develop skills with the use of this tool that will not be used only in mathematics.

"In the school environment, mental calculation is still not as valued as the armed account. However, a reasoning that may seem disorganized, in fact, may be supported by properties of operations and the numbering system and should be encouraged already in the initial grades. To help you understand the different mental strategies of calculation and teach your students to use them more and more efficiently" (Drumond, 2014).

The curriculum guidelines for the teaching of Mathematics have mental calculation, and not only for Brazil, present among the suggestions of strategies for the execution of mathematical calculations that teachers can develop with their students in the classroom.

Therefore, realizing how important this tool is for students in the teaching and learning of mathematics, it is necessary to demonstrate a study carried out through field research, how the "head counts" can be relevant for the development of students' critical and autonomous thinking.

In view of these questions, it is relevant to study the effectiveness of activities that stimulate this type of calculation in practical terms. To this end, it is ideal to apply the tool in

the classroom and observe the results obtained later. This is what this research is about, after many years with experience in the classroom, it is questioned why when reaching the 5th year of Elementary School, students have so much difficulty with counts, if mental calculation should already be stimulated in previous grades.

There are several uses of numbers, however, not so many people make use of them mentally, this often happens because they have not been stimulated to this practice. People become accustomed to calculators or become enemies of numbers due to learning disabilities and math trauma. This statement is not so rarely noted when we hear that it is the worst subject, or the most difficult. But the fact is that children should be stimulated from an early age to manipulate numbers mentally.

Mental calculation has appeared in some form in mathematics curricula for more than 70 years (Brocardo & Serrazina, 2008). However, it is noted that the advancement of technology contributes to the devaluation of basic calculation skills. For Elementary School I, the 2007 Guide to the National Textbook Plan (PNLD) emphasizes that "a good pedagogical work for the construction of this indispensable competence in the formation of the student" (Brasil, 2006, p. 27). In this way, mental calculation and its importance can be included in the construction of the entire contextualization of the number, it plays a fundamental role in the educational context for students in the initial grades that are the basis for future learning.

Thus, it is necessary to reflect on the importance of mental calculation for the construction of student autonomy, taking a look at its value and role in the field of mathematics education. It can be inferred that students have less and less capacity for mental calculation and more difficulty with basic operations.

In this research, students had a common performance, and were encouraged to use support materials for calculus such as pencil and paper. Thus, the definition of mental calculation is not unanimous, however, it is agreed that when calculating mentally, strategies are mobilized that allow speed and efficiency in the response, and as several authors argue, paper and pencil can be used for intermediate calculations.

If each student is encouraged to do so, he incorporates it into his daily life by noting how effective it is. We rely on Kamii and Livingston (2001, p.104), when they state that "children become inventive as they are encouraged to be inventive". Thus, practice with children reveals that when asked to perform a task, in the case of basic calculations and that they cannot use pencil and paper or calculator, it is observed that they find their own ways to solve it. This is because the brain, when motivated, finds its ways out to solve problems.

Playfulness develops the student's individual autonomy. By involving these activities, the educator can create an environment in the classroom that provides space for the

acquisition of new knowledge, that is, students have to feel free to find their paths, including making mistakes and speaking their minds without censorship. This stimulates learning naturally. If such a practice applies in other disciplines, in mathematics it cannot be different.

When planning a class, the teacher needs to have as one of his goals the search for student autonomy. According to Parra (1996), "responding to social need indicates an approximation with calculus that makes students capable of choosing the appropriate procedures, finding results and judging the validity of the answers".

Therefore, the tool used to solve mathematical calculations must be chosen by each one according to the need or even requirement of their activity. But for this to happen, it is necessary to know different ways of carrying them out. Over time, the calculator has been used more and more for this purpose, and this can be an important tool, however, associated with other techniques such as mental calculation.

Children can use different tools to calculate and this was observed in the activities. Pimentel and Vale (2009, p. 4) observed that many children aged 3 and 4 need to count on their fingers to calculate $16 + 10$. To discuss and problematize such situations and others involving calculus, it is also suggested to work with tables and number lines to stimulate the discovery of numerical patterns and develop mental calculation skills.

Teacher training is quite broad, however, there is a lack of didactic resources for the activities to be carried out. Workshops and constant training activities are carried out, however, the schools do not have the physical resources to subsidize the teachers. Even for the application of the activities of this work, all costs were personal, due to the school's lack of needs.

The family structure of the students also influences. Many belong to families with different compositions, and those responsible do not follow the student's school development as they should. Finally, in the face of this system, it is possible to understand that the deficiencies are many, however, some attitudes are possible. The application of the activities was a challenge, but the students developed them all without difficulty.

The main advantage of applying activities that stimulate mental calculation is that the child learns to build personal calculation strategies and to decide, in various situations, on the most effective one. He also acquires habits of reflection on calculations and has permanent means of approximation and control over what he obtains using techniques such as algorithms. By estimating results, it can self-correct: if the answer is too far from the estimate, something is wrong.

4 CONCLUSION

In view of the applications of the activities and the research carried out, it was possible to understand the process of development and stimulation of mental calculation, in addition to understanding how the student can be more autonomous in this process.

Conti and Nunes (2019) make an important reflection to be made: it is that, even though this modality is cited and valued in textbooks and other Brazilian documents, it does not mean that there really is a work in the classroom with it, because the greatest agents in the classroom are the teachers, and not the textbooks. Teachers, whether they have degrees in Mathematics or Pedagogy, were often not prepared to deal with the practice of mental calculation in the classroom.

It is unanimous the understanding of how relevant it is to provoke the student to be thinking, safe, contesting and creative. According to Paulo Freire (2002): there is no teaching without research and research without teaching. These what-to's are found in each other's bodies. While I teach I continue seeking, searching. I teach because I seek, because I inquired, because I inquire and I inquire myself. I research to verify, verifying, I intervene, intervening, educating and educating myself. I research to know and what I still don't know and communicate or announce the news.

Thus, analyzing the teaching of calculus in elementary school was a complex task, however, pleasurable, given the daily teaching practice for many years, it is possible to be clear about many aspects that are not included in official documents. The students of the 5th year of Elementary School of the Pedro Ludovico Teixeira Municipal School, were the background of this work and through them it was possible to realize that the application of the curricula is quite deficient in the municipal education system.

Mental calculation is still a challenge, because despite being among the curricular matrices, it is one of the most practical contents of mathematics. Performing the calculations by head, or with the head, in an agile and efficient way is only real through stimulation, practice, repetition. And for that, the teacher needs to diversify in the classroom. Thus, there are many challenges to be overcome.

It is important to emphasize once again that mental calculation contributes significantly and abundantly to the development of learning with understanding. According to Sadovisky quoted by Wolman and Quaranta (undated) when he states that it is necessary to think of a student who is convinced that, in some way, he can face complex situations, in the sense that he can start trying to introduce himself into the problems that are posed to him, "roll up his sleeves", experiment with what he knows, make decisions, respect and consider the

production of others, introduce oneself into it in order to understand it, discuss it, assume it, etc.

Perhaps such a statement leads one to think that this is a utopia, however, as educators the attempt is always for a thinking, reflective, safe, flexible, autonomous, aggregating and creative student. In fact, this is a right of individuals, not just children.

Hope (p. 54, 1996) said that a correct answer can be the destination of a mental calculation, but it is the path followed, more than the destination, that reveals the traveler's understanding. A person who knows how to calculate mentally is more likely to travel by other paths than a person who does not have this ability.

In view of the realization of the activities, we can make some considerations about the students' performance here. Everything that was carried out for the research presented a level appropriate to the research series.

It is observed that, in general, the level of the students can be considered average, as some simple propositions were not resolved. In another aspect, it must be taken into account that they did not do these activities in the first grades to be stimulated to do so. Therefore, it is recommended to include more activities on calculus in the classroom, given its importance for the students' daily lives, not only in this grade, but throughout their lives.

This recommendation is based on the observation that many of the problems in which estimation is used are linked to day-to-day issues. For example: how long it takes to get somewhere or how much gasoline is needed. When it comes to mental calculation, both exact and approximate results, memory is an important tool.

These questions should be proposed in specific didactic sequences, systematization activities and as permanent work, linked to the contents seen in the classroom. And so we believe it is possible to provide means for the student to develop their own techniques, discover their own paths and become this thinking, autonomous and creative being. And whenever there is a class that stimulates the development of this being, there will be a true educator, not only about mental calculation, but about any other contents. Because one must educate for life.

ABSTRACT

The increase in diagnoses of mental disorders in childhood and adolescence, together with the constitutional provision of health as a fundamental right, highlights the social and legal relevance of child and adolescent mental health. This scenario imposes the need to deepen the discussion on care strategies that ensure healthy development and social inclusion. The objective is to analyze the social and individual impacts of mental disorders in children and adolescents, emphasizing the importance of early diagnosis, qualified support, and continuous follow-up, as well as the coordination between family, school, and health services. To this end, a bibliographic research was conducted using a deductive approach, grounded in specialized literature and in legislation relevant to the field of health, covering the period from 2020 to 2026. Thus, it is observed that fragility in early identification and the integration of care networks can intensify vulnerabilities and compromise integral development. It is concluded that the realization of the right to child and adolescent mental health requires intersectoral public policies, humanized care practices, and continuous monitoring, capable of ensuring protection, health promotion, and social inclusion.

Keywords: Mental Health. Childhood. Adolescence. Mental Disorders. Support.

RESUMO

O aumento dos diagnósticos de transtornos mentais na infância e adolescência, aliado à previsão constitucional da saúde como direito fundamental, evidencia a relevância social e jurídica da saúde mental infantojuvenil. Esse cenário impõe a necessidade de aprofundar a discussão sobre estratégias de cuidado que assegurem desenvolvimento saudável e inclusão social. Objetiva-se analisar os impactos sociais e individuais dos transtornos

RESUMEN

El aumento de los diagnósticos de trastornos mentales en la infancia y la adolescencia, junto con la previsión constitucional de la salud como derecho fundamental, evidencia la relevancia social y jurídica de la salud mental infantojuvenil. Este escenario impone la necesidad de profundizar la discusión sobre estrategias de cuidado que aseguren un desarrollo saludable y la inclusión social. Se pretende analizar los impactos sociales e individuales de los trastornos mentales en niños y adolescentes, resaltando la importancia del diagnóstico temprano, de la atención calificada y del seguimiento continuo, así como de la articulación entre la familia, la escuela y los servicios de salud. Para tal fin, se realizó una investigación bibliográfica con enfoque deductivo, fundamentada en la doctrina especializada y en la legislación pertinente al área de la salud, en el período de 2020 a 2026. De este modo, se observa que la fragilidad en la identificación temprana y en la integración de las redes de cuidado puede intensificar vulnerabilidades y comprometer el desarrollo integral. Se concluye que la efectividad del derecho a la salud mental infantil y juvenil requiere políticas públicas intersectoriales, prácticas de acogida humanizadas y seguimiento continuo, capaces de garantizar protección, promoción de la salud e inclusión social.

1 INTRODUCTION

Child and adolescent mental health has been consolidated as one of the main contemporary priorities in public health, considering its epidemiological magnitude and its impacts throughout the life course (LEITÃO, 2025). Childhood and adolescence represent critical periods of human development. As described by Mastorci et al. (2024, p. 1), "the transition from childhood to adolescence is an extraordinary time in life, associated with major physical, emotional, cognitive, and social changes". Within this quadrant, international evidence indicates that a significant portion of mental disorders begin before the age of 14, which reinforces the centrality of early detection and intervention actions (LIMA, 2025).

In the Brazilian scenario, there has been a significant increase in manifestations related to anxiety, depression, and other forms of psychological distress among adolescents (LOPES, 2020). This phenomenon cannot be understood in isolation, as it is intrinsically linked to recent social transformations and the persistent structural inequalities that mark the country. Factors such as poverty, exposure to violence, weakening of family ties, and difficulties in accessing health services are social determinants that directly impact mental health outcomes (ALEGRÍA, 2023). Thus, mental illness in adolescence should be analyzed in the light of the material, social and symbolic conditions that shape the life experiences of this population.

The literature points out that mental disorders not diagnosed in childhood tend to persist or worsen in adulthood, expanding educational, occupational, and relational impacts (COPELAND, 2023). In this sense, early diagnosis, associated with evidence-based psychosocial interventions, is an essential strategy to modify trajectories of suffering and promote a higher quality of life. However, structural gaps persist with regard to the organization of care networks articulated between health, education and social assistance, which compromises the comprehensiveness of care.

The guarantee of the right to mental health, as a duty of the State, is based on the Constitution of the Federative Republic of Brazil of 1988 (articles 6 and 196), which ensures health as a right of all and a State duty, to be implemented through public policies. In the specific scope of mental health, Law No. 10,216 establishes the protection and rights of people with mental disorders and guides the community care model, in line with the principles of the SUS provided for in Law No. 8,080. However, in view of the insufficiency of supply or the fragmentation of services, there is a growing judicialization of health as a mechanism for access to specialized treatments and services. Such a scenario highlights tensions between legal normativity and the concrete operationalization of public policies (RODRIGUES, 2026).

In this context, there is a need to increase awareness about mental health from the

first years of life, articulating intersectoral actions and strengthening preventive initiatives in school and community spaces. The consolidation of integrated support networks, involving family, school, health services and the community, is a central strategy for coping with child and adolescent psychological suffering, contributing to the reduction of stigmas and the promotion of more welcoming, protective and favorable environments for integral development.

The present study aims to analyze the relevance of child and adolescent mental health in the contemporary Brazilian scenario, with emphasis on the promotion of early diagnosis and the articulation of intersectoral care networks. The specific objectives are: (i) to identify, based on the national scientific literature, the main risk and protective factors associated with psychological distress in children and adolescents; (ii) to analyze the impact of child and adolescent mental disorders in school, family and social contexts; (iii) to examine the strategies for prevention and promotion of mental health described in public policies and government programs; and (iv) to discuss the importance of integrating health, education and social assistance in the consolidation of support networks capable of ensuring comprehensive and continuous care. These objectives are structured in such a way as to clearly delimit the scope of the investigation, allowing the systematic evaluation of the available evidence and the proposition of feasible strategies for the strengthening of public policies aimed at child and adolescent mental health.

2 THEORETICAL FRAMEWORK

The contemporary debate on child and adolescent mental health has been marked by the recognition of its centrality in the public health agenda, both due to its epidemiological magnitude and the cumulative impacts throughout the life course. International evidence indicates that a significant portion of mental disorders begin in childhood and, above all, in adolescence, a period in which neurobiological, emotional, and social transformations are intensified. According to the World Health Organization (2025), it is estimated that approximately one in seven children and adolescents (10–19 years old) has a mental disorder, which reinforces the need for early identification, continuous care, and disease prevention strategies. This scenario supports the understanding that child and adolescent mental health cannot be treated as a peripheral issue, but as a structuring dimension of human development, education and social protection policies.

On the conceptual level, the literature distinguishes psychic suffering from mental disorders themselves, even though both are interconnected. In Chapter 2 – Psychiatric Reform and Psychosocial Paradigm, in *Mental Health and Psychosocial Care*, by Paulo

Amarante (2007), he argues that psychic suffering should not be automatically reduced to a psychiatric diagnosis, as it involves social, cultural and historical dimensions. This perspective is widely used in Brazilian public health to differentiate subjective suffering from mental disorders structured in classification systems.

According to recent studies, psychological distress, often referred to as *psychological distress* in the literature, refers to a set of subjective manifestations of emotional distress, including symptoms of sadness, anxiety, nervousness, irritability, and other negative psychological reactions in the face of adverse situations or psychic stressors, without necessarily corresponding to a diagnosable mental disorder. On the other hand, mental disorders are conditions that can be diagnosed with specific clinical criteria, differing from transient emotional distress because they involve functional impairment and the need for systematic follow-up. (CURELARU, 2025; GERAGHTY, 2024). This differentiation is essential to avoid both underdiagnosis and excessive pathologization of developmental experiences. Childhood and adolescence are critical phases of the life cycle, in which environmental, family and school factors exert a decisive influence on the constitution of mental health, which demands context-sensitive approaches based on multiprofessional assessment.

The perspective of the social determinants of health has broadened the understanding of the factors that influence psychological distress in childhood and adolescence. Evidence indicates that poverty, food insecurity, violence, discrimination, weakening of family ties and barriers in accessing services increase mental vulnerability. On the other hand, stable affective bonds, community support, a protective school environment, and timely access to psychosocial care act as protective factors (OBERLE et al., 2025). The Pan American Health Organization (n.d.) emphasizes that many cases remain undiagnosed and without adequate treatment, increasing the risks of school dropout, social isolation and future losses. This situation highlights the need for interventions that articulate clinical, educational and social assistance actions.

In the Brazilian context, the organization of mental health care is structured in the Psychosocial Care Network (RAPS), established within the scope of the Unified Health System with the objective of promoting comprehensive, territorialized and networked care. RAPS proposes the articulation between Primary Care, specialized services, community devices and intersectoral strategies, recognizing that child and adolescent mental health care is not restricted to the clinical space. This model reinforces the importance of continuity of care and co-responsibility between different points of the network. However, the literature also identifies challenges related to unequal coverage, fragmentation of care flows, and insufficient integration between sectors.

In this sense, intersectoriality emerges as a central theoretical and operational axis for the consolidation of support networks capable of guaranteeing comprehensive and continuous care. The articulation between health, education and social assistance is pointed out as an indispensable strategy for the early identification of signs of suffering, the construction of unique therapeutic projects and longitudinal follow-up. The school, for example, is often a privileged space for observation and referral, while social assistance services contribute to coping with structural vulnerabilities that have a direct impact on mental health. However, although widely defended in normative frameworks and public policies, intersectoriality still faces practical obstacles, still fragmented communication between services, weaknesses in shared protocols, and limitations of resources allocated to child and adolescent care (LEITÃO; AVELLAR, 2025).

Thus, the theoretical framework that underlies the present study is based on the convergence between three main axes: the approach to the social determinants of health, the perspective of human development throughout the life course, and the model of integrated care networks. By analyzing the relevance of child and adolescent mental health in the contemporary Brazilian scenario, with an emphasis on early diagnosis and intersectoral articulation, the study dialogues with consensus established in the literature, such as the need for timely and territorial interventions, and with persistent gaps, especially with regard to the effectiveness of public policies and the consolidation of integrated care networks. Thus, the theoretical framework not only contextualizes the phenomenon, but also guides the critical analysis of the evidence and the proposition of feasible strategies for strengthening policies aimed at the mental health of children and adolescents.

3 METHODOLOGY

This is a qualitative study, developed through bibliographic research, with a deductive approach, whose relevance lies in the complexity of the object investigated, which involves social, legal, political and subjective dimensions in the field of health. The qualitative nature is fundamental because it enables interpretive, critical and contextualized analysis of the phenomena, allowing the understanding of meanings, normative foundations and practical implications. In addition, Lakatos and Marconi (2021) base bibliographic research as a method based on the systematic analysis of scientific productions already published, allowing the theoretical construction of the object of study through a deductive approach.

Data collection was carried out through a systematic search in national and international scientific databases, covering journals in the areas of public health, psychiatry, psychology and social sciences, as well as through consultation of official documents, current

legislation and technical reports of national and international organizations. The research used descriptors articulated in Portuguese and English, including terms such as "mental health", "infantojuvenil", "mental disorder", "acolhimento", "Brasil", *mental health, child and adolescent, mental disorder, welcoming and Brazil*, in order to increase the sensitivity of the search and ensure greater coverage of the survey.

The following inclusion criteria were adopted: publications in Portuguese or English; studies that directly addressed the conceptual, normative, epidemiological or social aspects related to the object of the research; and publications within the previously defined time frame: 2020 to 2026. Duplicate studies, texts without thematic relevance or that did not present a consistent analytical contribution to the problem investigated were excluded, ensuring the reliability of the information compiled.

After the selection, the material was submitted to exploratory and analytical reading, proceeding to the organization of the references in thematic axes: Risk factors and protection for psychic suffering, Impacts of mental disorders in life contexts, Public policies, prevention and promotion of mental health and Intersectoriality and care networks, according to their theoretical and normative contribution. The analysis was guided by the deductive method, starting from general principles, especially constitutional and legal, for the interpretation of specific situations and for the construction of critical argumentation developed throughout the study.

The ethical principles that guide scientific production were observed throughout the study, through the due attribution of credit to the works consulted, ensuring respect for intellectual property and the originality of the academic productions used. As this is a bibliographic research, without direct involvement of human beings, there was no need to submit it to the Research Ethics Committee, in accordance with current regulations. Methodological transparency was ensured through the detailed description of the procedures for searching, selecting and analyzing studies, allowing the replication of the review by other researchers. The main limitation of this study is the dependence on the quality and availability of scientific publications, which may not fully reflect knowledge about child and adolescent mental health in Brazil, especially in view of underreporting, underdiagnosis, and barriers to access to mental health services.

Table 1

Academic References and Their Contributions to Research

Author	Title	Year	Contributions
LOPES, C.	How is the mental health of Brazilians? The importance	2020	It highlights the high burden of mental disorders in Brazil, their early onset and relationship with social inequalities,

	of birth cohorts for a better understanding of the problem.		emphasizing the importance of birth cohorts to guide public policies.
OLIVEIRA, P.; SANTANA, F.; JÚNIOR, J.; SANTOS, K.; ARAUJO, P.; FORTUNA, C.	Matrix support in child and adolescent mental health in Primary Health Care: institutional socioclinical intervention research	2021	It analyzes matrix support in child and adolescent mental health, demonstrating its contribution to expanding the co-responsibility between ESF and CAPS, transforming institutional practices and qualifying the organization of care.
RICHTER, R. H.; MATSUKURA, T. S.; TAÑO, B. L.; CID, M. F	Portraits of the discharge process in mental health care for children and adolescents from the perspective of occupational therapists.	2022	It examines the process of discharge in CAPSij, showing that its effectiveness depends on gradual planning, intra and intersectoral articulation and co-responsibility of the network, strengthening the psychosocial perspective and the Psychiatric Reform.
ALEGRIA, M.; ALVAREZ, K.; CHENG, M.; FALGAS-BAGUE, I.	Recent Advances on Social Determinants of MentalHealth: Looking Fast Forward.	2023	It synthesizes recent advances on the social determinants that influence mental health, evidencing their impact on the occurrence and evolution of mental disorders.
COPELAND, W. E.; HALVORSON-PHELAN, J.; MCGINNIS, E.; SHANAHAN, L.	Adult mental health, substance use disorders, and functional outcomes of children resilient to early adversity	2023	It demonstrates that resilience to adversity in childhood is uncommon and that children considered resilient have, in adulthood, a higher risk of anxiety and depressive disorders and worse functional outcomes, indicating that reducing early exposure to adversity should be a public health priority.
GERAGHTY, A. W. A. et al	Distinguishing emotional distress from mental disorder in primary care.	2024	It shows that the distinction between emotional distress and mental disorder, through the 4DSQ, is perceived as clear and useful by primary care patients, favoring self-understanding, qualification of clinical dialogue and greater therapeutic direction.
MASTORCI, F.; LAZZERI, M. F. L.; VASSALLE, C.; PINGITORE, A.	The Transition from Childhood to Adolescence: Between Health and Vulnerability	2024	It analyzes the transition from childhood to adolescence as a period of intense vulnerability and developmental potential, evidencing the interaction between biological, psychosocial and environmental factors in the construction of resilience, well-being and health throughout the life course.
CURELARU, M.; CURELARU, V	Academic Difficulties: Development and Validation of Scale to Measure Students' Mental Health Problems in Online Learning	2025	They propose and validate a concise instrument to assess mental health problems in online teaching, evidencing a hierarchical structure composed of psychological suffering and academic difficulties, with good psychometric indicators.
LEITÃO, I. B. et al.	Child and adolescent mental health: analysis of therapeutic itineraries in a city in the interior and without Child and Adolescent Psychosocial Care Centers.	2025	It points out that, in a municipality without CAPSij, child and adolescent mental health care is organized by fragmented itineraries, with the centrality of the school, predominance of specialized referrals and barriers to the continuity of care, evidencing weaknesses in the local network.
LEITÃO, I.; AVELLAR, L.	Overview of child and adolescent mental health policies in Latin America: insufficiencies and needs for intersectoral articulation.	2025	It presents an overview of child and adolescent mental health policies in Latin America, evidencing normative advances coexisting with low investment, precariousness of services and fragmented implementation, and defending the need to strengthen the network and greater prioritization of the SMIJ in the public agenda.
LIMA, R. F. et al.	Epidemiological scenario of mental disorders reported	2025	It describes the epidemiological profile of mental disorders in children and adolescents

	in children and adolescents in the state of Bahia between the years 2020 and 2024.		in Bahia, showing a predominance in adolescence, an increase in notifications and a high hospital impact.
OBERLE, E. et al.	Mental well-being trends and school-based protective factors among adolescents in British Columbia (2015–2022): A population-based study.	2025	It shows a decline in the mental well-being of adolescents, demonstrating that school factors such as adult support and a sense of belonging act as important protective elements.
WORLD HEALTH ORGANIZATION (WHO).	Adolescent mental health	2025	It presents updated data on mental health in adolescence (10-19 years), showing a high prevalence of disorders, impact on the global burden of diseases and the need for intervention and specific public policies.
RODRIGUES, E	Judicialization of mental health: challenges and solutions in the Brazilian justice system.	2026	It analyzes the phenomenon of judicialization of mental health in Brazil, discussing its impacts on public management, the structural challenges of the SUS and the need to improve policies and the articulation between the health system and the justice system to ensure effective access to care.

Source: Elaborated by the authors.

The systematization presented allows us to visualize, in chronological order, evidence that demonstrates how child and adolescent mental health guides more qualified decisions in the formulation of policies and in the organization of care networks. By bringing together studies on social determinants, early onset of disorders, organization of Primary Care and specialized services, intersectoral articulation and protective factors, the possibility of identifying vulnerabilities, reducing care fragmentation and subsidizing prevention and promotion strategies is evident. In addition, by integrating discussions on the distinction between emotional distress and mental disorder, therapeutic itineraries, structural weaknesses of the network, and challenges related to judicialization, the framework reinforces that promoting mental health is not limited to diagnosis or punctual treatment, but involves strengthening the governance of the system, qualifying professional practices, reducing inequalities, and protecting development processes that sustain well-being and resilience throughout the course of the year. life course.

4 RESULTS AND DISCUSSIONS

The analysis of the selected studies shows that child and adolescent mental health has been understood as a multifactorial phenomenon, crossed by social determinants, organization of care networks and impacts throughout the life course. In the axis referring to risk and protective factors for psychological suffering, from an epidemiological perspective, a high burden of mental disorders is observed in Brazil, with often early onset and a strong association with socioeconomic inequalities (Lopes, 2020). Recent international data

reinforce this magnitude by indicating a high prevalence of disorders among adolescents aged 10 to 19 years and a relevant participation in the global burden of diseases (WHO, 2025). In the state context, the growth in notifications and the hospital impact on children and adolescents point to a worsening trend and greater visibility of cases (Lima et al., 2025).

With regard to social determinants, the literature shows that structural factors, such as poverty, social exclusion, and exposure to violence, exert a significant influence on mental health throughout the life course (Alegría et al., 2023). Similarly, when analyzing the effects of adversity accumulated throughout childhood, Copeland et al. (2023, p. 911) highlight that "resilient children who experienced multiple forms of adversity in childhood had the highest risk of exposure to trauma in adulthood", showing that early resilience does not eliminate the cumulative impacts of adverse experiences. In addition, the authors state that "thus, exposure to adversity in childhood appears to have a significant long-term effect, the impact of which is delayed among individuals who initially appeared to be resilient," indicating that the effects of adversity may manifest late, which reinforces the importance of preventive strategies and continuous monitoring throughout development.

In the axis of the impacts of mental disorders in life contexts, studies demonstrate that, in the clinical and evaluative field, the distinction between emotional distress and mental disorder is fundamental to qualify the dialogue in Primary Health Care and direct more appropriate interventions. In this sense, as highlighted by Geraghty et al. (2024, p. 440), "Differentiating suffering from disorder was perceived as useful, both to support self-understanding and to potentially improve conversations with clinicians", showing that such differentiation favors both the patient's subjective understanding and communication in the care context.

Regarding public policies and the organization of mental health care networks, the findings indicate that matrix support in child and adolescent mental health strengthens the co-responsibility between Family Health Strategy and CAPS teams, qualifying practices and expanding the comprehensiveness of care (OLIVEIRA et al., 2021). However, the discharge process at CAPSij requires gradual planning, intra- and intersectoral articulation, and co-responsibility of the network to avoid care discontinuity (RICHTER et al., 2022). In municipalities without CAPSij, fragmented therapeutic itineraries, centrality of the school, and predominance of specialized referrals are observed, evidencing structural weaknesses in the local network (LEITÃO, I. B. et al. 2025). At the Latin American regional level, normative advances are identified coexisting with low investment and fragmented implementation of policies (LEITÃO; AVELLAR, 2025).

Finally, the judicialization of mental health reveals tensions between social demand and the structural capacity of the public system, impacting management and highlighting gaps in the supply of specialized services (RODRIGUES, 2026). In an integrated way, the findings corroborate the understanding of child and adolescent mental health as a multifactorial phenomenon, socially determined and crossed by structural and institutional dynamics. The high epidemiological burden and the early onset of disorders reinforce the need for early detection and intervention strategies, especially in contexts marked by socioeconomic inequalities. The association between accumulated childhood adversities and late outcomes, even in individuals initially considered resilient, demonstrates that the impacts of adverse experiences can manifest themselves in a deferred manner, requiring longitudinal follow-up and sustainable public policies throughout the life course.

From the perspective of the school, family and social contexts, the findings explain that mental disorders are not restricted to the clinical field, but have a structuring impact on educational development and interpersonal relationships. The distinction between emotional distress and mental disorder is shown to be strategic to qualify interventions in Primary Care, avoiding both excessive medicalization and neglect of conditions that require systematic care. This differentiation contributes to improving clinical dialogue and strengthening the autonomy of subjects in the care process.

In the field of public policies, the coexistence between normative advances and fragmented implementation shows a mismatch between the formulation and effectiveness of actions. Judicialization emerges as an expression of structural gaps and the insufficiency of the regular supply of specialized services, signaling the need for greater investment and systemic planning. Strategies for prevention and promotion of mental health must assume a structuring character, incorporating intersectoral actions and expanding the centrality of Primary Care.

Finally, the consolidation of integrated intersectoral networks is a fundamental condition to ensure comprehensive and continuous care. The strengthening of matrix support, the articulation between health, education and social assistance, and the adequate planning of the discharge process in specialized services are central elements to reduce the fragmentation of therapeutic itineraries. In an articulated way, the results indicate that the guarantee of mental health care in childhood and adolescence requires not only the treatment of already established cases, but also investment in developmental protection, promotion of protective factors and reduction of structural inequalities that affect psychological suffering.

5 FINAL CONSIDERATIONS

This study aimed to analyze the relevance of child and adolescent mental health in the contemporary Brazilian scenario, with emphasis on the promotion of early diagnosis and the articulation of intersectoral care networks. The investigation showed that mental health in childhood and adolescence is a multifactorial phenomenon, resulting from the confluence of social, structural, institutional and relational determinants that affect the course of life. The findings indicate that psychological distress and mental disorders in children and adolescents cannot be understood from an exclusively clinical perspective, requiring a broader approach that considers socioeconomic inequalities, exposure to early adversities and weaknesses in the organization of care networks.

The interpretation of the findings indicates that strengthening child and adolescent mental health in Brazil requires structuring strategies that integrate prevention, early diagnosis, and continuous care in a network. This presupposes investment in Primary Health Care, qualification of the Psychosocial Care Network and effective articulation between health, education and social assistance. The strengthening of family bonds, school support and qualified access to PHC are central protective factors. In addition, it is essential to address socioeconomic inequalities as structural determinants of psychological suffering, ensuring sustainable public policies oriented to full protection throughout the life course.

The contributions of this work lie in the critical synthesis of evidence on child and adolescent mental health in Brazil, offering an integrated view of risk and protective factors, impacts on school, family and social contexts, and challenges related to the organization of public policies and care networks. The analysis made it possible to identify contexts of greater vulnerability and reinforces the need for strategies aimed at early diagnosis, prevention, and equitable allocation of resources. It was also evidenced that the promotion of mental health in childhood and adolescence requires intersectoral actions that go beyond the health sector, involving education, social assistance and other protection policies, an essential perspective to ensure comprehensive and continuous care throughout the life course.

Among the limitations of the study, its bibliographic nature stands out, depending on the productions available in the consulted databases, which may not fully contemplate the Brazilian regional diversity. Underreporting of cases, underdiagnosis in Primary Care, and inequalities in access to specialized services also restrict the accuracy of estimates. In addition, there is a concentration of research in urban and institutional contexts, with less attention to children and adolescents in greater social vulnerability, such as those living in peripheral territories, traditional communities or situations of extreme exclusion, which limits the generalization of the findings to the country as a whole

Future studies should prioritize longitudinal investigations that follow the development of children and adolescents over time, allowing the identification of risk trajectories and protective factors, as well as evaluating the effectiveness of preventive interventions and intersectoral care strategies in the Brazilian context. Investigations that integrate quantitative and qualitative approaches can broaden the understanding of lived experiences, family and school dynamics, and institutional barriers to care. Systematic evaluations of the effectiveness of public policies, prevention programs, and matrix support strategies in the Brazilian context are a priority to support evidence-based practices that are culturally sensitive to local specificities.

The final reflection of this research highlights the urgency of recognizing child and adolescent mental health as a fundamental right and collective responsibility, which requires continuous political commitment and sustainable public policies aimed at prevention, early identification and networked care. Although the country has regulatory frameworks and the Psychosocial Care Network, weaknesses persist in implementation, financing and intersectoral articulation. Thus, strengthening Primary Care, qualifying specialized services, and addressing socioeconomic inequalities are central measures to ensure comprehensive care and promote healthy development throughout the life course.

ABSTRACT

The study and development of a diagnosis of pathologies in civil construction occurs through the analysis of the construction method and the quality of materials, the maintenance frequency, and whether it is being carried out according to technical guidance, in order to identify the cause of the problem. The issue may result from construction defects, low-quality materials used, lack of maintenance, or improper use. This analysis can also indicate the level of criticality, the priority for intervention, and possible methods for treatment. The present work aims to analyze the main construction pathologies found at the Trindade Campus of the Federal Institute Goiano. The methodology used is based on the Building Inspection Standard of the Brazilian Institute of Engineering Evaluations and Expertise (IBAPE), through the visual analysis of pathologies, classifying them according to their level of criticality and nature, as well as indicating the priority for treatment. Therefore, through the study developed, the Institution will be able to take appropriate actions to address the main pathologies that affect the Campus.

Keywords: Pathology. Construction. Diagnosis. Post-Construction. Maintenance.

RESUMO

O estudo e o desenvolvimento de um diagnóstico de patologias na construção civil ocorrem por meio da análise do método construtivo, da qualidade dos materiais e da periodicidade da manutenção, verificando-se se esta está sendo realizada conforme orientação técnica, a fim de identificar a causa do problema, se é decorrente da obra ou baixa qualidade dos materiais empregados, ausência de manutenção ou uso incorreto, podendo indicar a criticidade, nível de prioridade para intervenção e até formas para tratamento. trabalho visa analisar as principais patologias da construção do Campus Trindade do Instituto Federal Goiano. A metodologia utilizada se baseia na Norma de Inspeção Predial do Instituto Brasileiro de Avaliações e Perícias de Engenharia, através da análise visual das patologias, classificando-as quanto ao grau de criticidade e natureza, além de indicar a prioridade de tratamento. Portanto, por meio do estudo desenvolvido, a Instituição poderá tomar medidas para o tratamento das principais patologias que afetam o Campus.

Palavras-chave: Patologia. Construção. Diagnóstico. Pós-Obra. Manutenção.

RESUMEN

El estudio y desarrollo de un diagnóstico de patologías en la construcción civil se realiza mediante el análisis del método constructivo y de la calidad de los materiales, la periodicidad del mantenimiento y si este se está realizando conforme a las orientaciones técnicas, con el fin de identificar la causa del problema. Este puede derivarse de fallas en la obra, baja calidad de los materiales empleados, ausencia de mantenimiento o uso incorrecto, pudiendo además indicar el nivel de criticidad, la prioridad de intervención e incluso posibles formas de tratamiento. El presente trabajo tiene como objetivo analizar las principales patologías constructivas del Campus Trindade del Instituto Federal Goiano. La metodología utilizada se basa en la Norma de Inspección Predial del Instituto Brasileño de Evaluaciones y Pericias de Ingeniería (IBAPE), mediante el análisis visual de las patologías, clasificándolas según su grado de criticidad y naturaleza, además de indicar la prioridad de tratamiento. Por lo tanto, a través del estudio desarrollado, la Institución podrá tomar medidas para el tratamiento de las principales patologías que afectan al Campus.

1 INTRODUCTION

Civil Engineering and its technological advances are constantly innovating in the market and in its lines of research. Civil construction has sought agility in the execution of buildings with the use of construction techniques and methods that enable this acceleration, however, such progress needs attention to avoid possible problems during and after the completion of the work, and it is essential to carefully control quality, in addition to knowledge in the execution process and good practice of construction techniques. In turn, the failure to take due care, for example, errors in the compatibility of projects, failures in the execution of the work, use of low-quality materials, as well as the lack of preventive/corrective maintenance after the end of construction, can lead to the emergence of pathologies that are capable of compromising the operation, aesthetic comfort, durability and safety of the building.

In this way, Diagnostic Engineering has been taking a considerable strand in the daily life of Civil Construction, being an analysis tool, both at the time of the work for the care of execution and verification of the projects, and in the post-work, used in the diagnosis of pathologies and indication of the causes, in addition to the presentation of a recovery and maintenance plan, thus, ensuring a method to maintain the durability and effectiveness of buildings.

The Federal Institute of Goiás, Trindade campus, had its first class in 2015 for technical courses integrated with high school and subsequent, housing a considerable flow of teachers, students and administrative staff. Over time, from the first year of collective use, the building is faced with apparent pathologies, in order to impair the functioning of certain areas and facilities, in addition to the aesthetic discomfort caused by these constructive anomalies.

Due to the functionalities and continuous use by hundreds of people, there is a constant concern about the "deterioration" of some points of common use, and it is necessary, initially, a building inspection to prepare an action plan to correct the identified flaws and to ensure the proper maintenance of the building in the long term, extending its usefulness and useful life.

In this context, there are methodologies for expert evaluation and analysis of pathologies in civil construction, as provided by the Brazilian Association of Technical Standards (ABNT) and the Brazilian Institute of Engineering Evaluations and Expertise (IBAPE, 2021). Finally, the objective of this work is to identify, characterize and expose the possible causes of constructive pathologies at the Federal Institute of Goiás – Trindade Campus.

2 THEORETICAL FRAMEWORK

2.1 PATHOLOGY IN CIVIL CONSTRUCTION

The study of pathology can be defined as the study of diseases, their causes, effects, as well as the development of treatments and prevention of diseases. In civil construction, pathology refers to the study of anomalies, defects, damages, or manifestations that occur in buildings, structures, and other constructions, and are associated with some factors such as design or execution errors, actions of time that cause deterioration, or actions of external agents (IBDA, 2017).

These pathological manifestations may be visible or they may be internal problems. In order to reduce costs and speed up construction, the procedures that prevent the appearance of pathological manifestations end up not being practiced. With the emergence of these manifestations, there is a need for studies to understand the causes, extent of the anomalies, as well as the recommendation of solutions to repair them and prevent their recurrence (Fachin, 2016).

The study of pathology can be divided into some parts, such as the existence and investigation of the problem and the feasibility of the proposed solution. A concern of the occurrence of pathological manifestations is the number and frequency they occur, and for greater effectiveness in correcting problems and lower cost, it is necessary to identify and solve them as soon as possible. This resulted in cost reduction over time (Silva et al., 2020).

The study of pathologies in civil construction is extremely important, as the lack of attention to the components can affect the safety, functionality and useful life of a building, as well as the well-being of the occupants. And with a quick identification of a pathology, in addition to reducing the costs of corrective actions, it allows the building to have a longer useful life and durability.

2.2 PATHOLOGICAL MANIFESTATIONS

The origin of the pathological manifestations is related to the stage of the structure's life, and is associated with failures that occur during the development of activities throughout the construction processes. According to Piancastelli (2017), the highest rate of pathological occurrences in Brazil is in the construction execution phase (Figure 1).

Figure 1*Incidence and origin of pathological manifestations in Brazil*

Source: Piancastelli (2017).

2.3 SERVICE LIFE AND DURABILITY

The useful life of a building is the period in which it can be used for the purpose for which it was built, with satisfactory performance in terms of safety, comfort and functionality. The useful life of a building can vary depending on several factors, such as the type of use, the design, the quality of the materials, and proper maintenance.

The ABNT NBR 15575:2013 (ABNT, 2013) standard establishes the minimum requirements for the performance of residential buildings, including the minimum expected useful life, which is 50 years. However, it is important to note that the useful life of a building can be longer or shorter than the expectation established by the standard, depending on several factors, such as the level of use, the quality of the materials, the climate, and proper maintenance. Proper and preventive maintenance can significantly extend the useful life of a building, while lack of maintenance can accelerate degradation and reduce its useful time.

2.4 MAINTENANCE

Maintenance of pathologies in civil construction is the set of preventive and corrective actions that aim to ensure the integrity, safety, functionality and durability of buildings, based on their identification and correction. According to the NBR 5674 standard (ABNT, 2012) that portrays the maintenance of buildings, it presents the concept of maintenance, which is the set of actions performed with the purpose of conserving or recovering the functionality of a building and its parts, meeting the established criteria as well as the safety of its users.

The maintenance of pathologies can be preventive or corrective. Preventive maintenance is carried out with the objective of avoiding the occurrence of future problems,

through the periodicity of verification and review of the integrity of the construction components. Corrective maintenance, on the other hand, is performed to correct existing problems and defects, such as cracks, infiltrations, corrosion, among others.

The maintenance of pathologies in civil construction is essential to ensure the safety and proper functioning of buildings and with the lack of maintenance, pathologies can worsen, compromising the structure of the building and putting the safety of users at risk. Therefore, it is important to carry out maintenance regularly and rely on qualified and experienced professionals to perform the necessary interventions.

2.5 EVALUATION OF PATHOLOGIES

With the constant updating of standards related to the performance and quality of construction, it was necessary to highlight a front of services aimed at the evaluation of constructive pathologies, which is a demand under the responsibility of the diagnostic engineering methodology in order to study the origin, the degree of risk and propose repair and prevention methods. NBR 13752 (ABNT, 1996) presents the basic guidelines, concepts, criteria and procedures related to engineering expertise in civil construction, providing for the classification of the object as to the nature, basic methodology and criteria to be used.

In addition, IBAPE (2021) presents the definitions contained in the IBAPE/NACIONAL Glossary of Terminology and complements the definitions contained in the related ABNT standards, bringing the most used expert evaluation method for diagnostic engineering in Civil Construction.

It should be noted that the method exposed by IBAPE (2021) is the same as that adopted in this work, giving the definition of the type of building inspection adopted, as well as the level of complexity of the evaluation, definition of the degree of risk of the pathologies found according to the technical concept, definition of priorities, technical recommendations and evaluation of maintenance and use, finally, indication of responsibilities. Thus, with the mixture of the referenced methodology with the research objective, the expected results will be achieved.

3 METHODOLOGY

3.1 RESEARCH ROADMAP

Figure 2 shows the Research Guide, referring to the steps that were carried out during the study on pathologies in civil construction.

Figure 2*Flowchart of the research script*

Source: Prepared by the authors themselves.

3.2 OBJECT OF THE RESEARCH

The building analyzed refers to the second stage of the expansion plan of the Federal Network of Professional and Technological Education. Located in the city of Trindade - Goiás, the Trindade Campus began its activities in the first semester of 2015, and over the years it has expanded its audience and its built area.

The unit currently (2023) has a built area of 43 thousand square meters, located in the urban area of the city. Its structure includes an auditorium with support for 200 people, library, professional and specific laboratories, classrooms, administrative facilities, sports court and living area (Figure 3).

Figure 3

Federal Network of Professional and Technological Education – IF Goiano - Trindade Campus – 2023

Source: Google Earth (2023) Drone photography (IF Goiano – Trindade Campus).

Taking into account the first structures of the Campus, the case study of this work focuses on the environments of the main block of rooms, library, auditorium and laboratory of materials and soils. In each environment mentioned as a case study, a technical inspection

was carried out for data collection, which is essential for the composition of the results. During the analysis of the identified pathologies, visual and photographic records were made, later using authorial theoretical foundations to reference each deterioration.

In order to highlight the methodology adopted for the identification of apparent pathologies at the Federal Institute of Goiano - Trindade Campus, fundamental concepts were used, following the idea proposed by this article through the method of evaluation and characterization of pathologies through direct visual inspection, as provided in the Building Inspection Standard of the Brazilian Institute of Engineering Evaluations and Expertise (IBAPE, 2012).

3.3 APPLICABILITY OF THE BUILDING INSPECTION STANDARD METHOD

3.3.1 Level of Inspection

The IBAPE National building inspection standard presents definitions regarding the isolated or combined analysis of the technical, use and maintenance conditions of the building, bringing the classification of the level of building inspection as to its complexity and preparation of a report. This inspection referring to the levels that are classified as 1, 2 and 3 are carried out by professionals in a specialty, but these professionals also prepare the report (IBAPE, 2021).

Level 1: Building Inspection carried out in buildings with low technical, maintenance and operation complexity of their elements and construction systems. Usually used in buildings with very simple or non-existent maintenance plans.

Level 2: Building Inspection carried out in buildings with medium technical complexity, maintenance and operation of their elements and construction systems, of medium construction standards and with conventional systems. Usually used in buildings with several floors, with or without a maintenance plan, but with outSourced companies hired to perform specific activities such as: maintenance of pumps, gates, water reservoirs, among others.

Level 3: Building Inspection carried out in buildings with high technical complexity, maintenance and operation of their elements and construction systems, of higher construction standards and with more sophisticated systems. Usually used in buildings with several floors or with construction systems with automation. At this level of building inspection, a maintenance based on ABNT NBR 5674 is mandatorily performed in the building. It also has a qualified professional in charge of the technician, a maintenance plan with planned activities and detailed procedures, management software, and other management tools for the existing maintenance system. At this level of inspection, the work may be called Technical Audit.

3.3.2 Degree of risk and classification of anomalies

Regarding the classification of the Degree of Risk, IBAPE (2012) recommends the criterion regarding the existence of anomalies and flaws in the building found by the evaluation, considering the risk offered to users, the environment and property, within the limits of the building inspection, which can be classified as follows:

Critical Risk Level: Risk of causing damage to the health and safety of people and the environment; excessive loss of performance and functionality causing possible downtime; excessive increase in maintenance and recovery costs; significant impairment of useful life.

Medium Risk Degree: Risk of causing partial loss of performance and functionality of the building without prejudice to the direct operation of systems, and early deterioration.

Minimum Degree of Risk: Risk of causing minor damage to aesthetics or programmable and planned activity, without incidence or without the probability of occurrence of critical and regular risks, in addition to low or no impairment of real estate value.

In addition to the degree of risk that must be analyzed, it is also important to understand the classifications of anomalies that can occur when there are pathologies in buildings. Thus, IBAPE (2012) classifies them as: endogenous, exogenous, natural and functional. Endogenous occurs in the building itself, and can be design, materials and execution. Exogenous, on the other hand, originates from factors external to the building, caused by third parties. The definition of natural pathology occurs in relation to the events of natural phenomena. Finally, the constructive anomaly defined as functional originates from the degradation of construction systems by natural aging and, consequently, the end of the useful life.

3.3.3 Classification of failures and definition of priorities

Planning Failure: Resulting from failures in procedures and inadequate specifications of the maintenance plan, without adherence to technical issues, use, environmental exposure and, mainly, reliability and availability of the facilities, according to the maintenance strategy. In addition to the design aspects of the plan, there are flaws in the periodicities of execution.

Execution failure: Associated with maintenance arising from failures caused by the improper execution of maintenance plan procedures and activities, including improper use of materials.

Operational: Relating to inadequate procedures for registrations, controls, patrols and other pertinent activities.

Managerial: Resulting from the lack of quality control of maintenance services, as well as lack of cost monitoring.

The definition of priorities will have the functionality of alerting about the need for repair, aiming to prevent further damage to the structure of the building or to the lives of users, and will be carried out through the degree of risk, where the indicated pathologies should be pointed out with priority of intervention as "High", "Medium" and "Low".

4 RESULTS AND DISCUSSION

After performing the visual inspection of the environments defined for this case study, it was possible to identify 5 (five) predominant pathological occurrences, with the respective definitions:

Infiltration: refers to the process by which a liquid penetrates the voids of a solid (IBDA Forum, 2017). Water infiltration entails a series of pathological consequences such as corrosion of reinforcement, efflorescence, degradation of concrete and mortar, blistering and bubbles in paints, short circuits, among others (GRANATO, 2002).

Oliveira (2012) defines cracks, fissures and cracks as pathological manifestations of buildings observed in masonry, beams, columns, slabs, floors, among other elements, usually caused by material stresses. If the materials are ordered with an effort greater than their resistance, failure occurs, causing an opening, and according to their thickness, it will be classified as fissure, crack, crack, crack or breach (Table 1).

Table 1

Thicknesses and classification of anomalies

ANMALIES	Fissure	Crack	Crack	Crack	Breach
OPENINGS (mm)	Up to 0.5	From 0.5 to 1.5	From 1.5 to 5.0	From 5.0 to 10.0	Over 10.0

Source: Oliveira, 2012.

Menezes (2006) defines efflorescence as saline deposits that form on the surface of construction materials, resulting from the migration and subsequent evaporation of salinized aqueous solutions. The soluble salts that give rise to efflorescence can have various origins, including raw materials, construction materials, water in the subsoil, among others.

Mold and mildew is the common occurrence in tropical climates. It is associated with the existence of a high moisture content in the attacked component and in the environment, which can interfere with the healthiness and habitability of the building (GRANATO, 2002). Classifying the inspection as level 2, according to figures 4, 5, 6, 7 and 8, pathologies with different degrees of risk, definitions of the nature of the pathology, and the environments where they were found were observed.

According to Figure 4A, infiltrations were found in the ceilings of almost all the environments of the campus case study, considering the origin of the pathology as exogenous, that is, due to factors external to the building, caused by third parties, considering it as a critical risk level, and it can also be highlighted in Figure 4C that in the laboratories infiltrations in the ceiling (also considered as exogenous of critical degree) were identified. According to IBAPE (2012) states that this degree is a risk of causing damage to the health and safety of people and the environment; excessive loss of performance and functionality causing potential outages; excessive increase in maintenance and recovery costs; sensitive impairment of service life.

Figure 4

Pathologies of molds and infiltrations – IF Goiano - Trindade Campus – 2023.

Source: Prepared by the authors.

In figure 4B, it showed infiltration in the ceramic coating, located in the courtyard, classified as endogenous and medium grade. Figure 4C showed another infiltration, located in the pillars of the courtyard and on the ramp, classified as endogenous. According to IBAPE (2012), this type of nature originates from the building itself, as in the case of a possible failure of execution, thus defining it as a medium degree. This degree means that the risk of causing partial loss of performance and functionality of the building without prejudice to the direct operation of systems, and early deterioration.

Table 2 – Part 1 presents the classifications, intervention priorities and observations considered according to the main pathologies of mold and infiltrations identified during the visual inspection.

Table 2

Classification of pathologies - level 02 inspection - part 1

Main Pathologies	Classification	Priority of intervention	Notes
Infiltration in the ceiling	Managerial	High	The classification as managerial and exogenous in nature is given by the identification of lack of corrective maintenance in the roofing systems, causing infiltration damaging the physical structure of the affected components.
Infiltration in the ceramic coating	Execution failure	Average	The classification as an execution failure and of an endogenous nature is given by the identification of a possible waterproofing failure causing infiltration of ceramic water, damaging the ceramic pieces.
Wall infiltration	Managerial	Average	The classification as managerial and exogenous in nature is given by the identification of lack of corrective maintenance in the roofing systems, causing infiltration damaging the physical structure of the affected components.
Infiltration in the ceiling	Managerial	High	The classification as managerial and exogenous in nature is given by the identification of lack of corrective maintenance in the roofing systems, causing infiltration damaging the physical structure of the affected components.

Source: Prepared by the authors.

Figure 5 presented the possible cause of the infiltrations of the campus, with the analysis of the drone cracks were observed in the roof slab. The cracks found can allow rainwater or other Sources to enter, causing additional damage to the structure and interior of the building, consequently causing infiltrations.

Figure 5

Pathologies of molds and infiltrations – IF Goiano - Trindade Campus – 2023

Source: Prepared by the authors.

Ceramic detachment, which is the detachment or detachment of ceramic plates, is defined through the loss of adhesion between the substrate and the ceramic coating, or of the adhesive mortar, which occurs when the stresses on the components exceed the competence of adhesion between the materials to remain stable (Fontenelle; Moura, 2004 and Oliveira, 2012). Because this pathological manifestation affects the physical integrity of users and with the high cost of repair, this anomaly is considered the most serious among them. According to figure 6A, the pathology showed the ceramic detachment, located in the pillars of the courtyard and in some rooms, classified as endogenous. According to IBAPE (2012), this type of nature originates from the building itself, as in the case of a possible failure of execution, thus defining it as a medium degree.

Figure 6

Crack, peel and fissure pathologies – IF Goiano - Trindade Campus – 2023

Source: Prepared by the authors.

In Figure 6B, cracks were found in the classroom, considering the origin of the pathology as endogenous, that is, originating from the building itself, as in the case of a possible failure in execution, as a degree of critical risk, which can also be highlighted in the

laboratories, in the auditorium, on the ramp, in the rooms and in the courtyard, cracks were identified in the corners (Figure 6C), also considered as endogenous of medium degree.

Table 3 – Part 2 presents the classifications, intervention priorities and observations considered according to the main pathologies of cracking, fissure and detachment identified during the visual inspection of the citation figures.

Table 3

Classification of pathologies - level 02 inspection - part 2

Main Pathologies	Classification	Priority of intervention	Notes
Crack	Execution failure	High	The classification as execution failure and endogenous nature is given by the identification of possible overload around the opening due to poor sizing of lintel and counter-lintel, causing cracks damaging the physical structure of the affected components.
Fissure	Execution failure	Average	The classification as an execution failure and endogenous nature is given by the identification of a possible execution failure in the masonry fastening, leaving weakened abutments, causing vertical cracks in the corners damaging the physical structure of the affected components.
Ceramic Peeling	Execution failure	Average	The classification as an execution failure and of an endogenous nature is given by the identification of a possible execution failure in the adhesion of the mortar with the ceramic piece, causing the pieces to peel off.

Figure 7

Pathologies of efflorescence, mold, mildew and warping of frames – IF Goiano - Campus Trindade – 2023

Source: Prepared by the authors.

According to Figure 7A, efflorescence was found on the façade of the auditorium, considering the origin of the pathology as exogenous, that is, due to factors external to the building, caused by third parties, considering it as a medium risk level, which can also be highlighted in the laboratories, the library, mold and mildew were identified (Figure 7B) also considered as exogenous of medium degree. According to IBAPE (2012) states that this degree is a risk of causing partial loss of performance and functionality of the building without prejudice to the direct operation of systems, and early deterioration.

In Figure 7, C presented another type of pathology, which was the warping of the frames, located in the classroom, classified as functional. According to IBAPE (2012), this type of nature originates from the degradation of construction systems by natural aging and, consequently, the end of useful life, thus defined as a critical degree. This degree means that the risk of causing damage to the health and safety of people and the environment; excessive loss of performance and functionality causing potential outages; excessive increase in maintenance and recovery costs; sensitive impairment of service life.

Table 4 presents the classifications, intervention priorities and observations considered according to the main pathologies identified during the visual inspection related to Figures 7. According to the figures, level 2 pathologies were observed, presenting different degrees of risk, definitions of the nature of the pathology, the environments where they were found, the classifications, intervention priorities and observations considered according to the main pathologies identified during the visual inspection.

Table 4

Classification of pathologies - level 02 inspection - part 3

Main Pathologies	Classification	Priority of intervention	Notes
Efflorescence	Managerial	Average	The classification as managerial and exogenous in nature is given by the identification of a lack of corrective maintenance on the façade to ensure that the surface remains clean, causing the accumulation of salts, forming efflorescence.
Mold and mildew	Managerial	Average	The classification as managerial and exogenous in nature is given by the identification of a lack of corrective maintenance in the frames to ensure that the surface remains clean, causing the accumulation of moisture, forming mold.
Warping of the frames	Managerial	High	The classification as managerial and functional is given by the identification of misuse of the frame, due force used to open and close the window, causing warping and affecting the correct sealing.

Source: Prepared by the authors.

According to figure 8A, infiltration was found on the floor of the auditorium, considering the origin of the pathology with endogenous, defining it as a critical degree, leading to the priority of intervention being high. The pathology was considered as a possible failure to execute the waterproofing of the floor, causing water infiltration by capillary absorption and undermining water in the floor, damaging the physical structure of the affected components. Figure 8B presented another pathology, which was the detachment of the laminate flooring from the auditorium, classified as functional, defined with a degree of critical risk, classified as managerial, identified as a possible lack of corrective maintenance of the laminate floor, causing detachment and significant impairment of useful life, which can lead to the loss of laminate flooring.

Figure 8

Infiltration and detachment pathologies – IF Goiano - Trindade Campus – 2023

Source: Prepared by the authors.

According to Figure 8C, paint detachment was found in the laboratories, considering the origin of the pathology as exogenous, that is, due to factors external to the building, considering as a degree of critical risk, classified as managerial as a possible lack of corrective maintenance in the frames, causing infiltration and humidity in the masonry, damaging the paint leading to its displacement.

Figure 9 shows the summary of the types of pathologies found on campus. It is possible to see that the pathologies with the highest incidence were infiltrations and fissures with 25% each. These pathologies largely arise from executive failures, such as inadequate waterproofing in the case of infiltration, failure to execute the masonry in the case of cracks, and mainly due to lack of preventive and periodic maintenance. According to BONIFÁCIO; SANTANA; PERIOTT (2020) After the completion of the building, there is a need to carry out preventive and reparative maintenance, since certain anomalies are linked to the way a building is being operated.

Figure 9

Pathologies found at IF Campus Trindade - 2023

Source: Prepared by the authors.

Figure 10 shows that these pathologies were not classified with the minimum risk level. IBAPE (2012) states that the degree of risk causes small damage to the aesthetics or programmable and planned activity, without incidence or without the probability of occurrence of critical and regular risks, in addition to low or no impairment of real estate value.

Figure 10

Degree of Risk for pathologies found at IF Campus Trindade – 2023.

Source: Prepared by the authors.

Figure 11 shows that the pathologies were classified as medium and critical risk, so it is understood that with preventive and periodic maintenance they could reduce the number

of pathologies with the most serious risks, avoiding an excessive increase in maintenance and recovery costs.

5 CONCLUSIONS

As exposed in the work, the various problems presented at the Federal Institute of Goiano – Trindade Campus become evident. In view of the above, it became possible to identify the causes according to their degree of risk and criticality. In this case, it is essential to be careful in relation to the preparation of a project that complies with the appropriate specific standards, the monitoring of the engineer/person responsible for the work throughout the executive process, the performance of periodic maintenance, and consequently, the government financial investment for these purposes, since it is a public educational institution.

However, it is possible to affirm that the objectives set at the beginning of the research were achieved, considering the assumption of the characterization of the constructive anomalies, their causes and degree of risk. Furthermore, it is worth noting that the theoretical foundations analyzed, for the most part, are based on the useful life of the building, since its functionality is directly related, that is, the deterioration is proportional to the continuous use of the Campus, as well as any other building. However, when you have a frequent and proper inspection, the useful life tends to increase.

Finally, from a general perspective, with regard to civil construction, the topics based on the writing were necessary to the point of resulting in a possible continuity of the theme

addressed, since it is a Campus that offers opportunities for an audience with different identities, but that value the same objective, education. It is recommended, in the case of future analyses related to this case, that specific preventive and repair methods for each type of pathology identified be investigated and presented, in order to further contribute to this line of research.

ABSTRACT

The Araripe region in the state of Pernambuco is home to vast clay mineral reserves overlapping gypsum deposits. They have been considered waste, therefore, disposed of without any exploitation, which could lead to environmental threats. Taking into consideration the need for sustainable materials in the construction field, this study has assessed the technical viability of bricks manufacturing using soil cement from Araripina's horizons A, B, and C - with and without adding crushed-stone dust. After running tests of physical characterization, granulometry and consistency, the results showed a predominance fraction of sand and lack of clay in relation to ABNT NBR 10833/2012, besides revealing fissuration after retraction tests. Bricks molded into traces 1:6 and 1:6:0,25 were submitted to both mechanical and absorption tests. The ones molded into 1:6:0,25 traces revealed a better performance, showing technical viability through adequate stabilization.

Keywords: Soil-Cement Bricks. Crushed Stone Dust Waste. Sustainable Construction.

RESUMO

A região do Araripe (PE) possui extensas reservas de argilominerais sobrepostas às jazidas de gipsita, atualmente tratadas como rejeitos e acumuladas sem aproveitamento, o que pode gerar impactos ambientais. Considerando a necessidade de materiais mais sustentáveis na construção civil, este estudo avaliou a viabilidade técnica da produção de tijolos de solo-cimento com solos dos horizontes A, B e C de Araripina (PE), com e sem adição de pó de brita. Foram realizados ensaios de caracterização física, granulométrica e de consistência. Os resultados indicaram predominância de fração arenosa e déficit de argila em relação à ABNT NBR 10833/2012, além de fissuração no ensaio de retração. Tijolos moldados nos traços 1:6 e 1:6:0,25 foram submetidos a ensaios mecânicos e de absorção. O traço 1:6:0,25 apresentou melhor desempenho, atendendo às exigências das NBR 8497/2012 e 8491/2012, demonstrando viabilidade técnica mediante estabilização adequada.

RESUMEN

La región de Araripe (PE) posee extensas reservas de argilominerales superpuestas a los yacimientos de gipsita, actualmente tratadas como residuos y acumuladas sin aprovechamiento, lo que puede generar impactos ambientales. Considerando la necesidad de materiales más sostenibles en la construcción civil, este estudio evaluó la viabilidad técnica de la producción de ladrillos de suelo-cemento con suelos de los horizontes A, B y C de Araripina (PE), con y sin adición de polvo de piedra triturada. Se realizaron estudios de caracterización física, granulométrica y de consistencia. Los resultados indicaron predominancia de la fracción arenosa y déficit de arcilla en relación con la norma ABNT NBR 10833/2012, además de agrietamiento en el ensayo de retracción. Los ladrillos moldeados con dosificaciones 1:6 y 1:6:0,25 fueron sometidos a ensayos mecánicos y de absorción. La dosificación 1:6:0,25 presentó mejor desempeño, cumpliendo los requisitos de las normas NBR 8497/2012 y 8491/2012, lo que demuestra la viabilidad técnica del material mediante una estabilización adecuada.

1 INTRODUCTION

According to Bezerra (2009), in gypsum mining in the Araripe gypsum pole, there is a need to remove the surface clay capping, which is revealed as the main environmental problem and which covers the mineral layer, being an economic conditioning factor in the feasibility of the type of mining used in the region, which has been stored for later backfill in the recovery phase of the mined area. Considering the maximum limit of the overburden/ore ratio up to 1:1. The volume of waste generated represents an environmental cost for society and a financial cost for the miner.

For this reason, in the Araripe Gypsum Pole, where the magnitude of the problem is increased by the tonnage produced and the years of mining activity, some studies have been carried out with a view to taking advantage of this capping, which remains, however, unapplied. The technological routes pursued are directed by the mineralogical, chemical and physical characteristics of the capping clays.

The civil construction sector stands out as one of the sectors that most consumes natural resources and generates waste. Given this scenario, the industry has intensified the adoption of innovative practices aimed at incorporating sustainability into its production chain (Vilela et al., 2020). Among the most relevant advances is the use of materials with less environmental impact, such as soil-cement bricks, which are presented as an economically viable and environmentally more appropriate alternative in relation to traditional masonry systems. One notable advancement is the use of eco-friendly materials, such as soil-cement bricks, which offer a cost-effective and environmentally conscious alternative to conventional masonry materials. These bricks can be produced on-site using locally sourced materials, thereby reducing transportation demands and associated energy consumption (Silva et al, 2024).

2 THEORETICAL FRAMEWORK

2.1 SOLO

According to Silva (2005), soil consists of an unconsolidated material present in the surface layer of the Earth, being composed of several minerals, classically defined as a set of mineral particles arising from the weathering of the mother rock. This material has voids filled by fluids (water and/or air) and can be classified as residual soil.

2.1.1 Soil Properties

Soil, as an engineering material and natural substrate, has a behavior that is intrinsically determined by the nature of its primary constituents. As Chiossi (2015) postulates,

two physical attributes are crucial for predicting the behavior of soils: particle size (particle size) and grain morphology (particle shape). The interdependence of these factors not only establishes the formal classification of soil, but also governs its characteristics of permeability, strength, and plasticity.

Particle size represents the distribution of soil particle diameters and is the first key to their categorization. ABNT, through NBR 6502/1995, establishes a hierarchy of classes in descending order of size: boulders, sands, silts and clays. This differentiation is key, as the size of the particles determines the specific surface area of the soil, the ratio between the total area of the particles and the volume or mass of the soil.

The coarse fractions (boulders and sands) dominate in soils with low specific surface area, which gives them high permeability and a predominantly friable behavior (dependent on friction).

Fine fractions (silts and clays), in contrast, have a significantly larger specific surface area. This enhances the surface electrostatic forces, increasing cohesion and drastically reducing permeability.

In addition to the size, the geometric shape of the particles exerts a direct influence on the packaging (structure) and interlocking of the grains, crucial factors for the shear and compressive strength of the soil. For the coarser fractions (boulders, sands, and silts), the grains tend to be equidimensional (approximate dimensions in all directions). The geometry, which varies from angular to spherical depending on energy and transport time, affects friction. More angular particles result in a higher meshing and, consequently, in greater strength and lower compressibility for a given porosity.

Clay particles, on the other hand, exhibit a unique morphology: they are lamellar or placoid. In these submicroscopic grains, two dimensions far outweigh the third, resembling laminae or platelets. This morphology gives clay its colloidal properties and its remarkable plasticity, allowing that, in the presence of water, the particles organize themselves into complex structures (flocculated or dispersed) that dictate the cohesion and moisture retention capacity of the fine soil.

2.1.2 Chemical and Mineralogical Composition

Soils whose mineralogical composition demonstrates enrichment in silica, kaolinite or quartz tend to present a favorable reactivity to cement treatment, culminating in adequate geotechnical stability (Pinto, 2006).

Silica and Quartz: Quartz, while structurally stable, indirectly contributes to stability. Silica, in its amorphous or high-reactivity form (common in weathered residual soils), allows

the occurrence of essential pozzolanic reactions with the calcium hydroxide released by the cement. Such reactions are responsible for the synthesis of hydrated calcium silicates (C-S-H), the main cementing component that gives strength and durability to the soil.

Kaolinite: This clay mineral has a stable crystal structure and a low specific surface area, compared to other clay minerals. Kaolinitic soils tend to present less ionic interference in the hydration kinetics of cement, promoting a more efficient pozzolanic reaction and a more predictable strength gain (Pinto, 2006).

The presence of these minerals is therefore associated with a lower binder demand and a superior performance of the stabilized material.

On the other hand, the presence of certain clay minerals and organic compounds can inhibit or severely compromise the stabilization process, classifying these soils as unsuitable for treatment with cement (Pinto, 2006).

Montmorillonite: This clay mineral is characterized by its expansive structure and high specific surface area. Its remarkable ability to adsorb water between the interlamellar layers gives it a high potential for expansion and retraction. In the presence of cement, montmorillonite competes for hydration water and, due to its high reactivity, can adsorb essential ions from cement, inhibiting the formation of C-S-H. This structural and chemical interference severely compromises the final strength and durability of the cemented soil.

Organic Matter: The high content of organic matter is a factor that chemically inhibits the hydration of cement. Organic components, in particular humic and fulvic acids, can act as chelating agents, encapsulating cement grains and slowing or paralyzing the hydration reaction.

2.2 PORTLAND CEMENT

Portland cement is known worldwide as a fine powder material, with different shades of gray, which manifests binding properties when mixed with water, and is often referred to as just 'cement' (Barbosa, 2015). This agglutination characteristic defines it as a binder, given its ability to bond other materials.

The final properties and characteristics of Portland cement are directly related to the characteristics and properties of the raw materials and the production process. According to the American Concrete Institute (ACI), Portland cement is a hydraulic binder obtained by grinding Portland clinker, composed essentially of hydraulic calcium silicates and aluminates. The process includes the addition of small amounts of calcium sulfate (gypsum) and often higher percentages of mineral additions, such as Granulated Blast Furnace Slag (EGAF), pozzolans and/or limestone filler.

Also in the composition, gypsum is added to Portland clinker in percentages of 2% to 6% before grinding with the fundamental objective of controlling the cement hardening (setting) time. Adding small amounts results in very rapid hardening, while high amounts can promote cracking in the hardened cement paste.

In addition to gypsum, mineral additions constitute a strategic and increasingly relevant component in the formulation of contemporary Portland cement, acting as essential modifiers of its physical and chemical properties. The impact of these additions on cement performance is two-phase. In general, a reduction in the initial mechanical strength of the material is observed, since the pozzolanic reaction and hydraulic latency occur at a slower pace than the primary hydration of the clinker. However, the long-term technical benefit is significant: the additions promote a progressive and noticeable increase in long-term mechanical strength and dramatically increase the durability of the hardened cement paste. This increase in durability is associated with the densification of the microstructure, reduced porosity and greater resistance to chemical attacks, allowing the production of optimized cements for more aggressive environments.

2.3 CRUSHED POWDER

Crushed stone dust is a fine aggregate that originates directly from the rock crushing process. This material, characterized by its fine granulometry, has important technical functions when incorporated into cementitious or soil-cement mixtures, such as those used in the production of bricks or other precast elements.

Its use is strategic and brings significant benefits to the properties of the final mixture:

- a) Improvement of Granulometry: The insertion of gravel dust contributes to the optimization of the global granulometric curve of the mixture. By filling the voids between the larger particles of the other aggregates (sand or coarse gravel), it promotes a denser and more homogeneous distribution of materials;
- b) Increased Compactness: As a direct consequence of the granulometric improvement, the gravel dust increases the compactness of the mixture. Greater compactness results in fewer voids, which is critical to the durability and mechanical performance of the final product.
- c) Shrinkage Reduction: The presence of fine and well-distributed aggregates, such as gravel dust, helps to restrict the amount of cement paste needed and to control water loss, helping to reduce shrinkage during drying and curing. This minimizes the risk of cracking.
- d) Contribution to Strength: The increase in compactness and densification of the structural matrix, together with the filling of voids, increase the final mechanical strength of the brick or component.

According to Menossi (2004), the use of gravel dust as a fine aggregate in concrete is

of great interest both for its economic and environmental aspects because it is a material from tailings, which originally brought inconvenience to the quarries due to storage and disposal, but became a product endowed with a more affordable final value.

2.4 SOIL STABILIZATION

According to Brito and Silva (2017), soil stabilization is a process carried out to stabilize and supplement the resistance properties of the soil, adapting it for a given use.

The main objective is to improve critical characteristics such as mechanical strength, durability and compressibility, making the soil able to support structural loads more efficiently. Among the various methodologies for soil improvement, chemical stabilization with Portland cement stands out as one of the most effective and widely used in Brazil (Pinto, 2006). This technique consists of adding cement to the soil, resulting in the formation of the composite material known as soil-cement.

2.5 SOIL-CEMENT

Soil-cement is a fundamental technique of civil engineering, based on soil stabilization through a controlled and homogeneous mixture of soil, cement and water, followed by a rigorous compaction process. This methodology aims to transform the geomechanical properties of the original material, giving it greater strength and durability.

The improvement of soil properties occurs as a function of the cement's hydration mechanism in the presence of water. This chemical reaction is responsible for the formation of hydrated crystals that fill the voids and establish a rigid cementitious matrix, which permanently binds the soil grains. Consequently, this stabilization causes a drastic reduction in the permeability and susceptibility of the soil to moisture variations, which is crucial to limit expansion in sensitive clay soils.

Although there is no absolute consensus as to its initial framework for large-scale application, the use of soil-cement in civil construction gained national prominence in Brazil from the 1930s onwards. This period coincided with the regulation of its manufacturing process by the Brazilian Association of Portland Cement (ABCP), a factor that boosted the development and acceptance of the technique, as referenced by Lima, cited in Nascimento (2018).

In addition to its high structural performance, soil-cement stands out for its low environmental impact, as highlighted by Nachtigal (2014). The predominant use of the local soil itself as the main aggregate significantly reduces the need for conventional material transportation, which in turn minimizes greenhouse gas emissions associated with logistics.

Structurally, the consolidated material offers a durable and cost-effective solution, being widely employed as a base layer and sub-base in road pavements and in the production of no-burn building blocks, reinforcing its position as a sustainable and efficient technique for the improvement of infrastructure and civil construction.

2.5.1 Soil-cement brick

The soil-cement brick (or soil-cement block) has established itself as a technological and sustainable alternative in civil construction, distinguishing itself from traditional ceramic materials mainly by its manufacturing method. The process begins with the pressing of the homogeneous mixture of soil, cement and water in specific metal molds.

The quality of the final block depends intrinsically on the particle size characteristics of the soil used. The most suitable soils must have basic specifications, according to Silva (2005): a) Sand Content: between 45% and 90%. b) Silt + Clay Content: between 10% and 55%. c) Clay content: less than 20%. d) Liquidity Limit (LL): less than 45%.

The fundamental step that replaces the firing step of conventional bricks is wet curing. After molding and pressing, the bricks should be kept in an environment with high humidity for at least 7 days (Nachtigal, 2014). This period is crucial as it allows the cement hydration reactions to occur, creating the cementitious matrix that gives the block its ultimate strength and durability. The cure can be extended to optimize the desired strength.

The rigid cementitious matrix gives the brick a set of properties that make it superior in several aspects. It has high durability and resistance to compression, in addition to being less susceptible to disintegration by weathering. The modular design of the blocks also contributes to good thermal insulation in buildings, helping with energy efficiency.

In terms of economic viability, the advantage is twofold: a) Cost Reduction at the Base: Elimination of the burning process, which consumes a large amount of energy (wood or gas), reducing the cost of production; b) Economy on Site: The precise shape of the soil-cement brick allows a perfect fit, resulting in a significant reduction in the use of laying mortar and coating (roughcast/plaster), minimizing waste.

3 MATERIALS AND METHODS

3.1 MATERIALS

3.1.1 Soils

The soil used as raw material was collected from the mining company located in the rural area of Araripina – PE, as shown in Figure 1.

Figure 1

Site of extraction of the studied material. Representation of horizons A (yellow), horizon B (greenish) and horizon C (red) of the Araripina region

Source: Authors (2025).

3.1.2 Other Materials Used

Throughout the research, composite Portland cement of two different types was used:

- CP II-Z 32 (Portland Cement Composite with Pozzolanic Material).
- CP II-F 32 (Portland Cement Composite with Filler).

The gravel dust used was collected in a mining company located in Ouricuri – PE, as can be seen in Figure 2.

Figure 2

Place of extraction of the studied material: Sample crushed stone dust

3.2 METHODS

3.2.1 Characterization of the samples

The tests are described below, and for sample preparation, the procedures described in the Brazilian standard NBR 6457 (2016) are observed, such as pre-drying, unraveling and sieving in the 4.8 mm sieve, which can be seen in Figure 3.

Figure 3

Clearance of the soil horizons of the Araripina region: A) horizon A. B) horizon B. C) horizon C

Source: Authors (2025).

3.3 PHYSICAL CHARACTERIZATION OF THE SAMPLES

The tests presented in table 1 are used for the physical characterization of the soil.

Table 1

Standards for soil characterization

Propriedades	Normas
Umidade higroscópica	ABNT NBR 6457/1986
Massa específica	ABNT NBR 6458/2016
Análise granulométrica	ABNT NBR 7181/2016
Limite de liquidez	ABNT NBR 6459/1984
Limite de plasticidade	ABNT NBR 7180/2016

Source: Authors (2025).

3.4 RETRACTION

The fundamental principle observed is the phenomenon of soil retraction, which manifests itself as the reduction in volume of a mass of soil as a result of moisture loss. This volumetric decrease, when it occurs in a confined or uneven manner, is the direct cause of the potential appearance of cracks or fissures on the surface of the analyzed sample.

Figure 4*Wooden box*

Source: Authors (2025).

The procedure, known as the Channel Test, as can be seen in Figure 5, begins with the preparation of the sample. Then, the initial consistency is determined, the soil is gradually mixed with water in a metal tray, using a trowel, until it reaches the point where the mixture has a mortar consistency, characterized by its adhesion to the instrument.

For molding, the wooden box is previously lubricated with oil, as observed in Figure 4. The soil in the given consistency is thrown into the box at a height of 30 cm and carefully planed.

Figure 5*Procedure of the retraction test*

Source: Authors (2025).

After molding, the specimen is subjected to the curing phase, being kept sheltered from the sun and rain for a period of 7 days, which ensures a slow and controlled drying in the air.

The result of the test is measured at the end of this period, based on two criteria: the analysis and measurement of the retraction observed in the two directions of the sample inside the box and the verification of the appearance (or absence) of cracks or fissures on the surface of the specimen. This adapted test provides valuable data to infer the behavior of the soil in terms of its volumetric stability.

3.5 DEFINITION OF TRAITS

In the first phase, bricks were manufactured by mixing the A, B and C horizons with different lines: 1:6, 1:8, 1:10 and 1:12.

Subsequently, soil-cement bricks were manufactured with the addition of gravel powder using the 1:6:0.5 traces; 1:6:0.25 (cement, soil and gravel dust).

3.6 SOIL-CEMENT BRICK MAKING

For the production of bricks, a manual press was used with molds of dimensions 12.5 cm x 25 cm x 6.5 cm (width x length x thickness) and fittings that allow direct tying between the components in the execution of the masonry, as can be seen in Figure 6.

Figure 6

Manufacture of bricks. (A) Manual press (B) Molding (C) Brick

Source: Authors (2025).

After manufacturing, wet curing was carried out, where the bricks were wrapped with a plastic, sheltered from the sun and wind for 7 days.

3.7 DIMENSIONAL ANALYSIS

The Dimensional Analysis Test is a fundamental quality control procedure that aims to verify that the geometric dimensions of the brick conform to the nominal dimensions specified in the standard.

NBR 8491/2012 establishes that the brick is a rectangular parallelepiped. Dimensional stiffness is ensured by extremely tight tolerances, with a maximum deviation of only 1.0 mm from the nominal dimensions of length, width and height being permitted. This precision is essential to ensure the plumb, level and uniformity of the wall, minimizing the need for adjustments on site and the excessive consumption of laying mortar.

3.8 COMPRESSIVE STRENGTH TEST

Before the compression test, seven bricks were prepared according to the specifications of NBR 8492 (ABNT, 2012). The bricks were cut with the aid of a circular saw (Makita) in order to obtain uniform halves. From these halves, the specimens were made, using a cement paste as the binding material between the surfaces, as can be seen in Figure 7. After molding, the paste remained curing for approximately 24 hours, ensuring sufficient strength for handling and subsequent steps.

Figure 7

Compressive strength test procedures

Figure 8

Compressive strength test

Source: Authors (2025).

3.9 WATER ABSORPTION

The method used for the test to determine the water absorption in the blocks is prescribed by the NBR 13555 (ABNT, 2012) and NBR 8492 (ABNT, 2012) standards. The water absorption test aims to determine the amount of water that soil-cement bricks are able to absorb when subjected to controlled immersion, observed in Figure 9. This parameter is essential to evaluate the quality of the material, since high absorption rates can indicate lower density, higher porosity and, consequently, lower durability and mechanical resistance of the brick.

The values of the average absorption percentage of the specimens cannot exceed 20%, and individually cannot exceed 22%.

4 RESULTS AND DISCUSSIONS

4.1 HYGROSCOPIC MOISTURE AND SPECIFIC MASS ANALYSES

Table 2 presents the results of hygroscopic moisture and specific mass of horizons A, B, C, A+B+C, A+B+C+gravel dust from the region of Araripina (PE).

Table 2

Experimental values obtained for hygroscopic moisture and specific mass for the Araripina regio

Horizon	Hygroscopic Humidity (%)	Specific mass (g/cm ³)
A	2,24	2,42
B	2,47	1,85
C	2,05	1,75
A+B+C	2,31	2,55
A+B+C+crushed stone dust	3,28	2,57

Source: Authors (2025).

4.2 PARTICLE SIZE ANALYSIS

From the particle size test by screening and sedimentation, the distribution of grain diameters and their respective soil percentages in each specific size range was determined. Figure 10 shows the granulometric curve of the soils analyzed. Analyzing the graph, it is possible to notice that 100% of the soil samples pass through the 4.8 mm sieve, according to the recommendations for the production of cement soil bricks of NBR 10833/2012.

It is observed that, in the mixtures of the A+B+C and A+B+C horizons plus gravel dust, the percentage of material passing through the 0.075 mm sieve was lower than that

established by ABNT NBR 10833 (2012), evidencing a deficiency of clay fraction in the samples. With this test, we have that the soils of horizons "A" and "C" have approximately 80% sand and the soil of horizon "B" has approximately 70% sand. Showing the clay deficit in these soils, since according to the Soil-cement Brick Production Booklet, the quantities should be approximately 25% clay, 25% silt and 50% sand. (IEP, 2016).

Table 3

Composition of the samples according to particle size

Composition	Diameter (mm)	Sample A (%)	Sample B (%)	Sample C (%)	Sample A+B+C (%)	Sample A+B+C+powder gravel (%)
Clay	<0.02	10	15	10	11	11
Silt	≥ 0.002 to ≤ 0.06	10	15	10	5	5
Sand	≥ 0.06 to ≤ 2.0	80	70	80	86	86

Source: Authors (2025).

Figure 10

Particle size analysis: (A) of the A, B and C horizons of the Araripina region (B) of the A+B+C and A+B+C+gravel dust horizons

4.3 CONSISTENCY LIMITS

The results of the plasticity limit, liquidity limit, and plasticity index tests of the samples are presented in Table 4. The plasticity limit is related to the amount of water added to the clay for the molding stage, which is important for processing in technological applications (SANTOS, 1989).

Table 4

Atterberg Indices

Parameter	Requirement (%)	Horizon A	Horizon B	Horizon C	Horizon A+B+C	Horizon A+B+C+residue ceramic
Limit	≤ 45	33,38	48,58	36,80	39,80	32,67

liquidity(%) (LL)						
Plasticity Limit(%) (LP)		26.36 ± 0.93	27.73 ± 4.10	29.34 ±2.04	23.35±0.25	23.38±0.80
Index of Plasticity(%) (IP)	≤18	7,02	20,85	7,46	16,45	9,29

Source: Authors (2025).

4.4 RETRACTION TEST

After the full seven days of soil in the box, it is recommended that there are no cracks in the soil or that it moves more than 20 mm away from the channel. However, the appearance of cracks and retraction in soil masses can be identified, as can be seen in Figure 11.

Figure 11

Result of the soil shrinkage test

Source: Authors (2025).

It was observed that the test carried out with the soil under study showed the formation of cracks and the separation of the ends of the gutter, varying between 0.5 mm and 1.55 cm, which led to its disqualification in the test, as can be seen in Figure 11. However, it is noteworthy that soil stabilization with cement tends to minimize the effects of shrinkage, contributing to a more adequate structural performance.

4.5 DIMENSIONAL ANALYSIS

NBR 8491 (2012), for each dimension of the specimens, it was essential to perform at least 3 determinations at different points on each face of the samples. Table 5 shows the means of the categories of length, width, and height for each line, obtained with the aid of the digital caliper, in tenth of a unit, expressed in millimeters (mm).

Table 5

Dimensional analysis (cm) - Mean values

Trace	Length (cm)	Width(cm)	Height (cm)
1:6	25,10	12,60	6,82
1:8	25,20	12,60	7,06
1:10	25,19	12,60	7,01
1:12	25,04	12,60	6,95

1:6:0,25	25,20	12,60	7,14
1:6:0,50	25,35	12,60	7,00

Source: Authors (2025).

4.6 COMPRESSIVE STRENGTH

Observing the mean resistance for each trait, it was found that only the 1:6 and 1:6:0.25 traits obtained satisfactory results higher than the minimum of 1.7 Mpa, as can be seen in Figure 12. For the 1:6:0.25 trace, it can be observed that only 2 samples obtained a result higher than 1.7 Mpa and the other samples obtained values higher than those required by the NBR 8497/2012 standard.

Figure 12

(A) Graph of the mean compressive strength. (B) Graph of the mean compressive strength (1:6:0.25)

Source: Authors (2025).

4.7 WATER ABSORPTION

According to NBR 8491/2012, the average water absorption values of soil-cement bricks should not exceed 20%, and no individual unit can present absorption higher than 22%, as observed in Figure 13.

Figure 13

Absorption graph

Source: Authors (2025).

Among the samples submitted to the water absorption test, the 1:6:0.25 Trace was the only one to present satisfactory performance, reaching the requirements established by the current technical standard. This result validates the effectiveness of this mixture in reducing the porosity of the material, ensuring its durability and suitability for the proposed use.

5 CONCLUSION

Based on the results obtained, it is concluded that the soils of the A, B and C horizons of the region of Araripina (PE) have predominantly sandy characteristics, with a deficit of clay fraction in relation to the recommendations of the technical literature for the production of soil-cement bricks. The particle size analysis showed that all samples met the requirement of 100% through the 4.8 mm sieve, according to ABNT NBR 10833/2012; however, the percentage of material passing through the 0.075 mm sieve was lower than the minimum recommended for the mixtures A+B+C and A+B+C+gravel powder, indicating low potential plasticity and lower natural cohesion of the soil.

The consistency limit tests showed that the B horizon presented a plasticity index higher than the recommended limit, while the mixtures A+B+C and A+B+C+residue remained within the normative parameters.

In the shrinkage test, it was observed the formation of cracks and separation of the ends, leading to the disqualification of the natural soil, which reinforces the need for stabilization to improve technological performance.

In mechanical performance, it was found that only the 1:6 and 1:6:0.25 traces met the minimum requirement of compressive strength established by NBR 8497/2012 (≥ 1.7 MPa), and the 1:6:0.25 trace presented more consistent results.

Regarding water absorption, only the 1:6:0.25 trace fully complied with the limits of NBR 8491/2012, demonstrating better performance in terms of durability and lower porosity.

Thus, it is concluded that, despite the granulometric limitations and the clay deficiency of the soils studied, the stabilization with cement, especially in the 1:6:0.25 trait, proved to be technically feasible for the production of soil-cement bricks in the Araripina region, meeting the main normative requirements of strength and absorption. It is recommended, for future work, the granulometric correction of the soil with the addition of fine material or adjustments in the stabilizer content, in order to further optimize the mechanical and physical performance of the products.

ABSTRACT

Tropical cities have experienced increasing urban heat island intensification due to rapid urban expansion, soil sealing, and the reduction of vegetative cover, factors that negatively affect public health, energy consumption, and overall quality of life. In the Cuiabá metropolitan region, characterized by persistently high temperatures, there is a lack of accessible digital platforms capable of integrating climate data and supporting urban planning strategies. In response to this gap, this study proposes the development of AlbedoMaps, a collaborative digital platform designed to monitor urban heat islands using remote sensing data. The

RESUMO

As cidades de clima tropical enfrentam intensificação das ilhas de calor urbanas em decorrência da expansão urbana desordenada, da impermeabilização do solo e da redução da cobertura vegetal, fatores que impactam a saúde pública, o consumo energético e a qualidade de vida. Na região da Baixada Cuiabana, caracterizada por temperaturas elevadas ao longo do ano, observa-se a ausência de plataformas acessíveis que integrem dados climáticos e ferramentas de visualização voltadas ao planejamento urbano. Diante desse cenário, o presente estudo propõe o desenvolvimento do AlbedoMaps, uma plataforma digital colaborativa destinada ao monitoramento de ilhas de calor urbanas por meio de dados de sensoriamento remoto. A metodologia fundamenta-se na modelagem conceitual da solução, utilizando dados dos satélites Landsat 8/9 e estimativas de Temperatura da Superfície Terrestre (LST), processadas por técnica Split-Window, integradas a uma arquitetura web desenvolvida em Python. Como resultado, estruturou-se um Produto Mínimo Viável (MVP) capaz de gerar mapas térmicos interativos e de incorporar princípios de ciência cidadã e sustentabilidade corporativa (ESG). Conclui-se que a proposta apresenta potencial como instrumento de apoio à governança climática local, contribuindo para a democratização do acesso à informação ambiental e para o planejamento urbano sustentável.

RESUMEN

Las ciudades de clima tropical han experimentado una intensificación de las islas de calor urbanas debido a la expansión urbana acelerada, la impermeabilización del suelo y la reducción de la cobertura vegetal, factores que impactan negativamente la salud pública, el consumo energético y la calidad de vida. En la región metropolitana de Cuiabá, caracterizada por altas temperaturas a lo largo del año, se observa la ausencia de plataformas digitales accesibles que integren datos climáticos y apoyen la planificación urbana. Frente a esta problemática, el presente estudio propone el desarrollo de AlbedoMaps, una plataforma digital colaborativa orientada al monitoreo de islas de calor urbanas mediante el uso de datos de teledetección. La metodología se fundamenta en la modelación conceptual del sistema, integrando datos de los satélites Landsat 8/9 y estimaciones de Temperatura de la Superficie Terrestre (LST) obtenidas mediante la técnica Split-Window, incorporadas en una arquitectura web desarrollada en Python. Como resultado, se estructuró un Producto Mínimo Viable (MVP) capaz de generar mapas térmicos interactivos e integrar principios de ciencia ciudadana y gobernanza ambiental corporativa (ESG). Se concluye que la propuesta presenta potencial como herramienta de apoyo a la gobernanza climática local y al desarrollo de estrategias de planificación urbana sostenible.

1 INTRODUCTION

The process of intensive urbanization in recent decades has caused significant changes in the energy balance of cities, contributing to the emergence and intensification of the so-called urban heat islands. This phenomenon is mainly due to the replacement of natural surfaces by impermeable and low-reflectance materials, such as asphalt and concrete, which alter the local thermal dynamics and increase heat retention (Oke, 1987). According to Landsberg (1981), cities profoundly modify the fluxes of radiation, ventilation and humidity, configuring their own microclimates that differ substantially from the surrounding rural areas. In tropical regions, such effects tend to be more expressive due to the high solar incidence throughout the year.

In the Brazilian context, studies have shown that cities with hot climates are more vulnerable to the impacts of heat islands, with direct repercussions on public health, energy consumption, and the thermal comfort of the population (Amorim, 2019). In an investigation on urban thermal dynamics, Morais et al. (2013) highlight that heat islands occur mainly in cities with a high degree of urbanization and result in an increase in average temperatures in urban areas compared to rural areas. In the Baixada Cuiabana, especially in the conurbation between Cuiabá and Várzea Grande, the high average annual temperatures associated with disorderly urban growth reinforce the need for technical instruments that support mitigation and urban planning strategies (Souza et al., 2025).

The advancement of remote sensing technologies has significantly expanded the possibilities of urban environmental monitoring. The estimation of Land Surface Temperature (LST) by means of thermal images from Landsat satellites has been consolidated as a method widely used in the scientific literature (Sobrino; Jiménez-Muñoz; Paolini, 2004). According to Jiménez-Muñoz et al. (2014), split-window algorithms allow the recovery of surface temperature with greater accuracy, becoming strategic tools for spatio-temporal analysis in urban contexts. However, despite the methodological robustness of these approaches, the results produced remain, in many cases, restricted to the academic environment, with low public accessibility and limited integration with local governance instruments.

In this scenario, initiatives based on citizen science emerge as promising alternatives to bring scientific production and society closer together. Bonney et al. (2009) highlight that collaborative projects expand community engagement and strengthen scientific literacy, contributing to more participatory decision-making processes. At the same time, the incorporation of environmental impact metrics and corporate sustainability practices has been pointed out as a relevant mechanism for the viability and continuity of socio-environmental

projects, especially when articulated with international reporting and transparency benchmarks (GRI, 2021).

It is in this context that AlbedoMaps is inserted, whose conception originated in the Bachelor of Science and Technology course at the Federal University of Mato Grosso (UFMT), within the scope of the discipline Integrator Seminar IV. Structured by academics of the course as an extension action aimed at real problems of society, the project articulated knowledge of thermal physics, remote sensing and development of web systems, proposing a digital platform for interactive visualization of urban thermal patterns in the Baixada Cuiabana. Although born in an academic environment, the project was conceived with the potential for practical applicability and scalability.

In view of the gap identified — not in the absence of thermal analysis methods, but in the lack of accessible digital tools that integrate data, visualization, and social participation — the following research question is formulated: how can a digital platform based on Landsat data contribute to the monitoring of urban heat islands and support climate governance strategies in the Baixada Cuiabana?

Thus, the general objective of this work is to propose and describe AlbedoMaps as an interactive web platform structured in the format of Minimum Viable Product (MVP) for visualization of urban thermal patterns. Specifically, it seeks to: (i) integrate LST estimates derived from Landsat 8/9 data through the split-window technique; (ii) develop web architecture capable of providing interactive thermal maps; (iii) outline engagement mechanisms based on citizen science; and (iv) propose a sustainability model based on environmental impact metrics aligned with international benchmarks. By delimiting these objectives, it is intended to contribute to the debate on digital innovation applied to the urban climate, offering a technological proposal applicable to cities with a tropical climate.

2 THEORETICAL FRAMEWORK

2.1 URBAN HEAT ISLANDS AND TRANSFORMATIONS IN THE CLIMATE OF CITIES

Initially, it is important to understand that Urban Heat Islands (ICU) are defined as a horizontal thermal anomaly, characterized by the increase in temperature in the built environment compared to its rural surroundings (Amorim, 2019). This phenomenon is mainly due to the replacement of the natural soil cover by impermeable surfaces, such as asphalt and concrete, which significantly alter the urban energy balance by increasing the flow of sensible heat and reducing the evaporative cooling provided by vegetation (Sales; Sales; Mendonça, 2022). As a result, there is greater thermal storage during the daytime and gradual release of heat throughout the night, intensifying thermal discomfort in urbanized areas.

From a theoretical point of view, heat islands can be classified into three distinct levels: surface, related to the temperature of the earth's surface; the urban canopy layer, associated with the air between buildings; and the urban border layer, which surrounds the atmospheric portion above the city (Amorim, 2019). This distinction is particularly relevant, as it guides both analysis methodologies and mitigation strategies, especially when remote sensing techniques are employed to estimate the Earth's Surface Temperature (LST).

In addition, although heat islands are often associated with large metropolises, recent research shows that small and medium-sized cities also have significant thermal differences in relation to rural areas. Amorim (2019, p. 23) highlights that the urban climate problem is not restricted to large centers, stating that:

It is evident that problems related to the urban climate, such as the generation of heat islands, the impacts triggered by precipitation events or the problems resulting from atmospheric pollution are more visible and perceived by the population in large urban agglomerations. However, in the various studies carried out in Brazilian climatology, and at the international level, it has been verified that as well as in large urban centers, medium and small cities have also undergone strong transformations in the natural landscape, materialized through different forms of air, water, soil and subsoil pollution, in addition to transformations in the morphology and structure of the urban environment. Rivers and streams are channeled or have their courses altered; the morphology is modified through embankments and constructions; The vegetation is removed. (Amorim, 2019, p. 23)

From this perspective, the understanding that heat islands are an expression of the socio-spatial transformations promoted by the urbanization process, regardless of the demographic scale of the city, is expanded. Studies carried out in Brazilian municipalities indicate thermal differences of more than 6 °C between urban and rural areas (Amorim, 2020), showing that the phenomenon is not restricted to large capitals. In addition, a strong correlation is observed between surface water stress and temperature increase, reaching rates of up to 96% between soil moisture reduction and thermal intensification (Sales; Sales; Mendonça, 2022). These data consolidate the scientific consensus regarding the central role of vegetation cover and water availability in urban climate regulation.

At the same time, the impacts of heat islands go beyond the environmental dimension, reaching the sphere of public health. Technical reports indicate that heat waves are associated with increased mortality from cardiovascular, respiratory, and kidney diseases (Brasil, 2025). In this context, vulnerable groups, such as the elderly – due to their lower capacity for thermoregulation – and children – due to physiological immaturity – become particularly susceptible to the extreme effects of district heating.

Given this scenario, the literature points to different mitigation strategies. Bioclimatic Urbanism proposes the use of natural ventilation through urban parameters, such as the coefficient of use and progressive setbacks between vertical buildings (Brandão; Barbosa; Barbirato, 2019). In a complementary way, the implementation of green infrastructure and the use of high reflectivity materials, associated with the increase in urban albedo, are recognized as effective measures in reducing the accumulation of sensible heat (Cutieru, 2021; Brandão; Barbosa; Barbirato, 2019).

2.2 URBAN ALBEDO AND RADIATIVE BALANCE OF BUILT SURFACES

In the context of urban climate change, urban albedo — understood as the ability of city surfaces to reflect incident solar radiation — is a fundamental variable in the thermal regulation of the built environment. In physical terms, the greater the reflectance of a surface, the lower the amount of energy absorbed and converted into sensible heat. However, the urbanization process has promoted the replacement of natural surfaces by artificial materials, such as asphalt and concrete, whose radioactive properties favor greater energy absorption, directly contributing to the intensification of heat islands.

In this context, mitigation strategies based on the modification of the optical properties of materials have been widely discussed in the literature. It is recommended to use cold materials, characterized by high solar reflectance and high thermal emittance, attributes that make it possible to maintain lower surface temperatures. As demonstrated by Muniz-Gäal et al. (2018), the thermal efficiency of roofs is directly related to their ability to reflect solar radiation and emit accumulated heat. The authors show that light colors have higher reflectance values; however, they point out that surface roughness can increase absorptance due to the greater number of interreflections of the incident radiation. Thus, the relationship between reflectance and thermal performance proves to be more complex than a simple association between color and temperature.

To measure this solar heat rejection capacity, the Solar Reflectance Index (SRI) is used, which incorporates both the reflectance and the emissivity of the material. Comparative studies indicate that glazed ceramic tiles, especially in light shades, have superior thermal performance when compared to concrete tiles (Muniz-Gäal et al., 2018). Thus, the choice of construction materials plays a strategic role in urban thermal mitigation, particularly in cities located in regions with a hot climate.

However, the analysis of albedo cannot be dissociated from urban morphology. The radiative balance in cities is profoundly influenced by the configuration of so-called urban canyons, where multiple internal reflections of solar radiation produce the so-called "cavity

effect". Pereira and Marinoski (2022) demonstrate that increasing solar reflectance on facades and pavements can reduce surface temperatures; however, simultaneously, it can raise the radiation incident inside the canyon due to the successive reflections between the vertical surfaces. Therefore, interventions based exclusively on increasing albedo must consider the geometric complexity of urban space.

In addition, the distribution of radiative flux in long waves is a central element to understand urban thermal behavior. Machado (2009) demonstrates that urban morphology directly influences the redistribution of nocturnal thermal radiation, especially in vertical areas, where there is greater heat trapping. The relationship between the height of the buildings and the width of the roads — expressed by the H/W ratio — proves to be decisive in this process, since deeper canyons tend to reduce thermal dissipation and intensify energy storage.

More recently, the literature has broadened the discussion by incorporating albedo as an indicator of urban resilience. Ferreira and Vieira (2025, p. 3), when relating surface reflectance and climate adaptation, state that:

The albedo or hemispheric reflectance — which represents the fraction of solar radiation reflected by a surface — plays a crucial role in urban thermal regulation, influencing the urban climate, energy consumption in buildings, and greenhouse gas emissions [...] Given the relevance of albedo for urban resilience and mitigation of climate impacts, this article presents the methodology used to calculate the percentage of urban areas with high albedo (AAA), devoid of vegetation cover. The measurement of this indicator, described in ABNT NBR ISO 37123:2021, contributes to monitoring and promoting resilience to heat in urban areas, supporting strategies to mitigate greenhouse gas emissions, and promoting adaptations, contributing to sustainable urban development. This process requires a systemic approach, with integration of multidisciplinary data, where data collection and systematization of information is essential for the consolidation of integrated municipal management plans in parallel with the development of public policies. (Ferreira; Vieira, 2025, p. 3)

From this approach, it is observed that albedo is no longer just a physical-radiative variable and starts to assume a strategic role in sustainable urban planning. The need for multidisciplinary data integration and information systematization reinforces the importance of digital tools capable of translating technical metrics into accessible spatial representations.

3 METHODOLOGY

The present study is characterized as an applied research, of exploratory and descriptive nature, oriented to the development of a technological solution aimed at the monitoring of urban heat islands. It is the conception and modeling of a digital artifact — AlbedoMaps — structured from the perspective of design science research, a methodological approach aimed at the creation and evaluation of artifacts intended to solve real problems

(Hevner et al., 2004). Unlike purely empirical research, this approach prioritizes the construction of technological solutions that are theoretically grounded and validated for their technical feasibility.

The delimited study area corresponds to the Baixada Cuiabana, covering mainly the municipalities of Cuiabá and Várzea Grande, in the state of Mato Grosso. The choice of this region is based on its tropical continental climate condition, marked by high temperatures throughout the year and prolonged periods of drought, factors that favor the intensification of heat islands. In addition, the dynamics of urban expansion and the scarcity of public thermal visualization platforms reinforce the relevance of the proposal.

To estimate the Land Surface Temperature (LST), data from the Landsat 8 and Landsat 9 satellites were used, especially the thermal bands of the TIRS (Thermal Infrared Sensor) sensor. The use of Landsat images is widely consolidated in the scientific literature for urban thermal analysis, due to its adequate spatial resolution and free availability (Sobrino; Jiménez-Muñoz; Paolini, 2004). The processing of the images followed standardized steps: conversion of digital values (Digital Numbers – DN) into spectral radiance; conversion of radiance to brightness temperature; and application of the split-window technique for atmospheric correction and obtaining the LST.

The split-window technique was adopted for its efficiency in recovering surface temperature from thermal bands, considering atmospheric variations and surface emissivity (Jiménez-Muñoz et al., 2014). As the authors point out, the application of algorithms based on the difference between thermal bands allows reducing errors associated with atmospheric interference, increasing the reliability of thermal estimates. The processing was carried out through scripts developed in Python language, using libraries aimed at the manipulation of geospatial data, which ensures replicability and methodological transparency.

As far as the development of the platform is concerned, the architecture was structured into two main components: backend and frontend. The backend was responsible for the organization, storage and treatment of geospatial data, while the frontend was designed as an interactive interface for cartographic visualization of thermal patterns. This modular structure favors scalability and future integration with new indicators, such as metrics related to urban albedo and climate resilience.

The conceptual modeling of the platform also considered the possibility of integration with normative indicators, such as the percentage of urban areas with high albedo (AAA), described in ABNT NBR ISO 37123:2021, as discussed by Ferreira and Vieira (2025). Although the complete calculation of this indicator has not been operationalized at this stage, its methodological forecast reinforces the systemic character of the proposal and its

compatibility with sustainable urban planning strategies.

From an ethical point of view, the research used exclusively public remote sensing data made available by international space agencies, not involving the collection of personal data or sensitive information, which does not require submission to a research ethics committee.

Finally, limitations inherent to the study are recognized, especially those related to the spatial resolution of the Landsat data and the dependence on adequate atmospheric conditions for image acquisition. In addition, as it is a Minimum Viable Product (MVP), the platform still requires improvements in terms of automatic data updating and integration with local sensors. However, such limitations do not compromise the conceptual validity of the proposal, but indicate paths for future development.

4 RESULTS AND DISCUSSIONS

Based on the methodology adopted, a Minimum Viable Product (MVP) of the AlbedoMaps platform was structured, capable of integrating remote sensing data and providing interactive thermal maps referring to the Baixada Cuiabana. The processing of Landsat 8 and 9 images allowed the estimation of the Earth's Surface Temperature (LST), evidencing spatial patterns compatible with the literature on urban heat islands. The areas with higher building density and lower vegetation cover had higher surface temperatures than the less urbanized peripheral regions, corroborating findings previously described by Amorim (2019) and Morais et al. (2013).

The cartographic visualization revealed more intense thermal concentrations in areas characterized by high soil impermeabilization, which reinforces the understanding that the replacement of vegetation cover by artificial surfaces contributes significantly to the increase of sensible heat flux (Sales; Sales; Mendonça, 2022). Such spatial patterns confirm the scientific consensus that urban morphology and land use exert a determining influence on the thermal dynamics of cities (Oke, 1987).

From a technological point of view, the platform demonstrated functional feasibility by allowing interactive navigation, identification of critical areas, and potential future integration with normative indicators, such as the percentage of urban areas with high albedo (AAA), as discussed by Ferreira and Vieira (2025). The modular structure adopted, with Python backend and interactive frontend, proved to be adequate for the organization and presentation of geospatial data, ensuring transparency and methodological replicability.

When comparing the results obtained with the literature, there is convergence regarding the relevance of remote sensing as a tool for urban thermal diagnosis. According

to Sobrino, Jiménez-Muñoz and Paolini (2004), the estimation of the LST by means of Landsat data is a robust method for spatial analysis of heat islands. In addition, the application of the split-window technique, as systematized by Jiménez-Muñoz et al. (2014), proved to be adequate to reduce atmospheric interference, increasing the reliability of thermal estimates.

However, unlike most of the studies analyzed, which focus exclusively on the technical analysis of data, this proposal advances by structuring a digital instrument aimed at democratizing access to climate information. In this sense, AlbedoMaps is close to the perspective of citizen science discussed by Bonney et al. (2009), by enabling technical data to be translated into representations understandable to the non-specialized public, expanding the potential for social engagement and support for urban governance.

However, it is necessary to recognize limitations inherent to the study. The spatial resolution of Landsat images (30 meters) may not capture thermal microvariations at a very local scale, especially in areas of complex urban morphology. In addition, the absence of in situ validation by means of meteorological stations or urban sensors constitutes a methodological limitation, restricting the comparative analysis between surface temperature and air temperature. Such aspects point to the need for future integration with local weather data and urban IoT sensors.

Another limitation refers to the fact that the system is in the MVP stage, requiring improvements related to the automatic updating of images and the incorporation of additional metrics, such as vegetation indices and formal indicators of urban resilience described in ABNT NBR ISO 37123:2021. Despite this, the results obtained indicate technical feasibility and practical relevance of the proposal.

Thus, the results not only confirm patterns already described in the literature on heat islands, but also contribute by proposing a model of integration between climate diagnosis, interactive visualization and potential articulation with public policies. By combining remote sensing, digital architecture, and an environmental governance perspective, AlbedoMaps positions itself as a promising tool to support sustainable urban planning in tropical cities.

5 CONCLUSION

This article presented AlbedoMaps as a proposal for an experimental application developed within the scope of the Integrator Seminar III discipline of the Bachelor's Degree in Science and Technology at the Federal University of Mato Grosso (UFMT). The initiative emerged as an extension action aimed at the practical application of interdisciplinary

knowledge acquired throughout the training, articulating fundamentals of urban climatology, remote sensing and development of web systems.

By proposing a digital platform for viewing urban thermal patterns in the Baixada Cuiabana, the study sought to respond to the gap between scientific production on heat islands and the accessible availability of this information to public managers and civil society. In this sense, the work reinforces the importance of integrating environmental data, technological tools and urban planning, contributing to the strengthening of local climate governance.

Although the application is in the experimental phase and structured as a Minimum Viable Product (MVP), its conception demonstrates technical feasibility and potential for expansion. More than presenting consolidated results, the study offers a replicable methodological and technological model, which can be improved through the incorporation of new metrics, empirical validations, and integration with urban sensors.

Thus, the main contribution of the work lies in the articulation between teaching, extension and technological innovation, showing that academic projects can transcend the university environment and be configured as instruments to support urban sustainability. By emerging from a curricular component aimed at solving real problems, AlbedoMaps reaffirms the role of interdisciplinary training in the construction of digital solutions applied to contemporary climate challenges.

ACKNOWLEDGMENTS

We would like to thank the Faculty of Science and Technology (FCT), an academic unit of the University Campus of Várzea Grande (CUVG) of the Federal University of Mato Grosso (UFMT), for the institutional support and the academic environment that enabled the development of this work within the scope of the Bachelor's Degree in Science and Technology. Also recognizing the importance of the curricular component Integrator Seminar III as a training space that encouraged the articulation between teaching, extension and technological innovation applied to real problems.

AN ALTERNATIVE APPROACH FOR DEFINING PLANT BREEDING

UMA ABORDAGEM ALTERNATIVA PARA DEFINIR MELHORAMENTO DE PLANTAS

UN ENFOQUE ALTERNATIVO PARA DEFINIR EL MEJORAMIENTO VEGETAL

<https://doi.org/10.56238/sevened2026.008-202>

Paulo Sérgio Lima e Silva¹

ABSTRACT

Currently, the definition of plant breeding most widely accepted by breeders describes breeding as the art and science of improving plant heredity to benefit mankind. According to the proponents of this definition, the art lies in the intuition, discernment or ability of the breeder to identify superior phenotypes, or in their capacity for making better decisions, etc.; while, the science of plant breeding, lies in applying the knowledge of various fields of science so that the breeder can achieve his goals. This study proposes an alternative approach for defining plant breeding. Considering that the various actions taken by breeders when carrying out their work depend on human cognition and emotion, it is suggested that breeding be defined as a science in which cognitive and emotional processes are employed to modify a plant genotype in order to make the plants more useful to man.

Keywords: Action. Cognition. Emotion. Concept.

RESUMO

Atualmente, a definição de melhoramento de plantas mais aceita pelos melhoristas descreve que o melhoramento é a arte e a ciência de melhorar a hereditariedade das plantas em benefício da humanidade. De acordo com os defensores desta definição, a arte dependeria da intuição ou discernimento ou da habilidade do melhorista para identificar fenótipos superiores ou ainda da capacidade do melhorista de tomar melhores decisões etc. A ciência do melhoramento de plantas, segundo a definição, implicaria na aplicação dos conhecimentos de várias ciências para que o melhorista possa alcançar seus objetivos. No presente trabalho, propõe-se uma abordagem alternativa para se definir melhoramento de plantas. Considerando-se que as várias ações dos melhoristas para realizar seu trabalho dependem da cognição e da emoção humanas, sugere-se que o melhoramento seja definido como a ciência em que processos cognitivos e emocionais são empregados para modificar o genótipo das plantas de modo a torná-las mais úteis ao homem.

Palavras-chave: Ação. Cognição. Emoção. Conceito.

RESUMEN

Actualmente, la definición más aceptada de fitomejoramiento entre los fitomejoradores la describe como el arte y la ciencia de mejorar la herencia vegetal para beneficio de la humanidad. Según quienes defienden esta definición, este arte depende de la intuición o el discernimiento del fitomejorador, de su capacidad para identificar fenotipos superiores o de su capacidad para tomar mejores decisiones, entre otras. La ciencia del fitomejoramiento, según esta definición, implica la aplicación de conocimientos de diversas ciencias para que el fitomejorador pueda alcanzar sus objetivos. En este artículo, se propone un enfoque alternativo para definir el fitomejoramiento. Considerando que las diversas acciones de los fitomejoradores para llevar a cabo su trabajo dependen de la cognición y la emoción humanas, se sugiere definir el fitomejoramiento como la ciencia en la que se emplean procesos cognitivos y emocionales para modificar el genotipo de las plantas y hacerlas más útiles para los humanos.

Palabras clave: Acción. Cognición. Emoción. Concepto.

1 INTRODUCTION

Cognition — defined as the mental processes used by animals to gather, accumulate and use information about the external world — is fundamental to the decisions they make, such as where to live, what to eat or with whom to mate (Sol et al., 2025).

Various researchers have drawn attention to the importance of cognition in science. For example, Nersessian (2024) argues that scientific thinking is one of the most sophisticated expressions of the creative potential of human cognition. However, the way scientists think has, until now, played a limited role in research into cognitive science (Nersessian, 2024). Concern with the importance of cognition in research is not new: the book, 'The Cognitive Basis of Science', published more than 20 years ago, includes 18 topics on the subject (Carruthers et al., 2002).

Cognition is being studied in several areas, including aviation (Martins, 2016), education (Weidman and Baker, 2015), sports (Eldadi and Tenenbaum, 2025) and medicine (Stiegler and Tung, 2014). In plant breeding, the subject has been addressed rarely, directly or indirectly, in relation to decision-making. Directly, some articles have been published dealing with strategies (Kusmec et al., 2021), criteria (Jones and Cassells, 1995), models (Michel et al., 2025) and simulations (Sun et al., 2011) to assist in decision-making in breeding. Indirectly, the topic has been mentioned occasionally. For example, in defining plant breeding as both science and art, Hallauer et al. (2006) and Vencovsky et al. (2012) state that art remains a component of plant breeding since the breeder has to make decisions. In some articles, decision-making is considered one of the most important cognitive processes (Shahsavarani and Abadi, 2015).

The study of cognitive processes is crucial for understanding the way humans think (Shi, 2021), learn (Weizmann, 2023) and interact with the world (Olschewski et al., 2024). This allows for the development of interventions to address cognitive deficiency (Vance et al., 2016), improve educational practices (Cherukunnath and Singh, 2022) and enhance decision-making in various areas of life (Olschewski et al., 2024). Cognition differs among individuals (Logie, 2018), which can affect training in plant breeding and in improving the efficiency of breeding programmes. In medicine, probably the area where the most studies on cognition and emotion have been conducted, and excluding the fields that make up the cognitive sciences, such studies are relatively common. For example, it has been found that training in Surgical Cognitive Simulation has a statistically significant impact on improving surgical performance (Cragg et al., 2021).

Several of the suggested definitions for plant breeding are similar and consider it to have two components: art and science. For example, "Breeding is the art and science of

improving plant heredity for the benefit of humankind” (Sleper and Poehlman, 2006). “Plant breeding is the science, art, and business of improving plants for human benefit” (Bernardo 2002).

The aim of this study is to present a definition for plant breeding from the point of view of cognition.

2 PLANT BREEDING AS ART AND SCIENCE

The definition of plant breeding as both art and science has now been accepted by several generations of breeders. The art of plant breeding implies the breeder's ability to discern, through observation, the differences between the plants they manage in order to make selections (Agrawal, 1998). As an art, plant breeding depends on the intuition and previous experiences of each breeder (Borém et al., 2002; Elsen et al., 2013), as well as requiring subjective judgment when planning and implementing a breeding program. The art of plant breeding also involves the so-called “breeder's eye”—the intuition that tells the breeder that one parent, progeny group or cultivar is better than another (Bernardo, 2002). The art of plant breeding lies in the breeder's ability to distinguish between desirable and undesirable plant characteristics, so that only plants with the best agricultural merit reproduce in succeeding generations (Chahal and Gosal, 2006). As such, the success of plant breeding depends on the breeder's ability to identify which phenotypes will be expressed in the next generation (Hallauer et al., 2006).

As a science, plant breeding depends on a theoretical and practical knowledge of several areas of science, including genetics, statistics, agronomy and phytopathology, among many others (Borém et al., 2002; Agrawal, 1998; Chahal and Gosal, 2006). The sciences related to plant breeding provide the breeder with an objective basis for deciding which parents to cross, which selection methods to use, which progenies to keep and which cultivars to release (Bernardo, 2002).

3 EVOLUTION OF THE CONCEPT OF PLANT BREEDING

The concept (Table 1) of plant breeding evolved (Duvick, 1996; Hallauer, 2011) based on when it was formulated, but it has never lost its essence of being the art and science of manipulating plants for the benefit of man (Hallauer, 2011).

Has the definition of plant breeding also evolved to keep pace with the evolution of the concept? Apparently, one could say yes, with two changes. Firstly, including science, since plant breeding was originally considered only as an art. Secondly, for some, placing more

emphasis on science and, for others, more emphasis on art. Essentially, the definition has not evolved.

According to Hallauer et al. (2006), both art and science have contributed significantly to cultivar development; however the relative importance of art versus science has changed significantly over the last 150 years. Initially, phenotypic selection was practised between individual plants to obtain the ideal phenotype: success depending on the breeder's ability to identify phenotypes that would be expressed in the next generation. This ability to identify superior phenotypes depended on how effectively the plant breeder could visualise what might constitute superior improved cultivars. The art of the plant breeder was effective in developing cultivars that were phenotypically uniform for specific characteristics, however, the selected characteristics did not directly contribute to increased productivity. Selection was effective for characteristics of higher heritability, but relatively ineffective for those where heritability was lower, such as grain yield (Hallauer et al., 2006).

Figure 1

Concept and Definition

Concept and definition

Concepts are cognitive symbols (or abstract terms) that specify the characteristics, attributes or properties of a phenomenon in the real or phenomenological world that they are intended to represent and that distinguish them from other related phenomena (Podsakoff et al., 2016). The formation of concepts is the gathering and compilation of true statements concerning a given object. To determine the result of this compilation, an instrument is necessary. This instrument consists of any word or sign that can translate and establish the compilation (Dahlberg, 1978). From a scientific point of view, a concept is a cognitive symbol that has meaning for the scientific community that uses it (Podsakoff et al., 2016).

A definition is a statement that describes a concept, allowing it to be distinguished from other associated concepts (Lara, 2004). Definitions are indispensable assumptions in argumentation and communication, and are necessary elements in the construction of scientific systems (Dahlberg, 1978).

Science has become a more important component of plant breeding as fresh knowledge (from genetics, breeding, statistics and various other sciences) has generated methods, processes, techniques and concepts that help increase breeding efficiency. These concepts and studies, often referred to as 'milestones in breeding', have afforded a scientific basis for plant breeding. Several authors present lists of such milestones (Gonal et al., 2023; Ramalho et al., 2025).

Art, however, also remains a component of plant breeding, as the breeder needs to make decisions such as the choice of parents to be included in crosses, the size of the population to begin the selection, the phenotype preferred by producers (or clients), the generation(s) to be used for testing, and the target environments in which the cultivars will mainly be grown. But due to the statistical analyses available to assist plant breeders in their choices, such decisions are becoming ever more grounded in science (Hallauer et al., 2006).

It is the opinion of various breeders that plant breeding emerged as an art before becoming a combination of art and science (Elsen et al., 2013), and that the trend is for it to become more of a science than art (Hallauer et al., 2006; Jiang, 2013). However, for others, the trend is for it to remain more art than science (Duvick, 1996). According to Duvick (1996), plant breeders universally rely more on experience and art than on genetics.

4 AN ALTERNATIVE APPROACH TO DEFINING PLANT BREEDING

Definitions (Figure 1) that do not fully express scientific concepts can complicate learning a science and hinder the effective learning of a student. Poor definitions can be the result of (Wong et al., 2020) a lack of precision, lack of consistency, circularity and a lack of scope. (Podsakoff et al., 2016; Wong et al., 2020).

At least three points should be considered when defining plant breeding in terms of art and science. Art, presented as the intuition, distinction, skill, etc. of the breeder seems somewhat vague. There also seems to be some inconsistency among plant breeders: some value art more, others science. Thirdly, it can be questioned whether art and science should be considered in isolation or whether they should interact? Should the definition of plant breeding include other components in addition to art and science? What are the underlying processes of art and science?

5 STAGES OF PLANT BREEDING

Plant breeding is a continuous and cyclical process that involves identifying plants with desirable characteristics (yield, quality, resistance to abiotic and biotic factors, etc.) and developing strategies to combine these characteristics in order to obtain superior varieties (Acquaah, 2012). Although plant breeding is a continuous process, some authors tend to divide it into stages or phases.

Schnell (1982) was the first to divide a plant breeding programme into stages. He considered the following: the generation of genetic variability, selection, and the experimental testing of cultivars. Other breeders began to consider the stages defined by Schnell (1982) in varying degrees of detail (Bishaw and Gastel, 2009; Ceccarelli, 2009; Weltzien and Christinck, 2009, among others).

6 ACTIONS

6.1 DEFINITION

Action control is one of the most fundamental topics in cognition, as humans interact with the environment through goal-directed behaviours, i.e. through actions. Action is a fairly

generic term that describes several different types of phenomena, from a movement directed towards achieving a specific goal to behaviours in which the means and ends are temporally distant. The term action can be used in two ways: as a generic term indicating any type of intentional motor behaviour and as a specific term referring to goal-directed behaviours that produce a reward for the individual (Rizzolatti et al., 2001).

The notion of 'action' is not synonymous with 'movement'; this concept will be used in the broader sense of 'intentional action'. Such a notion implies that actions: (i) are motivated by goals and may or may not achieve those goals; (ii) often involve some degree of volitional control; (iii) require planning and decisions between alternatives; (iv) involve forecasting or anticipating an intended outcome; (v) are often, though not always, associated with a sense of agency, i.e. awareness by the agent of performing the specific action and of its objectives (Engel et al., 2013).

An activity comprises a pattern of multiple actions over time. Activities are intuitively far more complex than actions, but also better represent the actual life of a human being. This is because humans often carry out multiple actions simultaneously in a variety of temporal combinations (Liu et al., 2016).

Branchi (2022) defined behaviour as all the actions and associated mental states carried out or experienced by an individual in interacting with the environment. Behaviour includes everything an organism does, whether observed or not. This emphasis on behaviour should be valued in biopsychology, as behaviour is a crucial evolutionary determinant of survival. It is what organisms do (e.g. finding shelter, escaping predators, mating, or caring for offspring) that matters. As a result, the nervous system has evolved to meet the demands of interaction with and adaptation to the environment. As Engel and Schneiderman (1984) observed, "the *raison d'être* of the central nervous system is to optimise the organism's ability to interact with its environment". Behaviour is the way living beings interact with the world. Behaviour is a phenotype and, as such, depends on genetic and environmental factors. Behaviour is a product of a nervous system that processes sensory data from the environment: a nervous system that is integrated with the skeletal, circulatory, digestive and other systems to generate and regulate behaviours. The activities of this nervous system involve thousands of expressed genes but itself does not express behaviour. Although brain activity can be detected in the form of electrical impulses or bright spots on a computer screen during a brain scan, these phenotypes are not behaviours in themselves. Thought is an internal process that occurs in the brain but that cannot be directly detected by an external observer (Wahlsten, 2019).

6.2 TYPES OF ACTION

Humans interact with the environment in at least two different ways depending on whether the behaviour pattern is selected by the agents themselves or determined by external information (Wenke et al., 2009).

One type of action is carried out primarily in response to environmental demands. In this case, the choice of action is implied by external information. For example, it's normal to stop at an intersection when the traffic light is showing red. Such an action is considered stimulus-controlled. Once stimulus-response associations are established, external stimuli trigger their associated reactions more or less automatically (Wenke et al., 2009).

In another type of action, the agents themselves select the appropriate action. This selection is usually aimed at producing a specific environmental effect or satisfying a particular need. This class of action has two distinctive psychological characteristics: it involves internal generation of the action and a mental representation of the effects of the action (Wenke et al., 2009).

The regions of the brain involved in these two types of action are separable, at least in part. The response to external stimuli predominantly recruits a circuit that involves the parietal lobes and lateral premotor areas. In contrast, the generation of internal actions depends more on the medial-frontal areas of the brain, including the supplementary premotor area and the cingulate motor areas (Wenke et al., 2009).

6.3 FACTORS THAT INFLUENCE ACTIONS

Several factors influence an action, including: motivation (Aunger et al., 2025), sensation (Khilkevich et al., 2024) and perception (McDonough et al., 2019); biological and psychological factors such as genetics (Zhou et al., 2024), neurotransmitters (Sarmiento Rivera and Gouveia, 2022), hormones (Asokan and Falkner, 2025) and physical health (Umegaki et al., 2021); basic bodily needs such as sleep (Pickersgill et al., 2022), learning (Coddington and Dudman, 2019) and memory (Heuer and Rolfs, 2020); personality traits (Akmal et al., 2025); social and cultural factors, which may include the presence of other people (Rolison et al., 2020), social norms (Zinchenko and Arsalidou, 2018), social expectations (Cloutier et al., 2011) and social context or background (Saltapidas and Ponsford, 2007); and the sensorimotor system (Riemann and Lephart, 2002). However, several authors discuss action in terms of two types of processes, cognitive and emotional, that take into account the above factors. The concepts of 'cognition' and 'emotion' are simply abstractions for two aspects of a brain at the service of action (Storbeck and Clore, 2007). Cognition and emotion contribute jointly to ongoing behaviours (Pessoa et al., 2012). The

brain constructs not only concepts of emotion, but also cognitions and perceptions, all of which serve to guide action (Hoemann and Barretta, 2019). Cognitive processes have developed to enhance the preparation, execution and regulation of action (Kiesel et al., 2023); therefore, cognition serves action (Allport, 1987). Furthermore, it has been proposed that the distinction between cognition and emotion be eliminated (Pessoa, 2018; Pessoa, 2019).

7 COGNITIVE PROCESSES

Few authors have presented any definition of cognitive processes (Aizawa, 2015; Jarecki et al., 2020). Newen (2015), in a study entitled 'What are cognitive processes? An example-based approach', argues that cognitive processes can only be characterised with a clear scientific definition of what cognition is. According to Newen, cognitive processes are procedures that process all the information (be it multiple or complex) that human beings receive from the surrounding environment. This processing has the aim of transforming the information into easily manageable cognitive tasks (Newen, 2015). Table 1 presents a list of cognitive processes based on the brain model proposed by Wang and Wang (2006).

Is there any evidence that cognitive processes are involved in actions? According to Wurm and Eriguc (2024), recognising goal-directed actions is a computationally challenging task, requiring not only a visual analysis of body movements but also an analysis of how these movements causally impact and consequently induce a change in the target objects of the action. They tested the hypothesis that analysing body movements and the effects they induce depends on distinct neural representations in the superior parietal lobe and the anterior inferior parietal lobe. In four sessions of functional magnetic resonance imaging (fMRI), participants viewed videos of actions (e.g. breaking a stick, crushing a plastic bottle) together with stick figures in point-light displays, pantomimes and corresponding abstract animations of agent-object interaction. According to the authors, the results showed that the parietal cortex and the lateral occipitotemporal cortex are attuned to the physical characteristics of action, such as how body parts move in space relative to each other and how they interact with objects to induce a change (e.g. in position or shape/configuration). The high level of abstraction revealed by the results suggests a general neural code that underlies mechanical reasoning of how entities interact with each other and have an effect on one another.

8 EMOTIONS

8.1 THE NATURE OF EMOTIONS

Lindquist et al. (2022) argue that emotions are determined by both biological and cultural factors. According to those authors, academic debate about the nature of emotion traditionally pits biological and cultural influences against each other. One side of the debate emphasises the role of genetics, neurophysiological anatomy and the biological evolution of mammals as causal mechanisms of universal human emotions. These biological factors have led some scholars to look for emotional similarities among different human cultural groups, which are possibly the product of shared biological adaptations. For example, one study used machine learning to classify facial expressions that were repeated in 6 million YouTube videos across 144 countries during emotional events (such as weddings, sporting competitions and protests). The authors found global variation in the basic rate of emotional situations and in the movements of facial muscles that occurred in these situations, but they also discovered that an *a priori* set of 16 patterns of facial-muscle movements appeared worldwide. Each time a particular pattern occurred, up to 70% of the time and across various cultural contexts, it was in a similar situation (such as at a wedding). These findings have led researchers to conclude that discrete emotions are products of biological natural selection.

Table 1

Layered model of the brain (Wang and Wang, 2006, with modifications)

Subconscious processes		Conscious processes	
Layer 1 (sensations)	Layers 2 to 4 (memories, perception, actions)	Layer 5 (metacognitive processes)	Layer 6 (cognitive processes)
Sensory cognitive processes	Subconscious cognitive processes	Metacognitive processes	Higher cognitive processes
1.1. Vision	2. Memory	5.1. Attention	6.1. Recognition
1.2. Hearing	3. Perception	5.2. Concept Formation	6.2. Images
1.3. Smell	3.1. Self-awareness	5.3. Abstraction	6.3. Comprehension
1.4. Touch	3.2. Motivation	5.4. Search	6.4. Learning
1.4.1. Heat	3.3. Disposition	5.5. Categorisation	6.5. Reasoning
1.4.2. Pressure	3.4. Goal definition	5.6. Memorisation	6.6. Deduction
1.4.3. Weight	3.5. Emotions	5.7. Knowledge representation	6.7. Induction
1.4.4. Pain	3.6. Sense of spatiality		6.8. Decision- making
1.4.5. Texture	3.7. Sense of movement		6.9. Problem- solving
1.5. Taste			6.10. Explanation
1.5.1. Salty	4. Actions		6.11. Analysis
1.5.2. Sweet			6.12. Synthesis
1.5.3. Bitter			6.13. Creation
1.5.4. Sour			6.14. Analogy
1.5.5. Pungency			6.15. Planning
			6.16. Quantification

The other side of the debate emphasises the roles of local ecology and cultural learning in the production of culturally relative emotions. Human groups live in different ecologies, follow different norms and values, and throughout history have experienced different levels of intergroup exposure. These cultural facts have led some scholars to assume that different cultural backgrounds vary how humans around the world experience, express and perceive emotions. For example, cross-cultural variation can be seen in self-reported emotional experiences in the neural correlates of emotional experience and perception, in producing facial-muscle movements and in perceiving emotion in the faces and voices of other people (Lindquist et al., 2022).

8.2 DEFINITION OF EMOTION

There is no consensus among researchers regarding the definition of emotion (Mobayed, 2024, for example). Kleinginna and Kleinginna (1981) reviewed the topic and proposed the following definition: emotion is a complex set of interactions between subjective and objective factors, mediated by neuro-hormonal systems that can (a) give rise to affective experiences, such as feelings of arousal, pleasure or displeasure; (b) generate cognitive processes, such as emotionally relevant perceptual effects, evaluations and labelling; (c) activate generalised physiological adjustments to conditions of arousal; (d) lead to behaviours that are often, but not always, expressive, goal-oriented and adaptive.

Izard (2010) administered questionnaires containing questions related to emotion to 35 researchers. She found that several researchers stated that emotion influences thinking, decision-making, actions, social relationships, well-being, and physical and mental health. However, there was no consensus among the researchers on a definition of the word emotion, and current data suggest that it cannot be defined as a unitary concept. Theorists and researchers have attributed very different meanings to emotion.

8.3 CLASSIFYING EMOTIONS

Ekman (1969) identified six basic emotions: anger, disgust, fear, joy, sadness and surprise. Anger is defined as fury, frustration and resentment towards others. Disgust is synonymous with aversion, distaste or repugnance, and is the most visceral of the six emotions. Fear arises in the presence of a stressful or dangerous stimulus perceived by the sensory organs. When the fight-or-flight response appears, the heart rate and respiratory rate increase. In addition, the muscles become more tense to deal with threats in the environment. Joy or happiness is a pleasant emotional state, synonymous with contentment, satisfaction and well-being. Sadness is the opposite of happiness, characterised by sorrow,

disappointment and anguish. Surprise is triggered by an unexpected outcome to a situation, ranging from astonishment to shock.

Russell and Mehrabian (1977) proposed a dimensional approach in which any emotion is represented in relation to three dimensions: valence (positive/pleasurable or negative/unpleasant), activation (engaged or unengaged) and dominance (degree of control a person has over their affective states).

Plutchik (2003) proposed a model in the shape of a wheel comprising eight basic emotions that include joy, confidence, fear, surprise, sadness, disgust, anger and anticipation. The model describes emotions based on intensity, with strong emotions placed in the centre and weaker emotions placed towards the edge of a flower-shaped model.

8.4 EVIDENCE THAT EMOTIONS INFLUENCE ACTIONS

There are many studies that demonstrate how emotion impacts perception and behaviour. For example, Pereira et al. (2006) showed that viewing unpleasant images interfered with the performance of a basic non-emotional visual detection task. In a subsequent study, Pereira et al. (2010) used functional magnetic resonance imaging to test the hypothesis that, if the interaction of affective and motor signals underlies the effects of behavioural interference, the responses evoked by viewing unpleasant images would be correlated with the brain responses evoked during motor action. They further predicted that the slowdown in response times during unpleasant blocks might be linked to responses in regions of the brain involved in integrating emotional and motor signals, such as the cingulate cortex. As in the first study (Pereira et al., 2006), the participants performed a simple target-detection task following the presentation of unpleasant or neutral images. The results showed that an unpleasant emotional context modulated the responses evoked in various regions involved in the simple target-detection task (Pereira et al., 2010). In particular, the mid cingulate cortex was recruited when participants performed target-detection tests during the unpleasant context, with the signal responses in this region closely reflecting the behavioural interference pattern (as revealed by the reaction time). According to the authors, the results suggest that the mid cingulate cortex may be an important site for the interaction between negative valence signals and motor signals in the brain, and that it may be involved in implementing defensive responses.

9 RELATIONSHIP BETWEEN EMOTION AND COGNITION

Okon-Singer et al. (2015) showed that emotional signals, emotional states and emotional traits can strongly influence key elements of continuous information processing,

including selective attention, working memory and cognitive control. This influence often persists beyond the duration of transient emotional challenges, perhaps reflecting slower changes in neurochemistry. In turn, the circuits involved in attention and working memory contribute to the voluntary regulation of emotion. The distinction between the 'emotional' and 'cognitive' brain is tenuous and context-dependent. In fact, there is compelling evidence that regions (e.g. dorsolateral prefrontal cortex, mid cingulate cortex) and processes (e.g. working memory, cognitive control) conventionally associated with cognition play a central role in emotion. Furthermore, supposedly emotional and cognitive regions dynamically influence each other through a complex network of recurring, often indirect, anatomical connections, in ways that jointly contribute to adaptive behaviour. Taken together, these observations show that emotion and cognition are deeply intertwined in the structure of the brain, suggesting that widely held beliefs about the main constituents of the 'emotional brain' and of the 'cognitive brain' are fundamentally flawed.

10 RELATIONSHIP BETWEEN THE ACTIONS OF PLANT BREEDERS AND COGNITIVE AND EMOTIONAL PROCESSES

With the aim of completing each stage of plant breeding, breeders carry out various activities, including writing texts, taking notes, acquiring materials and equipment; implementing, conducting and harvesting experiments; keeping or disposing of seeds, performing calculations, giving lectures, etc. An observer watching the plant breeder would see the actions used in these activities. For example, when the breeder is writing a text, the observer might note the arrangement of the breeder's fingers and hands on the keyboard, or when consulting a source, the breeder's gaze directed at the monitor, etc. In short, the observer would see the action processes, but not the cognitive or emotional processes. The former might include the choice of words, the way the text is organised, the topics covered, etc.; while the latter might include, among others, the joy of having done a good job, the fear of having failed to include relevant information, and the anxiety that some readers may not have understood what was written.

Marano et al. (2025) conducted a study that illustrates what has been presented regarding cognitive processes. They assessed how handwriting and typing differentially activate regions of the brain associated with motor control, sensory perception and higher-order cognitive functions. Handwriting activates a broader network of brain regions involved in motor, sensory and cognitive processing. Typing involves fewer neural circuits, resulting in more-passive cognitive engagement.

In terms of emotional processes, Citron (2012) found that more-recent electrophysiological studies, together with hemodynamic neuroimaging, have clearly demonstrated that emotional variables affect written word processing at the very early stages, facilitating and enhancing the processing of emotionally important words, and recruiting areas of the brain previously associated with both more-basic emotional processing (e.g. the amygdala) and emotional experience (e.g. the anterior cingulate cortex and the medial prefrontal cortex).

11 A DEFINITION OF PLANT BREEDING

Based on the above, the following definition of plant breeding is proposed: a science which employs cognitive and emotional processes to modify plant genotypes in order to make the plants more useful to man. This definition may have certain limitations. Existing knowledge of cognitive and emotional processes is still limited. For example, there is no consensus on how to define cognition and emotion. It is not known whether cognition and emotion are the same process. It is also still debated whether cognition is brain-bound or extended, embodied, embedded or enacted. However, the proposed definition will surely be improved as knowledge of the cognitive sciences increases.

ABSTRACT

This research aims to understand how photography is constituted as a sign of information on the Instagram account of the Federal Government of Brazil. To achieve this, we will conduct a study of discursivity at a non-verbal level, analyzing a set of 15 photographs published on this social network during the week of March 30, 2024, in carousel format. Considering the role of language in society and of discourse in the organization of reality, this general objective unfolds into other specific objectives, selected according to the Principle of Pertinence (Barthes, 2001). Among them is the reflection on the relationships between information and power, as well as between public communication, oriented toward citizenship, and political communication, oriented toward ideological propaganda. Anchored in Barthesian semiology, the following analytical categories were adopted: discourse (sub-category: photography) and power according to Barthes (1978), information according to Capurro (2007), and the reflection by Brandão (2009) on public and political communication. Finally, we observe that the fabric of discourse indicates the subjection of the signs of information to the meanings of Lula's Power, converting public communication into political communication.

Keywords: Public Communication. Political Communication. Photography. Information. Discourse.

RESUMO

Esta pesquisa tem como objetivo compreender de que forma a fotografia se constitui como signo de informação no instagram do Governo Federal do Brasil. Para isso, realizaremos um estudo da discursividade em nível não verbal, de um conjunto de 15 fotografias publicadas nesta rede social, na semana do dia 30 de março de 2024, em formato carrossel. Considerando o papel da linguagem na sociedade, e do discurso na organização da realidade, esse objetivo geral se desdobra em outros, específicos, eleitos pelo Princípio da Pertinência (Barthes, 2001). Entre eles está a reflexão sobre as relações entre informação e poder, assim como entre a comunicação pública, orientada para a cidadania, e a comunicação política, orientada para a propaganda ideológica. Ancoradas na semiologia Barthesiana, pautamos as seguintes categorias de análise: discurso (sub-categoria, fotografia) e poder para Barthes (1978), informação para Capurro (2007), e na reflexão de

Brandão (2009) sobre comunicação pública e política. Por fim, observamos que a trama do discurso indicia o assujeitamento dos signos da informação aos sentidos do Poder de Lula, convertendo a comunicação pública em uma comunicação política.

Palavras-chave: Comunicação Pública. Comunicação Política. Fotografia. Informação. Discurso.

RESUMEN

Esta investigación tiene como objetivo comprender de qué manera la fotografía se constituye como signo de información en el Instagram del Gobierno Federal de Brasil. Para ello, se realizará un estudio de la discursividad a nivel no verbal, a partir del análisis de un conjunto de 15 fotografías publicadas en esta red social durante la semana del 30 de marzo de 2024, en formato carrusel. Considerando el papel del lenguaje en la sociedad y del discurso en la organización de la realidad, este objetivo general se desdobra en otros objetivos específicos, seleccionados según el Principio de Pertinencia (Barthes, 2001). Entre ellos se encuentra la reflexión sobre las relaciones entre información y poder, así como entre la comunicación pública, orientada a la ciudadanía, y la comunicación política, orientada a la propaganda ideológica. Ancladas en la semiología barthesiana, se adoptaron las siguientes categorías de análisis: discurso (subcategoría: fotografía) y poder para Barthes (1978), información para Capurro (2007), y la reflexión de Brandão (2009) sobre comunicación pública y política. Finalmente, observamos que la trama del discurso evidencia la sujeción de los signos de la información a los sentidos del Poder de Lula, convirtiendo la comunicación pública en una comunicación política.

Palabras clave: Comunicación Pública. Comunicación Política. Fotografía. Información. Discurso.

1 INTRODUCTION

Language, as a system of signs, and the discourses we produce through it, are forms of man's intervention in the world, which constitute a dialectical game through which the subject realizes himself, relates to the other (or others), and understands and explains the world around him. There is no subject outside language, just as there is no non-discourse (Barthes, 1981).

Media discourses, in turn, occupy a privileged place in society, since they are produced and distributed quickly and comprehensively: they are everywhere, all the time. Constituted by a diversity of languages, they manifest themselves in different ways, in multiple supports, and are intermediaries of social daily life. Therefore, such discourses can be opinion makers, consensus, reproduction or transformation of ways of being in the world.

It is these media discourses, for example, that express the places of power in the social structure, and offer lenses through which we can read this world. Therefore, the media space is also a public space (Habermas apud Correia, 1998). In addition to being constituted by the discourses of private life, consumption and leisure, they should be a place for the circulation of discourses about collective life, what we need to share as a society. In this sense, it deserves a close look at the very notion of what is public, and of public communication.

The concept of "public" indicates a wide range of meanings and contexts, from the public realm of information and resources, to the public space where social and political interactions take place. Public communication, on the other hand, ranges from government and institutional communication to mass media and social networks on the internet, where individuals can express themselves and interact on a global scale. The task of guaranteeing communication of this nature is everyone's, but above all, of the institutions that work for citizenship, and that, therefore, are also crossed by political institutions, of active participation in the construction of society through the propagation of certain ideas of the world, which want to be dominant.

Added to this scenario is the diversity of languages, formats and supports through which media discourses, and therefore political audiences, materialize. According to Kossoy (2000), we live in the civilization of the image, a cultural and social phenomenon in which discursive forms do not materialize solely, nor primarily, in verbal form, but overflow into imagetic languages, with the production of videos, photographs, illustrations and a myriad of other manifestations and developments, which circulate beyond the traditional means of communication, also in cyberspace.

Photography, as a particular reference of these manifestations, is a preponderant form of visual communication and as a discourse, it is multifaceted. It can be used in different ways

to communicate, inspire, provoke reflections and point to various perspectives of reality, contributing to the construction of an idea of the world and the formation of identities. As a means of capturing and "freezing" moments, events, and lived realities, photography carries information, produces meaning, and offers a tangible, and often emotionally impactful, visual interpretation of the world around us.

These are the assumptions that motivated us to combine: discourse, communication (public and political), information, photographic image and power, translating them into the following research problem: how photography constitutes itself as a sign of information on the Instagram of the Federal Government of Brazil. This general objective unfolds into other specific ones, chosen by the Principle of Belonging (Barthes, 2001), such as the reflection on the relations between information and power, as well as between public communication, oriented towards citizenship, and political communication, oriented towards ideological propaganda.

To answer this question, we chose to carry out a study of discursivity at a non-verbal level, from a set of 15 photographs published on *Instagram* (a social network on the internet), in the week of March 30, 2024, in carousel format by the profile *@govbr*. Anchored in Barthesian semiology, as the theoretical foundation of the research and method of approaching the object, we guided the following categories of analysis: discourse (sub-category, photography) and power, both for Barthes (1978), information, for Capurro (2007), and public communication, for Brandão (2009).

2 SEMIOLOGY: A THEORY AND A METHOD

Semiology is the science that studies signs and the processes of meaning production. According to Roland Barthes (1978), semiology is a discipline that examines how signs function in systems of signification. He says that signs are the fundamental units of meaning that make up complex semiotic systems. The semiologist, when speaking of the construction of the sign, distinguished the "signifier", which is the physical form of the sign (for example, a written word or a gesture), from the "signified", which is the concept or idea associated with the signifier. The simultaneous association of both generates what we call a sign. A set of signs organized in a system, in turn, constitutes Language.

Barthes (1978) states that society uses language to structure reality, organize signs and weave a discourse to "understand" the world around it. When we analyze the ways in which this discursivity manifests itself, we will perceive expressed in these manifestations, the ideas (or ideologies) that certain subjects or groups have of reality. In this way, we affirm that Power is always present in the discourse.

Above all, because of the old tenacity of a Barthesian certainty: what makes language suffer is ideology. Our Western languages are tired of making sense, in vicious and vicious semantic circles. We have arrived at a kind of engorgement, of semantic bottling, in which the meanings fight and self-annul, in a historical-discursive situation that Barthes characterized. (BARTHES, 1978, p.44)

Semiology is a theory and it is a methodology. As an investigation procedure, it is constituted through the Principle of Relevance (Barthes, 2001), which presupposes the explanation of facts, linked to a point of view, taking advantage of certain traits and discarding others. It is the pertinence between the object and its problematization that is materialized in a set of categories of analysis, responsible for intermediating the translinguistic (social reality) and the discourse. The author says that anchored by these categories we can question the discourses about the relations of meaning they produce among themselves and with the translinguistic (that which, strictly speaking, is outside a certain discourse, but crosses it).

These categories are also markers that point to structural elements of this reality, observable in the use of figures of speech, their conflicts, their subversions and their achievements. In this study, the *a priori categories* are: discourse (sub-category photography), power, information and public communication.

Guided by these questions, we cut out our corpus of analysis: a post made by the Federal Government of Brazil, on the social network Instagram, on March 30, 2024. There are 10 photographs in the form of a carousel (which brings together 15 images), compiled in a single post. To make such a cut, we established a set of criteria that, in a coherent way, preserves the photographic image as the only narrative. Thus, we exclude cards, videos and photographs with graphic intervention.

As part of the methodology, the conceptualization of the analytical categories will provide us with the theoretical assumptions to study their discursive marks in the structure of the text, in the use of figures of speech, and in the game between the signs constituted by the chosen images.

2.1 SPEECH

Barthes (1978) explains discourse as the possibility of saying something about something to someone. It is a dialectical game, based on the structure and mobility of signs, which combined give the receiver the opportunity to construct meanings about what is being said. Barthes (1981) believes that all the discourses we produce, but also those to which we connect, are constituted by who we are, the time in which we are living, by the relationships we create with the subjects who make up the scenarios with us, and by the way we install meanings in the text fabric.

As a category of analysis, to think about discourse is to think about its form, the resources we use to construct our narratives, the organization we propose to signs and the plasticity we give it, especially because the grammar of languages, in some way, crystallizes certain structures, and they are tensioning of the senses, which often force us to say.

It is not only phonemes, words and syntactic articulations that are subject to a parole regime, since we cannot combine them in any way; it is the entire sheet of discourse that is fixed by a network of rules, constraints, oppressions, repressions, massive or tenuous at the rhetorical level, subtle and acute at the grammatical level [...]. (Barthes, 1978, p. 14).

In the case of this investigation, the language of discourse is visual, and its form is photography, so to think about its grammar, or its foundations, is to think about the objective principles that can affect semiosis, and its polysemy. Therefore, photography is a sub-category of analysis.

2.1.1 Photography

When we look at the theme in Barthes (1984), we find an association between photography and death, like a death certificate. Historically, it is marked by the action of reproducing to infinity something or some moment that happened only once, but that through this materiality can be revisited by the reader. For Barthes (1984), every photograph represents a referent, present in the image through an aesthetic trait that reproduces it, but which after the registration, as a referent, no longer exists in our space of time, outside the photographic image.

However, it is the photographer who makes a choice, when he finds the referent, in the act of registration. According to Flusser (2002), this gesture is characterized as a leap, or a series of leaps, through which the photographer overcomes the barriers that separate time and space. From his lens, he looks, limits and puts into perspective what he wants to resonate with the image. On the other hand, in this act, he also delimits and excludes what he does not want to capture, what he wants to leave on the sidelines, allowing us to think about what the photograph does not show, but which may have been there at that moment.

Barthes (1981) says that these choices are guided by the photographer's ideology, and his subjective perception of the captured object and the world. Therefore, when we propose to analyze a photographic record, it is necessary to rescue certain contexts from which the subject speaks, so that we can recognize the meanings produced not only by what we see, but also from what is absent in the image. For the author, photography communicates different meanings for each reader, and for the photographer. Seeking to objectify these

distinctions, he associates these meanings to the feelings provided by the photographic image in the subjects.

There is a *studium* and a *punctum* in the photographs for each reader. "The *Punctum* of a photo is the chance that stings me in it" (Barthes, 1984, p. 28), that which particularly touches me, and may even indicate a feeling of loss or pain. The *Studium* is that which, in the image, carries a historical or social relevance, reflecting the intentions of the person who is photographing, and which can be perceived as a function of the culture of the person who reads it. In other words, after all, what makes us want to record a scene? They are "the same vague, uniform, irresponsible interests that we have for people, spectacles, books, which we consider distinct" (Barthes, 1984, p. 27). To observe these two elements is to signify the photographic image.

2.2 POWER

The manifestation of power is present in the most varied social actions, whether formal or informal, passing through the fraternal and family relationship, and moving to business organizations and political institutions. Power, for Barthes (1978), however, is not a matter of polarization (where some have it and others do not), but it is one of the means of ideological expression present in human relations and that is not reserved to the spaces of the State or institutionalized hierarchies (Barthes, 1978). It invariably accompanies our history, but it varies over time and contexts, and also exists as a potency, a libido that gives pleasure to the world.

We then guess that power is present in the finest mechanisms of social exchange: not only in the State, in classes, in groups, but also in fashions, in current opinions, in spectacles, in games, in sports, in information, in family and private relationships, and even in the liberating impulses that try to contest it [...] (Barthes, 1978, p.6).

In turn, language appears here as an alternative expression for these relations, and discourse can behave as excluding or inclusive, depending on the way in which power manifests itself, and in the face of it, it can mean its maintenance or subversion.

2.3 INFORMATION

According to Capurro (2007), two contexts in which the term information is used must be taken into account : the act of communicating knowledge and the act of shaping the mind. In the sense of communicated knowledge, it plays an important role in contemporary society, since it refers to the set of knowledge gathered on a given subject that can be transmitted or shared. In the second context, that of shaping the mind, it refers to the consequence of data

processing, in such a way that it represents a modification in the knowledge of the human or non-human system, which receives it.

Information can be presented in written form (printed or numerical), oral, sound or audio and visual, and its intense and fast circulation is one of the main characteristics of our society, called the information society.

Reinforcing the meaning of Capurro (2007), Hohlfeldt (2001) says that information is a set of organized and processed data, which can produce meaning or knowledge. It has the potential to be stored, transmitted by various means of communication, and interpreted. "In its etymological sense, 'inform' means 'to give shape to'. But what exactly is being 'formatted'? On the one hand, matter, very certainly, because it is a matter of elaborating material traces", on the other, a potential communication that enables the sharing of meanings between consciousnesses (Hohlfeldt 2001, p.17). Thus, information is a communication that can be activated and understood by the subjects of the discourse.

2.4 PUBLIC COMMUNICATION

The main concept of public communication concerns the practice of communication carried out by government organizations and public institutions to inform, engage and interact with citizens, legitimate ways for a government to bring information to the attention of all. This field encompasses a variety of activities and strategies aimed at promoting civic participation and building trust in so-called public institutions.

According to the author Brandão (2009), to the extent that public communication is oriented towards accountability, engaging the population in the programs adopted, recognizing the actions that are promoted in the political, economic and social areas, promoting a public debate, can also be recognized as an instrument for building the public agenda.

The communication promoted by the governments (federal, state and municipal) can be concerned with awakening civic sentiment (examples of recent advertising campaigns are: "the best of Brazil is the Brazilian" and "good example"); (elections, recently the referendum on the sale of firearms and ammunition); protect and promote citizenship (vaccination campaigns, traffic accidents, etc.), or call on citizens to fulfill their duties (the "Lion" of the Federal Revenue, military enlistment). (BRANDÃO 2009, p.5)

The Federal Constitution of Brazil recognizes and guarantees the right to information as a fundamental right of citizens, establishing the obligation of public bodies to provide information of public interest. In this sense, the author observes a gradual change in the scenario of public communication from the first decade of the twenty-first century. For her,

this change is linked both to the growing demands for transparency and accountability, and to the transformations in the field of communication, especially with the popularization of social media.

Brandão (2009) recalls that the concept of public communication must take into account the different agents involved in the communication process and recognize their interdependence. Under this assumption, an effective approach would involve the collaboration and active participation of all these actors, aiming to promote dialogue, inclusion and accountability in the public sphere. However, even with the advances of the last decades, it is noticeable that there are still setbacks in the development and implementation of public communication projects in Brazil.

According to Duarte (2009), one of the main challenges in this sector is to make this issue a priority within organizations, by allowing the population to know about the actions developed for the dissemination of information. Still, it is possible to highlight another "difficulty", which the author mentions: the difficulty of detaching public communication from the image of politicians. Neto (2004, p. 101) corroborates this orientation: "government propaganda should primarily inform what is being done and not who is doing it", so that the constitutional principle of impersonality is respected (BRASIL, 1988, art. 37, caput).

Based on these assumptions, a secondary question of this research is related to information and public communication: what are the profile photos of the Brazilian Federal Government informing? From these categories, we move on to the analysis.

3 ANALYSIS: A CAROUSEL OF INFORMATION ON POWER

The present work analyzed the discursivity in a publication made on March 31, 2024, on the official instagram of the Federal Government of Brazil. The post refers to the agenda experienced by the federal government that week. Among the events is the visit of the President of France, Emmanuel Macron, who was in Brazil to strengthen the partnership between the nations, learn about the riches of Brazil and make agreements.

The photographs reveal themselves to the reader in the form of a carousel³. These are 15 images, presented in a linear sequence of 10 clicks. In some of these images there is more than one photograph, usually two, pasted horizontally on the same interface. Below are the 10 figures corresponding to these images, presented in the order of scrolling of the carousel, as they are published on the Federal Government's Instagram profile:

³ Carousel is a publishing format offered by the digital social networking platform, *Instagram*. This format consists of the publication of a set of images, in a pre-defined sequence, which can be accessed by the reader user by passing his finger over the initial image, in a lateral direction.

Figure 1

Source: Federal Government Instagram Profile – @govbr

Figure 2

Source: Federal Government Instagram Profile – @govbr

The sequence of images refers to the most important events of the week for the federal government, as they are endorsed by the set of featured photographs. Figures 1 to 7 illustrate the visit of the President of France, Emmanuel Macron to sign military cooperation agreements, launch of the 3rd Brazilian submarine, the result of this partnership, and a visit to the Amazon rainforest, the focus of interest and collaboration of numerous foreign countries under the justification of environmental preservation. Finally, the last 3 images (**figures 8, 9 and 10**) show the "Pé de Meia" program, which is configured as a financial incentive from the government to high school students who are in the public network.

That said, we move on to the first category of analysis, that is, the **Discourse category**. As we have already mentioned, this category focuses on the form of the discourse, or rather the material substance that a given discourse appropriates to pronounce itself. In this case, this substance is mainly the photographic image. However, in this case, it is also the form that the structure of the social network imprints on the non-verbal text, based on the resources it makes available by housing the compilation of images.

Paying attention to this element is as important as looking at the very linguistic materiality that the discourse appropriates, since photographs published on Instagram configure the discourse from different connections and under different aspects: the post itself, the post as part of so many other posts in the same feed, and this feed as a discourse among many others, officially produced by the Federal Government, by the press, and by the conversation of people in circulation on the network.

Thus, we can say that each photographic image of this carousel means by itself, but it also means from the relationship it establishes with all the other images that compose it, and along the sequence to which it belongs. But, in addition, each image, and the images in sequence, also signify in relation to the translinguistic, that is, to all other contextual texts and discourse that tension the production of a narrative, this *feed* or other *feeds*, this network or other networks, in the digital space or outside it. Meanings are produced through intersubjectivity (the punctual dialogue between these images and the subjects), but also through intertextuality, that is, between this imagetic text and all the other texts (and the discourses in them), in different languages, around them.

There is, for example, a weave between the images of Lula and Macron, in the carousel, and the numerous memes that circulated on the internet, and on social networks themselves, throughout the same period of this post. They are speeches that draw the relationships of meaning between presidents, countries, these people, these men. In this case, the memes were created from photographs of the two presidents visiting the Amazon, suggesting an intimate relationship between them, with hands intertwined, as in the pre-wedding photo shoots, which take place before wedding ceremonies. By making this allusion, indicating the idea of a 'honeymoon' between the presidents, the memes tension multiple meanings, from the connotation of Brazil's good international relations, to the institution of a lascivious character to the relationship between Lula and Macron. This tension is not deflated by the official photographs (very similar to those used in memes) published by the official profile of the federal government, on the same platform where the comic discourse circulates.

To understand this dialectical game of meanings, constituted by the crossing of both discursiveness, requires recognizing the role of the translingual, that is, of that which is outside the discourse, but is dragged into it (Barthes, 1978). This happens through understanding the context of the creation of the meme, for example, but also to the extent that we recognize its appropriation and circulation in the public space.

This intertextuality, and the very hipertextual form of cyberculture, often allow a certain discourse, in this case, that of the meme and, by contiguity, that of our carousel, to resignify itself dialogically. When a discourse falls on the net and is appropriated by public conversation, it gains in longevity and overflows the original meanings (of the meme, in the initial intention of its creation, and of the carousel, as an official government document).

Considering this, we could say that the meanings of Macron's visit, materialized by this set of images in *@gov.br*, can also mean the response to an ideological dispute, guided by the political polarization that marks the current scenario of the country. In a recent episode,

in 2019, Macron was in conflict with the Brazilian federal government, at the time, represented by Jair Messias Bolsonaro. On that occasion, the French president expressed his dislike for Bolsonaro, mainly because the Brazilian has never shown commitment to environmental agendas. Also, they had a disagreement in an internet post where Bolsonaro mocked the appearance of the French first lady, Brigitte Macron.

Thus, from the perspective of their discursiveness, alone the images used in the meme can take on a jocular tone, but in the carousel, these photographs take on an official tone. But what meanings would they have when they dialogue? We believe that in the conversation between them, and in view of their association with the translinguistic context, they can take on an official, answering tone, an inside joke, and fine irony. This impression seems to be reinforced when Macron reproduces such mimetic images in his personal profile, endorsing their meaning as a response to a past event, and pointing to the resumption of good relations between the two countries, only achieved in the face of Lula's victory in the presidential elections. It is not possible, in the conjuncture that involves nations, to read these photographs disregarding the dialogue between these discourses.

In time, still on the Discourse category, there are primordial elements of this format (instagram carousel), which are tensioners of meaning. An example is the requirement of a certain linearity of reading in front of the 15 images. Even though it is a publication on a digital platform, which means the predominance of hypertextuality, reading this set of images in particular is an essentially linear practice: they can only be accessed one after the other, in a pre-established order. This condition, in itself, establishes a hierarchy of relevance between the images and the narrative.

Established as signs, the photographs, in the order in which they are placed, tell us a story, which we can call *storytelling*. Without having to read the caption of the post, we interpreted the photographs and it could mean that Lula was with Macron signing agreements, visiting the Amazon, the indigenous people.

In fact, after 10 images of Macron, when referring to the program "Pé de meia", we feel his absence: a sign whose disappearance means. Observing the sequence and we have the impression that it is a remnant of information, which bothers us, which does not seem to be part of the narrative. Curiously, or not so much, it is precisely in these last five images that the women are, in a more expressive way. And, almost as an apology, Vice President Geraldo Alckmin appears for the first time (so that he is not forgotten).

From the point of view of the information format, a carousel composed of 10 images is configured as a long text, especially in the logic of the network and the fast-updating feeds. The farther the images are from the first photograph, the less relevant they become. After 7

passes, the last 3 images (which hold these 5 photos) draw little or no attention. To speak of this organization of the narrative, and of the arrangement of the signs, is to speak of a structural form of discourse, which is not fixed, and which, according to Barthes (1988), exerts a kind of authority over the signs, articulating them. This structure involves more than the grammar of a plane of expression, it is what creates marks to indicate a certain reading path or even limit it.

The strengthening form of the hierarchical logic of this structure also includes the framing (general plan, medium plan); the verticality of the image; the size; and the very fact that these photographs will be accessed primarily by cell phone, in a moving feed. Since it is an automatic update system, where every second the algorithm renews the profile of the users shown on the screen, and displays a variability of carousel images, the user may not receive the post immediately with the first image selected by the profile; you may not realize that there is a sequence of photographs; and you can also lose interest in scrolling the images on the second click. In view of this ellipse, reinforcing the same meaning in each image, that is, saying the same thing in different images, can guarantee the support of the main discursive argument drawn by the proposal of the post, in particular, or of the profile, in general.

Considering the aspects of the carousel shape on Instagram, we still need to observe the materiality of photography. Barthes (1984) points out that the system of signs of the photographic image is based on the game between a **studium** and a **punctum**. The first refers to a sensible interest that the image arouses, linked to the collective context of the event or the referent portrayed. The second refers to the signs that draw the reader's attention, often overflowing with sensible meaning and falling into the particularity of a subjectively evoked emotion.

In the case of **figures 1 and 2**, this historical and sensible interest of *the studium* seems to be directly linked to the understanding that nations are united and strengthened, since the centrality of the image is occupied by handshakes, smiles and official documents. When we refer to the *punctum*, this collection of elements can shed meanings, since the particular impression we have is that their combination produces a metonymy, not only because they are in sequence, but because their contiguity produces the effect of movement from the hands to the smile, from the nations to the men who represent it.

In **figure 3**, the *studium* points to the renewal of military forces, whose common sign is the submarine. However, *the punctum* refers us directly to the sense of crowd. It becomes more important than the submarine itself, in the background of the photograph, so that the people in the cluster draw more attention than the characters, Janja, Lula, Macron and the commander. A sense deconstructed by the studium of the following images, **figures 4**,

focused on the submarine, and which seems to point to the people who matter, and who together, can press the button to start launching the submarine into the sea: "not just anyone can press the button".

In **figures 5 and 6**, in the same way as **figures 1 and 2, 3 and 4**, as a narrative structure that reruns itself, we have a relationship of contiguity, submitting the signs to the structuring lines of an ideology. In them, the *studium* is associated with the sensible interest in meeting Macron and Lula in an indigenous village, dialoguing intertextually with all the narratives that have previously circulated in the conversation of the networks and in the press, where France supposedly defends the preservation of the Amazon, or where Lula and Macron are close friends. There is **nothing singular in figure 5** that echoes subjectively.

However, **figure 6** wakes us up, sharpening our gaze in the face of the mid-shot framing of the indigenous leader. The *punctum* is revealed when we notice the mouth enlarger, the headdress and the paraphernalia that adorn his face, including a necklace with his name written. According to Barthes (1981) it is the names that give us existence, the ability to name, to transform the world into language is human and subjective. The word "Raoni" printed on the adornment, works here as a meta sign, considering that "Raoni" is the sign of the indigenous, of the chief; the necklace is Raoni's sign; and, finally, the name is the sign of chief.

In **figure 7**, the *studium* is marked by the presence of the tree trunk that extends from the ground to the sky, signifying not only the Amazon forest, but its extension and sumptuousness. The *punctum*, on the other hand, appears marked by the size of these two characters, which are small compared to the trunk of the tree. The Kapok is the largest tree in Brazil, and being under these men means the grandeur of nature, before which we (humans) are only a small part.

Still, in the same figure (7), the second photograph, the *studium* sets the place of the visit: a cocoa producer. The *punctum* marks us with the presence of Lula holding a broom and doing the work of turning over the seeds. It is not someone else who does this service, Lula is doing it, and "feeling" it in his skin, what the process is like, while Macron right behind, observes. Here, we cannot help but think of the metonymy between the colonizer and the colonized, the standard and the employee.

Figures **8, 9 and 10** represent a rupture, the emergence of a new subject, suppressing common elements of the previous 7 figures. However, they reiterate a structural form, of images that appear side by side, and that seems to exist more to prove the strength of the referent than to signify the details of the event. The *studium* in both photographs points to the negotiations and the launch of yet another government assistance program. The *punctum*, on

the other hand, stands out in figure 10, lower image, associated with the presence of women, which even has its meaning highlighted in view of the absence in most of the previous photos.

The number of women in the image can even work as a compensation, given their fleeting presence in all the other figures on the carousel. Around the president, there are ministers, deputies and voters, who make the "L" sign with their hand, a sign of support for Lula. However, this "L" is also the indictment of the male provider, which associated with the previous figure (9), can mean "protective father", the one we need.

When we look at these figures, guided by the category of discourse, we perceive the liabilities of the structural forms that, from the beginning, rhetorically indicate the places of **Power**. Its signs sometimes assume ordinary and regular forms, sometimes punctual forms, but in any case, they are always present. In fact, observing the progress of the analysis so far, evidently, in the set of images, we see the institutionalized power of the president, of the Federal Government, but also of Brazil.

The power of the countries is connoted by the image of the flags (**figures 1, 2 and 8**), which serve as a backdrop for the handshake (**figure 1**); in the image of the presidents, holding the book of international agreements (**figure 2**); in the dominant colors of each nation (**figures 1, 2 and 8**), and also strengthened by the colors under the blue background, formed from fireworks that explode in the sky, behind the submarine (**figure 4**). In addition, we observe the power of France, represented by the figure of Macron, especially in these formal photographs (**figures 1, 2, 4**), but also, in a less institutional and more contextual way, as a power, due to the contribution and prominent place that this nation, coming from the developed world, illustrates through images, to give to Brazil, a developing country. In this sense, we also mean the power of Brazil, as less powerful, although revealed, to receive attention and contribution from this nation.

The agglomeration of people in the hangar also becomes a sign of Power (**figure 3**), connoting the idea of crowd. To the extent that they surround Lula and Macron, the workers dissolve the image of the authorities present in the photograph. Presidents almost do not stand out in the face of the number of people. We could associate this composition with the sign of power of the people, but we understand that in the image, it is a purposely artificial meaning, used as a resource to tension semiosis.

There is also military power or the power of physical force, made tangible by the size of the submarine, with the colors of the Brazilian flag painted on the hull and marked in the sky; as well as the group of men, made up of the president, who together press the device to launch the submarine into the sea (**figure 4**). It is as if the narrative produced the meaning of "those who can" or "of the few who have the power to do so".

We also read the signs of power of the original peoples, marked by the game between the image of nature and the indigenous. The presence of the leader Raoni among the presidents, almost as equals, and then in an exclusive portrait of him (**figure 6**). We say "almost equal", because, in fact, the one who stands out in the image is the indigenous leader himself, since the supposed authorities are wearing white, but Raoni holds a headdress of vibrant colors. The combination, in sequence, of the three images: two of the authorities, among whom Raoni is, and soon after an exclusive photograph of him, reinforce the discursive strategy of protagonism of the native peoples. This perception gains tone if we observe the intertextuality with the translingual, since the narratives about this culture have intensified since the inauguration of this government, translating into public policies and visibility. The sign of power of this cultural group has been regularly circulated by official narratives.

In dialogue with the power of the indigenous people, there is the power of nature and the forest. The first is materialized in the trunk of the Kapok, which is very large compared to the human figure (**figure 7**). There is also a direct association between the images of the tree, the cocoa and the indigenous, as a form of metonymy of the Amazon. An object of discussion between Macron and Bolsonaro, the reference to Floresta is an obvious sign and raised by the translingual, while the Brazilian political-ideological dispute, through the narrative, is effected in an obtuse way, as a crossing that disturbs the meaning. According to Barthes (1990), the obtuse is characterized by the unexpected, a meaning that emerges from the complexity of semiosis and attacks the observer.

At the same time, we have agreements being signed by handshakes (**figures 1, 2 and 8**), and the striking figure of the entrepreneur (**figure 8**), as the protagonist of the "future", through which the signs of market power or economic power are revealed.

In the last 2 images (**figures 9 and 10**), which add up to three photographs, we can see the power of women, since they add up, visually, as the majority. However, this power seems to be subjugated by the set of images that constitute the carousel, predominantly starring men. Thus, it is possible to understand that this power of women exists as a power, but a power that is not realized. Furthermore, the power of young people is materialized in the last image (**figure 10**), associated with the investment in education made by the federal government. It is about the strengthening of the power of the government and, finally, the emergence of a new power, the power of the future, consensually linked to young people, and by metonymy: "to the future of the country". Barthes (apud Friderichs, 2010) reminds us that power cannot be understood in a simplistic way, where some have it and others not, but as an energy that mobilizes us, a source of disputes.

The revelation of man's power is also predominantly observed. In this sense, when we review the sequence of images established, in a linear way, by the Carousel, the uninterrupted presence of the male figure that insistently reprints itself, gradually signifying the power of man, stands out: the hands that seal an agreement between nations are men's, the presidents are men, those who "can" launch the submarine, are men, The one who has the economic power to guarantee the future is a man, the indigenous leaders are men and, even in the images where women appear, among many, there he is, a single man, "the blessed one to the fruit", "the benevolent father who embraces and smiles" (**figure 9**). It is men who occupy the center of images and places of power, constituting a sign of the patriarchal and macho culture, through which we constitute ourselves as a society and which, for now, also prevails as a dominant discourse.

Therefore, accessing these images, in the order in which they are, makes us feel the marked presence of men in the images, especially that of the president of the republic, which is in 13 of the 15 photographs. Therefore, we believe that, through the power of men and their centrality, we also see, in a redundant way, another power, the power of Lula.

His image, in a rhetorical way, is there, to reprise the same meaning. The actions recorded, the positions chosen, the cutouts, the choice of narrative structures and the combination of signs that reveal his power: Lula as president, Lula as a political figure, Lula as a diplomat, Lula as a businessman, Lula as a lover and defender of nature and native peoples, Lula as a friend of Macron, Lula as a father who cares, and guarantees the future: a white and hetero man, which is a criterion of acceptability in the society and context in which we are inserted.

However, this power does not appear associated with the sign of the subject Lula, but with the superhero Lula, of the character Lula, artificially forged to occupy this place. Thus, although power, as a sign and mobilizing energy of the world, according to Barthes (1978), can metamorphose into a variation of forms and places, Lula's power interdicts all of them, with its own luminance of occupying the center of the spectacle.

We also have in the images the signs of **Information**. Photographs communicate the events, where we can perceive different environments and people, and apparently provide information. We perceive their signs, in a less marginal way, in figures **2, 4, 7, 8** and **10**. This is because they point to a reference materialized in action: the closing of an agreement between two nations, the launch of a submarine, a visit to the forest, a closing of deals, the launch of a program.

It is relevant to point out here the role of the articulation between the photographs that constitute figures **4, 7, 8** and **10**, in a narrative way, as well as the side-by-side sequences of

figures 1 and 2, 4 and 5, 8, 9, and 10. In the absence of other languages, the sequence of two photos, forming a single image, or of two photos of the same scene, plays the role of constructing the representation of the fact, taking us from one sign to another, from one action to another. These photographs become a sign of information because something evidently takes shape in them, as Hohlfeldt (2001) proposes, something that needs to be informed, communicated to the public, something done by the government. When they are structured in sequence or side by side, they are transfigured into signs in dialogue, producing meaning, constituting the message that carries a set of data or knowledge.

In this set of images, we believe that the data are indicted by the characters, by the elements of scenery and objects that make up the scenes, they inform us. However, it is the actions that produce knowledge, the knowledge about what is happening, what the Government is doing. Thus, when going from one term to another, such as from characters to handshakes, we have the sign of information.

However, in the Carousel format, these images are not alone, they also mean to the extent that they come into play with the set of all the other published photographs, in a narrative sequence imposed by linearity. It is considering this discursive form that we observe a disturbance in this original informative sense, since the centrality of the power endorsed by the other 5 images, the protagonism of certain characters and the *punctum* that overflows the general interest of the photo, tension and repress by the imposition of other meanings, other than the merely informative.

Far from arousing civic feeling, as Brandão (2009) requires, the construction of trust in so-called public institutions is replaced by the construction of trust in Lula. And, even though it connotes accountability, publicizing implemented programs, it fails to motivate and/or educate the population to participate in specific moments in the life of the country, to the detriment of the protagonism of this man, benevolent and hero.

Consequently, the images, published on the official profile of the federal government of Brazil, which should offer information of public interest, disclosing the government's work on behalf of the citizen, with transparency, give up doing so. **Public communication** is subject to **political communication**, and this happens in the web of signs, where Lula's power interdicts the informative sense and converts it into a propagandistic sense, as conceptualized by Neto (2004): the sequence of images indicates more who is doing it than what is being done.

4 FINAL CONSIDERATIONS

The analysis carried out on the carousel of photographic images posted on March 31, 2024, on the profile of the Federal Government of Brazil on Instagram, indicates the subjection of the signs of information, about the Federal Government's agenda, to the meanings of Lula's Power, which are reprised in the narrative, occupying a central place AND assuming the most varied signifiers: president, political figure, diplomat and father. Even in the face of the other posts on the feed, these photographic images have a narrative that uninterruptedly reinforces how Lula is a good, humble man, who knows how to "do" politics and is working for the reconstruction of a new Brazil.

In this way, public communication, expected in the official profile of the Federal Government, also surrenders to Lula's political communication, by revealing more who is doing it, than what is being done. Thus, we understand that the dynamics of the play of signs is essentially in the production of a narrative of the whole, that is, of the sequence of images, rather than of each one of them separately. This discursive form is materialized in the Carousel.

Throughout the process of this study, we are faced with the revelation of a new category, political communication, which is opposed to the category of public communication. Brandão (2009) briefly reflects on the approach frequently adopted by government communication in Brazil, with a propagandistic bias, which would represent a distortion of the objectives of communication for citizenship, something that we observed in this case: the images have an objective of promoting Lula's image.

Throughout the research we came across some difficulties and limitations, one of which would be the study of political communication, here little explored as *an a posteriori category*, and also the study of the discursive relations between the different posts in the *feed*.

ABSTRACT

Ceramic coatings are a hallmark of Brazilian construction culture, enhancing buildings with their aesthetic impact and being widely used in the national context for several decades. The appropriate selection of materials, combined with precise application processes, directly reflects on the durability and longevity of buildings. This study emphasizes that specialized knowledge not only in the selection and application of coatings, but also in the identification and understanding of possible failures, is a key factor in preventing future problems. The relationship between the individual characteristics of materials, installation methods, and exposure to environmental conditions is crucial to avoid pathologies such as detachment, which may compromise structural stability. Therefore, by deepening the analysis of ceramic coatings and presenting a case study that illustrates these concepts, this work contributes to improving the understanding of coating systems and to the continuous evolution of construction practices in the national scenario, promoting more resilient and durable buildings for the future of Brazilian construction.

Keywords: Ceramic Coating. Building Pathology. Detachment. Building Performance. Construction Quality.

RESUMO

Os revestimentos cerâmicos são uma marca na cultura construtiva brasileira, valorizando as edificações com seu impacto estético, sendo utilizados no cenário nacional por várias

RESUMEN

Los revestimientos cerámicos son una característica destacada de la cultura constructiva brasileña, valorizando las edificaciones por su impacto estético y siendo utilizados en el contexto nacional durante varias décadas. La adecuada elección de los materiales, combinada con procesos de aplicación precisos, se refleja directamente en la resistencia y longevidad de las edificaciones. Este estudio destaca que el conocimiento especializado no solo en la selección y aplicación de los revestimientos, sino también en la identificación y comprensión de las posibles fallas, es un factor fundamental para prevenir problemas futuros. La relación entre las características individuales de los materiales, los métodos de instalación y la exposición a las condiciones ambientales es crucial para evitar patologías como el desprendimiento, que puede comprometer la estabilidad de las estructuras. Así, al profundizar en el análisis de los revestimientos cerámicos y presentar un estudio de caso que ilustra estos conceptos, este trabajo contribuye a mejorar la comprensión de los sistemas de revestimiento y a la evolución continua de las prácticas constructivas en el contexto nacional, promoviendo edificaciones más resilientes y duraderas para el futuro de la construcción brasileña.

Palabras clave: Revestimiento Cerámico. Patología de las Construcciones. Desprendimiento. Desempeño de Edificaciones. Calidad Constructiva.

1 INTRODUCTION

Civil construction plays a crucial role in Brazil's economic development, generating a large number of jobs. According to the Brazilian Chamber of the Construction Industry (CBIC, 2023), the sector will continue to grow in 2023, with the expectation of a growth of 2.5%, being the third consecutive year of growth in this market.

In the context of this scenario, it is important to acquire knowledge about the materials applied in civil construction, in order to facilitate the appropriate choice of their various applications and define their properties and technological qualities. In addition, it is essential to know the construction techniques available in the market, so that there is greater training of the professionals involved, and enabling the choice of the best actions that fit into each project and execution of civil works (CALLISTER, 2002). In this context, a problem that can be pointed out is the construction defects that cause pathologies in buildings. In this work, the causes and actions necessary to treat recurrent pathologies in ceramic tiles will be discussed.

In turn, ceramic tiles are widely used in civil construction due to their durability, surface resistance, cost-effectiveness and designs, playing a fundamental role in the final finish of a project, influencing aesthetics and the whole as a whole. However, even with good durability, ceramic pieces are subject to environmental and use factors, which can result in the emergence of pathologies (ANFACER, 2021).

Detachment, cracking, cracking, efflorescence and deterioration of joints are pathologies that can occur in ceramic tiles in indoor and outdoor environments. These defects can manifest themselves in the first years after the delivery of the work due to construction failures and vices, inadequate projects and planning errors. To avoid these pathologies, it is essential to have qualified labor and follow proper planning. In addition, it is essential to carry out regular maintenance of the coatings, to extend their useful life (ESTEVEZ, 2020).

A common pathology in ceramic tiles is the detachment of the pieces, which occurs when the pieces come loose or detach from the substrate. This can result in swelling of the coating, cracking, or even complete removal of the coating. Therefore, to treat problems in ceramic tiles, it is essential to carefully analyze each situation, considering the type of ceramic, place of use, environmental conditions, and specific problems. Based on this analysis, it is possible to develop restoration solutions adapted to the needs of the affected coating, ensuring its preservation and performance (PARREIRA, 2017).

Based on the information mentioned above, the detachment of the ceramic tile in the Porto Dourado Residential condominium, Goiânia-GO, was identified, where a case study was carried out, raising the possible causes for the appearance of pathologies after the

completion of the work.

A detailed analysis of the problem, an on-site evaluation to identify the possible causes and a literature review were carried out, in order to find possible solutions for the detachment of the ceramic tile. These resolutions may involve choosing the correct bonding binder, reviewing the executive methods of laying, and performing proper maintenance.

2 THEORETICAL FRAMEWORK

In the literature review, the history of ceramics, its manufacture and properties will be addressed. As well as ceramic pathology, emphasizing the flaws, especially the ceramic detachment. Finally, executive methods and the types of mortar used to prevent these problems, highlighting their importance in the durability and performance of the material.

2.1 HISTORY AND CHARACTERIZATION OF CERAMIC MATERIALS

The first ceramics appeared in the middle of 500 BC, remaining a difficult material to access for several centuries due to its high cost and for being an innovation. The greatest advances in the area were incorporated by Italian potters between the 1950s and 1960s, introducing innovative production processes. Potters exploited the Raku method, introducing fast firing and harsh cooling for unique effects. There was a shift to contemporary ceramics, focusing on unconventional forms and sculptures. In addition, innovations in enamels allowed for vibrant colors and unique textures, revitalizing ceramics as a form of artistic expression.

Ceramics are made up of inorganic materials and chemicals, excluding metals and their alloys, which are usually produced through heat treatment at high temperatures (ABCERAM, 2004). Ceramic materials are known for their unique properties, such as hardness, resistance to high temperatures, low electrical and thermal conductivity, high chemical resistance, and good wear resistance. These properties make them useful in a wide range of applications, such as in the manufacture of traditional ceramics, advanced ceramics, glass, refractories, electrical insulators, catalysts, biomaterials, and many others. Traditional ceramics, such as clay and porcelain ceramics, are widely used in everyday products such as dinnerware, tiles, and bricks. Advanced ceramics, on the other hand, are high-tech materials with inscribed properties applied in sectors such as electronics, energy, aerospace, automotive, medical and chemical (SILVA, 2005).

It is important to note that ceramic materials are not necessarily resistant, as they are often associated, but they can have high mechanical resistance when designed and industrialized correctly. In addition, they offer advantages such as chemical stability, low density, and excellent performance in indoor and outdoor environments (CARVALHO, 2012).

2.2 CERAMIC COATING

Ceramic coating, used to cover floor and wall surfaces in indoor and outdoor spaces, is a versatile material, made from raw materials such as clay, feldspar and quartz, molded into plates and fired at high temperatures to provide strength and impermeability. It offers a wide variety of colors, textures, and prints, mimicking other materials such as wood, stone, and metal, making it a popular choice for homes, offices, hospitals, and other high-traffic environments (SABATTINI, 2000). Their advantages include easy cleaning, wear resistance, durability, and low water absorption, but disadvantages can arise such as cracks, breakage when exposed to severe impacts, the need for careful installation, and potential difficulty in replacing them if they become damaged, requiring professional installation to avoid irregularities (NUNES et al., 2015). In short, ceramic tiles combine beauty, practicality and resistance in different spaces.

2.3 MANUFACTURE OF CERAMIC COATING

The useful life of a building is the period in which it can be used for the purpose for which it was built, with satisfactory performance in terms of safety, comfort and functionality. The useful life of a building can vary depending on several factors, such as the type of use, the design, the quality of the materials, and proper maintenance.

Standard NBR 15575 (ABNT, 2013) establishes the minimum requirements for the performance of residential buildings, including the minimum expected useful life, which is 50 years. However, it is important to note that the useful life of a building can be longer or shorter than the expectation established by the standard, depending on several factors, such as the level of use, the quality of the materials, the climate, and proper maintenance. Proper and preventive maintenance can significantly extend the useful life of a building, while lack of maintenance can accelerate degradation and reduce its useful time.

2.4 PROPERTIES OF CERAMIC PLATES

Ceramic tiles for coating have characteristics determined by their properties, and through this understanding we can make specifications for their proper use.

2.4.1 Water absorption

Water absorption in ceramic tiles is an important property to consider, and is linked to their porosity, when choosing a coating for wet areas such as bathrooms, kitchens, and outdoor areas. It is measured by the amount of water that a ceramic material absorbs in relation to its weight. Coatings are classified into different water absorption groups according

to technical norms and industry standards. These ratings usually vary depending on the percentage of water in the material. The lower the percentage of water absorption, the greater its resistance to water penetration (MADEIRA, 2019).

In addition, the absorption of the ceramic allows the analysis of the type of mortar that should be used for each installation. In this way, it is clear that the proper laying of the piece depends on the assertive use of the mortar, ensuring durability and resistance, increasing the useful life of the piece.

2.4.2 Hardness

Another important property of ceramic tile is hardness, which refers to the material's resistance to deformation, scratches, or abrasion. It is a mechanical property that determines the ability of ceramics to withstand loads and resist wear and tear (MACEA, 2018).

There are several hardness scales for measuring the strength of materials, with the Mohs scale, created in 1812 by Friedrich Mohs, focusing on natural minerals, and the Vickers hardness scale, created in 1921 by Smith & Sandland in Great Britain, being more appropriate for ceramics and hard materials. The Mohs scale ranges from 1 to 10, rating the hardness of minerals. However, for ceramics, the Vickers scale is preferred, involving a specific load applied to a given area, measuring the resulting impression (HOTZA et al, 2015).

The hardness of ceramics varies considerably, with aluminum oxide, silicon carbide, and silicon nitride being examples of ceramics notable for their high hardness and wear resistance. However, when choosing a ceramic, it is crucial to consider not only hardness but also properties such as fracture resistance, toughness, and chemical resistance, according to the specific needs of the application (HOTZA et al, 2015).

2.4.3 Surface abrasion resistance

The ability to resist surface wear caused by contact with people and objects is related to abrasion resistance. This resistance can be divided into two types: surface abrasion, which occurs in enameled products, and deep abrasion, which affects non-enameled products. The Porcelain Abrasion Index (PEI), is an abrasion resistance rating system used to evaluate the durability of ceramic tiles on floors and walls. It provides information on the abrasion resistance of ceramic surfaces, classifying them according to their ability to withstand wear. The measurement of abrasion itself involves specific tests, which assess the loss of material due to deterioration (NUNES et al, 2015).

2.5 CONCEPT OF PATHOLOGY

Pathology in ceramic tile refers to problems or defects that may arise during the installation, use, or maintenance of ceramic coated floors, walls, or other surfaces. These problems can be caused by various factors, such as problems in the manufacturing process of materials, failures in the installation process, or even improper use, or lack of maintenance (DOUGLAS et al., 2017).

One of the main factors that can lead to pathology in ceramic tiles is the poor quality of the substrates on which the tile is applied. If the substrate has irregularities, cracks or deformations, this can compromise the adhesion and stability of the coating, which can lead to cracks, detachments and other types of defects (LANNA, 2012).

Another factor that can contribute to pathology in ceramic tiles is the lack of planning and efficiency of the installation process. The choice of adhesive, for example, can affect the adhesion of the coating and compromise its durability. Likewise, the lack of care in the handling and transportation of the pieces can lead to damage that will later manifest itself in the form of defects (LANNA, 2012).

In addition, the choice of the type of ceramic tile can also have an impact on the occurrence of pathologies. For example, low-quality ceramic tiles can have cracks, peeling, and other defects even when installed correctly, while high-quality and high-strength tiles can perform better in harsh conditions.

2.6 FAILURES

There are several types of failures that can occur in ceramic tiles, and their occurrence can be influenced by a number of factors, such as the quality of the substrates, the installation process, the type of coating used, among others. According to DOUGLAS et al (2017), some of the most common types of flaws found in ceramic tiles are listed.

Design or design failure: design failures in ceramic tiles can occur for various reasons, including miscalculation, external specifications, or lack of consideration of environmental conditions, and can happen in the planning part, especially in the lack of project compatibility.

Execution failure: they can be attributed to problems in the substrate, such as its inadequacy, which can result in detachment, cracks or breaks in the floor. It is essential to check and correct problems on the substrate, including removing damaged flooring if necessary. Another common failure involves poor adhesion of the mortar, which can lead to peeling and cracking. Therefore, ensuring clean and appropriate substrates for ceramics, as well as choosing the appropriate mortar, is critical. The fixation of ceramic pieces is also

critical; An even application of mortar and proper pressure during installation are essential to avoid detachment or voids. Using spacers can help maintain proper spacing between parts.

Failure of use: this type of failure occurs mainly because the user of the product does not have the necessary knowledge for the correct use of the material, and ends up resulting in misuse of it, generating several pathologies.

2.7 PEELING OFF THE CERAMIC COATING

Ceramic tile peeling occurs when the ceramic tile detaches from the base where it was laid, as shown in figures 1 and 2. This problem can be caused by several factors, such as lack of adhesion of the mortar used in laying, as the surface that will receive the mortar must be clean, free of dust, dirt, oils or other contaminants, if the surface is not properly prepared, the adhesion of the mortar can be compromised. There is also the absence of leveling of the base, which can affect the direction of the mortar, since when the base is not level, there may be empty spaces between the mortar and the surface, which reduces adhesion, this can occur in several situations, one of them being the irregular surface, since if the surface where the mortar is applied has irregularities, such as ripples, holes or bumps, this can also affect the adhesion of the mortar.

For this reason, it is important to level the surface before applying the mortar, using appropriate techniques and materials for each specific case. Finally, there is excess moisture, which, like the other reasons, also compromises the adhesion of the mortar. Excessive humidity can compromise the mortar's ability to adhere to the surface and can lead to the appearance of efflorescence, stains, and detachment, which is the focus of the work. (MADEIRA, 2019).

2.7.1 Types of mortar

According to MADEIRA (2019), there are three types of adhesive mortars that are the most used in works for the laying of ceramic tiles. The first of these is ACI, used specifically to fix floors and natural stones in internal areas, such as floors and walls. The "AC" refers to the acronym "Adhesive Mortar", and the number "1" indicates the performance rating of the product. Adhesive mortars are designed to provide a strong and long-lasting direction between the coating and the application surface. The ACI rating generally refers to a mortar that performs well for indoor areas, with little exposure to moisture, and no specific deformation requirements.

When using ACI adhesive mortar, it is important to follow the manufacturer's instructions for mixing ratio, application time, surface preparation, and other specific requirements. Each manufacturer may have different formulations and recommendations for their products, so it is essential to read and follow the guidance provided.

The ACII adhesive mortar is a type of adhesive mortar with a higher performance rating compared to the ACI. It is designed for indoor and outdoor applications with increased exposure to moisture, such as bathrooms, kitchens, and laundry areas.

The ACII rating indicates that this mortar has a higher capacity for deformation and adhesion compared to ACI. It is more suitable for situations in which there may be greater movement of the experiments, such as thermal expansion, vibration or differential settlement. When using ACII sticky grout, it is important to follow the manufacturer's instructions for the best results. This includes correctly preparing the surface, applying the mortar according to the recommended proportions, and keeping track of the indicated curing and drying times.

Be sure to read and follow the specific instructions provided by the manufacturer of your chosen ACII adhesive mortar.

Finally, ACIII sticky mortar is another type of sticky mortar with an even higher performance rating compared to ACII. It is designed for indoor and outdoor applications with high exposure to moisture, movement, and deformation, such as swimming pools, facades, and floors with radiant heating. The ACIII rating indicates that this mortar has a higher capacity for deformation and adhesion compared to ACII. It is specially formulated to withstand more intense loads and movements, maintaining a secure and lasting fixation of the coatings (GIULIANO, 2015).

As with the other classifications, it is essential to follow the manufacturer's instructions for the best results when using ACIII adhesive mortar. This includes preparing the interface, mixing the mortar as per the recommended instructions, applying it correctly, and following the curing and drying times indicated by the manufacturer. Each manufacturer may have specific formulations and recommendations for their products, so it is important to read and follow the guidance provided by your chosen manufacturer.

2.7.2 Executive methods

For a proper laying of the ceramic tile, it is necessary to use appropriate tools, as well as a qualified workforce for the service. The tools needed for the service are: carpenter's pencil, hose level, plumb, trowel, spirit level, pointer, nylon line, aluminum ruler, tape measure, articulated meter, square, nail, brush, chisel, steel or nylon brushes and sledgehammer. Other materials that may have been essential are spacers, to maintain the thickness of the joints, and soft sponges to promote the cleanliness of the environments (REBELO, 2010).

To avoid peeling in ceramic tiles, it is important to follow the manufacturer's guidelines regarding the characteristics of the substrates and mortar to be used, as well as the instructions for laying and finishing the ceramic, as specified in NBR 13754 (ABNT, 1996). It is also important to ensure that the base where the ceramic will be laid is firm, level, and free of excessive moisture, always remembering the importance of a quality system in the execution of services on the construction site.

If it has already caused detachment in the ceramic tile, it is necessary to evaluate the cause and the degree of severity of the problem. Small areas of peeling can be corrected by applying adhesive mortar or grout, while large areas may require replacing damaged coating. In more severe cases, a technical diagnosis is necessary to verify whether the cause of the detachment is related to related or design problems (DOUGLAS et al., 2017).

3 METHODOLOGY

In the methodology, the focus will be exclusively on a case study, providing specific details for a deeper understanding and analysis of the data obtained.

3.1 CASE STUDY

The study presented addresses a real case of detachment of internal ceramic coatings in a construction located in Goiânia-GO, in Residencial Porto Dourado 01, in which the possible causes of the emergence of this pathology will be addressed, such as lack of qualified labor, inadequate preparation of the substrate, use of mortar in an erroneous way or even the use of mortar not suitable for the situation and material. As well as the possible solutions, based on the literature review made.

Thus, the objective of the case study is to understand and describe the phenomenon in question, analyzing its characteristics, processes, causal relationships and contexts. It allows for an in-depth analysis of the particular case, allowing the exploration of numerous variables and perspectives.

In summary, the case study is especially useful to analyze the situation in loco, obtaining a detailed and contextualized understanding of a phenomenon considered complex. However, by observing closely, it is possible to better see how the service was performed and thus understand, through studies and research, the causes and solutions to the observed problem.

4 RESULTS AND DISCUSSION

This segment will focus on the case study, presenting the location where it occurred, a detailed description of the affected building, and the analysis of the causes that led to the identified problem. In addition, images will be displayed that illustrate the pathology in question. Consequently, the solutions adopted to effectively resolve the situation in question will be explored and detailed.

4.1 AREA UNDER STUDY

The peeling of coatings is a common pathology in vertical constructions, involving the detachment of the applied coatings. This problem can arise due to problems in the application, improper use of materials, inferior quality of the mortar, structural movements, external action and weathering. In addition to compromising aesthetics, this detachment can lead to infiltrations, impairing the integrity of the structure and contributing to problems such as the emergence of fungi, corrosion of metal structures, among others. Preventing this

pathology requires qualified professionals, compatible materials, and the study of environmental conditions. In cases of occurrence, a detailed investigation of the causes is crucial, followed by corrective measures such as removal and reapplication of coatings and structural corrections, always with specialized support.

4.1.1 Location of the building

This work is a case study carried out in a residential building, located in the city of Goiânia and in the Andreia Sector, Block 02 Lot 01, in the Porto Dourado Residential 01, and in the following geographic coordinates: 16°47'44" S (latitude) and 49°21'42" W (longitude). In Figure 3, the image of the geographical location of the construction, acquired through Google Earth, clearly reveals the presence of other vertical buildings in the same area, pointing to a clear trend towards this type of construction in the region.

Figure 3

Representation of the location of Residencial Porto Dourado 01

Source: Prepared by the authors.

4.1.2 Description of the building

It is a multifamily residential building, which was built by Vila Brasil Engenharia. It consists of 46m² apartments with two bedrooms, bathroom, living room, kitchen, service area and garage. Condominium with gym station, adult pool and children's pool, fitness area, shower, sauna, playroom, party room, square, barbecue grills, playground and grassy field.

4.1.3 Description of Observed Pathological Manifestations

The presence of issues in ceramic tile has a vital connection with the quality of the installation, playing a crucial role in its durability. As the investigation deepens, the impact of sound installation techniques will be thoroughly examined, highlighting how consistent and

careful practices can prevent and solve potential problems. In addition, the role of the materials used will be discussed, highlighting the importance of appropriate choices to ensure the integrity of the coating over time. Exploring these aspects not only broadens the understanding of the associated challenges, but also offers valuable insights to improve future facilities, promoting more resilient and high-quality outcomes. In several housing units, small protrusions were identified on the ceramic plates in bathrooms, kitchens and laundry rooms, as shown in Figures 4 and 5.

Figure 4

Representation of protrusion in ceramic coating

Source: Prepared by the authors.

Figure 5

Ceramic coating protrusion

Source: Prepared by the authors.

In some regions, there was significant detachment of the ceramic tile, indicating a lack of adhesion between the tile and the mortar used to fix it, as illustrated in Figures 6 and 7. The back of the ceramic pieces showed a lack of connection with the adhesive mortar,

resulting in little or no adhesion. This highlights the importance of proper installation and attention to detail to avoid future problems.

4.1.4 Diagnosis of possible causes and origins of pathological manifestations

Coating peeling can happen for a variety of reasons, including planning issues that didn't account for possible movement in the substrate or used a low-quality base. In addition, leaks in the walls or floor that cause moisture are also a frequent cause of this problem.

Alteration of the substrate, whether due to factors such as thermal variations, vibrations, or improper settlement, can result in the peeling off of the coating. The lack of qualification of the workforce and the application of the coating without proper preparation of the substrate are also factors that contribute to this issue.

The excessive use of water in the fixing mortar, the use of expired mortar and the adoption of inappropriate practices, methods and tools weaken the adhesion between the coating and the substrate, resulting in peeling. In addition, the choice of inappropriate products for the application of the coating can compromise its adhesion.

Based on inspections and data collected during the investigation of ceramic detachment in a specific apartment, one of the first points of analysis was directed to the possible influence of structural movement as an underlying cause of this phenomenon.

However, despite the proximity of neighboring buildings, no cracks or any signs of movement that could affect the ceramic pieces inside the apartment under study were identified. This absence of relevant structural changes in the nearby constructions led to the exclusion of structural movement as a determining factor for the observed detachment.

This finding not only dismisses one of the possible initial causes of detachment, but also highlights the structural stability of adjacent buildings, contributing to direct the investigation to other possible reasons underlying the phenomenon of ceramic delamination.

The next step of this study focuses on the detailed analysis of other hypotheses, seeking to accurately identify the underlying cause of the detachment of the ceramic pieces inside the apartment under study.

In addition to the analysis performed to rule out structural movement as the cause of ceramic detachment, another possible hypothesis considered was infiltration. Given the potentially destructive nature of the water infiltrated in the construction materials, the presence of infiltration in the apartment under study was investigated.

Contrary to initial expectations, the inspections did not reveal any traces or evidence of infiltration in the areas affected by ceramic peeling. The absence of traces of moisture, stains or damage characteristic of infiltration contributed to the discarding of this hypothesis as the cause of the observed detachment.

As in the case of structural movement, the exclusion of infiltration as an underlying cause of the detachment reinforces the need to explore other potential causes that may explain the phenomenon that occurred inside the apartment under study.

In addition, a third hypothesis considered was the displacement due to the joints between the ceramic pieces. After some evaluations, no evidence of excessive wear, adhesion failures or other problems in the joints between the ceramic tiles affected by the

peeling was identified. This finding led to the exclusion of displacement due to joints as an underlying cause of the observed phenomenon.

Thus, the absence of evidence of wear or failures in these junctions reinforces the conclusion that they are not responsible for the detachment of ceramic pieces, directing the investigation to other possible causes for this specific phenomenon.

After an analysis of the remaining hypotheses, a more concrete conclusion emerges about the cause of the ceramic detachment observed in the apartment under study. Among the possible reasons investigated, the misapplication of the laying mortar emerges as the main cause for the observed phenomenon.

Details provided by the engineer in charge corroborate the hypothesis that the inadequate technique in the application of the mortar may have played a crucial role in the detachment of the ceramic pieces. This finding is reinforced by the lack of in-depth research on the quality of the material used, suggesting that poor application may have been a determinant for the problem faced.

Considering the relevance of this finding, the understanding of the misapplication of mortar as the main cause of ceramic peeling not only clarifies the observed phenomenon, but also highlights the critical importance of the proper execution of laying processes in construction projects.

The observation during the inspection of the work revealed an inadequate application of the adhesive mortar, evidenced by its fragmented and uneven distribution on the ceramic pieces. Different points of the pieces were partially covered, leaving empty spaces and areas with little adhesion to the substrate. In some places, the application was practically non-existent, resulting in inadequate or no adhesion.

This irregular and deficient execution resulted in an unsatisfactory adhesion of the mortar, which, as a direct consequence, led to the detachment of the ceramic pieces. The inconsistent and poorly executed application of the laying mortar emerged as the preponderant factor for the observed detachment, demonstrating the critical importance of adequate procedures in the installation phase for the durability and stability of ceramic structures.

4.1.5 Discussion

The detachments identified in the apartments arose as a result of an inadequate application of the adhesive mortar. In this process, the mortar was applied in small quantities, resulting in poor adhesion between the mortar and the coating. This deficiency in adhesion caused the detachment of the coating in several units of the condominium. This phenomenon

deserves further analysis, as it has an impact not only on the aesthetics but also on the structural integrity of the housing units in question.

The coatings of the apartments underwent a replacement process due to the detachment that occurred previously. To solve this problem, it was necessary to perform a complete leveling of the base. In addition, the application of the mortar was conducted according to the appropriate techniques, ensuring effective adhesion between the mortar and the new coating. This intervention not only restored the aesthetics of the environments, but also ensured the structural integrity of the housing units, providing a safe and visually pleasing environment for residents.

5 CONCLUSIONS

The work consisted of compiling information about the elements of the ceramic tile, describing the application process and characterizing the pathologies that may arise, identifying their origins. The objective was to connect this knowledge to facilitate the understanding of the origin of failures in ceramic tiles, including specific insights obtained through the case study on delamination.

The research developed provided several conclusions about ceramic tiles and the issues related to their failures. It was possible to thoroughly examine the individual characteristics of the materials that make up this system, from the ceramic block and its properties to the mortar layers and their respective roles in the coating. In addition, we have covered ceramic plates, highlighting their proper handling and storage ways.

Identifying these elements in isolation facilitated the understanding of the system as a whole, enabling an integrated analysis of the characteristics and how they are related to the emergence of problems. We also describe the proper procedure for attaching the ceramic slabs, from the production of the mortar to the selection of the appropriate tools and the laying process, including quality checks throughout the work.

Additionally, it is important to mention that a specific case study was conducted on the delamination of ceramic tiles. This study provided an understanding of the possible causes and factors involved in this specific problem, contributing to a deeper knowledge of failures within the context of ceramic tiles.

In addition, the most common pathologies observed in ceramic tiles were detailed, with emphasis on ceramic peeling, illustrating the problem with images. Based on the knowledge acquired about the elements and processes involved, possible causes for these failures were identified.

ABSTRACT

This article analyzes the development, structure, and validation of a didactic guide constructed through the adaptation of a Rapid Assessment Protocol (RAP) for elementary education, seeking to address the problem of how such an instrument can promote critical environmental learning and assist students in understanding the socio-ecological determinants of urban river degradation. Grounded in a qualitative approach, the study combined documentary analysis, methodological adaptation of the RAP, pedagogical workshops, and field activities conducted with students from a public school in Janiópolis, Paraná (Brazil). The theoretical framework engages with references on urban water resources (Tucci, 2008; Tundisi, 2014; 2020), Rapid Assessment Protocols (Callisto et al., 2002; Guimarães, Rodrigues & Malafaia, 2012), and Critical Environmental Education (Guimarães, 2004; Layrargues & Lima, 2014), as well as the principles of the National Water Resources Policy and Sustainable Development Goal 6 (SDG 6). The results indicate that the guide fostered a critical reading of the Água dos Peões stream, enhanced students' interpretive capacity, strengthened their understanding of anthropogenic pressures, and stimulated argumentative positioning in relation to local environmental conflicts. The product proved to be scientifically and pedagogically robust, with high potential for replication in public schools and practical relevance – particularly in terms of public management – for small municipalities. It is concluded that the guide constitutes a relevant educational technology for improving school-based environmental management, fostering social participation, and supporting formative practices aligned with the National Water Resources Policy, the SDGs, and critical perspectives in Environmental Education, thereby justifying its academic, public, and social significance.

RESUMO

Este artigo analisa o desenvolvimento, a estrutura e a validação de um guia didático construído a partir da adaptação de um Protocolo de Avaliação Rápida (PAR) para o Ensino Fundamental, buscando responder ao problema de como tal instrumento pode promover aprendizagens ambientais críticas e auxiliar estudantes na compreensão dos determinantes socioecológicos da degradação de rios urbanos. Ancorado em uma abordagem qualitativa, o estudo articulou análise documental, adaptação metodológica do PAR, oficinas pedagógicas e atividades de campo junto a estudantes de uma escola pública de Janiópolis (PR). A fundamentação teórica dialoga com referências sobre recursos hídricos urbanos (Tucci, 2008; Tundisi, 2014; 2020), Protocolos de Avaliação Rápida (Callisto et al., 2002; Guimarães; Rodrigues; Malafaia, 2012) e Educação Ambiental Crítica (Guimarães, 2004; Layrargues; Lima, 2014), além dos princípios da Política Nacional de Recursos Hídricos e do ODS 6. Os resultados evidenciam que o guia favoreceu a leitura crítica do córrego Água dos Peões, ampliou a capacidade interpretativa dos estudantes, fortaleceu sua compreensão das pressões antrópicas e estimulou posicionamentos argumentativos diante dos conflitos ambientais locais. O produto mostrou-se robusto do ponto de vista científico e pedagógico, com alto potencial de replicabilidade em escolas públicas e de utilidade – em termos de gestão pública – para municípios de pequeno porte. Conclui-se que o guia constitui uma tecnologia educacional relevante para qualificar a gestão ambiental escolar, fomentar a participação social e subsidiar práticas formativas coerentes com a PNREH, com os ODS e com perspectivas críticas da Educação Ambiental, justificando sua importância acadêmica, pública e social.

Palavras-chave: Avaliação Rápida de Rios. Diagnóstico Participativo. Recursos Hídricos Urbanos. Aprendizagem Investigativa. Gestão Socioambiental. Educação Ambiental Crítica.

RESUMEN

Este artículo analiza el desarrollo, la estructura y la validación de una guía didáctica construida a partir de la adaptación de un Protocolo de Evaluación Rápida (PER) para la Educación Primaria, con el propósito de responder al problema de cómo dicho instrumento puede promover aprendizajes ambientales críticos y ayudar a los estudiantes a comprender los determinantes socioecológicos de la degradación de los ríos urbanos. Basado en un enfoque cualitativo, el estudio articuló análisis documental, adaptación metodológica del PER, talleres pedagógicos y actividades de campo realizadas con estudiantes de una escuela pública del municipio de Janiópolis (PR, Brasil). El marco teórico dialoga con referencias sobre recursos hídricos urbanos (Tucci, 2008; Tundisi, 2014; 2020), Protocolos de Evaluación Rápida (Callisto et al., 2002; Guimarães, Rodrigues y Malafaia, 2012) y Educación Ambiental Crítica (Guimarães, 2004; Layrargues y Lima, 2014), además de los principios de la Política Nacional de Recursos Hídricos y del Objetivo de Desarrollo Sostenible 6 (ODS 6). Los resultados evidencian que la guía favoreció la lectura crítica del arroyo Água dos Peões, amplió la capacidad interpretativa de los estudiantes, fortaleció su comprensión de las presiones antrópicas y estimuló posicionamientos argumentativos frente a los conflictos ambientales locales. El producto se mostró sólido desde el punto de vista científico y pedagógico, con alto potencial de replicabilidad en escuelas públicas y utilidad – en términos de gestión pública – para municipios de pequeño porte. Se concluye que la guía constituye una tecnología educativa relevante para cualificar la gestión ambiental escolar, fomentar la participación social y sustentar prácticas formativas coerentes con la Política Nacional de Recursos Hídricos, los ODS y las perspectivas críticas de la Educación Ambiental, lo que justifica su importancia académica, pública y social.

1 INTRODUCTION

The degradation of Brazilian urban rivers, intensified in recent decades, has evidenced (i) the fragility of aquatic ecosystems in the face of anthropogenic pressures and, above all, (ii) the structural limits of traditional management and education models regarding water resources. The disorderly expansion of cities, the increasing impermeabilization of the soil, the continuous discharge of effluents and solid waste and the suppression of riparian forests configure a picture of degradation that compromises the quality of water, biodiversity and the socio-ecological balance of urban environments³. These problems deepen socio-environmental asymmetries, reinforcing historical inequalities that mainly affect vulnerable and/or racialized populations – see environmental racism – whose access to quality water is systematically threatened⁴.

This scenario directly confronts the principles of the National Water Resources Policy (PNREH), which recognizes water as a public good and demands integrated, participatory and decentralized management practices (Brasil, 1997). Likewise, it highlights the distance between the global normative projections enshrined in the Sustainable Development Goals (SDGs), especially SDG 6, and the concrete reality experienced in Brazilian urban micro-basins, still marked by *deficits* in planning, monitoring and territorialized environmental education (UN, 2015). In view of this, it is found that the environmental crisis of urban rivers is simultaneously ecological, political, pedagogical and epistemological – and therefore demands strategies that transcend exclusively technical diagnoses, calling for training processes that promote a critical reading of reality and community engagement.

In this sense, Critical Environmental Education (EAC) becomes central by proposing the overcoming of merely informative practices and the defense of emancipatory pedagogical processes capable of questioning productivist rationalities and the logics of degradation of common goods⁵. By incorporating the analysis of power relations, socio-environmental inequalities and the complexity of natural and social systems, EAC positions itself as an essential training field for students to understand their territory, identify local problems, interact with their socio-natural environments and recognize themselves as subjects capable of transforming their realities.

However, school practice still lacks qualified didactic methodologies that bring students closer to environmental research, stimulating intellectual autonomy, ecological sensitivity and ability to read the territory. The absence of pedagogical materials specifically aimed at the participatory diagnosis of urban rivers constitutes one of the gaps that limit the school's

³ Tucci, 2008; Andrade et al., 2019.

⁴ Tundisi, 2014; Brazil, 2021.

⁵ Guimarães, 2004; 2013; Layrargues; Lima, 2014.

commitments to scientific, citizen and environmentally critical education. Thus, it is urgent to develop and analyze didactic instruments that articulate ecological, geographical, chemical, social and political knowledge, especially in contexts of public schools located in municipalities that face the direct effects of water degradation.

It is in this context that this article is inserted, whose main objective is to present, analyze and discuss the development and validation of a didactic guide built from a Rapid Assessment Protocol (PAR) adapted for elementary education. This educational product, derived from research linked to the Professional Master's Degree in the National Network for the Teaching of Environmental Sciences (ProfCiamb), seeks to integrate investigative practices with participatory environmental diagnosis, bringing students closer to the critical analysis of the Água dos Peões stream, in the municipality of Janiópolis (PR). The guide was developed to allow an integrated reading of the physical, biological and anthropic factors that affect the environmental quality of urban rivers, seeking to transform field activity into interdisciplinary and critical formative practice.

The problem that guides this study is summarized as the following question: how can a didactic guide structured from an adapted PAR promote environmental learning and help elementary school students in understanding and diagnosing urban rivers? To answer it, the following objectives were defined: a) to present the conceptual and methodological foundations that support the elaboration of the guide; b) describe its process of construction and adaptation, considering the specificities of the PAR and the challenges of didactic transposition; c) analyze its application and validation with students, identifying learning, limits and potentialities; d) to discuss the contribution of the guide – an interdisciplinary educational product – in the context of ProfCiamb.

Methodologically, the study is based on a qualitative approach⁶, involving document analysis, technical adaptation of the PAR, pedagogical workshops, field activities and formative evaluation of students' learning. The construction of the guide emerges from the articulation between (i) theoretical references of the EAC, (ii) technical-ecological foundations of the Rapid Assessment Protocols⁷ and (iii) pedagogical demands identified in the school context. In addition, the study contributes to the field of Environmental Science Teaching by offering a replicable, low-cost and theoretically grounded educational technology, aligned with the principles of the PNREH, the commitments of the SDGs and the transformative perspectives of the EAC. In addition, the guide mobilizes the territory as a pedagogical space, stimulates participatory research processes and expands the methodological repertoire

⁶ Minayo, 2001; Gil, 2008; Silveira; Córdova, 2009.

⁷ Callisto et al., 2002; Guimarães; Rodrigues; Malafaia, 2012; Angels; Vasconcelos; Negreiros, 2021; Bersot, Menezes and Andrade, 2015; Pedroso; Colesanti, 2018.

available to educators and environmental managers. Finally, before presenting the development of the guide and the results of the research, it will be understood below the theoretical contributions that supported its conception – especially those related to water resources, the rapid evaluation of rivers, the critical perspectives of Environmental Education and the role of educational products in professional master's degrees.

2 THEORETICAL BACKGROUND

Understanding the socio-environmental dynamics that structure the relationship between society and water resources requires an interdisciplinary and critical approach, capable of articulating legal frameworks, scientific references and pedagogical perspectives that illuminate the contemporary challenges of water management and environmental education. In a context marked by increasing pressure on aquatic ecosystems, especially in urbanized areas, it is essential to analyze how water degradation is related to historical, economic, and cultural processes that shape the territory (Tucci, 2008; Andrade et al., 2019). At the same time, the literature shows that social participation, applied research and critical school education play a strategic role in promoting qualified readings of these environments and, consequently, in subsidizing public decisions and more sustainable community practices (Guimarães, 2004; Tundisi, 2014; CAPES, 2019). In this scenario, environmental diagnosis methods such as PARs and educational products developed in professional teaching programs emerge as important mediation devices between science, education and territorial management.

The present theoretical framework, therefore, discusses four fundamental axes: (i) the degradation and pollution of water resources and the need for integrated management; (ii) the principles and educational potential of the Rapid Assessment Protocols; (iii) Critical Environmental Education as an epistemological matrix; and (iv) the role of educational products within the scope of professional master's degrees, especially in ProfCiamb.

2.1 WATER RESOURCES: DEGRADATION, POLLUTION AND INTEGRATED MANAGEMENT

Water, constitutionally recognized as a good for the common use of the people and essential to life (Brasil, 1988; 2020a; 2020b), has been subjected to increasing pressures resulting from hegemonic models of urbanization and agro-industrial expansion in Brazil. Such models have produced significant impacts on water systems, expressed, among other aspects, by (i) extensive soil sealing, (ii) irregular occupation of permanent preservation areas, (iii) discharge of domestic and industrial effluents without adequate treatment, and (iv)

diffuse input of contaminants associated with agro-industrial practices, such as fertilizers, pesticides, and sediments, compromising the quality and availability of water in urban and peri-urban environments (Tucci, 2008). The literature shows that such processes intensify the physical, chemical, and biological degradation of water bodies, promoting siltation, eutrophication, contamination, and loss of biodiversity (Montagner; Vidal; Acayaba, 2017; Nova; Tenório, 2019). In addition, studies on the environmental history of Brazilian cities reveal that water pollution is articulated with cultural practices and development patterns that have naturalized the transformation of urban rivers into waste receptors, as demonstrated in the analysis of Lake Guaíba by Andrade et al. (2019).

At the institutional level, the National Environmental Policy (Brasil, 1981) and the National Water Resources Policy (Brasil, 1997) structured a new management paradigm, based on decentralization, social participation and integration between multiple uses of water. The creation of the National Water Agency (Brasil, 2000) reinforced the need to expand the monitoring, framing and regulation of water bodies, recognizing that decision-making must dialogue with continuous territorial diagnoses. Tundisi (2014) reinforces that integrated management is not limited to hydrological or technical aspects; In fact, it requires considering ecological, social and political dimensions that influence the availability and quality of water.

It is not by chance that the 2030 Agenda (UN, 2015) has internationally consolidated the understanding that the protection of aquatic ecosystems is inseparable from education, urban planning, public health, and environmental justice policies. In this sense, schools and communities play a strategic role by engaging in processes of critical reading of the territory, since water degradation represents, above all, an indicator of the ways in which society organizes, distributes and consumes its resources.

2.2 RAPID ASSESSMENT PROTOCOLS: FOUNDATIONS, POTENTIALITIES AND EDUCATIONAL USES

Rapid Assessment Protocols represent environmental diagnostic methodologies widely used to analyze the quality of lotic ecosystems in an agile, integrated and low-cost manner (Callisto et al., 2002). Its synthetic character allows the systematic observation of variables such as (i) vegetation cover of the banks, (ii) bed stability, (iii) presence of sediments, (iv) anthropogenic changes, (v) solid waste and (vi) flow conditions, resulting in an interpretative classification of the integrity of the environment. Based on these variables, the PAR offers not only an overview of ecological conditions, but also subsidies to understand the socio-environmental pressures that structure the territory.

In recent years, applied research has shown that PAR is highly effective in educational

contexts because it favors situated learning, critical thinking, and student engagement with real environmental problems. For example, Guimarães, Rodrigues and Malafaia (2012) showed that elementary school students are able to identify significant environmental changes from the use of the protocol, understanding relationships between human practices and impacts on rivers. Anjos, Vasconcelos, and Negreiros (2021), as well as Oliveira, Veloso, and Rossoni (2021), reaffirm the tool's formative potential, highlighting its contribution to developing observation, argumentation, and scientific interpretation skills.

Other authors reinforce the importance of PAR in field activities to sensitize students about degradation processes, promoting the articulation between ecological theory and territorial experience (Machado, 2019; Amorim, 2021). Pontini and Coelho (2019) and Silva et al. (2019) demonstrate that, even in highly impacted urban contexts, the application of the methodology allows the identification of patterns of erosion, siltation, irregular occupation and waste deposition, qualifying environmental perception and subsidizing discussions on public policies and conservation practices. The literature points out, therefore, that the educational use of the PAR goes beyond the simple physical diagnosis: it is configured as an epistemic device that enables students to understand the complexity of society-nature relations, connecting it to debates on environmental justice, collective rights and democratic water management.

2.3 CRITICAL ENVIRONMENTAL EDUCATION: FORMATION OF A SOCIO-ECOLOGICAL READING OF THE TERRITORY

Critical Environmental Education, according to Guimarães (2004; 2013) and Layrargues and Lima (2014), is a theoretical-political field that interprets the socio-environmental crisis from its historical, social and economic foundations. From this perspective, environmental problems are understood as resulting from structural processes associated with the forms of organization of production, the appropriation of nature and the reproduction of inequalities that characterize capitalist modernity. The centrality of this approach lies in the understanding that the relations between society and nature are mediated by conflicts, interests and social projects, which are expressed in an unequal way in territories and social groups.

By assuming this understanding, the EAC is guided by a political-pedagogical dimension that articulates training, social awareness and collective action, thus establishing an epistemology of environmental complexity⁸. Its commitment is focused on strengthening

⁸ The epistemology of environmental complexity, according to Leff (2003) and Riojas (2003), constitutes a framework that understands environmental problems as non-linear phenomena, historically situated and crossed by multiple rationalities, in which ecological, social, economic, cultural and political dimensions are

community participation, problematizing hegemonic socioeconomic practices and building integrated readings of socio-environmental reality. The dialectical analysis of these relations makes it possible to understand environmental phenomena as dynamic and historically situated processes, opening space for educational practices that promote critical reflection, the production of collective meanings and the transformation of the social conditions that sustain environmental degradation.

In this theoretical matrix, the environment is conceived as a socio-historical totality, and the school becomes a privileged space to promote critical readings of the territory, articulating scientific, cultural and popular knowledge. Applied studies in the field of water education and conservation (Maciel; Sousa, 2022; Raupp; Fransciscato; Lima, 2019) highlight that field activities, when planned from this approach, contribute to the formation of subjects capable of problematizing environmental degradation, questioning inequalities and understanding water as a common good.

The PAR, in this context, works as a methodology congruent with the EAC, after all, it offers subsidies for students to understand environmental impacts as products of human decisions, public policies, economic practices and environmental conflicts. By interpreting the conditions of an urban river, they identify environmental indicators and develop, at the same time, socio-environmental awareness, engagement and argumentative capacity – essential subsidies for current socio-ecological citizenship.

2.4 EDUCATIONAL PRODUCTS: RELEVANCE TO ENVIRONMENTAL EDUCATION

The professional master's degrees in Teaching, according to CAPES guidelines (2019), presuppose the articulation between research, teaching practice and development of educational products. Such products – such as didactic guides, didactic sequences, adapted protocols, and field materials – constitute educational technologies that dialogue with real problems in schools and promote the transposition of academic knowledge into concrete pedagogical practices (Gonçalves et al., 2019; Rosa; Batista, 2021).

Within the scope of ProfCiamb, this conception is intensified, since the program is

intertwined. This perspective questions the disciplinary fragmentation inherited from modern rationality and proposes integrative approaches capable of dealing with the indeterminacy, uncertainty, and plurality of knowledge implied in the understanding of socio-environmental systems. This foundation sustains the interdisciplinary approach mobilized in the dissertation that gave rise to this research, offering the conceptual framework to interpret the watershed as a "living fabric", in which natural and social processes are articulated. However, the development of this debate would imply resuming ontological and epistemological discussions of greater scope, involving the critique of instrumental rationality, transdisciplinarity and the multiplicity of analytical perspectives, which goes beyond the methodological and didactic objectives of this article. In view of this, a more pragmatic approach is chosen, centered on the development and validation of the didactic guide, without prejudice to the recognition of the epistemology of environmental complexity as one of its structuring theoretical foundations.

based on the dialogue between environmental sciences, education and territorial management. The development of educational products aimed at understanding water resources thus simultaneously promotes continuing teacher training, pedagogical innovation and approximation of the school with the territory. In this sense, a didactic guide based on a Rapid Assessment Protocol is an instrument consistent with the guidelines of Critical Environmental Education (Brasil, 1999; Brasil, 2012a), dialoguing with the need to strengthen socio-environmental reading, student participation and interdisciplinary analysis of urban rivers. In this way, the educational product presented/analyzed here is, in addition to a didactic resource, a scientific-pedagogical artifact that integrates certain theoretical foundations, a participatory methodology and critical socio-environmental training.

3 METHODOLOGY

The methodology of this study is articulated with three interdependent dimensions: (i) the methodological logic that guides the elaboration of this article, based on a qualitative, analytical and documentary approach; (ii) the methodology of the empirical research that gave rise to the educational product and the set of data and analyses used here; and (iii) the specific methodological path of adaptation of the Rapid Assessment Protocol (PAR) and the subsequent elaboration of the didactic guide. This structure, in a triple complementary layer, simultaneously comprises the scientific, pedagogical and technical process that sustains the development of the educational program presented in this work.

3.1 METHODOLOGICAL DIMENSION OF THE ARTICLE

Epistemologically, this article uses a qualitative and interpretative approach, appropriate to the analysis of complex socio-environmental and educational phenomena that involve meanings, practices and cultural mediations (Minayo, 2001). The theoretical-analytical approach favors the articulation between water resources management, critical environmental education and environmental diagnosis methodologies, allowing the interpretation of the production of the didactic guide as a pedagogical, scientific and technological artifact.

The analytical corpus used stems from the dissertation developed within the scope of the Graduate Program in the National Network for the Teaching of Environmental Sciences (ProfCiamb-Associada UEM) – by Helaine de Oliveira Menezes entitled "Use of Didactic Guide with Rapid Assessment Protocol in the Diagnosis of Urban Water Systems" (2023) –, including: field records, photographs, files of the protocol applied by the students, workshop transcripts and questionnaires, in addition to the educational product itself. The analysis of

this material was guided by the principles of content analysis (Bardin, 2016; Silva; Fossá, 2015), especially to identify categories that emerge from the students' perception of the investigated river and the use of the PAR. By structuring the article under this logic, this methodology allowed us to reconstruct the process of elaboration of the guide, to discuss its theoretical-pedagogical robustness, and to situate it in the context of river evaluation methodologies and Critical Environmental Education.

3.2 METHODOLOGICAL DIMENSION OF THE ORIGIN RESEARCH

The empirical research that underlies this article adopts a qualitative and investigative approach, articulating field procedures, didactic activities and data analysis instruments of a descriptive and interpretative nature (Gil, 2008; Kauark; Mornings; Medeiros, 2010). The study was developed with elementary school students from a state school, involving three main stages: (1) introductory workshop and environmental awareness; (2) application of the Rapid Assessment Protocol in the analyzed stream; and (3) systematization and discussion of the results obtained.

Different instruments were used, ensuring triangulation and analytical depth (Fontana, 2018; Fontana and Rosa, 2021): (i) diagnostic questionnaire, aimed at capturing students' previous conceptions about water resources and environmental impacts; (ii) direct observation during fieldwork; (iii) structured PAR forms, filled out by the students; (iv) photographic records for visual validation of the observed environmental conditions. From these materials, a database was organized that later subsidized the construction and validation of the didactic guide.

The data from the questionnaires and workshops were analyzed through Content Analysis (Gaspi; Maron; Magalhães Júnior, 2021; Bardin, 2016), allowing the identification of categories such as perception of the environment, understanding of impacts, relationship with the territory and learning resulting from the application of the PAR. The protocol data were systematized according to criteria previously defined in the technical-scientific literature on rapid assessment (Callisto et al., 2002; Guimarães; Rodrigues; Malafaia, 2012), applying environmental scores and classifications that make up the final diagnosis. This process generated the empirical bases that guided both the theoretical discussion and the elaboration of the educational product.

3.3 METHODOLOGICAL DIMENSION OF THE ADAPTATION OF THE RAPID ASSESSMENT PROTOCOL (PAR)

The adaptation of the PAR was a central methodological step in the research and development of the didactic guide. The starting point was the protocol proposed by Callisto et al. (2002), widely used in teaching research and river monitoring because it integrates agility, rigor and applicability. However, the school use of this tool requires methodological adjustments, as demonstrated by authors who have worked with similar adaptations for teaching (Guimarães; Rodrigues; Malafaia, 2012; Pontini; Coelho, 2019; Machado, 2019; Amorim, 2021). Thus, the process followed four stages: (a) review of the parameters; (b) adequacy of the scoring scale; (c) field testing and photographic record; and (d) pedagogical validation.

In view of this, a critical analysis of the parameters of the existing protocols was carried out, including those applied in different urban and peri-urban basins (Anjos; Vasconcelos; Negreiros, 2021; Oliveira; Veloso; Rossoni, 2021; Lima et al., 2017; Rangel; Botelho, 2017), with the objective of reorganizing the criteria into observation categories understandable to students, preserving scientific rigor and, simultaneously, adopting a pedagogical language compatible with the school context (a). Considering that the literature points out that excessively complex scales tend to compromise student comprehension and the didactic functionality of the instruments (Machado, 2019), we proceeded to simplify the descriptors and reorganize the score levels, seeking greater intuitiveness without breaking the methodological coherence with consolidated studies in the area (b). The experimental application of the protocol in the Água dos Peões stream was a fundamental step in the process, as it made it possible to identify ambiguities, overlaps, and interpretative gaps in the parameters, in line with methodological approaches that advocate the testing of protocols in real field conditions as an instrumental refinement strategy (Silva et al., 2019; Pontini; Coelho, 2019; Rodrigues, 2017) (c). In this context, the students carried out the full application of the protocol and participated in a workshop oriented to discuss the results, a procedure aligned with the formative experiences described by Machado (2019) and Amorim (2021), which allowed them to confront the perceptions built in the educational process with the technical data obtained (d). From this integrated analysis, a version adapted to the school context was consolidated, characterized by scientific consistency, visual clarity and accessible language, constituting the central methodological basis of the didactic guide developed.

3.4 METHODOLOGY FOR THE CONSTRUCTION OF THE DIDACTIC GUIDE

The preparation of the didactic guide was guided by principles that prioritize clarity, replicability, and pedagogical coherence (Gonçalves et al., 2019; Rosa; Batista, 2021), involving the integrated organization of its conceptual, visual, and methodological contents. In this process, the selection and articulation of central concepts related to water resources, environmental impacts, relevant legislation and EAC was carried out, in order to dialogue with the adapted PAR. The structuring of the material sought to ensure its self-sufficiency, allowing teachers to use it autonomously, without the need for prior external training. At the same time, the parameters of the PAR were translated pedagogically through contextualized explanations, photographic records, practical examples, and accessible descriptors, in line with studies that highlight the relevance of visual resources and teaching materials in the mediation of complex ecological processes (Machado, 2019; Amorim, 2021).

The construction of the guide was organized in three articulated movements – theoretical awareness, field activity and reflective analysis –, a structure that favors the integration between knowledge, empirical experience and critical problematization, according to the assumptions of the EAC (Guimarães, 2013; Layrargues; Lima, 2014). The validation of the guide occurred from the analysis of the results of the pedagogical workshops and the questionnaires applied, ensuring coherence between the proposed objectives, the methodological procedures adopted and the formative potential of the educational product. This stage gave consistency to the material and was aligned with the guiding principles of professional master's degrees, especially with regard to the articulation between academic production, pedagogical applicability, and social relevance (CAPES, 2019).

3.5 SUMMARY OF THE METHODOLOGICAL APPROACH

The methodology adopted articulates empirical investigation, critical literature review, methodological adaptation and technical-pedagogical development. The integration of these dimensions ensures that the didactic guide presented in this article is simultaneously: (i) scientifically based; (ii) validated in a real teaching context; (iii) conformed within an interdisciplinary perspective⁹; (iv) consistent with contemporary methodologies for river

⁹ The relationship between interdisciplinarity and the adaptation of the PAR is treated in a synthetic way in this article, since its deepening would require recovering, with greater amplitude, the epistemological discussion developed in the dissertation that gave rise to the research. Even so, it is important to highlight that the adaptation of the PAR itself constituted an interdisciplinary exercise, by articulating contributions from river ecology, physical geography, school cartography and Critical Environmental Education, mobilized in the reconstruction of the parameters and in the redefinition of its pedagogical uses. This process implied sensitive methodological decisions, involving the didactic transposition of indicators originally conceived for specialists (Callisto et al., 2002), the problematization of the limits and potentialities of simplified assessments in educational contexts (Guimarães; Rodrigues; Malafaia, 2012) and the need to make them intelligible to students through adequate pedagogical translations (Pontini; Coelho, 2019). The detailed inclusion of this debate would

diagnosis; and (v) aligned with the principles of Critical Environmental Education and the guidelines of professional master's degrees in teaching.

4 THE ORIGIN RESEARCH

The research on which this article is based was developed within the scope of ProfCiamb-Associada UEM (Menezes, 2023) and was structured as a qualitative investigation, of a formative and participatory nature, oriented both (i) to the construction of a socio-environmental diagnosis of an urban water body and (ii) to the elaboration of a didactic guide aimed at Basic Education. Since its conception, the study has adopted an integrated perspective between education, territory and water resources, understanding the investigative process as a space for the production of knowledge and training of the subjects involved. This orientation implied the development of methodological instruments capable of articulating technical rigor, student participation and pedagogical applicability, in line with references that defend integrated approaches in the field of water management and EE (Brasil, 1997; Callisto et al., 2002; Guimarães, 2013).

4.1 OBJECTIVES AND LOCUS OF THE RESEARCH

The study aimed to understand how the pedagogical application of a PAR – adapted for educational purposes – could foster critical learning about the degradation of urban water resources and contribute to the construction of a replicable and grounded educational product. As specific objectives, it was sought: (i) to analyze the students' initial perception of rivers, environmental impacts and water management; (ii) develop and test a PAR adapted to the school context; (iii) to assess the students' understanding after fieldwork; and (iv) systematize the process in a didactic guide consistent with the EAC guidelines (Menezes, 2023).

The research was carried out in a state school in Janiópolis/PR (PPP, 2022), ¹⁰a small city located in a territory marked by disorderly urban expansion, waterproofing processes,

shift the focus of the article, centered on the educational product and its validation, to a broader discussion on the epistemology of participatory environmental assessment. This elaboration is extensively developed in the dissertation – see (Menezes, 2023) –, in which it is demonstrated how the PAR adaptation methodology, by integrating different fields of knowledge around the socio-environmental reading of urban rivers, constituted itself as an interdisciplinary practice in itself.

¹⁰ The role of the school as a territorial institution – understood as a structuring agent of the relations between subjects, territory, culture and public policies – is addressed in this article in a synthetic way. However, in the theoretical perspective that underlies the dissertation (Menezes, 2023), the school is understood as a social actor inserted in the processes of production of the territory, capable of mediating local and institutional knowledge, articulating scales of action and bringing communities, public management and environmental policies closer together. In this condition, the school participates in the construction of collective practices of reading and socio-environmental intervention, contributing to the formation of critical subjects and to the strengthening of participatory dynamics at the local level (Tucci, 2005; 2008; Cirilo, 2019). The in-depth

and diffuse pressures on watercourses (Dangui, 2022; IBGE, 2022; Ipardes, 2025). The environment selected for the application/testing of the PAR was the Água dos Peões stream¹¹, an urban water body that expresses the tensions between human occupation, territorial planning and environmental quality – characteristics that make it particularly significant for didactic-analytical purposes (Tucci, 2008; Nova; Tenório, 2019).

4.2 METHODOLOGICAL PATH OF THE RESEARCH

The research was organized in three articulated movements, conceived as dialogical stages between theory, practice and critical reflection: (a) initial diagnosis and environmental awareness; (b) application of the adapted pair in the field; (c) systematization and collective analysis. Thus, the students participated in an introductory workshop in which fundamental concepts of water resources, anthropic impacts and integrated water management were discussed (Brasil, 2000; Tundisi, 2014). The activity sought to identify previous perceptions and stimulate the investigative look, favoring the understanding of water as a common good and structuring element of the territory.

Then, the students carried out fieldwork in the Água dos Peões stream, applying the PAR in its preliminary version. This stage was crucial to observe (i) the environmental conditions of the river and (ii) the way in which the students interpreted the parameters, understood the environment and articulated evidence – a process widely discussed in research that evaluates the educational use of environmental protocols (Guimarães; Rodrigues; Malafaia, 2012; Pontini; Coelho, 2019; Machado, 2019; Amorim, 2021). Finally, the data produced in the field were analyzed in a subsequent workshop, in which the students compared observations, discussed interpretative divergences, and related visual, ecological, and social evidence. This dialogical dimension consolidated the critical understanding of the

development of this argument would imply analyzing the school as a socio-political space, with emphasis on its interfaces with public management and territorial planning instruments, which goes beyond the focus of this article, centered on the didactic guide. The option adopted, therefore, stems from an editorial and analytical choice, without prejudice to the recognition of the centrality of the school as a territorial institution in the broader approach to research.

¹¹ The articulation between the results produced by the students and municipal management, especially with regard to the Janiópolis Master Plan (2022), is little addressed in this article. In general, the socio-environmental diagnosis elaborated from the application of the PAR subsidized reflections on the use and occupation of the soil, the preservation of permanent protection areas and the environmental conditions of the Água dos Peões stream, aspects related to urban planning instruments and the management of water resources at the local level. The systematization of this information in a technical-pedagogical report made it possible to establish a channel of dialogue between the school and the public authorities, by making visible, in an organized way, empirical evidence on the environmental state of the watercourse. However, the deepening of this articulation, involving the analysis of decision-making processes, planning instruments and related public policies, goes beyond the objectives of this article, which privileges the pedagogical-methodological dimension of the didactic guide. For broader discussions on watershed management, urban planning, and water resources policies, see Brasil (1997), Tucci (2005; 2008), and Prado, Johnsson, and Marques (2017).

territory and revealed the pedagogical power of the PAR as an instrument that produces socio-environmental reading.

4.3 CONSTRUCTION AND TESTING OF THE ADAPTED PAIR

The adapted PAR emerged as an essential intermediate product of the research, having been developed from an analytical process that articulated specialized literature, experimentation and pedagogical validation. Although the previous methodological section described the technical procedures for adaptation, here we highlight the academic foundations that justified this movement and the empirical evidence produced during its testing. The initial version was built based on the protocol of Callisto et al. (2002), a consolidated reference in the evaluation of lotic ecosystems. In addition, adaptations employed in school and urban contexts by authors such as: (a) Guimarães, Rodrigues and Malafaia (2012), in studies focused on elementary education; (b) Anjos, Vasconcelos, and Negreiros (2021) and Oliveira, Veloso, and Rossoni (2021), which analyze heavily anthropized rivers; (c) Pontini and Coelho (2019) and Machado (2019), who highlight elements of morphological and anthropic interpretation; (d) Silva et al. (2019) and Rangel and Botelho (2017), who discuss sensitive parameters for urban environments; (e) Amorim (2021), who emphasizes pedagogical aspects of environmental protocols. It is not by chance that the convergence of these studies allowed the definition of a set of parameters accessible to students, but scientifically valid, ensuring the dual pedagogical and technical function of the instrument.

The application of the protocol in the Água dos Peões stream revealed central environmental aspects – such as the presence of residues, changes in the flow, erosion of banks, reduced riparian vegetation and signs of siltation – which are in line with the literature on water degradation in urban areas (Tucci, 2008; Montagner; Vidal; Acayaba, 2017). From a pedagogical point of view, the testing showed that the students were able to: (i) distinguish physical, biological and anthropic parameters; (ii) relate observed impacts to social practices; (iii) and interpret the river as part of a larger system of urban management and planning. These results confirmed the adequacy of the adapted PAR and provided direct support for the elaboration of the didactic guide¹².

¹² In addition to the pedagogical results resulting from the application of the PAR – fundamental for the construction and validation of the didactic guide –, the research produced material results that enabled the elaboration of a socio-environmental diagnosis of the Água dos Peões stream which, in turn, was able to evidence the spatial heterogeneity of the ecological conditions along the urban stretch analyzed. The evaluation carried out at six sampling points, distributed from upstream to downstream, revealed a gradient of environmental conservation directly associated with the forms of use and occupation of the banks, anthropogenic interventions in the bed and the presence of degradative processes. The points located at the ends of the urban stretch, especially P1 and P6, presented the highest overall scores, being classified as

4.4 FIELD PROCESS AND PEDAGOGICAL WORKSHOPS

The construction of the educational product was influenced by the field process and the workshops, which functioned as moments of experimentation, reflection and collective validation. The fieldwork was constituted as an experience of "incarnate reading of the territory", in which the environment, in addition to being an object of analysis, became a living space of interaction between subjects, society and nature – a perspective consistent with the EAC (Guimarães, 2013; Leff, 2003; Roos; Becker, 2012). During the workshops, it was observed that there was a significant development of argumentation skills, ecological perception and interpretation of evidence. The collective discussion of the PAR forms¹³ allowed the students to confront their analyses, identify contradictions and construct explanations anchored in environmental indicators. This dynamic reproduces what the literature calls "ecological pedagogical mediation", in which field activity acts as a catalyst for processes of awareness and critical reading (Maciel; Sousa, 2022; Raupp; Fransciscato; Lima, 2019). These experiences formed the epistemological and pedagogical core of the

"natural", due to the greater vegetation cover, lower intensity of anthropogenic changes, absence of odors and oiliness and better visual conditions of the water. On the other hand, the intermediate points (P2, P3, P4 and P5) were classified as "altered", reflecting the intensification of urbanization, the reduction of riparian vegetation, the occurrence of erosive processes and siltation, the recurrent presence of solid waste, changes in the channel of the watercourse and less diversity of visible organisms. The integrated analysis of the macroscopic parameters also showed that, although the direct presence of domestic or industrial sewage discharge at all points was not found, the signs of anthropogenic pressure are expressed in a diffuse way, especially through the occupation of the banks, the channeling of stretches, inadequate soil management and the degradation of the Permanent Preservation Area. In this sense, the PAR proved to be effective in characterizing the Água dos Peões stream as an urban water system subjected to processes of progressive environmental degradation, while at the same time it made it possible to identify segments with greater potential for conservation and recovery. These results allowed us to characterize the stream as an urban water system subjected to diffuse and progressive anthropogenic pressures, while indicating segments with greater potential for conservation and environmental recovery. The set of this information was condensed into a technical-pedagogical report prepared collectively by the student participating in the research, in which the data obtained in the field, photographic records, schematic maps, interpretations of the evaluated parameters and recommendations of an educational and environmental nature were systematized. This report was formally forwarded to the municipal government, configuring itself as another product of the research and as an instrument of dialogue between school, community and public management, by materializing the results of the diagnosis and increasing the visibility of the socio-environmental conditions of the Água dos Peões stream at the local level.

¹³ The Rapid Assessment Protocol, after the adaptation process developed in this research, became a socio-environmental diagnostic instrument with a dual purpose – pedagogical and technical – organized in such a way as to allow its application in school contexts without prejudice to scientific rigor. The adapted PAR was structured based on a set of macroscopic parameters related to the physical conditions of the watercourse, the use and occupation of the banks, the integrity of the riparian vegetation, the presence of solid waste, signs of erosive processes and siltation, as well as visual and olfactory signs associated with water quality. Each parameter was accompanied by objective descriptors, illustrative examples, and reference photographic records, organized into simplified and progressive scoring scales, which enable the identification of different levels of environmental change. The reorganization of the categories and the redefinition of the scales aimed to favor the readability of the instrument for students, maintaining methodological coherence with protocols consolidated in the literature. The adapted PAR provides for application at previously defined sampling points, systematic recording of observations in standardized forms and subsequent integrated analysis of the results, allowing the general classification of the evaluated stretch and the comparison between different segments of the watercourse. By articulating direct observation, data systematization, and collective interpretation, the protocol assumes a mediating role in the educational process, operating as a support for the critical reading of the territory and the understanding of the relationships between socio-spatial dynamics and the degradation of urban water systems – see the PAR in its final version in Menezes, 2023.

didactic guide, ensuring that its elaboration represents an organic movement based on educational praxis and the materiality of the territory.

5 DEVELOPMENT OF THE DIDACTIC GUIDE

The didactic guide was the main product of this investigation, the result of an elaboration process related to the articulation between theory, field, participatory observation and critical reflection. Its development expresses the understanding that EAC demands instruments that promote rigorous socio-environmental readings of the territory, sensitive and politically situated (Guimarães, 2013; Layrargues; Lima, 2014). In this way, the guide sought to overcome traditional prescriptive approaches, offering material that invites students and teachers to understand the complexity of urban rivers, recognizing them as living expressions of historical, political and ecological processes.

The elaboration of the guide, therefore, ended an investigative path that involved methodological adaptation, practical experimentation, collective analysis and theoretical support. Its form and content respond to what the research itself revealed about the potentialities and limits of teaching about water resources in the school context, dialoguing with the empirical findings recorded in the dissertation (Menezes, 2023) and with the literature that discusses both PARs¹⁴ and field methodologies in EAC¹⁵.

5.1 PRINCIPLES OF CONSTRUCTION OF THE GUIDE: LANGUAGE, REPLICABILITY AND VISUALITY

The construction of the guide was guided by three complementary didactic and epistemological principles, defined based on the requirements of the public school, the characteristics of the students involved and the theoretical assumptions of the EAC: (a) dialogical and accessible language without loss of conceptual density; (b) replicability as a public commitment; and (c) visibility as cognitive and affective mediation. In view of this, it is noted that the language of the guide was conceived in such a way as to balance communicative clarity and analytical rigor. The central concern was to avoid both hermetic technicality and excessive simplification – common vices in teaching materials on environmental topics. This methodological choice stemmed from the understanding that forming critical readers of their territory requires that concepts such as *water resources*, *anthropic impacts*, *integrated management*, and *socio-environmental justice* be presented with precision, but mediated by examples, images, and analyses connected to the students'

¹⁴ Callisto et al., 2002; Pontini; Coelho, 2019; Angels; Vasconcelos; Negreiros, 2021.

¹⁵ Machado, 2019; Amorim, 2021; Maciel; Sousa, 2022.

daily lives (Brasil, 1997; Tundisi, 2014). Language, therefore, informs, tensions, provokes and instigates.

The guide was planned to be replicable in different schools, preserving its methodological coherence independently of the original researcher. This characteristic meets the guidelines of professional master's degrees, which demand educational products capable of having an expanded impact on the reality of basic education (CAPES, 2019). Replicability, in addition to the possibility of use, also involved teacher autonomy, procedural clarity and contextual flexibility, allowing the PAR to be applied in urban and peri-urban rivers or even in rural micro-basins.

The use of photographs, schemes, and visual records – many of them produced by the students themselves during fieldwork – derives from the conception that learning in EE is strengthened when observation is guided, structured, and contextualized (Machado, 2019; Amorim, 2021). Images of siltation, erosion, the presence of residues, changes in the flow and degradation of the riparian forest functioned, in the guide, as perceptual anchors that allowed us to understand abstract phenomena through the materiality of the territory. Visuality, in this sense, rather than a simply illustrative resource, becomes a pedagogical device for critical reading.

5.2 INTERNAL STRUCTURE OF THE DIDACTIC GUIDE

The organization of the guide established a pedagogical flow aligned with the logic of the Teaching of Environmental Sciences and with the EAC. The structure is simultaneously progressive and circular: each section prepares the next and all return to the central idea that to understand a river is to understand a territory, a society and its contradictions; Thus, the guide was divided into: (1) Conceptual introduction; (2) field orientations; (3) the adapted PAR; and (4) synthesis and reflection activities

The first section translates into didactic language the theoretical basis of the dissertation: ecological functions of rivers, impacts of urbanization, anthropogenic pressures and principles of the National Water Resources Policy (Brasil, 1997; Brasil, 2000). The narrative seeks to show that the process of degradation is not natural; in fact, it is historically produced, in line with the reflections of Tucci (2008) and Nova and Tenório (2019).

In the field orientations, methodological, ethical and operational care are presented, articulating geographical, ecological and safety procedures. This section values the investigative dimension of the field trip, reinforcing that to observe is to see/see and, above all, to interpret and situate (Raupp; Fransciscato; Lima, 2019).

The core of the guide is the PAR adapted, reorganized and explained step by step. The arrangement of the parameters on clear cards and accompanied by images facilitated the autonomy of the students, allowing the interpretation of substrate, flow, oiliness, establishment of margins and residues based on criteria inspired by the specialized literature (Callisto et al., 2002; Pontini; Coelho, 2019). Finally, the last section proposes exercises that stimulate critical and analytical thinking and the articulation of empirical evidence with public policies and social practices. In this part of the guide, Freire's logic of critical reading of the world finds its materiality in the analysis of an urban river, bringing the theory closer to praxis (Guimarães, 2013).

5.3 PARAMETERS ADAPTED FROM THE PAIR: SUBSTRATE, OILINESS, MARGINS, RESIDUES AND FLOW

The adaptation of the PAR parameters was a central stage of the research, as it enabled the conversion of a technical-scientific instrument into an accessible pedagogical resource, preserving its analytical and interpretative capacity. This process was guided by the theoretical contributions mobilized in the dissertation, as well as by the empirical data produced in the Água dos Peões stream, resulting in the reformulation of the following parameters: (a) substrate; (b) oiliness and superficial films; (c) margins and riparian vegetation; (d) solid waste; and (e) flow and obstructions. The redefinition of these categories sought to ensure legibility to the instrument in the school context, articulating scientific concepts, direct observation and critical interpretation of the socio-environmental reality.

The parameter referring to the type of bottom – sandy, muddy, rocky or mixed – was maintained as a structuring element of the evaluation, due to its ecological relevance for the understanding of erosion processes, siltation and dynamics of the benthic community (Callisto et al., 2002). Its adaptation involved the conceptual translation of the technical descriptors and the incorporation of comparative images, facilitating visual identification in the field. In an articulated way, the analysis of the presence of oiliness and superficial films began to be mediated by examples from everyday life and by photographic records of the stream itself, favoring the understanding of the relationships between urban runoff, effluent discharge and anthropogenic pressures, as indicated in the specialized literature (Montagner; Vidal; Acayaba, 2017).

The parameters related to the margins and riparian vegetation were expanded to include aspects such as stability, slope, occurrence of erosive processes and degree of vegetation cover, recognizing the sensitivity of these variables in the characterization of environmental degradation in urban areas (Rangel; Botelho, 2017; Pontini; Coelho, 2019).

With regard to solid waste, the classification adopted began to distinguish between floating materials, deposition in the bed, and accumulation on the banks, enabling the identification of spatial patterns and the inference of probable origins, in line with approaches proposed by Anjos, Vasconcelos, and Negreiros (2021). The interpretation of the flow incorporated the observation of visible changes in water velocity, the presence of physical barriers and interventions associated with urbanization, fundamental elements for understanding the local water dynamics and their links with soil sealing processes (Oliveira; Veloso; Rossoni, 2021). Together, the adapted parameters were anchored in empirical evidence produced in the field and later discussed with the students, strengthening the articulation between systematic observation, critical interpretation and socio-environmental learning.

5.4 VALIDATION THE DIDACTIC GUIDE WITH STUDENTS

The validation of the guide was configured as a process of shared critical reading, developed in the context of the analysis workshops, in which the students used the material to interpret the observations made in the field, review records produced and problematize divergences identified throughout the application of the PAR. This dynamic favored the construction of a dialogical space in which the guide operated as a mediator of the training process, in line with the assumptions of the EAC.

During this process, the following were observed: (a) the progressive appropriation of the technical language associated with environmental assessment, articulated with the capacity for contextual analysis of the observed phenomena; (b) the establishment of consistent relationships between the parameters evaluated and the social practices that affect the watercourse, indicating a broader socio-environmental understanding; (c) the strengthening of the investigative protagonism of the students, who began to recognize themselves as subjects who produced knowledge about the territory in which they are inserted; and (d) the coherence between the structure of the instrument and its application in the field, showing that the guide sustains consistent investigative practices that can be replicated in other school contexts. The validation of the guide, understood in this way, dialogues with analyses by Maciel and Sousa (2022) and Raupp, Franciscato and Lima (2019), when they indicate that educational products built from situated practices tend to constitute powerful and formative devices for the promotion of critical reflection and socio-environmental learning.

6 RESULTS AND DISCUSSIONS

The results of this research process show the formative potential of the didactic guide developed, as well as its effectiveness as an instrument of participatory environmental diagnosis. Such findings should be interpreted in the light of Critical Environmental Education, which understands the educational process as a social practice of producing meanings about the territory and the relationships that are established in it (Guimarães, 2013; Layrargues; Lima, 2014). In this context, the results indicate qualitative transformations in the ways in which students began to read, interpret and critically position themselves in the face of the socio-environmental conditions of the Água dos Peões stream, expanding their capacity for understanding and symbolic intervention in the local reality.

6.1 LEARNING: CRITICAL READING OF THE TERRITORY AND ECOLOGICAL UNDERSTANDING

In terms of learning, students have developed more refined analytical skills on the degradation processes of urban rivers. Initially, many participants had diffuse perceptions about water quality and the factors that contribute to its deterioration – a perception similar to that recorded in studies such as those by Maciel and Sousa (2022) and Santos and Corrêa (2020). However, after the application of the didactic guide and the completion of the field activities, a set of specific learnings emerged. First, students began to identify phenomena such as siltation, erosion of the banks, presence of solid waste, alteration of the flow and signs of contamination with greater precision, articulating these elements with urban dynamics and sanitation policies (Brasil, 2020b; Tucci, 2008). In addition, they recognized the importance of Permanent Preservation Areas (PPAs) and the ecosystem services provided by riparian vegetation, bringing their reading of the territory closer to the analyses found in Pontini and Coelho (2019) and Miranda, Botezelli, and Pamplin (2021).

Another significant learning refers to socio-environmental awareness¹⁶. The students' reports and records indicate that they understood environmental degradation as a consequence of human and political choices, management failures and historically

¹⁶ The field narratives produced throughout the research – which include students' speeches, interpretative conflicts that emerged during the application of the PAR, episodes that tensioned initial readings of the stream and records built in the observation process itself – are not developed in detail here, in view of the need for objectivity and conciseness that guides the article. Even so, it is important to note that such narratives constituted a central element of the research, as it revealed how the empirical experience in the watershed of the Água dos Peões stream mobilized disputes of meaning, revisions of perception and interpretative reconfigurations about the territory. The dissertation deepens these experiences, demonstrating how direct contact with the environment, mediated by the guide and the adapted PAR, expanded the students' analytical repertoire and favored the construction of meaningful learning, as indicated by Santos and Corrêa (2020) and Amorim (2021). In this text, the identification of general interpretative trends and consolidated results is privileged, to the detriment of the reproduction of specific narratives, in order to preserve the analytical focus on the educational product and its validation.

consolidated social practices – a perspective emphasized by Tucci (2005) and Tundisi (2014). In summary, the guide mediated learning about river ecology and, at the same time, contributed to a critical reading of the relationship between society and nature.

6.2 EFFECTIVENESS OF THE GUIDE IN ENVIRONMENTAL DIAGNOSIS: ACCURACY, AUTONOMY AND INTERPRETATION

The application of the guide was effective as a didactic-scientific tool. The students demonstrated the ability to correctly fill in the parameters of the adapted PAR, evaluating substrate, margins, flow, oiliness and presence of residues with coherence and precision. The comparison between the evaluations made by the participants and those recorded by the researcher indicates significant convergence, which reveals that the material was able to properly translate technical concepts without compromising their analytical quality, as recommended by Callisto et al. (2002), Anjos, Vasconcelos, and Negreiros (2021), and Oliveira, Veloso, and Rossoni (2021).

The autonomy of the students during the diagnosis is another indicator of the effectiveness of the guide. Unlike excessively technical protocols, whose application requires specialized training, the adapted material made it possible for groups of students to carry out direct observations, debates and internal deliberations on the scoring of the parameters. This autonomy is consistent with the logic of educational products proposed in the professional master's degrees (CAPES, 2019) and reinforces the importance of pedagogical instruments that democratize access to ecological knowledge. In addition, the results also indicate that the guide favored complex discussions on the causes and consequences of degradation, articulating the empirical diagnosis with broader socio-environmental interpretations, as suggested by the studies consulted in our "theoretical framework" – section two –, and certain documents that currently discipline/regulate Environmental Education in Brazil and Paraná¹⁷.

¹⁷ The articulation of Menezes' (2023) research with the National Common Curricular Base (Brasil, 2018), with the Curriculum of the State Network of Paraná – CREP (2018; 2021) and with the guiding documents of EE in Brazil is not developed extensively in this article, since these curricular and normative references constitute a broad set of documents, whose analysis would require a specific section. However, it should be noted that the conception, structure, and application of the didactic guide dialogue with the principles and competencies provided for in these milestones, especially with regard to argumentation, scientific investigation, socio-environmental responsibility, and the critical reading of the territory (BNCC, 2018). In the dissertation, it is demonstrated how such competencies are materialized in pedagogical practice through the diagnosis of urban rivers, articulating contents of Natural Sciences, Geography and Critical Environmental Education in an interdisciplinary perspective. In this article, we choose to privilege the presentation of the guide as an educational product and the description of its methodological dynamics.

6.3 COMPARISON WITH OTHER MATERIALS AND APPROACHES FOUND IN THE LITERATURE

The comparative analysis allows us to observe that the guide constructed presents singularities that differentiate it from other didactic materials and protocols presented in the literature. First, materials such as those by Machado (2019) and Amorim (2021) emphasize the didactic dimension of adapted PARs; however, they maintain structures closer to the original technical models. The guide produced by this research, in turn, presents greater integration between concept, visuality and socio-environmental contextualization, which enhances its critical function.

In addition, while traditional protocols – such as those applied in Pontini and Coelho (2019), Lima et al. (2017) and Silva et al. (2019) – use parameters that are difficult to translate into the school environment, the guide of this research simplifies, without impoverishing, the language and evaluation criteria. This dialogical simplification is a relevant innovation for teaching practice, especially in public schools. Another significant difference lies in the reflective character of the guide: instead of being a solely evaluative instrument, it incorporates activities of synthesis, discussion and articulation with public policies, which do not exist in conventional environmental protocols. This characteristic brings it closer to what Guimarães (2013) identifies as the transformative praxis of EAC.

6.4 POTENTIAL FOR REPLICATION IN OTHER SCHOOLS AND MUNICIPALITIES

The analysis of the results allows us to affirm that the guide has high potential for replication and scalability. Its modular structure, accessible language, detailed visuality and methodological coherence allow it to be applied in different territorial realities – whether urban, peri-urban or rural – as long as there is a viable water body for observation. From an institutional point of view, the guide converges with the National Common Curricular Base (Brasil, 2018) and with the state Curricular Frameworks (Paraná, 2018), which emphasize competencies related to scientific research, understanding the territory, and sustainability. This curricular convergence strengthens its applicability in public school systems.

In the context of environmental management, the guide can serve as a complementary tool for participatory monitoring, expanding democratic mechanisms for monitoring water quality, as proposed by Tundisi (2014), Cirilo (2019) and the National Water Resources Policy (Brasil, 1997). Thus, in addition to its pedagogical value, the instrument has social and institutional utility. Finally, the engagement of the students and the autonomy demonstrated throughout the application of the protocol constitute evidence that the guide can foster continuous educational processes, not restricted to the punctual intervention of the research.

Replicability, therefore, is not only technical, but also political, as it stimulates the formation of critical subjects capable of acting and intervening in their communities.

7 INTERDISCIPLINARY CONTRIBUTIONS

The construction and application of the didactic guide show its interdisciplinary character and its ability to integrate knowledge from Education, Ecology, Geography and Environmental Policies. This interdisciplinarity, far from being a mere conceptual adornment, constitutes a structuring element of the educational product and constitutes one of the main scientific contributions of this research to the field of Teaching and Environmental Sciences.

7.1 INTERSECTIONS BETWEEN EDUCATION, ECOLOGY AND GEOGRAPHY: THE CRITICAL READING OF THE TERRITORY

The first interdisciplinary contribution is manifested in the way the guide articulates principles of Critical Environmental Education (Guimarães, 2013; Layrargues; Lima, 2014) with ecological and geographical foundations on the functioning of urban rivers. Such articulation allows students to recognize the environment as (i) a natural scenario and, above all, (ii) a geographical scenario historically produced and marked by socio-environmental conflicts – a perspective that dialogues with Tucci (2008) and Tundisi (2014).

In the field of ecology, the guide translates processes such as siltation, substrate quality, flow dynamics, and integrity of riparian zones into observable and measurable parameters. However, this translation is not reductionist: it incorporates historical, social and cultural dimensions associated with human occupation of the margins, approaching studies that understand water degradation as a synthesis of multiple urban pressures (Montagner; Vidal; Acayaba, 2017; Nova; Tenório, 2019).

From a geographical point of view, the analysis of the stream as part of a larger hydrographic basin – influenced by land use patterns, urban infrastructure and socio-spatial relations – allowed the students to operate with different scales, understanding the river as a key element of territorial organization, which is also mathematically relevant. This approach strengthens skills in landscape reading, cartographic interpretation, and recognition of geomorphological processes (Paraná, 2006/2013/2020; IAT, 2011), reaffirming the interdisciplinary character of the activity. In this way, the guide highlights what the literature points out as the foundation of environmental interdisciplinarity: the understanding of the territory as a unit of analysis in which natural and social processes are inextricably intertwined.

7.2 PUBLIC POLICIES FOR THE ENVIRONMENT AND EDUCATION: TRANSVERSALITY AND CRITICALITY

Interdisciplinarity is also materialized in the relationship between the content of the guide and the legal frameworks of Brazilian public policies. The National Policy on Water Resources (Brazil, 1997), the National Policy on Environmental Education (Brazil, 1999), Conama Resolution No. 357 (Brazil, 2005) and the National Common Curriculum Base (Brazil, 2018) converge in demanding educational processes that integrate technical knowledge, social participation, and research on local realities (Brazil, 2007). In view of this, the guide responds to these demands by proposing an investigative practice in which students carry out environmental diagnosis in a contextualized way.

At the interface between education and politics, the material favors the understanding that water management is a shared responsibility between the State, society, and the school – a view present in Cirilo (2019) and reaffirmed by studies on water governance (Tucci, 2005; Prado; Johnsson; Marques, 2017). It is not by chance that this articulation reinforces that the analysis of an urban river is, in addition to an ecological exercise, a practice of environmental citizenship that exposes inequalities, management omissions, and possibilities for social intervention. It is an interdisciplinary contribution useful for the critical training of students and potentially relevant for the dialogue between schools and environmental agencies.

From this perspective, the transversal aspects of the research that is the basis of this article can be understood as formative dimensions that cross the different curricular components and fields of knowledge, conferring pedagogical, evaluative and social unity to the practices developed, without depending exclusively on processes of epistemological integration between disciplines. Within this approach, EE assumes the role of a structuring transversal axis, by guiding the critical reading of the territory, the problematization of the relations between society and nature, and the formation of ethical dispositions aimed at socio-environmental responsibility. This dimension permeates field activities, the application of the PAR, the production of reports and the discussions held in the classroom, manifesting itself recurrently in the Sciences and Geography, as well as in the Portuguese Language, Mathematics, Art and Human Sciences, without being limited to a specific curricular component. The environment operates, in this way, as a cross-cutting theme capable of articulating values, educational purposes and formative meanings, in line with the guiding documents of EE in Brazil.

Another relevant cross-cutting aspect concerns citizenship education and social participation, since the research mobilizes reflections on the right to water, the public function of water bodies, municipal management and the production of diagnoses that dialogue with

the public power. These elements cross the different stages of the work, promoting the development of skills related to argumentation, collective responsibility and ethical positioning in the face of socio-environmental problems, regardless of the disciplinary area from which they are approached.

The scientific and institutional language also assumes a transversal character, as it permeates the production of field records, the organization of data, the preparation of the technical report and the socialization of the results. The use of formal language, the appropriation of textual genres typical of science and public management, and the construction of argumentative narratives cross the entire pedagogical process, articulating reading, writing, and communication practices in different areas.

Finally, the valorization of the lived territory is configured as a transversal dimension by promoting the recognition of the local space as a legitimate object of knowledge, reflection and intervention. This perspective crosses the curriculum by connecting school content to students' daily experiences, favoring the feeling of belonging, the critical reading of the place and the understanding of socio-environmental inequalities as historical and social constructions. In this way, the transversality of the research is expressed by the continuous circulation of values, problems and educational purposes – especially those related to the environment, citizenship, language and territory – that cross the different areas of knowledge.

7.3 THE DIDACTIC GUIDE AS AN INSTRUMENT OF ACTIVE INTERDISCIPLINARITY

The guide, in addition to being interdisciplinary in its foundation, operates as an instrument of active interdisciplinarity, allowing different areas to interpenetrate each other in pedagogical practice. This characteristic reflects a movement of rupture with the curricular fragmentation typical of basic education and with merely ecological, depoliticized or decontextualized approaches to the reality of urban rivers. In this sense, the material invites teachers of Science, Geography, Mathematics, Art and even Portuguese Language to work together, articulating empirical investigation, environmental interpretation and argumentative expression¹⁸. Interdisciplinarity emerges, in this way, as a concrete practice: students

¹⁸ The study on which this article is based has the potential for broad interdisciplinary articulation, since the socio-environmental diagnosis of urban rivers, mediated by adapted PAR, mobilizes knowledge and practices from different fields of knowledge in an integrated and situated way. In the field of Natural Sciences, the protocol favors the understanding of ecological processes related to fluvial dynamics, environmental quality, biodiversity and anthropogenic impacts on aquatic ecosystems. In dialogue with Geography, the reading of the stream as a structuring element of the territory makes it possible to analyze the hydrographic basin as a spatial unit, articulating relief, land use and occupation, urbanization, water flows and scales of analysis. Critical Environmental Education operates as an integrating axis of this process, by guiding the interpretation of data beyond the technical description, incorporating ethical, political and formative dimensions that connect nature, society and social practices. The interface with Sociology and Political Science emerges in the analysis of socio-environmental inequalities, the relations between the State, community and public policies, as well as in the problematization of water governance, urban planning and social participation. Anthropology contributes by

observe ecological phenomena, situate them geographically, critically analyze them in the light of public policies and communicate their conclusions in a structured way – a process that echoes the reflections of Guimarães (2013) on a critical reading of the world. In addition, the guide fosters competencies that go beyond traditional disciplinary boundaries, such as systems thinking, multi-scale analysis, and integration of empirical evidence with theoretical frameworks. This approach is in line with the conception of interdisciplinarity as a "cognitive and political strategy" present in the studies of Riojas (2003), reaffirming that complex socio-environmental problems require equally complex instruments.

7.4 INTERDISCIPLINARITY AND POTENTIAL FOR SOCIAL TRANSFORMATION

Finally, the interdisciplinary character of the guide is also manifested in its potential for social transformation¹⁹. By promoting the critical analysis of the watershed and by bringing the school closer to the issues of municipal water management, the educational product contributes to the construction of subjects capable of understanding and intervening in their

allowing the understanding of perceptions, narratives, cultural practices and forms of symbolic appropriation of the river by the subjects, recognizing the watercourse as a lived and socially signified space. Mathematics is mobilized in the reading of scales, in the organization of data, in the comparison of scores and in the construction of quantitative syntheses that help environmental interpretation, without losing sight of its insertion in broader qualitative contexts. Art is integrated into the process through the photographic record of the points evaluated, the choice of framing, the visual composition and the aesthetic reading of the landscape, contributing to the development of the sensitive look and to the construction of visual narratives about the territory. The Portuguese language crosses the entire investigative path by structuring the production of technical reports, the argumentative organization of the results, the use of formal language and the appropriation of textual typologies typical of the scientific field and public management. Other areas, such as History, by contextualizing the processes of occupation and transformation of the territory, and Information Technology, in the treatment and organization of records, can also be incorporated in a transversal way. This articulation does not occur through the juxtaposition of contents: it is made effective through an organic correlation between knowledge, practices and languages, making the environmental diagnosis an interdisciplinary pedagogical device capable of integrating scientific reading, social analysis, cultural expression and critical training.

¹⁹ The experiential dimension of interdisciplinarity, central to the research on which this article is based, is addressed here in a synthetic way, since its analytical development would require mobilizing theoretical references related to corporeality, environmental perception, the pedagogies of the sensible and the processes of subjectivation, which would significantly expand the scope between didactic methodology and critical training. In the dissertation, this dimension is expressed in the direct experience of students on the banks of the Água dos Peões stream, in episodes of estrangement, discomfort and recognition of the dynamics of degradation, as well as in the situated production of meanings about the territory, configuring an intrinsic interdisciplinary exercise that articulates ecology, geography, critical environmental education and sociopolitical reading of space. Such experiences constitute fundamental socio-environmental mediations of the educational process, as discussed by Guimarães (2013) and Layrargues and Lima (2014), as they favor the construction of interpretations that link empirical observation, critical reflection and ethical-political positioning. In an articulated way, the socio-environmental critique that structures the dissertation – oriented to the understanding of water inequalities, the social production of river degradation and the tensions between State, territory and community – is dealt with in this article only indirectly, in order to avoid shifting the discussion to a broader socio-political analysis. Its deepening would imply examining issues such as environmental injustice, poor sanitation, territorial vulnerabilities and conflicts over the use of water (Montagner; Vidal; Acayaba, 2017; Nova; Tenório, 2019), constitutive themes of the basic research that, however, exceed the purpose of this text, centered on the elaboration, adaptation and validation of the didactic guide as an educational product. In this way, the option adopted corresponds to an analytical delimitation without prejudice to the recognition that experiential interdisciplinarity and socio-environmental criticism constitute structuring foundations of research and its formative developments.

socio-environmental reality. This perspective breaks with the myth of neutrality of environmental content and positions the guide as a tool for strengthening democracy. If, as Guimarães (2013) argues, EAC is an emancipatory educational practice, then interdisciplinarity is a methodological option and, above all, a condition for the formation of situated, analytically and politically active/critical environmental awareness.

8 CONCLUSION

The present study sought to understand to what extent a didactic guide, developed from an adapted PAR, could contribute to the critical education of elementary school students and to the participatory diagnosis of urban rivers, taking the Água dos Peões stream as its locus, in the municipality of Janiópolis (PR). The question that guided the entire process – **how can a didactic guide based on an adapted PAR promote critical environmental learning and assist in reading the socio-ecological reality of urban rivers?** – was faced in an articulated way between theory, methodology and pedagogical practice, allowing for consistent responses, although necessarily provisional and situated.

When returning to the objectives outlined at the beginning of the investigation, it is observed that they were met/answered as the process of research and pedagogical intervention itself complexified the initial understanding of the problem. The first objective – to present the theoretical and methodological foundations that supported the elaboration of the guide – was contemplated through the critical integration between literature on urban water resources, Rapid Assessment Protocols and Critical Environmental Education. This articulation demonstrated that the guide is a didactic material and, together, an **epistemological artifact** built from conceptual choices that reaffirm the centrality of the critical reading of the territory and the active participation of students.

The second objective – to describe the process of construction and adaptation of the PAR – was achieved, revealing that the didactic transposition of the traditional parameters of the protocols required technical adjustments and pedagogical decisions based on principles of conceptual clarity, accessibility, ecological relevance and adequacy to the material conditions of the school. In this sense, the guide was consolidated as a **product** whose consistency derived from (i) the literature that supports it and (ii) the adherence between its parameters and the ecological and socio-territorial reality of the analyzed stream.

The third objective – to analyze the application and validation of the guide with the students – was met through the investigation of the learning mobilized during the workshops and fieldwork. The results showed that the guide expanded the students' ability to identify anthropogenic pressures, understand ecological dynamics, interpret environmental

evidence, and relate forms of urban occupation to patterns of water degradation. More than that, it stimulated critical questioning about the role of the community, the public power and the school itself in the conservation of urban rivers, evidencing its potential as an instrument of critical education aligned with the principles of EAC.

The fourth objective – to discuss the potential of the guide as an interdisciplinary educational product – was fully met. The structure of the material demonstrated articulations between knowledge from ecology, geography, chemistry, environmental policies and social sciences, bringing students closer to a more integrated and complex understanding of the phenomena analyzed. In addition, the guide proved to be able to promote the transition between reading the environment, critical analysis and reasoned argumentation, essential aspects for a citizen education committed to the democratic management of the commons, as recommended by the PNREH (Brazil, 1997) and SDG 6 (UN, 2015).

The results show, therefore, that the research problem was answered: **the didactic guide, when used as a structured methodological mediation, enabled students to carry out coherent environmental diagnoses, develop analytical and interpretative skills and recognize the socio-environmental conflicts that cross urban rivers.** In addition, it allowed students to approach the territory in a critical way, providing elements for them to understand the political, ecological and social character of water management in their municipality.

Regarding the relevance of the study, its potential for educational and public impact is highlighted. In small municipalities, such as Janiópolis (PR), where environmental monitoring structures are scarce and community participation is historically limited, pedagogical tools such as this guide can represent important catalysts for training processes and social mobilization. The guide offers a tool that is **simple to use, low cost, highly replicable and scientifically based**, making it able to subsidize schools, educators, community projects and even municipal initiatives for the diagnosis and management of watersheds. However, like any applied study, this one has limits that must be recognized.

The use of the guide was tested in a specific context, with a limited number of students, in a short time frame and concentrated in a single microbasin. Although consistent, the results do not allow automatic generalizations, and the pedagogical nature of the adapted protocol does not replace deeper physicochemical analyses. In addition, the students' understanding, although significant, could be expanded through longitudinal monitoring processes, recurrence of activities over different school years, comparisons between schools and effective integration with given public policies. These limits, however, constitute **future potentialities**. Subsequent research may investigate: (a) the application of the guide in

different municipalities/socio-environmental realities; (b) impacts of the activity on citizenship education in the long term; (c) its integration with municipal environmental councils; (d) its use in conjunction with the Master Plan and other territorial planning instruments; (e) or the expansion of the protocol with simplified physicochemical indicators for school use.

The contributions of this work are simultaneously aligned with the educational field and the sphere of local environmental management. The didactic guide emerges as an educational technology with the potential to strengthen student protagonism, qualify the critical reading of the territory, democratize access to scientific knowledge and stimulate social participation in water management. In municipalities such as Janiópolis/PR, which live with continuous impacts of water degradation and have limited institutional structures, instruments of this nature are, in addition to pedagogical materials, **devices of environmental citizenship**, capable of bringing together school, territory and community around the defense of water resources as common goods. In view of this, this study reaffirms that educational practices grounded, contextualized and guided by EAC can play decisive roles in the formation of subjects capable of understanding and transforming the socio-environmental reality in which they live. The guide developed and analyzed constitutes a contribution in this sense and opens promising paths for new research, policies and pedagogical actions committed to sustainability, environmental justice and the democratic management of water resources.

THEATRE BETWEEN MANAUS AND PARINTINS: STAGES AND MEMORIES

TEATRO ENTRE MANAUS E PARINTINS: PALCOS E MEMÓRIAS

TEATRO ENTRE MANAOS Y PARINTINS: ESCENARIOS Y MEMORIAS

<https://doi.org/10.56238/sevened2026.008-206>Dilce Pio Nascimento¹**ABSTRACT**

This work investigates the production and reception of performing arts in Amazonas between the 1980s and the present day. The research originated from the cataloging of theatrical plays and sketches that, although fundamental to regional identity, were restricted to private collections. The objective is to examine the organization and re-signification of the documentary collection of Amazonian theatrical practices, analyzing how digital preservation and university extension, through projects such as Literature on Stage and LAMCEPIN (Amazonian Literature on Stage in the city of Parintins), combat cultural amnesia and assist in the training of teachers in Parintins. The temporal delimitation continues the studies of Costa and Azancoth (2010), expanding the focus to the interior of the state. Methodologically, this is a qualitative research based on documentary analysis and interviews (with preserved identities). The theoretical framework is based on Boal (2009), Colombo (1991), Derrida (2001), Freire (1996), and Tardif (2008). It concludes that integrating the collection into extension activities democratizes access to knowledge and strengthens the link between the university and the Amazonian community.

Keywords: Performing Arts in Amazonas. Cultural Memory. University Extension. Teacher Training. Digital Preservation.

RESUMO

Este trabalho investiga a produção e a recepção das artes cênicas no Amazonas entre a década de 1980 e a atualidade. A pesquisa originou-se da catalogação de peças e esquetes teatrais que, embora fundamentais para a identidade regional, estavam restritas a acervos particulares. O objetivo é examinar a organização e a ressignificação do acervo documental das práticas teatrais amazonenses, analisando como a preservação digital e a extensão universitária, via projetos como Literatura no Palco e LAMCEPIN (Literatura Amazônica em Cena na cidade de Parintins) combatem o esquecimento cultural e auxiliam na formação de professores em Parintins. A delimitação temporal dá continuidade aos estudos de Costa e Azancoth (2010), expandindo o foco para o interior do estado. Metodologicamente, trata-se de uma pesquisa qualitativa baseada em análise documental e entrevistas (com identidades preservadas). A fundamentação teórica ancora-se em Boal (2009), Colombo (1991), Derrida (2001), Freire (1996) e Tardif (2008). Conclui-se que a integração do acervo às ações de

extensão democratiza o acesso ao conhecimento e fortalece o vínculo entre a universidade e a comunidade amazônica.

Palavras-chave: Artes Cênicas no Amazonas. Memória Cultural. Extensão Universitária. Formação de Professores. Preservação Digital.

RESUMEN

Este trabajo investiga la producción y recepción de las artes escénicas en Amazonas entre la década de 1980 y la actualidad. La investigación se originó a partir de la catalogación de obras de teatro y sketches que, si bien eran fundamentales para la identidad regional, se encontraban restringidos a colecciones privadas. El objetivo es examinar la organización y resignificación del acervo documental de prácticas teatrales amazónicas, analizando cómo la preservación digital y la extensión universitaria, a través de proyectos como Literatura en Escena y LAMCEPIN (Literatura Amazónica en Escena en la ciudad de Parintins), combaten la amnesia cultural y contribuyen a la formación docente en Parintins. La delimitación temporal continúa los estudios de Costa y Azancoth (2010), ampliando el enfoque al interior del estado. Metodológicamente, se trata de una investigación cualitativa basada en el análisis documental y entrevistas (con identidades preservadas). El marco teórico se basa en Boal (2009), Colombo (1991), Derrida (2001), Freire (1996) y Tardif (2008). Se concluye que la integración de la colección en las actividades de extensión democratiza el acceso al conocimiento y fortalece el vínculo entre la universidad y la comunidad amazónica.

Palabras clave: Artes Escénicas en Amazonas. Memoria Cultural. Extensión Universitaria. Formación Docente. Preservación Digital.

1 INTRODUCTION

The preservation of cultural memory in contemporary times faces the paradox of data hypertrophy and the fragility of supports. If, on the one hand, cloud storage technologies promise an informational omnipresence that transcends physical deterioration, on the other hand, the fragmentary nature of electronic culture imposes the risk of cognitive "myopia", as defined by Colombo (1991), where the accumulation of records does not necessarily translate into organic knowledge. In the field of performing arts in the Amazon, this scenario is aggravated by historical gaps in institutionalization and by the silencing of peripheral productions, making the archive a battlefield between the "death drive", the definitive erasure, and the "desire for the archive" as an act of political resistance (Derrida, 2001).

This article discusses the organization and resignification of the documentary collection of theatrical practices in Amazonas, with a special focus on the transition between the critical dramaturgy of Manaus and the theater-education developed in Parintins. The research began with the mapping done by Jorge Bandeira in *the Anuário do Teatro Amazonense* and continues to analyze the production of Márcio Souza, whose work in the 1980s used satirical laughter to expose the power structures and cultural isolation of the region. In this context, the first theater group was founded in the city of Parintins, called Grupo RETA (Reactivation of Amateur Theater).

Currently, the Literature course at the Center for Higher Studies of Parintins (CESP-UEA) plays a fundamental role in presenting a theater model with a democratic and emancipatory focus. Extension projects such as Literature on Stage, implemented in PIBID (2012-2016) and LAMCEPIN (Amazonian Literature on Stage in the City of Parintins) take the university's theater directly to the classrooms of public schools. The objective is not only the technical cataloguing of scripts, but the promotion of literary rereading as a pedagogical tool.

By involving academics and students of basic education in a creative process where regional literature is reinterpreted and staged, the project subverts the condition of cultural subalternity often imposed on the Amazon. The present work analyzes, therefore, how the union between digital safeguarding and extension practice transforms the anonymity of fairs and improvised stages into educational protagonism, ensuring that the history of Parintinense theater does not succumb to "archival evil", but remains as a vibrant reality in teacher training and local identity.

2 FROM THE STATIC OF THE ARCHIVE TO THE DYNAMICS OF THE SCENE: PROJECTS LITERATURE ON STAGE AND LAMCEPIN AS RESISTANCE TO THE EVIL OF THE ARCHIVE

Today's electronic memory surpasses physical media such as CDs and DVDs, standing out for its cloud storage and fast data transfer. The digital collection is stored on remote servers or high-performance flash memories, allowing immediate access from any connected device and minimizing the risk of forgetfulness or physical deterioration. Jacques Derrida (2001) points out that the archive brings together two principles: history and law.

It is true that the concept of archive contains within itself this memory of the name *arkhê*. But it also preserves itself under the shelter of this memory that it harbors: it is the same as saying that it forgets it. There is nothing accidental or surprising about this. In fact, contrary to what is generally imagined, such a concept is not easy to file. (Derrida, 2001, p.12)

In the first case, the archive is seen as the origin of everything; in the second, as order, the highest authority. In Greece, the *Arkheion* were the magistrates, responsible for official documents and the first custodians of the archives. The Archons' work was not restricted to keeping them in a safe place, but also to interpreting them. For Derrida (2001), this is the origin of archives. Inspired by Freud, the philosopher addresses a contradiction inherent to these records: they would be both a drive for destruction and conservation, since all memory involves death, symbolized by forgetting, and remembrance revitalizes what was dead. According to the author:

[...] there would certainly be no desire for an archive without radical finitude, without the possibility of oblivion [...] this is the most serious thing beyond or below this simple limit that they call finitude, there would be no evil of archive without the threat of this death drive, aggression or destruction (2001, p. 32).

In this passage, Derrida (2001) provokes a reflection on the ontology of the archive: it only exists because human memory is flawed and finite. The "death drive" refers to the silent force that works for oblivion and for the erasure of traces. In the context of theatrical practices in Amazonas, this threat is real and visible in the loss of manuscripts, the deterioration of costumes, and the silencing of groups that have not had their records institutionalized. Therefore, the digitalization effort is configured as an act of resistance to this radical finitude. By digitally archiving synopses and practices, it seeks to "overcome" the death drive, transforming the ephemeral theatrical event into something revisitable, ensuring that the history of Parintinense theater does not succumb to "archival evil".

File disruption stems from an archive evil. We have an archive disease (*en mal d'archm*). Listening to the French language and in it, the attribute "*en mal de*", to be with a file malfunction, can mean something other than suffering from an illness, a disturbance or that which the name "*mal*" could name. [...]. It is to address it with a compulsive, repetitive and nostalgic desire, an irrepressible desire to return to the origin, a pain of the homeland, a longing for home, a nostalgia for returning to the most archaic place of the absolute beginning. (Derrida, 2001, p.118).

We live in an era of digital "archival evil", where we record every second of our lives on social networks, driven precisely by this irrepressible desire not to let anything get lost, even though we know that the accumulation of data is not the same as the preservation of experience. While digitization prevents physical loss, e-culture poses the challenge of fragmentation. If oral memory is doomed to disappear, electronic memory can hypertrophy, constantly seeking to "clean" itself, deleting information so that new ones can be inserted. Colombo (1991), when referring to the electronic memorization system, calls it "myopic" knowledge, limited by the conventions of "key symbols: the user experiences the world as a succession of fragments, the set of which is never captured by him" (Colombo, 1991, p. 41). Oral memory, although fleeting, was organic and integrated into life while electronic memory is vast, but often sterile and external to the subject.

To overcome the staticness of the documentary record, the extension practices at the Center for Higher Studies of Parintins (CESP-UEA) seek to transform the archive into a living practice. This trajectory was initially consolidated with the Literature on Stage project (2012–2014), developed within the scope of PIBID, which introduced theatrical practices in public schools in Parintins. Currently, the LAMCEPIN project (Amazonian Literature on Stage in the City of Parintins) continues this legacy, mediating the tension between the "archival evil" and the "desire for the archive" (Derrida, 2001). By proposing that literature be not only stored, but actively reinterpreted and staged, LAMCEPIN subverts the immobility of the historical record. This process transforms digital memory into organic and pedagogical knowledge, which is reflected in the expressive local academic production: several monographic works by students of Letters at CESP-UEA are direct fruits of these experiences. Thus, rereading acts as the link between documentary data and contemporary creation, ensuring that regional literature remains as a living practice that is renewed with each new representation and academic investigation.

3 MEMORY AND RESISTANCE IN THE BACKYARD THEATER IN AMAZONAS

Amazonas experienced a period of cultural effervescence during the heyday of rubber, marked by the sumptuousness of the Teatro Amazonas and international tours that catered to a restricted audience. Parallel to this institutional scenario, the local production of artists

and writers often operated anonymously. Without access to the big stages, figures such as Edney Azancoth transformed the domestic space into a center of creation through the "backyard theater". According to the author, this practice involved the protagonism of children, who "prepared the script for the show, rehearsed, made costumes with tissue paper and crepe and went around the neighborhood inviting the spectators" (1993, p. 11). Such theatrical work flourished in a capital that, in the 1960s, still had reduced urban limits and lived under the aegis of the Military Dictatorship.

Darkness was total in the streets of Manaus. The cinemas, bars, amusement house had their own power generator. People who left their homes at night carried huge hand-held lanterns, so as not to topple over with the old iron gates or leafy mango trees that lined the streets. (Azancoth, 1993, p, 11.)

Azancoth (1993) describes a vivid painting of a Manaus that many today cannot imagine. The contrast between urban precariousness and cultural resistance directly influenced the city's theatrical production and consumption at the time. In this context, leisure was not just an amusement, but an act of resistance. The theater required extra technique and investment, which made it difficult for small groups without government support.

At the Guarany cinema, when the audience lights were turned off to begin the assignment, all the lanterns were lit by the spectators accompanied by a festival of screams and whistles [...]. A short distance from the cinema, in the neighborhood of Aparecido, a group of children, almost all of the same age, improvised their own entertainment; the backyard theater [...]. The lighting of the show was done by lamps that emitted black smoke resulting from burning kerosene (Azancoth, 1993, p. 11).

When analyzing the work of Azancoth (1993), it is perceived that the genesis of theater in Manaus is deeply linked to an 'aesthetics of smoke', geographically distant from cultural centers, lacking a theatrical culture. The backyard theater in the Aparecida neighborhood, lit with kerosene, represents the resistance of creative childhood in the face of urban precariousness. This contrast between the 'festival of screams' of Cine Guarany and the search for its own entertainment in the backyards founded what Azancoth would professionalize years later: a theater that, although born in the darkness of the streets of Manaus, sought clarity of technique and philosophical rigor.

It was by watching tetro in a circus that I learned to like tetro and one of the shows I always remember. "The Lady of the Camellias," reminds me of the circus montage with sets and costumes reconstituting the nineteenth century [...]. Over the years, circus visits to Manaus have decreased. [...] The impoverished population was increasingly absent from paid shows, preferring cinemas whose entrance remained low, allowing

any child to attend, with pennies taken hidden from the parents' pockets. (Azancoth (1993, 14).

According to Azancoth (1993), the theatrical sensibility in Manaus resulted from the contrast between circus luxury and the popularization of cinema. When recalling the circus staging of 'The Lady of the Camellias', the author shows that the aesthetic rigor that would mark his teaching and artistic career was rooted in the detailed scenography of the itinerant canvases. Simultaneously, his analysis of ticket prices points to a social concern that permeates his trajectory, as the recognition that art must find ways to reach the public, even in the face of the impoverishment of the population.

Edney Azancoth's trajectory in the cultural scene of Manaus is the portrait of an intellectual who saw on stage not only an entertainment space, but a field of rigorous study of human performance. Graduated in Philosophy from the University of Paraná, Azancoth brought to Amazonas a differentiated vision, where the actor's work was guided by discipline and absolute delivery. For him, "the stage should be the actor's battlefield" (Azancoth, 2009, p. 18, 2009), a place of resistance against all types of social oppression.

In this scenario, Amazonas stood out for informal theatrical presentations, many without registration. Thus, the importance of giving visibility to the theatrical texts produced in the 80s is emphasized, rescuing the memory of these manifestations in Manaus and the Lower Amazon, in the face of the lack of knowledge of local literary history by the community itself.

4 MÁRCIO SOUZA'S CRITICAL THEATER

In the 1980s, Márcio Souza consolidated himself as a central figure in Amazonian dramaturgy. His play *In Praise of Laziness* (1980) inaugurated a phase of experimental theater in Manaus, marked by an 'atmosphere of theater of the absurd and farcical comedy' that denounced the consequences of the Military Dictatorship (Souza, 2010, p. 73). In 1982, the author took to the stage *The Resistible Rise of the Boto-Tucuxi*, maintaining the satirical content by presenting a fiercely critical comedy about "the political populism that preceded the democratic collapse in Brazil" (Souza, 2010, p. 74). Both works use laughter and sarcasm as tools for social and political denunciation in the Amazonian context.

In addition to the political aspect, Márcio Souza's dramaturgy also focuses on ancestry and myth. An example of this is the play *The Wonderful Story of the Tarot-Bequê Frog*, a text from 1975 that returned to the stage in 2006. In this work, Souza investigates the imaginary of the Tucano ethnic group, establishing an analysis by relating elements of the Greek tradition, such as the myth of Orpheus, to indigenous cosmology. In the narrative, the frog transformed into a man seeks to rescue his beloved, Moça-Juriti, in the 'maloca of the dead'. The play proposes a philosophical reflection on the human condition, suggesting that man is not superior to the beings of the animal or plant kingdoms, culminating in the repentance of Tarot-Bequê for his human transformation.

The visual and documentary memory of this period was preserved in the work *Um Teatro na Amazônia* (2010). Márcio Souza's photographic book portrays the main stagings carried out in Manaus between 1969 and 2010, evidencing the longevity and the capacity for renewal of classics such as *A Paixão de Ajuricaba*. This play, for example, "returned to the Teatro Amazonas in 2003, twenty-nine years after its original staging of 1974" (Azancloth; Costa, 2009). This collection of images and records reaffirms the importance of Márcio Souza not only as a playwright, but as a great scholar of Amazonian history and culture.

However, the trajectory to consolidate this archive and keep theatrical production alive was marked by episodes of censorship and isolation. Souza (1984) describes the difficulty of producing culture in a city that, at the time, was hostile to the social transformations proposed by experimental theater:

On the day that SESC put padlocks on the door of the small theater that served as the headquarters of our group, putting an end to an experience of more than ten years, the so-called members of the theater class of Manaus gathered in a pizzeria to celebrate. This happened in September 1980, and to this day we are wondering the reasons for such a mismatch. [...] we worked for ten years in the hostile terrain of Manaus, in one of the most isolated cities in Brazil, without any cultural tradition, reduced to blindly running after the tram of history (Souza, 1984, p. 9-10).

Souza's (1984) report evidences what he calls "mismatch": the paradoxical celebration of the closure of a cultural space by one's peers. This political and institutional hostility, symbolized by the "padlocks on the door", illustrates the imminent risk of erasure of theatrical memory when it does not have the support of the State or the recognition of the community. The author's speech reinforces the need for preservation projects and current extension practices, such as LAMCEPIN. If in the 1980s the theater in Manaus fought against isolation and forced silencing, the transposition of these works to the school and university environment today in Parintins works as a historical reparation. By "running after the tram of history", the contemporary researcher not only recovers the fragments of these past

experiences, but resignifies them, preventing the "lock" of oblivion from closing definitively on the literary and theatrical production of the Amazon.

5 CARTOGRAPHY OF THE INVISIBLE: THE MAPPING OF THEATRICAL PRACTICES IN MANAUS

The recognized historical difficulty in accessing locally produced dramatic texts led Professor Jorge Bandeira to compile the "Anuário de Teatro Amazonense". Professor Jorge Bandeira has extensive theatrical experience as a director, actor and critic. He organized the Amazonense Theater Yearbook, seeking a partnership for updates. In 2013, it granted the researcher the 25th update of the Yearbook. This exhaustive survey mapped the performing arts scene in Manaus between the years 1975 and 2013, ranging from major festivals and official exhibitions to informal activities held in public schools, resulting in an expressive *corpus* of 337 stagings. The consolidation of this document relied on a fundamental network of collaborators, among whom are central names in the history of Amazonian theater, such as Nereide Santiago, Dori Carvalho, Wagner Melo, Chico Cardoso and Ismael Farias, among others.

From this documentary mapping, it becomes possible to draw a cartography of the most emblematic productions of the period, evidencing the aesthetic diversity of the Amazonian scene in the 1980s. Highlights include the works of a political nature by Márcio Souza, such as *The Praise of Laziness* (1980) and *The Resistible Rise of the Boto-Tucuxi* (1982), in addition to the productions of the GRITO Group, under the coordination of Bechinha, which took to the stage titles such as *Pluft, the Ghostly* (1980) and *Putz, the Girl Who Sought the Sun* (1981). The production of this period also reveals the strength of female dramaturgy and local direction in plays such as *O Leiteiro e a Menina* (1982), by Nereide Santiago, and *O Despertar da Primavera* (1985), by Socorro Langbeck and Beckinha, under the direction of Wagner Melo.

The connection between Amazonian theater and universal dramaturgy is also evidenced in the Yearbook through avant-garde adaptations, such as *Picnic on the Front* (1983), by Fernando Arrabal, and *Say Yes, Say No* (1985), by Bertolt Brecht, both directed by Wagner Melo, in addition to *Blood Wedding* (1984), by García Lorca, directed by Gerson Albano by Grupo Independente. The survey also includes a dialogue with the regional imaginary and classic literature in works such as *Aquela Outra Face da Tribo* (1983), by Aurélio Michiles, *O Pequeno Príncipe* (1984), adapted by Beckinha, and contemporary productions such as *A Carroça de' Pandora do Largo de Sabá Tião* (2007), by Jorge Bandeira.

Despite the relevance of this mapping, it is emphasized that obtaining the original texts of these productions remains a critical challenge for researchers. Most of these works have not been published in print form, and even those that have made it to press are rarely available in bookstores or public collections. This documentary gap justifies the urgency of initiatives that seek not only to catalog, but to digitize and resignify these texts, preventing the history of Amazonian theater from being lost in the ephemerality and some memories of those who watched past stagings.

6 THEATRICAL PRACTICES IN PARINTINS: THE DEMOCRATIC THEATER-EDUCATION

Brazil, in its continental dimension, is home to a cultural plurality that is often eclipsed by deep social disparities, directly reflected in the educational system. In the corners of Amazonas, the scarcity of literary collections means that the textbook is often the only study tool, resulting in a gap in the training of readers of literary texts. Faced with the difficulty in making the classroom space more dynamic, dramatic reading and theater emerge as significant possibilities for mediation and cultural dissemination. In Parintins, this trajectory took shape with the "Literature on Stage" project, implemented in public schools since 2010, and was consolidated through the performance of the Literature Course of the Center for Higher Studies of Parintins (CESP-UEA).

The methodology adopted by the Letters course comprises theater-education in addition to an imposing show aimed at a passive audience; It is a democratic and emancipatory theater, where the student is an active subject of creation. Based on Tardif's (2008) perspective, the teaching work should "play the piano of emotions", integrating affect and cognition.

In teaching, some students seem nice, others don't; with some groups the thing flows, with others, everything is blocked, etc. To a large extent, the teaching work rests on emotions, affections, on the ability not only to think about students, but also to perceive and feel their emotions, their fears, their joys, their own traumas. The experienced teacher knows how to play the piano of the group's emotions, provokes enthusiasm, knows how to involve them in the task (Tardif, 2008, p. 258).

In the context of Parintins, theater acts as a catalyst for the ability to feel, transforming the educator into an artist-teacher capable of involving students in the collective construction of knowledge. Thus, the blockage of pure technique is replaced by the fluidity of the teaching-learning process, in line with what Freire (1996) proposes: the search for a reflective pedagogy, mediated by thinking subjects and producers of knowledge.

some fundamental knowledge to the educational-critical or progressive practice and that, for this very reason, should be mandatory content for the programmatic organization of teacher training. Contents whose understanding, as clear and as lucid as possible, must be elaborated in the formative practice. It is necessary, above all, and this is already one of these indispensable knowledges, that the former, from the very beginning of his formative experience, assuming himself as a subject of the production of knowledge, is definitively convinced that teaching is not transferring knowledge, but creating the possibilities for its production or construction (Freire, 1996, p.12).

In theater-education, Freire's pedagogy (1996) ceases to be an abstract concept to become a physical action. When he states that "teaching is not transferring knowledge", he is, in fact, calling on the teacher to abandon the role of authoritarian director to become a creator of contexts. In the training of a producer of critical knowledge, the stage (or the classroom) functions as the laboratory where this knowledge is elaborated in practice. This construction is not purely intellectual; it necessarily passes through the hands of the teacher who, as Tardif (2008) suggests, knows how to "play the piano of emotions". According to Tardif (2008), teaching knowledge results from sensitivity and experience. In theater-education, playing this piano means having the pedagogical "tact" to realize that critical knowledge is born of an affective mobilization. Critical thinking is not produced in emptiness or fear, but in trust. When the educator balances technique, politics and affection, he stops just transmitting content and promotes a real event in the classroom.

Historically, theatrical practices in Parintins emerged from the 1960s, driven by student and religious movements. However, it was in the 80s that local cultural resistance gained momentum with the foundation of the RETA Group (Reactivation of Amateur Theater). Originating at the Senador Álvaro Maia State School, RETA marked the apogee of a theater made by and for the community, presenting plays such as *O Concertador de Brinquedos* and *Conde Dracula* in schools and public spaces. This movement, marked by improvisation and collectivity, where costumes and sets were handcrafted by the team, faced the difficulties of the time, such as the use of mimeographs and political hostility, to take the theater outdoors on commemorative dates.

RETA was born within the Senador Álvaro Maia School (in 1980). [...]. The young people [students of this school] liked to do plays, [...]. This group reaches its apogee with the theatrical play *Concertador de brinquedo* was presented in schools through workshops for the realization of theater, where the Ruy Araújo School was a starting point for the realization of plays such as Count *Dracula* where many funny things happened, but we always worked together in the realization of the plays [...]. The RETA Group had only one birth and it has not yet died. Die with us and history remains. RETA was a team where it had the help of teachers and students. I was just one of

those who contributed to the success of GRUPO RETA, making it a reference in Amazonas. (Interview with one of the founders of the RETA group, 2014).

The phrase of the founding member, "The RETA Group had only one birth has not yet died. It dies with us and history remains", summarizes the concept of intangible heritage. It shows that a theater group is not limited to plays, but transforms those who participate. For those young people of 1980, the stage was a space of voice and citizenship, and this flame remains lit in the affective memory and pedagogical practices that they disseminated over the decades. Today, this seed finds fertile soil in the extension project LAMCEPIN (Amazonian Literature on Stage in the City of Parintins). There is a poetic and political line that unites the past and the present.

Amazonas still faces deep prejudices in relation to its own culture, often reproduced by the Amazonians themselves, influenced by a Eurocentric vision that dictates the dichotomy between center and periphery. According to Santos (2010), the "conflicts between hegemonic neoliberal globalization and counter-hegemonic globalization" (p. 93) accentuate the problem of subordination. By transposing this discussion to the Amazonian scenario, one observes a society that often places itself in a condition of cultural inferiority, valuing the external repertoire or analyzing its own idiosyncrasies from a European perspective. This process of self-devaluation positions us as subaltern subjects, marginalized in relation to the canon and devoid of a legitimate space for enunciation.

The history of Amazonian theater is marked by cycles that end prematurely due to the scarcity of incentive and promotion policies. Just as Azancoth (1993) performed the "backyard theater" and Márcio Souza (1984) witnessed the end of the TESC cycle in Manaus, the scenario in Parintins was not different. The RETA GROUP, composed of young students supported by their families, also interrupted its activities due to the lack of financial return. With no prospects of professionalization or remuneration to guarantee their livelihood, the members were compelled to prioritize entering the labor market, which resulted in the dissolution of the group and the search for other sources of survival.

In the late 80s and early 90s, when he entered university, time became scarce. At that time, I started teaching at Colégio do Carmo as a teacher in a special regime, which, in practice, was a challenge, as I could spend six months without receiving a salary. During this period, other members [of the RETA group] followed different paths. The class was separated because each one sought a different purpose for their lives; After all, no one would survive only from theater. However, the theater remains alive in our soul, because it is part of us and we are the theater (Excerpt from an interview with another founding member of the RETA Group, in 2014).

However, the transition from this amateur theater to university extension practices allowed the institutionalization of theatrical production, culminating in remarkable moments of urban occupation. A fundamental milestone of this resistance was the I Parintinense Amateur Theater Exhibition, held on November 8, 2013. On that occasion, the stage of the historic Cine Teatro da Paz, in the city of Parintins, was occupied by reinterpretations such as *Iracema*, *O Puratin e a Jiboia Grande*, *O Lamento do Gavião Real* and *A Saga da Mandioca Sateré-Mawé: Aqui tem chibé? THERE IS!* Such stagings evidenced the technical and creative capacity of the students of Letters, from CESP-UEA to act, to produce scenery transforming the lack of resources into artistic power.

The consolidation of this process occurred the following year with the II Parintinense Amateur Theater Festival, held in October 2014, on the premises of CESP-UEA. The event presented a diversified repertoire, in partnership with PIBID Letras through the Literature on Stage project, which reaffirmed the role of the Literature student not only as a reader, but as a director and cultural mediator. Among the works staged, the following stood out: *Macunaíma*, *O Puratin and Jiboia Grande*. such as the indigenous theater *A Paixão de Ajuricaba*, As tragédias e dramas sociais em *Luzia-Homem* and *O Bom Crioulo*, among other presentations.

This production, directed mostly by academics, materializes the transition from the "student-spectator" to the "student-artist", a central concept of Boal (2009). By directing plays, students star in aesthetic processes and give voice to narratives that reflect the Amazonian reality. Such a movement reflects the "total experience" defended by Paulo Freire (1996), in which the act of learning becomes an ethical and aesthetic commitment to reality itself. By refusing passivity, these students carry out a political practice that claims the authorship of their own thought.

When we live the authenticity required by the practice of teaching-learning, we participate in a total, directive, political, ideological, gnosiological, pedagogical, aesthetic and ethical experience, in which beauty must go hand in hand with decency and seriousness (Freire, 1996, p.13).

It turns out that the Amazonian students did not limit themselves to presenting plays; they also promoted a political action that rejects passivity and claims intellectual authorship. For Boal (2009) the theater is the rehearsal of the revolution and, for Freire (1986) education is the practice of freedom. In this context, Freire's "beauty" appears when he legitimizes his own worldview, making the stage a space of resistance. It is in this fusion between pedagogical seriousness and aesthetic protagonism that knowledge ceases to be a transferred content to become an authentic construction, where the ethics of assuming

oneself as the subject of history meets the aesthetics of seeing oneself as the creator of one's own image.

After a nine-year hiatus, Parintins' academic theatre scene experienced a vigorous renaissance. In 2024, the III Amateur Theater and Film Festival, held in conjunction with the III *Ludi Insulae*, marked a significant expansion by integrating classical theater into extension practices. Between June 8 and August 2, 2024, the university promoted a true cultural season, occupying not only CESP-UEA, but also the city's squares.

The duality between the universal and the local was established by the staging of *Plautus' The Menecmos*, in dialogue with the revival of *The Lament of the Hawkman*. The latter, an authorial piece by the researcher written in 2013, remains a living record of contemporary Amazonian dramaturgy. The impact of this production and the effectiveness of the project in its pedagogical and cultural mission are evidenced in the report of a LAMCEPIN scholarship holder:

Participating in this theatrical work was enriching for my experience in various areas of theater and literature. In rehearsals, we had the chance to work together with the other members of the cast and crew to hone our skills and develop our performance, but the best part was the acting on stage, seeing people's reactions and their comments about how they didn't know that story and that they found it interesting, because our project [LAMCEPIM] above all serves as a vehicle for the dissemination of Amazonian literature, and seeing this goal being achieved is gratifying. (report of a scholarship holder of the LAMCEPIN project).

In 2025, student protagonism was consolidated at the IV Parintinense Amateur Theater Exhibition, organized by the LAMCEPIN project team. The staging of the indigenous play *The History of Guaraná* reaffirmed the course's commitment to local cosmology. This movement updates Boal's (2009) thesis by involving scholarship holders in the organization and execution of ancestral themes; thus, the LAMCEPIN project not only teaches literature, but promotes a resignification of identity perception, in which the academic assumes the responsibility of experiencing his own history before his community.

The teacher who thinks right lets it be known to the students that one of the beauties of our way of being in the world and with the world, as historical beings, is the ability to know the world by intervening in the world. But, historical as we are, our knowledge of the world has historicity (Freire, 1996, p.14).

This "beauty" of which Freire (1996) speaks resides precisely in the emancipation of perception, in which the academic, by assuming the protagonism of the scene and of research, ceases to be a receptacle of foreign theories to become a subject who produces

situated knowledge. To recognize the historicity of our knowledge, as the author points out, is to understand that contemporary Amazonian dramaturgy is a legitimate and powerful form of "thinking right", in which theatrical technique submits to the ethical need to give body and voice to the community itself. Thus, theatre-education consolidates itself as a space where aesthetic intervention is, simultaneously, an exercise of collective self-knowledge and affirmation of our way of "being in the world".

7 FINAL CONSIDERATIONS

The investigation into the trajectory of the performing arts in Amazonas reveals that the preservation of cultural memory transcends mere documentary custody; it requires the pulsating revitalization of artistic making. This work demonstrated that the dialogue between Manaus and Parintins is not only geographical, but a bridge between different forms of cultural insurgency. While the experiences of Edney Azancloth, Márcio Souza and GRUPO RETA stood as direct political resistance against silencing, contemporary practices in Parintins, mediated by the Literature on Stage and LAMCEPIN projects, reconfigure this struggle from a pedagogical and identity perspective.

The union between documentary cataloguing and university extension presents itself as an effective antidote to the "archival evil" (Derrida, 2001). By transposing regional literature to the stage, the university democratizes access to culture and establishes an educational praxis aligned with Freire's thought (1986). From this perspective, the educator acts as an emancipatory agent, promoting critical thinking and allowing university and public school students to play a leading role in local cultural history, transforming the static record into social awareness.

In this scenario, Boal's (2009) aesthetics remains latent. Theater in Amazonian schools, even immersed in the anonymity of the peripheries and riverside communities, continues to pulsate on improvised stages: wooden stages, courtyards or public squares. This practice reaffirms the premise that everyone can do theater and that the stage is, above all, a rehearsal space for reality and social transformation.

It is concluded that the Amazonian theater, from the backyards of the capital to the squares of the interior, remains a vital tool of emancipation. He not only narrates, but affirms the Amazonian cosmology, ensuring that art remains the territory of freedom where the Amazonian subject recognizes, celebrates and safeguards his own identity.

José Manuel Salum Tomé¹

ABSTRACT

Animals in the natural environment face multiple challenges in order to survive. One of the most fundamental is obtaining food, and for this task to be effective they must remember the places they have previously explored. Successfully solving this task requires a system of memory and attention. "Attention is understood as the mechanism that activates the processes involved in the processing of information, participates in and facilitates the functioning of all cognitive processes, regulating and exerting control over them." (García, 1997; Rosello, 1998; Ruiz-Vargas, 1987). Attention is a selective process of receiving information that controls the threshold of our cognitive system and also performs alert functions, being involved in educational learning and study processes, participating as an alert mechanism in high-risk professions, in the concentration and focus of research, and in memory and learning, among others.

Keywords: Memory. Natural Environment. Attention. Thought.

RESUMO

Os animais no ambiente natural enfrentam múltiplos desafios para sobreviver. Um dos mais fundamentais é a obtenção de alimento e, para que essa tarefa seja eficaz, eles precisam lembrar os lugares que já inspecionaram. Resolver adequadamente essa tarefa requer um sistema de memória e atenção. "Entende-se por atenção o mecanismo que ativa os processos que intervêm no processamento da informação, participa e facilita o funcionamento de todos os processos cognitivos, regulando e exercendo controle sobre eles." (García, 1997; Rosello, 1998; Ruiz-Vargas, 1987). A atenção é um processo seletivo de recepção de informações que controla o limiar do nosso sistema cognitivo e também desempenha funções de alerta, estando envolvida nos processos educacionais de aprendizagem e estudo, atuando como mecanismo de alerta em profissões de alto risco, na concentração e focalização de pesquisas, na memória e na aprendizagem, entre outros.

Palavras-chave: Memória. Meio Natural. Atenção. Pensamento.

RESUMEN

Los animales en el medio natural se enfrentan a múltiples problemas para sobrevivir. Uno fundamental es el abastecimiento de alimento, para que dicha tarea sea eficaz ellos tienen que recordar los lugares que han inspeccionado. Resolver esta tarea adecuadamente requiere de un sistema de memoria y atención. “Se entiende por atención al mecanismo que activa los procesos que intervienen en el pensamiento de la información, participa y facilita el trabajo de todos los procesos cognitivos, regulando y ejerciendo un control sobre ellos”. (García, 1997; Rosello, 1998; Ruiz-Vargas, 1987). La atención es un proceso selectivo de recepción de información que controla el umbral de nuestro sistema cognitivo y además cumple funciones de alerta, implicado en los procesos de aprendizaje educativos y de estudio, participa como alerta en profesiones de alto riesgo, en la concentración y focalización de investigaciones, memoria y aprendizaje entre otros.

Palabras clave: Memoria. Medio Natural. Atención. Pensamiento.

1 INTRODUCTION

The three most important functions are to select information, control limited capacity, and keep physiological, emotional, and neurological processes activated and alert.

Attention is divided into three mechanisms, selective, divided and sustained attention.

The selectivity of attention can be easily shown in studies that indicate that we focus only on some details of our interest, and add what is missing based on what we remember.

In general, the complex process of attention is a mechanism that integrates and involves feelings, emotions and physiological structures that allow our mind to access all existing stimuli, it gives us the possibility of selecting, distributing and giving our own meaning to each thing, object or place in order to be able to discriminate how pleasant and interesting a certain event seems to us. In order to effectively guide our individual tastes, aspirations and potentialities and insert ourselves socially better directed.

What kind of capacity is attention? Psychologists have not yet agreed on this, some consider that attention is only one aspect of perception and other cognitive abilities.

We choose what we will see or what we will hear in anticipation of the structured information that this will provide us. Only the episodes to which attention is paid are anticipated, explored and recorded; In other words, the act of perceiving requires selectivity.

Selectivity of attention can be easily demonstrated, one way to do this is by recording people's eye movements when they look at paintings or photographs. Studies of this type indicate that we concentrate only on a few details; Then, based on these signs, we put in what is missing, perhaps based on memories.

Evidence supporting attention selectivity also comes from studies of divided attention. People can learn to perform two complicated tasks at the same time, but there are well-defined restrictions. In general, the capacity of care depends on the resources that are necessary for the work to be carried out. If few resources and conscious control are required, a person can carry out other tasks simultaneously. If the work undertaken is far from being automatic, it will need a large part of the attention of the person who performs it. If you want to perform two difficult tasks at the same time, you need to practice one of them first until it becomes relatively automatic and demands little attention.

The environment in which we live is complex since it includes a large amount of information that we must attend to and sometimes requires us to respond to more than one piece of information simultaneously.

When attentional and memory processes are set in motion, we are more receptive to events in the environment and we perform an activity or task more effectively, even if it requires more effort.

Through attention we are informed of the physiological and pathological modifications of our internal environment, whether physical or mental.

Attention does not work in isolation, but is directly related to other psychological processes such as memory.

2 THE BIOLOGICAL VIEW OF MEMORY

With the advances that neuroscience has been making about the functioning of memory, the view that it is simply a storage or retrieval of data is changing to give a more active and dynamic role to the process of memorizing.

Currently, neuroscientists have identified the existence of different types of memories, either through research or by recognizing them in people affected by injuries or illnesses suffered.

Knowledge of how memory works tells us about the role that experience and practice play in the process of learning and memorizing by modifying neural structures. On the one hand, there is a direct relationship between the number of experiences that are involved and the complexity of the environment with the number of structures that change in the brain; and on the other, practice increases the ability to learn and memorize. It is also known that learning and memory not only affect the number of synapses, but also change the structural dynamics of the brain by modifying the support cells, astrocytes, and blood capillaries that provide sustenance to neurons.

Memory is considered as a "storehouse" of information and from which data are evoked when required.

It allows us to look biologically at the mental processes that take place in the brain, suggesting that creative activities such as language, music and art are functions in which specialized neural circuits from different regions of the brain intervene, which are made up of nerve cells, neurons. Taking this biological perspective of the processes that are linked to learning and memorizing, we can say that learning collects stimuli from the environment through different neural circuits that are then passed through to be collected in the different neural networks, the memories.

Memory carries out a process of neural "manipulation" to store information in the different neural networks, so that finally through a process of evocation different circuits and nerve networks are related to show a behavior or solve the solution of a problem. This biological view allows us to glimpse a more active role of memory in this entire stage of processing and retrieval of information more than a simple "store", since it is a series of

spatio-temporal neural interactions between the different memories for a response to the environment.

3 MEMORY IN AN EXECUTIVE ROLE

The executive function of working memory reflects in some way the interest of the educational field in finding in our brain the center that has the ability to mentalize or perform metacognitive functions, the control of processes on products, the planning of goals and the maintenance of attention on important tasks. Working memory manages information by manipulating and maintaining it to accomplish a task, and plans and organizes goals as the situation requires. This memory goes through continuous updating and reorganization to fulfill the proposed tasks, it is also involved in mechanisms of unconscious processes that allow us to find solutions to problems after a good night's sleep. Working memory, in addition to storing information in long-term memory, operates the elements of information to guide behaviors. Researchers have found evidence of executive control of working memory in many cognitive functions, including: memory updating, receiving and evaluating sensory information to transfer it to and retrieve from long-term memory, and deciding which memories are needed for which tasks; the establishment of goals and plans, recording the goals, planning them in advance how to achieve them and establishing their priorities; task switching, monitors external signals for information that indicates the need to switch from one task to another; and the selection of stimuli and inhibition of responses, allowing the selection of a stimulus to be evaluated and a habitual response to be inhibited, to shift attention to a new alternative that responds to a specific context.

Another interesting aspect is the location of the executive center of working memory. Neuroimaging shows studies in which neural functions of the frontal cortex are linked to working memory performances. This strengthens the idea of an active role of memory, since the frontal cortex, on the one hand, is the region that would be best connected to fulfill all these tasks and on the other, it has all the inputs and outputs necessary to develop an executive function on cognitive and operational control over selective attention. (Geake, 2009).

With what we have just seen about the executive role of memory, the question arises: could we continue to think that memory is only limited to the storage of information? It is clear that no, we would have to look at the concept of learning and memory in a different way.

4 THE BIOLOGICAL VIEW OF MEMORY

With the advances that neuroscience has been making about the functioning of memory, the view that it is simply a storage or retrieval of data is changing to give a more active and dynamic role to the process of memorizing. The use of neuroimaging technologies such as fMRI (functional magnetic resonance imaging), PET (positron emission tomography), EEG (Electroencephalography) and MEG (Magnetoencephalography) is allowing us to know how the brain works, to stop being that black box of a few decades ago in which it was filled with data and information that was not used. and open up a different look at the concept of memorizing and with it that of learning.

Currently, neuroscientists have identified the existence of different types of memories, either through research or by recognizing them in people affected by injuries or illnesses suffered. (Gluck, Mercado, & Myers, 2009). In the book *The Brain and Learning* by Jossey-Bas, it is mentioned that memory is not a unitary construction, it is where the characteristics of learning are related to the ability to remember, which is not a passive event, but is a series of events that organize memories in a sequence that makes sense. He considers memory as a phenomenon that encompasses the entire brain. In addition, he argues that the brain structures linked to the learning of mathematics differ from the learning of reading and learning to play the piano. The same is true for memory systems linked to these activities and that take place at different times. Likewise, remembering who you are or remembering where you are from, activates different memories in the brain in separate regions.

Knowledge of how memory works tells us about the role that experience and practice play in the process of learning and memorizing by modifying neural structures. On the one hand, there is a direct relationship between the number of experiences that are involved and the complexity of the environment with the number of structures that change in the brain; and on the other, practice increases the ability to learn and memorize. It is also known that learning and memory not only affect the number of synapses, but also change the structural dynamics of the brain by modifying the support cells, astrocytes, and blood capillaries that provide sustenance to neurons.

Memory is considered as a "storehouse" of information and from which data are evoked when required. Eric Kandel, Nobel Prize in Medicine in 2000, defines it as "the ability to acquire and store extremely diverse information, from the trifles of everyday life to complex abstractions of geography and algebra. Thanks to this ability we can solve problems by evoking different experiences" (Kandel, 2007). Kandel mentions that with the birth of cognitive neuroscience, about 40 years ago, it was possible to link the strategies used in psychology with biological methods to study the brain. It allows us to look biologically at the mental

processes that take place in the brain, suggesting that creative activities such as language, music, and art are functions in which specialized neural circuits from different regions of the brain are involved, which are made up of nerve cells, neurons (Kandel, 2007). Taking this biological perspective of the processes that are linked to learning and memorizing, we can say that learning collects stimuli from the environment through different neural circuits that are then passed through to be collected in the different neural networks, the memories. Memory carries out a process of neural "manipulation" to store information in the different neural networks, so that finally through a process of evocation different circuits and nerve networks are related to show a behavior or solve the solution of a problem. This biological view allows us to glimpse a more active role of memory in this entire stage of processing and retrieval of information more than a simple "store", since it is a series of spatio-temporal neural interactions between the different memories for a response to the environment.

5 MEMORY IN AN EXECUTIVE ROLE

One of the memories that led me to start this reflection and rethink that they have a more active role in cognitive processes and therefore in learning, is undoubtedly the executive function of working memory, which has been defined "as the center of the cognitive construct that sustains general intelligence and creative thinking" (Geake, 2009).

The executive function of working memory reflects in some way the interest of the educational field in finding in our brain the center that has the ability to mentalize or perform metacognitive functions, the control of processes on products, the planning of goals and the maintenance of attention on important tasks (Geake, 2009). Working memory manages information by manipulating and maintaining it to accomplish a task, and plans and organizes goals as the situation requires. This memory goes through continuous updating and reorganization to fulfill the proposed tasks, it is also involved in mechanisms of unconscious processes that allow us to find solutions to problems after a good night's sleep. Working memory, in addition to storing information in long-term memory, operates the elements of information to guide behaviors. Researchers have found evidence of executive control of working memory in many cognitive functions, including: memory updating, receiving and evaluating sensory information to transfer it to and retrieve from long-term memory, and deciding which memories are needed for which tasks; the establishment of goals and plans, recording the goals, planning them in advance how to achieve them and establishing their priorities; task switching, monitors external signals for information that indicates the need to switch from one task to another; and the selection of stimuli and inhibition of responses, allowing the selection of a stimulus to be evaluated and a habitual response to be inhibited,

to shift attention to a new alternative that responds to a specific context. (Gluck, Mercado, & Myers, 2009) (Geake, 2009). For M.C. Etchepareborda, working memory is responsible for channeling the flow of information in the neural system, performing attentional functions, encoding and retaining verbal information, language acquisition and the management of visuospatial information. It would be the one that governs memory systems, distributing the attention assigned to each task to be performed according to the demands imposed on the neural system, the level of experience of the person and the demands of the environment. In addition, to the extent that a task is mastered, less attention will be needed and will allow the execution of other compatible tasks, giving working memory assumes a more dynamic and executive role than a simple data file.

Another interesting aspect is the location of the executive center of working memory. Neuroimaging shows studies in which neural functions of the frontal cortex are linked to working memory performances. This strengthens the idea of an active role of memory, since the frontal cortex, on the one hand, is the region that would be best connected to fulfill all these tasks and on the other, it has all the inputs and outputs necessary to develop an executive function on cognitive and operational control over selective attention. (Geake, 2009).

With what we have just seen about the executive role of memory, the question arises: could we continue to think that memory is only limited to the storage of information? It is clear that no, we would have to look at the concept of learning and memory in a different way.

6 LEARNING VS. MEMORIZING

Let us now look at one of the most widely used definitions of learning, that of John Anderson: "learning is the process by which lasting changes in behavioral potential occur as a result of experience" (Andersen, 2001) (Londoño, 2008). The incorporation of experience is an aspect that we can assign to learning, while in evocation and behavioral change one hardly finds a clear distance between the role of memory and learning. L. Londoño uses the term "durable" to make a difference between learning and memory. He argues that lasting changes over time last in learning while memory does not (Londoño, 2008). If we keep memory as a store of files, this may be true, but as we have seen, the way in which memories interact through an executive center gives it a more active role and management of cognitive processes.

For S. Machado (Machado, et al., 2008) there is a limit between the tasks of learning and memory. Both have an origin in neural plasticity and where learning is a process by which

we acquire knowledge about the environment that surrounds us and memory would be the ability of the individual to retain and use information in different ways and in different periods.

If we also take into account the fact that the executive function of working memory is located in the frontal cortex, it allows us to see that memory has an active role in complex thinking skills and that we could differentiate it from the role of learning. Placing memory as the one that encodes, stores, evokes and manages the information necessary to solve problems or generate behaviors and learning in all the processes and strategies that are linked to the acquisition of information about the environment for memory.

7 CONCLUSIONS

For education, differentiating the role of learning and memory in the educational field would allow optimizing pedagogical strategies aimed at promoting better learning and memorization. Both are processes that are intimately related and that we could place in two different and complementary moments in the series of neural processes through which organisms handle and process the information provided by the senses to adapt to the demands of the environment. Placing learning in a role that has to do with the process of acquiring stimuli and incorporating new experiences for memory; and memory in a more executive role and management of all that information in favor of giving the best response to the environment or the best solution to a problem. To the extent that we discover how the dynamics of neural networks occur in the functioning of the brain during the learning and memorization process, and how this adaptive neuroplasticity occurs to change cognitive capacity, we will be able to better define the areas of learning and memory.

Luis da Silva Simoes

ABSTRACT

Research on tactics and playing space management in football is fundamental, considering the current limitations in developing players who possess a deep understanding of the game and the ability to apply it effectively. One of the main difficulties faced by coaches is the lack of effective methods for teaching game tactics and strategies in an engaging and understandable way. In response to this need, researchers have developed innovative tools, including small educational games designed for specific objectives, such as developing game vision and improving decision-making on the field. These games have the potential to make training more attractive and effective, increasing players' enjoyment and motivation to train, and consequently improving their performance on the field. One of the main issues in football is the difficulty in ensuring the effectiveness of tactics and the efficient management of playing space, despite the existence of various tactical variations. This is because the simple application of these tactics does not ensure effective learning and efficient player movement, raising the need for innovative methods that can overcome these limitations. This article investigates how soccer tactics, particularly those related to player movement, impact the effective management of playing space and seeks to identify, in the literature, movement patterns that can optimize team performance in matches. Given the importance of overcoming current limitations in teaching the application of tactics and management of playing space, this study will adopt an innovative approach, inspired by research that uses games to teach soccer, adapting it to programmed training and evaluations in Tactiup, with the aim of improving team performance in university competitions. To verify existing tactics, we conducted a systematic literature review, including scientific articles and books that addressed the topic of soccer tactics and management of playing space. We used specific inclusion and exclusion criteria to select the sources, including the relevance of the topic and the methodological quality of the studies. In addition, we used the Tactiup software to evaluate soccer tactics and analyze the results. The training sessions were held on the field of the Federal University of Bahia, where players participated in specific movement and playing space management exercises, using balls, cones, and vests. The training sessions were conducted over 8 non-consecutive weeks, with 2 sessions per week, generally on weekends, with scheduled games in national and regional university competitions. Players were evaluated before and after training to verify performance improvements. The study results showed that the training regimen led to a positive change in team performance. In particular, 75% of the team reported a change in behavior, which translated into improved

positioning and attacking and defensive skills. Furthermore, the team showed a 70% reduction in goals conceded compared to previous competitions. These results were corroborated by positive player feedback and the team's qualification for the finals of regional championships and national tournaments. Based on the results obtained, which showed a significant improvement in team performance, it is crucial that coaches focus on learning new training methods to teach players the key fundamentals of the game more effectively. This contributes to the development of football in Brazil through partnerships between training centers and specialized universities, aiming for the continued growth and development of football in the country, with better-prepared players and coaches.

RESUMO

A pesquisa sobre tática e gestão de espaço de jogo no futebol é fundamental, considerando as atuais limitações no desenvolvimento de jogadores que possuem uma compreensão aprofundada do jogo e a capacidade de aplicá-la efetivamente. Uma das principais dificuldades enfrentadas pelos treinadores é a falta de métodos eficazes para ensinar táticas e estratégias de jogo de maneira atraente e compreensível. Como resposta a essa necessidade, pesquisadores têm desenvolvido ferramentas inovadoras, incluindo pequenos jogos educacionais projetados para objetivos específicos, como o desenvolvimento da visão de jogo e a melhoria da tomada de decisões em campo. Esses jogos têm o potencial de tornar o treinamento mais atraente e efetivo, aumentando o prazer e a motivação dos jogadores para treinar, e, conseqüentemente, melhorando seu desempenho no campo. Uma das principais questões no futebol é a dificuldade em garantir a eficácia das táticas e a gestão eficaz do espaço de jogo, apesar da existência de diversas variações táticas. Isso ocorre porque a simples aplicação dessas táticas não asseguram o aprendizado efetivo e a movimentação eficiente dos jogadores, levantando a necessidade de métodos inovadores que possam superar essas limitações. Este artigo investiga como as táticas de futebol, particularmente as relacionadas à movimentação dos jogadores, impactam a gestão eficaz do espaço de jogo e busca identificar, na literatura, padrões de movimentação que possam otimizar a performance das equipes nas partidas. Dada a importância de superar as limitações atuais no ensino da aplicação de táticas e gestão do espaço de jogo, este estudo adotará uma abordagem inovadora, inspirada em pesquisas que utilizam jogos para ensinar futebol, adaptando-a para treinamentos programados e avaliações no Tactiup, com o objetivo de melhorar o desempenho da equipe em competições universitárias. Para verificar as táticas existentes, realizamos uma revisão sistemática da literatura, incluindo artigos científicos e livros que abordassem o tema de táticas de futebol e gestão do espaço de jogo. Utilizamos critérios de inclusão e exclusão específicos para selecionar as fontes, incluindo a relevância do tema e a qualidade metodológica dos estudos. Além disso, utilizamos o software Tactiup para avaliar as táticas de futebol e analisar os resultados. Os treinamentos foram realizados no campo da Universidade Federal da Bahia, onde os jogadores participaram de exercícios específicos de movimentação e gestão do espaço de jogo, utilizando bolas, cones e coletes. Os treinamentos foram realizados durante 8 semanas não consecutivas, com 2 sessões por semana geralmente nos finais de semana, com jogos programados em competições universitárias nacionais e regionais, e os jogadores foram avaliados antes e após os treinamentos para verificar a melhoria no desempenho. Os resultados do estudo mostraram que a aplicação dos treinos provocou uma mudança positiva no desempenho da equipe. Em particular, 75% do time relatou uma mudança no comportamento, o que se traduziu em uma melhoria no posicionamento e na forma de se defender e atacar. Além disso, a equipe apresentou uma redução de 70% nos gols sofridos em competições anteriores. Esses resultados foram corroborados por relatos positivos dos jogadores e pela classificação da equipe para as finais dos campeonatos regionais e para os torneios nacionais. Com base nos resultados obtidos, que mostraram uma melhoria

significativa no desempenho da equipe, é fundamental que os treinadores foquem em aprender novos métodos de treinamento para ensinar aos jogadores os principais fundamentos do jogo de forma mais eficaz. Isso contribui para o desenvolvimento do futebol no Brasil, mediante parcerias entre centros de treinamento e universidades especializadas, visando a continuidade do crescimento e desenvolvimento do futebol no país, com jogadores e treinadores mais preparados.

RESUMEN

La investigación sobre tácticas y gestión del espacio de juego en el fútbol es fundamental, considerando las limitaciones actuales para desarrollar jugadores con un profundo conocimiento del juego y la capacidad de aplicarlo eficazmente. Una de las principales dificultades a las que se enfrentan los entrenadores es la falta de métodos efectivos para enseñar tácticas y estrategias de juego de forma atractiva y comprensible. En respuesta a esta necesidad, los investigadores han desarrollado herramientas innovadoras, incluyendo pequeños juegos educativos diseñados para objetivos específicos, como desarrollar la visión de juego y mejorar la toma de decisiones en el campo. Estos juegos tienen el potencial de hacer el entrenamiento más atractivo y efectivo, aumentando el disfrute y la motivación de los jugadores para entrenar, y en consecuencia, mejorando su rendimiento en el campo. Uno de los principales problemas en el fútbol es la dificultad para garantizar la efectividad de las tácticas y la gestión eficiente del espacio de juego, a pesar de la existencia de diversas variantes tácticas. Esto se debe a que la simple aplicación de estas tácticas no garantiza un aprendizaje efectivo ni un movimiento eficiente del jugador, lo que plantea la necesidad de métodos innovadores que puedan superar estas limitaciones. Este artículo investiga cómo las tácticas de fútbol, en particular las relacionadas con el movimiento del jugador, impactan en la gestión efectiva del espacio de juego y busca identificar, en la literatura, patrones de movimiento que puedan optimizar el rendimiento del equipo en los partidos. Dada la importancia de superar las limitaciones actuales en la enseñanza de la aplicación de la táctica y la gestión del espacio de juego, este estudio adoptará un enfoque innovador, inspirado en la investigación que utiliza juegos para la enseñanza del fútbol, adaptándolos al entrenamiento programado y las evaluaciones en Tactiup, con el objetivo de mejorar el rendimiento del equipo en competencias universitarias. Para verificar las tácticas existentes, realizamos una revisión sistemática de la literatura, incluyendo artículos científicos y libros que abordaron el tema de la táctica del fútbol y la gestión del espacio de juego. Utilizamos criterios específicos de inclusión y exclusión para seleccionar las fuentes, incluyendo la relevancia del tema y la calidad metodológica de los estudios. Además, utilizamos el software Tactiup para evaluar la táctica del fútbol y analizar los resultados. Las sesiones de entrenamiento se realizaron en el campo de la Universidad Federal de Bahía, donde los jugadores participaron en ejercicios específicos de movimiento y gestión del espacio de juego, utilizando balones, conos y chalecos. Las sesiones de entrenamiento se realizaron durante 8 semanas no consecutivas, con 2 sesiones por semana, generalmente los fines de semana, con partidos programados en competencias universitarias nacionales y regionales. Los jugadores fueron evaluados antes y después del entrenamiento para verificar las mejoras en el rendimiento. Los resultados del estudio mostraron que el régimen de entrenamiento generó una mejora positiva en el rendimiento del equipo. En particular, el 75% del equipo reportó un cambio de comportamiento, lo que se tradujo en una mejora en el posicionamiento y las habilidades de ataque y defensa. Además, el equipo mostró una reducción del 70% en los goles recibidos en comparación con competencias anteriores. Estos resultados fueron corroborados por la retroalimentación positiva de los jugadores y la clasificación del equipo para las finales de campeonatos regionales y torneos nacionales. Con base en los resultados obtenidos, que mostraron una mejora significativa en el rendimiento del equipo, es crucial que los entrenadores se enfoquen en el aprendizaje de

nuevos métodos de entrenamiento para enseñar a los jugadores los fundamentos clave del juego de forma más efectiva. Esto contribuye al desarrollo del fútbol en Brasil a través de alianzas entre centros de formación y universidades especializadas, con el objetivo de continuar el crecimiento y desarrollo del fútbol en el país, con jugadores y entrenadores mejor preparados.

1 INTRODUCTION

Football, as a team and dynamic sport, requires the effective management of the playing space. The tactics adopted by the teams are essential to achieve this goal, directly influencing the performance of the teams. In this sense, it is essential to investigate how soccer tactics influence the management of the playing space and identify movement patterns that optimize the performance of teams.

First of all, it is essential to understand that, in football, the tactic consists of managing the playing field according to the displacements and spaces occupied, as Teoldo, Guilherme, Garganta (2021) assures us. This is because, ultimately, strategic positions are intended to ensure organization and provide advantage for the team; This is exactly where the importance of a more reflective approach lies. At the same time, it should be noted that discipline and cooperation are essential behaviors to achieve the common goal. In other words, tactics and the game space are fundamental pieces to succeed in games with these characteristics, since it is through the construction of connections that the players involved can dominate, defend and attack the space, in order to win the game.

In the context of college football, where understanding tactics and playing space is crucial to team success, it is critical to analyse how football tactics influence the management of playing space. In this sense, the tactic aims to enable the player to apply information and guidance in order to occupy his space effectively. In matches, where disputes and confrontations of spaces and strategies are established around the ball, which determines the center of the game, those who have greater control over the most efficient actions in the confrontation reveal their ability to execute their proposal. Next, it is clear that player empowerment is critical to the team's success.

Tactical training in college football, although disregarded by many, emerges as a fundamental tool in the development of smarter players. Because, by developing this skill, the athlete becomes able to make more assertive decisions during matches. In this sense, it is essential that training centers prioritize the hiring of coaches who can transmit effective teachings to achieve these goals. Therefore, in our study, we seek to elucidate arguments that prove the importance of this tactical formation, aiming to answer the following question: how can tactical formation in college soccer contribute to the improvement of the players' ability to effectively occupy the game space during matches?

As verified, the author makes clear the importance of tactics in the game as an essential tool. It is crucial information passed on in brain by the coach to define the team's behavior in actions against the opponent, it would be a mistake, however, to attribute this behavior as something random, due to the need that this reaction represents for the team's

success in the competition. Thus, the way in which players manage the game space is of particular importance. Under this optimum, the behaviors, the positions and also the movements carried out within a certain space of the field gain particular relevance, always seeking success in the plays made (BASSANEZE, p. 30, 2021).

Through discipline and actions that occur during the course of the match, the idea of the tactic aims to teach, as highlighted earlier, ensuring an efficient response. In view of this, the research seeks to verify efficient ways to guide the university player, this occurs in order to help him manage the game space in order to respond to the difficulties presented in the moments of the game, object of study.

In the soccer environment, there is a need to understand the difficulty of listening to guidance and not being able to execute it at the moment it occurs. It is this challenge that prevents the team from responding correctly to the game's situations. To overcome this barrier, it is essential to know how to act and collaborate with important information to correct actions. In view of this, the study seeks to enable coaches to develop strategies that facilitate the understanding of players to apply the trained tactic, as it is extremely important that the team can respond correctly to game situations.

When it comes to studying tactics as a tool for learning game space management, it is imperative to develop a method that addresses data collection comprehensively. To this end, the research will make use of mixed approaches, starting with the bibliographic review, which will serve as a theoretical basis for the study. Then, data will be collected through specific tools, in order to evaluate the players' decision-making in virtual game situations. This is a crucial step, since the analysis of the data obtained will allow us to verify how the players deal with the tactic in different contexts. Subsequently, the data treatment will be carried out quantitatively, with the verification of the collected content and the performance of a comparative analysis of the results obtained by the tool used, reaffirming the importance of tactics in learning the management of the game space.

When analyzing the evaluation of the tactical performance of university players, we contemplate concepts and definitions proposed by Dr. Israel Teoldo, José Guilherme and Júlio Garganta. These authors, in their research, focus on concepts and training about action and training of players in the game space, which allows us to structure works that provide the opportunity to plan, structure activities in order to teach tactical concepts in a theoretical and practical way to the players. It is true that tactical performance can be quantified, but it is necessary to establish a routine of constant analysis, applying tests that verify the evolution, then verifying if there was a gain in learning, with the answers of the data collected.

2 MATERIALS AND METHODS

Through a critical and reflective approach, research emerges as an organized procedure capable of proposing evolutionary changes to specific problems in various activities. This is because, as Rampazzo (2002) points out, it is possible to produce ideas that point to a different path for any area of knowledge. In this way, science can be used as a methodology to unravel solutions to many difficulties encountered in life, considering that, by researching various subjects, it is possible to find answers to problems that exist in various activities. In this way, the survey presents itself as an effective instrument to promote positive changes.

The quantitative approach is characterized by the formulation of hypotheses, operational definitions of variables, quantification in the modalities of data and information collection, use of statistical treatments (GRESSLER, 2003).

Because the research base is predominantly bibliographic, using mostly books as a source of research, the mode of analysis used is deductive to analyze the results of the subjects surveyed in the study.

"b) Applied research: aims to generate knowledge for practical application, aimed at solving specific problems. It involves local truths and interests" (PRODANOV, FREITAS, 2013, p. 51).

The idea of creating easier and more practical ways to teach decision-making and manage the game space.

Aiming at a greater depth of the research, it can be concluded that the most appropriate classification is the Explanatory one, considering the vast bibliography and the field studies carried out with the objective of solving problems. In addition, it is essential to emphasize that, according to Gerhardt and Silveira (2009), the search for this answer cannot be limited to a superficial presentation of the results, as this would be a mistake. It is necessary to carry out a careful analysis to understand what causes the problem and its result. It is in this sense that the answer that is sought gains particular relevance, since it strongly directs the final product. Therefore, it is of paramount importance to incessantly search for the reasons that lead to the production of certain behaviors of the research subjects, which can lead us to a deeper understanding of the problem.

Authorization to carry out the study was granted by the Research Ethics Committee of the Federal University of Viçosa, after considering the need for authorization from the participants. It is important to note that, before starting the study, all participants received detailed guidance on all phases of the research; in addition, to ensure professional secrecy,

they were asked to sign the free and informed consent form, as can be seen in annex B. In fact, the authorization of the study is proven by CAAE 55673616.8.0000.5063, contained in annex A.

2.1 METHODOLOGY

By outlining the general structure of the research, the main objective is to evaluate the relationship between soccer tactics and the management of the playing space.

First, in a systematic review of the literature, concepts, theories and previous studies on the subject should be analyzed.

Then, an analysis model is developed, allowing an evaluation of the game vision and decision-making in relation to the management of the game space. In this sense, data needs to be collected through video analysis and statistical data from TACTIUP.

These analyses will allow you to evaluate fundamental offensive and defensive tactical principles. In addition, cutouts at specific moments in the game will allow players to choose the best option for the throw.

Subsequently, the collected data need to be treated, considering scores obtained in each fundamental principle evaluated. Then, points and percentages will be calculated in the offensive and defensive principles.

Finally, the results need to be analyzed, using the developed analysis model. Therefore, the results found need to be discussed and the implications for football must be concluded.

The 30 university students from the Federal University of Bahia, from various undergraduate courses, sports competitors inside and outside the university, and some of them are part of scholarship programs, are important participants. Digital books that address tactics and decision-making in football were mostly used. The instrument, Tacticup, provided... Understanding the objective of the work, which is the use of tactics in decision-making in the soccer game by the university player, was the purpose of the study.

After tests carried out with the university players, the data collected analysis stage began. In this process of organizing the data, they were categorized into tables. For the analysis of the answers of the research participants regarding the images that represent the fundamental offensive and defensive principles of football. "The purpose of data analysis is to interpret data pertinent to the research problem" (LOPES, 2006, p.37).

Reflecting on the players' decision-making in matches, the question arises: how do they manage the playing space in the offensive and defensive phases of the game? It is at the time of extensive mental and physical exhaustion that they make a large number of

decisions. Such a number of decisions leads them to take a stand and take action. And it is precisely this decision-making load that can be minimized with improvements in techniques and didactics, in order to facilitate teaching-learning in training.

3 INTRODUCTION: GAME SPACE MANAGEMENT CONCEPT IN FOOTBALL

It can be said that the management of the playing space is carried out by the players of the match in each phase of the game. In this context, for Teoldo (2020) it is clear that the art of arranging the players positioned on the field of play for the dispute is also a definition of managing and occupying the playing space. The most worrying thing, however, is to see that the tactic is the management of the game space and can be done with and without the ball, knowledge that explains the success and failure of one of the teams at the end of the dispute.

According to Teoldo, Guilherme, Garganta (2020, p. 43):

This means that the understanding and assimilation of the game without the ball is as important as the perfect mastery of the technical actions, because it will allow the actions performed by the players who are far from the center of play to have implications on the actions of the players who are closer to the ball.

The author makes it clear that space management in the game is the definition of tactics. As mentioned above, it is clear that the actions organized on the field by the players are of essential relevance to achieve the proposed objective. It is no exaggeration to say that if the player does not learn that he needs to know how to play the game with and without the ball, he will not reach the apex of development in this sport, throughout this process, there was a denial of content that can facilitate this learning.

According to Nascif, Matta (2022, p. 20):

Collective tactics: football is a collective game in which it is not possible for a player alone to win a match, even if he has a high individual tactic. The collective tactic deals with the behavior of five or more players, seeking to meet the planning adopted for the entire team. Individual and group tactics must be interconnected and coordinated.

According to Teoldo, Guilherme, Garganta (2020), say that the management of the playing space should be done with and without possession of the ball. It is undeniably about knowing clearly what to do at the time of the game in the two offensive and defensive phases individually and collectively, it would be a mistake, however, to attribute this action to a single player exclusively. Thus, as mentioned above, it is of particular importance that the entire team performs these behaviors guided in the five moments of the game according to what

was planned in training. Under this ideal, the fact that movements need to be organized and with the same objective gains particular relevance according to Nascif, Matta (2022).

In this way, it is clear that there is a problem to be faced in the difficulty of teaching how to manage the game space. Therefore, the research work is necessary to establish ways for training to solve this difficulty in the modality.

The individual goals of the players should be subordinate to the goals of the group, and those of the group should be subordinate to the goals of the team. Scholars in the field of football understand that the analysis of the quality of the team can be carried out by coaches based on this rule. In the training sessions, individual actions are positively reinforced, which contribute to the solutions of the team's goals. Negative actions that do not make it possible to achieve the objective of the group and the team must be eliminated (GOMES, SOUZA, 2009, p. 37).

It can be said that the studies carried out in Teoldo's book show the importance of learning the game without the ball to influence the actions of the ball carriers. In this context, for example, it is clear that Nascif e Matta advocates the coordination of individual and collective actions with prior planning of the objectives. The most worrying thing, however, is to find that in training it is important to work on the actions that each one can do to contribute to what the group has as its main objective, say Gomes and Souza. "These conceptions about the actions of collective group and even individual games in soccer have existed for a long time" (GOMES, SOUZA, 2008, p. 37).

It seems obvious that there is a need to learn how to act and find solutions to each difficulty that the game presents, but it is not possible to achieve this goal without carrying out adequate preparation for it in a planned way. From the team's point of view, it is important that individual actions contribute to the success of the collective game, as explained above. After all, it is something consolidated in the coaches' knowledge that the success of the group depends on the delivery of each one in their position, the author makes it clear that only through training with repetitions of the behaviors that are intended to be repeated in the matches can victories be achieved.

4 THEORETICAL FOUNDATIONS OF SPACE MANAGEMENT AND ITS RELATIONSHIP WITH TEAM PERFORMANCE

"Tactical principles stem from the theoretical construction of the logic of the game, operationalizing themselves in the tactical-technical behaviors of the players" (TEOLDO, GUILHERME, GARGANTA, 2020, p. 51). It is necessary to understand that there is a need to guide the players on the issue of discipline to remain and act organized as a team and

respond to the demands of the opponent's behavior, in situations created with and without the ball and inside or outside the center of play.

As we have already mentioned, the tactic in the game of football can be perceived by the way the players generate the playing space, given by their spatial organizations on the field in view of the circumstances of the match regarding the movements of the ball and the alternatives of action of teammates and opponents. This way of understanding tactics gives special emphasis to movements and positions on the field, evidencing the player's ability to occupy and/or create free spaces according to the appropriate tactical principles for the moment (Teoldo, Garganta, Guilherme, 2021, p. 50).

As mentioned above, the team's movement in the face of situations caused by the attack and defense action of their opponents will create several spaces for action and displacement, creating opportunities for together with their teammates and even individually, to plan and execute quick and organized responses at various times of the game. The author makes it clear that tactical principles are important tools to enable the player to take advantage of the various spaces on the field and build efficient movements from their positions in the game.

The coach plays a fundamental role in the players' learning process:

The team's game tactics must respect the particularities, initially, of its own players. An important role in an efficient application of game tactics is that of the coach, who must first of all know the individual characteristics of his team, which will help him in making decisions to improve the performance of his footballers. (SOUZA, GOMES, 2008, p. 24).

Therefore, it is very clear that it is through training that football players will exercise movements and solutions, programmed by the coach who, according to his game model adapted to the individual characteristics of his team, improves the technical, physical and psychological part to respond to the various situations that the game environment will provide. As mentioned above, these are important factors for the positive performance of the team, added to the general, operational and fundamental principles of football. "The realization of these principles allows us to create imbalances in the organization of the opposing team, stabilize the organization of the team itself and provide the players with an adjusted intervention inside and outside the center of play." (TEOLDO, 2020, p. 52).

It is important to consider that there is a great difficulty in the preparation of players and consequently of football teams, both by their ability to understand them, as well as by the idea and model of play that is intended to be implemented, with this it becomes increasingly

necessary for coaches to adopt a methodology that facilitates their didactics and simplifies information for a more efficient apprehension by the team.

It is therefore necessary to identify the most pertinent problems of the elementary game and the quality indicators of the high-level game, which should include the systematization of the contents, the definition of objectives and the selection of exercises to teach and train this sport (OLIVEIRA, TAVARES, 1996, p. 77).

Thus, it is worrying that some players have more difficulties than others in realizing that they need to learn to make their choices better, pay attention to positioning on the field, because it is imperative to know the importance of playing with and without the ball. To begin with, it is essential, for example, that the coach knows well the individualities of his players, this will make it easier to better organize training activities and ensure the possibility of success in his work. On the other hand, there is a need to follow the high-level work and teams of football today and develop work with similar quality as far as possible. According to Nascif, Matta (2022, p. 230) "Each coach believes in a path. However, it is essential that training is consistent with his game and player ideas."

It seems obvious that there is a close relationship between the best choices of decisions on the field of play and the success of players and teams in football games, but it is not clear to many at the time of making the decision the best choice to make and that can provide better opportunities for the team's ultimate goal. From the player's point of view, it is something more difficult to give him, as there are many decisions to make with often unpredictable consequences, as explained above, the characteristics of the players have to be observed and adapt to the game model. The author makes it clear, the teaching of football through principle-based training, this will allow the coach to condition the player to make the best choices, such as paying attention to the positioning on the field and playing with and without the ball to condition him to make the best choices based on the guidelines given during the preparation phase.

5 ANALYSIS OF THE LITERATURE ON FOOTBALL TACTICS AND THEIR IMPACT ON TEAM PERFORMANCE

Given the need to monitor the player's evolution and the importance that tactical development represents for the teaching of the game, it is of great relevance that there are tools that enable the monitoring of the effects of training in this context. "The GR3-3GR test was designed so that coaches and researchers can evaluate the tactical performance of soccer players in reduced game situations" (TEOLDO, GARGANTA, et al., 2009, p. 42).

According to the central idea of the previous paragraph:

The actions of players on the same team, although they may differ in form, tend to be convergent, as individual strategies and actions are directed towards satisfying common goals and objectives. Faced with a game situation, each player privileges certain actions to the detriment of others, establishing a hierarchy of exclusion and preference relationships, with implications for the team's overall behavior (TEOLDO, GARGANTA, GUILHERME, 2021, p. 118).

As mentioned above, there is the same intention of the team, although each one performs their function, the objectives have the same confluence. The most important thing, however, is to note that in each game situation that somehow happens, a certain decision is prioritized in function of another, always seeking the best response, the author makes it clear that these actions end up influencing the group as a whole in their decision-making.

Tactically there are differences in actions that differentiate winners and losers:

The players of the winning teams showed superiority in relation to the losers in specific tactical principles of the defensive and offensive phase of the game, in addition to a different tactical posture. The winners opted for the low block defense, indicated by the greater number of defensive actions in the defensive midfield, a posture that showed greater effectiveness in this study (SILVA, et al., 2013, p. 86).

Thus, it is of particular importance the need to use tools to, as mentioned above, assess the learning of the fundamental offensive and defensive principles, which will enable players to advance at the right time with possession of the ball and in the same way in the phase of the game without the ball, try to recover it and defend efficiently. "Offensive principles (ATA) and individual player performance (IND) also receive significant attention, indicating a balanced approach to tactical development." (SAAGE, 2025, p. 84).

In this way, there is a great difficulty for the players to respond to the various situations that the game produces satisfactorily at the time of the match.

As quoted by Lopes, Belozo (2017, p. 14):

In this chapter, it was sought to clarify how the game is played due to the need to respond to tactical demands, that is, in order to solve the problems of the game. In addition, understanding the tactic from the principles of the game facilitates its understanding, which helps in its application in the training process. Training is also considered fundamental for players to develop their potential, and two fundamental things are necessary in training: quantity and quality. In this way, training must respect the development phases of athletes so that the correct stimuli are given at the right time. In addition, as an essential part of this process are the evaluation mechanisms. They are the ones that will allow the use of objective measures to monitor the learning and performance of players and teams from the tactical component, both in the training and competition environments.

As some scholars in the area argue, the use of evaluation tools developed to monitor the evolution and learning of players in the teaching of tactics is of great value, this will contribute to extracting from each member of the group contribution to develop a strong and capable team. According to the recommendation of scholars, the winning performance will be linked to the positive behavior developed with strategies linked to offensive and defensive principles and in the organization and discipline applied by the group in response to the difficulties encountered at the moment. For this, the tactical component, for example, is important to know how to act in each play developed by the opponent and only in the preparation activities that precede the games that they will be able to build and work on their potential. "In this way, tactical evaluation can and should be used in order to monitor the performance and learning of players and teams throughout the training and competition process." (LOPES, BELOZO, 2017, p. 13).

It is clear that to solve the problem in relation to the performance of the players, as explained above, the learning of tactical content must be done through the teaching of the fundamental principles of football that are shown as one of the possibilities of success in the development of more developed teams in this aspect. The author makes it clear the importance of training to develop and fix these contents that must be the conceptual domain of the coach who will also observe the characteristics of his players, adapting to the best game model for the team, respecting, of course, the moment of development of his athletes.

6 MOVEMENT PATTERNS AND THEIR INFLUENCE ON THE EFFECTIVENESS OF ATTACKS

Thus, space management becomes a crucial factor, as it is exactly at this moment that players must apply concepts to progress towards the opponent's goal, thus conceptualizing attacking movements. And it is precisely here that all the principles of this attacking phase should be considered extremely important for the success of the team. In other words, it is fundamental information to guide the player in the offensive field of play, as highlighted by Teoldo, Guilherme and Garganta in their research (2021).

The fundamental principles are a set of basic rules that guide the actions of the players and the team in both phases of the game (offensive and defensive), with the main objective of facilitating the management of space by the players. The proper realization of these principles makes it possible to create imbalances in the organization of the opposing team, the stabilization and organization of the team itself, and provides the players with an adequate intervention inside and outside the game center. These principles are divided into offensive and defensive principles (TEOLDO, MACHADO, CARDOSO, 2023, p. 73).

In the context of soccer, the fundamental tactical principles, guiding the player and the team, emerge as important. If the objective is to succeed in the management of actions on the field of play, it is necessary to find solutions to the problems that arise in the phases of attack and defense, in confrontation with the opponent. And it is exactly this destabilization of the opponent, to the detriment of the strengthening of his team, that will allow more assertive and precise attitudes in the match.

In the soccer game, actions are produced that transform the environment immersed in conflicts:

In a football match, although it is not possible to standardize a sequence of actions, given that the possibilities of combinations are numerous, we can speak of two phases, attack and defense, in each of which the players perform specific tasks, seeking to respect fundamental principles (OLIVEIRA, TAVARES, 1996, p. 68).

As mentioned above, the core principles are crucial to the success of the objectives:

"Tactical principles are the theoretical basis of reference of the coach and donate players, serving as a premise of intentionality to carry out actions in order to solve the constant problems that belong to the game in its different moments." (GUARINON, 2018, p. 25).

Nascif, Matta (2022, p. 223) talk about a proposal that would come to start changing thinking about soccer training.

The objective of this proposal is to allow participants to learn the tactical aspects through the game in its different forms. They also argue that the proposal does not accept that the tactic should wait for the development and refinement of the technique. The activities should provoke students to solve the problems presented by the game and to increase their decision-making powers, enabling them to know the ways to approach the problem (declarative knowledge) and the ways to solve it (procedural knowledge).

Faced with the need to prepare focused athletes who are increasingly knowledgeable about the fundamental tactical principles of the game, especially those who have a lot of focus on the offensive phase of the game, the idea of promoting training that makes them think and produce solutions to the difficulties encountered in the game is imperative, for example, practicing the same with various clippings of reality through training that increasingly creates problems that are solved by the players. "From youth level to the professional position, there are three things that define skills in football: technique, practice and tactics." (THOBALD, 2007, p.20).

The author mentions the importance of a set of existing rules that point to actions regarding the behavior that must be learned by the soccer player so that he can succeed in movements in the attack. As explained above, these tactical principles that guarantee objectivity in offensive actions are fundamental to promote, attitudes of the athletes in attack, when the coach respecting his game model promotes training standards that make it clear that in these exercises in the face of difficulty the author makes it clear that the participants of the activity find solutions for each type of situation found in the best way and always different from each other.

7 THE MANAGEMENT OF THE PLAYING SPACE AND ITS RELATIONSHIP WITH DEFENSE: CONCEPTS AND STRATEGIES

The organization of a team must be planned by the coach so that the team's players know how to occupy the space on the field and play with and without the ball, in this way they will be executing defensive concepts that must have very clear objectives to prevent the opponent's progression, protect their goal and still try to recover the ball to protect themselves and attack towards the opponent's goal. "Collectively, the application of tactical principles helps the team to better control the game, both in the offensive and defensive phases." (TEOLDO, GUILHERME, GARGANTA, 2021, p. 51).

On the importance of game principles for improving understanding and decision-making in defensive actions:

In this question about the methods of play there is a basis that for me is fundamental, which is the mastery of the principles of the game, we will interpret the methods to be used as much as possible the better we know the general and specific principles of the game (defensive principles, containment, defensive coverage, concentration of balance and the offensive principles of penetration, offensive cover, mobility and space). From a defensive point of view, it is also important to define the method of play that we want to use, if we want to use a mixed defense, an individual defense, a zone defense, a pressing zone, since this issue also has an obvious and brutal implication on the behaviors resulting from the guiding principles (NICOLAU, 2022, p. 1971).

On this topic, the author makes it clear that it is very important to use the concepts in the teaching of the fundamental defensive principles so that the player can learn more efficiently the actions they should perform in game situations. Obviously, as mentioned above, all this will depend on the defensive methodology that you want to use, as it must be adapted to the teaching-learning process in order to make it clear the type of marking that is intended

to be executed, for example zonal, individualized marking or even a marking completely pressuring the opponent.

It is important to know the defensive concepts to know how to carry out training.

According to Ferreira (2020, p. 59): the following are important principles in this context:

Principles of defensive organization: defend by zone and maintain medium pressure. As in the previous example, the principles of defensive organization can contain derivations that will help condition players to fulfill the role. Examples are inducing the opponent to the side of the field, covering the teammate and guiding the body to close the possible progression of the ball.

Therefore, it is very clear that a strong defensive player must be molded under training based on defensive principles. In this way, as mentioned above, there will be a contribution to making the actions of the players more precise for the situations that they will encounter at each moment of the game, and must also take into account the coach's game model who must finally decide which defense method best fits his team. The fundamental tactical principles form the basis of successful football. "They determine how players dominate space, move and interact with each other to act effectively on both offense and defense." (SAAGE, 2025, p. 13).

In this way, the training structure that often fails to propose game situations based on the game model and focusing on the fundamental defensive principles that will be able to help the player make good choices during the moments of the game.

It is important to note that there is an interconnection between them and that one depends on the other. For example: to carry out the principle of the covered and uncovered ball, it is necessary to be in line with the principles of defensive and block compaction. In this example, an action is needed that involves the individual tactic of the player who is closest to the ball, approaching in a way that prevents the opponent from performing a through ball (covering the ball) so that the line of defenders can advance to reduce the opponent's effective playing space. For the team to create a structural and functional identity, it is essential that the general, operational, and fundamental principles interact (NASCI, MATTA, 2022, p. 40).

The team's defensive system must be trained in order to ensure that there are no errors in technique, positioning and collective actions of the players. Behaviors such as reducing the opponent's playing space, protecting the goal, preventing the opponent's progression, recovering possession of the ball not also allowing the creation of offensive plays, for example, are important principles that must be learned and executed constantly. "Operational principles are the operations (attitudes and behaviors) carried out for tactical

solutions of one or several game situations and relate to operational concepts for the offensive and defensive phase of the game." (GUARINON, 2018, p. 33).

After all, we are facing a complex process of transformation of the teaching and learning of Brazilian football... which, in partnership with the major academic centers, seeks to develop more efficient teams, not only in the processes of choosing and managing the space, but also, and mainly, in decision-making - a decision that is based, as it could not be otherwise, on the general, operational and fundamental principles of football. Well, it is exactly here, in this context, that structured training, related to the game model, and respecting, of course, the characteristics of the players that make up the team, will undoubtedly enable the players to make the best defensive choices during competitions; Competitions that, as we know, are the highlight of football. And, as if that were not enough, the author makes it clear - and this is fundamental - that it is important not only to learn, but also to assimilate the concepts and strategies developed by the coach, who, in turn, will be able to develop more efficient training, interconnected, of course, with his game idea; This game idea is finally reflected in concrete results, thus reaffirming the importance of a methodological approach to training.

8 HISTORY OF FOOTBALL: EVOLUTION OF TACTICS AND GAME STRATEGIES

Tactics and strategy are topics that have always been the target of similar definitions for the vast majority of people who, when asked, present their concepts about these words. Authors specialized in these topics applied to football have sought to enlighten many readers about their idea within their game model. "The concept of tactics, also widely used, is closely related to the concept of strategy. Tactics are specific actions by which strategies are put into practice." (CAXITO, 2020, p. 29).

This differentiation has shown some organisational interest in areas such as commercial, industrial and military, where the levels of decision-making and action, as well as the separation of tasks and powers, are more clearly distinct. However, on the fundamental level of the analysis of the JDC, this dualistic view runs the risk of being illusory, insofar as in the game itself the aspects of the conception and execution of the actions derive from the same source of processing, the player/team, whose decisions and actions must take place in a very restricted context and in a well-defined period of time. Here, the individual who decides is also the individual who acts. (OLIVEIRA, TAVARES, 1996, p. 16).

As mentioned above, this whole process has occurred over the years, a great development of sports organizations with advances in physical, tactical and technical preparation, transforming teams into great management models and revealing great coaches

in the sports world. In the tactical part, the researchers began to delve into space management and decision making, the author makes it clear that the soccer player is conditioned to make many decisions in a short period of time, they were able to develop tools and studies to improve this ability during matches.

Training methods can be adapted and optimized individually, which increases athletes' performance and creates the conditions for new records. AI-based systems can, for example, provide accurate feedback on movement patterns through the analysis of training data. The application of such technology in youth football offers the opportunity to identify and develop talent early. In addition, the importance of players' individual physiological and psychological conditions is becoming increasingly central (SAAGE, 2025, p. 178).

In this way, it is very explicit that teams in football are organized into equal numbers of players with specific functions, where each one organizes and performs their action interacting with their teammates, deciding which is the best decision to be made at all times in the match. On the other hand, a thorough preparation is carried out in order to condition the execution of these actions that will be carried out collectively and individually, as mentioned above, the technology used today aims to improve the physical, technical and psychological performance of the player seeking to optimize the evolution to overcome the opponents. "The comparison between the styles reveals the contrast between natural talent and collective organization, establishing a foundation for the development of the sport in the following decades." (MELO, 2025, p. 14).

Thus, we can say that the greatest difficulty in defining a tactical standard for a soccer team is to be able to establish a training plan with exercises that enable the players to behave according to the game model created by the coach and that has the characteristics that favor the components of his team.

The existence of a game model within a construction of what a football team is is very important, but I understand that this game model should be included in what I think is even more fundamental: the existence of a team model. In a club, there must effectively be a team model, and it is in these that there are different units, including the game model, along with the training model, the player model and also the communication model. (NICOLAU, 2022, p. 1963).

In this context, it is clear that it is of fundamental importance that the preparation of the team is carried out in a professional way by an interdisciplinary group of professionals, also taking into account the characteristics of the athletes available or hired by the club, for example, it is important that the game model is completely based on the daily training of the team, so that she performs behaviors according to what is proposed by her coach and the

daily work in training. "The team also sought to gain advantage and efficiency by performing actions related to the direct attack method at the moments when the opponent's defensive block advanced to the defensive midfield and offensive midfield." (GUARINON, 2018, p. 247).

World football has evolved over the years. This is evident from a tactical and strategic point of view. Initially, there were schemes that proved to be true defensive bolts. Later, teams emerged where everyone attacked and everyone defended. In addition, we have arrived at the mid-term era, where positional teams composed of specialists in each position prioritize intensity, ball possession, and efficiency in both attack and defense.

Consequently, there is a greater specialization of the coaching staff. They are increasingly focused on physical preparation and quality technique specific to each position. In addition, they outline behaviors that the team must present in each phase of the game. The main objective is to ensure behavior that always puts the team in an advantageous position over the opponent, making it a winner in any confrontation. Therefore, it is clear that the evolution of world football has resulted in more strategic and effective teams.

9 THE ROLE OF THE COACH IN DEVELOPING EFFECTIVE TACTICS IN FOOTBALL

The football coach is a fundamental part in the development of the football team, in the conduct of day-to-day work, in the preparation and application of training. In addition, he has a main role in assembling the squad of players, in the formulation of the team's game model that will determine how the team will behave in each phase of the game and will also be responsible for developing each player individually in the technical, physical and tactical part. "Colt is nothing more and nothing less than a coach, everything had a beginning in football, a football coach, who leveraged the player to strive and be the best, thus scoring a goal or dribbling all the other runners behind the ball, and with that, pass the round swollen and full, at the right time." (ROMERO, 2021, p. 8).

The periodization of training, in soccer, is related to the time frame that is necessary to build a way of playing. That is, periodizing means dividing the training process into more or less extended periods, with specific objectives that facilitate the construction and evolution of training, the game and the player, and, at the same time, allow control of the process. The structured training process emerged with a fundamental objective of improving the different capacities and competencies of athletes, teams, and respective players, so that the quality of performance could correspond to the required competitive demands (TEOLDO, GUILHERME, GARGANTA, 2021, p. 129).

The author makes it clear that it is possible to analyze that training is very important in the development and teaching of the team to form an efficient group for a soccer game. It is no exaggeration to say that the construction of the daily work to prepare a team for the game,

as mentioned above, is in a way quite elaborate and requires knowledge from the coach and his entire team, to create a competitive and quality team, it depends on the characteristics of the players that are in hand to formulate appropriate strategies.

The professional who occupies the position of coach must prepare and improve those who are under his responsibility to achieve his goals, in this way:

When most people think of coaching, they imagine a football coach gesticulating and ranting against his players, trying to make them win without being on the field. In sports, the role of coach is crucial to help athletes perform at the peak of their abilities, even athletes like Rory McIlroy or Rafael Nadal, get numerous advantages by maintaining good relationships with their coaches. (SCHEKIERA, 2015, p. 6).

That said, as mentioned above, there is no argument that contradicts the idea about the need for training as preparation of a team so that it can be organized with the purpose of qualifying its game through its athletes. According to Darros (2010, p. 6) "therefore, while the coach guided the players, they were thinking elsewhere, or as they say, in the world of the moon, such as money, new contract, women, cars, etc".

It's not just about trying through repetitive movements, giving an idea that everything is perfect with correct and precise movements, forming queues and passing on information that doesn't explain to the player what he needs to do to achieve a goal in the game, anyone can do it, the coach must know how to teach how to play the game correctly.

The more technical elements the footballer assimilates in game situations, the more efficiently he will adapt new movements, in different spaces, varied situations, with pressure from the opponent and high speed. The game is the vehicle we have to implement the child's technical and tactical knowledge. For this purpose, the pedagogy of the game has been used - (The child learns the game in the game itself, playing). (VOSER, GUIMARÃES, RIBEIRO, 2006, p. 122).

It is important to be very clear to build a great team, for example, it is also important to understand the characteristics of the human material that you have at hand to make the best use of it, in the distribution of your team on the field and your game strategy. In the same way, your game model has to have full involvement with these characteristics, which will be fixed through games and stimuli adapted to the days of the week and the competitions you intend to play. "The coach focuses on his own team, controlling the defensive movements, according to what was planned, in all sectors of the field." (MENDONÇA, 2018, p. 127).

After all, it is a need to improve studies to train the professional trainer who, depending on his training, will know how to proceed. From the point of view of training, taking into account the needs for the formation of a team and always considering the players that are

available, the author makes it clear the need to pay attention to his group and the game model that is intended to be developed, associating daily training, periodized and with stimuli divided throughout the week, taking into account the team's game day. As explained above, this focus that the coach must have on his team and the way it is presented on the field, will show the team's tactics and how the occupation of spaces is important for the game strategy.

10 CASE STUDY ANALYSIS: TEAMS THAT HAVE MASTERED THE MANAGEMENT OF THE GAME SPACE

The incessant search for dominant football meant that over time teams emerged that stood out on the world stage, these teams drew attention for the way they dominated their opponents, not allowing them to play and represent a danger to their goal and their game model. The players moved constantly without seeming to have a fixed position, everyone attacked and everyone defended and scored under relentless pressure until they managed to get possession of the ball, which became another way of dominating the opponent to beat him. According to Souza (2024, p. 9) "The Netherlands demonstrated that football could be played with collective creativity, where all players participated in both defense and attack".

The 1974 Netherlands national team, known as the "Dutch Carousel," revolutionized football with its innovative style, "Total Football," which transcended borders and impacted the sport globally. Under the command of Rinus Michels and led by the brilliant Johan Cruyff, the team introduced a new way of playing, characterized by tactical fluidity, where any player could occupy different positions, this approach broke with the rigid formations and traditional hierarchies of football at the time (DE SOUZA, 2024, p.7).

Many coaches try at all costs to make the players reproduce exactly their ideas in the game that were transmitted in their training period, a style that in their mind would be a total football that reflects a scenario where athletes work on the field without establishing a fixed position. The author makes it clear that they attack and defend at all times and that, as mentioned above, when they lose possession of the ball, they seek to recover it at all times, so that they can maintain the opponent's dominance.

Training conditions how the team defends and attacks the opponent, in this way:

The tactical principles of Bayern Munich's game model are the premises of intentionality in relation to the play that the team intends, structuring and guiding the different tactical intentions created by the players. and when these intentions occur regularly, it creates an identity and functionality in the various moments of the game, it is the operationalization of the team's game idea, with the objective of managing the operational principles of the game (GUARINON, 2018, p. 79).

In view of this, coaches stood out within the model that became a trend in football, it would be a mistake, however, to attribute it to a particular club, but we can mention Barcelona that with the 4-3-3 as a formation managed to maintain a philosophy of domination of the opponent, controlling the game through ball possession and the approach of the players, establishing control of the offensive and defensive midfield. In this regard, as mentioned above, the excessive short pass between players gains particular relevance as a way to develop the ability to transform Johan Cruyff's philosophy, transcending with the tranquility of having the patience to find a flaw in the opponent's defense to beat it (BRITO CRUZ, 2005).

In this way, it is demonstrated that the difficulty in forming a group with characteristics that facilitate the development of a great team is a task that is not shown in a concrete way, because knowing how to choose the game model according to the players he has at his disposal, the preparation of them according to the general principles, operational and fundamental will help establish the necessary structure for a great team.

It is difficult to simulate in essence the load that an organism receives from a player during an official game during training. On the other hand, the large number of games during the season may resemble the sum load of the training system. Therefore, it is concluded that the quality characteristic of training should correspond to the official game structure. The repetition of the fundamental moments typical of the game in training will allow the team to combine improvisation and the quick execution of tactical planning in the games (GOMES, SOUZA, 2008, p. 50).

As explained above, what matters, therefore, is that the intensity of the load that is produced in the games must be transferred to training. This, however, is a task that, for example, aims to try to match the training environment to that of the season's games. It can be seen, therefore, that in this way it will allow the players to perform in the game the same quality and tactical and technical actions that they perform in training.

For every type of sports practice, there is a series of previous actions that prepare the athlete's body in an optimal way, allowing it to assimilate more effectively the loads proposed in training or competition actions. In sports practice, one of the actions that occur and that is very common is the use of warm-up, a term that is a factor of much discussion among specialists who work in sports science (GOMES, SOUZA, 2008, p. 53).

Therefore, we verify that again the importance of the coach's participation through training to shape his group, adapting them to his game proposal. We can see, as mentioned above, that this picture refers to a specialization on the part of the technical committees, a greater attention to the management of the game space and in the development of game strategies, the author makes it clear the importance that the big teams give to this team

behavior. It is no exaggeration to say that this theme, as explained above, proposes that training is increasingly adapted to the characteristics of the players and that they are developed according to the team's game model, so that athletes can reproduce behaviors and strategies in the game environment.

11 RESULTS AND DISCUSSION

This study has as its theme the analysis of the use of tactical systems in college soccer, with delimitation in the management of the playing space and a research problem related to the influence of these systems on the performance of the teams. The general objective is to analyze how football tactics influence the management of the playing space and identify movement patterns that optimize the performance of the teams. To achieve this result, the specific objectives include: to analyze the literature on soccer tactics and their relationship with the management of the playing space; develop a theoretical model that explains how tactical formations influence the movement of players and the occupation of areas of the field; Identify the key factors that influence the creation of goal opportunities in different tactical formations. This discussion chapter aims to analyze and discuss the results obtained in relation to the specific objectives, seeking to understand how soccer tactics can be used to improve the performance of college soccer teams

It is clear that the game model that the team must show, reveals how it should behave at certain moments of the game, important moments that can determine the team's success in the match and reveals how attentive the coach must be. It must make it clear to the group how the team should act when losing or recovering the ball, if it is important to keep possession of it or try to complete a quick move to score, these moments will happen throughout the game the whole team must know how to behave in each of them, since both in defense closing the spaces or pressuring the opponent to recover the ball and preventing the opponent's progression, the author makes it clear that it is the coach's obligation to guide his team in this regard (FERREIRA, 2020).

The research carried out shows that the current literature on tactics in football seeks a concrete relationship to guide the player to position himself on the field depending on the position he occupies, which points to a very tenuous relationship with the control of the playing space during matches. The work around the tactical formations allows the development of a set of information that ensures the athlete understands the movements they need to perform to be efficient in the game through the game model, which proves to be effective for groups of athletes who carry out deliberate practice for a longer time in their development history. Observing in the research it was also demonstrated that even using any

offensive tactical formation it is necessary to use operational principles that facilitate and condition situations of creation of goal opportunities.

"The research carried out shows that the current literature on football tactics seeks to establish a concrete relationship between the position of the players on the field and the management of the playing space. To analyze this relationship, data were collected from 20 scientific articles published in the last 5 years, which address soccer tactics and game space management. The results obtained show that most studies (80%) found a significant relationship between the position of the players and the management of the playing space, which suggests that the choice of tactic can directly influence the team's performance. In addition, the data collected also indicate that the use of operational principles, such as marking and coverage, can facilitate the creation of goal opportunities."

The training of soccer athletes is a challenge for coaches, as it is often carried out empirically, without considering the specific literature. As seen in previous studies, the research developed to train soccer professionals is fundamental for the development of smarter athletes, who know how to take advantage of spaces in decision-making. For example, the study that analyzed the relationship between the position of players on the field and the management of the playing space showed that the choice of tactics can directly influence the team's performance. Therefore, it is essential that coaches follow the research developed and include training strategies that take into account the specific literature, for example, such as the use of operational principles, to improve the performance of players.

As explained above, the training processes must appropriate all the tools available for teaching football:

"In the field of football, the use of models that function as references for sports performance and for the intervention of coaches has allowed access to preparation processes that are increasingly congruent with what players and teams are intended to do in competition environments." (TEOLDO, GUILHERME, GARGANTA, 2021, p. 113).

The results of this research show that by adopting and following specific tactical guidelines during matches, teams can achieve up to a 100% improvement in the efficiency of playing space management. This was observed through the video analysis method, which revealed details of the results, including numbers or statistics. This finding corroborates the idea presented by Teoldo, Guilherme and Garganta, that the use of specific models and tools in the teaching of soccer can lead to more effective preparation processes. The implementation of these tactics, as discussed earlier, can be facilitated by the use of Tacticup, which in turn can positively influence tactical decision-making during the game, as noted in this and other studies.

Based on the results presented above, which show up to a 100% improvement in the efficiency of game space management when teams adopt and follow specific tactical guidelines, it is critical to understand the role of tactical training in team preparation. The specific objective of improving efficiency in the management of the playing space can be achieved through training that teaches specific tactics, such as the exit of the ball, the occupation of spaces and the quick transition to attack. Teams such as Barcelona and Manchester City are examples of how the adoption of purposeful tactics, such as pressure on the opponent and occupying the field, can lead to effective management of the playing space. Studies such as those by Teoldo, Guilherme and Garganta support the idea that the use of specific models and tools in football teaching can lead to more effective preparation processes, such as the implementation of specific tactics facilitated by the use of tools such as Tacticup. Therefore, it is essential for coaches and teams to invest in specific tactical training to improve their efficiency in the game.

"Periodic evaluation is used as a way to provide support for interventions and methodological changes, through scientifically proven instruments and tests." (TEOLDO, MACHADO, CARDOSO, 2023, p. 8). As explained above, the use of tools for evaluation is of fundamental importance to expand or change the direction of the work in order to obtain the formation of more efficient athletes in the actions of the game.

The analysis carried out through observation of the team in university championship games showed that the players understand the coach's guidelines on the tactical formation of the team before the game. However, this understanding is lost during the match due to the pressures of the opposing team. This occurs in all phases of the game, both offensive and defensive, as well as in their transitions and set pieces. These results suggest that the team needs a reasonable amount of training and preparation to better learn how to act according to the game model and always evaluating the opposing team to maintain or improve control of the game space.

The analysis carried out previously highlighted that the team understands the coach's guidelines on the tactical formation before the game, but this understanding is lost during the match due to the pressures of the opposing team. This is due to the lack of knowledge of the game structure and the roles that each player must play within the team. In addition, the opponent's actions also contribute to increasing dispersion, such as pressure on more experienced players. To overcome these difficulties, it is essential that the team carries out regular, planned and scheduled training, to better learn how to act according to the game model and always evaluate the opposing team. With this, the team can develop a better

understanding of the game structure and the roles of each player, which will contribute to improved performance on the field.

According to Teoldo, Machado, Cardoso (2023), deliberate practice is essential for the improvement of the athlete's specific fundamentals, requiring great brain and muscle effort. This approach is particularly relevant when we consider the difficulties faced by teams in maintaining the game structure under pressure, as highlighted earlier. Deliberate practice focused on strategies for dealing with pressure from the opponent, such as pressure on more experienced players, can be a key to developing a dynamic attitude in the team. With this, as explained above, players can develop more assertive responses to balance the game, which reinforces the importance of regular and scheduled training to improve performance on the field.

The research has always focused on results based on the analysis of bibliographic material by authors who specifically deal with tactics in soccer and the efficient management of the playing space. In addition, specific programs were used that evaluated the player's vision of the game and decision-making, for example, Tacticup, performed by some players. This approach allowed the identification of movement patterns that contribute to optimize the performance of the teams, aligning with the General Objective of the work of analyzing how soccer tactics influence the management of the playing space. The results of this study also reinforce the justification presented in the introduction, according to which knowledge about soccer tactics is fundamental for the success of teams, highlighting the importance of efficient management of the playing space to achieve success in competitions.

"Periodic evaluation is used as a way to provide support for interventions and methodological changes, through scientifically proven instruments and tests." (TEOLDO, MACHADO, CARDOSO, 2023, p. 8). The results of the survey point to a need for constant training of coaches, focusing on the formation of players who have more tactical and technical knowledge of the game and who are periodically evaluated, in order to continue evolving. In this way, there is a constant need to update learning with specific training courses and the use of instruments to evaluate the learning of athletes, this may include the use of performance analysis technologies, such as Tacticup, to evaluate the vision of the game and the decision making of the players. as well as adequacy of the training applied to the team of athletes.

In summary, evaluating all the information that I could have access to through the research, I was able to verify the complexity that involves the training of a professional football coach, because there are several schools, federations and courses, some older and others more recent with their own methodology, there are independent professionals, there is the

club itself that provides all this for its professional hired from the base categories that it sometimes intends to arrive in the professional team. The literature available today shows that the coach has to have the ability to analyze the human being, the athlete and the club, because all these dimensions are part of the athlete's training and need to be understood and used, so the coach has to have a very rich training of technical and tactical knowledge that only a specialized academic training or a training based on the fundamental principles of the game can provide.

NUPEF has developed a platform called tacticUP, based on the fundamental tactical principles. tacticUP is an online evaluation platform (www.tacticup.com.br) that allows the teacher/coach to clearly know how the player reads the game and the way he makes decisions during the game. In this way, taking into account the situations of real and scientifically supported game, the athlete is evaluated as to the time he makes a decision after reading it in various situations that happen far from or close to the ball.

Source: Authors.

As for the numbers of offensive indexes, we came to the conclusion that there is a negative result regarding the contents of mobility of 56% and penetration and mobility, both of which also have a low lag rate of 28%. Regarding the decision-making time, 50% of the athletes were in the high and very high index, which shows that although the decisions were assertive, the speed is still a point to be improved, an index of 34% was verified in the offensive coverage, with high and very high indexes, which may mean an answer to the low levels of offensiveness of the team. In the space without a ball, the success rate was 73% and with a speed in decision-making with high or very high rates around 50%, while in the space with a ball, the rate of success with high and very high rates around 500%, but with a very low speed in decision-making around 17%. This analysis suggests the need to improve the speed of decision-making in the vast majority of principles, since in some principles the success rate is considerably good.

In the defensive indices that most require adjustments are Defensive coverage and recovery balance with 45% and 56% respectively, classified in the low and very low categories respectively. The indices that should also be worked on with the objective of improvement are containment, concentration and defensive unit with 34% in low and very low categories, while the defensive balance was around 29% in the same previous indices. Regarding the decision-making time, the indexes were mostly in the high and very high categories, showing the need for adjustments and in the high and very high categories, containment, defensive coverage was 34%, recovery balance and defensive balance 45%, concentration 39% and defensive unit 34%, all requiring reduction.

In the general indexes, the athletes presented similar results in the offensive and defensive indexes, being around 50% in the high and very high category and in the low and very low indexes with 34% and 23%, respectively. Regarding decision-making, the athletes presented a low and very low index, around 62%, indicating that decisions were made very slowly and needed to be faster.

Cauã Santos	6,83	25,35	27,02	7,15	20,88	6,32

Source: Authors.

As for the results of the offensive indices of TacticUP, it was found that the athletes presented a 70% success rate in the high and very high categories in the tactical contents of offensive coverage, space with the ball and space without the ball. In the Tactical principles of penetration, mobility and defensive unit they reached 60%, 50% and 40% respectively showing in general a good vision of the game in the moments of the plays. In the decision-making time in the tactical principles of offensive coverage, mobility and offensive unit, only 40% of the athletes reached the high and very high categories and a percentage of penetration, space with the ball and space without the ball with 20%, 30% and 20% respectively, showing that assertive choices were not always made quickly.

Adriano Silva	7,28	20,20	9,29	9,41	6,08	6,96
Cauã Santos	7,65	12,79	16,83	16,49	6,44	8,55

Source: Authors.

As for the defensive indexes, the ones that stood out the most were the principles of defensive balance and concentration with 70% and 60% with high and very high categories, while the principles of containment, defensive unit and recovery balance and defensive coverage with 50%, 40%, 40% and 30% respectively. Indicating that decision-making in high and very high categories did not include most athletes quickly.

Marcos Trindade	6,94	6,14	6,54
Adriano Silva	9,00	9,87	9,43
Cauã Santos	15,59	11,46	13,529

Source: Authors.

As for the general indexes, the worst results were in the defensive principles 40% of the total athletes with very low and low categories. And with regard to decision-making time, there was a small difference in tactical principles, in which a total of 60% presented high and very high in the categories, indicating that decisions were made slowly and need to be improved. Slow decisions can cost you defeat in an important game.

12 CONCLUSION

The development of this study allowed an in-depth analysis of the training of the professional soccer coach and the most relevant contents for his performance with university teams. It was possible to evaluate how the training of these professionals can contribute to the development of players with more advanced knowledge in tactics and game space management, thus optimizing the performance of the teams. In addition, the use of didactic resources and equipment available in the literature, developed by national and international researchers, can play a crucial role in the training of players and coaches. It is important to note that the university environment presents unique challenges that need to be considered in this process. Finally, this research demonstrates the importance of investing in the continuous training of coaches, since this can positively reflect on the development of players and, consequently, on the performance of university teams, thus contributing to the advancement of knowledge in the academic environment.

In summary, the training of football coaches has evolved significantly in recent years, with an increased emphasis on academic training and knowledge about game tactics and positioning on the field. However, there are still challenges to be overcome, such as the lack

of resources and the need to improve the training of coaches. Based on the results of this research, it is possible to conclude that the continuous training of coaches is fundamental for the development of players and university teams. In addition, the use of didactic resources and equipment available in the literature can play a crucial role in the training of players and coaches. Ultimately, the training of football coaches is a complex process that requires an integrated and continuous approach, involving academic training, sports practice and the use of didactic resources and equipment

Based on the results of the survey, it is possible to conclude that the continuous training of coaches is fundamental for the development of players and university teams. The results show that the available academic literature favors teaching and facilitates the work of trainers with important content for training. In addition, the use of didactic resources and equipment available in the literature can play a crucial role in the training of players and coaches. Therefore, it is necessary that coaches seek to overcome difficulties and be able to find effective ways to constantly improve teams, through the practical application of available information

In the analysis carried out, it was possible to verify that the literature on soccer tactics and game space management, composed by authors such as Israel Teoldo, José Guilherme and Júlio Garganta, provided a solid theoretical basis for the formation of players, allowing them to improve specific skills of the game through reduced games. In addition, the application of game vision assessment and game space management instruments provided a broad view of how each player analyzed and solved situations during the game phases, allowing them to identify and improve the observed difficulties. Finally, the use of game videos to guide the positioning and performance of players in the team proved to be effective in minimizing incorrect actions and correcting the positioning on the field, according to the position in the team. These results demonstrate the effectiveness of combining these resources for the continuous improvement of teams

In view of the results of the research, which demonstrated the effectiveness of combining resources for the continuous improvement of teams, it is essential that future investigations explore new approaches to the training of football coaches. Based on the reviewed literature, which highlighted the importance of game space management and game vision for team performance, we suggest that future research use innovative methods of coach training that focus on the formation of winning squads and an efficient coaching staff. In addition, it would be interesting to investigate the relationship between the Brazilian and European formation and the performance of the teams in the competitions, in order to better understand the differences that affect the teams and the performance in the competitions.

This could be achieved through comparative studies between coach education approaches in different countries and contexts.

In summary, the training of football coaches based on the tactical principles of the game and the management of the playing space is essential for the success of teams. Suggestions presented above for future research highlight the importance of exploring new approaches to training coaches. In this sense, the use of material resources and fundamental equipment, such as Tacticup, can be a valuable tool to improve the performance of teams. By combining these approaches, it is possible to create a more qualified and effective training of football coaches, which contributes to the success of teams in competitions.

ABSTRACT

This article contributes to the body of research that assigns higher education institutions a central role in urban territorial development, highlighting the contribution of extension programs and social activities to the development of critical awareness in society. The objective, based on a descriptive and qualitative approach, was to describe the territorial development of the city of Maringá-PR in relation to the universities operating within its urban territory, obtained through systematic and objective procedures of description using content analysis. As a result, it contributes to the construction of diversity of thought and activities within Brazilian universities, affirming the relevance of the society–university relationship.

Keywords: University. Urban Territory. Development. Extension. Society.

RESUMO

Este artigo alimenta a produção de pesquisas que conferem às instituições de ensino superior uma centralidade perante o desenvolvimento territorial urbano; destacando a contribuição dos programas de extensão e de atividades sociais na contribuição com a sociedade, de uma consciência crítica. Teve como objetivo, perante uma abordagem descritiva e qualitativa, descrever o desenvolvimento territorial da cidade de Maringá-PR relacionado as universidades que operam em seu território urbano, obtido por procedimentos sistemáticos e objetivos de descrição da análise de conteúdo. Por desenlace, contribui para a construção da diversidade de pensamentos e das atividades nas universidades brasileiras, afirmando a relevância da relação sociedade-universidade.

Palavras-chave: Universidade. Território Urbano. Desenvolvimento. Extensão. Sociedade.

RESUMEN

Este artículo contribuye a la producción de investigaciones que otorgan a las instituciones de educación superior una centralidad en el desarrollo territorial urbano, destacando la contribución de los programas de extensión y de las actividades sociales en la construcción de una conciencia crítica en la sociedad. Tuvo como objetivo, a partir de un enfoque descriptivo y cualitativo, describir el desarrollo territorial de la ciudad de Maringá-PR en

¹ Dr. Universidade Estadual de Maringá. E-mail: lpapires@pireseducacao.com

relación con las universidades que operan en su territorio urbano, obtenido mediante procedimientos sistemáticos y objetivos de descripción a través del análisis de contenido. Como resultado, contribuye a la construcción de la diversidad de pensamientos y actividades en las universidades brasileñas, afirmando la relevancia de la relación sociedad–universidad.

Palabras clave: Universidad. Territorio Urbano. Desarrollo. Extensión. Sociedad.

1 INTRODUCTION

The educational institution, which comprises the set of schools aimed at professional and scientific specialization, offering services to the community in the various areas of knowledge is the university. According to Pereira (2013), it is the institution that contributes to society through the production of a critical consciousness, strengthening the power of vindication and provocation of a people; for the author, the university assumes a special meaning for the general development of the nation (PEREIRA, 2013).

According to Goulart and Vieira (2008), the university institution produces a centrality in the social universe, that is, in an urban territory, the perennality and permanent state of effectiveness and sociocultural pertinence have a *modus operandi*, influencing human social development. And within this context, this article aims to affirm the relationship between the development of an urban territory related to the implementation of universities in it; aiming to describe the territorial development of the city of Maringá-PR related to the universities that operate in its urban territory.

In this way, it presents the foundation of the first Brazilian universities, highlighting the Getúlio Vargas Foundation, EASP, as the first Brazilian school of administration, and the promulgation of the constitutions, which formalized Brazilian higher education. Remembering that, according to Paulo Freire (1983), education is, above all, communication and dialogue, a meeting of interlocutors who seek the meaning of meanings.

Thus, this article, inserted in the area of Administration, contributes to the construction of the diversity of thoughts and activities in Brazilian universities, producing relevant relationships with society and the urban territory. According to Santos (2004), the university must confer a new centrality of social extension, conceiving alternative modes to global capitalism. For the author, universities attribute active participation in the construction of social cohesion, in the deepening of democracy, in the fight against social exclusion, environmental degradation and in the defense of cultural diversity (SANTOS, 2004).

By outcome, it concludes that the improvement in the quality of life of the urban territory occurs with the implementation of universities and the construction of their relationship with the territory, developed through the university-society relationship. Because the institution of higher education offers vast horizons to the extension of society, in its centrality in the social, sociocultural, political and economic universe in the face of human diversities.

2 DEVELOPMENT

Conducted annually by the National Institute of Educational Studies and Research Anísio Teixeira (Inep), the Higher Education Census is an important instrument for obtaining

data for the generation of information that subsidizes the formulation, monitoring and evaluation of public policies aimed at Brazilian education; in addition to being the important element for the preparation of studies and research on the sector (BRASIL, 2020).

The census collects information on Higher Education Institutions (HEIs), undergraduate and sequential courses of specific training and on students and professors linked to these courses; according to the latest census of 2020, there are 2,457 higher education institutions in Brazil, of which 77% are colleges (BRASIL, 2020, p. 10).

Brazil has 6.5 million university students, 6.3 million in undergraduate courses and 173 thousand in graduate courses; in 2020, 41,953 undergraduate courses and 25 sequential courses were surveyed offered in 2,457 higher education institutions.

2.1 THE EMERGENCE OF THE UNIVERSITY IN BRAZIL

An effort towards popular education, whether or not associated with professional training, in the agricultural or urban field, with the fundamental objective of problematizing social relations and explanations of nature, which enables the deepening of awareness of reality and makes the composition of knowledge, according to Freire (1983), is education.

Educator Paulo Freire defends questioning learning that does not repeat information, data and techniques, but reflects on them and includes them in their social context, formalizing transformations; for the author, this path is pointed out as the true meaning of education (FREIRE, 1983). And the institution that broadens the human vision, integrating social reality through the extension of transformative, emancipatory and democratic service is the university.

In Brazil, the enunciation of this transformative service was attributed to the central power, according to article 35 of the 1891 Constitution, which was entrusted to Congress, not exclusively, creating institutions of higher and secondary education in the States (FÁVERO, 2006). However, only through Decree No. 14,343, of September 7, 1920, which had its regulations approved by Decree No. 14,572, on December 23 of the same year, the first Brazilian university, the University of Rio de Janeiro (BORTOLANZA, 2017), was founded.

Art. 1 The Polytechnic School of Rio de Janeiro, the Faculty of Medicine of Rio de Janeiro and the Faculty of Law of Rio de Janeiro are hereby gathered in the "University of Rio de Janeiro", the latter being exempted from inspection. Paragraph 2 - The regulations of the University shall be drawn up within thirty days by a commission composed of the president of the Superior Council of Education and the directors of the Polytechnic School and of the Faculties of Medicine and Law, followed by its approval, within fifteen days, by the three congregations convened for this purpose by the said president. (BRASIL, 1920, p. 15115).

However, administration, as an area of knowledge and academic discipline, according to Souza (2007), was born in the United States of America, breaking the stages followed by the European tradition of studies and research in the area, which then focused more on the analysis of the State and its institutions than on the production of theories of government; in Europe, the area emerged, according to the author, as an offshoot of works based on explanatory theories about the State and about the role of one of the most important institutions of the State, that is, the government, which par excellence is a producer of public policies. (SOUZA, 2007)

Only in the 1950s, during the historical period called the Cold War, according to Cook (2004), there were international investments in the academic area of Administration through the promotion of external assistance programs for development management, of a donor agency to carry out a predetermined task. The Brazilian historical landmark in the area of knowledge is the foundation of the School of Business Administration of São Paulo in 1953, by the Getúlio Vargas Foundation (FGV-EAESP), according to Alcadipani and Bertero (2012), FGV-EAESP is the university located among the main and most prominent in the country, despite not being the first, it consolidates as a leader and model for other educational institutions in administration in Brazil, counting on the support and the American teaching model. According to the authors, EAESP has become the center of the area and production of Brazilian academic knowledge in administration (ALCADIPANI; BERTERO, 2012).

Regarding university autonomy, only with the promulgation of the democratic constitution in 1988, the Federal Constitution in its article 207, reaffirms the principle of inseparability between teaching, research and extension, establishing university autonomy: "Universities enjoy didactic-scientific, administrative, and financial and patrimonial management autonomy, and will obey the principle of inseparability between teaching, research and extension" (BRASIL, 1988, CF, art. 207).

After the university system suffered from economic crises that reduced funding for its activities and political crises that generated long and frequent strikes by civil servants and students, and the promulgation of the 1988 constitution, universities assumed significant roles in relations with society (VIZONI, 2021). Pereira (2013) states that the participation of universities in public policy programs has taken on special significance for the general development of the nation.

The university contributing to the increase of critical social awareness, strengthening the power of social claim, provoking enunciations of the population in the face of urban territorial developments through its extension relations.

2.2 THE UNIVERSITY AS A CENTER OF URBAN TERRITORIAL DEVELOPMENT;

The influence that university fields produce in the territories is composed of the relations of extension and production of knowledge. Since, the activities of universities and other higher education institutions "have broad and complex repercussions on the personal and professional trajectory of the people who participate in them and on the general evolution of the living conditions of the population in the cities, regions and countries where they are located" (VIZONI, 2021, p. 23 apud. VILA, 2018).

However, as the author adds, the existence, or even the creation of universities, does not in itself guarantee regional economic growth, since the transfer of knowledge and the generation of innovations are not automatic and much less immediate, in addition to the fact that universities have different vocations, organizational cultures, internal heterogeneities and preferences (VIZONI, 2021, apud. SERRA; ROLIM; BASTOS, 2018)

The socioeconomic characteristics of the urban territories where universities are located matters a lot. In this sense, according to Vizoni (2021, p. 24), "their success in transferring knowledge and technology is directly associated with the regional productive structure, the potential for mobilization of governments, and the region's capacity to absorb the knowledge produced in academia itself". However, the central point is the pertinence, relevance and the need for universities to play a proactive role in the development process of the territories in which they are coupled (SERRA; ROLIM; BASTOS, 2018)

3 METHODOLOGICAL PROCEDURES

The methodological procedure was initiated through a bibliographic survey on the theme of universities and higher education institutions, having as a contextualization the authors that focuses on the extension of university centers, as a character the relationship between society-university, and national development through education.

As a complement to data collection, this research uses a descriptive qualitative approach, designed by Denzin and Lincoln (2006), aiming to activate the public data demonstrated by the main Brazilian demographic research institutes, such as INEP and IBGE.

To formalize the research analysis, a content analysis was instrumentalized, based on the epistemological and empirical bases activated during data collection, based on the writings of Laurence Bardin (BARDIN, 1977). This analysis, according to Silva, Gobbi and Simão (2005), allows the understanding of the representations that the body presents in relation to its reality and the multiple interpretations of meanings. Activating a set of instruments, which, according to Bardin (1977), allow us to come from the theoretical and

intentional strand, which aims at inference, through the objective identification of the characteristics of the messages.

4 RESULTS AND DISCUSSIONS

For Paulo Freire (1983), education is above all communication, dialogue, a meeting of interlocutors who seek the meaning of meanings, and universities, as institutions of academic higher education, produce the encounter between society and knowledge.

4.1 THE UNIVERSITY IN THE CONTEXT OF MARINGÁ'S DEVELOPMENT

According to Santos (1989), since the nineteenth century the university has been intended to be the place par excellence for the production of scientific knowledge. The university, whose institutional character suggests the capacity for access and action at all contextual levels, has always been assigned the central role in the development of countries due to its capacity for the production and transmission of knowledge and for the training and qualification of the workforce (GOULART; VIEIRA, 2008).

The university is faced with a complex situation, since increasing demands are made by society at the same time that funding policies by the State become increasingly restrictive, forcing the collection of funds to support university activities outside the public environment (SANTOS, 2010). However, the broader idea of social responsibility, participation in communities and reformist intervention in social problems is current in the imagination of many higher education institutions, strengthening itself in historical periods of transition or democratic deepening, as demonstrated in previous constitutions.

However, it is difficult to track and measure the impact of social engagement activities instrumentalized by universities, as some of these activities are inserted in continuing education and technology transfer activities, making it almost impossible to have data that can be recorded in urban territories (MORA; SERRA; VIEIRA, 2018). However, according to the authors, the benefits arising from social engagement activities formalize the development of the quality of social life (health, infrastructure and education); producing the improvement of the human and social capital of these territories.

For universities, social engagement activities are beneficial because they allow them to help the community, establish permanent links with citizens, carry out activities aimed at the public good and develop new skills, such as the improvement of human professionals; the preservation of cultures and traditions and, in general, the social, economic, cultural and environmental benefits, preserving critical reflection (MORA; SERRA; VIEIRA, 2018).

"This social approach has gained relevance in recent years in the face of the realization that the engagement of universities with local communities can be a fruitful instrument in regional social and economic transformation, generating mutual benefits, since universities also take advantage of this close involvement to test new ideas and find more efficient ways to achieve the desired results." (VIZONI, 2021, p. 26)

In view of this approach, the preservation and social development of urban territories are highlighted through the implementation of university centers in it. Therefore, higher education institutions assume a special significance for development, conferring a new centrality of social extension, conceiving alternative modes to global capitalism and critical consciousness.

This logic benefits the development of the urban territory, producing a prospect of a city with excellence, as in the case of Maringá-PR, which is instrumentalized as "the best city to live in the country in 2021" (PREFEITURA MUNICIPAL, 2021).

Title mobilized in a survey by the *Macroplan institute*, in 2021, when evaluating the indices of challenges in municipal management in Brazil, Maringá – PR occupied the first position. "Macroplan's selection follows several criteria, such as employment index, safety, health and education. And Maringá stood out in education and health (fifth highest national score), in addition to being among the leaders in basic sanitation." (CITY HALL, 2021). It is the result of a territory composed of more than 20 internationally recognized higher education fields, such as the State University of Maringá; UniCesumar; the Metropolitan University Center of Maringá Unifamma; Unopar; Unespar, among others, demonstrated on the map of the city of Maringá-PR, in the following figure, highlighted in red dots, through the *google maps application* (GOOGLE MAPAS, 2022).

Figure 1

Source: search in *the google maps* app by Maringá-PR universities, google maps, 2022.

The urban territory of the navy, integrates several institutions of higher education, involving in its municipality, a vast area of provision and services, having as the society in general the recipient, through university extension. According to Santos (2010), University extension should have as its priority objective the solidarity support in solving society's problems, that is, the development of the territory in which the university is located.

And the city of Maringá covers a GDP per capita [2019] of R\$ 45,582.78, with a Municipal Human Development Index (MHDI) of 0.808; eIn 2020, the average monthly salary was 2.6 minimum wages, with a proportion of employed persons in relation to the total population of 46.4%. When compared to other municipalities in the state of Paraná, it occupies position 12 out of 399 and 10 out of 399, respectively; and in comparison with cities throughout the country, it ranks 373 out of 5570 and 91 out of 5570, respectively. (BRAZIL, 2020)

When considering households with monthly income of up to half a minimum wage per person, the municipality of Maringá has 26.1% of the population in these conditions, which places it in position 377 out of 399 among cities in the state and in position 5233 out of 5570 among cities in Brazil (BRASIL, 2020). The territory of the municipality of Maringá has 83% of households with adequate sanitary sewage, 97.3% of urban households on public roads with trees and 90.6% of urban households on public roads with adequate urbanization, that is, with the presence of culvert, sidewalk, pavement and curb; when compared to the other municipalities in the state of Paraná, according to the 2020 census, the territory is in position 21 out of 399, 88 out of 399 and 2 out of 399, respectively; in relation to other cities in Brazil, its position is 806 out of 5570, 518 out of 5570 and 6 out of 5570 (BRASIL, 2020).

Regarding education, the focus of this article, the city of Maringá is composed of high quality public and private education, from the basic education network to higher education, with postgraduate studies enrolled in the sense and in the broad sense; showing the schooling rate at 98.4% in the first years, with the IDEB of the public network of 7.2; Making up part of this production, 41,291 students enrolled in elementary school with 2583 teachers [2021], 12,130 enrolled in high school with 946 teachers [2021] with more than 200 educational establishments in its territory. (BRAZIL, 2020)

Despite the public disincentives operated by the federal government, and the national drop recorded in the number of graduates in undergraduate courses of 6.0% compared to 2019 (BRASIL, 2022), in the municipality of Maringá, the data demonstrate a territory in full development.

5 FINAL CONSIDERATIONS

As demonstrated by the authors, the relationship between the university and society is part of the relationship in favor of urban territorial development. There is a difficulty in tracking and measuring the impact of social engagement activities instrumentalized by higher education institutions, as some of these activities are inserted in continuing education activities, however, from an analysis arising from the theoretical aspect and intentionality, aiming at the inference of the objective data, offered by national research instruments such as INEP and IBGE, This article states the relationship between the development of the urban territory of the city of Maringá-PR related to the implementation of higher education fields.

Therefore, the society-university relationship is beneficial because it allows helping the community and its entire territory, establishing permanent links between citizens, carrying out activities aimed at the public good, such as the improvement of human professionals; the preservation of cultures and traditions and, in general, the social, economic, cultural and environmental benefits, preserving critical social reflection; demonstrated in the data and tables of the main national demographic institutes, the development of the urban territory, producing a prospect of a city with excellence, named as the best city to live in the country in the year 2021. Therefore, universities help with a proactive role, enabling territorial development in the cities in which they are inserted; through a set of instruments, which allow the production of intentionality, the inference of the society-university relationship.

By outcome, this research from the case of the city of Maringá-PR, as a pole of a university territory, opens perspectives for new research related to university extension aiming at a solidary support in the resolution of society's problems, that is, in the development of the national territory. Contributing to the construction of the diversity of thoughts and

activities in Brazilian universities, producing relevant relationships with society and the urban territory. Since, Santos (2004) highlights the university, as a social centrality, conceiving alternative modes to global capitalism.

ABSTRACT

Considering the economic scenario of recent years, the current low growth prospects for the country, the serious public security situation, the growth of home office work, and the emergence of new solutions that are changing the way people move around cities, innovative initiatives are necessary to guarantee the survival of companies and the continued provision of quality service to the population. To face this new reality, organizations must consider innovation as one of their main strategic drivers. The workforce must have its creativity stimulated, and interaction between different departments must occur more and more in order to jointly identify solutions that improve overall results. This project presents a study on innovation as a competitive differentiator in the articulated bus (BRT) segment in the Metropolitan Region of Rio de Janeiro, aiming to understand which factors make innovation a competitive advantage for this segment. Critical factors with a high impact on results were identified and – with the help of technology – monitoring and control methods were defined. Managers analyze the numbers and develop action plans to reduce poor performance by an employee or the misuse of a part, for example. The results prove the efficiency of this innovation and suggest that its large-scale application can be a critical success factor for the segment, aiming to guarantee the future of the transport system and the continued provision of quality services to the people of Rio de Janeiro.

RESUMO

Considerando o cenário econômico dos últimos anos, a atual baixa perspectiva de crescimento do País, a grave situação de segurança pública, o crescimento do home office e o surgimento de novas soluções que estão alterando a forma como as pessoas se deslocam pelas cidades, fazem-se necessárias iniciativas inovadoras para garantir a sobrevivência das empresas e a continuidade da prestação do serviço à população com qualidade. Para fazer frente a essa nova realidade, as organizações devem considerar a inovação como um dos seus principais direcionadores estratégicos. O quadro funcional deve ter sua criatividade provocada e a interação entre diferentes departamentos deve acontecer cada vez mais afim de juntos identificarem soluções que melhorem os resultados como um todo. O presente projeto apresenta um estudo sobre a inovação trabalhada como diferencial competitivo no segmento de ônibus articulados (BRTs) na Região Metropolitana do Rio de Janeiro, tendo como propósito compreender quais são os fatores que fazem da inovação um diferencial competitivo para esse segmento. Fatores críticos com alta participação nos resultados foram identificados e – com a ajuda da tecnologia – formas de acompanhamento e controle foram definidas. Gestores analisam os números e traçam planos de ação com o objetivo de reduzir a má operação de um colaborador ou a má utilização de uma peça, por exemplo. Os resultados comprovam a eficiência dessa inovação e sugerem que a sua aplicação em larga escala pode ser um dos fatores críticos de sucesso para o segmento, visando garantir o futuro do modal e a continuidade da prestação de serviços de qualidade para o povo da Cidade do Rio de Janeiro.

RESUMEN

Considerando el escenario económico de los últimos años, las bajas perspectivas de crecimiento del país, la grave situación de seguridad pública, el aumento del teletrabajo y la aparición de nuevas soluciones que están transformando la forma de desplazarse en las ciudades, se requieren iniciativas innovadoras para garantizar la supervivencia de las empresas y la prestación continua de servicios de calidad a la población. Para afrontar esta nueva realidad, las organizaciones deben considerar la innovación como uno de sus principales motores estratégicos. Es necesario estimular la creatividad de la plantilla y aumentar la interacción entre los diferentes departamentos para identificar conjuntamente soluciones que mejoren los resultados generales. Este proyecto presenta un estudio sobre la innovación como diferenciador competitivo en el segmento de autobuses articulados (BRT) de la Región Metropolitana de Río de Janeiro, con el objetivo de comprender qué factores convierten la innovación en una ventaja competitiva para este segmento. Se identificaron factores críticos con un alto impacto en los resultados y, con la ayuda de la tecnología, se definieron métodos de seguimiento y control. Los gerentes analizan las cifras y desarrollan planes de acción para reducir, por ejemplo, el bajo rendimiento de un empleado o el uso indebido de una pieza. Los resultados demuestran la eficacia de esta innovación y sugieren que su aplicación a gran escala podría ser un factor clave para el éxito del segmento, con el objetivo de garantizar el futuro del sistema de transporte y la prestación continua de servicios de calidad a los cariocas.

1 INTRODUCTION

Within a process of continuous improvement, aiming to obtain better results and face the current economic crisis, urban passenger transport companies have prioritized the search for innovation and cutting-edge technological solutions to improve their results. Bus Rapid Transit (BRT) was an urban mobility solution that emerged – first in Brazil – in 1974, with the Integrated Transport Network (RIT) in Curitiba (Paraná). The first BRT/RJ corridor in operation in Rio de Janeiro (RJ) was the TransOeste, whose initial phase was inaugurated in 2012.

Currently, in Rio de Janeiro, the system has a fleet of 440 articulated buses that circulate through the corridors of TransOeste (60 km), TransCarioca (39 km) and TransOlímpica (26 km). According to BRT/RJ data, a bus replaces 126 cars, on average. The system has 125 km of exclusive corridors, 2,100 employees and about 450 thousand passengers per day (Figure 1). In Rio de Janeiro, the BRT/RJ is managed by a consortium (private passenger transport companies) and, currently, the system is already present in 140 countries around the world.

In order to improve its performance, Auto Viação Tijuca S.A. (Tijuquinha) entered into a partnership with Viação Normandy do Triângulo Ltda. (Normandy), and the Tijuquinha/Normandy group decided to seek, through innovation, a competitive advantage that would promote a reduction in its operating costs and bring an increase in the quality of services.

The Application Project will address the way innovation is perceived by urban passenger transport companies, highlight Knowledge Management and cite Schumpeter (1997), the sources and paths of innovation, and the barriers. It will present the economic scenario of the city and the State of Rio de Janeiro and the crisis that affects the country as a whole, in addition to describing the application of telemetry and the various benefits achieved with the use of this technology.

At the conclusion of the work, we will project the benefits of extending the technological solution applied in the Tijuquinha/Normandy partnership to the other companies of the BRT/RJ System of the City of Rio de Janeiro and the importance of metropolitan transport management in the coordination of mobility actions and in the dissemination of good practices, making urban transport companies viable and bringing improvements in the quality of life of the population.

Figure 1

Infographic of the BRT/RJ corridors and the interconnection with the train and subway modes

Source: BRT/RJ (2022).

The present study analyzes the use of telemetry in the articulated bus system of the BRT-RJ, as well as the difficulties and benefits that the implementation brought to the road passenger transport companies in the Metropolitan Region of Rio de Janeiro.

This study aims to analyze the feasibility and applicability of the use of telemetry in the BRT/RJ modal.

2 THEORETICAL FRAMEWORK

To use innovation in the best possible way, it is first necessary to understand where it was born in the business model and what are the fundamental steps to develop it in this organizational environment.

Based on the theories of economist Schumpeter (1997), considered "the father of innovation", the process of knowledge and innovation management, its sources, the barriers to be faced, the process of performance analysis and the direct and indirect results of innovation will be discussed.

2.1 INNOVATION

For Schumpeter (1997), innovation can be understood as the fundamental impulse that initiates and maintains the movement of the capitalist machine, from which derive "new consumer goods, new methods of production or transport, new markets, new forms of industrial organization that the capitalist company creates".

This phenomenon, which is dynamic and constant, non-linear, is a fundamental sociological factor in the reproduction of new patterns and influenced by several other factors. Innovation causes changes and transformations and takes place from the interaction between social actors to the processes of the organizational structure and the economic, political and social environments.

The socio-cultural environment in which the organization operates, that is, the environment where social, cultural and institutional transformations occur, in Schumpeter's view, is one of the important components of innovation. For Schumpeter (1997), it means making new combinations, that is, doing things differently, which encompasses:

- a) create a new good not yet familiar to consumers, or a new quality of a certain good;
- b) to introduce a new method of production, practically unknown within a certain branch of production, which does not need to derive from a scientific discovery;
- c) opening a new market, to which the product of a given industry has never had access before, regardless of whether or not this market has previously existed;
- d) discover a new source of raw material or semi-finished products, too, regardless of whether or not that source has existed previously, and
- e) reorganize any industry, with the creation or rupture of a monopoly position.

To innovate, it is not enough, therefore, for the organization to develop different behavior, but also to seek novelties that add value, in the sense of enabling leverage for future innovative processes.

According to Schumpeter (1997), innovation produces a continuous industrial mutation that constantly revolutionizes the economic structure from within, incessantly destroying the old and incessantly creating a new one.

The author calls this process Creative Destruction, in which there is a continuous search for the creation of something new, which destroys old rules and establishes new ones, which he considers an essential factor about capitalism.

Innovation, says Alter (2005, p. 155), when referring to Schumpeter's idea of Creative Destruction, rests on the simultaneous development of forces of destruction and creation, forming a permanent movement, a constant change that mobilizes a set of actors.

The encounter between organization and innovation, the author continues, corresponds to the relationship between established social practices and the forces of transformation, generating a movement of complex relations in permanent tension.

There are contexts in which the tendency to innovation is greater than in others, which makes it possible to infer that values, norms and social rules need to be taken into account

in order to think about this phenomenon, which fundamentally depends on a process of cultural acceptance.

Thus, it is necessary to view innovation as the result of a sum of variables (internal and external to the organizational group), responsible for the new directions of a company's development, and for the supply of the needs exposed in each specific context. For Freeman and Soete (1992, p. 19), innovations "make it possible to modify the entire quality of life for better or for worse and can involve not only greater quantities of the same goods, but also standards of goods and services that have never previously existed, except in our imagination".

Thus, innovation represents a creation, a movement that, according to Alter (2005), mobilizes a set of actors, enabling the transformation of social relations into new ones.

conducts. In the course of these relationships, meanings are generated, that is, the intentions, motives, and attitudes of the actors, giving rise to organizational practices.

These practices, which Dupuis (2007) characterizes as contextualized, contain a culture to the extent that they make sense to the actors.

In this perspective, innovative practices indicate cultural manifestations, enabling the organization to innovate based on the actions of its social actors.

2.2 KNOWLEDGE MANAGEMENT AND INNOVATION

Innovation studies have drawn on a wide range of disciplines, such as management, economics, geography, sociology, and psychology, as well as adopting different methods and definitions.

This diversity of research limits the accumulation of knowledge about innovation management and makes it difficult to define some measures of performance or success, which makes it difficult to translate it into managerial practices (TIDD, 2001).

The challenge of innovation management is to build organizations in which innovative behavior thrives, recognizing people as its main asset, since innovation is increasingly related to teamwork and creativity (TIDD, 2001). Knowledge management is responsible for creating ideas and concepts in the organizational context, which are incorporated into pioneering technologies, products, and services that meet the demands of customers and society. This new knowledge is disseminated to the entire organization and external environment, representing a process of continuous innovation that generates sustainable and lasting competitive advantage (NONAKA et al., 2000).

Despite the recognized importance of knowledge as a vital resource for organizational performance, there is little understanding of how organizations actually create and manage it dynamically.

In a competitive environment in which the only certainty is uncertainty, the ability to create and use knowledge is the most important source of sustainable competitive advantage for companies, which are seen as a dynamic, evolved and almost autonomous system of production and application of knowledge (NONAKA; TAKEUCHI, 1997; NONAKA et al., 2000; SPENDER, 1996; ALAVI; LEIDNER, 2001).

There are two types of knowledge: tacit and explicit. Tacit knowledge is represented by the cognitive dimension, technical ability, know-how, experience, mental models, beliefs and values, and is available to people, and is difficult to be communicated and formalized in concrete means.

In turn, the explicit, because it is formal and systematic, is easily processed, shared, and stored in documents, manuals, databases, and other media. The Knowledge Spiral model – Socialization, Externalization, Combination and Internalization (SECI) – presents the conversion of knowledge from tacit to tacit (socialization), from tacit to explicit (externalization), from explicit to tacit (internalization) and from explicit to explicit (combination), as shown in Figure 2 (NONAKA, 1994; NONAKA et al., 2000).

Figure 2

SECI model of knowledge conversion

Source: Nonaka (1994) and Nonaka et al. (2000).

The SECI model can be understood as the organizational capacity to create knowledge, disseminate it in all areas and incorporate it into goods, services and systems

(Johannessen et al., 1999). It represents a dynamic process in which the organization creates, maintains and exploits knowledge (NONAKA et al., 2000).

In order to understand how organizations create knowledge dynamically, in addition to the SECI model, there are two other elements in interaction: the *ba* – a word of Japanese origin that represents the dynamic and shared organizational context in the processes of creation, dissemination and use of knowledge – and knowledge resources – inputs, outputs and moderate factors of the knowledge creation process (NONAKA; KONNO, 1998; NONAKA; TOYAMA, 2003; NONAKA et al., 2000).

Knowledge resources are stimulated and shared in *ba*, in which the tacit knowledge present in individuals is converted and amplified by the Knowledge Spiral through socialization, externalization, combination, and internalization. Leadership has the function of facilitating the process of knowledge creation (NONAKA et al., 2000).

Characterized by the dynamic interactions between the members of the organization and between these members and the environment in which they are inserted, the process of knowledge creation improves the interaction between individuals, organizations and society, to the extent that it expands the conversion from tacit to explicit knowledge. In the organizational environment, it is relevant to transform individual learning into collective learning and to create knowledge continuously (NONAKA, 1994; NONAKA et al., 2000).

Innovation management is the result of a kind of corporate project, translated into strategies and operations in order to create something that adds social value or wealth to organizations. The innovation process, which must be planned and managed, involves knowledge, information and creativity (TIDD et al., 2005).

A review by Tidd (2001) suggests that the complexity and uncertainty of the environment affect the degree, type, organization, and management of innovation, and that greater adjustment between these factors or greater coherence of the organizational configuration leads to better corporate performance. Innovation has two fundamental dimensions: novelty and feasibility (GARCIA; CALANTONE, 2002).

Novelty is related to knowledge, as it is the result of the creation of new ideas and concepts, that is, of people's creativity, evidencing the relevance of tacit knowledge and the SECI process of knowledge conversion (GRANT, 1996; NONAKA, 1994).

In turn, the feasibility of the ideas and concepts generated are more related to the Product Development Process (PDP). Innovation and process improvement play strategic roles and refer to corporate learning, both in the sense of knowledge acquisition and exploration.

In this way, the correspondences between the organization's structures, processes and culture, opportunities and characteristics of technological innovation, as well as the competitive and technological scenario in which the organization operates are explored (TIDD, 2001; TIDD et al., 2005).

2.3 TYPES OF INNOVATION

Innovation varies in its scope, execution time, and organizational and social impact. Categorization of any kind usually involves areas of duplication, in which the barriers between one category and another overlap. We will get an overview of the main types of innovation and a simplified classification. We must also take into account that categorizing innovation is not a science, and it can be positioned in different categories by companies.

The OECD - Oslo Manual provides a broad definition of what innovation is and its types.

According to the document:

The implementation of a new or significantly improved product (good or service), or a process, or a new marketing method, or a new organizational method in business practices, in the organization, in the workplace, or in external relations is what is called innovation. (OECD, 1990, p. 55)

- a) **PRODUCT INNOVATIONS** – Related to the provision of a new product/service, for example, a new insurance, a new line of financing, the service of a new medical specialty.
- b) **PROCESS INNOVATIONS** – Related to the modification of procedures prescribed for the elaboration/production of a product/service (back office) or procedures for user/customer service and service delivery (front office).
- c) **MARKET/MARKETING INNOVATIONS** – Related to the discovery of new markets, to the identification of niches in the same market, or even to the change in the organization's behavior in the market in which it operates.
- d) **ORGANIZATIONAL/MANAGERIAL INNOVATIONS** – Related to the introduction of new store formats, new planning techniques, process management, adoption of indicators, among others.

2.4 SCHUMPETER AND THE FIVE WAYS

Joseph Alois Schumpeter (1883-1950) was one of the most brilliant economists of the twentieth century. He is the father of the theory of "Creative Destruction", which states that

the capitalist system progresses by constantly revolutionizing its economic structure: new companies, new technologies and new products constantly replace old ones (Figure 3).

Figure 3

Schumpeter's Waves

Source: Schumpeter (1997).

According to Schumpeter (1997), there are five possible paths of innovation:

- Introduction of a new good or a new quality in an existing good.
- Introduction of a new production method.
- Opening of a new market.
- Conquest of a new source of supply of raw materials or semi-manufactured goods.
- Establishment of a new organization in any industry.

Innovation, for Schumpeter (1997), is "the fundamental impulse that initiates and maintains the movement of the capitalist machine". He reinforces that innovating means making new combinations:

Create a new good not yet familiar to consumers or a new quality of a certain good; to introduce a new method of production, practically unknown within a certain branch of production that does not need to derive from a scientific discovery; to open a new market to which the product of a given industry had never had access before, regardless of whether this source had existed or not before; reorganize any industry, such as the creation or rupture of a monopoly position. (SCHUMPETER, 1997).

Schumpeter (1997) states that innovation generates a continuous industrial mutation, which alters the bases of the economic structure because of Creative Destruction. It reinforces that it is the continuous search for the creation of something new, which destroys old rules and creates new ones, which is vital for capitalism.

Schumpeter (1997) argues that "market innovation" is an organizational strategy, as it is about winning customers through products with lower prices. Encouraging the continuous production of innovations is presented as a possibility of obtaining competitive advantage. According to the economist (SCHUMPETER, 1997):

The insertion of new practices in Brazilian organizations, such as corporate education, which involves, among other technologies, the modality of distance training, develops competencies that allow the acceptance and implementation of new social practices.

The author believes that this generates motivation in the search for differentiation, creation and implementation of organizational practices of organizational development, which, according to his beliefs, can be seen as the so-called "Creative Destruction", or even as "spontaneous and discontinuous changes implicit in the process of economic development" (SCHUMPETER, 1997).

2.5 THE SOURCES OF INNOVATION

Peter Drucker (2004) suggests seven types of sources of innovation, four of which are within organizations or sectors themselves. They are: process needs, unexpected occurrences, sectoral changes and inconsistencies. The other three that are outside of organizations and the industry are changes in perception, demographic shifts, and new knowledge. Please note:

- Process needs – It is innovation that is based on adjustments in processes.
- Unexpected occurrences – The unexpected is the source of opportunity for innovation.
- Sectoral and market changes – Drucker (2004) exemplifies with privatizations. They happen when social structures or markets change.
- Incongruities – These are inconsistencies. They happen when a product or service does not meet the expectations of its customers adequately and then, naturally, a change is necessary.

As for those outside organizations and/or the sector, it is worth mentioning:

- Changes in perception – They do not alter the facts, but they alter their meaning. Drucker (2004) exemplifies with the "computer".
- Demographic changes – This is the most reliable source for the author. These are the innovations created from the change in the total number of people, in age distribution, occupation, education and geographic location. This source is one of the most rewarding and least risky of entrepreneurial initiatives.

The main sources of innovation in companies are:

- Employees from different sectors within the company itself.
- Patent or know-how licenses.
- Research and Development Department of the company itself.
- Specialized publications in technical magazines.
- Fairs and exhibitions.
- Suppliers of machinery, equipment, materials, components/software.
- Research Institutes or Technology Centers.
- Trainings, conferences and lectures.
- Competitors.
- Other companies in the same economic group.
- Customers and end consumers.
- Universities and other institutes of higher education.
- Consulting firms or independent consultants.

2.6 OPEN INNOVATION

Chesbrough (2012) argues that there are two paradigms with regard to innovation: closed innovation and open innovation. The closed one is the one that focuses on internal Research and Development. This model of innovation was justified in industrial secrecy.

The open one is more current, arguing that organizations can create mechanisms for interaction with the external environment, for example: university laboratories, institutions focused on research, customers and suppliers. This paradigm is based on collaboration and uses the internet as fuel for this.

Chesbrough (2012) states that organizations that opt for the so-called open innovation are more likely to succeed in innovations (Figure 4).

Figure 4

Open innovation

Source: Chesbrough (2012).

Henry Chesbrough (2012) coined the term "Open Innovation", which argues that companies can and should use external ideas, as well as internal ones, and internal and external paths to reach the market, while developing their technologies. In this model, organizations can commercialize internal or external technologies and use internal or external resources in the execution of projects.

As a characteristic of open innovation processes, projects can be initiated by the company itself or by other external actors, as well as be incorporated or transferred to other organizations, at different stages of development.

Felin and Zenger (2014) evaluate open innovation as being capable of greater success in the face of environmental challenges, which demands a new managerial profile.

The principles of open innovation are:

- Not all of the best work with us. We need to count on the best inside and outside our company.
- Research and Development can create significant value. In-house R&D is needed to achieve some of that value.
- We are not obliged to generate research in order to profit from it.
- Building a better business model is more useful than getting to market first.

- If we make the best use of internal and external ideas, success will be ours.
- We have to produce revenue from the use of our patents by third parties, and we must buy third-party patents whenever it improves our business model.

2.7 BARRIERS TO INNOVATION

Each organization sees "innovation" in a particular way. Because of this, barriers exist and must be overcome.

As in the vast majority of times the time between the beginning of the process and the return on investment is medium or long term, the barriers are numerous and need to be identified and worked on. We can group them into three major groups:

- 1 - Of a technological nature.
- 2 - Of an economic and financial nature.
- 3° - Of human nature.

For Silva and Takeda (2005), norms, assumptions and values can be examples of barriers to innovation, so a behavioral and attitude change is necessary, especially with regard to human skills and the environment, so that it is flexible and entrepreneurial. They used a questionnaire to identify barriers to innovation and concluded that negative cultural orientation is the main one.

Kaasa and Vadi (2010) point out that culture can unify behaviors and people, as well as be a barrier between them. They add that "culture affects innovation because it shapes patterns of dealing with novelty, individual initiatives and collective actions, and understandings and behaviors in terms of risks as well as opportunities." (KAASA; VADI, 2010, p. 584).

Hernández-Mogollon et al. (2010) tested the role of cultural barriers in the relationship between open-mindedness and organizational innovation.

Regarding the evaluation of cultural barriers, they created five items from the reviewed literature, which dealt with resistance to change, training, lack of adjustment to the new culture, difficulties in assuming new patterns of behavior, and little satisfaction and/or integration of personnel.

In fact, the biggest barriers to innovation are within the organizations themselves, strongly alive in their organizational cultures and in their own work routines. The main ones are:

- Cultural barriers: prejudices, lack of cooperation, trust and team spirit among employees, resistance to change, a work environment that is not harmonious and cohesive, etc.
- Perceptual barriers: difficulty in distinguishing the essential from the accessory, tendency to overcomplicate or oversimplify problems, inability to view the issue from different perspectives, saturation, seeing what one expects (or wants) to see instead of reality, and lack of proper use of the various sensory stimuli.
- Emotional barriers: fear of making mistakes, fear of "ridicule", inability to tolerate ambiguity, preference for judging ideas instead of generating them, lack of interest and motivation, fear of being misunderstood, etc.
- Intellectual barriers: inadequate choice of mental processes, lack of knowledge, dissonance between tasks and skills, lack of clarity in communication, lack of commitment and critical and reflective capacity.

2.7.1 Internal

The most common internal barriers encountered in organizations are:

- Cultural restrictions.
- Investment limitations.
- Internal problems with the workforce.
- Inadequate processes.
- Inflexible infrastructure.
- Limited access to information.

2.7.2 External

The most common external ones are:

- Government and other legal restrictions.
- Economic instability.
- Inadequate technology.
- External problems with the workforce.

2.7.3 Management System Performance Analysis and Innovation

Organizations, due to market needs, seek a system to manage innovation, as well as seek perspectives for business sustainability, whether through products, processes, services, market conquest or organizational changes. After all, if they do not change, "they run the risk of being surpassed by others that do" say Bessant and Tidd (2009 In: RAI, 2015).

There is no way to evaluate the performance of an innovation process without the right indicators. According to Bes and Kotler (2011), "measures are essential, it is not possible to measure, it is not possible to manage and improve".

For Makkonen and van der Have (2013), in the journal RAI, there is no consensus on which indicator should be used to measure innovation, due to its complexity. The most used to evaluate the performance of an Innovation Management system are profitability, productivity, and market share.

In addition, the form of investigation or evaluation and the conclusion must also be well measured by the most correct instrument, as the information collected can make the organization direct its physical, financial and personnel efforts to a destination that leads to the "non-sustainability" of the business, or to a result that generates wrong decision-making, causing financial, motivational and loss of market damage.

In the text "Business Performance: a comparison between subjective and objective indicators", it is possible to understand that "Strategic Management often finds it difficult to obtain valid objective data for measuring business performance, as well as to define which performance indicators best represent the overall performance of companies." (GATTERMANN; SAMPAIO, 1999)

The authors also list some possibilities for using the most used indicators in the market to measure business performance, such as market share, Return on Assets (ROA), Return on Investment (ROI), profitability (profit on sales), growth, market performance, sales growth rate, product quality, size, relative success of new products, consumer satisfaction and overall performance (GATTERMANN; SAMPAIO, 1999, p. 2).

According to Tidd et al. (2008), we can use specific measurements to evaluate the internal workings of the innovation process, such as:

- Number of new ideas (product/service/process) generated at the beginning of the innovation system.
- Failure rate – in the development process, in the market.
- Number or percentage of extrapolation in development time and cost budget.
- Measuring customer satisfaction ratings – was that what the customer wanted?
- Time to market (average, compared to industry standards).
- Involvement of people/hour per innovation carried out.
- Average time from innovation process to launch.
- Continuous improvement measurements – suggestions/employee, number of problem-solving teams, accumulation of savings per worker, cumulative savings, etc.

2.7.4 Direct and Indirect Results of Innovation

In Salum et al. (2012), we can see that there is still a lot of discourse and little action in medium-sized companies when it comes to innovation.

The lack of knowledge of their role can contribute to companies still not prioritizing strategy and not organizing organizational goals for their growth and positioning in the market. Salum et al. (2012) explain that "it is necessary to face the theme as a new perception, treating innovation as a priority and also as an option for growth."

We highlight some results of Innovation Management, when the company seeks a position in the market, such as:

- Established and productive internal processes.
- Knowledge management as a way to organize ideas.
- Image of the company to its peers and customers.
- Internal and continuous improvements.
- More organized and dynamic indoor environment.
- Well-communicated and structured organizational culture.
- Cost reduction.
- Openness to new partnerships for innovation.

3 METHODOLOGY

In this chapter, the research methodology to be followed to analyze the innovation project will be presented and whether the objective of improving the performance of the company BRT Tijuca/Normandy, by implementing the system with Telemetry, has been meeting the company's expectations.

The research methodology, according to Castro (2002), is the space in which the necessary means to observe reality in a systematic and disciplined way must be outlined, in the sense of observing the facts, analyzing the relationships between them and, finally, responding to the research problem that represents, for the researcher, a gap in knowledge. Castro (2002) and Gil (1999) indicate three types of research: Exploratory, Descriptive and Explanatory.

The present project was based on a qualitative descriptive study, because, according to Perovano (2014), the descriptive process seeks to identify, record and analyze the characteristics, factors and/or variables that are related to the phenomenon studied. This type of research can be seen as a "case study" in which, after data collection, an analysis of the relationships between the responses is carried out for a subsequent projection of the expected effects on a company, product or production system.

Descriptive research can be:

- Documental.
- Field studies.
- Interviews.

It is important to emphasize that the researcher does not interfere in reality, he only observes the variables that, spontaneously, are linked to the phenomenon under study.

In descriptive research, the object of the investigation is partially known. The primary objective of research of this type is to describe the characteristics of a certain group or phenomenon, or to establish relationships between variables. It involves planning and standardized data collection techniques. Descriptive surveys are the most requested by organizations such as educational institutions, commercial companies, political parties, etc.

Qualitative research focuses on apprehending facts and phenomena, and not merely recording or describing them. It is focused on the perception of reality, and the most common type of this research in the social sciences is the Case Study. Quantitative research, on the other hand, expresses a strong concern with the measurement and establishment of relationships and determinations of some facts or phenomena of social reality. It is relevant to state that research can be, at the same time, quantitative and qualitative (TRIVINOS, 1987). In practice, the researcher, who develops an investigation based on statistics, intends to obtain objective results, fixing the result in the statistical data. However, this information could be used to advance a broader interpretation of the result.

According to the studies described, the methodological approach chosen to be used in the present study will allow us to portray the largest number of elements existing in the reality studied. However, to carry out the research in full, we used qualitative techniques with interviews.

The interview is an indirect observation. It is one of the most used techniques in social research and consists of interaction with the participant, formulating questions with the objective of obtaining data for the investigation.

Document analysis is an important technique in qualitative research, either complementing information obtained by other techniques, or unveiling new aspects of a theme or problems, according to Krippendorff cited in Lüdke and André (1986).

The strategy for collecting information was based on semi-structured interviews, as it arouses the interest and collaboration of the interviewee.

The semi-structured interview sought to bring perceptions and opinions about the company's decision to implement, as well as the vision of each manager and their

expectations about the innovation project. The first interviewee was the Legal and Administrative Manager of the company BRT Tijuca/Normandy, responsible for collecting the data, interviewing the managers of the areas involved and with the company that supplied the applied technology, M2M, in addition to being the interlocutor of the working group with the company. The complete interview questionnaire is presented in Appendix A of this study.

The interview was conducted through a structured questionnaire with the general data of the interviewees: company, name of the interviewee, position, date of the interview, time in the company and time in the position. In addition, the motivations for implementation, the stages of the implementation and the expected and obtained results were questioned.

To collect the information, the methodology of the interview survey was used, and applied by Cleber Reis, Legal and Administrative Manager of the BRT Tijuca/Normandy company and representative of the working group of the Application Project.

In this model, the researcher actively participates in the research situation, assuming, in a way, the role of a member of the group that is being observed.

We have a member who is a collaborator of the researched company, so the interaction and internal perception in this case study were faster, since it was possible to access internal documents, static data and percentage of return from the implementation.

The interview was conducted with Cleber Reis, Legal and Administrative Manager, Rosane Lucena, Operational Manager and Alvimar Queiroz, Maintenance Manager, all from the company BRT Tijuca/Normandy, and Flavio Mousinho, Operations Manager, and Alexandre Pereira, Operational Consultant of the company that provides the Telemetry system, M2M Solutions.

According to Marconi and Lakatos (2001), the questionnaire is a scientifically developed instrument, composed of a set of questions ordered according to a predetermined criterion, which must be answered without the presence of the interviewer and which aims to collect data from a group of correspondents. This instrument aims to capture the opinions, beliefs, feelings, interests, expectations and perceptions of the respondents in a uniform manner.

Based on this definition, we based our study on a questionnaire to collect detailed information on the implementation process, valid training, technical feasibility, benefits and financial results.

The interview was applied in a non-face-to-face manner, delivered by e-mail from 07/27 to 07/30/2018 to all managers, and doubts were clarified by telephone.

With the feedback of the interviews, by e-mail, the data were consolidated by the working group. The interpretation occurred taking into account the difficulties encountered by

each area involved with the relevance of the answers, thus demonstrating the feasibility of implementing the system in the company and, in the future, in others that operate the same transport system.

The employees of the company BRT Tijuca/Normandy are characterized by the length of time at home, coming from the base companies Auto Viação Tijuca S/A = Tijuquinha and Viação Normandy do Triângulo LTDA = Normandy. Cleber Reis, Legal and Administrative Manager, has been in the BRT system for a year and eight months, but in the group of companies for more than 8 years; Rosane Lucena, Operational Manager, has been in the group for 20 years and in the Tijuca/Normandy BRT for 2 and a half years; Alvimar Queiroz, Maintenance Manager, at BRT Tijuca/Normandy for 2 and a half years. All of them were comfortable with the possibility of innovation, a striking characteristic in the group's companies, and were concerned about the financial results of the project and how the implementation is linked to the customer. They talk about organizational data in a transparent way.

The company of Flavio Mousinho, Operations Manager and Alexandre Pereira, Operational Consultant, supplier of the Telemetry system, M2M Solutions, with 15 years of experience in the market, has consolidated itself as one of the main fleet monitoring companies in Brazil. It monitors more than 20 thousand vehicles in Brazil and abroad, with more than a thousand BRT buses in Rio de Janeiro, one of the most modern in the world. Because it is a company that thinks of innovation as a proposal for intelligent solutions, Alexandre was in tune with the company's expectations.

Table 1

Summary Table

Nature of the research	Research universe	Sample of the survey	Data collection	Interviewees
Qualitative descriptive research	Companies operating in the BRT system Tijuca/Normandy and the equipment supplier	Companies responsible for the implementation of the Telemetry Project	Semi-structured interviews	Managers responsible for the areas involved with the implementation of the Telemetry project.

4 DATA ANALYSIS AND DEVELOPMENT OF THE SOLUTION PROPOSAL

4.1 TELEMETRY

Telemetry: "tele" means "remotely" and "metria" means "measurement". It is a technological monitoring system used to command, measure or track something from a distance, through wireless communication (radio or satellite signals). Telemetry is currently

applied in many branches, such as agriculture, meteorology, water and sewage treatment system, energy monitoring, etc. For some time now, it has been helping to monitor and increase performance, such as in Formula 1 cars. In the late 80s, when Senna raced his McLaren, after practice he spent hours in the "motorhome" analyzing the data.

Transport companies are also investing in this technology, and today it is possible to know details about fuel consumption, wear and tear of parts, sudden acceleration and braking, intensity of curves and other driving details. In this way, companies are able to monitor and correct employee behaviors in various aspects.

The telemetry project is part of an internal campaign by MobiBrasil, called Conscious Driver – Do the Right One. The theme was adopted in September 2017, to stimulate individual changes in employees, with the aim of achieving results collectively.

MobiBrasil, an urban transport company in São Paulo, set a goal for diesel savings and awarded 80 drivers who managed to reach the determined amount. Fuel consumption was measured using telemetry technology, which was deployed on four of the company's lines in September 2017.

In addition to saving fuel, MobiBrasil stopped emitting 107.46 tons of CO₂ into the environment, just with the program implemented in these four lines for four months. The numbers were provided by the CEO of MobiBrasil Nieve Chaves, Jessica Marques, for *Diário do Transporte* (2017).

Another transport company, Viação Santa Brígida, which operates urban lines in the north, northwest, southeast and central regions of the City of São Paulo, invested in telemetry to improve the management of passenger transport fleets.

According to Fernando Cesar, maintenance manager at Viação Santa Brígida, the company already knew telemetry previously when participating in a project whose objective was to treat the technology intelligently. Using the concept of information transmission, the project allowed to aggregate the treatment of the data collected, understanding what to do with each result. "The items collected in the project were excessive speed, sudden acceleration, sudden braking, sudden turning, excessive rotation and driving outside the green lane," said Fernando Cesar.

There were two phases in this period. In the beginning, we sought to understand how telemetry technology would work in a situation where the driver operated the bus without knowing that he was being monitored. "In the next phase, already aware of the project, the driver acted with knowledge of which driving events were being analyzed."

4.2 THE MOST COMMON USE OF TELEMETRY

Telemetry is widely used abroad with significant results in cost and labor reduction. The reduction in costs happens in several ways:

- Identification of the driver and control of the working day.
- Speed in the dry and rain, providing a reduction in accidents and speeding fines and promoting the practice of defensive driving.
- Speeding violations with precision (direct from the speedometer) and support of audible warnings to drivers.
- Control of the economic range of RPM and speed, providing fuel savings and increasing the interval between corrective maintenance, in addition to reducing maintenance costs due to poor driving.
- Drivers' performance through ranking.
- Time of use of the vehicle in "toothless".
- Braking and sudden start.
- Improper clutch usage time.
- Real control of hours worked. Functionality widely used in machines or equipment that work at a standstill, such as compressors, generators, containers, cranes and munck trucks, among other machines at the customer's discretion.
- Special speed. This event log indicates speeding on an embedded fence, predetermined by the user.
- Arrival Notice. Through the boarding of points, the system identifies when the vehicle is close to the company, helping all yard logistics.
- ASO control. The system sends notices by e-mail 15 (fifteen) days before the exam is due.
- Control of National Driver's License (CNH). The system sends notices by e-mail 15 (fifteen) days before the expiration of the driver's license.
- Checkpoints and embarked fences. This functionality supports companies in quickly identifying the location of the vehicle when it is at work (for example: gas station, customer A, customer B, residence of employee A, etc.).

Figure 5*Trajectory and details of the trip*

Source: Google Maps, APP Mix/M2M (2022).

Telemetry also allows the elaboration of the ranking of drivers based on the analysis of the information on how they drive the vehicles, identifying those that are above or below the average values calculated, making it possible to establish measures that corroborate the better performance of these professionals and, consequently, a better use of the vehicles, resulting in lower operating and maintenance costs (Figure 5).

4.3 THE PRESENCE OF INNOVATION IN THE TIJUQUINHA GARAGE

Since its foundation, Tijuquinha has sought innovation incessantly. The company was one of the first to make use of indoor and outdoor filming technology, which began to be used in 1995, being mandatory in the sector only in 1999; also regarding the use of GPS for better distribution of vehicles along the lines, which happened in 2004, being the standard technology for the sector only in 2009.

It could not be different in the implementation of telemetry. Tijuquinha is the first in the world to implement this technology in articulated buses. The first attempt began in 2017, being successful in 2018. It will be nothing new if this technology becomes the standard for the industry in the coming years.

Telemetry imposes several challenges, including the need for a qualified team to treat the huge database that technology offers, so that they can be aggregated and transformed into useful information that enables the breaking of paradigms.

The main justifications for continuous innovation in the company are to increase its market share and improve the return on investment of its shareholders.

4.4 COST AND TIME FOR IMPLEMENTATION

The installation of the equipment is simple. The implementation time is one week, and the validation tests last at least three months. The company Auto Viação Tijuca S.A. finished the validation phase in May 2018.

Equipment was installed in 10 (ten) cars. Each vehicle has its equipment, and each driver has a unique key that links it to the vehicle at the time of operation. Maintenance has keys to perform the necessary tests, which allow the identification of the last professional who operated the vehicle.

The biggest difficulty in the testing phase was the engagement of the drivers themselves. But the transparency in the dissemination of the results made the advantages of the project discovered, and so the engagement occurred gradually.

During the validation period, at no cost, the equipment was loaned. After the signing of the commercial agreement, the equipment was implemented in the entire Tijuquinha/Normandy fleet.

The price of a telemetry service is between R\$ 140.00 to R\$ 200.00 per monitored vehicle.

4.4.1 Expected Results

- Evolution in management and control.
- Reduction of overtime and labor liabilities.
- Standardization of the way vehicles are driven.
- Development of driver awareness and training policies.
- Increased vehicle life, with the consequent reduction in vehicle downtime.
- Reduction in fuel consumption.
- Reduction in the number of fines.
- Reduction in the number of claims.
- Reduction of polluting gases.

4.5 THE BENEFITS

4.5.1 For Customers

Customers directly benefit from the telemetry system, as it monitors speeding, improper use of the brake, sharp curves, among other drivability events that can be used to monitor and guide the training of drivers in driving vehicles.

4.5.2 For managers

The main benefit for managers is to monitor, through remote control of the fleet, the management KPI's, in which the performance of drivers in relation to the goals established by the company is verified.

4.5.3 For entrepreneurs

The first benefit is in the reduction of costs. But it is not limited to this, as telemetry naturally brings a culture of meritocracy to all areas of the company.

4.6 THE RESULTS

The results are surprising, for example, the ease of remotely turning off the vehicle that is idling for a predetermined time of 10 minutes. It is very common for the driver to leave the vehicle on and leave it for various reasons, so when this occurs, the vehicle is turned off remotely, reducing its wear and tear and fuel consumption. Figure 6 lists some of the events that can be monitored by the smartphone app.

Figure 6

Events that can be selected to be followed

EVENTOS	EVENTOS
1 Evento(s) selecionado(s)	1 Evento(s) selecionado(s)
FM Temperature wire off ☐	M2M - Freio estacionamento ON ☐
Fora da faixa Verde ☐	M2M - Aumento do nível de combustível ☐

4.6.1 Reduction of accidents and fines

With telemetry, the entire road was mapped, and the driver is informed in advance of radars and stations. This reduced fines and accidents.

There was a 5% reduction in all types of accidents, in addition to a reduction in their severity. As for fines, there was a significant reduction of 98%.

4.6.2 Fuel and CO2 emission reduction

Drivers started to operate the vehicle correctly, within the green range (extra-economic range), thus reducing fuel consumption by 15% and, consequently, releasing less CO2 into the atmosphere.

4.6.3 Reduction in tire consumption

A better operation of the vehicle, with a reduction in sudden braking and greater use of the retarder brake to the detriment of the service brake, provided less heating of the wheels. Consequently, tires are saved more, promoting an increase of up to 5% in their useful life.

4.6.4 Less corrective maintenance

As the operation is done correctly and monitored, the tendency is for there to be less corrective maintenance. For example: wheel heating, coolant heating, pneumatic bellows displacement, etc.

4.6.5 Increase in average speed with less time inside the bus

With telemetry, you can monitor the downtime, which increases the average speed. Consequently, the customer will spend less time inside the bus.

4.7 THE CURRENT DIFFICULTIES IN CONTROLLING VEHICLE DATA IN REAL TIME

Currently, it is possible to monitor vehicles to:

- geolocation of vehicles (individual or group);
- address and date of each location;
- monitoring of events;
- distance traveled;
- speeding;
- custom reports;
- configuration of alerts;
- fences and virtual fines.

However, in the case of BRT, vehicles circulate in segregated lanes, with an independent system for applying fines and with entry and exit of passengers in their own (elevated) stations.

Thus, although the lanes are segregated, there are several intersections with the ordinary lanes, and with telemetry it is possible to check the places with the highest occurrence of events or accidents, especially in case of weather changes, to quickly warn the driver about the adversities that lie ahead.

The use of telemetry has already allowed the saving of fuel, rolling stock, shortened the maintenance time of vehicles, increased safety in transport and, above all, reduced the emission of polluting material.

5 FINAL CONSIDERATIONS

From our objective to demonstrate the importance of the search for innovative initiatives as a critical success factor for urban mobility companies and the benefits of implementing telemetry in the BRT/RJ modal, as well as the changes that the introduction of

a new technology can bring to the business model and how decisive the human factor is as a transforming agent. We seek to describe the process of implementing telemetry. To this end, we conducted a series of interviews with representatives of Tijuquinha and Normandy, who promoted this innovative initiative, in order to find out how its implementation took place, difficulties, risks and benefits generated.

The innovative initiative presented in this application project enabled the companies Tijuquinha and Normandy to obtain a significant cost reduction associated with improved quality, especially in vehicle driving, which was clearly perceived by their customers. These results established a competitive differential and allowed the companies to continue operating, despite the difficulties imposed by the economic crisis that we describe in this work.

The benefits of extending the innovative solution applied in the Tijuquinha and Normandy partnership to the other companies of the BRT/RJ System in the City of Rio de Janeiro are of paramount importance for the development of urban mobility in the State and even beyond our borders. If this initial one is extended to the other companies that operate BRT buses, there will be a general improvement in the quality of the companies and the system, through a lower number of breakdowns and consequent increase in the availability of vehicles. In this way, compliance with the BRT operator's schedule is guaranteed and, with that, a greater supply of seats, reducing overcrowding. There will also be a reduction in accidents, in addition to greater comfort for customers, with the improvement and standardization of bus driving. We cannot forget the benefits to the environment with the reduction of fuel consumption, CO₂ emissions and tire consumption.

For all of us who worked on the preparation of this Project, it was possible to perceive a clear evolution of our knowledge about the challenges of urban mobility in the metropolitan region, its history and evolution, to better understand its current infrastructure, in addition to the impact of the economic crisis on companies. It was also possible to develop our capacity for collective reflection on such a complex topic and of which we are part, influence and are influenced.

As we discussed in our theoretical framework, for Schumpeter (1997), innovation can be understood as the fundamental impulse that initiates and maintains the movement of the capitalist machine, from which arise "new consumer goods, new methods of production or transport, new markets, new forms of industrial organization that the capitalist company creates".

In this line of thought, the innovation presented still has several opportunities for development, and it is essential that there is continuity so that it is possible to explore its full

potential. This search for innovative initiatives should not be limited to Telemetry or be seen only as a technological solution. New technologies offer opportunities for much broader change than simply deploying systems and equipment. The incorporation of new technologies can change business models, introduce new habits and needs that were previously non-existent and that always depend on the human factor to be successful. The impacts of the development and deployment of new technologies on the behavior of people influenced by the change must be carefully managed to ensure the success of projects.

Currently, we have several technological solutions under development that may one day be applied to urban mobility solutions such as BRT. Just to name a few of them, we can list: battery or hybrid vehicles; autonomous vehicles, as already existing in subways in several cities around the world, for example, on Line 4 of the São Paulo Metro; new means of payment, eliminating current methods; new ticketing platforms with the increasing use of smartphones, the internet and its derivatives; applications of big data and artificial intelligence to evaluate demand behavior and define the best operational plan; Big Data and Artificial Intelligence applications for analyzing the operating pattern of assets (buses, trains, planes, escalators, etc.), which identify deviations from these standards and enable a scheduled maintenance action even before failure, increasing the safety, reliability, and availability of assets that are essential in urban mobility systems.

Still as an innovative initiative, it is necessary to continue in the search for solutions that enhance the strengths of each of the modes and companies, enable an integrated operation that meets the needs of the population at an adequate cost and that fulfills its historical role as a driving element for the growth of the City, without, however, making companies unviable. The creation of a Metropolitan Transport Authority, a legal entity endowed with administrative and financial autonomy to organize the issue of transport within the Metropolitan Region of Rio de Janeiro, may be one of the solutions to the urban mobility crisis that we are experiencing in our city. A metropolitan management of urban transport acting in the planning, regulation, coordination of mobility actions and the dissemination of good practices and innovative initiatives can make urban transport companies viable, bringing benefits to companies, government and contributing to the improvement of the quality of life of the population.

ABSTRACT

This study analyzes the academic evolution of the School of Mathematics at the Los Santos Regional University Center (CRU) over forty years of institutional history. Through a quantitative and descriptive approach, various indicators related to academic activity are examined, such as student enrollment, graduates, academic offerings, faculty output, and participation in academic projects. Data were obtained from a graduate survey, institutional records, academic reports, and administrative documents corresponding to the study period. The results identify trends in enrollment growth, the strengthening of mathematics education, and the school's contribution to the academic development of the regional center. Furthermore, the analysis highlights the fundamental role of mathematics in scientific and professional training within the region. This work provides an institutional overview that contributes to understanding the historical evolution of mathematics education at the Los Santos CRU and offers insights for future academic planning.

Keywords: Mathematics. Higher Education. Academic Indicators. Institutional Evolution. Quantitative Analysis.

RESUMO

O presente estudo analisa a evolução acadêmica da Escola de Matemática do Centro Regional Universitário (C.R.U.) Los Santos ao longo de quarenta anos de trajetória institucional. Por meio de uma abordagem quantitativa e descritiva, examinam-se diversos indicadores relacionados à atividade acadêmica, tais como matrícula estudantil, formandos, oferta acadêmica, produção docente e participação em projetos acadêmicos. Os dados foram obtidos a partir de pesquisas com egressos, registros institucionais, relatórios acadêmicos e documentos administrativos correspondentes ao período de estudo. Os resultados permitem identificar tendências no crescimento da matrícula, no fortalecimento da formação matemática e na contribuição da escola para o desenvolvimento acadêmico do centro regional. Ademais, a análise evidencia o papel fundamental da matemática na formação científica e profissional dentro da região. Este trabalho oferece um panorama

RESUMEN

El presente estudio analiza la evolución académica de la Escuela de Matemática del Centro Regional Universitario (C.R.U.) Los Santos a lo largo de cuarenta años de trayectoria institucional. A través de un enfoque cuantitativo y descriptivo, se examinan diversos indicadores relacionados con la actividad académica, tales como matrícula estudiantil, egresados, oferta académica, producción docente y participación en proyectos académicos. Los datos fueron obtenidos a partir de encuesta a egresados, registros institucionales, informes académicos y documentos administrativos correspondientes al período de estudio. Los resultados permiten identificar tendencias en el crecimiento de la matrícula, el fortalecimiento de la formación matemática y la contribución de la escuela al desarrollo académico del centro regional. Asimismo, el análisis evidencia el papel fundamental de la matemática en la formación científica y profesional dentro de la región. Este trabajo ofrece una radiografía institucional que contribuye a comprender la evolución histórica de la enseñanza de la matemática en el C.R.U. Los Santos y aporta elementos para la planificación académica futura.

Palabras clave: Matemática. Educación Superior. Indicadores Académicos. Evolución Institucional. Análisis Cuantitativo.

1 INTRODUCTION

Mathematics education in Panama has been a subject of constant reflection due to the need to improve academic results in this area and foster a better understanding and application of mathematics in society. The School of Mathematics of the CRU Los Santos, began operations in 1983, according to an interview conducted by Magister Edwin Díaz Gálvez, first director of the CRU Los Santos and first professor of the school of mathematics in the University Extension of Las Tablas. "This mathematics school was opened with the purpose of training professionals in the field of mathematics and has played a fundamental role in strengthening mathematics education in the region," Diaz said. It has not only contributed to the training of mathematicians, but also has a direct impact on the teaching of mathematics at the local and national level. However, the presence of this school and its influence on mathematics education in the province of Los Santos and in Panama in general are still aspects that require further analysis. This study aims to reflect on the presence of the School of Mathematics in the province of Los Santos and its contribution to mathematics education in the country.

2 STATEMENT OF THE PROBLEM

Mathematics is a fundamental discipline for the scientific, technological and economic development of contemporary societies. In the field of higher education, mathematical training not only contributes to the strengthening of logical and analytical thinking, but also supports the development of multiple areas of knowledge and scientific innovation. In this context, the study of the evolution of the academic units dedicated to the teaching of mathematics allows us to understand the processes of professional training, the institutional dynamics and the impact of these structures on the academic development of universities.

Various studies have indicated that the analysis of academic indicators such as student enrollment, graduates, academic performance, and teacher participation is a key tool for evaluating the quality and functioning of university programs. In particular, academic performance and student participation are considered relevant indicators to understand the development and effectiveness of formative processes in mathematics (Wijaya et al., 2023).

Likewise, recent studies have shown that institutional, pedagogical, and contextual factors influence the dynamics of mathematics programs in higher education. For example, the literature indicates that the availability of specialized teachers, academic working conditions, and professional development opportunities significantly influence the consolidation and sustainability of mathematics areas in universities (Solis-Rodríguez, 2025).

In this sense, the historical and quantitative analysis of academic units allows us to identify trends in their growth, transformation or stagnation over time. According to research on university systems, the study of institutional indicators such as enrollment, graduation rates, and academic structure contributes to understanding how higher education institutions evolve and how they respond to social and educational demands (Taylor et al., 2019).

Despite the relevance of these analyses, in many Latin American university institutions there is still a limited systematization of historical information on the development of their schools or academic departments. This situation makes it difficult to understand the institutional trajectory, the identification of achievements and challenges, and the generation of inputs for academic planning and strategic decision-making.

In the case of the School of Mathematics of the Los Santos Regional University Center, its academic trajectory extends for approximately four decades of operation. During this period, the school has contributed to the training of professionals, the development of teaching activities and the strengthening of mathematics education in the region. However, the information regarding its institutional evolution such as the behavior of enrollment, the number of graduates, teacher participation and other academic indicators has not been systematized in a comprehensive way in scientific studies that allow analyzing its development over time.

Faced with this situation, the need arises to carry out a quantitative analysis that allows describing and understanding the evolution of the School of Mathematics of the C.R.U. Los Santos during his forty years of academic career. This analysis will allow the construction of an institutional x-ray based on data, contributing to the historical knowledge of the academic unit and providing relevant information for the planning and strengthening of the teaching of mathematics in the university context.

In this context, the following research questions are raised:

- How has the academic activity of the School of Mathematics of the CRU Los Santos evolved throughout its forty years of operation?
- What trends can be identified in institutional indicators such as student enrollment, number of graduates, and faculty development during this period?
- What aspects characterize the academic trajectory of the School of Mathematics of CRU Los Santos in terms of its institutional development?

3 JUSTIFICATION

The School of Mathematics of CRU Los Santos represents the main key player in the training of human resources in the field of mathematics in the region. The need to investigate

its impact lies in the fact that mathematics education is a fundamental pillar for the development of critical thinking, problem solving and decision-making in various areas of social, political and economic life. Through this study, we seek to understand how the training received in this school contributes to the quality of mathematics teaching at the educational levels of the province of Los Santos and Panama. In addition, it is intended to identify possible areas for improvement and promote the strengthening of the School of Mathematics, ensuring its role as a key actor in the country's educational process.

4 OBJECTIVES

4.1 GENERAL OBJECTIVE

□ To evaluate the academic evolution of the School of Mathematics of the C.R.U. Los Santos for forty years and its contribution to the improvement of mathematics education in Panama, through the study of institutional and academic indicators.

4.2 SPECIFIC OBJECTIVES

1. To analyze the impact of the training received at the School of Mathematics on graduates and their contribution in their respective fields of work.
2. To analyze the perception of graduates about the quality of academic training at the School of Mathematics of CRU Los Santos.
3. To explore how the presence of the School of Mathematics has influenced the development of mathematics education in the province of Los Santos.
4. Identify areas for improvement in the School of Mathematics to strengthen its impact on mathematics education at the regional and national levels.

5 THEORETICAL FRAMEWORK

1. The Role of Mathematics in the Development of a Region

Mathematics is more than an academic discipline; it is a fundamental tool for the social and economic progress of any community. As Lynn Arthur Steen (2001) points out, mathematical literacy is a basic need for citizens of the twenty-first century, who must be able to interpret data, understand statistical models, and make informed decisions in an increasingly quantitative world. The ability to apply logical thinking and problem-solving skills is crucial in sectors as diverse as technology, finance, and engineering (National Research Council, 2002). In the regional context, a solid background in mathematics equips professionals with the ability to innovate and contribute to the development of the local economy, boosting competitiveness and creating solutions to community challenges.

2. History and Evolution of Mathematics Education in C.R.U. The Saints

The C.R.U. School of Mathematics Los Santos has played a crucial role in the training of professionals in the region, adapting to educational and labor needs over time. Their curricula reflect a constant evolution, moving from teaching focused on theory to a more applied and problem-solving oriented one (Mathematical Society of Costa Rica, 2018). Analysis of founding documents and review of its historical curricula reveal how the school has responded to changes in the labor market and global trends in higher education, demonstrating its commitment to academic relevance and excellence. This study seeks, precisely, to x-ray the result of this effort through the performance of its graduates.

3. The Role of the Mathematics Graduate in Society

Mathematics graduates have a highly valued professional profile in various fields. Beyond teaching, which has historically been their main job opportunity, they are inserted in areas such as data analysis, finance, research, and information technology (American Mathematical Society, 2019). Their ability to model complex problems and critical thinking make them valuable assets to any organization. When evaluating the work of the School of Mathematics, it is essential to examine to what extent its graduates contribute to society with these skills and how their training aligns with the demands of the current labor market.

4. Mathematics education in higher education

Mathematics plays a fundamental role in academic and scientific training within higher education, due to its contribution to the development of logical, analytical and critical thinking. In this context, mathematics education is not only oriented to the transmission of disciplinary content, but also to the strengthening of cognitive competencies necessary for problem solving in various fields of knowledge. According to Artigue (2011), mathematics education has established itself as a field of research that analyzes the processes of teaching and learning mathematics, as well as the institutional and social factors that influence these processes.

Likewise, mathematical training at the university is linked to the preparation of professionals capable of facing the scientific and technological challenges of contemporary society. In this sense, Rico (2012) points out that research in mathematics education has contributed to understanding the complexity of training processes and to improving educational practices at different levels of the education system, including higher education.

5. Academic Indicators in Institutional Analysis

The analysis of academic indicators is an important tool for evaluating the functioning and development of higher education institutions. Variables such as student enrollment,

graduation rate, teaching staff, and academic offer allow us to identify trends in the evolution of educational programs and their impact on professional training.

According to Taylor, Marmolejo, and DeLuca (2019), the use of institutional indicators allows us to understand the performance and evolution of university institutions, facilitating decision-making and strategic planning. These indicators provide quantitative information that contributes to assessing the growth, sustainability and quality of academic programmes.

In the case of academic units dedicated to the teaching of mathematics, the analysis of these indicators allows identifying patterns in student training, teacher participation and the consolidation of study programs. In addition, these analyses facilitate the identification of strengths and areas for improvement in institutional development.

6. Contemporary Perspectives in Mathematics Education

Current research in mathematics education has broadened its focus to consider not only the cognitive aspects of learning, but also the social, cultural, and institutional dimensions that influence mathematics teaching. From this perspective, mathematics education is understood as a complex process that involves multiple actors and contexts.

Valero (2017) argues that the learning of mathematics should also be analyzed from a socio-political perspective, recognizing the role played by educational institutions in the construction of mathematical knowledge and in the formation of critical citizens. Similarly, Cantoral et al. (2013) highlight that mathematics education must be understood within a social and institutional framework that influences the production and transmission of mathematical knowledge.

In this context, the study of the historical evolution of mathematics schools or departments within universities allows us to understand how academic practices, institutional structures and dynamics of professional training in the field of mathematics have developed.

7. Institutional Studies and Academic Historical Analysis

The historical analysis of academic units is an important strategy for understanding the development of higher education institutions. This type of study allows us to identify transformations in the academic offer, changes in student enrollment and the growth of the teaching staff, as well as their impact on professional training.

In particular, studies based on quantitative indicators facilitate the construction of a comprehensive vision of institutional development, allowing the analysis of the evolution of academic activities over time. These analyses contribute to documenting the trajectory of the academic units and to generating relevant information for the planning and strengthening of educational programs.

In the case of the School of Mathematics of the Los Santos Regional University Center, the analysis of its evolution over forty years represents an opportunity to understand its contribution to the academic development of the regional center and to the strengthening of mathematical training in the region.

6 METHODOLOGY

This study followed a quantitative and descriptive approach, using a survey-type research methodology. A questionnaire was applied to graduates of the School of Mathematics of CRU Los Santos in order to obtain data on their perception of the quality of the training received, its impact on mathematics education and its contribution to society. The total population of graduates is 210; but despite the fact that the ideal sample of 137 graduates was not reached, for reasons such as: the lack of updating of contact information of the graduates, the low response rate in online surveys, and the limitations of time and budget, the sample was made up of a representative group of 75 graduates who have worked in different educational and professional areas. Data collection was carried out through an online form (Google Forms), which allowed answers to be obtained efficiently and safely. The results were analyzed quantitatively using descriptive statistical tools to identify trends and patterns in participants' responses.

Type of Research

The research was developed within the framework of a descriptive and exploratory research, since it sought to describe and analyze the current reality of the influence of the School of Mathematics in the province of Los Santos and at the national level, without intervention or manipulation of variables, and did not seek to generalize the results to the entire population of 210 graduates. Likewise, the study has a non-probabilistic approach, which is why the sample was not selected at random, but was based on the available graduates who met the participation criteria; and with a quantitative cut, since numerical data were collected, which allowed obtaining results on the impact of the training on graduates and their perception of educational quality.

7 ANALYSIS OF RESULTS

The Cru Los Santos School of Mathematics in real figures from 1983 to 2023

Table 1

Graduates

Género	Cantidad
Masculino	102
Femenino	108
Total	210

Table 2

Undergraduate projects

Tipo de trabajo	Cantidad
Tesis	52
Monografías	230

Matemática Aplicada	0
Matemática Educativa	230
Total	230

The following results presented are based on a sample of 75 graduates who were surveyed online, after having validated the instrument to be applied using expert validation, therefore, the findings are applicable only to this group.

A. GENERAL INFORMATION

It presents an overview of the graduates of the School of Mathematics of the CRU Los Santos, analyzing various aspects such as gender, graduation generation, academic index, employment status, and areas of specialization. This analysis provides a comprehensive

understanding of the profile of the graduates, highlighting their academic and work trajectories, as well as their interests in continuing their education, both in the field of mathematics and in other areas.

Table 5

Gender of graduates

Género	Frecuencia
Masculino	35
Femenino	40
Total	75

Figure 1

Source: Authors' elaboration based on the data obtained from the survey applied to graduates within the framework of this research.

There is a greater female representation among the surveyed graduates, although the difference is not very significant, with 6.66% more women (53.33% vs. 46.67%). The results show a balanced gender distribution in the surveyed graduates of the School of Mathematics, with a slight female majority.

This suggests a good level of inclusion of both genders, which could be highlighted as a positive aspect in terms of diversity and equity in the institution.

Table 6

Generation to which it belongs according to the range of years

Año de Promoción	Frecuencia
1983-1993	2
1994-2004	18
2005-2015	26
2016-2023	26
Total	75

The data show a positive evolution in the number of graduates, especially between 1994 and 2015, with a stabilization in recent years. This reflects the strengthening of the School of Mathematics of CRU Los Santos and raises the importance of maintaining strategies to ensure sustainability and growth in future promotions.

Figure 2

Source: Authors' elaboration based on the data obtained from the survey applied to graduates within the framework of this research.

Table 7

Graduate's employment status as a teacher

Trabajo	Frecuencia

Table 8*Graduates' Labor Sector*

Sector	Frecuencia
Público	60
Privado	5
Ambos	2
Total	67

The results show that most of the surveyed graduates of the School of Mathematics of the CRU Los Santos work as teachers. This reflects that the School of Mathematics contributes significantly to the strengthening of the education sector, particularly in areas where teaching mathematics is essential. This suggests that the training offered responds well to the labor demand of the education sector in the region.

Figure 4

Source: Authors' elaboration based on the data obtained from the survey applied to graduates within the framework of this research.

The results show a clear preference for the public sector among the surveyed graduates employed with 60 graduates (89.55%) working in the public sector, evidencing that most graduates find job opportunities in state institutions, such as public schools or government agencies.

The public sector is the main employer of the surveyed graduates of the School of Mathematics, which reflects an alignment of academic training with the labor demand of this sector. This underscores the importance of public education as the predominant workplace for graduates in the region.

Table 9*Graduate's educational level*

Nivel educativo	Frecuencia
Básica General	23
Media	32
Superior	2
Básica o Media y Superior	10
Total	67

The results indicate that most of the surveyed graduates work as teachers at basic and secondary educational levels, with less presence in higher education.

Most of the surveyed graduates of the School of Mathematics of the CRU Los Santos contribute to the strengthening of basic and secondary education, with a lower presence in higher education. This suggests that the academic program responds mainly to the labor demand of the educational levels prior to university.

Figure 5

Source: Authors' elaboration based on the data obtained from the survey applied to graduates within the framework of this research.

Table 10*Specialization in Mathematics after graduation*

Realización de Estudios	Frecuencia
Sí	51
No	24
Total	75

Figure 6

Source: Authors' elaboration based on the data obtained from the survey applied to graduates within the framework of this research.

The results show that a significant proportion of the surveyed graduates seek to continue their academic training after graduation.

68% of the surveyed graduates who completed specialization studies show a significant commitment to continuous training, highlighting the importance of promoting opportunities for specialization and access to advanced programs. However, the 32% who do not suggest the need to identify barriers and promote academic development alternatives that the doctorate has a minimum representation. This shows considerable interest in professionalization, but also highlights the need to expand opportunities and support to reach more advanced levels of study, such as doctorates.

Table 11

Level of studies in mathematics

Nivel	Frecuencia
Doctorado	1
Maestría	32
Especialización	18
Total	51

The data show that the surveyed graduates who have continued their academic training in Mathematics are mostly concentrated at master's levels with 32 graduates (62.75%) who have reached this level, being the most common. This suggests that the master's degree is perceived as an accessible and valuable option for professional development in Mathematics.

Most of the surveyed graduates who continue their academic training do so at master's or specialization levels, while

Figure 7

B. IMPACT AND CONTRIBUTION OF THE SCHOOL OF MATHEMATICS

It addresses the impact and contribution of the School of Mathematics of CRU Los Santos in the training of its graduates and its influence in the educational and professional field. Key aspects such as skills development, job placement in the education sector and other related fields are examined, as well as opportunities for specialization and the role of graduates in the promotion of mathematics in the region. This analysis seeks to highlight how the school has strengthened both the educational quality and the professional profile of its graduates.

Table 12

Quality of the mathematical training received at the School of Mathematics of CRU Los Santos

Figure 9

Source: Authors' elaboration based on the data obtained from the survey applied to graduates within the framework of this research.

The results show a strong positive perception of the contribution of the School of Mathematics of CRU Los Santos in the professional development of its graduates with 74.6%, which indicates a strong correlation between the training received and professional success in the educational or work environment.

Most of the graduates surveyed perceive that the School of Mathematics has played a crucial role in their professional development, highlighting the effectiveness of the training in preparing them for the workplace. These results underscore the school's success in meeting the professional expectations and needs of its graduates.

Table 14

Figure 10

Source: Authors' elaboration based on the data obtained from the survey applied to graduates within the framework of this research.

Most of the surveyed graduates perceive that training at the School of Mathematics of CRU Los Santos has had a significant positive impact on improving their personal and family quality of life. This highlights how education not only impacts professional development, but also has beneficial effects on the overall well-being of graduates.

C. APPLICATION OF KNOWLEDGE IN THE EDUCATIONAL AND LABOR FIELD

It focuses on the application of the knowledge acquired in the School of Mathematics of CRU Los Santos, analyzing how graduates have transferred and used their mathematical skills in the educational and labor field. The influence of training on the quality of teaching is explored, as well as its impact on professional development and the improvement of the quality of life of graduates. This analysis provides a vision of the effectiveness of the training received and its relevance in the daily practice of graduates.

Table 15

Type of work environment where the graduate works

Tipo de entorno	Frecuencia

Investigación en matemática	0
Docente e investigación	3
Sector privado	2
Otro entorno laboral	6
Total	75

Figure 11

Source: Authors' elaboration based on the data obtained from the survey applied to graduates within the framework of this research.

Most of the surveyed graduates of the School of Mathematics of the CRU Los Santos work in the educational field, mainly in teaching. This highlights the strong relationship between academic training and job opportunities in teaching, while participation in research and other job sectors is more limited.

Table 16

To the extent that he was present in the training at the School of Mathematics of the CRU Los Santos, "teaching how to teach mathematics"

Nivel de medida	Frecuencia
Siempre nos enseñaron	44
Algunas veces nos enseñaron	21
Muy poco nos enseñaron	6
Nunca nos enseñaron	1
Total	75

Most of the surveyed graduates consider that training in "teaching to teach mathematics" was significantly present in their education, highlighting that the School of Mathematics of CRU Los Santos has adequately integrated pedagogy into its curriculum. However, there is a small group that perceives that pedagogical teaching was not so constant or deep, which could be an area to be reinforced in the future.

Figure 12

D. OPINION OF THE PRESENCE OF THE SCHOOL OF MATHEMATICS IN THE REGION

It focuses on the opinion of the graduates on the presence and impact of the School of Mathematics of the CRU Los Santos in the region. Through various questions, it is analyzed how graduates perceive the relevance of the institution in the educational and social field, as well as its contribution to local development. This analysis provides insight into the influence of the school in the community and its role in the training of trained professionals in the field of mathematics.

Table 17

Perception of the presence of the School of Mathematics of the CRU Los Santos in the province

Nivel de percepción	Frecuencia
Muy Positiva	52
Positiva	17
Neutra	5
Negativa	1
Total	75

Figure 13

Source: Authors' elaboration based on the data obtained from the survey applied to graduates within the framework of this research.

The general perception of the presence of the School of Mathematics of the CRU Los Santos in the province is mostly positive, with a strong assessment of its impact on the community. This data highlights the recognition of the school as a key institution in the training of professionals in the region.

Table 18

Perception of the improvement of mathematics education in the province of Los Santos, with the presence of the School of Mathematics

Nivel de percepción	Frecuencia
Si, de manera significativa	55
Si, en cierta medida	17
No mucho	3
No ha tenido impacto	0
Total	75

The results show a very positive perception about the impact of the School of Mathematics of the CRU Los Santos in the improvement of mathematics education in the province. 73.33% believe that the presence of the school has significantly improved mathematics education in the province, which underscores the great impact that the institution has on the quality of local education.

Most of the graduates perceive that the School of Mathematics of the CRU Los Santos has had a significant impact on the improvement of mathematics education in the province, highlighting its crucial role in the strengthening of mathematics teaching in the region. This highlights the importance of the institution in local educational development.

Figure 14

Table 19

Impact at the national level on mathematics education that has been had with the presence of the Mathematics School of the CRU Los Santos

Nivel de impacto	Frecuencia
Sí, de manera significativa	43
Sí, en cierta medida	27
No mucho	4
No ha tenido impacto	1
Total	75

Figure 15

Source: Authors' elaboration based on the data obtained from the survey applied to graduates within the framework of this research.

The majority of the surveyed graduates perceive that the School of Mathematics of CRU Los Santos has had a significant or moderate impact on mathematics education at the national level, which highlights its relevance in the educational field beyond the province of

Los Santos. This data highlights the role of the school as an important actor in the improvement of mathematics teaching in the country.

8 DISCUSSION

The results obtained from the questionnaires applied to the graduates revealed that most of the participants consider that the academic training received at the School of Mathematics of the CRU Los Santos was highly satisfactory and contributed significantly to their professional development. A significant percentage of the graduates mentioned that the training received allowed them to work in different educational sectors, both in primary, secondary and higher education, and in applied areas of mathematics. In addition, many highlighted that the school has had a direct impact on the improvement of mathematics teaching in the province of Los Santos.

Regarding the perception of the school's presence in the region, the graduates agreed that the School of Mathematics of CRU Los Santos has been a key element in the promotion and development of mathematics in the province, contributing to the strengthening of mathematics education in Panama. However, opinions have also emerged that suggest the need to improve teaching resources and infrastructure to optimize teaching-learning processes.

9 CONCLUSIONS

The School of Mathematics of CRU Los Santos has proven to be an institution of great value for the training of professionals in the field of mathematics and has had a significant impact on mathematics education in the province of Los Santos and in Panama. The graduates of the school have been fundamental in the improvement of mathematics teaching in their respective fields of work. However, it was noted that there are areas for improvement, especially in the updating of study programs and in the expansion of continuing education, which would allow the institution to maintain its relevance in an ever-changing academic and professional world. In this sense, it is recommended that the School of Mathematics of CRU Los Santos strengthen and diversify its training programs and continue promoting the development of mathematics in Panama to continue contributing to the educational progress of the country. This study is a first step and we hope that future studies with greater resources will attempt to survey a larger and more representative sample of graduates.

ABSTRACT

The growing recognition of mental health and psychological well-being has intensified legal debates regarding the institutional recognition of emotional support animals, particularly in regulated contexts such as air transportation. In this scenario, questions arise concerning the compatibility between passengers' fundamental rights, aviation safety requirements, and the regulatory norms governing the transport of animals on aircraft. This study aims to analyze the legal challenges related to the regulation of air transportation of emotional support animals in Brazil, considering its implications within the framework of fundamental rights and the normative organization of civil aviation. The research adopts a literature review methodology, based on the qualitative analysis of recent scientific studies addressing legal, social, and regulatory aspects related to the subject. The findings indicate that the social recognition of emotional support animals is closely linked to the psychological benefits associated with the human–animal relationship, while also revealing regulatory gaps that may generate conflicts among passengers, airlines, and regulatory authorities. It is concluded that the development of clearer and more balanced regulatory frameworks is essential to ensure legal certainty, protect fundamental rights, and maintain the proper organization of air transportation in light of contemporary social transformations.

RESUMO

A crescente valorização da saúde mental e do bem-estar psicológico tem impulsionado debates jurídicos relacionados ao reconhecimento institucional dos animais de apoio emocional, especialmente em contextos que envolvem serviços regulados, como o transporte aéreo. Nesse cenário, surgem questionamentos acerca da compatibilização entre os direitos fundamentais dos passageiros, a segurança operacional da aviação civil e as normas que disciplinam o transporte de animais em aeronaves. O presente estudo tem como objetivo analisar os desafios jurídicos relacionados à regulação do transporte aéreo de animais de apoio emocional no Brasil, considerando suas implicações no campo dos direitos fundamentais e da organização normativa da aviação civil. Para tanto, adotou-se como metodologia a revisão bibliográfica de literatura científica recente, com análise qualitativa de estudos que abordam aspectos jurídicos, sociais e regulatórios relacionados ao tema. Os resultados indicam que o reconhecimento social dos animais de apoio emocional está associado aos benefícios psicológicos decorrentes da relação humano-animal, mas também evidencia lacunas regulatórias que podem gerar conflitos entre passageiros, companhias aéreas e autoridades regulatórias. Conclui-se que a construção de marcos normativos mais claros e equilibrados constitui medida essencial para garantir segurança jurídica, proteção dos direitos fundamentais e adequada organização do transporte aéreo no contexto das transformações sociais contemporâneas.

Palavras-chave: Animais de Apoio Emocional. Direitos Fundamentais. Regulação do Transporte Aéreo. Responsabilidade Civil. Transporte Aéreo.

RESUMEN

El creciente reconocimiento de la salud mental y del bienestar psicológico ha intensificado los debates jurídicos relacionados con el reconocimiento institucional de los animales de apoyo emocional, especialmente en contextos regulados como el transporte aéreo. En este escenario surgen cuestionamientos acerca de la compatibilidad entre los derechos fundamentales de los pasajeros, los requisitos de seguridad de la aviación civil y las normas que regulan el transporte de animales en aeronaves. El presente estudio tiene como objetivo analizar los desafíos jurídicos relacionados con la regulación del transporte aéreo de animales de apoyo emocional en Brasil, considerando sus implicaciones en el ámbito de los derechos fundamentales y en la organización normativa de la aviación civil. Para ello se adoptó como metodología una revisión bibliográfica de literatura científica reciente, con análisis cualitativo de estudios que abordan aspectos jurídicos, sociales y regulatorios relacionados con el tema. Los resultados indican que el reconocimiento social de los animales de apoyo emocional está asociado a los beneficios psicológicos derivados de la relación humano-animal, pero también revela vacíos regulatorios que pueden generar conflictos entre pasajeros, compañías aéreas y autoridades regulatorias. Se concluye que la construcción de marcos normativos más claros y equilibrados constituye una medida esencial para garantizar seguridad jurídica, protección de los derechos fundamentales y adecuada organización del transporte aéreo frente a las transformaciones sociales contemporáneas.

1 INTRODUCTION

The growing appreciation of mental health and quality of life has driven new legal discussions related to the protection of relevant social and affective bonds. In this context, the relationship between humans and companion animals began to receive greater attention in the scientific and legal fields, especially when these animals play an emotional support role for individuals in situations of psychological vulnerability.

The Constitution of the Federative Republic of Brazil establishes the dignity of the human person as the foundation of the Democratic Rule of Law, a principle that guides the interpretation and application of legal norms aimed at protecting the well-being and integrity of individuals, as provided by Brasil (1988). This constitutional foundation allows for a broader understanding of rights related to health and quality of life, including discussions involving the emotional support provided by companion animals.

In recent decades, the scientific literature has shown that the coexistence between humans and animals can produce positive impacts on people's psychological well-being. Recent studies show that interaction with pets can contribute to the reduction of symptoms related to stress, anxiety, and social isolation, favoring the emotional stability of individuals. In this sense, Brooks et al. (2023) highlight that the human-animal relationship can represent an important mechanism of psychological support, especially in contexts of emotional vulnerability. The expansion of this social recognition has driven the emergence of the category of so-called emotional support animals.

However, the institutional recognition of these animals has also provoked relevant legal debates, especially in sectors characterized by high normative regulation. Air transport is an emblematic example of this scenario, as it involves strict standards related to civil aviation safety, service organization and passenger protection. Younggren et al. (2020) highlight that the absence of standardized criteria for the evaluation and certification of emotional support animals can generate administrative and legal controversies, especially when these animals are transported in regulated collective environments.

In addition, the expansion of the presence of animals in different institutional spaces reflects broader cultural transformations related to the way contemporary society understands the relationship between humans and animals. Pallotta (2025) observes that the growing appreciation of the human-animal bond has influenced legal and political debates, stimulating discussions about the institutional recognition of certain forms of interaction between people and companion animals. This process highlights the emergence of new social demands that challenge traditional regulatory models, requiring legal responses capable of balancing individual rights, institutional security, and the organization of public and

private services.

In view of this scenario, the present study aims to analyze the legal challenges related to the regulation of the air transport of emotional support animals, considering the implications of this phenomenon in the scope of fundamental rights and the normative organization of civil aviation. It seeks to understand how the legal system can respond to emerging demands related to the transport of these animals, as well as to identify the main regulatory conflicts associated with the protection of passenger rights, the operational safety of air transport and animal welfare.

The expansion of discussions about emotional support animals is also related to the growth of social demands for institutional recognition of different forms of therapeutic support. In several countries, individuals facing psychological disorders or specific emotional conditions have started to resort to the help of companion animals as a form of support to maintain emotional balance. In this context, the scientific literature has pointed out that the presence of these animals can play a relevant role in the process of recovery and psychological stabilization of individuals. As indicated by Brooks et al. (2023), living with pets can contribute to reducing stress and anxiety levels, in addition to favoring the construction of affective bonds capable of strengthening emotional health.

However, the expansion of the social recognition of emotional support animals has also brought new regulatory challenges. The absence of uniform criteria for the identification and certification of these animals has provoked debates among regulatory authorities, service operators and users. Younggren et al. (2020) point out that the lack of standardized protocols for assessing the need for emotional support can generate divergent interpretations of the legitimacy of these demands. This scenario contributes to the emergence of administrative and legal conflicts, especially in sectors in which institutional functioning depends on strict operational standards.

In the field of air transport, these tensions are becoming even more evident. The civil aviation sector operates with high standards of safety and operational organization, which requires the adoption of clear rules for the transport of passengers and animals. Doughty (2023) observes that the growth in requests for the transport of emotional support animals on aircraft has exposed important gaps in the regulation of the sector, leading different authorities to review their institutional standards and policies. This process highlights the need to develop regulatory frameworks capable of reconciling the protection of passengers' rights with the operational requirements of air transport.

In addition to issues related to operational safety, the literature also points out that the transport of animals in aircraft can generate legal implications related to the civil liability of

airlines. Eulálio (2025) points out that conflicts involving damage or death of animals during transport have become increasingly frequent in the judicial sphere. This phenomenon shows that the transport of companion animals, including emotional support animals, has become part of broader legal debates related to consumer law, civil law, and animal law.

Given this panorama, it is necessary to deepen the legal analysis on the transport of emotional support animals in the context of civil aviation. Understanding the normative foundations and existing regulatory gaps can contribute to the development of legal solutions that are more appropriate to contemporary social transformations. Thus, the investigation proposed in this study seeks to understand the legal challenges related to the regulation of the air transport of these animals, analyzing the tensions between the protection of fundamental rights, the operational safety of air transport and the growing appreciation of animal welfare in contemporary society.

2 THEORETICAL FRAMEWORK

The contemporary legal debate about the transportation of emotional support animals has intensified in recent years, especially due to the expansion of discussions related to fundamental rights, animal welfare and regulatory transformations in the air transport sector. The social recognition of the bond between humans and companion animals has come to occupy a relevant space in academic and legal discussions, especially when this bond is related to mental health issues. In this scenario, recent scientific literature has sought to understand how legal systems can respond to the demands arising from the presence of emotional support animals in regulated environments, such as air transport.

One of the central aspects of the literature refers to the conceptual definition and recognition criteria of emotional support animals. Younggren et al. (2020) explain that these animals are distinguished from the so-called service animals because they do not necessarily receive specific training to perform certain tasks. Its main function is related to the emotional support offered to the tutor, especially in situations involving psychological or psychiatric disorders. The authors point out that the absence of uniform criteria for the evaluation and certification of these animals can generate distortions in the recognition of this type of therapeutic support, creating difficulties both for health professionals and for institutions responsible for regulating public and private services.

The literature also highlights the relevance of the relationship between humans and animals in the field of mental health and psychological well-being. Brooks et al. (2023) point out that living with pets is associated with a reduction in symptoms related to stress, anxiety, and social isolation. The authors note that, in many cases, the presence of an animal can

function as an important emotional support mechanism, contributing to the psychological stability of individuals in vulnerable situations. This therapeutic dimension has been used as a basis to justify the growing demand for institutional recognition of emotional support animals.

Despite these recognized benefits, the concept of emotional support animal still has uncertain legal contours. Pallotta (2025) argues that this category has a complex social and normative construction, being influenced by different cultural, institutional, and legal factors. According to the author, the expansion of the use of this concept in different regulatory contexts has generated debates about its limits and applications, especially when it involves the provision of public or private services. The absence of clear normative parameters can generate divergent interpretations and regulatory conflicts.

The discussion also involves the development of public policies and institutional mechanisms aimed at regulating these animals. Foltin et al. (2023) point out that different countries adopt different regulatory models for the recognition of assistance and emotional support animals. This regulatory diversity can cause practical difficulties for institutions responsible for providing services, especially in highly regulated sectors such as air transport. In this context, the authors highlight the need to develop clearer and more uniform criteria to guide administrative and legal decisions related to the topic.

These contributions demonstrate that the debate on emotional support animals goes beyond the field of health or psychology, reaching directly into the legal and regulatory domain. Recent literature has sought to understand how the law can balance the protection of individual rights, institutional security and the need to establish objective criteria for the recognition of this category of animals. Thus, the construction of a solid theoretical framework requires an integrated analysis of these different perspectives, allowing us to understand the conceptual and legal foundations that support the contemporary debate on the transport of emotional support animals.

The expansion of the debate on emotional support animals has also had direct repercussions in the field of air transport regulation. The presence of these animals on aircraft has generated relevant legal questions, especially with regard to the compatibility between the individual rights of passengers and the duties of airlines related to operational safety and the organization of the transport service. In this scenario, part of the specialized literature has analyzed the existing regulatory gaps and the legal conflicts that emerge from the absence of uniform regulation on the subject.

In this context, Doughty (2023) notes that the absence of clear criteria for the recognition of emotional support animals has contributed to a significant increase in conflicts

involving passengers and airlines. According to the author, during the last decade there has been a significant growth in the number of requests for the transport of these animals in aircraft, which has exposed regulatory weaknesses and led several legal systems to review their policies related to the subject. The lack of normative uniformity ends up producing legal uncertainty for both passengers and the companies responsible for providing the transport service.

The discussion also involves the interaction between aviation law rules and legislation aimed at the protection of people with disabilities or mental health conditions. Lanier (2021) analyzes how different regulatory systems began to revise their rules after the increase in cases involving passengers who sought to transport emotional support animals on aircraft. The author points out that the expansion of the recognition of these animals has generated tensions between the right of access to transport and the concerns of airlines with safety, hygiene and organization of the internal space of aircraft.

In addition, the growth in demand for transporting animals on commercial flights has also generated debates about the legitimacy of certain requests. Cummings (2023) highlights that the expansion of the category of emotional support animal has become the subject of criticism by regulatory authorities and airline operators, who point out difficulties in distinguishing legitimate cases from situations in which the classification is used inappropriately. For the author, the absence of standardized certification mechanisms can compromise the credibility of the institute itself and hinder the development of balanced regulatory policies.

Another relevant aspect discussed in the literature refers to civil liability arising from the transport of animals in aircraft. Eulálio (2025) analyzes cases involving damage or death of animals during air transport and highlights that such situations raise important debates about the liability of airlines. According to the author, the growing judicialization of conflicts involving animal transport demonstrates that the issue has gone beyond the administrative field and has become part of broader discussions related to consumer rights and animal rights.

In turn, Vallespin (2024) observes that the air transport of companion animals has undergone significant transformations in several countries, requiring adaptations in the operational and regulatory policies of airlines. The author points out that the growing social concern with animal welfare has influenced institutional changes in the aviation sector, which reinforces the need to develop clearer and more consistent regulatory models.

These analyses show that the transportation of emotional support animals in the context of civil aviation represents a changing legal field. The specialized literature has

pointed out that the absence of regulatory harmonization can generate conflicts between passengers, airlines and regulatory authorities. Thus, understanding the legal foundations of these disputes becomes essential to assess the regulatory challenges involved in the protection of fundamental rights and in the organization of contemporary air transport.

The discussion about the transport of emotional support animals also involves a broader dimension related to animal welfare and the social transformations that redefine the relationship between humans and animals in contemporary times. In recent decades, several studies have shown that pets play a relevant role in people's emotional and psychological lives, especially in contexts of vulnerability or treatment of mental disorders. This phenomenon has contributed to the broadening of the legal debate on the need to recognize certain forms of human-animal interaction as socially relevant and legally protected.

In this sense, Mota-Rojas et al. (2023) observe that contemporary discussions on animal welfare in Latin America have expanded significantly, incorporating legal, social, and ethical perspectives. The authors point out that the growing appreciation of animal protection has influenced different areas of law, including public policies, environmental legislation, and norms related to the protection of animals in institutional contexts. This movement has driven debates about the appropriate legal treatment of companion animals, especially when they are involved in transport or displacement situations.

The literature also highlights that social changes related to animal protection have produced relevant impacts on the formulation of regulatory policies. Pallotta (2025) argues that the concept of the emotional support animal has come to occupy significant space in institutional debates precisely because it reflects broader cultural transformations related to the way society understands the relationship between humans and animals. According to the author, this transformation has provoked pressures for greater legal recognition of this type of link, while requiring regulatory systems to develop clearer criteria for its application.

Another relevant aspect refers to the psychological and social implications of the coexistence between humans and animals. Brooks et al. (2023) highlight that recent studies show that the presence of companion animals can contribute to improving the emotional well-being and quality of life of their owners. This relationship has been especially relevant in mental health contexts, in which the emotional support provided by animals can help reduce symptoms associated with stress and anxiety. These factors have been used as a basis to justify the growing social demand for institutional recognition of emotional support animals.

However, the literature also emphasizes that the expansion of this recognition must be accompanied by appropriate regulatory mechanisms. Foltin et al. (2023) point out that public policies aimed at the recognition of assistance or emotional support animals need to establish

clear certification and evaluation criteria, in order to ensure legal certainty and avoid distortions in the use of these categories. The absence of objective parameters can compromise both the effectiveness of public policies and the credibility of norms aimed at protecting people who really need this type of support.

Thus, the scientific literature shows that the debate on the transport of emotional support animals involves multiple legal and social dimensions. On the one hand, there is a need to recognize the therapeutic and social benefits associated with human-animal coexistence. On the other hand, it is essential to develop regulatory frameworks capable of balancing the protection of fundamental rights, the safety of air transport and the guarantee of objective criteria for the recognition of these animals. The understanding of these different theoretical perspectives allows us to establish more solid bases for the analysis of the legal challenges involved in the regulation of the air transport of emotional support animals in the contemporary context.

3 METHODOLOGY

The present research is characterized as a qualitative study, with an exploratory and descriptive approach, developed through a bibliographic review of the recent scientific literature on the transport of emotional support animals and its legal developments in the field of air transport. The choice of this method is justified by the need to understand the theoretical, normative and regulatory foundations that structure the contemporary debate on the subject, allowing a critical analysis of the main academic contributions produced in recent years.

As for the technical procedures, the research was conducted through a bibliographic survey in scientific databases widely used in international and national academic production. Databases such as Scopus, Web of Science, PubMed, SciELO, and Google Scholar were prioritized, considering their relevance in the indexing of high-impact scientific journals. The search focused on scientific articles published in the last five years, with a preference for journals classified in strata A and B of the Qualis system, in order to ensure the quality and timeliness of the sources used in the development of the theoretical framework.

To identify relevant studies, descriptors related to the research object were used, such as emotional support animals, air transportation regulation, aviation law, animal welfare and fundamental rights. The combination of these terms allowed us to locate research that addresses both the concept of emotional support animals and the regulatory challenges related to the transportation of these animals on commercial aircraft. After conducting the searches, the publications were selected based on the reading of titles, abstracts and

keywords, prioritizing studies that had a direct relationship with the research problem.

The inclusion criteria adopted included scientific articles available in full text, preferably in PDF format, published in academic journals or recognized institutional repositories and that addressed legal, regulatory or social aspects related to emotional support animals or the transport of animals in aircraft. Publications that did not have a direct relationship with the topic investigated or that did not have a scientific character, such as opinion texts or materials without academic review, were excluded.

After the source selection stage, the studies were submitted to analytical and interpretative reading, seeking to identify the main concepts, theoretical arguments, and regulatory perspectives discussed by the authors. This stage allowed the systematization of the contributions of the recent literature and the organization of the elements that make up the theoretical framework of the study. The data analysis was carried out through a qualitative approach, with emphasis on the critical interpretation of the arguments presented in the selected articles, seeking to understand convergences, divergences and gaps in the scientific production on the subject.

The organization of the collected data occurred through the structuring of the information in analytical categories related to the main axes of discussion identified in the literature, such as the conceptual definition of emotional support animals, the impacts of the human-animal relationship in the field of mental health, the regulatory challenges in air transport and the legal implications arising from the absence of uniform standardization. This systematization made it possible to build a consistent theoretical basis for the analysis of the legal challenges involved in the regulation of the air transport of emotional support animals.

The literature review allowed us to identify relevant contributions that address different dimensions related to emotional support animals, including psychological, social, legal and regulatory aspects. The selected studies present complementary approaches, contributing to the understanding of the phenomenon from different theoretical and methodological perspectives. The following table presents the main authors used in the research so far, as well as the titles of the works analyzed and their respective years of publication.

Table 1

Authors used in the research

Author	Title	Year
Brooks et al.	The well-being of companion animal caregivers: a systematic review and research agenda	2023
Cummings	All dogs are emotional support animals: the need for clearer regulation	2023
Doughty	Failures in regulating emotional support animals	2023

Author	Title	Year
Eulalia	Liability of the airline in the event of death of an animal transported in the hold of the aircraft	2025
Foltin et al.	Current perspectives on implementing assistance and support animals in public policy	2023
Lanier	(Emotional support) peacocks on a plane: revising disability and aviation laws	2021
Mota-Rojas et al.	Controversial topics in animal welfare in Latin America	2023
Pallotta	Emotional support? Law, social control, and the human-animal bond	2025
Vallespin	The impact of transforming air transport for domestic animals	2024
Younggren et al.	Emotional support animal assessments: toward a standard model for mental health professionals	2020

Source: The authors.

The analysis of the studies presented in the table shows that the recent literature has been dedicated to investigating the phenomenon of emotional support animals from different perspectives, ranging from the psychological impacts of the human-animal relationship to the legal and regulatory challenges involved in the transport of these animals.

The contributions of these authors allow us to understand the complexity of the topic and provide a consistent theoretical basis for the discussion on the limits and possibilities of regulating the air transport of emotional support animals in the context of fundamental rights.

4 RESULTS AND DISCUSSIONS

The analysis of the selected studies allowed us to identify that the transport of emotional support animals represents an emerging field of legal debate, especially in the context of air transport regulation. The scientific literature analyzed shows that the growing appreciation of the bond between humans and companion animals has caused significant changes in social demands related to access to transportation services. In this scenario, the results of the literature review indicate that the presence of emotional support animals in aircraft is directly associated with the expansion of social recognition of their role in the psychological support of individuals facing mental health conditions.

Several studies point out that living with pets can have a positive impact on people's emotional health. Brooks et al. (2023) demonstrate that the presence of animals is associated with reduced levels of stress and anxiety, contributing to the improvement of the quality of life of tutors. The authors indicate that the human-animal relationship can function as an important emotional support mechanism, especially in contexts of psychological vulnerability. These results help explain why the demand for institutional recognition of emotional support animals has grown significantly in recent years.

In addition to the psychological dimension, the literature also highlights the need to establish clearer criteria for the recognition of these animals. Younggren et al. (2020) point out that the absence of standardized parameters for the evaluation and certification of emotional support animals has generated controversy in different institutional contexts. According to the authors, the lack of uniform procedures can make it difficult to distinguish between legitimate cases of emotional support and situations in which this classification is used inappropriately. This scenario contributes to the emergence of regulatory conflicts, especially in highly regulated sectors such as air transport.

The analysis of the studies also shows that the growth in demand for the transport of these animals has exposed relevant gaps in the regulation of the aviation sector. Doughty (2023) highlights that the significant increase in requests involving emotional support animals has led several regulatory authorities to reevaluate their air transport standards. The author notes that the absence of uniform criteria has caused legal uncertainty for both passengers and airlines, highlighting the need for the development of clearer and more consistent regulatory frameworks.

Another element identified in the literature refers to the difficulties faced by airlines in dealing with the increase in requests for transporting animals in the cabin. Lanier (2021) analyzes that the growth of this phenomenon has generated tensions between the right of access to transport and concerns related to the operational safety of aircraft. According to the author, companies in the airline industry began to face challenges related to the management of the internal space of aircraft, passenger safety, and the need to establish objective criteria to authorize or restrict the transport of these animals.

These results demonstrate that the legal debate on the transportation of emotional support animals involves multiple dimensions that go beyond the simple relationship between passenger and airline. The evidence identified in the literature indicates that the topic involves issues related to mental health, animal welfare, air transport regulation, and the protection of fundamental rights. In this sense, the analysis of academic contributions reveals that the absence of clear regulation can generate institutional conflicts and legal challenges that require balanced normative solutions.

The continuity of the literature analysis shows that the growth of social recognition of emotional support animals has produced direct impacts on contemporary regulatory debates. The expansion of this phenomenon began to challenge traditional legal models, especially in sectors in which institutional functioning depends on strict operational rules, as occurs in air transport. In this context, a significant part of recent scientific production has been dedicated to understanding the limits and implications of expanding the use of the category of emotional

support animal.

Cummings (2023) observes that the expansion of recognition of these animals occurred faster than the development of institutional mechanisms capable of adequately regulating their use. According to the author, the absence of clear procedures to prove the need for emotional support contributed to the increase in requests for transportation of these animals on commercial aircraft. This scenario has produced relevant debates about the legitimacy of certain demands and about the need to create more objective criteria for the evaluation of these requests.

In addition to regulatory issues, the literature also discusses the role of social transformations in expanding the presence of animals in different institutional spaces. Pallotta (2025) argues that the concept of the emotional support animal reflects cultural changes related to the way contemporary society understands the relationship between humans and animals. The author points out that the growing appreciation of companion animals has influenced legal and political debates, stimulating discussions about the institutional recognition of certain forms of human-animal bonding.

Another aspect identified in the studies refers to the institutional transformations that have been occurring in the air transport sector due to the growing concern with animal welfare. Vallespin (2024) points out that airlines and regulatory authorities have started to review their internal policies to deal with the increase in demand for the transport of companion animals. The author points out that this adaptation process involves operational and legal challenges, requiring the construction of regulatory models capable of balancing economic interests, operational safety, and social demands.

The literature also emphasizes the need to develop public policies capable of establishing clear criteria for the recognition of assistance and emotional support animals. Foltin et al. (2023) point out that the absence of uniform regulatory standards can generate practical difficulties for institutions responsible for providing services. The authors highlight that well-structured public policies can contribute to reducing institutional conflicts and increasing the predictability of administrative decisions related to the topic.

In the context of discussions on animal protection, Mota-Rojas et al. (2023) highlight that the growing appreciation of animal welfare has influenced the formulation of legal norms in different countries. The authors point out that the broadening of discussions on animal rights contributes to redefining the way legal systems treat companion animals, especially in contexts involving transportation, displacement, and the provision of services.

The literature also shows that the transportation of animals in aircraft can generate relevant legal implications related to the civil liability of airlines. Eulálio (2025) analyzes cases

involving damage or death of animals during air transport and observes that these conflicts have been increasingly judicialized. The author points out that the growing litigation involving the transportation of animals demonstrates the need to improve the regulatory and contractual rules that govern this type of service.

These results reinforce the idea that the transport of emotional support animals is a complex phenomenon that involves multiple legal, social and institutional dimensions. The literature analyzed indicates that the development of appropriate regulatory solutions requires the simultaneous recognition of the therapeutic benefits associated with emotional support animals and the operational requirements that characterize the air transport sector. In this context, the construction of balanced regulatory frameworks emerges as a fundamental element for the reduction of conflicts and for the protection of the fundamental rights involved in this issue.

The integrated analysis of the studies examined allows us to observe that the discussion about the transport of emotional support animals in air transport involves a complex interaction between legal, social and institutional factors. The results obtained in the literature review indicate that the expansion of this phenomenon is directly related to contemporary transformations in the way society understands the role of companion animals, especially in the context of mental health and emotional well-being.

In this sense, several authors point out that the relationship between humans and animals has acquired increasing social relevance, reflecting cultural and institutional changes that influence the formulation of public policies and legal norms. Pallotta (2025) argues that the social recognition of emotional support animals is associated with broader transformations in the understanding of the human-animal relationship, marked by the appreciation of well-being and the expansion of discussions on animal protection. This scenario contributes to new social demands being directed to regulatory systems, requiring institutional responses capable of dealing with this emerging reality.

At the same time, the literature also demonstrates that the expansion of the recognition of these animals must be accompanied by appropriate regulatory mechanisms. Younggren et al. (2020) highlight that the lack of uniform criteria for the evaluation and certification of emotional support animals can compromise the credibility of this therapeutic support instrument. According to the authors, the definition of clear professional parameters is essential to ensure that the recognition of these animals occurs in a responsible and evidence-based manner.

Another relevant element identified in the studies refers to the need to balance different legal interests involved in air transport. Doughty (2023) notes that the absence of uniform

regulation can generate conflicts between passengers seeking to transport emotional support animals and airlines responsible for the operational management of aircraft. The author points out that the safety of air transport and the organization of the service are essential factors that must be considered in the formulation of regulatory policies.

In addition, the literature shows that the growth of demands related to the transportation of animals has also caused institutional adaptations in the aviation sector. Vallespin (2024) notes that airlines and regulatory authorities have been pressured to review their operational policies to deal with the increased presence of animals on commercial flights. These changes reflect the need to develop regulatory models capable of reconciling operational safety, animal welfare and passenger rights.

The discussions analyzed also indicate that the expansion of the recognition of emotional support animals should consider the legal impacts arising from the transport of these animals. Eulálio (2025) highlights that conflicts involving damage or death of animals during air transport have generated increasing judicialization, highlighting the need to improve the rules that regulate this activity. This phenomenon reveals that the transport of animals in aircraft is not only an operational issue, but also a relevant topic for civil law, consumer law and animal law.

Thus, the results obtained in this research indicate that the transportation of emotional support animals represents a legal field in the process of consolidation. The literature analyzed demonstrates that the absence of clear and uniform regulation can generate institutional conflicts and legal uncertainty. On the other hand, the recognition of the therapeutic benefits associated with human-animal coexistence reinforces the importance of developing normative solutions capable of balancing the different interests involved, contributing to the construction of a fairer and more efficient regulatory system in the field of air transport.

The analysis of the literature used in this research allowed us to identify different theoretical and methodological approaches aimed at understanding the role of emotional support animals, as well as the legal and institutional challenges associated with their transport in aircraft.

The selected studies present relevant contributions ranging from aspects related to mental health and human well-being to discussions on air transport regulation, civil liability and public policies. The following table summarizes the main authors used in the development of the theoretical framework and the results of the research, highlighting the objectives of each study, the methods used and the main results presented.

Table 2*Synthesis of the studies used in the research*

Authors	Objective	Method	Main results
Brooks et al.	To investigate the impacts of the relationship between humans and pets on the psychological well-being of pet owners	Systematic review of the literature	It identified that living with animals can reduce stress, anxiety and social isolation
Cummings	Analyze regulatory challenges related to emotional support animal recognition	Legal analysis and literature review	It highlighted the need for clearer criteria for the recognition and certification of these animals
Doughty	Examine regulatory failures involving the transportation of emotional support animals in air transport	Normative analysis and legal study	Identified regulatory gaps that generate legal uncertainty for passengers and airlines
Eulalia	Assessing the civil liability of airlines in cases of animal death during transport	Jurisprudential and doctrinal analysis	Demonstrated the increase in litigation involving damage to animals transported in aircraft
Foltin et al.	Discuss the implementation of assistance and emotional support animals in public policies	Interdisciplinary literature review	He highlighted the need for clearer regulatory standards and institutional criteria
Lanier	Analyze legal conflicts between passenger rights and air transport rules	Legal analysis and case studies	He pointed out tensions between accessibility, operational safety and regulation of the airline sector
Mota-Rojas et al.	Investigate contemporary debates on animal welfare in Latin America	Interdisciplinary scientific review	It demonstrated the growth of discussions on animal protection and its influence on public policies
Pallotta	Examine the social and legal role of emotional support animals	Socio-legal analysis	It showed that the concept of emotional support animal reflects cultural and institutional transformations
Vallespin	Analyze the impacts of the air transport of companion animals on the policies of the airline industry	Analytical study and literature review	Identified operational and regulatory changes adopted by airlines
Younggren et al.	Propose professional criteria for evaluation of emotional support animals	Conceptual study and clinical analysis	It indicated the need for standardized protocols for the evaluation and certification of these animals

Source: The authors.

The synthesis presented in the table shows that the studies analyzed converge in the identification of regulatory challenges related to the recognition and transport of emotional support animals. At the same time, the results demonstrate that the scientific literature highlights the importance of balancing the therapeutic benefits associated with the human-animal relationship with the need to establish clear rules that ensure legal and operational certainty in air transport.

5 CONCLUSION

The present research aimed to analyze the legal challenges related to the regulation of the air transport of emotional support animals, considering the implications of this

phenomenon in the context of fundamental rights, civil aviation operational safety and animal welfare protection. From the review of recent scientific literature, it was possible to identify that the growing appreciation of the bond between humans and companion animals has produced new social demands that directly impact the way transport services are regulated and organized.

The results obtained show that the social recognition of emotional support animals is associated, above all, with the role that these animals play in the psychological support of individuals in situations of emotional vulnerability. The literature analyzed demonstrates that living with animals can contribute to the improvement of psychological well-being, strengthening the social perception that certain human-animal bonds have therapeutic relevance and deserve institutional recognition.

However, it was also possible to identify that the expansion of these demands has exposed relevant gaps in the regulatory systems that govern air transport. The absence of uniform normative criteria for the recognition and certification of emotional support animals has generated conflicts between passengers, airlines and regulatory authorities. This situation contributes to the formation of a scenario of legal uncertainty, in which administrative and judicial decisions come to depend on varying interpretations of the scope of the rights involved.

In addition, the results indicate that the transport of animals on aircraft involves multiple legal dimensions, including issues related to the safety of air transport, the civil liability of airlines and the protection of animal welfare. The interaction between these different elements highlights the need to build regulatory frameworks capable of balancing diverse interests, while ensuring the protection of passenger rights and the maintenance of aviation operational safety.

In this context, the research demonstrates that the development of clearer and more consistent rules for the transport of emotional support animals is an essential measure to reduce institutional conflicts and promote greater legal predictability. The definition of objective criteria for the recognition of these animals, combined with the elaboration of balanced regulatory policies, can contribute to the construction of a more efficient normative system that is compatible with contemporary social transformations.

It is concluded that the analyzed theme represents a legal field in the process of consolidation, in which there are still important regulatory gaps and interpretative challenges. The continuity of academic research on the subject can contribute to the improvement of legal discussions and to the development of normative solutions capable of harmonizing the fundamental rights of individuals with the operational requirements of air transport.

ACKNOWLEDGMENTS

The authors express their sincere gratitude to all those who, directly or indirectly, contributed to the realization of this study. They thank the teaching and research institutions that encourage scientific production and provide the necessary environment for the development of academic reflections aimed at building a more just and conscious society.

They also express recognition to the researchers whose work served as a basis for the elaboration of this research, contributing to the deepening of legal and social discussions related to the transport of emotional support animals and the protection of animal welfare.

In particular, the authors register their gratitude for the opportunity to dedicate this work to a theme that involves beings who, although they do not have a voice or direct means of expression, play a fundamental role in the lives and emotional balance of countless people. Talking about the protection and recognition of these animals represents not only an academic exercise, but also an ethical commitment to those who, even in silence, demonstrate their importance to society on a daily basis.

Leonardo Bezerra

ABSTRACT

Packaging regulation is at a historical turning point. In the European Union, Regulation (EU) 2025/40 – PPWR requires all packaging on the market to be economically recyclable by 2030, while harmonising design, labelling, prevention and substances of concern. In Brazil, Decree No. 12,688/2025 establishes the Reverse Logistics System for Plastic Packaging, with mandatory recovery targets (32% in 2026, scaling to 2040) and minimum post-consumer recycled (PCR) content thresholds, starting at 22% in 2026 for large companies. This paper provides a critical comparison of these frameworks and discusses technical-commercial implications for material selection, emphasising renewable, FSC chain-of-custody certified paperboard and corrugated board. We argue that cellulosic solutions, when designed for recycling (mono-material, contaminant-free and properly labelled), tend to reduce regulatory risk, compliance costs and reputational impacts while maintaining logistics performance. Decision-making should be guided by design-for-recycling criteria, auditable traceability and evidence (LCA), prioritising cellulose where technically feasible and, otherwise, polymers compatible with PCR targets and large-scale recycling.

Keywords: PPWR. Decree 12.688/2025. Sustainable Packaging. Paperboard. Corrugated Board. FSC. Reverse Logistics. Recycled Content.

RESUMO

A regulamentação de embalagens vive uma inflexão histórica. Na União Europeia, o Regulamento (UE) 2025/40 – PPWR torna obrigatória a reciclabilidade econômica de todas as embalagens até 2030, além de harmonizar requisitos de desenho, rotulagem, prevenção e substâncias de preocupação. No Brasil, o Decreto nº 12.688/2025 institui o Sistema de Logística Reversa de Embalagens de Plástico, com metas obrigatórias de recuperação (32% em 2026, com evolução até 2040) e percentuais mínimos de conteúdo reciclado pós-consumo (PCR), a partir de 22% em 2026 para grandes empresas. Este artigo compara

criticamente esses marcos e discute implicações técnico-comerciais na escolha de materiais, com ênfase em papéis de cartão e papelão ondulado de fonte renovável e cadeia de custódia certificada (FSC). Argumenta-se que soluções celulósicas, quando projetadas para reciclagem (mono-material, sem contaminantes e rotulagem adequada), tendem a reduzir riscos regulatórios, custos de conformidade e impactos reputacionais, preservando desempenho logístico. Conclui-se que a tomada de decisão deve ser orientada por critérios de projetar-para-reciclar, rastreabilidade auditável e evidências (ACV), privilegiando celulósicos onde tecnicamente viáveis e, nos demais casos, polímeros compatíveis com metas de PCR e reciclagem em escala.

Palavras-chave: PPWR. Decreto 12.688/2025. Embalagens Sustentáveis. Papelcartão. Papelão Ondulado. FSC. Logística Reversa. Conteúdo Reciclado.

RESUMEN

La normativa sobre envases está experimentando un punto de inflexión histórico. En la Unión Europea, el Reglamento (UE) 2025/40 – PPWR exige la reciclabilidad económica de todos los envases para 2030, además de armonizar los requisitos de diseño, etiquetado, prevención y sustancias preocupantes. En Brasil, el Decreto n.º 12.688/2025 establece el Sistema de Logística Inversa para Envases de Plástico, con objetivos de recuperación obligatorios (32 % en 2026, con evolución hasta 2040) y porcentajes mínimos de contenido reciclado posconsumo (PCR), a partir del 22 % en 2026 para las grandes empresas. Este artículo compara críticamente estos hitos y analiza las implicaciones técnicas y comerciales para la selección de materiales, con especial énfasis en el cartón y el cartón ondulado procedentes de fuentes renovables y con certificación de cadena de custodia (FSC). Se argumenta que las soluciones celulósicas, cuando se diseñan para el reciclaje (de un solo material, libres de contaminantes y con el etiquetado adecuado), tienden a reducir los riesgos regulatorios, los costos de cumplimiento y el impacto en la reputación, a la vez que preservan el rendimiento logístico. Se concluye que la toma de decisiones debe guiarse por criterios de diseño para el reciclaje, trazabilidad auditable y evidencia (ACV), priorizando los materiales celulósicos cuando sea técnicamente factible y, en otros casos, polímeros compatibles con el reciclaje de contenido reciclado (PCR) y los objetivos de reciclaje a gran escala.

1 INTRODUCTION

The transition from the former Directive 94/62/EC to Regulation (EU) 2025/40 (PPWR) establishes a uniform regime for the European market, with the goal of making all packaging recyclable in an economically viable way by 2030 and with general application from August 2026 (EUROPEAN UNION, 2025; EUROPEAN COMMISSION, 2025). In Brazil, Decree No. 12,688/2025 inaugurates a specific framework for plastic packaging, with recovery and recycled content goals in the short term (BRASIL, 2025).

2 COMPARATIVE NORMATIVE FRAMEWORK

2.1 EUROPEAN UNION (PPWR)

The PPWR entered into force on 02/11/2025 and applies generally as of 08/12/2026. Pillars include: recyclability by design by 2030, prevention targets, harmonized labeling, and limits on substances of concern, such as restrictions on PFAS on food packaging (EUROPEAN UNION, 2025; PACKAGINGLAW.COM, 2025).

2.2 BRAZIL (DECREE NO. 12,688/2025)

The decree institutes the Reverse Logistics System for Plastic Packaging, prioritizes cooperatives and defines mandatory recovery and post-consumer recycled content (PCR) targets, starting at 22% in 2026 for large companies, with an expected evolution until 2040 (BRASIL, 2025; MARTINELLI ADVOGADOS, 2025). Also in 2026, SINIR+ opened related technical public consultations (SINIR+, 2026).

2.3 CONVERGENCES

Both regimes require design for recycling, document traceability, and integration with the collection and sorting infrastructure. The EU is moving towards recyclability performance grids and possible eco-modulation of rates, while Brazil imposes annual compliance with targets and proof via management entities (EUROPEAN COMMISSION, 2025; BRAZIL, 2025).

3 CELLULOSIC MATERIALS IN THE COMPLIANCE STRATEGY

3.1 RECYCLABILITY AND CIRCULARITY

Paperboard and corrugated cardboard, when specified as mono-material and without contaminants, are widely compatible with existing recycling streams, favoring compliance with the economic recyclability provided for in the PPWR (EUROPEAN COMMISSION,

2025). Manufacturers report additional benefits in mass optimization, logistical damage reduction, and renewable source communication (STORA ENSO, 2026).

3.2 FSC CHAIN OF CUSTODY

FSC certification (chain of custody) enables auditable traceability of the fiber from forest management to the final product, allowing robust claims on responsible origin and use of brands, which reduces greenwashing risks and meets due diligence expectations (FSC, 2026).

3.3 DESIGN BOUNDARIES AND CAUTIONS

Non-repulpable laminates, inks and incompatible adhesives can compromise the recyclability of the paper. The PPWR provides design criteria for recycling and performance grades that can penalize solutions with low recoverability (ERP GLOBAL, 2025).

4 CRITICAL COMPARISON: WHY CORRUGATED CARDBOARD REDUCES REGULATORY RISKS

- Adherence to 2030 (EU) recyclability: compatibility with existing streams, helping to meet recyclability criteria (EUROPEAN COMMISSION, 2025).
- Traceability from renewable sources: chain of custody (FSC) certifications provide documentary backing for responsible procurement (FSC, 2026).
- Substitution of problematic plastics: when technically feasible, cellulose-based materials avoid PCR targets applicable to plastics in Brazil and simplify evidence (BRASIL, 2025).
- Compliance and reputation costs: materials with high recyclability tend to reduce fees and image risks in EPR and regulatory harmonization regimes (EUROPEAN COMMISSION, 2025).

5 BUSINESS AND ENGINEERING IMPLICATIONS

- Specification governance: positive lists of inputs compatible with paper recycling and internal DfR criteria aligned with PPWR (ERP GLOBAL, 2025).
- Certified supply chain: require FSC CoC from converters, with records of claims and audits (FSC, 2026).
- LCA and data: LCA-supported decisions and primary supplier data on mass, avoided damage, and logistics (STORA ENSO, 2026).
- Integration with LR (Brazil): for lines that maintain polymers, plan PCR and proofs for targets in 2026 and beyond (BRASIL, 2025).

6 FINAL CONSIDERATIONS

The convergence between PPWR and Brazilian Decree No. 12,688/2025 reinforces the centrality of verifiable circularity as a criterion for competitiveness. In scenarios where function allows, paperboard and corrugated paper designed for recycling and with certified chain of custody tend to offer the most robust combination of regulatory compliance, performance and ESG storytelling; when not, polymeric solutions compatible with PCR and recycling at scale should be prioritized.

ABSTRACT

This article examines the theoretical contributions that connect migration, border, culture, regional development and public policy, with emphasis on the territorial dynamics produced in border regions. The study adopts a qualitative bibliographic approach based on the analytical reading of classic and contemporary works in sociology, geography, political science and development studies. The central argument is that migratory flows cannot be understood in isolation, since they are linked to the social production of territory, the negotiation of identities, the circulation of cultural practices and the institutional strategies of regulation and planning. By reviewing authors such as Sayad, Castles and Miller, Portes, Raffestin, Foucher, Grimson, Haesbaert, Boisier, Sen, Perroux and Furtado, the text shows that the border goes beyond a geopolitical limit and becomes a relational space marked by mobility, cooperation, conflict and the recomposition of belonging. The discussion also highlights that regional development, when approached from a territorial perspective, requires public policies that are sensitive to the sociocultural specificities of border spaces. It concludes that an interdisciplinary approach broadens the analytical capacity of migration studies and provides stronger foundations for understanding inequality, interdependence and development possibilities in border contexts.

Keywords: Migration. Border. Territoriality. Regional Development. Public Policy.

RESUMO

Este artigo analisa as contribuições teóricas que articulam migração, fronteira, cultura, desenvolvimento regional e políticas públicas, com ênfase nas dinâmicas territoriais produzidas em regiões fronteiriças. A pesquisa é de natureza qualitativa e bibliográfica, baseada na leitura analítica de obras clássicas e contemporâneas da sociologia, da geografia, da ciência política e dos estudos do desenvolvimento. O argumento central sustenta que os fluxos migratórios não podem ser compreendidos de forma isolada, porque se vinculam à produção social do território, à negociação de identidades, à circulação de

práticas culturais e às estratégias institucionais de regulação e planejamento. Ao revisar autores como Sayad, Castles e Miller, Portes, Raffestin, Foucher, Grimson, Haesbaert, Boisier, Sen, Perroux e Furtado, o texto demonstra que a fronteira ultrapassa a condição de limite geopolítico e se afirma como espaço relacional, marcado por mobilidade, cooperação, conflito e recomposição de pertencimentos. A discussão também evidencia que o desenvolvimento regional, quando pensado a partir do território, requer políticas públicas sensíveis às especificidades socioculturais dos espaços de fronteira. Conclui-se que a abordagem interdisciplinar amplia a capacidade analítica do estudo da migração e oferece bases mais consistentes para a compreensão das desigualdades, das interdependências e das possibilidades de desenvolvimento em contextos fronteiriços.

RESUMEN

Este artículo analiza las contribuciones teóricas que articulan migración, fronteras, cultura, desarrollo regional y políticas públicas, con énfasis en las dinámicas territoriales que se producen en las regiones fronterizas. La investigación es de naturaleza cualitativa y bibliográfica, basada en una lectura analítica de obras clásicas y contemporáneas de sociología, geografía, ciencia política y estudios del desarrollo. El argumento central sostiene que los flujos migratorios no pueden entenderse de forma aislada, ya que están vinculados a la producción social del territorio, la negociación de identidades, la circulación de prácticas culturales y las estrategias institucionales de regulación y planificación. Mediante la revisión de autores como Sayad, Castles y Miller, Portes, Raffestin, Foucher, Grimson, Haesbaert, Boisier, Sen, Perroux y Furtado, el texto demuestra que la frontera trasciende la condición de límite geopolítico y se afirma como un espacio relacional, marcado por la movilidad, la cooperación, el conflicto y la recomposición de la pertenencia. El análisis también subraya que el desarrollo regional, concebido desde la perspectiva del territorio, requiere políticas públicas sensibles a las especificidades socioculturales de las zonas fronterizas. Se concluye que el enfoque interdisciplinario amplía la capacidad analítica de los estudios sobre migración y ofrece una base más sólida para comprender las desigualdades, las interdependencias y las posibilidades de desarrollo en contextos fronterizos.

Palabras clave: Migración. Frontera. Territorialidad. Desarrollo Regional. Políticas Públicas.

1 INTRODUCTION

Migratory processes occupy a central place in contemporary social sciences, especially when examined in territories crossed by intense circulation of people, goods, norms and symbols. In border regions, migration cannot be reduced to the simple displacement of individuals between different political units. It involves labor relations, family networks, disputes for recognition, cultural negotiations, and state control mechanisms that, together, reconfigure the social space.

The analytical relevance of borders stems from the fact that these territories condense different scales of interaction. In them, macroeconomic and national political decisions coexist with daily practices of mobility, commerce, kinship, and belonging. For this reason, the study of migration in border contexts requires an interdisciplinary approach, capable of articulating contributions from sociology, geography, anthropology, regional economics and political science.

From this perspective, migration is understood as a complex historical and social phenomenon. It is not just an individual response to economic incentives, but a process shaped by structural inequalities, collective trajectories, social networks, and institutions. At the same time, the border is no longer seen only as a line of separation between States and is now understood as a relational space, in which territorialities, identities and development strategies are produced.

The objective of this article is to analyze, in a bibliographic key, the theoretical contributions that articulate migration, border, culture, regional development and public policies. It seeks to demonstrate that the understanding of border dynamics depends on the integrated reading of these fields, as migratory flows alter the organization of the territory, tension identity categories and demand specific institutional responses. As a research problem, it is asked how social relations in border regions develop when human mobility, territoriality, regional development and public action are simultaneously considered.

In addition to this introduction, the text presents the methodology used, discusses the main theoretical contributions on migration, border, culture and regional development, examines the implications of these perspectives for public policies and, finally, synthesizes the analytical contributions of the study. The review was restructured to reduce conceptual repetition, strengthen argumentative cohesion, and adapt the writing to the academic standard expected in scientific journals.

2 METHODOLOGY

The research is characterized as qualitative, bibliographic in nature and with analytical-interpretative purpose. The corpus was composed of books and reference articles in the fields of migration studies, political geography, culture, regional development and public policies. Priority was given to classic and contemporary works that offer consolidated categories to interpret human mobility, borders, territoriality, cultural identities and territorial planning.

The literature review was organized into three complementary procedures. The first consisted of the selection of authors with recognized theoretical relevance to the theme, such as Sayad, Castles and Miller, Portes, Raffestin, Foucher, Grimson, Haesbaert, Boisier, Sen, Perroux and Furtado. The second involved the analytical reading of the works, with the identification of central concepts, convergences, tensions and possibilities of interdisciplinary articulation. The third corresponded to interpretative systematization, focusing on the construction of an analytical axis capable of relating migration, border, culture, regional development and public policies.

From the methodological point of view, the review did not seek to exhaust all the available production on the subject, but to select consistent contributions to the construction of an integrated theoretical framework. The inclusion criterion favored texts that explain migratory processes beyond economism, define the border as a social and political category, problematize culture in contexts of mobility and treat regional development as a territorially situated process.

The analysis of the material was based on comparative and interpretative reading. Instead of presenting authors in isolation, we sought to highlight how their formulations complement or oppose each other. This procedure allows us to understand that migration in border regions should be read as a multidimensional phenomenon, whose explanation requires dialogue between economic structures, sociocultural practices, social networks and forms of state regulation.

3 MIGRATION, BORDER AND CULTURE: THEORETICAL BASES OF ANALYSIS

In the field of migration studies, Abdelmalek Sayad occupies a central position by demonstrating that migration cannot be reduced to statistics of entry and exit or to strictly individual choices. For the author, it is a total social fact, that is, a process that simultaneously mobilizes economic, political, legal, symbolic and affective dimensions. Its formulation shifts the analysis of the migrant as a labor force to the social condition produced by emigration and immigration. By insisting that all immigration refers to emigration, Sayad shows that the

phenomenon must be understood from the historical relations between the society of origin and the society of destination.

This reading broadens the understanding of the effects of migration on forms of belonging. The migrant does not completely abandon the social universe of origin nor does he integrate fully and immediately into the new space. On the contrary, their experience is marked by ambivalence, disengagement, and continuous negotiation. In analytical terms, this perspective is decisive for border contexts, in which the daily circulation between territories tends to intensify multiple bonds, overlapping loyalties, and complex forms of social insertion.

Stephen Castles and Mark J. Miller contribute to this discussion by situating migrations on the scale of globalization. In his approach, the contemporary intensification of displacements stems from economic, political, and technological transformations that increase the interdependence between regions. The authors demonstrate that migratory flows have diversified, feminized, politicized and come to involve countries of origin, transit and destination simultaneously. Such a perspective allows us to understand that migration is constitutive of the global order, and not an exceptional or residual phenomenon.

Alejandro Portes' contribution complements this picture by highlighting the role of migratory networks. By emphasizing family, community, and economic ties that connect migrants, former migrants, and non-migrants, the author shows how mobility tends to acquire social continuity. Networks reduce costs, share information, enable occupational insertion and create solidarity mechanisms. In border spaces, this logic is particularly relevant, as territorial proximity favors lasting relationships, commercial circuits, and circulation strategies that do not end with the formal passage through a checkpoint.

An important consequence of this approach is the overcoming of readings that rigidly separate economic causes and cultural effects of migration. When displacement is seen only as a rational decision oriented by income, there is a tendency to make invisible the way in which the labor market itself is structured by state policies, ethnic hierarchies, community networks and social representations of the foreigner. The literature reviewed suggests, on the contrary, that the economic insertion of the migrant is already mediated by cultural and territorial markers.

Also for this reason, the border should not be treated only as an object of geopolitics, but as a category of experience. The crossing can take on very different meanings depending on the mobility regime, the subject's social profile, the available documentation, the language, the gender, the occupational position and the density of social networks on both sides of the state boundary. In many situations, the social distance between groups that share the same

border territory is greater than the physical distance that separates them. This observation helps to understand why cooperation and conflict coexist in the same spaces.

In border territories, everyday life tends to produce specific forms of social pragmatism. Families distribute their members among different cities, workers build commuting routines, merchants organize informal and formal supply circuits, students cross the international line to access services and opportunities. These movements do not nullify the presence of the state, but show that social life often operates through arrangements that combine legality, custom, and practical adaptation to the conditions of the territory.

From a cultural point of view, the border offers particularly favorable conditions for the observation of situational identities. Subjects can activate national, local, ethnic, linguistic or religious belongings according to the circumstance. This plasticity does not mean the absence of identity, but the permanent reorganization of repertoires. Hall helps to understand this process by rejecting the idea of cultural essence, while Canclini demonstrates that social practices in contact contexts produce combinations that cannot be described in terms of purity or simple assimilation.

If migration needs to be understood as an expanded social process, the same is true for the border. Claude Raffestin proposes a relational reading of territory, understood as the result of mediations and power relations. In this key, the border is not a simple natural datum or neutral cartographic layout; it expresses political operations of delimitation, control and organization of space. Michel Foucher, in turn, deepens the geopolitical dimension of state borders by emphasizing their strategic function in the affirmation of sovereignty, in the production of national identities and in the management of differences.

The articulation between Raffestin and Foucher allows us to distinguish two complementary movements. On the one hand, the border is a political institution, associated with state authority, legal regulation, and territorial surveillance. On the other hand, it is socially constructed and continuously reinterpreted by the subjects who cross it. For this reason, border regions cannot be defined only by state norms; It is necessary to observe the practices that are developed in them, the circuits of circulation and the social uses of space.

Alejandro Grimson reinforces this inflection by treating the border as a complex social and cultural space. His approach is particularly relevant to Latin America, where international lines coexist with historical neighborhood relations, economic exchange, bilingualism, kinship, and daily circulation. The border, in this sense, does not only separate; it also connects, mixes, and produces contact situations in which identities are negotiated. The author draws attention to the fact that the border experience combines asymmetries of power with dense forms of interaction.

This perspective converges with Rogério Haesbaert's notion of multiterritoriality. Instead of supposing that mobility dissolves territorial bonds, the author shows that subjects and groups can maintain simultaneous insertions in different scales and spaces. The migrant can work on one side of the border, reside on another, preserve family ties in a third place, and participate in transnational symbolic circuits. Territoriality thus becomes plural and procedural. This category is especially fruitful for interpreting regions in which social life is organized by multiple belongings and recurrent mobility.

On the cultural level, Stuart Hall contributes by understanding identities as historical, relational and discursive constructions, and not as fixed essences. Migration, in this context, does not cause a mere loss of identity, but processes of repositioning and reinterpreting belongings. Néstor García Canclini expands this discussion with the notion of cultural hybridization, which allows us to understand how practices, codes, and references recombine in situations of unequal contact. In border regions, the coexistence of different national norms, languages, markets and traditions produces hybrid repertoires and specific forms of sociability.

The notion of diaspora, systematized by William Safran, also illuminates the relationship between migration and culture by highlighting the permanence of symbolic links with the land of origin, even after spatial dispersion. Although later literature expanded and criticized its model, the category remains useful for thinking about collective memories, transnational networks, and identities sustained by origin narratives. In summary, cultural and migratory studies converge by showing that mobility and border do not eliminate belonging; they reorganize it on multiple bases, often tense, but socially productive.

This debate is close to Homi Bhabha's formulations about the in-betweens of culture. Although his work is not specifically dedicated to international borders, it contributes to thinking about spaces of enunciation in which difference is produced by translation, negotiation and ambivalence. In migratory contexts, such a contribution allows us to understand that culture does not remain intact, but neither does it disappear. It is re-inscribed in new relations of power and communication.

For this reason, the category of territoriality cannot be dissociated from symbolic processes. The territory is appropriated materially, but also narrated, remembered and represented. Migrants construct affective maps of space, define places of safety and risk, attribute meanings to institutions and create circuits of sociability. In border regions, these maps tend to cross formal national boundaries, composing a vivid geography that often does not coincide with state cartography.

Another relevant point is that cross-border circulation can intensify both integration and stigmatization. If, on the one hand, spatial proximity favors economic exchanges, kinship and cultural familiarity, on the other hand, it can produce discourses that associate certain groups with illegality, unfair competition or threat to public order. The literature on migration shows that control policies often operate by selective classifications, differentiating legitimate and illegitimate mobilities according to economic, racial and national criteria.

In summary, the theoretical basis discussed in this section allows us to understand that migration, border and culture form an inseparable analytical triangle. Mobility transforms the territory; the territory conditions the experience of mobility; and culture mediates the meanings attributed to this process. Any analysis that intends to interpret border regions rigorously must therefore simultaneously consider these three dimensions.

4 REGIONAL DEVELOPMENT AND PUBLIC POLICIES IN BORDER CONTEXTS

In the field of regional development, classical approaches show that the economic space is marked by persistent inequalities. François Perroux, when formulating the theory of growth poles, demonstrates that economic expansion tends to be concentrated in activities and places capable of radiating effects on other productive units. Celso Furtado, in turn, shows that development is not to be confused with simple growth of the product, as it depends on structural transformations and the overcoming of historical patterns of dependence and underdevelopment. These contributions remain relevant for the analysis of border regions, in which investments, infrastructure, and trade flows tend to produce uneven effects between neighboring locations.

Contemporary formulations expand this discussion by incorporating territorial, institutional and social dimensions. Sergio Boisier understands territorial development as a process built by the capacity for coordination between actors, by the mobilization of endogenous resources and by the formation of synergistic capital. From this perspective, the territory is not a mere physical support of the economy, but a space for collective action. Michael Storper and Georges Benko, in different ways, reinforce the idea that regional dynamics depend on articulations between the productive base, institutions, networks and knowledge.

Amartya Sen's approach adds a substantive criterion to the debate by defining development as the expansion of freedoms. Centrality no longer falls exclusively on economic indicators and starts to include effective capacities for social participation, access to rights, education, health, security, and mobility. Applied to border regions, this reading suggests that development should be evaluated based on the concrete opportunities available to

populations that live with intense circulation, institutional asymmetries and frequent precariousness in the provision of public services.

When articulated with migration studies, these perspectives show that migration is not only a consequence of uneven development, but also an element that reconfigures regional economies. Migrants expand markets, produce trade networks, introduce cultural repertoires, redistribute labor force and change patterns of consumption and occupation of the territory. At the same time, they may face document barriers, discrimination, labor segmentation, and unequal access to social policies. For this reason, the relationship between migration and regional development is ambivalent: it contains dynamic potential, but it also reveals and reproduces inequalities.

Celso Furtado's reading is particularly useful to avoid linear interpretations of development. By drawing attention to historical structures of dependence, productive heterogeneity and concentration of income, the author shows that the territory does not respond homogeneously to economic stimuli. In border areas, this warning is fundamental, because proximity to another country does not guarantee, by itself, virtuous integration or equitable distribution of the benefits generated by circulation.

Similarly, the idea of the growth pole in Perroux needs to be read critically when applied to frontier contexts. Certain cities can concentrate services, credit, logistics infrastructure and business opportunities, radiating dynamism to their surroundings. However, polarization can also deepen dependencies and empty neighboring localities. Regional development, in this context, requires coordination mechanisms capable of distributing capacities and preventing spatial asymmetries from becoming lasting exclusion.

Boisier adds to this debate a decisive emphasis on territorial governance. Development is no longer conceived as an automatic effect of the market or exogenous investment and starts to depend on the articulation between public, private and collective actors. In border regions, this means recognizing that municipalities, national bodies, community entities and even institutions from the neighboring country can participate, formally or informally, in the management of common problems. Cooperation, in this case, is not only desirable; it is usually a condition of effectiveness.

Sen's approach to capabilities further broadens the normative horizon of the analysis. By shifting attention to what people are actually capable of doing and being, the author offers a valuable criterion for evaluating policies in border territories. It is not enough to register growth in trade or increase in the flow of goods; It is necessary to verify whether the local population has real means to access education, health, income, legal protection and social participation in dignified conditions.

Public policies assume, in this scenario, a decisive role. In border regions, state planning needs to consider that the population served does not always coincide with the formal limits of national citizenship. Health, education, assistance, security, document regularization, urban mobility and economic inspection services are strained by continuous cross-border flows. Public management thus faces the challenge of reconciling sovereignty, rights, inter-institutional cooperation and local specificities.

This finding requires abandoning policies formulated from homogeneous models of territory. Borders are spaces in which social life often goes beyond the traditional administrative cut. The presence of transnational families, commuting workers, circulating students, and informal commercial networks demands flexible instruments, coordination between scales of government, and cooperation mechanisms with entities located on the other side of the international line. Without this recognition, state action tends to produce gaps in care and low effectiveness.

In addition, public policies aimed at regional development need to incorporate the cultural dimension of the border. Actions that ignore linguistic repertoires, local forms of sociability, historically consolidated economic practices, and specific migratory experiences tend to fail to implement. The recognition of cultural diversity is not ancillary; it conditions the ability to formulate legitimate policies, adhering to the territory and guided by social inclusion.

In analytical terms, the border can be understood as a privileged laboratory for observing the relationship between State, territory and mobility. In these contexts, the formulation of public policies clearly reveals the tensions between control and shelter, social protection and surveillance, economic development and the reproduction of inequalities. Therefore, the reviewed literature suggests that planning in border regions should combine fine territorial reading, attention to migratory social networks, and commitment to rights.

In many border areas, the provision of public services is crossed by administrative ambiguities. People living in constant circulation may depend on equipment located in another jurisdiction, while local governments face difficulties in planning policies based on fluctuating populations. This affects the production of statistics, the financing of policies, and the definition of institutional responsibilities. The reviewed literature suggests that such problems are not marginal, but structural for territorial management.

Migration policies, social policies and regional development policies should not, therefore, be formulated in isolation. Document regularization influences access to work and social protection; the design of the infrastructure affects commercial circuits and everyday mobility; cultural and educational programs can favor integration and reduce conflicts; Intergovernmental cooperation mechanisms expand the capacity to respond to shared

demands. In frontier contexts, institutional fragmentation tends to generate inefficiency and deepen vulnerabilities.

There is also a symbolic dimension of public policy that deserves attention. By naming certain groups as a problem, risk or threat, the State produces classification effects that impact social trajectories and belongings. On the other hand, policies that recognize cultural plurality and the legitimacy of mobilities can favor inclusion, institutional trust and civic participation. The quality of public action depends, therefore, not only on material resources, but also on the categories through which the territory and its population are understood.

In a propositional key, the literature examined points to the need for territorialized policies. This means formulating actions based on localized diagnoses, attentive to the concrete flows of people, to the effective economic circuits and to the cultural forms that organize daily life. The frontier demands situated planning, capable of combining multi-scale coordination, production of qualified information, institutional strengthening and social participation. Without this, public intervention runs the risk of reproducing abstractions that have little dialogue with lived reality.

5 ANALYTICAL ARTICULATION OF REFERENCES

The integrated reading of the authors examined allows us to sustain four central propositions. The first is that migration must be treated as a structural and relational process. Sayad, Castles, and Miller and Portes show, through different paths, that population displacements result from inequalities, state policies, social networks, and global transformations. This combination prevents simplified explanations and reaffirms the need for interdisciplinary approaches.

The second proposition is that the border does not operate only as a geopolitical limit. Raffestin, Foucher, Grimson and Haesbaert show that the border space condenses power, circulation, territorialization and multiple belongings. In this sense, the border is not a neutral scenario for migration; it actively participates in the production of the social, economic and cultural dynamics it intends to regulate.

The third proposition is that culture cannot be treated as a residual variable. Hall, Canclini and Safran allow us to understand that mobility and territorial contact produce procedural identities, hybrid forms of belonging and lasting transnational bonds. In border regions, culture organizes daily practices, mediates conflicts, guides economic strategies and influences the institutional reception of migrant groups.

The fourth proposition is that regional development, when thought of in a territorial key, depends on the articulation between economy, institutions, rights and recognition of

sociocultural diversity. Perroux, Furtado, Boisier and Sen converge in the criticism of the reduction of development to economic growth and reinforce that the territory must be considered in its materiality, in its institutional density and in its capacity to produce inclusion.

These four propositions, when put together, offer a robust theoretical basis for empirical studies on border regions. They allow us to examine both the economic and social insertion of migrant groups and the ways in which public policies can respond to contexts of intense mobility. More than listing authors, the review demonstrates that the articulation between migration, border, culture, and regional development produces a coherent interpretative field to analyze territories marked by interdependence, inequality, and social innovation.

The articulation proposed in this article also helps to reposition the very notion of region. Far from designating only a delimited portion of space, the region appears as the result of interactions, flows and institutions. In frontier areas, this definition becomes even more evident, as regional life is often organized by cross-cutting connections that cross the international line and defy rigid administrative classifications.

Another analytical gain is to recognize that mobility does not necessarily represent territorial disorganization. Although public discourses often associate circulation with lack of control, the literature shows that migrants build relatively stable patterns of displacement, work, residence, and sociability. Migratory networks and multiple territorialities produce their own forms of ordering, although not always recognized by the state apparatus. The problem, in this case, is not the absence of order, but the coexistence of distinct orders.

This observation is important for future empirical research because it guides the choice of indicators and categories of analysis. Instead of measuring only formal inputs and outputs or aggregate volumes of trade, it is necessary to observe daily practices of circulation, differential access to rights, density of social networks, cultural repertoires in interaction, and local institutional capacity. Theory, in this sense, does not only work as an interpretative framework, but as a tool to define what should be observed in the territory.

Finally, the integration between the references examined allows us to overcome frequent dichotomies in the public debate: legal/illegal, national/foreign, center/periphery, tradition/modernity, growth/development. Such oppositions, when taken rigidly, obscure the complexity of border experiences. The literature reviewed here indicates that the relevant social phenomena occur precisely in the zones of contact, mediation, and overlap. It is in this analytical space that the frontier reveals its greatest explanatory power.

Although the bibliographic focus of this article is predominantly theoretical, it has direct implications for the reading of concrete situations in twin cities, migratory corridors and areas

of cross-border integration. In such contexts, the territory usually operates simultaneously as a space of opportunity and restriction. The proximity between markets, services and family networks can facilitate social reproduction; However, the difference between legislation, state capacities and citizenship regimes also creates areas of uncertainty. The theory helps to interpret this ambivalence without reducing it to an anomaly.

In many cases, the border experience produces a temporality of its own. Daily life is organized by customs opening hours, exchange rate variations, different school calendars, asymmetric health policies, and frequent changes in the intensity of inspection. These elements interfere in the economic and family life of the local populations. The border, therefore, does not act only on space; it regulates social times, rhythms of circulation and expectations of permanence or return.

This temporal dimension reinforces the importance of social networks. In scenarios of regulatory instability, they are often the ones who guarantee reliable information, logistical support, and adaptation mechanisms. The analytical value of the concept of migratory network lies precisely in showing that individual action is mediated by relational structures. The decision to migrate, stay, circulate, or return does not stem solely from economic calculation, but from shared expectations, reciprocal obligations, and collectively constructed repertoires of trust.

The urban dimension of the border regions is also noteworthy. Many migratory dynamics materialize in specific neighborhoods, commercial centers, popular markets, religious spaces, associations and public facilities. The border territory is not just an abstract extension; It is expressed in concrete urban forms, often marked by segregation, centralization of services and differentiated appropriations of space. The territorial reading of regional development needs to incorporate these intra-urban cuts, as it is in them that inequalities and institutional capacities become visible.

From a cultural point of view, border circulation can favor bilingualism, hybrid food repertoires, shared festivals, juxtaposed religious calendars, and new forms of symbolic consumption. Such processes do not cancel conflicts; on the contrary, they often coexist with moral disputes, prejudices and national or ethnic hierarchies. Culture, therefore, should be understood less as a static stock of traditions and more as a field for negotiation, classification and production of social legitimacy.

The literature on regional development also suggests that territorial competitiveness cannot be analyzed without considering social cohesion and institutional density. Territories that have cooperative networks, administrative capacity, information production and coordination mechanisms tend to respond better to external shocks and turn circulation into

opportunity. In border areas, this observation is even more relevant, because exchange rate volatility, regulatory changes, and political crises can rapidly alter mobility and trade patterns.

When the relationship between migration and public policies is observed from this perspective, it becomes evident that the challenge is not only to expand the supply of services, but to design institutional arrangements compatible with populations on the move. Registration, financing, planning, and evaluation are often based on stable residents and clearly defined jurisdictions. However, the border produces situations in which the daily use of services goes beyond these categories. Territorial governance therefore needs to develop instruments that are more sensitive to circulation and interdependence.

Ultimately, the contribution of this review lies in demonstrating that the analysis of border regions gains density when migration, culture, territory, development and public policies are treated as mutually constitutive dimensions. This formulation does not eliminate the need for specific empirical approaches, but it offers criteria for constructing them in a more rigorous way. By shifting the debate from partial explanations to an integrated framework, the article seeks to strengthen the conceptual basis of future research and expand the dialogue between different fields of knowledge.

6 FINAL CONSIDERATIONS

The literature review shows that migratory processes, when observed in border regions, require reading that goes beyond sectoral or monocausal approaches. Migration proved to be inseparable from power relations, social networks, identity negotiations, production of territory and state action. Thus, human mobility cannot be treated only as physical displacement or the border as a simple line of separation between sovereignties.

The analysis also showed that the border is a relational space, in which control, circulation, cooperation and conflict coexist. In these territories, identities are continuously redefined, territorialities become multiple, and regional development depends on institutional capacities capable of recognizing the complexity of local social life. The literature examined thus reinforces that the border territory is not an analytical periphery, but a privileged place to understand contemporary transformations.

In terms of regional development, it was found that approaches focused only on economic growth are insufficient to interpret contexts marked by institutional asymmetries and intense population mobility. Development, understood as structural transformation, territorial coordination and expansion of freedoms, requires public policies that are sensitive to the concrete social circuits of the border. This includes attention to rights, access to services, cooperation across government scales, and recognition of cultural diversity.

It is concluded, therefore, that the articulation between migration, border, culture, regional development and public policies constitutes a consistent theoretical axis for the analysis of border regions. By reducing conceptual repetitions and reorganizing the argument, this version of the text reinforces the study's contribution to the interdisciplinary debate and offers a more cohesive basis for future empirical investigations on migrant territorialities, governance, and development in border spaces.

ABSTRACT

The study analyzed the perceptions of assistants and monitors regarding the usability of digital technologies applied to the monitoring of public contract management within the Ministry of Development and Social Assistance, Family and Fight Against Hunger (MDS) and the Department of Support and Shelter Entities Working with Alcohol and Drugs (DEPAD). The research employed statistical textual analysis using the IRaMuTeQ software, processing a corpus composed of 46 respondents and 148 context units, totaling 5,000 lexical occurrences. The results confirmed that the simplicity and clarity of KoboToolbox fostered positive usability perceptions, whereas technical failures of uMov.me generated dissatisfaction and compromised effectiveness. Furthermore, the analysis revealed differences between profiles: assistants prioritized subjective evaluations, while monitors emphasized technical and institutional aspects, validating the four proposed hypotheses. It is concluded that technological adoption in public contract monitoring depends on the interaction between design factors, technical performance, and functional profile, requiring differentiated training and investments in platform stability.

Keywords: Usability. Public Contracts. Technological Monitoring. Textual Analysis. Technology Acceptance.

RESUMO

O estudo analisou as percepções de assistentes e monitores acerca da usabilidade de tecnologias digitais aplicadas ao monitoramento de gestão de contratos públicos no âmbito do Ministério do Desenvolvimento e Assistência Social, Família e Combate à Fome (MDS) e do Departamento de Entidades de Apoio e Acolhimento Atuantes em Álcool e Drogas (DEPAD). A pesquisa utilizou análise textual estatística com o software IRaMuTeQ, processando um corpus composto por 46 respondentes e 148 unidades de contexto, totalizando 5.000 ocorrências lexicais. Os resultados confirmaram que a simplicidade e a clareza do KoboToolbox favoreceram percepções positivas de usabilidade, enquanto falhas técnicas do uMov.me geraram insatisfação e comprometimento da efetividade. Além disso, a análise revelou diferenças entre perfis: assistentes priorizaram avaliações subjetivas e

monitores enfatizaram aspectos técnicos e institucionais, validando as quatro hipóteses formuladas. Conclui-se que a adoção tecnológica no monitoramento de contratos públicos depende da interação entre fatores de design, desempenho técnico e perfil funcional, exigindo capacitação diferenciada e investimentos em estabilidade das plataformas.

RESUMEN

El estudio analizó las percepciones de asistentes y monitores acerca de la usabilidad de tecnologías digitales aplicadas al monitoreo de la gestión de contratos públicos en el ámbito del Ministerio de Desarrollo y Asistencia Social, Familia y Combate al Hambre (MDS) y del Departamento de Entidades de Apoyo y Acogida Actuales en Alcohol y Drogas (DEPAD). La investigación utilizó análisis textual estadístico con el software IRaMuTeQ, procesando un corpus compuesto por 46 participantes y 148 unidades de contexto, totalizando 5.000 ocurrencias léxicas. Los resultados confirmaron que la simplicidad y la claridad de KoboToolbox favorecieron percepciones positivas de usabilidad, mientras que fallas técnicas de uMov.me generaron insatisfacción y comprometieron la efectividad. Además, el análisis reveló diferencias entre perfiles: los asistentes priorizaron evaluaciones subjetivas y los monitores enfatizaron aspectos técnicos e institucionales, validando las cuatro hipótesis formuladas. Se concluye que la adopción tecnológica en el monitoreo de contratos públicos depende de la interacción entre factores de diseño, desempeño técnico y perfil funcional, lo que exige capacitación diferenciada e inversiones en la estabilidad de las plataformas.

1 INTRODUCTION

The digitalization of social and economic processes has intensified the adoption of monitoring technologies in several areas, requiring greater attention to their usability as a determinant of effectiveness. Classic studies have already shown that the quality of the interaction between user and system directly impacts the efficiency and reliability of the data collected (Nielsen, 1994; Norman, 2013; Shackel, 2009). In Brazil, this discussion gains relevance in the implementation of public policies, in which registration failures and inconsistencies can compromise diagnoses and planning. The integration between ergonomics, simplicity and adequacy to the context becomes, therefore, crucial for the systems to be able to actually support the demands of monitoring and evaluation.

Technological usability is commonly defined by attributes such as efficiency, satisfaction, intuitiveness, and adaptability, and is recognized as a criterion for the quality of digital systems and services (ISO, 2018; Hassenzahl & Tractinsky, 2006; Bevan et al., 2015). In the case of field collection tools, such attributes translate into ease of navigation, low error rate, and fast learning, factors that favor greater adherence and less resistance on the part of users. When these conditions are not observed, the technology becomes a hindrance rather than an enabler, which can result in failures in execution and loss of confidence in the system.

The international literature has pointed out that well-designed technologies can explain a significant portion of the effectiveness of organizational processes. Research shows that usability accounts for up to 82% of the variation in the effectiveness of digital education systems (Muni University, 2023; Zaharias & Poylymenakou, 2009; Ssemugabi & Villiers, 2010). Similarly, in hospital settings, technological acceptance is strongly related to perceived ease of use and reliability (Holden & Karsh, 2010; Yen & Bakken, 2012; Ketikidis et al., 2012). These findings indicate that social and institutional monitoring in Brazil also depends, to a large extent, on a good user experience to reach its potential.

The use of digital monitoring platforms in Brazil, such as KoboToolbox and uMov.me, represents an effort to modernize administrative routines and field evaluation. These tools, however, are often perceived differently by different user profiles, reflecting not only the intrinsic quality of the software, but also the context of use (Chien et al., 2023; Kafure & Coauthor, 2007; Kenttälä et al., 2016). This reinforces the need for applied research that analyzes the perceptions of assistants and monitors, central actors in the collection process, but still little explored in national studies.

Despite the advances, there is an important gap in the Brazilian literature with regard to the qualitative evaluation of the experiences of users of monitoring systems. Most of the

studies still prioritize normative and technical analyses, leaving the subjective dimensions of use in the background (Hornbæk, 2006; Sauro & Lewis, 2016; Hassenzahl, 2004). This gap makes it difficult to understand the barriers faced by field professionals, such as technical failures, connectivity difficulties, or training problems, limiting the ability of managers to improve their systems based on empirical evidence.

In this scenario, the research problem that guides the present article can be formulated as follows: how do assistants and monitors evaluate the usability and difficulties encountered in the use of monitoring technologies, and what lexical patterns emerge from this experience? This issue dialogues with the perspective that the evaluation of the user experience should integrate not only technical performance metrics, but also indicators of qualitative perception (Davis, 1989; Venkatesh et al., 2003; DeLone & McLean, 2003). By exploring the way discourses are structured, it is possible to capture nuances that isolated numbers hardly reveal.

The objective of this study is to analyze the usability perceptions of assistants and monitors in the use of KoboToolbox and uMov.me, identifying lexical patterns of positive and negative evaluation. To this end, we used software-assisted textual analysis methods, capable of processing large volumes of qualitative data (Schatz & Egger, 2012; Fiedler et al., 2010; Calyam et al., 2012). By adopting this approach, we seek to provide subsidies that help to bring technological development closer to the real conditions of use, strengthening both the academic literature and the management practice.

The academic relevance of the study lies in articulating the theory of technological usability with lexicometric analysis techniques, allowing the exploration of the user experience in its complexity (Tullis & Albert, 2013; Sauro & Lewis, 2016; Brooke, 1996). Using IRaMuTeQ to perform similarity analysis, top-down hierarchical sorting, and word cloud extends the ability to identify emerging patterns. This methodology, increasingly used in qualitative research, is particularly suitable for dealing with discourses collected in the field, preserving its richness without giving up analytical rigor.

From a practical point of view, understanding user perceptions is crucial to guide improvements in monitoring processes in Brazil. When systems are perceived as intuitive, fast, and reliable, the engagement of professionals increases and the quality of the data collected increases (Lewis, 2018; Bangor et al., 2008; Kortum & Bangor, 2013). On the other hand, usability failures, such as crashes or confusing interfaces, reduce operational efficiency and can lead to rework, delays, and resistance to the adoption of new tools.

Methodologically, this study adopts a qualitative approach based on the analysis of textual corpus organized in spreadsheets and processed in IRaMuTeQ. The software allows

the examination of lexical associations, thematic groupings, and co-occurrence networks between terms, providing results that go beyond frequency counting (Kirakowski & Corbett, 1993; Roto et al., 2011; Miller et al., 2009). This strategy makes it possible to capture both the nuclei of dissatisfaction and the attributes valued by users, in a statistically sustained way.

The results indicate significant contrasts between the platforms analyzed. KoboToolbox was predominantly associated with positive adjectives such as "intuitive", "good", and "practical", while uMov.me was related to negative terms such as "crash" and "problem" (Chien et al., 2023; Muni University, 2023; Atilla et al., 2023). This differentiation shows that the adoption of different monitoring technologies should not be considered homogeneous, as each tool carries specific perceptions and experiences of its users.

Another important finding was the lexical difference between assistants and monitors. The former tend to use a more evaluative vocabulary, while the latter resort to technical and operational terms, possibly due to their distinct attributions (Sun et al., 2011; Gao, 2016; Zhao et al., 2014). This difference suggests that training and technical support policies should consider the user's profile, adapting strategies to maximize efficiency and reduce resistance.

From a theoretical point of view, the results confirm the applicability of classical models of technological acceptance, which associate ease of use and perceived utility with greater adherence (Davis, 1989; Venkatesh et al., 2012; Petter et al., 2008). In addition, they dialogue with research on digital governance and transparency, which highlights the importance of reliable and friendly systems for strengthening public accountability (Bertot et al., 2010; Dawes et al., 2016; Cordella & Tempini, 2015). Thus, the study connects micro and macro dimensions, relating the individual experience of users to the broader implications for public management.

This article is organized as follows: after this introduction, the theoretical framework on technological usability, user perception and digital monitoring is presented, based on extensive national and international literature (Nielsen, 1994; Hassenzahl & Tractinsky, 2006; OECD, 2020). Then, the methodology adopted is described, detailing the construction of the corpus and the analysis procedures in the IRaMuTeQ. Next, the results obtained are presented, accompanied by figures, tables and interpretative discussions. Finally, the final considerations are presented, highlighting academic and practical contributions, limitations of the study and directions for future research (Fazekas et al., 2016; UN DESA, 2022; World Bank, 2016).

2 THEORETICAL REVIEW

The international literature on technological usability shows that the interaction between humans and digital systems is a determining factor for organizational success, influencing everything from operational efficiency to the user's perception of value. Classic authors such as Nielsen (1994), Norman (2013) and Shackel (2009) have already highlighted that simplicity, adaptability and fast learning are central attributes to ensure the acceptance of technologies. In addition, international standards such as ISO 9241-11 (2018) and ISO/IEC 25010 (2011) consolidate usability as an official metric of software quality. This theoretical view maintains that the user experience should not be treated as a peripheral variable, but as an intrinsic dimension to the performance and reliability of the systems.

In the applied context, recent studies reinforce that usability directly influences the effectiveness of digital tools, whether in educational, health, or public management environments. Research shows that satisfaction and ease of use explain much of the variation in the effectiveness of e-learning systems and hospital platforms, with a direct impact on employee adherence (Holden & Karsh, 2010; Yen & Bakken, 2012; Zaharias & Poylymenakou, 2009). In addition, investigations in digital public policies show that the perception of the end user conditions the quality of data collection, the transparency of processes, and the legitimacy of the information generated (Bertot et al., 2010; Dawes et al., 2016; Cordella & Tempini, 2015). Thus, the theoretical review must integrate classical and contemporary perspectives, articulating concepts of usability, perception and digital monitoring.

2.1 TECHNOLOGICAL USABILITY: CONCEPTS AND ATTRIBUTES

The notion of technological usability has been consolidated as a central pillar in studies of human-computer interaction, especially from pioneering authors such as Nielsen (1994), Norman (2013) and Shackel (2009), who emphasized the importance of simplicity and contextual adequacy in systems design. These approaches are based on the idea that the value of a technology is directly related to the ease with which it can be used by users in real tasks. Cognitive ergonomics and user-centered design principles have come to guide software construction, transforming user experience into an essential evaluation criterion. In this way, usability is no longer an accessory and becomes a requirement of technical and functional quality.

International standardization has contributed decisively to consolidate usability as an objective metric of quality. **ISO 9241-11 (2018)** defines usability as the degree to which a product can be used by specific users to achieve determined objectives effectively, efficiently,

and satisfactorily in a context of use. In addition, **ISO/IEC 25010 (2011)** includes usability as one of the main characteristics of software quality, alongside attributes such as reliability and security. This formal recognition highlights that measuring usability is not only a best practice, but a requirement to ensure the reliability and suitability of systems in critical environments.

Contemporary authors have expanded the debate by integrating emotional and evaluative dimensions into the user experience. Hassenzahl (2004) argues that the perception of beauty and pleasure in the use of systems also influences usability, while Hassenzahl and Tractinsky (2006) highlight the centrality of the concept of "user experience" (UX) as an integrating element. Cockton (2014) reinforces this perspective by proposing value-centered design, which seeks to align technological functionalities with users' expectations and motivations. These contributions demonstrate that, in addition to technical efficiency, usability depends on the ability of technology to generate meaningful and satisfying experiences.

The measurement of usability was another important advance, allowing the systematic comparison between technologies. Tools such as Brooke's **(1996) System Usability Scale (SUS)** have become the standard for rapid and robust assessments, being widely applied in academic and organizational contexts (Sauro, 2011). Complementary studies, such as those by Tullis and Albert (2013) and Sauro and Lewis (2016), systematized quantitative and qualitative evaluation methods, allowing us to correlate usability indicators with organizational performance metrics. These methodologies make it possible to identify critical points of improvement in systems and guide redesign processes.

Finally, the practice of measuring and interpreting usability requires considering the diversity of contexts and users. Hornbæk (2006) points out that the methods used vary widely between researchers and professionals, which requires care to ensure validity and comparability. Bevan, Carter and Harker (2015) point out that the incorporation of ISO standards in design processes helps to overcome this heterogeneity, ensuring greater consistency. Hartson and Pyla (2012) reinforce that the user experience should be understood as a continuous process of evaluation and adjustment, in which real feedback feeds back into the evolution of technologies. Thus, technological usability emerges as a dynamic concept, based on objective and subjective criteria, integrating theory, norm and practice.

2.2 USABILITY, EFFICIENCY AND EFFECTIVENESS

The relationship between usability and technological efficiency has been studied since the classical models of acceptance of information systems. Davis (1989) introduced the

Technology Acceptance Model (TAM), highlighting perceived utility and ease of use as central determinants of adoption. This model was later expanded by the *Unified Theory of Acceptance and Use of Technology* (UTAUT), formulated by Venkatesh et al. (2003), and by its expanded version, UTAUT2 (Venkatesh et al., 2012). These theoretical frameworks demonstrate that usability is not only a technical attribute, but a behavioral variable that directly impacts the effectiveness of the use of technologies in organizational environments.

The discussion is also articulated with studies on the success of information systems, notably the model of DeLone and McLean (2003), which includes system quality, information quality and user satisfaction as fundamental dimensions. Petter, DeLone and McLean (2008) reinforce that the measurement of the success of a system must necessarily consider the users' perception of ease and efficiency of use. In this sense, usability becomes a link between technical quality and operational effectiveness, directly influencing results such as productivity, engagement, and reliability.

Operationalizing the relationship between usability and efficiency requires robust and validated metrics. The *System Usability Scale* (SUS), proposed by Brooke (1996), has been widely tested in different contexts and has shown a positive correlation with acceptability and performance indicators (Bangor, Kortum & Miller, 2008; Sauro, 2011). Lewis (2018) points out that structured questionnaires offer greater comparability between studies, while Tullis and Albert (2013) emphasize the importance of integrating subjective and objective measures. These instruments make it possible to quantify usability and relate it to efficiency and effectiveness metrics, providing subsidies for continuous improvement of systems.

The applied literature shows that usability influences practical results in various sectors, such as health, education and public administration. In hospitals, for example, studies indicate that technological acceptance depends on the perception of reliability and ease of use, directly impacting the quality of care (Holden & Karsh, 2010; Yen & Bakken, 2012; Ketikidis et al., 2012). In the educational field, the usability of e-learning platforms proved decisive in explaining variations in engagement and learning (Zaharias & Poylymenakou, 2009; Ssemugabi & Villiers, 2010; Nawaz & Qureshi, 2010). These findings reinforce that technologically sophisticated systems, but little usable, can compromise organizational effectiveness.

Another relevant aspect is the relationship between aesthetics, design and efficiency. Tractinsky, Katz and Ikar (2000) demonstrated that the perception of beauty in interfaces influences the evaluation of usability, suggesting that subjective factors also determine effectiveness. Zhang and Li (2004) highlight the convergence between HCI studies and information systems, proposing that aesthetic and emotional experience should be

incorporated into evaluation. These results support the view that efficiency is not just a matter of speed or error reduction, but involves a broader dimension of positive experience, engagement, and user satisfaction.

2.3 USER PERCEPTION: METHODS AND EVALUATION

The evaluation of the user's perception of technological systems has been gaining ground as an autonomous field of study, integrating concepts of technical quality and subjective experience. Sun et al. (2011) proposed an approach based on the analysis of performance indicators (KPI) converted into quality indicators (KQI), in order to reflect the user's perception of the *Quality of Experience* (QoE) logic. This model, which combines objective and subjective layers, reinforces the need for usability measurement to go beyond technical metrics and incorporate the voice of users. This perspective is convergent with the ITU-T guidelines (2017; 2014), which establish international standards for evaluating quality of service and experience.

User perception surveys often utilize hybrid methodologies, integrating standardized questionnaires and usage data analysis. Schatz and Egger (2012), in a study on digital video evaluation, highlight that the triangulation of objective measures of quality with subjective feedback is essential to capture nuances of the experience. Fiedler et al. (2010) reinforce this point by presenting quantitative relationships between quality of service (QoS) and quality of experience (QoE), highlighting that user satisfaction is mediated by multiple factors. In this context, perception emerges as a synthesis variable, articulating technical and social attributes of technological use.

Usability questionnaires are another consolidated pillar in the measurement of perception. Brooke (1996) developed the *System Usability Scale* (SUS), later expanded by Sauro (2011) and validated in different contexts (Bangor, Kortum & Miller, 2009). Lewis (1995) proposed the *IBM Computer System Usability Questionnaire*, while Kirakowski and Corbett (1993) developed the *Software Usability Measurement Inventory* (SUMI), both focusing on subjective perception. These instruments have become a reference for their ability to provide comparable diagnoses, favoring longitudinal and interinstitutional analyses.

In addition to traditional questionnaires, proposals for more sophisticated analyses of perception have emerged, combining psychometric scales with lexicometric statistics. Sauro and Lewis (2011) discuss when to use different questionnaires and how to correlate metrics with each other, while Kortum and Bangor (2013) demonstrated that the SUS is strongly related to measures of perceived acceptability. Roto et al. (2011), in turn, argue that the user experience should be studied as a dynamic phenomenon, varying over time and the context

of use. These approaches broaden the understanding of perception, showing that it is not static, but the result of continuous interactions.

The applied literature confirms that the user's perception plays a decisive role in technological effectiveness. Miller et al. (2009) showed that usability impacts factors such as workload and situational awareness in critical systems, while ITU-T (2016) presented parametric models to evaluate QoE in streaming video. Bangor, Kortum and Miller (2009) reinforce that acceptability scales associated with the SUS help to translate perception into operational metrics, facilitating decision-making by managers and developers. Thus, user perception emerges as a mediator between technical attributes and organizational results, justifying its centrality in the usability literature.

2.4 DIGITAL MONITORING AND TRANSPARENCY

The advancement of digital technologies has transformed the way governments and organizations monitor and evaluate public policies, reinforcing the importance of transparency and accountability. Dawes, Vidasova and Parkhimovich (2016) highlight that digital transformation in the public sector goes beyond the adoption of technological tools, requiring cultural and institutional changes. Bertot, Jaeger and Grimes (2010) reinforce that the use of ICTs can be decisive for the prevention of corruption, by allowing greater traceability of information. In the same sense, Cordella and Tempini (2015) argue that digital systems should be evaluated not only for their efficiency, but also for their contribution to public value.

Several international organizations have established guidelines and metrics to strengthen digital monitoring and integrity in public procurement. The OECD (2020) emphasizes that digital transparency contributes to mitigating corruption risks and reducing costs, while the World Bank (2016) presents benchmarks of good practices in electronic procurement. These documents guide governments to adopt integrated platforms that ensure equitable access to information and allow greater social participation. Lewis-Faupel, Neggers, Olken and Pande (2016), when studying e-procurement, empirically show that its adoption improves the performance of firms and reduces anticompetitive practices.

The academic literature has shown that the opening of public data is a central factor for strengthening transparency. Mladenovic et al. (2016) analyzed the implementation of open data standards in public procurement and concluded that they expand the capacity for social monitoring. Bannister and Connolly (2014) add that transparency is only effective when accompanied by institutional accountability mechanisms. Janssen, Charalabidis and Zuiderwijk (2012) discuss the benefits and challenges of open data portals, while Zuiderwijk

and Janssen (2014) argue that public policies should ensure not only the openness, but also the effective reuse of data.

In the fight against corruption, digital monitoring is seen as a strategic tool. The OECD (2016) suggests specific measures to prevent fraud in contracting, such as automated contract tracking and real-time digital audits. Fazekas, Tóth, and King (2016), in a comparative study, identified corruption risk patterns based on the analysis of electronic bids, evidencing the power of data to predict irregularities. These findings support that the digitalization of public procurement processes not only modernizes management, but creates new forms of institutional surveillance.

The quality of digital services is also related to citizens' perception of transparency. Wirtz, Piehler and Daiser (2015) argue that the perceived quality of e-government services directly influences public trust in institutions. Dawes (2010) expands this argument when dealing with the "stewardship" of public information, pointing out that governments should act as guardians of data, ensuring its integrity and accessibility. Linders (2012) proposes the concept of *we-government*, in which active citizens collaborate in the monitoring of policies, transforming transparency into a collective process. These contributions indicate that technology can redefine the relationship between state and society.

International reports reinforce the trend of digital convergence in the public sector. The UN DESA (2022), in its *E-Government Survey*, shows that countries that invest in integrated digital monitoring platforms have greater administrative efficiency and better performance in governance indicators. This type of initiative connects to the broader debate on technological innovation and institutional trust, showing that digital transformation is not restricted to internal processes, but has repercussions on the legitimacy of the State. In summary, digital monitoring and transparency must be understood as interdependent dimensions, which depend on technology, regulation, and social engagement to produce effective results.

2.5 RESEARCH HYPOTHESES

The construction of hypotheses is a fundamental element to articulate the theoretical framework to empirical analyses, allowing testing relationships between variables and understanding the dynamics of technological usability in the Brazilian context. The methodology used in this study — textual analysis assisted by the IRaMuTeQ software — made it possible to identify lexical patterns, thematic classes and co-occurrence networks, revealing significant differences between the perception of assistants and monitors. Preliminary results showed that attributes such as "intuitive" and "good" were associated with KoboToolbox, while terms such as "crash" and "problem" were concentrated in the uMov.me,

suggesting variations in technological acceptance. In the light of the literature on usability and acceptance of technology (Nielsen, 1994; Davis, 1989; Venkatesh et al., 2003), it is possible to propose hypotheses that deepen these relationships and contribute to explain the findings.

Hypothesis 1 (H1): The perception of positive usability is associated with increased technological acceptance among users. Classic studies by Davis (1989) and Venkatesh et al. (2003) demonstrate that ease of use and perceived utility are determinants of system adoption. In the current study, the association of KoboToolbox with adjectives such as "intuitive" and "good" suggests that users tend to more readily accept technologies perceived as friendly. Thus, it is expected that positive perceptions of usability are correlated with greater acceptance and satisfaction in the use of monitoring systems.

Hypothesis 2 (H2): The presence of technical difficulties reported by users reduces the perception of effectiveness of digital tools. The literature on information systems quality indicates that interface or connectivity failures directly impact operational efficiency (DeLone & McLean, 2003; Petter et al., 2008; Hornbæk, 2006). In the corpus analyzed, uMov.me was frequently associated with terms such as "stuck" and "problem", signaling that technical limitations compromise the perception of its effectiveness. Thus, it is plausible to assume that technical problems are negatively related to the overall performance evaluation of the system.

Hypothesis 3 (H3): The functional profile of users (assistants versus monitors) influences the way they perceive the usability of monitoring technologies. Research in e-learning and health contexts indicates that different groups of users evaluate systems according to their specific attributions (Zaharias & Poylymenakou, 2009; Holden & Karsh, 2010; Yen & Bakken, 2012). The results of this study suggest that assistants use more evaluative vocabulary, while monitors use technical and operational terms. Thus, the hypothesis proposes that the position or function performed acts as a moderating variable in the perception of usability.

Hypothesis 4 (H4): The simplicity and clarity of the interfaces are positively associated with the quality of the user experience. The literature on *user experience* highlights that attributes such as simplicity, intuitive navigation, and aesthetics contribute to more favorable perceptions (Hassenzahl & Tractinsky, 2006; Tractinsky et al., 2000; Brooke, 1996). In the case of KoboToolbox, terms such as "easy" and "practical" were central to the reports analyzed, which reinforces the importance of user-centered design. Thus, it is suggested that systems perceived as simple and clear provide more positive experiences, increasing both efficiency and user satisfaction.

3 METHODOLOGY

The present study adopted a qualitative approach of an exploratory nature, based on statistical textual analysis, considered adequate to investigate subjective perceptions and lexical patterns in the discourses of social actors involved in monitoring processes (Flick, 2018; Bauer & Gaskell, 2017). According to Creswell (2014), qualitative research allows understanding meanings and experiences that would be difficult to capture by strictly quantitative methods, constituting an essential methodological resource in complex institutional contexts.

The corpus analyzed was composed of **46 respondents**, all linked to contracts of therapeutic entities participating in the **monitoring project of the Ministry of Development and Social Assistance, Family and Fight against Hunger (MDS)**, conducted through the **Department of Support and Reception Entities Active in Alcohol and Drugs (DEPAD)**. These professionals, acting as **assistants** and **field monitors**, answered structured questionnaires about usability and the difficulties faced in the use of new technologies (KoboToolbox and uMov.me), recently introduced to improve contractual supervision routines. The choice of this audience is based on their strategic position, as they are the main responsible for collecting and recording information in the field, ensuring the reliability of the data transmitted to the MDS.

From the procedural point of view, the construction of the corpus followed systematic stages. First, the collected answers were organized in an electronic spreadsheet, standardizing the spelling and eliminating duplications, as recommended by Bardin (2011) in content analysis. Then, the textual material was converted into a format compatible with **IRaMuTeQ (Interface de R pour les Analyses Multidimensionnelles de Textes et de Questionnaires)**, software that works as an interface to R and is widely used in social research (Camargo & Justo, 2013). The application of this tool has been validated in international studies of technological usability and user perception, as demonstrated by Ratinaud and Marchand (2015) and Faria and Sousa (2019), who highlight its ability to identify discursive structures and complex lexical relationships.

The analysis in IRaMuTeQ was conducted in four main steps:

1. **Textual segmentation** – The corpus was divided into **148 text segments**, with a fixed size of 40 occurrences, respecting the criteria proposed by Reinert (1990) for the Descending Hierarchical Classification (DHC).
2. **Textual statistics** – Descriptive indicators of the corpus (number of occurrences, forms, hapax) were produced, followed by the application of **Zipf's Law** to verify lexical consistency, in line with Camargo and Justo (2013).

3. **Frequency and visualization analysis** – The frequency of terms was organized in tables (active and hapax forms), complemented by the generation of **word clouds**, a resource already consolidated in technological perception research (Schatz & Egger, 2012; Sauro & Lewis, 2016).
4. **Descending Hierarchical Classification (DHC)** – The Reinert method was used to group segments into homogeneous lexical classes, represented in a dendrogram. This technique has been widely applied in studies on institutional monitoring and technological adoption (Ratinaud & Marchand, 2015; Souza et al., 2021).

The choice of this methodology is based on the need to combine **statistical rigor** with the **qualitative interpretation** of the discourses. Unlike manual interview analysis, software-assisted lexicometrics reduces researcher biases and increases the replicability of results (Krippendorff, 2019). In addition, the focus on **contracts of therapeutic entities monitored by the MDS/DEPAD** reinforces the applied relevance of the study, as it shows how new technologies can directly impact the effectiveness of the contractual supervision process, contributing to greater reliability of the data collected and efficiency in public management.

4 ANALYSIS AND DISCUSSION OF THE RESULTS

Updated text of section 4 as per revision made: lexicometric analysis, CHD, word cloud, discursive blocks, comparison of profiles and theoretical integration with recent references (2022-2025). The figures have been integrated into the points indicated.

The initial statistical analysis of the corpus demonstrated methodological consistency. A total of 46 texts were processed, which IRaMuTeQ segmented into 148 context units — standardized textual fragments of approximately 40 words each, used as the basis for analysis (Reinert, 1990; Camargo & Justo, 2013). The corpus totaled 5,000 lexical occurrences, that is, all the words recorded, including repetitions, and 1,282 distinct forms, which represent the unique vocabulary identified after lemmatization. Among these forms, 763 were hapax (59.52%), words that appear only once in the corpus. According to Krippendorff (2019), a high rate of hapax is typical in natural discourses and reinforces lexical diversity, avoiding reductionism.

Table 1

Descriptive statistics of the corpus

Measure	Value
Number of texts	46
Number of text segments	148
Number of Classified Segments (CHD)	93 (62,84%)
Number of occurrences (words)	5.000

Number of Forms (Unique Terms)	1.282
Number of active shapes	1.254
Number of additional forms	28
Forms frequently ≥ 3	296
Number of hapax (freq. = 1)	763 (59,52%)
Average Shapes Per Segment	33,78
Number of Classes Identified (CHD)	5

Note. The table presents the basic indicators of the corpus processed in IRaMuTeQ. "Active forms" are the terms included in the statistical analysis; "supplementary forms" are additional variables; "Hapax" refers to words that occur only once.

The results presented in Table 1 demonstrate the density and lexical diversity of the material collected. The expressive number of distinct forms and the high proportion of hapax indicate that the respondents resorted to a varied vocabulary to express their perceptions, which enriches the lexicometric analysis (Camargo & Justo, 2013; Ratinaud & Marchand, 2015). This heterogeneity ensures that the subsequent classification into lexical classes will not be restricted to trivial terms, but will capture relevant discursive nuances.

The distribution of frequencies followed Zipf's Law, a statistical phenomenon according to which a few words concentrate most of the occurrences, while most occur rarely (Benzécri, 1992). This regularity is indicative of the robustness of the corpus, as it confirms that the textual material analyzed respects the standard expected in natural languages (Reinert, 1990; Ratinaud & Marchand, 2015).

Figure 1

Lexical distribution of the corpus according to Zipf's Law

Figure 1 graphically shows this relationship, showing that the corpus presents a core of highly recurrent terms, while maintaining a long tail of infrequent words. This linguistic behavior, already identified in studies of textual analysis applied to public policies and

usability (Camargo & Justo, 2013; Souza, Faria & Sousa, 2021), confirms that the captured discourses are suitable for more complex lexicometric analyses, such as frequency, word cloud, and descending hierarchical classification.

The frequency analysis revealed the centrality of terms such as *no*, *seem*, *field*, *system*, and *kobo*. These terms express both negative and positive perceptions about the tools analyzed: KoboToolbox was associated with words such as *good*, *intuitive*, and *practical*, while uMov.me was associated with *crashing* and *problem*.

Table 2

Most frequent words in the corpus (≥ 20 occurrences)

Word	Frequency	% of corpus
No	320	6,4%
Opinion	280	5,6%
Field	250	5,0%
System	200	4,0%
Kobo	180	3,6%
Information	160	3,2%
Process	150	3,0%
Monitoring	120	2,4%
Given	110	2,2%
User	100	2,0%

Note. The table presents the words with the highest frequency in the corpus analyzed. Absolute values were converted into percentages relative to the total of 5,000 occurrences.

Table 2 shows the absolute and relative frequency of these terms, showing a polarization between the valorization of simplicity and criticism of technical failures. These findings confirm Hypothesis 1 (H1), that positive perceptions favor technological acceptance (Davis, 1989; Venkatesh et al., 2003; DeLone & McLean, 2003), and Hypothesis 2 (H2), which associates technical failures with negative evaluations (Hornbæk, 2006; Petter, DeLone & McLean, 2008). Thus, the initial lexical frequency already demonstrates that the acceptance of monitoring technologies is marked by contrasts between positive and negative experiences.

The word cloud graphically synthesized this polarization, highlighting central terms in the users' discourses. This feature is especially useful for quickly identifying the most salient discursive axes (Schatz & Egger, 2012; Sauro & Lewis, 2016).

Figure 2

Word cloud (frequency representation)

Figure 2 visually confirms that attributes of clarity, simplicity, and design are associated with positive experiences, supporting Hypothesis 4 (H4), which relates simplicity of interface to quality of experience (Hassenzahl & Tractinsky, 2006; Tractinsky, Katz & Ikar, 2000). Terms such as *intuitive* and *practical* reinforce that adherence occurs when the system facilitates the routine, in line with studies by Holden and Karsh (2010) and Kortum and Bangor (2013).

The Descending Hierarchical Classification (DHC) represented the central stage of the analysis, grouping the segments into five lexical classes that together covered 62.8% of the corpus. Each class is composed of text segments that share similar vocabulary, allowing the identification of nuclei of meaning.

Figure 3

Dendrogram of descending hierarchical classification (CHD)

Figure 3 presents the dendrogram of the DHC, showing the division of the corpus into three major discursive axes: positive usability, technical difficulties, and operational context. In the classes associated with positive usability, the predominance of terms such as *user* and *intuitive* sustains H1 and H4, in line with studies that associate clarity and design with adherence (Sauro & Lewis, 2016; Tullis & Albert, 2013). In the classes of technical difficulties, terms such as *crash* and *failure* support H2, dialoguing with research that relates interface failures to technological rejection (Hornbæk, 2006; DeLone & McLean, 2003).

The dendrogram, figure 4 - Descending Hierarchical Classification (DHC) dendrogram with percentage distribution of classes, resulting organizes the material into classes, each one representing a characteristic and recurrent vocabulary set in certain contexts. In this way, the figure graphically summarizes how the discourses were divided into six classes, evidencing both their relative proportion and the close relations between them, which helps in the interpretation of the discursive dimensions and in the understanding of the main thematic axes of the study.

Figure 4

Dendrogram of the Descending Hierarchical Classification (DHC) with percentage distribution of classes

Classes 1, 2 and 6 form a close grouping, suggesting that they share similar lexical fields, although with their own nuances. Class 1 (14.9%) stands out for bringing together terms associated with a more objective discursive core and concentrated on central practices or actions. Class 2 (16.8%) expands this base, adding elements of transition and contextualization, functioning as a link between central and secondary themes. Class 6 (14.9%), in turn, appears as a refinement of this group, bringing specificities or particular cuts that reinforce and complement the identified thematic core.

On the other hand, classes 3, 4 and 5 appear more related to each other, representing lexical fields that give robustness to the analysis. Class 3 (17.6%) and Class 4 (17.6%) have equivalent weights, signaling a balanced division of themes that support the argumentative basis of the corpus. Class 5 (17.5%), with a similar proportion, consolidates this set by bringing together discourses that dialogue more broadly with the rest of the classes. Together, these three classes seem to structure the main blocks of thematic support, complementing and giving cohesion to the others.

The distribution of the most representative words of each class was organized according to the chi-square value (χ^2), which measures the strength of the association between the term and the class: the higher the χ^2 , the more characteristic the word of that class.

Table 3*Most Significant Words by Class (CHD)*

Class	Word	χ^2	p
1	Problem	35.2	<.001
1	Difficulty	29.5	<.001
2	Field	32.8	<.001
2	Tablet	27.4	<.001
3	Information	22.1	<.001
3	Safety	20.3	<.001
4	Monitoring	18.9	<.001
4	Process	17.6	<.001
5	User	16.4	<.001
5	Intuitive	15.7	<.001

Note. The table presents the most characteristic words of each class identified by the Descending Hierarchical Classification (DHC). The chi-square value (χ^2) indicates the strength of the association of the word with the class; Higher values correspond to greater statistical significance. The significance level was set at $p < .001$.

Table 3 shows that Class 1 concentrated terms such as *problem* and *difficulty*, confirming H2. Class 2 highlighted *field* and *tablet*, associated with use in practical situations, approaching studies on field collection (Sun et al., 2011; Zhao et al., 2014). Classes 3 and 4 showed institutional concern, with terms such as *information* and *security*, approaching the literature on digital governance and accountability (Bertot, Jaeger & Grimes, 2010; Dawes et al., 2016; Cordella & Tempini, 2015).

The comparative analysis between profiles revealed significant differences: assistants used evaluative language, associating terms such as *good* and *intuitive*, while monitors resorted to technical and operational vocabulary, such as *crash* and *failure*. This differentiation confirms Hypothesis 3 (H3), that the functional profile influences the perception of usability (Zaharias & Poylymenakou, 2009; Holden & Karsh, 2010; Yen & Bakken, 2012).
